• Draft/wind noise and water leaks at floor pan and grommets	• Missing or damaged plugs/grommets	• CHECK plugs/grommets for correct installation or damage. INSTALL new plugs/grommets if necessary.
• Road noise	• Missing mastic insulators • Missing body insulators	• CHECK for missing mastic insulators. REFER to Section 501-35 . • CHECK for missing body insulators.
• Rattles in body/doors and instrument panel	• Loose wires/cables • Loose objects/components in door wells, pillars quarter trim panels • Buzz from instrument panel components	• CHECK that all wires/cables are correctly routed and inserted in correct retainers. • CHECK doors by carefully striking underside of doors with a rubber mallet while listening for rattles in doors and pillars. REMOVE or TIGHTEN loose objects/components. • IDENTIFY which components of the instrument panel are buzzing. SECURE/FASTEN components as necessary, ADD foam or felt as needed if rattle persists.
• Door drain holes collecting water	• Holes clogged with mud or road tar	• CLEAN drain holes of foreign material with a

repair4less

		punch or screwdriver. CHECK drain holes regularly.
• Wind noise from exterior rear view mirror	• Exterior mirror housing misaligned • Mirror sail gasket folded/misaligned • Mirror housing trim cap installed incorrectly • Air leak through mirror housing hinge • Inner sail trim installed incorrectly • Inner sail gasket/barrier installed incorrectly • Air path through wiring bundle/fastener access holes • Exposed fastener access hole on mirror housing/sail	• REALIGN with edges shingled to airflow, with no gaps. • REINSTALL with gasket unfolded and aligned correctly. • REINSTALL with edges shingled to airflow. • Fully ENGAGE mirror into its operating position/USE foam to block air path through hinge. • REINSTALL sail trim/ADJUST door trim. • REINSTALL trim cover with gasket/barrier aligned correctly • BLOCK air path(s) with foam/tape. • INSTALL a new cap if missing.
• Rattle/vibration from exterior rear view mirror	• Mirror glass adjustment screws loose • Mirror mounting nuts loose • Aftermarket air deflector/stone shields • If equipped with power fold mirrors, power fold mirrors folded/unfolded manually or are not synchronized	• REMOVE mirror glass and TIGHTEN mirror glass adjustment motor screws. REFER to Section 501-09 . • TIGHTEN mirror mounting nuts. REFER to Section 501-09 . • If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST vehicle. If concern is no longer present, ADVISE customer that aftermarket component was causing concern. • If equipped with power fold mirrors, SYNCHRONIZE power fold mirrors. REFER to Section 501-09 .
• Draft/wind noise and water leak around perimeter of all fixed glass	• Gaps in the sealant bead • Air traveling up	• APPLY approved sealant. • INSTALL foam rope full

	windshield molding along A-pillar • Gaps in sealant bead of windshield/rear glass • Windshield/rear glass misaligned or not installed correctly • Rear hood seal at base of windshield misaligned/damaged • High-mounted stoplamp	length of the A-pillar. • RESEAL windshield/rear glass. REFER to Section 501-11 . • REINSTALL windshield/rear glass. REFER to Section 501-11 . • REALIGN or INSTALL a new seal as necessary • CHECK high-mounted stoplamp seal. REPAIR or INSTALL as necessary.
• Draft noise at cowl	• Cowl seal misaligned/damaged	• REALIGN or INSTALL a new seal as necessary.
• Draft/water leak or noise from roof opening panel	• Roof opening panel/components	• REFER to Section 501-17 for diagnosis.
• Wind noise created by airflow over or behind body panels	• Fender splash shield misaligned • Body panel misaligned (exposed edge) • Hood misaligned (front margin) • Front grille edge noise	• REALIGN fender splash shield. • REALIGN appropriate body panel. • CHECK hood gaps and fit. ADJUST hood as necessary. • APPLY foam in hollow areas behind louvers.
• Wind noise created by grille opening panel	• Grille relationship to leading edge on hood • Sharp edges due to material imperfections	• If possible, ADJUST grille opening panel forward to eliminate wind noise. • REMOVE sharp edges (no damage to visible surface).
• Wind noise from air extractor (body vent)	• Air extractor housing seated incorrectly • Air extractor housing or flaps damaged	• REINSTALL air extractor housing. • INSTALL a new air extractor.
• Wind noise from bug shield/exterior windshield sun visor	• Turbulence created by location and shape	• Determine if an OEM part or aftermarket. If aftermarket advise customer accordingly. If OEM, verify correctly installed. If noise is abnormal repair or replace as required.
• **NOTE:** The sliding back glass is a "wet" system. Water is allowed to come into	• Sliding back glass drain holes are clogged	• REMOVE any foreign material from the sliding back glass drain holes.

repair4less

the vehicle and collect at the bottom of the assembly in the lower rail, as long as it drains out in a timely fashion and does not overflow. Water collecting in the sliding back glass lower channel		
• Rattle from tailgate	• Loose tailgate latch	• If possible. ADJUST the tailgate latch. TIGHTEN the tailgate latch bolts. REFER to Section 501-14 .
	• Loose or worn tailgate assist handle	• TIGHTEN or REPLACE the tailgate assist handle. REFER to Section 501-04 .
	• Loose or worn tailgate step	• ADJUST or REPLACE the tailgate step. REFER to Section 501-04 .
	• Loose or broken tailgate lift assist torsion rod	• RESEAL or REPLACE the tailgate lift assist torsion rod. REFER to Section 501-04 .
	• Loose or worn tailgate latch striker sleeve	• TIGHTEN or REPLACE the tailgate striker.

Body Sealer Types And Applications

Seam Sealer

Seam Sealer TA-2 or equivalent:

- is a heavy-bodied, non-sag adhesive/sealer for use on standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans.
- can be used on water leaks and noise concerns.

Clear Silicone Rubber

Clear Silicone Rubber TA-32 or equivalent meeting Ford Specification ESB-M4G92-A:

- does not run.
- is fast drying.
- remains semi-elastic.
- can be used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

Silicone Gasket and Sealant

Silicone Gasket and Sealant TA-30 or equivalent meeting Ford specification WSE-M4G323-A4:

- is a form-in-place gasket and multi-purpose adhesive/sealant.
- is a room temperature curing silicone rubber.

Caulking Cord

3M™ Strip Caulk-Black 051135-08578 or equivalent meeting Ford specification WSB-M4G32-C:

- is a heavy-bodied, plastic base with a filler.
- is commonly known as perma-gum.
- is used on spot-weld holes and between surfaces not sealed with a gasket.

Weatherstrip Adhesive

Trim and Weatherstrip Adhesive Permatex® 8150 or equivalent:

- is a quick drying, strong adhesive designed to hold weatherstripping onto all body panels and surrounding metal.

Silicone Lubricant

Silicone Spray Lubricant XL-6 or equivalent meeting Ford specification ESR-M13P4-A:

- is used to keep the door and the window weatherstrip pliable and soft.

repair4less

- makes the door easier to close.
- retards weatherstrip squeaks.
- retards weatherstrip wear.
- helps retain door window alignment by reducing friction between the glass frame and the rubber weatherstrip.
- should not be used prior to painting.

Insulation

Insulation is used as a sound-deadener to reduce exterior road and powertrain noises from the interior of the vehicle. Mastic insulators are also used as insulation. For information on the location of the mastic insulators, refer to Section 501-35 . Insulation is installed:

- under the roof.
- above and below the instrument panel.
- at the cowl side panels.
- over the front and rear tunnel.
- over the front and rear floor pans.

It has heat-bondable mastic deadeners for improved NVH characteristics.

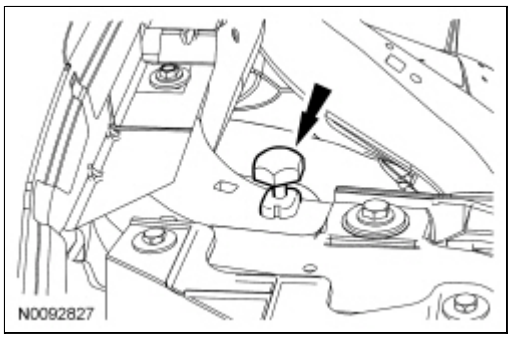
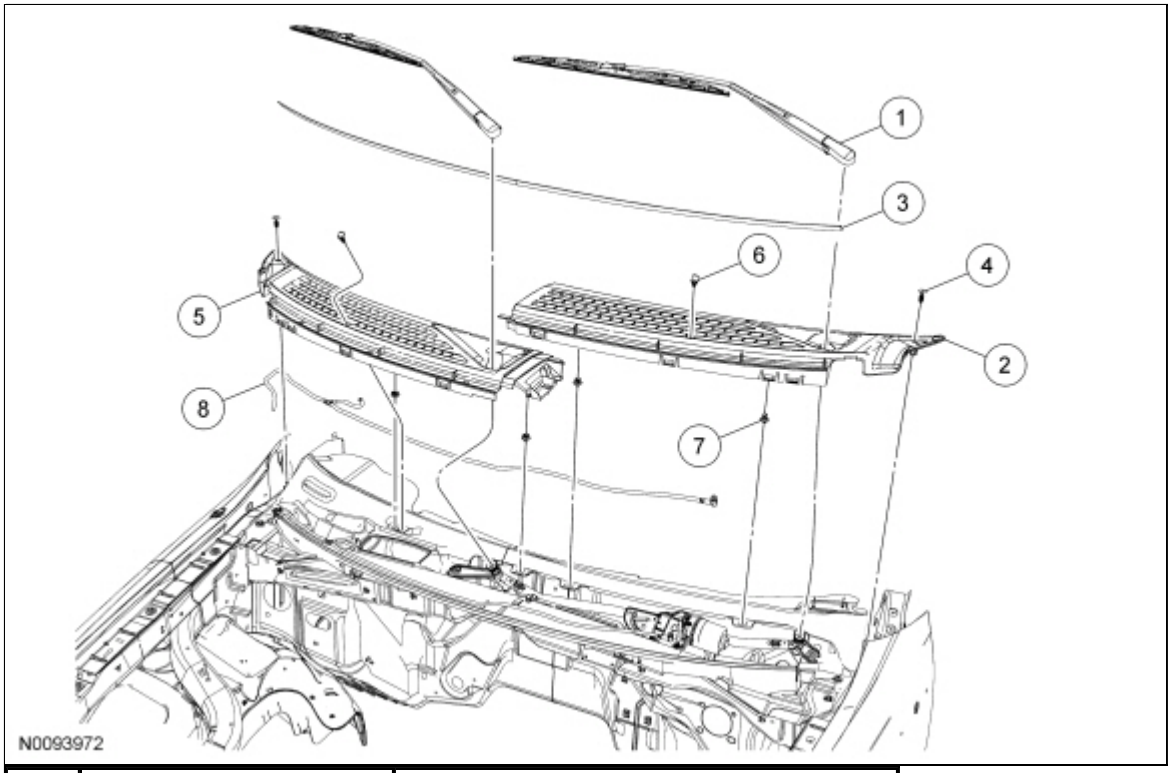
Hood Alignment

1. Raise and support the hood.



2. Loosen the lower hood hinge bolts so the hood will move slightly.

3. Lower the hood and position the hood for correct and proper fit. For additional information, refer to Margins in Section 501-35 .

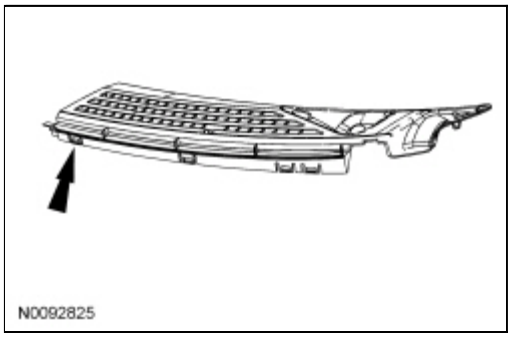


4. Tighten the hood hinge-to-body bolts.
   - To install, tighten to 30 Nm (22 lb-ft).

5. Adjust the hood height using the adjustable hood bumpers until the hood fits flush with the fenders. Check the hood for correct latching and if necessary, adjust the hood latch.

repair4less

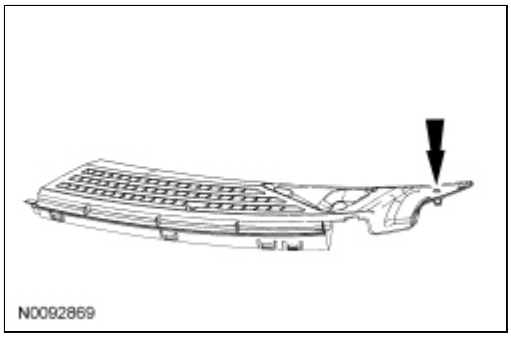
Cowl Panel Grille



Item	Part Number	Description
1	17526A LH/ 17527A RH	Wiper pivot arm
2	15022A69A	Left cowl panel grille
3	1502824A	Cowl panel grille seal
4	W710312	Cowl grille pushpin retainer (2 required)
5	15022A68A	Right cowl panel grille
6	17603	Windshield washer nozzle (2 required)
7	W708771	Cowl grille pushpin retainer (4 required)
8	17K664	Windshield washer hose

Removal and Installation

NOTE: It is necessary to remove the left cowl grille panel before removing the right cowl grille panel.



1. Remove the wiper pivot arms. For additional information, refer to Section 501-16 .
2. Open the hood.
3. Remove the left cowl panel grille pushpin retainer.

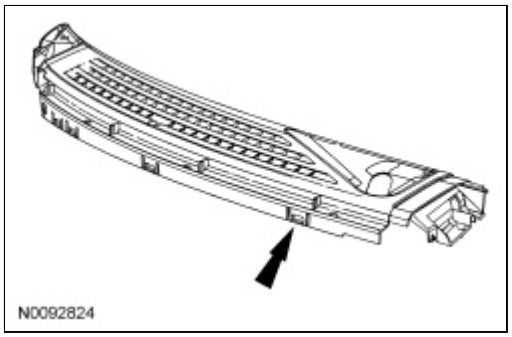
4. Release the front edge of the left cowl grille panel.
    - Starting at the center of the vehicle, depress the forward tab and press upward on the front edge of the cowl grille panel to release it from the cowl.
    - Continuing out from the center of the vehicle, depress the remaining forward tabs and release the rest of the front edge of the cowl grille panel from the cowl.

5. **NOTE:** Attaching clips will remain connected to the cowl sheet metal.

    Pull up on the rear LH edge of the cowl grille panel and disengage the 2 rear attaching clips from the cowl grille panel.

6. **NOTE:** The attaching clips will need to be removed from the cowl sheet metal and inspected. Replace any damaged clips.

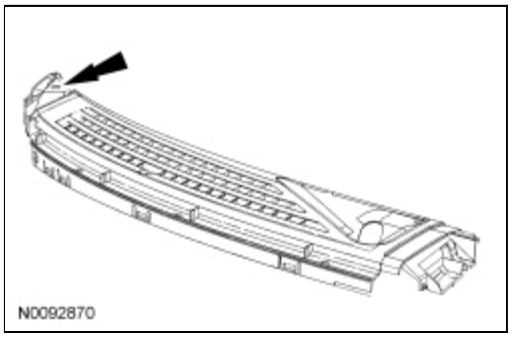
    Remove the attaching clips by rotating the clips one-fourth of a turn to release them from the cowl sheet metal. Inspect and replace any damaged clips and reinstall the clips onto the cowl grille panel.



7. Disconnect the windshield washer hose.

8. Remove the left cowl grille panel.

9. Remove the right cowl panel grille pushpin retainer.



10. Release the front edge of the right cowl grille panel.
    - Starting at the center of the vehicle, depress the forward tab and press upward on the front edge of the cowl grille panel to release it from the cowl.
    - Continuing out from the center of the vehicle, depress the remaining forward tabs and release the rest of the front edge of the cowl grille panel from the cowl.

repair4less

11. **NOTE:** Attaching clips will remain connected to the cowl sheet metal.

    Pull up on the rear RH edge of the cowl grille panel and disengage the 2 rear attaching clips from the cowl grille panel.

12. **NOTE:** The attaching clips will need to be removed from the cowl sheet metal and inspected. Replace any damaged clips.

    Remove the attaching clips by rotating the clips one-fourth of a turn to release them from the cowl sheet metal. Inspect and replace any damaged clips and reinstall the clips onto the cowl grille panel.

13. Disconnect the windshield washer hose.

14. Remove the right cowl grille panel.

15. To install, reverse the removal procedure.

repair4less

Fender Splash Shield

Removal and Installation

Both splash shields

1. If equipped, remove the fender moulding. For additional information, refer to Section 501-08 .
2. Remove the wheel and tire. For additional information, refer to Section 204-04

LH splash shield

3. Open the hood and remove the 5 wiring harness pushpins attached to the splash shield in the engine compartment.
4. Remove the 3 splash shield pushpins and the 5 splash shield screws.
5. Partially lower the splash shield and remove the 2 air box deflector pushpins from the engine side of the splash shield.

RH splash shield

6. Open the hood and remove the 4 wiring harness pushpins attached to the splash shield in the engine compartment.
7. Remove the 3 splash shield pushpins and the 5 splash shield screws.

Both splash shields

8. Remove the splash shield.
9. To install, reverse the removal procedure.

repair4less

Fender

Material

Item	Specification
Flexible Foam Repair Fusor® 121, or equivalent; obtain locally	—

Removal and Installation

Both fenders

1. On vehicles equipped with 3.5L GTDI engine, remove the front fender foam hood seal.
2. If equipped, remove the fender mouldings. For additional information, refer to Section 501-08 .
3. Remove the headlamp assembly. For additional information, refer to Section 417-01 .

RH fender

4. Remove the antenna cable. Refer to the appropriate section in Group 415 for the procedure..

Both fenders

5. Remove the fender splash shield. For additional information, refer to Fender Splash Shield in this section.
6. Remove the 3 front bumper cover-to-fender bolts.
7. Remove the fender lower reinforcement bolt.
8. Remove the bumper cover-to-fender support brace bolts (1 each side).
9. Remove the fender upper rear bolt.
   - To install, tighten to 9 Nm (80 lb-in).
10. **NOTE:** It will be necessary to remove the rear expandable foam baffle pushpins and position the foam baffle aside to gain access to the fender rear inside bolt.

    Remove the rear expandable foam baffle pushpin retainers.
11. **NOTE:** If expandable foam sealant has been used between the rear expandable foam baffle and the cowling, carefully cut the foam sealant to remove the rear expandable foam baffle from the cowling.

    NOTE: If reusing an existing expandable foam baffle, use Flexible Foam Repair or equivalent to seal the area around the entire perimeter of the rear expandable foam baffle.

Remove the rear expandable foam baffle.

12. Remove the fender rear inner bolt.
    - To install, tighten to 9 Nm (80 lb-in).

13. If equipped, remove the fender lower trim cover pushpins (2 each side).

14. Remove the lower fender bolts (2 each side).
    - To install, tighten to 9 Nm (80 lb-in).

15. Remove the upper fender bolts.
    - To install, tighten to 6 Nm (53 lb-in).

16. Remove the fender.

17. To install, reverse the removal procedure.

7	8A211	RH air deflector
8	W388577	Air deflector pushpins (5 required)
9	W706350	Air deflector scrivets (2 required)
10	W711848	Hood release bolt (2 required)
11	16700	Hood release
12	W712867	Hood release cable retainer (5 required)

1. Remove the front bumper. For additional information, refer to Section 501-19 .
2. Remove the front bumper cover. For additional information, refer to Section 501-19 .
3. Depower the Supplemental Restraint System (SRS). For additional information, refer to Supplement Restraint System Depower and Repower in Section 501-20B .
4. Remove the front LH and RH SRS impact sensor bolt and position the sensor and harness aside.
5. Remove the 2 hood release bolts.
   - To install, tighten to 35 Nm (26 lb-ft).
6. Release the hood cable retainers from the radiator grille support and position the hood release and cable aside.
7. Disconnect the horn wiring connector.
8. Remove the ambient air sensor retainer from the radiator grille support and position the sensor and harness aside.
9. Remove the horn bracket bolt.
   - To install, tighten to 35 Nm (26 lb-ft).
10. Remove the 4 Smart Junction Box (SJB) bolts and position the SJB inward.
    - To install, tighten to 35 Nm (26 lb-ft).

11. Remove the 2 coolant module bolts-to-radiator from the rear of the grille support.

- To install, tighten to 15 Nm (133 lb-in).

12. Remove the 6 radiator grille support bolts (3 each side).
    - To install, tighten to 30 Nm (22 lb-ft).

13. **NOTE:** It will be necessary to lift the cooling module upward and slide the radiator support forward to separate the radiator grille support from the cooling module.

    Remove the radiator grille support.

14. **NOTE:** Inspect all of the radiator grille support insulters. Replace as necessary.

    To install, reverse the removal procedure.
    - Transfer all necessary components.
    - Repower the Supplemental Restraint System (SRS). For additional information, refer to Supplement Restraint System Depower and Repower in Section 501-20B .

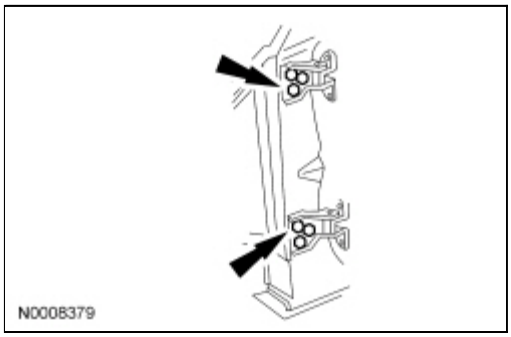
Door Alignment — Front

All adjustments

1. Remove the door latch striker.

Horizontal and vertical adjustment



2. Loosen the front door hinge-to-front door bolts.

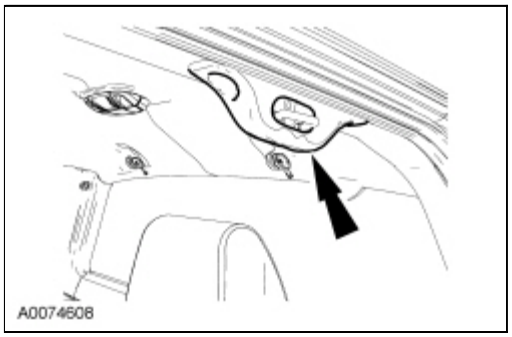
3. Adjust the front door. For additional information, refer to the dimensions in Section 501-35 .
4. Tighten the front door hinge-to-front door bolts to 30 Nm (22 lb-ft).

Fore and aft adjustment

5. Remove the front fender. For additional information, refer to Section 501-02 .
6. Loosen the door hinge-to-body bolts.

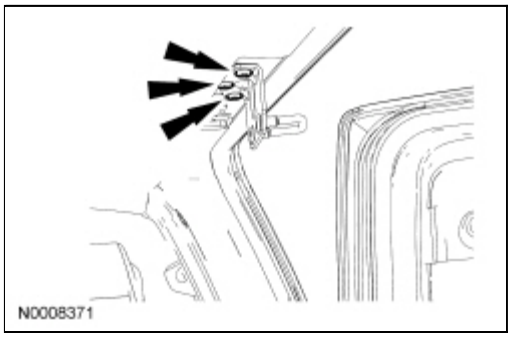
7. Adjust the front door. For additional information, refer to the dimensions in Section 501-35 .
8. Tighten the front door hinge-to-body bolts to 30 Nm (22 lb-ft).
9. Install the front fender. For additional information, refer to Section 501-02 .

All adjustments



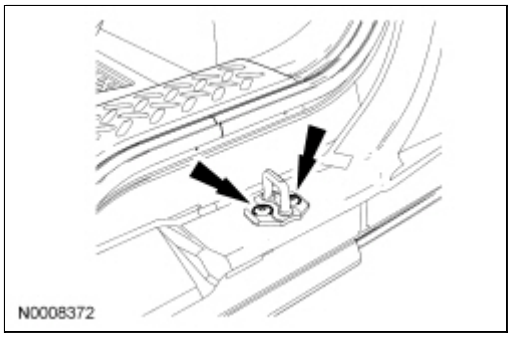
repair4less

10. Install the front door latch striker.
    - Tighten to 25 Nm (18 lb-ft).



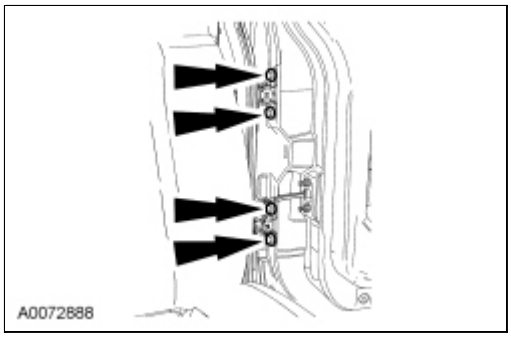
Door Alignment — Rear, SuperCab

All adjustments



1. Remove the upper rear door striker cover.

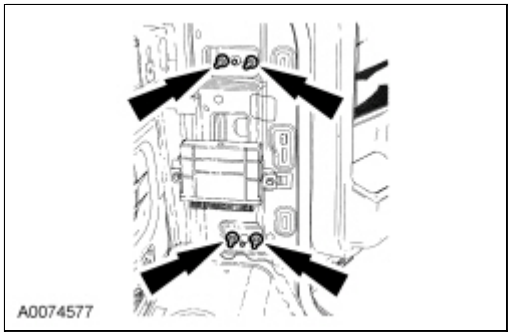
2. Remove the upper rear door striker.



3. Remove the lower rear door striker.

Horizontal and vertical adjustments

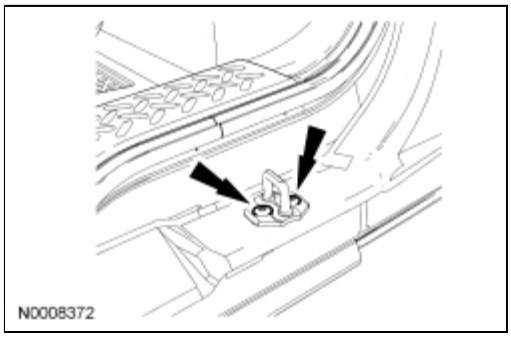
4. Loosen the rear door hinge-to-rear door bolts.



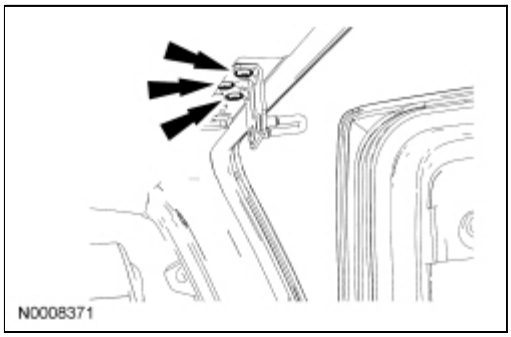
repair4less

5. Adjust the rear door. For additional information, refer to the dimensions in Section 501-35 .
6. Tighten the rear door hinge-to-rear door bolts to 30 Nm (22 lb-ft).

Fore and aft adjustment

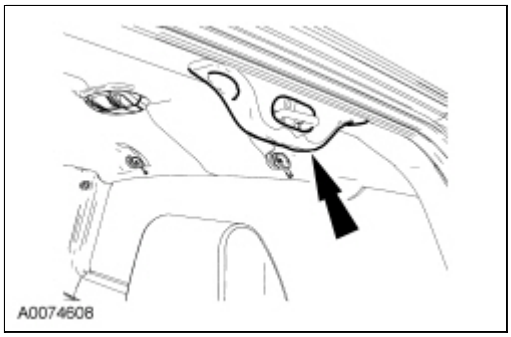


7. Remove the corner trim panel. For additional information, refer to Section 501-05 .
8. Loosen the rear door hinge-to-body nuts.



9. Adjust the door. For additional information, refer to the dimensions in Section 501-35 .
10. Tighten the rear door hinge-to-body nuts to 30 Nm (22 lb-ft).
11. Install the corner trim panel. For additional information, refer to Section 501-05 .

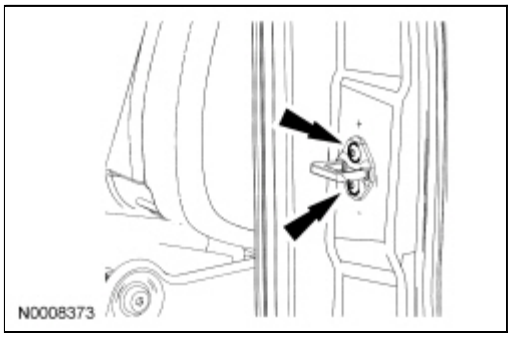
All adjustments



12. Install the lower rear door striker.
    - Tighten to 25 Nm (18 lb-ft).

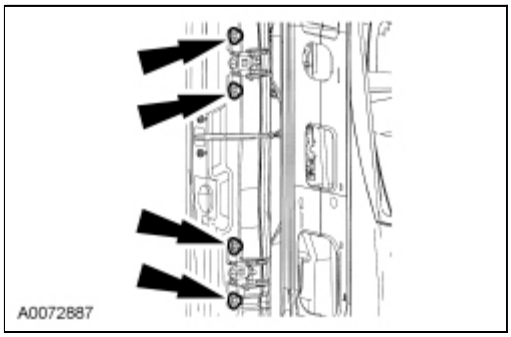
13. Install the upper rear door striker.
    - Tighten to 25 Nm (18 lb-ft).

14. Install the upper rear door striker cover.



repair4less

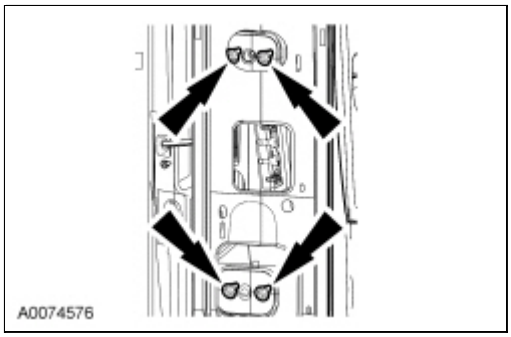
Door Alignment — Rear, SuperCrew



All adjustments

1. Remove the rear door striker.

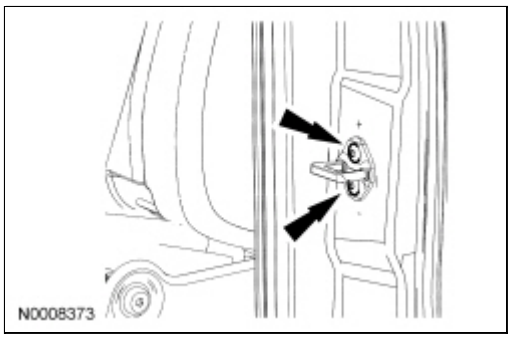
Horizontal and vertical adjustments



2. Loosen the rear door hinge-to-rear door bolts.

3. Adjust the rear door. For additional information, refer to the dimensions in Section 501-35 .
4. Tighten the rear door hinge-to-rear door bolts to 30 Nm (22 lb-ft).

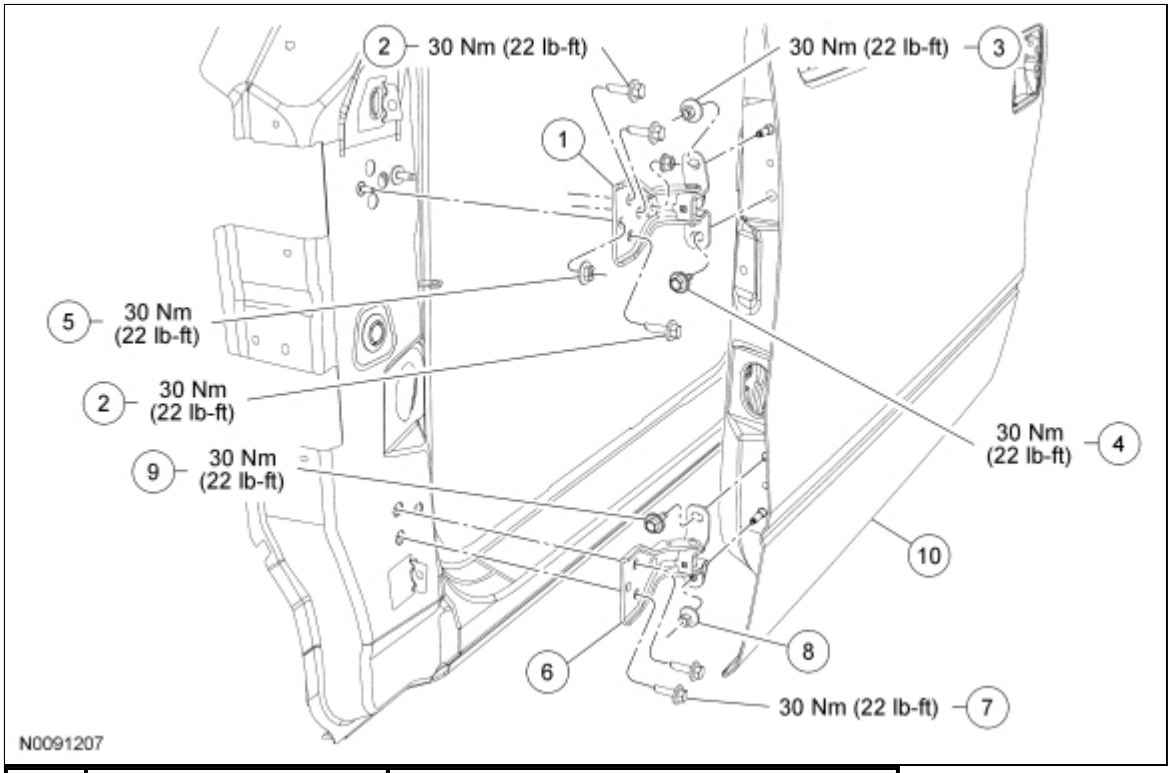
Fore and aft adjustment



5. Remove the B-pillar trim panel. For additional information, refer to Section 501-05 .
6. Loosen the rear door hinge-to-body nuts.

7. Adjust the door. For additional information, refer to the dimensions in Section 501-35 .
8. Tighten the rear door hinge-to-body nuts to 30 Nm (22 lb-ft).
9. Install the B-pillar trim panel. For additional information, refer to Section 501-05 .

All adjustments



10. Install the rear door striker.
    - Tighten to 25 Nm (18 lb-ft).

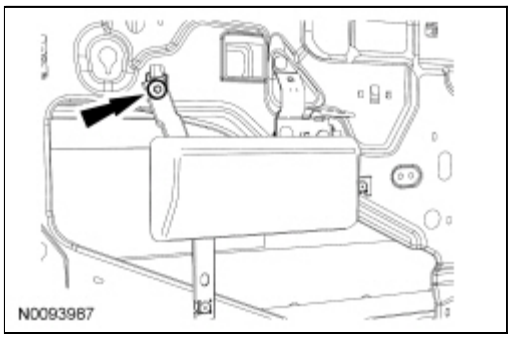
Removal and Installation

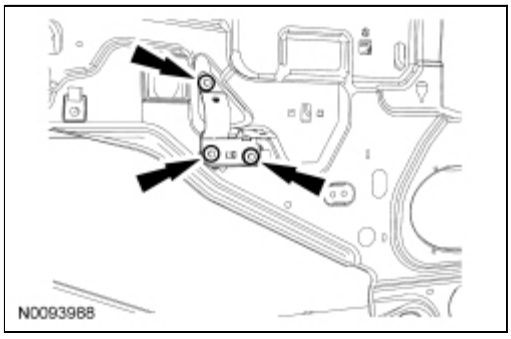
All vehicles

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .



repair4less

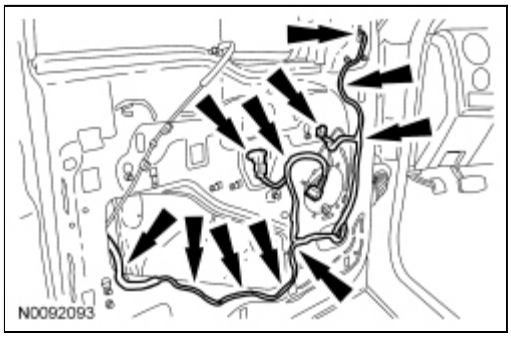
2. Open the front door and support as needed.



Vehicles not equipped with an A-pillar electrical connector

3. Remove the door speaker. For additional information, Refer to the appropriate section in Group 415 for the procedure.

4. Remove the armrest backing screw and remove the armrest backing.



5. Remove the armrest bracket bolts and remove the bracket.

6. Pull outward to release the water shield adhesive and remove the water shield.

7. Pull outward to release the sail panel water shield adhesive and remove the sail panel water shield.

8. Pull outward to release the wiring harness retainers.

9. Disconnect the keyless entry and door lock electrical connectors.

10. Disconnect the mirror electrical connectors.

11. Disconnect the side impact sensor electrical connector.

12. Route the wiring harness through the door.

Vehicles equipped with an A-pillar electrical connector

13. Disconnect the front door A-pillar electrical connector.

All vehicles

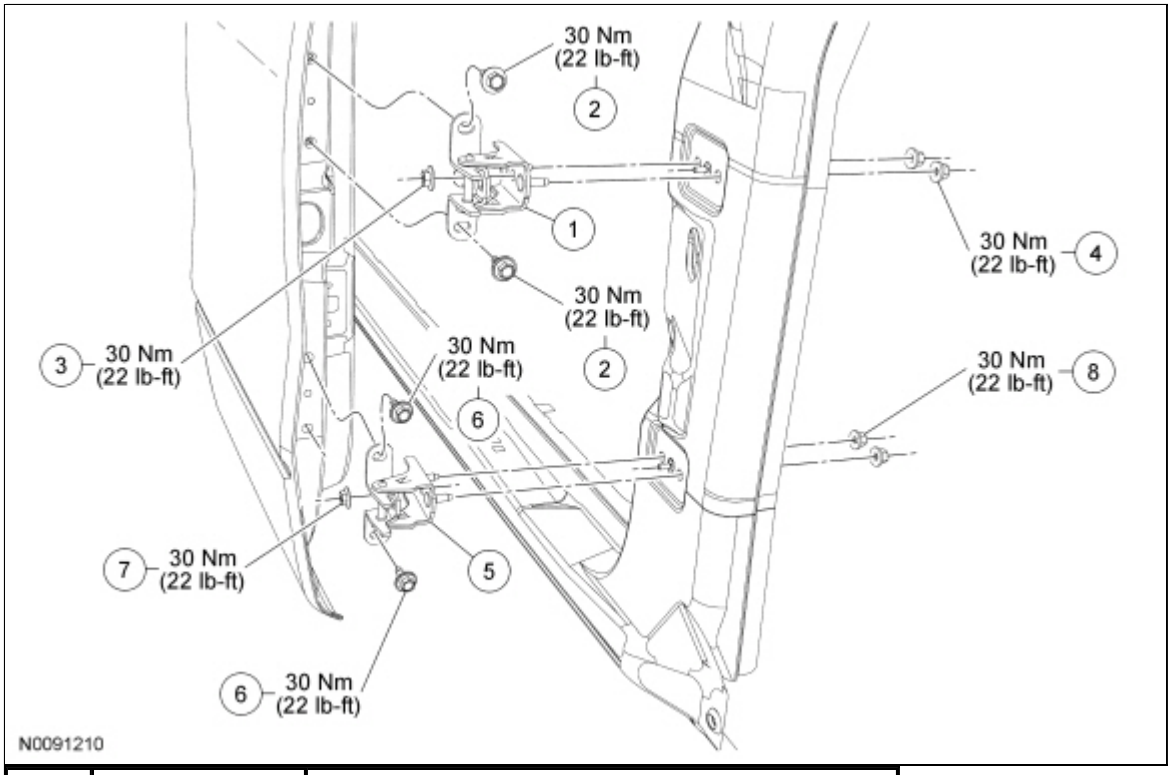
NOTICE: **The following steps require the aid of an assistant. Failure to follow this direction may result in damage to the vehicle.**

14. Remove the lower front door hinge-to-door nut and bolt.
    - To install, tighten the bolt to 30 Nm (22 lb-ft).
    - To install, tighten the nut to 30 Nm (22 lb-ft).

15. Remove the upper front door hinge-to-door nut and bolt and remove the front door.
    - To install, tighten the bolt to 30 Nm (22 lb-ft).
    - To install, tighten the nut to 30 Nm (22 lb-ft).

16. ***NOTICE:*** **To minimize the possibility of cross threading, hand-start all fasteners during the installation.**

    To install, reverse the removal procedure.
    - If installing a new front door, transfer parts as necessary.



17. Adjust the front door. For additional information, refer to Door Alignment — Front in this section.

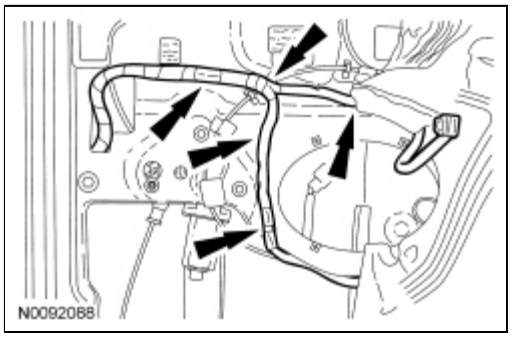
1. Open the rear door and support as needed.

Vehicles not equipped with a B-pillar electrical connector

2. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .



3. Remove the door speaker. For additional information, Refer to the appropriate section in Group 415 for the procedure.

4. Reposition the water shield.

5. Disconnect the window motor electrical connector.

6. Disconnect the door lock electical connector.

7. Pull outward to release the wiring harness retainers from the door.

8. Route the wiring harness out of the door.

Vehicles equipped with a B-pillar electrical connector

9. Disconnect the rear door electrical connector.

All vehicles

10. Remove the lower rear door hinge-to-rear door bolts.
    - To install, tighten bolt to 30 Nm (22 lb-ft).

11. ***NOTICE:*** **To avoid damaging the door, this step requires an assistant.**

    Remove the upper rear door hinge-to-rear door bolts and remove the rear door.
    - To install, tighten bolt to 30 Nm (22 lb-ft).

12. ***NOTICE:*** **To minimize the possibility of cross threading, hand-start all fasteners during the installation.**

    To install, reverse the removal procedure.
    - If installing a new rear door, transfer parts as necessary.

13. Adjust the rear door. For additional information, refer to Door Alignment — Rear, SuperCab in this section.

Pickup Bed

The pickup bed consists of:

- styleside pickup bed (pan assembly).
- pickup box tie-down hooks.
- body side wheel opening splash shield.
- rear-wheel opening moulding (Four-Wheel Drive (4WD) only).

The styleside pickup bed:

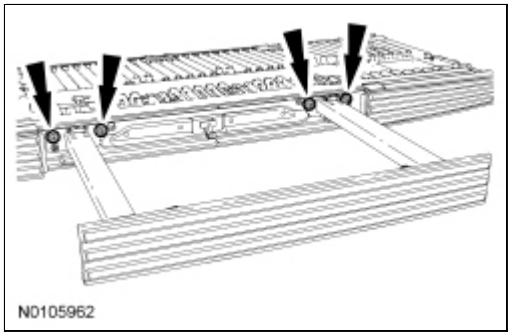
- is standard.
- comes in standard lengths of 1.67 m (5.5 ft) or 1.98 m (6.5 ft) or optional 2.43 m (8 ft) length.
- is double-wall steel construction.
- houses 4 stake pockets in the top of the 1.98 m (6.5 ft) bed and 6 stake pockets on the 2.43 m (8 ft) bed.
- on 4WD vehicles, includes rear-wheel opening mouldings.
- is constructed of an inner steel box and steel tailgate with stamped outer panels.

The F-150 SVT Raptor:

- is offered on 4WD only.
- is offered on 1.67 m (5.5 ft) length only.
- has extended styleside outer panels to provide extra clearance for the wheel.

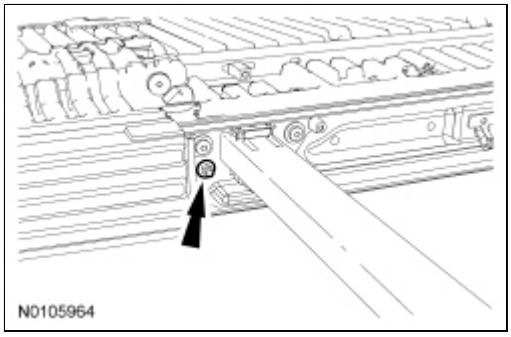
Styleside pickup beds:

- come standard with 4 pickup bed tie-down hooks.



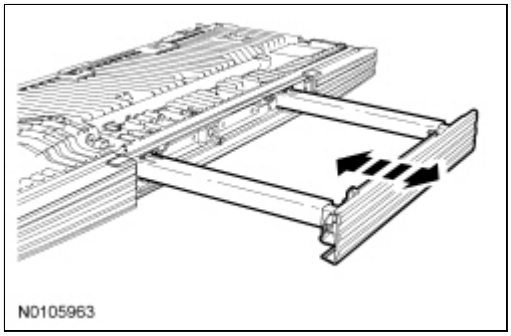
The tailgate assembly consists of:

- tailgate.
- tailgate hinges.
- tailgate support cables.
- torsion rod.
- tailgate step (if equipped).
- tailgate step handle (if equipped).
- rear view camera (if equipped).

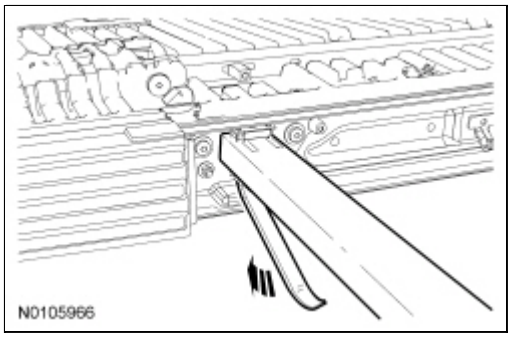


repair4less

Tailgate Step Adjustment



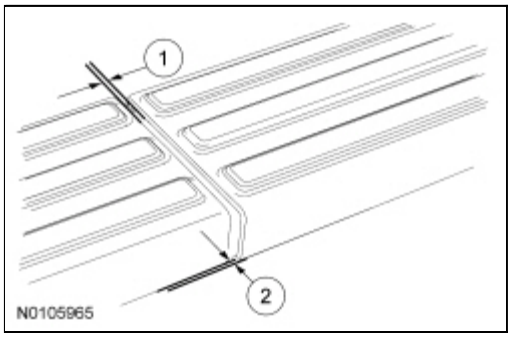
1. Loosen the 4 tailgate step bolts.



2. Loosen the driver side tailgate step nab pin nut.

3. Cycle the tailgate step to the fully extended position 2 times.

4. Using a suitable trim tool or wedge, pry upward on the driver side of the flex step.



5. Tighten the driver side tailgate step nab pin to 11 Nm (97 lb-in).

6. Tighten the 4 tailgate step bolts to 25 Nm (18 lb-ft).

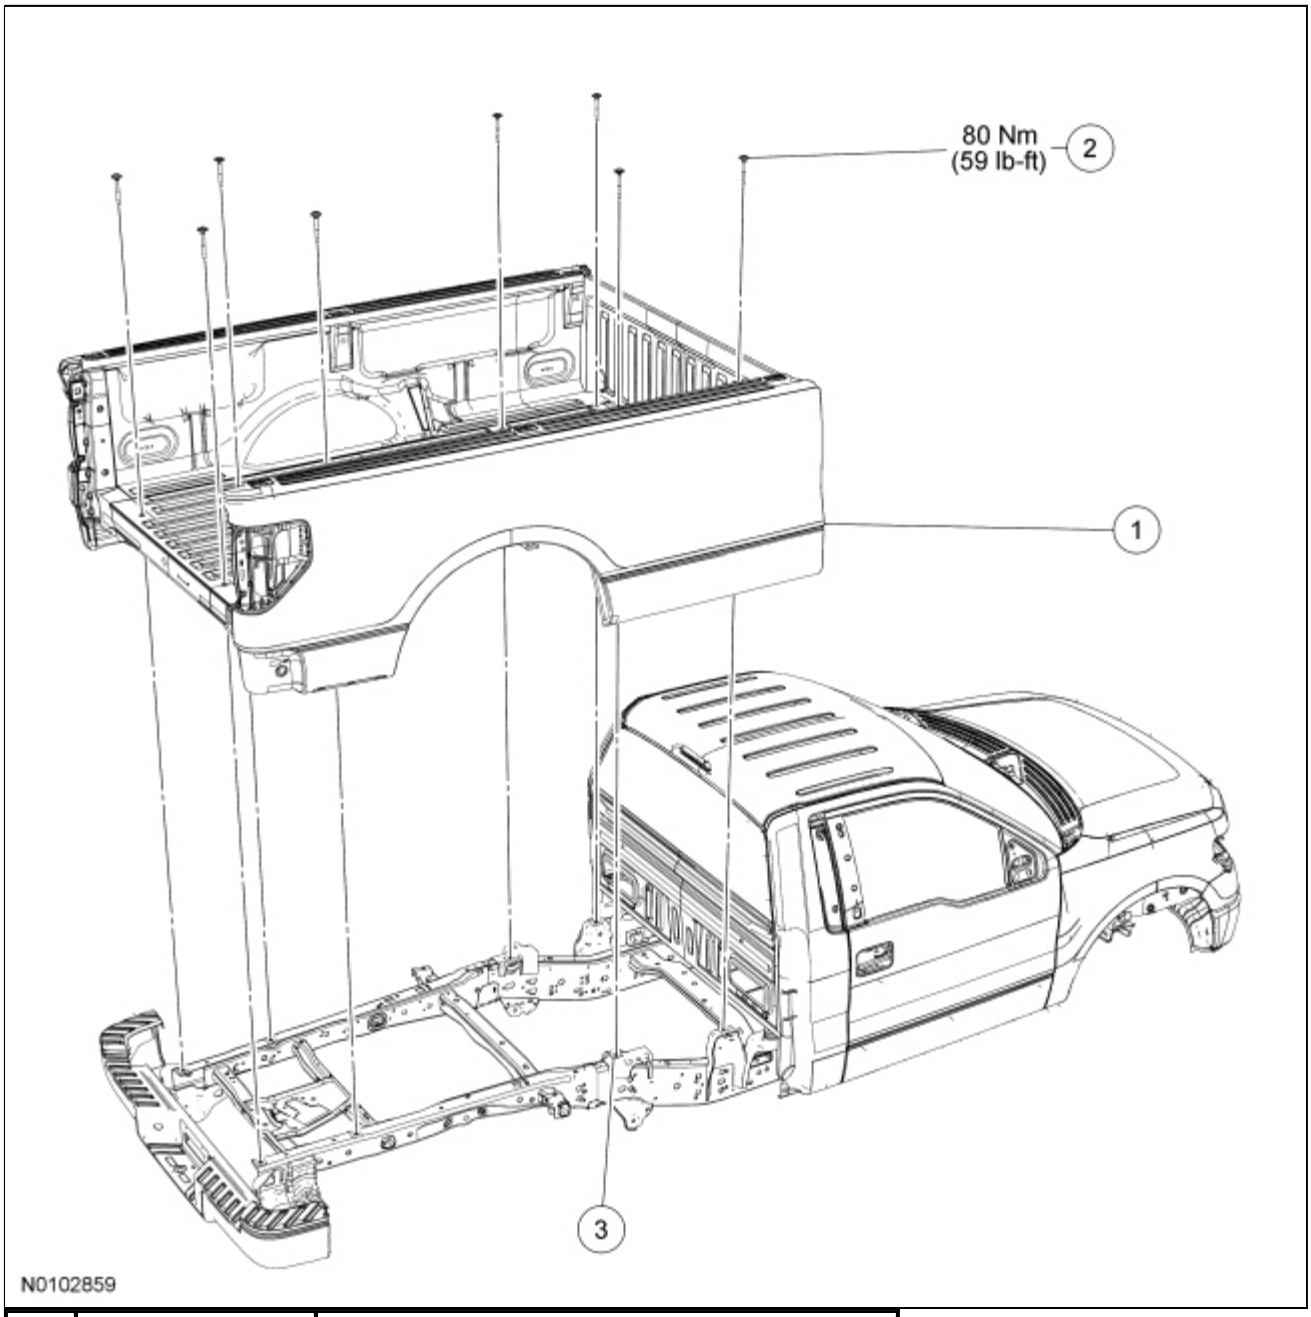
7. **NOTE:** Make sure the tailgate step does not pinch against the tailgate moulding.

   Inspect the tailgate step gap margin and flushness and adjust as necessary.
   1. Gap Margin = 4.0 mm (0.157 in) ± 2.0 mm (0.078 in).
   2. Flushness = 1.0 mm (0.039 in) ± 3.0 mm (0.118 in).
      - Cycle the tailgate step to the fully extended position to make sure of normal operation.

repair4less

Pickup Bed

NOTE: Eight-foot styleside pickup bed shown, all other styleside similar.



Item	Part Number	Description
1	9928508	Pickup box (complete assembly)
2	W709424	Pickup box bolt (all 8-foot pickup beds have 8 bolts; all others will have 6 bolts)

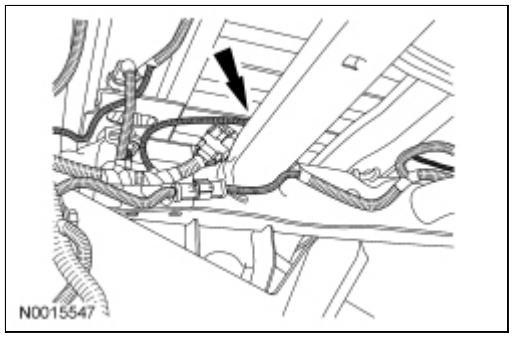
repair4less

3	W708605/ W712174	Pickup box attachment clip (8-foot beds [6-W708605, 2-W712174], 6.5 foot beds, [4-W708605, 2-W712174], 5.5 foot beds, [2-W708605, 4-W712174])

F-150 SVT Raptor

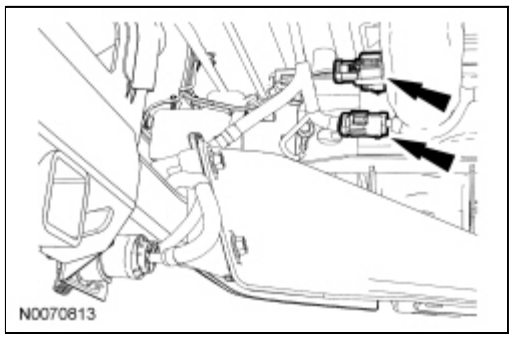
Item	Part Number	Description
1	9928508	Pickup box (complete assembly)
2	W709424	Pickup box bolt (6 required)
3	W708605/ W712174	Pickup box attachment clip (4-W708605) (2-W712174)

Removal and Installation



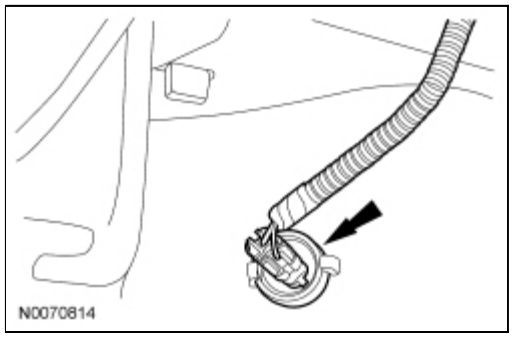
1. If equipped, remove the bed liner.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



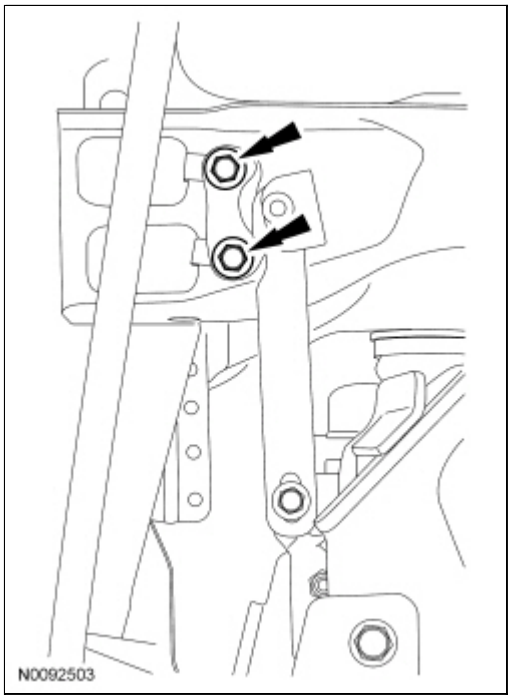
3. Remove the rear bumper. For additional information, refer to Section 501-19 .

4. Remove the fuel filler pipe. For additional information, refer to Section 310-01 .

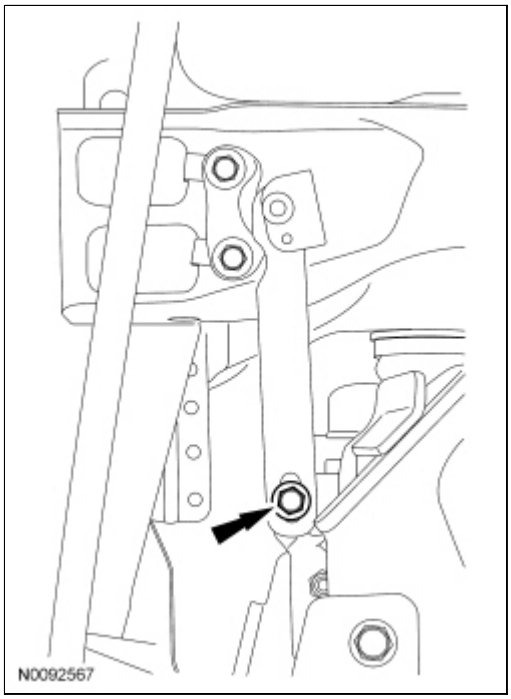


5. Remove the wiring harness ground bolt located on the frame cross member, just above the spare tire.
   - To install, tighten to 10 Nm (89 lb-in).

6. Disconnect the main tail lamp connector. If equipped, disconnect the reverse parking aid harness connector and the reverse camera wiring harness.



7. Disconnect the license lamp connectors.



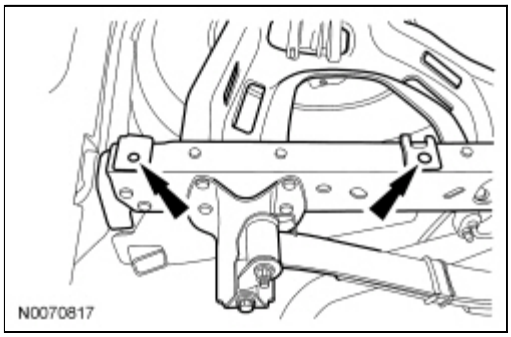
8. Remove the axle vent tube clip from the pickup bed floor crossmember and position the tube to the side.

repair4less

9. If equipped, remove the 2 upper bolts from the side step bracket-to-bed.
    - Tighten to 22 Nm (16 lb-ft).

10. If equipped, loosen the lower side step bracket-to-step bolt and position the bracket so it will rest on the step housing.
    - To install, tighten to 55 Nm (41 lb-ft).

11. **NOTE:** The pickup bed bolts are one-time-use only. Install new bolts whenever the bolts are removed.



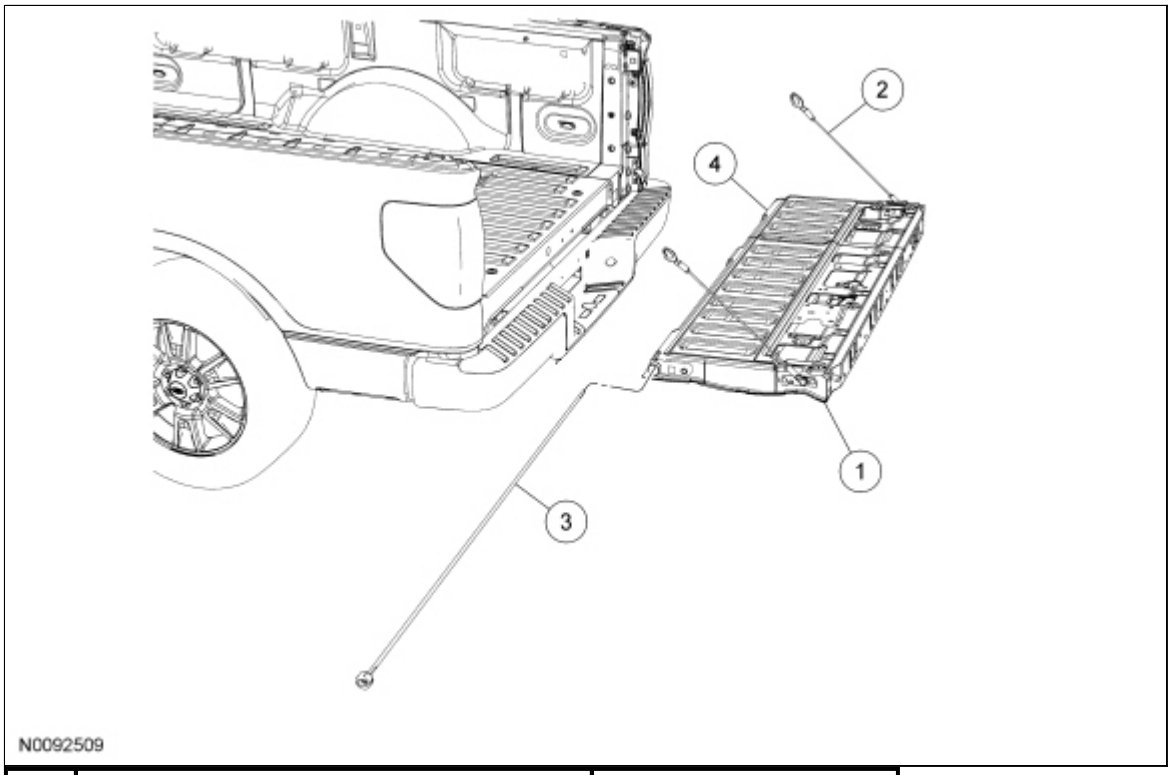
NOTE: All 8-foot pickup beds will have 8 bolts; all others will have 6 bolts.

Remove and discard the 8 pickup box bolts.

- To install, tighten the new bolts to 80 Nm (59 lb-ft).

12. **NOTE:** New attachment clips must be installed whenever the pickup box is removed. All 8-foot pickup beds will have 8 attachment clips; all others will have 6 attachment clips.

    Install new attachment clips before reinstalling the pickup box.

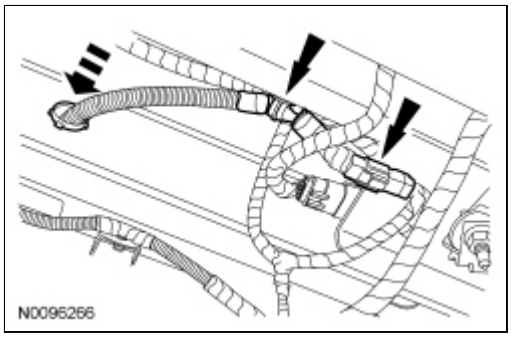


13. To install, reverse the removal procedure.

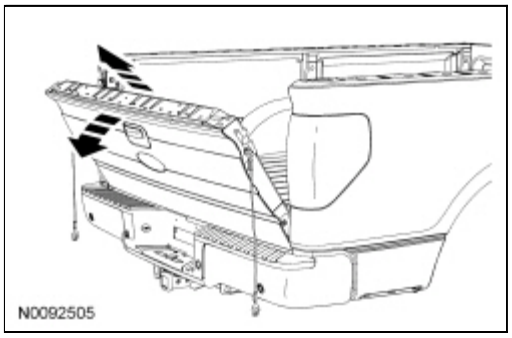
repair4less

Tailgate Lift Assist Torsion Rod

Material

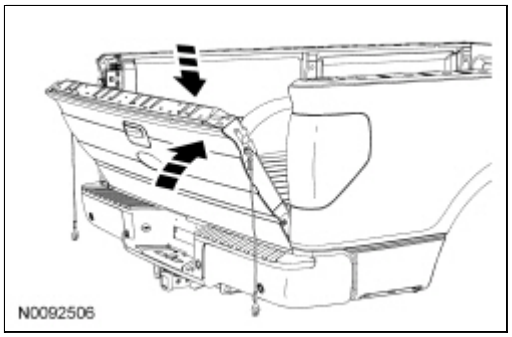


Item	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



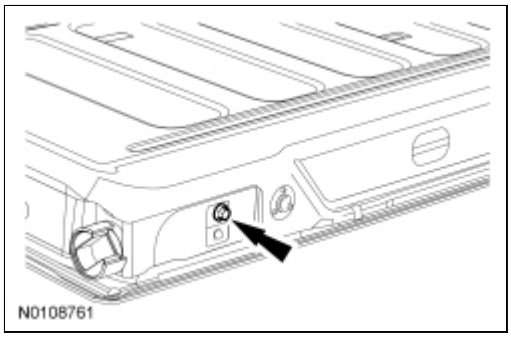
Item	Part Number	Description
1	9940700	Tailgate assembly
2	9944410 RH/ 9944411 LH	Tailgate support cable
3	99402A68-A (without step)/ 99402A68-B (with step)	Torsion rod
4	W505258	Clamp block machine screw

Removal



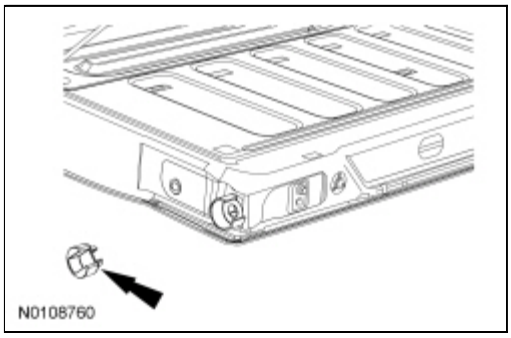
1. If equipped, disconnect the reverse camera wiring harness connector from the main harness and release the retaining clip. Slide the harness through the box crossmember.

2. Remove the tailgate from the vehicle.
    - Detach both tailgate support cables from the sides of the pickup bed, then lower the tailgate to approximately 41 degrees from vertical.
    - Pull the RH side of the gate out and away from the hinge.



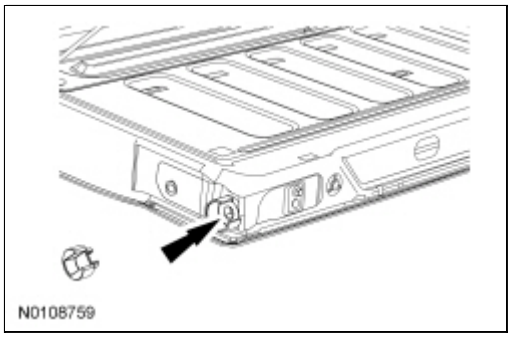
3. Raise the gate back up to approximately 10 degrees from vertical while keeping the RH tailgate pivot close to the hinge. Slide the tailgate to the right to release the LH hinge.

4. Set the tailgate on a no-scratch surface.



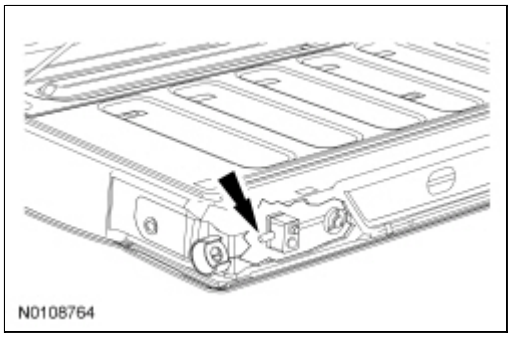
5. Loosen the clamp block machine screw 2-3 turns.

repair4less

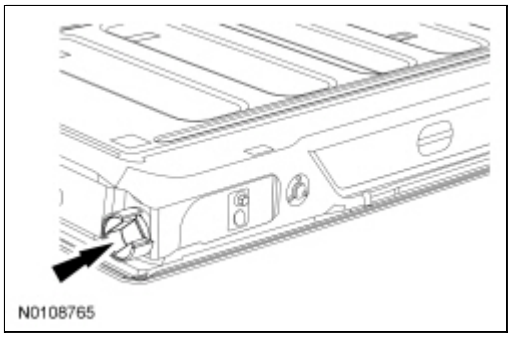


6. Remove the torsion rod from the tailgate. If the broken end of the torsion rod is stuck in the clamp block, carry out Steps 7 through 11.

7. Remove the urethane bushing from the RH pivot.

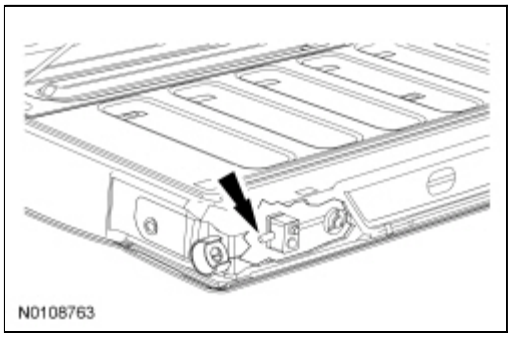


8. From the hole in the base of the RH pivot, drill an 8 mm (0.31 in) access hole through the tailgate inner panel.



9. **NOTE:** Portions of the tailgate are removed for clarity.

   Use a drift to press the broken end of the rod from the clamp block, then remove broken end through drain hole in the bottom edge of the tailgate.

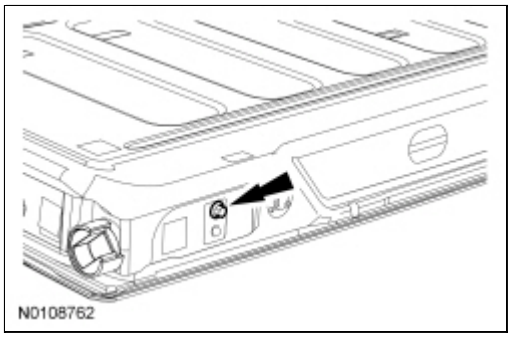


10. Seal the 8 mm (0.31 in) access hole in the tailgate inner panel with silicone gasket and sealant.
11. Install the urethane bushing in the RH pivot.

Installation

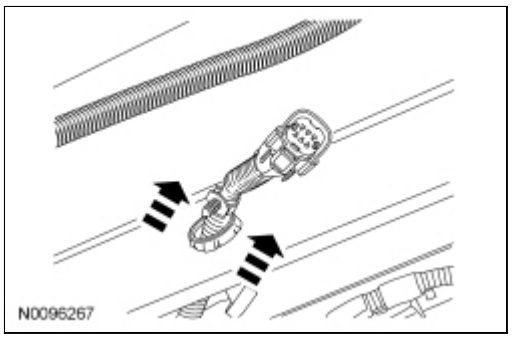
1. **NOTE:** Portions of the tailgate are removed for clarity.

   Install a new torsion rod through the LH pivot. Guide the rod into the clamp block.

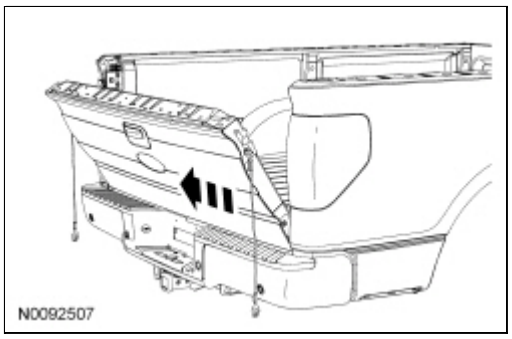


2. **NOTE:** The torsion rod must be installed with the same orientation as shown.

   Position the torsion rod so that the end bottoms out and is flush with the LH pivot.

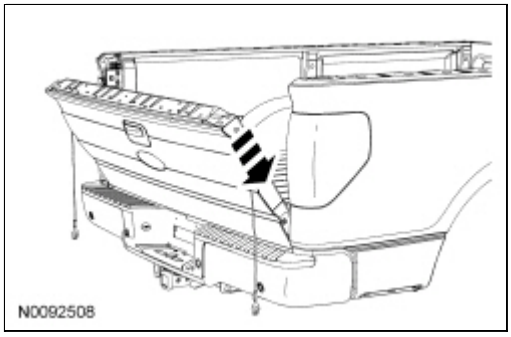


repair4less

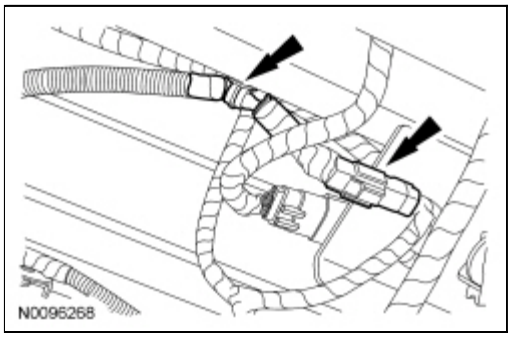


3. Tighten the 2 clamp block machine screws.
    - To install, tighten to 14 Nm (124 lb-in).

4. Position the reverse camera wiring harness through the box crossmember.

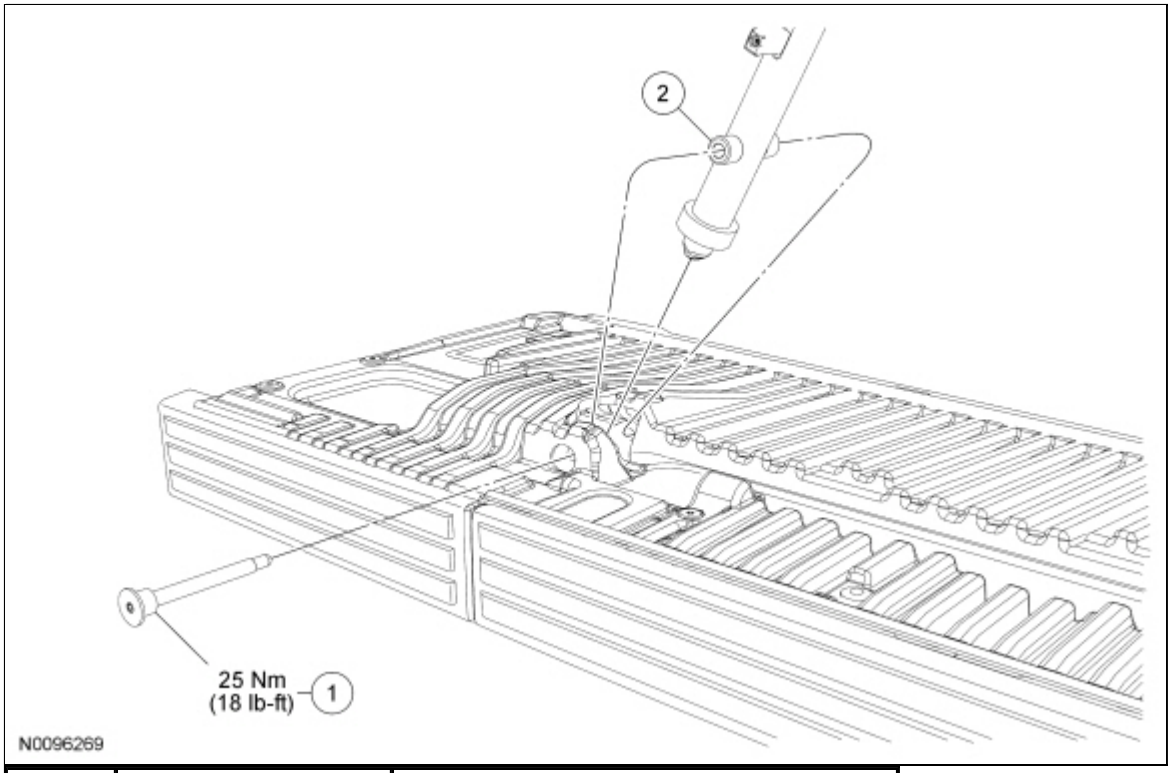


5. Position the tailgate so the LH tailgate pivot is close to the LH hinge and the tailgate is approximately 10 degrees from vertical. Keep the RH tailgate pivot close to the RH hinge, then slide the tailgate left to engage the LH pivot on the LH hinge.



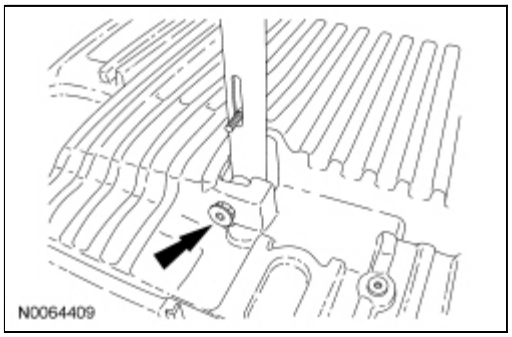
6. Position the tailgate so that it is approximately 41 degrees from vertical. Push the RH pivot onto the

hinge. Attach both tailgate support cables to the sides of the pickup bed.



7. Connect the reverse camera wiring harness connector to the main harness connector and position the reverse camera wiring harness into the retainer. Close the retainer.

repair4less

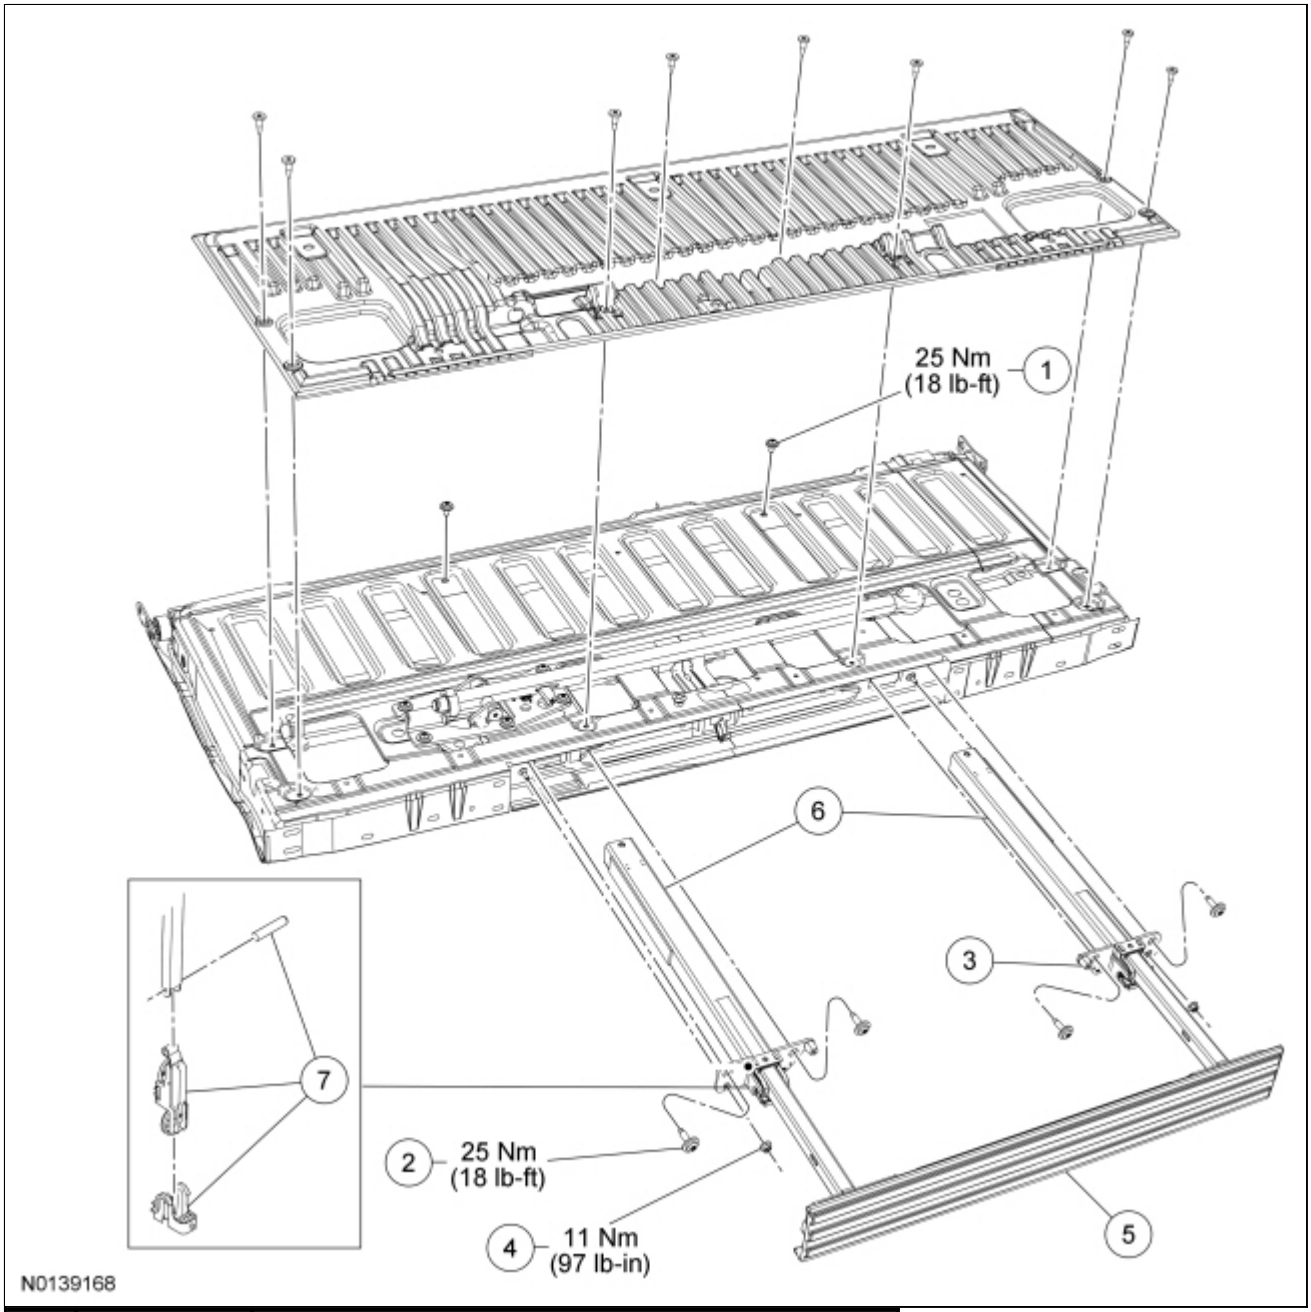


Tailgate Step Assist Handle

Item	Part Number	Description
1	99402B64	Tailgate assist handle bolt
2	9943300	Tailgate assist handle

1. Lower the tailgate.

2. Remove the T40 Torx head bolt from the assist handle.
   - To install, tighten to 25 Nm (18 lb-ft).



3. Remove the assist handle.

4. To install, reverse the removal procedure.

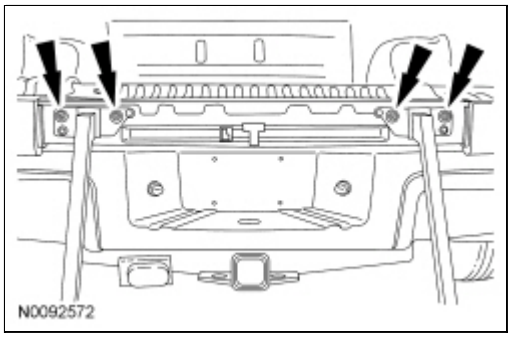
repair4less

Tailgate Step

Item	Part Number	Description
1	W712069	Tailgate step inside bolt (2 required)
2	W707916	Tailgate step upper bolt (4 required)
3	99439A00	Rubber bumper
4	—	Tailgate step nab pin nuts (part of 402A48) (2

		required)
5	9940602	Moulding repair kit
6	99402A48	Tailgate step assembly
7	99402K19	Rail slider and roller assembly repair kit (2 required)

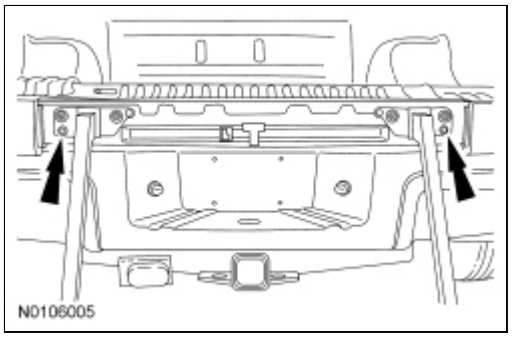
Removal and Installation



NOTE: Select parts are available for repair of some individual tailgate step components.

1. Lower the tailgate and open the assist step.

2. Remove the 2 tailgate step inside bolts.
   - To install, tighten to 25 Nm (18 lb-ft).



3. Remove the 4 tailgate step upper bolts.
   - To install, tighten to 25 Nm (18 lb-ft).

4. Remove the 2 tailgate step nab pin nuts.
   - To install, tighten to 11 Nm (97 lb-in).

repair4less

5. Remove the tailgate step.

6. To install, reverse the removal procedure.
    - Adjust as necessary. For additional information, refer to Tailgate Step Adjustment in this section.

A-Pillar Trim Panel

Removal and Installation

Passenger side

1. ***NOTICE:*** **Use a non-marring flat-blade tool and start on the inside edge of the covers. Covers are equipped with a tether. Failure to follow this direction may result in damage to the component.**

   Remove the assist handle bolt covers.

2. Remove the assist handle bolts.
   - To install, tighten to 8 Nm (71 lb-in).

3. If equipped with a speaker in the A-pillar trim panel, remove the instrument panel side finish panel and disconnect the speaker electrical connector.

4. Remove the A-pillar trim panel.
   - Pull outward to release the retainer clip.

Driver side

5. If equipped with a speaker in the A-pillar trim panel, remove the instrument panel side finish panel and disconnect the speaker electrical connector.

6. ***NOTICE:*** **During installation, the A-pillar trim panel locator pins must be inserted into the slots on the instrument panel. Failure to follow this instruction may result in damage to the component.**

   NOTE: The trim panel has a 2-stage high-retention clip.

   Remove the A-pillar trim panel.
   - Pull outward to disengage the first stage of the high-retension clip.
   - **NOTE:** This step will temporarily distort the A-pillar trim panel. There will be a "pop" noise when the pin is released from the sheet metal.

     Pull outward in the middle of the trim panel to disengage the 4-way locator pin from the sheet

metal.

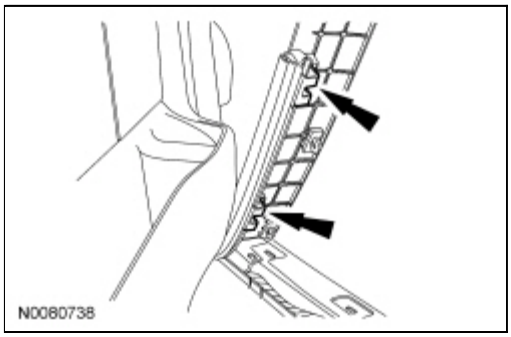
- Pull upward then inboard to disengage the high-retension clip from the mounting bracket.

All vehicles

7. **NOTE:** The A-pillar trim panel is equipped with 3 locator tabs and a 4-way locator pin that must be positioned correctly during reinstallation.

   To install, reverse the removal procedure.

repair4less



B-Pillar Trim Panel — Regular Cab

Removal and Installation

1. Position seats fully down and forward.

2. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .

3. Pull upward to release the scuff plate clips and remove the front door scuff plate.
   - Detach the scuff plate from the weatherstrip.

4. Position the weatherstrips aside.
   - If equipped, position the rear weatherstrips aside.

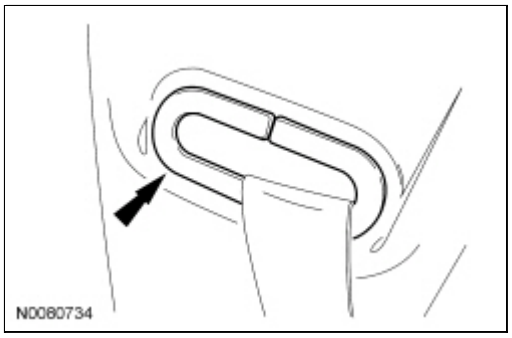
5. Remove the safety belt D-ring trim cover.

6. Remove the safety belt D-ring bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

7. Remove the B-pillar trim panel pin-type retainer.

8. **NOTE:** Starting at the top of the cover, use a non-marring tool.

   Remove the B-pillar trim panel bolt cover.



9. Remove the B-pillar trim panel bolt.
   - To install, tighten to 9 Nm (80 lb-in).

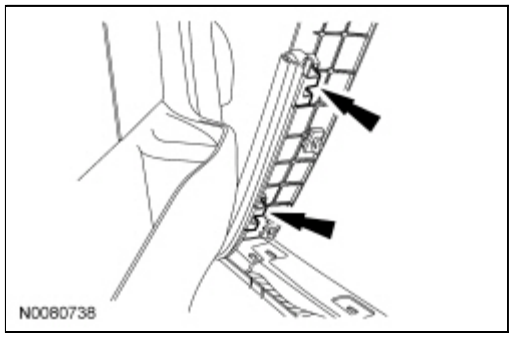
10. Remove the safety belt anchor bolt trim cover.

11. Remove the safety belt anchor bolt.
    - Disconnect electrical connector.
    - To install, tighten to 40 Nm (30 lb-ft).

12. Remove the safety belt trim ring.

repair4less

13. Remove the B-pillar trim panel.
    - Position the safety belt through the B-pillar trim panel.



14. **NOTE:** The B-pillar trim panel has a 2-way locator and a 4-way locator that must be positioned correctly on installation.

    To install, reverse the removal procedure.

B-Pillar Trim Panel — SuperCab

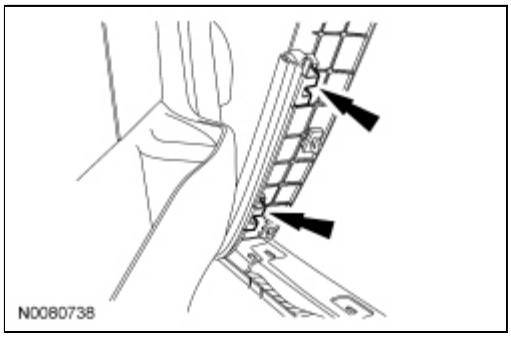
Removal and Installation

1. Remove the rear seat backrest. For additional information, refer to Section 501-10 .
2. Pull upward to release the scuff plate clips and remove the scuff plate trim panel.
   - Detach the scuff plate from the weatherstrip.

3. Reposition the rear door weatherstrip.
4. Remove the B-pillar trim panel pin-type retainer.
5. Remove the B-pillar trim panel bolt cover.
6. **NOTE:** Starting at the top of the cover, use a non-marring tool.

   Remove the B-pillar trim panel bolt.
   - To install, tighten to 9 Nm (80 lb-in).
7. Pull inward to release the B-pillar trim panel clips.
8. Reposition the B-pillar trim panel.
9. Remove the safety belt anchor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).
10. Reposition the safety belt through the B-pillar trim panel and remove the B-pillar trim panel.
11. To install, reverse the removal procedure.

repair4less



B-Pillar Trim Panel — SuperCrew

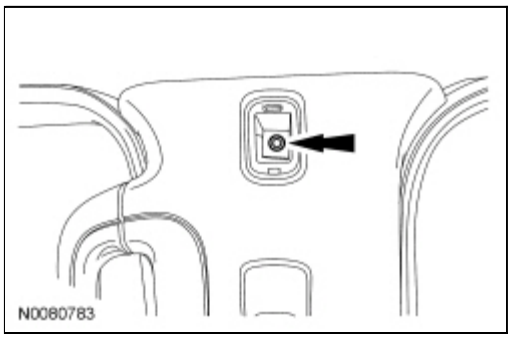
Removal and Installation

1. Position seats fully down and forward.

2. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .

3. Pull upward to release the scuff plate clips and remove the front door scuff plate.
   - Detach the scuff plate from the weatherstrip.

4. Position the front and rear weatherstrips aside.



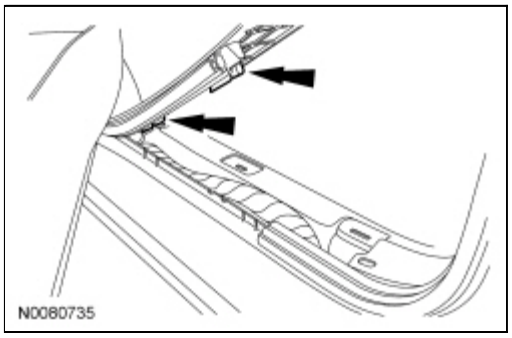
5. Remove the safety belt D-ring trim cover.

6. Remove the safety belt D-ring bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

7. **NOTE:** Starting at the top of the cover, use a non-marring tool.

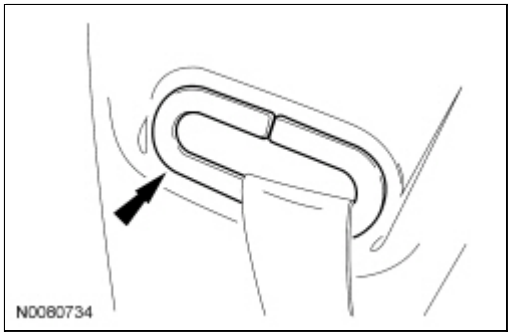
   Remove the B-pillar bolt cover.

8. Remove the B-pillar bolt.



9. Remove the safety belt anchor bolt trim cover.

repair4less



10. Remove the safety belt anchor bolt.
    - Disconnect electrical connector.
    - To install, tighten to 40 Nm (30 lb-ft).

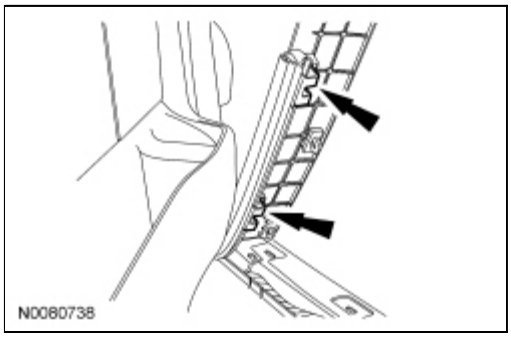
11. Pull upward to release the scuff plate clips and remove the rear door scuff plate.
    - Detach the scuff plate from the weatherstrip clip.

12. Remove the safety belt trim ring and pull the safety belt through the B-pillar.

13. Remove the B-pillar trim panel.

14. **NOTE:** The B-pillar trim panel has a 2-way locator and a 4-way locator that must be positioned correctly on installation.

    To install, reverse the removal procedure.



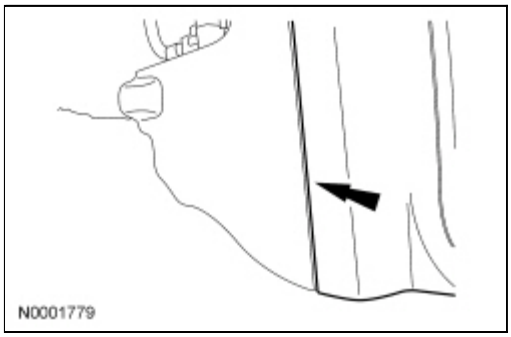
repair4less

Cowl Side Trim Panel

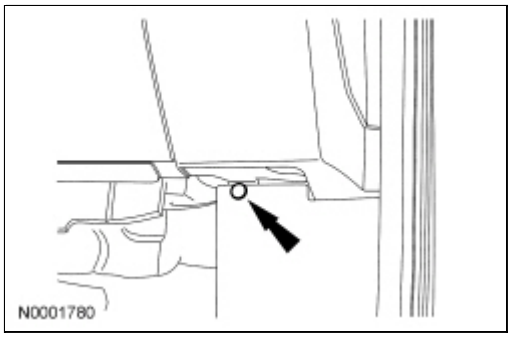
Removal and Installation

Both sides

1. Pull upward to release the scuff plate clips and remove the front door scuff plate.
    - Detach the scuff plate from the weatherstrip.



LH side



2. Remove the cowl trim panel.

RH side

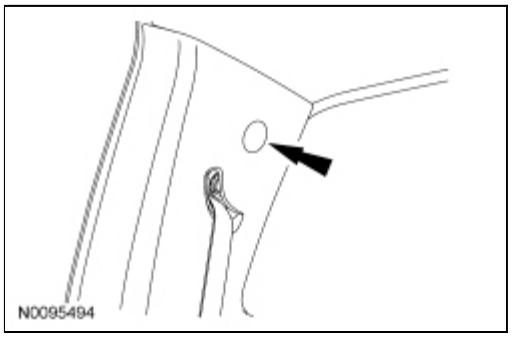
3. Remove the fuse panel access door.

4. Remove the pin-type retainer from the cowl trim panel.

Both sides

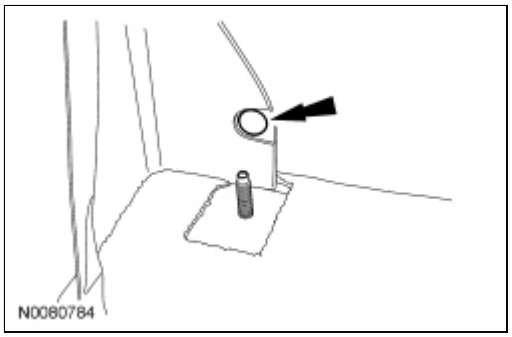
5. Remove the cowl trim panel.
6. **NOTE:** Make sure the cowl side trim panel J-hook is correctly installed.

   To install, reverse the removal procedure.



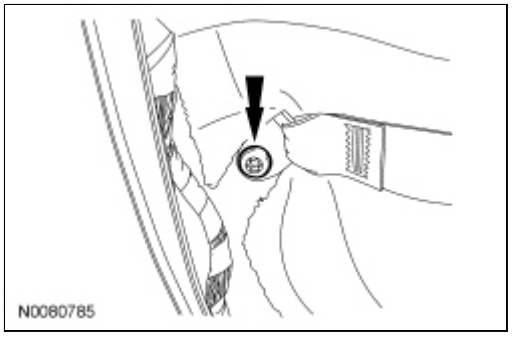
---

repair4less

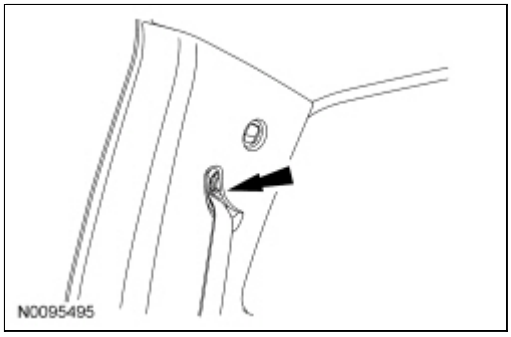


C-Pillar Trim Panel

Removal and Installation



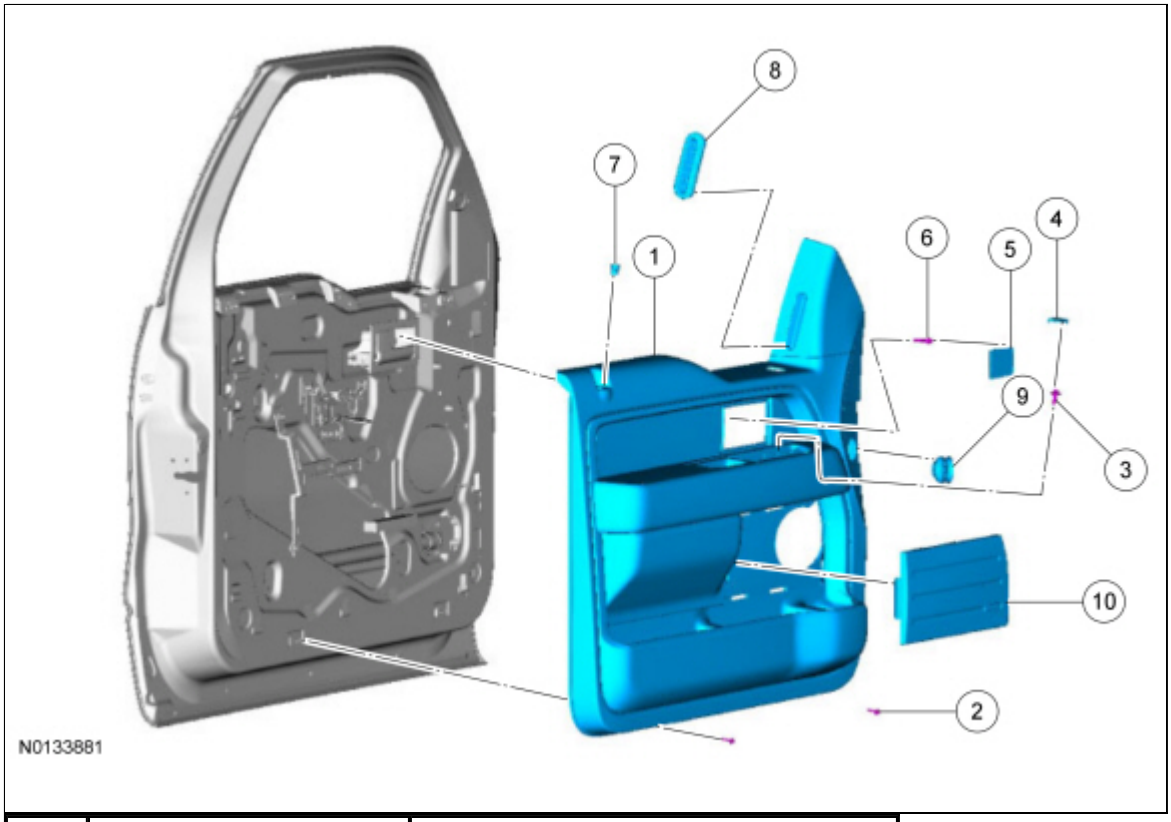
1. Remove the rear seat assembly. For additional information, refer to Section 501-10 .
2. Using a non-marring flat-blade tool, remove the C-pillar screw cover.



3. Remove the C-pillar screw.
4. Remove the C-pillar pin-type retainer.

5. Reposition the C-pillar trim.
6. Remove the safety belt anchor bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

7. Reposition the safety belt through the trim panel.



8. Remove C-pillar trim panel.
9. **NOTE:** The C-pillar trim panel has locator pins that must be positioned correctly for installation.

   NOTE: The C-pillar trim panel should be parallel to the rear window blackout.

   To install, reverse removal procedure.

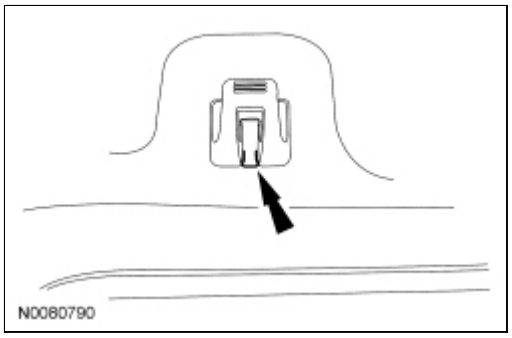
6. ***NOTICE:*** **Do not pull directly outward on the rear door trim panel. Damage may occur.**

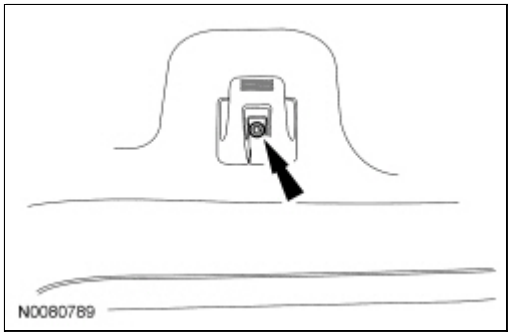
   Remove the rear door trim panel.
   - Lift upward to remove the rear door trim panel and position aside.
   - Disconnect the interior handle activating cable from the interior door handle and remove the rear door trim panel.

7. To install, reverse the removal procedure.

Headliner — Regular Cab



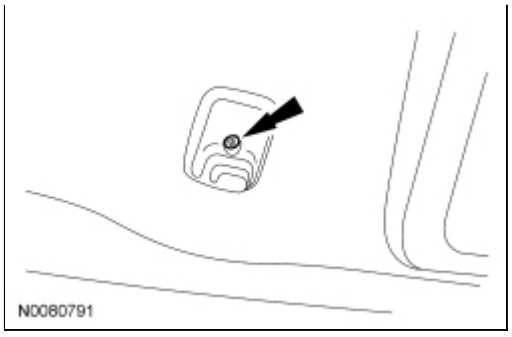
Item	Part Number	Description
1	51944	Headliner
2	29024	Garment hooks
3	N610938A	Garment hook screws
4	04132	Sun visor clips
5	N610938	Sun visor clip screws
6	04104 RH/ 04105 LH	Sun visors
7	N610938	Sun visor screws (4 required)



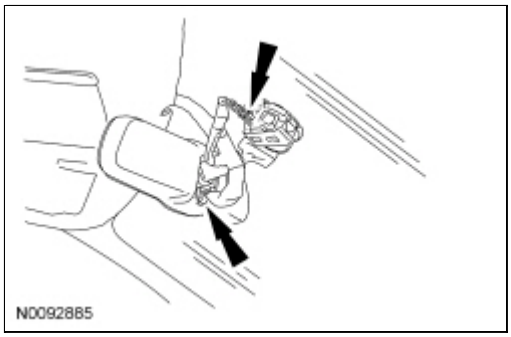
Removal and Installation

1. Remove the A-pillar trim panels. For additional information, refer to A-Pillar Trim Panel in this section.
2. Remove the B-pillar trim panels. For additional information, refer to B-Pillar Trim Panel — Regular Cab in this section.
3. Open the garment hook screw covers.

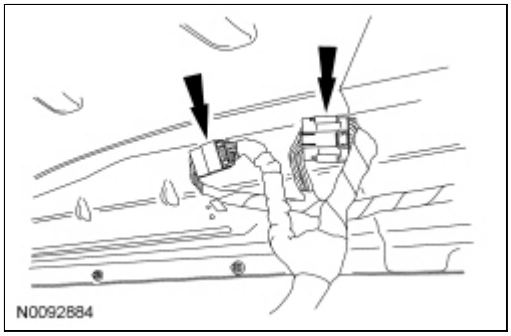
repair4less



4. Remove the garment hook screws and remove the hooks.

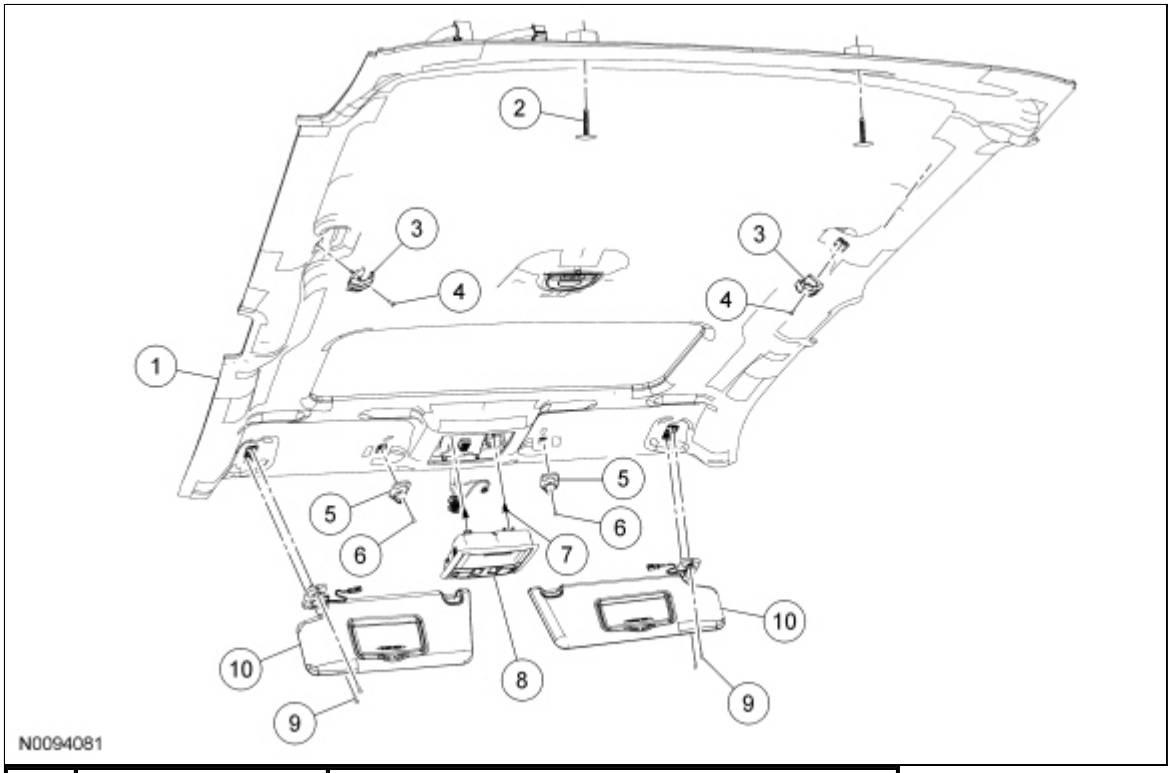


5. Remove the sun visor screws and remove the sun visors.
    - If equipped, disconnect the electrical connector.



6. Remove the sun visor clip screws and remove the sun visor clips.

7. If equipped, disconnect the mirror electrical connector and the rain sensor.



8. Disconnect the headliner electrical connectors.

9. Position the seats to the full reclined position.
10. Remove the headliner out of the passenger side door.

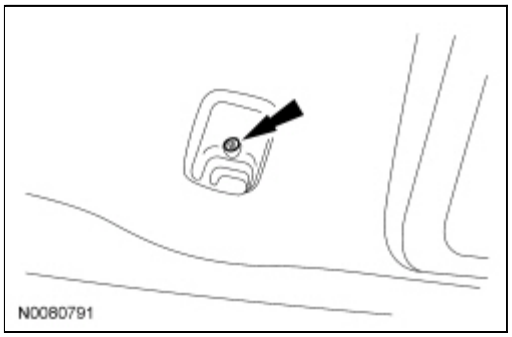
Headliner — SuperCrew

Item	Part Number	Description
1	51944	Headliner
2	W710041	Headliner pin-type retainer (2 required)
3	29024	Garment hooks
4	N610938A	Garment hook screws
5	04132	Sun visor clips
6	N610938A	Sun visor clip screws
7	—	Overhead console clip (part of 519A70) (2 required)
8	519A70	Overhead console
9	N610938	Sun visor screws (4 required)
10	04104 RH/ 04105 LH	Sun visors

Removal

1. Remove the front passenger seat. For additional information, refer to Section 501-10 .
2. Remove the driver seat. For additional information, refer to Section 501-10 .

3. Remove the floor console. For additional information, refer to Section 501-12 .

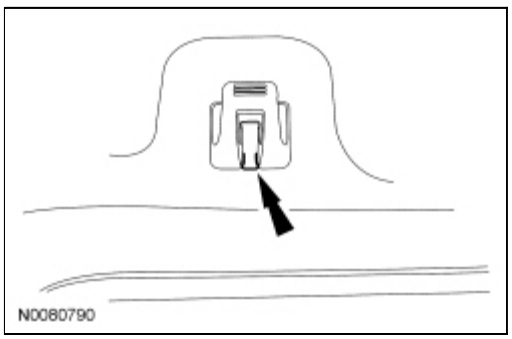


4. Remove the A-pillar trim panel. For additional information, refer to A-Pillar Trim Panel in this section.

5. Reposition the B-pillar trim panels. For additional information, refer to B-Pillar Trim Panel — SuperCrew in this section.

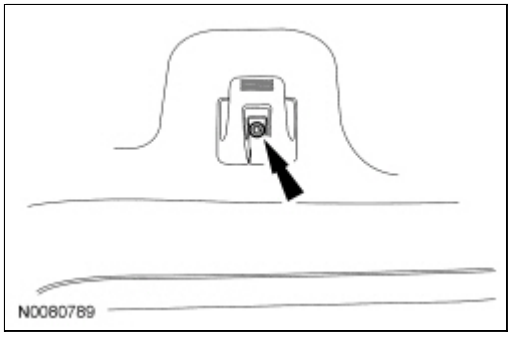
6. Reposition the C-pillar trim panels. For additional information, refer to C-Pillar Trim Panel in this section.

7. Remove the overhead console. For additional information, refer to Section 501-12 .

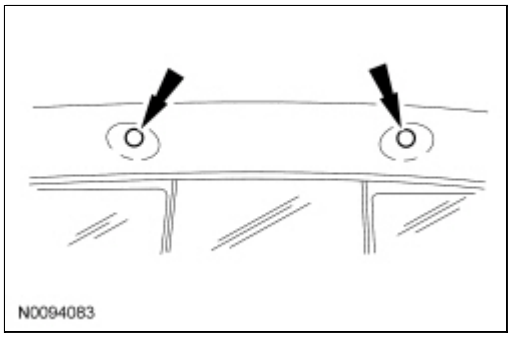


8. Remove the sun visor clip screws and clips.

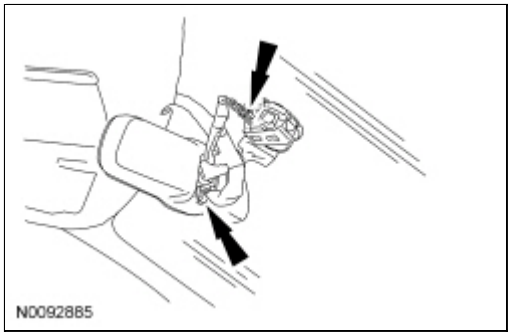
9. Remove the LH and RH sun visors.
    - Remove the sun visor screws.
    - Reposition the sun visor and disconnect the electrical connector.



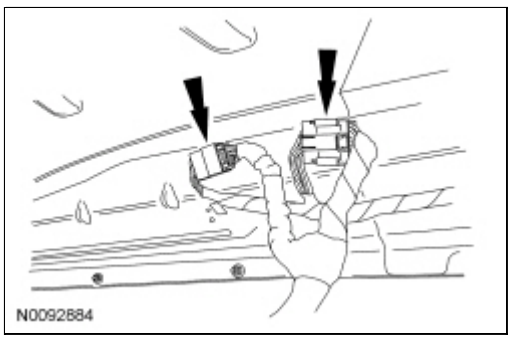
10. Open the garment hook screw cover.



repair4less



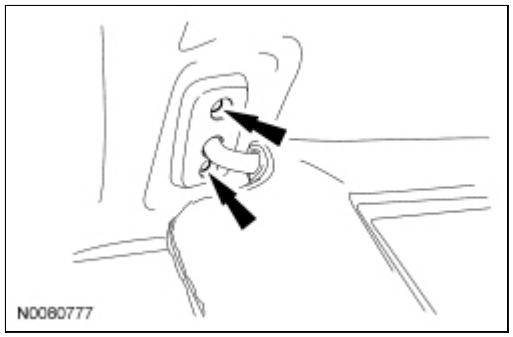
11. Remove the garment hook screw and remove the hook.



12. Remove the headliner pin-type retainers.

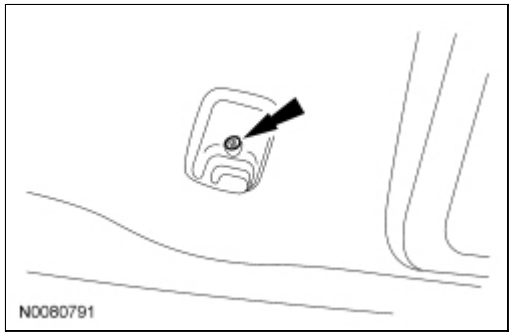
13. If equipped, disconnect the mirror electrical connector and the rain sensor.

14. Disconnect the headliner electrical connectors.



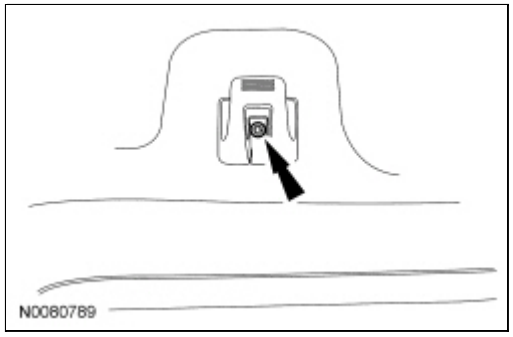
15. With the aid of an assistant, remove the headliner through the passenger door.

16. To install, reverse the removal procedure.



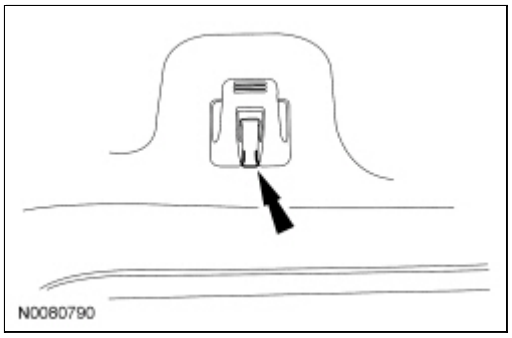
Installation

1. Position the headliner in the vehicle so that the sun visor and coat hook openings are aligned.

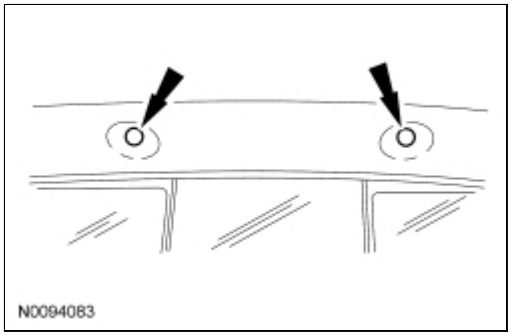


2. Install the LH and RH sun visors.
   - Reposition headliner and connect electrical connector.
   - Install the sun visor retainer screws.

3. Install the sun visor clip and sun visor clip screws.

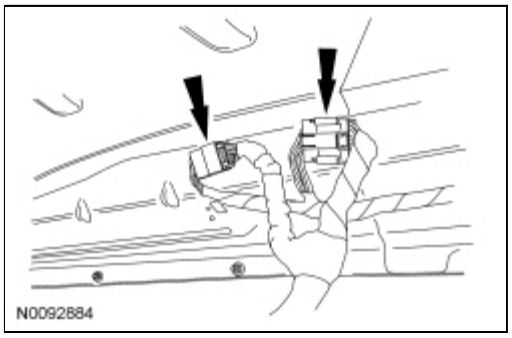


4. Install the garment hooks and garment hook screws.

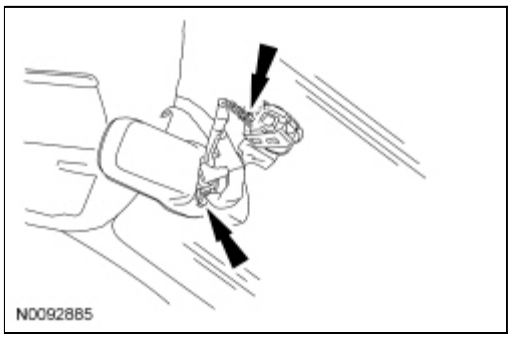


5. Close the garment hook screw covers.

repair4less



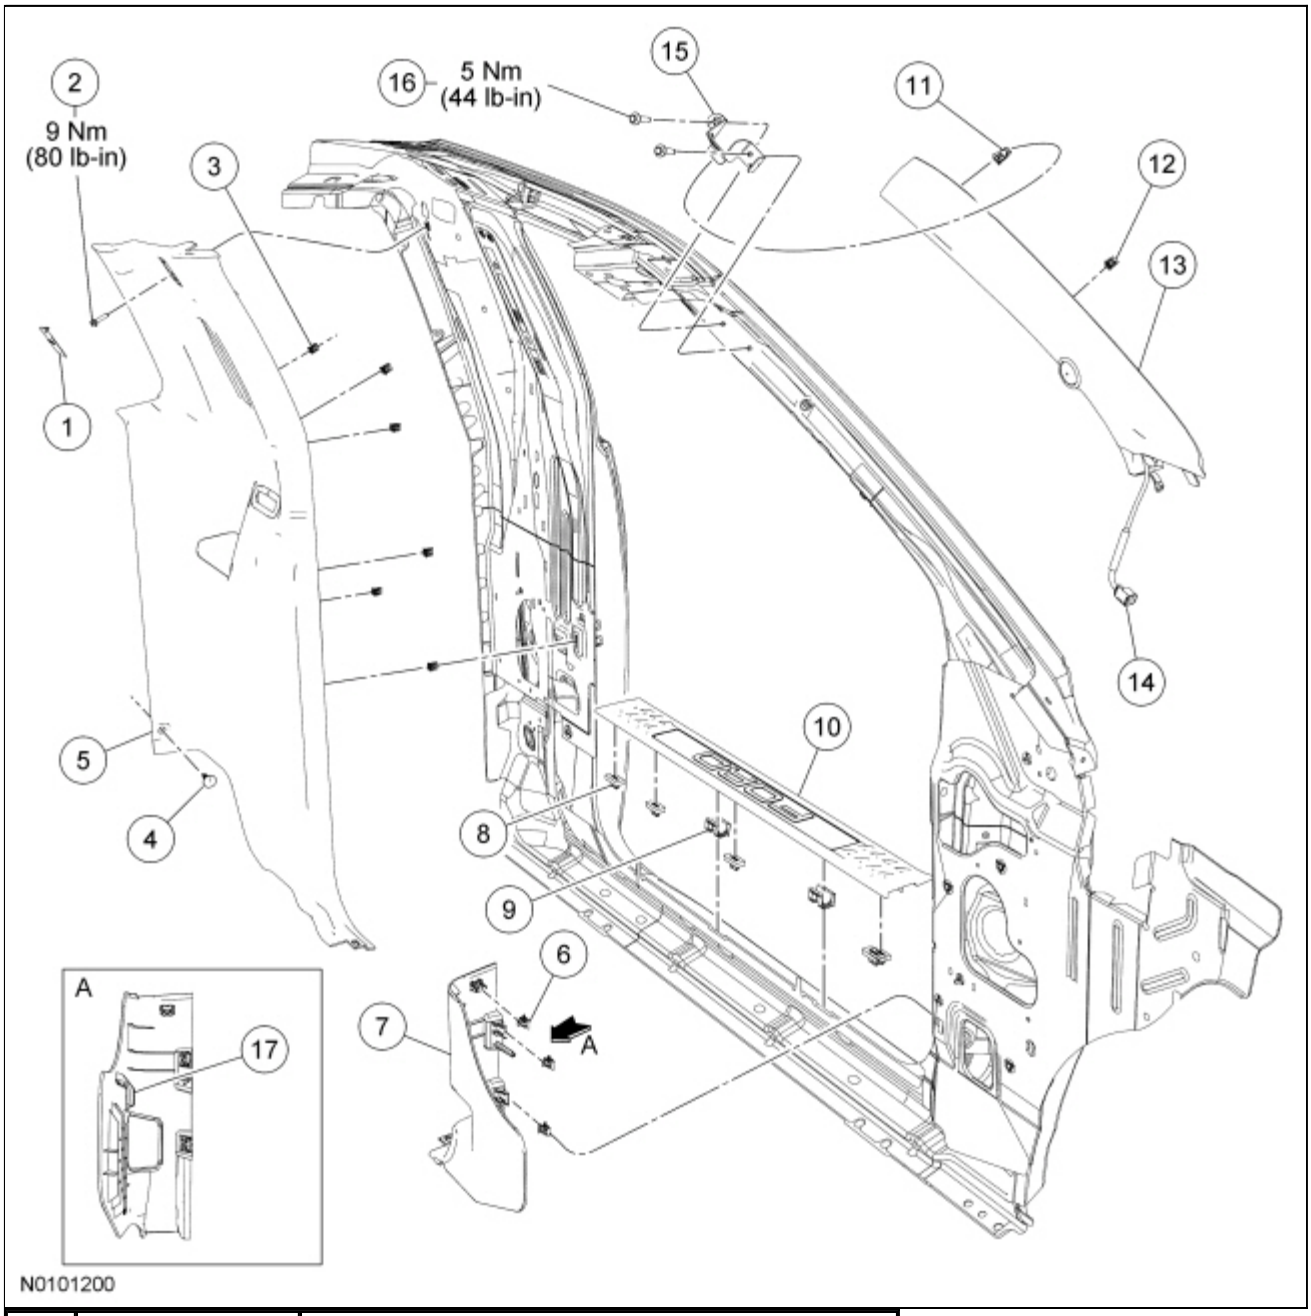
6. If equipped with a roof opening panel, secure the hook-and-loop tape around the front edge of the roof opening panel and then secure the back edge of the roof opening panel so that it is flush and the headliner does not sag. If sagging occurs, loosen the sun visors and coat hooks to realign the headliner. Retighten the sunvisors and coat hooks.



7. Install the headliner pin-type retainers.

8. Connect the headliner electrical connectors.

9. If equipped, connect the mirror electrical connector and the rain sensor.



10. Install the overhead console. For additional information, refer to Section 501-12 .
11. Install the A-pillar trim panel. For additional information, refer to A-Pillar Trim Panel in this section.
12. Install the B-pillar trim panels. For additional information, refer to B-Pillar Trim Panel — SuperCrew in this section.
13. Install the C-pillar trim panels. For additional information, refer to C-Pillar Trim Panel in this section.
14. Install the floor console. For additional information, refer to Section 501-12 .
15. Install the driver seat. For additional information, refer to Section 501-10 .
16. Install the front passenger seat. For additional information, refer to Section 501-10 .

Exterior Trim

The exterior trim and ornamentation consists of the:

- window mouldings.
- running boards.
- Power Running Boards (PRBs) (if equipped).
- PRB step.
- PRB motor (includes linkage).
- PRB step end caps.
- PRB module.

The PRB step end caps can be serviced separately.

If equipped, the PRBs automatically move when the doors are opened to assist entering and exiting the vehicle.

The PRB feature may be enabled/disabled through the message center. For information on how to access the PRB feature within the message center, refer to the Owner's Literature.

When the PRB is disabled (OFF), the PRBs will immediately move to the stowed position regardless of the position of the doors.

When the PRB is enabled (AUTO), the PRBs will extend when the doors are opened and return to the stowed position when the doors are closed or vehicle speed is greater than 8 km/h (5 mph).

When the PRBs are manually set to the deployed position (OUT), they will return to the stowed position and AUTO mode when the vehicle speed is greater than 8 km/h (5 mph).

repair4less

Power Running Board (PRB)

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The Power Running Boards (PRBs) are controlled by the PRBs module. The PRB motors receive motor power and ground from the PRB module. The PRB module receives door ajar switch status and vehicle speed information from the Controller Area Network (CAN).

When in AUTO mode, the PRBs will deploy when a door on the same side of the vehicle is opened. When both doors on the same side are closed, the PRBs will retract.

When in OUT mode, both PRBs will stay deployed until OUT mode is deselected, reset to AUTO mode or vehicle speed is greater than 8 km/h (5 mph). Mode will automatically switch back to AUTO once above 8 km/h (5 mph).

When an obstacle is detected, the PRB will reverse direction. If a second obstacle is detected, the PRB will reverse direction again. If a third obstacle is detected, the PRB will stop against the third obstacle until the following conditions are met:

- Change in door ajar status
- Change in the message center status (AUTO, OUT, OFF)
- Vehicle speed greater than 8 km/h (5 mph)

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Power Running Board (PRB)	• Battery Junction Box (BJB) fuse 11 (30A)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PRB module.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the PRB module.

9. If the DTCs retrieved are related to the concern, go to Power Running Board (PRB) Module DTC Chart. For all other DTCs, refer to Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Chart

B1168	Left Power Running Board Stow Circuit Short To Ground	GO to Pinpoint Test D .
B1169	LH Motor Traveled Too Far	LH motor is freewheeling (broken geartrain linkage). INSTALL a new LH Power Running Board (PRB) motor. REFER to Power Running Board (PRB) Motor in this section.
B116A	RH Motor Traveled Too Far	RH motor is freewheeling (broken geartrain linkage). INSTALL a new RH PRB motor. REFER to Power Running Board (PRB) Motor in this section.
B116B	LH Power Running Board Motor Short	GO to Pinpoint Test D .
B116C	RH Power Running Board Motor Short	GO to Pinpoint Test D .
B116D	LH Power Running Board Motor Line Open	GO to Pinpoint Test D .
B116E	RH Power Running Board Motor Line Open	GO to Pinpoint Test D .
B1170	Right Power Running Board Hall Effect Sensor Failure	GO to Pinpoint Test E .
B1171	Left Power Running Board Hall Effect Signal Noisy	INSTALL a new LH PRB motor. REFER to Power Running Board (PRB) Motor in this section.
B1172	Right Power Running Board Hall Effect Signal Noisy	INSTALL a new RH PRB motor. REFER to Power Running Board (PRB) Motor in this section.
B1175	Right Power Running Board Stow Circuit Short To Ground	GO to Pinpoint Test D .
B1178	Right Power Running Board Deploy and/or Stow Circuit Short To Battery	GO to Pinpoint Test D .
B1317	Battery Voltage High	GO to Pinpoint Test F .
B1318	Battery Voltage Low	GO to Pinpoint Test F .
B1342	ECU is Faulted	INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section.
B2139	Data Mismatch (receive data does not match what was expected)	REFER to Section 419-10 .
B2813	LH Power Running Board Stow Time Fail	GO to Pinpoint Test B .
B2814	LH Power Running Board Deploy Time Fail	GO to Pinpoint Test B .
B2816	RH Power Running Board Stow Time Fail	GO to Pinpoint Test C .
B2817	RH Power Running Board	GO to Pinpoint Test C .

	Deploy Time Fail	
U1900	CAN Communication Bus Fault - Receive Error	Do not install a new PRB module as part of the repair for a PRB DTC U1900 fault. The PRB is not the source of the fault when DTC U1900 is present. REFER to Section 418-00 to diagnose the Controller Area Network (CAN) concern.
U2050	No Application Present	INSTALL a new PRB module. REFER to Section 419-10 . REPEAT the self-test.
All other DTCs	—	REFER to the Master DTC Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The Power Running Board (PRB) does not operate correctly — both running boards	• Fuse • Circuitry • Smart Junction Box (SJB) • PRB module • PCM • Instrument Cluster (IC)	• GO to Pinpoint Test A .
• The PRB does not operate correctly — left running board does not deploy/stow or reverses direction	• Circuitry • Door ajar switch • PRB mechanical assembly • PRB motor • PRB module	• GO to Pinpoint Test B .
• The PRB does not operate correctly — right running board does not deploy/stow or reverses direction	• Circuitry • Door ajar switch • PRB mechanical assembly • PRB motor • PRB module	• GO to Pinpoint Test C .

Pinpoint Tests

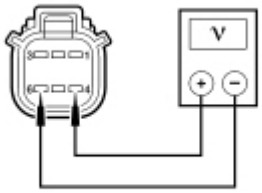
Pinpoint Test A: The Power Running Board (PRB) Does Not Operate Correctly — Both Running Boards

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

NOTE: The Power Running Board (PRB) module will stop functionality when battery voltage drops below 9.5 volts (early build) or 9.0 volts (late build). The PRB system will recover at the next door ajar transition provided that the battery voltage remains above 9.0 volts (late build only).

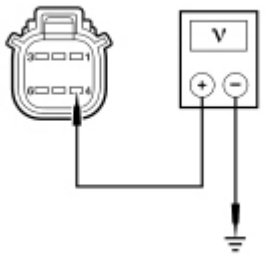
Normal Operation

repair4less



The PRB module receives power through circuit SBB11 (BU/RD) and ground through circuit GD134 (BK/VT). The LH and RH PRB motor Hall-effect sensors receive a regulated 10-volt power supply from the PRB module through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module receives door ajar and vehicle speed status over the Controller Area Network (CAN).

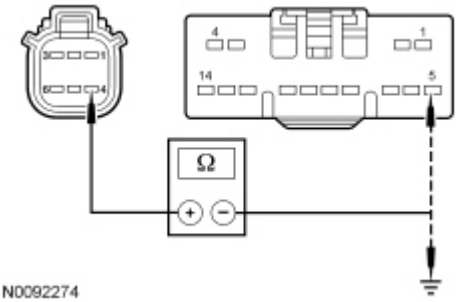
This pinpoint test is intended to diagnose the following:

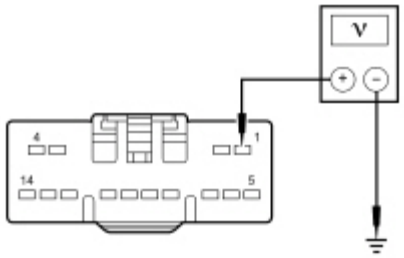


- Fuse
- Wiring, terminals or connectors
- PCM
- Instrument Cluster (IC)
- PRB module

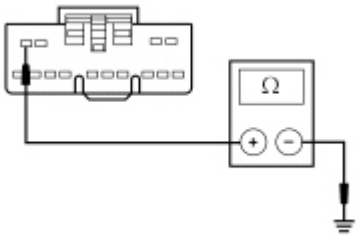
PINPOINT TEST A: THE POWER RUNNING BOARD (PRB) DOES NOT OPERATE CORRECTLY — BOTH RUNNING BOARDS

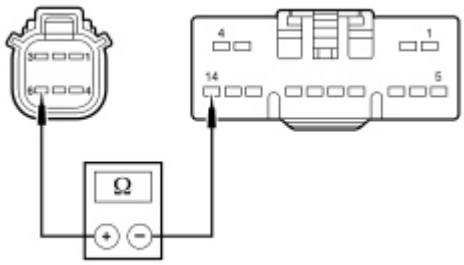
Test Step	Result / Action to Take
A1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — ALL CMDTCs . • **Are any door ajar switch or vehicle speed related DTCs present?**	**Yes** REFER to Section 419-10 to diagnose the door ajar switch or vehicle speed related DTCs. **No** GO to A2 .
A2 CHECK THE OPERATION OF THE PRBs — AUTOMATIC MODE	
• Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion or noise while in motion?**	**Yes** The system is operating as designed. REVIEW operation of the PRB system with the customer. **No** GO to A3 .
A3 CHECK THE OPERATION OF THE PRBs — MANUAL MODE	
• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 8 km/h (5 mph). • **Did both PRBs deploy?**	**Yes** GO to A5 . **No** GO to A4 .
A4 CHECK THE PRBs FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce-back, stops in mid-travel, is noisy or will not deploy or stow completely, check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step	**Yes** The system is operating normally. The concern may have been caused

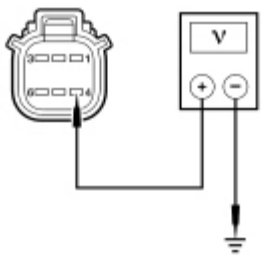




area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the LH and RH PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Does the PRB system operate normally during all test steps?**	by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the Owner's Literature for correct cleaning instructions. **No** GO to A5.
A5 VERIFY THE DOOR AJAR SWITCH OPERATION	
• Open and close each door, verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened and OFF when the door is closed?**	**Yes** GO to A6. **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.
A6 CHECK THE HALL-EFFECT SENSOR POWER AND GROUND	
• Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition ON. • Measure the voltage between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and C3186-6, circuit RPR47 (BU/GN), harness side.  N0092272 • Open RH door. • Voltage signal will only be present for less than one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to A13. **No** If the voltage was less than 7 volts, GO to A7. If the voltage was greater than 10.5 volts, GO to A12.
A7 CHECK HALL-EFFECT SENSOR POWER CIRCUIT FOR VOLTAGE	
• Measure the voltage between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and ground.	**Yes** GO to A11. **No** GO to A8.







repair4less

N0092273

- Open RH door.
- Voltage signal will only be present for less than one second.
- **Is the voltage between 7 and 10.5 volts?**

A8 CHECK HALL-EFFECT SENSOR POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: PRB Module C3313B. • Measure the resistance between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and PRB module C3313B-5, circuit CPR47 (GY/BN), harness side; and between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and ground.  N0092274 • **Is the resistance less than 5 ohms between the PRB motor and PRB module; and greater than 10,000 ohms between the PRB motor and ground?**	**Yes** GO to A9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A9 CHECK THE PRB MODULE POWER CIRCUIT FOR VOLTAGE	
• Measure the voltage between PRB module C3313B-1, circuit SBB11 (BU/RD), harness side and ground.  N0055096 • **Is battery voltage present?**	**Yes** GO to A10 . **No** VERIFY Battery Junction Box (BJB) fuse 11 (30A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A10 CHECK THE PRB MODULE GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF. • Measure the resistance between the PRB module C3313B-4, circuit GD139 (BK/YE), harness side and ground.  N0060073 • **Is the resistance less than 5 ohms?**	**Yes** GO to A13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A11 CHECK THE HALL-EFFECT SENSOR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PRB Module C3313B. • Measure the resistance between RH PRB motor C3186-6, circuit RPR47 (BU/GN), harness side and PRB module C3313B-14, circuit RPR47 (BU/GN), harness side.  N0092275 • **Is the resistance less than 5 ohms?**	**Yes** GO to A13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A12 CHECK THE HALL-EFFECT SENSOR POWER CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PRB Module C3313B. • Ignition ON. • Measure the voltage between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and ground.  N0092273 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR The DTCs. REPEAT the self-test. **No** GO to A13 .

repair4less

A13 CHECK THE PRB MODULE FOR CORRECT OPERATION	

• Connect: PRB LH Motor C3185.
• Connect: PRB RH Motor C3186.
• Visually inspect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section.
	CLEAR the DTCs.
	REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.
	CLEAR the DTCs.
	REPEAT the self-test.

Pinpoint Test B: The Power Running Board (PRB) Does Not Operate Correctly — Left Running Board Does Not Deploy/Stow or Reverses Direction

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

During self-test, the Power Running Board (PRB) module monitors the length of time it takes to deploy and stow the LH and RH PRBs . If the time exceeds 4 seconds, DTC B2813 or B2814 will be generated.

The PRB module receives door ajar and vehicle speed status over the Controller Area Network (CAN). During LH PRB deployment, the PRB module supplies power to the LH PRB motor through circuit CPR41 (BU/WH) and ground through circuit CPR42 (WH). The PRB module stows the LH PRB by supplying power to the LH PRB motor through circuit CPR42 (WH) and ground through circuit CPR41 (BU/WH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the LH PRB Hall-effect signal through circuit VPR43 (GY/BU). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

- DTC B2813 (LH Power Running Board Stow Time Fail) — When the left running board takes greater than 4 seconds to stow.
- DTC B2814 (LH Power Running Board Deploy Time Fail) — When the left running board takes greater than 4 seconds to deploy.

This pinpoint test is intended to diagnose the following:

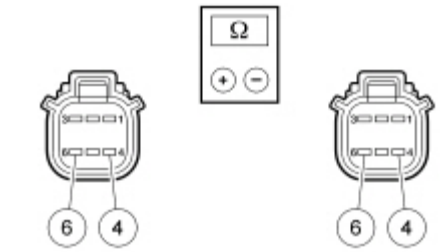
- Mechanical resistance due to foreign material
- Wiring, terminals or connectors
- Door ajar switch
- PRB module
- LH PRB motor

PINPOINT TEST B: THE POWER RUNNING BOARD (PRB) DOES NOT OPERATE CORRECTLY — LEFT RUNNING BOARD DOES NOT DEPLOY/STOW OR REVERSES DIRECTION

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE PRB — AUTOMATIC MODE • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion, or noise while in motion?**	**Yes** The system is operating as designed. REVIEW operation of the PRBs system with the customer. **No** GO to B2.
B2 CHECK THE OPERATION OF THE PRBs — MANUAL MODE • Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 8 km/h (5 mph). • **Did both PRBs deploy?**	**Yes** GO to B5. **No** GO to B3.
B3 CHECK THE PRBs FOR FOREIGN MATERIAL • **NOTE:** If the system has false bounce-back, stops in mid-travel, is noisy or will not stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the LH PRB for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • **Does the LH PRB operate normally during all test steps?**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the Owner's Literature for correct cleaning instructions. **No** GO to B4.
B4 CHECK IF DTCs ARE PRESENT • Use the recorded PRB module DTCs from the continuous and on-demand self tests. • **Is DTC B2813 or B2814 present?**	**Yes** INSTALL a new PRB motor. REFER to Power Running Board (PRB) Motor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to B6.
B5 VERIFY THE DOOR AJAR SWITCH OPERATION • Open and close the LH front and LH rear door, and verify the interior lights operate correctly and door ajar is noted on the vehicle	**Yes** GO to B6.

repair4less

message center.



- **Do the interior lights turn ON when the door is opened, and OFF when the door is closed?**

No
REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.

B6 CHECK FOR CONTINUITY BETWEEN LH AND RH PRB MOTORS ON THE HALL-EFFECT SENSOR POWER AND GROUND CIRCUITS

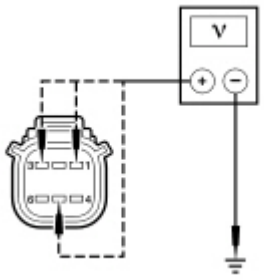
- Disconnect: PRB LH Motor C3185.
- Disconnect: PRB RH Motor C3186.
- Ignition OFF.
- Measure the resistance between LH PRB motor C3185, harness side and RH PRB motor C3186, harness side using the following chart:

LH PRB Motor	Circuit	RH PRB Motor
C3185-4	CPR47 (GY/BN)	C3186-4
C3185-6	RPR47 (BU/GN)	C3186-6

N0092493

- **Is the resistance less than 5 ohms?**

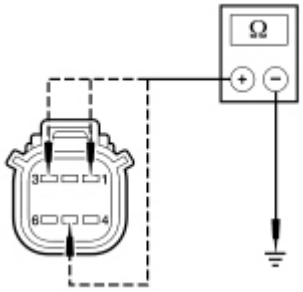
Yes
GO to B7.



No
REPAIR the circuit.
CLEAR the DTCs.
REPEAT the self-test.

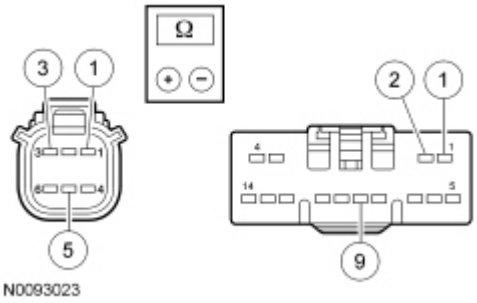
B7 CHECK FOR A SHORT TO VOLTAGE IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT

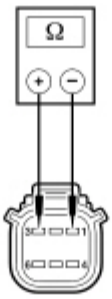
- Ignition OFF.
- Disconnect: PRB Module C3313A.
- Disconnect: PRB Module C3313B.
- Ignition ON.
- Measure the voltage between LH PRB motor C3185-5, circuit VPR43 (GY/BU), harness side and ground; and between LH PRB motor C3185-3, circuit CPR41 (BU/WH), harness side and ground; and between C3185-1, circuit CPR42 (WH), harness side and ground.



Yes
REPAIR the circuit.
CLEAR the DTCs.
REPEAT the self-test.

No
GO to B8.





N0092494

- **Is any voltage present?**

B8 CHECK FOR A SHORT TO GROUND IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • Measure the resistance between LH PRB motor C3185-5, circuit VPR43 (GY/BU), harness side and ground; and between LH PRB motor C3185-3, circuit CPR41 (BU/WH), harness side and ground; and between C3185-1, circuit CPR42 (WH), harness side and ground.  N0093022 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B9 CHECK FOR AN OPEN IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Measure the resistances between PRB module C3313A or C3313B, harness side and LH PRB motor C3185, harness side using the following chart: **LH Motor Connector** / **Circuit** / **PRB Module Connector** C3185-5 / VPR43 (GY/BU) / C3313B-9 C3185-3 / CPR41 (BU/WH) / C3313A-1 C3185-1 / CPR42 (WH) / C3313A-2	**Yes** GO to B10 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

repair4less

 N0093023 • **Is the resistance less than 5 ohms?**	
B10 CHECK FOR A SHORT BETWEEN THE STOW AND DEPLOY CIRCUITS	
• Measure the resistance between LH PRB motor C3185-3, circuit CPR41 (BU/WH), harness side and C3185-1, circuit CPR42 (WH) harness side.  N0092496 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new LH PRB bracket assembly. REFER to Power Running Board (PRB) Motor in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, GO to B11. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B11 CHECK THE PRB MODULE FOR CORRECT OPERATION	

• Connect: PRB LH Motor C3185.
• Connect: PRB RH Motor C3186.
• Visually inspect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Power Running Board (PRB) Does Not Operate Correctly — Right Running Board Does Not Deploy/Stow or Reverses Direction

Refer to Wiring Diagrams Cell 109, Power Liftgate/Power Running Boards for schematic and connector information.

Normal Operation

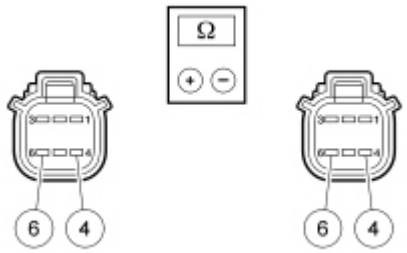
During self-test, the Power Running Board (PRB) module monitors the length of time it takes to deploy and stow the LH and RH PRBs . If the time exceeds 4 seconds, B2816 or B2817 will be generated.

The PRB module receives door ajar and vehicle speed status over the Controller Area Network (CAN). During RH PRB deployment, the PRB module supplies power to the RH PRB motor through circuit CPR44 (BN/WH) and ground through circuit CPR45 (VT/GY). The PRB module stows the RH PRB by supplying power to the RH PRB motor through circuit CPR45 (VT/GY) and ground through circuit CPR44 (BN/WH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the RH PRB Hall-effect signal through circuit VPR46 (GY). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

- DTC B2816 (RH Power Running Board Stow Time Fail) — Right running board takes greater than 4 seconds to stow.
- DTC B2817 (RH Power Running Board Deploy Time Fail) — Right running board takes greater than 4 seconds to deploy.

This pinpoint test is intended to diagnose the following:

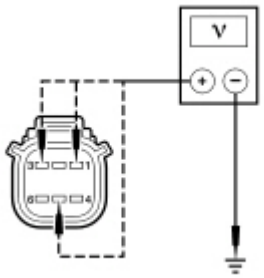
- Mechanical resistance due to foreign material
- Wiring, terminals or connectors
- Door ajar switch
- PRB module
- RH PRB motor

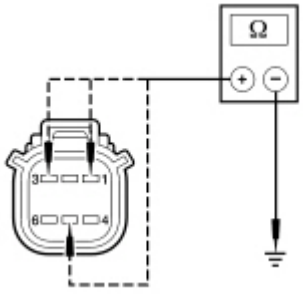


PINPOINT TEST C: THE POWER RUNNING BOARD (PRB) DOES NOT OPERATE CORRECTLY — RIGHT RUNNING BOARD DOES NOT DEPLOY/STOW OR REVERSES DIRECTION

Test Step	Result / Action to Take
C1 CHECK THE OPERATION OF THE PRB — AUTOMATIC MODE	
• Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion or noise while in motion?**	**Yes** The system is operating as designed. REVIEW operation of the PRBs system with the customer. **No** GO to C2 .
C2 CHECK THE OPERATION OF THE PRBs — MANUAL MODE	
• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 8 km/h (5 mph). • **Did both PRBs deploy?**	**Yes** GO to C5 . **No** GO to C3 .
C3 CHECK THE PRB FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce-back, stops in mid-travel, is	**Yes**

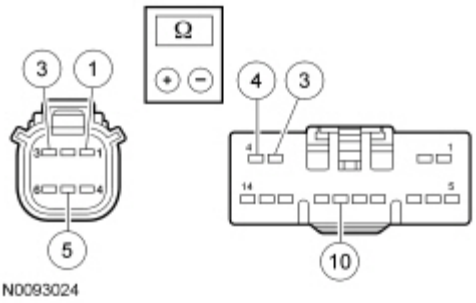
repair4less





noisy or will not stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the RH PRB for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Does the RH PRB operate normally during all test steps?**	The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the Owner's Literature for correct cleaning instructions. **No** GO to C4 .
C4 CHECK IF DTCs ARE PRESENT	
• Use the recorded PRB module DTCs from the continuous and on-demand self tests. • **Is DTC B2816 or B2817 present?**	**Yes** INSTALL a new PRB motor. REFER to Power Running Board (PRB) Motor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to C6 .
C5 VERIFY THE DOOR AJAR SWITCH OPERATION	
• Open and close the RH front and RH rear door, and verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened, and OFF when the door is closed?**	**Yes** GO to C6 . **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.
C6 CHECK FOR CONTINUITY BETWEEN LH AND RH PRB MOTORS ON THE HALL-EFFECT SENSOR POWER AND GROUND CIRCUITS	
• Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition OFF. • Measure the resistance between LH PRB motor C3185, harness side and RH PRB motor C3186, harness side using the following chart:	**Yes** GO to C7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

LH PRB Motor	Circuit	RH PRB Motor
C3185-4	CPR47 (GY/BN)	C3186-4
C3185-6	RPR47 (BU/GN)	C3186-6



N0092493

- **Is the resistance less than 5 ohms?**

C7 CHECK FOR A SHORT TO VOLTAGE IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • Disconnect: PRB Module C3313A. • Disconnect: PRB Module C3313B. • Ignition ON. • Measure the voltage between RH PRB motor C3186-5, circuit VPR46 (GY), harness side and ground; and between RH PRB motor C3186-3, circuit CPR44 (BN/WH), harness side and ground; and between C3186-1, circuit CPR45 (VT/GY), harness side and ground.  N0092494 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C8 .
C8 CHECK FOR A SHORT TO GROUND IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • Measure the resistance between RH PRB motor C3186-5, circuit VPR46 (GY), harness side and ground; and between RH PRB motor C3186-3, circuit CPR44 (BN/WH), harness side and ground; and between C3186-1, circuit CPR45 (VT/GY), harness side and ground.  N0093022 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

repair4less

C9 CHECK FOR AN OPEN IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Measure the resistances between PRB module C3313A or C3313B, harness side and RH PRB motor C3185, harness side using the following chart: **RH Motor Connector** / **Circuit** / **PRB Module Connector** C3186-5 / VPR46 (GY) / C3313B-10 C3186-3 / CPR44 (BN/WH) / C3313A-4 C3186-1 / CPR45 (VT/GY) / C3313A-3  N0093024 • **Is the resistance less than 5 ohms?**	**Yes** GO to C10 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
C10 CHECK FOR A SHORT BETWEEN THE STOW AND DEPLOY CIRCUITS	
• Measure the resistance between RH PRB motor C3186-3, circuit CPR44 (BN/WH), harness side and C3186-1, circuit CPR45 (VT/GY), harness side.  N0092496 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new RH PRB bracket assembly. REFER to Power Running Board (PRB) Motor in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, GO to C11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C11 CHECK THE PRB MODULE FOR CORRECT OPERATION	

• Connect: PRB LH Motor C3185.
• Connect: PRB RH Motor C3186.
• Visually inspect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
	Yes
	INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section.
	CLEAR the DTCs.
	REPEAT the self-test.

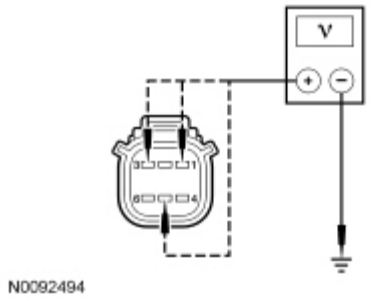
• Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTCs B1167, B1168, B1175, B1178, B116B, B116D, B116C and B116E

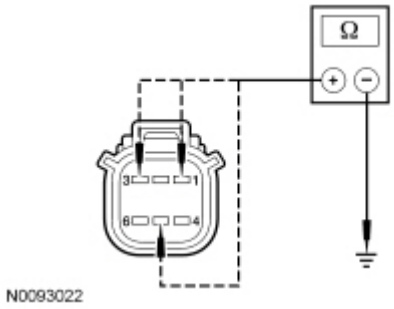
Refer to Wiring Diagrams Cell 109 , Power Liftgate/Power Running Boards for schematic and connector information.

Normal Operation

During Power Running Board (PRB) deployment, the PRB module supplies power to the PRB motor through circuit CPR41 (BU/WH) (LH) or CPR44 (BN/WH) (RH) and ground through circuit CPR42 (WH) (LH) or CPR45 (VT/GY) (RH). The PRB module stows the PRB by supplying power to the PRB motor through circuit CPR42 (WH) (LH) or CPR45 (VT/GY) (RH) and ground through circuit CPR41 (BU/WH) (LH) or CPR44 (BN/WH) (RH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the PRB Hall-effect signal through circuit VPR43 (GY/BU) (LH) or VPR46 (GY) (RH). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.



DTC Description	Fault Trigger Conditions
• B1167 — Left Power Running Board Deploy and/or Stow Circuit Short to Battery	The PRB module sets this DTC if a short to battery voltage is detected in the LH running board motor circuit(s).
• B1168 — Left Power Running Board Motor Circuit Short to Ground	The PRB module sets this DTC if a short to ground is detected in the motor circuit while attempting to retract/stow the LH running board.
• B1175 — Right Power Running Board Stow Circuit Short to Ground	The PRB module sets this DTC if a short to ground is detected in the motor circuit while attempting to retract/stow the RH running board.
• B1178 — Right Power Running Board Deploy and/or Stow Circuit Short to Battery	The PRB module sets this DTC if a short to battery voltage is detected in the RH running board motor circuit(s).
• B116B — LH Power Running Board Motor Short	The PRB module sets this DTC if it detects the LH running board motor circuit(s) are shorted together.
• B116C — RH Power Running Board Motor Short	The PRB module sets this DTC if it detects the RH running board motor circuit(s) are shorted together.
• B116D — LH Power Running Board Motor Line Open	The PRB module sets this DTC when it detects an open in the LH running board motor circuit(s).
• B116E — RH Power Running Board Motor Line Open	The PRB module sets this DTC when it detects an open in the RH running board motor circuit(s).



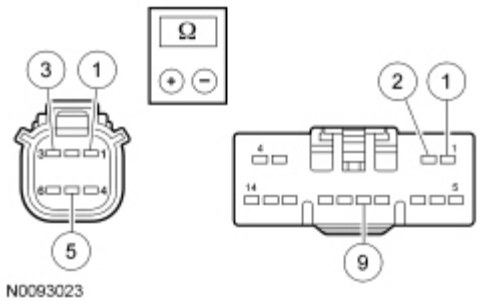
This pinpoint test is intended to diagnose the following:

repair4less

- Wiring, terminals or connectors
- LH or RH PRB motor assembly
- PRB module

PINPOINT TEST D: DTCs B1167, B1168, B1175, B1178, B116B, B116D, B116C and B116E

Test Step	Result / Action to Take
D1 CHECK FOR A SHORT TO VOLTAGE IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • Disconnect: PRB Module C3313A. • Disconnect: PRB Module C3313B. • Ignition ON. • For DTC B1167, B1168, B116B or B116D, measure the voltage between LH PRB motor C3185-5, circuit VPR43 (GY), harness side and ground; and between LH PRB motor C3185-3, circuit CPR41 (BU/WH), harness side and ground; and between C3185-1, circuit CPR42 (WH), harness side and ground.  N0092494 • For DTC B1175, B1178, B116C or B116E, measure the voltage between RH PRB motor C3186-5, circuit VPR46 (GY/OG), harness side and ground; and between RH PRB motor C3186-3, circuit CPR44 (BN/WH), harness side and ground; and between C3186-1, circuit CPR45 (VT/GY), harness side and ground. • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to D2.
D2 CHECK FOR A SHORT TO GROUND IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-5, circuit VPR43 (GY/BU), harness side and ground; and between LH PRB motor C3185-3, circuit CPR41 (BU/WH), harness side and ground; and between C3185-1, circuit CPR42 (WH), harness side and ground.	**Yes** GO to D3. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



N0093022

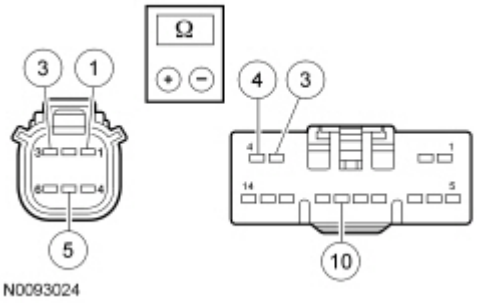
- For DTC B1175, B1178, B116C or B116E, measure the resistance between RH PRB motor C3186-5, circuit VPR46 (GY), harness side and ground; and between RH PRB motor C3186-3, circuit CPR44 (BN/WH), harness side and ground; and between C3186-1, circuit CPR45 (VT/GY), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

D3 CHECK FOR AN OPEN IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT

- Ignition OFF.
- For DTC B1167, B1168, B116B or B116D, measure the resistances between PRB module C4322A or C4322B, harness side and LH PRB motor C3185, harness side using the following chart:

LH Motor Connector	Circuit	PRB Module Connector
C3185-5	VPR43 (GY/BU)	C3313B-9
C3185-3	CPR41 (BU/WH)	C3313A-1
C3185-1	CPR42 (WH)	C3313A-2

N0093023

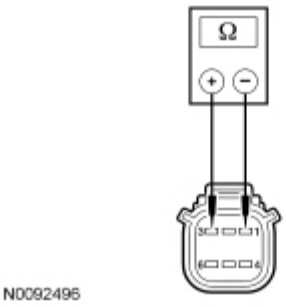


- For DTC B1175, B1178, B116C or B116E, measure the resistances between PRB module C4322A or C4322B, harness side and RH PRB motor C3186, harness side using the following chart:

RH Motor Connector	Circuit	PRB Module Connector
C3186-5	VPR46 (GY)	C3313B-10
C3186-3	CPR44 (BN/WH)	C3313A-4
C3186-1	CPR45 (VT/GY)	C3313A-3

Yes
GO to D4 .

No
REPAIR the circuit(s).
CLEAR the DTCs.
REPEAT the self-test.



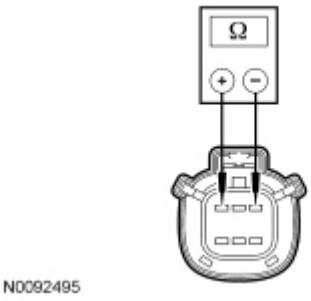
repair4less

- **Is the resistance less than 5 ohms?**

D4 CHECK FOR A SHORT BETWEEN THE STOW AND DEPLOY CIRCUITS

- For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-3, circuit CPR41 (BU/WH), harness side and C3185-1, circuit CPR42 (WH), harness side.

- For DTC B1175, B1178, B116C or B116E, measure the resistance between RH PRB motor C3186-3, circuit CPR44 (BN/WH), harness side and C3186-1, circuit CPR45 (VT/GY), harness side.
- **Is the resistance greater than 10,000 ohms?**

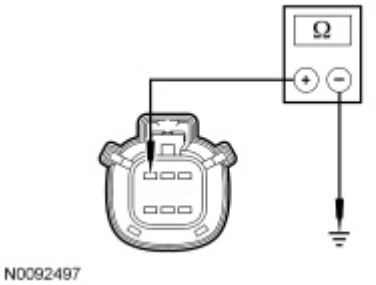


Yes
GO to D5 .

No
REPAIR the circuit.
CLEAR the DTCs.
REPEAT the self-test.

D5 CHECK THE PRB MOTOR FOR AN OPEN CIRCUIT

NOTE: The running board motor(s) has approximately 0.42 ohms of resistance at 20°C (68°F). The running board motor(s) should not show an open circuit (no continuity) when measured with a DMM .



- For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-3, circuit CPR41 (BU/WH), component side and C3185-1, circuit CPR42 (WH), component side.

- For DTC B1175, B1178, B116C or B116E, measure the resistance between RH PRB motor C3186-3, circuit CPR44 (BN/WH), component side and C3186-1, circuit CPR45 (VT/GY), component

Yes
GO to D6 .

No
INSTALL a new PRB motor. REFER to Power Running Board (PRB) Motor in this section.
CLEAR the DTCs.
REPEAT the self-test.

side. • **Is any continuity present?**	
D6 CHECK THE PRB MOTOR FOR A SHORT TO GROUND	
• For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-1, circuit CPR 42 (WH), component side and ground.  N0092497 • For DTC B1175, B1178, B116C or B116E, measure the resistance between RH motor C3186-1, circuit CPR45 (VT/GY), component side and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D7. **No** INSTALL a new PRB motor. REFER to Power Running Board (PRB) Motor in this section. CLEAR the DTCs. REPEAT the self-test.
D7 CHECK THE PRB MODULE FOR CORRECT OPERATION	

• Connect: PRB LH Motor C3185.
• Connect: PRB RH Motor C3186.
• Visually inspect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTCs B1162, B1163, B1164 and B1170

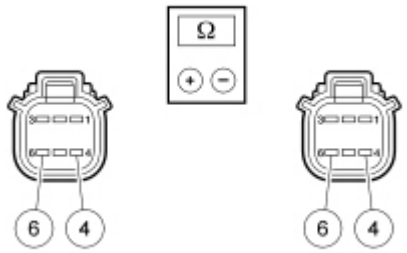
Refer to Wiring Diagrams Cell 109, Power Liftgate/Power Running Boards for schematic and connector information.

Normal Operation

The Power Running Board (PRB) module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the PRB Hall-effect signal through circuit VPR43 (GY/BU) (LH) or VPR46 (GY) (RH). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

repair4less

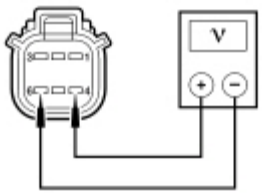
DTC Description	Fault Trigger Conditions
• B1162 — Power Running Board Hall-Effect Sensor Power Circuit Short to Battery	The PRB module sets this DTC if it detects the Hall-Effect sensor power circuit is shorted to battery voltage.
• B1163 — Left Power Running Board Hall-Effect Sensor Failure	The PRB module sets this DTC if it does not see any feedback from the Hall-Effect sensor during the stowing/deploying of the LH running board.
• B1164 — Power Running Board Hall-Effect Sensor Power Circuit Short to Ground	The PRB module sets this DTC if it detects the Hall-Effect sensor power circuit is shorted to ground.
• B1170 — Right Power Running Board Deploy and/or Stow Circuit Short to Battery	The PRB module sets this DTC if it does not see any feedback from the Hall-Effect sensor during the stowing/deploying of the RH running board.

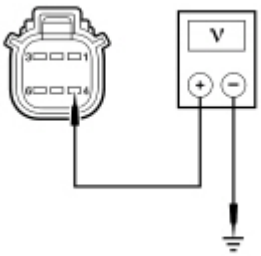


This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PRB module
- LH or RH PRB motor assembly

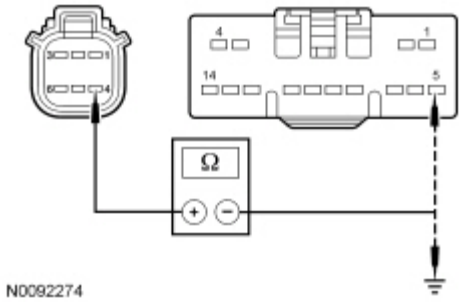
PINPOINT TEST E: DTCs B1162, B1163, B1164 AND B1170

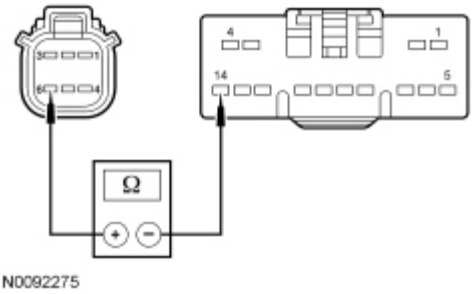


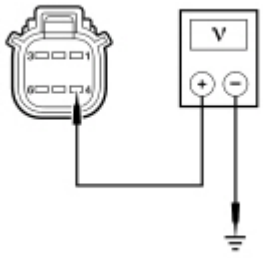


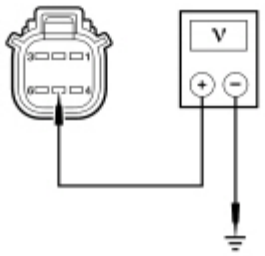
Test Step	Result / Action to Take
E1 CHECK FOR CONTINUITY BETWEEN LH AND RH PRB MOTORS ON THE HALL-EFFECT SENSOR POWER AND GROUND CIRCUITS	
• Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition OFF. • Measure the resistance between LH PRB motor C3185, harness side and RH PRB motor C3186, harness side using the following chart:	**Yes** GO to E2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

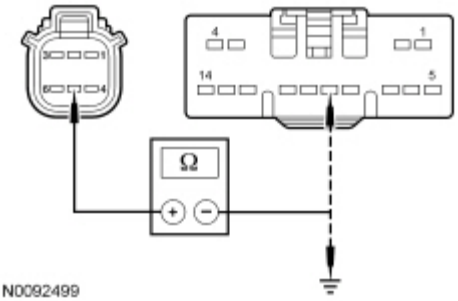
LH PRB Motor	Circuit	RH PRB Motor
C3185-4	CPR47 (GY/BN)	C3186-4
C3185-6	RPR47 (BU/GN)	C3186-6





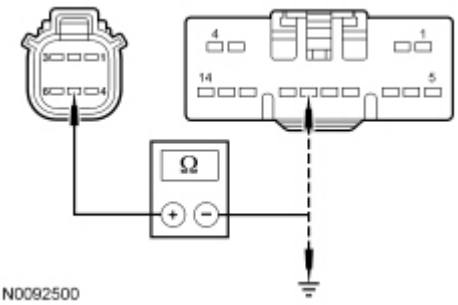






N0092493

- **Is the resistance less than 5 ohms?**



E2 CHECK THE HALL-EFFECT SENSOR POWER AND GROUND	
• Ignition ON. • Measure the voltage between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and C3186-6, circuit RPR47 (BU/GN), harness side.  N0092272 • Open RH door. • Voltage signal will only be present for less than one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to E7 . **No** If the voltage was less than 7 volts, GO to E3 . If the voltage was greater than 10.5 volts, GO to E6 .
E3 CHECK HALL-EFFECT SENSOR POWER CIRCUIT FOR VOLTAGE	
• Measure the voltage between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and ground.  N0092273 • Open RH door. • Voltage signal will only be present for less than one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to E5 . **No** GO to E4 .
E4 CHECK HALL-EFFECT SENSOR POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: PRB Module C3313B. • Measure the resistance between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and PRB module C3313B-5, circuit	**Yes** GO to E9 . **No**

repair4less

CPR47 (GY/BN), harness side; and between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and ground.  N0092274 • **Is the resistance less than 5 ohms between the PRB motor and the PRB module; and greater than 10,000 ohms between the PRB motor and ground?**	REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E5 CHECK THE HALL-EFFECT SENSOR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PRB Module C3313B. • Measure the resistance between RH PRB motor C3186-6, circuit RPR47 (BU/GN), harness side and PRB module C3313B-14, circuit RPR47 (BU/GN), harness side.  N0092275 • **Is the resistance less than 5 ohms?**	**Yes** GO to E9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E6 CHECK THE HALL-EFFECT SENSOR POWER CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PRB Module C3313B. • Ignition ON. • Measure the voltage between RH PRB motor C3186-4, circuit CPR47 (GY/BN), harness side and ground.  N0092273 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E9 .

E7 CHECK THE HALL-EFFECT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PRB Module C3313B. • Ignition ON. • For DTC B1163, measure the voltage between LH PRB motor C3185-5, circuit VPR43 (GY/BU), harness side and ground.  N0092498 • For DTC B1170, measure the voltage between RH PRB motor C3186-5, circuit VPR46 (GY), harness side and ground. • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E8 .
E8 CHECK THE HALL-EFFECT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • For DTC B1163, measure the resistance between LH PRB motor C3185-5, circuit VPR43 (GY/BU), harness side and PRB module C3313B-9, circuit VPR43 (GY/BU), harness side; and between LH PRB motor C3185-5, circuit VPR43 (GY/BU), harness side and ground.  N0092499 • For DTC B1170, measure the resistance between RH PRB motor C3186-5, circuit VPR46 (GY), harness side and PRB module C3313B-10, circuit VPR46 (GY), harness side; and between RH PRB motor C3186-5, circuit VPR46 (GY), harness side and ground.	**Yes** GO to E10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

repair4less

- **Is the resistance less than 5 ohms between the PRB motor and PRB module; and greater than 10,000 ohms between the PRB motor and ground?**

E9 CHECK THE PRB MODULE FOR CORRECT OPERATION	

• Connect: PRB LH Motor C3185.
• Connect: PRB RH Motor C3186.
• Disconnect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

E10 CHECK THE PRB MODULE FOR CORRECT OPERATION	

• Connect: PRB LH Motor C3185.
• Connect: PRB RH Motor C3186.
• Disconnect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to E11 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

E11 CHECK THE PRB FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce-back, stops in mid-travel, is noisy or will not deploy or stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the pivot areas or track guides. REFER the customer to the Owner's Literature for correct cleaning instructions.

high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Do the LH and RH PRBs operate normally during all test steps?**	**No** INSTALL a new PRB motor. REFER to Power Running Board (PRB) Motor in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC B1317/B1318 — Battery Voltage High/Battery Voltage Low

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

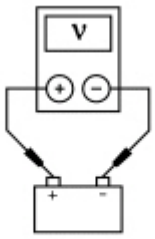
NOTE: DTC B1317 or B1318 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

Normal Operation

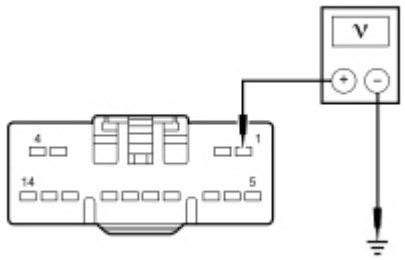
The Power Running Board (PRB) module continuously monitors the input voltage for correct operation. If the PRB module detects input voltage below 9.5 volts, it will store DTC B1318 in memory. If the PRB module detects input voltage greater than 16 volts, it will store DTC B1317 in memory. If the PRB module sets DTC B1317 or B1318, it will inhibit the power liftgate system operation.

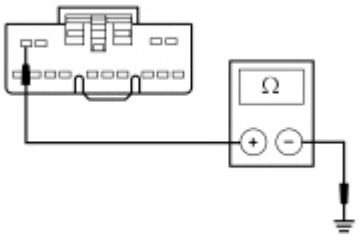
- DTC B1317 (Battery Voltage High) — If the PRB module detects voltage above 16 volts while the running boards are in motion (deploy/stow), it will set this DTC. Once this DTC is set, the PRB system will be disabled until the battery voltage returns to normal.
- DTC B1318 (Battery Voltage Low) — If the PRB module detects voltage below 9.5 volts while the running boards are in motion (deploy/stow), it will set this DTC.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- PRB module





PINPOINT TEST F: DTC B1317/B1318 — BATTERY VOLTAGE HIGH/BATTERY VOLTAGE LOW

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

Test Step	Result / Action to Take
F1 RETRIEVE ALL CMDTCs IN ALL MODULES • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ALL CMDTCs . • **Is DTC B1317 or B1318 retrieved from one or more modules and P0563, P0620, P0626 or P065B retrieved from the PCM?**	**Yes** REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). REPEAT the PRB module self-test.

repair4less

	No GO to F2 .
F2 TEST BATTERY CONDITION • Ignition OFF. • Carry out the Battery Condition Test. Refer to Section 414-01 . • **Did the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . REPEAT the PRB module self-test. If the battery passed the condition test and did not require a recharge, GO to F3 . **No** INSTALL a new battery. CLEAR all CMDTCs . REPEAT the PRB module self-test.
F3 CHECK CHARGING SYSTEM VOLTAGE **NOTE:** Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Measure the voltage of the battery: ▪ For DTC B1317, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ▪ For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.  AJ0210-A • **Is the voltage between 13 and 15.2 volts?**	**Yes** For DTC B1318, GO to F4 . For DTC B1317, GO to F6 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . REPEAT the PRB module self-test.
F4 CHECK THE PRB MODULE POWER CIRCUIT • Ignition OFF. • Disconnect: PRB module C3313B. • Measure the voltage between PRB module C3313B-1, circuit SBB11 (BU/RD), harness side and ground.	**Yes** GO to F5 . **No** VERIFY Battery Junction Box

 N0055096 • **Is the voltage greater than 10 volts?**	(BJB) fuse 11 (30A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the PRB module self-test. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the PRB module self-test.
F5 CHECK THE PRB MODULE GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between PRB module C3313B-4, circuit GD139 (BK/YE), harness side and ground.  N0060073 • **Is the resistance less than 5 ohms?**	**Yes** GO to F6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the PRB module self-test.
F6 CHECK FOR PRB MODULE OPERATION	
• Check PRB module C3313A and C3313B for the following: ▪ corrosion. ▪ damaged pins. ▪ pushed-out pins. • Connect PRB module C3313A and C3313B and make sure the connectors seat correctly. • Clear all CMDTCs . • Operate the system to verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. REPEAT the PRB module self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PRB module self-test.

repair4less

Applique — Rear

Special Tool(s)

 ST1073-A	Heat Gun 107-R0300

General Equipment

Moulding Removal Tool
C-Clamp Pliers
38 mm (1.496 in) x 89 mm (3.503 in) x 2.13 m (84 in) Common Whitewood Stud
Hand Roller
Stripe Removal Wheel

Material

Item	Specification
Motorcraft® Detail Wash ZC-3-A	—

1. If equipped, remove the rear video camera. For additional information, refer to Section 413-13 .

2. Apply masking tape over the tailgate badges and on the tailgate surfaces surrounding the applique.

3. **NOTE:** 3M™ Prep Solvent-70 is commercially available.

   Spray a liberal amount of 3M™ Prep Solvent-70 or equivalent along the top of the applique and in the separated areas between the applique and in the separated area between the applique and tailgate sheet metal.
   - Allow 10 minutes of saturation time for the solvent to break down the adhesive tape.

4. ***NOTICE:*** **Applique is equipped with 4 attaching clips located horizontally across the middle of the applique. Vehicles built after 12/20/2009 may have 2 additional clips, staggered equal distance along the top edge. Use care not to damage the clips and clip mounting tabs during removal.**

   NOTICE: **Do not use excessive pressure or prying leverage to remove the applique or damage to it or the tailgate sheet metal could occur.**

   Break the bond of the adhesive tape at the top of the applique using a moulding removal tool.
   - General Equipment: Moulding Removal Tool.

repair4less

5. Work the applique free from the sheet metal from the top and sides as far as the tool will reach.
    - Continue to apply solvent as required to help break the adhesive bond.

6. Remove the tailgate from the vehicle and place on a workstand.

7. Saturate the lower portion of the tailgate applique adhesive with solvent.
    - Allow 10 minutes of saturation time for the solvent to break down the adhesive tape.

8. ***NOTICE:*** **Do not use excessive pressure or prying leverage to remove the applique or damage to the applique or the tailgate sheet metal could occur.**

    Break the bond of the adhesive tape on the bottom section using the moulding removal tool and remove the tailgate applique.
    - Place the tailgate applique on a workstand equipped with padding that will protect the finish side of the part from damage.
    - General Equipment: Moulding Removal Tool.

9. Remove the tailgate release handle from the tailgate. For additional information, refer to Section 501-14 .

10. ***NOTICE:*** **High speed RPM usage of the stripe removal tool may result in applique damage. Slower RPM will allow for faster adhesive tape removal and prevent applique damage.**

    Carefully remove all existing adhesive tape from the tailgate sheet metal and the applique using stripe removal tool. Operate the wheel at slower RPM for best results. If necessary, have an assistant hold the part.
    - General Equipment: Stripe Removal Wheel

NOTICE: **Solvent will be absorbed in the original tape and will drip on the replacement tape causing a bonding failure. It is critical to remove all the original tape.**

11. **NOTE:** 3M™ General Purpose Adhesive Cleaner and 3M™ Specialty Adhesive Remover Liquid are commercially available.

    Soak the residual adhesive on the ribbed sections along the top and bottom of the appliques using 3M™ General Purpose Adhesive Cleaner or 3M™ Specialty Adhesive Remover Liquid (Low VOC Compliant). Remove all adhesive from the ribs with a wire detail brush and dry with compressed air.

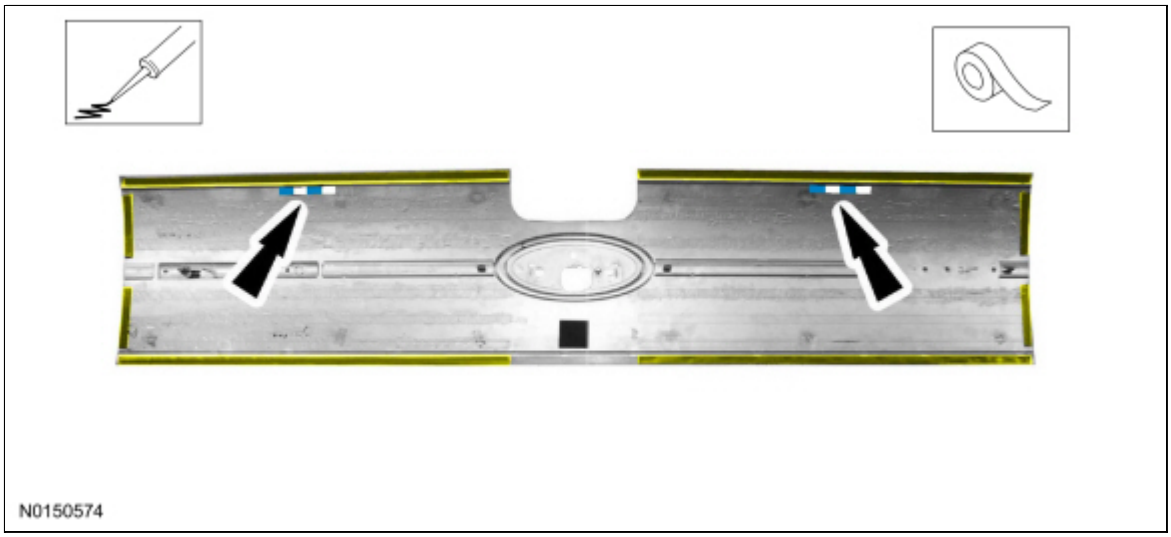
12. Thoroughly wash the tailgate and applique with Motorcraft® Detail Wash or equivalent to remove all solvent residue. Blow dry and repeat as required.

NOTICE: **Failure to completely remove solvent residue will prevent replacement tape from adhering correctly.**

13. Apply a 13 cm (5 in) to 15 cm (6 in) wide layer of masking tape along the entire length of the top and bottom sections on the finish side of the applique.

14. Tape will be applied to the outside perimeter of the applique in a picture frame pattern. Wipe the flat vertical sides and ribbed horizontal sections along the top and bottom of the applique with isopropyl alcohol. Repeat on the corresponding locations of the tailgate.

15. Place the tailgate on a workstand with the outside surface exposed.



16. **NOTE:** 3M™ Acrylic Plus Tape is commercially available.

    NOTE: Do not apply one continuous length of tape across the bottom. Distance between the two sections must be present for drainage.

    NOTE: Do not allow the tape to extend past the ribbed sections.

    Apply 3M™ Acrylic Plus Tape over the top and bottom ribbed sections of the applique as shown.

repair4less

17. Apply tape to the vertical outside edges. Do not allow tape to extend to the ribbed sections or near the raised profile in the middle of the part. The individual sections of tape in this area should be no longer than 112 mm (4.409 in).

18. Use a hand roller to firmly wet-out the tape.
    - General Equipment: Hand Roller.

19. **NOTE:** 3M™ Duramix Universal Adhesive 08214 is commercially available.

    Apply a 13 mm (0.511 in) by 76 mm (2.992 in) bead of 3M™ Duramix Universal Adhesive 08214, approximately 13 mm (0.511 in) below the center of the upper sections of tape. Do not allow the adhesive to make contact with tape.

20. **NOTE:** The adhesive has a 10 minute work time.

    Remove the tape backing, and with the aid of an assistant immediately place the applique on the tailgate and seat the attaching clips.

21. **NOTE:** Do not remove the tape backing until the applique is ready to be installed.

    Use a hand roller to firmly wet-out the tape around the perimeter of the applique.
    - General Equipment: Hand Roller.

22. Place a 38 mm (1.496 in) x 89 mm (3.503 in) x 2.13 m (84 in) common whitewood stud along the top edge of the applique. Secure the lumber on each side of the tailgate using locking C-clamp pliers with swivel pads. When clamped properly the lumber will form to the contour of the applique.
    - General Equipment: C-Clamp Pliers.
    - General Equipment: 38 mm (1.496 in) x 89 mm (3.503 in) x 2.13 m (84 in) Common Whitewood Stud.

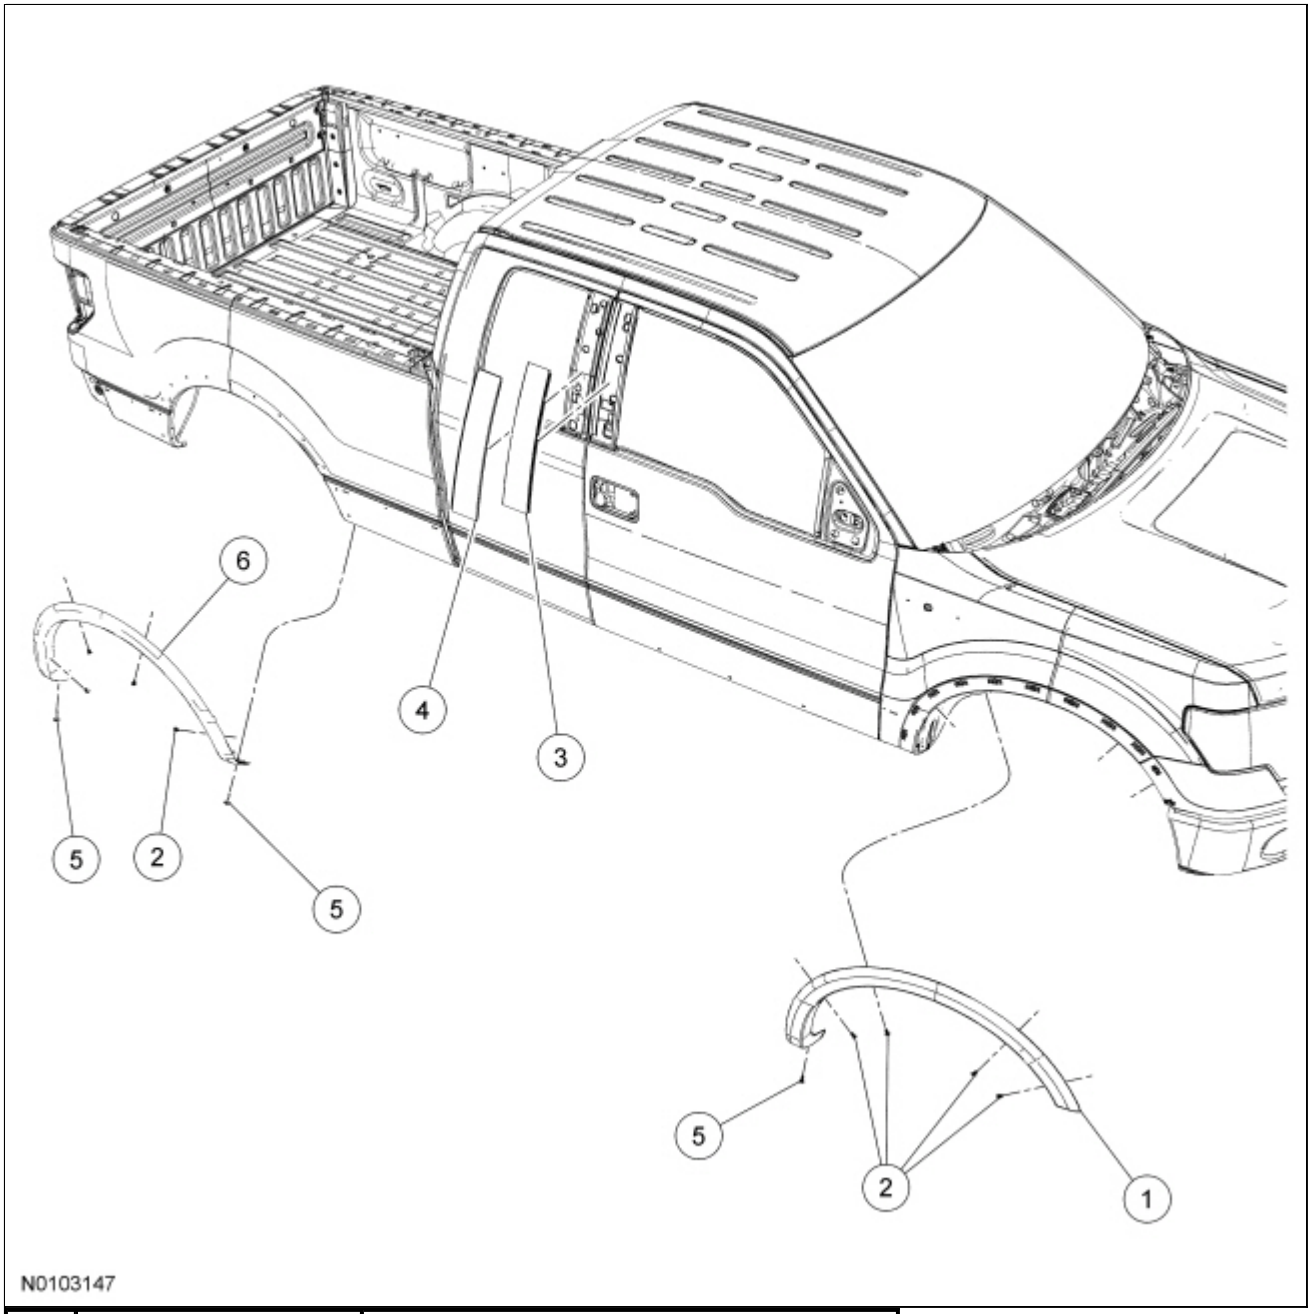
23. **NOTE:** The C-clamps should be oriented as in illustration to achieve proper clamping force.

    NOTE: If the stud being used is slightly bowed, orient the bowed (crowned) side down against the applique to achieve proper clamping force.

    Place a second stud along the bottom section of the applique, attaching in the same way.
    - General Equipment: C-Clamp Pliers.
    - General Equipment: 38 mm (1.496 in) x 89 mm (3.503 in) x 2.13 m (84 in) Common Whitewood Stud.

24. The applique must remain clamped for a minimum of 4 hours to properly set the adhesive.

25. Remove the clamps and studs and reinstall the tailgate handle. For additional information, refer to Section 501-14 .



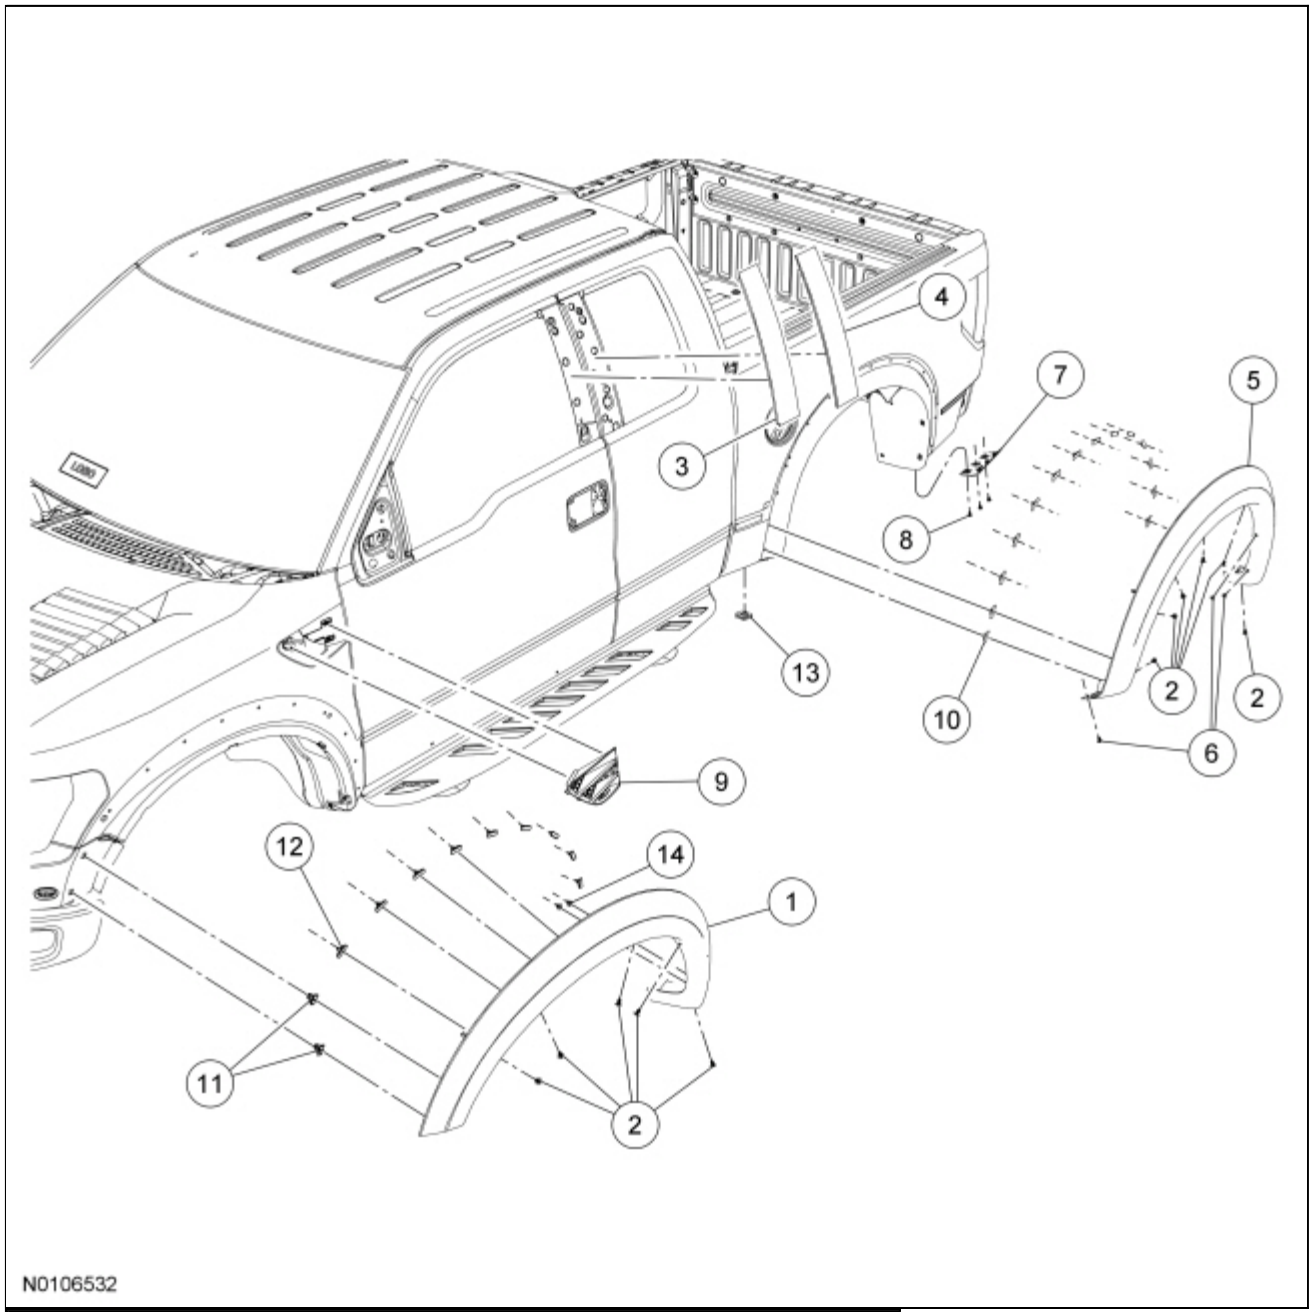
repair4less

26. Install the tailgate.

27. If equipped, reinstall the rear video camera. For additional information, refer to Section 413-13 .

Exterior Trim — Exploded View

F-150 Except SVT Raptor



Item	Part Number	Description
1	16038 RH/ 16039 LH	Front fender moulding
2	W705589	Fender moulding pin-type retainers (8 required)

repair4less

3	20554 RH/ 20555 LH	Front door window moulding
4	255A34 RH/ 255A35 LH	Rear door window moulding
5	W709346	Fender moulding screws
6	29164 RH/ 29165 LH	Rear fender moulding

SVT Raptor

Item	Part Number	Description
1	16A074 RH/ 16A075 LH	Front fender moulding

2	W705589	Fender moulding pin-type retainers (11 required)
3	20554 RH/ 20555 LH	Front door window moulding
4	255A34 RH/ 255A35 LH	Rear door window moulding
5	291C20 RH/ 291C21 LH	Rear fender moulding
6	W710763	Fender moulding screw (3 required)
7	292A23	Rear quarter trim panel
8	W705589	Rear quarter trim panel pin-type retainers (3 required)
9	16C027	Fender vent
10	—	Rear fender moulding pin-type retainer (part of 291C20 RH/ 291C21 LH) (14 required)
11	—	Front fender moulding forward pin-type retainers (part of 16A074 RH/ 16A075 LH)
12	—	Front fender moulding pin-type retainer (part of 16A074 RH/ 16A075 LH) (9 required)
13	W705546	Rear fender moulding U-nut
14	—	Rear fender moulding rear pin-type retainer (2 required)

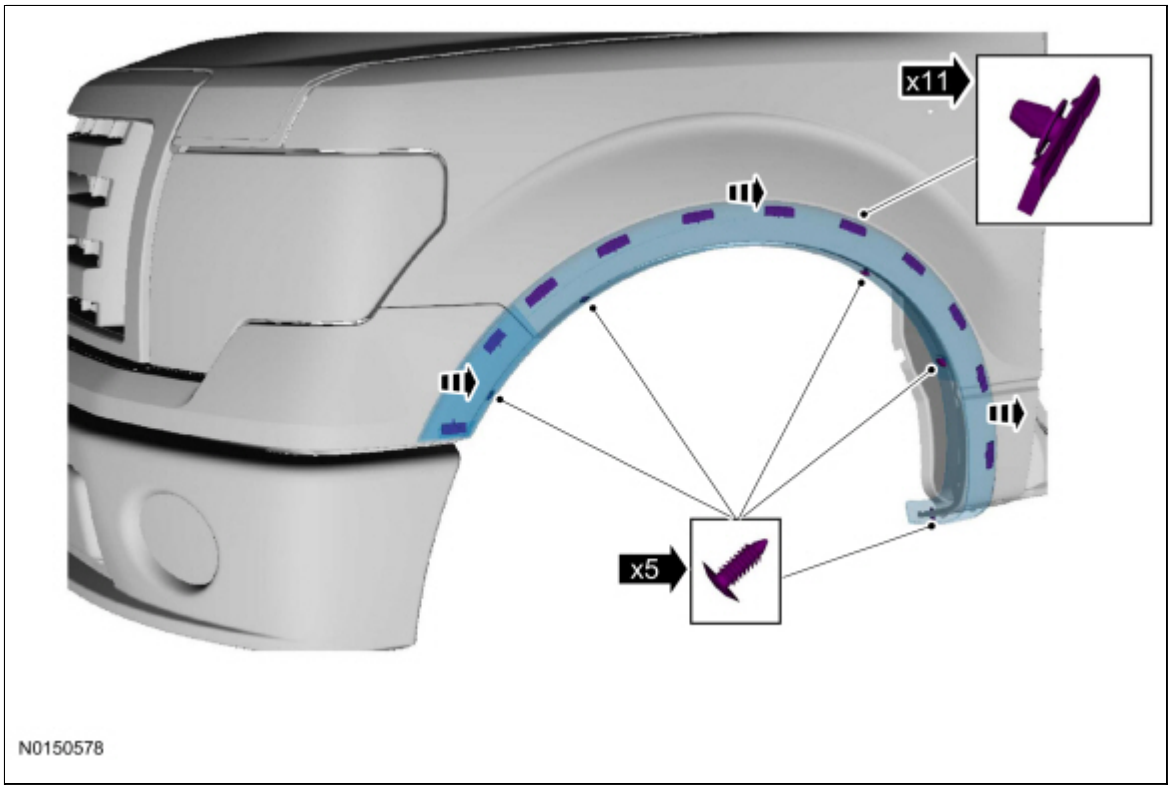
Fender Moulding — Front



Removal and Installation

Standard

1. Remove the 2 front fender moulding nuts.
    - Tighten to 3.5 Nm (31 lb-in).

2. Remove the 5 front fender moulding pin-type retainers.
    - Starting at the front of the fender moulding, pull outward to release moulding from the fender.

3. Using a non-marring trim tool, carefully pry the moulding outward to gain access to the forward pin-type retainers.

4. ***NOTICE:*** **Pry directly on the pin-type retainer. Do not pry on the fender moulding. Failure to follow this direction may result in damage to the component.**

   Using a non-marring tool, release the front fender moulding front pin-type retainers.
   - Pry outward on the first front fender moulding front pin-type retainer by pushing the handle toward the fender.
   - Pry outward on the second front fender moulding front pin-type retainer by pushing the handle toward the fender.
   - Follow this sequence for the remaining retainers.

5. Remove the front fender moulding.
   - Pull outward to release the rear fender moulding pin-type retainers.

SVT Raptor

6. Remove the 5 front fender moulding pin-type retainers.

repair4less

7. Using a non-marring trim tool, carefully pry the moulding outward to gain access to the forward pin-type retainers.

8. ***NOTICE:*** **Pry directly on the pin-type retainer. Do not pry on the fender moulding. Failure to follow this direction may result in damage to the component.**

   Using a non-marring tool, release the front fender moulding front pin-type retainers.
   - Pry outward on the first front fender moulding front pin-type retainer by pushing the handle toward the fender.
   - Pry outward on the second front fender moulding front pin-type retainer by pushing the handle toward the fender.
   - Follow this sequence for the remaining retainers.

9. Remove the front fender moulding.
   - Pull outward to release the rear fender moulding pin-type retainers.

All vehicles

10. To install, reverse the removal procedure.

repair4less

Fender Moulding — Rear

Removal and Installation

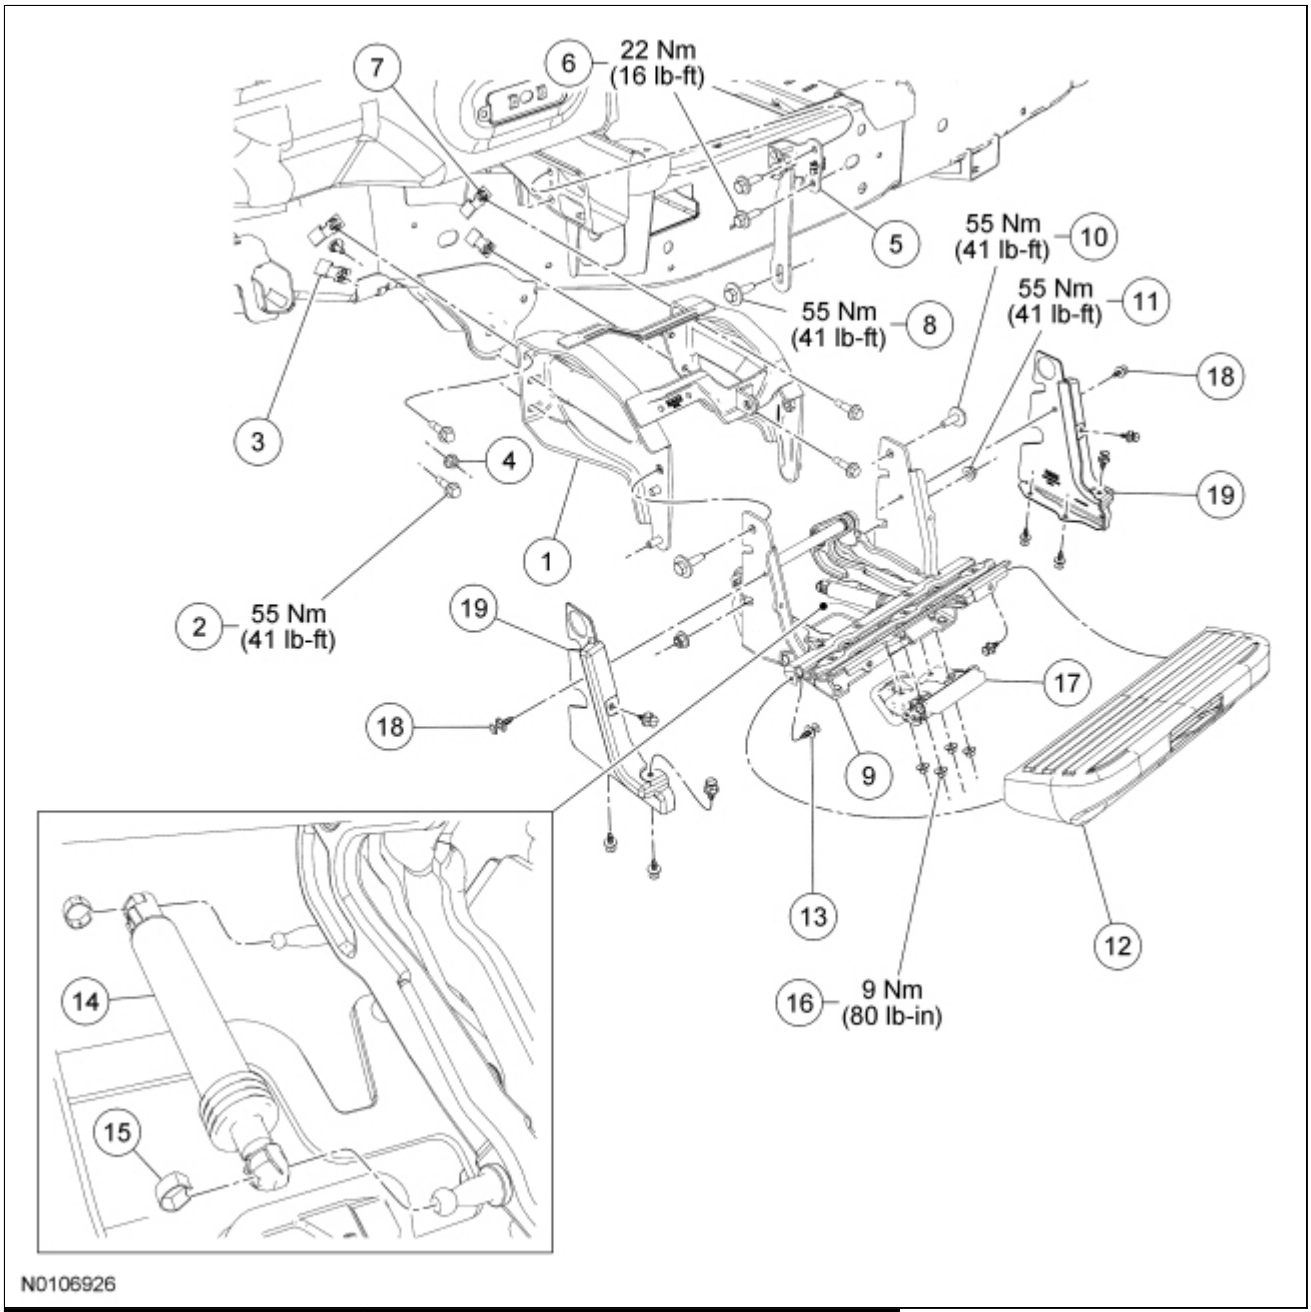
Standard

1. Remove the 2 rear fender moulding screws.
2. Remove the 4 rear fender moulding pin-type retainers.
3. Starting at the front of the fender moulding, pull outward to release it from the fender.

SVT Raptor

4. Remove the 6 rear fender moulding pin-type retainers.
5. Remove the rear fender moulding screws.
6. ***NOTICE:*** **Pry directly on the pin-type retainer. Do not pry on the fender moulding. Failure to follow this direction may result in damage to the component.**

   Using a non-marring tool, starting at the front of the rear fender moulding, pry outward on the pin-type retainers by pushing the handle toward the fender.
7. Remove the rear fender moulding.



All vehicles

8. To install, reverse the removal procedure.

repair4less

Pickup Bed Side Step

NOTE: The pickup bed side step latch is a serviceable component. For additional information, refer to Section 501-14 .

Item	Part Number	Description
1	16A417 LH/ 16A416 RH	Pickup bed side step bracket
2	W506433	Pickup bed side step bracket bolt (4

		required)
3	W520824	Pickup bed side step bracket nut (4 required)
4	—	Pickup bed side step bracket locating nut (part of 16A417)
5	99200B39A LH/ 99200B38A RH	Pickup bed side step bracket slide strap support
6	W705196	Pickup bed side step bracket slide strap support-to-box bolt (2 required)
7	W520833	Pickup bed side step bracket slide strap support-to-box nut (2 required)
8	W505443	Pickup bed side step bracket slide strap support-to-step bracket bolt
9	1520040A	Pickup bed side step body
10	W505443	Pickup bed side step body upper bolt (2 required)
11	W520113	Pickup bed side step body lower nut (2 required)
12	16490C	Pickup bed side step body trim cover
13	W505153	Pickup bed side step body trim cover pin-type retainer (2 required)
14	15200M48A	Pickup bed side step body strut
15	—	Pickup bed side step body shock clip (part of 15200M48A) (2 required)
16	W520101	Pickup bed side step latch nuts
17	16516	Pickup bed side step latch
18	W709176	Pickup bed side step cover pin-type retainer (10 required)
19	200A20 RH/ 200A21 LH	Pickup bed side step cover

Removal and Installation

Side step assembly

NOTE: The pickup bed side step must be closed to complete this procedure.

1. Remove the pickup bed side step bracket slide strap support bracket-to-side step bracket bolt.
    - To install, tighten to 55 Nm (41 lb-ft).

2. Remove the 4 pickup bed side step-to-frame bolts.
    - Tighten to 55 Nm (41 lb-ft).

3. Remove the locating nut.
    - To install, tighten to 55 Nm (41 lb-ft).

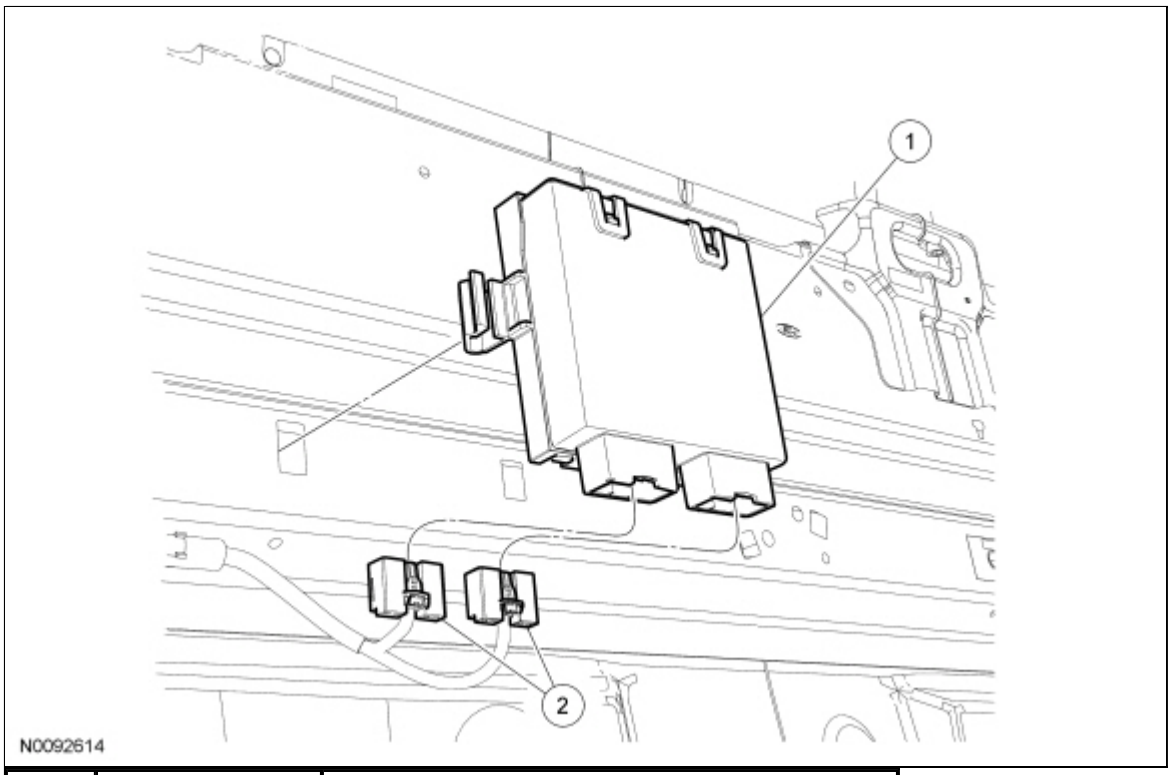
4. Remove the pickup bed side step assembly.

repair4less

Side step body

5. Remove the pickup bed side step body upper retainer bolts.
    - To install, tighten to 55 Nm (41 lb-ft).

6. Loosen the pickup bed side step body lower nuts.
    - To install, tighten to 55 Nm (41 lb-ft).

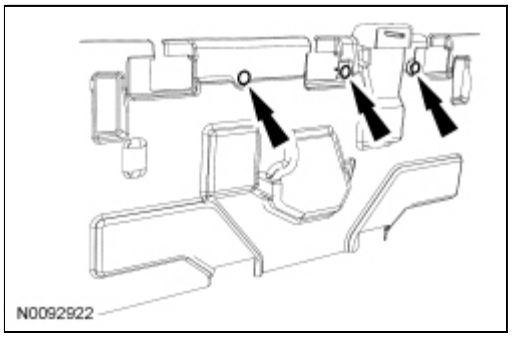


7. **NOTE:** Pull outward to release the step body from the pickup bed side step bracket studs.

   Remove the pickup bed side step body.

All procedures

8. To install, reverse the removal procedure.

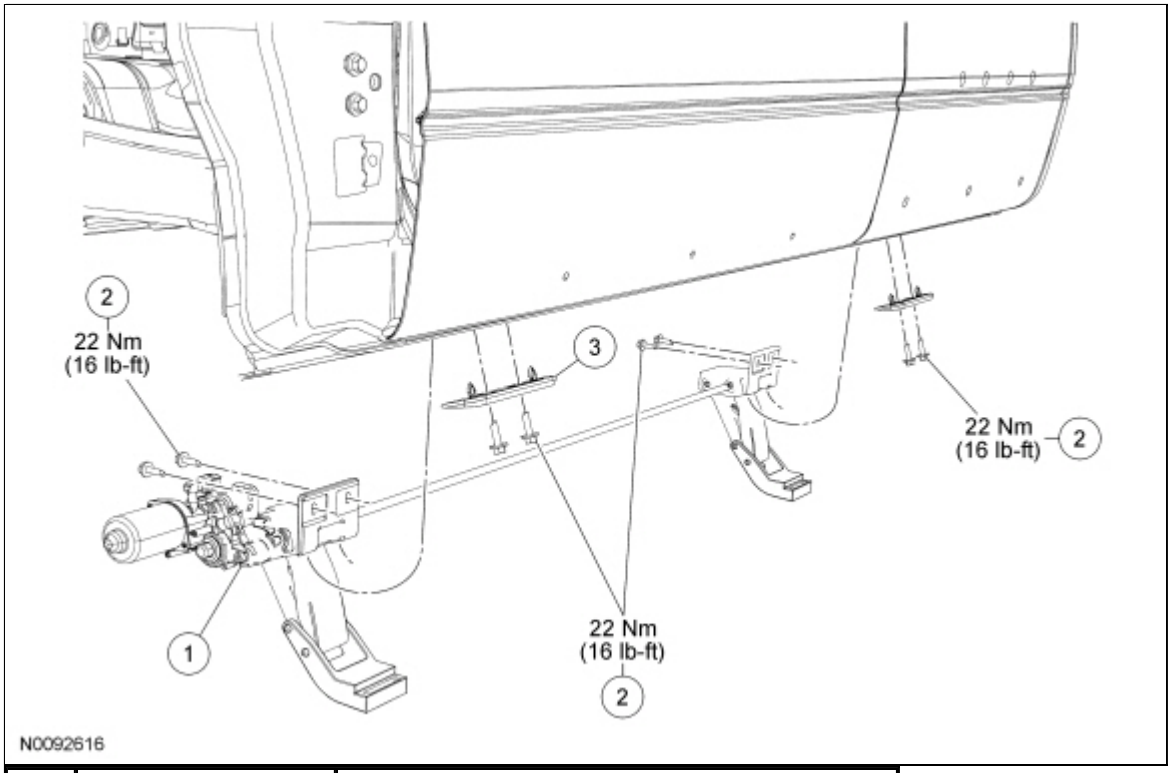


Power Running Board (PRB) Module

Item	Part Number	Description
1	14C177	Power Running Board (PRB) module
2	—	PRB module electrical connectors

Removal and Installation

1. Remove the C-pillar trim panels. For additional information, refer to Section 501-05 .
2. Remove the 3 rear sound insulator pin-type retainers and remove the rear sound insulator.



3. Disconnect the Power Running Board (PRB) module electrical connectors.

repair4less

4. Remove the PRB module.
5. To install, reverse the removal procedure.

Power Running Board (PRB) Motor

Item	Part Number	Description
1	16A506 RH/ 16A507 LH	Power Running Board (PRB) motor and bracket assembly
2	W705196	PRB motor and bracket assembly bolts (8 required)
3	16N454	PRB bracket cover (2 required)

Removal and Installation

NOTE: The Power Running Board (PRB) motor and brackets are serviced as an assembly.

1. Remove the PRB step. For additional information, refer to Power Running Board (PRB) Step in this section.

2. Disconnect the PRB electrical connector.

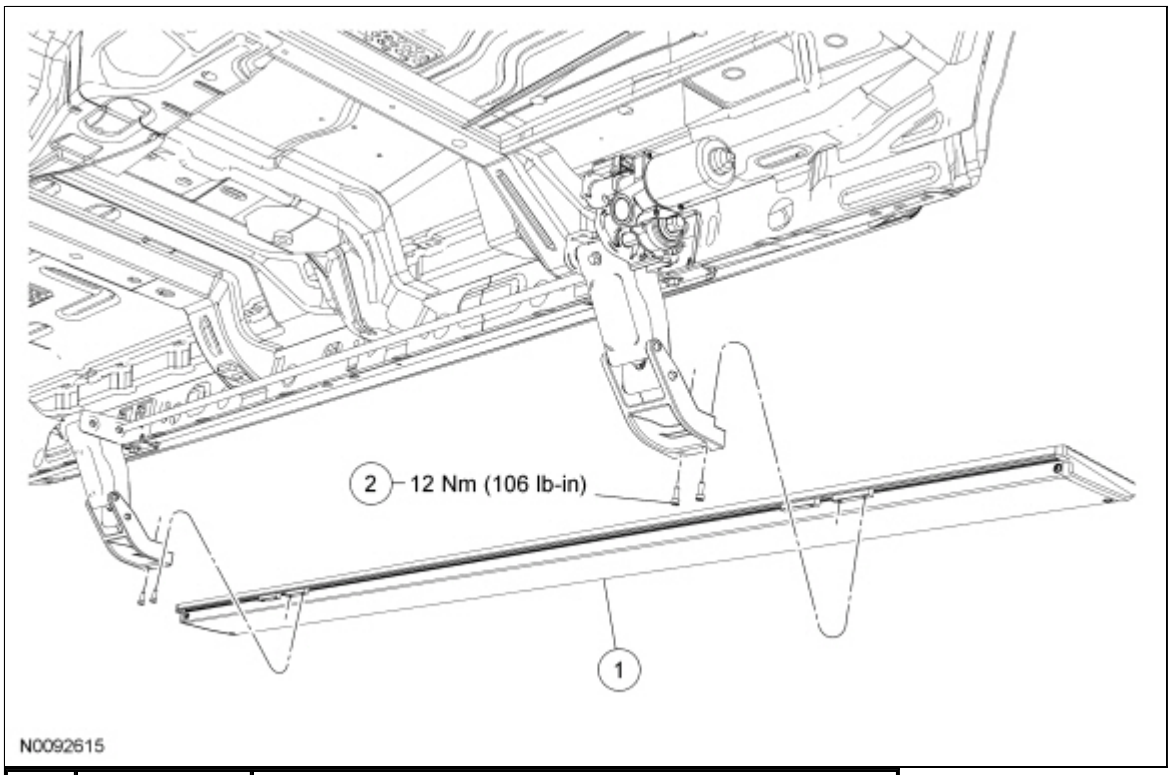
NOTICE: **The following steps require an assistant. Failure to follow this instruction may result in damage to the vehicle.**

3. Remove the PRB motor and bracket assembly front bracket upper bolts.
   - To install, tighten to 22 Nm (16 lb-ft).

4. Remove the PRB motor and bracket assembly front bracket lower bolts.

repair4less

- To install, tighten to 22 Nm (16 lb-ft).



5. Remove the PRB motor and bracket assembly rear bracket upper bolts.
    - To install, tighten to 22 Nm (16 lb-ft).

6. Remove the PRB motor and bracket assembly rear bracket lower bolts.
    - To install, tighten to 22 Nm (16 lb-ft).

7. Remove the PRB motor and bracket assembly.

8. To install, reverse the removal procedure.

Power Running Board (PRB) Step

Item	Part Number	Description
1	16490	Power Running Board (PRB) step
2	—	PRB bracket-to-step screw (part of 16490) (4 required)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** If the Power Running Board (PRB) cannot be extracted, extend the running board by hand.

   Extend the PRB .

3. Remove the 2 front and 2 rear PRB bracket-to-step screws and the PRB step
   - To install, tighten to 12 Nm (106 lb-in).

4. To install, reverse the removal procedure.

repair4less

Power Running Board (PRB)

Item	Part Number	Description
1	16451C LH/ 16450E RH	Power Running Board (PRB) assembly
2	W705196	PRB assembly bolts (8 required)
3	16N454	PRB bracket cover (2 required)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** If the Power Running Board (PRB) cannot be extracted, extend the running board by hand.

   Extend the PRB .

3. Disconnect the PRB electrical connector.

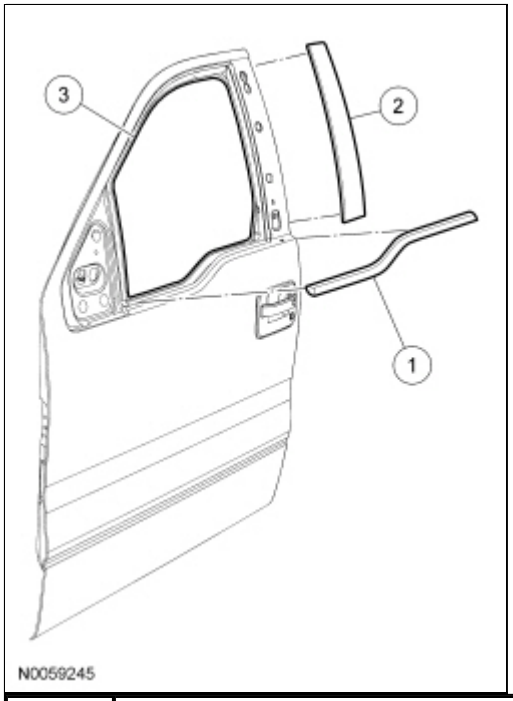
NOTICE: **The following steps require an assistant. Failure to follow this instruction may result in damage to the vehicle.**

4. Remove the PRB assembly front bracket upper bolts.
   - To install, tighten to 22 Nm (16 lb-ft).

repair4less

5. Remove the PRB assembly front bracket lower bolts.
    - To install, tighten to 22 Nm (16 lb-ft).

6. Remove the PRB assembly rear bracket upper bolts.
    - To install, tighten to 22 Nm (16 lb-ft).



7. Remove the PRB assembly rear bracket lower bolts.
    - To install, tighten to 22 Nm (16 lb-ft).

8. Remove the PRB assembly.

9. To install, reverse the removal procedure.

Window Moulding

NOTE: LH side shown, RH side similar.

Item	Part Number	Description
1	22596 RH/ 22597 LH	Outer belt moulding
2	20554 RH/ 20555 LH	Window moulding
3	1452 RH/ 1453 LH	Glass run

Removal

1. Remove the outer belt moulding.
   - Release the retaining clip at the rear of the belt moulding, then slide the front of the moulding off of the flange to remove the belt moulding from the door.

2. **NOTE:** The window moulding is held on by double-sided tape from the forward edge of the moulding and by trim clips near the center of the moulding. The rearmost edge rolls over the door frame sheet metal.

   Starting at the upper forward corner of the moulding, insert a suitable removal tool between the moulding and the door frame.

3. Determine the location of the double-sided tape. Carefully spread spray-on adhesive cleaner down the space between the applique and door frame. Allow the cleaner to set for several minutes.

4. Using the removal tool, begin removing the moulding, spraying additional adhesive cleaner as needed.

repair4less

Installation

1. Remove all remaining adhesive tape on the mating surfaces of the door and apply new adhesive tape.

2. **NOTE:** Make sure the forward edge of the moulding is underneath the glass run lip.

   Install the window moulding on the edge of the door, engage the groove then gently press down to engage the clips and tape.

3. Install the outer belt moulding.

Rear View Mirrors

Exterior Mirrors

Aero Exterior Mirrors

The main serviceable components of the aero exterior mirrors are:

- Exterior mirror glass
- Exterior mirror plastic housing
- Exterior mirror control switch (optional)
- Heated exterior mirror glass (optional)
- Exterior mirror glass (blind spot optional, LH only)
- LH auto-dimming exterior mirror glass (optional)
- Exterior mirror glass adjustment motors (optional)
- Exterior mirror cover (plastic, chrome or painted)
- Exterior mirror glass adjustment motors (optional — with memory)
- Exterior mirror glass adjustment motor (manual) (standard)
- Exterior mirror puddle lamps (optional)
- Exterior mirror turn signals (optional)

Trailer Tow Exterior Mirrors

The main serviceable components of the trailer tow exterior mirrors are:

- Exterior mirror glass
- Exterior mirror spotter glass
- Heated exterior mirror glass (optional)
- Exterior mirror cover (optional — chrome or painted)
- Exterior mirror control switch (optional)
- Exterior telescoping mirror control switch (optional — part of the exterior mirror control switch)
- Exterior mirror glass adjustment motors (optional — power mirrors only)
- Exterior mirror puddle lamps (optional)
- Exterior mirror turn signals (optional)
- Exterior mirror side marker (optional — telescoping mirrors only)
- Exterior mirror fold relay (power folding with telescoping mirrors only)
- DSM (optional — memory exterior mirrors)

Interior Mirror

Interior Rear View Mirrors

The vehicle may be equipped with one of the following interior rear view mirrors:

- Interior rear view mirror
- Interior auto-dimming rear view mirror with compass
- Interior auto-dimming rear view mirror with video display
- Interior auto-dimming rear view mirror with compass and video display

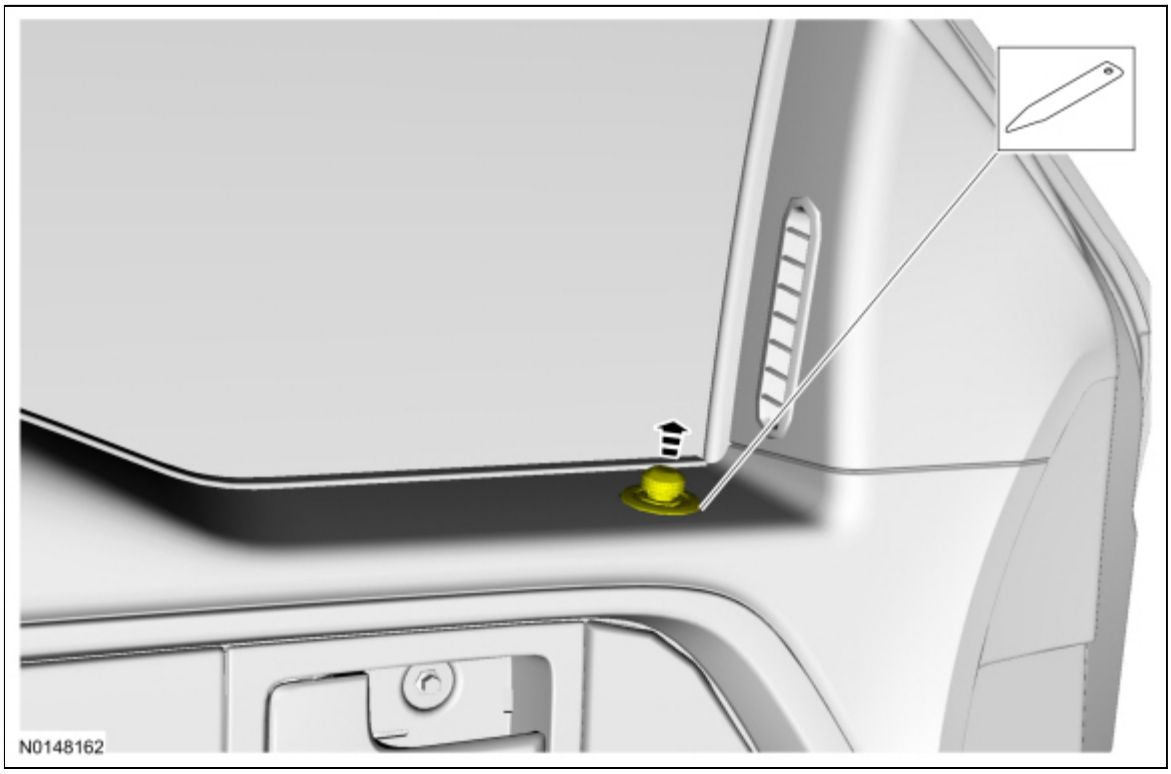
Exterior Mirror Motor Synchronization — Power Folding

NOTE: The power folding mirrors may need to be synchronized anytime the mirrors are folded or unfolded without using the exterior mirror control switch, or if a new power folding mirror is installed.

NOTE: If the power folding mirrors are electronically folded or unfolded continuously (6 to 10 cycles), the power lockout feature will disable the system for 3-10 minutes to prevent damage to the power fold motors. After 3-10 minutes have elapsed, normal operation will resume.

1. **NOTE:** For vehicles equipped with the mirror control switch integral to the window switch, Click here to view a video version of this procedure. For the stand alone switch, Click here to view a video version of this procedure.

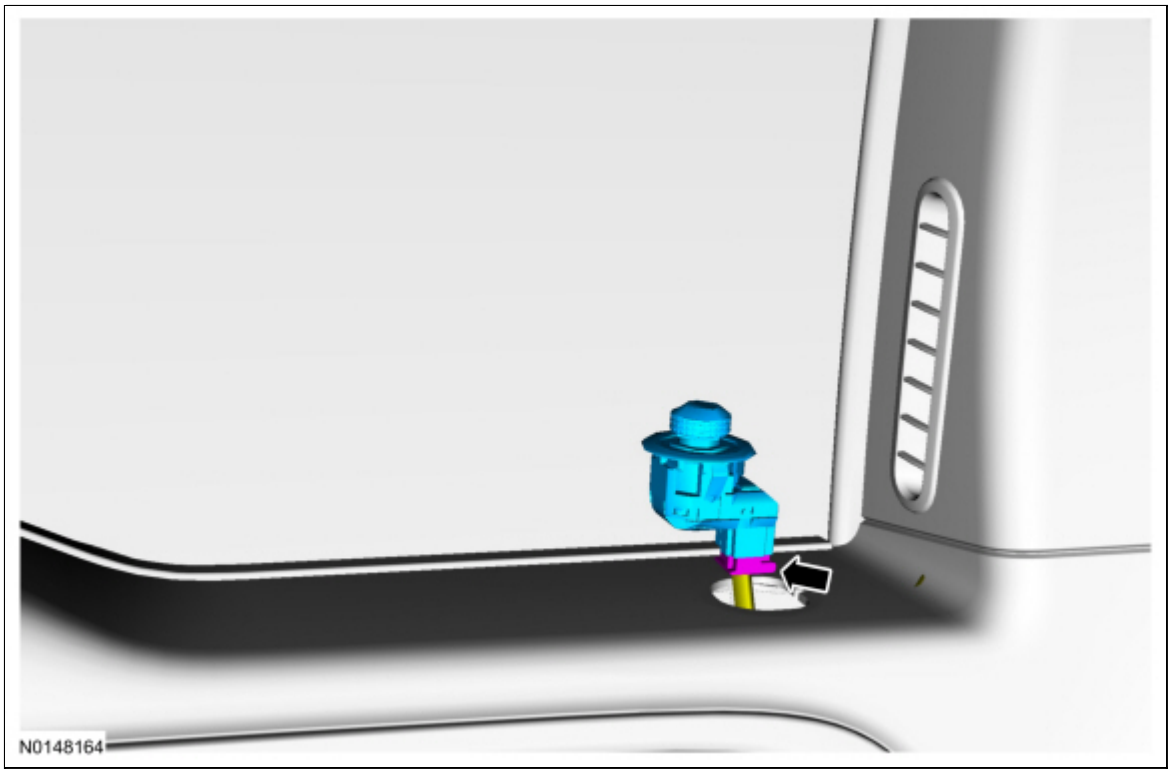
   Fold the mirrors back on each side so they are parallel with the side windows.



2. Position the exterior mirror control switch to the CENTER position.

3. Press the exterior mirror control switch rearward to the FOLD/UNFOLD position and cycle the power folding mirrors in and out until a loud popping noise is heard.

Exterior Mirror Control Switch — Aero

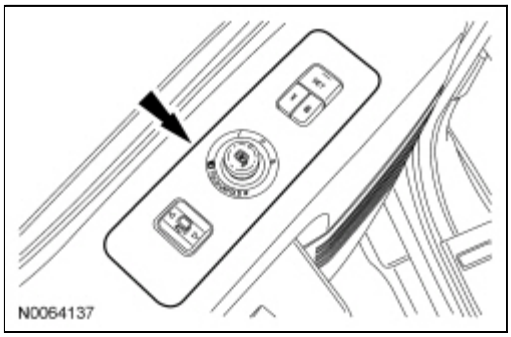


Removal and Installation

1. Using a non-marring tool, lift upward on the exterior mirror control switch at the location shown.

2.

repair4less



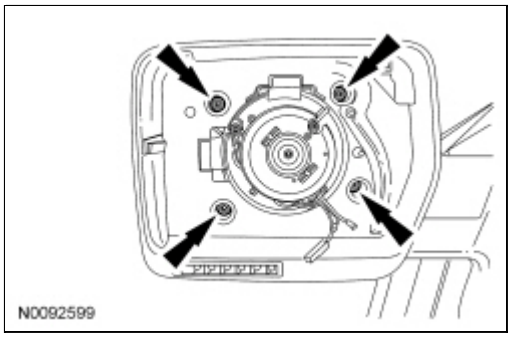
3. To install, reverse the removal procedure.

Exterior Mirror Control Switch — Trailer Tow

Removal and Installation

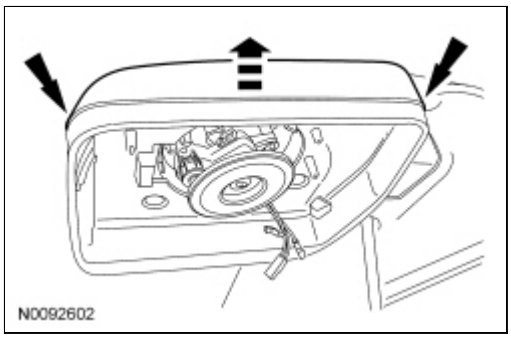
1. Lift upward and remove the exterior mirror trim panel.
    - Disconnect the electrical connectors.

2. Depress the locking tabs and remove the exterior mirror control switch.
3. To install, reverse the removal procedure.



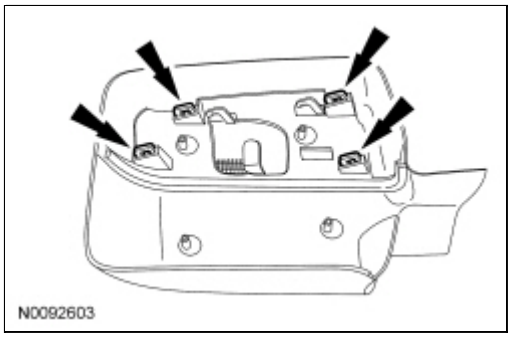
repair4less

Exterior Mirror Cover — Aero



Removal and Installation

NOTE: The power folding mirrors may need to be synchronized anytime the mirrors are folded or unfolded without using the exterior mirror control switch, or if a new power folding mirror is installed. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.



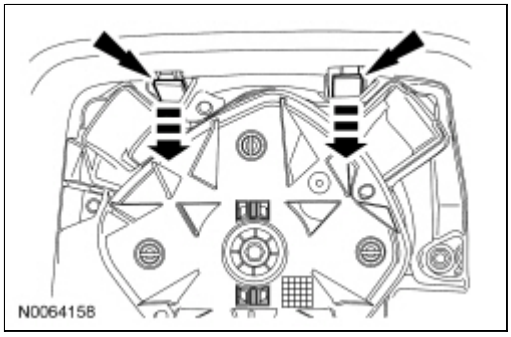
1. Remove the exterior mirror glass. For additional information, refer to Exterior Mirror .
2. Remove the 4 exterior mirror lower cover screws.

3. Remove the exterior mirror upper and lower covers from the exterior mirror.
   - Pull the exterior mirror upper and lower covers towards the front of the vehicle.

4. Release the exterior mirror cover retaining tabs.

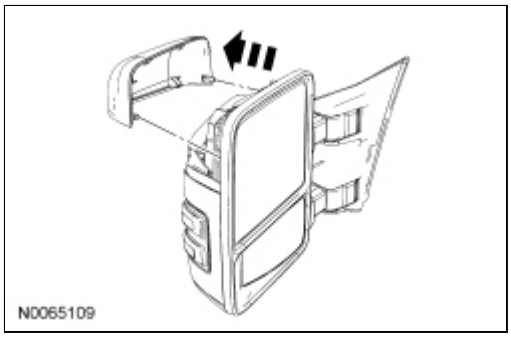
5. Separate and remove the upper exterior mirror cover from the lower exterior mirror cover.
6. To install, reverse the removal procedure.

---



repair4less

Exterior Mirror Cover — Trailer Tow



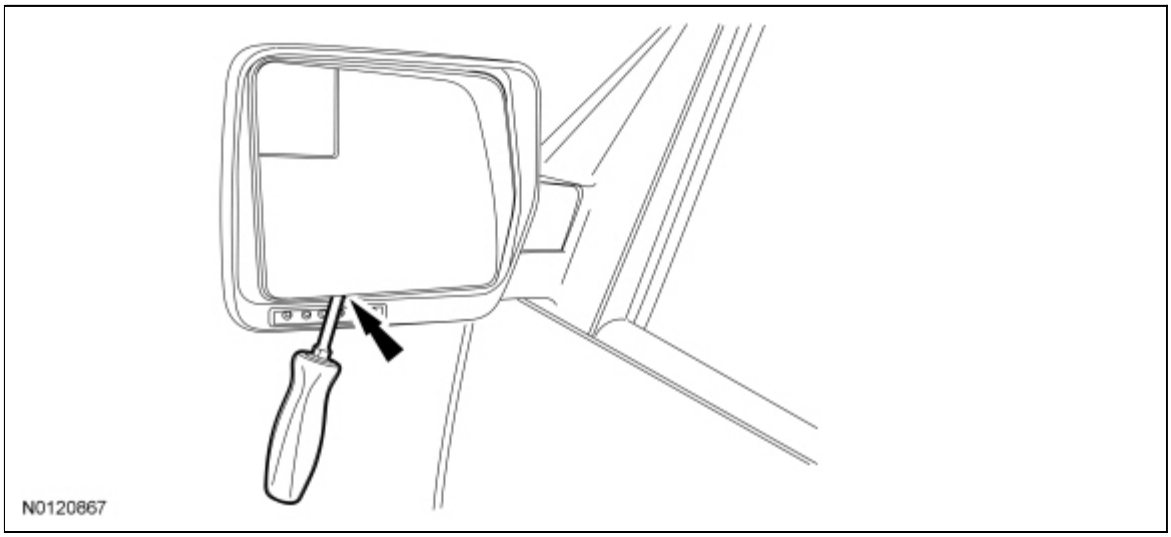
Removal and Installation

1. Remove the exterior mirror glass. For additional information, refer to Exterior Mirror Glass — Trailer Tow in this section.

2. Insert a flat-blade screwdriver into the clip slots at the top of the mirror and release the clips.

3. Separate and remove the exterior mirror cover from the exterior rear view mirror.

4. To install, reverse the removal procedure.

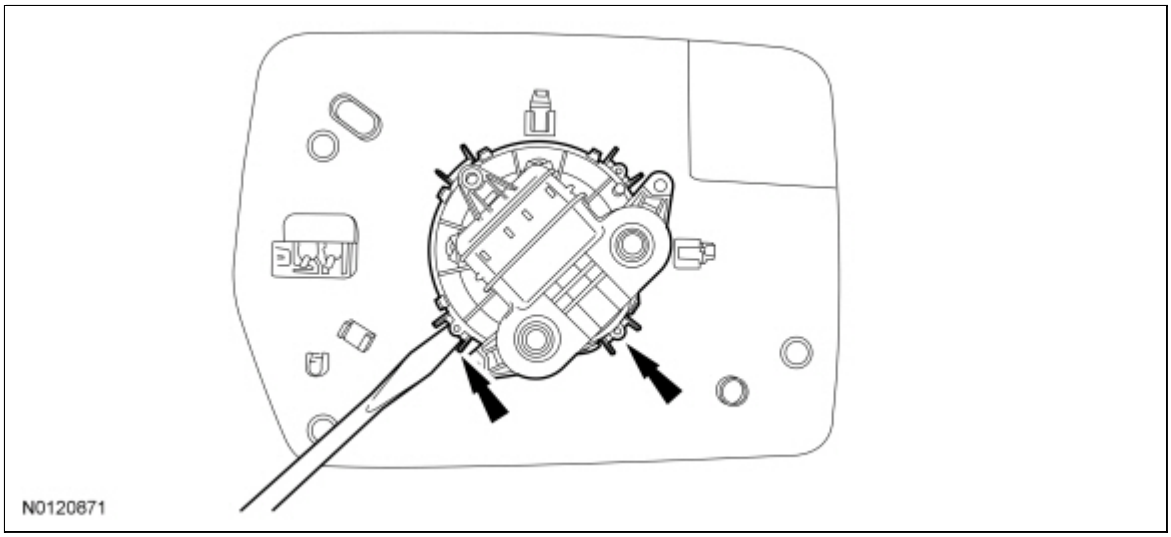


repair4less

Exterior Mirror Glass — Aero

Removal

NOTE: The power folding mirrors may need to be synchronized anytime the mirrors are folded or unfolded without using the exterior mirror control switch, or if a new power folding mirror is installed. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.



1. Position the exterior mirror glass to the full upward and inboard position and insert a thin flat-blade screwdriver.

2. **WARNING: Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

   NOTE: LH mirror and motor shown removed from the housing and from the back to show location of clips and placement of screwdriver.

   Using the thin flat-blade screwdriver, release the tabs starting at the lower outboard side of the exterior mirror and continue to the lower inboard side and remove the exterior mirror glass.

Installation

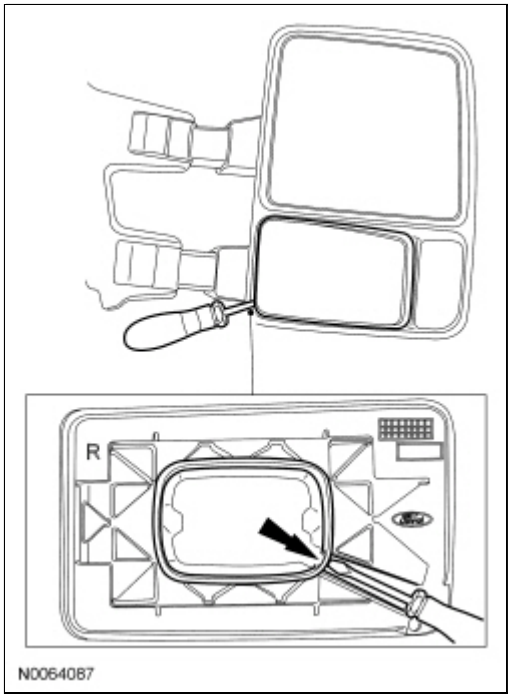
1. If equipped, connect the electrical connectors.
2. Position the exterior mirror glass on the mirror motor.
3. **WARNING: Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

   Place a hand against the back of the exterior mirror housing and a hand flat against the exterior mirror glass. Press the mirror glass in place until it is fully seated.

repair4less

Exterior Mirror Glass — Spotter, Trailer Tow

Removal



NOTE: RH spotter mirror shown, LH spotter mirror similar.

1. Position the spotter mirror glass fully upward and outward.

2. **NOTE:** The backside of the spotter mirror glass backing plate is shown to help with the location of the spotter mirror glass removal slot.

   NOTE: Non-heated spotter mirror glass shown, heated spotter mirror glass similar.

   Insert a 5 mm (3/16 in) flat-blade screwdriver into the spotter mirror glass removal slot, located on the backside of the spotter mirror glass backing plate at the inboard side of the spotter mirror glass assembly.

3. **WARNING: Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

   Remove the spotter mirror glass in the following sequence:
   1. Twist the screwdriver handle 90 degrees.
   2. Lift outward on the upper inboard spotter mirror glass backing plate using light hand pressure.
   3. Remove the spotter mirror glass from the spotter mirror glass pivot assembly.
      - If equipped, disconnect the electrical connectors.

Installation

1. If equipped, connect the electrical connectors.
2. Position the spotter mirror glass assembly onto the spotter mirror glass pivot assembly.
3. **WARNING: Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

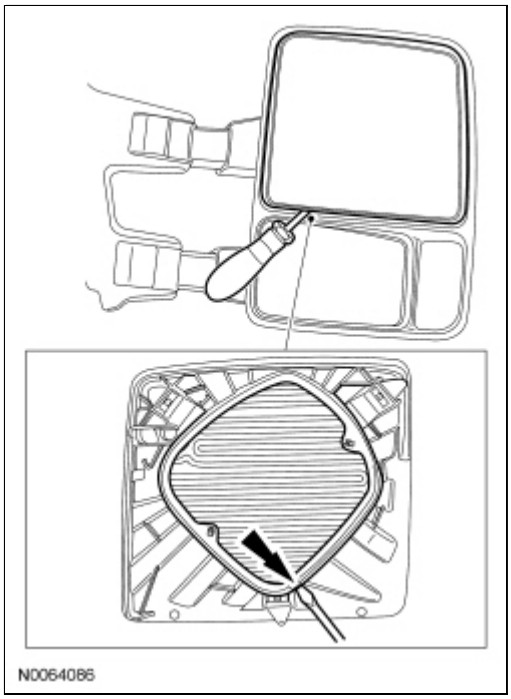
   NOTICE: **The spotter mirror glass can break if pressure is not applied directly over the spotter mirror glass pivot assembly.**

   Place a hand against the back of the exterior rear view mirror housing and a hand flat against the center of the spotter mirror glass. Press the spotter mirror glass in place until it is fully seated.

---

repair4less

Exterior Mirror Glass — Trailer Tow



Removal

NOTE: RH trailer tow mirror shown, LH trailer tow mirror similar.

1. Position the exterior mirror glass fully upward and outward.

NOTE: The backside of the exterior mirror glass backing plate is shown to help with the location of the exterior mirror glass removal slot.

2. Insert a 5 mm (3/16 in) flat-blade screwdriver into the exterior mirror glass removal slot, located on the backside of the exterior mirror glass backing plate at the inboard side of the exterior mirror glass assembly.

3. **WARNING: Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

   Remove the exterior mirror glass.
   - Twist the screwdriver handle 90 degrees.
   - Lift outward on the lower inboard exterior mirror glass backing plate using light hand pressure.
   - Remove the exterior mirror glass from the exterior mirror glass pivot assembly.
     - If equipped, disconnect the heated mirror glass electrical connector.

Installation

1. If equipped, connect the heated mirror glass electrical connector.

2. Position the exterior mirror glass assembly onto the exterior mirror glass pivot assembly.

3. **WARNING: Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

   NOTICE: **The exterior mirror glass can break if pressure is not applied directly over the exterior mirror glass pivot assembly.**

   Place a hand against the back of the exterior rear view mirror housing and a hand flat against the center of the exterior mirror glass. Press the exterior mirror glass in place until it is fully seated.

repair4less

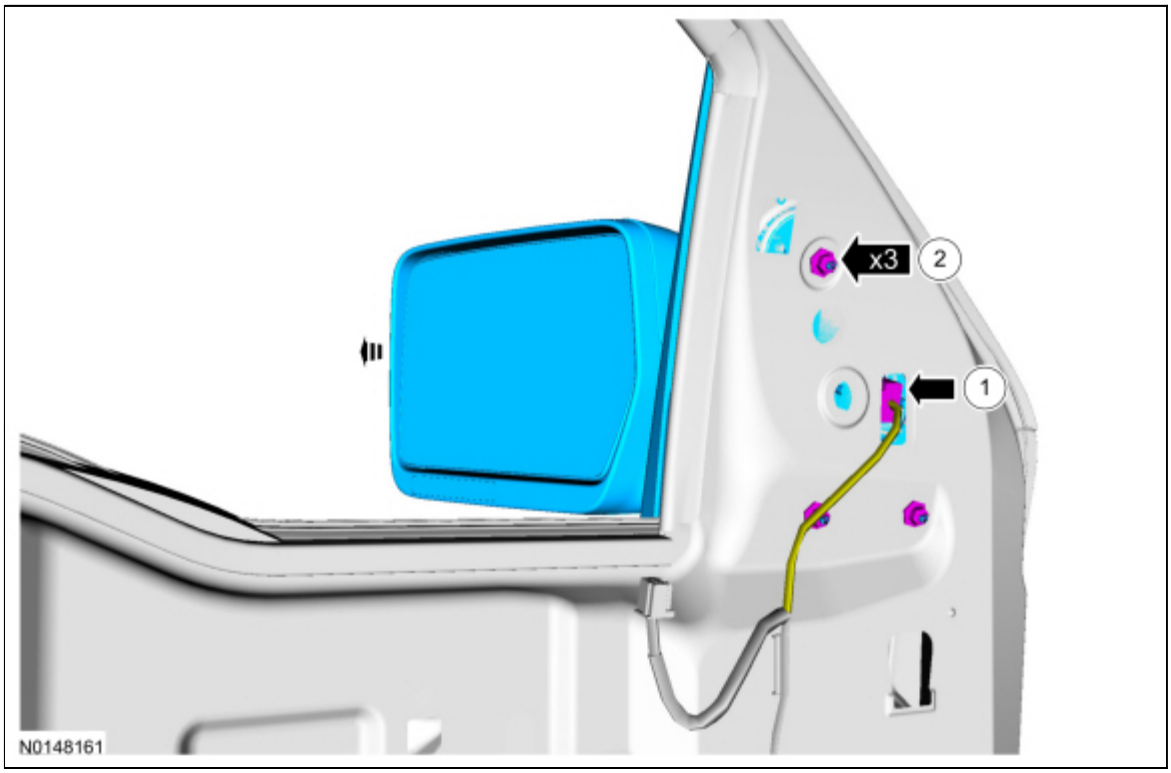
Exterior Mirror Motor

Removal and Installation

NOTE: The power folding mirrors may need to be synchronized anytime the mirrors are folded or unfolded without using the exterior mirror control switch, or if a new power folding mirror is installed. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

1. Remove the exterior rear view mirror glass. For additional information, refer to Exterior Mirror Glass — Aero or Exterior Mirror Glass — Trailer Tow in this section.
2. Remove the 3 exterior rear view mirror motor screws.
3. Disconnect the exterior rear view mirror motor electrical connectors.
4. Remove the exterior rear view mirror motor.
5. To install, reverse the removal procedure.
    - If equipped, synchronize the power folding mirrors. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

Exterior Mirror



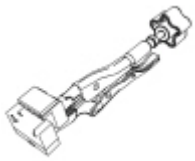
Removal and Installation

NOTE: Do not remove the exterior mirror assembly when repairing an individual part. Individual components can be installed without removing the exterior mirror.

NOTE: The power folding mirrors may need to be synchronized anytime the mirrors are folded or unfolded without using the exterior mirror control switch, or if a new power folding mirror is installed. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

NOTE: The aero mirror is shown, the trailer tow mirror is similar.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Position aside the water shield to gain access to the electrical connector.
3.
   - To install, tighten to 12 Nm (106 lb-in).



4. Remove the exterior mirror.
5. To install, reverse the removal procedure.
   - If equipped with power folding mirrors, they must be synchronized. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

Seating

Front Seats

Front Bucket Seats

NOTE: For component identification and locations, refer to Seat — Exploded View, Front in this section.

The front bucket seats can be equipped with the following serviceable items:

- Adjustable head restraint and guide sleeves attached to the backrest frame
- Backrest and cushion covers
- Backrest and cushion foam pads
- Backrest frames (equipped with manual and power recliners) attached to the seat track
- Climate controlled seat system components (heated/cooled seats)
- Cushion side shield attached to the outboard side of the seat cushion frames
- Heated seat system
- Manual adjustable lumbar assembly attached to the backrest and seat track
- Manual and power seat tracks located at the seat base (includes cushion frame)
- Memory system components attached to the driver seat
- Occupant Classification System (OCS) system on passenger seat
- Power adjustable lumbar assembly attached to the backrest frame
- Power recliner motor attached to the backrest frames
- Safety belt buckle attached to the seat track
- Seat control switches attached to the cushion side shield inserts
- Seat side air bag attached to the seat backrest frames
- Seat track position sensor attached to driver seat track (part of the Supplemental Restraint System (SRS))

Driver Seat Module (DSM) — Memory Seat

The driver power seat is controlled by the DSM . The DSM is located on the driver seat track.

This system allows automatic positioning of the driver seat to 2 programmable positions. For information on programming memory positions or recalling a stored memory position, refer to Memory Position Programming in this section.

Memory Recall — Remote Keyless Entry (RKE)

When the vehicle is equipped with a memory driver seat, the RKE can be used with a key that includes an

Integrated Keyhead Transmitter (IKT). A personality or memory position for the driver seat and exterior rear view mirrors can be assigned to an IKT . Up to 2 personalities can be assigned, 1 per IKT . If the remote IKT has been associated to a memory position, pushing IKT unlock button recalls the memory seat and exterior rear view mirror positions.

For information on diagnosing a RKE concern or associating an IKT to a memory position, refer to Section 501-14 .

Easy Entry/Exit

The easy entry/exit feature is a function of the DSM . The memory driver seat easy entry/exit feature moves the seat slightly rearward for easier exit from the vehicle and returns the seat forward after entry. The easy entry/exit feature can be enabled/disabled using the selections on the message center. For additional information on how to enable/disable the easy entry/exit feature, refer to the Owner's Literature or Section 413-01 for information on the message center.

Heated Seats — Front

This system allows independent seat electrical heating of the driver and front passenger seats on demand.

The heated seat system includes the following serviceable components:

- Heater mats attached to the seat backrest and cushion foam pads
- Front Display Interface Module (FDIM) (touchscreen)
- HVAC module

Climate Controlled Seats

The climate control seat system is able to heat and cool the driver and front passenger seats. Each climate controlled seat is operated by push-buttons on the Front Display Interface Module (FDIM) located on the instrument panel. Each front seat temperature is then monitored and controlled by the Dual Climate Controlled Seat Module (DCSM) located on the passenger front seat track.

The climate controlled seat system contains the following serviceable components:

- Air filter (attached to each Thermo-Electric Device (TED) and blower assembly) (See the Owner's Literature for additional service and scheduled maintenance interval information)
- Cushion and backrest foam pads
- Cushion and backrest manifolds
- DCSM attached to the passenger seat track
- Front Display Interface Module (FDIM)
- HVAC module
- TED and blower assembly within each front seat cushion and backrest
- Ventilated cushion and backrest trim covers

repair4less

Remote Start Climate Operation (If Equipped With Heated Or Climate Controlled Seats)

The customer can select different climate control modes/preferences when the vehicle is started using the remote start feature. This can be accessed through the message center. For information on how to set the remote start preferences, refer to the Owner's Literature. When the driver seat and/or passenger seat is set to AUTO mode, the driver/passenger heated/climate controlled seat activates in full heat mode when the outside temperature is less than 0°C (32°F) and full cool mode (climate controlled seats only) when outside temperature is greater than 27°C (80°F) any time the vehicle is started using the remote start feature. No heated/climate controlled seat adjustments are recognized during remote start operation. When the ignition is cycled to the ON position after a remote start event, the heated/climate controlled seat switches off.

Front Seat Track Motor

There are 3 front seat track motors present on power seat tracks. The horizontal (fore/aft) front seat track motor is the only seat track motor which can be serviced separately from the seat track assembly. All other seat track motors (front up/down, rear up/down) are serviced as part of the seat track assembly.

Front Seat Motor Cable

The horizontal (fore/aft) front seat track motor rotates 2 cables which drive each side of the seat track uniformly. The outboard (long) cable can be serviced separately from the horizontal front seat track motor.

Manual Lumbar

The manual front seat backrest lumbar is adjusted by a knob attached at the side of the seat cushion side shield. The lumbar adjuster is mounted to the seat track assembly and drives a cable connected to the lumbar assembly attached to the backrest frame.

Power Lumbar

The lumbar switch is attached to the cushion side shield insert and is part of the seat control switch. The lumbar motor is mounted to the lumbar assembly and is serviced only with a new lumbar assembly.

Manual Recliner

The manual recliner can be adjusted by a handle mounted on the outboard side of the cushion side shield. Manual recliners are only serviceable by installing a new backrest frame assembly.

Power Recliner

The power recliner switch is part of the seat control switch attached to the seat cushion side shield insert. The power recliner motor can be serviced separately but the power recliner assembly is serviceable only with a new backrest frame.

Occupant Classification System (OCS) System

The OCS system is standard equipment on all front outboard passenger seats. For information on

diagnosing or servicing the OCS system, refer to Section 501-20B .

Front Center Seat

Front center seat can be equipped with the following serviceable items:

- Backrest cover (without backrest storage)
- Backrest latch and latch cover attached to the RH side of the backrest and seat frame
- Cushion cover
- Cushion latch release handle
- Front and rear cup holders
- Front and rear storage trays attached to the seat frame
- LH and RH side shields attached to the seat frame
- Power Point and wiring attached to the rear cup holder and seat frame
- Safety belt buckle attached to the seat frame
- Seat frame
- Storage tray (in seat frame under cushion) (if equipped)

The front center seat is mounted to a pedestal under the carpet. Pedestal removal is not required for seat removal. The pedestal is also used for floor console mounting when not equipped with a front center seat. The pedestal is equipped with press fit spacers and washers above and below to prevent corrosion of body and seat structures. If removed, any of these items that become separated from the pedestal during service must be reinstalled to prevent corrosion damage that may compromise structural integrity of the body and seats.

Rear Seats — SuperCab

The SuperCab rear seat is equipped with a non-folding bench style backrest mounted to the rear cab panel and seat cushion frame and a 40/60 split folding cushion attached to the floor.

The SuperCab rear seat can be equipped with the following serviceable items:

- Adjustable head restraints and head restraint covers
- Backrest and cushion covers
- Backrest and cushion foam pads
- Backrest, cushion and seat frames
- Backrest latches attached to the seat frame
- Backrest upper clips attached to the backrest frame
- Cushion latches, latch bolt covers and release handles
- Head restraint guide sleeves attached to the backrest frame
- Inboard and outboard seat risers
- Non-serviceable lower anchors and tethers for children welded to the seat frame

Rear Seats — Crew Cab

The Crew Cab rear seat is a 40/60 split bench style with folding cushions and optional folding armrest with

repair4less

cup holder. The backrests are fixed to the rear cab panel by latches that can be accessed from behind only for service allowing the backrest to fold down. The backrest latches are accessible only when the seat cushion is folded upright.

The Crew Cab rear seat can be equipped with the following serviceable items:

- Accessory hooks attached to the bottom of each cushion
- Adjustable head restraints and head restraint covers
- Armrest, backrest and cushion covers
- Armrest, backrest and cushion foam pads
- Armrest, backrest, cushion and seat frames
- Backrest latch attached to each backrest frame
- Backrest latch strikers attached to the rear cab panel
- Cup holder attached to the armrest frame
- Cushion latches attached to the cushion frame and outboard risers
- Cushion release handle and bezel attached to the bottom of each cushion frame (includes release cable)
- Head restraint guide sleeves attached to the backrest frames
- Heated seat system
- Inboard and outboard seat risers
- Inboard and outboard side shields attached to the seat risers
- Non-serviceable lower anchors and tethers for children welded to the seat cushion frames
- Safety belt buckle attached to each inboard seat riser

Heated Seats — Rear

This system allows independent seat electrical heating of the 40 percent and outboard 60 percent seat positions on demand.

The heated seat system includes the following serviceable components:

- Heater mats attached to the seat backrest and cushion foam pads
- Heated seat module attached behind the 60 percent seat backrest
- Heated seat switches attached to the rear door power window switch bezels
- Wire harness attached to the base of each backrest frame

repair4less

Seating

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Driver (Without Memory) and Passenger Power Seats

The 6-way power seat feature operates independently of the ignition position and moves the seat in 6 possible directions:

- forward or backward
- front and back of the cushion can be moved up and down independently

The 10-way power seat feature operates independently of the ignition position and moves the seat in 10 possible directions:

- forward or backward
- front and back of the cushion can be moved up and down independently
- backrest of the seat can be moved forward and backward
- lumbar can be moved in and out

All 10 positions are controlled by a single switch.

The power seat motors are hardwired to the seat control switch. The circuits are normally grounded through

the seat control switch. An individual circuit is switched to voltage when a specific adjustment position is selected.

Driver Power Seat With Memory

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition can interfere with memory seat operation, even if vehicle starting is possible.

NOTE: A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall is executed.

The Driver Seat Module (DSM) controls the driver power memory seat. The DSM is located underneath the driver seat. The memory seat feature allows the driver to program a personalized seat position that can be recalled using the memory SET switch or a Remote Keyless Entry (RKE) transmitter. There are 2 memory settings possible.

For information on programming memory positions or recalling a stored memory position, refer to Memory Position Programming in this section. For information on RKE transmitter programming or to diagnose a concern, refer to Section 501-14 .

The NEUTRAL position of the driver seat control switch is at a ground state through the seat control switch normally-closed contacts. The driver seat control switch provides voltage to the DSM only when activated. A voltage input causes the DSM to power the appropriate motor until the input is removed. Ground is the normal state of the motor circuits through the DSM . The DSM internally switches the appropriate circuit from ground to voltage to operate the motors.

As the seat is adjusted, the DSM monitors the motor position sensors to record the current seat position. The DSM removes voltage from the motor upon termination of the seat control switch input or if the DSM does not detect movement from the motor while monitoring the position sensor during a memory recall operation.

The DSM communicates DTCs and other information using the MS-CAN . Refer to Section 418-00 for information concerning MS-CAN .

This section only diagnoses concerns specific to the memory seat. To diagnose an exterior mirror concern, refer to Section 501-09 . To diagnose a power adjustable pedal concern, refer to Section 206-06 . To diagnose a power steering column concern, refer to Section 211-04 .

For information on programming memory positions or recalling a stored memory position, refer to Memory Position Programming in this section.

Remote Keyless Entry (RKE) Transmitter

NOTE: A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall is executed.

A Remote Keyless Entry (RKE) transmitter can be used to recall previously set memory positions but must first be associated to that memory position. The transmitter associated with personality 1 is capable of recalling memory position 1 only. Similarly, the associated personality 2 transmitter can recall only memory position 2.

Memory recall occurs when the unlock button is pressed on the RKE transmitter if it has been associated

repair4less

with a memory position.

For information on diagnosing an RKE concern or associating an RKE transmitter to a memory position, refer to Section 501-14 .

Easy Entry/Easy Exit Feature

The easy entry/exit feature is a function of the DSM that moves the driver seat back approximately 50.8 mm (2 in) (unless seat is already positioned at or near the end of travel) when the ignition key is removed from the ignition switch. The DSM receives the key-in ignition status over the MS-CAN . The DSM cancels this operation if a valid input command is received from the driver seat control switch, memory SET switch, exterior mirror control switch or if the function has been disabled.

The DSM records the current seat positions before operating the seat for an easy exit operation. During easy entry operation, the seat is returned to the seat position previous to the easy exit operation. Easy entry operation is cancelled if a valid input command is received by the DSM .

The easy entry/easy exit feature is a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's Literature or Section 413-01 for information on the message center.

Driver Seat Module (DSM) Hard Stop/Soft Stop

The DSM has the ability for soft stops both at the upper and lower limits on all axes of the driver seat. When an axis reaches the hard stop and the switch is held for approximately one second, it then backs up 180 ms and establishes the soft stop for that axis in that direction. The DSM uses this back up strategy to check sensor integrity any time movement has stopped prematurely due to a sensor failure or obstruction.

A hard stop occurs when one of the memory seat track axes or backrest recline physically reach the end of travel and can go no further. A soft stop occurs when the seat stops before physically reaching the end of travel. The hard stop is set by seat design and cannot be changed or adjusted. The seat track axes are forward/rearward, front up/down and rear up/down. The backrest axis is recline forward/backward. To prevent unnecessary stress on the seat and motors, the DSM sets soft stop positions, 2 for each moving axis. The DSM uses a preset distance from the hard stop to determine where the soft stop occurs.

Setting the Soft Stop

NOTE: If a new DSM or driver seat track has been installed, reset all driver seat track soft stops.

Use the following procedure once a new seat track or DSM has been installed.

During the setting procedure, if the seat track stops before the end of travel has been reached, the DSM has stopped at a previously set soft stop. To set the new soft stop, release the seat control switch and immediately press again in the same direction until the seat track stops at the hard stop for that given direction.

1. Turn the ignition to the ON position.

2. Press the seat control switch horizontal button forward until the seat track stops.

3. Keep the horizontal button pressed forward for one second after the seat track reaches its forward end of travel. The horizontal forward soft stop has been set, release the switch button.

4. Repeat Steps 2 and 3 for all seat track axes in both directions.

Heated Seats — Front

The driver and passenger heated seat control buttons and indicators are located on the touchscreen interface (Front Display Interface Module (FDIM)). The FDIM is mounted directly to the Accessory Protocol Interface Module (APIM). The heated seat system functions independently of the vehicle's climate control system. Each time the heated seat button is pressed, the APIM sends the request to the Front Controls Interface Module (FCIM) using the Infotainment Controller Area Network (I-CAN). The FCIM sends the message to the Instrument Panel Cluster (IPC) using the I-CAN . The IPC sends the request message to the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). Finally, the BCM sends the request to the HVAC module which decreases one setting (the sequence is high, low, off, high, etc.).

When activated, the HVAC module supplies voltage to the selected seat's heater circuit. Each seat's cushion heater mat and backrest heater mat is connected in a series circuit to the HVAC module and powered by the output circuit for that seat. The HVAC module monitors inputs from a temperature sensor located in each seat's cushion heater mat, and maintains seat temperature by cycling the heater circuits on/off. The heated seat remains ON until the heated seat switch button is pressed to cycle the HVAC module OFF or the ignition is set to OFF.

If a fault is detected by the HVAC module, the module stops supplying voltage to that individual left or right seat that the fault was detected on until the ignition is turned OFF and then ON.

Heated Seats — Rear, Crew Cab

Rear heated seats are controlled by the heated seat module located behind the rear 60 percent seat backrest and a dual momentary switch attached to each rear door panel. When the heated seat switch is pressed, a momentary ground signal is sent to the heated seat module. The heated seat module then supplies voltage to the heater circuit. The seat cushion and backrest heater mats are wired in series and supplied voltage by the same output. The heated seat module monitors inputs from a temperature sensor, located in each cushion heater mat and maintains seat temperature by cycling output voltage to the heater grids as necessary to maintain the set point temperature. The heated seat module supplies voltage to the appropriate indicator circuit in the heated seat switch. The heated seat module does not time out and remains on until switched off or ignition is OFF.

The heated seat module does not report DTCs and does not communicate on any network. If a fault is detected, the affected seat system is disabled. The faults detected are:

- a heater feed circuit short to battery, ground or open.
- sensor circuit short to battery or open.
- heated seat switch stuck closed to ground.
- heated seat switch low and high inputs shorted together.

To reset the module, cycle the ignition OFF and then ON. After the heated seat module has been reset, the module returns to an off state.

A new heated seat module must be configured after installation for correct operation. Heated seat module configuration occurs automatically when the low heat mode button is pressed on either rear heated seat

repair4less

switch. Until the module is correctly configured, the heated seats operates incorrectly from the high heat mode button on either heated seat switch by following a sequence of high, low and off with each button press. After the low heat mode button is pressed on either heated seat switch, the module correctly configures and the system operates correctly.

Climate Controlled Seat System

NOTICE: **Avoid applying voltage directly to a Thermo-Electric Device (TED) for testing its operation. Doing so may cause damage to the TED .**

NOTE: When installing a new Dual Climate Controlled Seat Module (DCSM), it is necessary to carry out Programmable Module Installation (PMI). Refer to Section 418-01 .

Both the driver and front passenger climate controlled seats are independently controlled electronically by the DCSM mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running. However, if a scan tool is used to command the DCSM , diagnostic testing can be carried out with the ignition ON engine OFF in 15 second durations.

If one of the voltage supply circuits opens, both seats will remain operational because the circuits are connected internally in the DCSM .

If a fault occurs and sets a DTC specific to either climate controlled seat, only the affected seat is disabled by the module. If the system shuts down due to a DTC fault, cycling the ignition to OFF and then ON again resets the DCSM to function until the DTC sets again.

When the climate control seat buttons are activated on the touchscreen interface, the Accessory Protocol Interface Module (APIM) sends the climate controlled seat commands to the Front Controls Interface Module (FCIM) using the Infotainment Controller Area Network (I-CAN). The FCIM sends the request message to the Instrument Panel Cluster (IPC) using the I-CAN . The IPC sends the request message to the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). Finally, the BCM sends the climate controlled seat commands to the DCSM using the MS-CAN .

Each driver and front passenger seat cushion and backrest is equipped with a Thermo-Electric Device (TED) and blower motor assembly. Applying voltage to the TED in one direction causes it to heat. Applying voltage polarity in the opposite direction causes the TED to cool. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the incoming air depending on the control switch settings. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once activated, the DCSM maintains the heating/cooling modes until deactivated.

The temperature differences between the individual heated and cooled settings is minimal. For example, it is difficult to distinguish between LOW cool and MED cool settings. Measuring seat temperature at different settings is possible by monitoring the DCSM PIDs using the scan tool.

Heating Characteristics

- In heat mode, the TED can add up to 40-60°C (72-108°F) to the ambient inlet air temperature as it passes over the TED .
- The system control settings are indicated next to each climate controlled seat heat switch button on the touchscreen. The first setting is HIGH (3 indicators), the second setting is MED (2 indicators) and the third is LOW (1 indicator) then OFF (no indicators).
- When heating, the DCSM varies the speed of the blowers and the TED duty cycle in order to reach and maintain the temperature determined by the switch setting.

Cooling Characteristics

- In cool mode, the TED can remove up to 8°C (14°F) from the ambient air temperature entering the system.
- The system control settings are based on the 3 indicators next to each climate controlled seat cool switch button on the touchscreen. The first setting is HIGH (3 indicators), the second setting is MED (2 indicators) and the third is LOW (1 indicator) then OFF (no indicators).
- When cooling, the DCSM maintains constant speed of the blowers and constant TED supply voltage (the duty cycle is determined by the switch setting) in COOL mode.

Climate Controlled Seat System Recovery Mode

NOTE: The presence of overtemperature faults (DTCs B2729, B2730, B272A and B272B) can be induced by incorrect operation of the climate controlled seat system after an initial heat setting has been attained. If a heat setting is repeatedly turned OFF and ON in an attempt to increase the seat temperature or repeatedly toggled between heat and cool modes, an overtemperature condition can result and the DTCs are set.

If the temperature at one of the TEDs rises above 110°C (230°F) in the heat mode or 65°C (149°F) in the cool mode for more than 4 seconds, the DCSM records an overtemperature DTC, remove voltage from the TEDs and go into recovery mode (blower only) for 30 seconds to cool down the TEDs . The same occurs if a temperature difference of 60°C (108°F) or greater is seen between the backrest and cushion TEDs on either front seat. The DCSM continues to monitor the TEDs while in recovery mode. If the temperature of the TEDs does not drop to 105°C (221°F) in the heat mode or 60°C (140°F) in the cool mode after 30 seconds, the system continues to cool the TEDs in recovery mode for up to 5 minutes. If the TEDs cool down at anytime after 30 seconds, but before 5 minutes (checked at 4-second intervals), the system operates as normal. An overtemperature DTC still is recorded even if the system recovers and is operating normally. This is more likely to occur during extreme cabin temperatures with significant seat back sunload. If the system does not recover within 30 seconds in heat mode or within 5 minutes in cool mode, the DCSM disables that seat (fault mode) and remain off until the ignition is cycled. Also, if the DCSM detects temperature differential fault twice during the same ignition cycle, it shutdowns. When a fault causes a shutdown, the climate controlled seat indicators turns off and that seat is not operational until the next key cycle.

Remote Start Climate Operation (If Equipped With Heated Or Climate Controlled Seats)

The customer can select different climate control modes/preferences when the vehicle is started using the remote start feature. This can be accessed through the message center. For information on how to set the remote start preferences, refer to the Owner's Literature. When the driver seat and/or passenger seat is set to AUTO mode, the driver/passenger heated/climate controlled seat activates in full heat mode when the outside temperature is less than 0°C (32°F) and full cool mode (climate controlled seats only) when outside temperature is greater than 27° (80°F) any time the vehicle is started using the remote start feature. No heated/climate controlled seat adjustments are recognized during remote start operation. When the ignition is cycled to the ON position after a remote start event, the heated/climate controlled seat switches off.

Inspection and Verification

1. Verify the customer concern by operating the power seat, memory seat or climate controlled seat functions.

2. Visually inspect for obvious signs of mechanical and electrical damage.

repair4less

Visual Inspection Chart

Mechanical	Electrical

• Switch(es)
• Seat tracks obstructed or damaged
• Lumbar assembly damaged
• Recliner assembly damaged (backrest frame)
• Thermo-Electric Device (TED) assembly filter dirty (cushion or backrest)
	• Battery Junction Box (BJB) fuse(s):
	  ▪ 14 (30A) (passenger seat control switch)
	  ▪ 69 (30A) (Dual Climate Controlled Seat Module (DCSM) and front heated seat module)
	  ▪ 71 (20A) (rear heated seat module)
	  ▪ 74 (30A) (driver seat control switch)
	• Body Control Module (BCM) fuse(s):
	  ▪ 5 (20A) (Driver Seat Module (DSM) and front heated seat module)
	  ▪ 7 (7.5A) (DSM logic)
	• Wiring harness
	• Loose or corroded connector(s)
	• Seat control switch
	• Memory SET switch
	• Heated seat switch(es)
	• Power seat motor (seat track)
	• Power lumbar motor (lumbar assembly)
	• TED assembly (cushion or backrest)
	• Power recliner motor (backrest frame)
	• DSM
	• DCSM
	• FDIM
	• HVAC module
	• Seat cushion heater mat
	• Seat backrest heater mat
	• Heated seat module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is with the power seat (non-memory seat), power lumbar or heated seat(s) and the cause is not visually evident, verify the symptom and GO to Symptom Chart .

5. If the concern is with the memory seat or climate controlled seat and the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms voltage and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .

- If the network test passes, retrieve and record on-demand and Continuous Memory Diagnostic Trouble Codes (CMDTCs).

9. Clear the CMDTCs and carry out the self-test diagnostics for the DSM, HVAC module, or DCSM.

10. If the DTCs retrieved are related to the concern, go to Driver Seat Module (DSM) DTC Chart, HVAC Module DTC Chart or Dual Climate Controlled Seat Module (DCSM) DTC Chart. For all other DTCs, refer to Section 419-10.

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

If OK, CARRY OUT the network test using a scan tool and VERIFY network communication of the Front Controls Interface Module (FCIM) and DCSM . REFER to Section 418-00 to diagnose a module communication or network concern. If OK, CARRY OUT the DCSM self-test and RETRIEVE any DTCs. If any DTC is

	• FDIM	present, REFER to the Dual Climate Controlled Seat Module (DCSM) DTC Chart. VERIFY the touchscreen operation. If the touchscreen does not operate correctly, REFER to Section 415-00D or Section 415-00E to diagnose the inoperative touchscreen. If OK, INSTALL a new DCSM. REFER to Dual Climate Controlled Seat Module (DCSM) in this section.
• A single climate controlled seat is inoperative	• Wiring, terminals or connectors • APIM • FDIM • DCSM	• **NOTE:** If a fault occurs setting a DTC specific to only one climate controlled seat, the DCSM disables only the affected seat outputs and allow the other seat to remain operational. CHECK for DTCs specific to the affected climate controlled seat and if a DTC is present, REFER to the Dual Climate Controlled Seat Module (DCSM) DTC Chart. GO to Pinpoint Test L.
• A single climate controlled seat does not operate correctly — poor or intermittent cooling/heating	• Excessive sun load or extreme cabin temperatures • Incorrectly installed Thermo-Electric Device (TED) or manifold • Air flow blockage • TED • DCSM	• CARRY OUT the DCSM self-test and retrieve any DTCs. If any DTC is present, REFER to the Dual Climate Controlled Seat Module (DCSM) DTC Chart. If no DTC is present, CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold air duct and foam pad) and REPAIR as needed. If OK, CHECK for air flow restrictions (TED inlets and outlets, TED -to-manifold connections, filters and ducts) and REPAIR as needed. CHECK the TED cooling performance on the affected seat and VERIFY the system is operating correctly. REFER to

repair4less

		Component Test — Thermo-Electric Device (TED) Cooling Performance.
• A single climate controlled seat does not operate correctly — exhibits poor air flow or performance	• Incorrectly installed Thermo-Electric Device (TED) or manifold • Air flow blockage • Disconnected air duct	• CARRY OUT the DCSM self-test and retrieve any DTCs. If any DTC is present, CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED , manifold air duct and foam pad) and REPAIR as needed. If OK, CHECK for air flow restrictions (TED inlets and outlets, TED -to-manifold connections, filters and ducts) and REPAIR as needed. RETEST the system for normal operation.
• The heated seat is inoperative — driver	• Fuse • Wiring, terminals or connectors • FDIM • APIM • FCIM • Heater mat • HVAC module	• GO to Pinpoint Test N .
• The heated seat is inoperative — front passenger	• Fuse • Wiring, terminals or connectors • FDIM • APIM • FCIM • Heater mat • HVAC module	• GO to Pinpoint Test O .
• The heated seats are inoperative — rear	• Fuse(s) • Wiring, terminals or connectors • Heated seat module	• GO to Pinpoint Test Q .
• The heated seat is inoperative — left rear	• Fuse • Wiring, terminals or connectors • Heated seat switch • Heater mat • Heated seat module	• GO to Pinpoint Test R .

• The heated seat is inoperative — right rear	• Fuse • Wiring, terminals or connectors • Heated seat switch • Heater mat • Heated seat module	• GO to Pinpoint Test S .
• The heated seat does not operate correctly — left rear seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • Heated seat switch • Heated seat module	• GO to Pinpoint Test T .
• The heated seat does not operate correctly — right rear seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • Heated seat switch • Heated seat module	• GO to Pinpoint Test U .
• The heated seat does not operate correctly — left rear heated seat indicator is always on	• Wiring, terminals or connectors • Heated seat module	• GO to Pinpoint Test V .
• The heated seat does not operate correctly — right rear heated seat indicator is always on	• Wiring, terminals or connectors • Heated seat module	• GO to Pinpoint Test W .

Pinpoint Tests

NOTICE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Refer to Inspection and Verification, the Driver Seat Module (DSM) DTC Chart, Dual Climate Controlled Seat Module (DCSM) DTC Chart, HVAC Module DTC Chart and the Symptom Chart for direction to the appropriate pinpoint test.

Pinpoint Test A: The Power Seat is Inoperative — Driver, With Manual Recliner

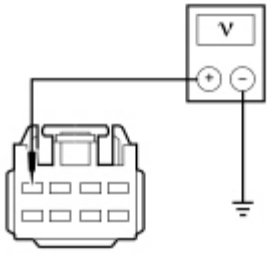
Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

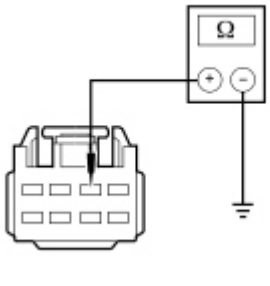
repair4less

The driver seat control switch is supplied voltage and ground. When the driver seat control switch is activated, voltage and ground is supplied to the applicable seat track motor to move the seat to the desired position. There are 3 seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new motor on the seat track needs to be installed, it is necessary to install an entire seat track assembly.

This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Seat control switch



PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE — DRIVER, WITH MANUAL RECLINER

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
A1 CHECK THE DRIVER SEAT CONTROL SWITCH FOR VOLTAGE • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Driver Seat Control Switch C360 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat control switch C360-4, circuit CBX05 (VT/RD), harness side and ground.  N0010817 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** VERIFY Battery Junction Box (BJB) fuse 74 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
A2 CHECK THE DRIVER SEAT CONTROL SWITCH GROUND CIRCUIT FOR AN OPEN • Measure the resistance between driver seat control switch	**Yes**

C360-2, circuit GD904 (BK/BU), harness side and ground.  N0010818 • **Is the resistance less than 5 ohms?**	INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B. **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.

Pinpoint Test B: The Power Seat is Inoperative — Passenger

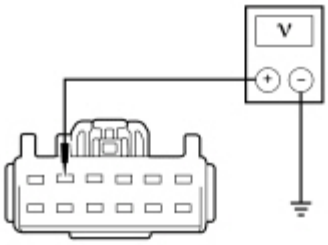
Refer to Wiring Diagrams Cell 120, Power Seats for schematic and connector information.

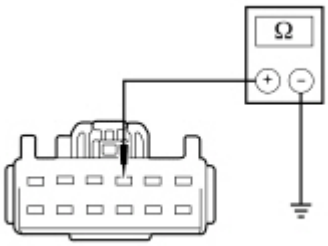
Normal Operation

When the passenger seat control switch is activated, voltage and ground is supplied to the applicable seat track motor or seat recliner motor to move the seat to the desired position. There are 3 seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the seat recliner mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire seat track assembly.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch





PINPOINT TEST B: THE POWER SEAT IS INOPERATIVE — PASSENGER

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B.

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

repair4less

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
B1 CHECK THE PASSENGER SEAT CONTROL SWITCH FOR VOLTAGE	
• Ignition OFF. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Passenger Seat Side Air Bag Module C339. • Disconnect: Passenger Seat Control Switch C330. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Measure the voltage between passenger seat control switch C330-5, circuit CBX05 (VT/RD), harness side and ground.  N0010819 • **Is the voltage greater than 10 volts?**	**Yes** GO to B2. **No** VERIFY Battery Junction Box (BJB) fuse 14 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
B2 CHECK THE PASSENGER SEAT CONTROL SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between passenger seat control switch C330-3, circuit GD903 (BK/WH), harness side and ground.  N0010825 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side

	air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test C: The Power Seat Does Not Move Horizontally/Vertically — Driver, With Manual Recliner

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

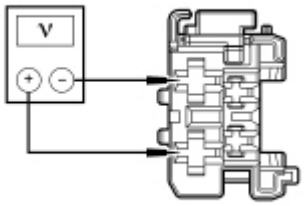
Normal Operation

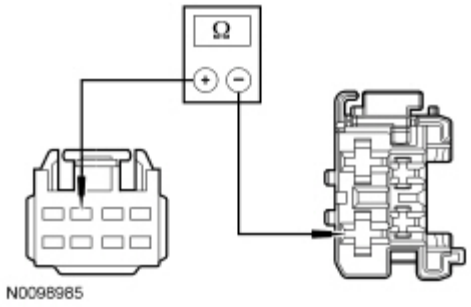
When the driver seat control switch is activated, voltage and ground is supplied to the applicable seat track motor to move the seat to the desired position. There are 3 seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire seat track assembly.

This pinpoint test is intended to diagnose the following:

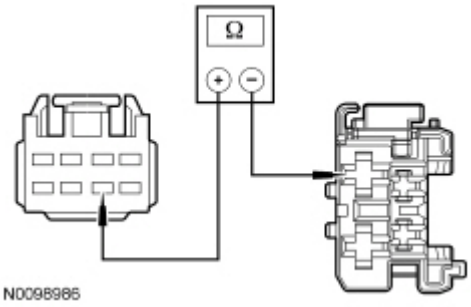
- Wiring, terminals or connectors
- Seat control switch
- Horizontal seat track motor
- Power seat track assembly

PINPOINT TEST C: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY — DRIVER, WITH MANUAL RECLINER



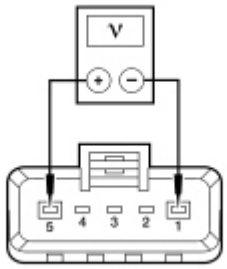


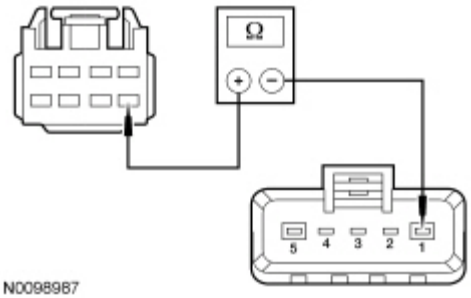
NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

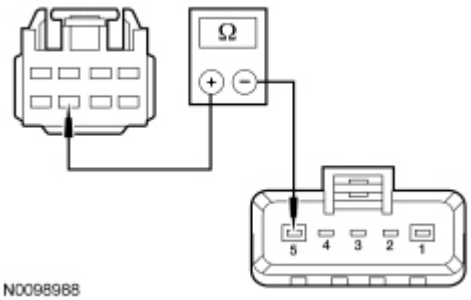


NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

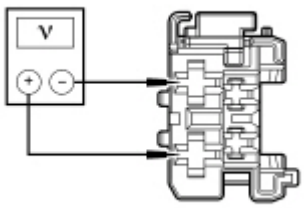
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.







Test Step	Result / Action to Take
C1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	
• Operate the driver power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to C5 . **No** GO to C2 .
C2 CHECK VOLTAGE TO THE HORIZONTAL MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Driver Seat Horizontal Motor C362 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may**	**Yes** INSTALL a new front seat track motor. REFER to Seat Track Motor — Front in this section. TEST the system for normal operation.



repair4less

result in serious personal injury in the event of an accidental deployment. • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between driver seat horizontal motor C362-1, circuit CPS23 (GN/VT), harness side and C362-2, circuit CPS28 (GN), harness side, while pressing the driver seat control switch forward and rearward.  N0057525 • **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volt in the rest position?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** GO to C3 .
C3 CHECK THE HORIZONTAL MOTOR CIRCUIT FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C360 . • Measure the resistance between driver seat control switch C360-3, circuit CPS23 (GN/VT), harness side and driver seat horizontal motor C362-1, circuit CPS23 (GN/VT), harness side.  N0098985 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
C4 CHECK THE HORIZONTAL MOTOR CIRCUIT FOR AN OPEN	
• Measure the resistance between driver seat control switch C360-6, circuit CPS28 (GN), harness side and driver seat horizontal motor C362-2, circuit CPS28 (GN), harness side.	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051.

 • **Is the resistance less than 5 ohms?**	REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
C5 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Operate the front and rear seat height adjustments. • **Are both front and rear seat height adjustments inoperative?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** If only front height adjust operates, GO to C6 . If only rear height adjust operates, GO to C9 .
C6 CHECK VOLTAGE TO THE REAR HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Driver Seat Rear Height Motor C363 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated.	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS .

repair4less

• Measure the voltage between driver seat rear height motor C363-5, circuit CPS26 (YE/BU), harness side and C363-1, circuit CPS27 (BU/BN), harness side, while operating the seat control switch rear height adjust up and down.  N0091109 • **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volt in the rest position?**	REFER to Section 501-20B . **No** GO to C7 .
C7 CHECK THE REAR HEIGHT MOTOR CIRCUIT FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C360 . • Measure the resistance between driver seat control switch C360-5, circuit CPS27 (BU/BN), harness side and driver seat rear height motor C363-1, circuit CPS27 (BU/BN), harness side.  N0098987 • **Is the resistance less than 5 ohms?**	**Yes** GO to C8 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
C8 CHECK THE REAR HEIGHT MOTOR CIRCUIT FOR AN OPEN	
• Measure the resistance between driver seat control switch C360-7, circuit CPS26 (YE/BU), harness side and driver seat rear height motor C363-5, circuit CPS26 (YE/BU), harness side.  N0098988 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST

	the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
C9 CHECK VOLTAGE TO THE FRONT HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Driver Seat Front Height Motor C382 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between driver seat front height motor C382-1, circuit CPS24 (GY), harness side and C382-2, circuit CPS25 (WH/VT), while operating the seat control switch front height adjust up and down.  N0057525 • **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volt in the rest position?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** GO to C10 .
C10 CHECK THE FRONT HEIGHT MOTOR CIRCUIT FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C360 . • Measure the resistance between driver seat control switch C360-1, circuit CPS25 (WH/VT), harness side and driver seat front height motor C382-2, circuit CPS25 (WH/VT), harness side.	**Yes** GO to C11 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable.

repair4less

 N0098989 • **Is the resistance less than 5 ohms?**	CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.
C11 CHECK THE FRONT HEIGHT MOTOR CIRCUIT FOR AN OPEN	
• Measure the resistance between driver seat control switch C360-8, circuit CPS24 (GY) harness side, and driver seat front height motor C382-1, circuit CPS24 (GY), harness side.  N0098990 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B. **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.

Pinpoint Test D: The Power Seat Does Not Move Horizontally/Vertically/Recline — Passenger

Refer to Wiring Diagrams Cell 120, Power Seats for schematic and connector information.

Normal Operation

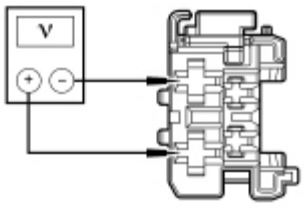
When the passenger seat control switch is activated, voltage and ground is supplied to the applicable seat track motor or seat recliner motor to move the seat to the desired position. There are 3 seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the seat recliner mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire seat track

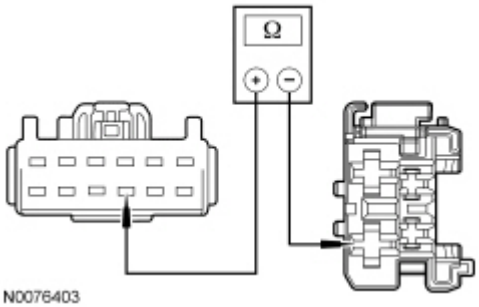
assembly.

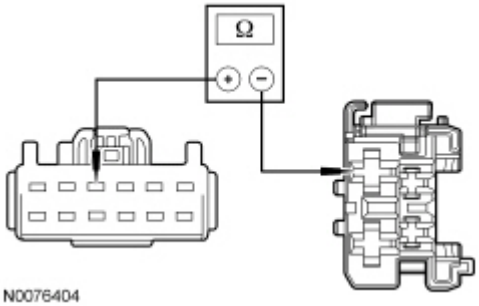
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Horizontal seat track motor
- Power seat track assembly

PINPOINT TEST D: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE — PASSENGER



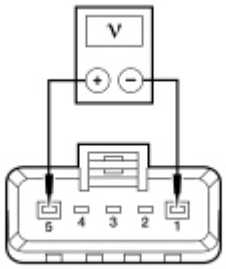




NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.



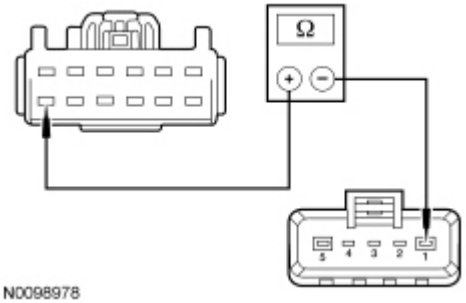
Test Step	Result / Action to Take
D1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	
• Operate the passenger power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to D2 . **No** GO to D3 .
D2 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION	
• Recline the passenger backrest forward and rearward. • **Will the seat backrest recline forward and rearward?**	**Yes** GO to D6 . **No** GO to D13 .
D3 CHECK VOLTAGE TO THE HORIZONTAL MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: Passenger Seat Horizontal Motor C332 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side and C332-2, circuit CPS33 (WH), harness side, while pressing the passenger seat control switch forward and rearward.	**Yes** INSTALL a new front seat track motor. REFER to Seat Track Motor — Front in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

repair4less

 N0057525 • **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volt in the rest position?**	**No** GO to D4 .
D4 CHECK THE HORIZONTAL MOTOR CIRCUIT FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C330 . • Measure the resistance between passenger seat control switch C330-9, circuit CPS38 (GN/BU), harness side and passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side.  N0076403 • **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
D5 CHECK THE HORIZONTAL MOTOR CIRCUIT FOR AN OPEN	
• Measure the resistance between passenger seat control switch C330-4, circuit CPS33 (WH), harness side and passenger seat horizontal motor C332-2, circuit CPS33 (WH), harness side.  N0076404 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation.

	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
D6 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Operate the front and rear seat height adjustments. • **Does the seat front and rear height adjust up and down?**	**Yes** If only front height adjust operates, GO to D7 . If only rear height adjust operates, GO to D10 . **No** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
D7 CHECK VOLTAGE TO THE REAR HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: Rear Height Motor C3075 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between passenger seat rear height motor C3075-5, circuit CPS36 (YE/GY), harness side and C3075-1, circuit CPS37 (WH/BU), harness side, while depressing the seat control switch rear height adjust up and down.	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to D8 .

repair4less



N0091003

- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volt in the rest position?**

D8 CHECK THE REAR SEAT HEIGHT MOTOR FOR AN OPEN

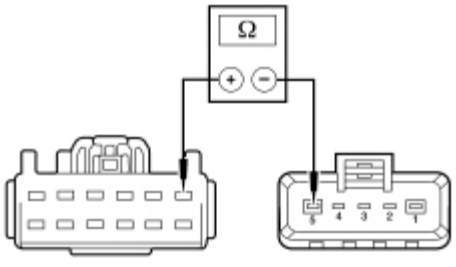
- Disconnect: Passenger Seat Control Switch C330 .
- Measure the resistance between passenger seat control switch C330-12, circuit CPS37 (WH/BU), harness side and passenger seat rear height motor C3075-1, circuit CPS37 (WH/BU), harness side.

N0098978

- **Is the resistance less than 5 ohms?**

Yes
GO to D9 .

No
REPAIR the circuit. TEST the system for normal operation.



DISCONNECT the battery ground cable.

CONNECT passenger seat side air bag module C339.

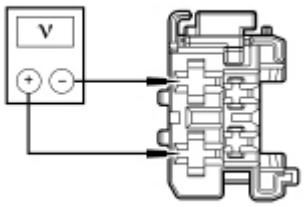
REPOWER the SRS .
REFER to Section 501-20B .

D9 CHECK THE REAR SEAT HEIGHT MOTOR CIRCUIT FOR AN OPEN

- Measure the resistance between passenger seat control switch C330-1, circuit CPS36 (YE/GY), harness side and passenger seat rear height motor C3075-5, circuit CPS36 (YE/GY), harness side.

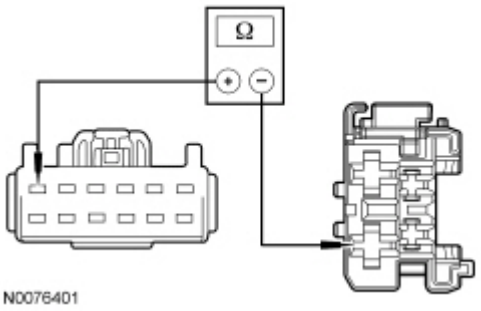
N0098977

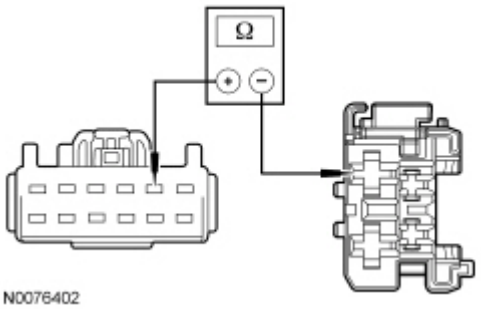
- **Is the resistance less than 5 ohms?**



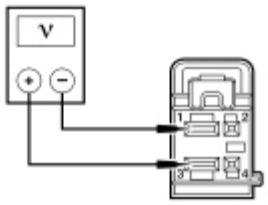
Yes
INSTALL a new passenger seat control switch.
REFER to Seat Control Switch in this section.
TEST the system for normal operation.

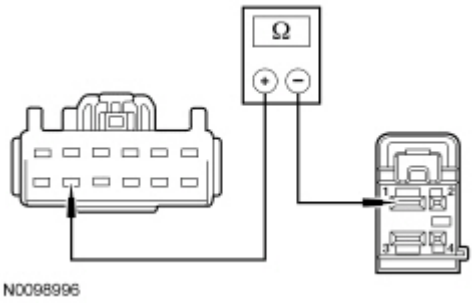
DISCONNECT the battery ground cable.

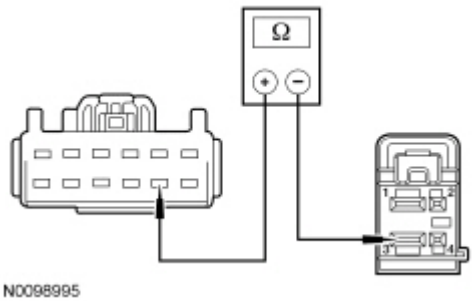




CONNECT passenger seat side air bag module C339.







REPOWER the SRS .
REFER to Section 501-20B .

No
REPAIR the circuit. TEST the system for normal operation.

	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
D10 CHECK VOLTAGE TO THE FRONT HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: Passenger Seat Front Height Motor C3074 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side and C3074-2, circuit CPS34 (GY/BU), while pressing the seat control switch front height adjust up and down.  N0057525 • **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volt in the rest position?**	**Yes** INSTALL a new seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to D11 .
D11 CHECK THE FRONT HEIGHT MOTOR CIRCUIT FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C330 . • Measure the resistance between passenger seat control switch C330-6, circuit CPS35 (VT/GN), harness side and front height motor C3074-1, circuit CPS35 (VT/GN), harness side.	**Yes** GO to D12 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat

repair4less

 N0076401 • **Is the resistance less than 5 ohms?**	side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
D12 CHECK THE FRONT HEIGHT MOTOR CIRCUIT FOR AN OPEN	
• Measure the resistance between passenger seat control switch C330-2, circuit CPS34 (GY/BU) harness side, and front height motor C3074-2, circuit CPS34 (GY/BU), harness side.  N0076402 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
D13 CHECK VOLTAGE TO THE SEAT RECLINER MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: Passenger Seat Recliner Motor C3189 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 .	**Yes** INSTALL a new seat recliner motor. REFER to Seat Recliner Motor in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat

• **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between passenger seat recliner motor C3189-3, circuit CPS08 (VT/OG), harness side and C3189-1, circuit CPS07 (GY/BN), while pressing the recline switch forward and rearward.  N0091006 • **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volt in the rest position?**	side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to D14 .
D14 CHECK THE RECLINER MOTOR CIRCUIT FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C330 . • Measure the resistance between passenger seat control switch C330-11, circuit CPS39 (GY/YE), harness side and seat recliner motor C3189-1, circuit CPS07 (GY/BN), harness side.  N0098996 • **Is the resistance less than 5 ohms?**	**Yes** GO to D15 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
D15 CHECK THE RECLINER MOTOR CIRCUIT FOR AN OPEN	
• Measure the resistance between passenger seat control switch C330-8, circuit CPS40 (VT/GY) harness side, and seat recliner motor C3189-3, circuit CPS08 (VT/OG), harness side.  N0098995 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-

repair4less

	20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test E: The Power Seat Does Not Move Horizontally/Vertically/Recline — Driver, With Memory

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 149 , Component Testing for component testing.

Normal Operation

The seat control switch supplies voltage and ground to the applicable Driver Seat Module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate seat track motor or seat recliner motor to move the seat in the desired direction. There are 3 seat track motors that combine to move the seat horizontally (forward/backward) and vertically (front up/down and rear up/down). The seat recliner mechanism uses a single motor to pivot the seat backrest forward and backward.

The following pinpoint test diagnoses a power seat with memory that does not operate or does not operate correctly. If the seat does not operate using the memory SET switch or operates in one second intervals, GO to Pinpoint Test F .

DTC Description	Fault Trigger Conditions
• B1663 — Seat Driver Front Up/Down Motor Stalled • B1664 — Seat Driver Rear Up/Down Motor Stalled • B1665 — Seat Driver Forward/Backward Motor Stalled	During self-test, the DSM attempts to operate the appropriate seat track motor and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1666 — Seat Driver Recline Motor Stalled	During self-test, the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables the output.
• B1703 — Seat Driver Recline Forward Switch	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than

Circuit Short to Battery • B1707 — Seat Driver Recline Rearward Switch Circuit Short to Battery	2 minutes the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1711 — Seat Driver Front Up Switch Circuit Short to Battery • B1715 — Seat Driver Front Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1719 — Seat Driver Forward Switch Circuit Short to Battery • B1723 — Seat Driver Rearward Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1727 — Seat Driver Rear Up Switch Circuit Short to Battery • B1731 — Seat Driver Rear Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.

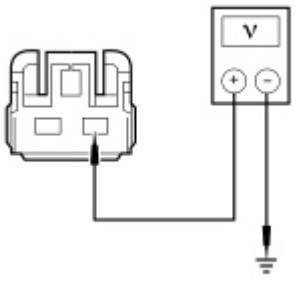
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch
- Horizontal seat track motor
- Memory seat track assembly
- DSM

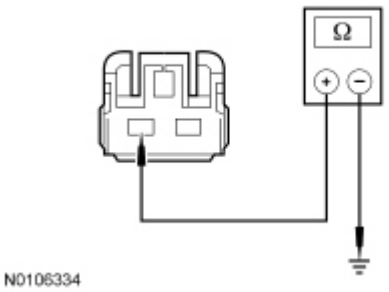
PINPOINT TEST E: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE — DRIVER, WITH MEMORY

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

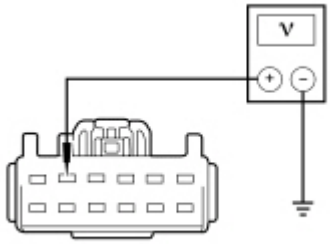


NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.



NOTE: If a new DSM has been installed, all seat soft stops must be reset. If a new seat track or recline motor has been installed, only reset the soft stops for that component being installed new. To reset the soft stops, refer to Principles of Operation in this section.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.



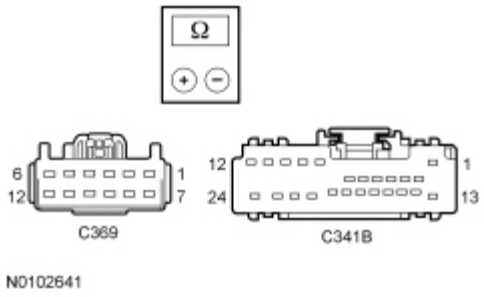
Test Step	Result / Action to Take
E1 RETRIEVE THE DSM DTCs	

repair4less

• Enter the following diagnostic mode on the scan tool: Self Test — DSM . • **Are any DSM DTCs retrieved?**	**Yes** If DTCs B1663, B1664, B1665 and B1666 are all retrieved, GO to E2 . If DTC B1663, GO to E11 . If DTC B1664, GO to E14 . If DTC B1665, GO to E17 . If DTC B1666, GO to E20 . If DTC B1703, B1707, B1711, B1715, B1719, B1723, B1727 or B1731, GO to E8 . For any other DSM DTCs, REFER to the Driver Seat Module (DSM) DTC Chart. **No** GO to E4 .
E2 CHECK FOR VOLTAGE TO THE DSM • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: DSM C341A . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between DSM C341A-1, circuit CBX05 (VT/RD), harness side and ground.  N0067979 • **Is the voltage greater than 10 volts?**	**Yes** GO to E3 . **No** VERIFY Battery Junction Box (BJB) fuse 74 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
E3 CHECK THE DSM GROUND CIRCUIT FOR AN OPEN • Measure the resistance between DSM C341A-2, circuit GD906 (BK/GY), harness side and ground.	**Yes** INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. CLEAR the DTCs. REPEAT the self-test.

 N0106334 • **Is the resistance less than 5 ohms?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
E4 MONITOR THE DSM PIDs AND CHECK FOR CORRECT SEAT CONTROL SWITCH INPUTS • Enter the following diagnostic mode on the scan tool: DataLogger — DSM . ▪ Driver Power Seat Front Up/Down Switch (SFNT_SW) ▪ Driver Power Seat Forward/Backward Switch (SFWD_SW) ▪ Driver Power Seat Recline Switch Status (SRCL_SW) ▪ Driver Power Seat Rear Up/Down Switch (SREARSW) • Operate the seat control switch in all positions while monitoring the DSM driver seat control switch input status PIDs. • **Do the PID values agree with the switch positions?**	**Yes** GO to E10 . **No** If no response from any PID, GO to E5 . Otherwise, GO to E7 .
E5 CHECK VOLTAGE TO THE SEAT CONTROL SWITCH • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Seat Control Switch C369 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between seat control switch C369-5, circuit CBX04 (WH/RD), harness side and ground.	**Yes** GO to E6 . **No** VERIFY Body Control Module (BCM) fuse 5 (20A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .

repair4less



N0010816

- **Is the voltage greater than 10 volts?**

E6 CHECK THE SEAT CONTROL SWITCH GROUND FOR AN OPEN	
• Measure the resistance between seat control switch C369-3, circuit GD904 (BK/BU), harness side and ground.  N0010815 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch in this section. CLEAR the DTCs. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
E7 CHECK THE AFFECTED CIRCUITS BETWEEN THE SEAT CONTROL SWITCH AND DSM FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: DSM C341B . • Disconnect: Seat Control Switch C369 . • Measure the resistance between seat control switch C369, harness side and DSM C341B, harness side using the following chart:	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch in this section. CLEAR the DTCs. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .

Seat Control Switch Connector	Circuit	DSM Connector
C369-1	CPS27 (BU/BN)	C341B-17

C369-2	CPS25 (WH/VT)	C341B-18
C369-4	CPS23 (GN/VT)	C341B-16
C369-6	CPS24 (GY)	C341B-6
C369-8	CPS30 (VT/BN)	C341B-7
C369-9	CPS28 (GN)	C341B-15
C369-11	CPS29 (WH/BN)	C341B-19
C369-12	CPS26 (YE/BU)	C341B-5

N0102641

- **Are the resistances less than 5 ohms?**

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B.

E8 CHECK THE SEAT CONTROL SWITCH

- Remove the seat control switch. Refer to Seat Control Switch in this section.
- Check the seat control switch.

  Refer to Wiring Diagrams Cell 149, Component Testing for component testing.

- **Is the seat control switch OK?**

Yes
GO to E9.

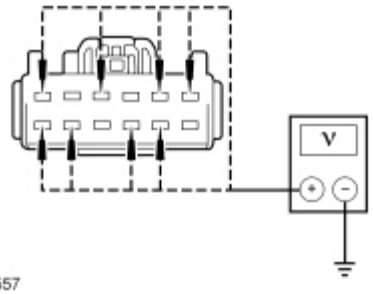
No
INSTALL a new seat control switch. REFER to Seat Control Switch in this section. CLEAR the DTCs. TEST the system for normal operation.

E9 CHECK THE AFFECTED CIRCUITS BETWEEN THE SEAT CONTROL SWITCH AND DSM FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Depower the SRS. Refer to Section 501-20B.
- Disconnect: Driver Seat Side Air Bag Module C3051.
- Disconnect: DSM C341B.
- **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**
- Connect the battery ground cable. Refer to Section 414-01.
- Ignition ON.

Yes
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable.



CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B.

repair4less

- Measure the voltage between seat control switch C369, harness side and ground using the following chart:

Seat Control Switch Connector	Circuit
C369-1	CPS27 (BU/BN)
C369-2	CPS25 (WH/VT)
C369-4	CPS23 (GN/VT)
C369-6	CPS24 (GY)
C369-8	CPS30 (VT/BN)
C369-9	CPS28 (GN)
C369-11	CPS29 (WH/BN)
C369-12	CPS26 (YE/BU)

N0013557

- **Is any voltage present on any circuit?**

No
INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable.

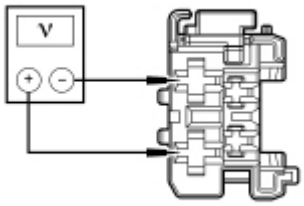
CONNECT driver seat side air bag module C3051.

REPOWER the SRS . REFER to Section 501-20B .

E10 CHECK THE DSM FOR CORRECT OUTPUTS

- Enter the following diagnostic mode on the scan tool: DataLogger — DSM .
  - Front Motor Up (FRONT_UP)
  - Front Motor Down (FRONT_DWN)
  - Rear Motor Up (REAR_UP)
  - Rear Motor Down (REAR_DWN)
  - Horizontal Motor Forward (HORZ_FWD)
  - Horizontal Motor Backward (HORZ_BWD)
  - Recline Motor Forward (RECL_FWD)
  - Recline Motor Backward (RECL_BWD)
- Toggle the DSM active commands ON and OFF while monitoring the seat movement.
- **Does the driver seat operate correctly using the active commands?**

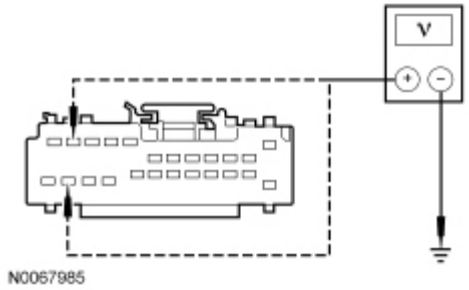
Yes
The fault is intermittent. CHECK the electrical connectors for corrosion, poor pin contact or pushed out pins, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new components at this time. Components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. CLEAR the DTCs. REPEAT the self-test.

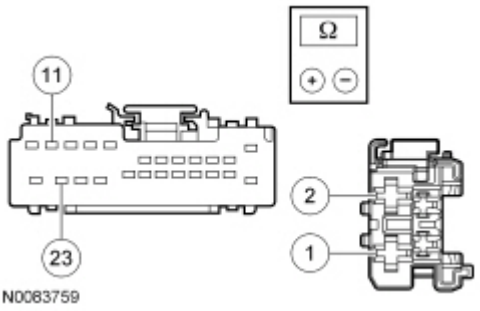


DISCONNECT the battery ground cable.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS . REFER to Section 501-20B .



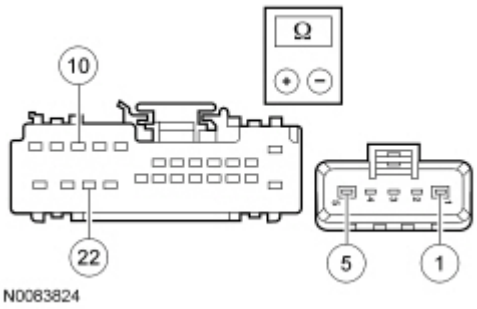


No

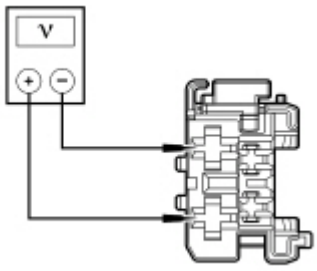
	If no front height seat movement, GO to E11. If no rear height seat movement, GO to E14. If no horizontal seat movement, GO to E17. If no seat recliner movement, GO to E20.

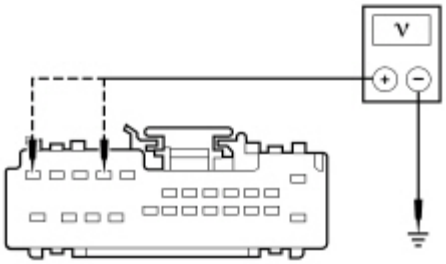
E11 CHECK THE FRONT HEIGHT MOTOR FOR CORRECT OPERATION USING ACTIVE COMMANDS
 	
• Ignition OFF.
• Depower the SRS. Refer to Section 501-20B.
• Disconnect: Driver Seat Side Air Bag Module C3051.
• Disconnect: Front Height Motor C382.
• **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**
• Connect the battery ground cable. Refer to Section 414-01.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: DataLogger — DSM.
  ▪ Front Motor Up (FRONT_UP)
  ▪ Front Motor Down (FRONT_DWN)
• Measure the voltage between front height motor C382-1, circuit CPS02 (GY/YE) and C382-2, circuit CPS03 (VT/GY), harness side while using the scan tool to operate DSM active commands front motor up and front motor down, ON and OFF.
 	

 	
N0057525
 	
• **Is the voltage greater than 10 volts when commanded ON in both directions and no voltage present when commanded OFF?**
	Yes
	INSTALL a new seat track assembly. REFER to Seat Track in this section. CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable.
	
	CONNECT driver seat side air bag module C3051.
	
	REPOWER the SRS. REFER to Section 501-20B.
	
	No
	GO to E12.



E12 CHECK THE FRONT HEIGHT MOTOR CIRCUITS FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: DSM C341B. • Ignition ON. • Measure the voltage between:	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.





repair4less

	DISCONNECT the battery ground cable.
	
	CONNECT driver seat side air bag module C3051.
	
	REPOWER the SRS. REFER to Section 501-20B.
	
	No
	GO to E22.

E22 CHECK THE RECLINER MOTOR CIRCUITS FOR AN OPEN	

• Ignition OFF.
• Measure the resistance between:
  ▪ DSM C341B-13, circuit CPS07 (GY/BN), harness side and recliner motor C3187-1, circuit CPS07 (GY/BN), harness side.
  ▪ DSM C341B-21, circuit CPS08 (VT/OG), harness side and recliner motor C3187-3, circuit CPS08 (VT/OG), harness side.

 	
N0083826
• **Are the resistances less than 5 ohms?**
	Yes
	INSTALL a new DSM. REFER to Driver Seat Module (DSM) in this section. CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable.
	
	CONNECT driver seat side air bag module C3051.
	
	REPOWER the SRS. REFER to Section 501-20B.
	
	No
	REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable.
	
	CONNECT driver seat side air bag module C3051.
	
	REPOWER the SRS. REFER to Section 501-20B.

Pinpoint Test F: The Memory Seat Does Not Operate Correctly — Motor(s) Operate In One Second Intervals or Memory Seat Recall Not Functioning Correctly

Refer to Wiring Diagrams Cell 123, Memory Seats for schematic and connector information.

Normal Operation

repair4less

When the memory SET switch is activated, it supplies a ground signal to the Driver Seat Module (DSM) to initiate a memory SET or recall command. Memory button 1 and memory button 2 each have separate circuits to the DSM .

The DSM supplies a shared signal feed circuit to each position sensor. Each position sensor sends a signal pulse back to the DSM to monitor the position of the seat track and seat recliner. The DSM stores the sensor position data when a SET command is received and uses this information to return the seat to the stored position when a recall command is received.

When a recall command is initiated, the DSM supplies voltage and ground to the seat track motors and seat recliner motor to move the seat to the stored position. For information on programming memory positions or recalling a stored memory position, refer to Memory Position Programming in this section.

The following pinpoint test diagnoses a memory seat that does not operate correctly using the memory SET switch. If the memory seat does not move in all directions using the seat control switch, GO to Pinpoint Test E .

DTC Description	Fault Trigger Conditions
• B1534 — Memory 1 Switch Circuit Short to Ground • B1538 — Memory 2 Switch Circuit Short to Ground	If a short to ground is sensed on the switch input circuit during the DSM self-test, the DTC is set. If activity is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1663 — Seat Driver Front Up/Down Motor Stalled • B1664 — Seat Driver Rear Up/Down Motor Stalled • B1665 — Seat Driver Forward/Backward Motor Stalled	During self-test the DSM attempts to operate the seat track motors and uses the motor's position sensor to monitor movement. If no motor movement is sensed, a DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1666 — Seat Driver Recline Motor Stalled	During self-test the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables the output.
• B1952 — Seat Rear Up/Down Position Feedback Circuit Short to Battery • B1956 — Seat Front Up/Down Position Feedback Circuit Short to Battery • B1960 — Seat Recline Forward/Backward Position Feedback Circuit Short to Battery • B1964 — Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Battery	If a short to voltage condition is present on the affected motor's position sensor (Hall effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one-second increments.
• B1953 — Seat Rear Up/Down Position Feedback Circuit Short to Ground • B1957 — Seat Front	If a short to ground or open condition is present on the affected motor's position sensor (Hall effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one-second

Up/Down Position Feedback Circuit Short to Ground • B1961 — Seat Recline Forward/Backward Position Feedback Circuit Short to Ground • B1965 — Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Ground	increments.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Memory SET switch
- Missing status information — Medium Speed Controller Area Network (MS-CAN) communication bus messages:
  - ignition status
  - gear selector position
- Remote Keyless Entry (RKE) transmitter
- Horizontal seat track motor
- Memory seat track assembly
- DSM

PINPOINT TEST F: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY — MOTOR(S) OPERATE IN ONE SECOND INTERVALS OR MEMORY SEAT RECALL NOT FUNCTIONING CORRECTLY

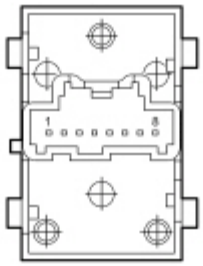
NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

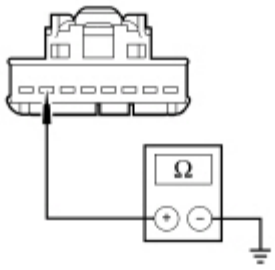
NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

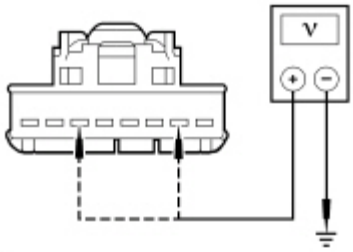
NOTE: Verify the PID(s) states agree with the ignition and transmission gear selector in all positions before proceeding with memory seat diagnosis.

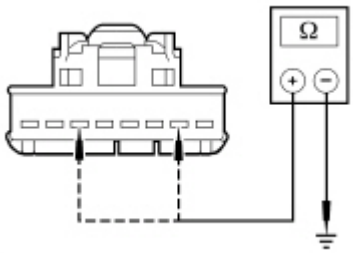




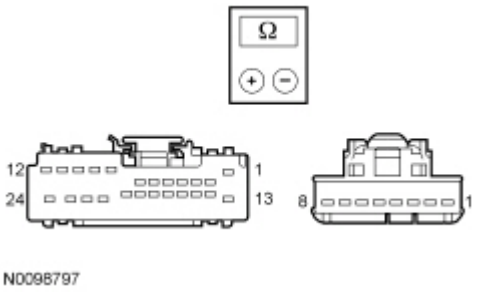
Test Step	Result / Action to Take
F1 CHECK THE TRANSMISSION GEAR SELECTOR TRANSMISSION RANGE (TR) PID STATES	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM PID: TR . • Operate the selector lever in all positions while monitoring the PCM PID TR states. • **Do the PID states agree with the selected positions?**	**Yes** GO to F2 . **No** To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-05 .

repair4less





F2 CHECK THE IGNITION SWITCH PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — DSM . • Cycle the ignition switch in all positions while monitoring the DSM IGN_SW PID states. • **Do the PID states agree with the selected positions?**	**Yes** GO to F3 . **No** To diagnose an ignition switch status concern, REFER to Section 211-05 .
F3 RETRIEVE THE DSM DTCs	
• Using the switches, operate the memory seat and memory mirrors in all directions through the full range of travel. • Place the memory seat and memory mirrors in central travel positions. • Enter the following diagnostic mode on the scan tool: Self Test — DSM . • **Are any DSM DTCs retrieved?**	**Yes** If DTCs B1952, B1956, B1960 and B1964 are all retrieved, GO to F10 . If DTCs B1953, B1957, B1961 and B1965 are all retrieved, GO to F10 . If DTC B1534 or B1538, GO to F5 . If DTC B1663, B1956 or B1957, GO to F11 . If DTC B1664, B1952 or B1953, GO to F14 . If DTC B1665, B1964 or B1965, GO to F17 . If DTC B1666, B1960 or B1961, GO to F20 . For any other DSM DTCs, REFER to the Driver Seat Module (DSM) DTC Chart. **No** GO to F4 .
F4 MONITOR THE DSM PIDs AND CHECK THE DSM FOR CORRECT MEMORY SET SWITCH INPUTS	

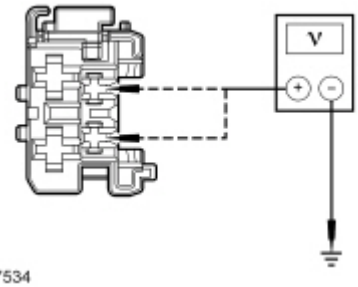


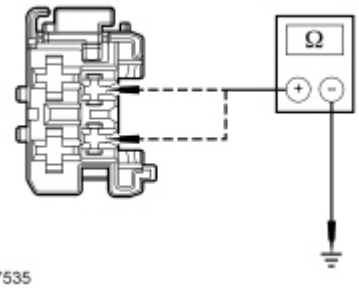
• Enter the following diagnostic mode on the scan tool: DataLogger — DSM .
  ▪ Memory 1 recall switch status (MEM_1)
  ▪ Memory 2 recall switch status (MEM_2)
• Monitor the DSM PIDs while pressing each memory SET switch button.
• **Do the PID values agree with the switch button positions?**
	Yes
	GO to F10 .
	
	No
	GO to F5 .

F5 CHECK THE MEMORY SET SWITCH	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Memory SET Switch C3246 . • Using the following table to check the memory SET switch, measure the resistance between the memory SET switch pins, component side, while pressing and releasing the indicated	**Yes** GO to F6 . **No** INSTALL a new memory SET switch. REFER to

switch buttons and compare the results to the table. **Switch Button / Pins / Ohms** Button 1 / 2 and 7 / Less than 20 when pressed; Greater than 10,000 when released Button 2 / 6 and 7 / Less than 20 when pressed; Greater than 10,000 when released  A0074536 • **Is the memory SET switch OK?**	Memory Set Switch in this section. CLEAR the DTCs. REPEAT the self-test. REPOWER the SRS. REFER to Section 501-20B.
F6 CHECK THE MEMORY SET SWITCH GROUND FOR AN OPEN • Ignition OFF. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Driver Seat Side Air Bag Module C3051. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Measure the resistance between memory SET switch C3246-7, circuit GD904 (BK/BU), harness side and ground.  A0042473 • **Is the resistance less than 5 ohms?**	**Yes** GO to F7. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.
F7 CHECK THE MEMORY SET SWITCH CIRCUITS FOR A SHORT TO VOLTAGE • Disconnect: DSM C341C. • Ignition ON. • Measure the voltage between:	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT

repair4less

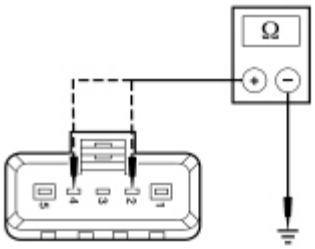


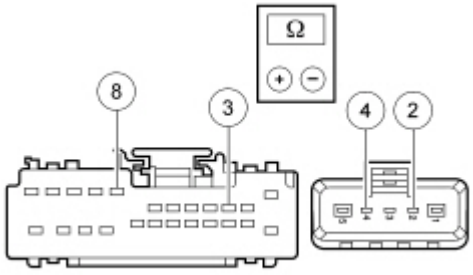


■ memory SET switch C3246-2, circuit CPS15 (VT/WH), harness side and ground. ■ memory SET switch C3246-6, circuit CPS16 (YE), harness side and ground.  N0083765 • **Is any voltage present on either circuit?**	the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B. **No** GO to F8.
F8 CHECK THE MEMORY SET SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between: ■ memory SET switch C3246-2, circuit CPS15 (VT/WH), harness side and ground. ■ memory SET switch C3246-6, circuit CPS16 (YE), harness side and ground.  N0083766 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F9. **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.
F9 CHECK THE MEMORY SET SWITCH CIRCUITS FOR AN OPEN	
• Measure the resistance between: ■ DSM C341C-16, circuit CPS15 (VT/WH), harness side and memory SET switch C3246-2, circuit CPS15 (VT/WH), harness side. ■ DSM C341C-17, circuit CPS16 (YE), harness side and memory SET switch C3246-6, circuit CPS16 (YE), harness side.	**Yes** INSTALL a new DSM. REFER to Driver Seat Module (DSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.

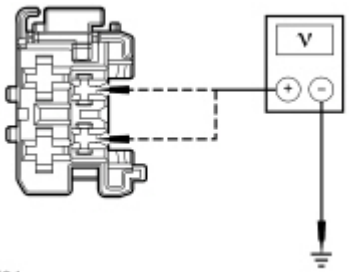
 N0098797 • **Are the resistances less than 5 ohms?**	**No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.

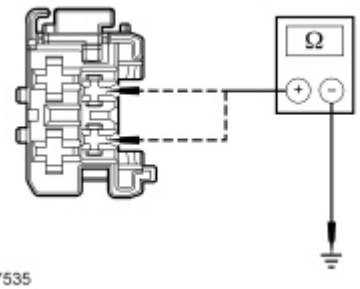
F10 MONITOR THE DSM PIDs
• Enter the following diagnostic mode on the scan tool: DataLogger — DSM.
  ▪ Driver Power Seat Front Up/Down Sense (SFNT_MT)
  ▪ Driver Power Seat Forward/Backward Sense (SFWD_MT)
  ▪ Driver Power Seat Recline Sense (SRCL_MT)
  ▪ Driver Power Seat Rear Up/Down Sense (SREARMT)
• Operate the memory seat in all directions through the full range of travel while monitoring the PIDs.
• **Does each PID indicate the sensor is operational throughout each associated motor's full range of travel?**
	Yes
	INSTALL a new DSM. REFER to Driver Seat Module (DSM) in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	If front up/down position sensor PID value indicates not present, GO to F11.
	
	If rear up/down position sensor PID value indicates not present, GO to F14.
	
	If forward/rearward position sensor PID value indicates not present, GO to F17.
	
	If recline position sensor PID value indicates not present, GO to F20.





F11 CHECK THE FRONT HEIGHT POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE • Ignition OFF. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Driver Seat Side Air Bag Module C3051. • Disconnect: DSM C341B. • Disconnect: Front Height Motor C382. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Ignition ON. • Measure the voltage between: ▪ front height motor C382-3, circuit RPS13 (GN/OG), harness side and ground.	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B. **No**

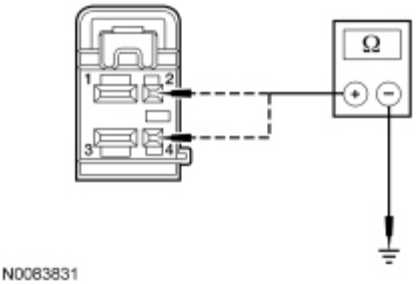




repair4less

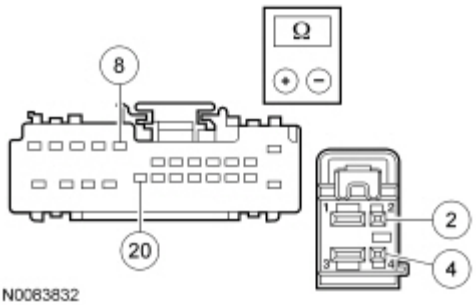
■ front height motor C382-4, circuit VPS10 (BU/GN), harness side and ground.  N0057534 • **Is any voltage present on either circuit?**	GO to F12 .
F12 CHECK FRONT HEIGHT POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between: ■ front height motor C382-3, circuit RPS13 (GN/OG), harness side and ground. ■ front height motor C382-4, circuit VPS10 (BU/GN), harness side and ground.  N0057535 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F13 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
F13 CHECK FRONT HEIGHT POSITION SENSOR CIRCUITS FOR AN OPEN	
• Measure the resistance between: ■ front height motor C382-3, circuit RPS13 (GN/OG), harness side and DSM C341B-8, circuit RPS13 (GN/OG), harness side. ■ front height motor C382-4, circuit VPS10 (BU/GN), harness side and DSM C341B-4, circuit VPS10 (BU/GN), harness side.	**Yes** INSTALL a new seat track assembly. REFER to Seat Track in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .

 N0083768 • **Are the resistances less than 5 ohms?**	**No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
F14 CHECK THE REAR HEIGHT POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: DSM C341B . • Disconnect: Rear Height Motor C363 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between: ▪ rear height motor C363-2, circuit RPS13 (GN/OG), harness side and ground. ▪ rear height motor C363-4, circuit VPS11 (GN/BN), harness side and ground.  N0083827 • **Is any voltage present on either circuit?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** GO to F15 .
F15 CHECK THE REAR HEIGHT POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between: ▪ rear height motor C363-2, circuit RPS13 (GN/OG), harness side and ground. ▪ rear height motor C363-4, circuit VPS11 (GN/BN), harness side and ground.	**Yes** GO to F16 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.



repair4less

 N0083828 • **Are the resistances greater than 10,000 ohms?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
F16 CHECK THE REAR HEIGHT POSITION SENSOR CIRCUITS FOR AN OPEN	
• Measure the resistance between: ▪ rear height motor C363-2, circuit RPS13 (GN/OG), harness side and DSM C341B-8, circuit RPS13 (GN/OG), harness side. ▪ rear height motor C363-4, circuit VPS11 (GN/BN), harness side and DSM C341B-3, circuit VPS11 (GN/BN), harness side.  N0083829 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new seat track assembly. REFER to Seat Track in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
F17 CHECK THE HORIZONTAL POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: DSM C341B . • Disconnect: Driver Seat Horizontal Motor C362 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side



may result in serious personal injury in the event of an accidental deployment. • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between: ▪ horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and ground. ▪ horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and ground.  N0057534 • **Is any voltage present on either circuit?**	air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** GO to F18 .
F18 CHECK THE HORIZONTAL POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between: ▪ horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and ground. ▪ horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and ground.  N0057535 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F19 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
F19 CHECK THE HORIZONTAL POSITION SENSOR CIRCUITS FOR AN OPEN	
• Measure the resistance between: ▪ horizontal motor C362-3, circuit RPS13 (GN/OG), harness side and DSM C341B-8, circuit RPS13 (GN/OG), harness side. ▪ horizontal motor C362-4, circuit VPS09 (BN/BU), harness side and DSM C341B-14, circuit VPS09 (BN/BU), harness side.	**Yes** INSTALL a new front seat track motor. REFER to Seat Track Motor — Front in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable.

repair4less

 N0083769 • **Are the resistances less than 5 ohms?**	CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
F20 CHECK THE RECLINER POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: DSM C341B . • Disconnect: Seat Recliner Motor C3187 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between: ▪ seat recliner motor C3187-2, circuit VPS12 (GY/OG), harness side and ground. ▪ seat recliner motor C3187-4, circuit RPS13 (GN/OG), harness side and ground.  N0083830 • **Is any voltage present on either circuit?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** GO to F21 .
F21 CHECK THE RECLINER POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Measure the resistance between:
  ■ seat recliner motor C3187-2, circuit VPS12 (GY/OG), harness side and ground.
  ■ seat recliner motor C3187-4, circuit RPS13 (GN/OG), harness side and ground.

 	
N0083831
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to F22 .
	
	No
	REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable.
	
	CONNECT driver seat side air bag module C3051.
	
	REPOWER the SRS . REFER to Section 501-20B .

F22 CHECK THE RECLINER POSITION SENSOR CIRCUITS FOR AN OPEN	

• Measure the resistance between:
  ■ seat recliner motor C3187-2, circuit VPS12 (GY/OG), harness side and DSM C341B-20, circuit VPS12 (GY/OG), harness side.
  ■ seat recliner motor C3187-4, circuit RPS13 (GN/OG), harness side and DSM C341B-8, circuit RPS13 (GN/OG), harness side.

 	
N0083832
• **Are the resistances less than 5 ohms?**
	Yes
	INSTALL a new seat recliner motor. REFER to Seat Recliner Motor in this section. CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable.
	
	CONNECT driver seat side air bag module C3051.
	
	REPOWER the SRS . REFER to Section 501-20B .
	
	No
	REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable.
	
	CONNECT driver seat side air bag module C3051.
	
	REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test G: Easy Exit/Easy Entry is Inoperative/Does Not Operate Correctly

repair4less

Normal Operation

The Driver Seat Module (DSM) receives a key out command from the Body Control Module (BCM) over the Medium Speed Controller Area Network (MS-CAN) and moves the driver seat rearward about 51 mm (2 in).

This pinpoint test is intended to diagnose the following:

- Easy entry/exit feature is not enabled
- Missing Medium Speed Controller Area Network (MS-CAN) status information:
  - ignition status
  - gear selector position
- Wiring, terminals or connectors
- Key-in-ignition warning switch
- DSM

PINPOINT TEST G: EASY EXIT/EASY ENTRY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

NOTE: The transmission gear selector must be in PARK for the easy entry/exit feature to function.

NOTE: Make sure all memory seat DTC and symptom based faults are corrected before proceeding with easy entry/exit diagnosis. Verify the PID(s) states agree with the ignition and transmission gear selector in all positions before proceeding with easy entry/exit diagnosis.

Test Step	Result / Action to Take
G1 CHECK FOR SEAT OPERATION AND RETRIEVE DTCs	
• Ignition ON. • Check the message center to verify the easy entry/exit feature is enabled. Refer to the Owner's Literature or Section 413-01 for information on the message center. • Using the seat control switch, verify the driver power seat operates fully forward and rearward. • Place the memory seat and memory mirrors in central travel positions. • Enter the following diagnostic mode on the scan tool: Self Test — DSM . • **Are any DSM DTCs retrieved?**	**Yes** REFER to the Driver Seat Module (DSM) DTC Chart. **No** If OFF, turn the easy entry/exit feature ON with the message center. REFER to the Owner's Literature or Section 413-01 . TEST the system for normal operation. If OK, INSTRUCT the customer on correct system operation. If the seat does not move horizontally from the seat control switch, GO to Pinpoint Test E . Otherwise, GO to G2 .
G2 CHECK THE TRANSMISSION GEAR SELECTOR TRANSMISSION RANGE (TR) PID STATES	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM PID: TR . • Operate the selector lever in all positions while monitoring the PCM PID TR states.	**Yes** GO to G3 . **No** To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-05 .

• **Do the PID states agree with the selected positions?**	
G3 CHECK THE KEY IN IGNITION SWITCH (KEY_IN_SW) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — BCM . • Insert and remove the ignition key from the ignition lock cylinder while monitoring the KEY_IN_SW PID states. • **Does the PID agree with key positions in and out of the ignition switch?**	**Yes** INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. CLEAR the DTCs. REPEAT the self-test. **No** To diagnose the key-in-ignition warning switch fault, REFER to Section 413-01 .

Pinpoint Test H: The Power Lumbar is Inoperative — Driver

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

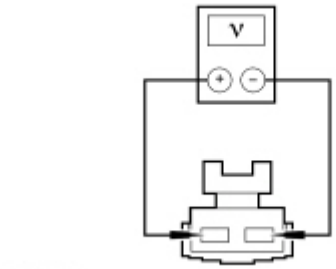
Normal Operation

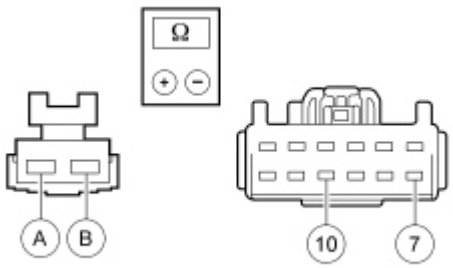
The seat control switch contains the lumbar button and when pressed, supplies battery voltage and ground to the power lumbar motor to move the lumbar assembly in the desired direction.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Power lumbar motor assembly

PINPOINT TEST H: THE POWER LUMBAR IS INOPERATIVE — DRIVER





NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
H1 CHECK OTHER SEAT CONTROL SWITCH FEATURES FOR CORRECT OPERATION	
• Operate the seat horizontally and vertically. • **Does the seat operate horizontally and vertically?**	**Yes** GO to H2 . **No** GO to Pinpoint Test E to diagnose the inoperative seat.

repair4less

H2 CHECK FOR VOLTAGE TO THE LUMBAR MOTOR • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Power Lumbar Motor C3215 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between power lumbar motor C3215-B, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-A, circuit CPS19 (GY/VT), harness side, while operating the lumbar switch in both directions.  N0040627 • **Is the voltage greater than 10 volts when the switch is operated in both directions and 0 volt in the rest position?**	**Yes** INSTALL a new power lumbar assembly. REFER to Lumbar Assembly — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** GO to H3 .
H3 CHECK THE LUMBAR MOTOR CIRCUITS FOR AN OPEN • Disconnect: Driver Seat Control Switch C369 . • Measure the resistance between: ▪ seat control switch C369-7, circuit CPS19 (GY/VT), harness side and power lumbar motor C3215-A, circuit CPS19 (GY/VT), harness side. ▪ seat control switch C369-10, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-B, circuit CPS18 (BN/GN), harness side.  N0092043 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable.

	CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.

Pinpoint Test I: The Power Lumbar is Inoperative — Passenger

Refer to Wiring Diagrams Cell 120, Power Seats for schematic and connector information.

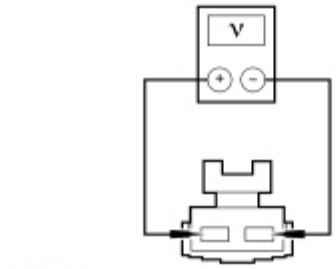
Normal Operation

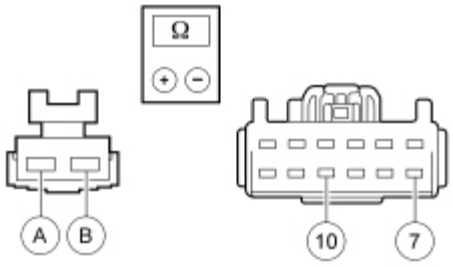
The seat control switch contains the lumbar button and when pressed, supplies battery voltage and ground to the power lumbar motor to move the lumbar assembly in the desired direction.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Power lumbar motor assembly

PINPOINT TEST I: THE POWER LUMBAR IS INOPERATIVE — PASSENGER





NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B.

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
I1 CHECK OTHER SEAT CONTROL SWITCH FEATURES FOR CORRECT OPERATION	
• Operate the seat horizontally and vertically. • **Does the seat operate horizontally and vertically?**	**Yes** GO to I2. **No** GO to Pinpoint Test B to diagnose the inoperative seat.
I2 CHECK FOR VOLTAGE TO THE LUMBAR MOTOR	
• Ignition OFF. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Passenger Seat Side Air Bag Module C339. • Disconnect: Power Lumbar Motor C3216. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the**	**Yes** INSTALL a new power lumbar assembly. REFER to Lumbar Assembly — Power in this section. TEST the system for normal operation.

repair4less

battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment. • Connect the battery ground cable. Refer to Section 414-01 . • **NOTE:** During the following step, the voltage being measured changes polarity dependent upon which direction the seat control switch is activated. • Measure the voltage between power lumbar motor C3216-B, circuit CPS18 (BN/GN), harness side and power lumbar motor C3216-A, circuit CPS19 (GY/VT), harness side, while operating the lumbar switch in both directions.  N0040627 • **Is the voltage greater than 10 volts when the lumbar switch is operated in both directions and 0 volt in the rest position?**	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I3 .
I3 CHECK THE LUMBAR MOTOR CIRCUITS FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C330 . • Measure the resistance between: ▪ seat control switch C330-10, circuit CPS20 (VT), harness side and power lumbar motor C3216-B, circuit CPS18 (BN/GN), harness side. ▪ seat control switch C330-7, circuit CPS21 (WH/OG), harness side and power lumbar motor C3216-A, circuit CPS19 (GY/VT), harness side.  N0092043 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit(s). TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test L: A Single Climate Controlled Seat is Inoperative

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The Dual Climate Controlled Seat Module (DCSM) is supplied voltage at all times, but the climate controlled seat system only operates with the engine running. The system can be operated with the ignition ON engine OFF by using a scan tool to bypass the climate controlled seat buttons on the touchscreen interface. When commanding a heat or cool mode operation in this manner, it only operates in 15 second intervals. Both DCSM voltage supply circuits are spliced together inside the DCSM , so if one circuit becomes open, both seats can still be operated. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat is disabled by the DCSM .

When the climate control seat buttons are activated on the touchscreen interface, this initiates the CAN communication to request climate controlled seat operation.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- APIM
- FDIM
- DCSM

PINPOINT TEST L: A SINGLE CLIMATE CONTROLLED SEAT IS INOPERATIVE

Test Step	Result / Action to Take
L1 CHECK THE OPERATION OF BOTH CLIMATE CONTROLLED SEATS AND VERIFY THE SYMPTOM	
• Check the operation of both climate controlled seats and verify the symptom. • **Is only a single climate controlled seat inoperative?**	**Yes** GO to L2 . **No** If both seats are inoperative, GO to Symptom Chart .
L2 CHECK FOR DCSM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — DCSM . • **Were any DTCs retrieved during the self-tests?**	**Yes** GO to the Dual Climate Controlled Seat Module (DCSM) DTC Chart. **No** GO to L3 .
L3 CHECK OPERATION OF THE DCSM USING PIDs	
NOTE: The purpose of this step is to verify the DCSM is able to receive and process inbound command messages from the communication bus and demonstrate if the DCSM is operational. This indicates the FCIM may not be sending the commands correctly. • Enter the following diagnostic mode on the scan tool: DataLogger — DCSM .	**Yes** GO to L4 . **No** INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. TEST the system for normal operation.

repair4less

Driver Seat ■ Seat cushion Thermo-Electric Device (TED) temperature (CSHTEMP) ■ Seat back TED temperature (BK_TEMP) ■ Climate-controlled seat heat command (TED_HEAT_D) **Front Passenger Seat** ■ Passenger Cushion TED Temperature (PCSHTMP) ■ Passenger Back TED Temperature (PBKTMP) ■ Passenger TED Heat Mode (TED_HEAT_P) ● **NOTE:** The DCSM active commands TED_HEAT_D (driver seat) and TED_HEAT_P (passenger seat) are limited to 15 seconds in the ON state, then turn OFF. ● Operate the affected climate controlled seat using the active command while monitoring the appropriate PIDs for that seat. ■ When the command is in process the TED temperature PIDs on the affected seat should momentarily increase. If no temperature increase is noted, remove the cushion blower filter and repeat the active command while physically monitoring the cushion blower for movement. ● **Do the PID states or cushion blower movement indicate climate controlled seat operation when using the active command?**	
L4 USE THE CLIMATE CONTROLLED SEAT SWITCH AND MONITOR THE DCSM PID FOR A RESPONSE	
● Enter the following diagnostic mode on the scan tool: DataLogger — DCSM . ■ Driver State Seat Mode (DCCSMOD) (driver seat) ■ Passenger State Seat Mode (PCCSMOD) (passenger seat) ● Start the engine. ● **NOTE:** Operation of the climate controlled seats repeatedly ON and OFF or repeatedly switching between heat and cool modes may cause DCSM DTCs to set, disabling one or both seat systems and may require DTCs to be cleared before seat operation may continue. It is recommended to allow time between modes for seat temperatures to return toward ambient temperatures before continuing. ● Attempt to operate the affected climate controlled seat in all modes using the appropriate switch while monitoring the DCSM PID DCCSMOD (driver seat) or PCCSMOD (passenger seat). ● **Do all the PID states match the climate controlled seat settings selected?**	**Yes** If the fault is intermittent, CHECK for causes of the intermittent fault. INSPECT the connectors, terminals and wiring. ATTEMPT to recreate the fault by flexing the wire harness and operating the system. CHECK the electrical connectors for corrosion, poor pin contact or pushed-out pins. REPAIR any intermittent concerns found and TIGHTEN any loose DCSM connector pins. CLEAR the DTCs. REPEAT the self-test. **No** REFER to Section 415-00D or Section 415-00E to diagnose the inoperative touchscreen button(s). CLEAR the DTCs. TEST the system for normal operation.

Pinpoint Test N: The Heated Seat is Inoperative — Driver

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

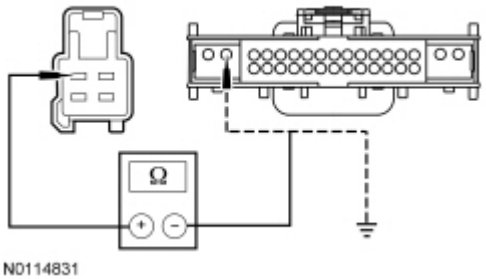
The engine must be running for the heated seat system to operate. The driver and passenger heated seat buttons are selected from the touchscreen interface, which initiates the CAN communication to request heated seat operation. Upon receiving the request, the HVAC module supplies voltage to the appropriate driver and/or passenger seat cushion and backrest heater mats, which are connected in series. Temperature is maintained by the HVAC module using a sensor contained within the cushion heater mat. The HVAC module supplies a reference voltage to the temperature sensor and monitors the return signal from the temperature sensor for controlling current flow to the heater mats. The HVAC module remains on, heating the seat and maintaining temperature until commanded off from the touchscreen (or until the ignition is turned OFF).

DTC Description	Fault Trigger Conditions
• B1034:11 — Left Front Seat Heater Element: Circuit Short To Ground	Sets when the HVAC module senses the left front heater element current draw has exceeded a specified threshold. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.
• B1034:13 — Left Front Seat Heater Element: Circuit Open	Sets when the HVAC module senses the left front heater element current draw is less than a specified threshold. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.
• B1038:11 — Left Front Seat Heater Sensor: Circuit Short To Ground	Sets when the HVAC module senses the left front heater sensor voltage is out-of-range low. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.
• B1038:12 — Left Front Seat Heater Sensor: Circuit Short To Battery	Sets when the HVAC module senses the left front heater sensor voltage is out-of-range high. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.

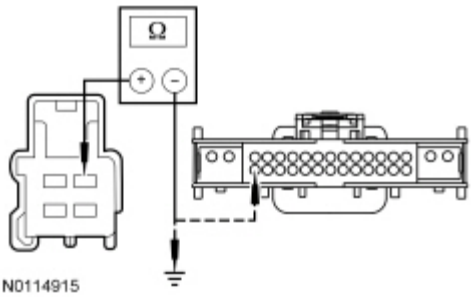
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- FDIM
- APIM
- FCIM
- Heater mat
- HVAC module

PINPOINT TEST N: THE HEATED SEAT IS INOPERATIVE — DRIVER

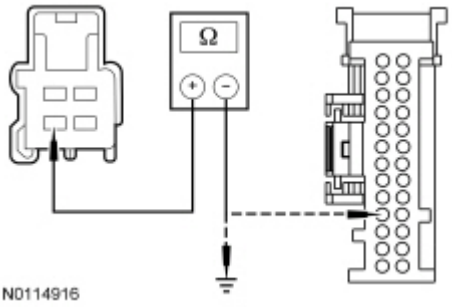


NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .



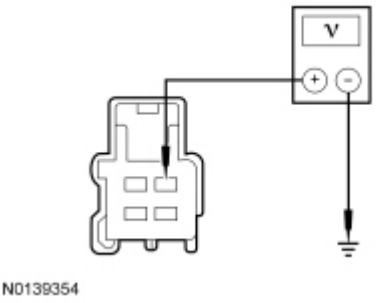
NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

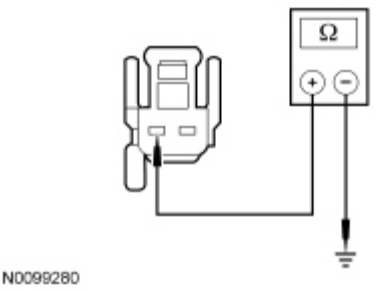
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.



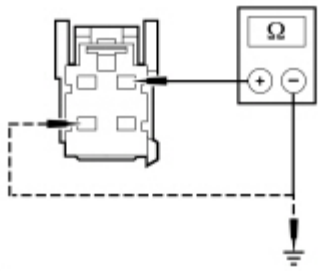
Test Step	Result / Action to Take

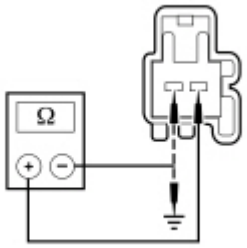
repair4less

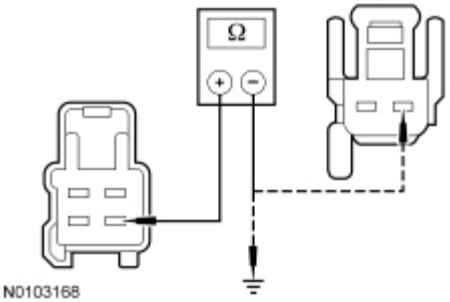




N1 CHECK FOR HVAC DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — HVAC Module . • **Were any DTCs retrieved during the self-tests?**	**Yes** For DTCs B1034:11 or B1034:13, GO to N3 . For DTCs B1038:11 or B1038:12, GO to N4 . For all other DTCs, REFER to the HVAC Module DTC Chart in this section. **No** GO to N2 .
N2 CHECK THE TOUCHSCREEN CONTROLS OPERATION • Start the engine. • Select each audio and climate control function using the touchscreen controls. • **Do all touchscreen controls operate?**	**Yes** GO to N3 . **No** REFER to Section 415-00D or Section 415-00E to diagnose the inoperative touchscreen.
N3 CHECK THE HEATER ELEMENT POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: HVAC Module C228B . • Disconnect: Driver Cushion Heater Mat C364 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between: ▪ driver seat cushion heater mat C364-1, circuit CHS02 (YE/BU), harness side and ground. ▪ driver seat cushion heater mat C364-1, circuit CHS02 (YE/BU), harness side and HVAC module C228B-16, circuit CHS02 (YE/BU), harness side.  N0114831 • **Is the resistance greater than 10,000 ohms between the driver seat cushion heater mat and ground; and less than 3 ohms between the driver seat cushion heater mat and the**	**Yes** GO to N7 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .

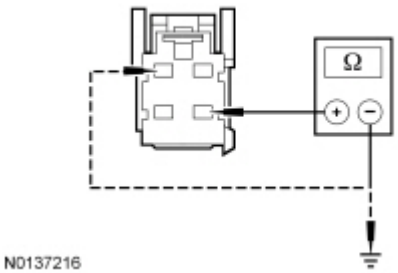






HVAC module?	
N4 CHECK RESISTANCE OF THE DRIVER SEAT HEATER MATS AND HEATER CIRCUITS • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: HVAC Module C228B . • Disconnect: Driver Cushion Heater Mat C364 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between: ▪ driver seat cushion heater mat C364-2, circuit VHS26 (VT), harness side and ground. ▪ driver seat cushion heater mat C364-2, circuit VHS26 (VT), harness side and HVAC module C228B-30, circuit VHS26 (VT), harness side.  N0114915 • **Is the resistance greater than 10,000 ohms between the driver seat cushion heater mat and ground; and less than 3 ohms between the driver seat cushion heater mat and the HVAC module?**	**Yes** GO to N5 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
N5 CHECK THE HEATED SEAT TEMPERATURE SENSOR RETURN CIRCUIT FOR AN OPEN OR SHORT TO GROUND • Disconnect: HVAC Module C228A . • Measure the resistance between: ▪ driver seat cushion heater mat C364-3, circuit RHS05 (YE/VT), harness side and ground. ▪ driver seat cushion heater mat C364-3, circuit RHS05 (YE/VT), harness side and HVAC module C228A-23, circuit RH111 (GY/BU), harness side.	**Yes** GO to N6 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .

repair4less



- **Is the resistance greater than 10,000 ohms between the driver seat cushion heater mat and ground; and less than 3 ohms between the driver seat cushion heater mat and the HVAC module?**

N6 CHECK THE HEATED SEAT TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between driver seat cushion heater mat C364-2, circuit VHS26 (VT), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** GO to N11 .
N7 CHECK THE HEATER ELEMENT GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Driver Seat Backrest Heater Mat C365 . • Measure the resistance between driver seat backrest heater mat C365-2, circuit GD904 (BK/BU), harness side and ground.  • **Is the resistance less than 0.5 ohms?**	**Yes** GO to N8 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
N8 CHECK CUSHION HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between driver seat cushion heater mat C364 pins 1 and 4, component side; and between driver seat cushion heater mat C364 pin 1, component side and ground.	**Yes** GO to N9 .

 N0137106 • **Is the resistance between 0.6 ohms and 2 ohms between pins 1 and 4; and greater than 10,000 ohms between pin 1 and ground?**	**No** INSTALL a new cushion heater mat. REFER to Seat Cushion Heater Mat — Front in this section. TEST the system for normal operation. . DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
N9 CHECK THE BACKREST HEATED SEAT MAT FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between driver seat backrest heater mat C365 pins 1 and 2, component side; and between driver seat backrest heater mat C365 pin 2, component side and ground.  N0137108 • **Is the resistance between 0.9 and 1.1 ohms between pins 1 and 2: and greater than 10,000 ohms between pin 2 and ground?**	**Yes** GO to N10 . **No** INSTALL a new passenger seat backrest heater mat. REFER to Seat Backrest Heater Mat — Front in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
N10 CHECK THE CIRCUIT BETWEEN THE CUSHION HEATER MAT AND BACKREST HEATER MAT FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between: ▪ seat cushion heater mat C364-4, circuit CHS01 (GY/VT), harness side and seat backrest heater mat C365-1, circuit CHS01 (GY/VT) harness side. ▪ seat cushion heater mat C364-4, circuit CHS01 (GY/VT), harness side and ground.  N0103168	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation.

repair4less

• **Is the resistance less than 3 ohms between C364-4 and C365-1; and greater than 10,000 ohms between C364-4 and ground?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
N11 CHECK THE HEATED SEAT TEMPERATURE SENSOR FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between heated seat cushion C364 pins 2 and 3, component side; and between heated seat cushion C364 pin 2, component side and ground.  N0137216 • **Is the resistance between 300 ohms and 300K ohms between pins 2 and 3; and greater than 10,000 ohms between pin 2 and ground?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test O: The Heated Seat is Inoperative — Front Passenger

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

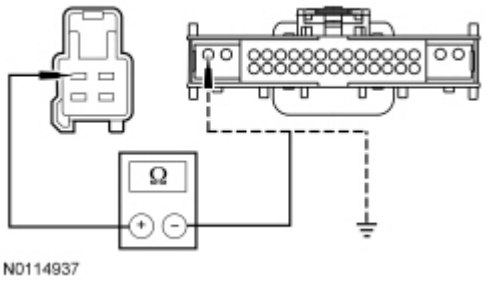
The engine must be running for the heated seat system to operate. The driver and passenger heated seat buttons are selected from the touchscreen interface, which initiates the CAN communication to request heated seat operation. Upon receiving the request, the HVAC module supplies voltage to the appropriate driver and/or passenger seat cushion and backrest heater mats, which are connected in series. Temperature is maintained by the HVAC module using a sensor contained within the cushion heater mat. The HVAC module supplies a reference voltage to the temperature sensor and monitors the return signal from the temperature sensor for controlling current flow to the heater mats. The HVAC module remains on, heating the seat and maintaining temperature until commanded off from the touchscreen (or until the ignition is turned OFF).

DTC Description	Fault Trigger Conditions
• B1036:11 — Right Front Seat Heater Element: Circuit Short To Ground	Sets when the HVAC module senses the right front heater element current draw has exceeded a specified threshold. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.
• B1036:13 — Right Front Seat Heater Element: Circuit Open	Sets when the HVAC module senses the right front heater element current draw is less than a specified threshold. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.
• B103A:11 — Right Front Seat Heater Sensor: Circuit Short To Ground	Sets when the HVAC module senses the right front heater sensor voltage is out-of-range low. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.
• B103A:12 — Right Front Seat Heater Sensor: Circuit Short To Battery	Sets when the HVAC module senses the right front heater sensor voltage is out-of-range high. When this DTC sets, the HVAC module disables the circuit until the ignition is cycled.

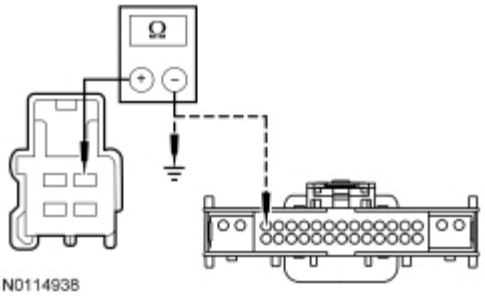
This pinpoint test is intended to diagnose the following:

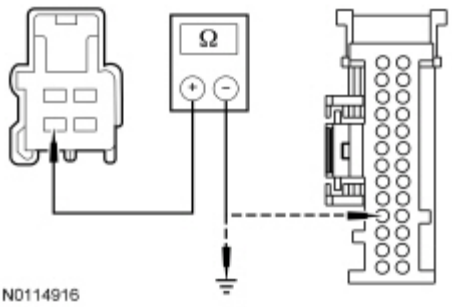
- Wiring, terminals or connectors
- FDIM
- APIM
- FCIM
- Heater mat
- HVAC module

PINPOINT TEST O: THE HEATED SEAT IS INOPERATIVE — FRONT PASSENGER



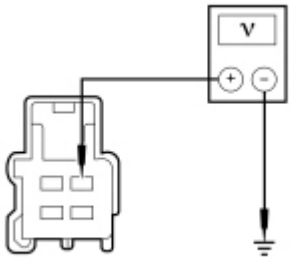
NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

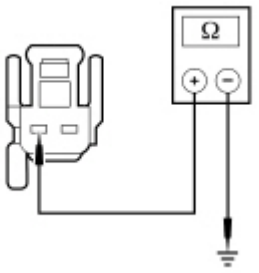


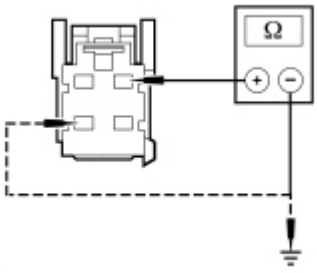


NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

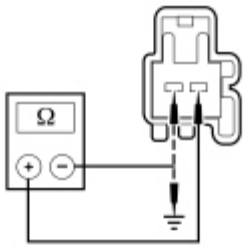
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

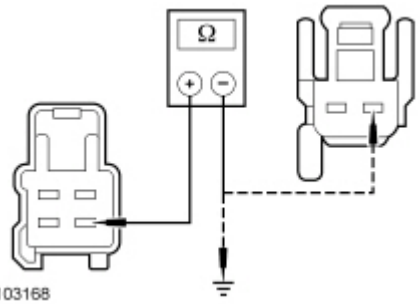






Test Step	Result / Action to Take
O1 CHECK FOR HVAC DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — HVAC Module . • **Were any DTCs retrieved during the self-tests?**	**Yes** For DTCs B1036:11 or B1036:13, GO to O3 . For DTCs B103A:11 or B103A:12, GO to O4 . For all other DTCs, REFER to the HVAC Module DTC Chart in this section. **No** GO to O2 .
O2 CHECK THE TOUCHSCREEN CONTROLS OPERATION	
• Start the engine. • Select each audio and climate control function using the	**Yes** GO to O3 .





repair4less

touchscreen controls. • **Do all touchscreen controls operate?**	**No** REFER to Section 415-00D or Section 415-00E to diagnose the inoperative touchscreen.
O3 CHECK THE HEATER ELEMENT POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: HVAC Module C228B . • Disconnect: Passenger Cushion Heater Mat C334 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between: ▪ passenger seat cushion heater mat C334-1, circuit CHS07 (GY/BU), harness side and ground. ▪ passenger seat cushion heater mat C334-1, circuit CHS07 (GY/BU), harness side and HVAC module C228B-17, circuit CHS07 (GY/BU), harness side. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

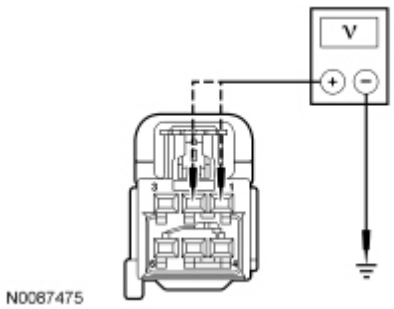
Pinpoint Test Q: The Heated Seats are Inoperative — Rear

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

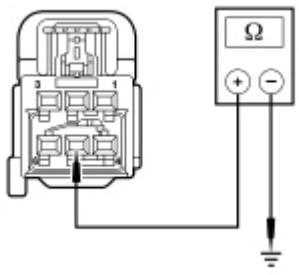
Normal Operation

When the LH or RH rear heated seat control switch is activated with the ignition ON, a ground signal is supplied to the heated seat module to command the system in high heat mode or low heat mode. When commanded ON, voltage is supplied to the heated seat switch from the heated seat module to illuminate the switch indicator. The heated seat module also supplies voltage to the LH or RH rear seat cushion and backrest heater mats, which are connected in series. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor and monitors the return signal from the temperature sensor for controlling current flow to the heater mats. The heated seat module remains ON, heating the seat and maintaining temperature until switched OFF or the ignition voltage is switched OFF.

A new heated seat module must be configured after installation for correct operation. To configure, press the low heat mode button on either rear heated seat switch. Module configuration will occur automatically after the low heat mode button is pressed. Until the module is correctly configured, the heated seats will operate incorrectly when selecting the high heat mode by following a sequence of high, low and off with each button press. The system will operate correctly after the heated seat module receives a low heat request on either of the low heat request circuits and rear heated seat module configuration is activated.

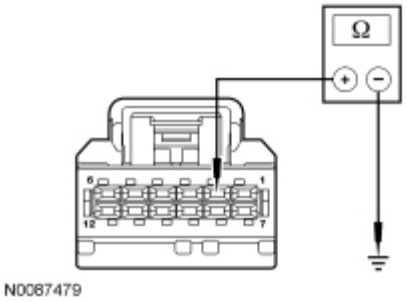


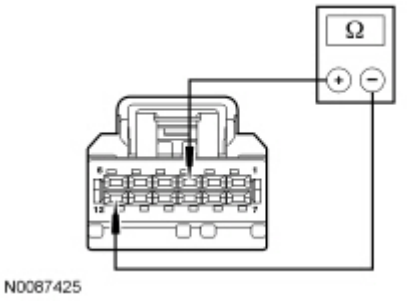
This pinpoint test is intended to diagnose the following:



- Fuse(s)
- Wiring, terminals or connectors
- Heated seat module

PINPOINT TEST Q: THE HEATED SEATS ARE INOPERATIVE — REAR





NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Q1 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE	

• For electrical connector access, release and lower the rear 60 percent seat backrest. Refer to the appropriate steps in Heated Seat Module — Rear in this section.
• Disconnect: Heated Seat Module C3162B .
• Ignition ON.
• Measure the voltage between:
  ▪ rear heated seat module C3162B-2, circuit CBP33 (WH/BN), harness side and ground.
  ▪ rear heated seat module C3162B-1, circuit SBB71 (WH/RD), harness side and ground.

 	
N0087475
• **Are the voltages greater than 10 volts?**
	Yes
	GO to Q2 .
	
	No
	VERIFY Battery Junction Box (BJB) fuse 71 (20A) and Body Control Module (BCM) fuse 33 (10A) are OK. If OK, REPAIR the circuit(s). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. TEST the system for normal operation.

Q2 CHECK THE REAR HEATED SEAT MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between rear heated seat module C3162B-5, circuit GD134 (BK/VT), harness side and ground.  N0087476 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q3 . **No** REPAIR the circuit. TEST the system for normal operation.
Q3 CHECK THE REAR HEATED SEAT SWITCH GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Heated Seat Module C3162A . • **NOTE:** This step will verify if the shared ground supplied to both heated seat switches is open by measuring the switch input resistance at the heated	**Yes** GO to Q4 . **No**

repair4less

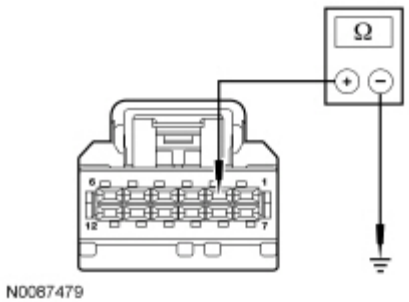
seat module. • Measure the resistance between rear heated seat module C3162A-2, circuit CHS46 (YE/GN), harness side and ground while pressing the LH heated seat switch to high.  N0087479 • **Is the resistance less than 30 ohms when the switch is pressed and greater than 10,000 ohms when not pressed?**	REPAIR circuit GD139 (BK/YE). TEST the system for normal operation.
Q4 CHECK THE TEMPERATURE SENSOR RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between heated seat module C3162A-12, circuit RHS41 (GN/BN), harness side and C3162A-3, circuit VHS42 (GN), harness side.  N0087425 • **Is the resistance between 300 and 300K ohms?**	**Yes** INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** REPAIR circuit RHS41 (GN/BN). TEST the system for normal operation.

Pinpoint Test R: The Heated Seat is Inoperative — Left Rear

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

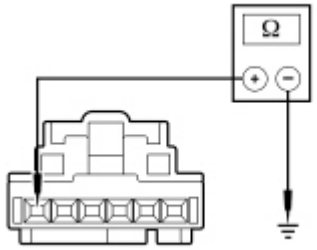
Normal Operation

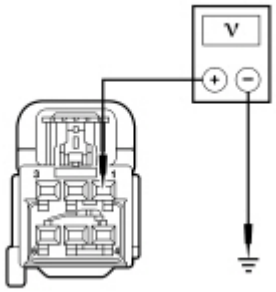
When the LH or RH rear heated seat control switch is activated with the ignition ON, a ground signal is supplied to the heated seat module to command the system in high heat mode or low heat mode. When commanded ON, voltage is supplied to the heated seat switch from the heated seat module to illuminate the switch indicator. The heated seat module also supplies voltage to the LH or RH rear seat cushion and backrest heater mats, which are connected in series. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor and monitors the return signal from the temperature sensor for controlling current flow to the heater mats. The heated seat module remains ON, heating the seat and maintaining temperature until switched OFF or the ignition voltage is switched OFF.

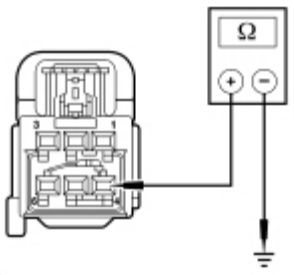


A new heated seat module must be configured after installation for correct operation. To configure, press the

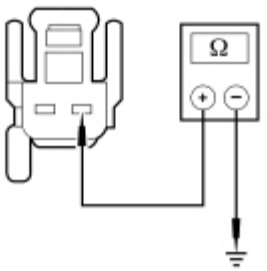
low heat mode button on either rear heated seat switch. Module configuration will occur automatically after the low heat mode button is pressed. Until the module is correctly configured, the heated seats will operate incorrectly when selecting the high heat mode by following a sequence of high, low and off with each button press. The system will operate correctly after the heated seat module receives a low heat request on either of the low heat request circuits and rear heated seat module configuration is activated.

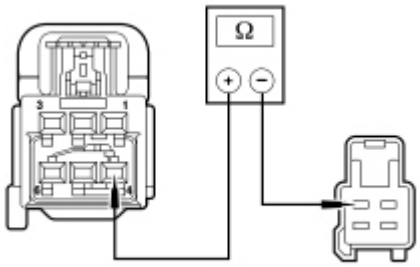






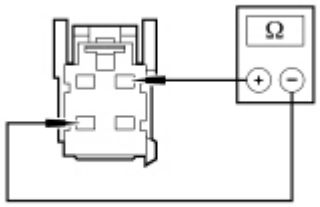
This pinpoint test is intended to diagnose the following:

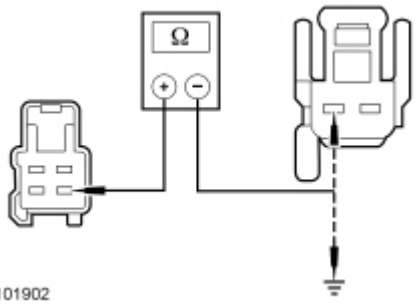


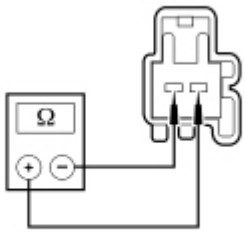


- Fuse
- Wiring, terminals or connectors
- Heater mat
- Heated seat switch
- Heated seat module

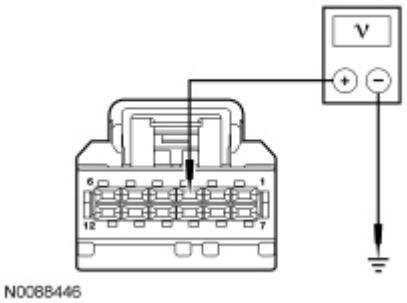
PINPOINT TEST R: THE HEATED SEAT IS INOPERATIVE — LEFT REAR

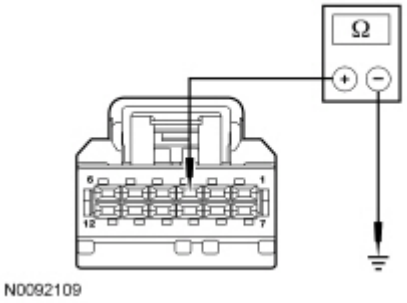






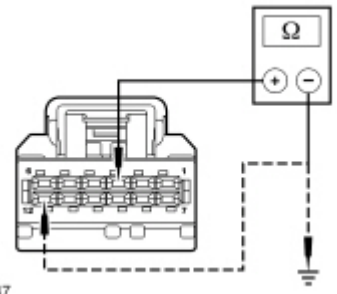
Test Step	Result / Action to Take
R1 CHECK THE HEATED SEAT OPERATION	
• Ignition ON. • Operate the left rear heated seat switch. • **Does the seat operate in either setting?**	**Yes** If only the low setting operates, GO to R15 . If only the high setting operates, GO to R16 . **No** GO to R2 .
R2 CHECK THE HEATED SEAT SWITCH INPUT	
• Ignition OFF. • For electrical connector access, release and lower the rear 60 percent seat backrest. Refer to the appropriate steps in Heated Seat Module — Rear in this section. • Disconnect: Rear Heated Seat Module C3162A . • Measure the resistance between rear heated seat module C3162A-2, circuit CHS46 (YE/GN), harness side and ground while pressing the heated seat switch to high.  N0087479 • **Is the resistance less than 30 ohms when the switch is pressed and greater than 10,000 ohms when not pressed?**	**Yes** GO to R4 . **No** GO to R3 .

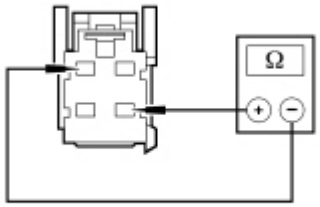




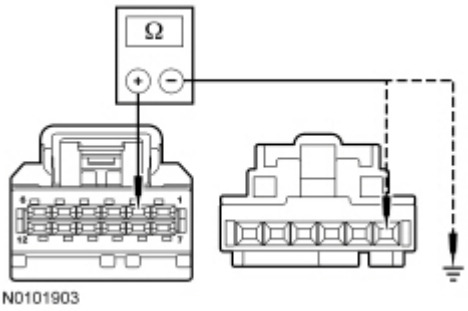
repair4less

R3 CHECK THE HEATED SEAT SWITCH GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Left Rear Heated Seat Switch C731 . • Measure the resistance between left rear heated seat switch C731-6, circuit GD134 (BK/VT), harness side and ground.  N0101900 • **Is the resistance less than 5 ohms?**	**Yes** GO to R17 . **No** REPAIR the circuit. TEST the system for normal operation.
R4 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE	
• Disconnect: Rear Heated Seat Module C3162B . • Measure the voltage between rear heated seat module C3162B-1, circuit SBB71 (WH/RD), harness side and ground.  N0087480 • **Is the voltage greater than 10 volts?**	**Yes** GO to R5 . **No** VERIFY BCM fuse 71 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
R5 CHECK THE HEATER CIRCUITS AND HEATER MATS FOR AN OPEN	
• Measure the resistance between rear heated seat module C3162B-4, circuit CHS39 (GN/BU), harness side and ground.  N0091126 • **Is the resistance between 2.5 and 4.5 ohms?**	**Yes** GO to R11 . **No** GO to R6 .





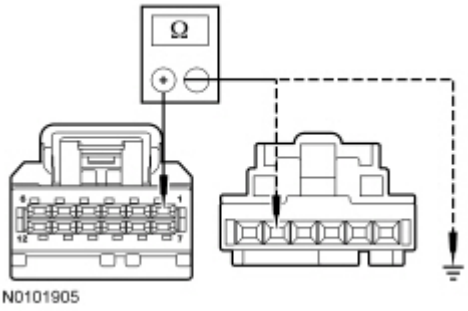
R6 CHECK THE HEATER MAT GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Left Rear Backrest Heater Mat C3168 . • Measure the resistance between left rear backrest heater mat C3168-1, circuit GD134 (BK/VT), harness side and ground.  N0101901 • **Is the resistance less than 5 ohms?**	**Yes** GO to R7 . **No** REPAIR the circuit. TEST the system for normal operation.
R7 CHECK THE HEATER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Disconnect: Left Rear Cushion Heater Mat C3167 . • Measure the resistance between: ▪ rear heated seat module C3162B-4, circuit CHS39 (GN/BU), harness side and left rear cushion heater mat C3167-1, circuit CHS39 (GN/BU), harness side. ▪ rear heated seat module C3162B-4, circuit CHS39 (GN/BU), harness side and ground.  N0090833 • **Is the resistance less than 5 ohms between C3162B-4 and C3167-1, and greater than 10,000 ohms between C3162B-4 and ground?**	**Yes** GO to R8 . **No** REPAIR the circuit. TEST the system for normal operation.
R8 CHECK THE CUSHION HEATER MAT FOR AN OPEN	
• Measure the resistance between left rear heated seat cushion C3167 pins 1 and 4, component side.	**Yes** GO to R9 . **No** INSTALL a new cushion heater mat. REFER to Seat Cushion Heater Mat — Rear in this section. TEST the system for normal operation.



repair4less

 N0088932 • **Is the resistance between 1.5 and 2.5 ohms?**	
R9 CHECK FOR AN OPEN OR A SHORT TO GROUND BETWEEN THE HEATER MATS	
• Measure the resistance between: ▪ left rear cushion heater mat C3167-4, circuit CHS40 (GY/VT), harness side and left rear backrest heater mat C3168-2, circuit CHS40 (GY/VT), harness side. ▪ left rear cushion heater mat C3167-4, circuit CHS40 (GY/VT), harness side and ground.  N0101902 • **Is the resistance less than 5 ohms between C3167-4 and C3168-2, and greater than 10,000 ohms between C3167-4 and ground?**	**Yes** GO to R10 . **No** REPAIR the circuit. TEST the system for normal operation.
R10 CHECK THE BACKREST HEATER MAT FOR AN OPEN	
• Measure the resistance between left rear backrest heater mat C3168 pins 1 and 2, component side.  N0091136 • **Is the resistance between 1 and 2 ohms?**	**Yes** The fault is intermittent. CHECK the electrical connectors for corrosion, poor pin contact or pushed out pins, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new components at this time. Components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. TEST the system for normal operation. **No** INSTALL a new backrest heater mat. REFER to Seat Backrest Heater Mat — Rear in this section. TEST the system for

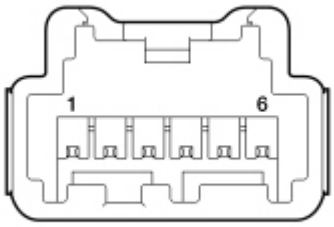
	normal operation.
R11 CHECK THE TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO VOLTAGE • Ignition ON. • Measure the voltage between rear heated seat module C3162A-3, circuit VHS42 (GN), harness side and ground.  N0088446 • **Is any voltage present?**	**Yes** REPAIR the circuit. GO to R14 to check the temperature sensor for damage. If temperature sensor is OK, TEST the system for normal operation. **No** GO to R12 .
R12 CHECK THE TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Measure the resistance between rear heated seat module C3162A-3, circuit VHS42 (GN), harness side and ground.  N0092109 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R13 . **No** REPAIR the circuit. TEST the system for normal operation.
R13 CHECK THE TEMPERATURE SENSOR AND CIRCUITS FOR AN OPEN OR SHORT TO GROUND • Connect: Left Rear Cushion Heater Mat C3167 (if previously disconnected) . • Measure the resistance between: ▪ rear heated seat module C3162A-3, circuit VHS42 (GN), harness side and C3162A-12, circuit RHS41 (GN/BN), harness side. ▪ rear heated seat module C3162A-3, circuit VHS42 (GN), harness side and ground.	**Yes** INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** GO to R14 .



repair4less

 N0088447 • **Is the resistance between 300 and 300K ohms between C3162A-3 and C3162A-12 and greater than 10,000 ohms between C3162A-3 and ground?**	
R14 CHECK THE TEMPERATURE SENSOR FOR AN OPEN	
• Disconnect: Left Rear Cushion Heater Mat C3167 . • Measure the resistance between left rear cushion heater mat C3167 pins 2 and 3, component side.  N0088935 • **Is the resistance between 8,000 and 15,000 ohms?**	**Yes** REPAIR circuit RHS41 (GN/BN) or VHS42 (GN). TEST the system for normal operation. **No** INSTALL a new cushion heater mat. REFER to Seat Cushion Heater Mat — Rear in this section. TEST the system for normal operation.
R15 CHECK THE HIGH HEAT REQUEST CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• For electrical connector access, release and lower the rear 60 percent seat backrest. Refer to the appropriate steps in Heated Seat Module — Rear in this section. • Disconnect: Left Rear Heated Seat Switch C731 . • Measure the resistance between: ▪ rear heated seat module C3162A-2, circuit CHS46 (YE/GN), harness side and left rear heated seat switch C731-1, circuit CHS46 (YE/GN), harness side. ▪ rear heated seat module C3162A-2, circuit CHS46 (YE/GN), harness side and ground.	**Yes** GO to R17 . **No** REPAIR the circuit. TEST the system for normal operation.

- **Is the resistance less than 5 ohms between C3162A-2 and C731-1 and greater than 10,000 ohms between C3162A-2 and ground?**



R16 CHECK THE LOW HEAT REQUEST CIRCUIT FOR AN OPEN OR SHORT TO GROUND	

• Disconnect: Left Rear Heated Seat Switch C731 .
• For electrical connector access, release and lower the rear 60 percent seat backrest. Refer to the appropriate steps in Heated Seat Module — Rear in this section.
• Measure the resistance between:
  ▪ rear heated seat module C3162A-1, circuit CHS47 (VT/GN), harness side and left rear heated seat switch C731-5, circuit CHS47 (VT/GN), harness side.
  ▪ rear heated seat module C3162A-1, circuit CHS47 (VT/GN), harness side and ground.
 	

 	
• **Is the resistance less than 5 ohms between C3162A-1 and C731-5 and greater than 10,000 ohms between C3162A-1 and ground?**
	Yes
	GO to R17 .
	
	No
	REPAIR the circuit. TEST the system for normal operation.

R17 CHECK THE HEATED SEAT SWITCH	
• Disconnect: Left Rear Heated Seat Switch C731 . • Use the following chart and measure the resistance between rear heated seat switch pins, component side, while pressing the indicated switch buttons and compare the results. **Heated Seat Switch Mode** / **Pins** / **Ohms** High / 1 and 6 / Less than 30	**Yes** INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** INSTALL a new heated seat switch. REFER to Heated Seat Switch — Rear in this section.

repair4less

At rest	1 and 6	Greater than 10,000
Low	5 and 6	Less than 30
At rest	5 and 6	Greater than 10,000

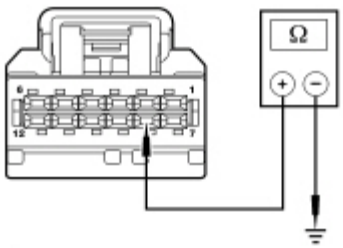
N0088486

- **Is the heated seat switch OK?**

Pinpoint Test S: The Heated Seat is Inoperative — Right Rear

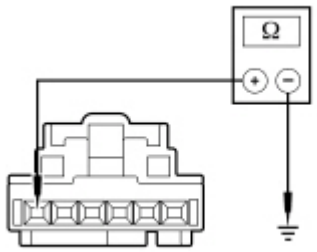
Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation



When the LH or RH rear heated seat control switch is activated with the ignition ON, a ground signal is supplied to the heated seat module to command the system in high heat mode or low heat mode. When commanded ON, voltage is supplied to the heated seat switch from the heated seat module to illuminate the switch indicator. The heated seat module also supplies voltage to the LH or RH rear seat cushion and backrest heater mats, which are connected in series. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor and monitors the return signal from the temperature sensor for controlling current flow to the heater mats. The heated seat module remains ON, heating the seat and maintaining temperature until switched OFF or the ignition voltage is switched OFF.

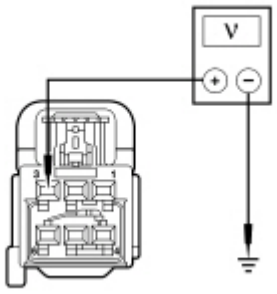
A new heated seat module must be configured after installation for correct operation. To configure, press the low heat mode button on either rear heated seat switch. Module configuration will occur automatically after the low heat mode button is pressed. Until the module is correctly configured, the heated seats will operate incorrectly when selecting the high heat mode by following a sequence of high, low and off with each button press. The system will operate correctly after the heated seat module receives a low heat request on either of the low heat request circuits and rear heated seat module configuration is activated.

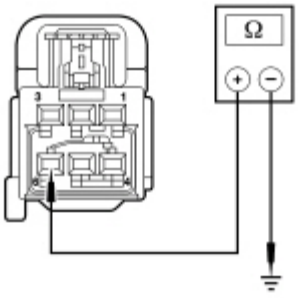


This pinpoint test is intended to diagnose the following:

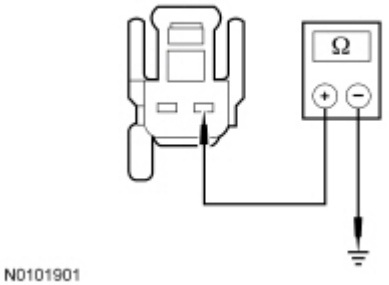
- Fuse
- Wiring, terminals or connectors
- Heater mat
- Heated seat switch
- Heated seat module

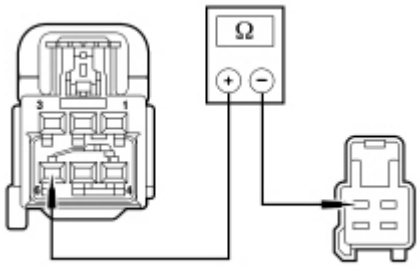
PINPOINT TEST S: THE HEATED SEAT IS INOPERATIVE — RIGHT REAR



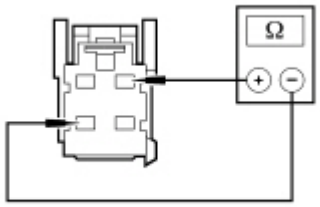


Test Step	Result / Action to Take
S1 CHECK THE HEATED SEAT OPERATION • Ignition ON. • Operate the right rear heated seat switch. • **Does the seat operate in either setting?**	**Yes** If only the low setting operates, GO to S15 . If only the high setting operates, GO to S16 . **No** GO to S2 .
S2 CHECK THE HEATED SEAT SWITCH INPUT • Ignition OFF. • For electrical connector access, release and lower the rear 60 percent seat backrest. Refer to the appropriate steps in Heated Seat Module — Rear in this section. • Disconnect: Rear Heated Seat Module C3162A . • Measure the resistance between rear heated seat module C3162A-8, circuit CHS50 (BU/GY), harness side and ground while pressing the heated seat switch to high.  N0088472 • **Is the resistance less than 30 ohms when the switch is pressed and greater than 10,000 ohms when not pressed?**	**Yes** GO to S4 . **No** GO to S3 .
S3 CHECK THE HEATED SEAT SWITCH GROUND CIRCUIT FOR AN OPEN • Disconnect: Right Rear Heated Seat Switch C831 . • Measure the resistance between right rear heated seat switch C831-6, circuit GD139 (BK/YE), harness side and ground.	**Yes** GO to S17 . **No** REPAIR the circuit. TEST the system for normal operation.





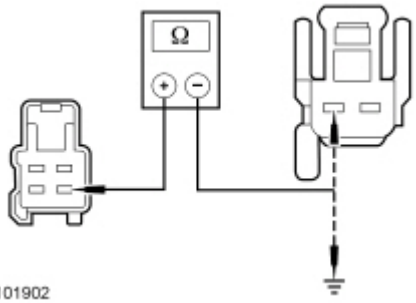
repair4less

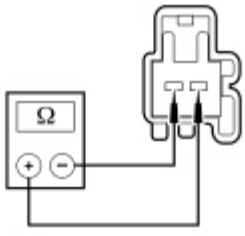


N0101900

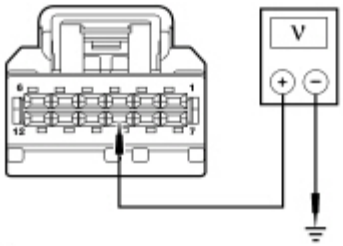
- **Is the resistance less than 5 ohms?**

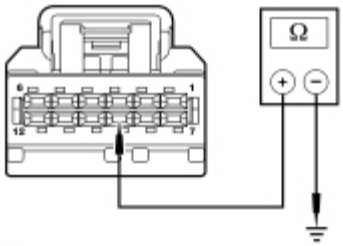
S4 CHECK VOLTAGE TO THE RIGHT REAR HEATED SEAT MODULE FEED CIRCUIT	
• Disconnect: Rear Heated Seat Module C3162B . • Measure the voltage between rear heated seat module C3162B-3, circuit SBB71 (WH/RD), harness side and ground.  N0088707 • **Is the voltage greater than 10 volts?**	**Yes** GO to S5 . **No** VERIFY BCM fuse 71 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
S5 CHECK THE HEATER CIRCUITS AND HEATER MATS FOR AN OPEN	
• Measure the resistance between rear heated seat module C3162B-6, circuit CHS43 (GY/BU), harness side and ground.  N0091155 • **Is the resistance between 2.5 and 4.5 ohms?**	**Yes** GO to S11 . **No** GO to S6 .
S6 CHECK THE HEATER MAT GROUND CIRCUIT FOR AN OPEN	
• For electrical connector access, release and lower the rear 40 percent seat backrest. Refer to the appropriate steps in Seat Backrest Latch — Rear, Crew Cab in this section. • Disconnect: Right Rear Backrest Heater Mat	**Yes** GO to S7 . **No** REPAIR the circuit. TEST the system for



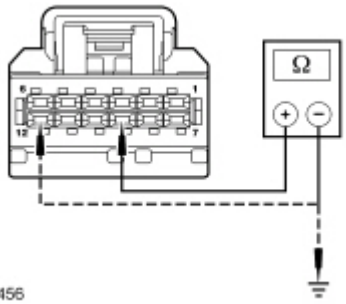


C3170 . • Measure the resistance between right rear backrest heater mat C3170-1, circuit GD139 (BK/YE), harness side and ground.  N0101901 • **Is the resistance less than 5 ohms?**	normal operation.
S7 CHECK THE HEATER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Disconnect: Right Rear Cushion Heater Mat C3169 . • Measure the resistance between: ▪ rear heated seat module C3162B-6, circuit CHS43 (GY/BU), harness side and right rear cushion heater mat C3169-1, circuit CHS43 (GY/BU), harness side. ▪ rear heated seat module C3162B-6, circuit CHS43 (GY/BU), harness side and ground.  N0090843 • **Is the resistance less than 5 ohms between C3162B-6 and C3169-1, and greater than 10,000 ohms between C3162B-6 and ground?**	**Yes** GO to S8 . **No** REPAIR the circuit. TEST the system for normal operation.
S8 CHECK THE CUSHION HEATER MAT FOR AN OPEN	
• Measure the resistance between right rear cushion heater mat C3169 pins 1 and 4, component side.	**Yes** GO to S9 . **No** INSTALL a new cushion heater mat. REFER to Seat Cushion Heater Mat — Rear in this section. TEST the system for normal operation.





repair4less



N0088932

- **Is the resistance between 1.5 and 2.5 ohms?**

S9 CHECK FOR AN OPEN OR A SHORT TO GROUND BETWEEN THE HEATER MATS	
• Measure the resistance between: ▪ right rear cushion heater mat C3169-4, circuit CHS44 (GN/VT), harness side and right rear backrest heater mat C3170-2, circuit CHS44 (GN/VT), harness side. ▪ right rear seat cushion heater mat C3169-4, circuit CHS44 (GN/VT), harness side and ground.  N0101902 • **Is the resistance less than 5 ohms between C3169-4 and C3170-2, and greater than 10,000 ohms between C3169-4 and ground?**	**Yes** GO to S10 . **No** REPAIR the circuit. TEST the system for normal operation.
S10 CHECK THE BACKREST HEATER MAT FOR AN OPEN	
• Measure the resistance between right rear backrest heater mat C3170 pins 1 and 2, component side.  N0091136 • **Is the resistance between 1 and 2 ohms?**	**Yes** The fault is intermittent. CHECK the electrical connectors for corrosion, poor pin contact or pushed out pins, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new components at this time. Components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. TEST the system for normal operation. **No** INSTALL a new rear seat backrest heater mat. REFER to Seat Backrest Heater Mat

	— Rear in this section. TEST the system for normal operation.
S11 CHECK THE TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between heated seat module C3162A-9, circuit VHS45 (GY/BN), harness side and ground.  N0088706 • **Is any voltage present?**	**Yes** REPAIR the circuit. GO to S14 to check the temperature sensor for damage. If the temperature sensor is OK, TEST the system for normal operation. **No** GO to S12 .
S12 CHECK THE TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between heated seat module C3162A-9, circuit VHS45 (GY/BN), harness side and ground.  N0092115 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S13 . **No** REPAIR the circuit. TEST the system for normal operation.
S13 CHECK RIGHT REAR HEATED SEAT TEMPERATURE SENSOR CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Connect: Right Rear Cushion Heater Mat C3169 (if previously disconnected) . • Measure the resistance between: ▪ rear heated seat module C3162A-9, circuit VHS45 (GY/BN), harness side and C3162A-12, circuit RHS41 (GN/BN), harness side. ▪ rear heated seat module C3162A-9, circuit VHS45 (GY/BN), harness side and ground.	**Yes** INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** GO to S14 .

repair4less

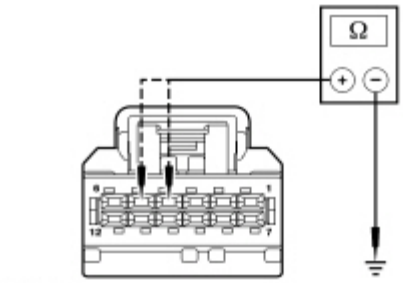
Pinpoint Test T: The Heated Seat Does Not Operate Correctly — Left Rear Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

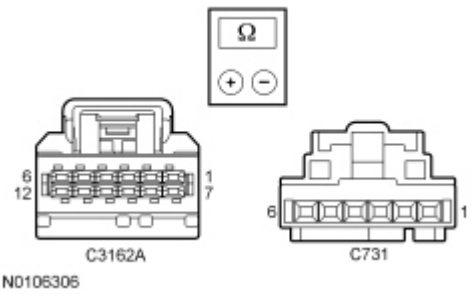
With the ignition and heated seat on, the heated seat module supplies voltage to the indicator circuit(s) to illuminate the appropriate switch indicator. The heated seat and indicator deactivates with a second button press.

A new heated seat module must be configured after installation for correct operation. To configure, press the low heat mode button on either rear heated seat switch. Module configuration will occur automatically after the low heat mode button is pressed. Until the module is correctly configured, the heated seats will operate incorrectly when selecting the high heat mode by following a sequence of high, low and off with each button press. The system will operate correctly after the heated seat module receives a low heat request on either of the low heat request circuits and rear heated seat module configuration is activated.



This pinpoint test is intended to diagnose the following:

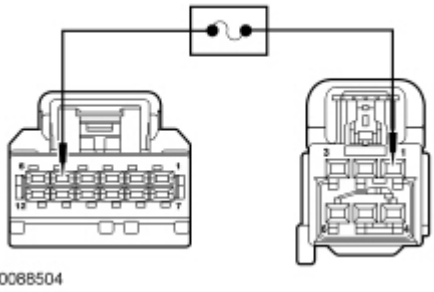
- Wiring, terminals or connectors
- Heated seat switch
- Heated seat module

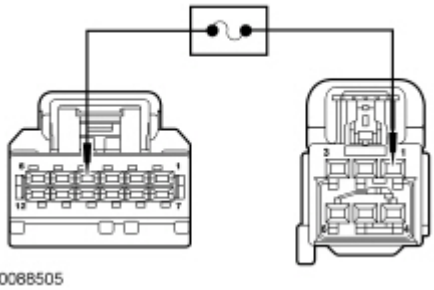


PINPOINT TEST T: THE HEATED SEAT DOES NOT OPERATE CORRECTLY — LEFT REAR SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

Test Step	Result / Action to Take
T1 CHECK THE HEATED SEAT INDICATOR CIRCUITS FOR A	

SHORT TO GROUND	





• Ignition OFF.
• For electrical connector access, release and lower the rear 60 percent seat backrest. Refer to the appropriate steps in Heated Seat Module — Rear in this section.
• Disconnect: Rear Heated Seat Module C3162A .
• Disconnect: Left Rear Heated Seat Switch C731 .
• Measure the resistance between:
  ▪ heated seat module C3162A-4, circuit CHS49 (VT), harness side and ground.
  ▪ heated seat module C3162A-5, circuit CHS48 (YE), harness side and ground.

 	
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to T2 .
	
	No
	REPAIR the circuit(s). TEST the system for normal operation.

T2 CHECK THE HEATED SEAT INDICATOR CIRCUITS FOR AN OPEN	

• Measure the resistance between:
  ▪ heated seat module C3162A-4, circuit CHS49 (VT), harness side and left rear heated seat switch C731-4, circuit CHS49 (VT), harness side.
  ▪ heated seat module C3162A-5, circuit CHS48 (YE), harness side and left rear heated seat switch C731-3, circuit CHS48 (YE), harness side.

 	
• **Are the resistances less than 5 ohms?**
	Yes
	GO to T3 .
	
	No
	REPAIR the circuit(s). TEST the system for normal operation.

T3 CHECK THE HIGH HEAT INDICATOR	
• Connect: Left Rear Heated Seat Switch C731 . • Disconnect: Rear Heated Seat Module C3162B . • Connect a fused jumper lead between rear heated seat module C3162A-5, circuit CHS48 (YE), harness side and C3162B-1, circuit SBB71 (WH/RD), harness side.	**Yes** GO to T4 . **No** INSTALL a new heated seat switch. REFER to Heated Seat

repair4less

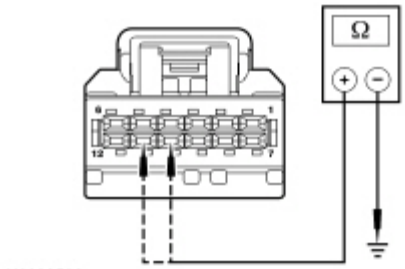
 N0088504 • **Does the indicator illuminate?**	Switch — Rear in this section. TEST the system for normal operation.
T4 CHECK THE LOW HEAT INDICATOR	
• Connect a fused jumper lead between rear heated seat module C3162A-4, circuit CHS49 (VT), harness side and C3162B-1, circuit SBB71 (WH/RD), harness side.  N0088505 • **Does the indicator illuminate?**	**Yes** INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** INSTALL a new heated seat switch. REFER to Heated Seat Switch — Rear in this section. TEST the system for normal operation.

Pinpoint Test U: The Heated Seat Does Not Operate Correctly — Right Rear Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

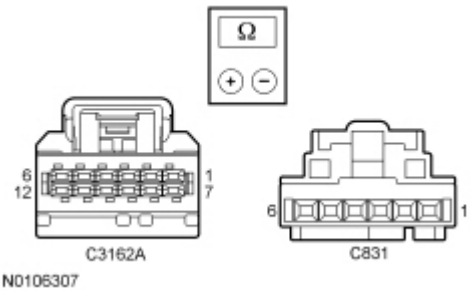
Normal Operation

With the ignition and heated seat on, the heated seat module supplies voltage to the indicator circuit(s) to illuminate the appropriate switch indicator. The heated seat and indicator deactivates with a second button press.



A new heated seat module must be configured after installation for correct operation. To configure, press the low heat mode button on either rear heated seat switch. Module configuration will occur automatically after the low heat mode button is pressed. Until the module is correctly configured, the heated seats will operate incorrectly when selecting the high heat mode by following a sequence of high, low and off with each button press. The system will operate correctly after the heated seat module receives a low heat request on either of the low heat request circuits and rear heated seat module configuration is activated.

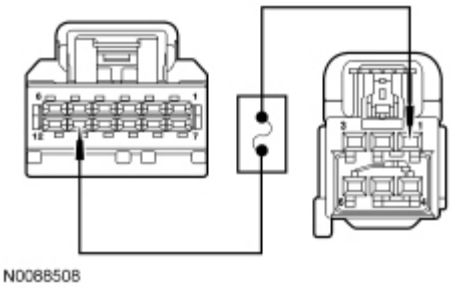
This pinpoint test is intended to diagnose the following:

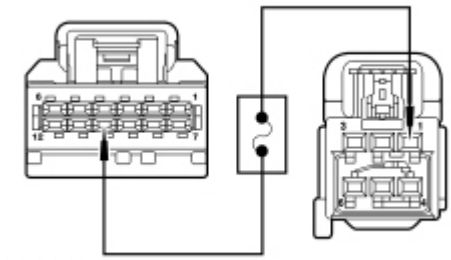


- Wiring, terminals or connectors
- Heated seat switch
- Heated seat module

PINPOINT TEST U: THE HEATED SEAT DOES NOT OPERATE CORRECTLY — RIGHT REAR SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

Test Step	Result / Action to Take
U1 CHECK THE HEATED SEAT INDICATOR CIRCUITS FOR A SHORT TO GROUND	





• Ignition OFF.
• For electrical connector access, release and lower the rear 60 percent seat backrest. Refer to the appropriate steps in Heated Seat Module — Rear in this section.
• Disconnect: Rear Heated Seat Module C3162A .
• Disconnect: Right Rear Heated Seat Switch C831 .
• Measure the resistance between:
  ▪ heated seat module C3162A-10, circuit CHS53 (WH/BN), harness side and ground.
  ▪ heated seat module C3162A-11, circuit CHS52 (BU), harness side and ground.

 	
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to U2 .
	
	No
	REPAIR the circuit(s). TEST the system for normal operation.

U2 CHECK THE HEATED SEAT INDICATOR CIRCUITS FOR AN OPEN	

• Measure the resistance between:
  ▪ heated seat module C3162A-10, circuit CHS53 (WH/BN), harness side and right rear heated seat switch C831-3, circuit CHS53 (WH/BN), harness side.
  ▪ heated seat module C3162A-11, circuit CHS52 (BU), harness side and right rear heated seat switch C831-4, circuit CHS52 (BU), harness side.

 	
• **Are the resistances less than 5 ohms?**
	Yes
	GO to U3 .
	
	No
	REPAIR the circuit(s). TEST the system for normal operation.

U3 CHECK THE HIGH HEAT INDICATOR	

repair4less

• Connect: Right Rear Heated Seat Switch C831 . • Disconnect: Rear Heated Seat Module C3162B . • Connect a fused jumper lead between rear heated seat module C3162A-11, circuit CHS52 (BU), harness side and C3162B-1, circuit SBB71 (WH/RD), harness side.  N0088508 • **Does the indicator illuminate?**	**Yes** GO to U4 . **No** INSTALL a new heated seat switch. REFER to Heated Seat Switch — Rear in this section. TEST the system for normal operation.
U4 CHECK THE LOW HEAT INDICATOR	
• Connect a fused jumper lead between rear heated seat module C3162A-10, circuit CHS53 (WH/BN), harness side and C3162B-1, circuit SBB71 (WH/RD), harness side.  N0088509 • **Does the indicator illuminate?**	**Yes** INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** INSTALL a new heated seat switch. REFER to Heated Seat Switch — Rear in this section. TEST the system for normal operation.

Pinpoint Test V: The Heated Seat Does Not Operate Correctly — Left Rear Heated Seat Indicator is Always On

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

With the ignition and heated seat on, the heated seat module supplies voltage to the indicator circuit(s) to illuminate the appropriate switch indicator. The heated seat and indicator deactivates with a second button press.

A new heated seat module must be configured after installation for correct operation. To configure, press the low heat mode button on either rear heated seat switch. Module configuration will occur automatically after the low heat mode button is pressed. Until the module is correctly configured, the heated seats will operate incorrectly when selecting the high heat mode by following a sequence of high, low and off with each button press. The system will operate correctly after the heated seat module receives a low heat request on either of the low heat request circuits and rear heated seat module configuration is activated.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module

PINPOINT TEST V: THE HEATED SEAT DOES NOT OPERATE CORRECTLY — LEFT REAR HEATED SEAT INDICATOR IS ALWAYS ON

Test Step	Result / Action to Take
V1 CHECK THE INDICATOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: Rear Heated Seat Module C3162A . • **Does the indicator turn off when the heated seat module is disconnected?**	**Yes** INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** REPAIR circuit CHS49 (VT) or CHS48 (YE) for a short to voltage. TEST the system for normal operation.

Pinpoint Test W: The Heated Seat Does Not Operate Correctly — Right Rear Heated Seat Indicator is Always On

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

With the ignition and heated seat on, the heated seat module supplies voltage to the indicator circuit(s) to illuminate the appropriate switch indicator. The heated seat and indicator deactivates with a second button press.

A new heated seat module must be configured after installation for correct operation. To configure, press the low heat mode button on either rear heated seat switch. Module configuration will occur automatically after the low heat mode button is pressed. Until the module is correctly configured, the heated seats will operate incorrectly when selecting the high heat mode by following a sequence of high, low and off with each button press. The system will operate correctly after the heated seat module receives a low heat request on either of the low heat request circuits and rear heated seat module configuration is activated.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module

PINPOINT TEST W: THE HEATED SEAT DOES NOT OPERATE CORRECTLY — RIGHT REAR HEATED SEAT INDICATOR IS ALWAYS ON

Test Step	Result / Action to Take
W1 CHECK THE INDICATOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: Rear Heated Seat Module	**Yes**

repair4less

C3162A . • **Does the indicator turn off when the heated seat module is disconnected?**	INSTALL a new heated seat module. REFER to Heated Seat Module — Rear in this section. TEST the system for normal operation. **No** REPAIR circuit CHS53 (WH/BN) or CHS52 (BU) for a short to voltage. TEST the system for normal operation.

Pinpoint Test X: DTCs B103B and B1111

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The seat cushion and backrest are equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). When the Dual Climate Controlled Seat Module (DCSM) detects an overcurrent and/or overtemperature in the output circuits to the TEDs , it will disable the affected seat and set the following DTCs:

- DTC B103B (Thermoelectric Driver Overcurrent Low) — If DCSM outputs to the driver seat backrest or cushion TED (circuit pin G, H, J or K at the DCSM connector) or any components within these circuit loops are shorted to ground or a TED resistance of less than 0.9 ohm is sensed, the DCSM shuts down the driver seat system and sets this DTC.
- DTC B1111 (Driver Thermal Electric Device Control Overtemperature Fault) — If the DCSM TED driver integrated circuit temperature exceeds 175°C (347°F), the DCSM shuts down the driver seat system and sets this DTC.

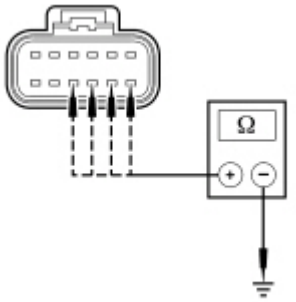
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST X: DTCs B103B AND B1111

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .



NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
X1 CHECK THE TED CIRCUITS FOR A SHORT TO GROUND	

- Ignition OFF.
- Depower the SRS . Refer to Section 501-20B .
- Disconnect: Driver Seat Side Air Bag Module C3051 .
- Disconnect: Passenger Seat Side Air Bag Module C339 .
- Disconnect: DCSM C3265A .
- Measure the resistance between DCSM C3265A, harness side and ground using the following chart:

DCSM Connector	Circuit
C3265A-G	CHS02 (YE/BU)
C3265A-H	RHS02 (BU/OG)
C3265A-J	CHS01 (GY/VT)
C3265A-K	RHS01 (WH/VT)

- **Are the resistances greater than 10,000 ohms?**

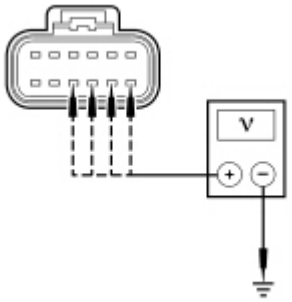
Yes
GO to X2 .

No
If the resistance of C3265A-G, circuit(s) CHS02 (YE/BU) and/or C3265A-H, circuit RHS02 (BU/OG) to ground is **not** greater than 10,000 ohms to ground, GO to X6 .

If the resistance of C3265A-J, circuit(s) CHS01 (GY/VT) and/or C3265A-K, circuit RHS01 (WH/VT) to ground is **not** greater than 10,000 ohms to ground, GO to X7 .

X2 CHECK THE TED CIRCUITS FOR A SHORT TO VOLTAGE

- **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**
- Connect the battery ground cable. Refer to Section 414-01 .
- Ignition ON.
- Measure the voltage between DCSM C3265A, harness side and ground using the following chart:

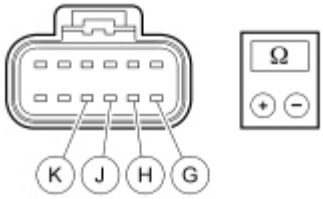


DCSM Connector	Circuit
C3265A-G	CHS02 (YE/BU)
C3265A-H	RHS02 (BU/OG)
C3265A-J	CHS01 (GY/VT)
C3265A-K	RHS01 (WH/VT)

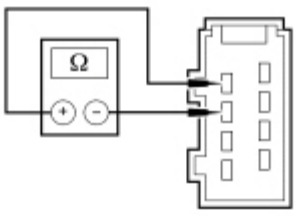
Yes
If voltage is present at C3265A-G and/or C3265A-H, GO to X8 .

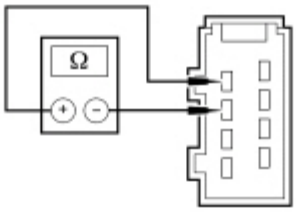
If voltage is present at C3265A-J and/or C3265A-K, GO to X9 .

No
GO to X3 .



repair4less

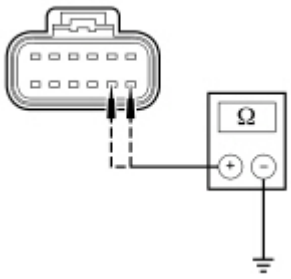


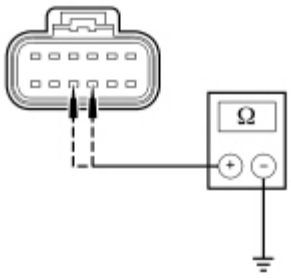


N0097825

- **Is any voltage present on any circuits?**

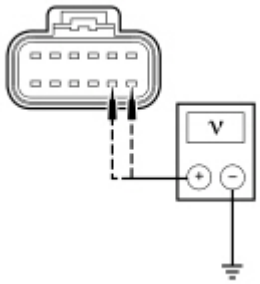
X3 CHECK THE TED AND WIRING RESISTANCE	

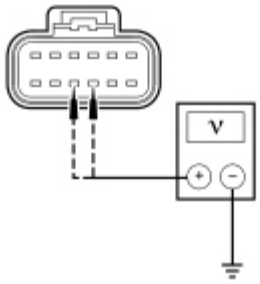




• Ignition OFF.
• Measure the resistance between:
  ▪ DCSM C3265A-G, circuit CHS02 (YE/BU), harness side and DCSM C3265A-H, circuit RHS02 (BU/OG), harness side.
  ▪ DCSM C3265A-J, circuit CHS01 (GY/VT), harness side and C3265A-K, circuit RHS01 (WH/VT), harness side.

 	
N0092076
• **Are the resistances between 0.9 and 10 ohms?**
	Yes
	INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
	
	No
	If the resistance is between DCSM C3265A-G and C3265A-H is **not** between 0.9 and 10 ohms, GO to X5 .
	
	If the resistance is between DCSM C3265A-J and C3265A-K is **not** between 0.9 and 10 ohms, GO to X4 .





X4 CHECK THE BACKREST TED RESISTANCE	
• Disconnect: Backrest TED C3034 . • Measure the resistance between backrest TED C3034 pins 1 and 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric

	Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
X5 CHECK THE CUSHION TED RESISTANCE • Disconnect: Cushion TED C3035 . • Measure the resistance between cushion TED C3035 pins 1 and 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. Pinpoint Test Y: DTC B103C

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The seat cushion and backrest are equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). If the Dual Climate Controlled Seat Module (DCSM) detects an open circuit or high TED resistance, the following DTC will be set:

- DTC B103C (Thermoelectric Driver Open Load) — If DCSM outputs to the driver seat backrest or

repair4less

cushion TED (circuit pin G, H, J or K at the DCSM connector) or any components within these circuit loops are open, disconnected or a TED resistance greater than 90,000 ohms is sensed, the DCSM continues normal operation and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST Y: DTC B103C

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.

Pinpoint Test Z: DTC B103D

Refer to Wiring Diagrams Cell 119, Climate Controlled Seats for schematic and connector information.

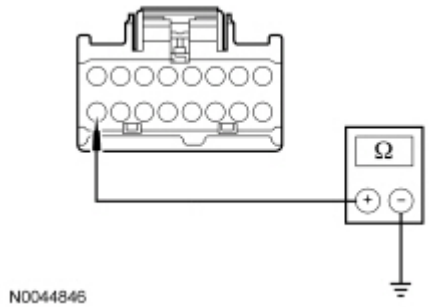
Normal Operation

Climate controlled seats are independently controlled by the Dual Climate Controlled Seat Module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition ON. Both voltage supply circuits to the DCSM are spliced together internally, so if one circuit becomes open, both seats can still be operated. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

The seat cushion is equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, the seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the seat switch settings.

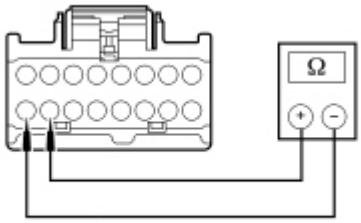
- DTC B103D (Blower Driver Overtemperature) — If the DCSM outputs to the driver seat blower or any components within these circuit loops are shorted to ground or cause an excessive current draw, the DCSM overheats, shuts down the driver seat system and sets this DTC.

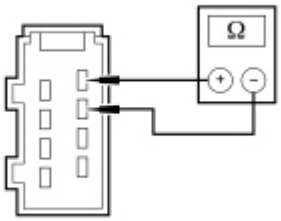
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- TED assembly
- DCSM



PINPOINT TEST Z: DTC B103D

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**





NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
Z1 CHECK THE TED BLOWER CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Cushion TED C3035 . • Disconnect: Backrest TED C3034 . • Measure the resistance between DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Z2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
Z2 CHECK FOR A SHORT BETWEEN THE TED BLOWER CIRCUITS	

repair4less

• Measure the resistance between DCSM C3265C-15, circuit RHS03 (GY/OG), harness side and C3265C-16, circuit CHS03 (GN/BN), harness side.  N0044847 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Z3 . **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
Z3 CHECK THE BACKREST BLOWER AND CUSHION BLOWER RESISTANCES • **NOTE:** The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between: ▪ backrest TED C3034 pins 2 and 4, component side. ▪ cushion TED C3035 pins 2 and 4, component side.  N0053768 • **Are the resistances between 4,000 and 10,000 ohms?**	**Yes** INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** If the cushion TED resistance is **not** between 4,000 and 10,000 ohms, INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. If the backrest TED resistance is **not** between 4,000 and 10,000 ohms, INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AA: DTCs B1113 and B111B

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The seat cushion and backrest are equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). When the Dual Climate Controlled Seat Module (DCSM) detects an overcurrent and/or overtemperature in the output circuits to the TEDs , it will disable the affected seat and set the following DTCs:

- DTC B1113 (Passenger Thermal Electric Device Control Overtemperature Fault) — If the DCSM TED driver integrated circuit temperature exceeds 175°C (347°F), the DCSM shuts down the passenger seat system and sets this DTC.
- DTC B111B (Passenger Thermoelectric Driver Overcurrent Low) — If DCSM outputs to the passenger seat backrest or cushion TED (circuit pin A, B, C or D at the DCSM connector) or any components within these circuit loops are shorted to ground or a TED resistance of less than 0.9 ohms is sensed, the DCSM shuts down the passenger seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AA: DTCs B1113 AND B111B

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Pinpoint Test AB: DTC B111C

Refer to Wiring Diagrams Cell 119, Climate Controlled Seats for schematic and connector information.

Normal Operation

The seat cushion and backrest are equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). If the Dual Climate Controlled Seat Module (DCSM) detects an open circuit or high TED resistance, the following DTC will be set:

- DTC B111C (Passenger Thermoelectric Driver Open Load) — If DCSM outputs to the passenger seat backrest or cushion TED (circuit pin A, B, C or D at the DCSM connector) or any components within these circuit loops are open, disconnected or a TED resistance greater than 90,000 ohms is sensed, the DCSM continues normal operation and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST AB: DTC B111C

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B.

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Pinpoint Test AC: DTC B111D

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Climate controlled seats are independently controlled by the Dual Climate Controlled Seat Module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM , diagnostic testing can be carried out with the ignition ON. Both voltage supply circuits to the DCSM are spliced together internally, so if one circuit becomes open, both seats can still be operated. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

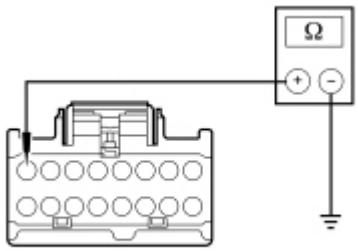
The seat cushion is equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, the seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the seat switch settings.

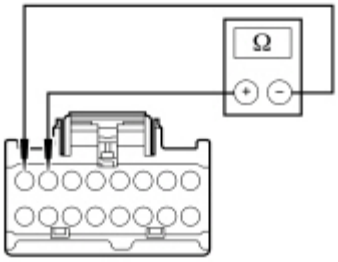
- DTC B111D (Passenger Blower Driver Overtemperature) — If the DCSM outputs to the passenger seat blower or any components within these circuit loops are shorted to ground or cause an excessive current draw, the DCSM overheats, shuts down the passenger seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

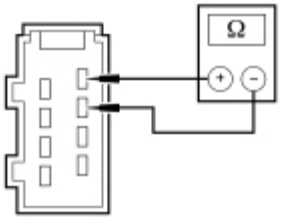
PINPOINT TEST AC: DTC B111D





NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .



NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

repair4less

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AC1 CHECK THE TED BLOWER CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Cushion TED C3040 . • Disconnect: Backrest TED C3039 . • Measure the resistance between DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and ground. Pinpoint Test AE: DTC B19A2

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

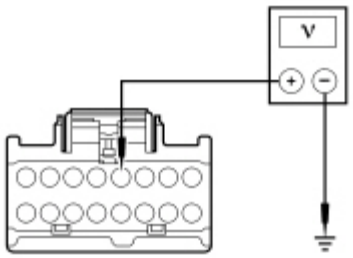
The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to the passenger seat backrest Thermo-Electric Device (TED). The DCSM also sends a speed control voltage signal to the TED to control blower speed.

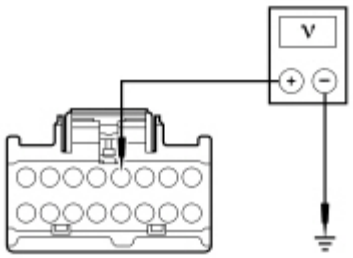
- DTC B19A2 (Passenger Seat Back Blower Speed Short to Battery) — If the passenger seat backrest blower speed circuit is shorted to voltage, the DCSM shuts down the passenger seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED and blower assembly
- DCSM

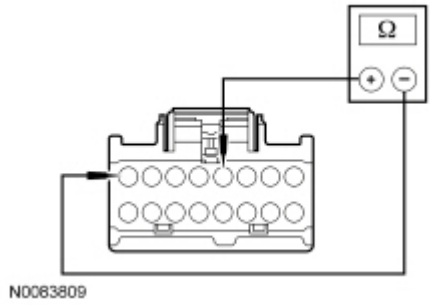
PINPOINT TEST AE: DTC B19A2

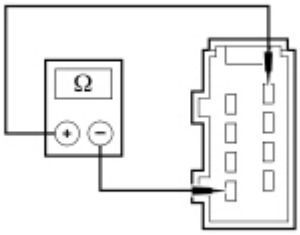




NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .





NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AE1 CHECK THE BACKREST TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Depower the SRS . Pinpoint Test AF: DTC B19A3

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to the driver seat cushion

Thermo-Electric Device (TED). The DCSM also sends a speed control voltage signal to the TED to control blower speed.

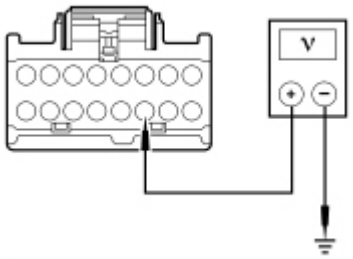
- DTC B19A3 (Driver Seat Cushion Blower Speed Short to Battery) — If the driver seat cushion blower speed circuit is shorted to voltage, the DCSM shuts down the driver seat system and sets this DTC.

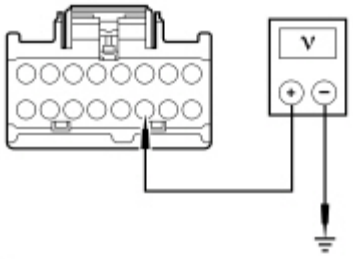
This pinpoint test is intended to diagnose the following:

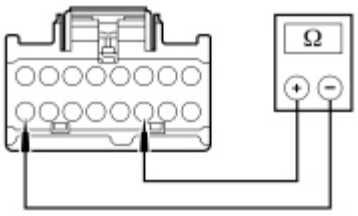
- Wiring, terminals or connectors
- TED and blower assembly
- DCSM

PINPOINT TEST AF: DTC B19A3

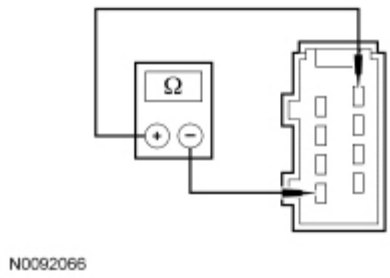
NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**







NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .



NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AF1 CHECK THE CUSHION TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between C3265C-11, circuit VHS18 (BN/GN), harness side and ground.	**Yes** GO to AF2 . **No** GO to AF3 .

repair4less

 N0083800 • **Is any voltage present?**	
AF2 CHECK THE CUSHION TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Cushion TED C3035 . • Measure the voltage between C3265C-11, circuit VHS18 (BN/GN), harness side and ground.  N0083800 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AF3 .
AF3 CHECK THE CUSHION TED BLOWER SPEED CONTROL AND BLOWER OUTPUT CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: Cushion TED C3035 . • Measure the resistance between DCSM C3265C-11, circuit VHS18 (BN/GN), harness side and C3265C-16, circuit CHS03 (GN/BN), harness side.  N0083810 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AF4 . **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AF4 CHECK THE CUSHION TED RESISTANCE FOR AN INTERNAL SHORT	

• Measure the resistance between cushion TED C3035 pins 2 and 7, component side.  N0092066 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AG: DTC B19A4

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

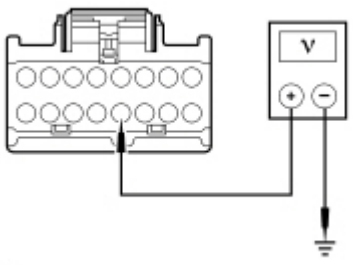
The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to the driver seat backrest Thermo-Electric Device (TED). The DCSM also sends a speed control voltage signal to the TED to control blower speed.

- DTC B19A4 (Driver Seat Back Blower Speed Short to Battery) — If the driver seat backrest blower speed circuit is shorted to voltage, the DCSM shuts down the driver seat system and sets this DTC.

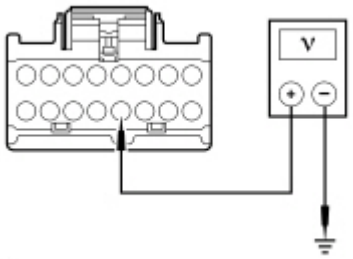
This pinpoint test is intended to diagnose the following:

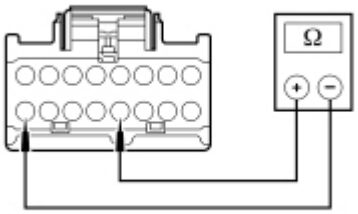
- Wiring, terminals or connectors
- TED and blower assembly
- DCSM

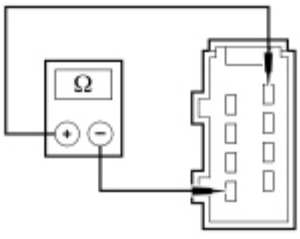
repair4less



PINPOINT TEST AG: DTC B19A4







NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AG1 CHECK THE BACKREST TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between C3265C-12, circuit CHS09 (GY), harness side and ground.  N0083801 • **Is any voltage present?**	**Yes** GO to AG2 . **No** GO to AG3 .
AG2 CHECK THE BACKREST TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Backrest TED C3034 . • Measure the voltage between C3265C-12, circuit CHS09 (GY), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0083801 • **Is any voltage present?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AG3 .
AG3 CHECK THE BACKREST TED BLOWER SPEED CONTROL AND BLOWER OUTPUT CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: Backrest TED C3034 . • Measure the resistance between DCSM C3265C-12, circuit CHS09 (GY), harness side and C3265C-16, circuit CHS03 (GN/BN), harness side.  N0083811 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AG4 . **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AG4 CHECK THE BACKREST TED RESISTANCE FOR AN INTERNAL SHORT	
• Measure the resistance between backrest TED C3034 pins 2 and 7, component side.  N0092066 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

repair4less

	No INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AH: DTC B19A5

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

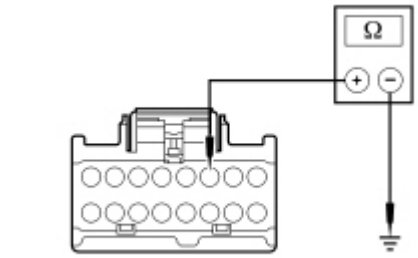
Normal Operation

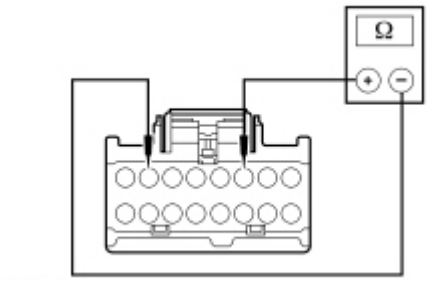
The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to the passenger seat cushion Thermo-Electric Device (TED). The DCSM also sends a speed control voltage signal to the TED to control blower speed.

- DTC B19A5 (Passenger Seat Cushion Blower Speed Short to Ground) — If the passenger seat cushion blower speed circuit is shorted to ground, the DCSM shuts down the passenger seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED and blower assembly
- DCSM





PINPOINT TEST AH: DTC B19A5

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AH1 CHECK THE CUSHION TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Cushion TED C3040 . • Measure the resistance between DCSM C3265C-3, circuit VHS23 (BN/BU), harness side and ground.  N0083842 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AH2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AH2 CHECK THE CUSHION TED BLOWER SPEED CONTROL CIRCUIT AND BLOWER GROUND CIRCUIT FOR A SHORT TOGETHER	
• Measure the resistance between DCSM C3265C-3, circuit VHS23 (BN/BU), harness side and C3265C-7, circuit RHS08 (VT/WH), harness side.  N0083843 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. If the DTC is retrieved again, INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

repair4less

Pinpoint Test AI: DTC B19A6

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

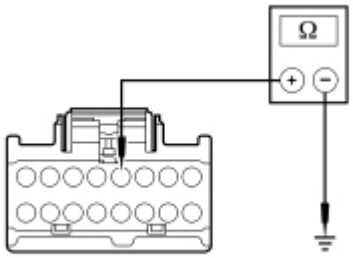
The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to the passenger seat backrest Thermo-Electric Device (TED). The DCSM also sends a speed control voltage signal to the TED to control blower speed.

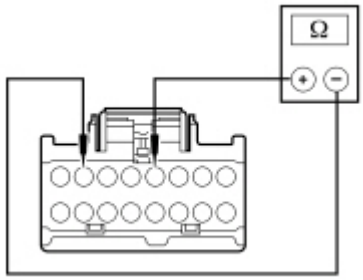
- DTC B19A6 (Passenger Seat Back Blower Speed Short to Ground) — If the passenger seat backrest blower speed circuit is shorted to ground, the DCSM shuts down the passenger seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED and blower assembly
- DCSM

PINPOINT TEST AI: DTC B19A6





NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AI1 CHECK THE BACKREST TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Backrest TED C3039 . • Measure the resistance between DCSM C3265C-4, circuit VHS21 (BU/WH), harness side and ground.	**Yes** GO to AI2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

 N0083844 • **Is the resistance greater than 10,000 ohms?**	
AI2 CHECK THE BACKREST TED BLOWER SPEED CONTROL CIRCUIT AND BLOWER GROUND CIRCUIT FOR A SHORT TOGETHER	
• Measure the resistance between DCSM C3265C-4, circuit VHS21 (BU/WH), harness side and C3265C-7, circuit RHS08 (VT/WH), harness side.  N0083845 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. If the DTC is retrieved again, INSTALL a new DCSM. REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.

Pinpoint Test AJ: DTC B19A7

Refer to Wiring Diagrams Cell 119, Climate Controlled Seats for schematic and connector information.

Normal Operation

The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to the driver seat cushion Thermo-Electric Device (TED). The DCSM also sends a speed control voltage signal to the TED to control

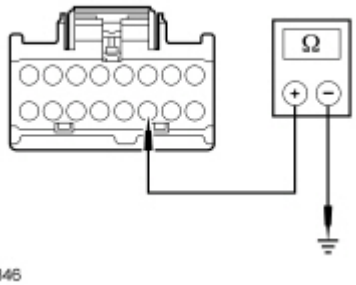
repair4less

blower speed.

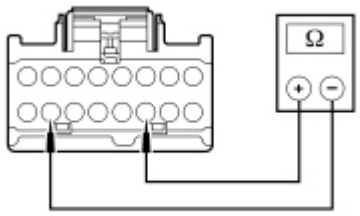
- DTC B19A7 (Driver Seat Cushion Blower Speed Short to Ground) — If the driver seat cushion blower speed circuit is shorted to ground, the DCSM shuts down the driver seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED and blower assembly
- DCSM



PINPOINT TEST AJ: DTC B19A7



NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AJ1 CHECK THE CUSHION TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Cushion TED C3035 . • Measure the resistance between DCSM C3265C-11, circuit VHS18 (BN/GN), harness side and ground.  N0083846 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AJ2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AJ2 CHECK THE CUSHION TED BLOWER SPEED CONTROL CIRCUIT AND BLOWER GROUND CIRCUIT FOR	

A SHORT TOGETHER	
• Measure the resistance between DCSM C3265C-11, circuit VHS18 (BN/GN), harness side and C3265C-15, circuit RHS03 (GY/OG), harness side.  N0083847 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. If the DTC is retrieved again, INSTALL a new DCSM. REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.

Pinpoint Test AK: DTC B19A8

Refer to Wiring Diagrams Cell 119, Climate Controlled Seats for schematic and connector information.

Normal Operation

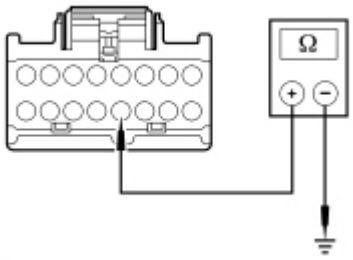
The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to the driver seat backrest Thermo-Electric Device (TED). The DCSM also sends a speed control voltage signal to the TED to control blower speed.

- DTC B19A8 (Driver Seat Back Blower Speed Short to Ground) — If the driver seat backrest blower speed circuit is shorted to ground, the DCSM shuts down the driver seat system and sets this DTC.

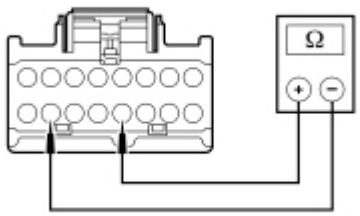
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED and blower assembly
- DCSM

repair4less



PINPOINT TEST AK: DTC B19A8



NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AK1 CHECK THE BACKREST TED BLOWER SPEED CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Backrest TED C3034 . • Measure the resistance between DCSM C3265C-12, circuit CHS09 (GY), harness side and ground.  N0083848 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AK2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AK2 CHECK THE BACKREST TED BLOWER SPEED CONTROL CIRCUIT AND BLOWER GROUND CIRCUIT FOR A SHORT TOGETHER	
• Measure the resistance between DCSM C3265C-12, circuit VHS16 (BU/GN), harness side and C3265C-15, circuit RHS03 (GY/OG), harness side.	**Yes** INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. If the DTC is retrieved again, INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test.

 N0083849 • **Is the resistance greater than 10,000 ohms?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AL: DTCs B1317, B1318 and B2486

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation — Driver Seat Module (DSM)

The Driver Seat Module (DSM) continuously monitors the input voltage for correct operation. If the DSM detects input voltage below 10 volts, it stores DTC B1318 in memory. If the DSM detects input voltage above 15 volts, it stores DTC B1317 in memory. If DTC B1317 or B1318 is set, the DSM disables the memory system outputs for the driver seat and memory mirror operation.

Normal Operation — Dual Climate Controlled Seat Module (DCSM)

The Dual Climate Controlled Seat Module (DCSM) monitors the input voltage for correct operation. If the DCSM detects input voltage below 10 volts or above 15 volts, it stores DTC B2486 in memory. If DTC B2486 sets, the DCSM enters a standby mode and suspends the system outputs for the operation of both seats until system voltage between 10 and 15 volts is restored and a climate controlled seat switch button is selected on.

- DTC B1317 (Battery Voltage High) — If the DSM detects voltage above 15 volts, the DTC is set.
- DTC B1318 (Battery Voltage Low) — If the DSM detects voltage below 10 volts, the DTC is set.
- DTC B2486 (Climate Control Seat Module Voltage Out of Range) — If the DCSM detects voltage below 10 volts or greater than 15 volts, the DTC is set.

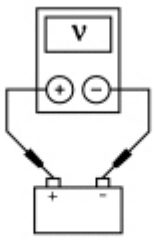
This pinpoint test is intended to diagnose the following:

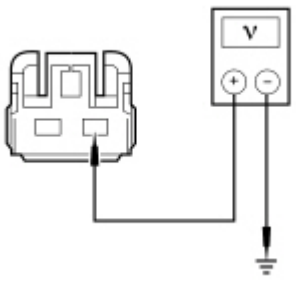
- Wiring, terminals or connectors
- DSM
- DCSM

repair4less

PINPOINT TEST AL: DTCs B1317, B1318 AND B2486

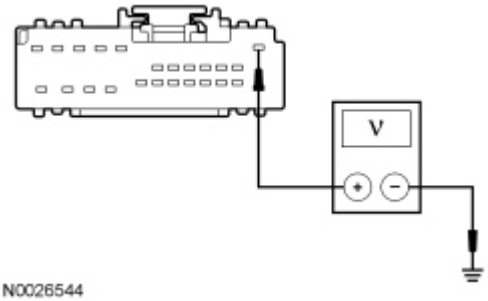
NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**





NOTE: DTC B1317, B1318 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

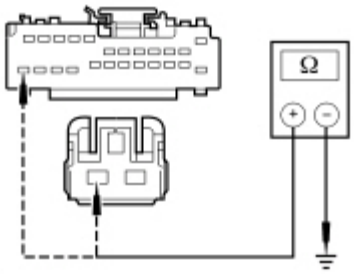


NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

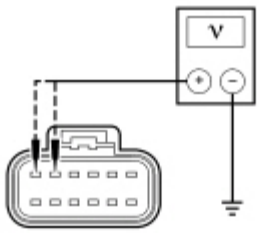
Test Step	Result / Action to Take
AL1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ALL CMDTCs . • **Is DTC B1317, B1318, B2486, B1676, U3003:16 or U3003:17 present in one or more modules and are any charging system DTCs present in the PCM?**	**Yes** REFER to Section 414-00 to diagnose the charging system. **No** GO to AL2 .
AL2 CHECK THE BATTERY CONDITION	
NOTE: DTC B1317, B1318, B2486, B1676, U3003:16 or U3003:17 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on. • Ignition OFF. • Carry out the Battery Condition Test. Refer to Section 414-01 . • **Did the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to AL3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
AL3 CHECK THE CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite	**Yes** For DSM DTC B1317 or

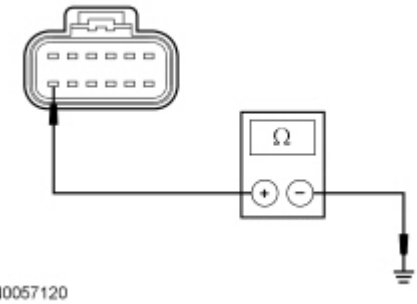
and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery with and without a load on the charging system as follows: ▪ Turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring the battery voltage. ▪ Turn on the headlights and HVAC blower on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring the battery voltage.  AJ0210-A • **Are the voltages between 13 and 15.2 volts?**	B1318, GO to AL4 . For DCSM DTC B2486, GO to AL7 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.
AL4 CHECK FOR VOLTAGE TO THE DSM • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: DSM C341A and C341B . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between DSM C341A-1, circuit CBX05 (VT/RD), harness side and ground.  N0067979 • Measure the voltage between DSM C341B-1, circuit CBX03 (BU/RD), harness side and ground.	**Yes** GO to AL5 . **No** VERIFY the Battery Junction Box (BJB) fuse 74 (30A) and Body Control Module (BCM) 7 (7.5A) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR all CMDTCs . REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .



repair4less

N0026544





- **Are the voltages greater than 10 volts?**

AL5 CHECK THE DSM GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF.
• Measure the resistance between:
  ▪ DSM C341A-2, circuit GD906 (BK/GY), harness side and ground.
  ▪ DSM C341B-24, circuit GD905 (BK/GN), harness side and ground.

 	
N0067980
• Repeat this measurement while wiggling the harness.
• **Are the resistances less than 5 ohms?**
	Yes
	GO to AL6 .
	
	No
	REPAIR the circuit(s). CLEAR all CMDTCs . REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .

AL6 CHECK FOR CORRECT DSM OPERATION	

• Check the harness and component side connectors for the following:
  ▪ corrosion.
  ▪ damaged pins.
  ▪ pushed-out pins.
• Connect: DSM C341A and C341B .
• Make sure the DSM connectors are seated correctly.
• Operate the memory seat, mirrors and pedals to verify correct memory system operation.
• Enter the following diagnostic mode on the scan tool: Self Test — DSM .
• **Is DTC B1317 or B1318 still present?**
	Yes
	INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. CLEAR all CMDTCs . REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS . REFER to Section 501-20B .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all CMDTCs . REPEAT the self-test.

	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B.
AL7 CHECK FOR VOLTAGE TO THE DCSM • Ignition OFF. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Passenger Seat Side Air Bag Module C339. • Disconnect: DCSM C3265A. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Ignition ON. • Measure the voltage between: ▪ DCSM C3265A-E, circuit CBX01 (GN/RD), harness side and ground. ▪ DCSM C3265A-F, circuit CBX01 (GN/RD), harness side and ground.  N0042997 • **Are the voltages greater than 10 volts?**	**Yes** GO to AL8. **No** VERIFY the BJB fuse 69 (30A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR all CMDTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AL8 CHECK THE DCSM GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Measure the resistance between DCSM C3265A-M, circuit GD903 (BK/WH), harness side and ground.  N0057120 • Repeat this measurement while wiggling the harness. • **Is the resistance less than 5 ohms?**	**Yes** GO to AL9. **No** REPAIR the circuit. CLEAR all CMDTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AL9 CHECK FOR CORRECT DCSM OPERATION	

repair4less

• Check the harness and component side connectors for the following:
  ▪ corrosion.
  ▪ damaged pins.
  ▪ pushed-out pins.
• Connect: DCSM C3265A .
• Make sure the DCSM connector is seated correctly.
• Start the engine.
• Operate the climate controlled seats and verify system operation.
• Enter the following diagnostic mode on the scan tool: Self Test — DCSM .
• **Is DTC B2486 still present?**
	Yes
	INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR all CMDTCs . REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all CMDTCs . REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AM: DTC B2729

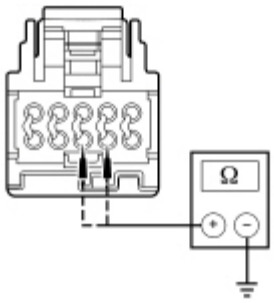
Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The Dual Climate Controlled Seat Module (DCSM) monitors seat cushion temperature while it supplies voltage and ground to both blower motors. The DCSM also supplies a variable voltage signal to control the blower speed. Cabin air enters the blower through a filter attached to the Thermo-Electric Device (TED) housing. Heated or cooled air exits the TED and flows through a manifold attached to the foam pad.

- DTC B2729 (Cushion Over-Temp Detected) — If the driver seat cushion TED temperature exceeds 85°C (185°F) in heat mode or 70°C (158°F) in cool mode for more than 34 seconds the DCSM shuts down the driver seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:



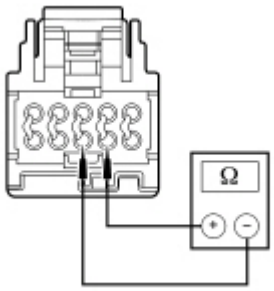
- Wiring, terminals or connectors
- Restricted cushion TED filter
- Crushed or restricted climate controlled seat manifold
- Cushion TED assembly

PINPOINT TEST AM: DTC B2729

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.



Test Step	Result / Action to Take
AM1 CHECK THE DCSM FOR ON-DEMAND DTCs	
• Start the vehicle and set the driver seat to HIGH heat. • Enter the following diagnostic mode on the scan tool: Self Test — DCSM . • **Was DTC B2729 retrieved on-demand during the self-test?**	**Yes** GO to AM2 . **No** GO to AM5 .
AM2 CHECK THE DRIVER SEAT CUSHION TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Side Air Bag C3051 and Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265B . • Disconnect: Driver Seat Cushion TED C3035 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between: ▪ DCSM C3265B-7, circuit VHS26 (VT), harness side and ground. ▪ DCSM C3265B-8, circuit RHS05 (YE/VT), harness side and ground.  N0042889 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AM3 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AM3 CHECK THE DRIVER SEAT CUSHION TED THERMISTOR	

repair4less

AND WIRING

- Connect: Driver Seat Cushion TED C3035 .
- Measure the resistance between DCSM C3265B-7, circuit VHS26 (VT), harness side and DCSM C3265B-8, circuit RHS05 (YE/VT), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

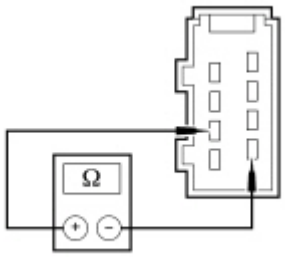
- **Is the resistance within the limits indicated?**

Yes
GO to AM18 .

No
GO to AM4 .

AM4 CHECK THE DRIVER SEAT CUSHION TED THERMISTOR

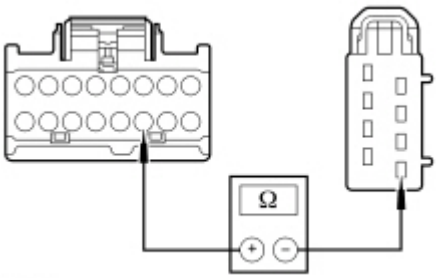
- Disconnect: Driver Seat Cushion TED C3035 .
- Measure the resistance between driver seat cushion TED C3035 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

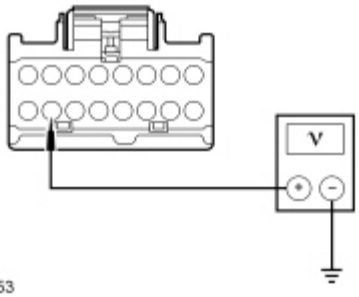


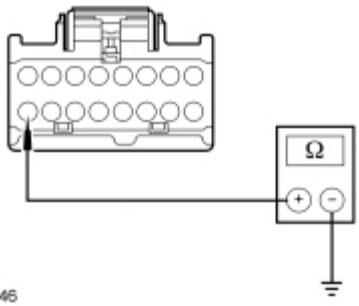
Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

Yes
REPAIR circuit VHS26 (VT) or RHS05 (YE/VT) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339.



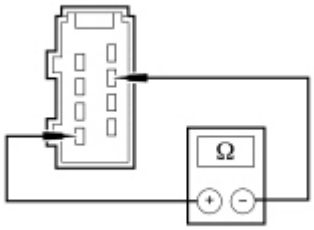




REPOWER the SRS . REFER to Section 501-20B .

No
INSTALL a new driver seat cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

 N0053767 • **Is the resistance within the limits indicated?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AM5 CONFIRM THE FAULT WHILE MONITORING THE DCSM SEAT BACK THERMAL ELECTRIC DEVICE TEMPERATURE (BK_TEMP) AND SEAT CUSHION THERMAL ELECTRIC DEVICE TEMPERATURE (CSHTEMP) PIDs	
• Set the driver seat to OFF. • Enter the following diagnostic mode on the scan tool: Clear DTCs - DCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - DCSM . • Monitor the DCSM PIDs BK_TEMP and CSHTEMP. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault making it necessary to occupy the seat to recreate and identify the fault. • Attempt to recreate the fault. Start the vehicle and set the driver seat to HIGH heat for at least 15 minutes while occupying the seat. • **Do the PIDs increase incrementally (gradually) and stay within 15°C (27°F) of each other?**	**Yes** The fault is not present at this time. The fault may have been set due to a past failure, incorrect use of the climate controlled seat system by repeated switching between heat and cool modes or due to excessive passenger compartment temperature. CLEAR the DTCs. REPEAT the self-test. **No** If the CSHTEMP PID increases incrementally and is greater than 15°C (27°F) of the BK_TEMP PID, GO to AM6 . If the CSHTEMP PID increases quickly (temperature "jumps" and does not increase incrementally) and is greater than 15°C (27°F) of the BK_TEMP PID, GO to AM16 .
AM6 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS	
• With the engine running, set both front seats to HIGH cool. • Note the airflow exhausting from the driver seat cushion TED and compare it to the airflow exhausting from the passenger seat cushion TED . • Carry out a wiggle test of the wire harnesses between the DCSM and the driver seat cushion TED while monitoring blower operation of the TED . The blower should operate consistently and not change speeds. • **Is the airflow exhausting from the driver seat cushion TED comparable to the airflow exhausting from the passenger seat cushion TED with no change in operation when carrying out the wiggle test?**	**Yes** GO to AM7 . **No** If the airflow exhausting from the driver seat cushion TED is not comparable to the airflow exhausting from the passenger seat cushion TED , GO to AM8 . If the driver seat cushion TED



repair4less

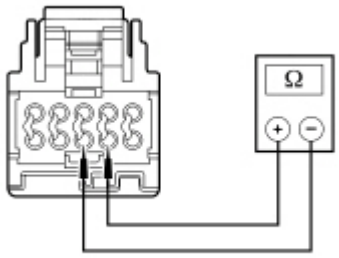
	blower operation changed while carrying out the wiggle test, IDENTIFY and REPAIR the wiring fault. CLEAR the DTCs. REPEAT the self-test.
AM7 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS WHILE OCCUPIED	
• Note the airflow exhausting from the driver seat cushion TED with the driver seat occupied and compare it to the airflow exhausting from the passenger seat cushion TED with the passenger seat occupied. • **Is the airflow exhausting from the driver seat cushion TED comparable to the airflow exhausting from the passenger seat cushion TED ?**	**Yes** GO to AM16 . **No** INSTALL a new driver seat cushion foam pad and/or climate controlled seat manifold. CLEAR the DTCs. REPEAT the self-test.
AM8 CHECK THE DRIVER SEAT CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER	
• Ignition OFF. • Inspect the blower of the driver seat cushion TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. CLEAR the DTCs. REPEAT the self-test. **No** GO to AM9 .
AM9 CHECK THE DRIVER SEAT CUSHION BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Side Air Bag C3051 and Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265C . • Disconnect: Driver Seat Cushion TED C3035 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between DCSM C3265C-11, circuit VHS18 (BN/GN), harness side and driver seat cushion TED C3035-7, circuit VHS18 (BN/GN), harness side.	**Yes** GO to AM10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

 N0058092 • **Is the resistance less than 5 ohms?**	
AM10 CHECK THE DRIVER SEAT CUSHION BLOWER CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between DCSM C3265C-15, circuit RHS03 (GY/OG), harness side and ground.  N0044853 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** GO to AM11.
AM11 CHECK THE DRIVER SEAT CUSHION BLOWER CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and ground.  N0044846 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AM12. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AM12 CHECK THE DRIVER SEAT CUSHION BLOWER CIRCUITS FOR AN OPEN	
• Measure the resistance between: ▪ DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and driver seat cushion TED C3035-2, circuit CHS03 (GN/BN), harness side.	**Yes** GO to AM13. **No**

repair4less

▪ DCSM C3265C-15, circuit RHS03 (GY/OG), harness side and driver seat cushion TED C3035-4, circuit RHS03 (GY/OG), harness side.  N0108651 • **Are the resistances less than 5 ohms?**	REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AM13 CHECK THE DRIVER SEAT CUSHION BLOWER RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged.** • Measure the resistance between driver seat cushion TED C3035 pin 2 and pin 4, component side.  N0053768 • **Is the resistance between 4,000 ohms and 10,000 ohms?**	**Yes** GO to AM14. **No** INSTALL a new driver seat cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AM14 CHECK THE DRIVER SEAT CUSHION BLOWER SPEED CONTROL RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged.** • Measure the resistance between driver seat cushion TED C3035 pin 7 and pin 4, component side.	**Yes** GO to AM15. **No** INSTALL a new driver seat cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag

 N0054028 • **Is the resistance between 240K ohms and 400K ohms?**	module C339. REPOWER the SRS . REFER to Section 501-20B .
AM15 CHECK THE DRIVER SEAT CUSHION TED INSTALLATION AND FOR CRUSHED SEAT CUSHION	



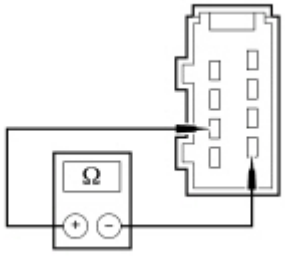
• Ignition OFF.
• Remove the driver seat. Refer to Seat — Front in this section.
• Remove the driver seat cushion cover. Refer to Seat Cushion Cover — Front in this section.
• Inspect the driver seat cushion for the following:
  ▪ Is the driver seat cushion TED correctly installed?
  ▪ Is the driver seat cushion seat cushion foam pad crushed or restricted?
  ▪ Is the driver seat cushion climate controlled seat manifold crushed or restricted?
• **Is the driver seat cushion TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	INSTALL the driver seat cushion cover and seat and GO to AM18 .
	
	No
	CORRECTLY install the driver seat cushion TED or INSTALL a new driver seat cushion foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339.
	
	REPOWER the SRS .
	REFER to Section 501-20B .

AM16 CHECK THE DRIVER SEAT CUSHION TED THERMISTOR AND WIRING	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Side Air Bag C3051 and Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265B . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between DCSM C3265B-7, circuit	**Yes** GO to AM18 . **No** GO to AM17 .

repair4less

VHS26 (VT), harness side and C3265B-8 circuit RHS05 (YE/VT), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms



N0100803

- **Is the resistance within the limits indicated?**

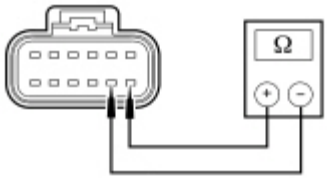
AM17 CHECK THE DRIVER SEAT CUSHION TED THERMISTOR

- Measure the resistance between driver seat cushion TED C3035 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

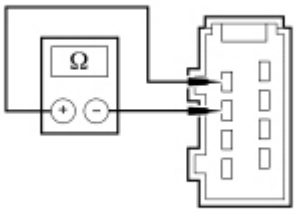
N0053767

- **Is the resistance within the limits indicated?**



Yes
REPAIR circuit VHS26 (VT) or RHS05 (YE/VT) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339.



REPOWER the SRS. REFER to Section 501-20B.

No
INSTALL a new TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag

	module C339. REPOWER the SRS . REFER to Section 501-20B .
AM18 CHECK THE DRIVER SEAT CUSHION TED HEATING/COOLING CIRCUITRY CURRENT DRAW	
• Connect: All DCSM , TED and body harness-to-seat harness connectors . • ***NOTICE:*** **It may be necessary to open the seat wire harness conduit to allow placing the inductive current probe around the circuit as described in the following step. Care must be taken when opening up the wire harness so as not to damage any wiring or connectors. Do not damage any wiring or induce stress on any wiring or connectors. Close up the wire harness once repairs to the seat are complete.** • **NOTE:** Use a commercially available inductive current probe (such as Electronic Specialties Current Probe/Multimeter 685 or a Fluke I410 [used with a digital multimeter]) or the low current probe from the Vehicle Measurement Module available for use with Integrated Diagnostic System (IDS). If these are unavailable, the inductive current probe feature from a battery tester may be substituted. • Place an inductive current probe around circuit CHS02 (YE/BU) near DCSM C3265A-G and monitor the current draw. • Start the vehicle and set the driver seat to HIGH heat. • **Is the current draw less than 11 amps?**	**Yes** GO to AM19 . **No** INSTALL a new driver seat cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AM19 CHECK RESISTANCE OF THE DRIVER SEAT CUSHION TED AND WIRING	
• Ignition OFF. • Disconnect: DCSM C3265A . • Measure the resistance between DCSM C3265A-G circuit CHS02 (YE/BU), harness side and C3265A-H, circuit RHS02 (BU/OG), harness side.  N0042194 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AM21 . **No** GO to AM20 .
AM20 CHECK THE RESISTANCE OF THE DRIVER SEAT CUSHION TED	
• Disconnect: Driver Seat Cushion TED C3035 . • Measure the resistance between driver seat cushion TED C3035 pin 1 and pin 3, component side.	**Yes** REPAIR circuit CHS02 (YE/BU) or RHS02 (BU/OG) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery

repair4less

 N0053766 • **Is the resistance between 0.9 and 10 ohms?**	ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** INSTALL a new driver seat cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AM21 CHECK FOR CORRECT DCSM OPERATION • Inspect the DCSM and driver seat cushion TED harness and component side connectors and the body harness-to-seat harness connectors for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect: All DCSM, TED and Body Harness-to-Seat Harness Connectors . • Make sure the connectors are seated correctly. • Start the engine. • Set the driver seat to OFF. • Enter the following diagnostic mode on the scan tool: Clear DTCs - DCSM. • Attempt to recreate the fault. With the engine still running set the driver seat to HIGH heat for at least 15 minutes. • **Is the concern still present?**	**Yes** INSTALL a new DCSM. REFER to Dual Climate Controlled Seat Module (DCSM) in this section. REPEAT the self-test. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag

	module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AN: DTC B272A

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The Dual Climate Controlled Seat Module (DCSM) monitors seat cushion temperature while it supplies voltage and ground to both blower motors. The DCSM also supplies a variable voltage signal to control the blower speed. Cabin air enters the blower through a filter attached to the Thermo-Electric Device (TED) housing. Heated or cooled air exits the TED and flows through a manifold attached to the foam pad.

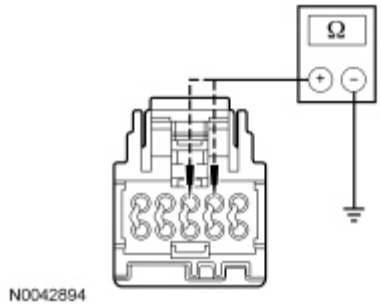
- DTC B272A (Passenger Cushion Over-Temp Detected) — If the passenger seat cushion TED temperature exceeds 85°C (185°F) in heat mode or 70°C (158°F) in cool mode for more than 34 seconds the DCSM shuts down the passenger seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion TED filter
- Crushed or restricted climate controlled seat manifold
- Cushion TED assembly

PINPOINT TEST AN: DTC B272A

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**



NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AN1 CHECK THE DCSM FOR ON-DEMAND DTCs	
• Start the vehicle and set the passenger seat to HIGH heat. • Enter the following diagnostic mode on the scan tool: Self Test — DCSM . • **Was DTC B272A retrieved on-demand during the self-test?**	**Yes** GO to AN2 . **No** GO to AN5 .
AN2 CHECK THE PASSENGER SEAT CUSHION TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	

repair4less

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
- Disconnect: Passenger Seat Side Air Bag C339 .
- Disconnect: DCSM C3265B .
- Disconnect: Passenger Seat Cushion TED C3040 .
- **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**
- Connect the battery ground cable. Refer to Section 414-01 .
- Measure the resistance between:
  - DCSM C3265B-2, circuit VHS27 (WH/OG), harness side and ground.
  - DCSM C3265B-3, circuit RHS10 (BU/OG), harness side and ground.

N0042894

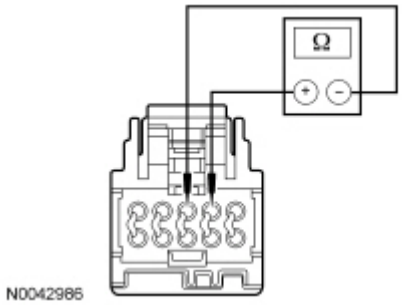
- **Are the resistances greater than 10,000 ohms?**

Yes
GO to AN3 .

No
REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

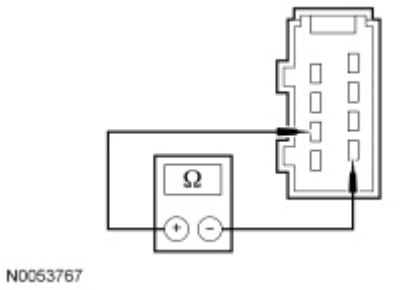
DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.

REPOWER the SRS .
REFER to Section 501-20B .



AN3 CHECK THE PASSENGER SEAT CUSHION TED THERMISTOR AND WIRING

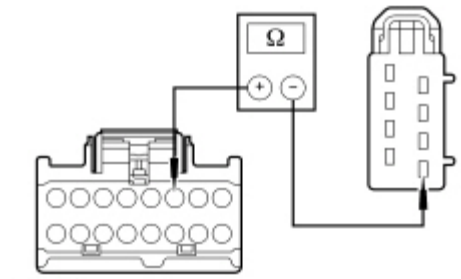
- Connect: Passenger Seat Cushion TED C3040 .
- Measure the resistance between DCSM C3265B-2, circuit VHS27 (WH/OG), harness side and DCSM C3265B-3, circuit RHS10 (BU/OG), harness side. Note the ambient temperature and refer to the following table.

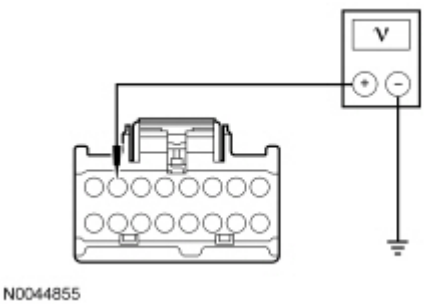


Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

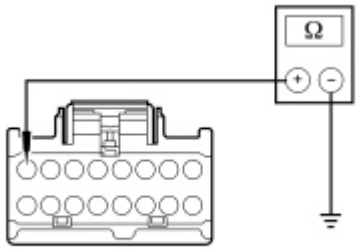
Yes
GO to AN18 .

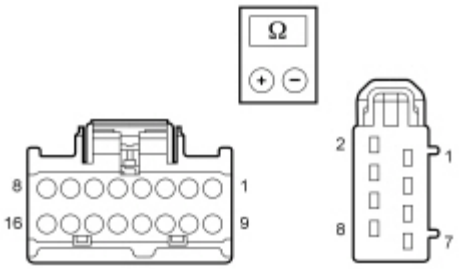
No
GO to AN4 .



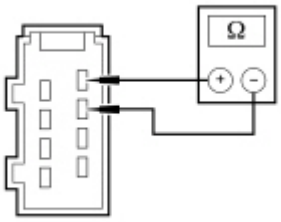


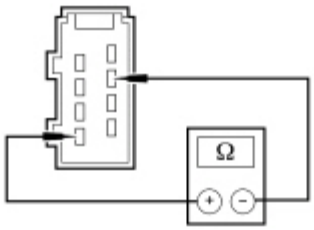
- **Is the resistance within the limits indicated?**





AN4 CHECK THE PASSENGER SEAT CUSHION TED THERMISTOR	
• Disconnect: Passenger Seat Cushion TED C3040 . • Measure the resistance between passenger seat cushion TED C3040 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) / 2,782-1,663 ohms 10-20°C (50-68°F) / 1,837-1,140 ohms 20-30°C (68-86°F) / 1,260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms  • **Is the resistance within the limits indicated?**	**Yes** REPAIR circuit VHS27 (WH/OG) or RHS10 (BU/OG) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new passenger seat cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AN5 CONFIRM THE FAULT WHILE MONITORING THE DCSM SEAT BACK THERMAL ELECTRIC DEVICE TEMPERATURE (PBKTEMP) AND SEAT CUSHION THERMAL ELECTRIC DEVICE TEMPERATURE (PCSHTEMP) PIDs	
• Set the passenger seat to OFF. • Enter the following diagnostic mode on the scan tool: Clear DTCs - DCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - DCSM . • Monitor the DCSM PIDs PBKTEMP and PCSHTEMP. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault making it necessary to occupy the seat to recreate and identify the fault.	**Yes** The fault is not present at this time. The fault may have been set due to a past failure, incorrect use of the climate controlled seat system by repeated switching between heat and cool modes or due to excessive passenger



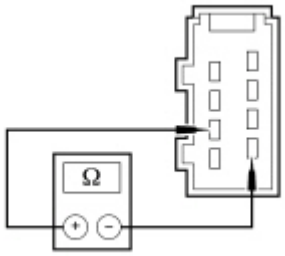


repair4less

• Attempt to recreate the fault. Start the vehicle and set the passenger seat to HIGH heat for at least 15 minutes while occupying the seat. • **Do the PIDs increase incrementally (gradually) and stay within 15°C (27°F) of each other?**	compartment temperature. CLEAR the DTCs. REPEAT the self-test. **No** If the PCSHTEMP PID increases incrementally and is greater than 15°C (27°F) of the PBKTEMP PID, GO to AN6 . If the PCSHTEMP PID increases quickly (temperature "jumps" and does not increase incrementally) and is greater than 15°C (27°F) of the PBKTEMP PID, GO to AN16 .
AN6 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS	
• With the engine running, set both front seats to HIGH cool. • Note the airflow exhausting from the passenger seat cushion TED and compare it to the airflow exhausting from the driver seat cushion TED . • Carry out a wiggle test of the wire harnesses between the DCSM and the passenger seat cushion TED while monitoring blower operation of the TED . The blower should operate consistently and not change speeds. • **Is the airflow exhausting from the passenger seat cushion TED comparable to the airflow exhausting from the driver seat cushion TED with no change in operation when carrying out the wiggle test?**	**Yes** GO to AN7 . **No** If the airflow exhausting from the passenger seat cushion TED is not comparable to the airflow exhausting from the driver seat cushion TED , GO to AN8 . If the passenger seat cushion TED blower operation changed while carrying out the wiggle test, IDENTIFY and REPAIR the wiring fault. CLEAR the DTCs. REPEAT the self-test.
AN7 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS WHILE OCCUPIED	
• Note the airflow exhausting from the passenger seat cushion TED with the passenger seat occupied and compare it to the airflow exhausting from the driver seat cushion TED with the driver seat occupied. • **Is the airflow exhausting from the passenger seat cushion TED comparable to the airflow exhausting from the driver seat cushion TED ?**	**Yes** GO to AN16 . **No** INSTALL a new passenger seat cushion foam pad and/or climate controlled seat manifold. CLEAR the DTCs. REPEAT the self-test.
AN8 CHECK THE PASSENGER SEAT CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER	
• Ignition OFF. • Inspect the blower of the passenger seat cushion TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. CLEAR the DTCs. REPEAT the self-test.

	No GO to AN9 .
AN9 CHECK THE PASSENGER SEAT CUSHION BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265C . • Disconnect: Passenger Seat Cushion TED C3040 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between DCSM C3265C-3, circuit VHS23 (BN/BU), harness side and passenger seat cushion TED C3040-7, circuit VHS23 (BN/BU), harness side.  N0058093 • **Is the resistance less than 5 ohms?**	**Yes** GO to AN10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AN10 CHECK THE PASSENGER SEAT CUSHION BLOWER CIRCUIT FOR A SHORT TO VOLTAGE • Ignition ON. • Measure the voltage between DCSM C3265C-7, circuit RHS08 (VT/WH), harness side and ground.  N0044855 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AN11 .
AN11 CHECK THE PASSENGER SEAT CUSHION BLOWER CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Measure the resistance between DCSM C3265C-8, circuit	**Yes** GO to AN12 .

repair4less



CHS08 (BN/YE), harness side and ground.  N0044848 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AN12 CHECK THE PASSENGER SEAT CUSHION BLOWER CIRCUITS FOR AN OPEN	
• Measure the resistance between: ▪ DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and passenger seat cushion TED C3040-2, circuit CHS08 (BN/YE), harness side. ▪ DCSM C3265C-7, circuit RHS08 (VT/WH), harness side and passenger seat cushion TED C3040-4, circuit RHS08 (VT/WH), harness side.  N0108651 • **Are the resistances less than 5 ohms?**	**Yes** GO to AN13. **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AN13 CHECK THE PASSENGER SEAT CUSHION BLOWER RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged.** • Measure the resistance between passenger seat cushion TED C3040 pin 2 and pin 4, component side.	**Yes** GO to AN14. **No** INSTALL a new passenger seat cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.

 N0053768 • **Is the resistance between 4,000 ohms and 10,000 ohms?**	
AN14 CHECK THE PASSENGER SEAT CUSHION BLOWER SPEED CONTROL RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged.** • Measure the resistance between passenger seat cushion TED C3040 pin 7 and pin 4, component side.  N0054028 • **Is the resistance between 240K ohms and 400K ohms?**	**Yes** GO to AN15 . **No** INSTALL a new passenger seat cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AN15 CHECK THE PASSENGER SEAT CUSHION TED INSTALLATION AND FOR CRUSHED SEAT CUSHION	
• Ignition OFF. • Remove the passenger seat. Refer to Seat — Front in this section. • Remove the passenger seat cushion cover. Refer to Seat Cushion Cover — Front in this section. • Inspect the passenger seat cushion for the following: ▪ Is the passenger seat cushion TED correctly installed? ▪ Is the passenger seat cushion seat cushion foam pad crushed or restricted? ▪ Is the passenger seat cushion climate controlled seat manifold crushed or restricted? • **Is the passenger seat cushion TED correctly installed and are there no signs of damage to the foam pad and manifold?**	**Yes** INSTALL the passenger seat cushion cover and seat and GO to AN18 . **No** CORRECTLY install the passenger seat cushion TED or INSTALL a new passenger seat cushion foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.

repair4less

	REPOWER the SRS . REFER to Section 501-20B .
AN16 CHECK THE PASSENGER SEAT CUSHION TED THERMISTOR AND WIRING • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265B . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between DCSM C3265B-2, circuit VHS27 (WH/OG), harness side and C3265B-3 circuit RHS10 (BU/OG), harness side. Note the ambient temperature and refer to the following table. Temperature / Resistance 0-10°C (32-50°F) / 2,782-1,663 ohms 10-20°C (50-68°F) / 1,837-1,140 ohms 20-30°C (68-86°F) / 1,260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms  N0100803 • **Is the resistance within the limits indicated?**	**Yes** GO to AN18 . **No** GO to AN17 .
AN17 CHECK THE PASSENGER SEAT CUSHION TED THERMISTOR • Measure the resistance between passenger seat cushion TED C3040 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. Temperature / Resistance 0-10°C (32-50°F) / 2,782-1,663 ohms	**Yes** REPAIR circuit VHS27 (WH/OG) or RHS10 (BU/OG) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery

10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

N0053767

- **Is the resistance within the limits indicated?**

ground cable. CONNECT passenger seat side air bag module C339.

REPOWER the SRS. REFER to Section 501-20B.

No
INSTALL a new TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.

REPOWER the SRS. REFER to Section 501-20B.

AN18 CHECK THE PASSENGER SEAT CUSHION TED HEATING/COOLING CIRCUITRY CURRENT DRAW

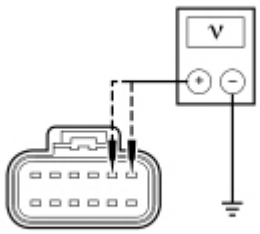
- Connect: All DCSM, TED and Body Harness-to-Seat Harness Connectors.
- ***NOTICE:*** **It may be necessary to open the seat wire harness conduit to allow placing the inductive current probe around the circuit as described in the following step. Care must be taken when opening up the wire harness so as not to damage any wiring or connectors. Do not damage any wiring or induce stress on any wiring or connectors. Close up the wire harness once repairs to the seat are complete.**
- **NOTE:** Use a commercially available inductive current probe (such as Electronic Specialties Current Probe/Multimeter 685 or a Fluke I410 [used with a digital multimeter]) or the low current probe from the Vehicle Measurement Module available for use with Integrated Diagnostic System (IDS). If these are unavailable, the inductive current probe feature from a battery tester may be substituted.
- Place an inductive current probe around circuit CHS07 (GY/BU) near DCSM C3265A-A and monitor the current draw.
- Start the vehicle and set the passenger seat to HIGH heat.
- **Is the current draw less than 11 amps?**

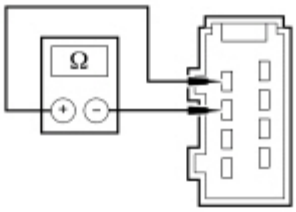
Yes
GO to AN19.

No
INSTALL a new passenger seat cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.

REPOWER the SRS. REFER to Section 501-20B.





AN19 CHECK RESISTANCE OF THE PASSENGER SEAT CUSHION TED AND WIRING

- Ignition OFF.
- Disconnect: DCSM C3265A.
- Measure the resistance between DCSM C3265A-A circuit CHS07 (GY/BU), harness side and C3265A-B, circuit RHS07 (BU), harness side.

Yes
GO to AN21.

No
GO to AN20.

repair4less

 N0042885 • **Is the resistance between 0.9 and 10 ohms?**	
AN20 CHECK THE RESISTANCE OF THE PASSENGER SEAT CUSHION TED	
• Disconnect: Passenger Seat Cushion TED C3040 . • Measure the resistance between passenger seat cushion TED C3040 pin 1 and pin 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR circuit CHS07 (GY/BU) or RHS07 (BU) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new passenger seat cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AN21 CHECK FOR CORRECT DCSM OPERATION	
• Inspect the DCSM and passenger seat cushion TED harness and component side connectors and the body harness-to-seat harness connectors for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect: All DCSM , TED and Body Harness-to-Seat Harness Connectors . • Make sure the connectors are seated correctly. • Start the engine. • Set the passenger seat to OFF. • Enter the following diagnostic mode on the scan tool: Clear	**Yes** INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. REPEAT the self-test. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag

DTCs - DCSM . • Attempt to recreate the fault. With the engine still running set the passenger seat to HIGH heat for at least 15 minutes. • **Is the concern still present?**	module C339. REPOWER the SRS . REFER to Section 501-20B . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AO: DTC B272B

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

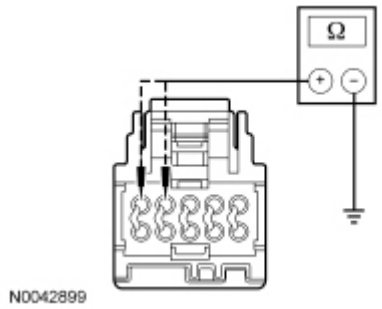
The Dual Climate Controlled Seat Module (DCSM) monitors seat backrest temperature while it supplies voltage and ground to both blower motors. The DCSM also supplies a variable voltage signal to control the blower speed. Cabin air enters the blower through a filter attached to the Thermo-Electric Device (TED) housing. Heated or cooled air exits the TED and flows through a manifold attached to the foam pad.

- DTC B272B (Passenger Back Over-Temp Detected) — If the passenger seat backrest TED temperature exceeds 85°C (185°F) in heat mode or 70°C (158°F) in cool mode for more than 34 seconds the DCSM shuts down the passenger seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted backrest TED filter
- Crushed or restricted climate controlled seat manifold
- Backrest TED assembly

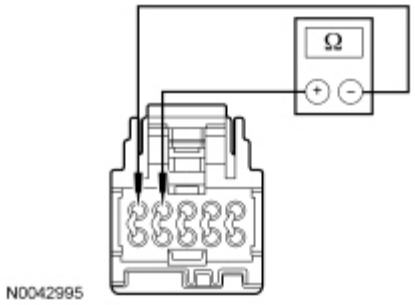
PINPOINT TEST AO: DTC B272B



NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

repair4less



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

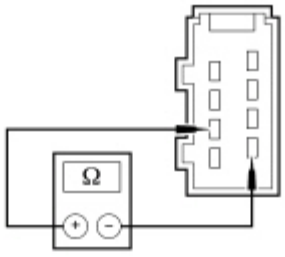
Test Step	Result / Action to Take
AO1 CHECK THE DCSM FOR ON-DEMAND DTCs	
• Start the vehicle and set the passenger seat to HIGH heat. • Enter the following diagnostic mode on the scan tool: Self Test — DCSM . • **Was DTC B272B retrieved on-demand during the self-test?**	**Yes** GO to AO2 . **No** GO to AO5 .
AO2 CHECK THE PASSENGER SEAT BACKREST TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
• Disconnect: Passenger Seat Side Air Bag C339 .
• Disconnect: DCSM C3265B .
• Disconnect: Passenger Seat Backrest TED C3039 .
• **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**
• Connect the battery ground cable. Refer to Section 414-01 .
• Measure the resistance between:
  ▪ DCSM C3265B-4, circuit VHS36 (YE/BU), harness side and ground.
  ▪ DCSM C3265B-5, circuit RHS20 (GN/BU), harness side and ground.

 	
N0042899
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to AO3 .
	
	No
	REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.
	
	REPOWER the SRS .
	REFER to Section 501-20B .

AO3 CHECK THE PASSENGER SEAT BACKREST TED THERMISTOR AND WIRING	
• Connect: Passenger Seat Backrest TED C3039 . • Measure the resistance between DCSM C3265B-4, circuit VHS36 (YE/BU), harness side and DCSM C3265B-5, circuit RHS20 (GN/BU), harness side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance**	**Yes** GO to AO18 . **No** GO to AO4 .

0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms



- **Is the resistance within the limits indicated?**

AO4 CHECK THE PASSENGER SEAT BACKREST TED THERMISTOR

- Disconnect: Passenger Seat Backrest TED C3039 .
- Measure the resistance between passenger seat backrest TED C3039 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

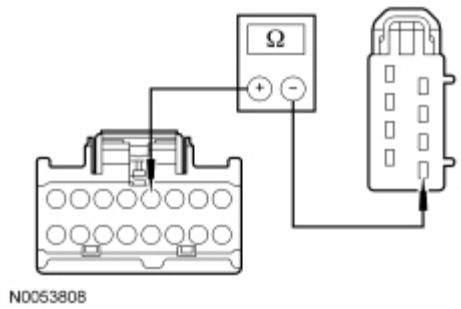
- **Is the resistance within the limits indicated?**

Yes
REPAIR circuit VHS35 (VT/OG) or RHS15 (GY/BN) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.

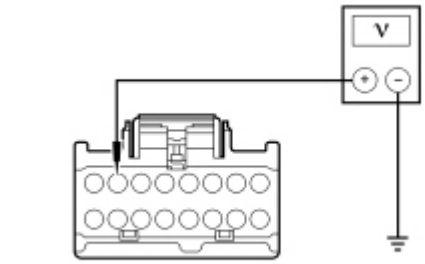
REPOWER the SRS . REFER to Section 501-20B .

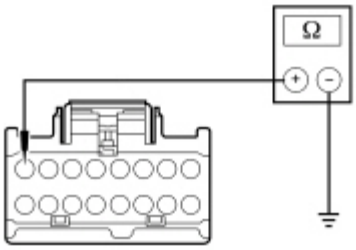
No
INSTALL a new passenger seat backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

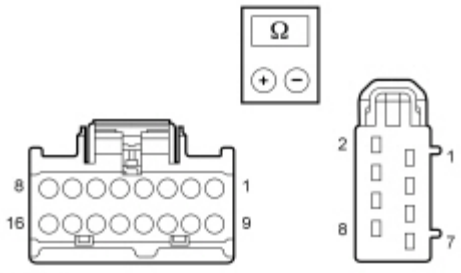


DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.

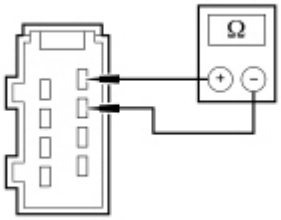
REPOWER the SRS . REFER to Section 501-20B .

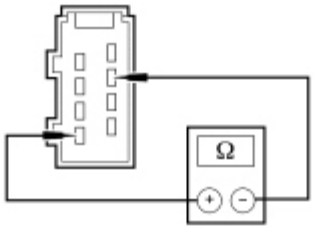






AO5 CONFIRM THE FAULT WHILE MONITORING THE DCSM SEAT BACK THERMAL ELECTRIC DEVICE TEMPERATURE (PBKTEMP) AND SEAT CUSHION THERMAL ELECTRIC DEVICE

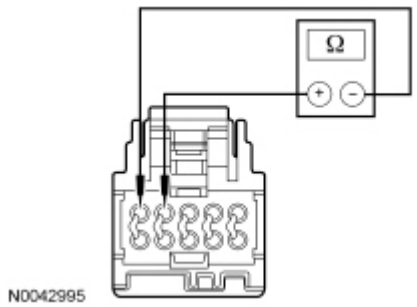




repair4less

TEMPERATURE (PCSHTEMP) PIDs	
• Set the passenger seat to OFF. • Enter the following diagnostic mode on the scan tool: Clear DTCs - DCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - DCSM . • Monitor the DCSM PIDs PBKTEMP and PCSHTEMP. • **NOTE:** A crushed seat backrest foam pad or a crushed climate controlled seat manifold may be the cause of the fault making it necessary to occupy the seat to recreate and identify the fault. • Attempt to recreate the fault. Start the vehicle and set the passenger seat to HIGH heat for at least 15 minutes while occupying the seat. • **Do the PIDs increase incrementally (gradually) and stay within 15°C (27°F) of each other?**	**Yes** The fault is not present at this time. The fault may have been set due to a past failure, incorrect use of the climate controlled seat system by repeated switching between heat and cool modes or due to excessive passenger compartment temperature. CLEAR the DTCs. REPEAT the self-test. **No** If the PBKTEMP PID increases incrementally and is greater than 15°C (27°F) of the PCSHTEMP PID, GO to AO6 . If the PBKTEMP PID increases quickly (temperature "jumps" and does not increase incrementally) and is greater than 15°C (27°F) of the PCSHTEMP PID, GO to AO16 .
AO6 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS	
• With the engine running, set both front seats to HIGH cool. • Note the airflow exhausting from the passenger seat backrest TED and compare it to the airflow exhausting from the driver seat backrest TED . • Carry out a wiggle test of the wire harnesses between the DCSM and the passenger seat backrest TED while monitoring blower operation of the TED . The blower should operate consistently and not change speeds. • **Is the airflow exhausting from the passenger seat backrest TED comparable to the airflow exhausting from the driver seat backrest TED with no change in operation when carrying out the wiggle test?**	**Yes** GO to AO7 . **No** If the airflow exhausting from the passenger seat backrest TED is not comparable to the airflow exhausting from the driver seat backrest TED , GO to AO8 . If the passenger seat backrest TED blower operation changed while carrying out the wiggle test, IDENTIFY and REPAIR the wiring fault. CLEAR the DTCs. REPEAT the self-test.
AO7 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS WHILE OCCUPIED	
• Note the airflow exhausting from the passenger seat backrest TED with the passenger seat occupied and compare it to the airflow exhausting from the driver seat backrest TED with the driver seat occupied. • **Is the airflow exhausting from the passenger seat backrest**	**Yes** GO to AO16 . **No** INSTALL a new passenger seat backrest foam pad

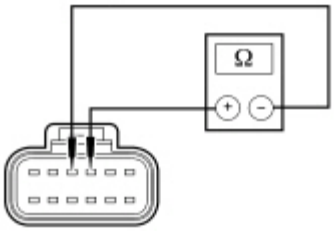
TED comparable to the airflow exhausting from the driver seat backrest TED ?	and/or climate controlled seat manifold. CLEAR the DTCs. REPEAT the self-test.
AO8 CHECK THE PASSENGER SEAT BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER	
• Ignition OFF. • Inspect the blower of the passenger seat backrest TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. CLEAR the DTCs. REPEAT the self-test. **No** GO to AO9 .
AO9 CHECK THE PASSENGER SEAT BACKREST BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265C . • Disconnect: Passenger Seat Backrest TED C3039 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between DCSM C3265C-4, circuit VHS21 (BU/WH), harness side and passenger seat backrest TED C3039-7, circuit VHS16 (BU/GN), harness side.  N0053808 • **Is the resistance less than 5 ohms?**	**Yes** GO to AO10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AO10 CHECK THE PASSENGER SEAT BACKREST BLOWER CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between DCSM C3265C-7, circuit RHS08 (VT/WH), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.



repair4less

 N0044855 • **Is any voltage present?**	REPOWER the SRS . REFER to Section 501-20B . **No** GO to AO11 .
AO11 CHECK THE PASSENGER SEAT BACKREST BLOWER CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and ground.  N0044848 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AO12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AO12 CHECK THE PASSENGER SEAT BACKREST BLOWER CIRCUITS FOR AN OPEN	
• Measure the resistance between: ▪ DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and passenger seat backrest TED C3039-2, circuit CHS03 (GN/BN), harness side. ▪ DCSM C3265C-7, circuit RHS08 (VT/WH), harness side and passenger seat backrest TED C3039-4, circuit RHS03 (GY/OG), harness side.  N0108651 • **Are the resistances less than 5 ohms?**	**Yes** GO to AO13 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AO13 CHECK THE PASSENGER SEAT BACKREST BLOWER RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the**	**Yes**

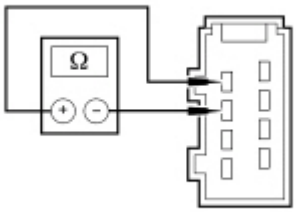
positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged. • Measure the resistance between passenger seat backrest TED C3039 pin 2 and pin 4, component side.  N0053768 • **Is the resistance between 4,000 ohms and 10,000 ohms?**	GO to AO14 . **No** INSTALL a new passenger seat backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AO14 CHECK THE PASSENGER SEAT BACKREST BLOWER SPEED CONTROL RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged.** • Measure the resistance between passenger seat backrest TED C3039 pin 7 and pin 4, component side.  N0054028 • **Is the resistance between 240K ohms and 400K ohms?**	**Yes** GO to AO15 . **No** INSTALL a new passenger seat backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AO15 CHECK THE PASSENGER SEAT BACKREST TED INSTALLATION AND FOR CRUSHED SEAT BACKREST	



• Ignition OFF.
• Remove the passenger seat. Refer to Seat — Front in this section.
• Remove the passenger seat backrest cover. Refer to Seat Backrest Cover — Front in this section.
• Inspect the passenger seat backrest for the following:
  ▪ Is the passenger seat backrest TED correctly installed?
  ▪ Is the passenger seat backrest foam pad crushed or restricted?
  ▪ Is the passenger seat backrest climate controlled seat manifold crushed or restricted?
• **Is the passenger seat backrest TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	INSTALL the passenger seat backrest cover and seat and GO to AO18 .
	
	No
	CORRECTLY install the passenger seat backrest TED or INSTALL a new passenger seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REFER to Section 414-01 . CLEAR

repair4less

	the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AO16 CHECK THE PASSENGER SEAT BACKREST TED THERMISTOR AND WIRING • Ignition OFF. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B. • Disconnect: Passenger Seat Side Air Bag C339. • Disconnect: DCSM C3265B. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Measure the resistance between DCSM C3265B-4, circuit VHS36 (YE/BU), harness side and C3265B-5 circuit RHS20 (GN/BU), harness side. Note the ambient temperature and refer to the following table. | Temperature	Resistance | |---|---| | 0-10°C (32-50°F) | 2,782-1,663 ohms | | 10-20°C (50-68°F) | 1,837-1,140 ohms | | 20-30°C (68-86°F) | 1,260-806 ohms | | 30-40°C (86-104°F) | 893-570 ohms | | 40-50°C (104-122°F) | 630-428 ohms |  • **Is the resistance within the limits indicated?**	**Yes** GO to AO18. **No** GO to AO17.
AO17 CHECK THE PASSENGER SEAT BACKREST TED THERMISTOR • Measure the resistance between passenger seat backrest TED	**Yes**



C3039 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) / 2,782-1,663 ohms 10-20°C (50-68°F) / 1,837-1,140 ohms 20-30°C (68-86°F) / 1,260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms  N0053767 • **Is the resistance within the limits indicated?**	REPAIR circuit VHS35 (VT/OG) or RHS15 (GY/BN) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** INSTALL a new TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AO18 CHECK THE PASSENGER SEAT BACKREST TED HEATING/COOLING CIRCUITRY CURRENT DRAW	
• Connect: All DCSM, TED and Body Harness-to-Seat Harness Connectors. • ***NOTICE:*** **It may be necessary to open the seat wire harness conduit to allow placing the inductive current probe around the circuit as described in the following step. Care must be taken when opening up the wire harness so as not to damage any wiring or connectors. Do not damage any wiring or induce stress on any wiring or connectors. Close up the wire harness once repairs to the seat are complete.** • **NOTE:** Use a commercially available inductive current probe (such as Electronic Specialties Current Probe/Multimeter 685 or a Fluke I410 [used with a digital multimeter]) or the low current probe from the Vehicle Measurement Module available for use with Integrated Diagnostic System (IDS). If these are unavailable, the inductive current probe feature from a battery tester may be substituted. • Place an inductive current probe around circuit CHS06 (BU/BN) near DCSM C3265A-C and monitor the current draw. • Start the vehicle and set the passenger seat to HIGH heat. • **Is the current draw less than 11 amps?**	**Yes** GO to AO19. **No** INSTALL a new passenger seat backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AO19 CHECK RESISTANCE OF THE PASSENGER SEAT BACKREST TED AND WIRING	
• Ignition OFF. • Disconnect: DCSM C3265A. • Measure the resistance between DCSM C3265A-C circuit CHS06 (BU/BN), harness side and C3265A-D, circuit RHS06 (WH), harness side.	**Yes** GO to AO21. **No** GO to AO20.

repair4less

N0042989

- **Is the resistance between 0.9 and 10 ohms?**

AO20 CHECK THE RESISTANCE OF THE PASSENGER SEAT BACKREST TED	
• Disconnect: Passenger Seat Backrest TED C3039 . • Measure the resistance between passenger seat backrest TED C3039 pin 1 and pin 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR circuit CHS01 (GY/VT) or RHS01 (WH/VT) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new passenger seat backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AO21 CHECK FOR CORRECT DCSM OPERATION	

• Inspect the DCSM and passenger seat backrest TED harness and component side connectors and the body harness-to-seat harness connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: All DCSM , TED and Body Harness-to-Seat Harness Connectors .
• Make sure the connectors are seated correctly.
• Start the engine.
• Set the passenger seat to OFF.
	Yes
	INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. REPEAT the self-test. TEST the system for normal operation.
	
	DISCONNECT the battery ground cable. CONNECT

• Enter the following diagnostic mode on the scan tool: Clear DTCs - DCSM . • Attempt to recreate the fault. With the engine still running set the passenger seat to HIGH heat for at least 15 minutes. • **Is the concern still present?**	passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AP: DTC B272C

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Climate controlled seats are independently controlled by the Dual Climate Controlled Seat Module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM , diagnostic testing can be carried out with the ignition ON. Both voltage supply circuits to the DCSM are spliced together internally, so if one circuit becomes open, both seats can still be operated. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

The seat cushion is equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, the seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on an affected seat are reporting very different temperatures to the DCSM . This may result from an airflow restriction or a circuit fault of either TED area. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and not the area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

- DTC B272C (Driver Differential Temperature Fault) — If there is a temperature differential between the driver backrest and cushion TED of 60°C (108°F) or more for more than 4 seconds, if the TED is disconnected or if the duct is blocked, this DTC sets. When this happens the first time in a key cycle, the DCSM puts the driver seat system into recovery mode (see Principles of Operation). If the system is able to recover, it functions normally. If the system is able to recover and it occurs a second time in the same key cycle, the DCSM shuts down the driver seat system.

repair4less

This pinpoint test is intended to diagnose the following:

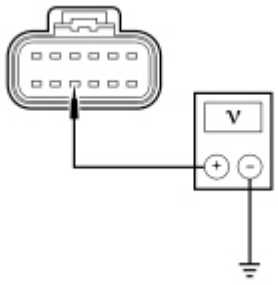
- Wiring, terminals or connectors
- Restricted cushion or backrest TED filter
- Crushed or restricted cushion or backrest foam pad
- Crushed or restricted cushion or backrest climate controlled seat manifold
- Cushion or backrest TED assembly
- DCSM

PINPOINT TEST AP: DTC B272C

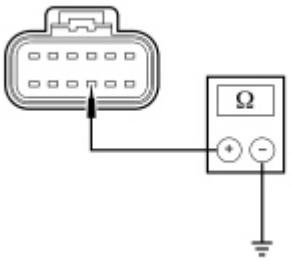
NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

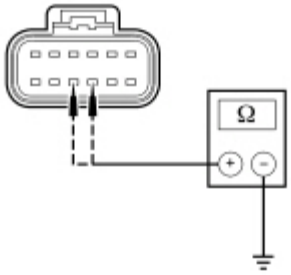
NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

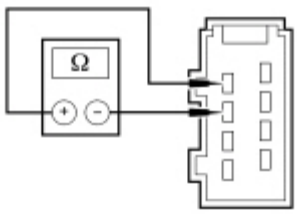
NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.



NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

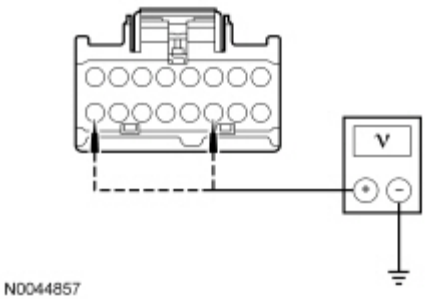


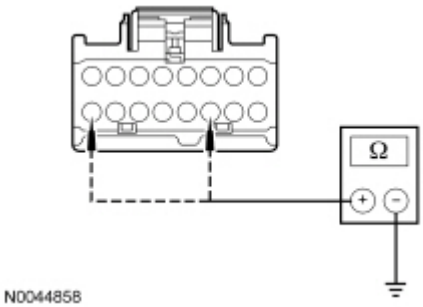




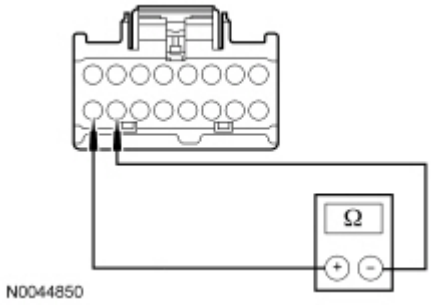
Test Step	Result / Action to Take
AP1 CHECK FOR DCSM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — DCSM . • **Was DTC B2729 or B2730 retrieved?**	**Yes** For DTC B2729, GO to Pinpoint Test AM . For DTC B2730, GO to Pinpoint Test AT . **No** GO to AP2 .
AP2 MONITOR THE DCSM TED TEMPERATURE PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger — DCSM . ▪ Passenger Cushion TED Temperature (PCSHTMP) ▪ Passenger Back TED Temperature (PBKTMP) ▪ Seat cushion TED temperature (CSHTEMP) ▪ Seat back TED temperature (BK_TEMP) • **NOTE:** Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs. Not allowing stabilization can cause incorrect readings and lead to incorrect identification of components that are not faulty. • Monitor TED temperature PIDs with the climate controlled seats OFF. Compare the PID values of the driver seat to those of the front passenger seat, this can help identify if there is a concern with the driver seat cushion or backrest PID value readings. • **Are both driver seat TED temperature PIDs within 10°**	**Yes** GO to AP3 . **No** If the driver seat cushion PID varies 10°C (18°F) or more from ambient temperature, GO to AP16 . If the driver seat backrest PID varies 10°C (18°F) or more from ambient temperature, GO to AP31 .

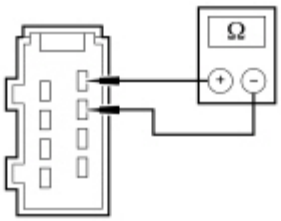
C (18°F) of the ambient temperature?	
AP3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR THE BACKREST • Ignition OFF. • Ignition ON. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • After cycling the ignition and with the engine running, set the driver seat to high heat. Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the driver seat. • **Do the driver seat cushion TED and backrest TED PIDs vary more than 60°C (108°F) from each other?**	**Yes** If the driver seat cushion PID is 60° C (108°F) hotter than the backrest PID, GO to AP5 . If the driver seat backrest PID is 60° C (108°F) hotter than the cushion PID, GO to AP20 . **No** GO to AP4 .
AP4 CHECK THE TEDs COOLING PERFORMANCE • Check the TEDs cooling performance on the affected seat. Refer to Component Test — Thermo-Electric Device (TED) Cooling Performance in this section. • **Did the TEDs pass the component test?**	**Yes** The DTC may have been set by extreme cabin temperatures or excessive sunload on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If a concern cannot be found or duplicated, RETURN the vehicle to the customer. **No** CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED , manifold, plenum, air ducts and foam pad). CHECK for airflow restrictions (TED inlets and outlets, TED -to-manifold or plenum connections, filters and ducts) and REPAIR as needed. CHECK for an intermittent wiring fault. REPAIR as needed. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.





AP5 CHECK FOR CORRECT TED INSTALLATION AND FOR CRUSHED FOAM
• Ignition OFF.
• Remove the seat. Refer to Seat — Front in this section.
• Remove the seat cushion trim cover. Refer to Seat Cushion Cover — Front in this section.
• Inspect the seat cushion for the following:
  ▪ Is the cushion blower obstructed?
  ▪ Is the blower filter restricted or plugged?
  ▪ Is the TED correctly installed?
	Yes
	GO to AP6 .
	
	No
	CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. INSTALL





repair4less

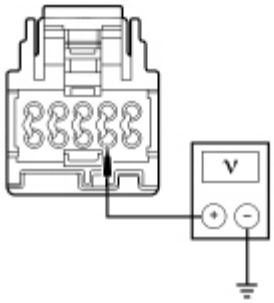
▪ Is the seat cushion foam pad crushed or restricted? ▪ Is the climate controlled seat manifold crushed or restricted? • **Is the TED correctly installed and the foam pad and manifold OK?**	the seat. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. REPOWER the SRS. REFER to Section 501-20B.
AP6 CHECK THE BACKREST TED - CIRCUIT FOR A SHORT TO VOLTAGE	
NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B. **NOTE:** The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault. **NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Ignition OFF. • Position the driver seat in the vehicle and connect the seat-to-floor connectors. • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265A . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Ignition ON. • Measure the voltage between DCSM C3265A-K, circuit RHS01 (WH/VT), harness side and ground.  N0044951 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** GO to AP7.
AP7 CHECK THE BACKREST TED + CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between DCSM C3265A-J, circuit CHS01 (GY/VT), harness side and ground.	**Yes** GO to AP8. **No** REPAIR the circuit. CLEAR the

 N0042910 • **Is the resistance greater than 10,000 ohms?**	DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AP8 CHECK THE BACKREST TED AND WIRING RESISTANCE	
• Measure the resistance between DCSM C3265A-J, circuit CHS01 (GY/VT), harness side and DCSM C3265A-K, circuit RHS01 (WH/VT), harness side.  N0042876 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AP10. **No** GO to AP9.
AP9 CHECK THE BACKREST TED RESISTANCE	
• Disconnect: Backrest TED C3034. • Measure the resistance between backrest TED C3034 pins 1 and 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AP10 CHECK THE BLOWER AND SPEED CONTROL	

repair4less

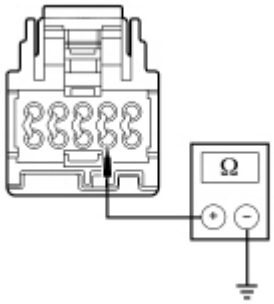
CIRCUITS FOR A SHORT TO VOLTAGE • Disconnect: DCSM C3265C . • Ignition ON. • Measure the voltage between: ▪ DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and ground. ▪ DCSM C3265C-11, circuit VHS18 (BN/GN), harness side and ground.  N0044857 • **Is any voltage present on either circuit?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AP11 .
AP11 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND • Ignition OFF. • Measure the resistance between: ▪ DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and ground. ▪ DCSM C3265C-11, circuit VHS18 (BN/GN), harness side and ground.  N0044858 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AP12 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AP12 CHECK THE BLOWER AND WIRING RESISTANCE • **NOTE:** The ohmmeter must be connected with the positive lead to DCSM C3265C-16, circuit CHS03 (GN/BN) and the negative lead to DCSM C3265C-15, circuit RHS03 (GY/OG) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and DCSM C3265C-15, circuit RHS03 (GY/OG), harness side.	**Yes** GO to AP14 . **No** GO to AP13 .

 N0044850 • **Is the resistance between 4,000 and 10,000 ohms?**	
AP13 CHECK THE BLOWER RESISTANCE	
• Disconnect: Cushion TED C3035 . • **NOTE:** The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between cushion TED C3035 pins 2 and 4, component side.  N0053768 • **Is the resistance between 4,000 and 10,000 ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AP14 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT RESISTANCE	
• **NOTE:** The ohmmeter must be connected with the positive lead to C3265C-11, circuit VHS18 (BN/GN), harness side and the negative lead to C3265C-15, circuit RHS03 (GY/OG), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between DCSM C3265C-11, circuit VHS18 (BN/GN) harness side and DCSM C3265C-15, circuit RHS03 (GY/OG), harness side.	**Yes** GO to AP16 . **No** GO to AP15 .



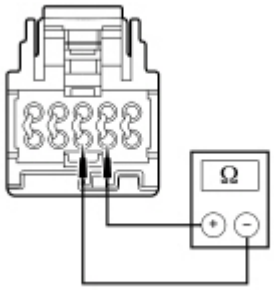
repair4less

N0044859



- **Is the resistance between 240K ohms and 4M ohms?**

AP15 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• Disconnect: Cushion TED C3035 . • **NOTE:** The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between cushion TED C3035 pins 7 and 4, component side.  N0054028 • **Is the resistance between 240K ohms and 4M ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AP16 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265B . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between DCSM C3265B-7, circuit VHS26 (VT), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AP17 .

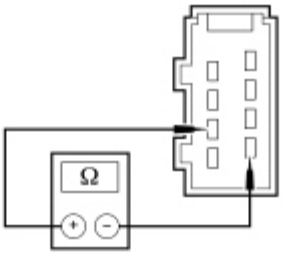


N0042906

- **Is any voltage present?**

AP17 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO GROUND - Ignition OFF. - Measure the resistance between DCSM C3265B-7, circuit VHS26 (VT), harness side and ground.  N0042907 - **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AP18 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AP18 CHECK THE TED THERMISTOR AND WIRING RESISTANCE AT THE DCSM - Measure the resistance between DCSM C3265B-7, circuit VHS26 (VT), harness side and DCSM C3265B-8, circuit RHS05 (YE/VT), harness side. Note the ambient temperature and compare result to the following table: **Temperature** / **Resistance** 0-10°C (32-50°F) / 2,782-1,663 ohms 10-20°C (50-68°F) / 1,837-1,140 ohms 20-30°C (68-86°F) / 1,260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms	**Yes** INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AP19 .

repair4less



- **Is the resistance within the limits indicated?**

AP19 CHECK THE TED THERMISTOR RESISTANCE

- Disconnect: Cushion TED C3035 .
- Measure the resistance between cushion TED pins 5 and 8, component side. Note the ambient temperature and compare result to the following table:

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

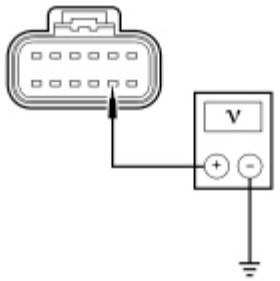
- **Is the resistance within the limits indicated?**

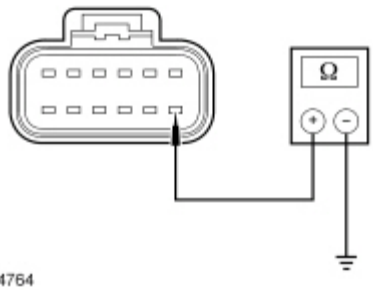
Yes
REPAIR the circuit(s) for high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

No
INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

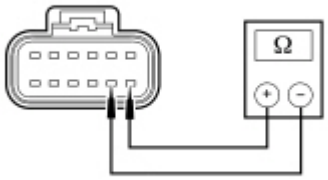
DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

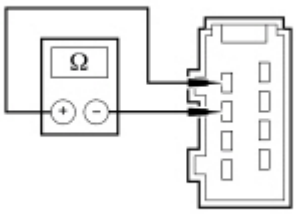




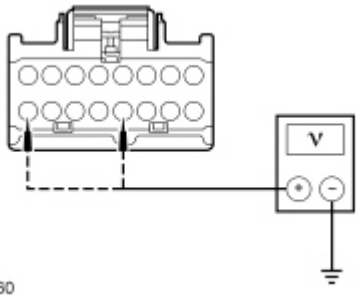
AP20 CHECK FOR CORRECT TED INSTALLATION AND FOR CRUSHED FOAM

- Ignition OFF.
- Remove the seat. Refer to Seat — Front in this section.
- Remove the seat backrest trim cover. Refer to Seat Backrest Cover — Front in this section.
- Inspect the seat backrest for the following:
  - Is the backrest blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?





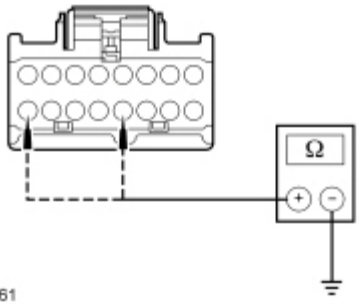
Yes
GO to AP21 .



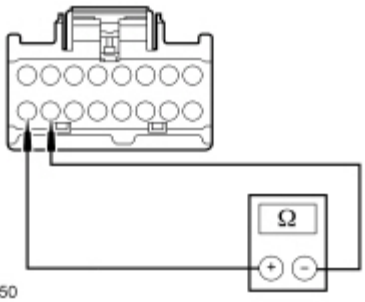
No
CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. INSTALL the seat. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground

• **Is the TED correctly installed and the foam pad and manifold OK?**	cable. REPOWER the SRS. REFER to Section 501-20B.
AP21 CHECK THE CUSHION TED CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Position the driver seat in the vehicle and connect the seat-to-floor connectors. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Driver Seat Side Air Bag Module C3051. • Disconnect: Passenger Seat Side Air Bag Module C339. • Disconnect: DCSM C3265A. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Ignition ON. • Measure the voltage between DCSM C3265A-H, circuit RHS02 (BU/OG), harness side and ground.  N0044952 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** GO to AP22.
AP22 CHECK THE CUSHION TED + CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between DCSM C3265A-G, circuit CHS02 (YE/BU), harness side and ground.  N0044764 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AP23. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AP23 CHECK THE CUSHION TED AND WIRING RESISTANCE	



repair4less



• Measure the resistance between DCSM C3265A-G circuit CHS02 (YE/BU), harness side and DCSM C3265A-H, circuit RHS02 (BU/OG), harness side.  N0042194 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AP25 . **No** GO to AP24 .
AP24 CHECK THE CUSHION TED RESISTANCE • Disconnect: Cushion TED C3035 . • Measure the resistance between cushion TED C3035 pins 1 and 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new cushion TED . • **Is the resistance between 4,000 and 10,000 ohms?**	
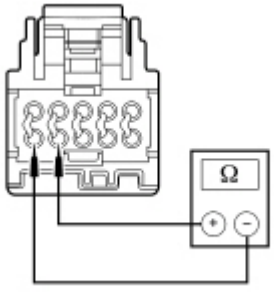
AP28 CHECK THE BLOWER RESISTANCE	
• Disconnect: Backrest TED C3034 . • **NOTE:** The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between backrest TED C3034 pins 2 and 4, component side.  N0053768 • **Is the resistance between 4,000 and 10,000 ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AP29 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT RESISTANCE	
• **NOTE:** The ohmmeter must be connected with the positive lead to C3265C-12, circuit CHS09 (GY), harness side and the negative lead to C3265C-15, circuit RHS03 (GY/OG), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between DCSM C3265C-12, circuit CHS09 (GY) harness side and DCSM C3265C-15, circuit RHS03 (GY/OG), harness side.  N0044862 • **Is the resistance between 240K ohms and 4M ohms?**	**Yes** GO to AP31 . **No** GO to AP30 .
AP30 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• Disconnect: Backrest TED C3034 . • **NOTE:** The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between backrest TED C3034 pins 7 and 4, component side.  N0054028 • **Is the resistance between 240K ohms and 4M ohms?**	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AP31 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Driver Seat Side Air Bag Module C3051. • Disconnect: Passenger Seat Side Air Bag Module C339. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Disconnect: DCSM C3265B. • Ignition ON. • Measure the voltage between DCSM C3265B-9, circuit CHS14 (GN), harness side and ground.  N0042974 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** GO to AP32.
AP32 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between DCSM C3265B-9, circuit CHS14 (GN), harness side and ground.	**Yes** GO to AP33.

repair4less

- **Is the resistance greater than 10,000 ohms?**



No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

AP33 CHECK THE TED THERMISTOR AND WIRING RESISTANCE

- Measure the resistance between DCSM C3265B-9, circuit CHS14 (GN), harness side and DCSM C3265B-10, circuit CHS29 (WH/BU), harness side. Note the ambient temperature and compare result to the following table:

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

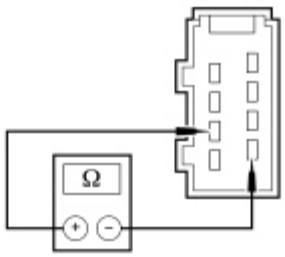
- **Is the resistance within the limits indicated?**

Yes
INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

No
GO to AP34 .

AP34 CHECK THE TED THERMISTOR RESISTANCE



- Disconnect: Backrest TED C3034 .
- Measure the resistance between backrest TED pins 5 and 8, component side. Note the ambient temperature and compare result to the following table:

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms

Yes
REPAIR the circuit(s) for high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS .

20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

N0053767

- **Is the resistance within the limits indicated?**

REFER to Section 501-20B .

No
INSTALL a new backrest TED .
REFER to Seat Backrest Thermo-Electric Device in this section.
CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS .
REFER to Section 501-20B .

Pinpoint Test AQ: DTC B272D

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Climate controlled seats are independently controlled by the Dual Climate Controlled Seat Module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM , diagnostic testing can be carried out with the ignition ON. Both voltage supply circuits to the DCSM are spliced together internally, so if one circuit becomes open, both seats can still be operated. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

The seat cushion is equipped with a Thermo-Electric Device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, the seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on an affected seat are reporting very different temperatures to the DCSM . This may result from an airflow restriction or a circuit fault of either TED area. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and is not the area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

- DTC B272D (Passenger Differential Temperature Fault) — If there is a temperature differential between the passenger backrest and cushion TED of 60°C (108°F) or more for more than 4 seconds, the TED is disconnected or the duct is blocked, this DTC sets. When this happens the first time in a key cycle, the DCSM puts the passenger seat system into recovery mode (see Principles of Operation). If the system is able to recover, it functions normally. If the system is able to recover and it occurs a second time in the same key cycle, the DCSM shuts down the passenger seat system.

repair4less

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion or backrest TED filter
- Crushed or restricted cushion or backrest foam pad
- Crushed or restricted cushion or backrest climate controlled seat manifold
- Cushion or backrest TED assembly
- DCSM

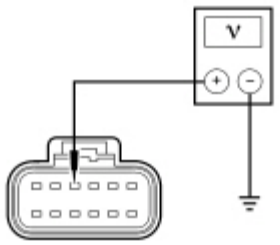
PINPOINT TEST AQ: DTC B272D

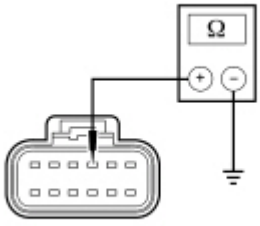
NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

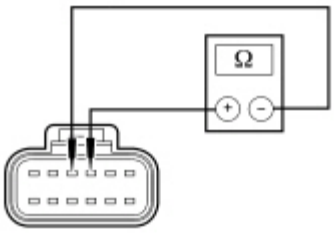
NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

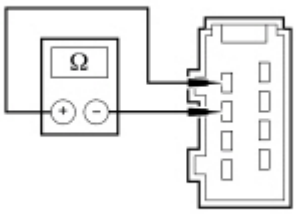
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.





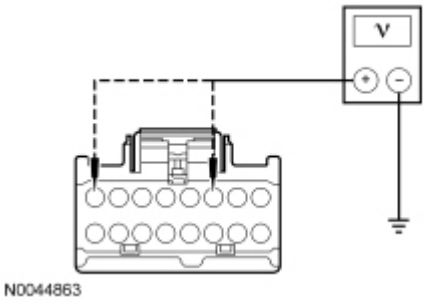
Test Step	Result / Action to Take
AQ1 CHECK THE DCSM FOR DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — DCSM . • **Was DTC B272A or B272B retrieved?**	**Yes** For DTC B272A, GO to Pinpoint Test AN . For DTC B272B, GO to Pinpoint Test AO . **No** GO to AQ2 .
AQ2 MONITOR THE DCSM TED TEMPERATURE PIDs	





• Enter the following diagnostic mode on the scan tool: DataLogger — DCSM .
  ▪ Passenger cushion TED temperature (PCSHTMP)
  ▪ Passenger back TED temperature (PBKTMP)
  ▪ Seat cushion TED temperature (CSHTEMP)
  ▪ Seat back TED temperature (BK_TEMP)
• **NOTE:** Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs. Not allowing stabilization can cause incorrect readings and lead to incorrect identification of components that are not faulty.
• Monitor the TED temperature PIDs with the climate controlled seats OFF. Compare the PIDs of the front passenger seat to those of the driver seat, this can help identify if there is a concern with the front passenger seat cushion or backrest PID readings.
• **Are both front passenger seat TED temperature PIDs within 10°C (18°F) of the ambient temperature?**
	Yes
	GO to AQ3 .
	
	No
	If the front passenger seat cushion PID varies 10°C (18°F) or more from ambient temperature, GO to AQ16 .
	
	If the front passenger seat backrest PID varies 10°C (18°F) or more from ambient temperature, GO to AQ31 .

AQ3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR BACKREST	
• Ignition OFF. • Ignition ON. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • After cycling the ignition and with the engine running, set the passenger seat to high heat. Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the passenger seat. • **Do the passenger seat cushion TED and backrest TED PIDs vary more than 60°C (108°F) from each other?**	**Yes** If the front passenger seat cushion PID is 60°C (108°F) hotter than the backrest PID, GO to AQ5 . If the front passenger seat backrest PID is 60°C (108°F) hotter than the cushion PID, GO to AQ20 . **No** GO to AQ4 .
AQ4 CHECK THE TEDs COOLING PERFORMANCE	
• Check TEDs cooling performance on the affected seat. Refer to Component Test — Thermo-Electric Device (TED) Cooling Performance in this section. • **Did the TEDs pass the component test?**	**Yes** The DTC may have been set by extreme cabin temperatures or excessive sunload on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. CLEAR the DTCs. TEST the system for normal operation. If a concern cannot be found or duplicated, RETURN the vehicle to the customer. **No** CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED , manifold, plenum, air ducts and foam pad). CHECK for airflow restrictions (TED inlets and outlets, TED -to-manifold or plenum connections, filters and ducts) and REPAIR as needed. CHECK for an intermittent wiring fault. REPAIR as needed. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AQ5 CHECK FOR CORRECT TED INSTALLATION AND FOR CRUSHED FOAM	

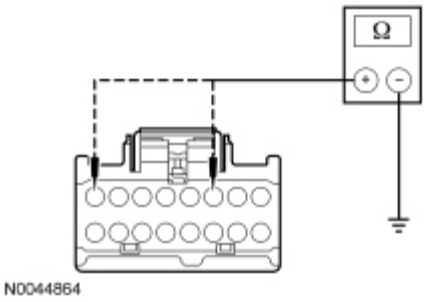


• Ignition OFF.
• Remove the seat. Refer to Seat — Front in this section.
• Remove the seat cushion trim cover. Refer to Seat Cushion Cover — Front in this section.
• Inspect the seat cushion for the following:
  ▪ Is the cushion blower obstructed?
  ▪ Is the blower filter restricted or plugged?
  ▪ Is the TED correctly installed?
  ▪ Is the seat cushion foam pad crushed or
	Yes
	GO to AQ6 .
	
	No
	CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. INSTALL the seat. CLEAR the DTCs.

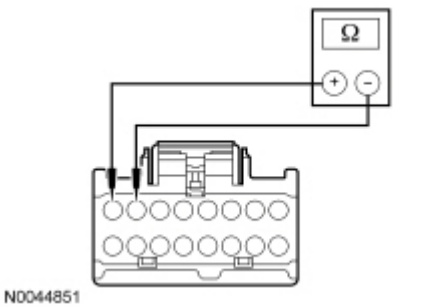
repair4less

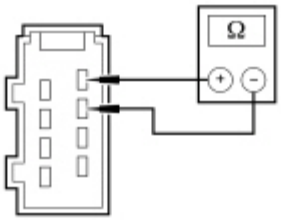
restricted? ▪ Is the climate controlled seat manifold crushed or restricted? • **Is the TED correctly installed and the foam pad and manifold OK?**	REPEAT the self-test. DISCONNECT the battery ground cable. REPOWER the SRS. REFER to Section 501-20B.
AQ6 CHECK THE BACKREST TED - CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Position the front passenger seat in the vehicle and connect the seat-to-floor connectors. • Depower the SRS. Refer to Section 501-20B. • Disconnect: Passenger Seat Side Air Bag Module C339. • Disconnect: DCSM C3265A. • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01. • Ignition ON. • Measure the voltage between DCSM C3265A-D, circuit RHS06 (WH), harness side and ground.  N0044950 • **Is any voltage present?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** GO to AQ7.
AQ7 CHECK THE BACKREST TED CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between DCSM C3265A-C, circuit CHS06 (BU/BN), harness side and ground.  N0042988 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AQ8. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.

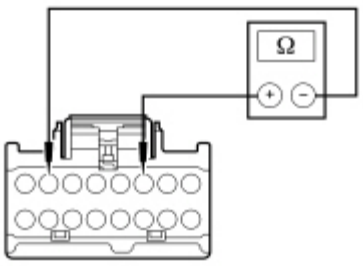
AQ8 CHECK THE BACKREST TED AND WIRING RESISTANCE	
• Measure the resistance between DCSM C3265A-C, circuit CHS06 (BU/BN), harness side and DCSM C3265A-D, circuit RHS06 (WH), harness side.  N0042989 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AQ10 . **No** GO to AQ9 .
AQ9 CHECK THE BACKREST TED RESISTANCE	
• Disconnect: Backrest TED C3039 . • Measure the resistance between backrest TED C3039 pins 1 and 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AQ10 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: DCSM C3265C . • Ignition ON. • Measure the voltage between: ▪ DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and ground. ▪ DCSM C3265C-3, circuit VHS23 (BN/BU), harness side and ground.	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AQ11 .



repair4less

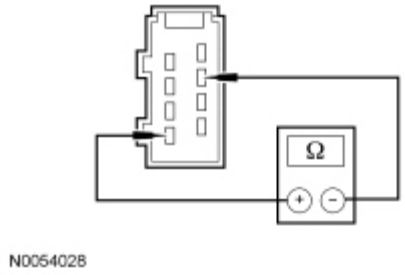


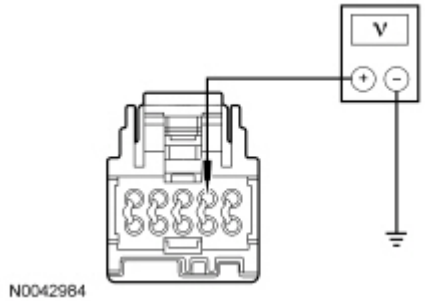




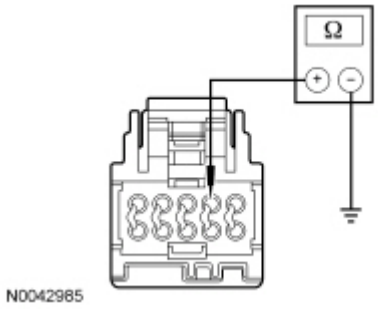
N0044863

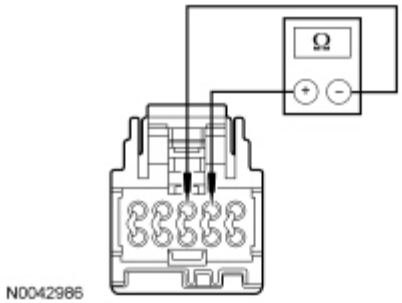
- **Is any voltage present on either circuit?**





AQ11 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND	



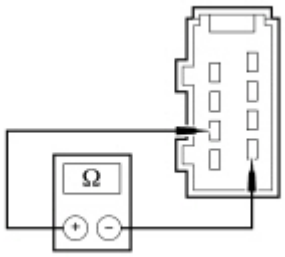


• Ignition OFF.
• Measure the resistance between:
  ▪ DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and ground.
  ▪ DCSM C3265C-3, circuit VHS23 (BN/BU), harness side and ground.

 	
N0044864
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to AQ12 .
	
	No
	REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

AQ12 CHECK THE BLOWER AND WIRING RESISTANCE	
• **NOTE:** The ohmmeter must be connected with the positive lead to DCSM C3265C-8, circuit CHS08 (BN/YE) and the negative lead to DCSM C3265C-7, circuit RHS08 (VT/WH) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and DCSM C3265C-7, circuit RHS08 (VT/WH), harness side.  N0044851 • **Is the resistance between 4,000 and 10,000 ohms?**	**Yes** GO to AQ14 . **No** GO to AQ13 .

AQ13 CHECK THE BLOWER RESISTANCE	
• Disconnect: Cushion TED C3040 . • **NOTE:** The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between cushion TED C3040 pins 2 and 4, component side.  N0053768 • **Is the resistance between 4,000 and 10,000 ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AQ14 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT RESISTANCE	
• **NOTE:** The ohmmeter must be connected with the positive lead to C3265C-3, circuit VHS23 (BN/BU), harness side and the negative lead to C3265C-7, circuit RHS08 (VT/WH), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between DCSM C3265C-3, circuit VHS23 (BN/BU), harness side and DCSM C3265C-7, circuit RHS08 (VT/WH), harness side.  N0047113 • **Is the resistance between 240K ohms and 4M ohms?**	**Yes** GO to AQ16 . **No** GO to AQ15 .
AQ15 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• Disconnect: Cushion TED C3040 . • **NOTE:** The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat



repair4less

• Measure the resistance between cushion TED C3040 pins 7 and 4, component side.  N0054028 • **Is the resistance between 240K ohms and 4M ohms?**	side air bag module C339. REPOWER the SRS . 30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

N0053767

- **Is the resistance within the limits indicated?**

No
INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.

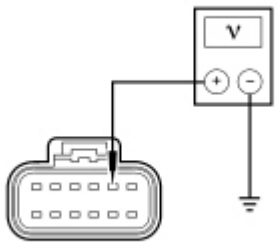
AQ20 CHECK FOR CORRECT TED INSTALLATION AND FOR CRUSHED FOAM

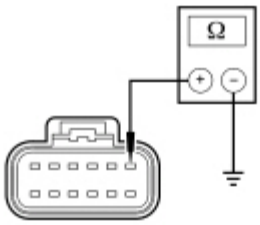
- Ignition OFF.
- Remove the seat. Refer to Seat — Front in this section.
- Remove the seat backrest trim cover. Refer to Seat Backrest Cover — Front in this section.
- Inspect the seat backrest for the following:
  - Is the backrest blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and the foam pad and manifold OK?**

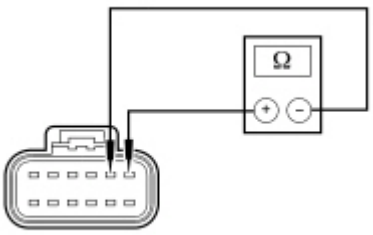
Yes
GO to AQ21.

No
Correctly INSTALL the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. REFER to Seat Backrest Thermo-Electric Device in this section. INSTALL the seat. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. REPOWER the SRS. REFER to Section 501-20B.

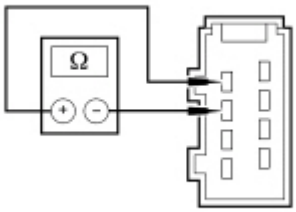


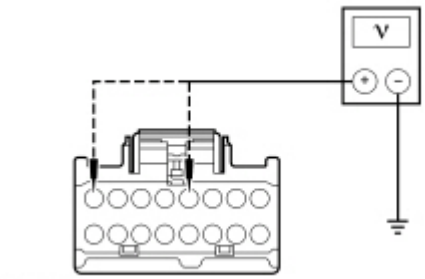




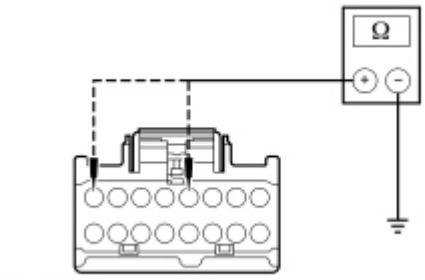
AQ21 CHECK THE CUSHION TED CIRCUIT FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Position the front passenger seat in the vehicle and connect the seat-to-floor connectors.
- Depower the SRS. Refer to Section 501-20B.
- Disconnect: Passenger Seat Side Air Bag Module C339.
- Disconnect: DCSM C3265A.
- **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**
- Connect the battery ground cable. Refer to Section 414-01.
- Ignition ON.
- Measure the voltage between DCSM C3265A-B, circuit RHS07 (BU), harness side and ground.





Yes
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



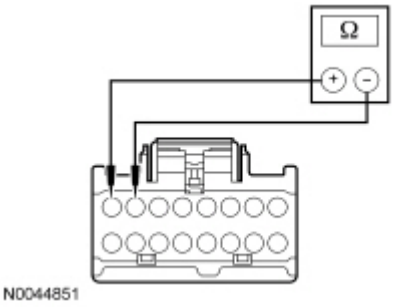
DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.

No
GO to AQ22.

 N0044870 • **Is any voltage present?**	
AQ22 CHECK THE CUSHION TED CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between DCSM C3265A-A, circuit CHS07 (GY/BU), harness side and ground.  N0042978 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AQ23 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AQ23 CHECK THE CUSHION TED AND WIRING RESISTANCE	
• Measure the resistance between DCSM C3265A-A circuit CHS07 (GY/BU), harness side and DCSM C3265A-B, circuit RHS07 (BU), harness side.  N0042979 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AQ25 . **No** GO to AQ24 .
AQ24 CHECK THE CUSHION TED RESISTANCE	
• Disconnect: Cushion TED C3040 . • Measure the resistance between cushion TED C3040 pins 1 and 3, component side.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339.

repair4less

 N0053766 • **Is the resistance between 0.9 and 10 ohms?**	REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new cushion TED . REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AQ25 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: DCSM C3265C . • Ignition ON. • Measure the voltage between: ▪ DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and ground. ▪ DCSM C3265C-4, circuit VHS21 (BU/WH), harness side and ground.  N0044866 • **Is any voltage present on either circuit?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AQ26 .
AQ26 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between: ▪ DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and ground. ▪ DCSM C3265C-4, circuit VHS21 (BU/WH), harness side and ground.	**Yes** GO to AQ27 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .



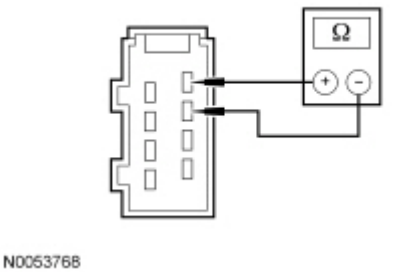
N0044867

- **Are the resistances greater than 10,000 ohms?**

AQ27 CHECK THE BLOWER AND WIRING RESISTANCE

- **NOTE:** The ohmmeter must be connected with the positive lead to DCSM C3265C-8, circuit CHS08 (BN/YE) and the negative lead to DCSM C3265C-7, circuit RHS08 (VT/WH) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.
- Measure the resistance between DCSM C3265C-8, circuit CHS08 (BN/YE), harness side and DCSM C3265C-7, circuit RHS08 (VT/WH), harness side.

N0044851



- **Is the resistance between 4,000 and 10,000 ohms?**

Yes
GO to AQ29 .

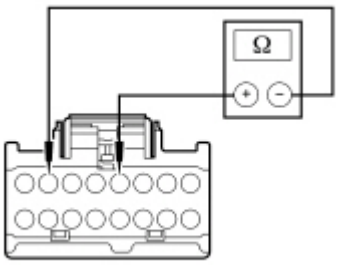
No
GO to AQ28 .

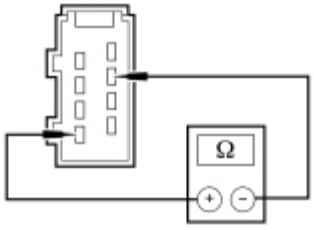
AQ28 CHECK THE BLOWER RESISTANCE

- Disconnect: Backrest TED C3039 .
- **NOTE:** The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.
- Measure the resistance between backrest TED C3039 pins 2 and 4, component side.

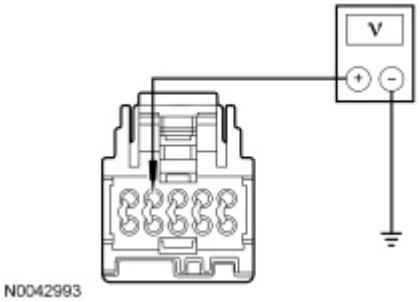
N0053768

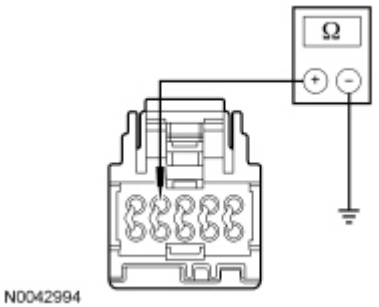
- **Is the resistance between 4,000 and 10,000 ohms?**





Yes
REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

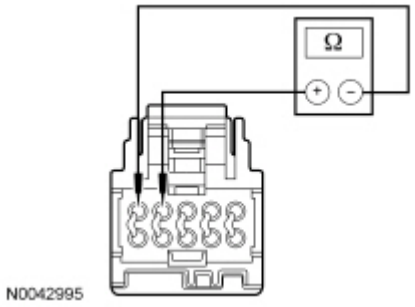




DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

No
INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to



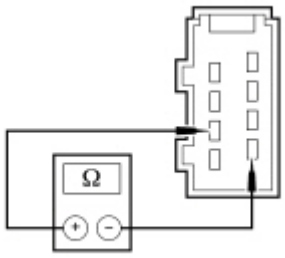
repair4less

	Section 501-20B .
AQ29 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT RESISTANCE	
• **NOTE:** The ohmmeter must be connected with the positive lead to C3265C-4, circuit VHS21 (BU/WH), harness side and the negative lead to C3265C-7, circuit RHS08 (VT/WH), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between DCSM C3265C-4, circuit VHS21 (BU/WH), harness side and DCSM C3265C-7, circuit RHS08 (VT/WH), harness side.  N0044868 • **Is the resistance between 240K ohms and 4M ohms?**	**Yes** GO to AQ31 . **No** GO to AQ30 .
AQ30 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• Disconnect: Backrest TED C3039 . • **NOTE:** The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty. • Measure the resistance between backrest TED C3039 pins 7 and 4, component side.  N0054028 • **Is the resistance between 240K ohms and 4M ohms?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AQ31 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265B .	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

• **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between DCSM C3265B-4, circuit VHS36 (YE/BU), harness side and ground.  N0042993 • **Is any voltage present?**	DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AQ32 .
AQ32 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between DCSM C3265B-4, circuit VHS36 (YE/BU), harness side and ground.  N0042994 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AQ33 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AQ33 CHECK THE TED THERMISTOR AND WIRING RESISTANCE AT THE DCSM	
• Measure the resistance between DCSM C3265B-4, circuit VHS36 (YE/BU), harness side and DCSM C3265B-5, circuit RHS20 (GN/BU), harness side. Note the ambient temperature and compare result to the following table: **Temperature** / **Resistance** 0-10°C (32-50°F) / 2,782-1,663 ohms 10-20°C (50-68°F) / 1,837-1,140 ohms 20-30°C (68-86°F) / 1,260-806 ohms	**Yes** INSTALL a new DCSM . REFER to Dual Climate Controlled Seat Module (DCSM) in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

repair4less

30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms



- **Is the resistance within the limits indicated?**

No
GO to AQ34 .

AQ34 CHECK THE TED THERMISTOR RESISTANCE

- Disconnect: Backrest TED C3039 .
- Measure the resistance between backrest TED pins 5 and 8, component side. Note the ambient temperature and compare result to the following table:

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

Yes
REPAIR the circuit(s) for high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

No
INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AR: DTC B272E

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The driver climate controlled seat blowers are located within the backrest and cushion Thermo-Electric Devices (TEDs). The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to both blowers. The blowers are independently controlled by separate speed control circuits from the DCSM .

- DTC B272E (Driver Ignition Run/Blower Circuit Short to Ground) — If either the blower voltage supply or return circuits are open (to both cushion or backrest blowers) or shorted to voltage, the DTC is set and after 4-6 seconds the DCSM disables outputs to the driver seat. The DTC also sets if the blower voltage supply or return circuit is open to only one blower when DCSM supply voltage is less than 12 volts.

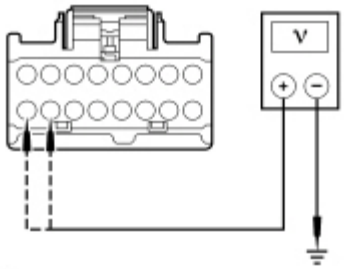
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Backrest or cushion TED
- DCSM

PINPOINT TEST AR: DTC B272E

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**

NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .



NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AR1 CHECK THE TED BLOWER MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Cushion TED C3035 . • Disconnect: Backrest TED C3034 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between DCSM C3265C, harness side and ground using the following chart.	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AR2 .

Pinpoint Test AS: DTC B272F

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The passenger climate controlled seat blowers are located within the backrest and cushion Thermo-Electric Devices (TEDs). The Dual Climate Controlled Seat Module (DCSM) supplies voltage and ground to both blowers. The blowers are independently controlled by separate speed control circuits from the DCSM .

- DTC B272F (Passenger Ignition Run/Blower Circuit Short to Ground) — If either the blower voltage supply or return circuits are open (to both cushion and backrest blowers) or shorted to voltage, the DTC is set and after 4-6 seconds the DCSM disables outputs to the passenger seat. The DTC also sets if the blower voltage supply or return circuit is open to only one blower when DCSM supply voltage is less than 12 volts.

This pinpoint test is intended to diagnose the following:

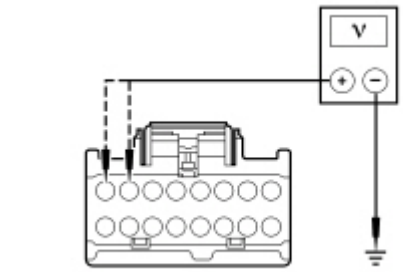
- Wiring, terminals or connectors

repair4less

- Backrest or cushion TED
- DCSM

PINPOINT TEST AS: DTC B272F

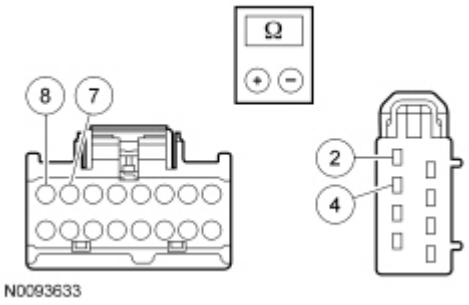
NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.**



NOTE: If a seat equipped with a seat mounted side air bag is being repaired, the Supplemental Restraint System (SRS) must be depowered. Refer to Section 501-20B .

NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.



Test Step	Result / Action to Take
AS1 CHECK THE TED BLOWER MOTOR CIRCUITS FOR A SHORT TO VOLTAGE • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: DCSM C3265C . • Disconnect: Cushion TED C3040 . • Disconnect: Backrest TED C3039 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between DCSM C3265C, harness side and ground using the following chart.	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B . **No** GO to AS2 .

REFER to Seat Cushion Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. If the backrest TED resistance is **not** between 4,000 and 10,000 ohms, INSTALL a new backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test AT: DTC B2730

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

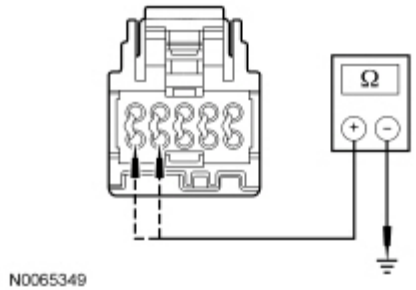
Normal Operation

The Dual Climate Controlled Seat Module (DCSM) monitors seat backrest temperature while it supplies voltage and ground to both blower motors. The DCSM also supplies a variable voltage signal to control the blower speed. Cabin air enters the blower through a filter attached to the Thermo-Electric Device (TED) housing. Heated or cooled air exits the TED and flows through a manifold attached to the foam pad.

- DTC B2730 (Back Over-Temp Detected) — If the driver seat backrest TED temperature exceeds 85° C (185°F) in heat mode or 70°C (158°F) in cool mode for more than 34 seconds the DCSM shuts down the driver seat system and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted backrest TED filter
- Crushed or restricted climate controlled seat manifold
- Backrest TED assembly

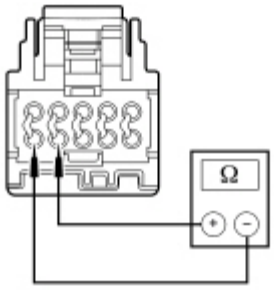


PINPOINT TEST AT: DTC B2730

NOTICE: **When taking measurements at Dual Climate Controlled Seat Module (DCSM) harness connectors, do not insert the electrical probes into the female connector pins. Inserting the probes**

into connector pins can cause intermittent or open electrical connections after reassembly resulting in Diagnostic Trouble Codes (DTCs) and system failure. Touching the tip of these connector pins is recommended instead.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AT1 CHECK THE DCSM FOR ON-DEMAND DTCs	
• Start the vehicle and set the driver seat to HIGH heat. • Enter the following diagnostic mode on the scan tool: Self Test — DCSM . • **Was DTC B2730 retrieved on-demand during the self-test?**	**Yes** GO to AT2 . **No** GO to AT5 .
AT2 CHECK THE DRIVER SEAT BACKREST TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Side Air Bag C3051 and Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265B . • Disconnect: Driver Seat Backrest TED C3034 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between: ▪ DCSM C3265B-9, circuit CHS14 (GN), harness side and ground. ▪ DCSM C3265B-10, circuit CHS29 (WH/BU), harness side and ground.  N0065349 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AT3 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AT3 CHECK THE DRIVER SEAT BACKREST TED THERMISTOR AND WIRING	

repair4less

- Connect: Driver Seat Backrest TED C3034 .
- Measure the resistance between DCSM C3265B-9, circuit CHS14 (GN), harness side and DCSM C3265B-10, circuit CHS29 (WH/BU), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

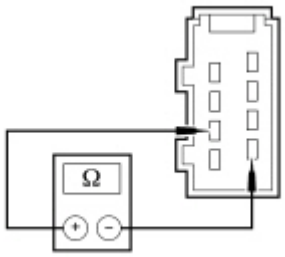
Yes
GO to AT18 .

No
GO to AT4 .

AT4 CHECK THE DRIVER SEAT BACKREST TED THERMISTOR

- Disconnect: Driver Seat Backrest TED C3034 .
- Measure the resistance between driver seat backrest TED C3034 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

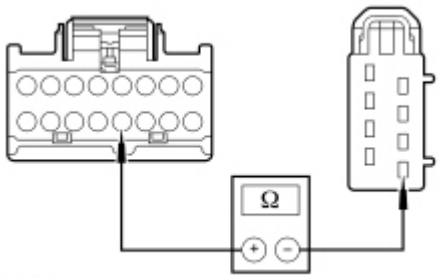
Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

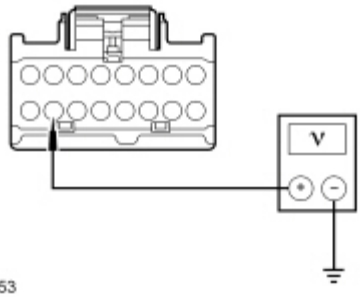


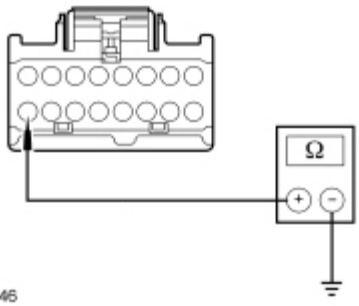
Yes
REPAIR circuit VHS35 (VT/OG) or RHS15 (GY/BN) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339.

REPOWER the SRS .
REFER to Section 501-20B .



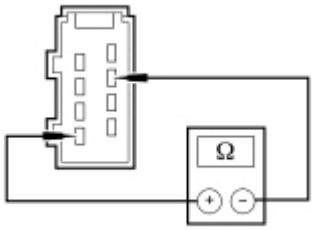




No
INSTALL a new driver seat backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT

 N0053767 • **Is the resistance within the limits indicated?**	driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AT5 CONFIRM THE FAULT WHILE MONITORING THE DCSM SEAT BACK THERMAL ELECTRIC DEVICE TEMPERATURE (BK_TEMP) AND SEAT CUSHION THERMAL ELECTRIC DEVICE TEMPERATURE (CSHTEMP) PIDs	
• Set the driver seat to OFF. • Enter the following diagnostic mode on the scan tool: Clear DTCs - DCSM. • Enter the following diagnostic mode on the scan tool: DataLogger - DCSM. • Monitor the DCSM PIDs BK_TEMP and CSHTEMP. • **NOTE:** A crushed seat backrest foam pad or a crushed climate controlled seat manifold may be the cause of the fault making it necessary to occupy the seat to recreate and identify the fault. • Attempt to recreate the fault. Start the vehicle and set the driver seat to HIGH heat for at least 15 minutes while occupying the seat. • **Do the PIDs increase incrementally (gradually) and stay within 15°C (27°F) of each other?**	**Yes** The fault is not present at this time. The fault may have been set due to a past failure, incorrect use of the climate controlled seat system by repeated switching between heat and cool modes or due to excessive driver compartment temperature. CLEAR the DTCs. REPEAT the self-test. **No** If the BK_TEMP PID increases incrementally and is greater than 15°C (27°F) of the CSHTEMP PID, GO to AT6. If the BK_TEMP PID increases quickly (temperature "jumps" and does not increase incrementally) and is greater than 15°C (27°F) of the CSHTEMP PID, GO to AT16.
AT6 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS	
• With the engine running, set both front seats to HIGH cool. • Note the airflow exhausting from the driver seat backrest TED and compare it to the airflow exhausting from the passenger seat backrest TED. • Carry out a wiggle test of the wire harnesses between the DCSM and the driver seat backrest TED while monitoring blower operation of the TED. The blower should operate consistently and not change speeds. • **Is the airflow exhausting from the driver seat backrest TED comparable to the airflow exhausting from the passenger seat backrest TED with no change in operation when**	**Yes** GO to AT7. **No** If the airflow exhausting from the driver seat backrest TED is not comparable to the airflow exhausting from the passenger seat backrest TED, GO to AT8.



repair4less

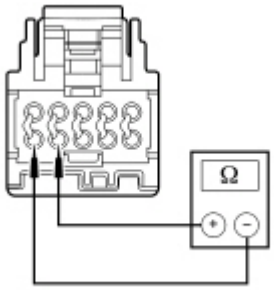
carrying out the wiggle test?	If the driver seat backrest TED blower operation changed while carrying out the wiggle test, IDENTIFY and REPAIR the wiring fault. CLEAR the DTCs. REPEAT the self-test.
AT7 COMPARE OPERATION OF THE DRIVER AND PASSENGER SEATS WHILE OCCUPIED	
• Note the airflow exhausting from the driver seat backrest TED with the driver seat occupied and compare it to the airflow exhausting from the passenger seat backrest TED with the passenger seat occupied. • **Is the airflow exhausting from the driver seat backrest TED comparable to the airflow exhausting from the passenger seat backrest TED ?**	**Yes** GO to AT16 . **No** INSTALL a new driver seat backrest foam pad and/or climate controlled seat manifold. CLEAR the DTCs. REPEAT the self-test.
AT8 CHECK THE DRIVER SEAT BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER	
• Ignition OFF. • Inspect the blower of the driver seat backrest TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. CLEAR the DTCs. REPEAT the self-test. **No** GO to AT9 .
AT9 CHECK THE DRIVER SEAT BACKREST BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Side Air Bag C3051 and Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265C . • Disconnect: Driver Seat Backrest TED C3034 . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between DCSM C3265C-12, circuit CHS09 (GY), harness side and driver seat backrest TED C3034-7, circuit VHS16 (BU/GN), harness side.	**Yes** GO to AT10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .

 N0053810 • **Is the resistance less than 5 ohms?**	
AT10 CHECK THE DRIVER SEAT BACKREST BLOWER CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between DCSM C3265C-15, circuit RHS03 (GY/OG), harness side and ground.  N0044853 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** GO to AT11.
AT11 CHECK THE DRIVER SEAT BACKREST BLOWER CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and ground.  N0044846 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AT12. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AT12 CHECK THE DRIVER SEAT BACKREST BLOWER CIRCUITS FOR AN OPEN	
• Measure the resistance between: ▪ DCSM C3265C-16, circuit CHS03 (GN/BN), harness side and driver seat backrest TED C3034-2, circuit CHS03 (GN/BN), harness side.	**Yes** GO to AT13. **No**

repair4less

▪ DCSM C3265C-15, circuit RHS03 (GY/OG), harness side and driver seat backrest TED C3034-4, circuit RHS03 (GY/OG), harness side.  N0108651 • **Are the resistances less than 5 ohms?**	REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AT13 CHECK THE DRIVER SEAT BACKREST BLOWER RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged.** • Measure the resistance between driver seat backrest TED C3034 pin 2 and pin 4, component side.  N0053768 • **Is the resistance between 4,000 ohms and 10,000 ohms?**	**Yes** GO to AT14. **No** INSTALL a new driver seat backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AT14 CHECK THE DRIVER SEAT BACKREST BLOWER SPEED CONTROL RESISTANCE	
• ***NOTICE:*** **The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected results in false readings and leads to incorrect identification of components that are not damaged.** • Measure the resistance between driver seat backrest TED C3034 pin 7 and pin 4, component side.	**Yes** GO to AT15. **No** INSTALL a new driver seat backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag

 N0054028 • **Is the resistance between 240K ohms and 400K ohms?**	module C339. REPOWER the SRS . REFER to Section 501-20B .
AT15 CHECK THE DRIVER SEAT BACKREST TED INSTALLATION AND FOR CRUSHED SEAT BACKREST	



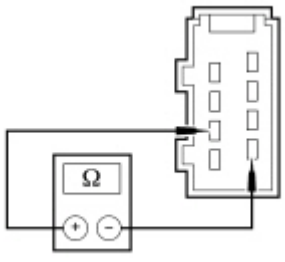
• Ignition OFF.
• Remove the driver seat. Refer to Seat — Front in this section.
• Remove the driver seat backrest cover. Refer to Seat Backrest Cover — Front in this section.
• Inspect the driver seat backrest for the following:
  ▪ Is the driver seat backrest TED correctly installed?
  ▪ Is the driver seat backrest foam pad crushed or restricted?
  ▪ Is the driver seat backrest climate controlled seat manifold crushed or restricted?
• **Is the driver seat backrest TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	INSTALL the driver seat backrest cover and seat and GO to AT18 .
	
	No
	CORRECTLY install the driver seat backrest TED or INSTALL a new driver seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test.
	
	DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339.
	
	REPOWER the SRS .
	REFER to Section 501-20B .

AT16 CHECK THE DRIVER SEAT BACKREST TED THERMISTOR AND WIRING	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Side Air Bag C3051 and Passenger Seat Side Air Bag C339 . • Disconnect: DCSM C3265B . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between DCSM C3265B-9, circuit	**Yes** GO to AT18 . **No** GO to AT17 .

repair4less

CHS14 (GN), harness side and C3265B-10 circuit CHS29 (GY), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms



N0042976

- **Is the resistance within the limits indicated?**

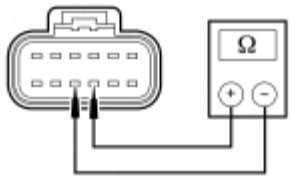
AT17 CHECK THE DRIVER SEAT BACKREST TED THERMISTOR

- Measure the resistance between driver seat backrest TED C3034 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

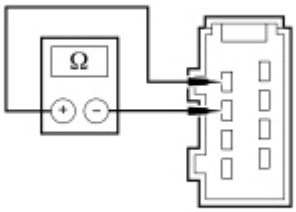
N0053767

- **Is the resistance within the limits indicated?**



Yes
REPAIR circuit VHS35 (VT/OG) or RHS15 (GY/BN) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339.



REPOWER the SRS. REFER to Section 501-20B.

No
INSTALL a new TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag

	module C339. REPOWER the SRS . REFER to Section 501-20B .
AT18 CHECK THE DRIVER SEAT BACKREST TED HEATING/COOLING CIRCUITRY CURRENT DRAW	
• Connect: All DCSM , TED and Body Harness-to-Seat Harness Connectors . • ***NOTICE:*** **It may be necessary to open the seat wire harness conduit to allow placing the inductive current probe around the circuit as described in the following step. Care must be taken when opening up the wire harness so as not to damage any wiring or connectors. Do not damage any wiring or induce stress on any wiring or connectors. Close up the wire harness once repairs to the seat are complete.** • **NOTE:** Use a commercially available inductive current probe (such as Electronic Specialties Current Probe/Multimeter 685 or a Fluke I410 [used with a digital multimeter]) or the low current probe from the Vehicle Measurement Module available for use with Integrated Diagnostic System (IDS). If these are unavailable, the inductive current probe feature from a battery tester may be substituted. • Place an inductive current probe around circuit CHS01 (GY/VT) near DCSM C3265A-J and monitor the current draw. • Start the vehicle and set the driver seat to HIGH heat. • **Is the current draw less than 11 amps?**	**Yes** GO to AT19 . **No** INSTALL a new driver seat backrest TED . REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS . REFER to Section 501-20B .
AT19 CHECK RESISTANCE OF THE DRIVER SEAT BACKREST TED AND WIRING	
• Ignition OFF. • Disconnect: DCSM C3265A . • Measure the resistance between DCSM C3265A-J circuit CHS01 (GY/VT), harness side and C3265A-K, circuit RHS01 (WH/VT), harness side.  N0132223 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AT21 . **No** GO to AT20 .
AT20 CHECK THE RESISTANCE OF THE DRIVER SEAT BACKREST TED	
• Disconnect: Driver Seat Backrest TED C3034 . • Measure the resistance between driver seat backrest TED C3034 pin 1 and pin 3, component side.	**Yes** REPAIR circuit CHS01 (GY/VT) or RHS01 (WH/VT) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery

repair4less

 N0053766 • **Is the resistance between 0.9 and 10 ohms?**	ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** INSTALL a new driver seat backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. CLEAR the DTCs. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B.
AT21 CHECK FOR CORRECT DCSM OPERATION • Inspect the DCSM and driver seat backrest TED harness and component side connectors and the body harness-to-seat harness connectors for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect: All DCSM, TED and Body Harness-to-Seat Harness Connectors . • Make sure the connectors are seated correctly. • Start the engine. • Set the driver seat to OFF. • Enter the following diagnostic mode on the scan tool: Clear DTCs - DCSM. • Attempt to recreate the fault. With the engine still running set the driver seat to HIGH heat for at least 15 minutes. • **Is the concern still present?**	**Yes** INSTALL a new DCSM. REFER to Dual Climate Controlled Seat Module (DCSM) in this section. REPEAT the self-test. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C339. REPOWER the SRS. REFER to Section 501-20B. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C3051 and passenger seat side air bag

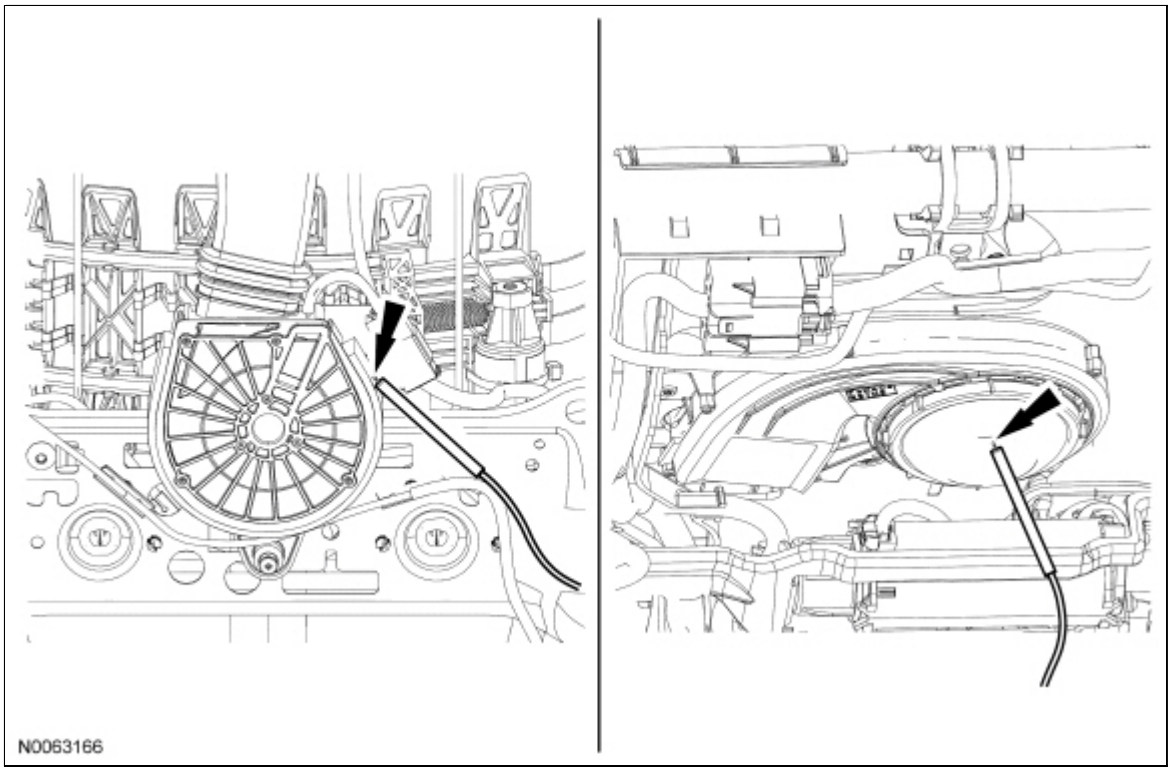
	module C339. REPOWER the SRS . REFER to Section 501-20B .

Component Test

Component Test — Thermo-Electric Device (TED) Cooling Performance

NOTE: This test is intended to check the cooling mode performance of an operational climate controlled seat backrest or cushion Thermo-Electric Device (TED) and verify it is cooling inlet air at the TED (ambient cabin air) between 6-8°C (10-14°F).

NOTE: Make sure the vehicle is out of direct sunlight and is in an area with a stable air temperature when testing the climate controlled seat system.



NOTE: For correct temperature measurements, the seat being tested should be occupied.

1. Enter DataLogger and monitor the following Dual Climate Controlled Seat Module (DCSM) PIDs:
   - Seat cushion TED temperature (CSHTEMP)
   - Seat back TED temperature (BK_TEMP)
   - Passenger cushion TED temperature (PCSHTMP)
   - Passenger back TED temperature (PBKTMP)
   - Driver state seat mode (DCCSMOD)
   - Passenger state seat mode (PCCSMOD)

2. Any initial PID value of greater than 205°C (401°F) or less than 2°C (36°F) indicates a system hardware failure. Do not proceed with this test. GO to Symptom Chart or Dual Climate Controlled Seat Module (DCSM) DTC Chart for diagnosis.

3. Gain access to the seat cushion and backrest TEDs and use a suitable thermo-couple temperature measuring device to monitor the air inlet temperature.
   - Release the J-clip at the backrest bottom and unzip the 2 zippers at the backrest side edges.
   - Place the temperature probe near each TEDs air filter.

repair4less

4. **NOTE:** The engine must be running to operate the climate controlled seat system and carry out this test.

   Operate system in high cool mode and measure the temperature at the cushion TED filter using the thermo-couple device.
   - Obtain and record the air inlet temperature at the TED .
     - Secure the temperature probe at the cushion TED air filter before measuring.

5. Use a scan tool to measure the cushion TED PID temperature and record the value.
   - Monitor the MODE PID and verify the system is operating. If during testing, the PID value changes to Blower Only state, the system has entered into recovery mode and voltage to the TEDs is disabled. If this occurs, the seat has failed the test. Do not continue. Return to the diagnostic routine.

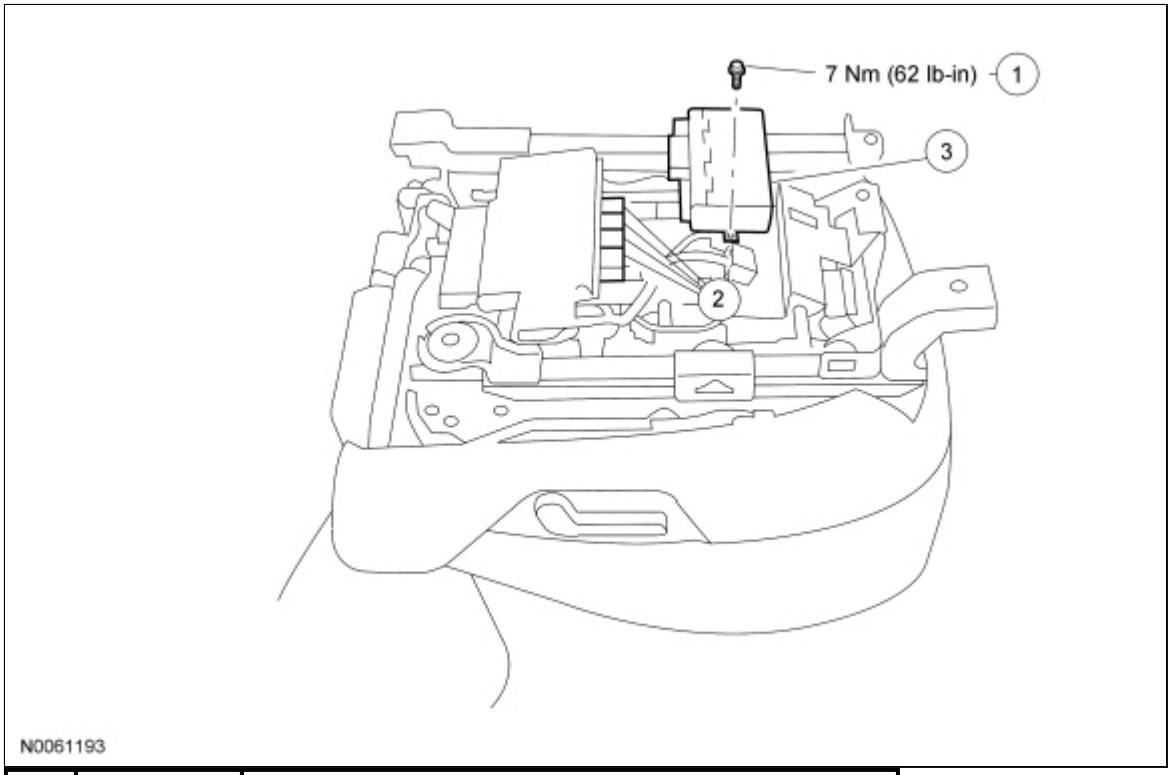
6. Subtract the cushion TED PID temperature from the cushion air inlet temperature and record the temperature difference value.

7. Continue to operate the system in high cool mode and use the thermo-couple device to measure the temperature at the backrest TED filter.
   - Obtain and record the air inlet temperature at the TED .
     - Secure the temperature probe at the backrest TED air filter and close the backrest cover before measuring.

8. Use a scan tool to measure the backrest TED PID temperature and record the value.
   - Monitor the MODE PID and verify the system is operating. If during testing, the PID value changes to Blower Only state, the system has entered into recovery mode and voltage to the TEDs is disabled. If this occurs, the seat has failed the test. Do not continue. Return to the diagnostic routine.

9. Subtract the backrest TED PID temperature from the backrest air inlet temperature and record the

value.



10. Compare the cushion and backrest calculated temperature values. The temperature difference should be between 6 and 8 degrees.

11. If the calculated temperature values are not within these specifications, check the climate controlled seat components for air duct or filter restrictions, blockages, duct or electrical disconnections and for incorrect assembly. Repair as needed. If OK, carry out the DCSM self-test and if any DTC is retrieved, go to Dual Climate Controlled Seat Module (DCSM) DTC Chart for diagnostic direction. Return to the diagnostic routine.

repair4less

Driver Seat Module (DSM)

Item	Part Number	Description
1	—	Driver Seat Module (DSM) screws (2 required) (part of 14C708)
2	—	DSM electrical connectors (part of 14C719)
3	14C708	DSM

Removal and Installation

1. **NOTE:** This step is only necessary when installing a new component.

   NOTE: The PMI process must begin with the current DSM installed. If the current DSM does not respond to the diagnostic scan tool, the tool may prompt for As-Build Data as part of the repair.

   Using a diagnostic scan tool, begin the PMI process for the DSM following the onscreen instructions.

2. **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Ignition must remain OFF until repair is complete. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

   Turn key off, wait one minute.

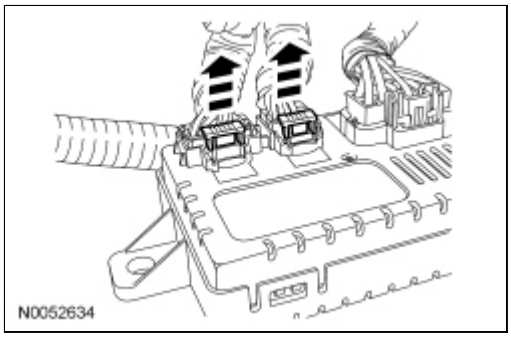
3. Move the seat back and up to access the DSM .

4. Remove the 2 screws.
   - To install, tighten to 7 Nm (62 lb-in).
5. Disconnect the electrical connectors and remove the DSM .
6. To install, reverse the removal procedure.
7. **NOTE:** This step is only necessary when installing a new component.

   Using a diagnostic scan tool, complete the PMI process for the DSM following the on-screen instructions.
8. **NOTE:** This step is only necessary when installing a new component.

   Operate the driver seat, column and pedals through the full range of travel to register stop positions.

repair4less



Dual Climate Controlled Seat Module (DCSM)

Removal and Installation

1. When installing a new Dual Climate Controlled Seat Module (DCSM), carry out the appropriate steps in the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

2. Remove the front passenger seat. For additional information, refer to Seat — Front in this section.

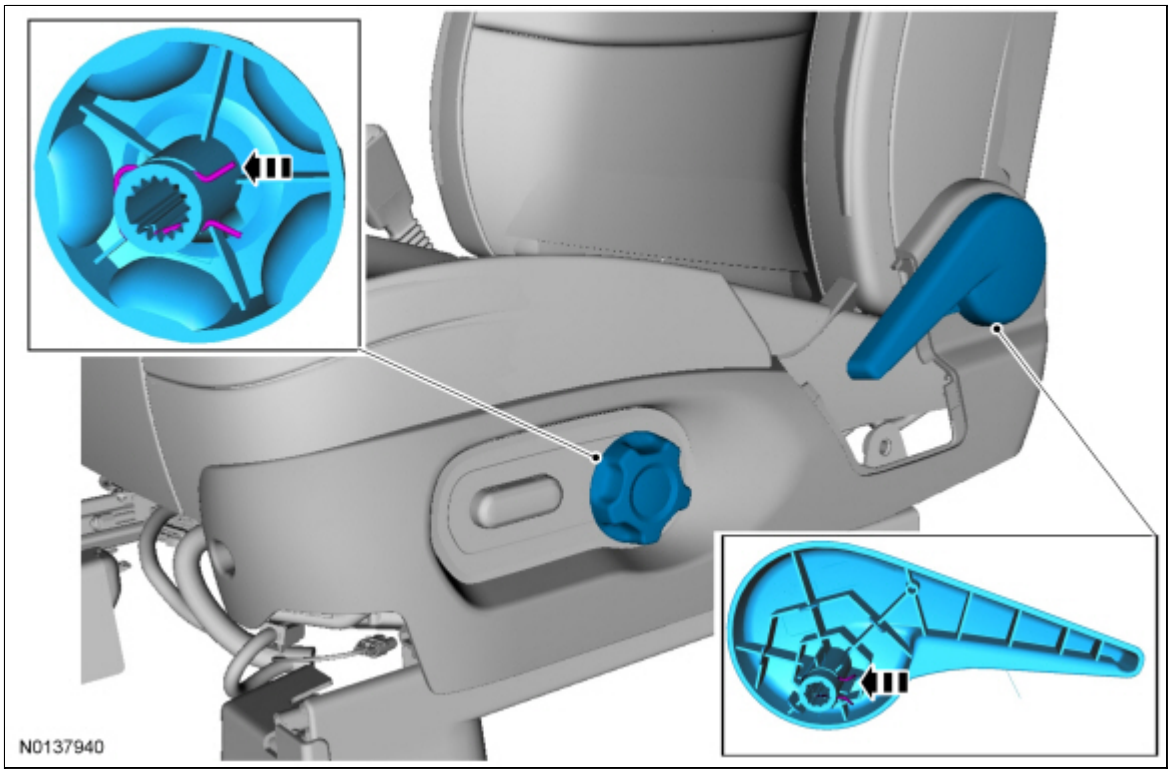
3. Disconnect the 3 DCSM electrical connectors.
   - Release the 2 locking wedges.
   - Disconnect the 3 connectors.

4. Remove the 2 screws and DCSM .

5. To install, reverse the removal procedure.

6. If a new DCSM has been installed, carry out the appropriate steps to complete the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

repair4less



Front Seat Motor Cable

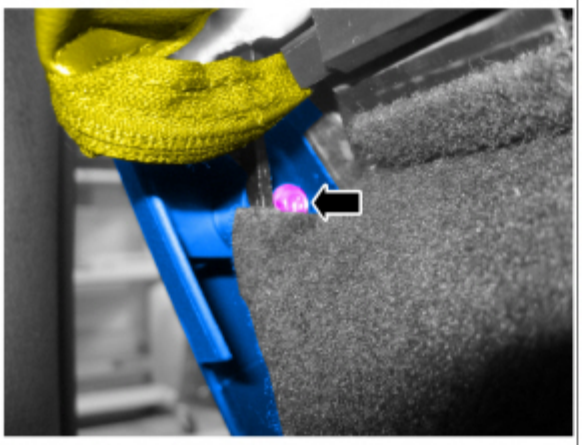
Removal

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

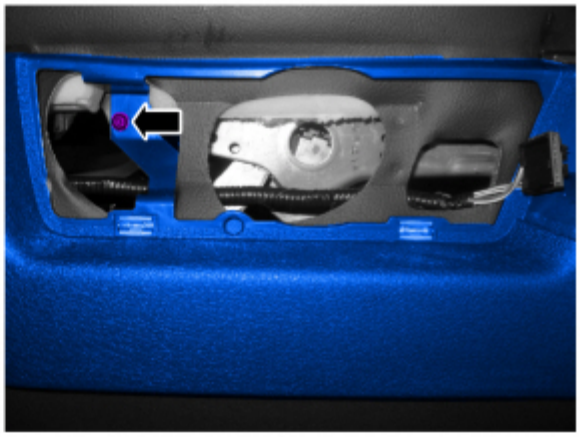
NOTE: Typical driver seat shown, others similar.

1. Remove the seat. Refer to Seat — Front .
2. If equipped.

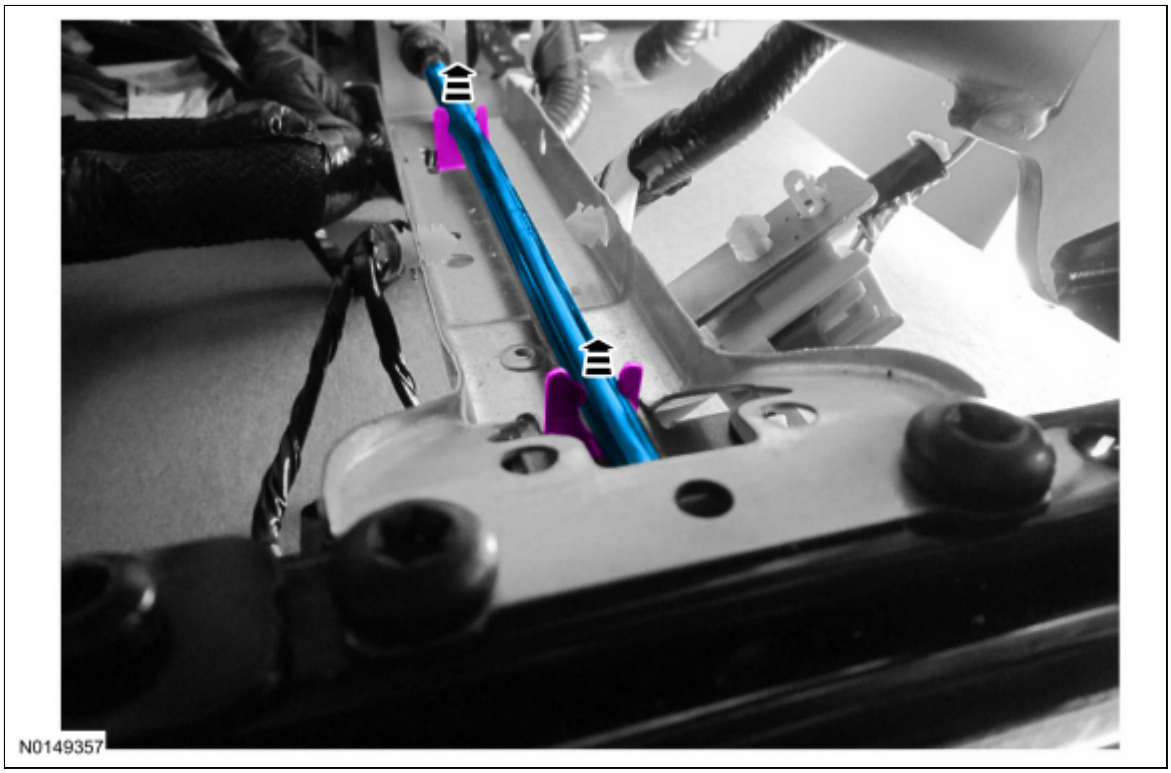
3. If equipped.



repair4less



N0149039



4. Remove the screws and side shield.

N0148529

5.

Installation

NOTE: The front seat motor cable service part for the driver seat is different than the service part for passenger seat. Make sure to install the correct service part required for the seat.

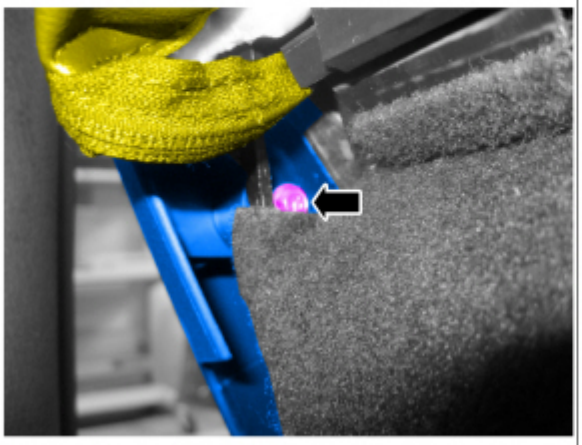
1.

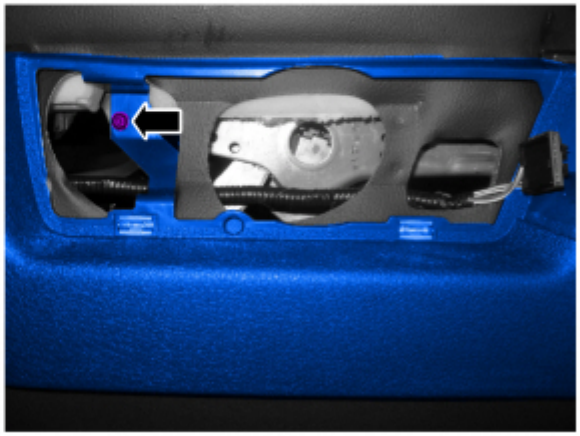
repair4less

2. **NOTE:** The cable felt covering should not be visible when the cable is correctly engaged to the horizontal motor square drive.

    - Push the cable into the horizontal motor square drive twisting back and forth to engage the cable.

3.



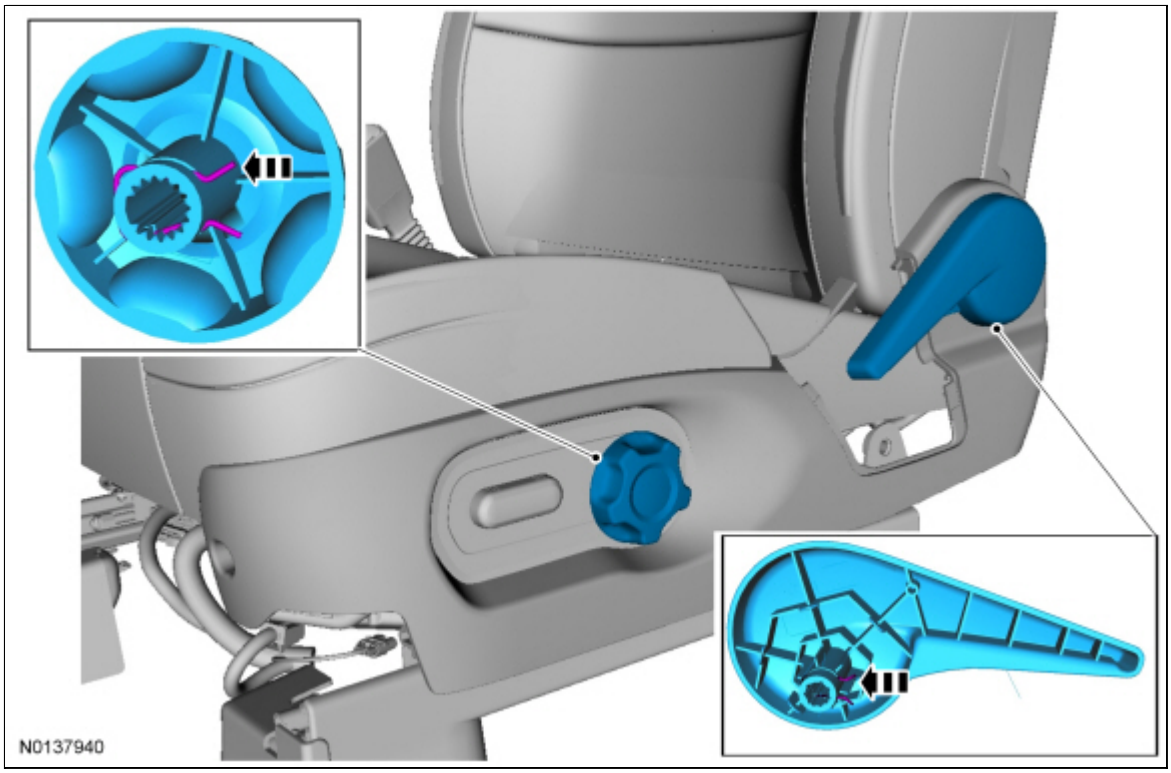


4.

5. Install the side shield and screws.

repair4less

N0148529

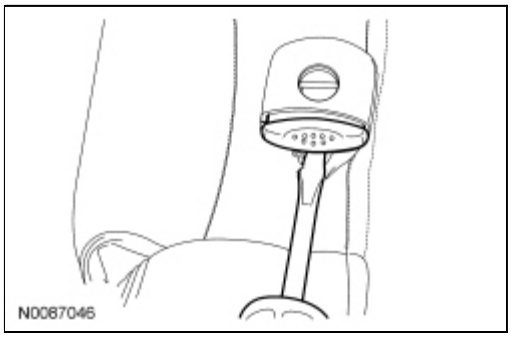


6. If equipped.

N0149040

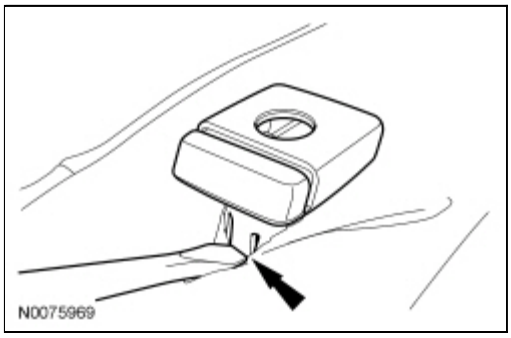
7. If equipped.

8. Install the front seat. Refer to Seat — Front .



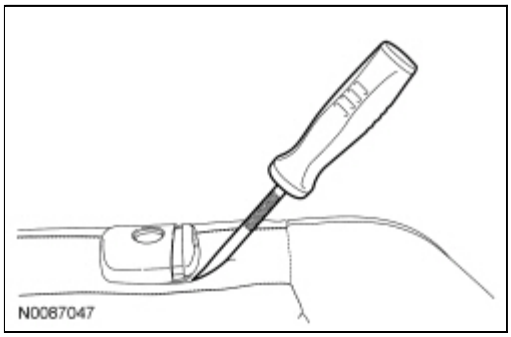
repair4less

Head Restraint Guide Sleeve



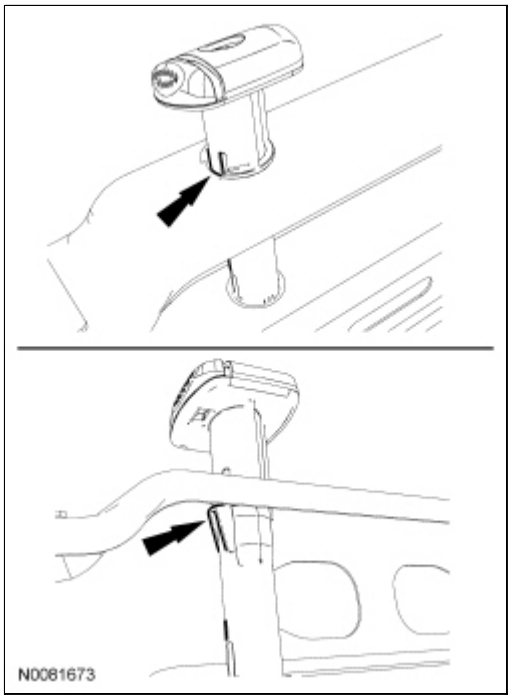
Removal

NOTE: Typical head restraint guide sleeve shown, others similar.

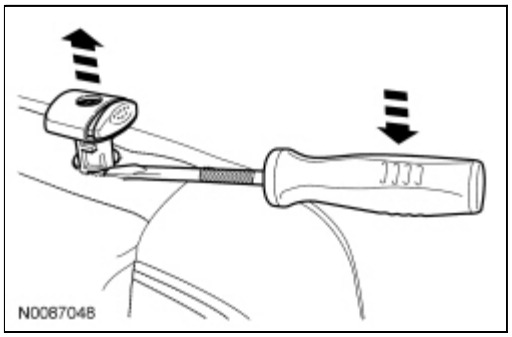


1. Push in on the 2 head restraint guide sleeve release buttons and remove the head restraint.
2. Obtain a flat-head screwdriver with a width of 4 mm (0.157 in) to 7 mm (0.275 in) and a thickness of approximately 1 mm (0.039 in).
3. Align the screwdriver to the middle of the head restraint guide sleeve release button.

4. Position the screwdriver between the head restraint guide sleeve neck, backrest cover and foam pad.



5. Position the screwdriver at a 45-degree angle.



6. **NOTE:** For retainer clarity, backrest cover and foam pad are omitted.

   Push in the screwdriver, bending the lock feature on the head restraint guide sleeve in.

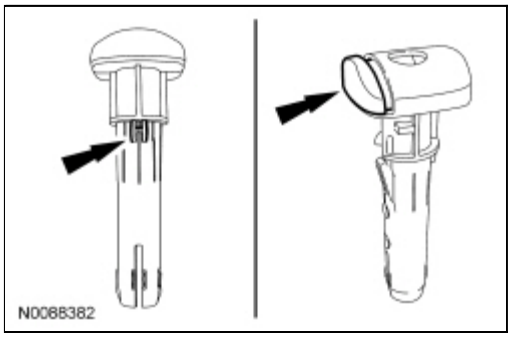
7. While bending the lock feature in, push down on the screwdriver handle, prying the head restraint guide sleeve up and disengaging it from the backrest frame crossmember.

8. Remove the head restraint guide sleeve.
   - Discard the head restraint guide sleeve.

9. Repeat these steps for the head restraint guide sleeve on the opposite side.

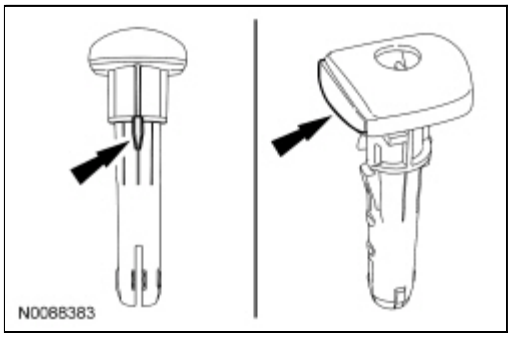
Installation

NOTICE: **Always install new head restraint guide sleeves. Difficult adjustment of the head restraint may occur. Failure to follow these instructions may result in component failure.**



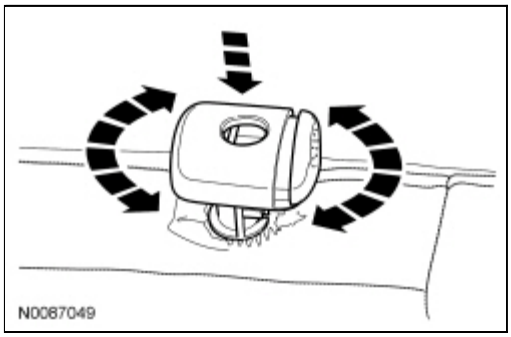
NOTICE: **The head restraint guide sleeves are not interchangeable. Failure to install the correct head restraint guide sleeve at the correct position may result in component failure.**

1. Make sure the holes in the backrest foam pad and backrest cover are aligned to the holes in the



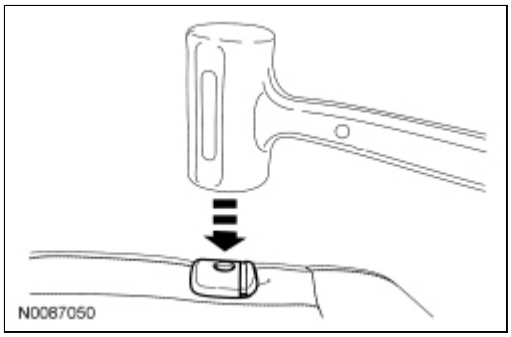
repair4less

backrest frame.



2. Install the head restraint guide sleeve with the large button and wide key to the LH side.

3. Install the head restraint guide sleeve with the small button and thin key to the RH side.



4. To allow the head restraint guide sleeve to slide freely through the backrest foam pad and backrest cover, twist the head restraint guide sleeve while pushing it into the backrest frame hole as far as it will go with hand pressure.

5. ***NOTICE:*** **Do not attempt to seat the head restraint guide sleeve by hand. This may result in excessive head restraint adjustment efforts and permanent damage to the head restraint guide sleeve.**

   NOTICE: **Striking effort should not result in any type of damage or distortion to the head restraint guide sleeve. If a head restraint guide sleeve is damaged, install a new one.**

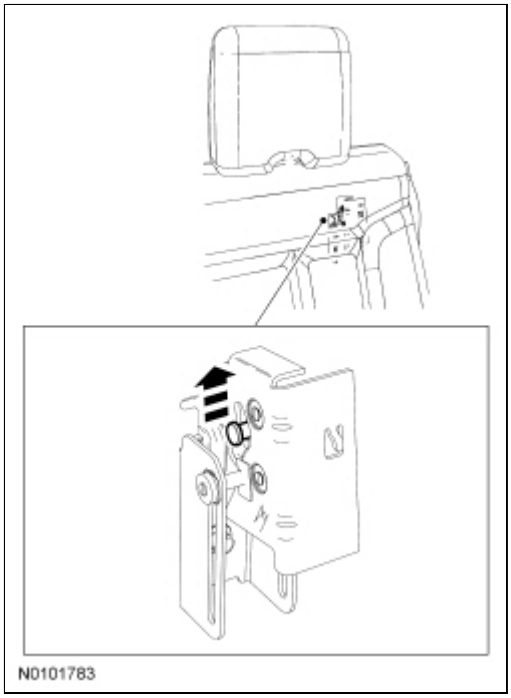
   Using a non-marring mallet, strike the top of the head restraint guide sleeve with moderate force, seating it in the backrest frame.
   - Striking effort must be high enough to snap the head restraint guide sleeve retainer in place in the backrest frame.

6. Inspect the head restraint guide sleeve.
    - Pull the head restraint guide sleeve out by hand, making sure it is locked in place. If the head restraint guide sleeve can be removed by hand, repeat the installation procedure. If the head restraint guide sleeve can be removed again after installing a second time, install a new head restraint guide sleeve.

7. Repeat these steps for the head restraint guide sleeve on the opposite side.

8. After installation of 2 new head restraint guide sleeves, install the head restraint in the following sequence.
    1. Position the head restraint rods to the head restraint guide sleeve holes.
    2. Push the head restraint down, guiding the rods into the head restraint guide sleeve holes.
    3. Make sure the head restraint adjusts without excessive effort and locks in place.

repair4less



Heated Seat Module — Rear

Removal

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. **NOTE:** The seat backrest latch is only accessible when the seat cushion is raised.

   Release and lower the 60 percent seat backrest.
   - From behind the backrest, pull up on the latch release and pull the backrest forward.
   - Release the cushion latch and lower the cushion and backrest.

2. Disconnect the 2 electrical connectors.

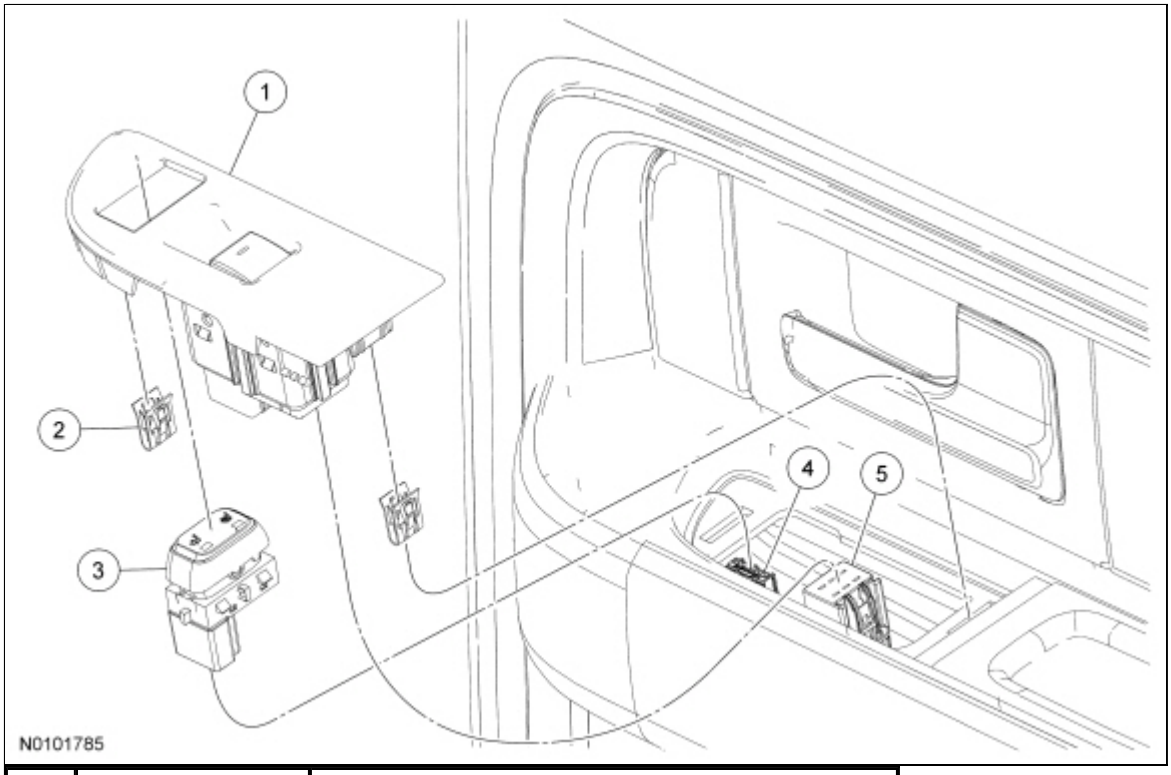
3. Remove the screw and un-hook the heated seat module.

Installation

1. Install the heated seat module and screw.
   - Tighten to 14 Nm (124 lb-in).

2. Connect the 2 electrical connectors.

3. Raise and latch the backrest.
   - Slide the striker pin up/down and align to the backrest latch.
   - Make sure the backrest is fully latched.



4. Carry out the auto-configuration sequence to program the heated seat module for use with a dual momentary switch.
    - Start the vehicle and push the low button on either heated seat switch.
    - Operate the heated seats, monitor the indicators and verify the system is operating correctly in high and low.

---

repair4less

Heated Seat Switch — Rear

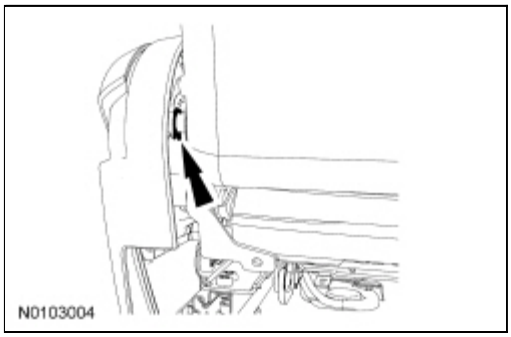
NOTE: RH shown, LH similar.

Item	Part Number	Description
1	14528 RH/ 14527 LH	Window control switch bezel
2	W705289	Retainer (2 required)
3	14D694 RH/ 14D695 LH	Heated seat switch
4	—	Heated seat switch electrical connector (part of 14630 RH/ 14631 LH)
5	—	Window control switch electrical connector (part of 14630 RH/ 14631 LH)

Removal and Installation

1. Using a suitable trim tool, release the 2 retainers and window control switch bezel.
2. Disconnect the heated seat switch and window control switch electrical connectors.
3. Release the locking tabs and remove the heated seat switch.
4. To install, reverse the removal procedure.

repair4less



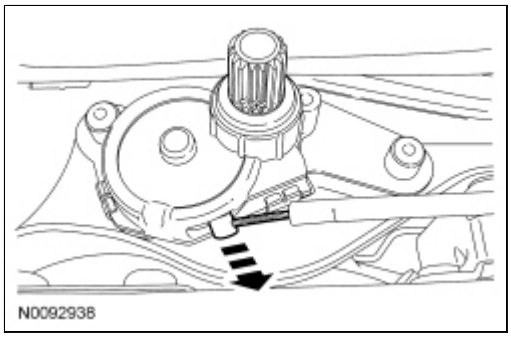
Lumbar Assembly — Manual

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat. For additional information, refer to Seat — Front in this section.

2. For SuperCab, remove the manual recline handle, if equipped.
   - Insert an appropriate tool behind the cushion side shield, release the retainer and remove the handle.



3. If equipped, remove the adjustable lumbar knob.
   - Adjust the lumbar until fully relaxed.
   - Release the retainer and remove the knob.

4. Remove the side shield insert.
   - Release the lower retainers and lift to release the upper retainers.
   - If equipped, disconnect the seat control switch electrical connector.

5. Remove the side shield.
   - Remove the front and rear side shield screws.
   - Pull the cushion side shield outward to release the retainers.
   - Reinstall all retainers back to the side shield.

6. Release the cushion cover outboard J-clip and access the lumbar adjuster.

7. Detach the cable from the lumbar adjuster, release the pin-type retainer and route out the cable from the cushion frame.
   - Note cable routing for correct installation.

8. Remove and discard the 2 rivets from the lumbar adjuster.

9. Release the backrest cover J-clip and unzip the 2 zippers.

10. Remove the lumbar assembly.
    - Detach the cable from the backrest frame.
        - Note cable routing for correct installation.
    - Pinch the lumbar retainers together to release from the backrest frame.
    - For installation, make sure the arrow is pointed up.

11. To install, reverse the removal procedure.

---

repair4less

Lumbar Assembly — Power

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Release the backrest cover J-clip and unzip the 2 zippers.

2. If equipped, remove the backrest Thermo-Electric Device (TED). For additional information, refer to Seat Backrest Thermo-Electric Device in this section.

3. Disconnect the lumbar motor electrical connector.

4. Remove the lumbar assembly.
   - Pinch the lumbar retainers together to release from the backrest frame.
   - For installation, make sure the arrow is pointed up.

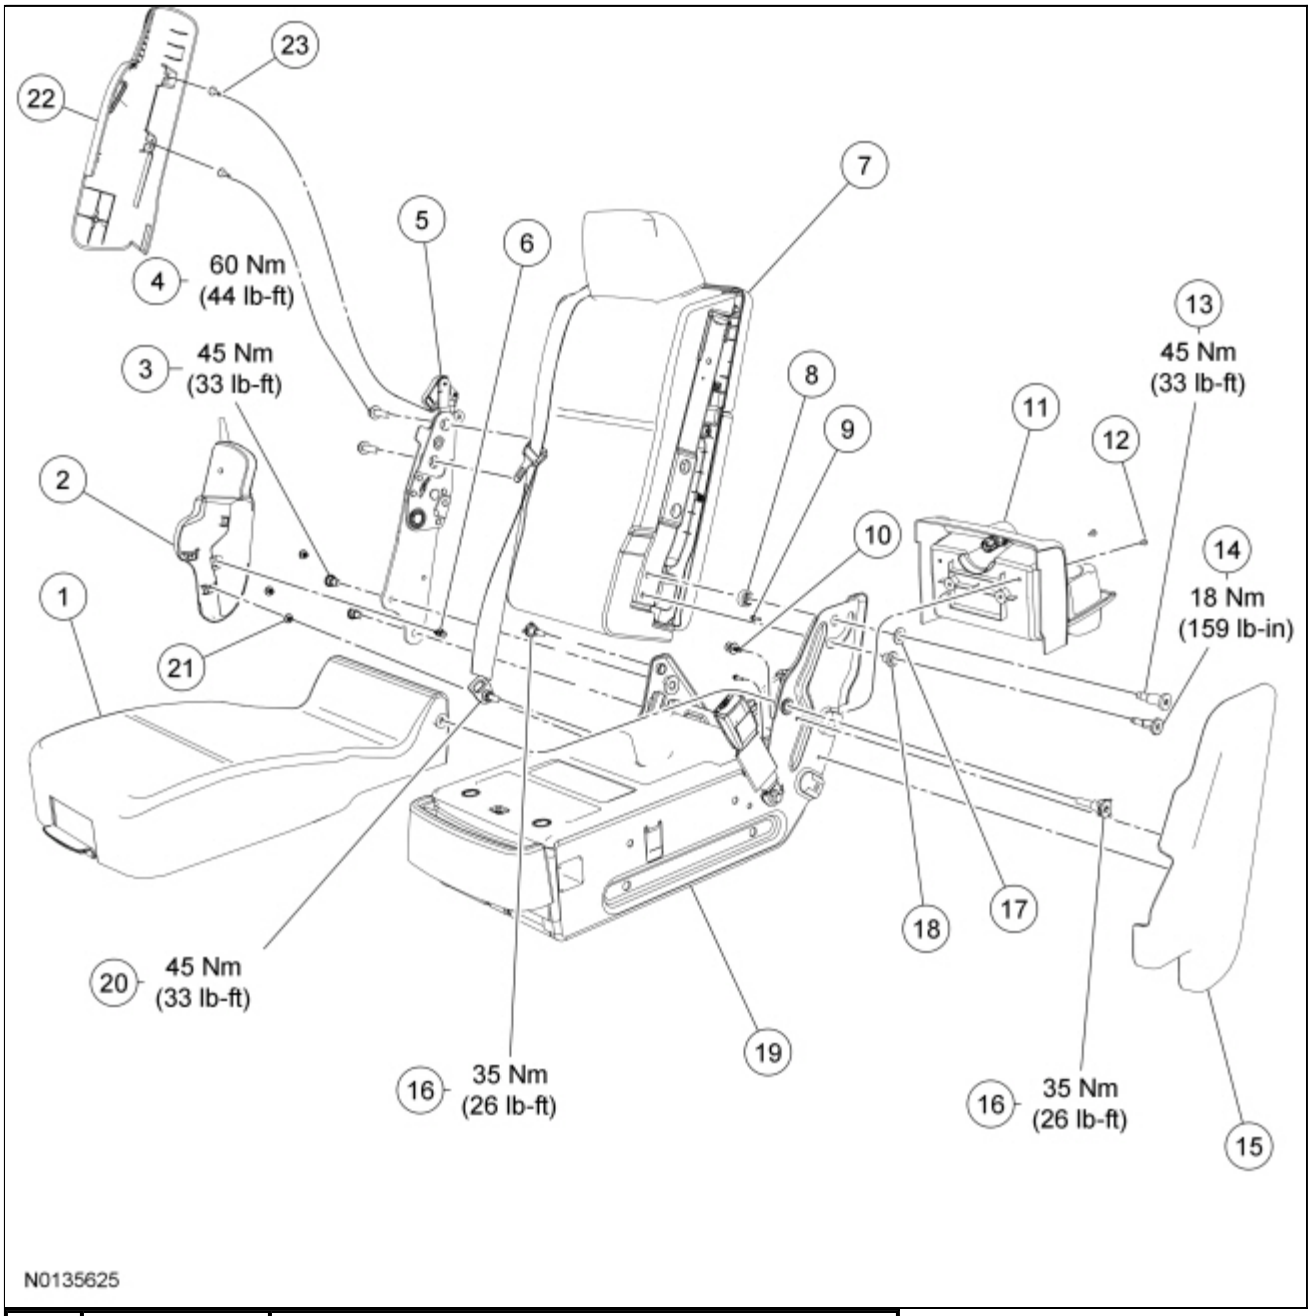
5. To install, reverse the removal procedure.

Memory Set Switch

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the side shield insert.
   - Release the lower retainers and lift to release the upper retainers.
   - Disconnect the seat control switch electrical connector.
   - Disconnect the memory SET switch electrical connector.



2. Release the retaining tabs and remove the switch.

3. To install, reverse the removal procedure.

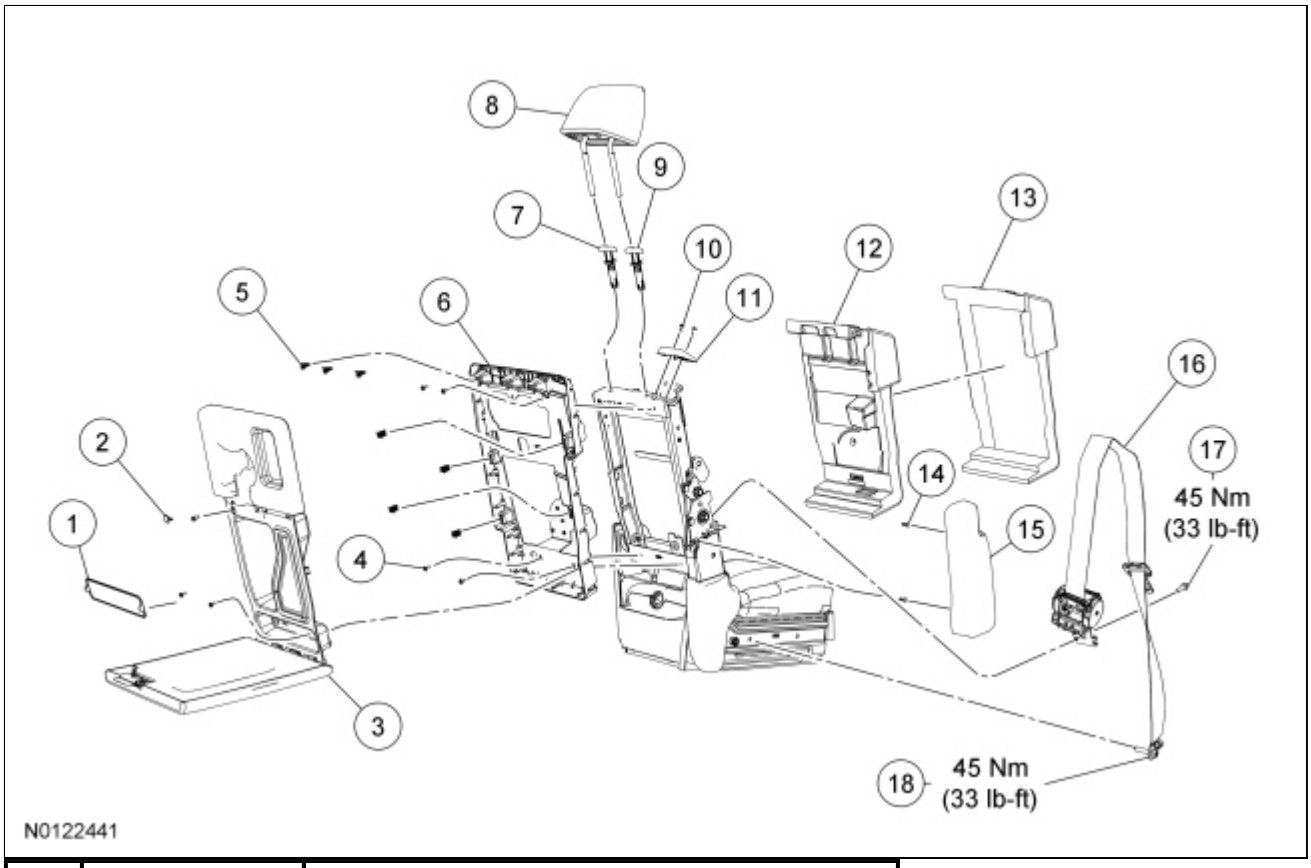
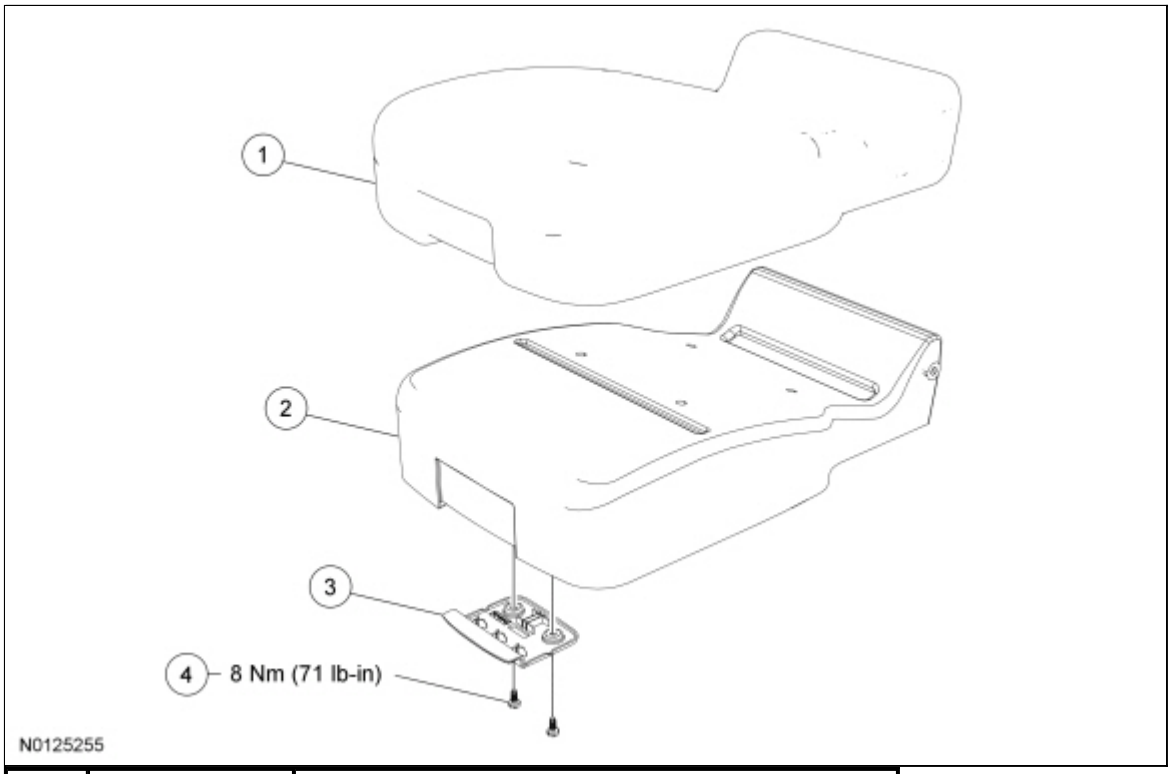
Seat — Exploded View, Front, Center

Seat Retainers and Trim



Item	Part Number	Description
1	632A22	Cushion assembly

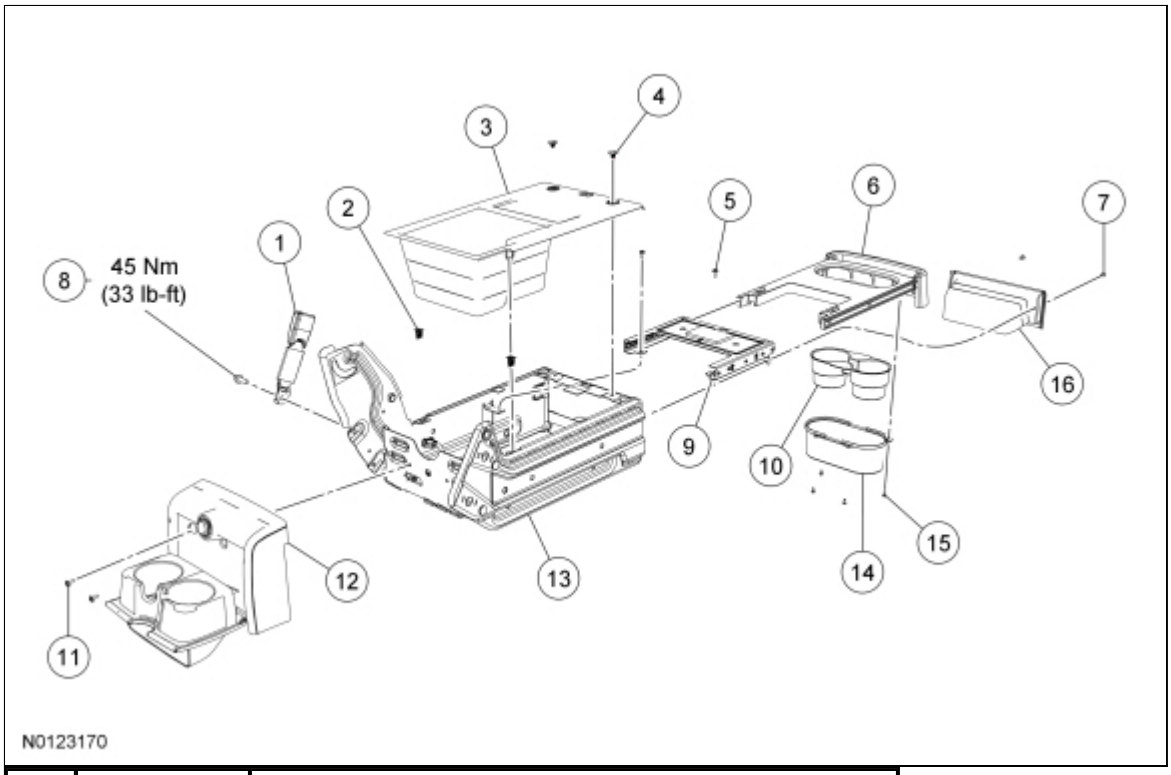
2	672A32	RH side shield
3	W714792	Backrest latch lower bolt (2 required)
4	W715031	Backrest latch upper bolt (2 required)
5	645A04	Backrest latch
6	N803678	Pin-type retainer
7	65478	Backrest assembly
8	654A76	Backrest pivot spacer
9	W303547	LH side shield screw (2 required)
10	—	Side shield retainer (part of 672A29)
11	13562	Rear cupholder
12	600A58	Rear cupholder screw (2 required)
13	W707769	Backrest pivot bolt
14	W303546	Backrest stop bolt
15	672A29	LH side shield
16	W714277	Cushion pivot bolt (2 required)
17	654A76	Backrest pivot spacer
18	—	Backrest pivot guide
19	61708	Seat base frame
20	—	Safety belt anchor bolt (part of 611B64)
21	—	Side shield retainer (part of 672A32) (3 required)
22	672A33	Backrest latch cover
23	—	Pin-type retainer (part of 672A33) (2 required)



Seat Backrest

repair4less

Item	Part Number	Description
1	045G34	Trim cover
2	W506841	Screw
3	644A22	Armrest/storage bin
4	W303547	Screw (4 required)
5	W711045	Clip (7 required)
6	624A14	Armrest/storage bin bracket
7	610A18	Head restraint guide sleeve (master)
8	611A08/610A62	Head restraint/head restraint cover
9	610A18	Head restraint guide sleeve (slave)
10	W303547	Screw (2 required)
11	601B30	Safety belt bezel
12	64810	Backrest foam pad
13	64416	Backrest cover
14	W707211	Pin-type retainer (part of 672A33) (2 required)
15	672A28	Backrest latch cover
16	611B64	Safety belt retractor
17	W505275	Safety belt retractor bolt
18	—	Safety belt anchor bolt (part of 611B64)



Seat Cushion

Item	Part Number	Description
1	62900	Cushion cover
2	632A22	Cushion
3	454A48	Cushion release handle
4	W714751	Cushion release handle screw (2 required)

Seat Base

repair4less

Item	Part Number	Description
1	611B70	Safety belt buckle
2	W711045	Retainer clips (2 required)
3	115A00	Storage tray
4	N803678	Pin-type retainers (2 required)
5	600A58	Front cupholder screw (2 required)
6	13562	Front cupholder
7	600A58	Front storage tray screw (2 required)
8	—	Safety belt buckle bolt (part of 611B70)
9	—	Front cupholder carriage (part of 13562)
10	—	Cup insert (part of 13562)
11	600A58	Rear cupholder screw (2 required)
12	13562	Rear cupholder
13	61708	Seat base frame
14	—	Lower cupholder tray (part of 13562)
15	—	Lower cupholder tray screw (part of 13562) (4 required)
16	115A00	Front storage tray

Seat — Front, Center

Item	Part Number	Description
1	W714278	Seat mounting bolt (4 required)
2	N803678	Pin-type retainers (2 required)
3	115A00	Storage tray
4	W711045	Retainer clips (2 required)
5	045B34	Pedestal
6	—	Spacer (part of 045B34) (2 required)
7	13562	Front cupholder
8	W714792	Pedestal bolts (rear) (2 required)
9	W714276	Pedestal bolts (front) (2 required)
10	—	Washer (part of 045B34) (4 required)

Removal

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

NOTICE: **The pedestal used for the front center seat and floor console mounting contains press fit washers and spacers designed to prevent corrosion at the front center seat and floor console mounting areas. Do not remove these parts from the pedestal during service and make sure they are correctly positioned before installation. Failure to follow these instructions may result in severe corrosion damage to mounting areas and fasteners.**

All seats

1. If equipped, disconnect the power point electrical connector.
    - For access, raise the cushion and remove the storage tray.
        - Release the retainers at the rear edge and pull rearward to unhook and remove.

2. Position the outboard front seats as needed to access and remove the 4 seat mounting bolts.

3. Remove the seat.

Seat pedestal removal

4. Remove the front seats. For additional information, refer to Seat — Front in this section.

5. Remove the 2 front and 2 rear pedestal bolts and pedestal.
    - Install any washers or spacers that separate from the pedestal.

Installation

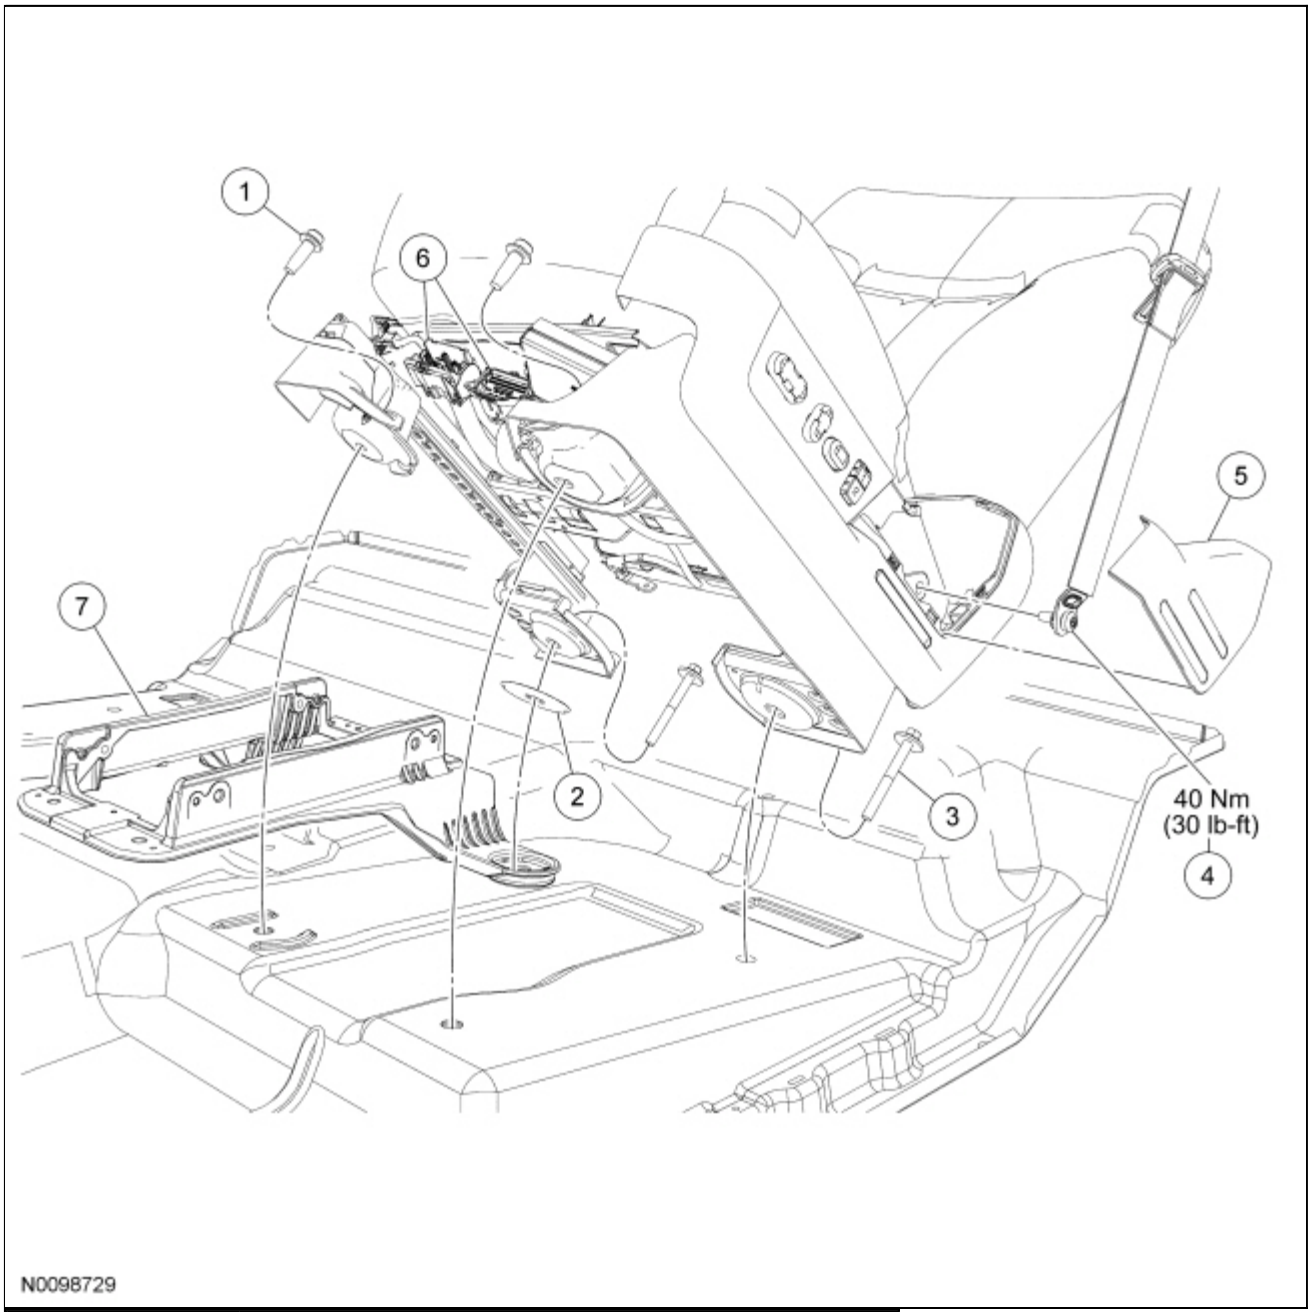
NOTE: Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

1. ***NOTICE:*** **Use care when removing and installing the pedestal to avoid damage to the Restraints Control Module (RCM) and Supplemental Restraint System (SRS) electrical wiring.**

   If removed, install the pedestal and the 2 front and 2 rear pedestal bolts.
    - Make sure the 2 spacers are positioned between the floor and pedestal at the rear bolt holes.
    - Make sure the 4 washers are positioned between the floor and pedestal at the bolt holes.
    - To install, tighten front pedestal bolts to 47 Nm (35 lb-ft).
    - To install, tighten rear pedestal bolts to 55 Nm (40 lb-ft).

2. Position the seat in the vehicle and install the 4 seat mounting bolts.
    - To install, tighten to 47 Nm (35 lb-ft).

3. If equipped, connect the power point electrical connector and install the storage tray.



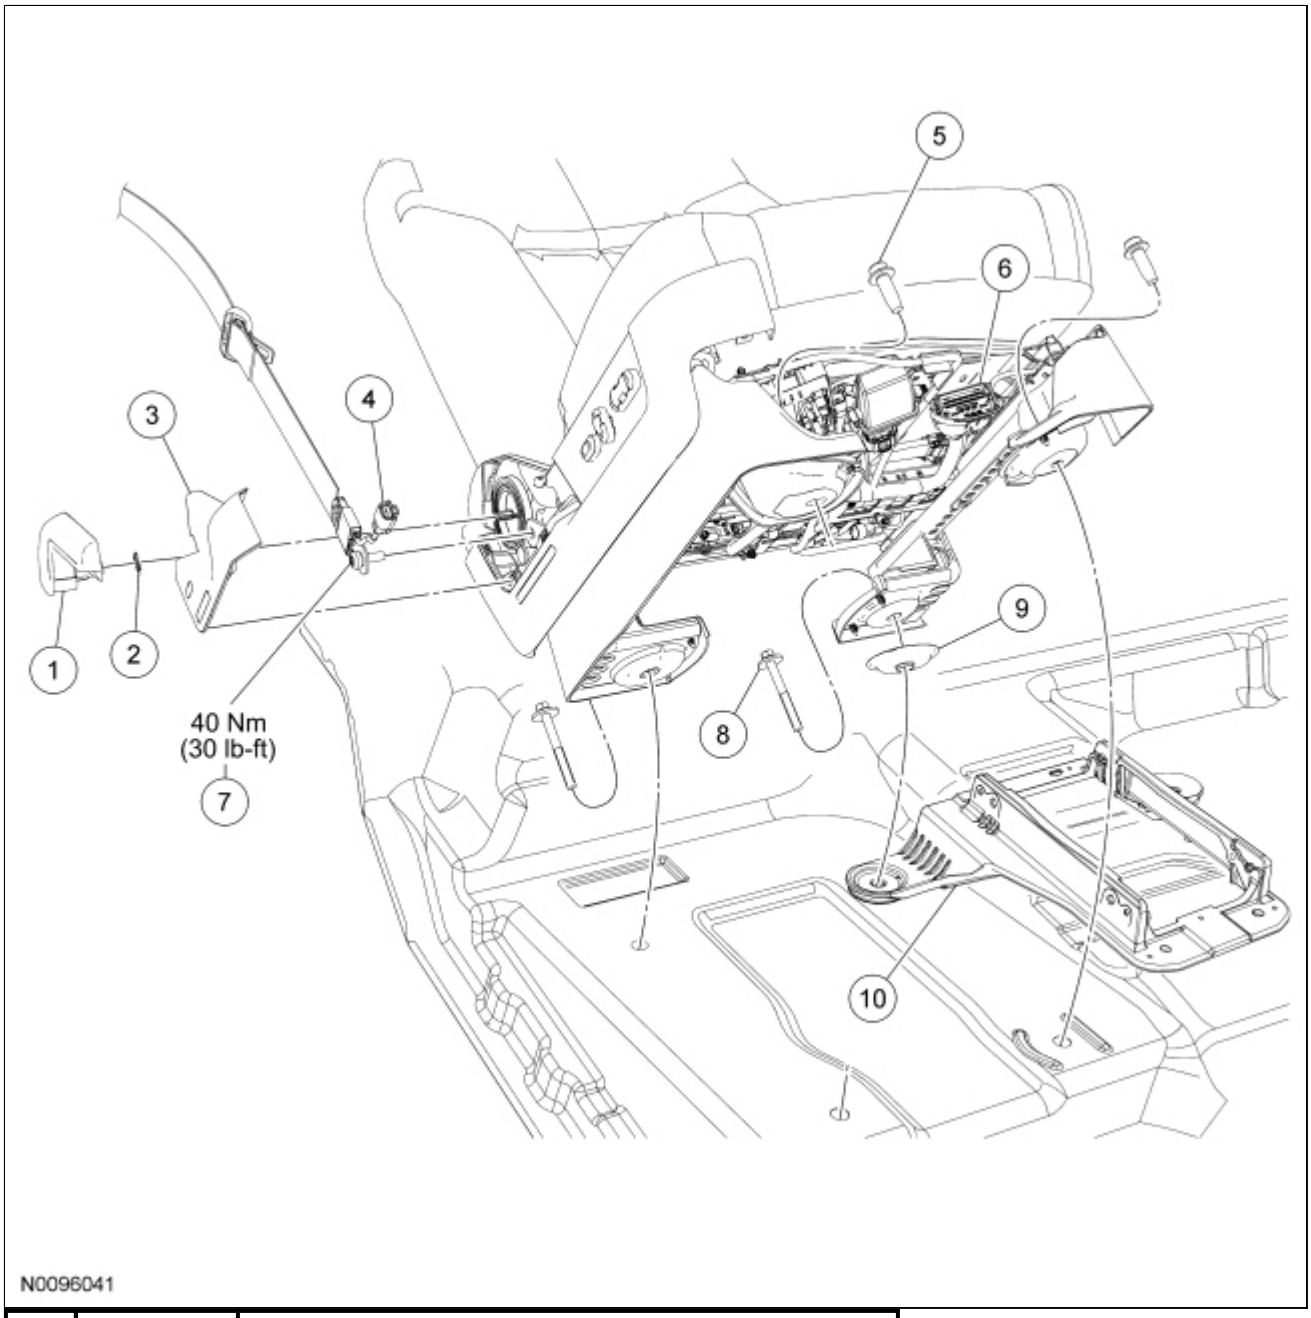
4. If removed, install the front seats. For additional information, refer to Seat — Front in this section.

repair4less

Seat — Front

Driver Seat

NOTE: Refer to the installation steps for tightening sequence and torque specification.



Item	Part Number	Description
1	W714302	Front seat mounting bolt (2 required)

repair4less

2	—	Upper spacer (part of 045B34)
3	W714093	Rear seat mounting bolt (2 required)

5	61693	Safety belt anchor cover (regular and Crew Cab only)
6	—	Seat electrical connectors (part of 14D231)
7	045B34	Pedestal

Passenger Seat

NOTE: Refer to the installation steps for tightening sequence and torque specification.

Item	Part Number	Description
1	62622	Manual recliner handle (if equipped)
2	—	Manual recliner handle retainer (if equipped)
3	61692	Safety belt anchor cover (regular and Crew Cab only)
4	—	Belt Tension Sensor (BTS) electrical connector (part of 611B08)
5	W714302	Front seat mounting bolt (2 required)
6	—	Seat electrical connector (part of 14D230)
7	—	Safety belt anchor and bolt (part of 611B08) (regular and Crew Cab only)

repair4less

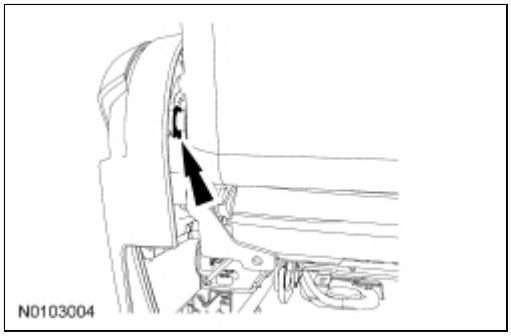
8	W714093	Rear seat mounting bolt (2 required)
9	—	Upper spacer (part of 045B34)
10	045B34	Pedestal

Removal

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **The pedestal used for front center seat and floor console mounting contains press fit washers and spacers designed to prevent corrosion at the front seat and floor console mounting areas. Do not remove these parts from the pedestal during service and make sure they are correctly positioned before installation. Failure to follow these instructions may result in severe corrosion damage to mounting areas and fasteners.**

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. Remove the covers and 2 rear seat mounting bolts.

Regular cab and Crew Cab

2. If equipped, remove the manual recline handle.
    - Insert an appropriate tool behind the cushion side shield, release the retainer and remove the handle.

3. Remove the safety belt anchor cover.
    - If power seat, position the seat fully down.
    - Insert an appropriate tool, release the lower retainers, lift to release the upper retainers tabs and remove the cover.
    - Return any detached retainers to the side shield.

4. Remove the bolt and safety belt anchor.
    - If passenger seat, disconnect the Belt Tension Sensor (BTS) electrical connector.

All vehicles

5. Position the seat and remove the 2 front seat mounting bolts.

6. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

7. **WARNING: Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.**

   Disconnect the seat electrical connector(s) from the body wiring harness and remove the seat from the vehicle.
   - If the upper spacer (at rear inboard mount) separates from the pedestal (under carpet), make sure it is returned for correct installation.

Installation

WARNING: Make sure the front passenger seat is correctly installed and fastened to the vehicle. Do not force the alignment to the floorpan mounting holes. If the seat does not align to the floorpan mounting holes, repair the seat or floorpan as needed. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increase the risk of serious personal injury or death in a crash.

All vehicles

1. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   Position the seat in the vehicle and connect the seat to body wire harness electrical connector(s).
   - Make sure the upper spacer is correctly positioned between the pedestal and seat at the rear inboard mount.

2. Install the 2 front mounting bolts and tighten in the following sequence:
   1. If manual seat track, make sure the seat track rails are in sync and locked for correct mounting alignment.
   2. Tighten the front seat mounting bolt on the inboard side.
      - Tighten to 55 Nm (41 lb-ft).
   3. Tighten the front seat mounting bolt on the outboard side.
      - Tighten to 55 Nm (41 lb-ft).

Regular cab and Crew Cab

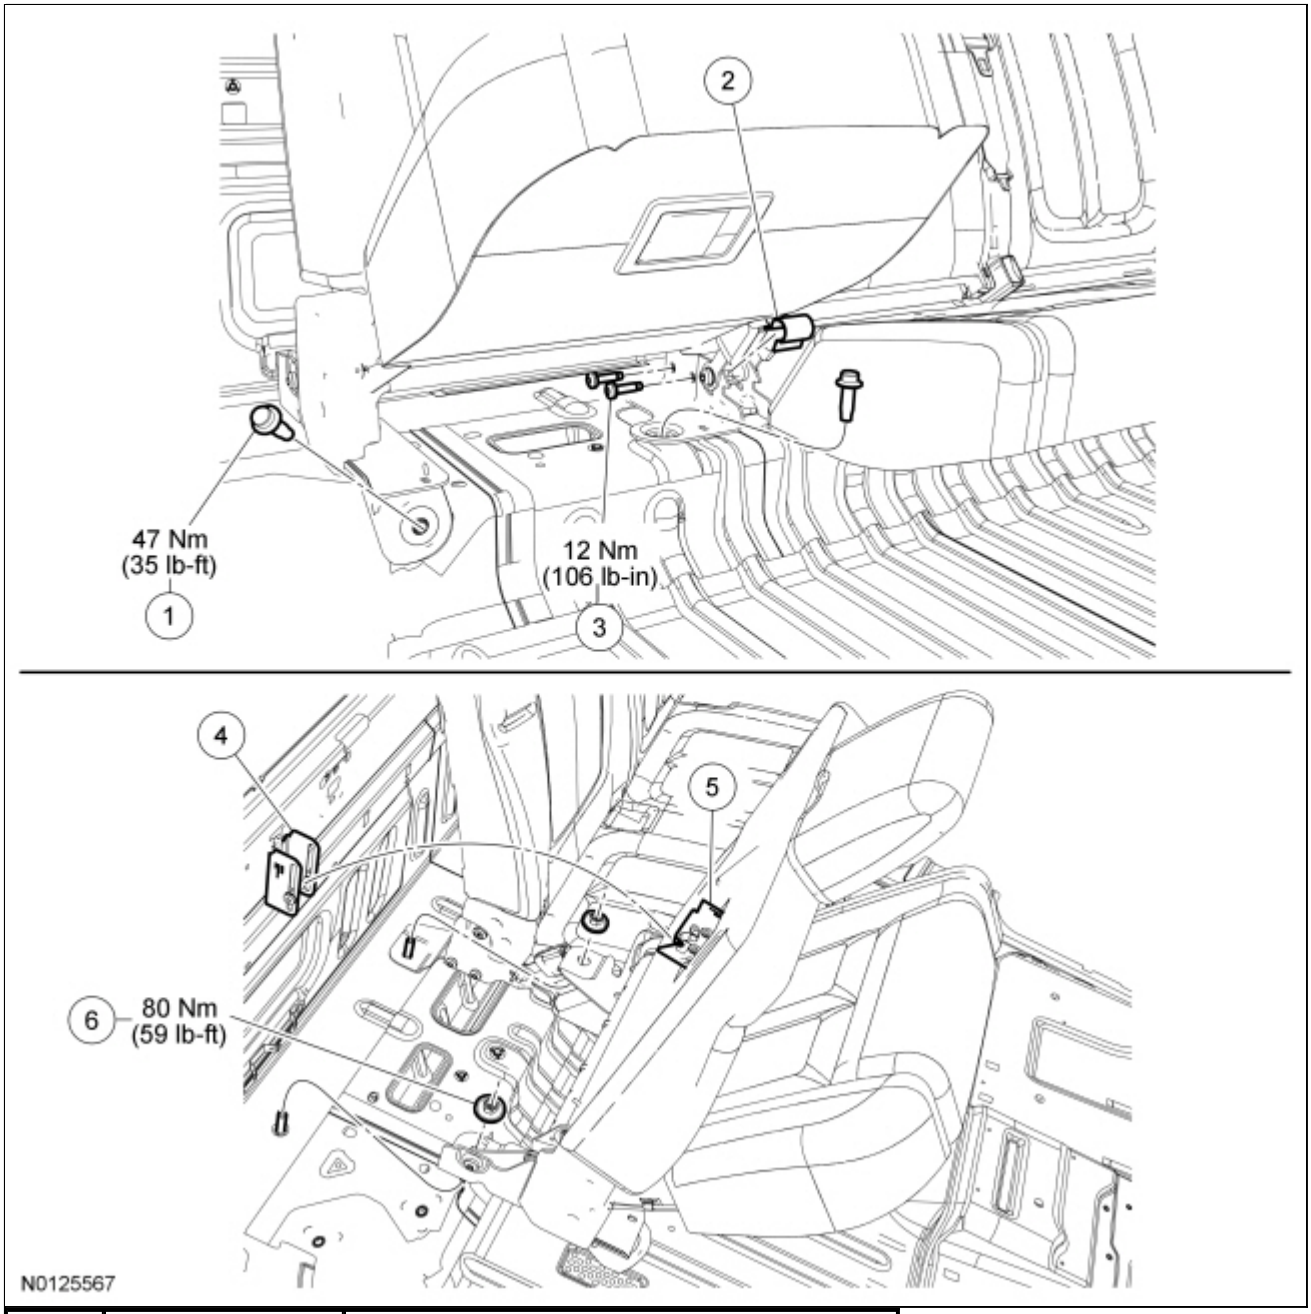
3. Install the safety belt anchor and bolt.
   - Tighten to 40 Nm (30 lb-ft).
   - If passenger seat, connect the BTS electrical connector.

4. Install the safety belt anchor cover.

5. If equipped, install the manual recline handle and retainer.

repair4less

All vehicles



6. Repower the SRS . **If a passenger seat has been serviced, do not prove out the SRS at this time** . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

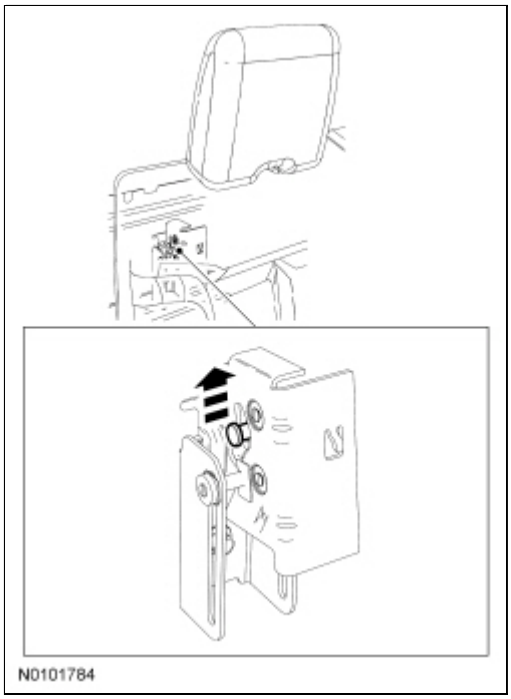
7. Position the seat forward and install the 2 rear seat mounting bolts and covers.
   - Tighten to 55 Nm (41 lb-ft).

8. For passenger seat, carry out the Occupant Classification System (OCS) System Reset. For additional information, refer to the General Procedures portion of Section 501-20B .

Seat — Rear, Crew Cab, 40 Percent

40 Percent Seat

Item	Part Number	Description
1	W710721	Front seat bolt (2 required)
2	—	Safety belt buckle bolt cover
3	N806910	Seat connecting bolt (2 required)



repair4less

4	62452	Striker
5	61383	Backrest latch
6	W708731	Rear seat nut (2 required)

Removal

1. Raise the seat cushion and remove the 2 front seat bolts.
2. Remove the 2 seat connecting bolts.
3. Remove the safety belt buckle bolt cover.
4. **NOTE:** The seat backrest latch is only accessible when the seat cushion is raised.

   Release the backrest latch.
   - From behind the backrest, pull up on the latch release and pull the backrest forward.
   - Release the cushion latch and lower the cushion and backrest.

5. If equipped with heated seats, disconnect the electrical connector.
6. Remove the 2 rear seat nuts and seat.

Installation

1. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   Position the seat in the vehicle and raise the backrest and cushion but do not latch the backrest at this time.

2. Install the 2 seat connecting bolts.
    - Tighten to 12 Nm (106 lb-in).

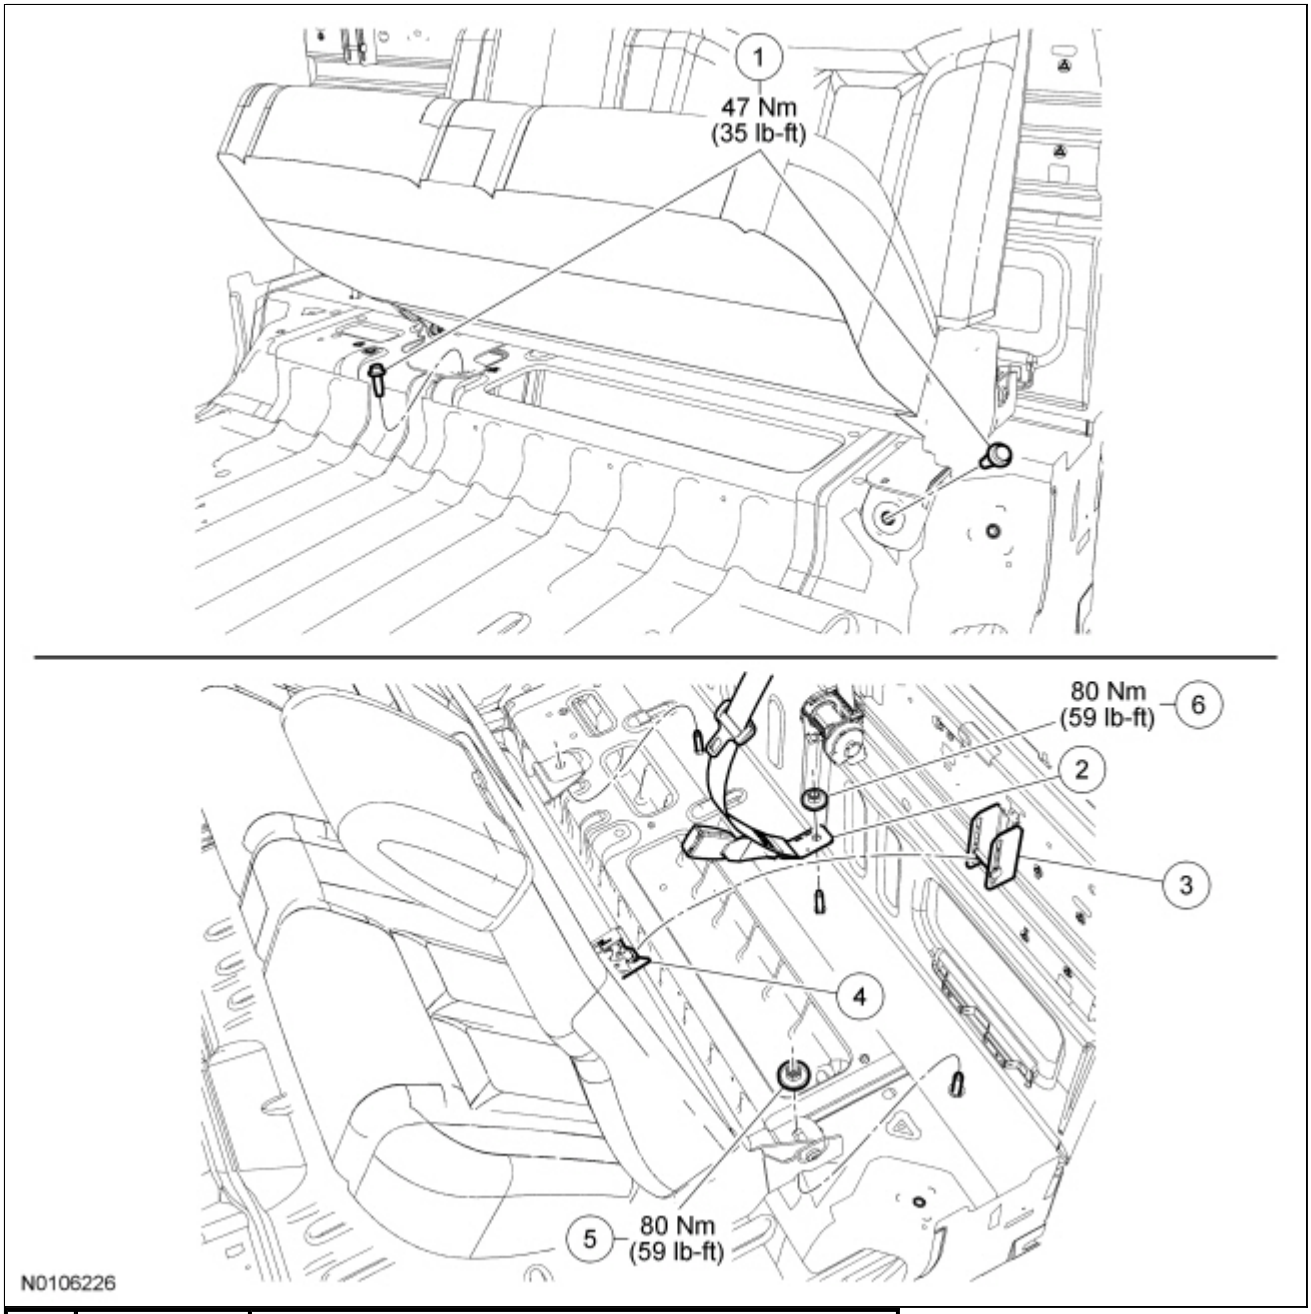
3. Install the outboard front seat bolt.
    - Tighten to 47 Nm (35 lb-ft).

4. Install the inboard front seat bolt.
    - Tighten to 47 Nm (35 lb-ft).

5. Lower the cushion and backrest and install the 2 rear seat nuts.
    - Tighten to 80 Nm (59 lb-ft).

6. If equipped with heated seats, connect the electrical connector.

7. Raise and latch the backrest.
    - Slide the striker pin up/down and align to the backrest latch.
    - Make sure the backrest is fully latched.



8. Install the safety belt buckle bolt cover.

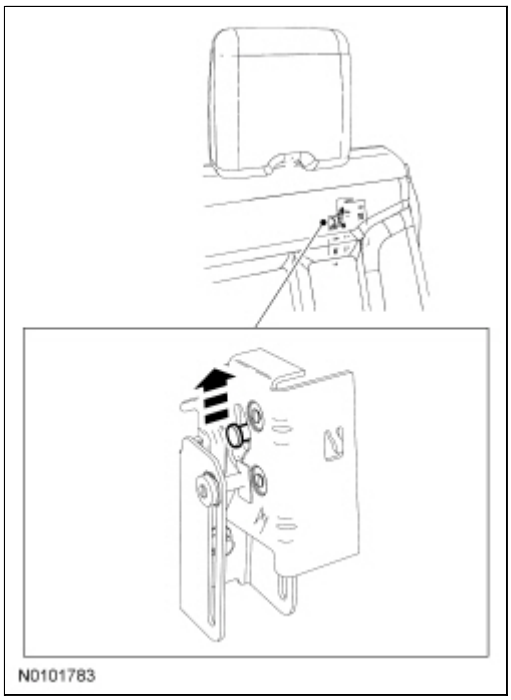
Seat — Rear, Crew Cab, 60 Percent

60 Percent Seat

Item	Part Number	Description
1	W710721	Front seat bolts (2 required)
2	—	Safety belt retractor anchor and buckle (part of 611B64)

3	62452	Striker
4	61383	Backrest latch
5	W708731	Rear seat nut
6	W708731	Safety belt retractor anchor nut



Removal

1. Remove the 40 percent seat. For additional information, refer to Seat — Rear, Crew Cab, 40 Percent in this section.

2. Raise the seat cushion and remove the 2 front seat bolts.

3. **NOTE:** The seat backrest latch is only accessible when the seat cushion is raised.

   Release the backrest latch.
   - From behind the backrest, pull up on the latch release and pull the backrest forward.
   - Release the cushion latch and lower the cushion and backrest.

4. If equipped with heated seats, disconnect the electrical connector.

5. Remove the safety belt retractor anchor nut.
   - Pull the safety belt retractor anchor and buckle through the seat cushion.

6. Remove the rear seat nut and seat.

Installation

1. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

repair4less

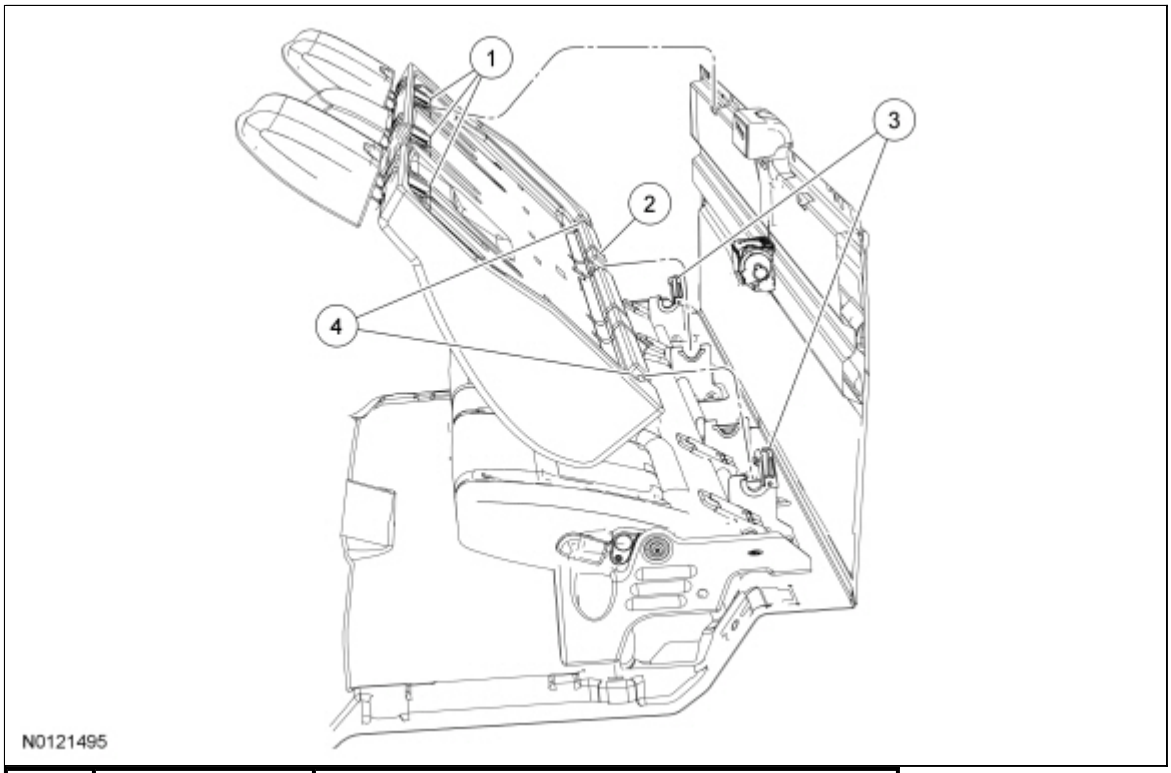
Position the seat in the vehicle and raise the backrest and cushion but do not latch the backrest at this time.

2. Install the outboard front seat bolt.
    - Tighten to 47 Nm (35 lb-ft).

3. Install the inboard front seat bolt.
    - Tighten to 47 Nm (35 lb-ft).

4. Lower the cushion and backrest and install the rear seat nut.
    - Tighten to 80 Nm (59 lb-ft).

5. Install the safety belt retractor anchor and buckle through the seat cushion and install the nut.
    - Tighten to 80 Nm (59 lb-ft).

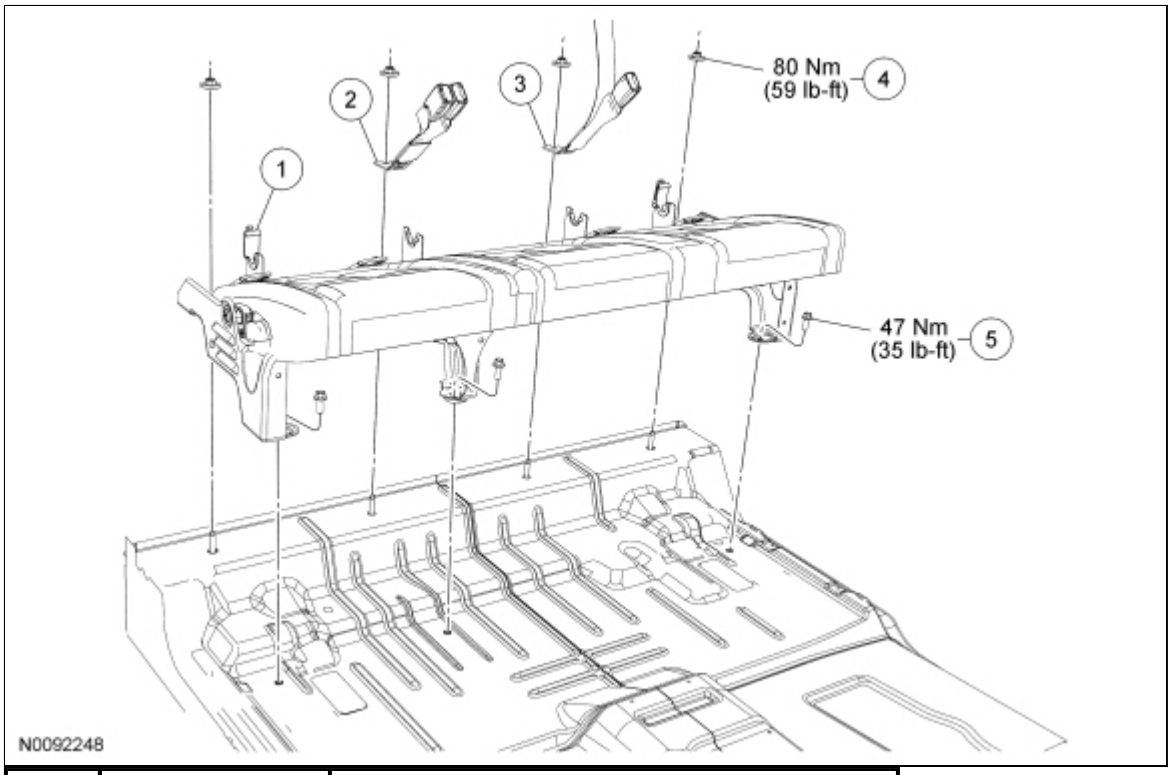


6. If equipped with heated seats, connect the electrical connector.

7. Raise and latch the backrest.
    - Slide the striker pin up/down and align to the backrest latch.
    - Make sure the backrest is fully latched.

8. Install the 40 percent seat. For additional information, refer to Seat — Rear, Crew Cab, 40 Percent in this section.

Seat — Rear, SuperCab

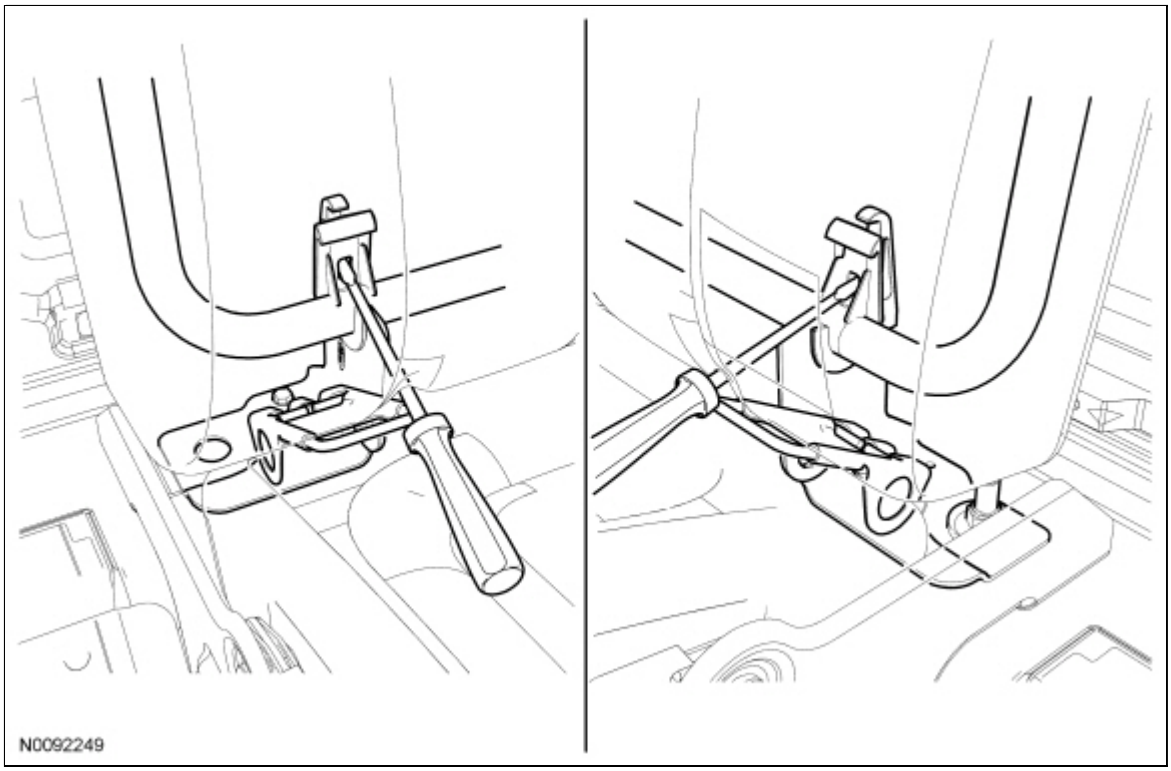


Seat Backrest

Item	Part Number	Description
1	613F60	Upper clips (3 required)
2	—	Backrest frame guide (part of 613A38)
3	613F60	Backrest latches (2 required)
4	—	Locking tabs (part of 613A38)

Seat Cushion

repair4less



Item	Part Number	Description
1	613F60	Backrest latch (2 required)
2	60044	Safety belt buckle
3	—	Safety belt anchor (part of 611B64)
4	W708731	Rear seat nut (4 required)
5	W710721	Front seat bolt (3 required)

Removal

Seat backrest removal

1. Release the 2 backrest latches.
    - Locate the 2 access holes in the backrest frame aligned with the inboard edge of the child safety seat anchors and insert a suitable tool through the access holes.
        - Be careful not to damage the seat trim covers.
    - Push in and release the 2 backrest latches.
        - Push the backrest down slightly to allow the latches to release, then raise the backrest away from the latch.

2. Raise the backrest and release the upper clips.

3. Route the backrest through the center safety belt webbing and remove.

Seat cushion removal

4. With the backrest removed, remove the 4 rear seat nuts.
    - Position the rear center safety belt anchor aside.
    - Remove the safety belt buckle.

5. Remove the spare tire jack to access the front seat bolts.

6. Remove the 3 front seat bolts and seat cushion.

Installation

NOTE: Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

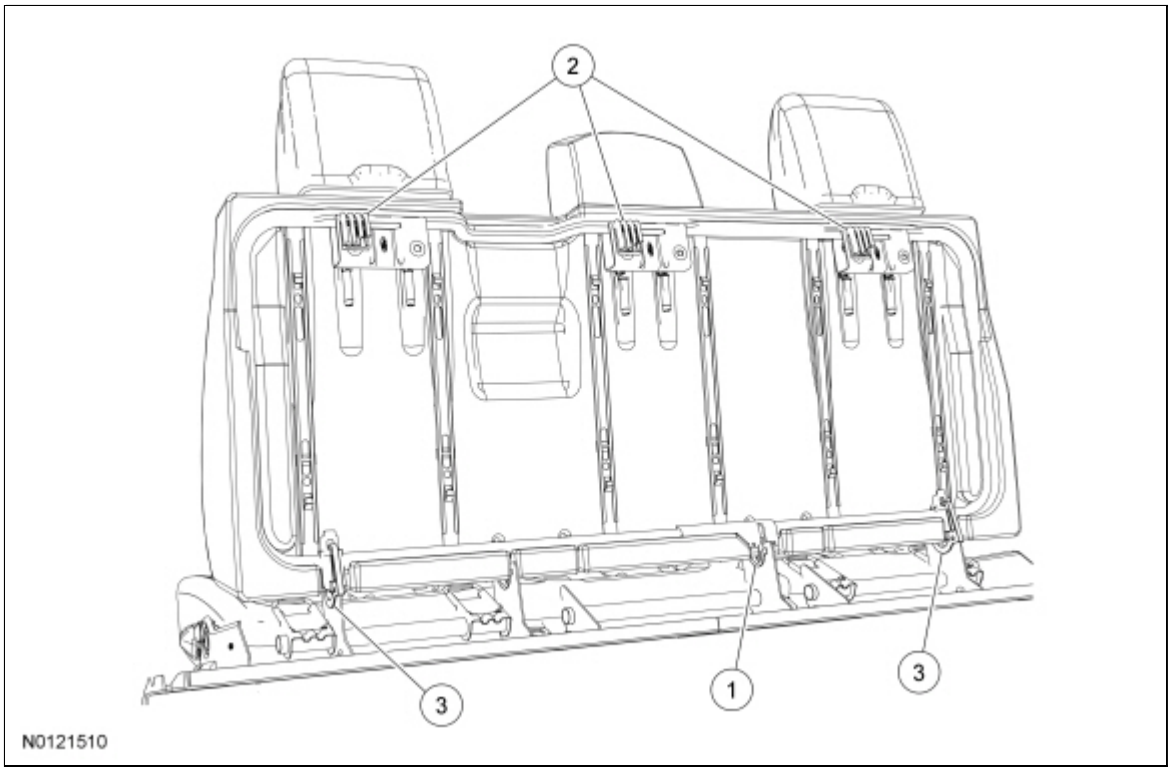
Seat cushion installation

1. Position the seat cushion in the vehicle.

2. Install the 3 front seat bolts.
    - Tighten to 47 Nm (35 lb-ft).

3. Install the rear center safety belt anchor, safety belt buckle and 4 rear seat nuts.
    - Tighten to 80 Nm (59 lb-ft).
    - Route the safety belt buckle through the elastic strap.

repair4less



4. Install the spare tire jack.

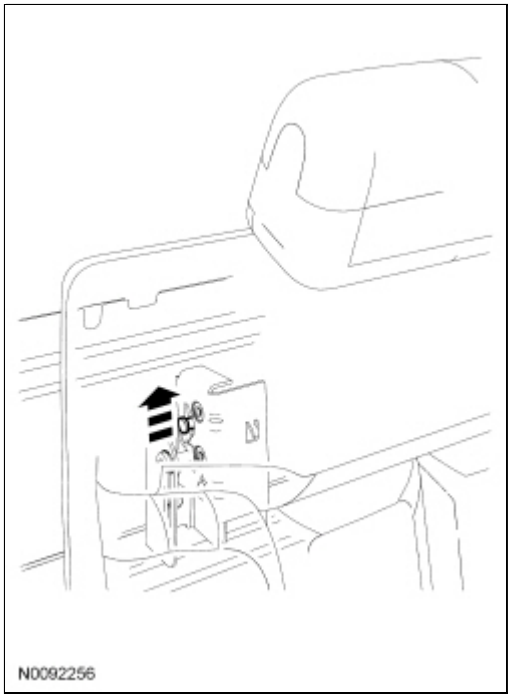
Seat backrest installation

5. Route the backrest through the center safety belt webbing and position in the vehicle.

NOTE: Cab back panel not shown for clarity.

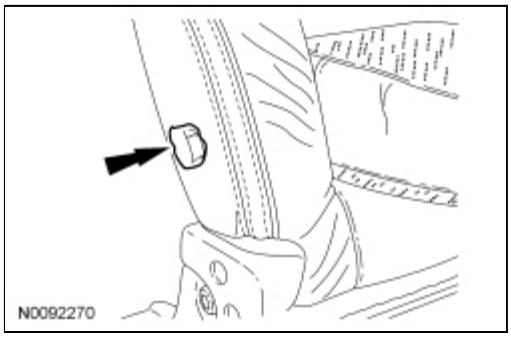
6. Install the backrest.
    1. Align the backrest frame guide to the cushion frame.
    2. Align the 3 upper clips to the rear cab sheet metal.
    3. Press down on the backrest until the 2 backrest latches engage.
        - Make sure all 3 upper clips are engaged and both backrest latches are locked.

repair4less



Seat Armrest — Rear, Crew Cab

Removal and Installation



NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. **NOTE:** The seat backrest latch is only accessible when the seat cushion is raised.

   Release the backrest latch on the 40 percent seat and lower the backrest.
   - From behind the backrest, pull up on the latch release and pull the backrest forward.
   - Release the cushion latch and lower the cushion and backrest.

2. Remove armrest bolt through the access hole on the inboard edge of the 60 percent seat backrest.
   - To install, tighten to 25 Nm (18 lb-ft).

3. Push the armrest to the inboard side of the seat to disengage the pivot and remove the armrest.

4. To install, reverse the removal procedure.

---

repair4less

Seat Backrest — Front, Center

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front, Center in this section.

1. Remove the seat. For additional information, refer to Seat — Front, Center in this section.

2. Remove the rear cupholder.
   - Remove the 2 rear cupholder screws.
   - If equipped, disconnect the power point electrical connector.

3. Remove the LH side shield.
   - Remove the 2 LH side shield screws.
   - Release the pin-type retainer.

4. Remove the backrest latch cover.

5. Remove the backrest stop bolt.
   - To install, tighten to 18 Nm (159 lb-in).

6. Remove the backrest pivot bolt.
   - To install, tighten to 45 Nm (33 lb-ft).

7. Remove the safety belt anchor bolt.
   - To install, tighten to 45 Nm (33 lb-ft).

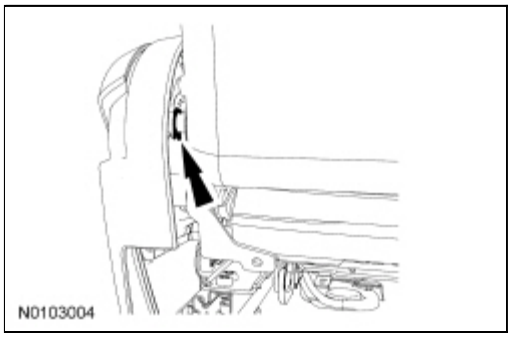
8. Remove the 2 backrest latch upper bolts and backrest.
   - To install, tighten to 60 Nm (44 lb-ft).

9. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

repair4less

Seat Backrest — Front



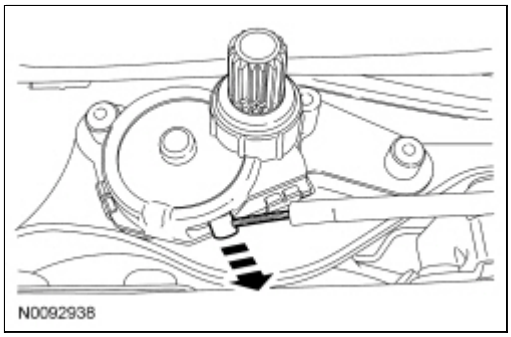
Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

All seats

1. Remove the seat. For additional information, refer to Seat — Front in this section.

2. For SuperCab, remove the manual recline handle, if equipped.
   - Insert an appropriate tool behind the cushion side shield, release the retainer and remove the handle.



3. If equipped, remove the adjustable lumbar knob.
   - Adjust the lumbar until fully relaxed.
   - Release the retainer and remove the knob.

4. Remove the side shield insert.
   - Release the lower retainers and lift to release the upper retainers.
   - If equipped, disconnect the seat control switch and memory SET switch electrical connectors.

5. Remove the side shield.
   - Remove the front and rear side shield screws.
   - Pull the side shield outward to release the retainers and remove.
   - Reinstall all retainers back to the side shield.

6. Release the cushion cover rear J-clip and rear flaps.

7. If equipped, detach the cable from the lumbar adjuster, release the pin-type retainer and route out the cable from the cushion frame.
   - Note cable routing for correct installation.

Power and climate controlled seats

8. Disconnect the backrest wiring harness electrical connector and detach the wiring harness pin-type retainers from the seat track.
    - Note wiring harness routing for correct installation.

All seats

9. Disconnect and detach the side air bag wiring harness electrical connector from the seat track.
    - Note wiring harness routing for correct installation.

10. **WARNING: Use care when the seat back frame is removed and when releasing the recliners from a backrest upright position. The recliners are spring-loaded, which may cause the recliner upper arms to fold with significant speed/force. Failure to follow this instruction may result in serious personal injury.**

    Remove the 4 bolts and seat backrest.
    - To install, tighten to 45 Nm (33 lb-ft).

11. To install, reverse the removal procedure.

---

repair4less

Seat Backrest — Rear, Crew Cab

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. Remove the seat. For additional information, refer to Seat — Rear, Crew Cab, 40 Percent or Seat — Rear, Crew Cab, 60 Percent in this section.

2. Remove the 2 screws and inboard side shield.

3. Remove the screw and outboard side shield.
   - If detached, return the retainer clip to the side shield before installation.

4. If equipped, disconnect the cushion heater mat electrical connector.

5. Remove the 2 backrest pivot bolts and backrest.
   - To install, tighten to 25 Nm (18 lb-ft).

6. To install, reverse the installation procedure.

repair4less

Seat Backrest Cover — Front, Center

Removal and Installation

NOTE: The seat backrest cover on a backrest equipped with storage tray is not serviceable separately. A new backrest must be installed. For additional information, refer to Seat Backrest — Front, Center in this section.

NOTE: For parts identification and location, refer to Seat — Exploded View, Front, Center in this section.

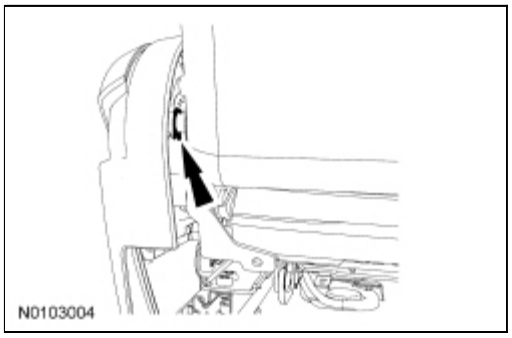
1. Remove the seat backrest. For additional information, refer to Seat Backrest — Front, Center in this section.
2. Un-tuck the zipper and open the backrest cover.
3. Invert the backrest cover and remove the hog rings.
4. Remove the backrest cover.
5. To install, reverse the removal procedure.

Seat Backrest Cover — Front

Removal and Installation

WARNING: Front seat backrest trim covers installed on seats equipped with seat side airbags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side airbag deploying incorrectly and increase the risk of serious personal injury or death in a crash.

NOTE: If a side air bag deployment took place, a new seat backrest foam pad, backrest trim cover, deployment chute and side air bag module and nuts must be installed. A new seat backrest frame should be installed if necessary.



NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat. For additional information, refer to Seat — Front in this section.

2. Remove the 2 head restraint guide sleeves. For additional information, refer to Head Restraint Guide Sleeve in this section.

3. Release the backrest cover J-clip and unzip the 2 zippers.
   - Route the J-clip between the seat cushion and backrest.

4. For SuperCab, remove the manual recline handle, if equipped.
   - Insert an appropriate tool behind the cushion side shield, release the retainer and remove the handle.

5. If equipped, remove the adjustable lumbar knob.
   - Adjust the lumbar until fully relaxed.
   - Release the retainer and remove the knob.

6. Remove the side shield insert.
   - Release the lower retainer clips and lift to release the upper retainer tabs.
   - If equipped, disconnect the seat control switch electrical connector.
   - If equipped, disconnect the memory SET switch electrical connector.

7. Remove the side shield.

repair4less

- Remove the front and rear side shield screws.
- Pull the side shield outward to release the retainers and remove.
- Remove any retainers remaining in the seat track and reinstall them to the side shield.

8. **WARNING: Always carry a live airbag with the deployment door, trim cover or tear seam pointed away from the body. Do not place a live airbag down with the deployment door, trim cover or tear seam facing down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

   WARNING: Before installing the seat side air bag module/deployment chute assembly:
   - **Inspect the side air bag module and mounting surfaces for any damage or foreign material.**
   - **Remove any foreign material from the mounting surfaces of the deployment chute, the seat backrest frame mounting bracket and the air bag module cavity in the seat backrest foam pad.**
   - **Install new parts if damaged.**

   Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

   Remove the side air bag module.
   - Remove the 2 side air bag nuts.
     - To install, tighten to 9 Nm (80 lb-in).
   - Separate the side air bag module from the backrest frame and disconnect the electrical connector.
   - Slide the side air bag module out of the deployment chute.
   - Route the deployment chute through the opening in the backrest foam pad.

9. ***NOTICE:*** **Use care when separating the seat backrest cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the foam pad.**

   Release the J-clip from the backrest frame and partially invert the backrest cover to the row of hog rings.

10. Remove all the hog rings and backrest cover.
    - For climate controlled seat, before installation, make sure the backrest manifold is correctly fitted into the valleys in the foam pad.

11. To install, reverse the removal procedure.

repair4less

Seat Backrest Cover — Rear, Crew Cab

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. Remove the seat. For additional information, refer to Seat — Rear, Crew Cab, 40 Percent or Seat — Rear, Crew Cab, 60 Percent in this section.

2. For 60 percent seat, remove the backrest. For additional information, refer to Seat Backrest — Rear, Crew Cab in this section.

NOTE: 60 percent seat has 4 head restraint guides. 40 percent seat 2 head restraint guides.

3. Remove and discard the head restraint guides. For additional information, refer to Head Restraint Guide Sleeve in this section.

4. If equipped, remove the armrest. For additional information, refer to Seat Armrest — Rear, Crew Cab in this section.

5. Release the lower J-clip.
   - If 40 percent seat equipped with heat, disconnect the cushion heater mat electrical connector.

6. ***NOTICE:*** **Use care when separating the backrest cover from the hook-and-loop strip or the hook-and-loop strip can be torn from the foam pad.**

   Partially invert the backrest cover.
   - For 60 percent seat, release the center J-clip(s) and armrest cavity retainers, if equipped.

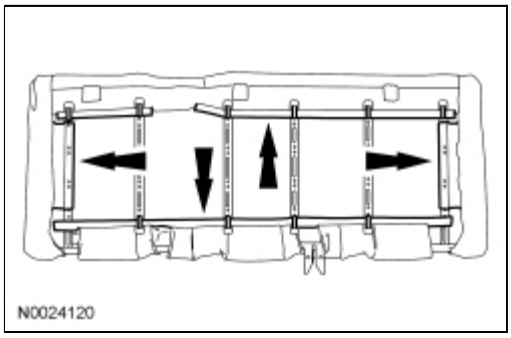
7. Remove all the hog rings attaching the backrest cover to the foam pad.
   - If needed, remove the hog rings attaching the foam pad to the backrest frame and disconnect the backrest heater mat electrical connector (if equipped).

8. To install, reverse the removal procedure.

repair4less

Seat Backrest Cover — Rear, SuperCab

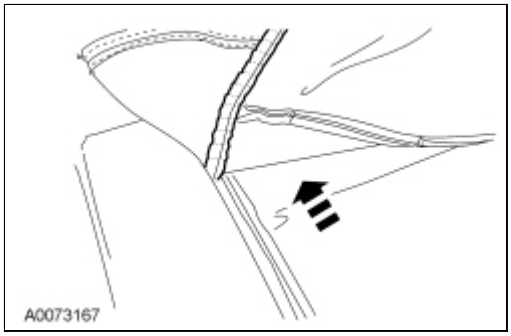
Removal and Installation



NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, SuperCab in this section.

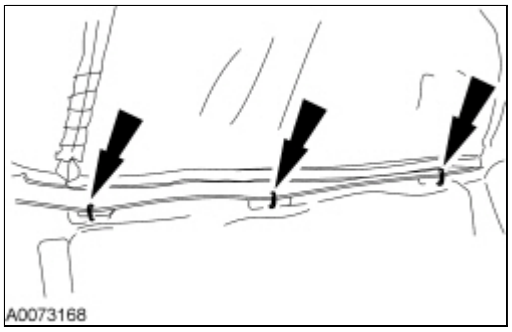
1. Remove the rear seat backrest. For additional information, refer to Seat — Rear, SuperCab in this section.

2. Push the release buttons and remove the 3 head restraints.



3. Remove and discard the 6 head restraint guide sleeves. For additional information, refer to Head Restraint Guide Sleeve in this section.
   - To install, install 6 new head restraint guide sleeves.

4. Release all the backrest cover J-clips and retainer strips.



5. ***NOTICE:*** **Use care when separating the backrest cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the foam pad.**

   Invert the backrest cover and separate the hook-and-loop strips.

6. Remove the hog rings and backrest cover.
   - If required, remove the hog rings from the backrest frame and separate from the foam pad.

7. To install, reverse the removal procedure.

repair4less

Seat Backrest Heater Mat — Front

Removal

NOTICE: **The heater mat is not designed to be separated from the foam pad. Doing so will damage the foam pad. Install a new foam pad and heater mat. Failure to follow this instruction can result in seat component damage and system failure.**

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat backrest cover. For additional information, refer to Seat Backrest Cover — Front in this section.

2. Disconnect the backrest heater mat electrical connector and detach the wiring harness.
   - Note wire harness routing for correct installation.

3. Remove the backrest foam pad with heater mat and discard.

Installation

WARNING: Never install heated seat parts not intended for use on this vehicle. Parts released for other model years or vehicle lines are not compatible even if they appear visually and physically similar. Installing incorrect parts will result in heated seat system performance outside design specification. Failure to follow this instruction may result in serious personal injury.

1. Install the backrest foam pad to the backrest frame.

2. ***NOTICE:*** **Remove the paper strip covering the adhesive before adhering the heater mat to the foam pad. Otherwise, damage to the seat can occur.**

   NOTE: When adhering the heater mat to the foam pad, be sure to position the heater mat so it is straight and free of any wrinkles that may show through the cover material after installation.

   Install the heater mat to the foam pad.
   - Align the heater mat square to the seat backrest with the narrow area of the heater mat tucked into the valley of the foam pad and the wiring toward the lower edge.
   - Align the upper windows of the heater mat over the listing wire in the foam pad to allow for hog ring installation when the backrest cover is installed.
   - Firmly apply the heater mat to the foam pad and rub to seal the adhesive.

3. Route the electrical connector and wire harness through the hole at the bottom of the foam pad, fasten the wire harness and connect the electrical connector.

4. Install the seat backrest cover. For additional information, refer to Seat Backrest Cover — Front in this section.

repair4less

Seat Backrest Heater Mat — Rear

Removal

NOTICE: **The heater mat is not designed to be separated from the foam pad. Doing so will damage the foam pad. Install a new foam pad and heater mat. Failure to follow this instruction can result in seat component damage and system failure.**

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. Remove the seat backrest cover. For additional information, refer to Seat Backrest Cover — Rear, Crew Cab in this section.
   - For 40 percent seat, disconnect the cushion heater mat electrical connector.

2. Disconnect and detach the backrest heater mat electrical connector.
   - Note the wire harness routing for correct installation.

3. Remove the backrest foam pad with heater mat and discard.

Installation

1. Install the backrest foam pad to the backrest frame.

2. ***NOTICE:*** **Remove the paper strip covering the adhesive before adhering the heater mat to the foam pad. Otherwise, damage to the seat can occur.**

   NOTE: When adhering the heater mat to the foam pad, be sure to position the heater mat so it is straight and free of any wrinkles that may show through the cover material after installation.

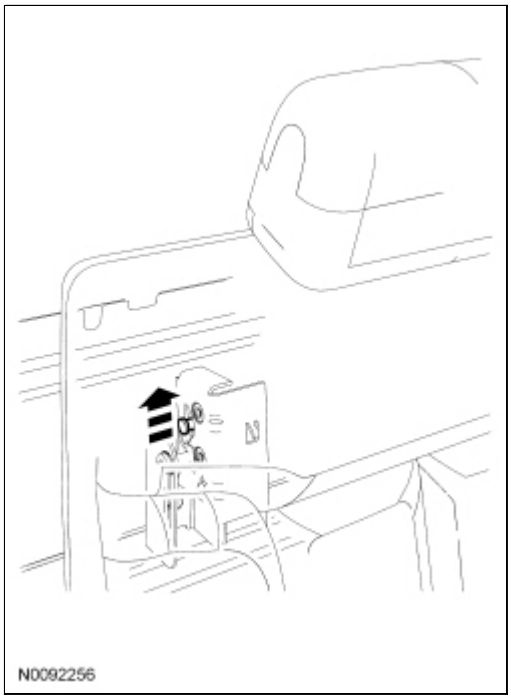
   Install the heater mat to the foam pad.
   - Align the heater mat square to the seat with the wiring toward the lower edge and tuck the narrow areas into the valley of the foam pad.
   - Align the upper windows of the heater mat over the listing wire in the foam pad to allow for hog ring installation when the backrest cover is installed.
   - Firmly apply the heater mat to the foam pad and rub to seal the adhesive.

3. Route the wire harness through the hole in the foam pad, attach and connect the electrical connector.

4. Install the seat backrest cover. For additional information, refer to Seat Backrest Cover — Front in this section.
   - For 40 percent seat, connect the cushion heater mat electrical connector.

repair4less

Seat Backrest Latch — Rear, Crew Cab



Removal and Installation

NOTE: RH shown, LH similar.

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. **NOTE:** The seat backrest latch is only accessible when the seat cushion is raised.

   Release the backrest latch.
   - From behind the backrest, pull up on the latch release and pull the backrest forward.
   - Release the cushion latch and lower the cushion and backrest.

2. Remove the 2 bolts and backrest latch.
   - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.

repair4less

Seat Backrest Thermo-Electric Device

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Position the seat backrest fully forward.
2. Release the backrest cover J-clip and unzip the 2 zippers.
3. Disconnect the Thermo-Electric Device (TED) electrical connector.
4. Detach the pin-type retainer attaching the TED duct to the backrest frame.
5. Un-hook the TED from the backrest support wire and remove.
    - If equipped with power lumbar, note cable routing for correct installation.
6. To install, reverse the removal procedure.

Seat Control Switch

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. If equipped, remove the adjustable lumbar knob.
   - Adjust the lumbar until fully relaxed.
   - Release the retainer and remove the knob.

2. Remove the side shield insert.
   - Release the lower retainers and lift to release the upper retainers.
   - Disconnect the seat control switch electrical connector.
   - If equipped, disconnect the memory SET switch electrical connector.

3. Remove the seat control switch button.

4. If equipped, remove the recliner switch button.

5. Release the retaining tabs and remove switch.

6. To install, reverse the removal procedure.

repair4less

Seat Cushion Cover — Front, Center

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front, Center in this section.

1. Remove the seat. For additional information, refer to Seat — Front, Center in this section.

2. Remove the rear cupholder.
   - Remove the 2 rear cupholder screws.
   - If equipped, disconnect the power point electrical connector.

3. Remove the RH side shield.
   - Release the pin-type retainer.

4. Remove the LH side shield.
   - Remove the 2 LH side shield screws.
   - Release the pin-type retainer.

5. Remove the 2 cushion pivot bolts and cushion assembly.
   - To install, tighten to 35 Nm (26 lb-ft).

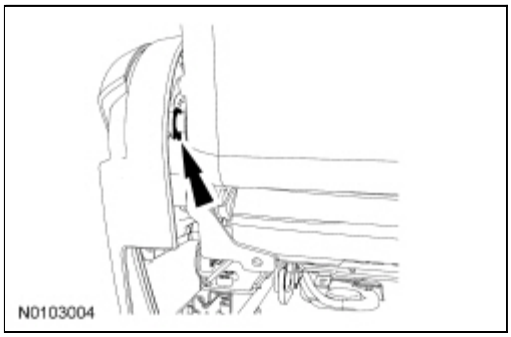
6. Remove the 2 cushion release handle screws and cushion release handle.

7. ***NOTICE:*** **Use care when separating the seat cushion cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Release the J-clip, invert the cushion cover and remove.

8. To install, reverse the removal procedure.

repair4less



Seat Cushion Cover — Front

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat. For additional information, refer to Seat — Front in this section.

2. For SuperCab, remove the manual recline handle, if equipped.
   - Insert an appropriate tool behind the cushion side shield, release the retainer and remove the handle.

3. If equipped, remove the adjustable lumbar knob.
   - Adjust the lumbar until fully relaxed.
   - Release the retainer and remove the knob.

4. Remove the side shield insert.
   - Release the lower retainers and lift to release the upper retainers.
   - If equipped, disconnect the seat control switch electrical connector.
   - If equipped, disconnect the memory SET switch electrical connector.

5. Remove the side shield.
   - Remove the front and rear side shield screw.
   - Pull the cushion side shield outward to release the retainers.
   - Reinstall all retainers back to the side shield.

6. Release cushion cover rear J-clip and rear flaps.

7. If equipped, disconnect the cushion heater mat electrical connector and detach the wiring harness.

8. Release all the cushion cover retainers and remove the cover and foam pad.

9. ***NOTICE:*** **Use care when separating the seat cushion cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the foam pad.**

   Remove all the hog rings and cushion cover.
   - For correct installation, make sure the rear strap on the cushion cover is looped around the

cushion foam pad.

- For climate controlled seat, before installation, make sure the cushion manifold is correctly fitted into the valleys of the foam pad.

10. To install, reverse the removal procedure.

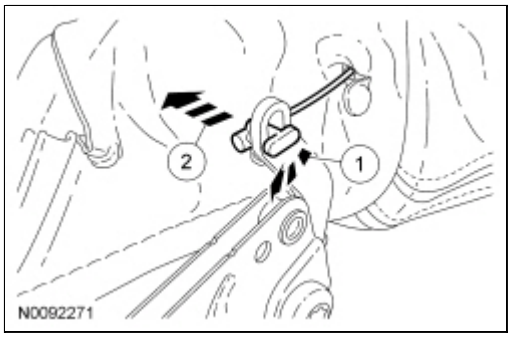
Seat Cushion Cover — Rear, Crew Cab

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

NOTE: 40 percent seat shown, 60 percent similar.



1. Remove the seat. For additional information, refer to Seat — Rear, Crew Cab, 40 Percent or Seat — Rear, Crew Cab, 60 Percent in this section.

2. If equipped, pry up to release the retainers and remove the accessory hook from the cushion bottom side.

3. Pry up to release the retainers and remove the latch bezel from the cushion bottom side.

4. Remove the screw and outboard side shield.

5. Detach the latch cable clamp.
    1. Rotate cable end to align with the slot in the clamp.
    2. Pull the cable end through the slot and separate from the clamp.

6. If equipped, disconnect the cushion heater mat electrical connector.

7. ***NOTICE:*** **Use care when separating the seat cushion cover from the hook-and-loop strip or the hook-and-loop strip can be torn from the foam pad.**

    Release the J-clip(s) and partially invert the cushion cover.
    - For 60 percent seat, remove the hog ring from the safety belt buckle sleeve.
    - Route the latch release cable through the cushion cover flap.

8. Remove all the hog rings and cushion cover.

9. To install, reverse the removal procedure.
    - Make sure the lower anchors and tethers for children are accessible.

repair4less

Seat Cushion Cover — Rear, SuperCab

Removal and Installation

NOTE: 40 percent and 60 percent rear seat cushion covers are removed in the same manor.

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, SuperCab in this section.

1. Remove the rear seat cushion. For additional information, refer to Seat — Rear, SuperCab in this section.
2. Release the cushion cover J-clip.
3. ***NOTICE:*** **Use care when separating the seat cushion cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Invert the cushion cover to the row of hog rings.
4. Remove the hog rings.
5. Invert and remove the cushion cover.
   - If needed, separate and remove foam pad from the cushion frame.
6. To install, reverse the removal procedure.

Seat Cushion Heater Mat — Front

Removal

NOTICE: **The heater mat is not designed to be separated from the foam pad. Doing so will damage the foam pad. Install a new foam pad and heater mat. Failure to follow this instruction can result in seat component damage and system failure.**

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat cushion cover. For additional information, refer to Seat Cushion Cover — Front in this section.

2. Remove the cushion foam pad with heater mat and discard.

Installation

WARNING: Never install heated seat parts not intended for use on this vehicle. Parts released for other model years or vehicle lines are not compatible even if they appear visually and physically similar. Installing incorrect parts will result in heated seat system performance outside design specification. Failure to follow this instruction may result in serious personal injury.

1. Install the cushion foam pad to the seat track.

2. ***NOTICE:*** **Remove the paper strip covering the adhesive before adhering the heater mat to the foam pad. Otherwise, damage to the seat can occur.**

   NOTE: When adhering the heater mat to the foam pad, be sure to position the heater mat so it is straight and free of any wrinkles that may show through the cover material after installation.

   Install the heater mat to the foam pad.
   - Align the heater mat square to the seat cushion with the narrow area of the heater mat tucked into the valley of the foam pad and the wiring toward the front edge.
   - Align the windows of the heater mat over the listing wire in the foam pad to allow for hog ring installation when the cushion cover is installed.
   - Firmly apply the heater mat to the foam pad and rub to seal the adhesive.

3. Fasten the wire harness and connect the electrical connector.

4. Install the seat cushion cover. For additional information, refer to Seat Cushion Cover — Front in this section.

repair4less

Seat Cushion Heater Mat — Rear

Removal

NOTICE: **The heater mat is not designed to be separated from the foam pad. Doing so will damage the foam pad. Install a new foam pad and heater mat. Failure to follow this instruction can result in seat component damage and system failure.**

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. Remove the seat cushion cover. For additional information, refer to Seat Cushion Cover — Rear, Crew Cab in this section.

2. Disconnect the cushion heater mat electrical connector.
   - Note the wire harness routing for correct installation.

3. Remove the cushion foam pad with heater mat and discard.

Installation

1. Install the cushion foam pad.

2. ***NOTICE:*** **Remove the paper strip covering the adhesive before adhering the heater mat to the foam pad. Otherwise, damage to the seat can occur.**

   NOTE: When adhering the heater mat to the foam pad, be sure to position the heater mat so it is straight and free of any wrinkles that may show through the cover material after installation.

   Install the heater mat to the foam pad.
   - Align the heater mat square to the seat with the wiring toward the rear edge and tuck the narrow areas into the valley of the foam pad.
   - Align the windows of the heater mat over the listing wire in the foam pad to allow for hog ring installation when the cushion cover is installed.
   - Firmly apply the heater mat to the foam pad and rub to seal the adhesive.

3. Route the wire harness through the hole in the foam pad and connect the electrical connector.

4. Install the seat cushion cover. For additional information, refer to Seat Cushion Cover — Front in this section.

repair4less

Seat Cushion Thermo-Electric Device

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat cushion cover. For additional information, refer to Seat Cushion Cover — Front in this section.

2. Remove the screw from the Thermo-Electric Device (TED) mounting bracket.

3. Remove the cushion TED .
   - Disconnect the electrical connector.
   - Detach the pin-type retainer and wiring harness.
   - Route the wiring harness and remove the TED .

4. To remove the TED mounting bracket, un-hook from the cushion support wires.

5. To install, reverse the removal procedure.

repair4less

Seat Latch — Front, Center

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front, Center in this section.

1. Remove the seat. For additional information, refer to Seat — Front, Center in this section.

2. Remove the rear cupholder.
   - Remove the 2 rear cupholder screws.
   - If equipped, disconnect the power point electrical connector.

3. Remove the backrest latch cover.

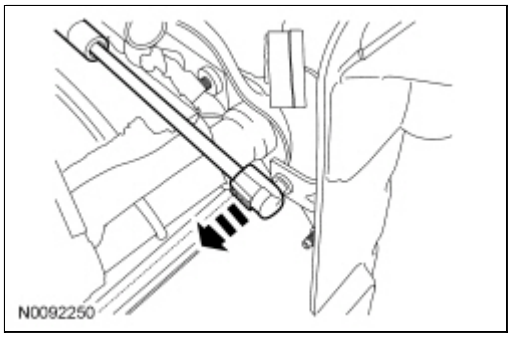
4. Remove the RH side shield.
   - Release the pin-type retainer.

5. Remove the 2 backrest latch upper bolts.
   - Lower the backrest to avoid damaging the pivot side.
   - To install, tighten to 60 Nm (44 lb-ft).

6. Remove the 2 backrest latch lower bolts and backrest latch.
   - To install, tighten to 45 Nm (33 lb-ft).

7. To install, reverse the removal procedure.

Seat Latch — Rear, Crew Cab



Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. Remove the seat cushion cover. For additional information, refer to Seat Cushion Cover — Rear, Crew Cab in this section.

2. Remove the 2 screws and latch release handle.
   - Release the cable retainer.
   - Note cable routing for correct installation.

3. For 60 percent seat, detach the assist spring strut from the outboard riser.

4. Remove the front and rear latch bolts.
   - To install, tighten to 32 Nm (24 lb-ft).

5. Remove the cushion pivot bolt, outboard riser and cushion latch.
   - To install, tighten to 32 Nm (24 lb-ft).

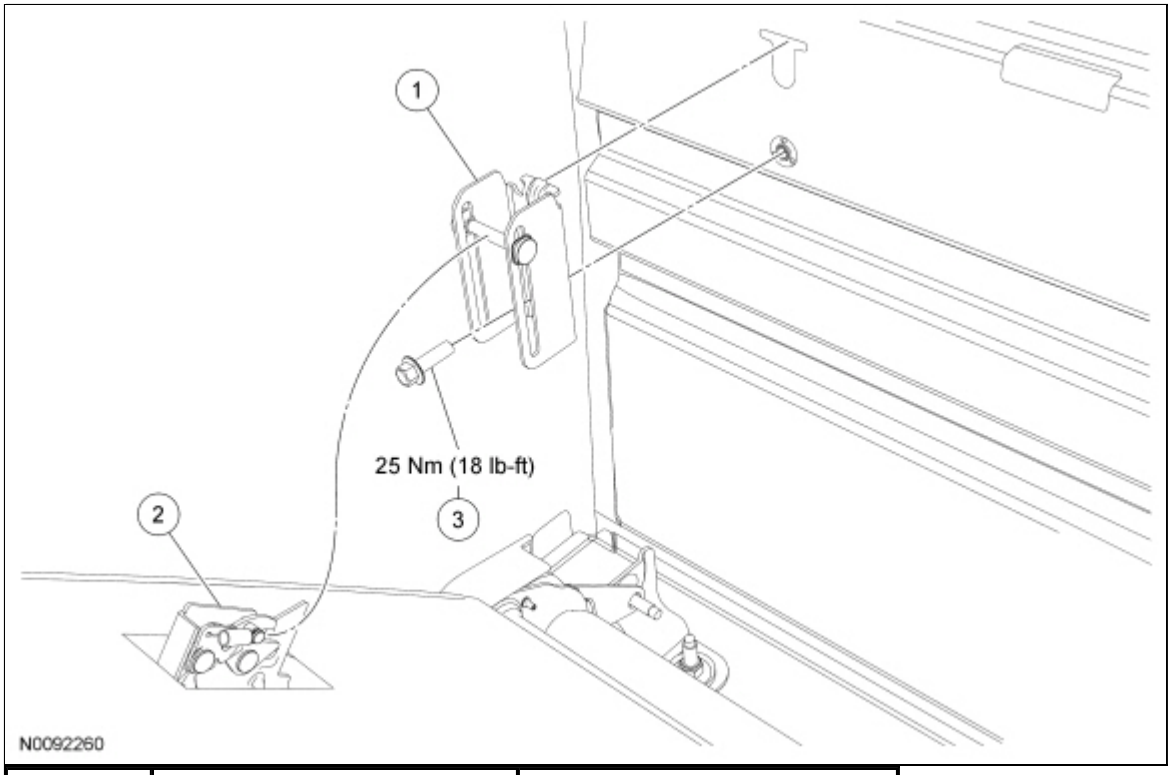
6. To install, reverse the removal procedure.

repair4less

Seat Latch — Rear, SuperCab

Removal and Installation

NOTE: 40 percent and 60 percent rear seat cushion latches are removed in the same manor.



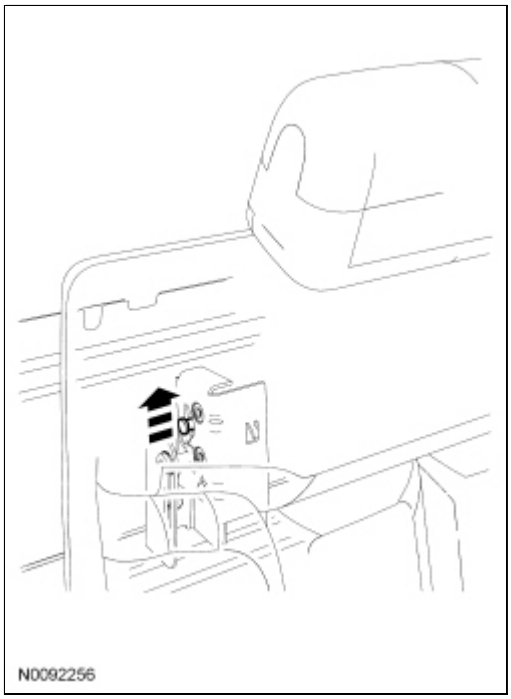
NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, SuperCab in this section.

1. Remove the rear seat. For additional information, refer to Seat — Rear, SuperCab in this section.
2. Remove the cushion pivot bolt.
   - To install, tighten to 33 Nm (24 lb-ft).
3. Remove the rear screw from the outboard riser.
   - Separate the cushion from the inboard riser to avoid pivot bushing damage.
   - To install, tighten to 6 Nm (53 lb-in).
4. Remove the rear latch bolt and outboard seat riser.
   - To install, tighten to 24 Nm (18 lb-ft).
5. Remove the screw and latch bolt cover.
6. Remove the front latch bolt and cushion latch.
   - To install, tighten to 32 Nm (24 lb-ft).
7. To install, reverse the removal procedure.

repair4less

Seat Latch Striker — Rear, Crew Cab

NOTE: 40 percent shown, 60 percent similar.



Item	Part Number	Description
1	62452	Striker
2	61383	Backrest latch
3	W505284	Striker bolt

Removal and Installation

1. **NOTE:** The seat backrest latch is only accessible when the seat cushion is raised.

   Release the backrest latch.
   - From behind the backrest, pull up on the latch release and pull the backrest forward.
   - Release the cushion latch and lower the cushion and backrest.
   - To install, slide the striker pin up/down and align to the backrest latch.

repair4less

2. Remove the bolt and striker.
    - To install, tighten to 25 Nm (18 lb-ft).

3. To install, reverse the removal procedure.
    - Make sure the backrest is fully latched when completed.

Seat Recliner Motor

Removal

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat. For additional information, refer to Seat — Front in this section.

2. For SuperCab with manual recliner, release the retainer and remove the handle.

3. Remove the side shield insert.
   - Release the lower retainers and lift to release the upper retainers
   - If equipped, disconnect the seat control switch electrical connector.
   - If equipped, disconnect the memory SET switch electrical connector.

4. Remove the side shield.
   - Remove the front and rear side shield screws.
   - Pull the cushion side shield outward to release the retainers.
   - Reinstall all retainers back to the side shield.

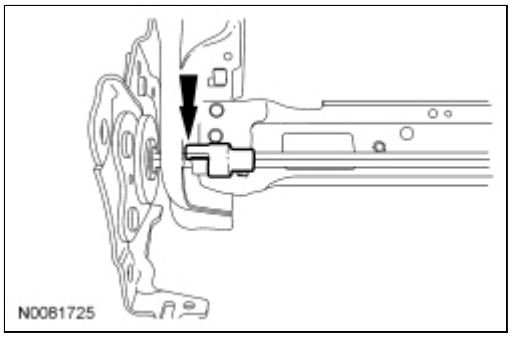
5. Release the backrest cover J-clip and unzip the 2 zippers.
   - Route the J-clip between the seat cushion and backrest.

6. If equipped, remove the backrest Thermo-Electric Device (TED). For additional information, refer to Seat Backrest Thermo-Electric Device in this section.

7. If equipped, remove the power lumbar. For additional information, refer to Lumbar Assembly — Power in this section.

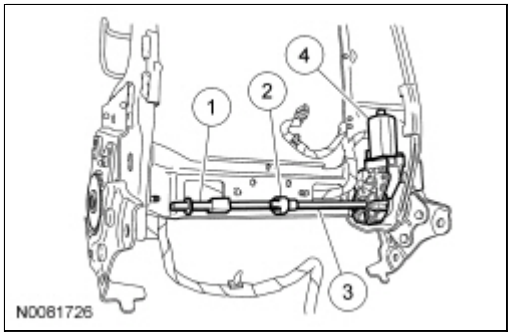
8. If equipped, detach the manual adjustable lumbar from the backrest frame and position aside.
   - Pinch the lumbar retainers together to release from the backrest frame.
   - For installation, make sure the arrow is pointed up.

9. If equipped, disconnect the backrest heater mat electrical connector and detach the wire harness.



10. Push the backrest cover and foam pad away to gain access to the power recliner.

11. Remove the torque shaft retainer.



12. Remove the recline motor bolt.

13. Release the 2 clips (1 shown) and slide the sleeve back on the recliner torque shaft.

repair4less

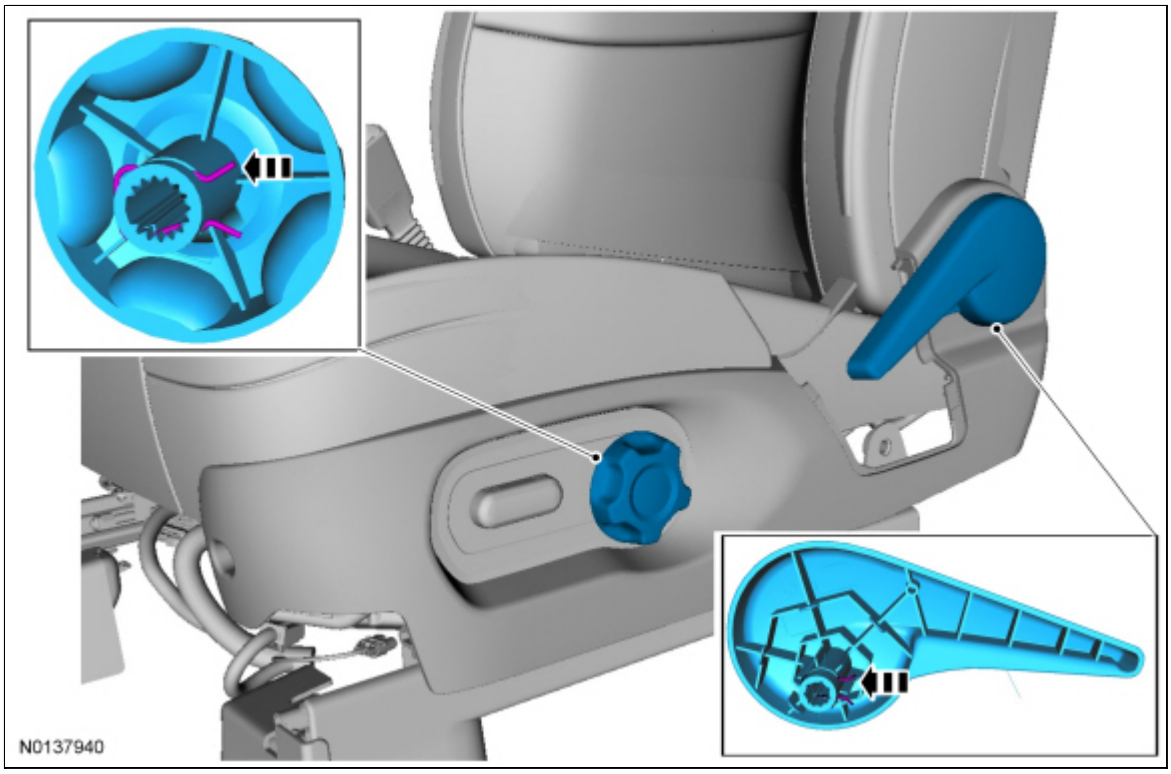
14. Remove the power recline motor.
    1. Slide the recliner torque shaft assembly out of the recliner and remove the short torque shaft.
    2. Remove the sleeve from the long torque shaft.
    3. Slide the torque shaft out of the recline motor.
    4. Disconnect the electrical connector and remove the power recline motor.

15. To install, reverse the removal procedure.
    - If a new power recliner motor has been installed on a driver seat with memory, operate the recliner in both directions through the full range of travel to allow the Driver Seat Module (DSM) to correctly register recliner stop positions and prevent premature stooping points after repair is complete.

repair4less

Seat Track Motor — Front

Material



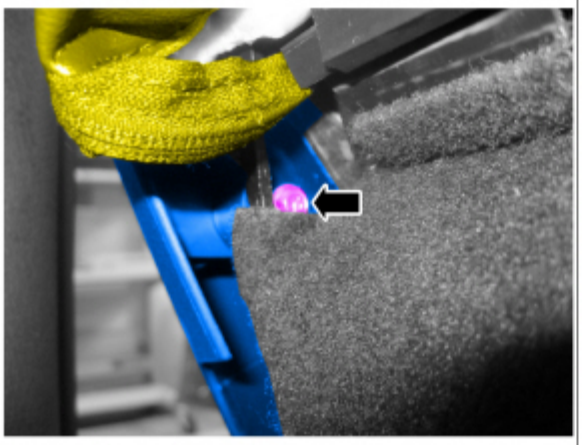
Item	Specification
Motorcraft® Threadlock and Sealer TA-25	WSK-M2G351-A5

Removal

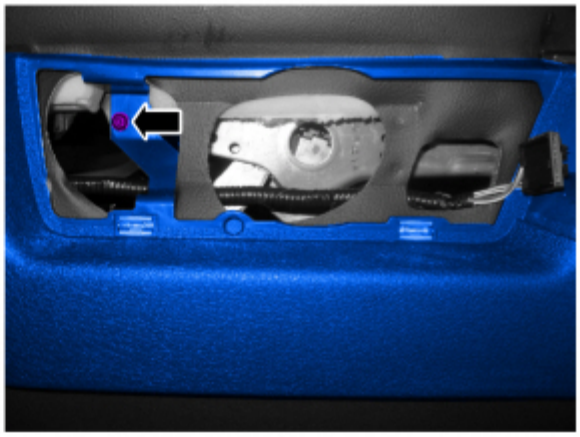
WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

NOTE: Typical driver seat shown, others similar.

1. Remove the seat. Refer to Seat — Front .
2. If equipped.

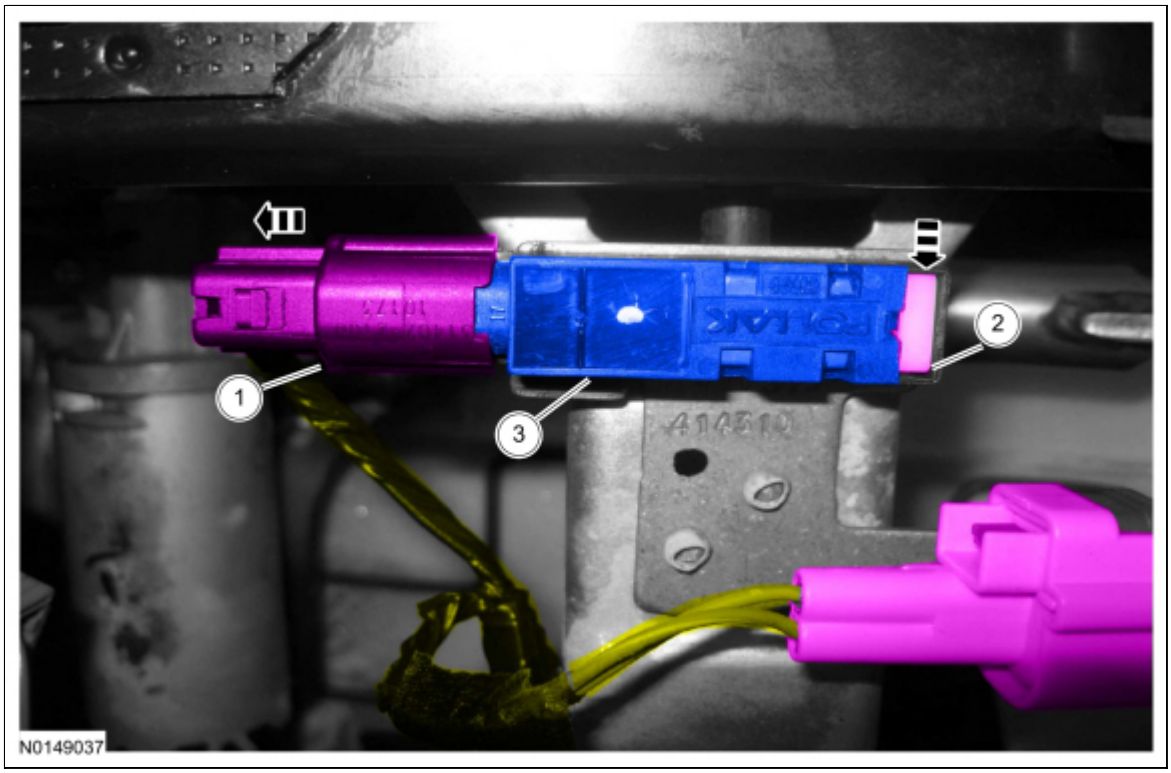


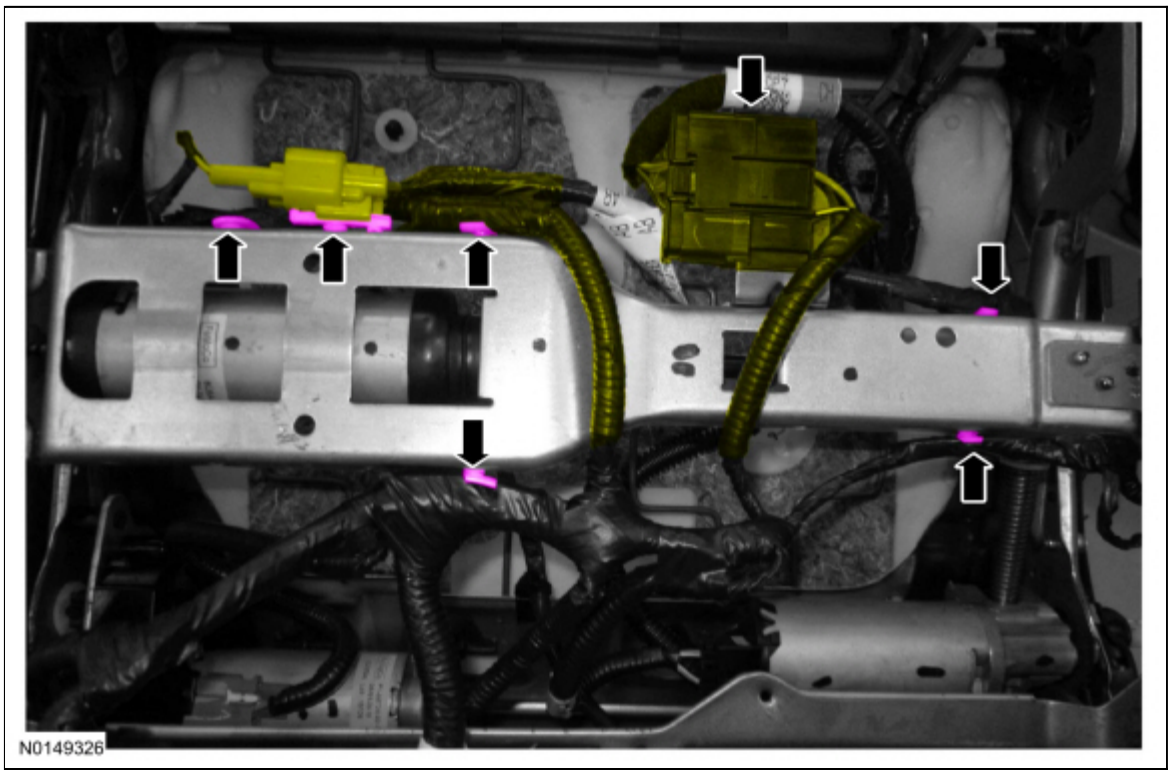
3. If equipped.



N0149039

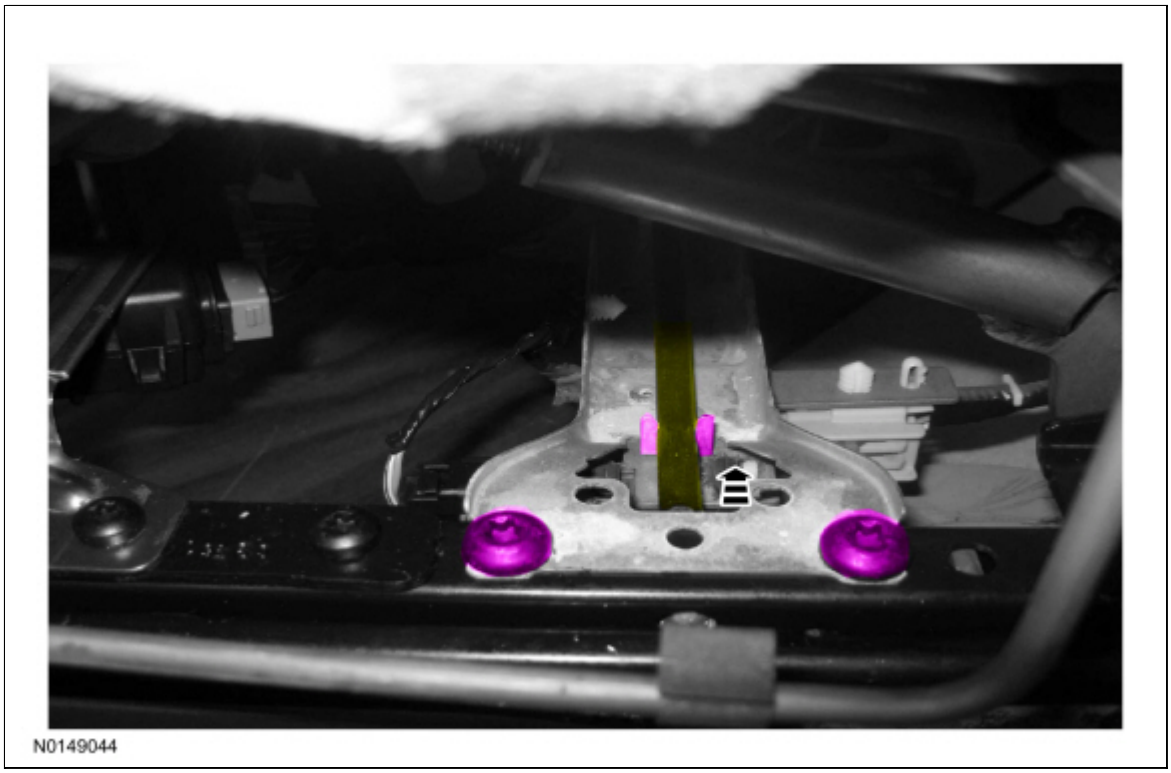
4. Remove the screws and side shield.



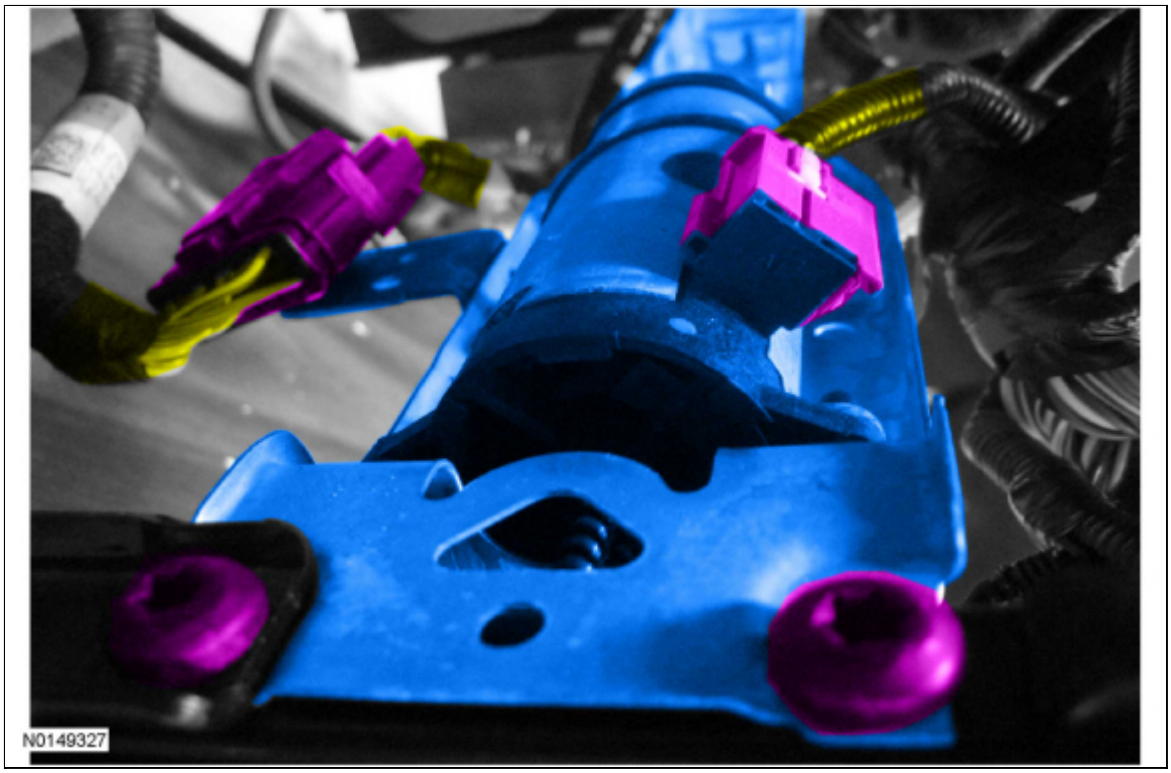


N0148529

5. If equipped.



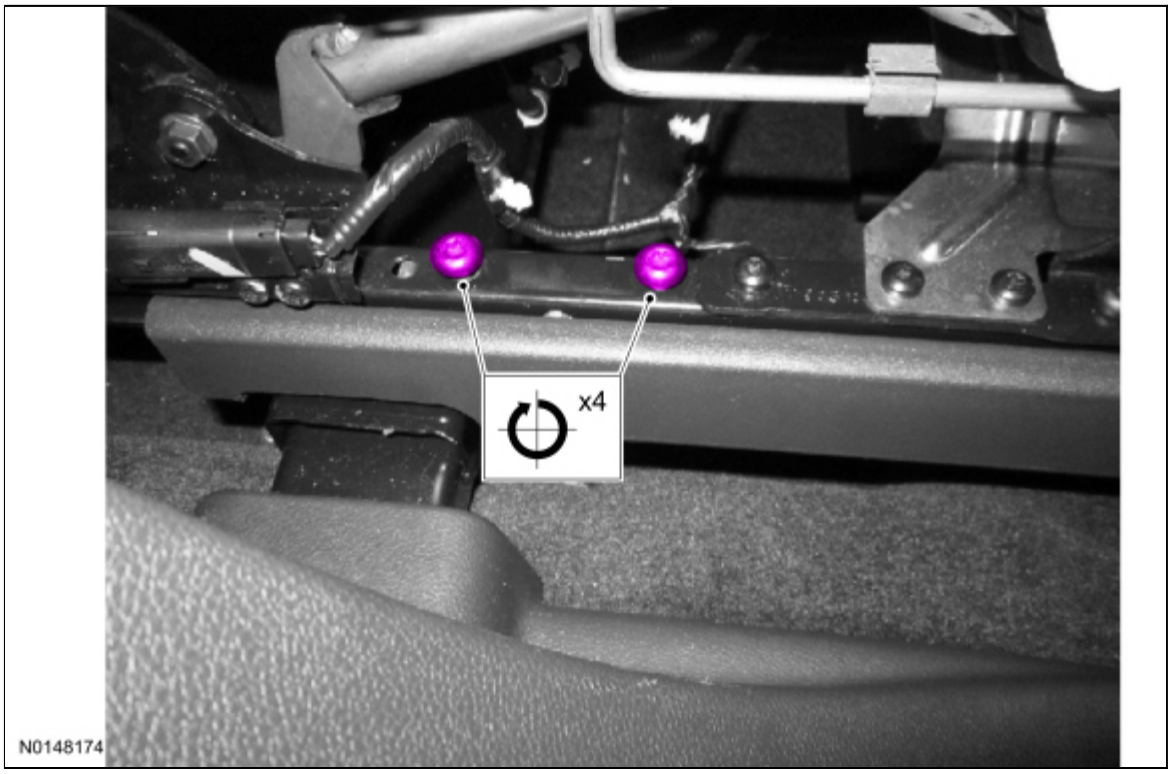
repair4less



6. **NOTE:** Seat cushion wire harness take-outs will vary with seat option content. Note the wire harness routing, attachment points and connections to the horizontal seat motor and bracket for installation.

7.

8.



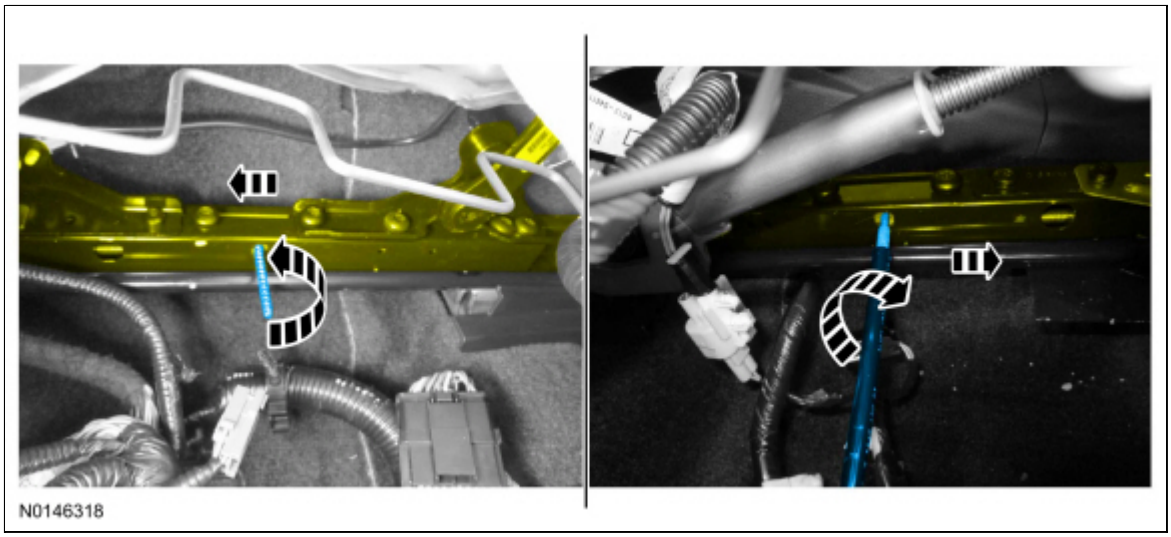
Installation

1. **NOTE:** Applying pressure to the lower seat track rail forward or backward can aid in bolt hole

repair4less

alignment.

On both sides.

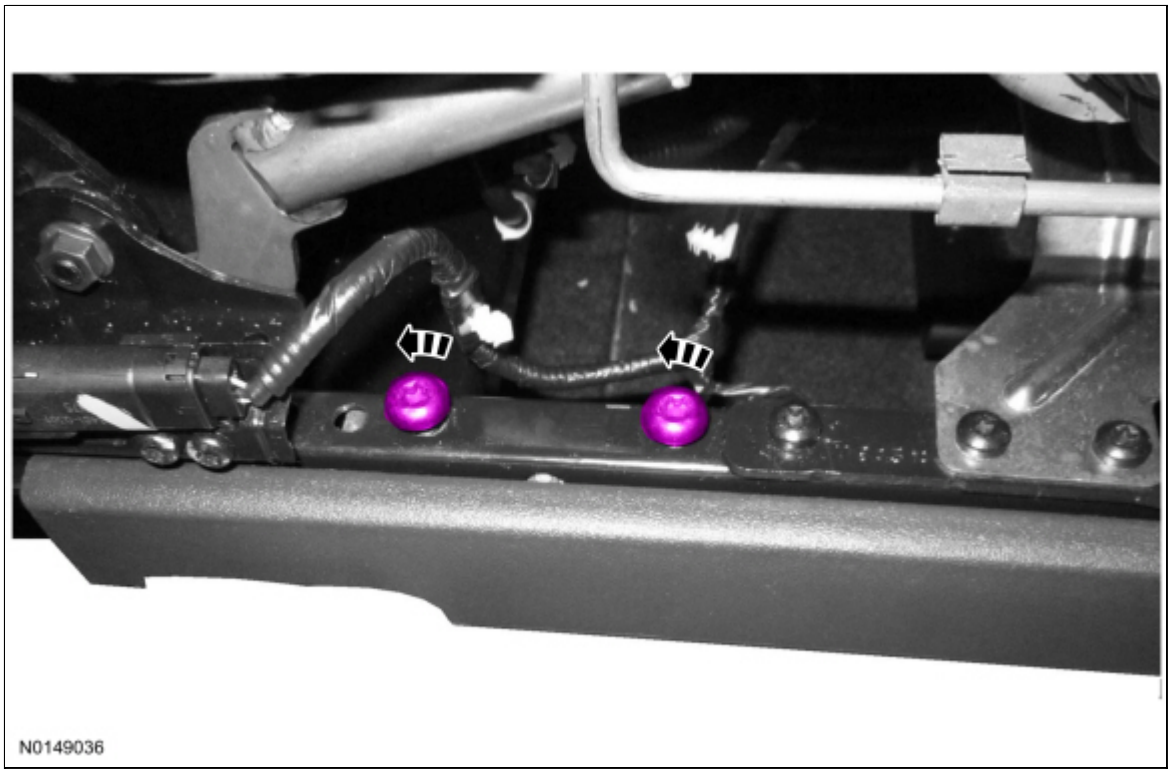


2. ***NOTICE:*** **When using a drill to move the seat track, do not move the seat track to its forward or rearward end of travel stops. Doing so can result in damage to the seat track requiring its replacement.**

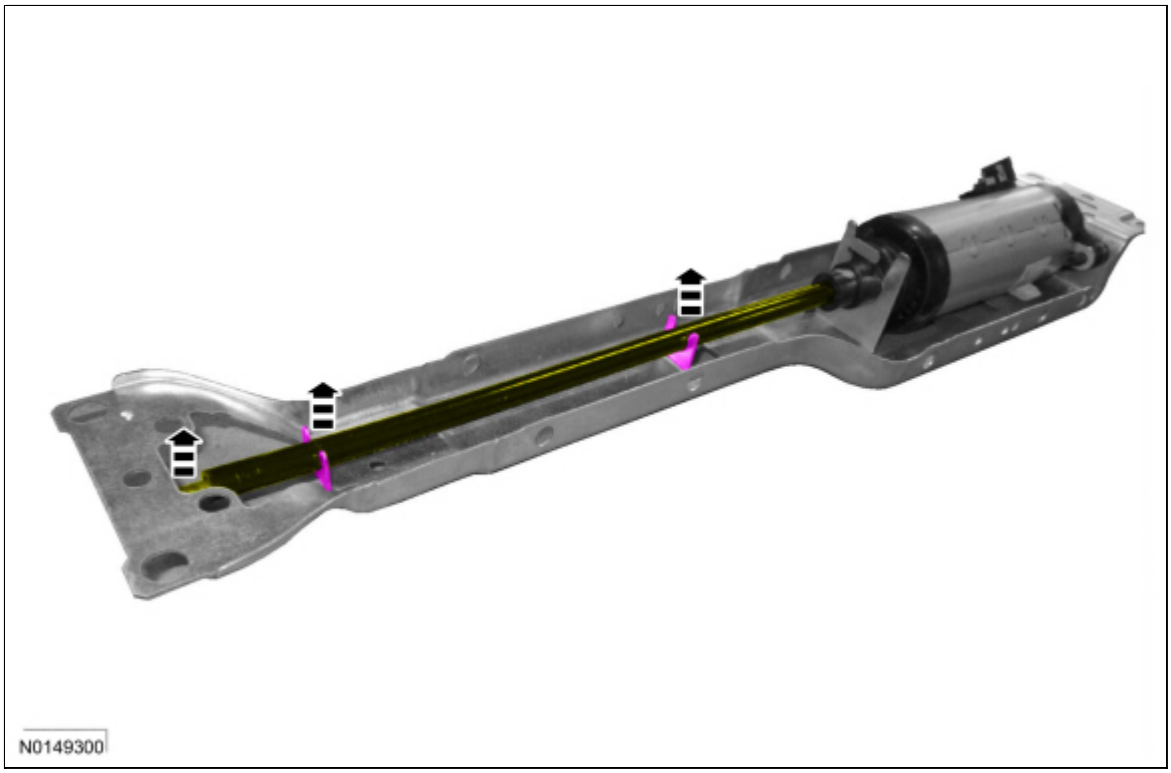
   NOTE: Be sure to drive the seat track evenly or the track will bind during movement.

   NOTE: Rotate the cables using 2 drills operating at similar speeds to most efficiently position the seat track.

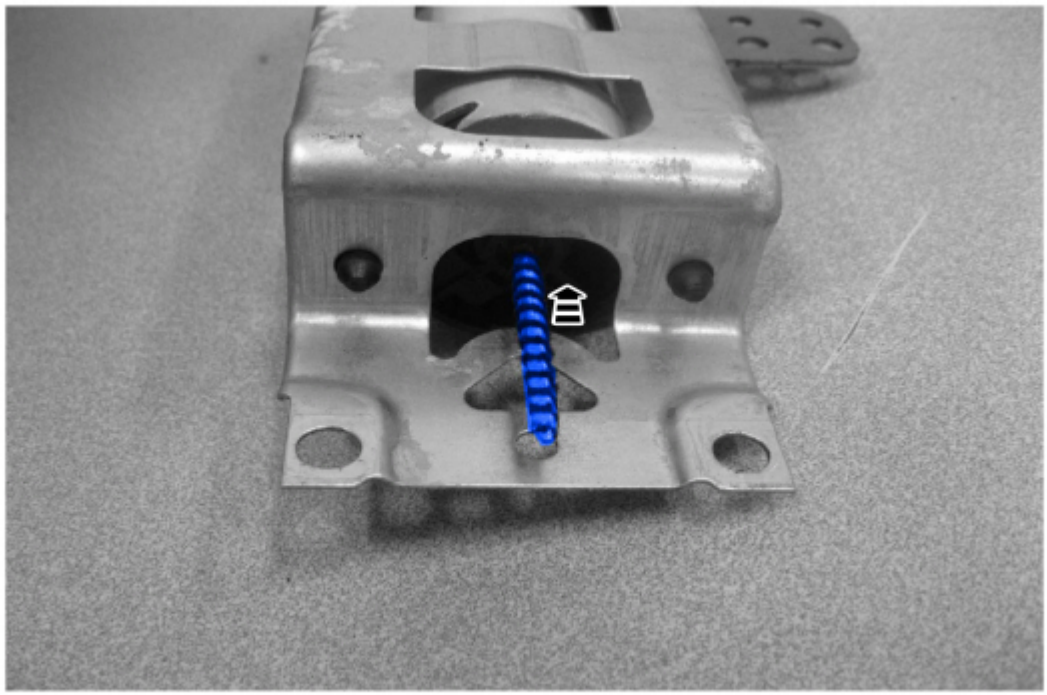
   Align the seat track on both sides.
   General Equipment: Drill(s).
   - Insert the original seat track motor cables into the inboard and outboard gearbox and seat track rails.
   - Drive each gearbox and seat track uniformly until the rear edge of the upper and lower seat tracks are flush.



3. The rear edges of the upper and lower seat track rails must align with each other on both sides.

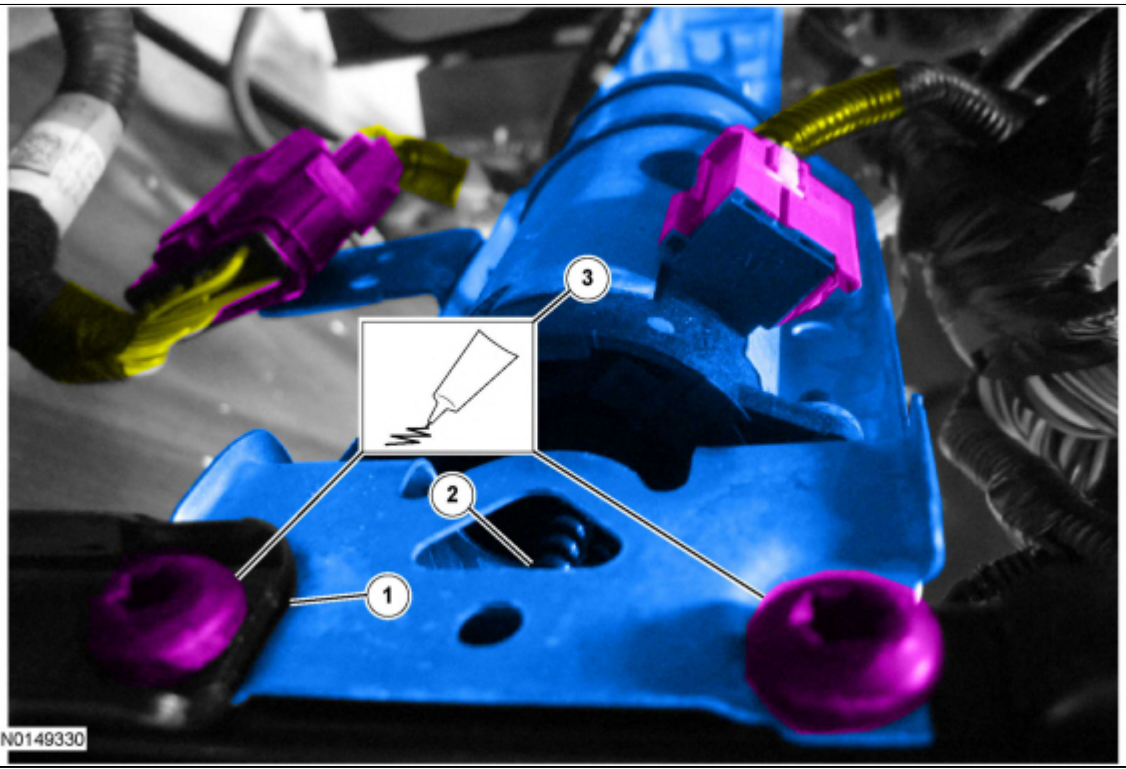


4. On both sides.



repair4less

5.



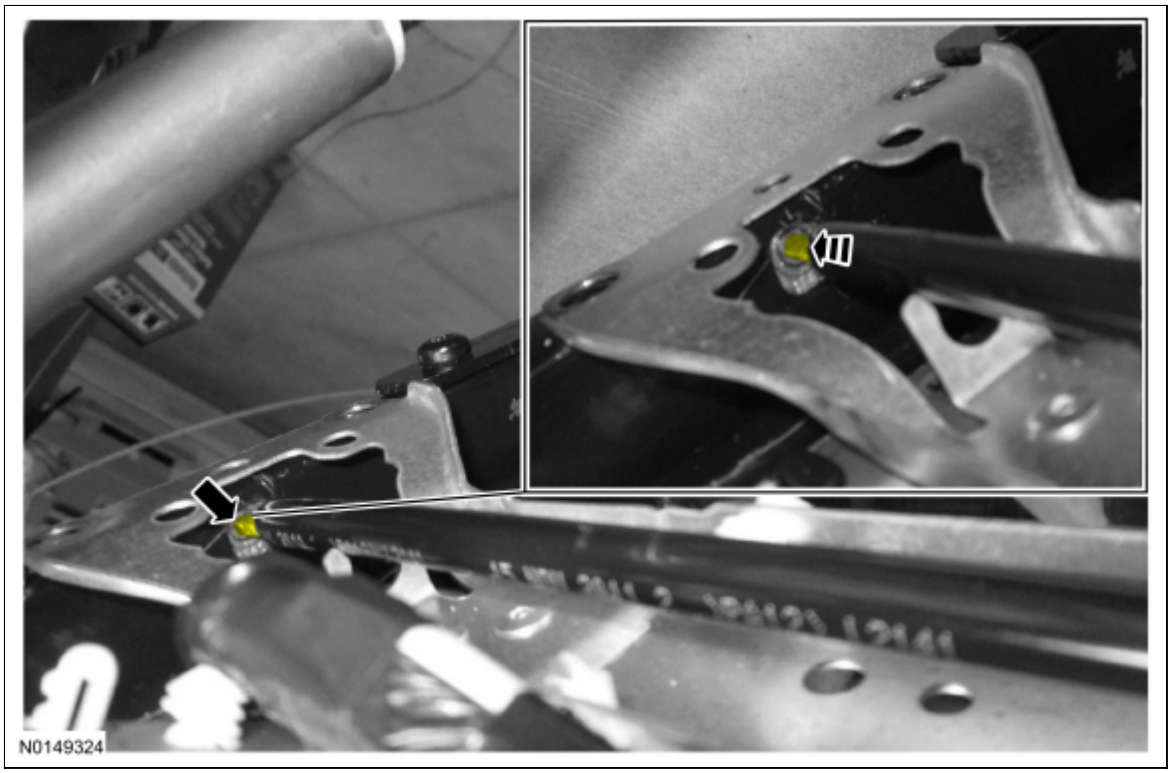
6.

N0149031

7. **NOTE:** Applying pressure to either the upper or lower seat track rail can aid in bolt hole alignment.

    1. Install the horizontal motor and bracket assembly onto the seat track making sure the bracket is positioned between the seat belt anchor bracket and the upper seat track rail.
    2. Insert the small cable through the seat track rail and into the gearbox hole.
    3. Apply Threadlock and Sealer to the 2 bolts and tighten to 24 Nm (18 lb-ft).

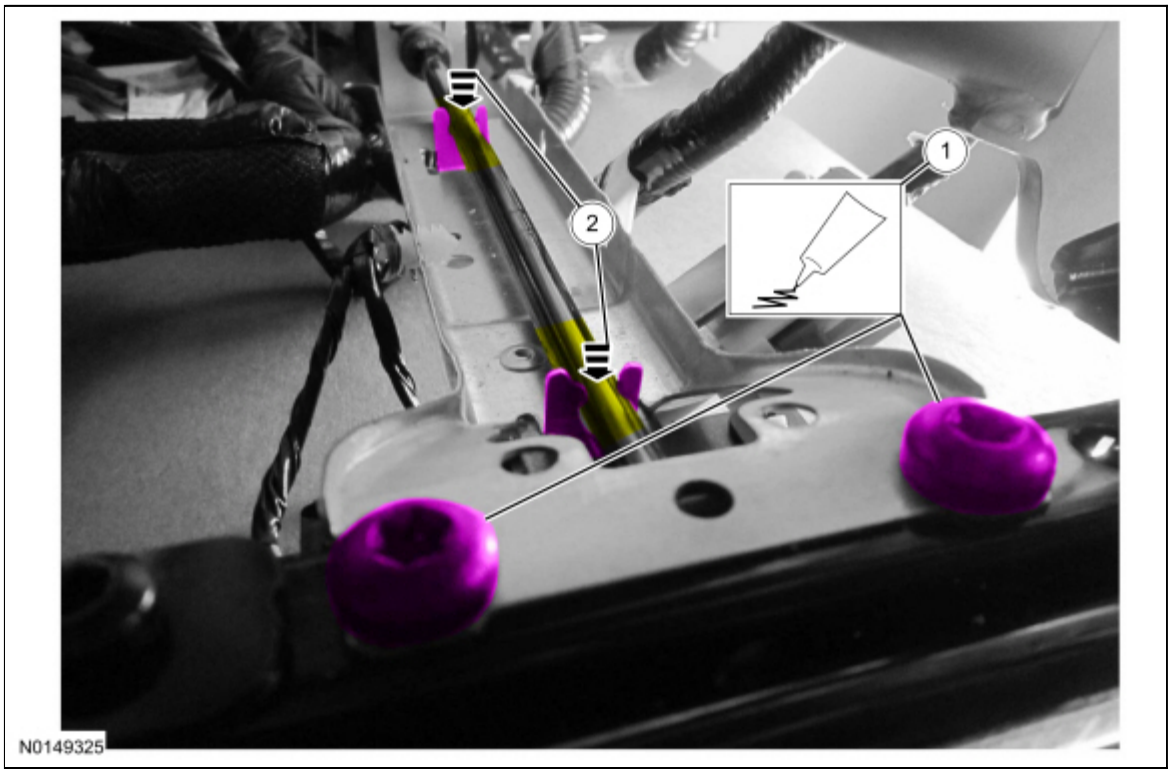
N0149330



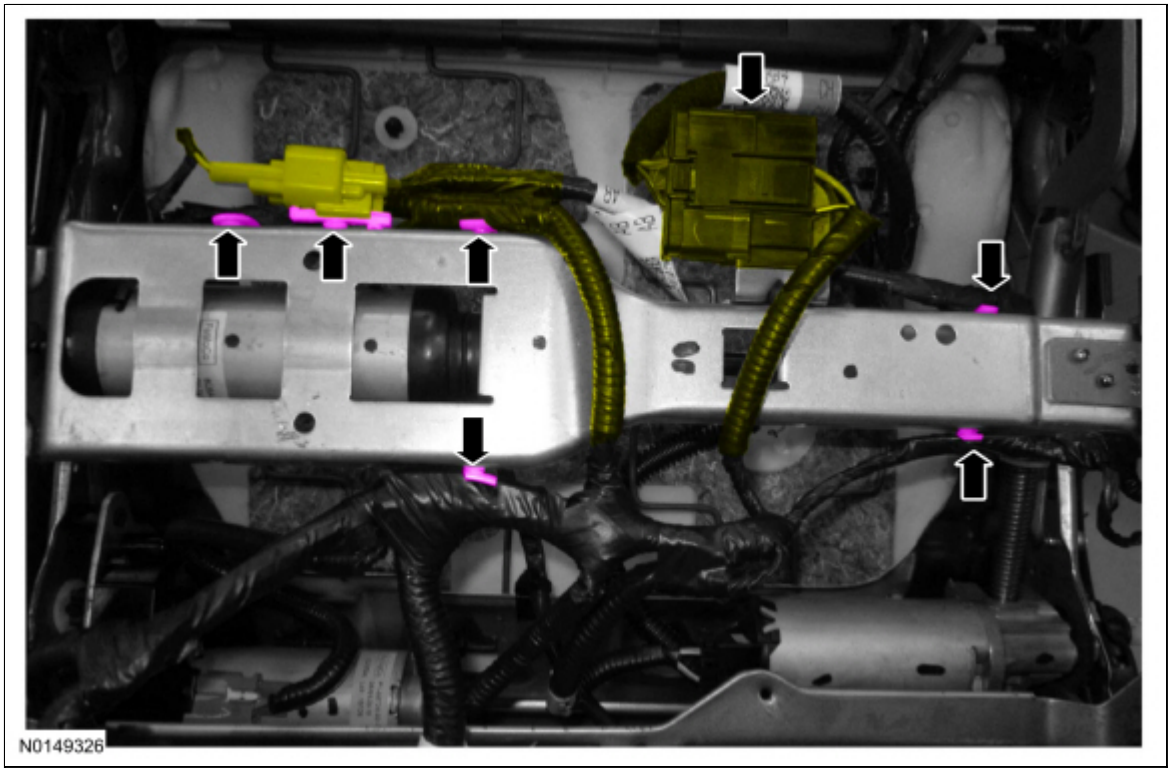
repair4less

8. **NOTE:** The cable felt should not be visible when the cable is correctly engaged to the horizontal motor square drive.

    - Push the cable into the horizontal motor square drive twisting back and forth to engage the cable.

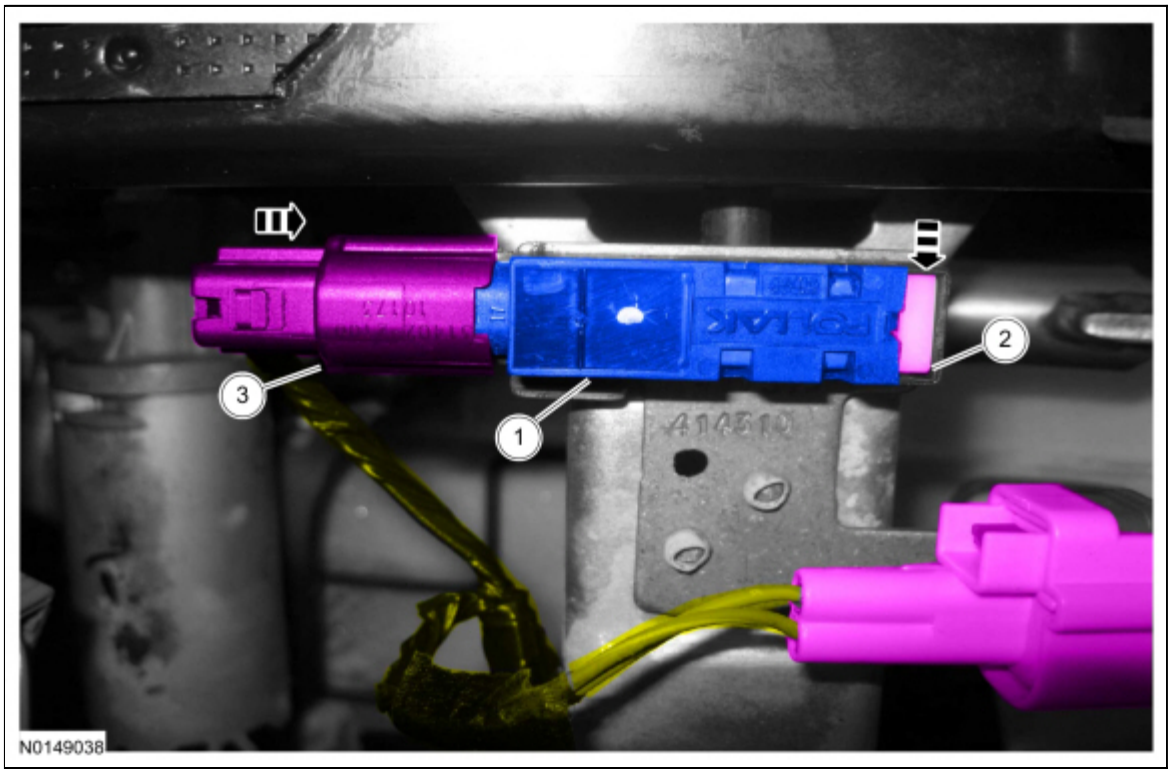


9.

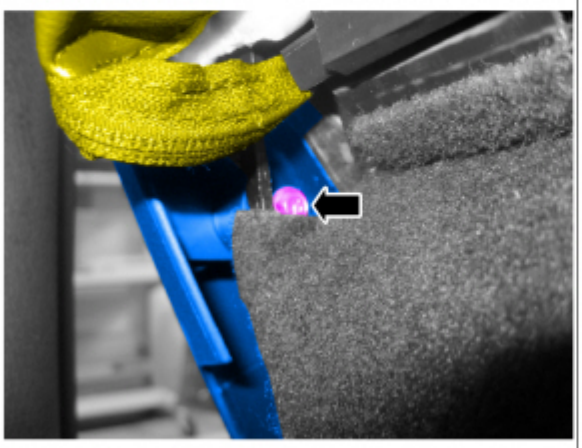


10. **NOTE:** Applying pressure to either the upper or lower seat track rail can aid in bolt hole alignment.

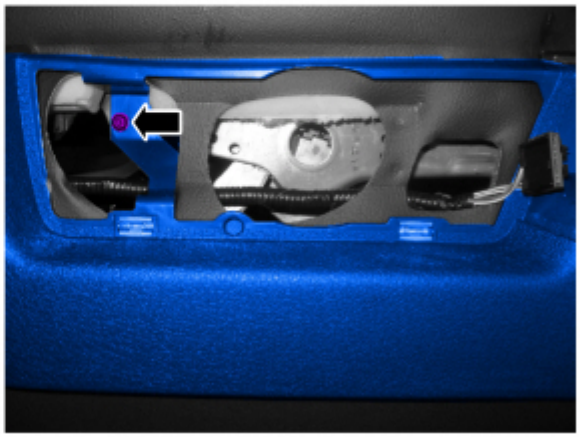
    1. Apply Threadlock and Sealer to the 2 bolts and tighten to 24 Nm (18 lb-ft).
    2. -



repair4less



11. From beneath the seat, route, attach and connect the seat cushion wire harness as noted during removal.

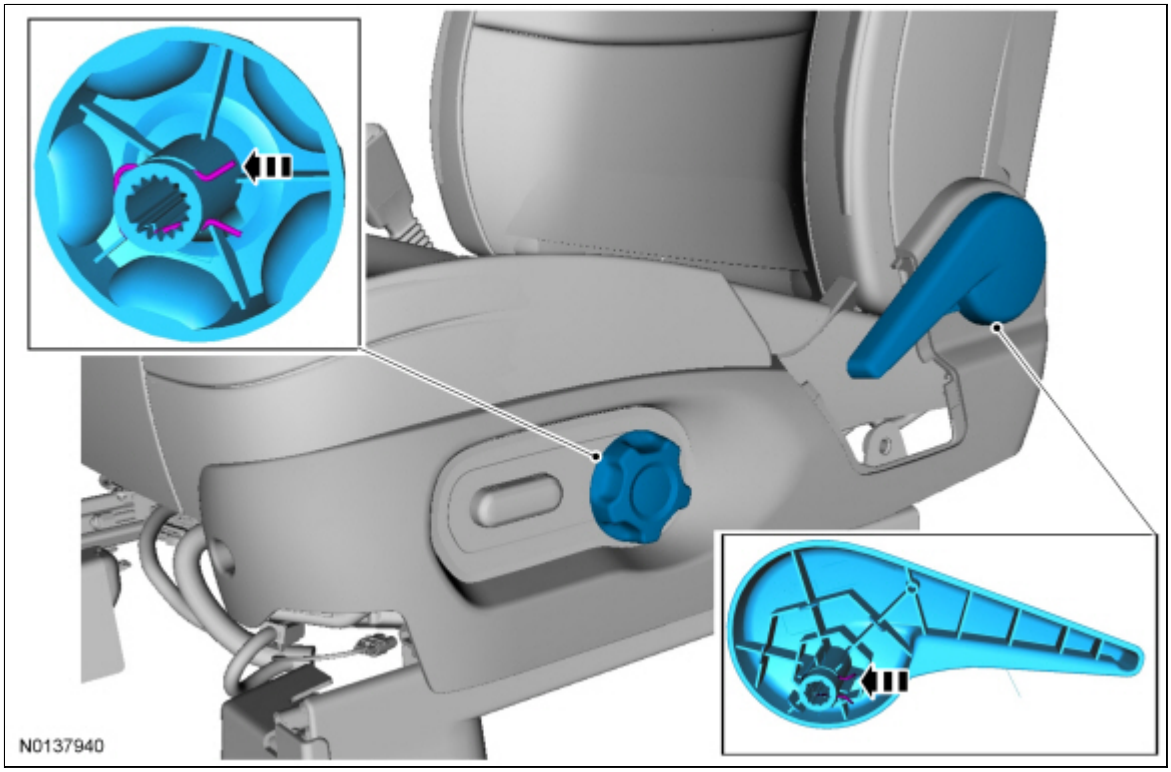


12. If equipped.

13. Install the side shield and screws.

N0148529

14. If equipped.



N0149040

repair4less

15. If equipped.

16. Install the front seat. Refer to Seat — Front .

17. On vehicles with memory seat, operate the horizontal motor in both directions through the full range of travel to allow the DSM to correctly register stop positions and prevent premature stopping points after the repair is complete.

repair4less

Seat Track

Removal and Installation

NOTE: For parts identification and location, refer to Seat — Exploded View, Front

NOTE: Removal steps in this procedure may contain install details.

1. Remove the seat backrest. Refer to Seat Backrest — Front .
2. Remove the seat cushion cover. Refer to Seat Cushion Cover — Front .
3. Remove the 6 pin-type retainers, front inboard, rear inboard and outboard seat track covers.
4. Remove the bolt and safety belt buckle.
   - Disconnect the safety belt buckle electrical connector and detach the wire harness.
   - To install, tighten to 40 Nm (30 lb-ft).
5. If driver seat, remove the seat position sensor. Refer to Section 501-20B .
6. If equipped, remove the DSM . Refer to Driver Seat Module (DSM) .
7. If equipped, remove the DCSM . Refer to Dual Climate Controlled Seat Module (DCSM) .
8. If equipped, remove the cushion TED . Refer to Seat Cushion Thermo-Electric Device .
9. For passenger seat, remove the OCSM . Refer Occupant Classification System Module (OCSM) procedure in Section 501-20B .
10. Disconnect any remaining electrical connectors, detach the wire harness retainers and remove the wire harness. For correct passenger seat wire harness routing, Refer to Seat Wire Harness Routing .
11. To install, reverse the removal procedure.
    - If a new seat track has been installed on a driver seat with memory, operate the seat track in all directions through the full range of travel to allow the DSM to correctly register seat track stop positions and prevent premature stopping points after repair is complete.
12. If a passenger seat was serviced, carry out the OCS System Reset. Refer to the General Procedures portion of Section 501-20B .

repair4less

Seat Armrest — Rear, Crew Cab

Disassembly and Assembly

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. Remove the armrest. For additional information, refer to Seat Armrest — Rear, Crew Cab in this section.
2. If equipped, release the retainer clips and remove the cupholder bezel cover.
3. Open the zipper at the rear edge and invert the armrest cover.
4. Release the front retainer strips and remove the armrest cover.
    - For installation, make sure the pull strap is accessible.
5. Remove the plastic liner bag.
6. Remove the armrest foam pad.
7. Remove the 2 pin-type retainers and plastic cover.
8. If equipped, remove the 3 screws and cupholder.
9. To assemble, reverse the disassembly procedure.

Seat Backrest — Front

Disassembly and Assembly

NOTE: For parts identification and location, refer to Seat — Exploded View, Front in this section.

1. Remove the seat backrest. For additional information, refer to Seat Backrest — Front in this section.

2. Remove the seat backrest cover. For additional information, refer to Seat Backrest Cover — Front in this section.

3. Remove the backrest foam pad.

4. If equipped, remove the backrest Thermo-Electric Device (TED). For additional information, refer to Seat Backrest Thermo-Electric Device in this section.

5. If equipped, remove the power lumbar assembly. For additional information, refer to Lumbar Assembly — Power in this section.

6. If equipped, remove the manual lumbar assembly.
   - Detach the cable from the backrest frame.
     - Note cable routing for correct installation.
   - Pinch the lumbar retainers together to release from the backrest frame.
   - For installation, make sure the arrow is pointed up.

7. ***NOTICE:*** **Inspect the backrest support and retainers for damage. If any damaged, loose or detached retainers are found, new retainers must be installed. Failure to follow this instruction may result in backrest support failure.**

   Remove the backrest support.
   - Detach the 2 lower retainers from the backrest frame.
   - Using a suitable tool, release and detach the 2 upper retainers and remove the backrest support.
     - For installation, make sure the backrest support rests in front of the backrest frame and install the retainers from the front side. Crimp and tighten the retainers over the backrest support and backrest frame.

8. To assemble, reverse the disassembly procedure.

repair4less

Seat Backrest — Rear, Crew Cab

Disassembly and Assembly

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab in this section.

1. Remove the seat backrest. For additional information, refer to Seat Backrest — Rear, Crew Cab in this section.

2. Remove the seat backrest cover. For additional information, refer to Seat Backrest Cover — Rear, Crew Cab in this section.

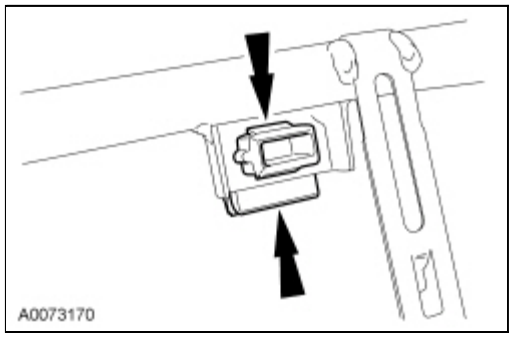
3. Remove the 2 bolts and backrest latch.
    - To install, tighten to 10 Nm (89 lb-in).

4. If equipped, remove the heated seat system components.
    - Disconnect and detach the backrest heater mat electrical connector.
    - For 60 percent backrest, remove the heated seat module and bracket.
        - Disconnect the 2 heated seat module electrical connectors.
        - Remove the 2 screws, heated seat module and bracket.
        - To install, tighten to 14 Nm (124 lb-in).
    - Release the pin-type retainers and remove the wire harness.
        - Note the wire harness routing for correct installation.

5. Remove the hog rings and foam pad from the backrest frame.

6. To assemble, reverse the disassembly procedure.

repair4less



Seat Backrest — Rear, SuperCab

Disassembly and Assembly

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, SuperCab in this section.

1. Remove the seat backrest cover. For additional information, refer to Seat Backrest Cover — Rear, SuperCab in this section.

2. Push the release tabs and remove the 3 backrest plastic lock clips (one shown).

3. To assemble, reverse the disassembly procedure.

repair4less

Seat Cushion — Front

Disassembly and Assembly

1. The seat cushion frame and seat track are serviced as a seat track assembly. To disassemble the serviceable seat track components, refer to Seat Track in this section.

Seat Cushion — Rear, CrewCab

Disassembly and Assembly

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, Crew Cab .

1. Remove the seat cushion latch. Refer to Seat Latch — Rear, Crew Cab .

2. Remove the cushion foam pad.
   - If equipped, disconnect the cushion heater mat electrical connector.
     - Note the wire harness routing for correct installation.

3. Remove the bolt and safety belt buckle.
   - To install, tighten to 32 Nm (24 lb-ft).

4. Remove the screw and inboard side shield.

5. Remove the inboard pivot bolt, inboard pedestal and cushion.
   - To install, tighten to 32 Nm (24 lb-ft).

6. To assemble, reverse the disassembly procedure.

repair4less

Seat Cushion — Rear, SuperCab

Disassembly and Assembly

NOTE: For parts identification and location, refer to Seat — Exploded View, Rear, SuperCab in this section.

1. Remove the rear seat cushion cover(s). For additional information, refer to Seat Cushion Cover — Rear, SuperCab in this section.

2. Remove the seat cushion latch. For additional information, refer to Seat Latch — Rear, SuperCab in this section.

3. Remove the riser rear screw and inboard riser from the rear seat frame.
   - To install, tighten to 6 Nm (53 lb-in).

4. Remove the 2 screws and 2 backrest latches from the rear seat frame.

5. To assemble, reverse the disassembly procedure.

Tether anchor bolt	30	22	—

Glass, Frames and Mechanisms

The glass, frames and mechanisms section consists of the following:

- Accessory delay relay
- Body Control Module (BCM)
- FDIM (touchscreen, if equipped)
- Front Controls Interface Module (FCIM)
- Front door window glass
- Front door window regulator and motor
- Front door window top run
- HVAC module
- Power/manual sliding glass panel (if equipped)
- Rear door window glass
- Rear door window regulator and motor
- Rear door window top run
- Rear window defrost relay
- Rear window glass
- Rear window glass regulator and motor
- Window control switch
- Windshield glass

If equipped with power windows, the window control switch:

- is located on each door trim panel.
- can be used to manually raise or lower all windows from the LH front window control switch or the individual side window from the corresponding individual door window control switch.
- can manually raise or lower the LH or RH front window when the corresponding front window control switch is pressed/pulled and held in the first detent position.
- can automatically raise or lower the LH or RH front window when the corresponding front window control switch is momentarily pressed/pulled to the second detent position and released.
- has a lock-out feature (SuperCab and SuperCrew only). When the LH front window lock-out switch is in the LOCK position, the rear passenger windows only operate from the LH front window control switch.

The rear glass can be equipped with an optional manual or power sliding glass.

Delayed Accessory Feature

The accessory delay relay, located in the BCM , provides voltage for the operation of the power windows and the roof opening panel (if equipped). The accessory delay relay is active when the ignition is in the RUN or the ACC position, or when the ignition is changed from RUN or ACC to the OFF/LOCK position and the LH and RH front doors are closed.

repair4less

Heated Rear Window

The HVAC module controls the state of the rear window defrost relay. The defrost system is activated at one of the three following locations: HVAC module, FCIM or FDIM (8-inch [203mm] touchscreen). If equipped, the rear window defrost can also be activated/deactivated by using voice commands. When the rear window defrost relay is active, the rear window defrost grid is energized and the rear window defrost status LED illuminates. For vehicles equipped with a power sliding rear window, the rear window defrost grid (and status LED) does not operate unless the rear sliding window glass is in the fully CLOSED position.

If equipped, the customer can select certain climate control modes/preferences when the vehicle is started using the remote start feature. When the rear defrost is set to AUTO mode, the rear window defrost activates when the outside temperature is less than 0° C (32° F). Once the ignition is cycled to the ON position, the climate control system returns to the previous settings (last ignition-ON cycle) and adjustments can be made normally. For additional information on how to set the remote start preferences, refer to the Owner's Literature.

Glass, Frames and Mechanisms

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3094-A	Test Light SGT27000 or equivalent 250-300 mA incandescent bulb test lamp
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Delayed Accessory Power

The Body Control Module (BCM) controls voltage to the power windows with the accessory delay relay. The BCM activates the accessory delay relay whenever the ignition is in the RUN or the ACC position, or when the ignition is changed from RUN or ACC to the OFF position and the LH and RH front doors are closed.

The BCM deactivates the accessory delay relay when:

- the LH front door is ajar and the ignition is in the OFF or key-out position.
- the RH front door is ajar and the ignition is in the OFF or key-out position.
- ten minutes have elapsed since the ignition was changed from ACC or RUN to the OFF position.

LH and RH Front Power Window Control

The LH and RH front door window motors have integral electronics and must be initialized whenever a new

repair4less

window motor has been installed. Initialization is required to learn the full UP position and the profile of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled. When mechanical repairs have been carried out on the window regulator or glass run, the window motor must be de-initialized, and then initialized. The window control switch sends 2 separate signals to the window motor: up and down. When the window control switch is pressed to the first detent position, a 12-volt signal is sent to the window motor to request an up or down operation. When auto up or auto down is requested (switch pressed to the second detent position), the window control switch provides a 12-volt signal on both the up and down line simultaneously. During an auto up or auto down request, the window motor determines intended window direction by the signal first received. If the window control switch is pressed too quickly to the second detent position (less than 5 milliseconds of time between first detent signal and second detent signal), the window motor is not able to determine the intended direction request and cannot operate until the window control switch is released and pressed again. The up and down contacts are floating within the window control switch when the switch is in the neutral position. The up and down feeds to the window motor are all low current.

The LH and RH front window motors operate when the delayed accessory relay is active. The high current required to move the front windows are supplied through the B+ and motor ground input.

The LH and RH front window regulator motors have a protection shutdown feature that disables the motor operation if the windows are continually operated up and down for a number of cycles (6-10). The feature disables the motor operation for 5 minutes to prevent damage to the regulator motors. Normal operation will resume when the window switch has been inactive for 5 minutes.

When the LH or RH front window motor is operating in auto up or auto down mode, movement of the front window can be stopped by pressing the switch to any position (UP, DOWN, auto UP, auto DOWN). The front window control switches must be released before the window can move again.

A new LH or RH front window motor cannot operate in one-touch up mode and the bounce-back feature is disabled prior to initialization. If the switch is actuated to the auto UP position and released, window movement stops when the up contact in the front window control switch is released. If the front window motor is removed from the window regulator drum housing, or if a new front window motor is installed, it must be initialized. Refer to Window Motor Initialization in this section.

The front window motors automatically adjust to system changes throughout its life: changes in seal drag and slight changes in the full OPEN position occur and are automatically compensated for. Once initialized, the window motor soft stalls into the upper position contributing to extended durability of the system. If the window does not seal completely in the full UP position (very small gaps/non bounce-back events only), the window switch can be actuated to the UP position to energize the window motor for a fraction of a second to fully seal and this new position is learned.

Bounce-Back

The front window motors have a bounce-back feature. If an obstacle has been detected in the window opening as the window glass is moving upward, the window motor automatically reverses direction and moves the glass toward the bounce-back position (in both up and one-touch up modes). If an obstruction occurs between 4 mm (0.15 in) and 200 mm (7.87 in) of window opening, the bounce-back position is approximately at 250 mm (9.84 in) of window opening. If an obstruction occurs at a position greater than 200 mm (7.87 in) of window opening, the bounce-back position is approximately at 50 mm (1.96 in) below where the obstruction occurred.

Security Override

To override a bounce-back condition (to overcome the resistance of ice on the window or seals for

example), within 2 seconds after the window reaches the bounce-back position, pull and hold the window control switch. The window travels up with no bounce-back or pinch protection. If the window control switch is released before the window is fully closed, the window stops. If the ignition is turned to OFF or START (without delayed accessory), the window motor stops.

Rear Passenger Window Operation — SuperCab and SuperCrew Only

Rear passenger windows can be raised or lowered using the LH front window control switch or the corresponding passenger window control switch. The rear passenger window control switches receive power when the delayed accessory relay is active and the LH front window lock-out switch is in the UNLOCK position. When the LH front window lock-out switch is in the LOCK position, the rear passenger windows only operate from the LH front window control switch.

Rear Window Defrost (if equipped)

When the rear window defrost switch is pressed and the engine is running, the HVAC module activates the rear window defrost relay located in the Battery Junction Box (BJB). When the rear window defrost relay is active, the rear window defrost grid is energized and the rear window defrost status LED is illuminated. For vehicles equipped with a power sliding rear window, the rear window defrost grid does not activate unless the rear sliding window glass is in the fully CLOSED position due to a glass position switch in series with the grid circuit. The glass position switch is integral to the power sliding rear window assembly. There is a feedback circuit incorporated into the glass position switch which illuminates the rear window defrost switch LED when the defrost grid is active and the sliding glass is fully closed. If the sliding glass is opened while the defrost system is active, the heated mirrors continue to operate and the rear window defrost switch LED is no longer illuminated.

The HVAC module deactivates the rear window defrost relay when one of the following conditions is met:

- The rear window defrost switch is pressed when the feature is active
- Ignition state is changed from RUN to OFF/LOCK
- The 15-minute timing function is completed

Feature Inputs

- Ignition RUN position (12V on both RUN and RUN/ACC inputs)
- Rear window defrost switch (momentary contact to ground when switch is pressed)

Feature Output

- Rear window defrost relay control (grounded when activated, open circuit when deactivated)

Remote Start Climate Operation (if equipped)

The customer can select different climate control modes/preferences when the vehicle is started using the remote start feature. This can be accessed through the message center. For information on how to set the remote start preferences, refer to the Owner's Literature. When the rear defrost is set to AUTO mode, the rear window defrost activates when the outside temperature is less than 0° C (32° F) and the vehicle is started using the remote start feature. No climate control adjustments are recognized during remote start operation. Once the ignition is cycled to the ON position, the climate control system returns to the previous settings (last ignition-ON cycle) and adjustments can be made normally. If the previous setting was off, the climate control system turns off.

Inspection and Verification

1. Verify the customer concern.

repair4less

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Window regulator and motor assembly
• Window glass
• Window control switch
	• Loose, corroded connectors
	• Circuitry
	• Window control switch
	• Battery Junction Box (BJB) fuse(s):
	  ▪ 32 (40A)
	  ▪ 54 (5A)
	• Body Control Module (BCM) circuit breaker 48 (30A)
	• BCM fuse(s):
	  ▪ 1 (30A)
	  ▪ 3 (30A)
	  ▪ 32 (15A)
	• Accessory delay relay
	• Rear window defrost relay
	• Rear window defrost grid

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test:
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the BCM, FCIM and HVAC module.

9. If the DTCs retrieved are related to the concern, go to the Body Control Module (BCM) DTC Chart or HVAC Module DTC Chart. For all other DTCs, refer to Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B131A:12	Delayed Accessory Power: Circuit Short To Battery	GO to Pinpoint Test J.
B131A:14	Delayed Accessory Power: Circuit Short To Ground or Open	If the delayed accessory is always on, GO to Pinpoint Test K. If the delayed accessory is inoperative, GO to Pinpoint Test J.
All other DTCs	—	REFER to the Master DTC Chart in Section 419-10.

HVAC Module DTC Chart

DTC	Description	Action
B1C83:11	Rear Defog Relay: Circuit Short to Ground	REFER to Section 501-09 to diagnose the inoperative heated mirror system.
B1C83:12	Rear Defog Relay: Circuit Short to Battery	REFER to Section 501-09 to diagnose the inoperative heated mirror system.
B1C83:13	Rear Defog Relay: Circuit Open	REFER to Section 501-09 to diagnose the inoperative heated mirror system.
All other DTCs	—	REFER to the Master DTC Chart in Section 412-00.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• All power windows are inoperative — intermittent operation, SuperCab or SuperCrew	• Circuit breaker • Wiring, terminals or connectors	• GO to Pinpoint Test A.
• All power windows are inoperative	• Fuse • Circuit breaker • Accessory delay	• GO to Pinpoint Test B.

repair4less

	relay • Wiring, terminals or connectors • Window control switch • Body Control Module (BCM)	
• All passenger power windows are inoperative — LH and RH rear	• Wiring, terminals or connectors • Window control switch	• GO to Pinpoint Test L .
• A single power window is inoperative — LH front	• Fuse • Wiring, terminals or connectors • Window control switch • Power window motor	• GO to Pinpoint Test C .
• A single power window is inoperative — RH front	• Fuse • Wiring, terminals or connectors • Window control switch • Power window motor	• GO to Pinpoint Test D .
• A single power window is inoperative — LH rear	• Wiring, terminals or connectors • Window control switch • Power window motor	• GO to Pinpoint Test E .
• A single power window is inoperative — RH rear	• Wiring, terminals or connectors • Window control switch • Power window motor	• GO to Pinpoint Test F .
• A single power window is inoperative — power sliding rear window	• Wiring, terminals or connectors • Overhead console switch • Power sliding rear window motor	• GO to Pinpoint Test G .
• The one-touch up/down feature is inoperative	• Power window motor not initialized • Battery power was lost while power window motor was operating • Window control switch • Power window	• GO to Pinpoint Test M .

	motor	
• The defrost system is inoperative	• Fuse(s) • Rear window defrost relay • Wiring, terminals or connectors • Rear sliding glass position switch (if equipped) • Rear window defrost grid • HVAC module • Front Controls Interface Module (FCIM)	• GO to Pinpoint Test H .
• The defrost switch LED does not illuminate — the defroster operates	• Wiring, terminals or connectors • HVAC module • Front Controls Interface Module (FCIM) • Rear sliding glass contacts	• If equipped with rear sliding glass, GO to Pinpoint Test H . • If not equipped with rear sliding glass: ▪ For vehicles equipped with EMTC , INSTALL a new HVAC module. REFER to Section 412-01 . ▪ For vehicles equipped with EATC , INSTALL a new FCIM . Refer to the appropriate section in Group 415 for the procedure.
• The defrost system does not shut off automatically	• Wiring, terminals or connectors • Rear window defrost relay • HVAC module	• GO to Pinpoint Test I .
• The defrost system does not respond to voice command only	• Voice recognition system	• VERIFY the rear window defrost operation using the instrument panel rear window defrost switch. If the rear window defrost is still inoperative, GO to Pinpoint Test H . If the rear window defrost operates, Refer to the appropriate section in Group 415 for the procedure.
• The defrost system does not respond to touchscreen command only	• Touchscreen	• VERIFY the rear window defrost operation using the instrument panel rear window defrost switch. If the rear window defrost is still inoperative, GO to Pinpoint Test H . If the rear window defrost operates, Refer to the appropriate section in Group 415 for the procedure.
• The delayed accessory is inoperative	• Door ajar switches • Wiring, terminals or connectors • Accessory delay	• GO to Pinpoint Test J .

repair4less

	relay • BCM	
• The delayed accessory does not turn off	• Wiring, terminals or connectors • Accessory delay relay • BCM	• GO to Pinpoint Test K .

Pinpoint Tests

Pinpoint Test A: All Power Windows are Inoperative — Intermittent Operation, SuperCab or SuperCrew

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Voltage is supplied to the LH front window control switch through Body Control Module (BCM) circuit breaker 48 (30A). Intermittent operation can be caused by a short to ground which temporarily causes the circuit breaker to open. Once open, all power windows are inoperative until the circuit breaker cools and the contacts close again. Activating all window control switches one at a time in both directions until the breaker opens can help in narrowing down the exact location of the short circuit if present.

This pinpoint test is intended to diagnose the following:

- Circuit breaker
- Wiring, terminals or connectors

PINPOINT TEST A: ALL POWER WINDOWS ARE INOPERATIVE — INTERMITTENT OPERATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

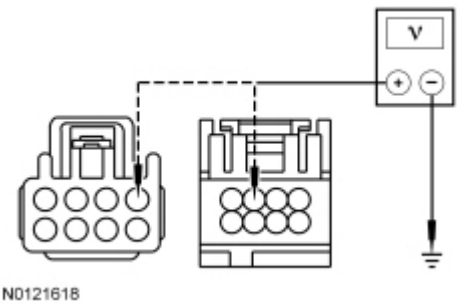
Test Step	Result / Action to Take
A1 CHECK FOR A SHORT TO GROUND IN THE POWER WINDOW SYSTEM	
• Disconnect: BCM Circuit Breaker 48 (30A). • Install a fused jumper wire in place of BCM circuit breaker 48 (30A). • Ignition ON. • Attempt to operate each individual power window in both directions from the LH window control switch as well as the passenger door(s) window control switch(es). • **Did the jumper wire fuse open during the test?**	**Yes** REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new circuit breaker. TEST the system for normal operation.

Pinpoint Test B: All Power Windows are Inoperative

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Voltage is supplied to the LH front window control switch from the accessory delay relay. For SuperCab or SuperCrew, the LH front window control switch supplies voltage to the rear window control switches when the lock-out switch is in the UNLOCK position.



This pinpoint test is intended to diagnose the following:

- Fuse
- Circuit breaker
- Accessory delay relay
- Wiring, terminals or connectors
- Window control switch
- BCM

PINPOINT TEST B: ALL POWER WINDOWS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

B1 CHECK THE VOLTAGE TO THE LH FRONT WINDOW CONTROL SWITCH
• Disconnect: LH Front Window Control Switch C504 (Regular Cab) or C535A (SuperCab or SuperCrew).
• Ignition ON.
• Measure the voltage between LH front window control switch and ground.
  ▪ For regular cab, measure the voltage between C504-3, circuit CBP32 (GN/VT), harness side and ground.
  ▪ For SuperCab or SuperCrew, measure the voltage between C535B-1, circuit CBP01 (BU), harness side and ground.

 	
N0121618
• **Is the voltage greater than 10 volts?**
	Yes
	INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation.
	
	No
	VERIFY Body Control Module (BCM) fuse 32 (15A) (regular cab) or BCM circuit breaker 48 (30A) (SuperCab or SuperCrew) is OK. If OK, GO to Pinpoint Test J to diagnose the accessory delay circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: A Single Power Window is Inoperative — LH Front

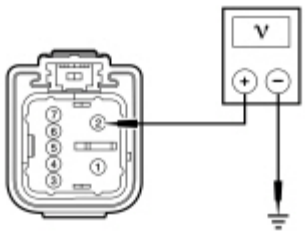
repair4less

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

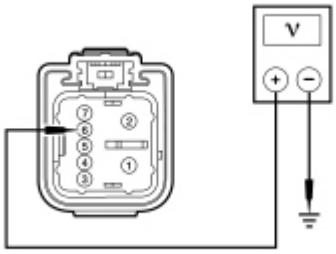
NOTE: De-initialize, then initialize the front window motor when any of the following occur:

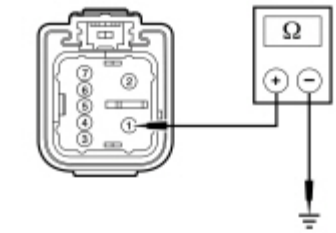
- the LH or RH front window motor is removed from the window regulator drum housing
- a new window regulator and/or motor is installed
- a new window glass is installed
- a new top run is installed
- a new top run is installed
- any operation in which grease or lubricants are applied to the window regulator or glass run

Normal Operation



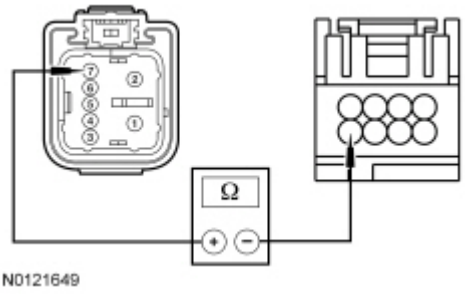
Voltage is supplied to the LH front window control switch and LH front power window motor from the accessory delay relay. The LH front power window motor has dedicated high current voltage and ground circuits. When the LH front window control switch is activated, a low current voltage signal is supplied to the LH front power window motor which causes the window to move upward or downward.





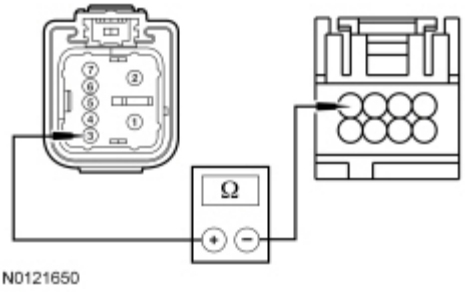
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Window control switch
- Power window motor



PINPOINT TEST C: A SINGLE POWER WINDOW IS INOPERATIVE — LH FRONT

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
C1 CHECK THE VOLTAGE TO THE POWER WINDOW MOTOR • Ignition OFF. • Disconnect: LH Front Power Window Motor C524. • Measure the voltage between LH front power window motor C524-2, circuit SBP01 (RD), harness side and ground.  N0121645 • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** VERIFY Body Control Module (BCM) fuse 1 (30A) is OK. If OK, REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

C2 CHECK THE LH FRONT POWER WINDOW MOTOR DELAYED ACCESSORY FEED	
• Ignition ON. • Measure the voltage between LH front power window motor C524-6, circuit CBP32 (GN/VT), harness side and ground.  N0121646 • **Is the voltage greater than 10 volts?**	**Yes** GO to C3 . **No** VERIFY Body Control Module (BCM) fuse 32 (15A) is OK. If OK, REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
C3 CHECK THE LH FRONT POWER WINDOW MOTOR GROUND	
• Ignition OFF. • Measure the resistance between LH front power window motor C524-1, circuit GD134 (BK/VT), harness side and ground.  N0121647 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
C4 CHECK THE WINDOW CONTROL SWITCH TO LH FRONT MOTOR CIRCUITS FOR AN OPEN	
• Disconnect: LH Front Window Control Switch C504 (regular cab) or C535A (SuperCab or SuperCrew). • Measure the resistance between LH front power window motor and LH front window control switch. ▪ For regular cab, measure the resistance between LH front power window motor C524-7, circuit CPW10 (YE/VT), harness side and LH front window control switch C504-8, circuit CPW10 (YE/VT), harness side. ▪ For SuperCab or SuperCrew, measure the resistance between LH front power window motor C524-7, circuit CPW10 (YE/VT), harness side and LH front window control switch C535A-8, circuit CPW10 (YE/VT), harness side.	**Yes** GO to C5 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

repair4less

- **Is the resistance less than 5 ohms?**

C5 CHECK THE WINDOW CONTROL SWITCH TO LH FRONT MOTOR CIRCUITS FOR AN OPEN	
• Measure the resistance between LH front power window motor and LH front window control switch. ▪ For regular cab, measure the resistance between LH front power window motor C524-3, circuit CPW11 (BU/GY), harness side and LH front window control switch C504-4, circuit CPW11 (BU/GY), harness side. ▪ For SuperCab or SuperCrew, measure the resistance between LH front power window motor C524-3, circuit CPW11 (BU/GY), harness side and LH front window control switch C535A-4, circuit CPW11 (BU/GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to C6 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
C6 CHECK THE LH FRONT WINDOW CONTROL SWITCH	
• Carry out the LH front window control switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the window control switch pass the component test?**	**Yes** INSTALL a new LH front window regulator motor. REFER to Window Regulator Motor in this section. INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. **No** INSTALL a new LH front window control switch. REFER to Window Control

	Switch — Front in this section. INITIALIZE the LH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

Pinpoint Test D: A Single Power Window is Inoperative — RH Front

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

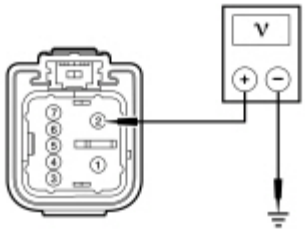
NOTE: De-initialize, then initialize the front power window motor when any of the following occur:

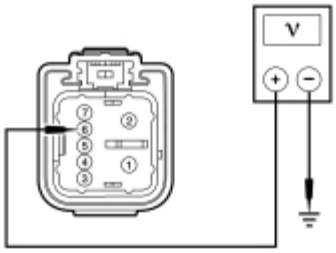
- the LH or RH front power window motor is removed from the window regulator drum housing
- a new window regulator and/or motor is installed
- a new window glass is installed
- a new top run is installed
- a new top run is installed
- any operation in which grease or lubricants are applied to the window regulator or glass run

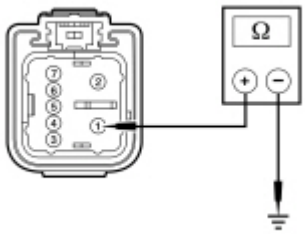
Normal Operation

Voltage is supplied to the LH and RH front window control switches and RH front power window motor from the accessory delay relay. The RH front power window motor has dedicated high current voltage and ground circuits. When the LH or RH front window control switch is activated, a low current voltage signal is supplied to the RH front power window motor which causes the window to move upward or downward.

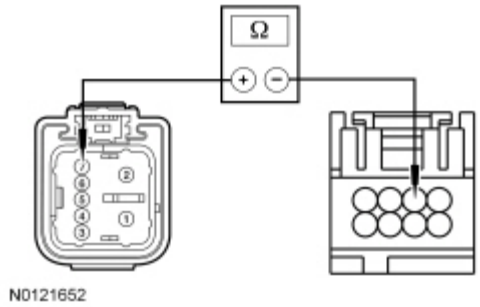
This pinpoint test is intended to diagnose the following:





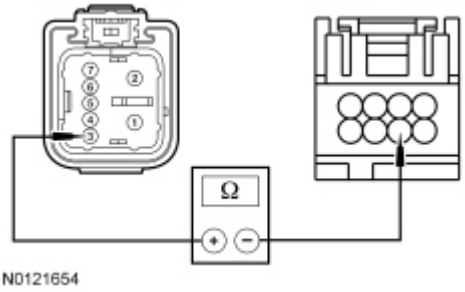


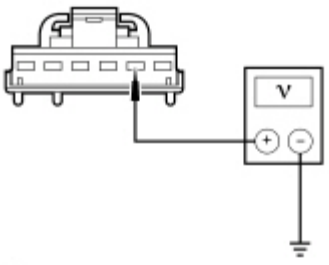
- Fuse
- Wiring, terminals or connectors
- Window control switch
- Power window motor



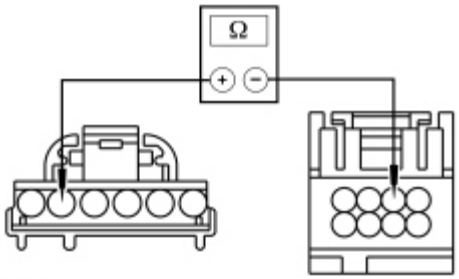
PINPOINT TEST D: A SINGLE POWER WINDOW IS INOPERATIVE — RH FRONT

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



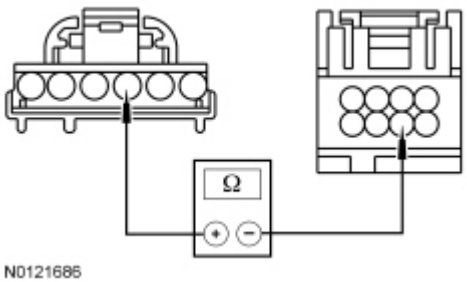


Test Step	Result / Action to Take
D1 CHECK THE RH FRONT POWER WINDOW OPERATION FROM THE LH FRONT WINDOW CONTROL SWITCH	
• Ignition ON. • Attempt to operate the RH front window using the LH front window control switch. • **Does the RH front window operate when using the LH front window control switch?**	**Yes** GO to D8 . **No** GO to D2 .
D2 CHECK THE VOLTAGE TO THE POWER WINDOW MOTOR	
	Yes



repair4less

• Ignition OFF. • Disconnect: RH Front Power Window Motor C608. • Measure the voltage between RH front power window motor C608-2, circuit SBP03 (BU/RD), harness side and ground.  N0121645 • **Is the voltage greater than 10 volts?**	GO to D3 . **No** VERIFY Body Control Module (BCM) fuse 3 (30A) is OK. If OK, REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
D3 CHECK THE RH FRONT POWER WINDOW MOTOR DELAYED ACCESSORY FEED	
• Ignition ON. • Measure the voltage between RH front power window motor C608-6, circuit CBP32 (GN/VT), harness side and ground.  N0121646 • **Is the voltage greater than 10 volts?**	**Yes** GO to D4 . **No** VERIFY Body Control Module (BCM) fuse 32 (15A) is OK. If OK, REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
D4 CHECK THE RH FRONT POWER WINDOW MOTOR GROUND	
• Ignition OFF. • Measure the resistance between RH front power window motor C608-1, circuit GD139 (BK/YE), harness side and ground.  N0121647 • **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.



D5 CHECK THE WINDOW CONTROL SWITCH TO RH FRONT MOTOR CIRCUITS FOR AN OPEN • Disconnect: LH Front Window Control Switch C504 (Regular Cab) or C535A (SuperCab or SuperCrew). • Measure the resistance between RH front power window motor and LH front window control switch. ▪ For regular cab, measure the resistance between RH front power window motor C608-7, circuit CPW12 (GN/OG), harness side and LH front window control switch C504-2, circuit CPW12 (GN/OG), harness side. ▪ For SuperCab or SuperCrew, measure the resistance between RH front power window motor C608-7, circuit CPW12 (GN/OG), harness side and LH front window control switch C535A-2, circuit CPW12 (GN/OG), harness side.  N0121652 • **Is the resistance less than 5 ohms?**	**Yes** GO to D6 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
D6 CHECK THE WINDOW CONTROL SWITCH TO RH FRONT MOTOR CIRCUITS FOR AN OPEN • Measure the resistance between RH front power window motor and LH front window control switch. ▪ For regular cab, measure the resistance between RH front power window motor C608-3, circuit CPW13 (BN/YE), harness side and LH front window control switch C504-6, circuit CPW13 (BN/YE), harness side. ▪ For SuperCab or SuperCrew, measure the resistance between RH front power window motor C608-3, circuit CPW13 (BN/YE), harness side and LH front window control switch C535A-6, circuit CPW13 (BN/YE), harness side.	**Yes** GO to D7 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

repair4less

 N0121654 • **Is the resistance less than 5 ohms?**	
D7 CHECK THE LH FRONT WINDOW CONTROL SWITCH	
• Carry out the LH front window control switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the window control switch pass the component test?**	**Yes** INSTALL a new RH front window regulator motor. REFER to Window Regulator Motor in this section. INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. **No** INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
D8 CHECK THE VOLTAGE TO THE RH FRONT WINDOW CONTROL SWITCH	
• Ignition OFF. • Disconnect: RH Front Window Control Switch C604. • Ignition ON. • Measure the voltage between RH front window control switch C604-2, circuit CBP32 (GN/VT), harness side and ground.  N0043634 • **Is the voltage greater than 10 volts?**	**Yes** GO to D9. **No** REPAIR the circuit. TEST the system for normal operation.
D9 CHECK THE WINDOW CONTROL SWITCH CIRCUITS FOR AN OPEN	
• Ignition OFF.	**Yes**

• Disconnect: LH Front Window Control Switch C504 (Regular Cab) or C535A (SuperCab or SuperCrew).
• Measure the resistance between RH front window control switch and LH front window control switch.
  ▪ For regular cab, measure the resistance between RH front window control switch C604-5, circuit CPW12 (GN/OG), harness side and LH front window control switch C504-2, circuit CPW12 (GN/OG), harness side.
  ▪ For SuperCab or SuperCrew, measure the resistance between RH front window control switch C604-5, circuit CPW12 (GN/OG), harness side and LH front window control switch C535A-2, circuit CPW12 (GN/OG), harness side.

N0121685
• **Is the resistance less than 5 ohms?**
	GO to D10 .
	
	No
	REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

D10 CHECK THE WINDOW CONTROL SWITCH CIRCUITS FOR AN OPEN	

• Measure the resistance between RH front window control switch and LH front window control switch.
  ▪ For regular cab, measure the resistance between RH front window control switch C604-3, circuit CPW13 (BN/YE), harness side and LH front window control switch C504-6, circuit CPW13 (BN/YE), harness side.
  ▪ For SuperCab or SuperCrew, measure the resistance between RH front window control switch C604-3, circuit CPW13 (BN/YE), harness side and LH front window control switch C535A-6, circuit CPW13 (BN/YE), harness side.

N0121686
• **Is the resistance less than 5 ohms?**
	Yes
	INSTALL a new RH front window control switch. REFER to Window Control Switch — Front in this section. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
	
	No
	REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the RH front power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

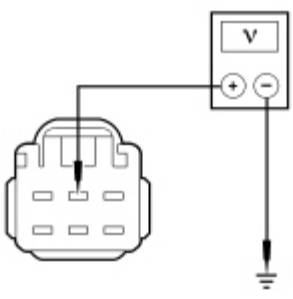
repair4less

Pinpoint Test E: A Single Power Window is Inoperative — LH Rear

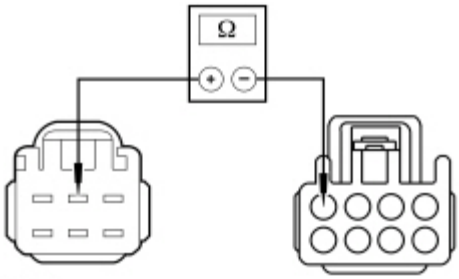
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

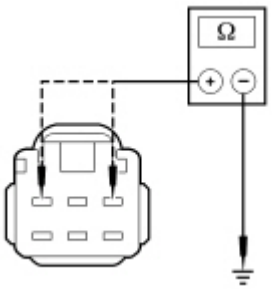
Normal Operation

The LH rear window control switch receives voltage from the LH front window control switch when the lock-out switch is in the UNLOCK position. Ground is also provided to the LH rear window control switch from the LH front window control switch. The LH rear window control switch transfers voltage and ground to the power window motor. Window direction is controlled by reversing polarity of the voltage and ground circuits being supplied to the power window motor.



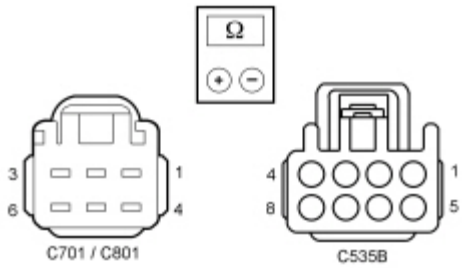
When operating the LH rear window from the LH front window control switch, voltage and ground is sent from the LH front window control switch through the normally closed contacts within the LH rear window control switch. Window direction is controlled by reversing polarity of the voltage and ground circuits being supplied to the power window motor.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Window control switch
- Power window motor



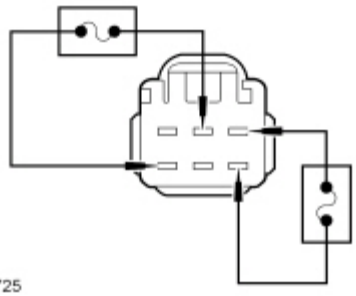
PINPOINT TEST E: A SINGLE POWER WINDOW IS INOPERATIVE — LH REAR

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

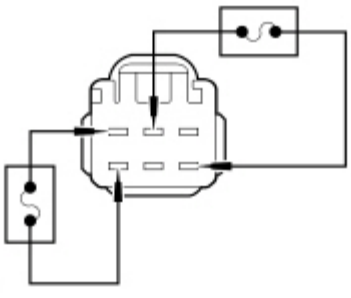
Test Step	Result / Action to Take
E1 CHECK THE VOLTAGE TO THE LH REAR WINDOW CONTROL SWITCH	
• Disconnect: LH Rear Window Control Switch C701. • Ignition ON. • **NOTE:** Set the LH front window lock-out switch to the UNLOCK position. • Measure the voltage between LH rear window control switch C701-2, circuit CPW14 (VT/WH), harness side and ground.  N0092722 • **Is the voltage greater than 10 volts?**	**Yes** GO to E3 . **No** GO to E2 .
E2 CHECK THE WINDOW CONTROL SWITCH POWER CIRCUIT	

FOR AN OPEN	
• Ignition OFF. • Disconnect: LH Front Window Control Switch C535B. • Measure the resistance between LH rear window control switch C701-2, circuit CPW14 (VT/WH), harness side and LH front window control switch C535B-4, circuit CPW14 (VT/WH), harness side.  N0121692 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
E3 CHECK THE GROUNDS TO THE LH REAR WINDOW CONTROL SWITCH	
• Ignition OFF. • Measure the resistance between LH rear window control switch C701-1, circuit CPW16 (BU/OG), harness side and ground; and between LH rear window control switch C701-3, circuit CPW15 (YE), harness side and ground.  N0092724 • **Are the resistances less than 5 ohms?**	**Yes** GO to E5 . **No** GO to E4 .
E4 CHECK THE CIRCUITS TO THE LH REAR WINDOW CONTROL SWITCH FOR AN OPEN	
• Disconnect: LH Front Window Control Switch C535B. • Measure the resistance between LH rear window control switch C701, harness side and LH front window control switch C535B, harness side using the following chart: **LH Rear Window Control Switch** / **Circuit** / **LH Front Window Control Switch** C701-3 / CPW15 (YE) / C535B-6 C701-1 / CPW16 (BU/OG) / C535B-5	**Yes** INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

repair4less



N0121693



- **Are the resistances less than 5 ohms?**

E5 CHECK THE LH REAR WINDOW OPERATION

- Ignition ON.
- **NOTE:** Set the LH front window lock-out switch to the UNLOCK position.
- Connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW14 (VT/WH), harness side and C701-6, circuit CPW21 (BN), harness side; and a second fused jumper wire between LH rear window control switch C701-4, circuit CPW22 (GN/VT), harness side and C701-1, circuit CPW16 (BU/OG), harness side. The LH rear window should operate in the upward direction.

N0092725

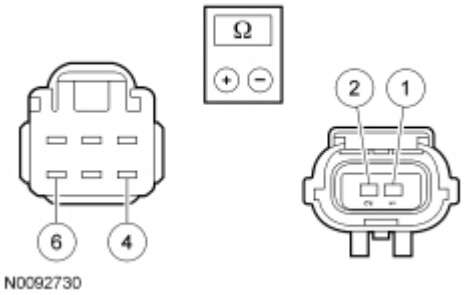
- Connect a fused jumper wire between LH rear window control switch C701-2, circuit CPW14 (VT/WH), harness side and C701-4, circuit CPW22 (GN/VT), harness side; and a second fused jumper wire between LH rear window control switch C701-6, circuit CPW21 (BN), harness side and C701-3, circuit CPW15 (YE), harness side. The LH rear window should operate in the downward direction.

N0092726

- **Does the LH rear window operate correctly?**

Yes
If the LH rear window did not operate with the LH rear window control switch, INSTALL a new LH rear window control switch. REFER to Window Control Switch — Rear in this section. TEST the system for normal operation.

If the LH rear window did operate with the LH rear window control switch, but not with the LH front window control switch, INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation.

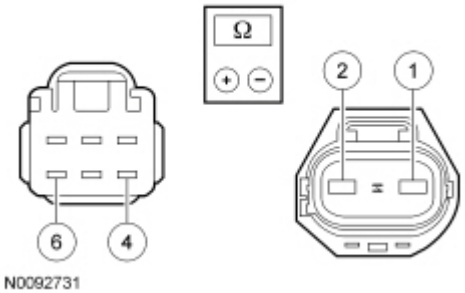


No
GO to E6 .

E6 CHECK THE POWER WINDOW MOTOR CIRCUITS FOR AN

OPEN

- Ignition OFF.
- Disconnect: LH Rear Power Window Motor C726 (SuperCab) or C703 (SuperCrew).
- For SuperCab, measure the resistance between LH rear window control switch C701, harness side and LH rear power window motor C726, harness side using the following chart:



LH Rear Window Control Switch	Circuit	LH Rear Power Window Motor
C701-6	CPW21 (BN)	C726-1
C701-4	CPW22 (GN/VT)	C726-2

N0092730

- For SuperCrew, measure the resistance between LH rear window control switch C701, harness side and LH rear power window motor C703, harness side using the following chart:

LH Rear Window Control Switch	Circuit	LH Rear Power Window Motor
C701-6	CPW21 (BN)	C703-1
C701-4	CPW22 (GN/VT)	C703-2

N0092731

- **Are the resistances less than 5 ohms?**

Yes
INSTALL a new LH rear power window motor. REFER to Window Regulator Motor in this section. TEST the system for normal operation.

No
REPAIR the circuit(s). TEST the system for normal operation.

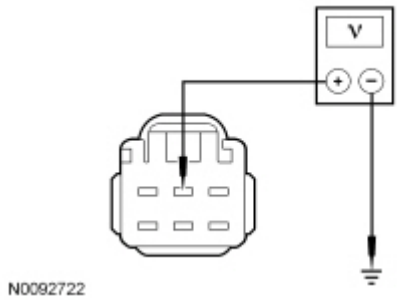
Pinpoint Test F: A Single Power Window is Inoperative — RH Rear

repair4less

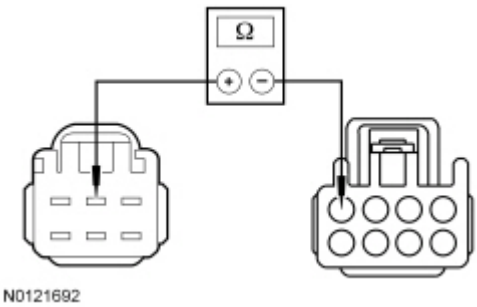
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

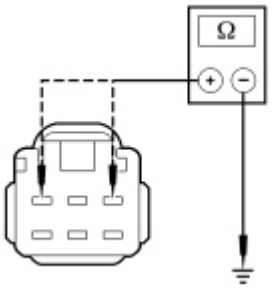
Normal Operation

The RH rear window control switch receives voltage from the LH front window control switch when the lock-out switch is in the UNLOCK position. Ground is also provided to the RH rear window control switch from the LH front window control switch. The RH rear window control switch transfers voltage and ground to the power window motor. Window direction is controlled by reversing polarity of the voltage and ground circuits being supplied to the power window motor.



When operating the RH rear window from the LH front window control switch, voltage and ground is sent from the LH front window control switch through the normally closed contacts within the RH rear window control switch. Window direction is controlled by reversing polarity of the voltage and ground circuits being supplied to the power window motor.

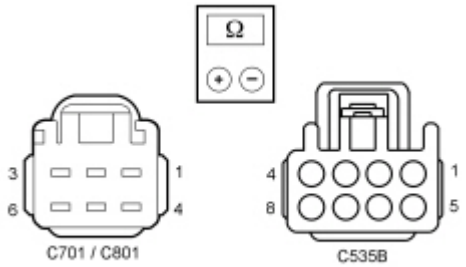




This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Window control switch
- Power window motor

PINPOINT TEST F: A SINGLE POWER WINDOW IS INOPERATIVE — RH REAR



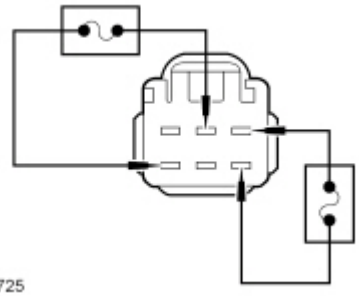
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK THE VOLTAGE TO THE RH REAR WINDOW CONTROL SWITCH	
• Disconnect: RH Rear Window Control Switch C801. • Ignition ON. • **NOTE:** Set the LH front window lock-out switch to the UNLOCK position. • Measure the voltage between RH rear window control switch C801-2, circuit CPW14 (VT/WH), harness side and ground.  N0092722 • **Is the voltage greater than 10 volts?**	**Yes** GO to F3 . **No** GO to F2 .
F2 CHECK THE WINDOW CONTROL SWITCH POWER CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: LH Front Window Control Switch C535B. • Measure the resistance between RH rear window control switch	**Yes** INSTALL a new LH front window control switch.

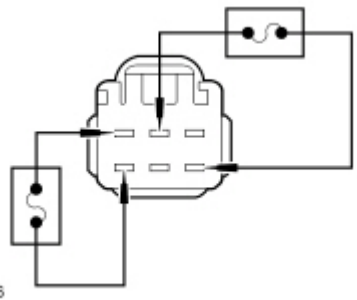
C801-2, circuit CPW14 (VT/WH), harness side and LH front window control switch C535B-4, circuit CPW14 (VT/WH), harness side.  N0121692 • **Is the resistance less than 5 ohms?**	REFER to Window Control Switch — Front in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
F3 CHECK THE GROUNDS TO THE LH REAR WINDOW CONTROL SWITCH	
• Ignition OFF. • Measure the resistance between RH rear window control switch C801-1, circuit CPW18 (GY/VT), harness side and ground; and between RH rear window control switch C801-3, circuit CPW17 (BN/GN), harness side and ground.  N0092724 • **Are the resistances less than 5 ohms?**	**Yes** GO to F5 . **No** GO to F4 .
F4 CHECK CIRCUITS CPW17 (BN/GN) AND CPW18 (GY/VT) FOR AN OPEN	
• Disconnect: LH Front Window Control Switch C535B. • Measure the resistance between RH rear window control switch C801, harness side and LH front window control switch C535B, harness side using the following chart:	**Yes** INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

RH Rear Window Control Switch	Circuit	LH Front Window Control Switch
C801-3	CPW17 (BN/GN)	C535B-4
C801-1	CPW18 (GY/VT)	C535B-7

repair4less



N0121693



- **Are the resistances less than 5 ohms?**

F5 CHECK THE RH REAR WINDOW OPERATION

- Ignition ON.
- **NOTE:** Set the LH front window lock-out switch to the UNLOCK position.
- Connect a fused jumper wire between RH rear window control switch C801-2, circuit CPW14 (VT/WH), harness side and C801-6, circuit CPW23 (GY), harness side; and a second fused jumper wire between RH rear window control switch C801-4, circuit CPW24 (WH/VT), harness side and C801-1, circuit CPW18 (GY/VT), harness side. The RH rear window should operate in the downward direction.

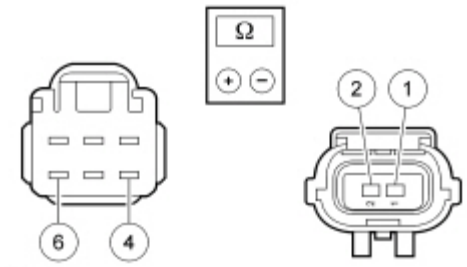
N0092725

- Connect a fused jumper wire between RH rear window control switch C801-2, circuit CPW14 (VT/WH), harness side and C801-4, circuit CPW24 (WH/VT), harness side; and a second fused jumper wire between RH rear window control switch C801-6, circuit CPW23 (GY), harness side and C801-3, circuit CPW17 (BN/GN), harness side. The RH rear window should operate in the upward direction.

N0092726

- **Does the LH rear window operate correctly?**

Yes
If the RH rear window did not operate with the RH rear window control switch, INSTALL a new RH rear window control switch. REFER to Window Control Switch — Rear in this section. TEST the system for normal operation.

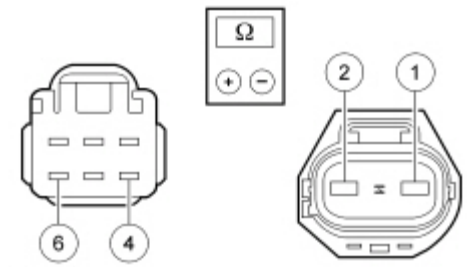


If the RH rear window did operate with the RH rear window control switch, but not with the LH front window control switch, INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation.

No
GO to F6 .

F6 CHECK THE POWER WINDOW MOTOR CIRCUITS FOR AN OPEN

- Ignition OFF.
- Disconnect: RH Rear Power Window Motor C828 (SuperCab) or C803 (SuperCrew).
- For SuperCab, measure the resistance between RH rear window control switch C801, harness side and RH rear power window motor C828, harness side using the following chart:



RH Rear Window Control Switch	Circuit	RH Rear Power Window Motor
C801-6	CPW23 (GY)	C828-1
C801-4	CPW24 (WH/VT)	C828-2

N0092730

- For SuperCrew, measure the resistance between RH rear window control switch C801, harness side and RH rear power window motor C803, harness side using the following chart:

RH Rear Window Control Switch	Circuit	RH Rear Power Window Motor
C801-6	CPW23 (GY)	C803-1
C801-4	CPW24 (WH/VT)	C803-2

N0092731

- **Are the resistances less than 5 ohms?**

Yes
INSTALL a new RH rear power window motor. REFER to Window Regulator Motor in this section. TEST the system for normal operation.

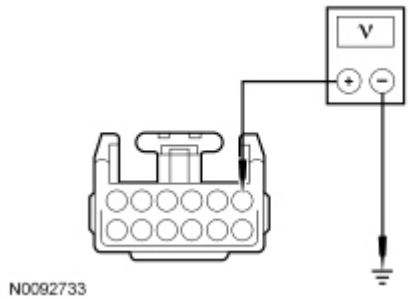
No
REPAIR the circuit(s). TEST the system for normal operation.

Pinpoint Test G: A Single Power Window is Inoperative — Power Sliding Rear Window

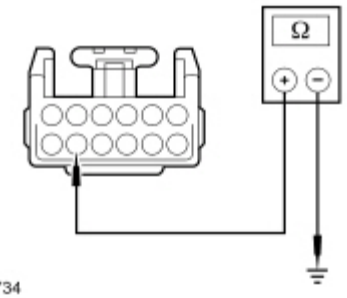
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

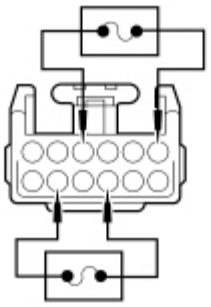
repair4less

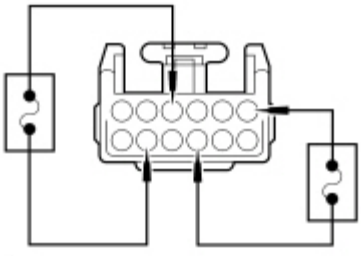
Normal Operation



The overhead console switch supplies voltage and ground to the power sliding window motor to control movement. The overhead console switch controls movement by reversing polarity of the voltage and ground circuits being supplied to the power sliding window motor.



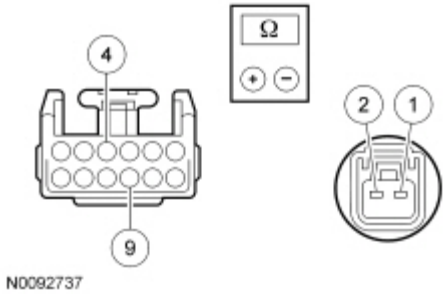




This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Overhead console switch
- Power sliding window motor

PINPOINT TEST G: A SINGLE POWER WINDOW IS INOPERATIVE — POWER SLIDING REAR WINDOW



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK THE POWER WINDOW OPERATION	
• Ignition ON. • Verify the power windows operate. • **Do the power windows operate?**	**Yes** GO to G2 . **No** GO to Pinpoint Test B to diagnose the inoperative power windows.
G2 CHECK THE VOLTAGE TO THE OVERHEAD CONSOLE SWITCH	
• Ignition OFF. • Disconnect: Overhead Console Switch C912. • Ignition ON. • Measure the voltage between overhead console switch C912-1, circuit CBP01 (BU), harness side and ground.  N0092733 • **Is the voltage greater than 10 volts?**	**Yes** GO to G3 . **No** REPAIR the circuit. TEST the system for normal operation.
G3 CHECK THE GROUND TO THE OVERHEAD CONSOLE SWITCH FOR AN OPEN	
• Ignition OFF. • Measure the resistance between overhead console switch C912-11, circuit GD139 (BK/YE), harness side and ground.	**Yes** GO to G4 .

 N0092734 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit(s). TEST the system for normal operation.
G4 CHECK THE OVERHEAD CONSOLE SWITCH	
• Ignition ON. • Connect a fused jumper between overhead console switch C912-1, circuit CBP01 (BU), harness side and C912-4, circuit CPW59 (VT/BN), harness side; and a second fused jumper wire between overhead console switch C912-9, circuit CPW58 (YE/OG), harness side and C912-11, circuit GD139 (BK/YE), harness side. The power sliding window should open.  N0092735 • Connect a fused jumper between overhead console switch C912-1, circuit CBP01 (BU), harness side and C912-9, circuit CPW58 (YE/OG), harness side; and a second fused jumper wire between overhead console switch C912-4, circuit CPW59 (VT/BN) and C912-11, circuit GD139 (BK/YE), harness side. The rear sliding window should close.  N0092736 • **Did the rear power sliding window open and close?**	**Yes** INSTALL a new overhead console control switch. TEST the system for normal operation. **No** GO to G5 .
G5 CHECK THE POWER SLIDING WINDOW MOTOR CIRCUITS FOR AN OPEN	
• Disconnect: Power Sliding Window Motor C3145. • Measure the resistance between overhead console switch C912, harness side and power sliding window motor C3145, harness side using the following chart:	**Yes** INSTALL a new rear sliding window motor. REFER to Window

repair4less

Overhead Console Switch	Circuit	Power Sliding Window Motor
C912-9	CPW58 (YE/OG)	C3145-2
C912-4	CPW59 (VT/BN)	C3145-1

- **Are the resistances less than 5 ohms?**

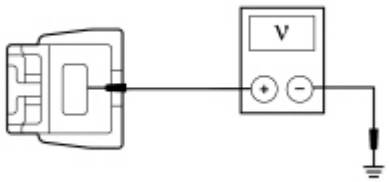
Regulator Motor — Rear in this section. TEST the system for normal operation.

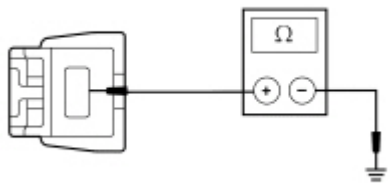
No
REPAIR the circuit(s). TEST the system for normal operation.

Pinpoint Test H: The Defrost System is Inoperative

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

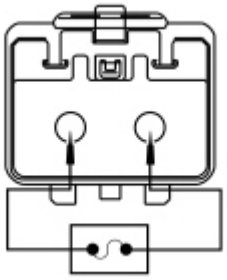
Normal Operation

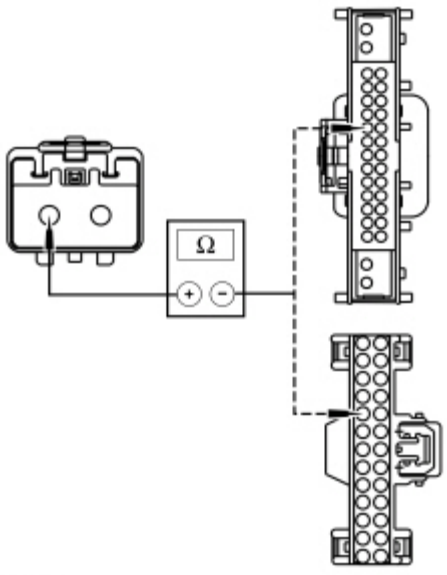




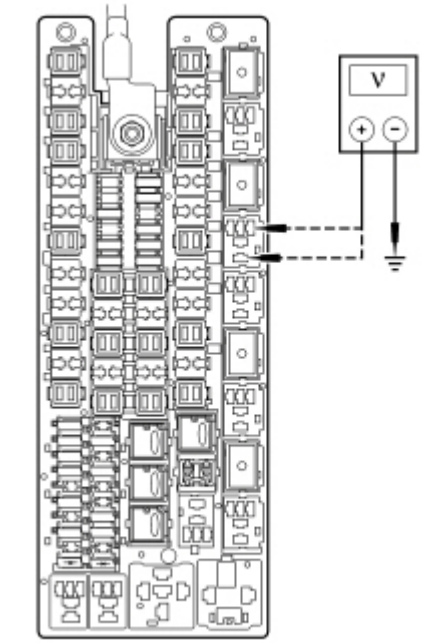
When the engine is running and the defrost switch is pressed, the HVAC module activates the rear window defrost relay. The defrost system is activated at one of the three following locations: HVAC module, FCIM or FDIM (8-inch [203mm] touchscreen). The FCIM and/or FDIM sends the defrost request message to the HVAC module over the Controller Area Network (CAN). When the rear window defrost relay is active, voltage is supplied to the rear window defrost grid. For vehicles equipped with a power sliding rear window, the rear window defrost grid does not activate unless the rear sliding window glass is in the fully CLOSED position due to a glass position switch in series with the grid circuit. The glass position switch is integral to the power sliding rear window assembly. The glass position switch sends a feedback signal to the HVAC module. When this signal is received, the HVAC module sends a message to the FCIM to illuminate the rear window defrost switch LED when the defrost grid is active and the sliding glass is fully closed. If the sliding glass is opened while the defrost system is active, the heated mirrors continue to operate and the rear window defrost switch LED is no longer illuminated.

This pinpoint test is intended to diagnose the following:



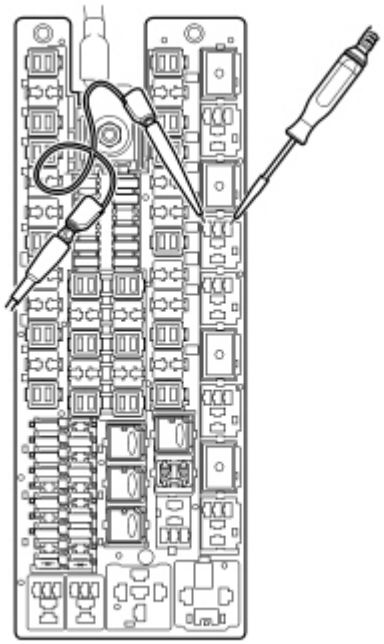


- Fuse(s)
- Rear window defrost relay
- Wiring, terminals or connectors
- Rear sliding glass position switch (if equipped) (part of power sliding rear window assembly)
- Rear window defrost grid
- HVAC module
- FCIM

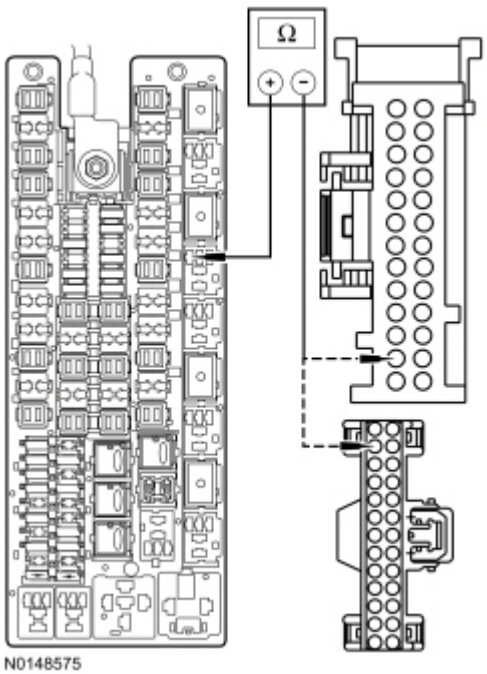


PINPOINT TEST H: THE DEFROST SYSTEM IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
H1 CHECK THE REAR WINDOW DEFROST GRID VOLTAGE	
• Disconnect: Rear Window Defrost Grid Power (Passenger Side Terminal). • Start the engine. • Activate the rear window defrost switch and measure the voltage between rear window defrost grid power terminal, harness side and ground.  A0010641 • **Is the voltage greater than 10 volts?**	**Yes** GO to H2. **No** GO to H5.
H2 CHECK THE REAR WINDOW DEFROST GRID GROUND	
• Ignition OFF. • Disconnect: Rear Window Defrost Grid Ground (Driver Side Terminal). • Measure the resistance between rear window defrost grid ground terminal, harness side and ground.  A0010644 • **Is the resistance less than 5 ohms?**	**Yes** If equipped with a power sliding rear window, GO to H3. If not equipped with a power sliding rear window, CARRY OUT the Grid Wire Test in this section. ATTEMPT to REPAIR the rear window defrost grid, REFER to Window Grid Wire Repair. If not repairable, INSTALL a new rear window glass assembly. REFER to Window Glass — Rear in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H3 CHECK THE REAR WINDOW DEFROST SWITCH LED OPERATION	
• Ignition OFF. • Disconnect: Rear Window Defrost Grid Inline (Passenger Side) C3368. • Install a fused jumper wire between rear window defrost grid inline C3368-1, circuit CH122 (WH/OG), harness side and C3368-2, circuit CRD06 (BN/YE), harness side.	**Yes** CARRY OUT the Grid Wire Test in this section. ATTEMPT to REPAIR the rear window defrost grid, REFER to Window Grid Wire Repair. If not repairable, INSTALL a new rear window glass assembly. REFER to



repair4less

 N0122406 • Start the engine. • Activate the rear window defrost switch. • **Does the rear window defrost switch LED illuminate?**	Window Glass — Rear in this section. TEST the system for normal operation. **No** GO to H4.
H4 CHECK THE REAR WINDOW DEFROST FEEDBACK CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module — EATC C228B or HVAC Module — Electronic Manual Temperature Control (EMTC) C294A. • Measure the resistance between rear window defrost grid inline C3368 and the HVAC module. ▪ For vehicles equipped with EMTC, measure the resistance between rear window defrost grid inline C3368-1, circuit CH122 (WH/OG), harness side and HVAC module — EMTC C294A-22, circuit CH122 (WH/OG), harness side. ▪ For vehicles equipped with EATC, measure the resistance between rear window defrost grid inline C3368-1, circuit CH122 (WH/OG), harness side and HVAC module — EATC C228B-7, circuit CH122 (WH/OG), harness side.  N0148574 • **Is the resistance less than 5 ohms?**	**Yes** GO to H10. **No** REPAIR the circuit. TEST the system for normal operation.

H5 CHECK THE POWER TO THE RELAY	
• Ignition OFF. • Disconnect: Rear Window Defrost Relay. • Ignition ON. • Measure the voltage between rear window defrost relay socket pin 1, circuit CBB54 (VT/OG), harness side and ground; and between pin 3, circuit SBB32 (VT/RD), harness side and ground.  N0093251 • **Is the voltage greater than 10 volts for both measurements?**	**Yes** GO to H6 . **No** VERIFY Battery Junction Box (BJB) fuse(s) 32 (40A) and 54 (5A) are OK. If OK, REPAIR the circuit(s). TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation.
H6 CHECK THE HVAC MODULE	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Start the engine. • Activate the rear window defrost switch. • Connect the 12-volt incandescent test light between rear window defrost relay socket pin 2, circuit CRD02 (BN/BU) and rear window defrost relay socket pin 1, circuit CBB54 (VT/OG).	**Yes** GO to H7 . **No** For vehicles equipped with the 4.2-inch (107mm) or 8-inch (203mm) display, GO to H8 . For vehicles not equipped with the 4.2-inch (107mm) or 8-inch (203mm) display, GO to H9 .

repair4less

 N0101517 • **Does the test light illuminate?**	
H7 CHECK THE REAR WINDOW DEFROST RELAY	
• Ignition OFF. • Carry out the rear window defrost relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the rear window defrost relay pass the component test?**	**Yes** REPAIR open in circuit CRD06 (BN/YE). TEST the system for normal operation. **No** INSTALL a new rear window defrost relay. TEST the system for normal operation.
H8 CHECK THE REAR DEFROST SWITCH (CC_SW_R_DEF) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — FCIM . • Monitor the FCIM CC_SW_R_DEF PID while pressing and releasing the rear window defrost switch. • **Does the PID agree with the rear defrost switch status?**	**Yes** GO to H9 . **No** INSTALL a new FCIM . Refer to the appropriate section in Group 415 for the procedure. TEST the system for normal operation.
H9 CHECK THE REAR WINDOW DEFROST RELAY CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module — EATC C228B or HVAC Module — Electronic Manual Temperature Control (EMTC) C294A. • Measure the resistance between rear window defrost relay and the HVAC module. ▪ For vehicles equipped with EATC , measure the resistance between rear window defrost relay socket pin 2, circuit CRD02 (BN/BU) and HVAC module — EMTC C294A-25, circuit CRD02 (BN/BU), harness	**Yes** GO to H10 . **No** REPAIR the circuit. TEST the system for normal operation.

side. ■ For vehicles equipped with EATC , measure the resistance between rear window defrost relay socket pin 2, circuit CRD02 (BN/BU) and HVAC module — EATC C228A-25, circuit CRD02 (BN/BU), harness side.  N0148575 • **Is the resistance less than 5 ohms?**	
H10 CHECK FOR CORRECT HVAC MODULE OPERATION	
• Disconnect all HVAC module electrical connectors. • Check for: ■ corrosion. ■ pushed-out pins. • Connect all HVAC module electrical connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

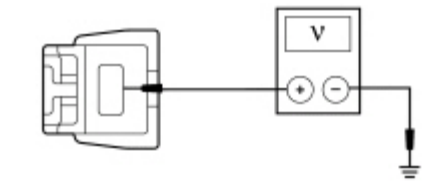
Pinpoint Test I: The Defrost System Does Not Shut Off Automatically

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

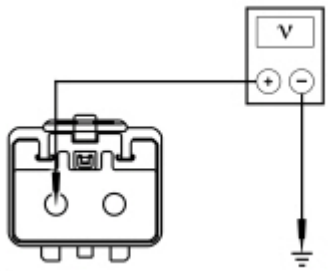
Normal Operation

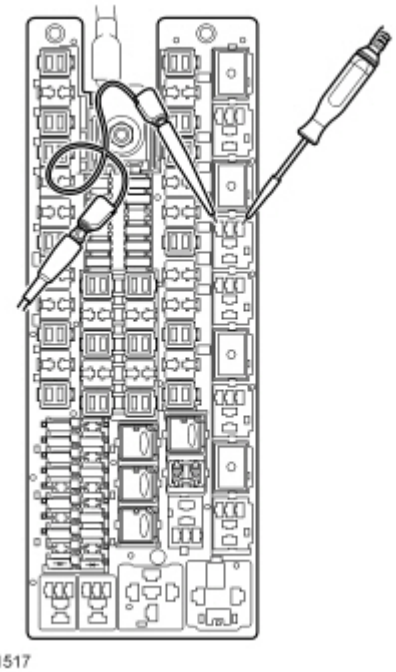
When the engine is running and the defrost switch is pressed, the HVAC module activates the rear window defrost relay. The rear window defrost switch is integral to the HVAC module (if equipped with EMTC) or the FCIM (if equipped with EATC). For vehicles equipped with EATC , the FCIM sends the defrost request message to the HVAC module over the Controller Area Network (CAN). When the rear window defrost relay

repair4less



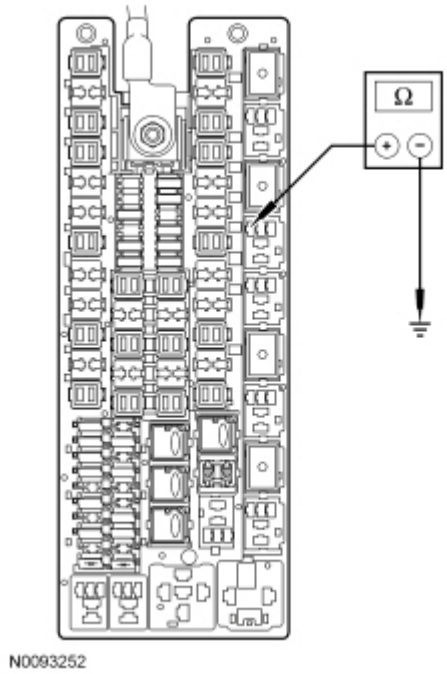
is active, voltage is supplied to the rear window defrost grid. For vehicles equipped with a power sliding rear window, the rear window defrost grid does not activate unless the rear sliding window glass is in the fully CLOSED position due to a glass position switch in series with the grid circuit. The glass position switch is integral to the power sliding rear window assembly. The glass position switch sends a feedback signal to the HVAC module to illuminate the rear window defrost switch LED when the defrost grid is active and the sliding glass is fully closed. For vehicles equipped with EATC , the HVAC module sends a message to the FCIM to illuminate the rear window defrost switch LED when the defrost grid is active and the sliding glass is fully closed. If the sliding glass is opened while the defrost system is active, the heated mirrors continue to operate and the rear window defrost switch LED is no longer illuminated.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Rear window defrost relay
- HVAC module



PINPOINT TEST I: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
I1 CHECK REAR WINDOW DEFROST GRID POWER CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Rear Window Defrost Relay. • Disconnect: Rear Window Defrost Grid Power (Passenger Side Terminal). • Ignition ON. • Measure the voltage between rear window defrost grid power terminal, harness side and ground.  A0010641 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CRD06 (BN/YE) for a short to voltage. TEST the system for normal operation. **No** If equipped with a power sliding rear window, GO to I2 . If not equipped with a power sliding rear window, GO to I4 .
I2 CHECK THE REAR WINDOW DEFROST SWITCH LED STATUS	
• Observe the rear window defrost switch status. • **Is the rear window defrost switch LED illuminated?**	**Yes** GO to I3 . **No** GO to I4 .
I3 CHECK THE REAR WINDOW DEFROST FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF.	**Yes**

• Disconnect: Rear Window Defrost Grid Inline (passenger side) C3368. • Disconnect: HVAC Module — EATC C228B or HVAC Module — Electronic Manual Temperature Control (EMTC) C294A. • Ignition ON. • Measure the voltage between rear window defrost grid inline C3368-1, circuit CH122 (WH/OG), harness side and ground.  N0122474 • **Is any voltage present?**	REPAIR the circuit. TEST the system for normal operation. **No** GO to I6 .
I4 CHECK THE HVAC MODULE ***NOTICE:*** **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Start the engine. • Connect the 12-volt incandescent test light between rear window defrost relay socket pin 2, circuit CRD02 (BN/BU) and rear window defrost relay socket pin 1, circuit CBB54 (VT/OG).  N0101517 • **Does the test light illuminate?**	**Yes** GO to I5 . **No** INSTALL a new rear window defrost relay. TEST the system for normal operation.
I5 CHECK THE REAR WINDOW DEFROST RELAY CONTROL CIRCUIT	

repair4less

FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module — EATC C228B or HVAC Module — Electronic Manual Temperature Control (EMTC) C294A. • Measure the resistance between rear window defrost relay socket pin 2, circuit CRD02 (BN/BU), harness side and ground.  N0093252 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I6 . **No** REPAIR short to ground in circuit CH122 (WH/OG). TEST the system for normal operation.
I6 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Disconnect all HVAC module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all HVAC module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test J: The Delayed Accessory is Inoperative

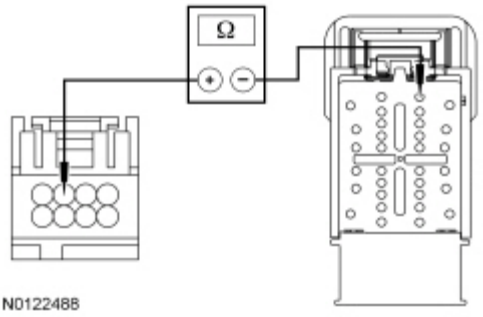
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

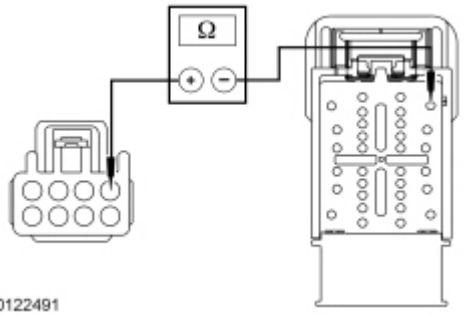
Normal Operation

The accessory delay relay is located in the Body Control Module (BCM). When the ignition is turned ON, the BCM activates the accessory delay relay by grounding the relay coil. When the ignition is turned to the OFF position, the BCM continues to ground the accessory delay relay coil for approximately 10 minutes, or until a front door is opened. When the accessory delay relay is active, it supplies voltage to the power window system.

- DTC B131A:12 (Delayed Accessory Power: Circuit Short To Battery) — sets when the BCM senses a short to voltage on the accessory delay relay control circuit.
- DTC B131A:14 (Delayed Accessory Power: Circuit Short To Ground or Open) — sets when the BCM senses an open or short to ground on the accessory delay relay control circuit.

This pinpoint test is intended to diagnose the following:





- Door ajar switches
- Accessory delay relay
- Wiring, terminals or connectors
- BCM

PINPOINT TEST J: THE DELAYED ACCESSORY IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
J1 CHECK FOR CORRECT OPERATION OF THE DOOR AJAR SWITCHES	
• Open and close the front doors. Verify the interior lights turn on when the doors are open and off when the doors are closed. • **Do the interior lights operate normally?**	**Yes** GO to J2. **No** REFER to Section 417-02 to diagnose the interior lighting and door ajar switches.
J2 CHECK THE ACCESSORY DELAY RELAY	
• Disconnect: Accessory Delay Relay. • Carry out the accessory delay relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the delayed accessory relay pass the component test?**	**Yes** VERIFY Body Control Module (BCM) fuse 32 (15A) (regular cab) or BCM circuit breaker 48 (30A) (SuperCab or SuperCrew) is OK. If OK, GO to J3. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new accessory delay relay. TEST the system for normal operation.
J3 CHECK THE LH FRONT WINDOW CONTROL SWITCH POWER CIRCUIT FOR AN OPEN	
• Ignition OFF.	**Yes**

repair4less

• Disconnect: BCM C2280D. • Disconnect: LH Front Window Control Switch C504 (Regular Cab) or C535B(SuperCab or SuperCrew). • For regular cab, measure the resistance between LH front window control switch C504-3, circuit CBP32 (GN/VT), harness side and BCM C2280D-17, circuit CBP32 (GN/VT), harness side.  N0122488 • For SuperCab or SuperCrew, measure the resistance between LH front window control switch C535B-1, circuit CBP01 (BU), harness side and BCM C2280D-27, circuit CBP01 (BU), harness side.  N0122491 • **Is the resistance less than 5 ohms?**	GO to J4. **No** REPAIR the circuit. TEST the system for normal operation.

J4 CHECK FOR CORRECT BCM OPERATION
• Disconnect all BCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test K: The Delayed Accessory Does Not Turn Off

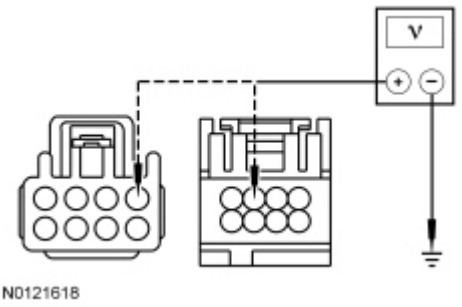
Refer to Wiring Diagrams Cell 100, Power Windows for schematic and connector information.

Normal Operation

The accessory delay relay is located in the Body Control Module (BCM). When the ignition is turned ON, the BCM activates the accessory delay relay by grounding the relay coil. When the ignition is turned to the OFF position, the BCM continues to ground the accessory delay relay coil for approximately 10 minutes, or until a front door is opened. When the accessory delay relay is active, it supplies voltage to the power window system.

- DTC B131A:14 (Delayed Accessory Power: Circuit Short To Ground or Open) — sets when the BCM senses an open or short to ground on the accessory delay relay control circuit.

This pinpoint test is intended to diagnose the following:



- Accessory delay relay
- Wiring, terminals or connections
- BCM

PINPOINT TEST K: THE DELAYED ACCESSORY DOES NOT TURN OFF

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
K1 CHECK FOR STUCK/STICKING ACCESSORY DELAY RELAY	
• Disconnect: Accessory Delay Relay. • Ignition ON. • Attempt to operate the power windows. • **Do the power windows still operate?**	**Yes** GO to K3. **No** GO to K2.
K2 CHECK THE ACCESSORY DELAY RELAY	
• Ignition OFF. • Carry out the accessory delay relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the accessory delay relay pass the component test?**	**Yes** GO to K4. **No** INSTALL a new accessory delay relay. TEST the system for normal operation.
K3 CHECK THE LH FRONT WINDOW CONTROL SWITCH POWER CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280D. • Disconnect: LH Front Window Control Switch C504 (Regular Cab) or C535A (SuperCab or SuperCrew). • Ignition ON. • Measure the voltage between LH front window control switch and ground. ▪ For regular cab, measure the voltage between C504-3, circuit CBP32 (GN/VT), harness side and ground. ▪ For SuperCab or SuperCrew, measure the voltage between C535B-1, circuit CBP01 (BU), harness side and ground.	**Yes** REPAIR circuit CBP01 (BU) or CBP32 (GN/VT) for a short to voltage. TEST the system for normal operation. **No** GO to K4.

repair4less

 N0121618 • **Is any voltage present?**	

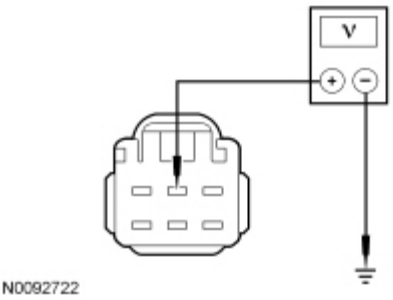
K4 CHECK FOR CORRECT BCM OPERATION
• Disconnect all BCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

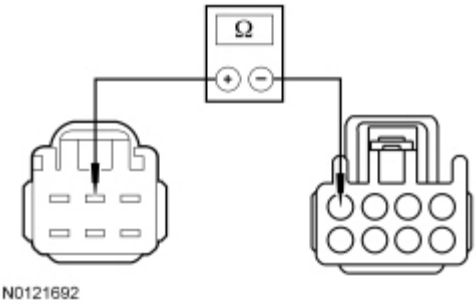
Pinpoint Test L: All Passenger Power Windows are Inoperative — LH and RH Rear

Refer to Wiring Diagrams Cell 100, Power Windows for schematic and connector information.

Normal Operation

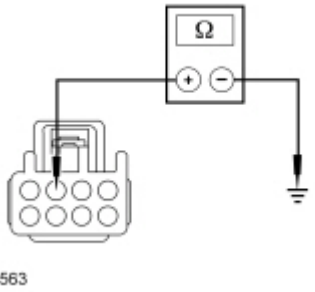
The LH and RH rear window control switches receive voltage from the LH front window control switch when the lock-out switch is in the UNLOCK position. Ground is also provided to the LH and RH rear window control switches from the LH front window control switch. The LH and RH rear window control switches transfer voltage and ground to the power window motor. Window direction is controlled by reversing polarity of the voltage and ground circuits being supplied to the power window motor.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front window control switch



PINPOINT TEST L: ALL PASSENGER POWER WINDOWS ARE INOPERATIVE — LH AND RH REAR

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 CHECK THE VOLTAGE TO THE LH REAR WINDOW CONTROL	

SWITCH	
• Disconnect: LH Rear Window Control Switch C701. • Ignition ON. • **NOTE:** Set the LH front window lock-out switch to the UNLOCK position. • Measure the voltage between LH rear window control switch C701-2, circuit CPW14 (VT/WH), harness side and ground.  N0092722 • **Is the voltage greater than 10 volts?**	**Yes** GO to L3 . **No** GO to L2 .
L2 CHECK THE WINDOW CONTROL SWITCH POWER CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: LH Front Window Control Switch C535B. • Measure the resistance between LH rear window control switch C701-2, circuit CPW14 (VT/WH), harness side and LH front window control switch C535B-4, circuit CPW14 (VT/WH), harness side.  N0121692 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
L3 CHECK THE LH FRONT WINDOW CONTROL SWITCH GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: LH Front Window Control Switch C535B. • Measure the resistance between LH front window control switch C535B-3, circuit GD134 (BK/VT), harness side and ground.	**Yes** INSTALL a new LH front window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

repair4less

 N0122563 • **Is the resistance less than 5 ohms?**	

Pinpoint Test M: The One-Touch Up/Down Feature is Inoperative

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

NOTE: A new power window motor will not operate in one-touch up mode until initialized. Refer to Window Motor Initialization in this section.

Normal Operation

During normal operation, when the window control switch is pressed to the second detent position to request a one-touch up or down operation, the window control switch provides a 12-volt signal on both the up and down line simultaneously. During a one-touch up or down request, the window motor determines intended window direction by the signal first received (first detent position). If the window control switch is pressed too quickly to the second detent position (less than 5 milliseconds of time between first detent signal and second detent signal), the window motor will not be able to determine the intended direction request and will not operate until the window control switch is released and pressed again.

This pinpoint test is intended to diagnose the following:

- Power window motor not initialized
- Window control switch
- Window regulator motor

PINPOINT TEST M: THE ONE-TOUCH UP/DOWN FEATURE IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 CHECK FOR POWER (B+) LOSS DURING WINDOW OPERATION	
• Verify if power (B+) was lost during window operation. • **Was power (B+) lost while the window was in operation?**	**Yes** RAISE the suspect window to the fully CLOSED position. VERIFY the window glass stalls into the upper header seal. The window should function normally. TEST the system for normal operation. **No** GO to M2 .

M2 DE-INITIALIZE, THEN INITIALIZE THE WINDOW MOTOR	
• De-initialize the suspect window motor, then carry out the window motor initialization procedure. Refer to Window Motor Initialization in this section. • **Is the one-touch down feature operating correctly?**	**Yes** The system is operating normally at this time. The window motor lost initialization. **No** GO to M3 .
M3 CHECK THE SUSPECT WINDOW CONTROL SWITCH	
• Ignition OFF. • Disconnect: Suspect Window Control Switch C504 (LH front, Regular Cab) C535A, C535B (Supercrew or SuperCab), or C604 (RH front). • Carry out the component test for the suspect window control switch. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the window control switch pass the component test?**	**Yes** INSTALL a new window regulator and motor. REFER to Window Regulator and Motor — Front Door in this section. INITIALIZE the window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. **No** INSTALL a new window control switch. REFER to Window Control Switch — Front in this section. TEST the system for normal operation.

Component Test

Grid Wire Test

1. Using a bright lamp in the vehicle, inspect the wire grid from the exterior. A broken grid wire will appear as a brown spot.

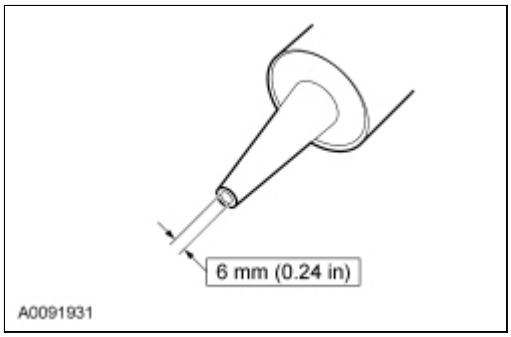
2. Run the engine at idle. Set the rear window defrost switch to ON. The indicator light should come on.

3. Working in the vehicle with a voltmeter, contact the broad red-brown stripes of the rear glass window positive lead to battery side and the negative lead to ground side. The meter should read 10-13 volts. A lower voltage reading indicates a loose ground connection.

4. Contact a good ground point with the negative lead of the meter. The voltage reading should not change.

5. With the negative lead of the meter grounded, touch each grid line of the heated rear window glass at its midpoint with the positive lead. A reading of approximately 6 volts indicates the line is good. A reading of 0 volt indicates the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates the circuit is broken between the midpoint of the grid line and ground.

6. Pinpointing the exact position of the break can be accomplished (if the voltmeter reads 0 volt when the midpoint of the grid line is touched with the positive lead of the voltmeter) by moving the positive lead of the voltmeter toward the B+ side of the grid line and touching the grid line until the voltmeter reads 12 volts. If the voltmeter reads 12 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter, simply move the positive lead of the voltmeter toward the ground connection of the grid line and touch the grid line until the voltmeter reads 0 volt.



repair4less

Glass Reseal — Windshield

Material

Item	Specification
Dow Urethane Adhesive Betaseal™ Express	—
Sika Urethane Adhesive Sika Tack ASAP	—
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the cowl panel grille. For additional information, refer to Section 501-02 .
2. If equipped, remove the overhead console or dome lamp assembly. For additional information, refer to Section 501-12 .
3. Remove the interior rear view mirror. For additional information, refer to Section 501-09 .
4. If equipped, remove the rain sensor. For additional information, refer to Section 501-16 .
5. Remove the A-pillar trim panels, sunvisors and sunvisor clips. For additional information, refer to Section 501-05 .
6. Partially lower the front portion of the headliner near the windshield upper opening and block with a suitable material.
7. Clean the edge formed by the existing urethane adhesive and the glass on the inside at the top, sides and outside on the bottom of the windshield with glass cleaner.
8. Cut the urethane adhesive applicator tip to specification.

9. **NOTE:** Use either a high-ratio electric or battery-operated caulk gun that will apply the urethane adhesive with less effort and a continuous bead.

   NOTE: Make sure all gaps in the urethane adhesive are smoothed into one continuous bead.

repair4less

Apply urethane adhesive over the top of the existing urethane adhesive.

- Apply the urethane adhesive to the top and sides of the windshield from the interior of the vehicle.
- Apply the urethane adhesive to the bottom of the windshield from the exterior of the vehicle.

10. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

    After the urethane adhesive has cured, check the windshield seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

11. Position the front portion of the headliner.

12. Install the A-pillar trim panels, sunvisors and sunvisor clips. For additional information, refer to Section 501-05 .

13. If equipped, install the rain sensor. For additional information, refer to Section 501-16 .

14. Install the interior rear view mirror. For additional information, refer to Section 501-09 .

15. If equipped, install the overhead console or dome lamp assembly. For additional information, refer to Section 501-12 .

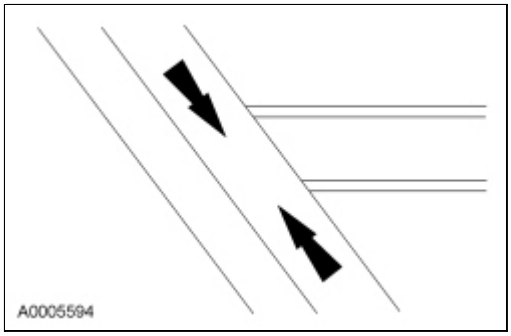
16. Install the cowl panel grille. For additional information, refer to Section 501-02 .

Lead Terminal Repair

General Equipment

Terminal Kit — Back Glass 4F1Z-14421-AA

Material



Item	Specification
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

NOTE: This procedure is for vehicles equipped with fixed rear window assembly only. The lead terminals cannot be repaired on vehicles equipped with a power sliding rear window.

1. Bring the vehicle up to room temperature of at least 16°C (60°F) or above.

2. **NOTE:** The new terminal will cover the original terminal location, but it must be placed so that the terminal conductive areas will be placed on a good conductive base.

   Clean the bus bar in the area to be repaired with steel wool (000 to 0000 grade), and then with glass cleaner to remove all dirt, wax, grease, oil or other foreign material.

3. ***NOTICE:*** **Do not use any type of flame torch or flame-heated soldering gun for this procedure. Use of these tools provide inadequate heat generation at the tip and the exhaust heat can cause damage to plastic trim parts in the area. Use only an electric soldering gun with 100 watts or more of power. Before using the soldering gun, be sure to melt a small amount of rosin core solder to the tip. The solder will assist in achieving better heat transfer from the soldering gun tip to the new terminal.**

   NOTE: Depending on the original terminal location, and whether the terminal is covered by pillar trim, will determine where to locate the new terminal. Some grid line bus bars may only allow the placement of the terminal above or below the original tab location due to space limitations. For most vehicle applications, the replacement tab location will cover the original tab location, but still allow the replacement tab to attach to the bus bar on good conductive material.

   Place the replacement terminal type A over the original tab location, making sure the conductive

repair4less

areas of the terminal will be on a good conductive area. Do not place the terminal tab foot on the original location, which does not have conductive material.

4. Hold the terminal in place with an item such as a regular lead pencil at a 90 degree angle from the terminal. (Holding at other than a 90 degree angle may allow the terminal to slip when the solder liquefies.)

5. **NOTE:** The new terminal has pre-applied solder, flux and temperature-sensitive paint. The paint provides a visual indication when the terminal has reached the correct temperature to melt solder on the terminal. When the correct temperature is achieved, the temperature paint will liquefy and change color.

   Place the soldering gun tip on the top of the terminal, but not on the painted areas of the tab. Energize the soldering gun and watch for the painted area of the terminal to liquefy and change color. The paint should liquefy in approximately 25-45 seconds after heating. As soon as the paint color completely changes on either side of the terminal, de-energize the soldering gun and continue to hold the terminal in place with the soldering gun and pencil for an additional 30 seconds.

6. Remove the soldering gun and pencil from the terminal. The terminal should be allowed to cool for another 2 minutes before the wiring lead is attached to the terminal.

7. Attach the electrical lead connection to this terminal, turn on the heated rear window and verify the operation.

Window Glass Adjustment — Front Door

NOTE: A misadjusted front window glass may cause a customer concern of slow power window travel when raising the window.

1. If equipped with power windows, remove the window control switch. For additional information, refer to Window Control Switch — Front in this section.
2. Remove the front door trim panel. For additional information, refer to Section 501-05 .
3. Position aside the front door watershield.
4. Temporarily install the window control switch or the window crank to raise or lower the window glass as necessary to access the glass-to-regulator assembly bolts.
5. Loosen the front door window glass-to-regulator assembly bolts.
6. Push the glass up into the header by hand, then shift the glass rearward until it stops against the rear window run seal while lowering the glass back down into the window glass clamps.
7. **NOTE:** Make sure the window glass is seated in the bottom of the glass clamps.

   Tighten the front door window glass-to-regulator assembly bolts to 11 Nm (97 lb-in).
8. Install the watershield.
9. Install the front door trim panel. For additional information, refer to Section 501-05 .
10. If equipped with power windows, install the window control switch. For additional information, refer to Window Control Switch — Front in this section.

repair4less

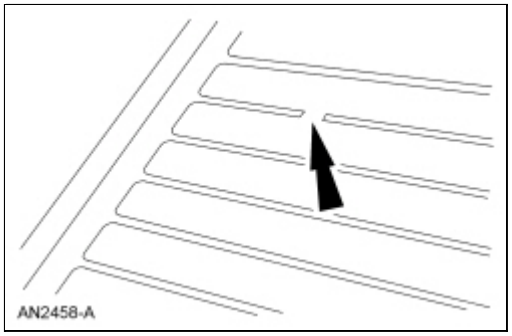
Window Grid Wire Repair

General Equipment

Polypropylene Film Fine Line Tape (Commercially available)

Material

Item	Specification
Motorcraft® Lacquer Touch-Up Paint (match color to exterior grid wire) PMP-19500-XXXXX	ESR-M2P100-C
Permatex® Quick Grid™ Rear Window Defogger Repair Kit 15067	—
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A



NOTE: The grid line material is not embedded into the glass, but is baked to the glass surface and consequently can be scraped off. An undamaged grid line will have small ridges that project above the surface of the glass and can easily be felt when running a fingernail across them. Grid lines that have been "razor bladed" will feel smooth when a fingernail is dragged across the affected area. Inoperative lines may appear to the eye to be undamaged due to residue remaining on the glass and will require diagnosis with a voltmeter or 12V test lamp. For additional information, refer to Diagnosis and Testing in this section.

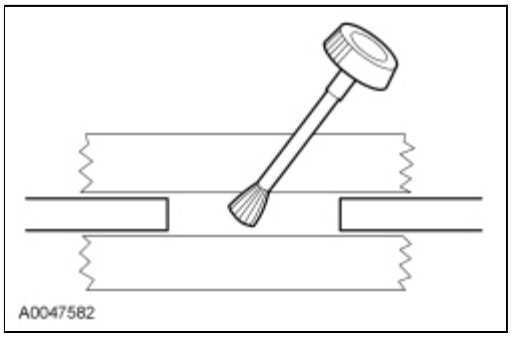
1. Bring the vehicle up to a room temperature of at least 16°C (60°F) or above.

2. ***NOTICE:*** **Do not use scrapers, sharp instruments or abrasive window cleaners on the interior surface of the rear window glass as this may cause damage to the grid lines.**

   Clean the entire grid line repair area with glass cleaner and 0000 steel wool to remove all dirt, wax, grease, oil or other foreign material.

3. Mark the location of the grid break on the exterior of the rear window glass.

repair4less



4. Using a polypropylene film fine line tape, mask the area directly above and below the grid break extending the tape 26 mm (1.02 in) beyond the concern area in both directions. The break area should be at the center of the mask.

5. **NOTE:** If the brown layer is not broken or missing, apply only the silver grid repair compound to the break. If both the brown and silver layers of the grid are broken or missing, apply a coating of the lacquer touch up paint across the break in the grid line prior to applying the rear window defroster repair compound. Do not overlap the silver grid line with the paint. Several applications may be necessary to achieve a color match.

   NOTE: Allow at least 5 minutes of drying time between applications for the touch up paint or the silver repair coating. Applying fewer coats or not allowing adequate drying time between coats will produce repaired resistance that is greater than OEM resistance, resulting in poor defrost performance and excessive localized heating.

   Apply the repair coating to the grid break area in several smooth, continuous strokes. Extend the silver repair coating at least 6.35 mm (0.25 in) on both sides of the break area.
   Apply a minimum of 6 applications of the grid repair compound.

6. **NOTE:** The repair coating air-dries in approximately one minute and can be energized after 5 minutes. Optimum adhesion occurs after approximately 24 hours.

   Allow the repair area to dry completely and remove the mask.

7. ***NOTICE:*** **Be careful not to damage the grid line with the razor blade. If this occurs, additional repair may be necessary.**

   Remove any excess repair compound above or below the grid line with a razor blade.

8. **NOTE:** The interior side of the grid lines are not painted, but due to the silver tarnishing will tend to change the grid to a gold or brown color. The repair area will be bright silver and will also tarnish over time to match the rest of the grid.

Test the system for normal operation.

---

repair4less

Window Motor Initialization

NOTE: Initialization is required to learn both the full UP and full DOWN positions and the profile of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled. This procedure is only required for LH and RH front window motors.

NOTE: The front window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

NOTE: A new (original factory setting) or de-initialized front window motor cannot operate in one-touch up mode until initialized. If a new front window motor has been installed, proceed to the initialization procedure.

NOTE: If diagnosing a LH or RH front window switch problem, carry out the window initialization procedure before installing a new window switch.

NOTE: All front window components (window glass, window regulator, window motor, seals and glass top run) must be installed and tightened to specification before carrying out the initialization procedure.

NOTE: Excessive bounce-back (window reverses direction with no obstructions present) can indicate that a de-initialization procedure may need to be carried out.

De-Initialization Procedure

NOTE: The front window motor must be de-initialized (reset to its original factory settings) before carrying out the initialization procedure.

1. Turn the ignition ON.

2. Operate the window control switch in one-touch mode and remove power from the window motor **while the window is moving** by one of the following methods:
    1. Disconnect the vehicle battery cable **while the window is moving** .
    2. Remove the LH or RH front window motor fuse **while the window is moving** .

3. This de-initializes the window motor and reset the window motor to its original factory settings.

4. Carry out the initialization procedure to turn the one-touch-up feature on.

Window Motor Initialization

WARNING: Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.

NOTE: The front window must be in the full OPEN position for this procedure to operate correctly.

NOTE: If the initialization procedure is only partially completed, the front window motor remains de-initialized and operates only in proportional up/down and one-touch-down modes.

5. Turn the ignition ON.

6. Activate and hold the window control switch in the UP position at the second detent until the window glass stalls for 2 seconds into the glass top run and release the switch.

7. Activate and hold the window control switch in the DOWN position at the second detent until the window glass stalls for 2 seconds at the bottom of its travel and release the switch.

8. Test for correct window operation by carrying out the one-touch-up and one-touch-down features.

---

repair4less

Door Glass Top Run — Front

Removal and Installation

NOTE: The front window motor must be de-initialized, then initialized whenever the LH front or RH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

1. Remove the front door window glass. For additional information, refer to Window Glass — Front Door in this section.

2. Remove the exterior rear view mirror. For additional information, refer to Section 501-09 .

3. Remove the front door outer belt moulding. For additional information, refer to Section 501-08 .

4. Remove the front door glass top run.
    - Remove the front door glass top run through the top opening of the front door.

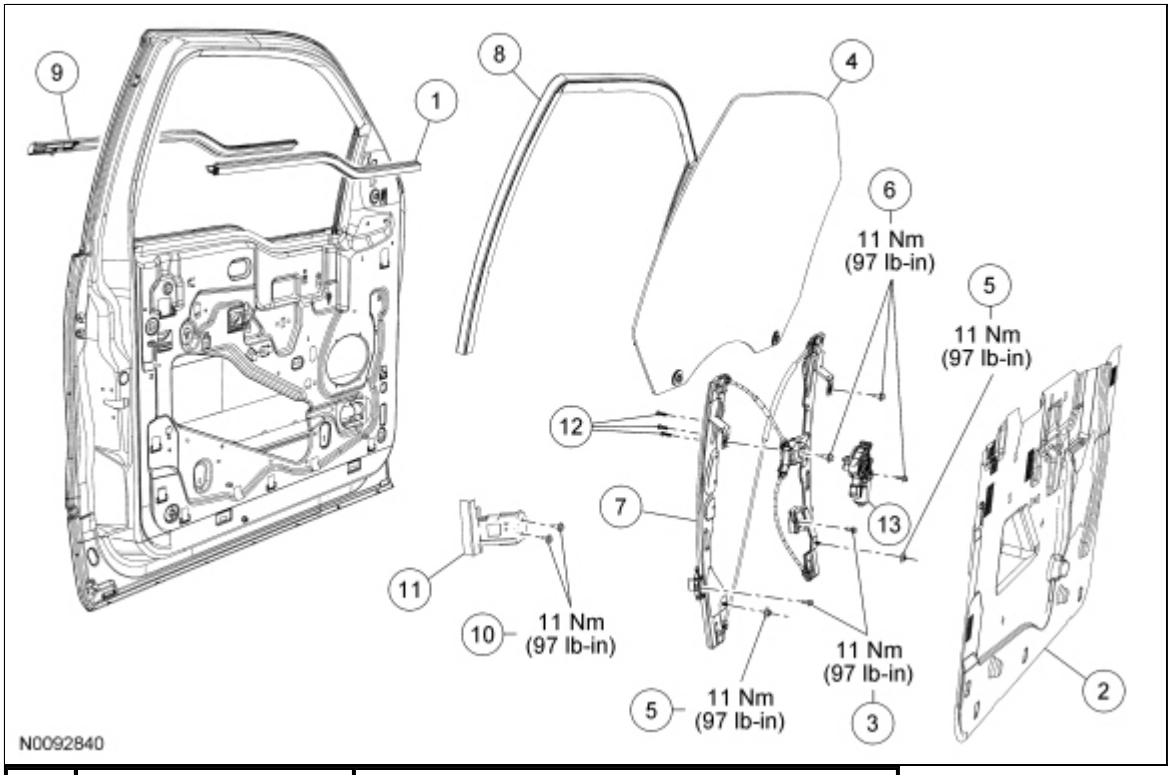
5. To install, reverse the removal procedure.
    - Initialize the front window motor. For additional information, refer to Window Motor Initialization in this section.

Door Glass Top Run — Rear, SuperCab

Removal and Installation

1. Position the rear door window glass in the full downward position.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the rear door interior moulding.
4. Remove the rear door window glass top run.
    - Remove the rear door window glass top run through the top opening of the rear door.
5. To install, reverse the removal procedure.

repair4less



Door Glass Top Run — Rear, SuperCrew

Removal and Installation

1. Position the rear door window glass in the full downward position.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the rear door interior moulding.
4. Remove the rear door window glass top run.
    - Remove the rear door window glass top run through the top opening of the rear door.
5. To install, reverse the removal procedure.

Window Glass — Front Door

Removal

NOTE: The front window motor must be de-initialized, then initialized whenever the LH front or RH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

With power windows

1. Remove the window control switch. For additional information, refer to Window Control Switch — Front in this section.

All vehicles

2. Remove the front door trim panel. For additional information, refer to Section 501-05 .

3. Remove the front door interior moulding.

4. If equipped, remove the bolster assembly.
   - Remove the bolt and 2 pin-type retainers.

5. Position aside the front door watershield.

6. Remove the 2 front door below belt bracket bolts and bracket.
   - If equipped, disconnect the electrical wiring harness pushpin.

7. Temporarily install the window control switch or the window crank to raise or lower the window as necessary to access the glass-to-regulator assembly bolts.

8. Loosen the 2 front door window glass-to-regulator assembly bolts.

9. Tape the window in position, then lower the front door window regulator to the full downward position.

10. **NOTE:** The top run may be positioned aside to gain additional clearance if needed.

    Tip the front of the glass down and pull the front door window glass out through the top outboard side of the door.

Installation

All vehicles

1. Install the glass into the door and tape in place.
   - Reposition the top run if it was positioned aside during the glass removal.

2. Temporarily install the window control switch or the window crank to raise or lower the regulator as necessary to access the glass-to-regulator assembly bolts.

3. **NOTE:** It is important that this step is performed to prevent a customer concern of slow power window travel when raising the window.

   Push the glass up into the header by hand, then shift the glass rearward until it stops against the rear window run seal while lowering the glass back down into the window glass clamps.

4. **NOTE:** Make sure the window glass is seated in the bottom of the glass clamps.

   Tighten the 2 front door window glass-to-regulator assembly bolts to 11 Nm (97 lb-in).

5. Install the 2 front door below belt bracket bolts and bracket.
   - Tighten to 11 Nm (97 lb-in).

6. Install the front door watershield.

7. If equipped, install the bolster assembly.
   - Tighten the bolt and install the 2 pin-type retainers.

8. Install the front door interior moulding.

9. Install the front door trim panel. For additional information, refer to Section 501-05 .

With power windows

10. Install the window control switch. For additional information, refer to Window Control Switch — Front in this section.
    - Initialized the front window motor. For additional information, refer to Window Motor Initialization in this section.

---

repair4less

Window Glass — Rear Door, SuperCab

Removal and Installation

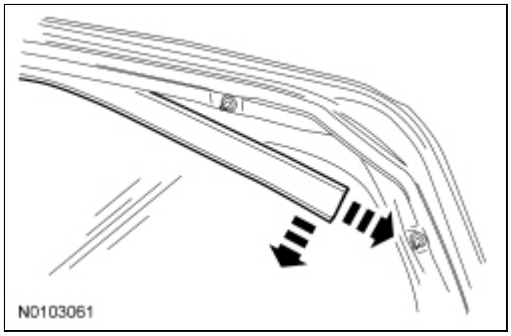
1. Remove the window control switch. For additional information, refer to Window Control Switch — Rear in this section.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the rear door mounted speaker. For additional information, Refer to the appropriate section in Group 415 for the procedure.
4. Remove the rear door interior moulding.
5. Position aside the rear door watershield.
6. Temporarily install the window control switch to raise or lower the window as necessary to access the glass-to-regulator assembly bolts.
7. Remove the C-pillar below belt bracket bolt and bracket.
   - Slide the bracket down to disengage from the U-channel in the door.
   - To install, tighten to 11 Nm (97 lb-in).
8. Remove the B-pillar below belt bracket bolt and bracket.
   - To install, tighten to 11 Nm (97 lb-in).
9. Loosen the rear door window glass-to-regulator assembly bolts.
   - To install, tighten to 11 Nm (97 lb-in).
10. Tape the window in position, then lower the rear door window regulator to the full downward position.
11. Remove the rear door window glass.
    - Pull the rear door window glass out through the top inboard side of the door.
12. To install, reverse the removal procedure.

repair4less

Window Glass — Rear Door, SuperCrew

Removal and Installation

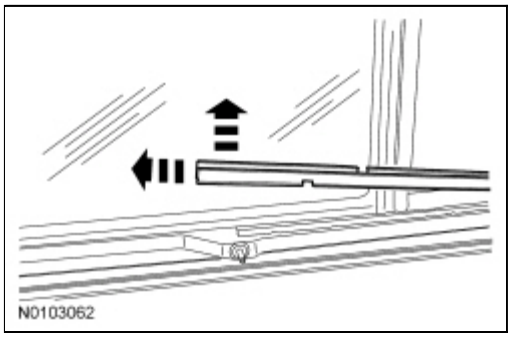
1. Remove the window control switch. For additional information, refer to Window Control Switch — Rear in this section.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the rear door mounted speaker. For additional information, Refer to the appropriate section in Group 415 for the procedure.
4. Remove the rear door interior moulding.
5. Position aside the rear door watershield.
6. Temporarily install the window control switch to raise or lower the window as necessary to access the glass-to-regulator assembly bolts.
7. Loosen the rear door window glass-to-regulator assembly bolts.
    - To install, tighten to 11 Nm (97 lb-in).
8. Tape the window in position, then lower the rear door window regulator to the full downward position.
9. Remove the rear door window glass.
    - Pull the rear door window glass out through the top inboard side of the door.
10. To install, reverse the removal procedure.



repair4less

Window Glass — Rear, Manual Sliding Panel

1. Remove the rear window glass assembly from the vehicle and place on a stable work surface. For additional information, refer to Window Glass — Rear in this section.



2. Position the sliding glass panel to the full CLOSED position.

3. Remove the upper rail filler.
   - Pull down the driver side of the upper filler while carefully sliding it out of the track towards the driver side of the rear glass assembly.

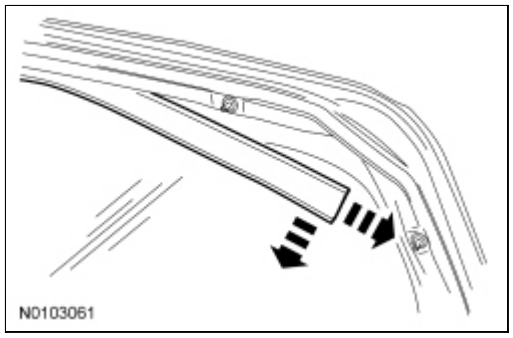
4. Position the sliding glass panel to the full OPEN position.

5. Remove the lower rail filler.
   - Pull up the passenger side of the lower filler while carefully sliding it out of the track towards the passenger side of the rear glass assembly.

6. Push the sliding glass upward and tilt the bottom inward to disengage the sliding glass from the track. Remove the sliding glass panel.

7. To install, reverse the removal procedure.

repair4less



Window Glass — Rear, Power Sliding Panel

NOTE: If equipped with rear window defrost, the sliding glass panel cannot be serviced separately. The rear window must be replaced as a complete assembly. For additional information, refer to Window Glass — Rear in this section.

1. Remove the rear window glass assembly from the vehicle and place on a stable work surface. For additional information, refer to Window Glass — Rear in this section.

2. Position the sliding glass panel to the full CLOSED position.

3. Remove the upper rail filler.
   - Pull down the driver side of the upper filler while carefully sliding it out of the track towards the driver side of the rear glass assembly.

4. Push the sliding glass upward and tilt the bottom inward to disengage the sliding glass from the center bracket guide. Remove the sliding glass panel.

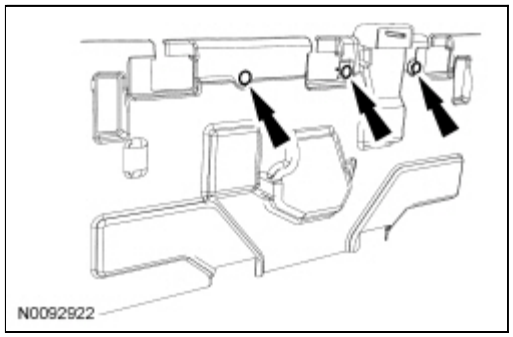
5. To install, reverse the removal procedure.

repair4less

Window Glass — Rear

Material

Item	Specification
Foam Core Butyl E69Z-19562-A	WSB-M3G143-B1

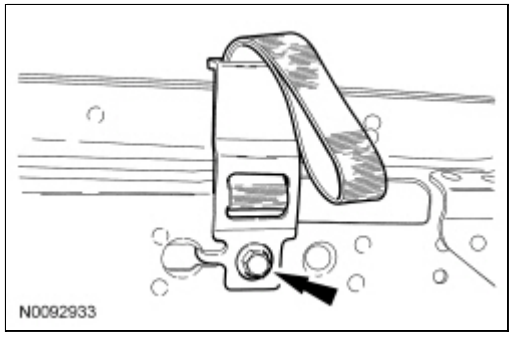


Removal

NOTE: If the rear window glass is being removed to repair a dust/water leak, remove and reinstall the existing rear window glass.

All vehicles

1. For regular and SuperCab vehicles, remove the headliner. For SuperCrew vehicles, lower and position the headliner forward. For additional information, refer to Section 501-05 .



2. Remove the rear trim panel pin-type retainers.

3. Position aside the rear trim panel.

4. If equipped, disconnect the 2 rear window defrost grid electrical connectors.
   - If equipped with power sliding window, disconnect the in-line electrical connector (blue).

5. If equipped, remove the center tether anchor bolt and tether anchor.

6. Remove the rear window glass nuts.

7. ***NOTICE:*** **Use only a plastic windshield setting tool to slide under the seal to separate the foam core butyl from the glass. Once the glass starts to separate from the body, constant hand pressure will break the seal and the glass can be removed. The aid of an assistant will be required to support the glass during this step to prevent damage to the glass frame, body or power sliding window cables (if equipped). Failure to use a plastic windshield setting tool can damage the body or the glass frame.**

   NOTE: If equipped with a power sliding rear window, the glass must be supported in close proximity to the body during the following power sliding rear window removal steps.

   Remove the rear glass from the vehicle.

Power sliding rear window

8. **NOTE:** LH transition block screw shown, RH similar.

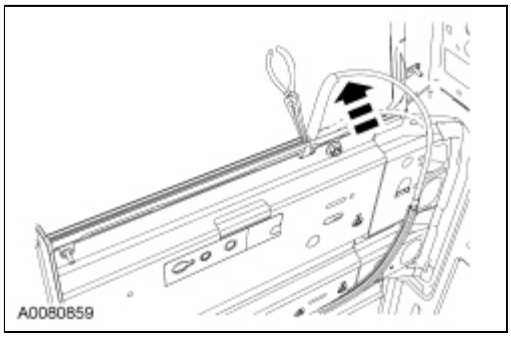
   Remove the 2 screws from the LH and RH transition blocks.

9. ***NOTICE:*** **The following substeps are to prevent the cables from popping out of the motor housing. If an existing regulator and motor assembly is to be reused, do not allow the cables to pop out of the motor housing, as they can unwind from the drum. If the cables unwind from the drum, a new regulator and motor assembly will have to be installed.**

   NOTE: LH side shown, RH side similar.

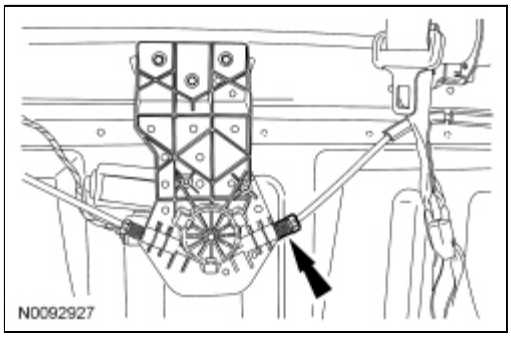
   Remove the LH cable first, then the RH side cable. Press and hold the transition block away from the centerline of the vehicle.

10. **NOTE:** LH side shown, RH side similar.



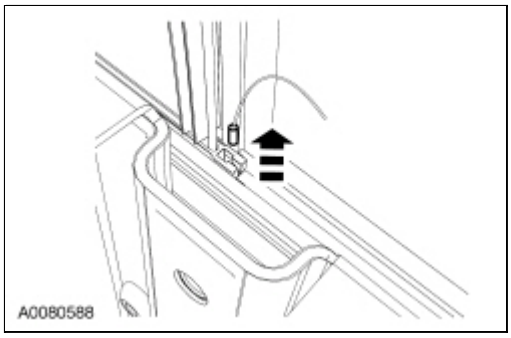
repair4less

Clamp and hold the cable near the transition block.



11. **NOTE:** LH side shown, RH side similar.

    Gently pull up the end of the transition block and lift it out of the groove. Do not release the clamp.



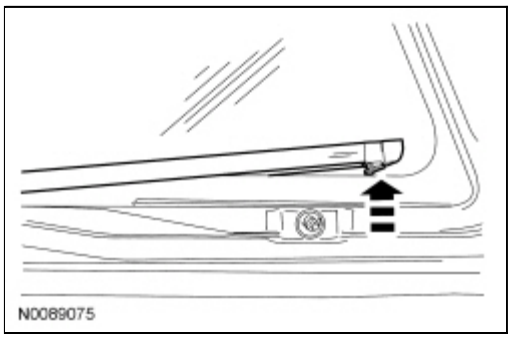
12. **NOTE:** LH side shown, RH side similar.

    Slowly release the clamp on the cable to gradually unload the tensioning spring on the motor housing.

13. **NOTE:** LH side shown, RH side similar.

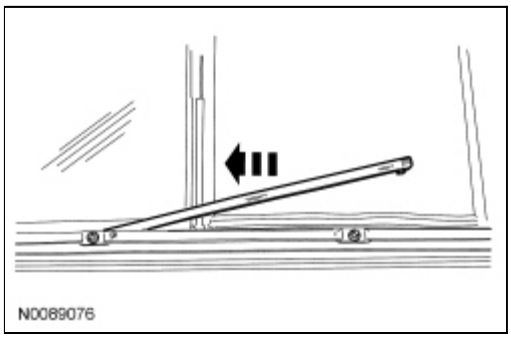
    Remove the cable swag from the guide bracket on the sliding rear window.

NOTE: The remaining removal step(s) are only necessary when transferring the original sliding glass panel to the new rear sliding window assembly.



Power or manual sliding rear window

14. Remove the sliding rear window glass. For additional information, refer to Window Glass — Rear, Power Sliding Panel or Window Glass — Rear, Manual Sliding Panel in this section.



15. Remove the upper and lower rail fillers from the new rear window glass frame assembly.

Power sliding rear window

16. Slide the center bracket guide all the way to the LH side, then pull the LH side straight up so the guide foot can pass through the slot in the glass frame assembly.

17. Carefully slide the center bracket guide all the way to the RH side, then pull the RH side straight up so the guide foot can pass through the slot in the glass frame assembly. Transfer the center bracket guide to the new rear glass assembly.

Power or manual sliding rear window

repair4less

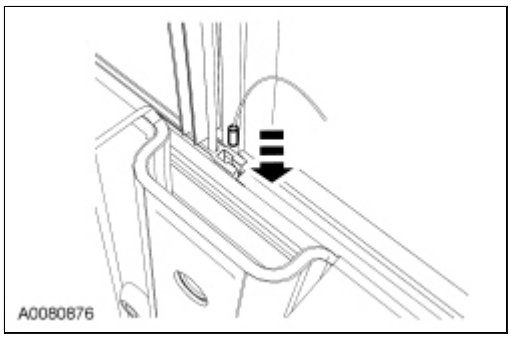
18. Transfer the original sliding rear window glass to the new rear glass assembly. For additional information, refer to Window Glass — Rear, Power Sliding Panel or Window Glass — Rear, Manual Sliding Panel in this section.

Installation

All vehicles

1. **NOTE:** Remove as much of the foam core butyl as possible from the body and window glass prior to installation.

   Apply foam core butyl to the window. Overlap the foam core butyl by 25 mm (1 in) at the bottom middle of the rear window glass.



Power sliding rear window

2. ***NOTICE:*** **The following substeps are to prevent the cables from popping out of the motor housing. If an existing regulator and motor assembly is to be reused, do not allow the cables to pop out of the motor housing, as they can unwind from the drum. If the cables unwind from the drum, a new regulator and motor assembly will have to be installed.**

   NOTE: The aid of an assistant will be required to support the glass in close proximity to the body opening during the following power sliding rear window installation steps.

   NOTE: LH side shown, RH side similar.

   Install the LH cable first, then the RH side cable. Install the cable swag into the guide bracket on the sliding rear window.

3. **NOTE:** LH side shown, RH side similar.

   Compress and hold the cable tension spring.

4. **NOTE:** LH side shown, RH side similar.

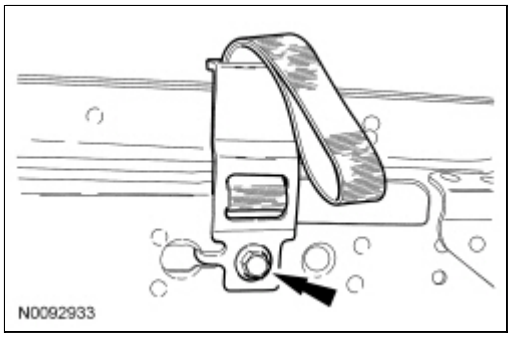
   NOTE: While holding the LH cable under tension, cycle the window motor to decrease the freeplay on the RH cable. Reducing the freeplay on the RH cable will allow ease of installation of the RH cable.

   Press the transition block away from the centerline of the vehicle, then snap it into the groove. Release the cable tension spring.

5. **NOTE:** LH side shown, RH side similar.

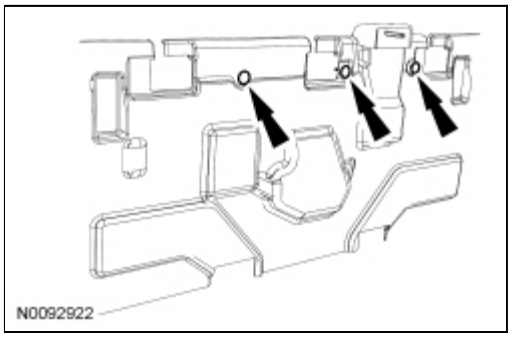
   The transition block is correctly seated when its top edge is +/- 10 mm (0.39 in) above the top of the window opening.

6. Install the LH and RH transition block screws.



All vehicles

7. Carefully install the rear window glass into the body opening.



8. Install the rear window glass nuts.
   - Tighten to 4 Nm (35 lb-in).

9. If equipped, install the center tether anchor bolt and tether anchor.
   - To install, tighten to 30 Nm (22 lb-ft).

repair4less

10. If equipped, connect the rear window defrost grid electrical connectors.
11. Install the rear trim panel.
12. Install the rear trim panel pin-type retainers.

13. For regular and SuperCab vehicles, install the headliner. For SuperCrew vehicles, raise and reposition the headliner. For additional information, refer to Section 501-05 .

Window Regulator and Motor — Front Door

Removal

NOTE: The front window motor must be de-initialized, then initialized whenever the LH front or RH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

With power windows

1. Remove the window control switch. For additional information, refer to Window Control Switch — Front in this section.

All vehicles

2. Remove the front door trim panel. For additional information, refer to Section 501-05 .

3. If equipped, remove the bolster assembly.
   - Remove the bolt and 2 pin-type retainers.

4. Position aside the front door watershield.

5. Temporarily install the window control switch or the window crank to raise or lower the window as necessary to access the glass-to-regulator assembly bolts.

All vehicles

6. Loosen the 2 front door window glass-to-regulator assembly bolts.

7. Tape the window in the full upward position, then lower the front door window regulator to the full downward position.

With power windows

8. Disconnect the window regulator motor electrical connector.

All vehicles

9. Remove and/or loosen the front door window regulator fasteners.
   - Remove the front door window regulator assembly through the large opening in the door.

Installation

All vehicles

1. Install the front door window regulator assembly.
   - Tighten all front door window regulator fasteners to 11 Nm (97 lb-in).

repair4less

With power windows

2. Connect the window regulator motor electrical connector.

All vehicles

3. Temporarily install the window control switch or the window crank to raise or lower the regulator as necessary to access the glass-to-regulator assembly bolts.

4. **NOTE:** It is important that this step is performed to prevent a customer concern of slow power window travel when raising the window.

   Push the glass up into the header by hand, then shift the glass rearward until it stops against the rear window run seal while lowering the glass back down into the window glass clamps.

5. **NOTE:** Make sure the window glass is seated in the bottom of the glass clamps.

   Tighten the 2 front door window glass-to-regulator assembly bolts to 11 Nm (97 lb-in).

6. Install the front door watershield.

7. If equipped, install the bolster assembly.
   - Tighten the bolt and install the 2 pin-type retainers.

8. Install the front door trim panel. For additional information, refer to Section 501-05 .

With power windows

9. Install the window control switch. For additional information, refer to Window Control Switch — Front in this section.
   - Initialized the front window motor. For additional information, refer to Window Motor Initialization in this section.

repair4less

Window Regulator and Motor — Rear Door, SuperCab

Removal and Installation

1. Remove the window control switch. For additional information, refer to Window Control Switch — Rear in this section.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the rear door mounted speaker. For additional information, Refer to the appropriate section in Group 415 for the procedure.
4. Position aside the rear door watershield.
5. Temporarily install the window control switch to raise or lower the window as necessary to access the glass-to-regulator assembly bolts.
6. Loosen the rear door window glass-to-regulator assembly bolts.
    - To install, tighten to 11 Nm (97 lb-in).
7. Secure the rear door glass in the full upward position with tape, then lower the rear door window regulator to the full downward position.
8. Disconnect the rear door window motor electrical connector.
9. Remove and/or loosen the rear door window regulator assembly fasteners.
    - Remove the regulator assembly through the large opening in the door.
    - To install, tighten to 11 Nm (97 lb-in).
10. To install, reverse the removal procedure.

repair4less

Window Regulator and Motor — Rear Door, SuperCrew

Removal and Installation

1. Remove the window control switch. For additional information, refer to Window Control Switch — Rear in this section.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the rear door mounted speaker. For additional information, Refer to the appropriate section in Group 415 for the procedure.
4. Position aside the rear door watershield.
5. Temporarily install the window control switch to raise or lower the window as necessary to access the glass-to-regulator assembly bolts.
6. Loosen the rear door window glass-to-regulator assembly bolts.
    - To install, tighten to 11 Nm (97 lb-in).
7. Secure the rear door glass in the full upward position with tape, then lower the rear door window regulator to the full downward position.
8. Disconnect the rear door window motor electrical connector.
9. Remove and/or loosen the rear door window regulator assembly fasteners.
    - Remove the regulator assembly through the large opening in the door.
    - To install, tighten to 11 Nm (97 lb-in).
10. To install, reverse the removal procedure.

repair4less

Window Regulator and Motor — Rear

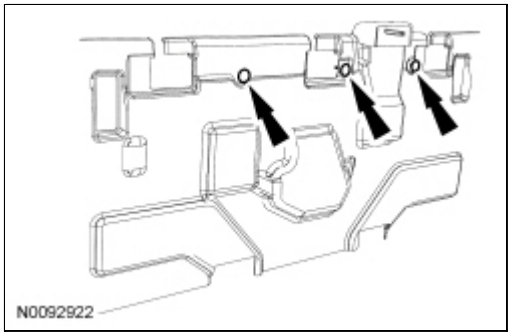
Removal

1. Remove the rear window glass. For additional information, refer to Window Glass — Rear in this section.

2. Disconnect the rear window glass motor electrical connector.

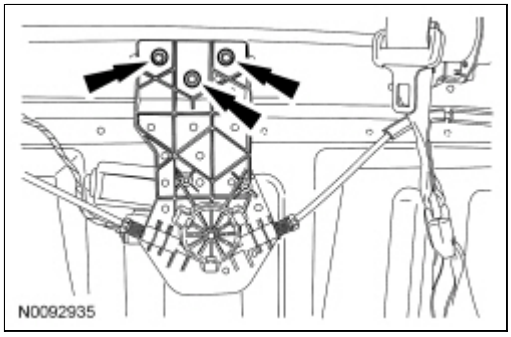
3. Remove the rear window glass regulator and motor assembly screws.
   - To install, tighten to 11 Nm (97 lb-in).

4. Remove the rear window glass regulator and motor assembly from the vehicle.



5. ***NOTICE:*** **If installing a new regulator and motor assembly, make sure any clips, retainers or wire ties that may have been used for shipping purposes are removed once the new regulator and motor are installed. Failure to follow this instruction may result in damage to the new regulator and motor assembly.**

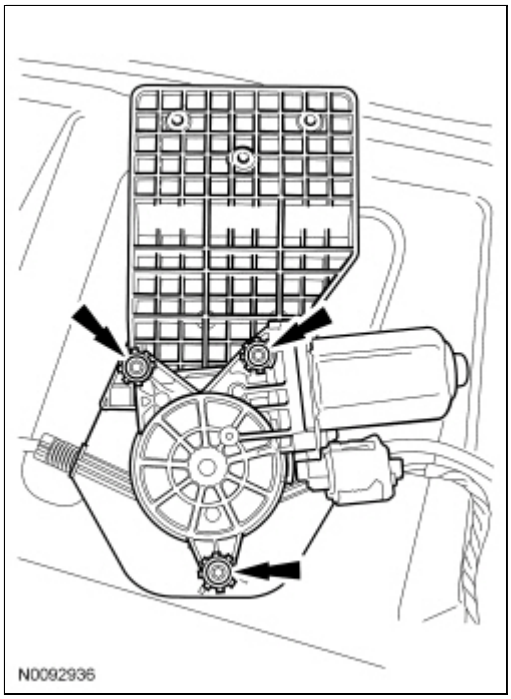
   To install, reverse the removal procedure.



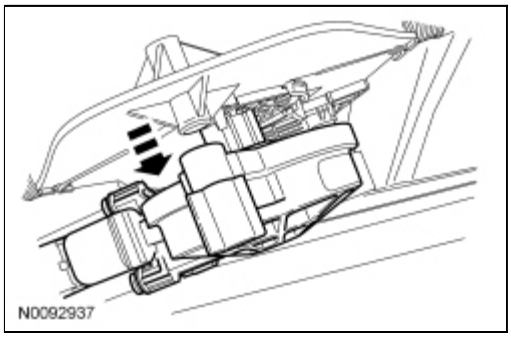
Window Regulator Motor — Rear

Removal

1. For SuperCab and SuperCrew, remove the rear corner trim panels.
   - For SuperCab, remove the B-pillar trim panels. For additional information, refer to Section 501-05 .
   - For SuperCrew, remove the C-pillar trim panels. For additional information, refer to Section 501-05 .
2. Remove the rear trim panel pin-type retainers and the rear trim panel.

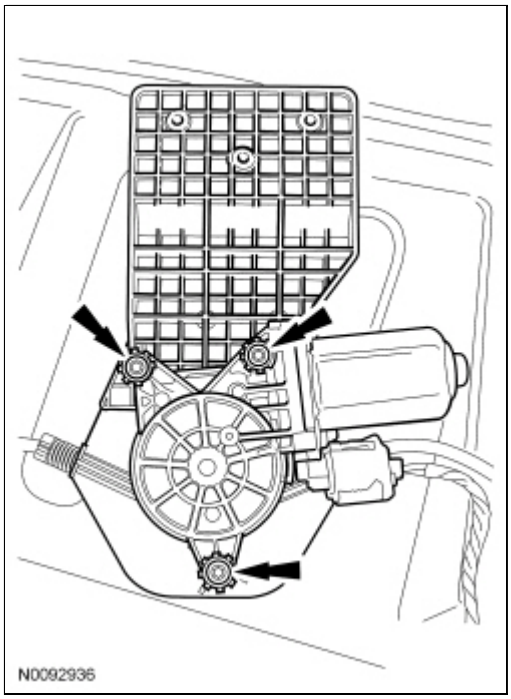


3. Disconnect the rear window glass motor electrical connector.
4. Remove the 3 rear window glass regulator and motor assembly screws.

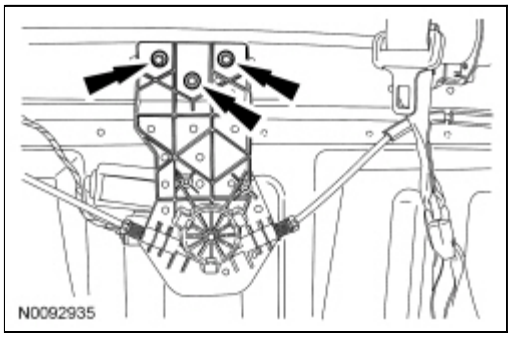


5. Carefully remove the 3 bolts attaching the steel bracket to the plastic cable housing.

repair4less

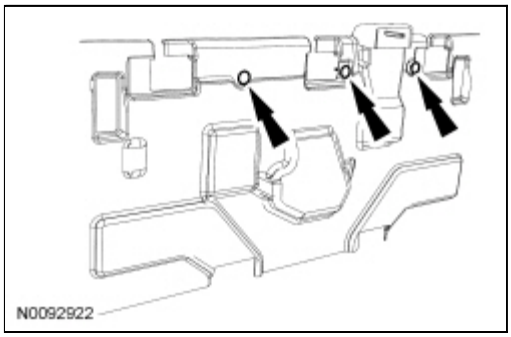


6. Hold the plastic cable housing and motor together, place a screwdriver between the drum (located in the cable housing) and the motor housing and pry the motor away from the drum, making sure the drum stays inside the plastic cable housing.



Installation

1. Align the motor gear splines onto the drum and press the motor into place, making sure there is correct alignment of the attachment bolt holes.
    - Install the 3 bolts attaching the steel bracket to the plastic cable housing.



2. Install the rear window glass regulator and motor assembly screws.
    - Tighten to 11 Nm (97 lb-in).

3. Connect the rear window glass motor electrical connector.

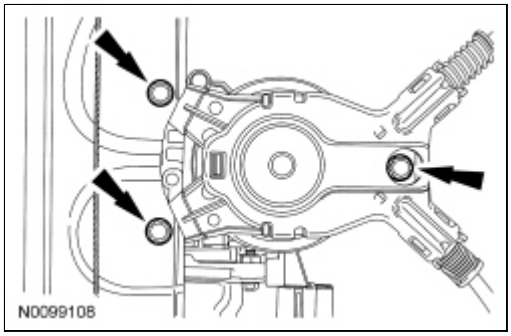
4. Install the rear trim panel and the pin-type retainers.

5. For SuperCab and SuperCrew, install the rear corner trim panels.
    - For SuperCab, install the B-pillar trim panels. For additional information, refer to Section 501-05 .

repair4less

- For SuperCrew, install the C-pillar trim panels. For additional information, refer to Section 501-05 .

Window Regulator Motor



Removal and Installation

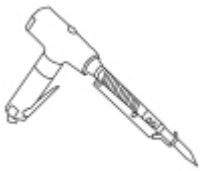
NOTE: The front window motor must be de-initialized, then initialized whenever the LH front or RH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

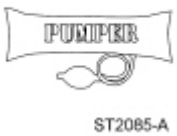
1. Remove the window regulator and motor assembly. For additional information, refer to Window Regulator and Motor — Front Door , Window Regulator and Motor — Rear Door, SuperCab or Window Regulator and Motor — Rear Door, SuperCrew in this section.

2. **NOTE:** Front door window regulator shown, all others similar.

   Remove the 3 door window-to-regulator bolts.

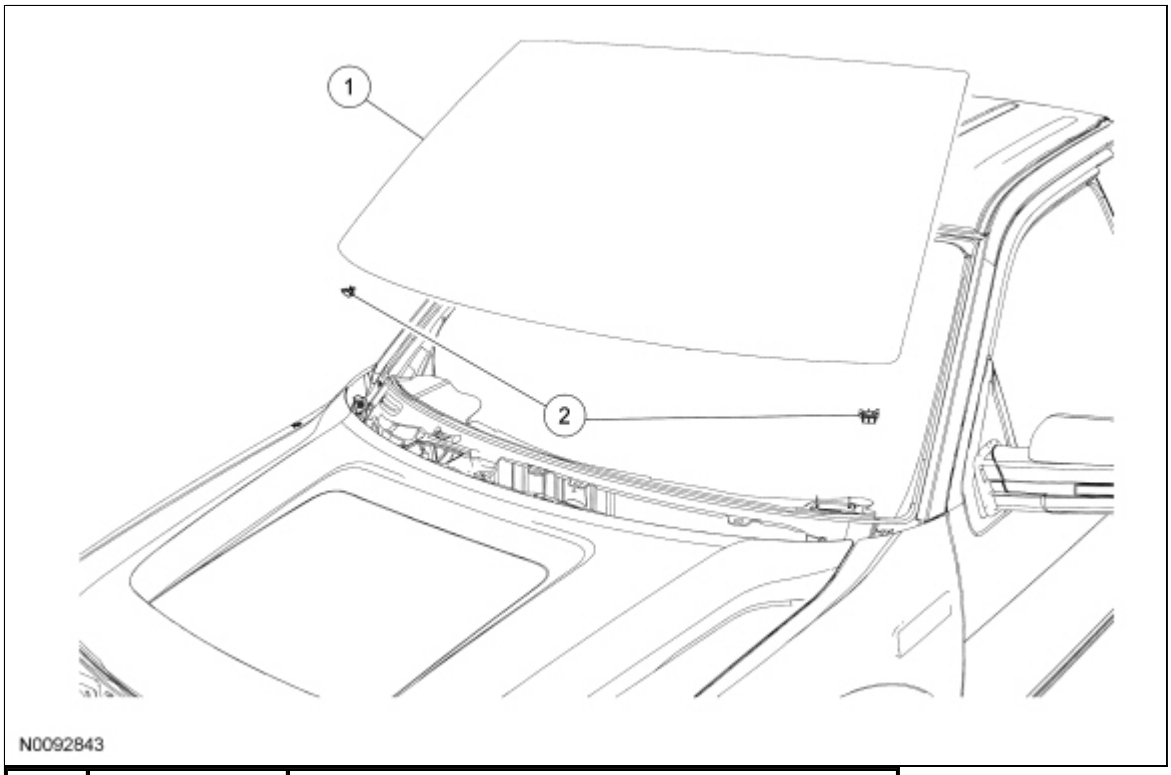




3. To install, reverse the removal procedure.
   - Initialized the front window motor. For additional information, refer to Window Motor Initialization in this section.

repair4less

Windshield Glass



Special Tool(s)

 ST3109-A	Air Caulking Gun AST405 or equivalent
 ST3274-A	Deluxe Air Windshield Knife 300-AST 1770E or equivalent
 ST2085-A	The Pumper 164-R2459 or equivalent

Material

Item	Specification
Dow Urethane Adhesive Betaseal™ Express	—
Dow Urethane One Step Glass Primer Betaprime™ 5500 / 5500A / 5500SA	—
Sika Urethane Adhesive Sika Tack ASAP	—
Sika Urethane Metal and Glass Primer Sika 206 G+P	—
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

repair4less

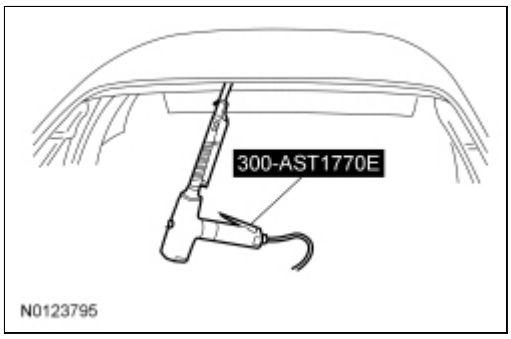
Item	Part Number	Description
1	03100	Windshield glass
2	03489	Windshield glass spacer blocks (2 required)

Removal

1. Remove the cowl panel grille. For additional information, refer to Section 501-02 .
2. If equipped, remove the overhead console or dome lamp assembly. For additional information, refer to Section 501-12 .
3. Remove the interior rear view mirror. For additional information, refer to Section 501-09 .
4. If equipped, remove the rain sensor. For additional information, refer to Section 501-16 .
5. Remove the A-pillar trim panels, sunvisors and sunvisor clips. For additional information, refer to Section 501-05 .
6. Partially lower the front portion of the headliner near the windshield upper opening and block with a suitable material.
7. **WARNING: Wear eye and ear protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

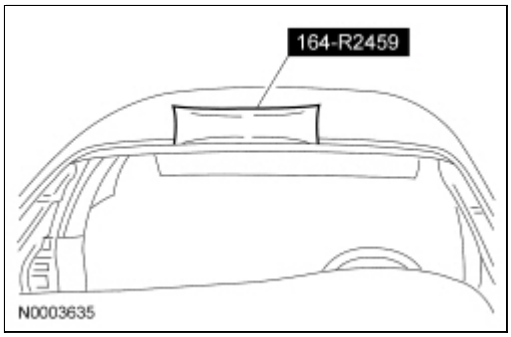
   WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

   NOTICE: **To avoid rust formation, use extreme care not to scratch the paint or primer or**



otherwise damage the pinchweld during glass removal.

NOTE: Insert the blade into the Deluxe Air Windshield Knife so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinchweld and allow a dry fit of the replacement windshield glass.



NOTE: Lubricate the urethane adhesive with water to aid the Deluxe Air Windshield Knife when cutting the urethane adhesive.

NOTE: Support the windshield glass to prevent the glass from dropping while cutting the urethane adhesive.

Working from inside the vehicle, cut the urethane adhesive using the Deluxe Air Windshield Knife starting at the top center and working toward the bottom corners then across the bottom.

8. Using The Pumper, distance the windshield glass from the body.

9. **NOTE:** Removing the windshield glass requires more than one technician.

   Using the Deluxe Air Windshield Knife, cut the remaining urethane adhesive and remove the windshield glass and place on a stable work surface.

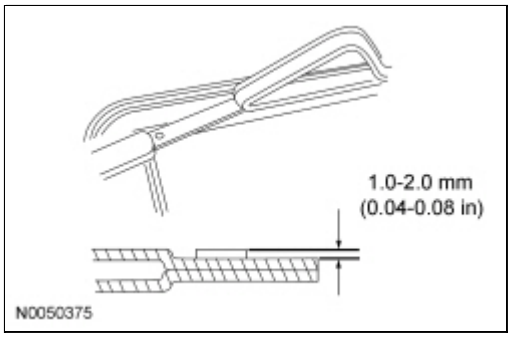
Installation

NOTE: For additional material guidelines, refer to the manufacturer's installation information.

1. Inspect the glass spacer blocks for damage. If necessary, install new spacer blocks.

2. Dry-fit the windshield glass on the existing urethane adhesive bead on the pinch weld.
   - Position the windshield glass on the pinch weld.
   - Center the glass in the opening.
   - Adjust the windshield spacer blocks as needed for best fit.

repair4less



- Make alignment marks with tape or non-staining grease pencil (preferably at the spacer blocks) on the windshield glass and the body.

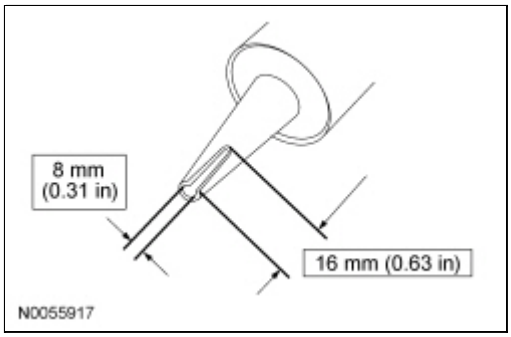
3. After the dry-fit alignment, remove the glass from the body opening and place on a stable work surface with the interior side of the glass facing upward.

4. **WARNING: Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   NOTE: Avoid scratching the pinch weld. Repair all minor scratches or exposed metal on the pinch weld following manufacturer's instructions. Use the same brand pinch weld primer, glass primer and urethane adhesive.

   Using an appropriate tool, trim the urethane adhesive leaving a 1 mm to 2 mm (0.04 in to 0.08 in) base of original equipment urethane adhesive on the pinchweld.

5. Using a clean shop towel, brush or oil-free compressed air, clean the pinch weld area around the existing urethane adhesive. Remove any foreign material or water that may have entered during glass removal.

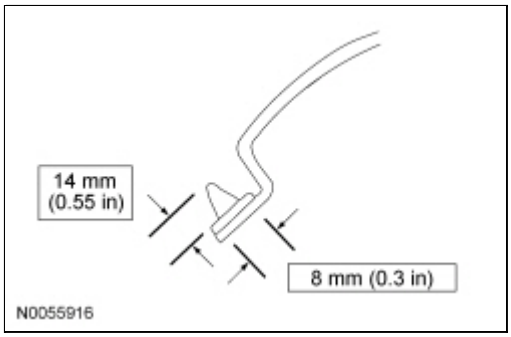


6. If reinstalling the same windshield glass, remove the remaining urethane adhesive from the windshield glass leaving a thin layer to bond with the new urethane adhesive bead.

7. Clean the inside of the windshield glass surface with glass cleaner.
   - Make sure to thoroughly clean the surface of the blackened border area where the urethane adhesive will be applied.

8. ***NOTICE:*** **Be sure to use the same brand and cure-rate products for the urethane adhesive and glass primer. Do not mix different brands of urethane adhesive and glass primer. Refer to the Material Chart in this procedure.**

   If installing a new windshield glass, apply glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.



9. Cut the urethane adhesive applicator tip to specification.

10. **NOTE:** Use either an Air Caulking Gun or a high-ratio, electric or battery-operated caulk gun that will apply the urethane adhesive with less effort and continuous bead.

    NOTE: The windshield glass must be positioned within 10 minutes of applying the urethane adhesive.

    Apply urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld, starting and ending at the bottom of the windshield near the center, making sure there are no gaps in the bead.

11. **WARNING: Improper curing of the urethane adhesive may adversely affect glass retention, which is important for restraint system performance during a crash. Carefully follow the urethane adhesive manufacturer's curing instructions. Do not drive the vehicle until the urethane adhesive seal has cured. Failure to follow these instructions may result in serious injury to vehicle occupant(s) during a crash.**

    NOTICE: **Before positioning the windshield glass, open vehicle windows to prevent the air pressure of closing doors from affecting the urethane adhesive bond.**

    Position the windshield glass on the pinch weld using the alignment marks made previously.

12. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

    After the urethane adhesive has cured, check the windshield glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

13. Position the front portion of the headliner.

14. Install the A-pillar trim panels, sunvisors and sunvisor clips. For additional information, refer to Section 501-05 .

15. If equipped, install the rain sensor. For additional information, refer to Section 501-16 .

repair4less

16. Install the interior rear view mirror. For additional information, refer to Section 501-09 .

17. If equipped, install the overhead console or dome lamp assembly. For additional information, refer to Section 501-12 .

18. Install the cowl panel grille. For additional information, refer to Section 501-02 .

Removal and Installation

Vehicles with selector lever in floor console

1. Apply the parking brake.

All vehicles

2. Position the front seats forward.

3. Remove the 2 floor console rear bolts.
   - To install, tighten to 9 Nm (80 lb-in).

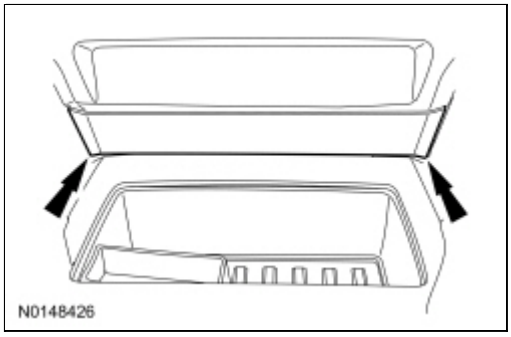
4. Position the front seats rearward.

Consoles with flow thru vents

5. Remove the LH and RH floor console lower finish panels, in the following sequence.
   1. Pull the rear section of the panels outward to release the retaining clips.
   2. Pull the panels toward the rear of the vehicle.
   3. If equipped, disconnect the ambient light connector(s).

All vehicles — except Mark LT, Platinum, Limited

6. Remove the 3 screws and storage compartment door.



Vehicles with selector lever in floor console

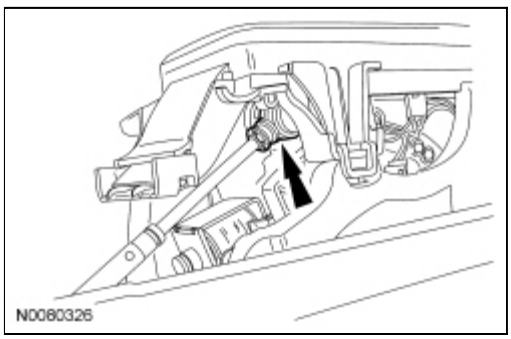
7. ***NOTICE:*** **When prying on a component, a non-marring tool must be used or damage to the component may occur.**

   Remove the instrument panel-to-floor console finish panel.
   - Using a non-marring tool, gently pry outward at the lower corners of the instrument panel-to-

repair4less

floor console finish panel to release the retaining clips.

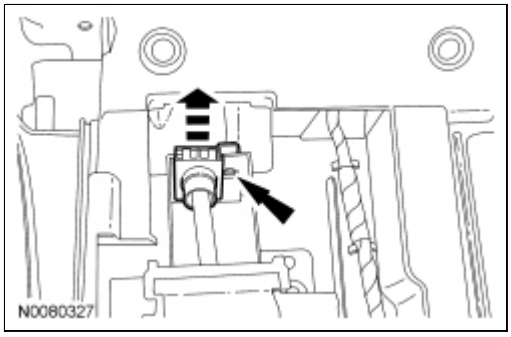
8. Remove the floor console upper finish panel.
    - Lift the floor console upper finish panel upward, at the locations indicated, to release the retaining clips.



9. Remove the selector lever trim panel.
    - Lift the selector lever trim panel upward releasing the retaining clips from the floor console.

10. Remove the 2 floor console-to-instrument panel bolts.
    - To install, tighten to 2.5 Nm (23 lb-in).

11. Remove the 2 floor console front bolts.
    - To install, tighten to 9 Nm (80 lb-in).



12. Position the floor console rearward.

13. Disconnect the selector lever cable from the selector lever assembly.

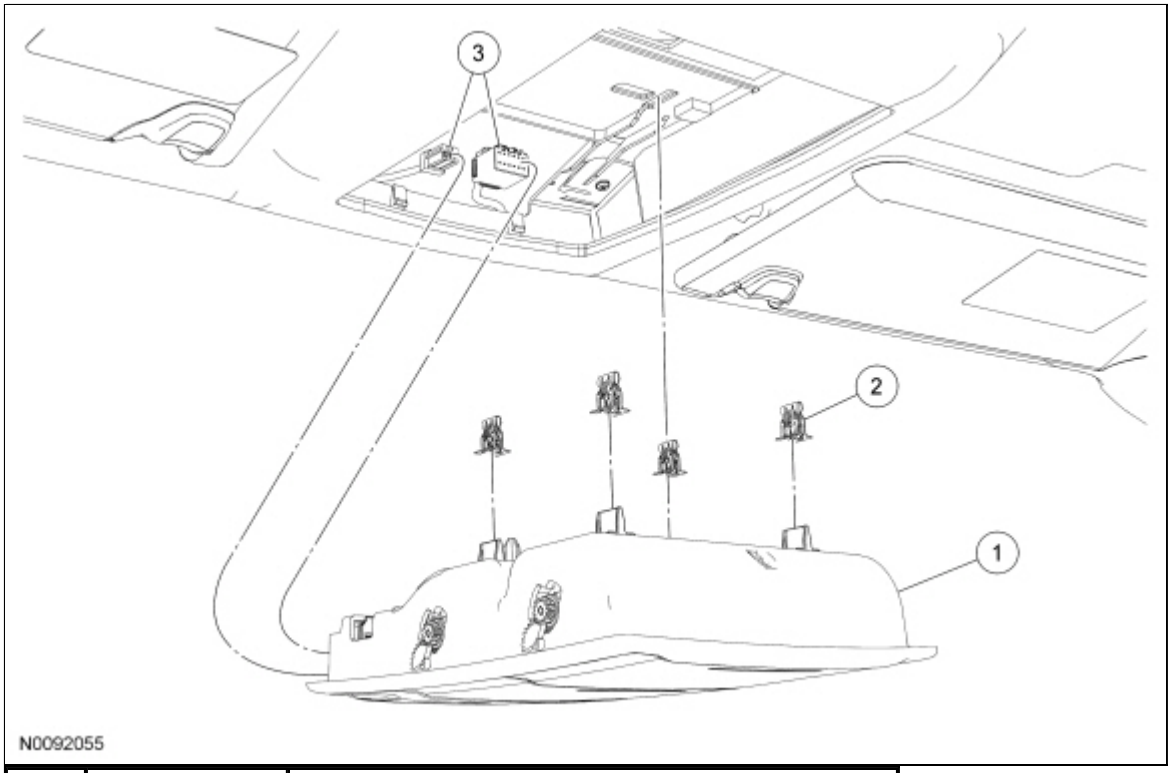
14. Release the selector lever cable retaining tab and remove the selector lever cable from the selector

lever assembly retainer.

Vehicles without selector lever in floor console

15. Remove the 4 floor console front bolts.
    - To install, tighten to 9 Nm (80 lb-in).

All vehicles

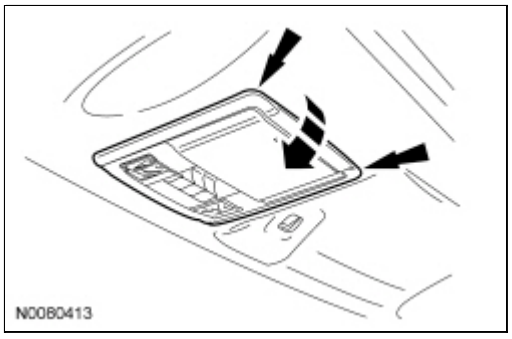


16. Disconnect the floor console electrical connector(s).

17. Remove the floor console.

18. To install, reverse the removal procedure.
    - Make sure to align the trim panel retaining clips to the adjacent retaining clip holes.

repair4less



Console — Overhead

Item	Part Number	Description
1	519A70	Overhead console
2	W705289	Overhead console retaining clip (4 required)
3	14358	Overhead console wiring harness

Removal and Installation

1. Pull the rear edge of the overhead console downward, at the locations shown, and then pull rearward.

2. Disconnect the electrical connectors.

3. Remove the overhead console.

4. To install, reverse the removal procedure.
    - Make sure to align the overhead console retaining clips to the adjacent retaining clip holes.

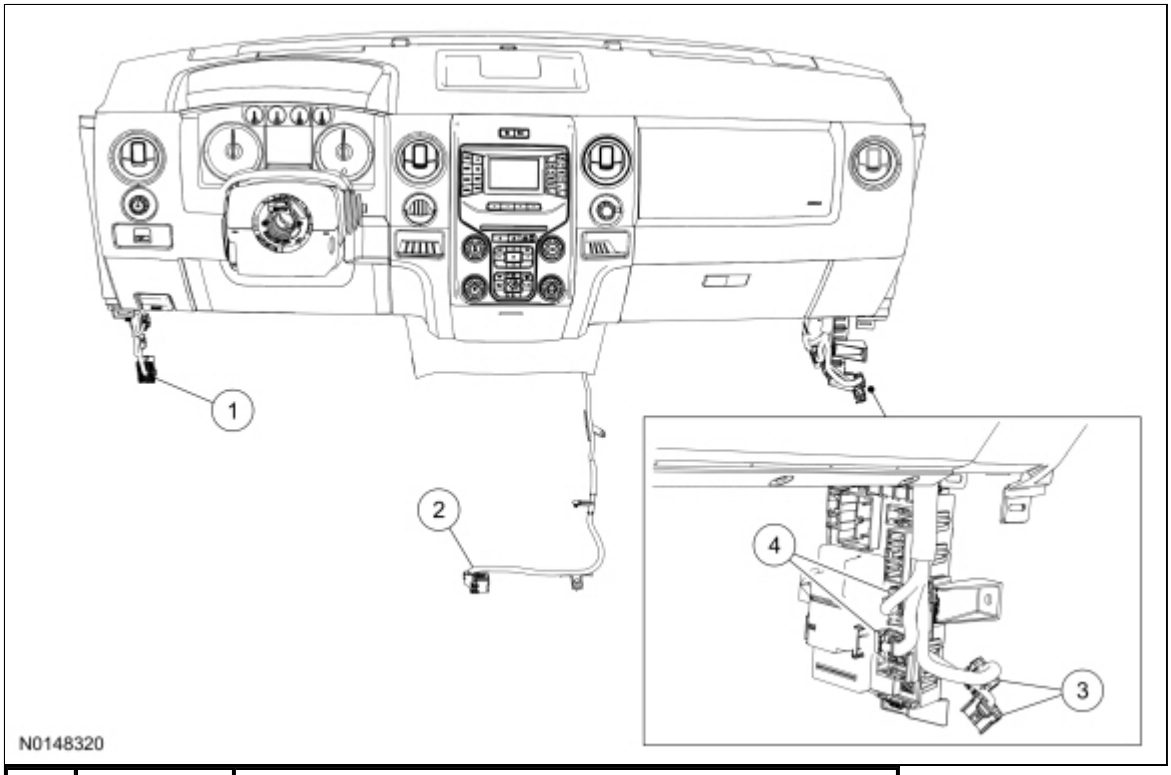
Instrument Cluster Finish Panel

Removal and Installation

1. Apply the parking brake.
2. Place the selector lever in the 1 position.
3. Position the steering wheel downward.

4. Remove the 2 instrument cluster finish panel screws and remove the instrument cluster finish panel.
    - Release the gap hider retainers.
    - Pull the instrument cluster finish panel toward the rear of the vehicle to release the retaining clips.



5. To install, reverse the removal procedure.

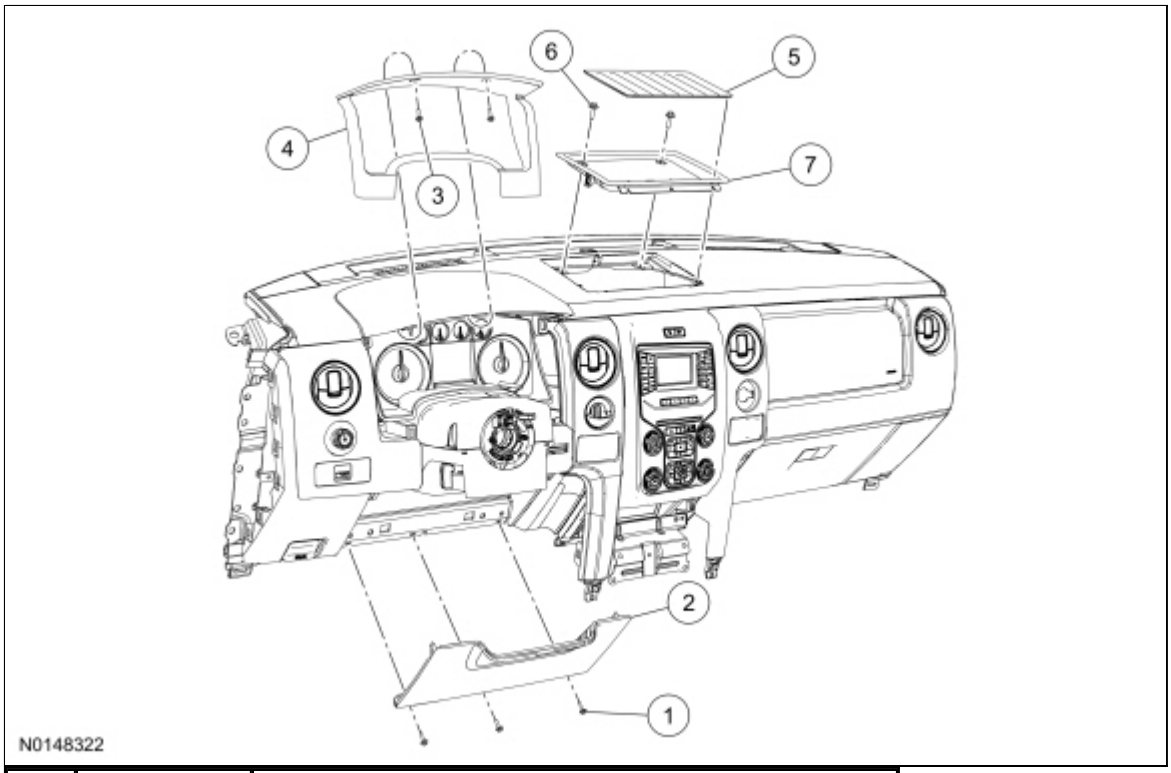
Instrument Panel Electrical Connectors

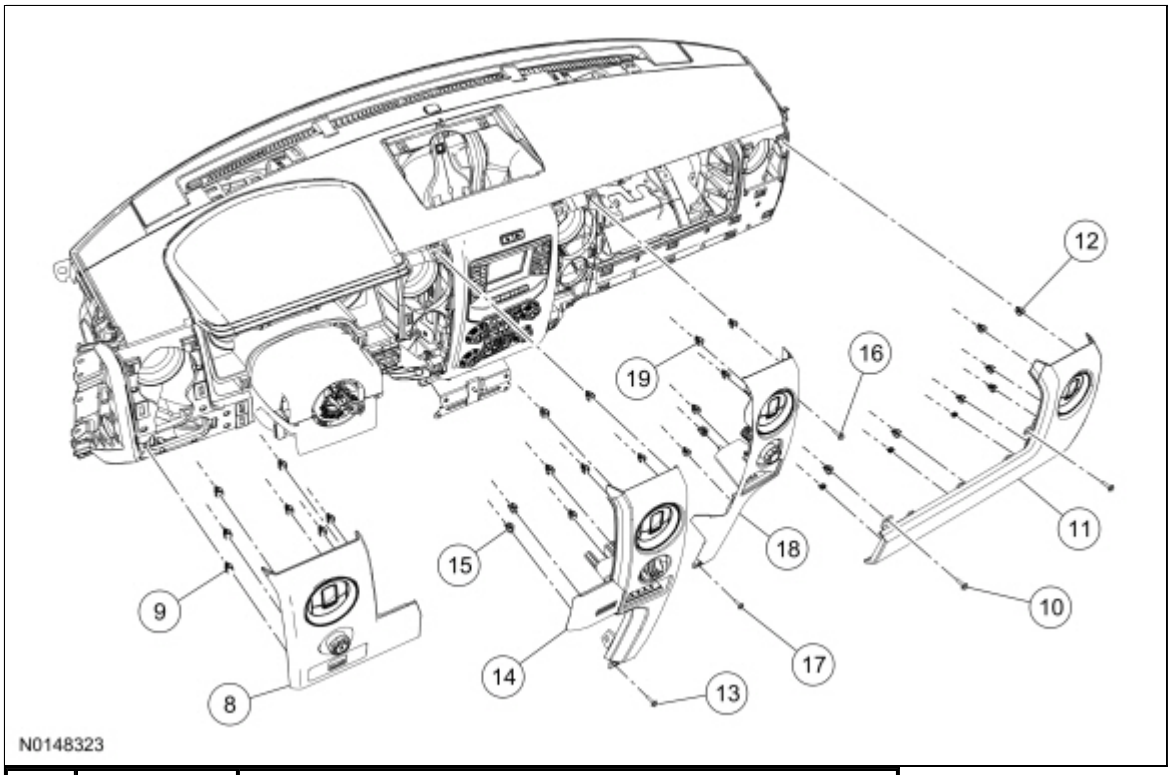
Item	Part Number	Description
1	—	LH lower cowl electrical connector (part of 14401)
2	—	Small Restraints Control Module (RCM) electrical connector (part of 14401)
3	—	RH lower cowl electrical connectors (part of 14401)
4	—	Smart Junction Box (SJB) electrical connectors (part of 14401)

Instrument Panel Fasteners



Item	Part Number	Description
1	04480 RH/ 04481 LH	Instrument panel side finish panel
2	043C54	Instrument panel upper cowl trim panel
3	N808684	Steering column shaft-to-steering column bolt
4	N807316	Center instrument panel support bracket bolt (4 required per side)
5	045F38 LH/ 045B00 RH	Center instrument panel support bracket (2 required)
6	W706426	LH instrument panel upper bolt (3 required)
7	W706426	RH instrument panel upper bolt

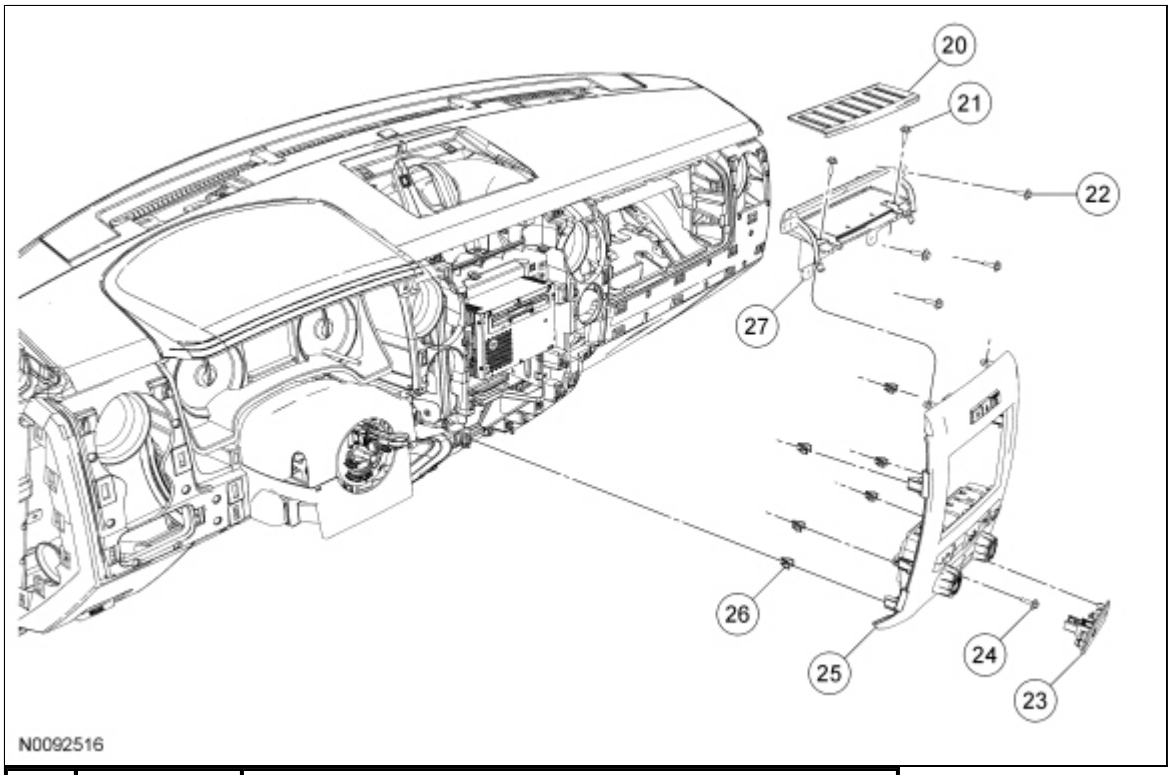
repair4less



8	W706426	LH instrument panel side bolt (3 required)
9	W706426	RH instrument panel side bolt (2 required)

Instrument Panel Finish Panels

Item	Part Number	Description
1	W707628	Steering column opening trim panel screw (3 required)
2	04459	Steering column opening trim panel
3	—	Instrument cluster finish panel screw (2 required)
4	044D70	Instrument cluster finish panel
5	045G34A	Upper storage compartment mat
6	—	Upper storage compartment screw (2 required)
7	042A82	Upper storage compartment



Instrument Panel Finish Panels (Continued)

Item	Part Number	Description
8	04338B	LH instrument panel finish panel
9	W712210	LH instrument panel finish panel retaining clip (7 required)
10	W707281	RH instrument panel finish panel screw (2 required)
11	04338A	RH instrument panel finish panel
12	W712210	RH instrument panel finish panel retaining clip (10 required)
13	W707281	LH center instrument panel finish panel bolt
14	04338D	LH center instrument panel finish panel
15	W712210	LH center instrument panel finish panel retaining clip (8 required)
16	—	RH center instrument panel finish panel upper bolt
17	W707281	RH center instrument panel finish panel lower bolt
18	04338C	RH center instrument panel finish panel
19	W712210	RH center instrument panel finish panel lower bolt retaining clip (6 required)

Instrument Panel Finish Panels (AM/FM Single CD Only)

repair4less

Item	Part Number	Description

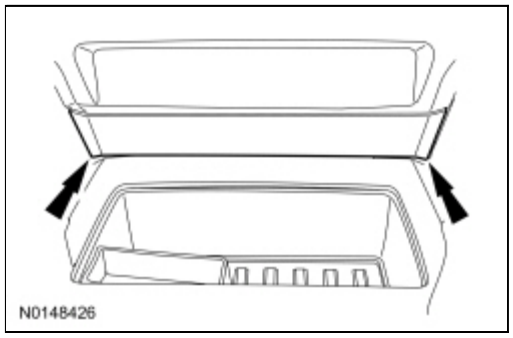
repair4less

Instrument Panel Finish Panel — Center, LH

Vehicles with flow thru floor console

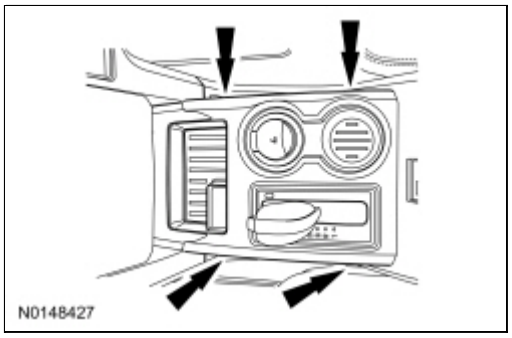
1. Apply the parking brake.

2. Position the front seats forward.



3. Remove the 2 floor console rear bolts.
   - To install, tighten to 9 Nm (80 lb-in).

4. Position the front seats rearward.



5. Remove the LH and RH floor console lower finish panels, in the following sequence.
   1. Pull the rear section of the panels outward to release the retaining clips.
   2. Pull the panels toward the rear of the vehicle.
   3. Disconnect the ambient lighting.

6. ***NOTICE:*** **When prying on a component, a non-marring tool must be used or damage to the component may occur.**

   Remove the instrument panel-to-floor console finish panel.
   - Using a non-marring tool, gently pry outward at the lower corners of the instrument panel-to-floor console finish panel to release the retaining clips.

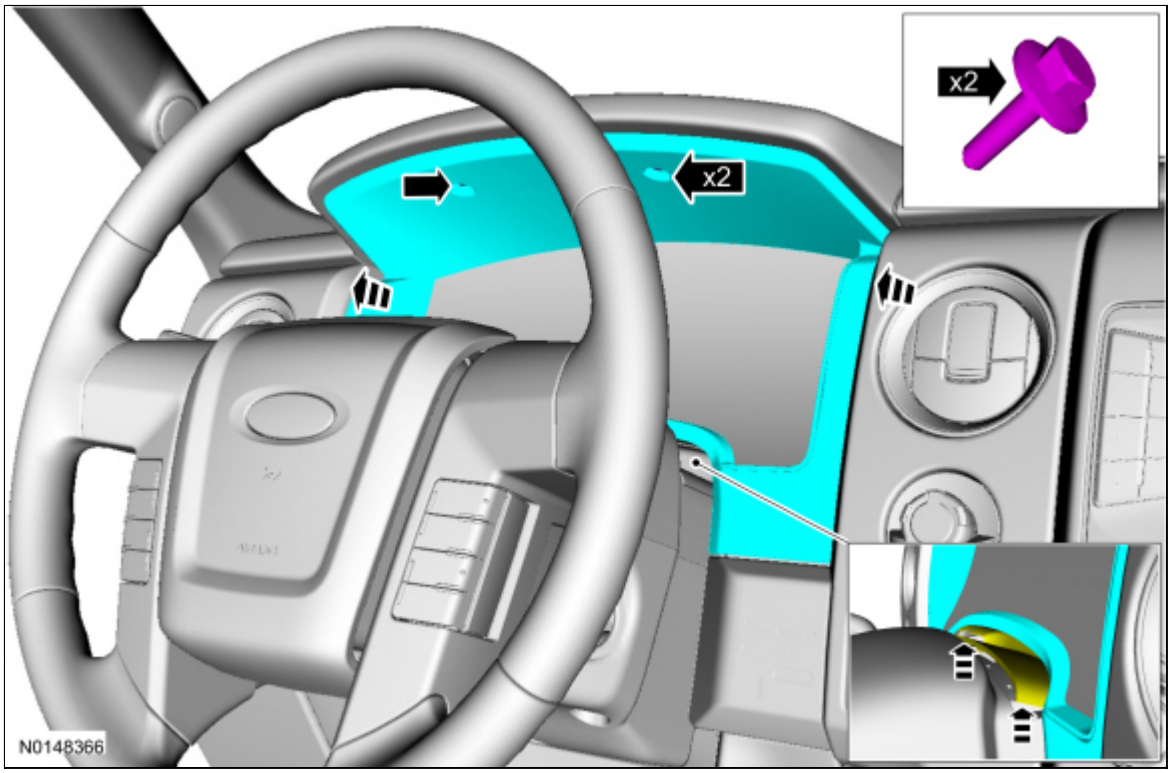
7. Remove the floor console upper finish panel.
   - Lift the floor console upper finish panel upward, at the locations indicated, to release the retaining clips.

8. Remove the selector lever trim panel.
    - Lift the selector lever trim panel upward releasing the retaining clips from the floor console.

9. Remove the 2 floor console-to-instrument panel bolts.
    - To install, tighten to 2.5 Nm (23 lb-in).

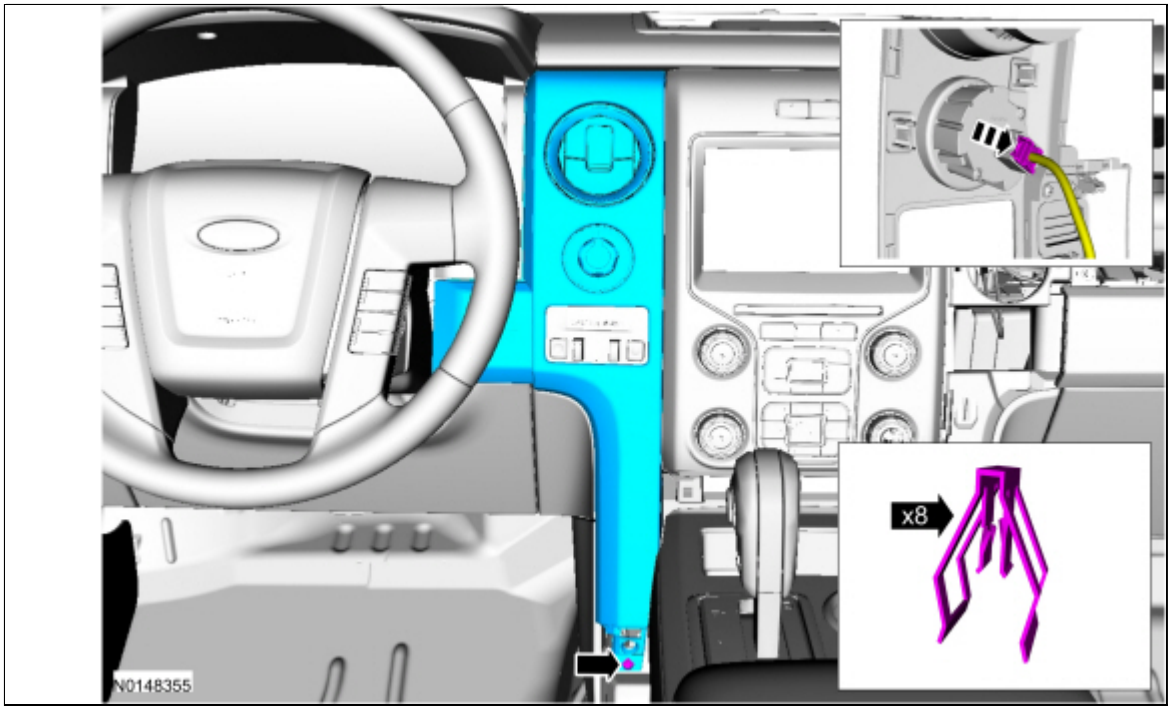
10. Remove the 2 floor console front bolts.
    - To install, tighten to 9 Nm (80 lb-in).

11. Position the floor console rearward.



Vehicles without flow thru floor console

12. Remove the lower instrument panel trim panel.



All vehicles

13. Remove the 2 instrument cluster finish panel screws and the instrument cluster finish panel.
    - Release the gap hider retainers.

repair4less

14. Remove the LH center instrument panel trim panel lower bolt and the LH center instrument panel trim panel.
    - Pull the LH center instrument panel trim panel toward the rear of the vehicle to release the retaining clips.
    - If equipped, disconnect the electrical connector.

15. To install, reverse the removal procedure.

- Make sure to align the finish panel retaining clips to the adjacent retaining clip holes.

---

repair4less

Instrument Panel Finish Panel — Center, Lower

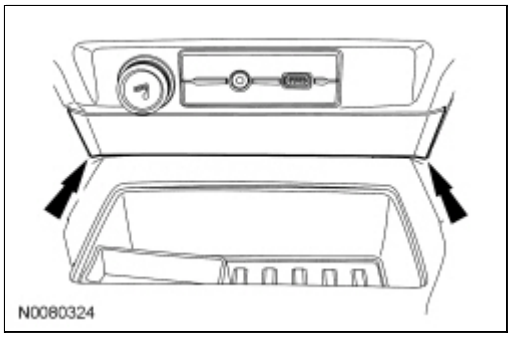
Removal and Installation

Vehicles with flow thru floor console

NOTE: This procedure applies to AM/FM, AM/FM single CD audio systems only.

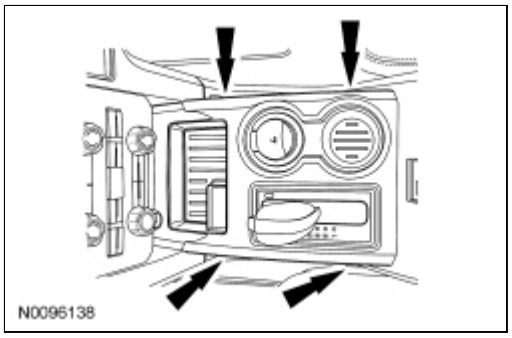
1. Apply the parking brake.

2. Position the front seats forward.



3. Remove the 2 floor console rear bolts.
   - To install, tighten to 9 Nm (80 lb-in).

4. Position the front seats rearward.



5. Remove the LH and RH floor console lower finish panels, in the following sequence.
   1. Pull the rear section of the panels outward to release the retaining clips.
   2. Pull the panels toward the rear of the vehicle.
   3. Disconnect the ambient lighting.

6. ***NOTICE:*** **When prying on a component, a non-marring tool must be used or damage to the component may occur.**

   Remove the instrument panel-to-floor console finish panel.
   - Using a non-marring tool, gently pry outward at the lower corners of the instrument panel-to-floor console finish panel to release the retaining clips.

N0080324

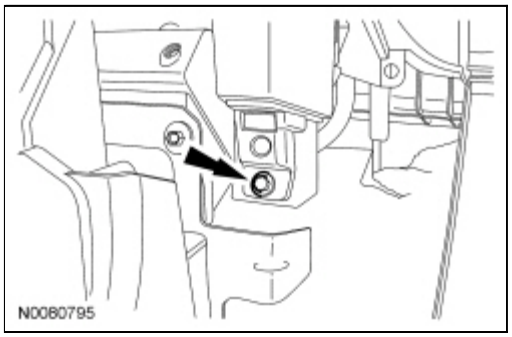
7. Remove the floor console upper finish panel.
   - Lift the floor console upper finish panel upward, at the locations indicated, to release the retaining clips.

8. Remove the selector lever trim panel.
    - Lift the selector lever trim panel upward releasing the retaining clips from the floor console.

9. Remove the 2 floor console-to-instrument panel bolts.
    - To install, tighten to 2.5 Nm (23 lb-in).

10. Remove the 2 floor console front bolts.
    - To install, tighten to 9 Nm (80 lb-in).

11. Position the floor console rearward.



Vehicles without flow thru floor console

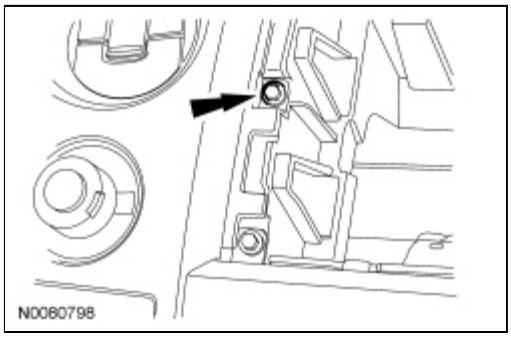
12. Remove the lower instrument panel trim panel.

All vehicles

13. **NOTE:** RH center instrument panel trim panel lower bolt is shown, LH center instrument panel trim panel lower bolt is similar.

    Remove the LH and RH center instrument panel trim panel lower bolts.

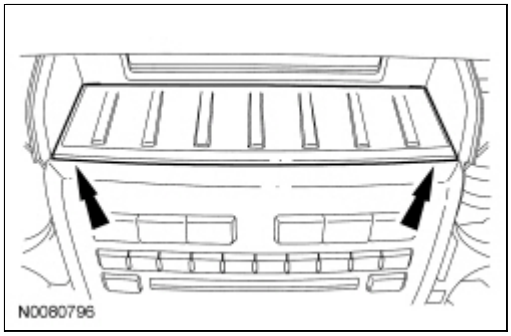
14. Remove the 2 instrument cluster finish panel screws.



15. Remove the instrument cluster finish panel.

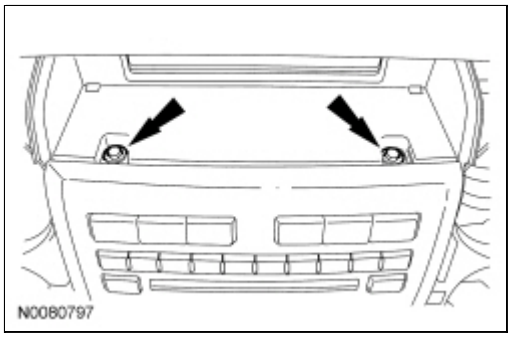
16. Remove the LH center instrument panel trim panel.
    - Pull the LH center instrument panel trim panel toward the rear of the vehicle to release the retaining clips.
    - If equipped, disconnect the electrical connector.

repair4less



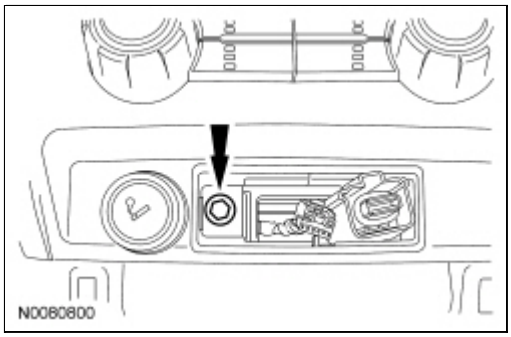
17. Remove the passenger air bag module. For additional information, refer to Section 501-20B .

18. Remove the RH center instrument panel trim panel upper bolt.



19. Remove the RH center instrument panel trim panel.
    - Pull the RH center instrument panel trim panel toward the rear of the vehicle to release the retaining clips.
    - If equipped, disconnect the electrical connector.

20. Remove the center instrument panel upper finish panel mat.



21. Remove the 2 center instrument panel lower finish panel upper screws.

22. Remove the audio input jack trim cover.
    - Using a non-marring tool, pry outward on the lower left corner of the audio input jack cover.
    - Disconnect the electrical connector(s).

23. Remove the instrument panel lower center finish panel center screw.

24. Remove the instrument panel lower center finish panel.
    - Pull the instrument panel lower finish panel toward the rear of the vehicle to release the retaining clips.
    - Disconnect the electrical connectors.

25. To install, reverse the removal procedure.
    - Make sure to align the finish panel retaining clips to the adjacent retaining clip holes.

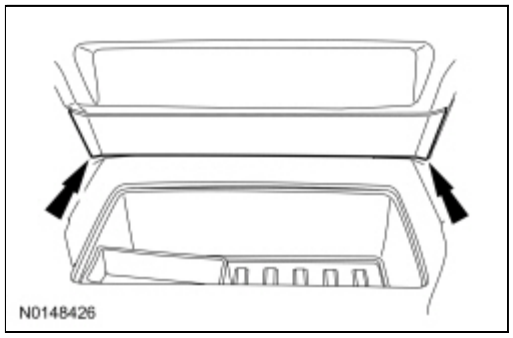
repair4less

Instrument Panel Finish Panel — Center, RH

Vehicles with flow thru floor console

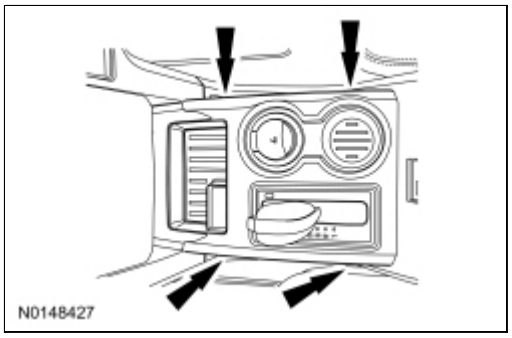
1. Apply the parking brake.

2. Position the front seats forward.



3. Remove the 2 floor console rear bolts.
   - To install, tighten to 9 Nm (80 lb-in).

4. Position the front seats rearward.



5. Remove the LH and RH floor console lower finish panels, in the following sequence.
   1. Pull the rear section of the panels outward to release the retaining clips.
   2. Pull the panels toward the rear of the vehicle.
   3. Disconnect the ambient lighting.

6. ***NOTICE:*** **When prying on a component, a non-marring tool must be used or damage to the component may occur.**

   Remove the instrument panel-to-floor console finish panel.
   - Using a non-marring tool, gently pry outward at the lower corners of the instrument panel-to-floor console finish panel to release the retaining clips.

7. Remove the floor console upper finish panel.
   - Lift the floor console upper finish panel upward, at the locations indicated, to release the retaining clips.

8. Remove the selector lever trim panel.
    - Lift the selector lever trim panel upward releasing the retaining clips from the floor console.

9. Remove the 2 floor console-to-instrument panel bolts.
    - To install, tighten to 2.5 Nm (23 lb-in).

10. Remove the 2 floor console front bolts.
    - To install, tighten to 9 Nm (80 lb-in).

11. Position the floor console rearward.

Vehicles without flow thru floor console

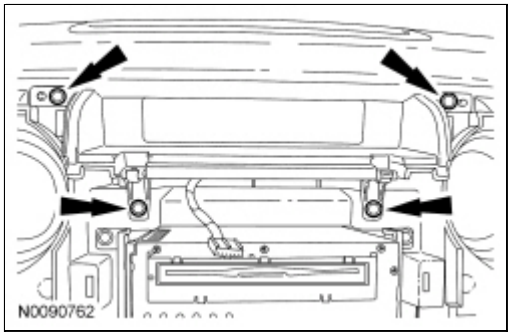
12. Remove the lower instrument panel trim panel.

All vehicles

13. Remove the passenger air bag module. For additional information, refer to Section 501-20B .

14. Remove the RH center instrument panel trim panel upper and lower bolt and the RH center instrument panel trim panel.
    - Pull the RH center instrument panel trim panel toward the rear of the vehicle to release the retaining clips.
    - If equipped, disconnect the electrical connector.

repair4less



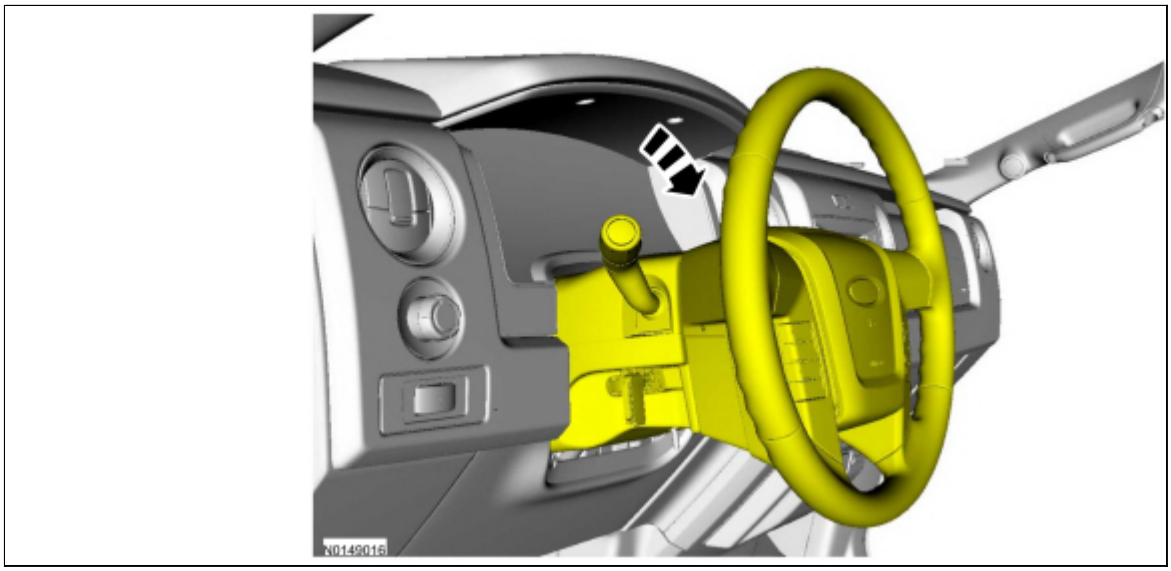
15. To install, reverse the removal procedure.
    - Make sure to align the finish panel retaining clips to the adjacent retaining clip holes.

Instrument Panel Finish Panel — Center, Upper

Removal and Installation

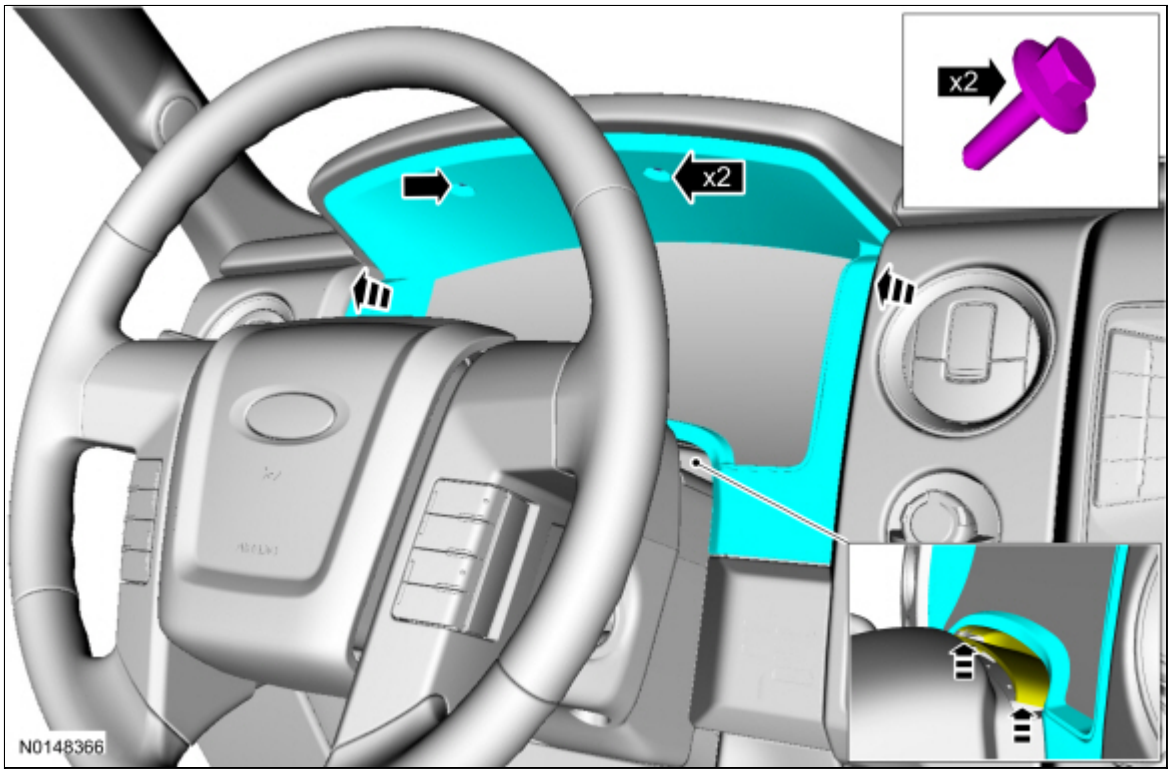
1. Remove the center instrument panel lower finish panel. For additional information, refer to Instrument Panel Finish Panel — Center, Lower in this section.

2. Remove the 4 center instrument panel upper finish panel screws.



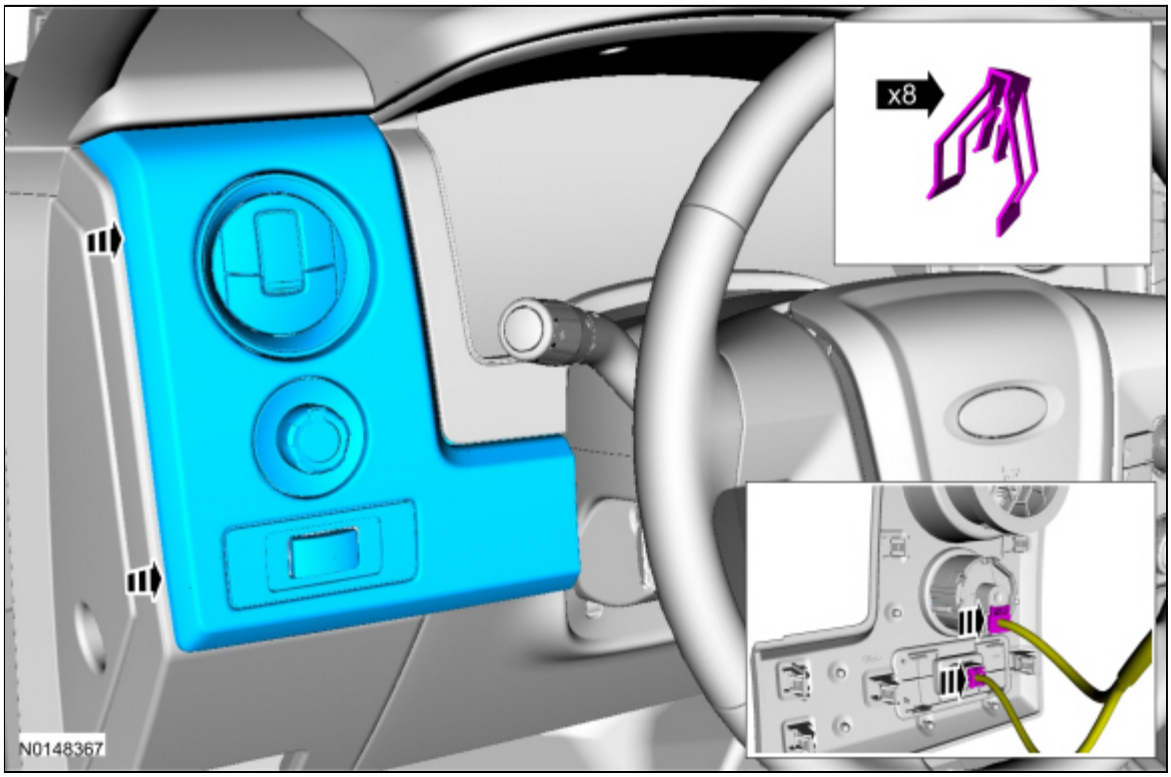
3. To install, reverse the removal procedure.

repair4less



Instrument Panel Finish Panel — LH

Removal and Installation

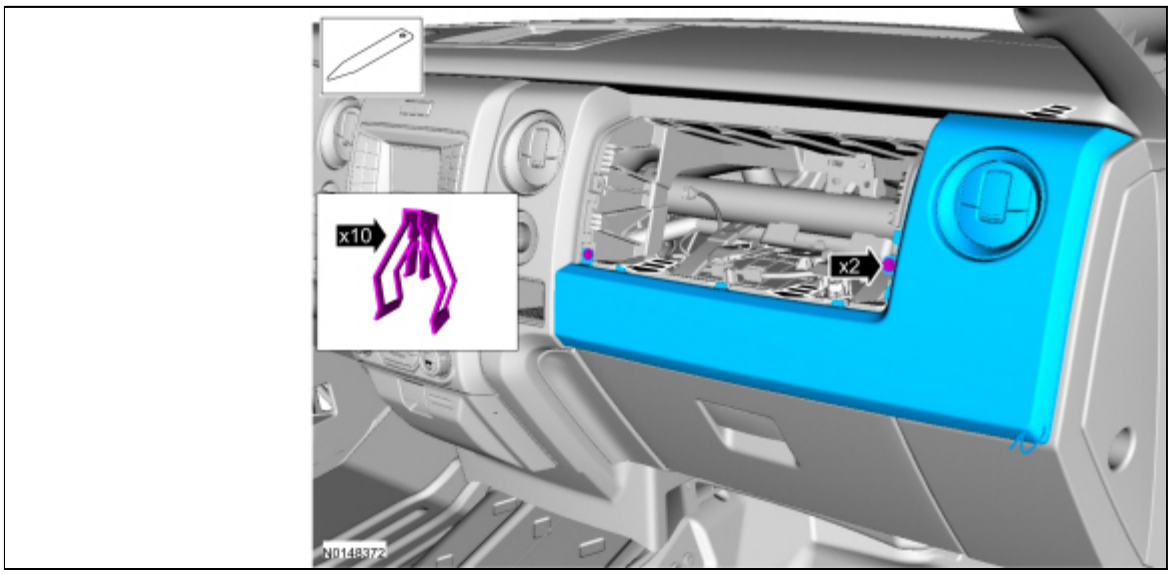


1. Position the steering wheel downward.

2. Remove the 2 instrument cluster finish panel screws and the instrument cluster finish panel.
   - Release the gap hider retainers
   - Pull the instrument cluster finish panel toward the rear of the vehicle to release the retaining clips.

3. Remove the LH instrument panel finish panel.
    - Pull the LH instrument panel finish panel toward the rear of the vehicle to release the retaining clips.
        - Disconnect the electrical connectors.

repair4less



4. To install, reverse the removal procedure.

Instrument Panel Finish Panel — RH

Removal and Installation

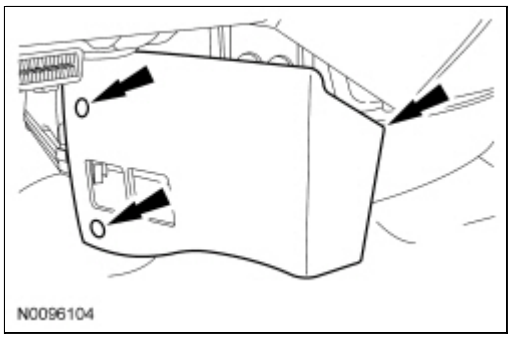
1. Remove the passenger air bag module. For additional information, refer to Section 501-20B .

2. Remove the 2 RH instrument panel finish panel screws and the RH instrument panel finish panel.
   - Pull the RH instrument panel finish panel toward the rear of the vehicle to release the retaining clips.

3. To install, reverse the removal procedure.
   - Make sure to align the finish panel retaining clips to the adjacent retaining clip holes.

repair4less

Instrument Panel



Removal

All vehicles

1. Apply the parking brake.
2. Place the selector lever in the NEUTRAL position.
3. If equipped with adjustable pedals, move the pedals to the full forward position.
4. Remove the steering wheel. For additional information, refer to Section 211-04 .
5. Remove the Instrument Cluster (IC). For additional information, refer to Section 413-01 .

Vehicles without floor console

6. Remove the valance panel and the 3 pin-type retainers.

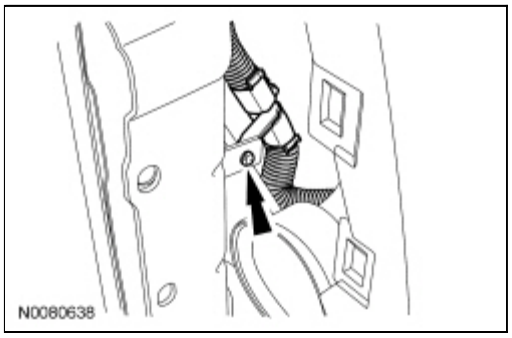
Vehicles with floor console

7. Remove the floor console. For additional information, refer to Console — Floor in this section.

Vehicles with rear footwell ducts

8. Remove the front passenger seat. For additional information, refer to Section 501-10 .

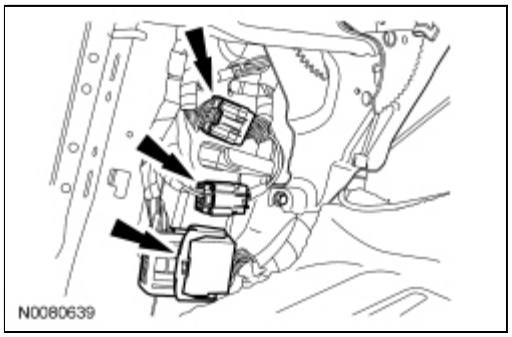
All vehicles



9. Remove the LH and RH front door scuff plate trim panels.
10. Position the LH and RH front door weatherstrip seals aside.
11. Remove the A-pillar trim panels and cowl side trim panels. For additional information, refer to Section 501-05 .
12. Remove the LH and RH instrument panel side finish panels.

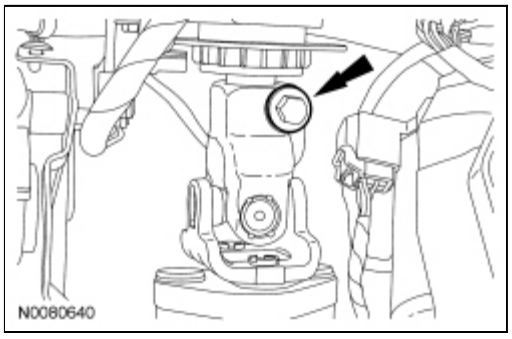
repair4less

13. Remove the LH and RH lower cowl trim panels.
    - Remove the RH lower cowl trim panel pushpin retainer.



14. Remove the parking brake release handle bolt.

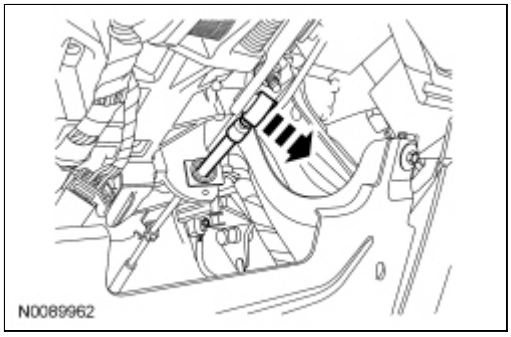
15. Detach the wire harness pin-type retainer and route the parking brake release handle through the lower instrument panel frame.



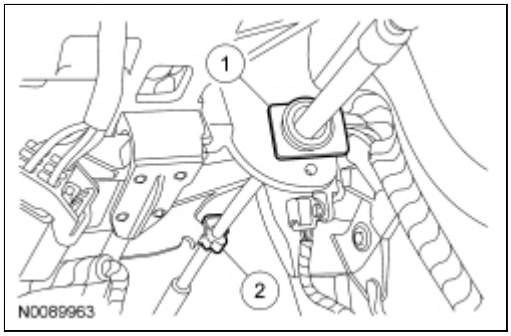
16. Remove the hood release handle bolt and position aside the hood release handle.

17. Disconnect the 3 electrical connectors at the LH lower cowl.

18. Detach the wire harness pin-type retainer at the LH lower cowl.



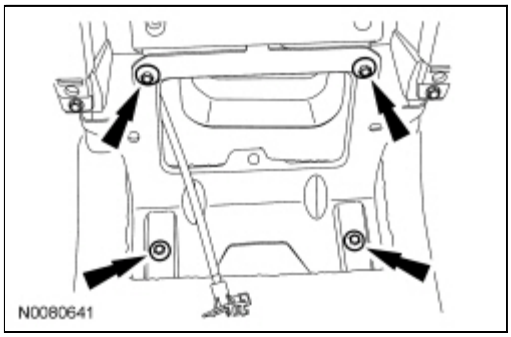
19. Remove and discard the steering column shaft-to-steering column bolt.



20. Separate the steering column shaft from the steering column.

Vehicles with column shift

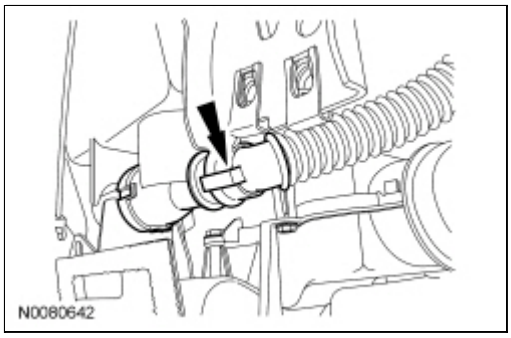
21. Disconnect the steering column selector lever cable from the selector lever.



22. Position aside the steering column selector lever cable in the following sequence.
    1. Remove the selector lever cable from the bracket.
    2. Remove the selector lever cable pin-type retainer and position aside the steering column selector lever cable.

If equipped with a floor console

23. Remove the 4 center instrument panel support bracket bolts and remove the center instrument panel support bracket.



All vehicles

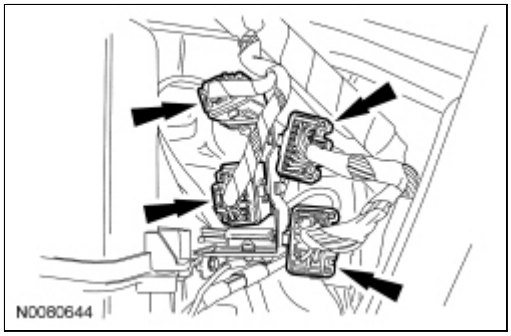
24. Position aside the LH footwell carpet, remove the 4 LH center instrument panel support bracket bolts.

25. Remove the LH center instrument panel support bracket.

26. If equipped, disconnect the in-vehicle temperature sensor hose.

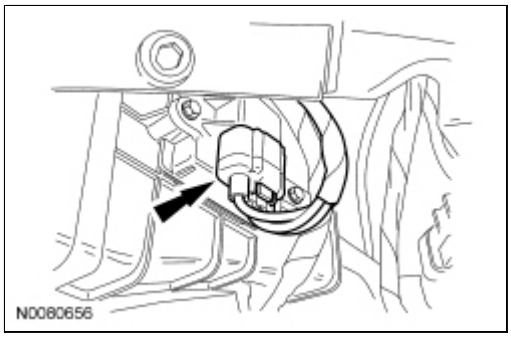
repair4less

27. Detach the wire harness pin-type retainer located on the RH center instrument panel support bracket.



28. Position aside the RH footwell carpet and remove the 4 RH center instrument panel support bracket bolts.

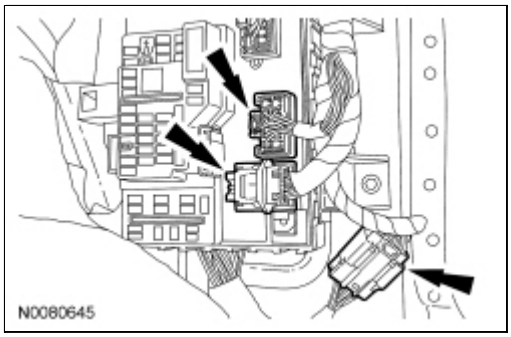
29. Remove the RH center instrument panel support bracket.



30. Fully lower the glove compartment door in the following sequence.
    1. Open the glove compartment door.
    2. Depress the 2 glove compartment door tabs inward and fully lower the glove compartment door.

31. Disconnect the radio antenna and if equipped, the satellite antenna.

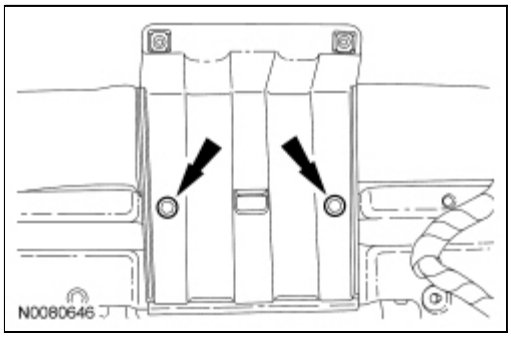
32. Disconnect the 4 electrical connectors located on the HVAC housing.



33. Disconnect the blower motor speed controller electrical connector.

34. Fully close the glove compartment door in the following sequence.
    1. Lift the glove compartment door upward.
    2. Depress the 2 glove compartment door tabs inward and fully close the glove compartment

door.



35. Disconnect the electrical connector at the RH lower cowl and the 2 Smart Junction Box (SJB) electrical connectors.

36. Detach the 2 wire harness pin-type retainers from the SJB .

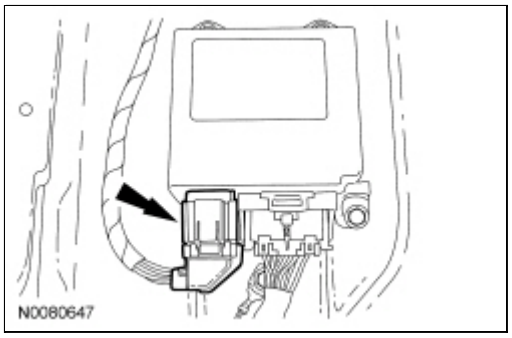
37. Remove the LH and RH instrument panel upper cowl trim panels.

38. Remove the 2 screws from the instrument panel reinforcement bracket located in the IC opening.

39. Pull the instrument panel reinforcement bracket toward the rear of the vehicle.

40. Remove the 3 LH instrument panel upper bolts.

41. Remove the RH instrument panel upper bolt.

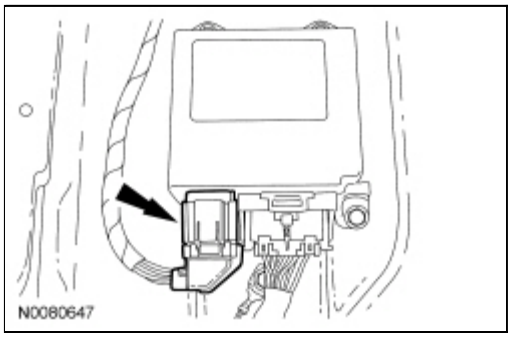


42. Remove the Digital Signal Processing (DSP) module, if equipped with a Sony® sound system. For additional information, refer to Section 415-00E .

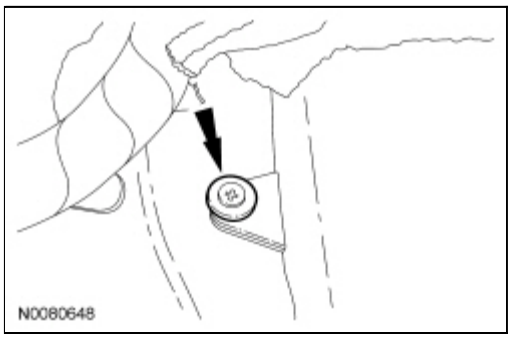
Vehicles with 20 percent front seat

43. Remove the cushion tray in the following sequence.
    1. Raise the 20 percent front seat cushion.
    2. Remove the 2 pushpins and lift the rear edge of the cushion tray upward to release the retainers.
    3. Pull the cushion tray rearward to unhook the front edge of the cushion tray from the seat frame.
    4. Lift upward to remove the cushion tray.

44. Lift the small carpet flap and disconnect the small Restraints Control Module (RCM) connector.



repair4less



45. Remove the RCM wire harness scrivet from under the small carpet flap.
46. Pull back the front footwell area of the passenger side carpet to gain access to the RCM wire harness.
47. Remove the RCM wire harness scrivet and detach the RCM wire harness pin-type retainer.
48. Pull the RCM wire harness out from under the 20 percent front seat bracket and the carpet.

Vehicles with a floor console

49. Lift the small carpet flap and disconnect the small RCM electrical connector.

50. Remove the wire harness scrivet from under the small carpet flap.
51. Pull back the front footwell area of the passenger side carpet to gain access to the RCM wire harness.
52. If equipped, remove the passenger floor duct pushpin retainer.

53. If equipped, position the passenger floor duct above the carpet.

54. Detach the RCM wire harness pin-type retainer.

55. Pull the RCM wire harness under the floor console mounting bracket.

56. If equipped, lift the passenger floor duct upward and detach the wire harness pin-type retainer.

57. If equipped, pull the wire harness under the passenger floor duct.

All vehicles

58. ***NOTICE:*** **To avoid damage to the instrument panel, an assistant is required to support the panel before carrying out this step.**

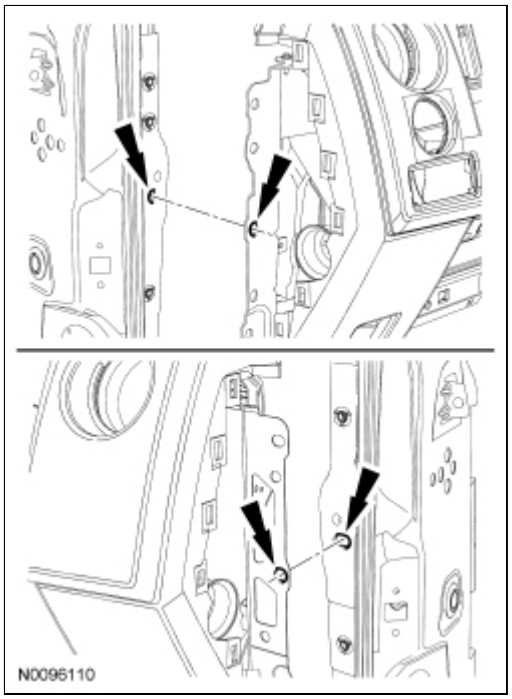
    Remove the LH and RH instrument panel side bolts.

59. ***NOTICE:*** **To avoid damage to the instrument panel, an assistant is required when carrying out this step.**

    NOTICE: **To avoid damage to the wire harness, make sure that all electrical wiring and connectors are not caught up on other components.**

    Remove the instrument panel form the vehicle.
    - Transfer parts as needed.

Installation



All vehicles

1. ***NOTICE:*** **To avoid damage to the instrument panel, an assistant is required when carrying out this step.**

   NOTICE: **To avoid damage to the wire harness, make sure that all electrical wiring and connectors are routed correctly.**

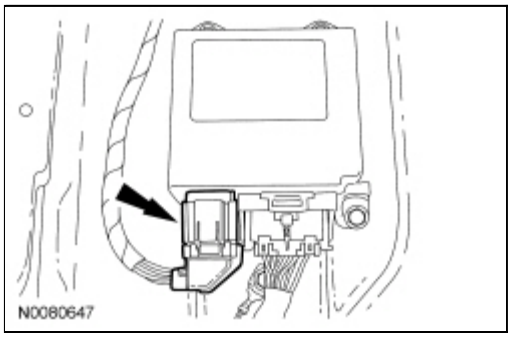
   Install the instrument panel into the vehicle and using a tapered punch or suitable tool, center the instrument panel.
   - Install the LH and RH instrument panel side bolts.
     - Tighten to 30 Nm (22 lb-ft).

repair4less

2. Install the LH and RH instrument panel upper bolts.
    - Tighten to 30 Nm (22 lb-ft).

3. Install the LH and RH instrument panel upper trim panels.

Vehicles with a floor console



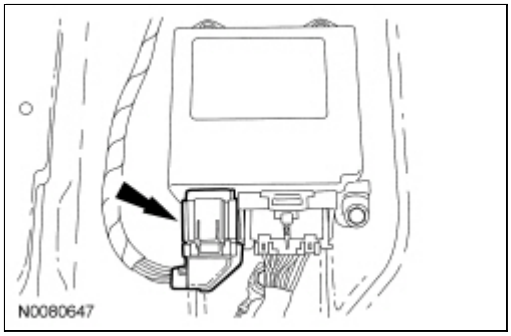
4. If equipped, lift the passenger floor duct upward and route the RCM wire harness under the passenger floor duct.

5. Install the 2 RCM wire harness pin-type retainers.

6. Route the RCM wire harness under the carpet and the floor console mounting bracket.

7. Install the front footwell area of the passenger side carpet.

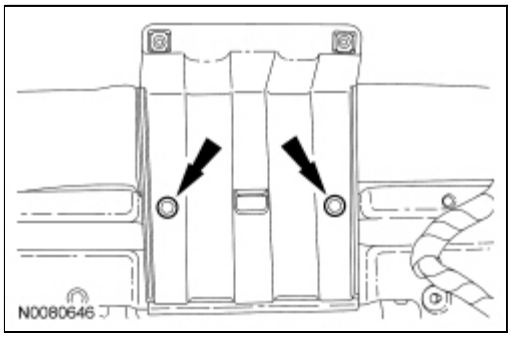
8. Lift the small carpet flap and connect the small RCM electrical connector.



9. Attach the RCM wire harness scrivet.

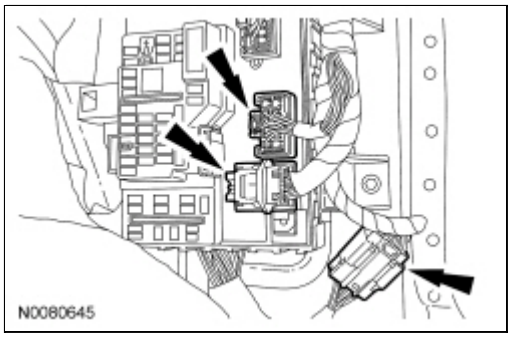
10. Install the small carpet flap.

Vehicles with 20 percent front seat



11. Route the RCM wire harness under the carpet and the 20 percent front seat bracket.
12. Install the RCM wire harness scrivet and attach the RCM wire harness pin-type retainer.
13. Install the front footwell area of the passenger side carpet.
14. Lift the small carpet flap and connect the small RCM connector.

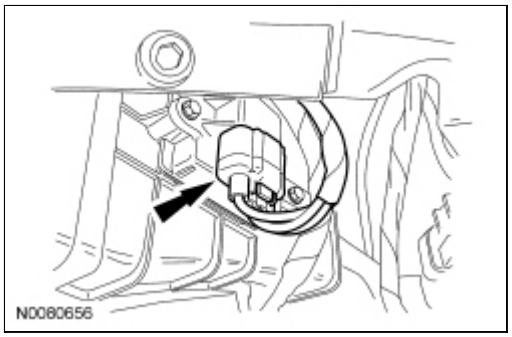
15. Install the RCM wire harness scrivet.
16. Install the small carpet flap.
17. Install the cushion tray in the following sequence.
    1. Install the cushion tray on to the seat frame.
    2. Install the 2 pushpins.
    3. Lower the 20 percent front seat cushion.



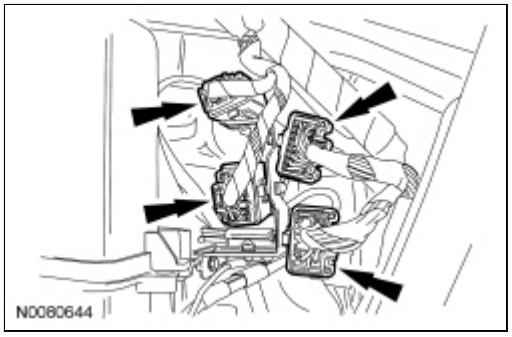
All vehicles

18. Install the DSP module, if equipped with a Sony® sound system. For additional information, refer to Section 415-00E .
19. Lift the instrument panel reinforcement bracket upward.
20. Install and tighten the 2 instrument panel reinforcement bracket screws.

21. Connect the electrical connector at the RH lower cowl and the 2 SJB electrical connectors.

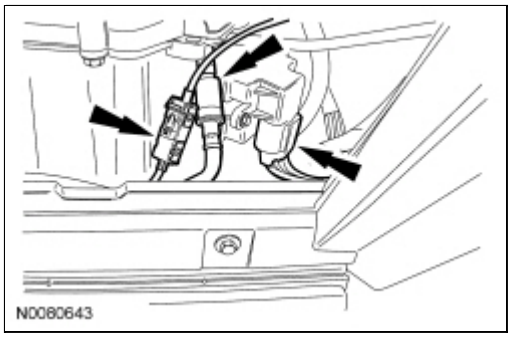


repair4less



22. Attach the 2 wire harness pin-type retainers onto the SJB .

23. Fully lower the glove compartment door in the following sequence.
    1. Open the glove compartment door.
    2. Depress the 2 glove compartment door tabs inward and fully lower the glove compartment door.

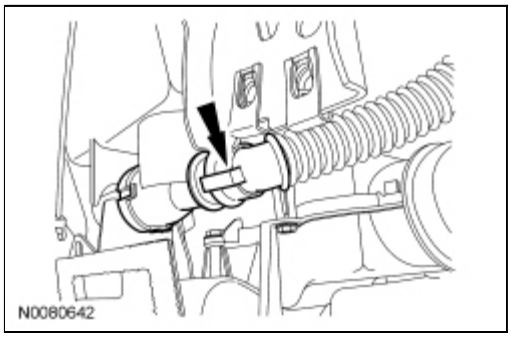


24. Connect the blower motor speed controller electrical connector.

25. Connect the 4 electrical connectors located on the HVAC housing.

26. Connect the radio antenna and if equipped, the satellite antenna.

27. Fully close the glove compartment door in the following sequence.
    1. Lift the glove compartment door upward.
    2. Depress the 2 glove compartment door tabs inward and fully close the glove compartment door.



28. Position aside the RH footwell carpet and install the RH center instrument panel support bracket.

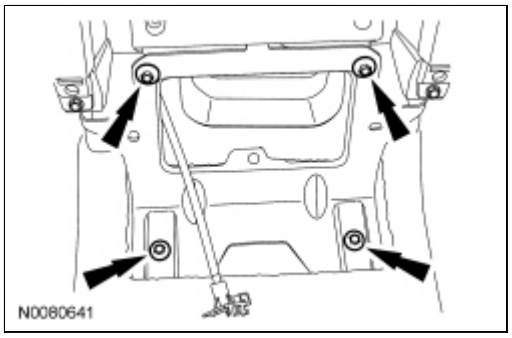
29. Install the 4 RH center instrument panel support bracket bolts.
    - Tighten to 9 Nm (80 lb-in).

30. Attach the wire harness pin-type retainer onto the RH center instrument panel support bracket.

31. Install the RH footwell carpet.

32. If equipped, connect the in-vehicle temperature sensor hose.

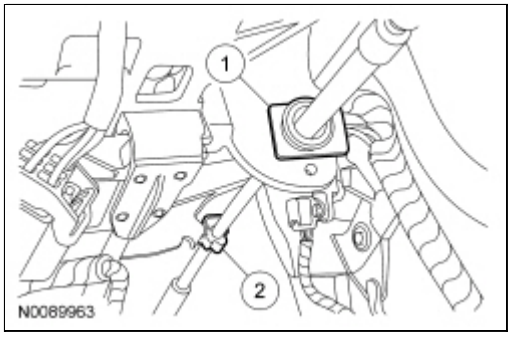
33. Position aside the LH footwell carpet and install the LH center instrument panel support bracket.



34. Install the 4 LH center instrument panel support bracket bolts.
    - Tighten to 9 Nm (80 lb-in).

35. Install the LH footwell carpet.

If equipped with a floor console

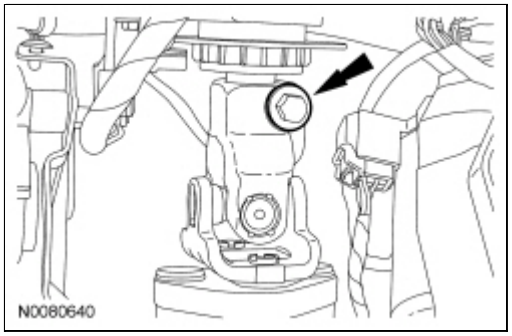


36. Install the center instrument panel support bracket and the 4 center instrument panel support bracket bolts.
    - Tighten to 9 Nm (80 lb-in).

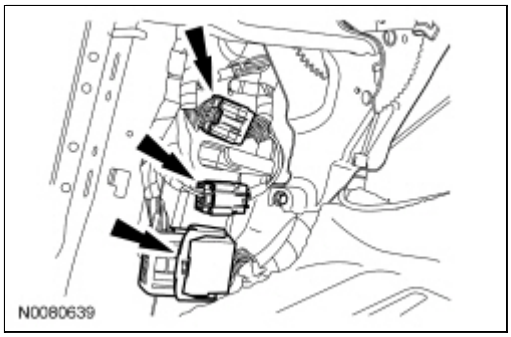
repair4less

Vehicles with column shift

37. Install the selector lever cable in the following sequence.
    1. Install the selector lever cable onto the bracket.
    2. Install the selector lever cable pin-type retainer.



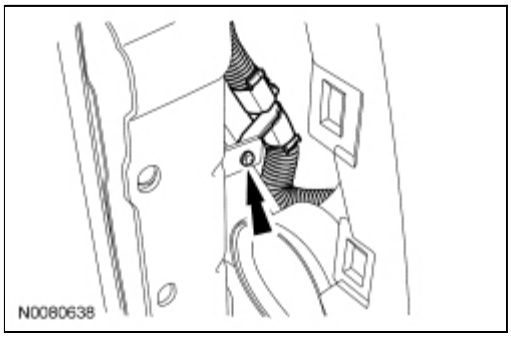
38. Connect the selector lever cable onto the selector lever.



All vehicles

39. Connect the steering column shaft to the steering column.

40. Install a new steering column shaft-to-steering column bolt.
    - Tighten to 30 Nm (22 lb-ft).



41. Connect the 3 electrical connectors and attach the wire harness pin-type retainer at the LH lower cowl.

42. Install the hood release handle and the hood release handle bolt.
    - Tighten to 9 Nm (80 lb-in).

43. Route the parking brake release handle through the lower instrument panel frame and attach the wire harness pin-type retainer.

44. Install the parking brake release handle bolt.

45. Install the LH and RH lower cowl trim panels.
    - Install the RH lower cowl trim panel pushpin retainer.

46. Install the LH and RH instrument panel side finish panels.

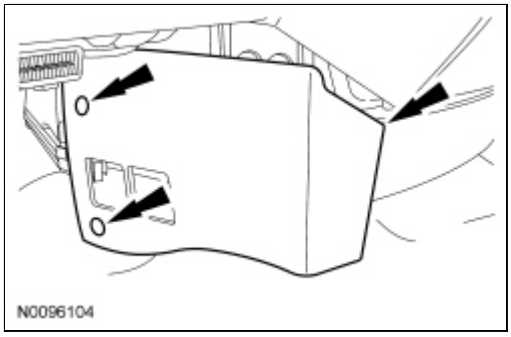
47. Install the A-pillar trim panels and cowl side trim panels. For additional information, refer to Section 501-05 .

48. Install the LH and RH front door weatherstrip seals.

49. Install the LH and RH front door scuff plate trim panels.

Vehicles with rear footwell ducts

50. Install the front passenger seat. For additional information, refer to Section 501-10 .



Vehicles with floor console

51. If equipped, install the floor console. For additional information, refer to Console — Floor in this section.

Vehicles without floor console

repair4less

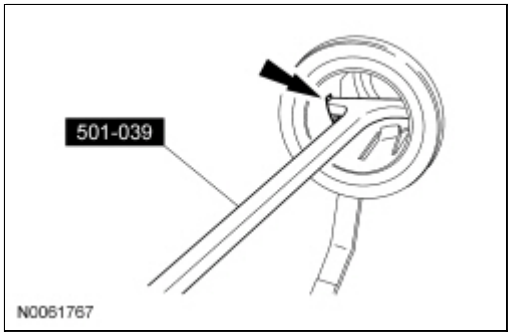
52. Install the valance panel and the 3 pin-type retainers.

All vehicles

53. Install the IC . For additional information, refer to Section 413-01 .

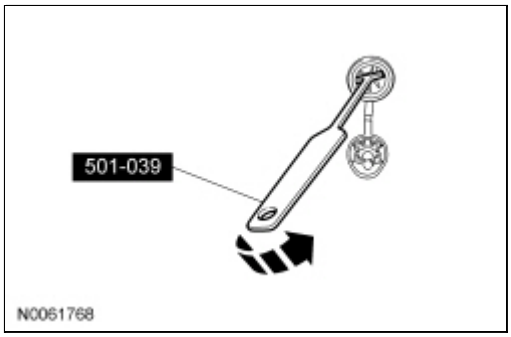
54. Install the steering wheel. For additional information, refer to Section 211-04 .

Power Point



Special Tool(s)

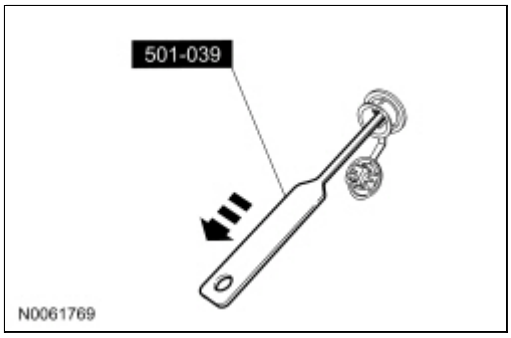
 ST3024-A	Remover, Power Point Socket 501-039 or equivalent



Removal

NOTE: Power point cover may differ depending on location.

1. Open the power point cover.
2. Install the Power Point Socket Remover in one of the power point socket slots.



3. Position the Power Point Socket Remover so that it engages in the adjacent slot.

4. Using the Power Point Socket Remover, pull the power point socket out of the retainer.

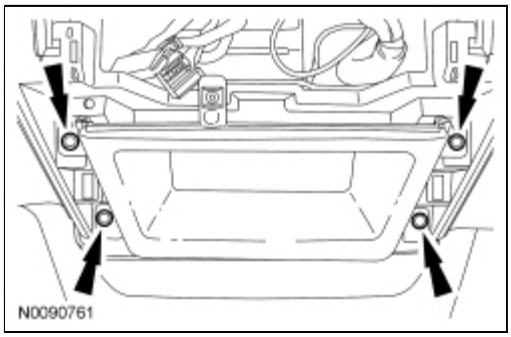
repair4less

5. Disconnect the electrical connector.

Installation

1. Connect the electrical connector.
2. Slide the power point socket into the retainer.

Storage Compartment — Lower

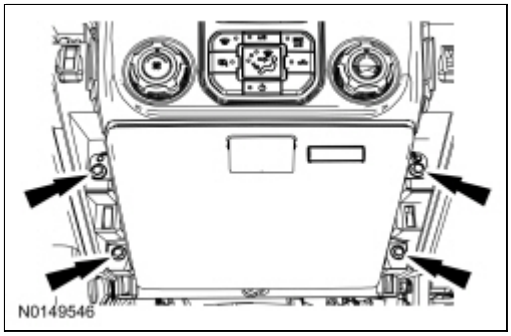


Removal and Installation

All vehicles

1. Remove the lower instrument panel center finish panel. For additional information, refer to Instrument Panel Finish Panel — Center, Lower in this section.

Vehicles equipped with a storage compartment



2. Remove the 4 instrument panel lower storage compartment screws.

3. Remove the instrument panel lower storage compartment.

Vehicles equipped with an media bin

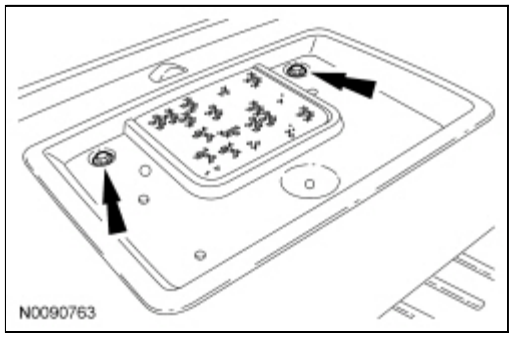
4. Remove the 4 media bin screws.

5. Remove the media bin.

All vehicles

6. To install, reverse the removal procedure.

repair4less



Storage Compartment — Upper

Removal and Installation

1. Remove the instrument panel upper storage compartment mat.

2. **NOTE:** Instrument panel upper storage compartment with speaker shown, instrument panel upper storage compartment without speaker similar.

   Remove the 2 instrument panel upper storage compartment screws.

3. Remove the instrument panel upper storage compartment in the following sequence.
   1. Lift upward on the front edge of the instrument panel upper storage compartment.
   2. Pull the instrument panel upper storage compartment toward the front of the vehicle.
   3. If equipped, disconnect the electrical connector.

4. To install, reverse the removal procedure.

repair4less

Handles, Locks, Latches and Entry Systems

Hood Latch

The hood latch system consists of the following components:

- Hood latch
- Primary hood latch release handle and cable
- Secondary hood latch release handle and cable

Front Door

The front door entry system consists of the following components:

- Door ajar switch (part of the front door latch)
- Door lock cylinder
- Exterior front door handle
- Front door latch
- Front door lock actuator (part of the front door latch)
- Interior door handle actuating cable
- Interior door handle

Rear Door, SuperCab

The SuperCab rear door latch system consists of the following components:

- Interior door handle
- Lower rear door latch and cable
- Upper rear door latch and cable

Rear Door, Crew Cab

The Crew Cab rear door latch system consists of the following components:

- Door ajar switch (part of the rear door latch)
- Exterior rear door handle
- Interior door handle
- Interior door handle actuating cable
- Rear door latch
- Rear door lock actuator (part of the rear door latch)

Tailgate

The tailgate latch system consists of the following components:

- Tailgate latches
- Tailgate latch actuating rods

repair4less

- Tailgate latch release handle
- Tailgate latch remote control

Spare Tire

To prevent theft of the spare tire, the vehicle is equipped with a spare tire lock cylinder.

Power Locks

The power lock/unlock feature requests all of the vehicle doors locked or unlocked upon a customer request from either door lock control switch in the vehicle. The power door locking system functions independently of ignition status or vehicle speed.

Autolock

The autolock feature locks all the doors when the following conditions are met:

- all the doors are closed
- the ignition switch is in the RUN position
- the vehicle is shifted into any gear, putting the vehicle in motion
- the vehicle attains a speed greater than 20 km/h (12 mph)

The autolock feature repeats when:

- any door is opened then closed while the ignition is still in the RUN position
- the vehicle speed is 15 km/h (9 mph) or slower
- and the vehicle then attains a speed greater than 20 km/h (12 mph)

Refer to Autolock and Auto-Unlock Programming in this section for programming information.

Auto-Unlock

NOTE: The doors do not auto-unlock if the vehicle has been locked using a door lock control switch, Remote Keyless Entry (RKE) transmitter, or keyless entry keypad before the driver door is opened.

The auto-unlock feature unlocks all the doors when the following conditions are met:

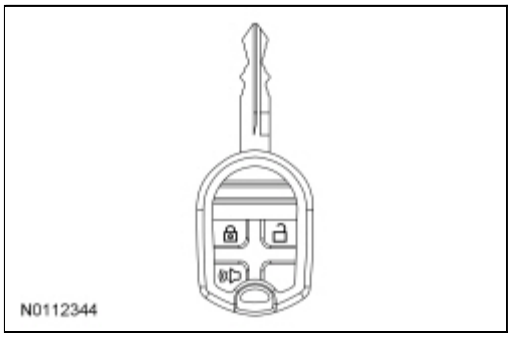
- the ignition switch is in the RUN position
- all the doors are closed
- the vehicle has been in motion at a speed greater than 20 km/h (12 mph)
- the vehicle then comes to a stop
- the ignition is switched to the OFF or ACC position
- the driver door is opened within 10 minutes of the ignition being switched to the OFF, LOCK or ACC position

Refer to Autolock and Auto-Unlock Programming in this section for programming information.

Smart Unlock

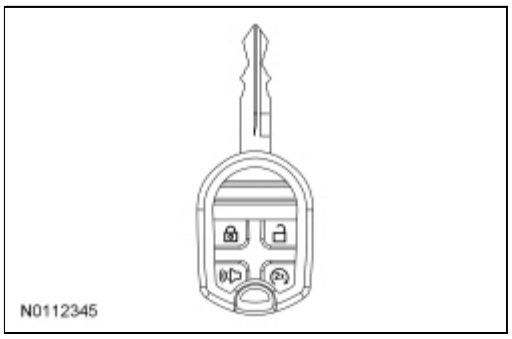
The smart unlock feature prevents the doors from locking with the key in the ignition lock cylinder. When the Body Control Module (BCM) receives a lock command from a door lock control switch only with the key in the ignition lock cylinder and one of the front doors open, the BCM commands the doors to unlock.

The vehicle can still be locked with the ignition key in the ignition cylinder by locking the doors with the push button rods, the door lock cylinder or a lock command from a Remote Keyless Entry (RKE) transmitter.



Remote Keyless Entry (RKE)

The RKE system uses an Integrated Keyhead Transmitter (IKT). The IKT incorporates both the Passive Anti-Theft System (PATS) functions and the RKE transmitter functions in a single device.



The RKE transmitter is programmed automatically during PATS programming. During PATS programming, the BCM obtains the Transmitter Identification Code (TIC) from the IKT .

The BCM accepts programming of up to 4 IKTs . In addition to the IKTs , 4 conventional keyfobs can also be programmed to the vehicle if requested by the customer. For information on programming the IKTs , refer to the key programming procedures in Section 419-01B . Refer to Remote Keyless Entry (RKE) Transmitter Programming in this section for keyfob programming information.

IKT Without Remote Start

IKT With Remote Start

The RKE transmitter carries out the following functions:

- Unlocks the driver door
- Unlocks all doors
- Locks all doors
- Activates/deactivates the panic alarm
- Commands the interior lamps on (when unlocking) and off (when locking)
- Provides a long flash of the turn signals when UNLOCK is pressed
- Remotely start the engine (if equipped with the factory installed system)
- Sounds the horn once when LOCK is pressed twice within 3 seconds, and the doors are closed
- Sounds the horn twice when LOCK is pressed twice within 3 seconds, and any door is ajar

repair4less

The RKE transmitter has a normal operating range of 10 m (33 ft).

Remote Keyless Entry (RKE) Lock/Unlock Control — Unlock

The RKE feature provides lock/unlock functions independently of key position, vehicle speed, or transmission position. The RKE feature provides a stepped (if enabled) process for unlocking the doors. Upon receipt of the first request for unlocking the doors, the RKE feature requests the BCM to unlock the driver door only and provides a long flash of the turn signals. If another unlock request is received within 3 seconds of the first, the RKE feature requests the BCM to unlock all the doors. This feature can be configured to global unlock, so that all the doors unlock on the first press of the UNLOCK button. Refer to Stepped Unlock Programming in this section for programming information.

Remote Keyless Entry (RKE) Lock/Unlock Control — Lock

The RKE feature requests that all the doors be locked when the LOCK button is pressed. On any press of the LOCK button with all doors closed, the BCM provides one flash of the turn signals. If any door is ajar, no flash occurs. As soon as the last door is closed, the BCM provides the flash of the turn signals. If 2 presses of the LOCK button are received within 3 seconds, the horn chirps once and the turn signals flash twice to indicate that all the doors are closed and locked. If any door is ajar when the second lock request is received within 3 seconds of the first, the RKE transmitter feature requests the BCM to chirp the horn twice without flashing the turn signals to indicate all the doors are locked but one or more doors are ajar. When the key is in the RUN or START position, the turn signal flashes and horn chirp confirmations do not occur.

Panic Alarm

The panic alarm feature provides audible and visual alarms which are evident from the exterior of the vehicle. The panic alarm feature requests that the turn signals are flashed and the horn sounds until deactivation. The flashing of the outputs occurs simultaneously. Activation of the panic alarm is accomplished by pressing the panic button on an RKE transmitter whenever the key is in the OFF position. At all other times this feature is disabled. Deactivation of an active panic alarm is accomplished by any of the following actions:

- A second press of the RKE transmitter panic button
- The key is switched out of the OFF position
- A period of 2 minutes and 45 seconds has elapsed since the initial activation

Remote Keyless Entry (RKE) Transmitter Memory Seat

The RKE transmitter feature provides a memory position for the seat/adjustable pedals/mirrors/steering column feature. When the unlock button is pressed, the driver seat, the adjustable pedals, the mirrors, and the steering column move to the desired memory position (the seat, pedal, mirror, and steering column position correspond to the transmitter being used). This feature can be enabled/disabled. Refer to Remote Memory Activation and Remote Memory Deactivation in this section for programming information.

Remote Start

The factory installed remote start (if equipped), is controlled by an IKT and allows the engine to be started from outside the vehicle. Refer to Section 303-06 for information on the remote start feature.

Keyless Entry Keypad

The keyless entry keypad (if equipped), located in the exterior handle of the driver door, provides a method for the customer to access the vehicle without a key or RKE transmitter. The keyless entry keypad feature:

- Locks all doors

- Unlocks the driver door
- Unlocks all doors
- Programs/erases the customer keypad code
- Enables/disables auto-locking
- Enables/disables auto-unlocking
- Illuminates the keypad
- Illuminates the interior lamps

The keyless entry keypad feature operates independently of key position status, vehicle speed, or transmission position. When a keyless entry keypad button is pressed, the keyless entry keypad buttons illuminate to provide better visibility. If buttons 7/8 and 9/0 are pressed simultaneously or 5 seconds have elapsed since the last button press, the illumination is turned off.

Vehicles equipped with a keyless entry keypad are programmed with a factory set 5-digit entry code. This code is provided to the customer on a wallet card in the Owner's Literature package. In addition, this code is available through the use of a scan tool and is printed on the BCM label located on the back side of the module (installed position). When entering codes, each digit must be entered within 5 seconds of the previous button press. The BCM accepts the programming of 3 personal entry codes. Refer to Keyless Entry Keypad Code Programming in this section for programming information.

Unlocking the Doors with the Keyless Entry Keypad System

To unlock the driver door (with stepped unlock enabled), enter either the factory set code or the personal code (each digit must be pressed within 5 seconds of the prior digit). This also illuminates the interior lamps.

To unlock all doors with stepped unlock enabled, enter either the factory set code or the personal code (driver door unlocks) and press the 3/4 button within 5 seconds.

To unlock all doors with stepped unlock disabled, enter either the factory set code or the personal code. This also illuminates the interior lamps. Refer to Stepped Unlock Programming in this section for information on how to program the stepped unlocking.

Locking the Doors with the Keyless Entry Keypad System

It is not necessary to enter the factory set or personal code prior to locking all the doors. To lock all the doors, press the 7/8 and 9/0 buttons at the same time with the driver door closed.

Keyless Entry Keypad Memory Seat Feature

The keypad provides a memory position for the seat/adjustable pedals/mirrors/steering column feature. The feature is associated with the personal entry codes and positions the driver seat, the adjustable pedals, the mirrors, and the steering column to move to the desired memory position (the seat, pedal, mirror, and steering column position correspond to the personal code being used). Refer to Keyless Entry Keypad Code Programming in this section for programming information.

Anti-Scan Feature

To provide added security, the keyless entry keypad is disabled for 1 minute after pressing the button 35 times without a valid entry code being entered. The keypad flashes during this 1-minute mode with all functionality disabled except for buttons 7/8 and 9/0 still being allowed to lock the vehicle.

Anti-scan is turned off after any of the following events:

- One minute of keyless entry keypad inactivity has elapsed

repair4less

- The RKE transmitter UNLOCK button is pressed
- The key is turned to the RUN position

Handles, Locks, Latches and Entry Systems

Principles of Operation

Power Locks

The Body Control Module (BCM) monitors the door lock control switches. When the BCM receives an unlock/lock command from either door lock control switch, the BCM energizes a relay (internal to the BCM)

repair4less

to supply the correct power and grounds for the door lock actuators.

Remote Keyless Entry (RKE)

The Remote Keyless Entry (RKE) feature is controlled by BCM . The BCM receives the RKE inputs from the Tire Pressure Monitor (TPM) module over the Medium Speed Controller Area Network (MS-CAN). When any RKE transmitter button is pressed, the signal is received by the TPM module internal antenna. The TPM module then filters the RKE signal received to make sure it is a programmed transmitter. If the signal received is from a programmed transmitter, the TPM module sends the RKE command to the BCM over the MS-CAN . The BCM then interprets the RKE command and activates the corresponding output.

The BCM requests the illuminated entry feature to turn the interior lamps on when an unlock command is received. If a lock command is received, the illuminated entry feature turns off. The BCM then supplies voltage to the appropriate door lock actuator(s) to lock or unlock the doors. The RKE transmitter can also be used to activate the panic alarm. On vehicles with memory, the RKE transmitter also causes the BCM to send a MS-CAN message to the Driver Seat Module (DSM) to activate all memory features to the positions associated with the RKE transmitter being used.

Remote Start

The factory equipped remote start system is controlled by the BCM . How the BCM receives the remote start command from an Integrated Keyhead Transmitter (IKT) is very similar to the RKE function. For additional information on the factory equipped remote start system, refer to Section 303-06 .

Keyless Entry Keypad

The keyless entry keypad is hardwired to the BCM . The BCM interprets the inputs from the keyless entry keypad and then controls the associated operation. The keyless entry keypad is illuminated for 5 seconds when any button is pressed. The BCM requests the illuminated entry feature to turn the interior lamps on when a valid entry code is received. If a lock all doors code is entered, the illuminated entry feature turns off.

NOTE: The keyless entry keypad does not lock the doors if the driver door is ajar.

The keyless entry keypad supplies a signal to the BCM when the buttons are pressed. The BCM then supplies voltage to the appropriate door lock actuator(s) to lock or unlock the doors. On vehicles with memory, the keyless entry keypad also causes the BCM to send an MS-CAN message to the DSM to activate all memory features to the positions associated with the personal entry code entered on the keypad.

Field-Effect Transistor (FET) Protection

Field-Effect Transistor (FET) is a type of transistor that when used with module software can be used to monitor and control current flow on module outputs. The FET protection strategy is used to prevent module damage in the event of excessive current flow.

The BCM utilizes an FET protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A short circuit DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit is still shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based

on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the short circuit DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), DTC U1000:00 and the associated DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When each level is reached, the DTC associated with the short circuit sets along with DTC U1000:00. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs U1000:00 and U3000:49 set along with the associated short circuit DTC. DTC U3000:49 cannot be cleared and the module must be replaced after the repair.

The BCM FET protected output circuit for the handles, locks, and latches system is the keypad illumination output circuit.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Door handles ● Binding latch mechanisms	● Body Control Module (BCM) fuse(s): ■ 18 (10A) ■ 20 (20A) ● Wiring, terminals or connectors ● Door lock control switches ● Keyless entry keypad ● Integrated Keyhead Transmitter (IKT) ● TPM module ● BCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

repair4less

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs for the BCM .

8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart — Electrical

Condition	Possible Sources	Action
• All door locks are inoperative	• Fuse • Wiring, terminals or connectors • Body Control Module (BCM)	• GO to Pinpoint Test A .
• A single/more than one door lock is inoperative	• Wiring, terminals or connectors • Door lock actuators • BCM	• GO to Pinpoint Test B .
• The door locks operate only one way	• Wiring, terminals or connectors • Door lock control switch • BCM	• GO to Pinpoint Test C .
• All door locks are inoperative from one switch	• Wiring, terminals or connectors • Door lock control switch	• GO to Pinpoint Test D .
• The doors do not lock/unlock using the keyless entry keypad	• Wiring, terminals or connectors • Keyless entry keypad • BCM	• GO to Pinpoint Test F .
• The keyless entry keypad illumination is inoperative/does not operate correctly	• Wiring, terminals or connectors • Keyless entry keypad • BCM	• GO to Pinpoint Test G .
• The Remote Keyless Entry (RKE) transmitter is inoperative	• Integrated Keyhead Transmitter (IKT) • IKT battery • IKT button pressed a substantial amount of times while outside the range of the vehicle • IKT programming • Tire Pressure Monitor (TPM) module • BCM	• GO to Pinpoint Test H .
• An individual button/feature is inoperative from the Remote Keyless Entry (RKE) transmitter	• Door locks • Horn system • Factory remote start system (if equipped) • Turn signal system • IKT	• GO to Pinpoint Test I .
• The Remote Keyless Entry (RKE) transmitter has poor	• Environmental interference • IKT	• GO to Pinpoint Test J .

repair4less

range performance	• IKT battery • TPM module	
• The autolock does not operate correctly	• Programming • Door ajar switch input • Vehicle speed signal message	• GO to Pinpoint Test K .
• The smart unlock does not operate correctly	• Key-in-ignition switch • Door ajar switch input	• GO to Pinpoint Test L .
• The auto-unlock does not operate correctly	• Programming • Door ajar switch input • Vehicle speed signal message	• GO to Pinpoint Test M .
• The memory seat does not operate correctly using the Remote Keyless Entry (RKE) transmitter	• The remote memory feature is not activated	• ACTIVATE the remote memory. REFER to Remote Memory Activation in this section. TEST the system for normal operation. If the remote memory is still inoperative, REFER to Section 501-10 to diagnose the memory seat.
• The 2-step door unlocking does not operate correctly	• The 2-step door unlocking is disabled	• PROGRAM the 2-step door unlocking. REFER to Stepped Unlock Programming in this section. TEST the system for normal operation.

Symptom Chart — Mechanical

Condition	Possible Sources	Action
• Hard to open/close door from either door handle	• Door alignment • Door hinges • Striker adjustment • Door latch	• GO to Pinpoint Test N .
• A door is difficult/does not open from the exterior door handle	• Broken or binding linkage • Exterior door handle to latch rod adjustment • Exterior door handle • Door latch	• GO to Pinpoint Test O .
• A door is difficult/does not open from the interior door handle	• Broken or binding cable/linkage • Door latch	• GO to Pinpoint Test P .
• Exterior door release handle sticks	• Binding linkage • Broken handle	• GO to Pinpoint Test Q .

	return spring • Exterior door handle to latch rod adjustment • Door latch	
• Interior door release handle sticks	• Binding cable • Broken handle return spring • Door latch	• GO to Pinpoint Test R .
• Manual interior lock/unlock rod inoperative	• Bent or binding lock rod • Door latch	• OPERATE the door lock rod manually while observing the door lock rod for any binding or if the rod is bent. ▪ If the rod is bent or damaged, REPAIR as necessary. TEST the system for normal operation. ▪ If the rod is OK, INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation.
• Squeak/rattle/chucking noise from door	• Door alignment • Striker adjustment • Door latch	• GO to Pinpoint Test S .
• Manual door lock cylinder inoperative	• Bent or binding lock rod and lever • Door lock cylinder • Door latch	• GO to Pinpoint Test T .
• Ignition key cannot be returned to the OFF position	• Wiring, terminals or connectors • Transmission selector lever • Binding steering column components • Ignition lock cylinder • Ignition switch	• GO to Pinpoint Test U .

Pinpoint Tests

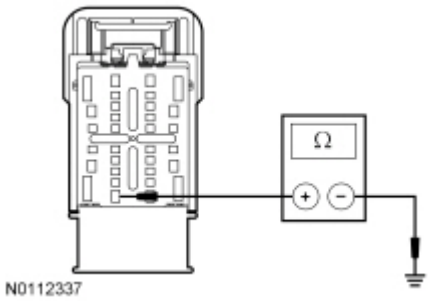
Pinpoint Test A: All Door Locks Are Inoperative

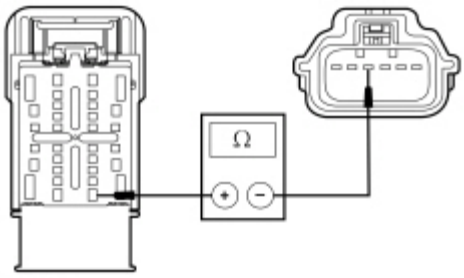
repair4less

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The Body Control Module (BCM) supplies voltage to the lock all relay, the unlock driver door relay or unlock all relay based upon input from the door lock control switches, the Remote Keyless Entry (RKE) transmitter, or the keyless entry keypad. Upon a lock request, the BCM supplies voltage on the all door lock circuit and ground on the driver and passenger door unlock circuits. Upon an unlock request, the voltage and ground are reversed on the previously listed circuits. When the door lock and unlock relays are not energized they are connected to ground. A dedicated BCM ground circuit is provided only for the lock and unlock relays.





This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- BCM

PINPOINT TEST A: ALL DOOR LOCKS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE DOOR LOCK OPERATION FROM BOTH DOOR LOCK CONTROL SWITCHES	
• Check the operation of all of the door lock actuators from both of the door lock control switches. • **Are all of the door lock actuators inoperative from both door lock control switches?**	**Yes** GO to A2 . **No** GO to Pinpoint Test D .
A2 VERIFY ALL DOOR LOCKS ARE INOPERATIVE	
• Press the lock and unlock buttons from a door lock control switch while observing the door locks. • **Are all the door locks inoperative from both switch positions (lock and unlock)?**	**Yes** VERIFY the BCM fuse 20 (20A) is OK. If OK, GO to A3 . If not OK, GO to A5 . **No** CHECK the symptom(s) and GO to Symptom Chart - Electrical .
A3 CHECK THE POWER DOOR LOCK RELAY GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280D. • Measure the resistance between the BCM C2280D-16, circuit GD139 (BK/YE), harness side and ground.	**Yes** GO to A4 . **No** REPAIR circuit GD139 (BK/YE) for an open. TEST the system for normal operation.

 N0112337 • **Is the resistance less than 5 ohms?**	
A4 CHECK THE ALL LOCK CIRCUIT FOR AN OPEN	
• Disconnect: LH Front Door Lock Actuator C525. • Measure the resistance between the BCM C2280D-26, circuit CPL11 (GY/BN), harness side and the LH front door lock actuator C525-4, circuit CPL11 (GY/BN), harness side.  N0119388 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR CPL11 (GY/BN) for an open. TEST the system for normal operation.
A5 CHECK THE ALL LOCK CIRCUIT FOR A SHORT TO GROUND	
• Install a new BCM fuse 20 (20A). • Operate the door lock actuators by pressing LOCK on the door lock control switch. • **Is the BCM fuse 20 (20A) OK?**	**Yes** REPAIR circuit CPL51 (BU/GN) or circuit CPL52 (VT/GY) for a short to ground. TEST the system for normal operation. **No** REPAIR circuit CPL11 (GY/BN) for a short to ground. TEST the system for normal operation.
A6 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM .
	REFER to Section 419-10 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

repair4less

Pinpoint Test B: A Single/More Than One Door Lock Is Inoperative

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The Body Control Module (BCM) supplies voltage to the lock all relay, the unlock driver door relay or unlock all relay based upon input from the door lock control switches, the Remote Keyless Entry (RKE) transmitter, or the keyless entry keypad. Upon a lock request, the BCM supplies voltage on the all door lock circuit and ground on the driver and passenger door unlock circuits. Upon an unlock request, the voltage and ground are reversed on the previously listed circuits. When the door lock and unlock relays are not energized they are connected to ground. A dedicated BCM ground circuit is provided only for the lock and unlock relays.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock actuators
- BCM

PINPOINT TEST B: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTICE: **The following Pinpoint Test uses a test light to simulate normal circuit loads. Use only the test lamp recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Rotunda Flex Probe kit for the test light probe connection to the vehicle. Do not use the test lamp probe directly on any connector.**

Test Step	Result / Action to Take
B1 CHECK THE DOOR LATCH FOR BINDING	
• Lock and unlock the inoperative door lock using the door lock rod. • **Does the door lock and unlock?**	**Yes** GO to B3 . **No** GO to B2 .
B2 CHECK THE LOCK ROD FOR BINDING	
• Operate the door lock rod manually while observing the door lock rod for any binding or if the rod is bent. • **Is the door lock rod bent or binding?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation.
B3 CHECK THE ALL LOCK CIRCUIT FOR VOLTAGE	
• Ignition OFF.	**Yes**

- Disconnect: Inoperative Door Lock Actuator.
- Connect a test light between the inoperative door lock actuator, harness side and ground as follows:

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-4	CPL11 (GY/BN)
RH front	C609-4	CPL11 (GY/BN)
LH rear	C705-4	CPL11 (GY/BN)
RH rear	C805-4	CPL11 (GY/BN)

N0120890

- **NOTE:** The BCM only supplies voltage to the actuator momentarily. It is important to monitor the test light while pressing the door lock control switch.
- Monitor the test light while pressing the door lock control switch in the LOCK position.
- **Does the test light momentarily illuminate?**

GO to B4.

No
REPAIR circuit CPL11 (GY/BN) for an open. TEST the system for normal operation.

B4 CHECK THE UNLOCK CIRCUITS FOR VOLTAGE

- Connect a test light between the inoperative door lock actuator, harness side and ground as follows:

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-3	CPL51 (BU/GN)

Yes
INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation.

No

repair4less

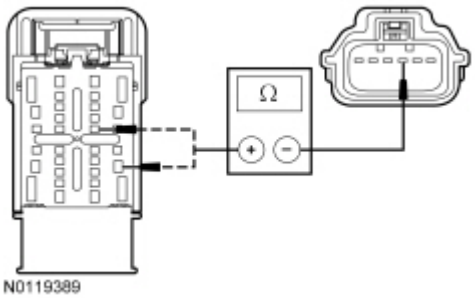
RH front	C609-3	CPL52 (VT/GY)
LH rear	C705-3	CPL52 (VT/GY)
RH rear	C805-3	CPL52 (VT/GY)

N0120891

- **NOTE:** The BCM only supplies voltage to the actuator momentarily. It is important to monitor the test light while pressing the door lock control switch.
- Monitor the test light while pressing the door lock control switch in the UNLOCK position.
- **Does the test light momentarily illuminate?**

GO to B5 .

B5 CHECK THE UNLOCK CIRCUITS FOR AN OPEN



- Disconnect: BCM C2280D.
- Measure the resistance between the BCM , harness side and the inoperative door lock actuator, harness side as follows:

BCM Connector-Pin	Inoperative Door Lock Actuator Connector-Pin	Circuit
C2280D-21	C525-3	CPL51 (BU/GN)
C2280D-31	C609-3	CPL52 (VT/GY)
C2280D-31	C705-3	CPL52 (VT/GY)
C2280D-31	C805-3	CPL52

Yes
GO to B6 .

No
REPAIR circuit CPL51 (BU/GN) or circuit CPL52 (VT/GY) for an open. TEST the system for normal operation.

		(VT/GY)

- **Is the resistance less than 5 ohms?**

B6 CHECK FOR CORRECT BCM OPERATION	

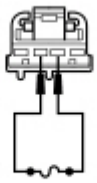
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Door Locks Operate Only One Way

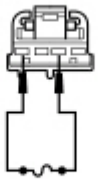
Refer to Wiring Diagrams Cell 110, Power Door Locks for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage signals to the door lock control switches through the lock and unlock input circuits. When the lock or unlock switch is pressed, the corresponding voltage signal is routed to ground, signaling the BCM to lock or unlock the doors. The door lock control switches have a dedicated ground circuit.



This pinpoint test is intended to diagnose the following:



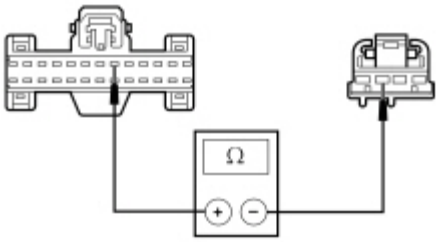
- Wiring, terminals or connectors
- Door lock control switch
- BCM

PINPOINT TEST C: THE DOOR LOCKS OPERATE ONLY ONE WAY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

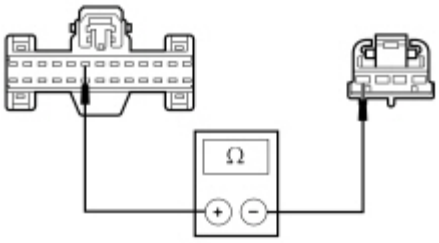
repair4less

Test Step	Result / Action to Take
C1 CHECK THE RECORDED BCM DTCs FROM THE SELF-TEST • Check the recorded results from the BCM self-test. • **Is DTC B126A:01 present?**	**Yes** GO to Pinpoint Test E . **No** GO to C2 .
C2 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES • Ignition OFF. • Press the lock and unlock button of both door lock control switches while observing the door lock operation. • **Do the door locks operate only one way from both switches?**	**Yes** GO to C4 . **No** GO to C3 .
C3 CHECK THE LOCK INPUT OR UNLOCK INPUT CIRCUIT FOR AN OPEN (SINGLE SWITCH INOPERATIVE) • Disconnect: Suspect Door Lock Control Switch. • Unlock the doors from the working door lock control switch. • Connect a fused jumper wire between the LH door lock control switch C505-3, circuit CPK19 (BU/GN), harness side and the LH door lock control switch C505-2, circuit GD134 (BK/VT), harness side; or between the RH door lock control switch C605-3, circuit CPK19 (BU/GN), harness side and the RH door lock control switch C605-2, circuit GD139 (BK/YE), harness side.  N0072779 • Remove the jumper wire. • Connect a fused jumper wire between the LH door lock control switch C505-4, circuit CPK23 (YE/VT), harness side and the LH door lock control switch C505-2, circuit GD134 (BK/VT), harness side; or between the RH door lock control switch C605-4, circuit CPK23 (YE/VT), harness side and the RH door lock control switch C605-2, circuit GD139 (BK/YE), harness side.	**Yes** REMOVE the jumper wire. INSTALL a new door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR the input circuit in question. TEST the system for normal operation.



N0090257

- **Do the doors lock and unlock with the jumper wire?**



C4 CHECK THE LOCK INPUT OR UNLOCK INPUT CIRCUIT FOR AN OPEN (BOTH SWITCHES INOPERATIVE)

- Disconnect: RH Door Lock Control Switch C605.
- Disconnect: BCM C2280C.
- If the doors do not lock, measure the resistance between the BCM C2280C-6, circuit CPK19 (BU/GN), harness side and the RH door lock control switch C605-3, circuit CPK19 (BU/GN), harness side.

N0120802

- If the doors do not unlock, measure the resistance between the BCM C2280C-8, circuit CPK23 (YE/VT), harness side and the RH door lock control switch C605-4, circuit CPK23 (YE/VT), harness side.

N0120803

- **Is the resistance less than 5 ohms?**

Yes
GO to C5 .

No
REPAIR circuit CPK19 (BU/GN) or circuit CPK23 (YE/VT) for an open. TEST the system for normal operation.

C5 CHECK FOR CORRECT BCM OPERATION

- Disconnect all the BCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the BCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.

No
The system is

repair4less

	operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: All Door Locks Are Inoperative From One Switch

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage signals to the door lock control switches through the lock and unlock input circuits. When the lock or unlock switch is pressed, the corresponding voltage signal is routed to ground, signaling the BCM to lock or unlock the doors. The door lock control switches have a dedicated ground circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch

PINPOINT TEST D: ALL DOOR LOCKS ARE INOPERATIVE FROM ONE SWITCH

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE SUSPECT DOOR LOCK CONTROL SWITCH FOR CORRECT OPERATION	
• Disconnect: Suspect Door Lock Control Switch. • Carry out the door lock control switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Does the door lock control switch pass the component test?**	**Yes** REPAIR circuit GD134 (BK/VT) or GD139 (BK/YE) for an open. TEST the system for normal operation. **No** INSTALL a new door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.

Pinpoint Test E: DTC B126A:01

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

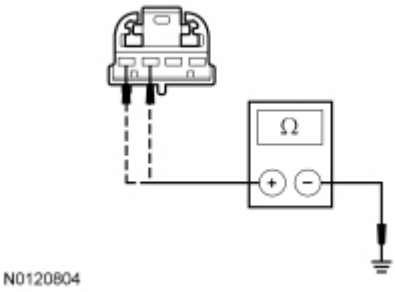
Normal Operation

The Body Control Module (BCM) sends voltage signals to the door lock control switches through the lock

and unlock input circuits. When the lock or unlock switch is pressed, the corresponding voltage signal is routed to ground, signaling the BCM to lock or unlock the doors. The door lock control switches have a dedicated ground circuit.

- DTC B126A:01 (Drivers Door Interior Lock Switch: General Electrical Failure) — sets when the BCM detects a short to ground from the lock or unlock request input circuits.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Door lock control switch
- BCM

PINPOINT TEST E: DTC B126A:01

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE RECORDED BCM DTCs FROM THE SELF-TEST • Check the recorded results from the BCM self-test. • **Is DTC B126A:01 present?**	**Yes** GO to E2. **No** CHECK the symptom(s) and GO to Symptom Chart - Electrical.
E2 CHECK THE LH DOOR LOCK CONTROL SWITCH • Disconnect: LH Door Lock Control Switch C505. • Repeat the BCM self-test. • **Is DTC B126A:01 retrieved again?**	**Yes** LEAVE the switch disconnected. GO to E3. **No** INSTALL a new LH door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.
E3 CHECK THE RH DOOR LOCK CONTROL SWITCH • Disconnect: RH Door Lock Control Switch C605. • Repeat the BCM self-test. • **Is DTC B126A:01 retrieved again?**	**Yes** LEAVE the switch disconnected. GO to E4. **No** INSTALL a new RH door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.
E4 CHECK THE LOCK OR UNLOCK INPUT CIRCUIT FOR A SHORT TO GROUND	

repair4less

• Ignition OFF. • Disconnect: BCM C2280C. • Measure the resistance between the RH door lock control switch C605-3, circuit CPK19 (BU/GN), harness side and ground; and between the RH door lock control switch C605-4, circuit CPK23 (YE/VT), harness side and ground.  N0120804 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to E5 . **No** REPAIR circuit CPK19 (BU/GN) or circuit CPK23 (YE/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
E5 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM .
	REFER to Section 419-10 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Doors Do Not Lock/Unlock Using The Keyless Entry Keypad

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The Body Control Module (BCM) monitors for a ground signal on the keyless entry keypad signal input circuits. When an individual keypad button is pressed, an individual or combination of the input circuits is routed to ground. The BCM then determines which button was pressed based on which circuit(s) are grounded. The keypad has a dedicated ground circuit. Once the BCM determines that the 5-digit personal entry code, or the factory set 5-digit entry code has been entered on the keypad, the BCM then energizes the driver door unlock relay to unlock the driver door (stepped unlock enabled).

To unlock all the doors, the 3/4 button must be pressed within 5 seconds of the 5-digit code being entered.

To lock all the doors, the 5-digit code does not need to be entered. Press the 7/8 and 9/0 buttons at the same time, with the driver door closed.

The keyless entry keypad has an anti-scan feature to help prevent theft. If a valid 5-digit code is not entered within 7 attempts (35 consecutive button presses), the keyless entry keypad goes into anti-scan. In anti-scan mode, the keypad illumination flashes and all input is ignored except for pressing the 7/8 and 9/0 buttons,

which will lock all doors.

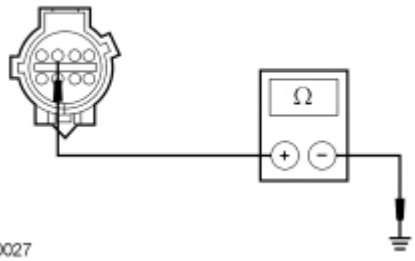
- DTC B121B:01 (Keypad Input Switch: General Electrical Failure) — sets when the BCM detects a short to ground on any of the keyless entry keypad input circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Keyless entry keypad
- BCM

PINPOINT TEST F: THE DOORS DO NOT LOCK/UNLOCK USING THE KEYLESS ENTRY KEYPAD

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
F1 CHECK THE BCM KEYPAD CODE • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Observe the BCM PIDs (KEYCODE_1stD, KEYCODE_2ndD, KEYCODE_3rdD, KEYCODE_4thD, and KEYCODE_5thD). Read and record the 5-digit factory set entry code. • Enter the 5-digit factory set entry code on the keyless entry keypad. • **Do the doors unlock?**	**Yes** The system is operating as designed. INFORM the customer of the correct system operation. **No** GO to F2.
F2 RETRIEVE THE RECORDED BCM DTCs FROM THE SELF-TEST • Check for recorded BCM DTCs from the self-test. • **Is DTC B121B:01 recorded?**	**Yes** GO to F3. **No** GO to F4.
F3 REPEAT THE BCM SELF-TEST • Disconnect: Keyless Entry Keypad C500. • Clear the DTCs, then repeat the BCM self-test. • **Is DTC B121B:01 recorded?**	**Yes** GO to F9. **No** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. TEST the system for normal operation.
F4 CHECK THE BCM KEYPAD PIDs • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Press each keyless entry keypad button while observing the PIDs (KYPD_BTN_1/2, KYPD_BTN_3/4, KYPD_BTN_5/6, KYPD_BTN_7/8, and KYPD_BTN_9/0). • **Do the PIDs display active when the corresponding button is**	**Yes** GO to F10. **No** GO to F5.

repair4less

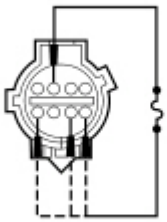
pressed?

F5 CHECK THE KEYPAD GROUND CIRCUIT FOR AN OPEN

- Disconnect: Keyless Entry Keypad C500.
- Measure the resistance between the keyless entry keypad C500-3, circuit GD134 (BK/VT), harness side and ground.

A0070027

- **Is the resistance less than 5 ohms?**



Yes
GO to F6 .

No
REPAIR circuit GD134 (BK/VT) for an open. TEST the system for normal operation.

F6 CHECK THE KEYLESS ENTRY KEYPAD

- Connect a fused jumper wire between the keyless entry keypad, harness side, while monitoring the BCM PIDs (KYPD_BTN_1/2, KYPD_BTN_7/8, and KYPD_BTN_9/0) as follows:

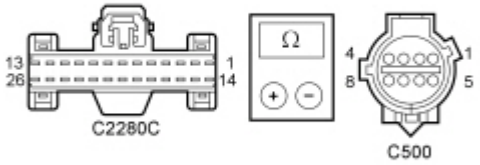
Keyless Entry Keypad Connector-Pin/Circuit	Keyless Entry Keypad Connector-Pin/Circuit	BCM PID
C500-8 CPK29 (GY/BU)	C500-3 GD134 (BK/VT)	KYPD_BTN_1/2
C500-6 CPK30 (VT/GN)	C500-3 GD134 (BK/VT)	KYPD_BTN_7/8
C500-5 CPK31 (YE/GN)	C500-3 GD134 (BK/VT)	KYPD_BTN_9/0

N0104320

- **Do the PIDs display active when the jumper wire is connected?**

Yes
INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section.

No
REMOVE the jumper wire. GO to F7 .



F7 CHECK THE KEYPAD INPUT CIRCUITS FOR AN OPEN

- Ignition OFF.
- Disconnect: BCM C2280C.

Yes
GO to F8 .

- Measure the resistance between the BCM, harness side and the keyless entry keypad, harness side as follows:

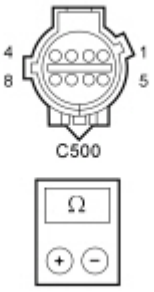
BCM Connector-Pin	Circuit	Keyless Entry Keypad Connector-Pin
C2280C-24	CPK29 (GY/BU)	C500-8
C2280C-18	CPK30 (VT/GN)	C500-6
C2280C-11	CPK31 (YE/GN)	C500-5

N0120805

- **Are the resistances less than 5 ohms?**

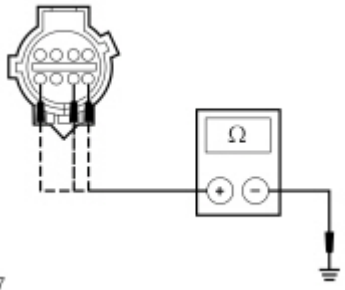
No
REPAIR the circuit in question for an open. TEST the system for normal operation.

F8 CHECK THE KEYPAD INPUT CIRCUITS FOR A SHORT TO EACH OTHER



- Measure the resistance between the keyless entry keypad, harness side as follows:

Keyless Entry Keypad Connector-Pin	Circuits	Keyless Entry Keypad Connector-Pin
C500-8	CPK29 (GY/BU) and CPK30 (VT/GN)	C500-6
C500-8	CPK29 (GY/BU) and CPK31 (YE/GN)	C500-5
C500-6	CPK30 (VT/GN) and CPK31 (YE/GN)	C500-5



Yes
GO to F9.

No
REPAIR the circuits in question. TEST the system for normal operation.

repair4less

- **Are the resistances greater than 10,000 ohms?**

F9 CHECK THE KEYPAD INPUT CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280C. • Measure the resistance between the keyless entry keypad, harness side and ground as follows: **Connector-Pin** / **Circuit** C500-8 / CPK29 (GY/BU) C500-6 / CPK30 (VT/GN) C500-5 / CPK31 (YE/GN)  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F10. **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-test.
F10 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Keyless Entry Keypad Illumination Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

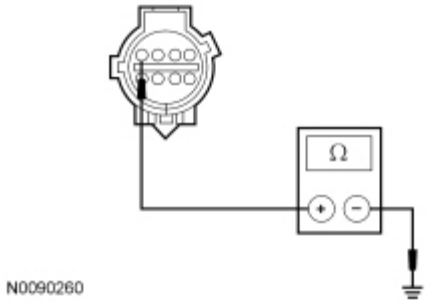
Normal Operation

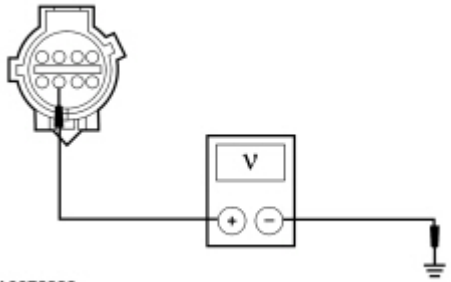
When any keypad button is pressed the Body Control Module (BCM) sends voltage to the keyless entry keypad LEDs on the illumination circuit to assist the driver in entering an access code at night. The keyless entry keypad has a separate ground circuit for the LEDs.

The keyless entry keypad has an anti-scan feature to help prevent theft. If a valid 5-digit code is not entered within 7 attempts (35 consecutive button presses), the keyless entry keypad goes into anti-scan mode. In anti-scan mode, the keypad illumination flashes and all input is ignored except for pressing the 7/8 and 9/0 buttons, which locks all the doors.

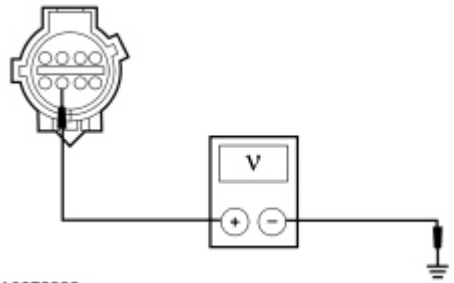
- DTC B121A:11 (Keypad Illumination Output: Circuit Short to Ground) — sets when the BCM detects a short to ground on the keyless entry keypad illumination circuit.

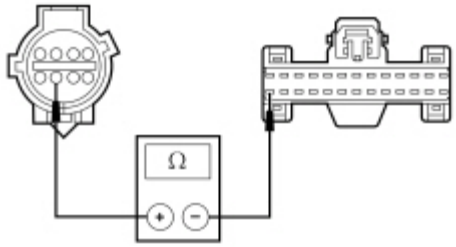
This pinpoint test is intended to diagnose the following:





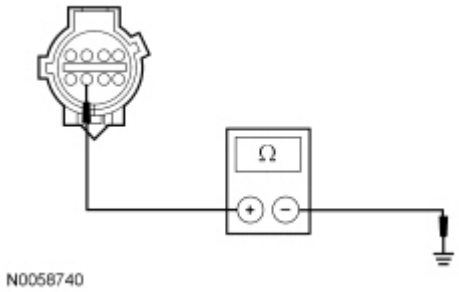
- Wiring, terminals or connectors
- Keyless entry keypad
- BCM





PINPOINT TEST G: THE KEYLESS ENTRY KEYPAD ILLUMINATION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
G1 CHECK THE KEYLESS ENTRY KEYPAD OPERATION	
• Press the 7/8 and 9/0 buttons simultaneously on the keyless entry keypad. • **Do all of the doors lock?**	**Yes** GO to G2 . **No** GO to Pinpoint Test F .
G2 CHECK THE RECORDED BCM DTCs FROM THE SELF-TEST	
• Check the recorded results from the BCM self-test. • **Is DTC B121A:11 present?**	**Yes** GO to G9 . **No** GO to G3 .
G3 CHECK THE KEYLESS ENTRY KEYPAD ILLUMINATION	
• Check the keyless entry keypad illumination. • **Is the keyless entry keypad illumination always on?**	**Yes** GO to G8 . **No** GO to G4 .

repair4less

G4 CHECK THE KEYPAD ILLUMINATION GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Keyless Entry Keypad C500. • Measure the resistance between the keyless entry keypad C500-4, circuit GD134 (BK/VT), harness side and ground.  N0090260 • **Is the resistance less than 5 ohms?**	**Yes** GO to G5 . **No** REPAIR circuit GD134 (BK/VT) for an open. CLEAR the DTCs. REPEAT the self-test.
G5 CHECK THE KEYPAD ILLUMINATION CIRCUIT FOR REFERENCE VOLTAGE	
NOTE: The BCM sends out a constant reference voltage on circuit CPK28 (WH/GN) for its own circuit diagnostics. This voltage is 10 volts (+/- 1 volt). • Ignition ON. • Measure the voltage between the keyless entry keypad C500-7, circuit CPK28 (WH/GN), harness side and ground.  A0078888 • **Is 10 volts (+/- 1 volt) present?**	**Yes** GO to G6 . **No** GO to G7 .
G6 CHECK FOR BCM OUTPUT	
NOTE: This pinpoint test checks for a voltage increase above the reference voltage checked in the previous pinpoint test when the keypad lamp is active commanded on. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Measure the voltage between the keyless entry keypad C500-7, circuit CPK28 (WH/GN), harness side and ground while active commanding the BCM PID (KEY_PAD_LMP) on.	**Yes** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to G11 .

 A0078888 • **Is the voltage greater than 11 volts?**	
G7 CHECK THE KEYPAD ILLUMINATION CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280C. • Measure the resistance between the keyless entry keypad C500-7, circuit CPK28 (WH/GN), harness side and the BCM C2280C-26, circuit CPK28 (WH/GN), harness side.  N0120808 • **Is the resistance less than 5 ohms?**	**Yes** GO to G11 . **No** REPAIR circuit CPK28 (WH/GN) for an open. CLEAR the DTCs. REPEAT the self-test.
G8 CHECK THE KEYPAD ILLUMINATION CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: BCM C2280C. • Ignition ON. • Observe the keypad illumination. • **Is the keypad still illuminated?**	**Yes** REPAIR circuit CPK28 (WH/GN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to G11 .
G9 CHECK THE KEYLESS ENTRY KEYPAD FOR A SHORT TO GROUND	
• Disconnect: Keyless Entry Keypad C500. • Clear the DTCs, then repeat the BCM self-test. • **Is DTC B121A:11 recorded?**	**Yes** GO to G10 . **No** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. TEST the system for normal operation.
G10 CHECK THE KEYPAD ILLUMINATION CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF.	**Yes**

repair4less

• Disconnect: BCM C2280C. • Measure the resistance between the keyless entry keypad C500-7, circuit CPK28 (WH/GN), harness side and ground.  N0058740 • **Is the resistance greater than 10,000 ohms?**	GO to G11 . **No** REPAIR circuit CPK28 (WH/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
G11 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM .
	REFER to Section 419-10 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Remote Keyless Entry (RKE) Transmitter Is Inoperative

Normal Operation

The Remote Keyless Entry (RKE) feature is controlled by the Tire Pressure Monitor (TPM) module and the Body Control Module (BCM). When a button is pressed on an Integrated Keyhead Transmitter (IKT) the Transmitter Identification Code (TIC) and RKE command is received by the internal TPM antenna. If the TPM module determines that it is a valid and programmed TIC , it sends the RKE command and TIC to the BCM over the Medium Speed Controller Area Network (MS-CAN). When the BCM receives the RKE command, it carries out the command by controlling the door locks or activating the horn and turn signals for the panic alarm.

The RKE transmitters and the BCM also utilize a rolling code to prevent the code from being "captured" by a code grabber. The system advances the counter in the RKE transmitter and the BCM every time an RKE transmitter button is pressed.

- DTC B10AB: 00 (Remote Keyless Entry Synchronization: No Sub Type Information) — sets when the BCM detects the rolling counter received from an RKE transmitter is out of synchronization with the rolling counter stored in the module.
- DTC B1218: 00 (Transmitter Identification Code: No Sub Type Information) — sets when the BCM detects an invalid TIC from an IKT .

This pinpoint test is intended to diagnose the following:

- IKT

- IKT battery
- IKT button pressed a substantial amount of times while outside the range of the vehicle
- IKT programming
- TPM module
- BCM

PINPOINT TEST H: THE RKE TRANSMITTER IS INOPERATIVE

NOTE: Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.

Test Step	Result / Action to Take
H1 CHECK FOR THE CORRECT IKTs • **NOTE:** Make sure the IKTs are those provided with the OEM system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle. • Check that the correct IKTs are used with the vehicle. Compare the IKTs with the one shown in Handles, Locks, Latches and Entry Systems in the Description and Operation portion of this section. • **Are the correct RKE transmitters present?**	**Yes** GO to H2. **No** The system cannot be tested without the correct IKTs. INFORM the customer that the correct IKTs must be present to proceed with diagnosis of the system.
H2 CHECK THE RKE OPERATION WHEN THE TPM MODULE IS IN AN AWAKE MODE • Open and close the driver door. • Press any button on the IKT. • **Does the RKE feature operate?**	**Yes** GO to H3. **No** GO to H4.
H3 CHECK THE RKE OPERATION WHEN THE TPM MODULE IS IN A SLEEP MODE • Ignition OFF. • Let the vehicle sit for 10 minutes to allow the vehicle modules to go into a sleep mode. • Press any button on the IKT. • **Does the RKE feature operate?**	**Yes** The system is operating correctly at this time. **No** GO to H12.
H4 PERFORM THE NETWORK TEST ON THE TPM MODULE • Connect the scan tool. • Ignition ON. • Perform the network test on the TPM module. • **Does the TPM module pass the network test?**	**Yes** GO to H5. **No** REFER to Section 418-00 to diagnose the TPM module does not respond to the scan tool.
H5 CHECK FOR TPMS DTCs • Perform the BCM self-test.	**Yes**

repair4less

• **Are any TPMS DTCs recorded?**	DIAGNOSE all TPMS DTCs first. REFER to section Section 204-04 . **No** GO to H6 .
H6 CHECK FOR DTC B10AB:00 OR DTC B1218:00 FROM THE BCM SELF-TEST	
• Check the recorded results from the BCM self-test. • **Is DTC B10AB:00 or DTC B1218:00 present?**	**Yes** For DTC B10AB: 00 GO to H7 . For DTC B1218: 00 GO to H8 . **No** GO to H8 .
H7 RESYNCHRONIZE THE INOPERATIVE IKT	
• Ignition OFF. • Ignition ON. • Ignition OFF. • Press any button on the IKT . • **Does the RKE feature operate?**	**Yes** The system is OK. CLEAR the DTCs. REPEAT the self-test. **No** GO to H8 .
H8 MAKE SURE THE RKE TRANSMITTER SIGNAL IS BEING RECEIVED	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Press a button on the IKT while observing the BCM PIDs (TIC_LAST_BC and LST_RKE_xMTR). • **Does the Transmitter Identification Code (TIC) and RKE command show up on the scan tool screen when a button is pressed?**	**Yes** GO to H9 . **No** GO to H10 .
H9 CHECK IF THE RKE TRANSMITTERS ARE PROGRAMMED	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Press a button on the IKT and compare the BCM PID (TIC_LAST_BC) with the PIDs (TIC_01_BCM, 2, 3, 4, 7, 8, 9, or 10). • **Does the TIC displayed match any of the TICs stored in memory?**	**Yes** GO to H13 . **No** PROGRAM the inoperative IKT individually or PROGRAM all the IKTs . REFER to Section 419-01B for the programming procedures. If all the IKTs are to be programmed, INFORM the customer that any IKTs not present need to be programmed. CLEAR the DTCs. REPEAT the self-test.
H10 CHECK THE IKT BATTERY	
• Using a thin coin, open the IKT . • Do not clean off any grease from the battery terminals on the back surface of the circuit board. • Verify the correct battery is used (CR2032). • Remove the IKT battery and measure the voltage. • **Is the voltage greater than 2.5 volts?**	**Yes** GO to H11 . **No** INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the IKT (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.

H11 CHECK FOR NORMAL OPERATION WITH A KNOWN GOOD IKT	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Use the customer's second IKT , or a known good RKE transmitter that is correct for the vehicle, press a button on the IKT while observing the BCM PID (TIC_LAST_BC). • **Does the TIC show up on the scan tool when a button is pressed?**	**Yes** REPLACE the inoperative IKT and PROGRAM the new IKT individually or PROGRAM all the IKTs . REFER to Section 419-01B for the programming procedures. If all the IKTs are to be programmed, INFORM the customer that any IKTs not present need to be programmed. CLEAR the DTCs. REPEAT the self-test. **No** GO to H13 .
H12 CHECK FOR CORRECT TPM MODULE OPERATION	
• Disconnect the TPM module connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the TPM module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TPM module. REFER to Section 204-04 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
H13 CHECK FOR CORRECT BCM OPERATION	
• Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: An Individual Button/Feature Is Inoperative From The Remote Keyless Entry (RKE) Transmitter

Normal Operation

The Remote Keyless Entry (RKE) feature is controlled by the Tire Pressure Monitor (TPM) module and the Body Control Module (BCM). When a button is pressed on an Integrated Keyhead Transmitter (IKT) the Transmitter Identification Code (TIC) and RKE command is received by the internal TPM antenna. If the TPM module determines that it is a valid and programmed TIC , it sends the RKE command and TIC to the BCM over the Medium Speed Controller Area Network (MS-CAN). When the BCM receives the RKE command, it carries out the command by controlling the door locks or activating the horn and turn signals for the panic alarm.

The BCM will disable the panic feature if the ignition key is in any position other than OFF or LOCK.

This pinpoint test is intended to diagnose the following:

repair4less

- Door locks
- Factory remote start system (if equipped)
- Horn system
- Turn signal system
- IKT

PINPOINT TEST I: AN INDIVIDUAL BUTTON/FEATURE IS INOPERATIVE FROM THE RKE TRANSMITTER

Test Step	Result / Action to Take
I1 VERIFY THE DOOR LOCK OPERATION	
• Press the lock and unlock button from the driver door lock control switch while observing the door lock operation. • **Do the door locks operate correctly?**	**Yes** GO to I2. **No** CHECK the symptom(s) and GO to Symptom Chart - Electrical.
I2 VERIFY THE HORN OPERATION	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Select the BCM PID (HORN) and active command the horn on. • **Does the horn sound when commanded on?**	**Yes** GO to I3. **No** REFER to Section 413-06.
I3 VERIFY THE HAZARD LAMP OPERATION	
• Place the hazard switch in the ON position. • **Do the hazard lamps operate correctly?**	**Yes** For vehicles without remote start, REPLACE the inoperative IKT and PROGRAM the new IKT individually or PROGRAM all the IKTs. REFER to Section 419-01B for the programming procedures. If all the IKTs are to be programmed, INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation. For vehicles equipped with the factory remote start, GO to I4. **No** REFER to Section 417-01.
I4 VERIFY THE REMOTE START BUTTON	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Select the BCM PID (LST_RKE_xMTR) while pressing the remote start button on an IKT.	**Yes** REFER to Section 303-06. **No** REPLACE the inoperative IKT and PROGRAM the new IKT individually or PROGRAM all the IKTs. REFER to Section 419-01B for the programming procedures. If all the IKTs are

• **Does the PID indicate the remote start button is being pressed?**	to be programmed, INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation.

Pinpoint Test J: The Remote Keyless Entry (RKE) Transmitter Has Poor Range Performance

Normal Operation

The Remote Keyless Entry (RKE) transmitter has a normal operating range of 10 m (33 ft). The Tire Pressure Monitor (TPM) module has an internal antenna to receive the RKE transmitter signal. When the TPM module receives a command from a programmed RKE transmitter, the TPM module sends the RKE signal to the Body Control Module (BCM), which processes the command to provide the appropriate output.

This pinpoint test is intended to diagnose the following:

- Environmental interference
- IKT
- IKT battery
- TPM module

PINPOINT TEST J: THE RKE TRANSMITTER HAS POOR RANGE PERFORMANCE

NOTE: All RKE transmitters must be present to begin diagnosis of the RKE system.

NOTE: Aftermarket or dealer-installed systems can adversely affect the RKE system operation. These systems must be disconnected before diagnosing any RKE concerns.

Test Step	Result / Action to Take
J1 CHECK FOR THE CORRECT RKE TRANSMITTERS	
• **NOTE:** Make sure the RKE transmitters are those provided with the OEM system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle. • Check that the correct IKTs are used with the vehicle. Compare the IKTs with the one shown in Handles, Locks, Latches and Entry Systems in the Description and Operation portion of this section. • **Are the correct RKE transmitters present?**	**Yes** GO to J2. **No** The system cannot be tested without the correct RKE transmitters. INFORM the customer that the correct RKE transmitters must be present to proceed with diagnosis of the system.
J2 CHECK ALL RKE TRANSMITTERS FOR POOR RANGE PERFORMANCE	
• **NOTE:** The 10 m (33 ft) measurement of range is not the standard but is a guideline that clearly indicates a vehicle is experiencing normal range performance. • Check all RKE transmitters for poor range performance (less than 10 m [33 ft]).	**Yes** GO to J4. **No** GO to J3.

repair4less

• **Do all RKE transmitters experience poor range?**	
J3 CHECK THE IKT BATTERY • Using a thin coin, open the IKT . • Do not clean off any grease from the battery terminals on the back surface of the circuit board. • Verify the correct battery is used (CR2032). • Remove the IKT battery and measure the voltage. • **Is the voltage greater than 2.5 volts?**	**Yes** REPLACE the inoperative IKT and PROGRAM the new IKT individually or PROGRAM all the IKTs . REFER to Section 419-01B for the programming procedures. If all the IKTs are to be programmed, INFORM the customer that any IKTs not present need to be programmed. TEST the system for normal operation. **No** INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the IKT (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.
J4 CHECK THE LOCATION OF THE VEHICLE AND THE APPROACH ANGLES AROUND THE VEHICLE • Make sure the poor performance is consistent in nature and is not from one approaching angle. • The RKE transmitter range performance may be degraded in certain locations. For example, if the vehicle is within 0.5 mile (0.8 km) of high-power devices or radio/TV towers, the operating distance of the RKE transmitters may be reduced. • **Is the poor range performance consistent around the vehicle?**	**Yes** GO to J5 . **No** The system is operating correctly at this time. The range may have been affected by environmental interference.

J5 CHECK FOR CORRECT TPM MODULE OPERATION
• Disconnect all the TPM module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the TPM module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TPM module. REFER to Section 204-04 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: The Autolock Does Not Operate Correctly

Normal Operation

The Body Control Module (BCM) energizes the lock relay based on input from the ajar switches, the ignition switch, the Transmission Range (TR) sensor and the vehicle speed signal. The BCM locks the doors when the following conditions are met:

- All the doors are closed

- The ignition switch is in the RUN position
- The vehicle is shifted into any gear putting the vehicle in motion
- The vehicle attains a speed greater than 20 km/h (12 mph)

This pinpoint test is intended to diagnose the following:

- Programming
- Door ajar switch input
- Vehicle speed signal message

PINPOINT TEST K: THE AUTOLOCK DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
K1 CHECK THE COURTESY LAMP OPERATION • Open and close the doors while checking the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** GO to K2 . **No** REFER to Section 417-02 .
K2 CHECK THE VEHICLE SPEED OPERATION • Check the operation of the speedometer. • **Does the speedometer operate correctly?**	**Yes** ENABLE the autolock feature. REFER to Autolock and Auto-Unlock Programming in this section. **No** REFER to Section 413-01 .

Pinpoint Test L: The Smart Unlock Does Not Operate Correctly

Normal Operation

The Body Control Module (BCM) commands all doors to unlock based on input from the key-in-ignition switch and the door ajar signal. This feature helps prevent the keys from being locked in the vehicle by unlocking the doors if the key is in the ignition and either front door is ajar.

The vehicle can still be locked with the key in the ignition, by using the manual lock rod, a key in the door lock cylinder, the keyless entry keypad, or the LOCK button on a Integrated Keyhead Transmitter (IKT).

This pinpoint test is intended to diagnose the following:

- Key-in-ignition switch
- Door ajar switch input

PINPOINT TEST L: THE SMART UNLOCK DOES NOT OPERATE CORRECTLY

repair4less

Test Step	Result / Action to Take
L1 CHECK THE DOOR LOCK OPERATION	
• Check the operation of the door locks from the driver door lock control switch. • **Do all the doors lock and unlock?**	**Yes** GO to L2 . **No** CHECK the symptom(s) and GO to Symptom Chart - Electrical .
L2 CHECK THE COURTESY LAMP OPERATION	
• Open and close the left front door while checking the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** REFER to Section 413-01 to DIAGNOSE the key-in-ignition warning chime. **No** REFER to Section 417-02 .

Pinpoint Test M: The Auto-Unlock Does Not Operate Correctly

Normal Operation

The Body Control Module (BCM) energizes the unlock relay based on input from the door ajar switches and the vehicle speed signal. The BCM unlocks the doors when the following conditions are met:

- The vehicle speed has exceeded 20 km/h (12 mph) then dropped to 0 km/h (0 mph)
- The key is turned to the OFF or ACC position
- The LH front door is opened within 10 minutes of the key being turned to the OFF or ACC position

The auto-unlock feature is cancelled if the doors are locked with the door lock control switch or the Integrated Keyhead Transmitter (IKT) within the 10-minute active window. After the 10-minute active window expires, the auto-unlock feature does not unlock the doors if the driver door is opened.

This pinpoint test is intended to diagnose the following:

- Programming
- Door ajar switch input
- Vehicle speed signal message

PINPOINT TEST M: THE AUTO-UNLOCK DOES NOT OPERATE CORRECTLY

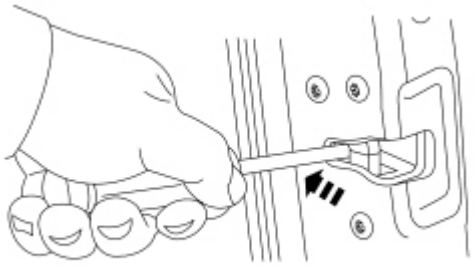
Test Step	Result / Action to Take
M1 CHECK THE COURTESY LAMP OPERATION	
• Open and close the doors while observing the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** GO to M2 . **No** REFER to Section 417-02 .
M2 CHECK THE VEHICLE SPEED	

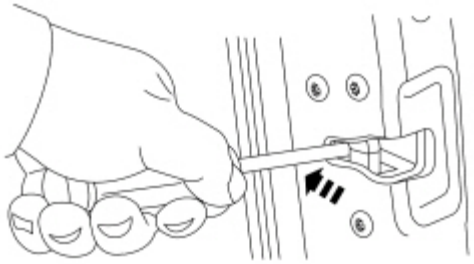
OPERATION	
• Check the operation of the speedometer. • **Does the speedometer operate correctly?**	**Yes** ENABLE the auto-unlock feature. REFER to Autolock and Auto-Unlock Programming in this section. **No** REFER to Section 413-01 .

Pinpoint Test N: Hard To Open/Close Door From Either Door Handle

Normal Operation

The door latch can be actuated from the interior or exterior door handle. When actuated, the door latch releases and allows the door to open. If the door latch or the door hinges have insufficient lubrication or if the striker or door are misaligned, it causes extra force to be used when opening or closing the door.





This pinpoint test is intended to diagnose the following:

- Door alignment
- Door hinges
- Striker adjustment
- Door latch

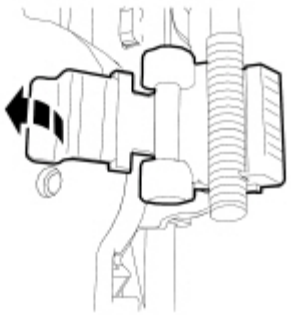
PINPOINT TEST N: HARD TO OPEN/CLOSE DOOR FROM EITHER DOOR HANDLE

Test Step	Result / Action to Take
N1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES	
• Open and close the door using both the interior and exterior door handles. • **Does the door open normally from one of the door handles?**	**Yes** If the door is difficult/does not open from the exterior door handle, GO to Pinpoint Test O . If the door is difficult/does not open from the interior door handle, GO to Pinpoint Test P . **No** If the door does not operate correctly from both door handles, GO to N2 .
N2 CHECK THE LATCH OPERATION	
• Open the door. • Using a screwdriver, fully close the latch (2 clicks).	**Yes** GO to N4 . **No** GO to N3 .

repair4less

 N0094195 • Verify that the latch releases easily while pulling on the interior/exterior door handle. • **Does the latch release easily?**	
N3 CHECK THE LATCH OPERATION AFTER LUBRICATION	
• Lubricate the door latch. Refer to Latch Lubrication in this section. • Using a screwdriver, fully close the latch (2 clicks).  N0094195 • Verify that the latch releases easily while pulling on the interior/exterior door handle. • **Does the latch release easily?**	**Yes** The concern was caused by an insufficiently lubricated door latch. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation.
N4 CHECK THE STRIKER ADJUSTMENT	
• Check the adjustment of the striker. Refer to Section 501-03 . • **Is the striker adjusted correctly?**	**Yes** GO to N5 . **No** ADJUST the striker as necessary. TEST the system for normal operation.
N5 CHECK THE DOOR ALIGNMENT	
• Check the alignment of the door. Refer to Section 501-03 . • **Is the door aligned correctly?**	**Yes** LUBRICATE the door hinges. TEST the system for normal operation. **No** ADJUST the door as necessary. TEST the system for normal operation.

Pinpoint Test O: A Door Is Difficult/Does Not Open From The Exterior Door Handle



Normal Operation

The exterior door handle is connected to the door latch with an actuating rod. When the exterior door handle is pulled it causes the actuating rod to push down on the latch lever. The actuating rod can be adjusted for proper exterior door handle operation. When the latch lever is moved, the door latch releases, allowing the door to open.

This pinpoint test is intended to diagnose the following:

- Broken or binding linkage
- Exterior door handle to latch rod adjustment
- Exterior door handle
- Door latch

PINPOINT TEST O: A DOOR IS DIFFICULT/DOES NOT OPEN FROM THE EXTERIOR DOOR HANDLE

Test Step	Result / Action to Take
O1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES • Open the door using both the interior and exterior door handles. • **Does the door open normally from one of the door handles?**	**Yes** If the door is difficult/does not open from only the exterior door handle, GO to O2. **No** If the door does not operate correctly from both door handles, GO to Pinpoint Test N.
O2 CHECK THE EXTERIOR DOOR HANDLE • Remove the door trim panel. Refer to Section 501-05. • Open the clip and disconnect the exterior door handle actuating rod.  N0088081 • Pull and release the exterior door handle. • **Does the exterior door handle operate correctly?**	**Yes** GO to O3. **No** INSTALL a new exterior door handle. REFER to Exterior Front Door Handle or Exterior Door Handle — SuperCrew in this section. TEST the system for normal operation.
O3 CHECK THE EXTERIOR DOOR HANDLE AND LINKAGE OPERATION • Operate the exterior door handle while observing the linkage. • **Are any of the exterior door handle components or linkages binding or broken?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to O4.

repair4less

O4 CARRY OUT THE EXTERIOR DOOR HANDLE ADJUSTMENT	
• Carry out the exterior door handle to latch rod adjustment. Refer to Door Handle to Latch Rod Adjustment in this section. • **Does the exterior door handle operate correctly?**	**Yes** The concern was caused by an improperly adjusted exterior door handle. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation.

Pinpoint Test P: A Door Is Difficult/Does Not Open From The Interior Door Handle

Normal Operation

The interior door handle is connected to the door latch by an actuating cable. When the interior door handle is pulled it causes the cable to pull on the latch lever. When the latch lever is moved, the door latch releases, allowing the door to open.

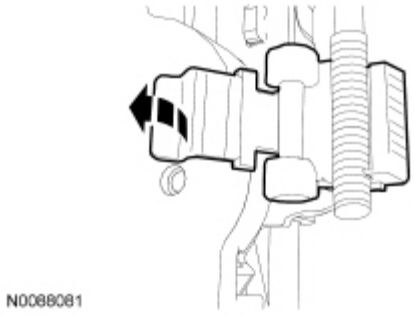
This pinpoint test is intended to diagnose the following:

- Broken or binding cable/linkage
- Door latch

PINPOINT TEST P: A DOOR IS DIFFICULT/DOES NOT OPEN FROM THE INTERIOR DOOR HANDLE

Test Step	Result / Action to Take
P1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES	
• For the rear SuperCrew doors, make sure the child lock is in the unlock position. • Open the door using both the interior and exterior door handles. • **Does the door open normally from one of the door handles?**	**Yes** If the door is difficult/does not open from only the interior door handle, GO to P2. **No** If the door does not operate correctly from both door handles, GO to Pinpoint Test N.
P2 CHECK THE INTERIOR DOOR HANDLE AND CABLE/LINKAGE OPERATION	
• Remove the door trim panel. Refer to Section 501-05. • Install the interior door handle back onto the release cable. • Operate the interior door handle while observing the cable/linkage. • **Are any of the interior door handle components or cable/linkages binding or broken?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation.

Pinpoint Test Q: Exterior Door Release Handle Sticks



Normal Operation

The exterior door handle is connected to the door latch with an actuating rod. When the exterior door handle is pulled it causes the actuating rod to push down on the latch lever. The actuating rod can be adjusted for proper exterior door handle operation. When the latch lever is moved, the door latch releases, allowing the door to open. The handle has a return spring to make sure the handle returns to a closed position.

This pinpoint test is intended to diagnose the following:

- Binding linkage
- Broken handle return spring
- Exterior door handle to latch rod adjustment
- Door latch

PINPOINT TEST Q: EXTERIOR DOOR RELEASE HANDLE STICKS

Test Step	Result / Action to Take
Q1 CHECK FOR A BROKEN RETURN SPRING	
• Remove the door trim panel. Refer to Section 501-05 . • Open the clip and disconnect the exterior door handle actuating rod.  N0088081 • Pull and release the exterior door handle. • **Does the exterior door handle return to a closed position once released?**	**Yes** GO to Q2 . **No** INSTALL a new exterior door handle. REFER to Exterior Front Door Handle or Exterior Door Handle — SuperCrew in this section. TEST the system for normal operation.
Q2 CARRY OUT THE EXTERIOR DOOR HANDLE ADJUSTMENT	
• Carry out the exterior door handle to latch rod adjustment. Refer to Door Handle to Latch Rod Adjustment in this section. • **Does the exterior door handle operate correctly?**	**Yes** The concern was caused by an improperly adjusted exterior door handle. **No** GO to Q3 .
Q3 CHECK THE EXTERIOR DOOR HANDLE AND LINKAGE OPERATION	

repair4less

• Operate the exterior door handle while observing the linkage. • **Are any of the exterior door handle components or linkages binding?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation.

Pinpoint Test R: Interior Door Release Handle Sticks

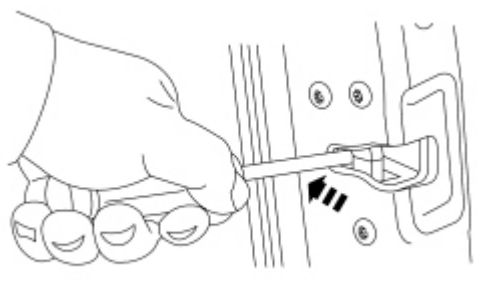
Normal Operation

The interior door handle is connected to the door latch by an actuating cable. When the interior door handle is pulled it causes the cable to pull on the latch lever. When the latch lever is moved, the door latch releases, allowing the door to open. The handle has a return spring to make sure the handle returns to a closed position.

This pinpoint test is intended to diagnose the following:

- Binding cable
- Broken handle return spring
- Door latch

PINPOINT TEST R: INTERIOR DOOR RELEASE HANDLE STICKS



Test Step	Result / Action to Take
R1 CHECK FOR A BROKEN RETURN SPRING	**Yes** GO to R2. **No** INSTALL a new interior door handle. REFER to Interior Door Handle — Front or Interior Door Handle — SuperCrew in this section. TEST the system for normal operation.
• Remove the interior door handle. Refer to Interior Door Handle — Front or Interior Door Handle — SuperCrew in this section. • Pull and release the interior door handle. • **Does the interior door handle return to a closed position once released?**	
R2 CHECK THE INTERIOR DOOR HANDLE CABLE OPERATION	**Yes** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation. **No** REPAIR as necessary. TEST the system for normal operation.
• Remove the door latch release cable. • Observe the door latch release cable for any damage or binding. • **Is the door latch release cable OK?**	

Pinpoint Test S: Squeak/Rattle/Chucking Noise From Door

This pinpoint test is intended to diagnose the following:

- Door alignment
- Striker adjustment
- Door latch

PINPOINT TEST S: SQUEAK/RATTLE/CHUCKING NOISE FROM DOOR

Test Step	Result / Action to Take
S1 CHECK FOR ANY LOOSE COMPONENTS • Remove the door trim panel. Refer to Section 501-05 . • Inspect inside the door for any loose components. • **Are there any loose components inside the door?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to S2 .
S2 CHECK THE STRIKER ADJUSTMENT • Check the adjustment of the striker. Refer to Section 501-03 . • **Is the striker adjusted correctly?**	**Yes** GO to S3 . **No** ADJUST the striker as necessary. TEST the system for normal operation.
S3 CHECK THE DOOR ALIGNMENT • Check the alignment of the door. Refer to Section 501-03 . • **Is the door aligned correctly?**	**Yes** GO to S4 . **No** ADJUST the door as necessary. TEST the system for normal operation.
S4 CHECK THE LATCH OPERATION AFTER LUBRICATION • Lubricate the door latch. Refer to Latch Lubrication in this section. • Using a screwdriver, fully close the latch (2 clicks).  N0094195 • Operate the door latch and listen for the noise.	**Yes** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch — SuperCrew in this section. TEST the system for normal operation. **No** The concern was caused by an insufficiently lubricated door latch.

repair4less

• **Is the original noise still present after the latch is lubricated?**	

Pinpoint Test T: Manual Door Lock Cylinder Inoperative

Normal Operation

The door lock cylinder is connected to the door latch via a lock rod and can be used to manually lock/unlock a door.

This pinpoint test is intended to diagnose the following:

- Bent or binding lock rod and lever
- Door lock cylinder
- Door latch

PINPOINT TEST T: MANUAL DOOR LOCK CYLINDER INOPERATIVE

Test Step	Result / Action to Take
T1 CHECK THE LOCK CYLINDER OPERATION AFTER LUBRICATION	
• Spray a lock lubricant such as Motorcraft XL-1 into the lock cylinder opening for a couple seconds. • Operate the door lock cylinder with the key. • **Does the door lock and unlock using the door lock cylinder?**	**Yes** The concern was caused by an insufficiently lubricated lock cylinder. Spray a multi-purpose grease such as Motorcraft XL-5 into the lock cylinder for a couple seconds to provide long term lubrication. **No** GO to T2 .
T2 CHECK THE DOOR LOCK CYLINDER	
• Remove the door lock cylinder. Refer to Door Lock Cylinder in this section. • Operate the door lock cylinder with the key. • **Does the door lock cylinder rotate freely to both lock and unlock positions?**	**Yes** GO to T3 . **No** INSTALL a new door lock cylinder. REFER to Door Lock Cylinder in this section. TEST the system for normal operation.
T3 CHECK THE DOOR LOCK CYLINDER LINKAGE	
• Install the door lock cylinder. Refer to Door Lock Cylinder in this section. • Operate the door lock cylinder while observing the linkage. • **Is the door lock cylinder rod and lever bent or binding?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch in this section. TEST the system for normal operation.

Pinpoint Test U: Unable To Remove The Key From The Ignition Lock Cylinder

Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

Normal Operation

The ignition switch contains a key removal inhibit solenoid. The solenoid prevents the ignition lock cylinder to be turned to lock and the key removed any time the transmission selector lever is in any position except park. The inhibit solenoid receives voltage at all times from the Body Control Module (BCM) fuse 28 (15A). When the transmission selector lever is in any gear except park, the selector switch closes, which supplies ground to the solenoid.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Transmission selector lever
- Binding steering column components
- Ignition lock cylinder
- Ignition switch

PINPOINT TEST U: IGNITION KEY CANNOT BE RETURNED TO THE OFF POSITION

Test Step	Result / Action to Take
U1 CHECK FOR AN ENERGIZED KEY REMOVAL INHIBIT SOLENOID	
• Remove the BCM fuse 28 (15A). • Attempt to turn the ignition key to the run position and then back to the lock position and remove the key. • **Does the ignition lock cylinder turn to the lock position and can the key be removed?**	**Yes** REFER to Section 211-05 to continue diagnosis of the key removal inhibit solenoid system. **No** GO to U2 .
U2 CHECK THE IGNITION LOCK CYLINDER FOR BINDING	
• Remove the ignition lock cylinder. Refer to Ignition Lock Cylinder — Functional in this section. • Rotate the ignition lock cylinder through all positions using the key. • **Does the ignition lock cylinder freely rotate through all positions and can the key be removed from the lock cylinder?**	**Yes** REFER to Section 211-05 to continue diagnosis of the steering column for any binding steering column components or ignition switch. **No** INSTALL a new ignition lock cylinder. REFER to Ignition Lock Cylinder — Functional in this section. TEST the system for normal operation.

repair4less

Autolock and Auto-Unlock Programming

Programming the Autolock Feature Using the Door Lock Control Switch

NOTE: The autolock feature can also be programmed using the message center.

NOTE: The autolock feature can be activated or deactivated independently of the auto-unlock feature.

NOTE: When programming the autolock feature using the door lock control switch method, the following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. **NOTE:** Prior to beginning, make sure the ignition key is in the OFF position and all vehicle doors are closed.

   Turn the ignition key from the OFF to the ON position.

2. Press the unlock button on the door lock control switch 3 times.

3. Turn the ignition key from the ON to the OFF position.

4. Press the unlock button on the door lock control switch 3 times.

5. Turn the ignition key to the ON position. The horn chirps once to indicate that programming mode is entered.

6. To enable/disable the autolock feature, press the unlock button on the door lock control switch, then the lock button. The horn chirps once if the autolocks are disabled or twice (one short chirp followed by a long chirp) if the autolocks are enabled.

7. Turn the ignition key to the OFF position. The horn chirps once to signal that the programming is complete.

Programming the Autolock Feature Using the Keyless Entry Keypad

NOTE: The autolock feature can also be programmed using the message center.

NOTE: The autolock feature can be activated or deactivated independently of the auto-unlock feature.

1. Turn the ignition key to the OFF position and close all vehicle doors.

2. Enter the permanent factory keyless entry keypad code.

3. Press and hold the 3/4 button on the keypad. While holding the 3/4 button, press the 7/8 button.

4. Release the 7/8 button, then release the 3/4 button. The horn chirps once if the autolocks are disabled or twice (one short chirp followed by a honk) if the autolocks are enabled.

Programming the Auto-Unlock Feature Using the Door Lock Control Switch

repair4less

NOTE: The auto-unlock feature can also be programmed using the message center.

NOTE: The auto-unlock feature can be activated or deactivated independently of the autolock feature.

NOTE: When programming the auto-unlock feature using the door lock control switch method, the following steps must be carried out within 30 seconds or the procedure will need to be repeated. If the procedure needs to be repeated, wait 30 seconds between programming sessions.

1. **NOTE:** Prior to beginning, make sure the ignition key is in the OFF position and all vehicle doors are closed.

   Turn the ignition key from the OFF to the ON position.

2. Press the unlock button on the door lock control switch 3 times.

3. Turn the ignition key from the ON to the OFF position.

4. Press the unlock button on the door lock control switch 3 times.

5. Turn the ignition key to the ON position. The horn chirps once to indicate that programming mode is entered.

6. To enable/disable the auto-unlock feature, press the lock button on the door lock control switch, then the unlock button. The horn chirps once if auto-unlock is disabled or twice (one short chirp followed by a long chirp) if auto-unlock is enabled.

7. Turn the ignition key to the OFF position. The horn chirps once to signal that the programming is complete.

Programming the Auto-Unlock Feature Using the Keyless Entry Keypad

NOTE: The auto-unlock feature can also be programmed using the message center.

NOTE: The auto-unlock feature can be activated or deactivated independently of the autolock feature.

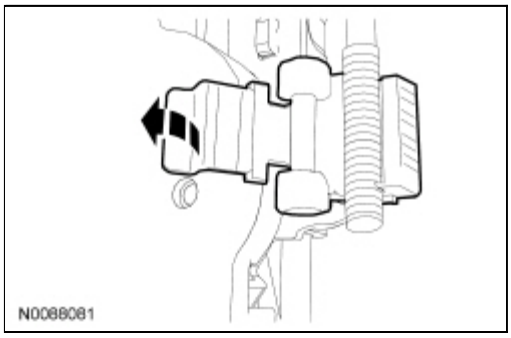
1. Turn the ignition key to the OFF position and close all vehicle doors.

2. Enter the permanent factory keyless entry keypad code.

3. Press and hold the 3/4 button on the keypad. While holding the 3/4 button, press and release the 7/8 button. While still holding the 3/4 button, press and release the 7/8 button a second time.

4. Release the 3/4 button. The horn chirps once if auto-unlock is disabled or twice (one short chirp followed by a honk) if auto-unlock is enabled.

repair4less



Door Handle to Latch Rod Adjustment

NOTE: If the vehicle is equipped with an adjustable door latch actuating rod, perform this procedure.

NOTE: An incorrectly adjusted exterior door handle can cause a loose handle, rattle noise, door hard to open from the outside door handle, or the outside door handle to not sit flush in the closed position.

NOTE: Prior to carrying out the adjustment procedure, the door latch, exterior door handle, and linkages must be installed on the door.

1. Raise the door glass to the full-up position.
2. Remove the door trim panel. For additional information, refer to Section 501-05 .
3. Position the water shield aside.
4. Open the clip and disconnect the exterior door handle actuating rod.

5. Position the actuating rod and latch actuating lever in a neutral position.
6. **NOTE:** Do not push up or pull down on the actuating rod or latch actuating lever.

   Reinstall the exterior door handle actuating rod back into the clip.
7. Close the clip and test the system to make sure that the exterior door handle is operating correctly.
8. Reseal the water shield.
9. Install the door trim panel. For additional information, refer to Section 501-05 .

repair4less

Keyless Entry Keypad Code Programming

Programming a Personal Entry Code and Keypad Association to Memory Features (If Equipped)

NOTE: The system allows 3 personal codes to be programmed.

NOTE: Multiple personal codes can be programmed in one step. When programming multiple codes in one step, each code must be programmed by entering each button within 5 seconds of each other. If 5 seconds elapse between any button press, programming mode is exited.

NOTE: If only a single personal code is desired or unable to program multiple codes in one step, each personal code can be programmed individually by repeating Steps 1-5 for each code desired.

1. Enter the factory set 5-digit keyless entry keypad code.

2. Within 5 seconds, press the 1/2 button on the keypad to activate the programming mode.

3. Enter the new personal 5-digit keyless entry keypad code. Each number must be entered within 5 seconds of each other.

4. After entering the new personal code, press a 6th button to program each new code.
   - Pressing 1/2 stores the first personal code (if equipped with memory, this code is associated with driver 1 settings).
   - Pressing 3/4 stores the second personal code (if equipped with memory, this code is associated with driver 2 settings).
   - Pressing 5/6, 7/8 or 9/0 stores the third personal code, but does not associate the code with a memory setting.

5. The door locks lock and unlock to confirm the new code is programmed.

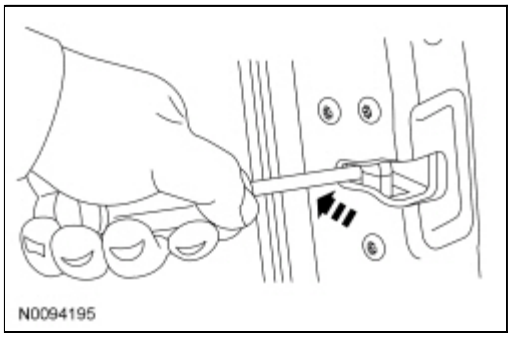
Erasing a Personal Entry Code

1. Enter the factory set 5-digit keyless entry keypad code.

2. Within 5 seconds, press the 1/2 button on the keypad and release.

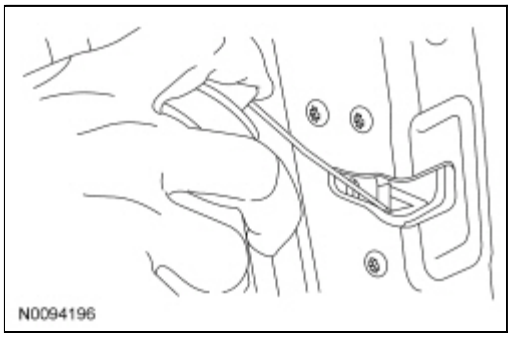
3. Within 5 seconds, press and hold the 1/2 button for 2 seconds.

4. All personal codes are now erased and only the factory set 5-digit code works.



repair4less

Latch Lubrication



Material

Item	Specification
Motorcraft® Multi-Purpose Grease XL-5	ESB-M1C93-B

1. Open the door.
2. Using a screwdriver, fully close the latch (2 clicks).

3. Spray the multi-purpose grease into the opening on the door latch for approximately 5 seconds.

4. Open the latch using either the interior or exterior door handle.
5. Open and close the door several times to circulate the lubricant inside the latch.
6. Wipe off any excess grease.

repair4less

Remote Keyless Entry (RKE) Transmitter Programming

NOTE: This procedure is for programming conventional keyfobs only. The Remote Keyless Entry (RKE) transmitter of the Integrated Keyhead Transmitter (IKT) is programmed automatically during the Passive Anti-Theft System (PATS) programming. For additional information, refer to the key programming procedures in Section 419-01B to program the IKT .

NOTE: The RKE transmitters can also be programmed with the scan tool.

NOTE: All RKE transmitters must be programmed at the same time.

NOTE: Do not apply the brake pedal during this sequencing, as doing so ends the sequence and the transmitters will not be programmed.

1. Electronically unlock the door locks using the door lock control switch.

2. Cycle the ignition switch from the OFF to the RUN position 8 times in rapid succession (within 10 seconds), with the eighth turn ending in RUN. If the module successfully enters program mode, it locks and then unlocks all the doors.

3. **NOTE:** If no action is taken within 20 seconds after a transmitter has been programmed, the programming sequence ends (the doors lock and unlock to confirm that programming is complete).

   Within 20 seconds, press any button on the RKE transmitter to be programmed. The doors lock and then unlock to confirm that each RKE transmitter is programmed. Repeat this step for each RKE transmitter.

4. Exiting the programming mode is accomplished if one of the following occurs:
   - The key transitions to the OFF position.
   - 20 seconds have passed since entering programming mode or since the last RKE transmitter was programmed.
   - The maximum number (4) of RKE transmitters have been programmed.

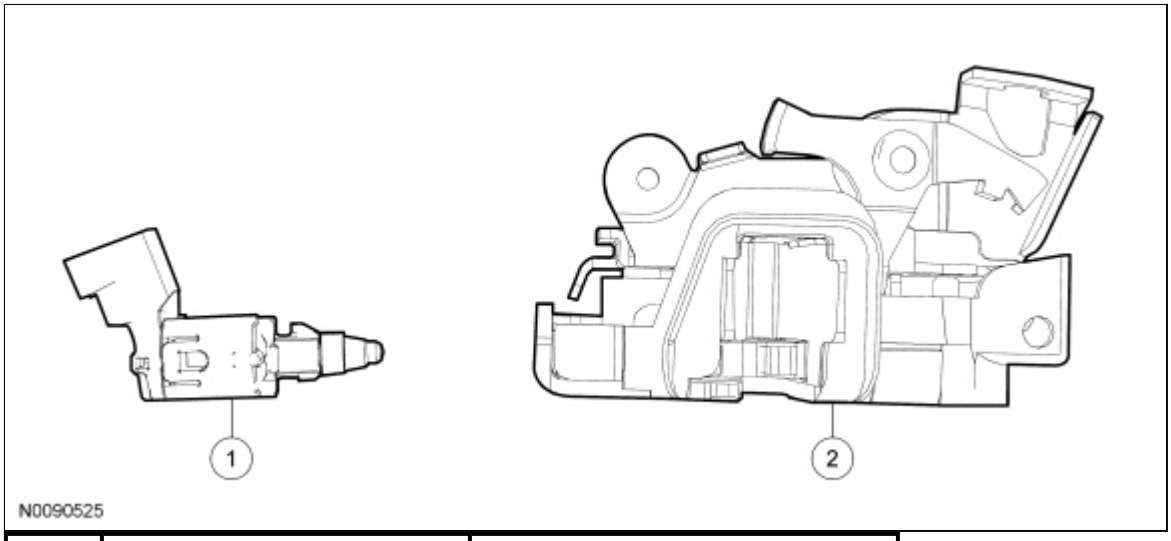
repair4less

Remote Memory Activation

1. Move the driver seat, power mirrors, and adjustable pedals to the desired positions using the associated controls.
2. Press and hold control button 1 for five seconds. A tone will be heard after two seconds confirming memory position has been set. Continue to hold until a second tone is heard after five seconds.
3. Within three seconds press the lock button.
4. Wait 10 seconds, then press the unlock button.
5. Repeat this procedure for memory 2 and another transmitter if desired.

Remote Memory Deactivation

1. Press the set button on the memory set switch.
2. Within 5 seconds, press any button on the Remote Keyless Entry (RKE) transmitter that you wish to deactivate and then press the set button on the memory set switch.
3. If a second memory setting is desired to be deactivated, repeat the procedure with the second RKE transmitter.



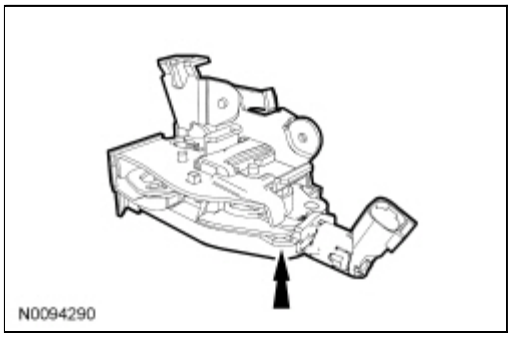
repair4less

Stepped Unlock Programming

1. With the ignition switch in the OFF position, press the LOCK and UNLOCK buttons on the Remote Keyless Entry (RKE) transmitter simultaneously for 4 seconds.
    - The turn signals flash twice to indicate the mode change.

2. Repeat Step 1 to enable/disable the stepped unlocking feature.

Door Ajar Switch — Rear, SuperCab

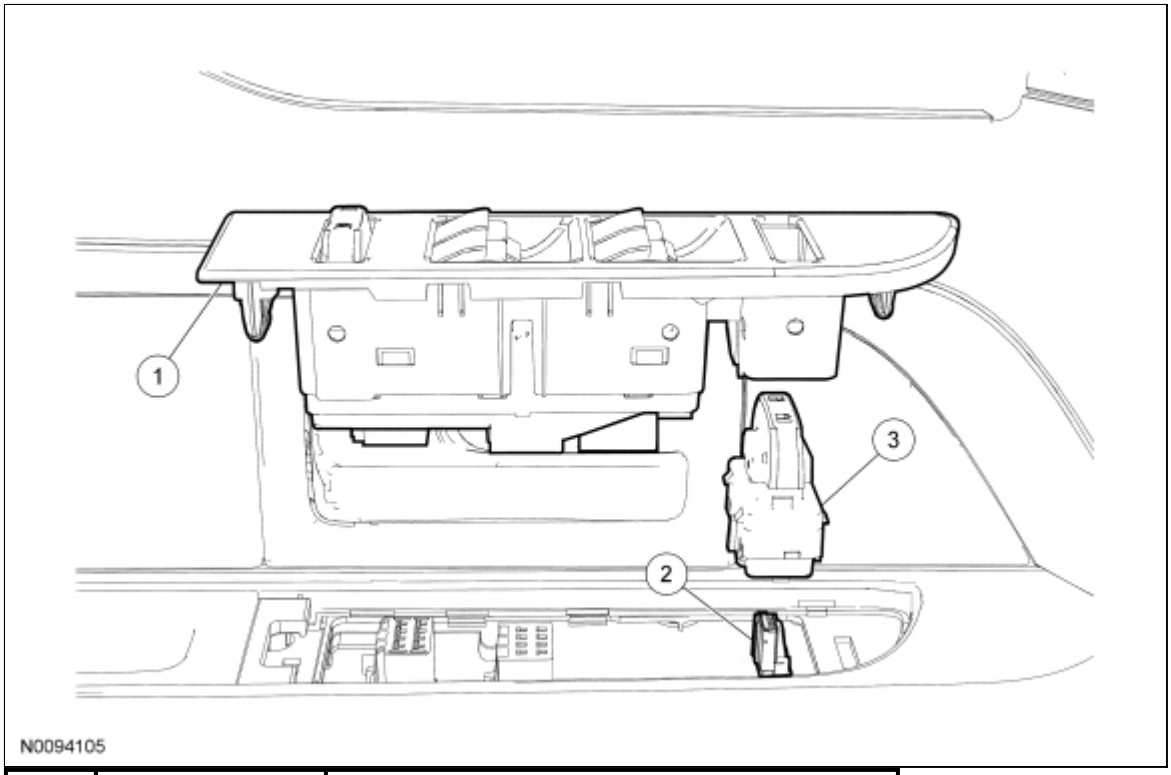


Item	Part Number	Description
1	18265B29	Door ajar switch
2	18264A01/ 18264A00	Lower door latch (LH/RH)

Removal and Installation

1. Remove the lower rear door latch. For additional information, refer to Rear Door Latch — Lower, SuperCab in this section.

2. Insert a screwdriver or suitable tool into the opening on the door latch and push up on the tab.



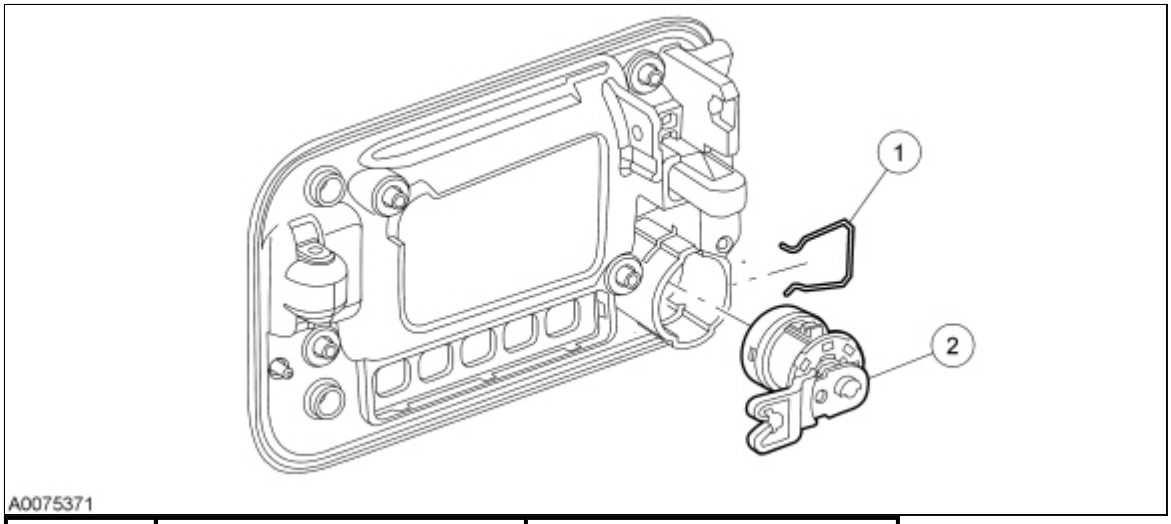
3. Rotate the door ajar switch and remove from the door latch.

4. To install, reverse the removal procedure.

repair4less

Door Lock Control Switch

NOTE: LH side shown, RH side similar.



Item	Part Number	Description
1	14527/ 14528	Switch plate cover (LH/RH)
2	—	Door lock switch electrical connector
3	14028	Door lock control switch

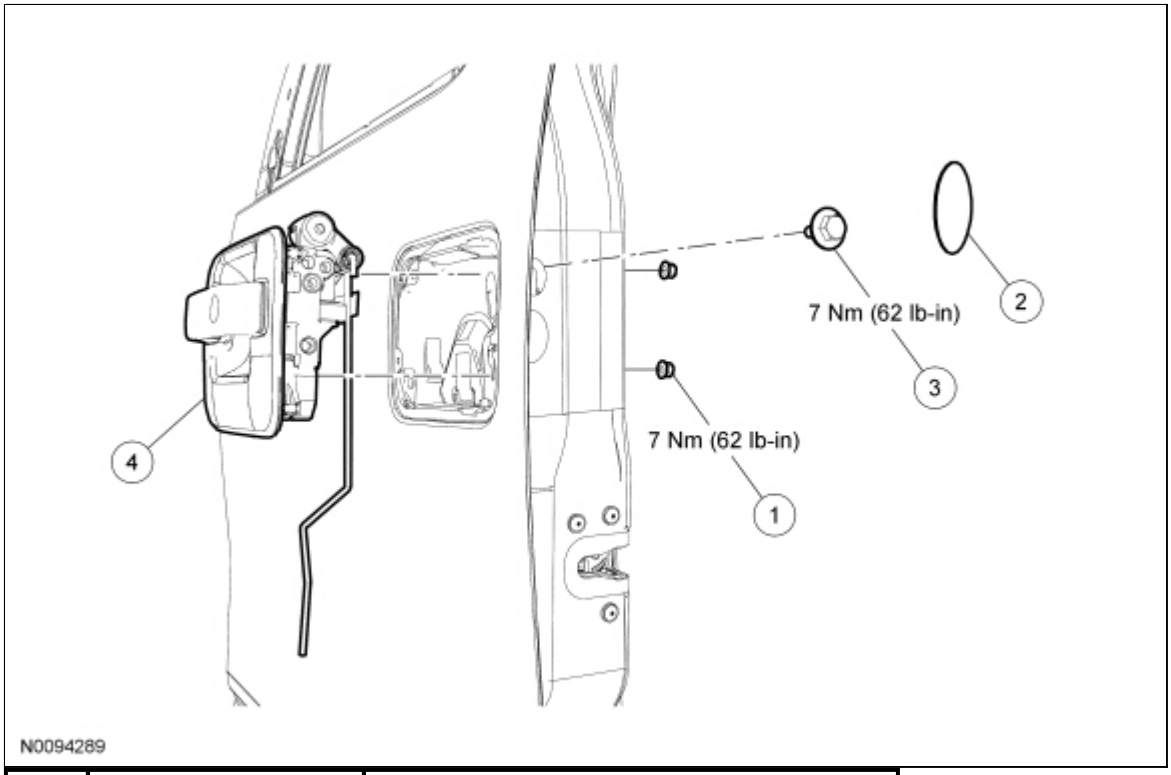
Removal and Installation

1. Lift up to remove the switch plate cover.
2. Disconnect the electrical connector.
3. Release the door lock control switch tabs and remove the door lock control switch.
4. To install, reverse the removal procedure.

repair4less

Door Lock Cylinder

Item	Part Number	Description
1	1522023	Retaining clip
2	1521990	Lock cylinder



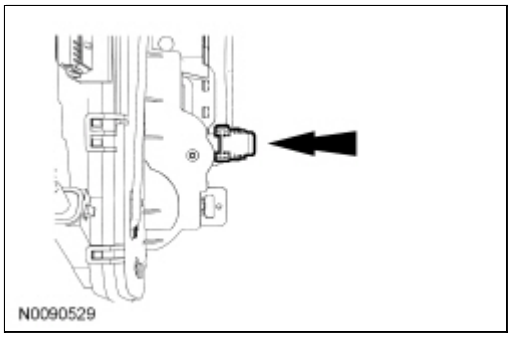
Removal and Installation

NOTE: Individual door lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build a new lock cylinder to the current key code of the vehicle.

1. Remove the exterior front door handle. For additional information, refer to Exterior Front Door Handle in this section.
2. Remove the retaining clip and the door lock cylinder.
3. To install, reverse the removal procedure.

repair4less

Exterior Door Handle — SuperCrew



Item	Part Number	Description
1	N620480	Exterior door handle nuts (2 required)
2	W714163	Exterior rear door handle seal
3	W709562	Exterior rear door handle bolt
4	1626605/ 1626604	Exterior rear door handle (LH/RH)

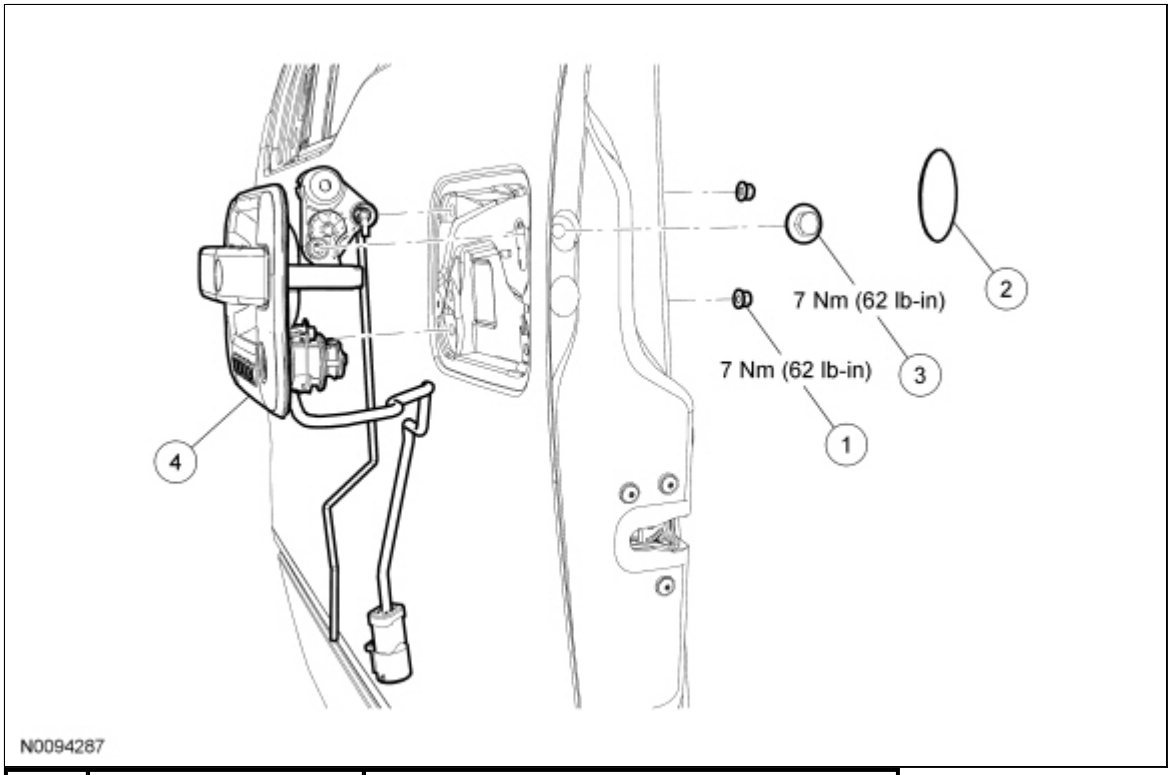
Removal and Installation

NOTE: The door window glass must be completely raised.

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Open the clip and disconnect the exterior rear door handle actuating rod.

repair4less

4. Remove the 2 exterior door handle nuts.
    - To install, tighten to 7 Nm (62 lb-in).



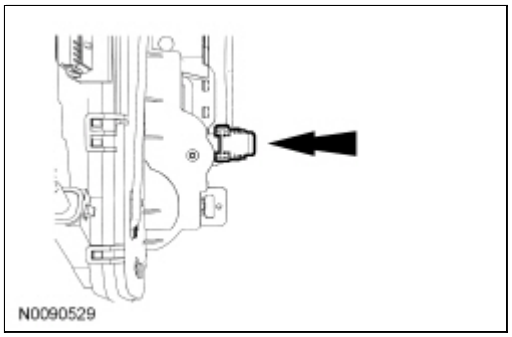
5. Remove the upper exterior rear door handle seal.

6. Remove the exterior door handle bolt.
    - To install, tighten to 7 Nm (62 lb-in).

7. Remove the exterior door handle.

8. To install, reverse the removal procedure.

Exterior Front Door Handle



Item	Part Number	Description
1	N620480	Exterior door handle nuts (2 required)
2	W714163	Exterior door handle bolt seal
3	W709562	Exterior door handle bolt
4	1522405/ 1522404	Exterior door handle (LH/RH)

Removal and Installation

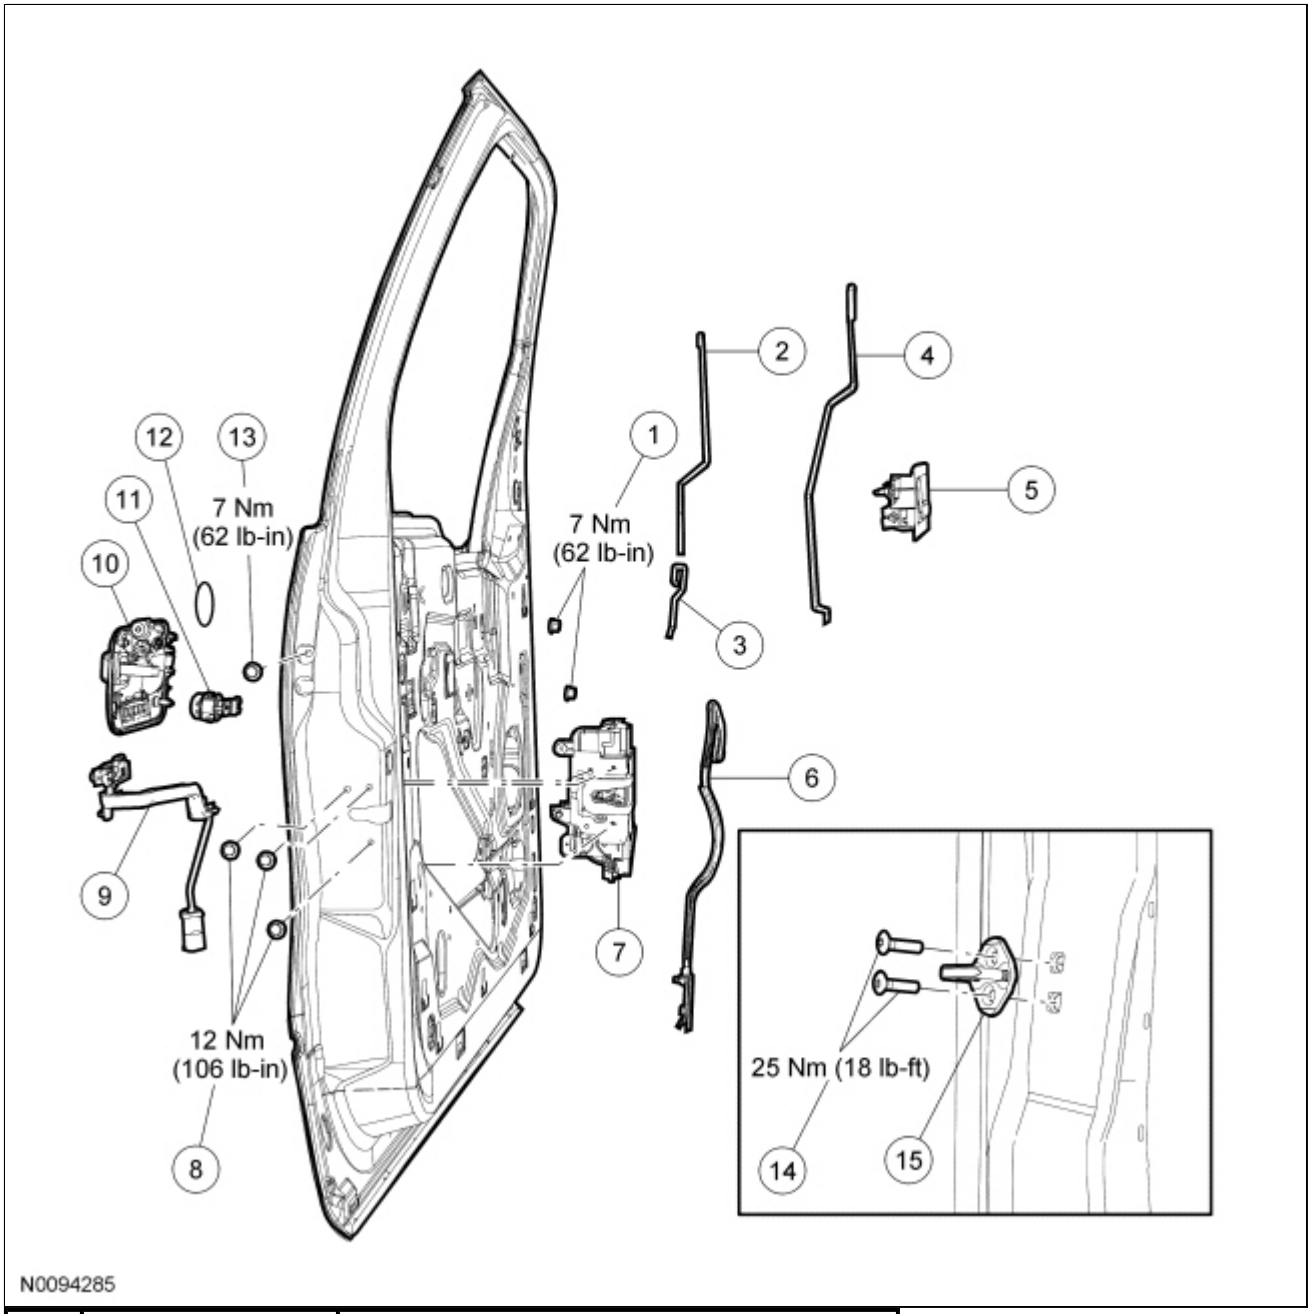
NOTE: The door window glass must be completely raised.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the side impact energy absorption panel.
3. Position the water shield aside.
4. If equipped, disconnect the actuating rod from the door lock cylinder.
5. Open the clip and disconnect the exterior front door handle actuating rod from the front door latch.

repair4less

6. If equipped, disconnect the keyless entry keypad electrical connector and disconnect the harness channel from the door.

7. Remove the 2 exterior door handle nuts.
    - To install, tighten to 7 Nm (62 lb-in).



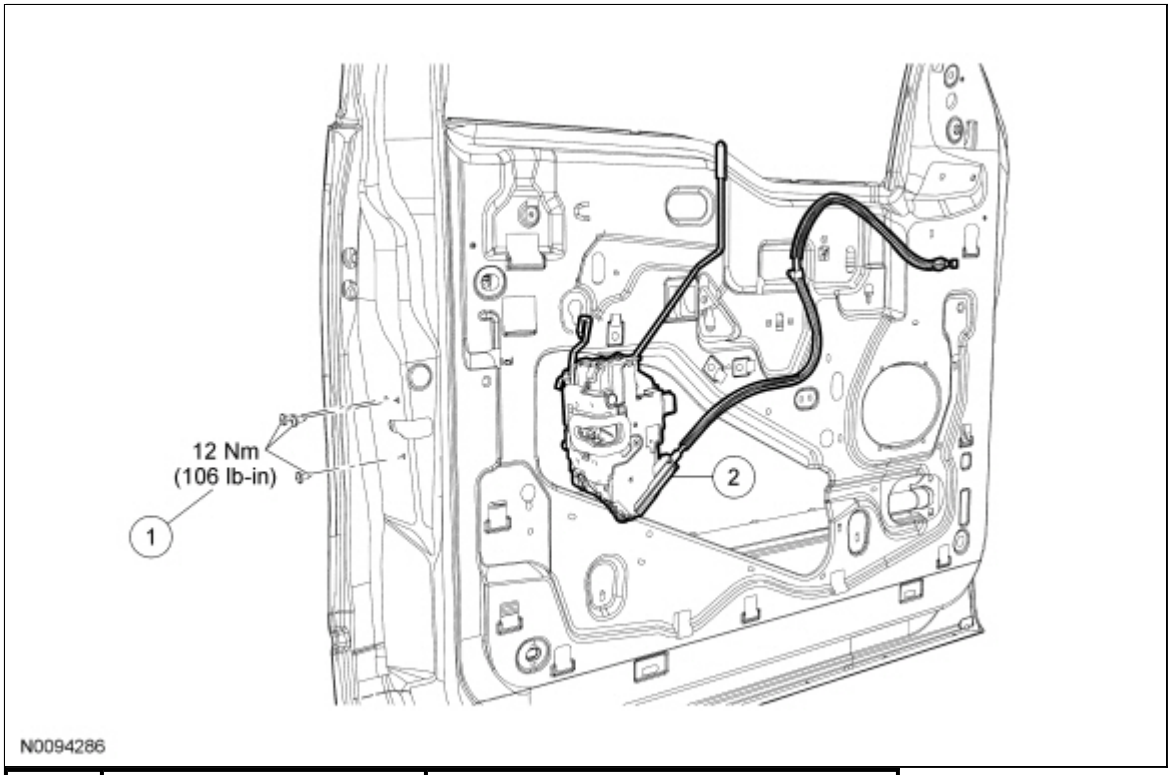
8. Remove the upper exterior front door handle bolt seal.

9. Remove the exterior front door handle bolt.
    - To install, tighten to 7 Nm (62 lb-in).

10. Remove the exterior front door handle.

11. To install, reverse the removal procedure.

Front Door Handles, Locks and Latches — Exploded View



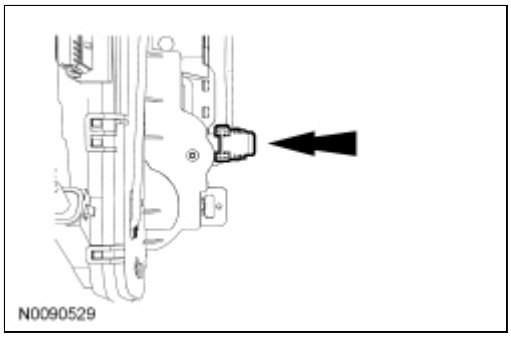
Item	Part Number	Description
1	N620480	Exterior door handle nuts (2 required)
2	1522153/ 1522152	Exterior door handle actuating rod (LH/RH)
3	1522135/ 1522134	Lock cylinder actuating rod (LH/RH)
4	1521853/ 1521852	Door lock rod (LH/RH)

repair4less

5	1522601/ 1522600	Interior door handle (LH/RH)
6	63221A00	Door latch release cable
7	5421813/ 5421812	Door latch (LH/RH)
8	W714092	Door latch bolts (3 required)
9	14A626	Keyless entry keypad (if equipped)
10	1522405/ 1522404	Exterior door handle (LH/RH)
11	1521990	Door lock cylinder
12	W714163	Exterior door handle bolt seal
13	W709562	Exterior door handle bolt
14	W714017	Door latch striker bolts (2 required)
15	1522008	Door latch striker

1. For additional information, refer to the procedures in this section.

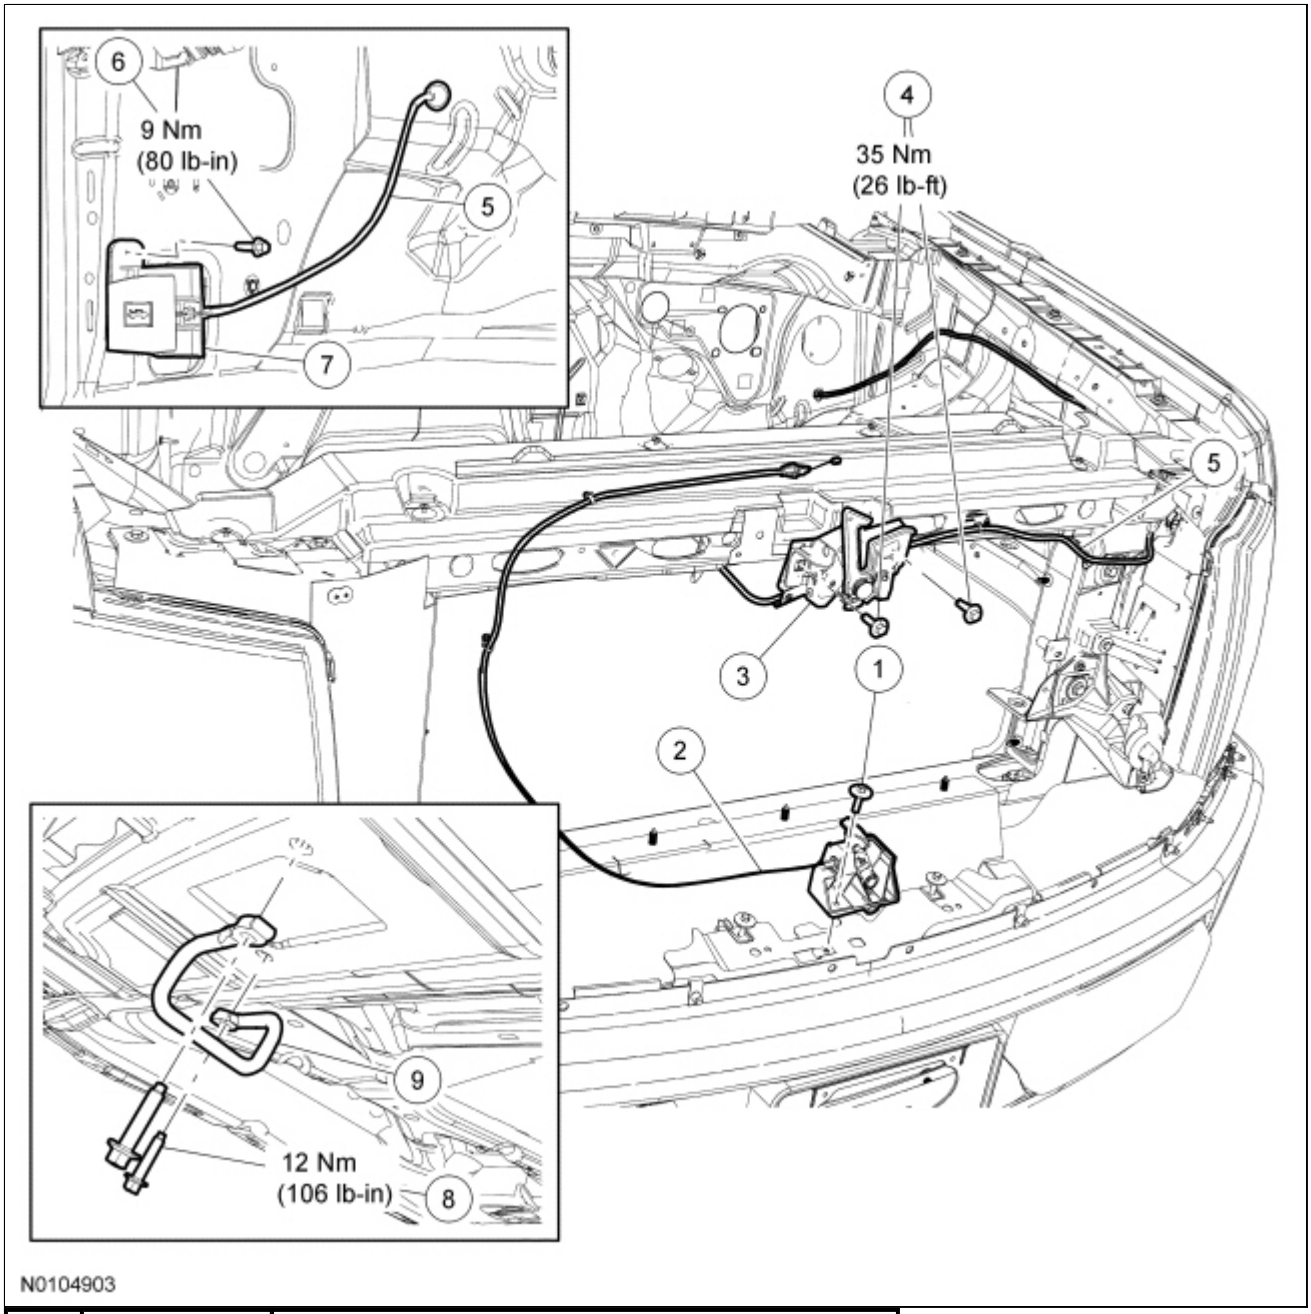
Front Door Latch



Item	Part Number	Description
1	W714092	Door latch bolts (3 required)
2	5421813/ 5421812	Door latch (LH/RH)

Removal and Installation

NOTE: The door window glass must be completely raised.

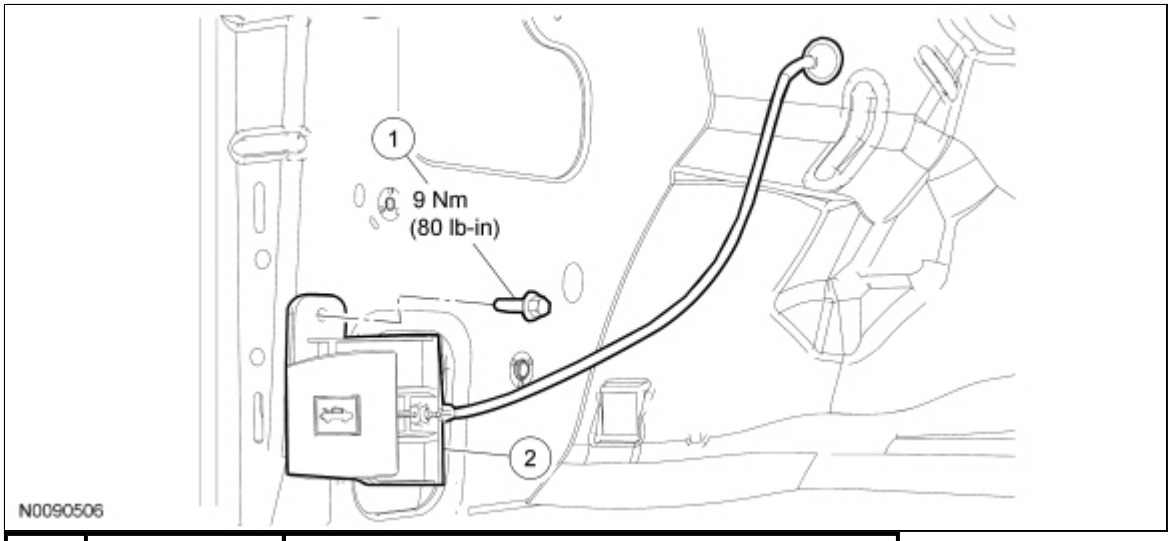


1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the side impact energy absorption panel.
3. Position the water shield aside.
4. Release the interior front door handle actuating cable from the locating clip.
5. Disconnect the front door latch electrical connector.
6. If equipped, disconnect the actuating rod from the door lock cylinder.
7. Open the clip and disconnect the exterior front door handle actuating rod from the front door latch.

repair4less

8. Remove the 3 door latch bolts.
    - To install, tighten to 12 Nm (106 lb-in).
9. Remove the front door latch.
10. To install, reverse the removal procedure.

Hood Latch and Components — Exploded View

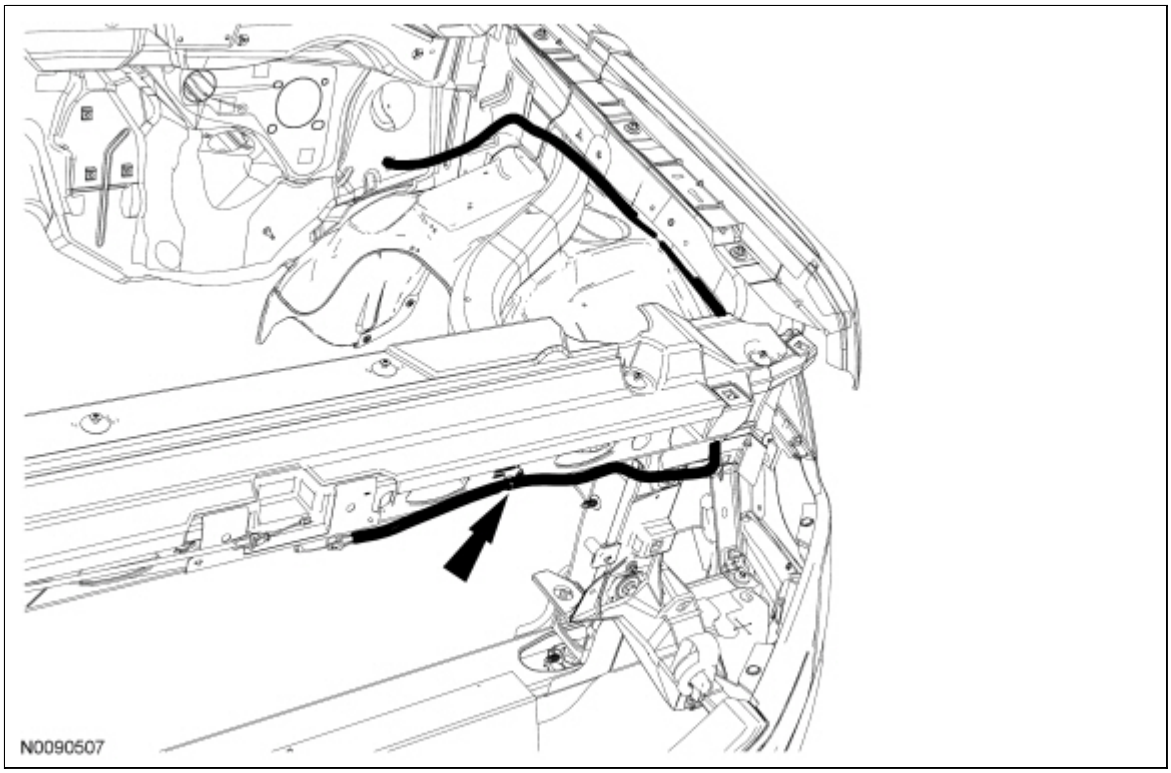


Item	Part Number	Description
1	W505425	Secondary hood latch release handle bolt
2	16916	Secondary hood latch release handle and cable
3	16700	Hood latch
4	W711848	Hood latch bolts (2 required)

repair4less

5	16916	Primary hood latch release cable
6	W707722	Primary hood latch release handle bolt
7	16916	Primary hood latch release handle
8	W500215	Hood latch striker bolts (2 required)
9	16K689	Hood latch striker

1. For additional information, refer to the procedures in this section.

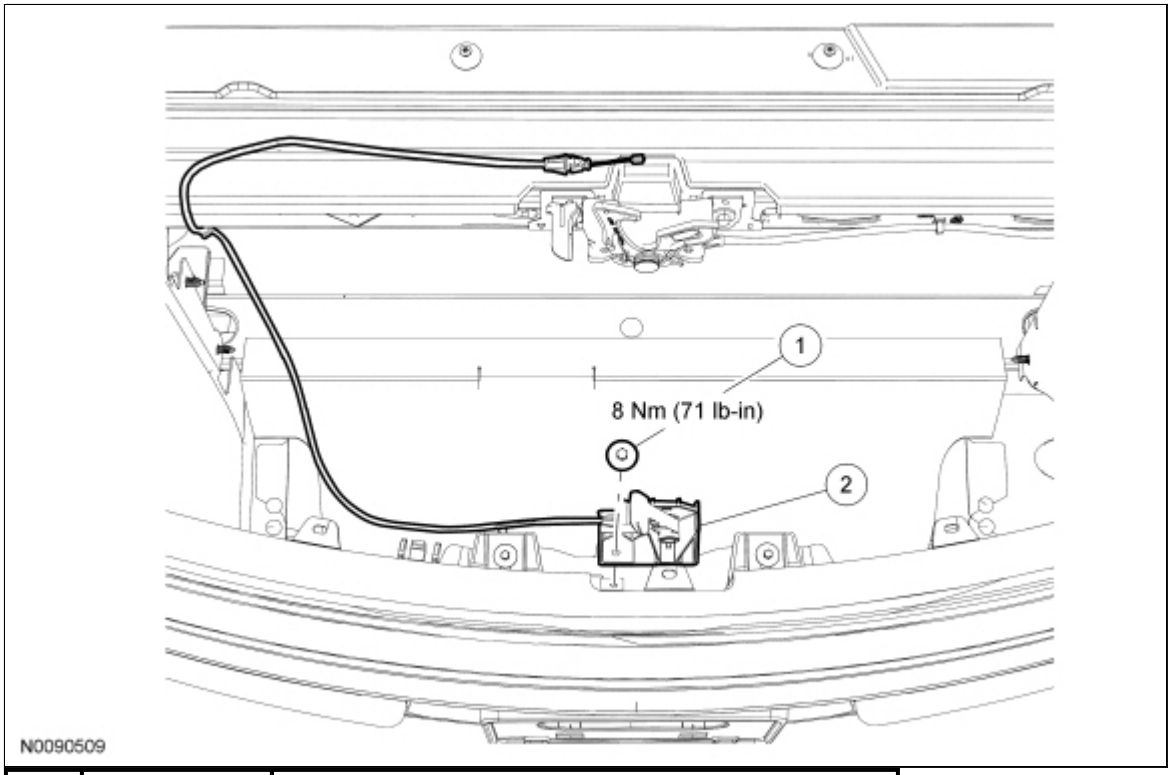


Hood Latch Release Handle — Primary

Item	Part Number	Description
1	N805375	Primary hood latch release handle bolt
2	16916	Primary hood latch release handle and cable

Primary Hood Latch Release Cable Routing

repair4less

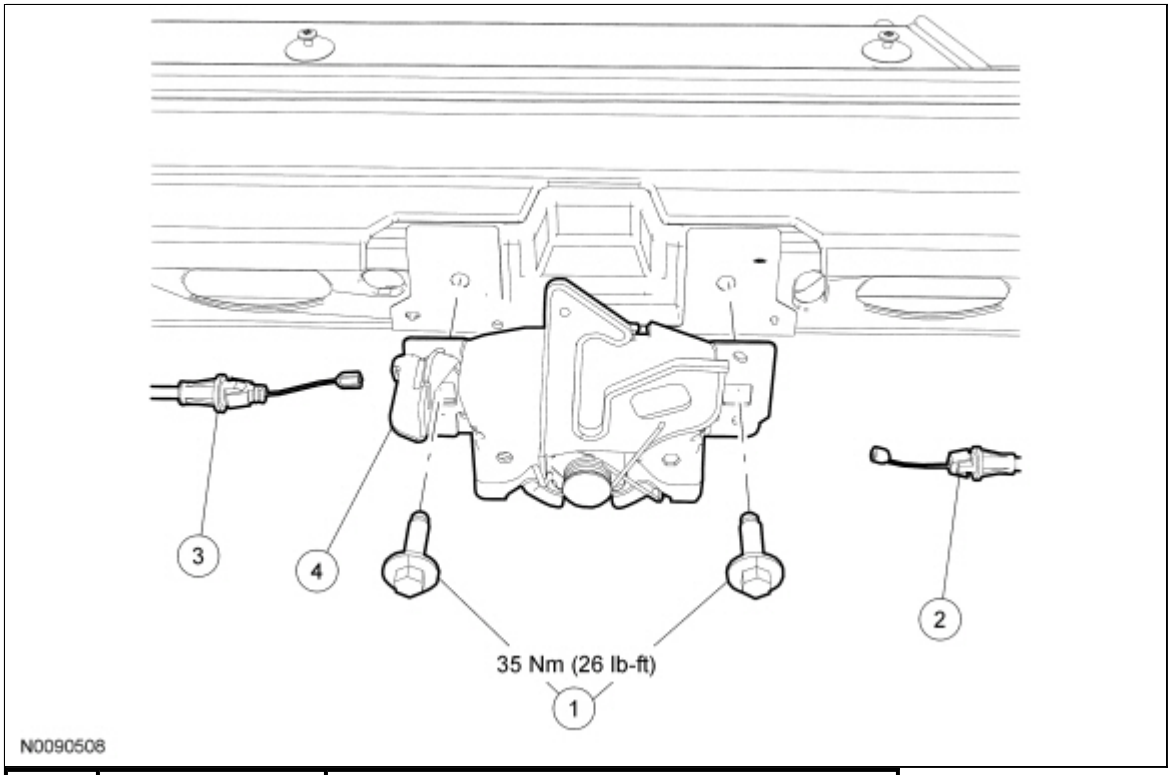


Removal and Installation

1. Remove the hood latch. For additional information, refer to Hood Latch in this section.
2. Remove the air cleaner element. For additional information, refer to Section 303-12 .
3. Remove the degas bottle bolts and position the degas bottle assembly aside.
4. Remove the cowl side trim panel. For additional information, refer to Section 501-05 .
5. Remove the primary hood latch release handle bolt.
    - To install, tighten to 9 Nm (80 lb-in).
6. Release the cable locators and remove the primary hood latch release cable.
7. To install, reverse the removal procedure.
    - When the hood latch is installed, the latch adjustment must be checked to make sure the latch is installed and aligned correctly.

repair4less

Hood Latch Release Handle — Secondary



Item	Part Number	Description
1	W711848	Secondary hood latch release handle bolt
2	16916	Secondary hood latch release handle and cable

Removal and Installation

1. Disconnect the secondary hood latch release cable from the hood latch.
2. Disconnect the secondary hood latch release cable from the guide clips.
3. Remove the secondary hood latch release handle bolt.
    - To install, tighten to 8 Nm (71 lb-in).
4. Remove the secondary hood latch release.
5. To install, reverse the removal procedure.

repair4less

Hood Latch

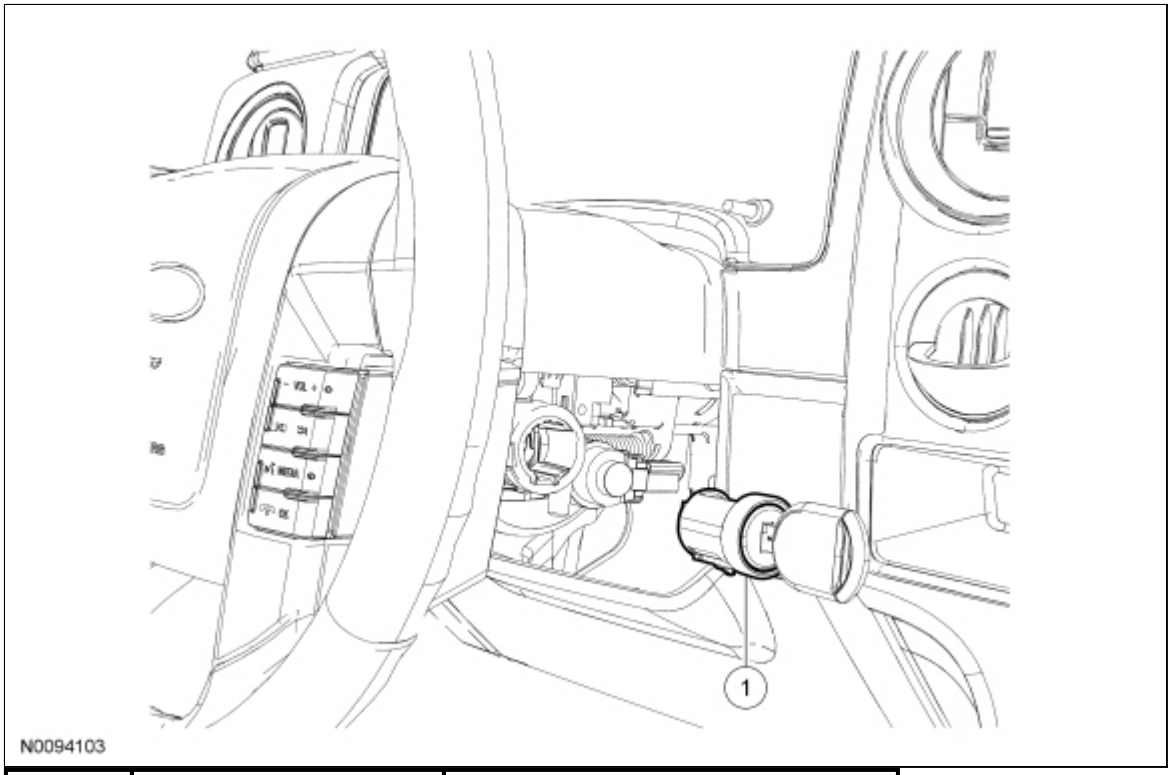
Item	Part Number	Description
1	W711848	Hood latch bolts (2 required)
2	16916	Primary hood latch release cable
3	16916	Secondary hood latch release cable
4	16700	Hood latch

Removal and Installation

1. **NOTE:** Mark the location of the hood latch with a permanent-type marker.

   Remove the 2 hood latch bolts and position the hood latch aside.
   - To install, tighten to 35 Nm (26 lb-ft).

2. Disconnect the primary hood latch release cable.



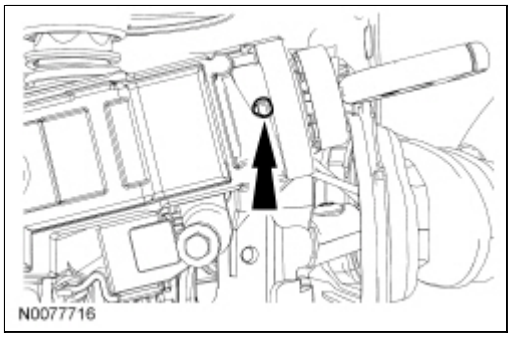
3. Disconnect the secondary hood latch release cable.

4. Remove the hood latch.

5. To install, reverse the removal procedure.
   - When the hood latch is installed, the latch adjustment must be checked to make sure the latch is installed and aligned correctly.

repair4less

Ignition Lock Cylinder — Functional



Item	Part Number	Description
1	11582	Ignition lock cylinder

Removal

NOTE: The individual lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build a new lock cylinder to the current key code of the vehicle.

1. Remove the Passive Anti-Theft System (PATS) transceiver. For additional information, refer to Section 419-01B .

2. With the ignition switch in the ACC position, press the locking pin with a suitable tool and remove the lock cylinder.

Installation

1. Make sure the lock cylinder is in the ACC position.

2. Insert the ignition lock cylinder into the ignition lock cylinder access hole located on the steering column.
    - Make sure to align the locking pin with the locking pin access hole.

3. Rotate the ignition key through all lock cylinder positions to check for correct operation.

---

repair4less

Ignition Lock Cylinder — Non Functional

Removal

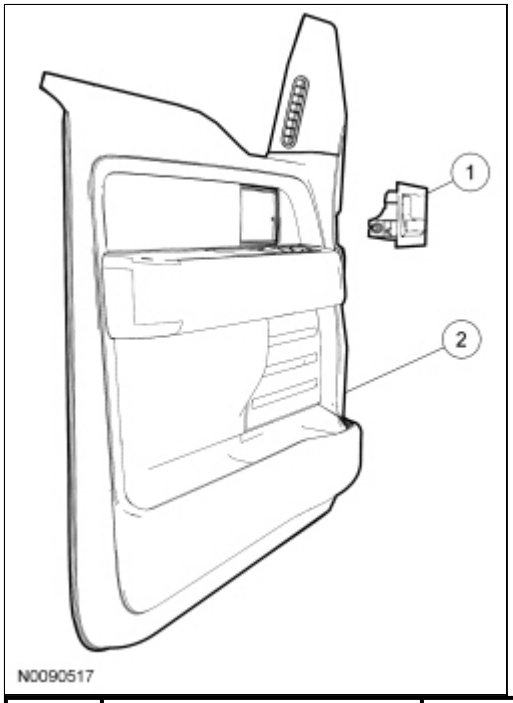
1. Remove the Passive Anti-Theft System (PATS) transceiver. For additional information, refer to Section 419-01B .

2. Remove the ignition lock cylinder.
   - Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.
   - Remove and discard the ignition lock cylinder and drill shavings from the steering column.

3. Remove the bearing retainer.

4. Remove the steering column lock housing bearing and steering column lock gear.

Installation

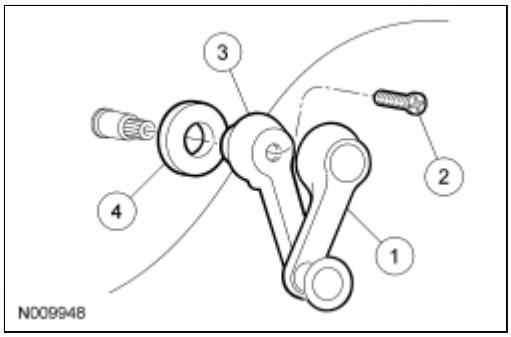


1. Thoroughly clean all drill shavings from the steering column and inspect it for damage.

2. Install a new ignition lock cylinder.
   - Verify the ignition lock cylinder operation.

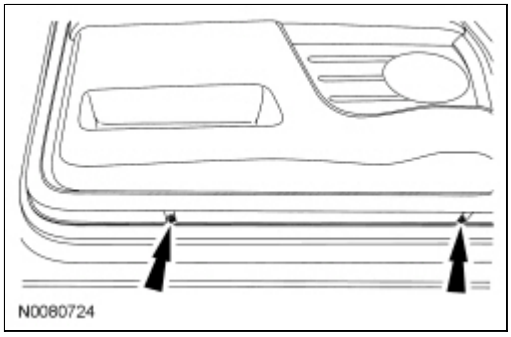
3. If needed, program the new PATS keys. For additional information, refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in Section 419-01B .

Interior Door Handle — Front



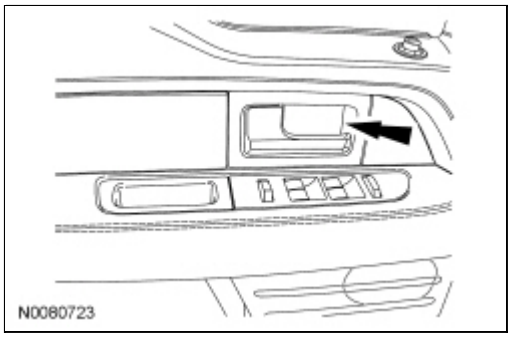
NOTE: LH side shown, RH similar.

Item	Part Number	Description
1	1522601/ 1522600	Interior door handle (LH/RH)
2	1823943/ 1823942	Door trim panel (LH/RH)

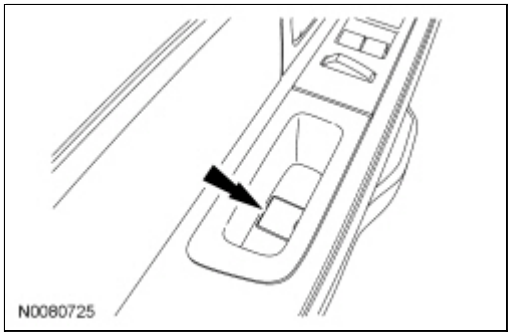


Removal and Installation

1. If equipped, remove the window regulator handle.
    1. Separate the handle cover from the handle.
    2. Remove the screw.
    3. Remove the window regulator handle.
    4. Remove the spacer.

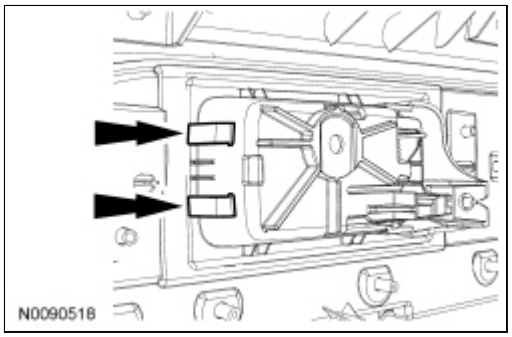


repair4less



2. Remove the 2 front door trim panel lower screws.

3. Remove the door handle screw cover and screw.

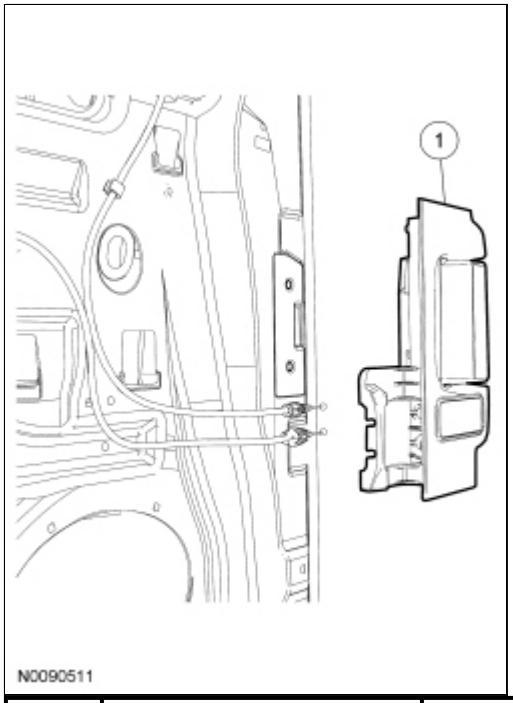


4. Remove the pull cup screw cover and screw.

5. ***NOTICE:*** **Do not pull directly outward on the front door trim panel, as damage may occur.**

   Position the front door trim panel outward.
   - Lift upward to remove the front door trim panel and position outward.
   - Disconnect the interior handle activating cable from the interior door handle.

6. Release the interior door handle retaining tabs and remove the interior door handle.



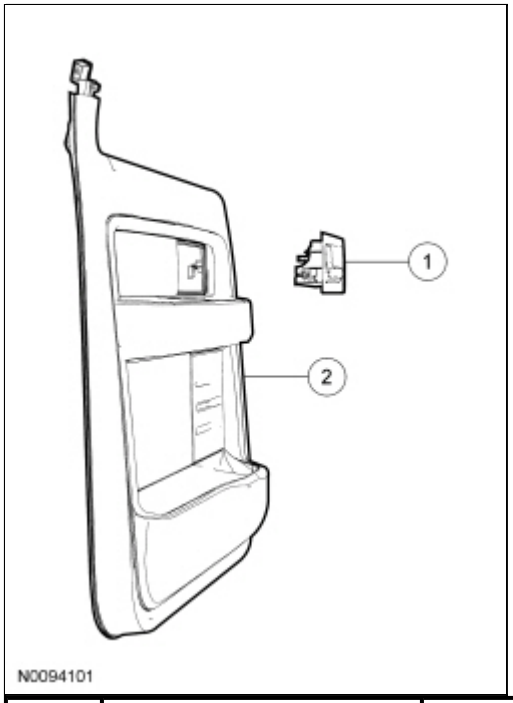
7. To install, reverse the removal procedure.

repair4less

Interior Door Handle — SuperCab

NOTE: LH side shown, RH similar.

Item	Part Number	Description
1	1822601/ 1822600	Interior door handle (LH/RH)

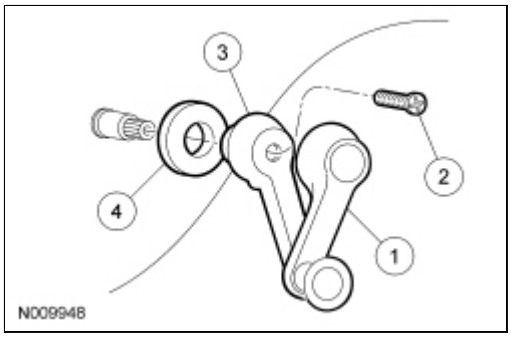


Removal and Installation

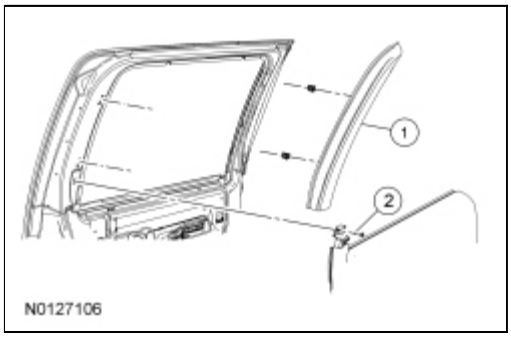
1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Disconnect the upper door latch release cable from the interior door handle.
3. Disconnect the lower door latch release cable from the interior door handle, and remove the interior door handle.
4. To install, reverse the removal procedure.

repair4less

Interior Door Handle — SuperCrew



NOTE: LH side shown, RH similar.



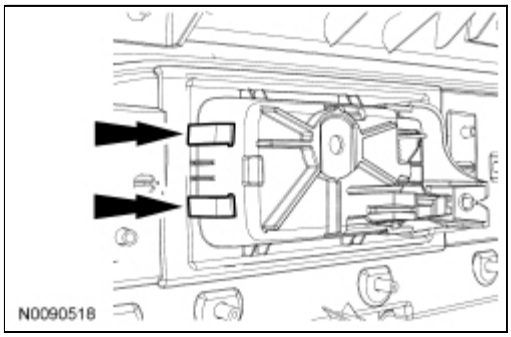
Item	Part Number	Description
1	1822601/ 1822600	Interior door handle (LH/RH)
2	1627407/ 1627406	Door trim panel (LH/RH)

Removal and Installation

1. If equipped, remove the window regulator handle.
    1. Separate the handle cover from the handle.
    2. Remove the screw.
    3. Remove the window regulator handle.
    4. Remove the spacer.

2. Remove the rear door garnish moulding.
    1. Pull outward to release the rear door garnish moulding clips from the door.
    2. Remove the upper rear door trim panel screw.

3. Remove the rear door handle cover plate.

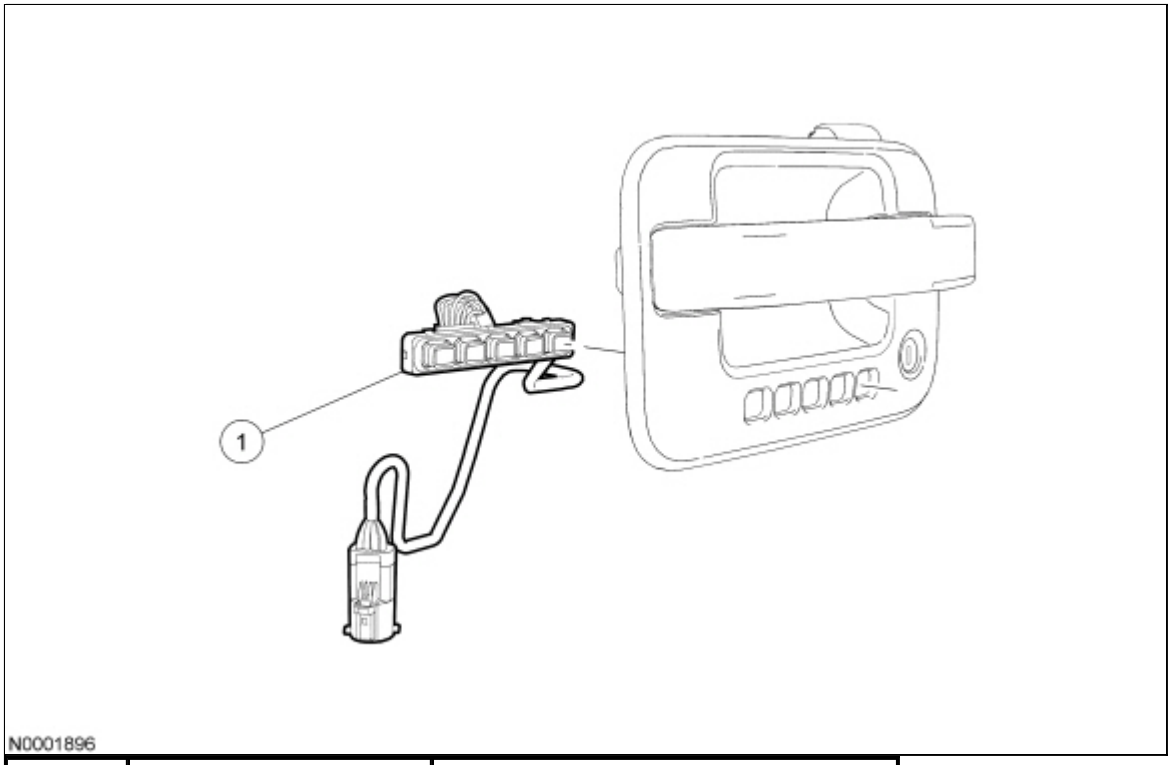


4. Remove the rear door handle screw.

5. Remove the 2 rear door trim panel screws.

6. ***NOTICE:*** **Do not pull directly outward on the rear door trim panel. Damage may occur.**

   Position the rear door trim panel outward.
    - Lift upward to remove the rear door trim panel and position outward.
    - Disconnect the interior handle activating cable from the interior door handle.

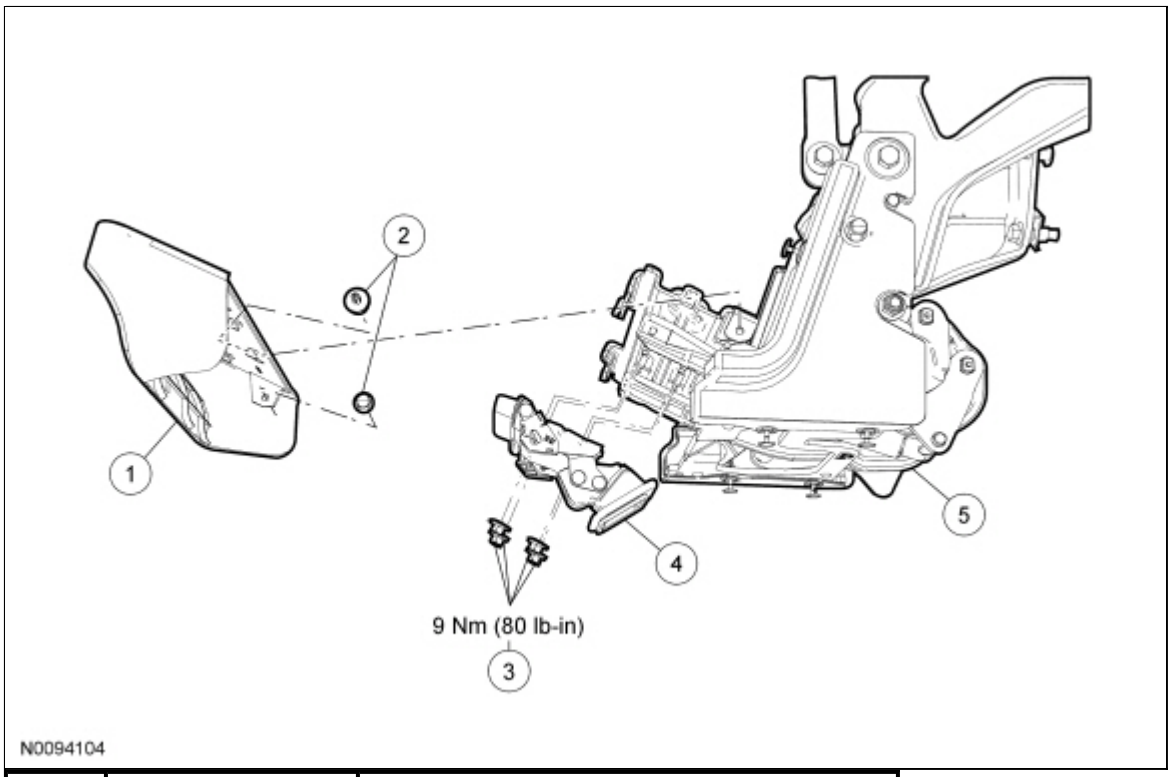


7. Release the interior door handle retaining tabs and remove the interior door handle.

8. To install, reverse the removal procedure.

repair4less

Keyless Entry Keypad



Item	Part Number	Description
1	14A626	Keyless entry keypad

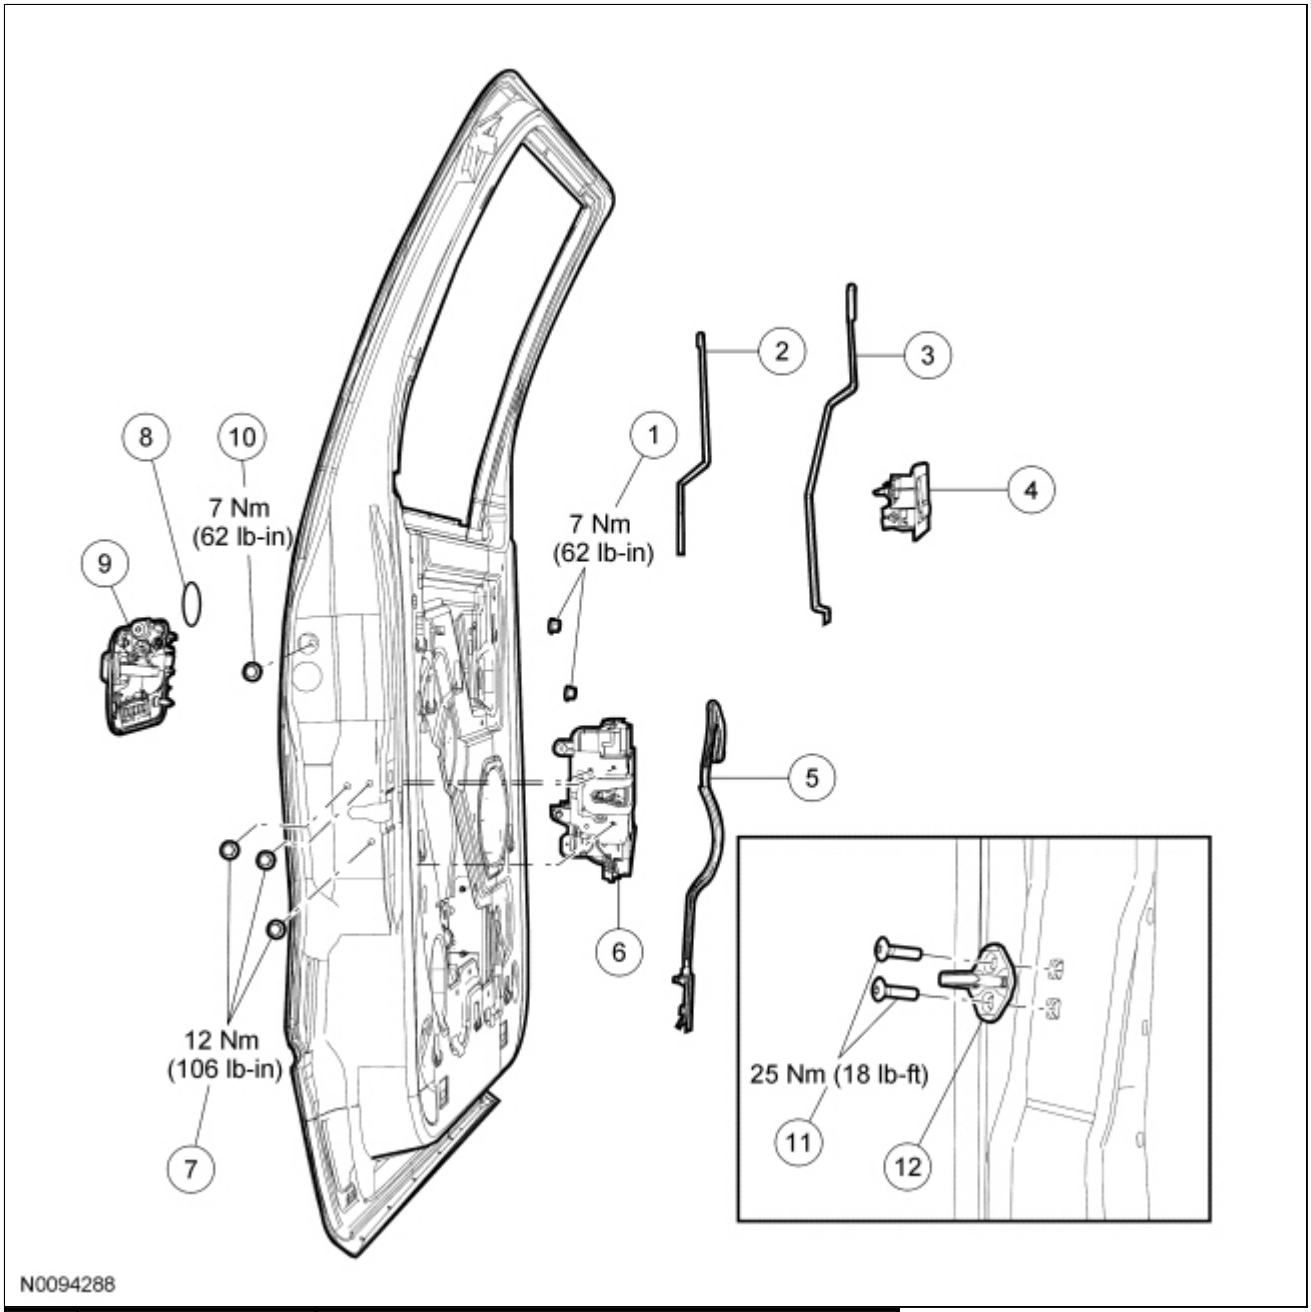
Removal and Installation

1. Remove the exterior front door handle. For additional information, refer to Exterior Front Door Handle in this section.
2. Release the locking tabs and remove the keyless entry keypad.
3. To install, reverse the removal procedure.

repair4less

Pickup Bed Side Step Latch

Item	Part Number	Description
1	1520044	Step cover
2	W505153	Step cover screws (2 required)
3	—	Step latch nuts (4 required)
4	1516516	Step latch
5	—	Step assembly



Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Open the step to the full extended position.
3. Remove the 2 step cover screws.
4. Slide the step cover off the step.
5. Remove the 4 latch nuts and the latch.
    - To install, tighten to 9 Nm (80 lb-in).

repair4less

6. To install, reverse the removal procedure.

Rear Door Handles, Locks and Latches — Exploded View, Super Crew

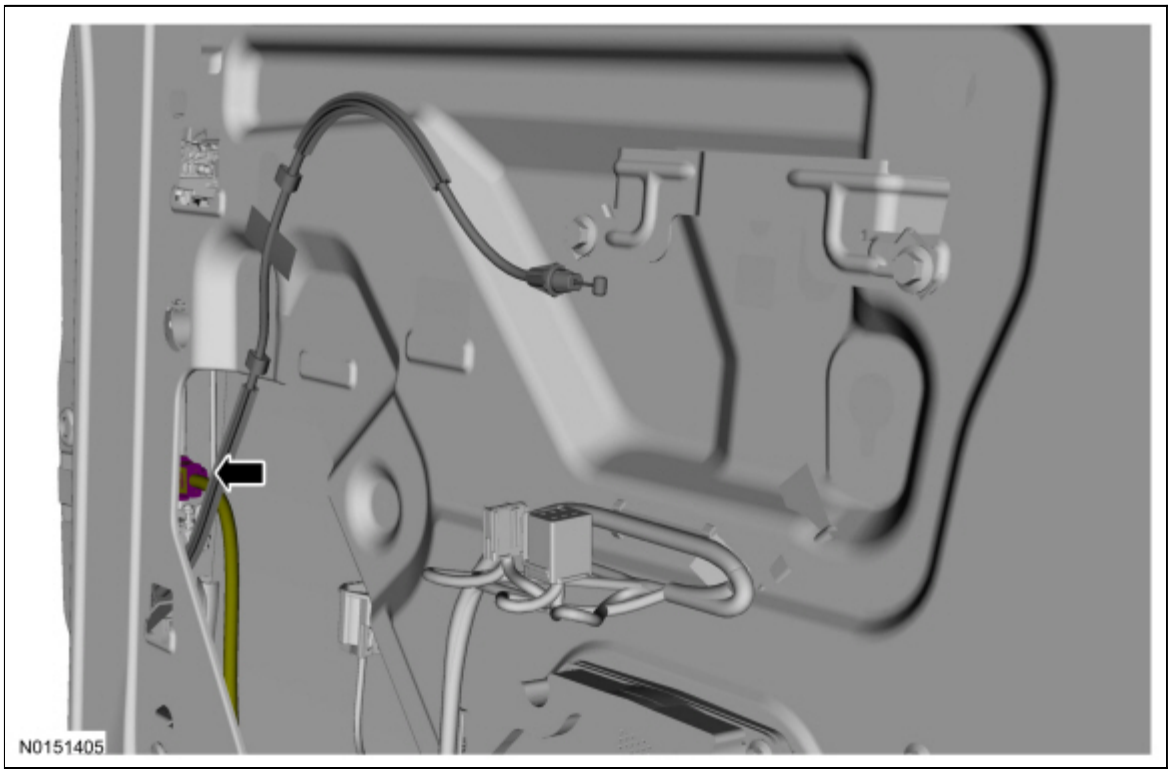
8	W710881	Lower door latch striker bolts (2 required)
9	18264B70	Lower door latch striker

1. For additional information, refer to the procedures in this section.

Rear Door Latch — Lower, SuperCab

Item	Part Number	Description
1	W714092	Lower door latch bolts (3 required)
2	18264A01/ 18264A00	Lower door latch and cable (LH/RH)

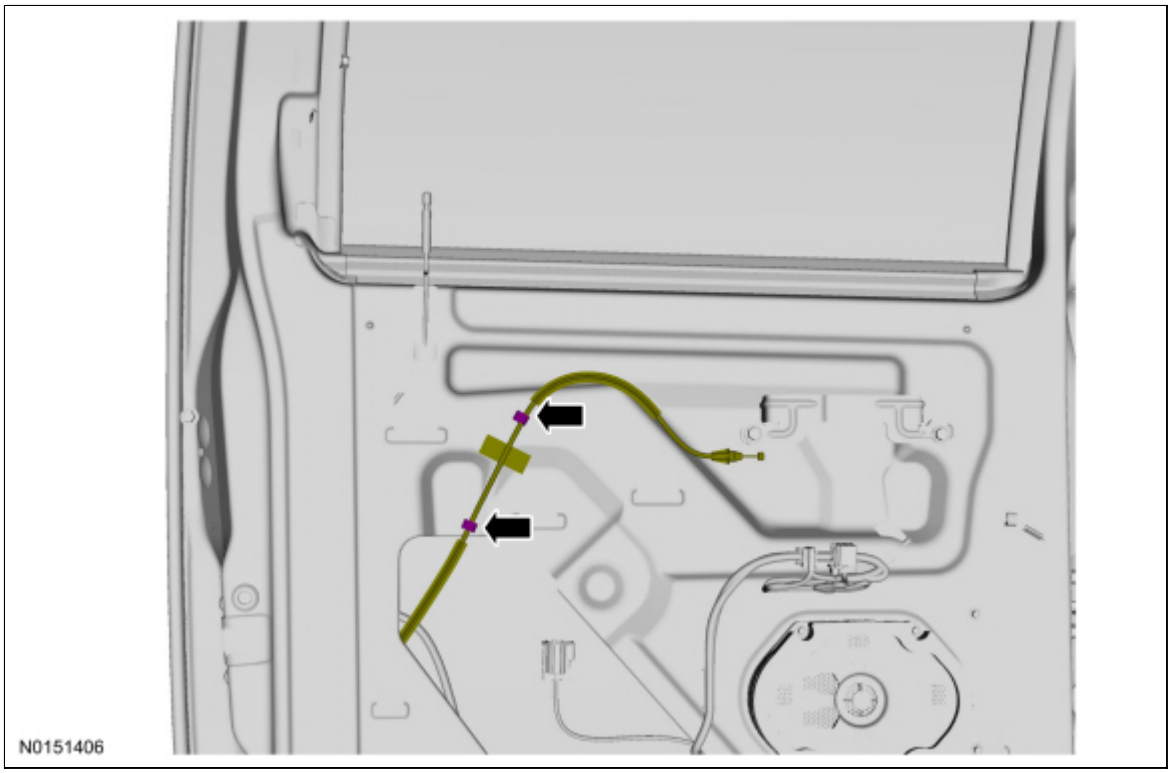
Removal and Installation



1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Disconnect the door ajar switch electrical connector.
4. Disconnect the lower door latch actuating cable from the interior door handle.
5. Remove the interior door handle actuating cable from the guide clips.
6. Remove the 3 lower door latch bolts and the lower door latch.
   - To install, tighten to 12 Nm (106 lb-in).
7. To install, reverse the removal procedure.

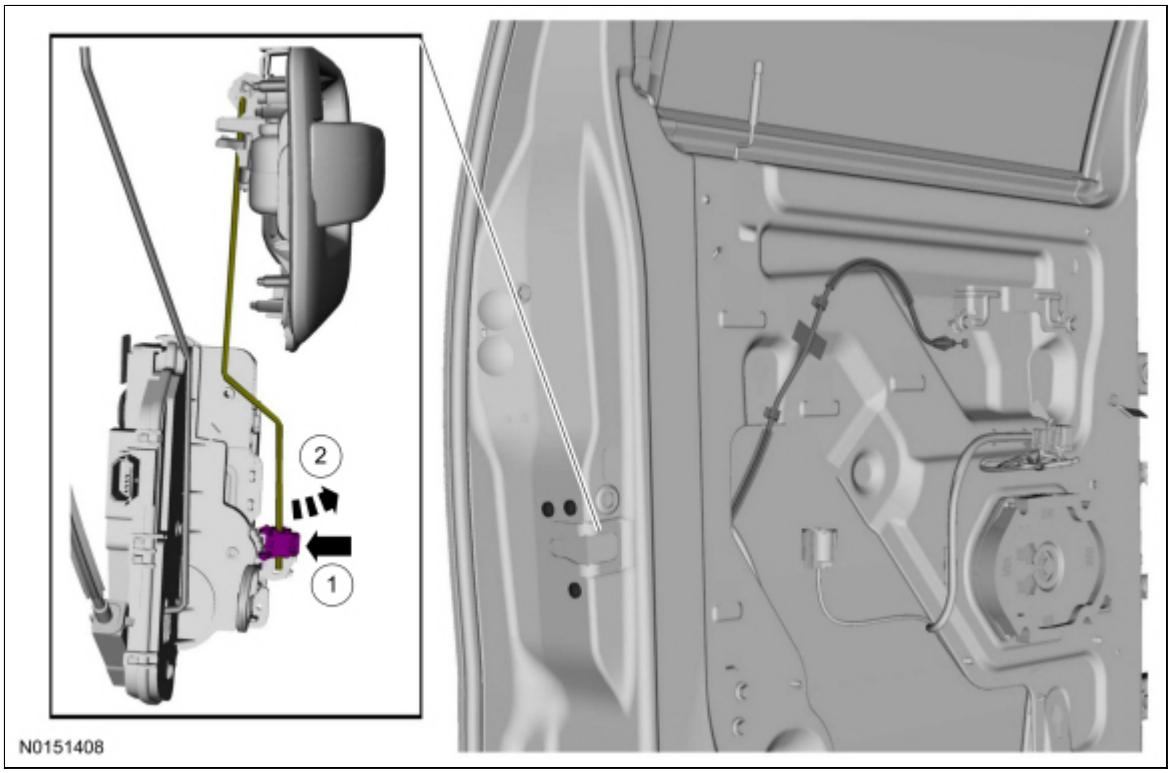
repair4less

Rear Door Latch — SuperCrew

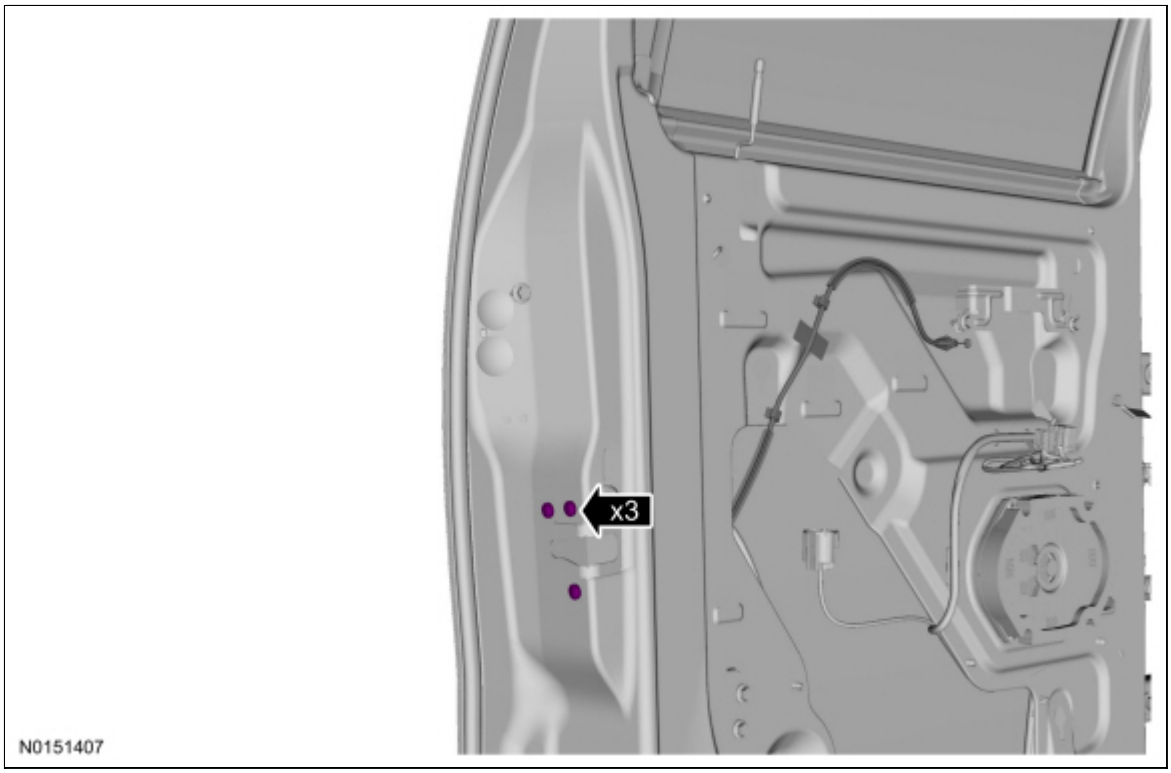


Removal and Installation

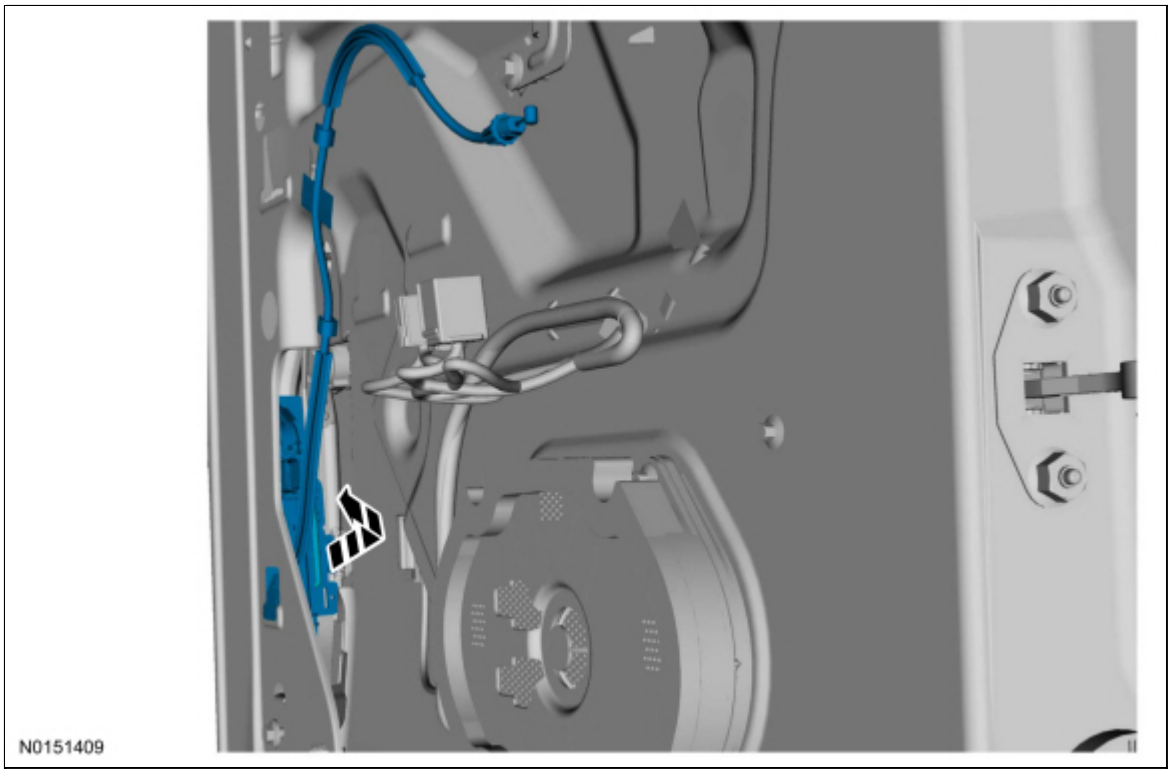
1. Remove the rear window regulator and motor. For additional information, refer to Section 501-11 .
2. Disconnect the rear door latch electrical connector.



3. Disconnect the 2 rear inside door handle cable routing clips from the door.



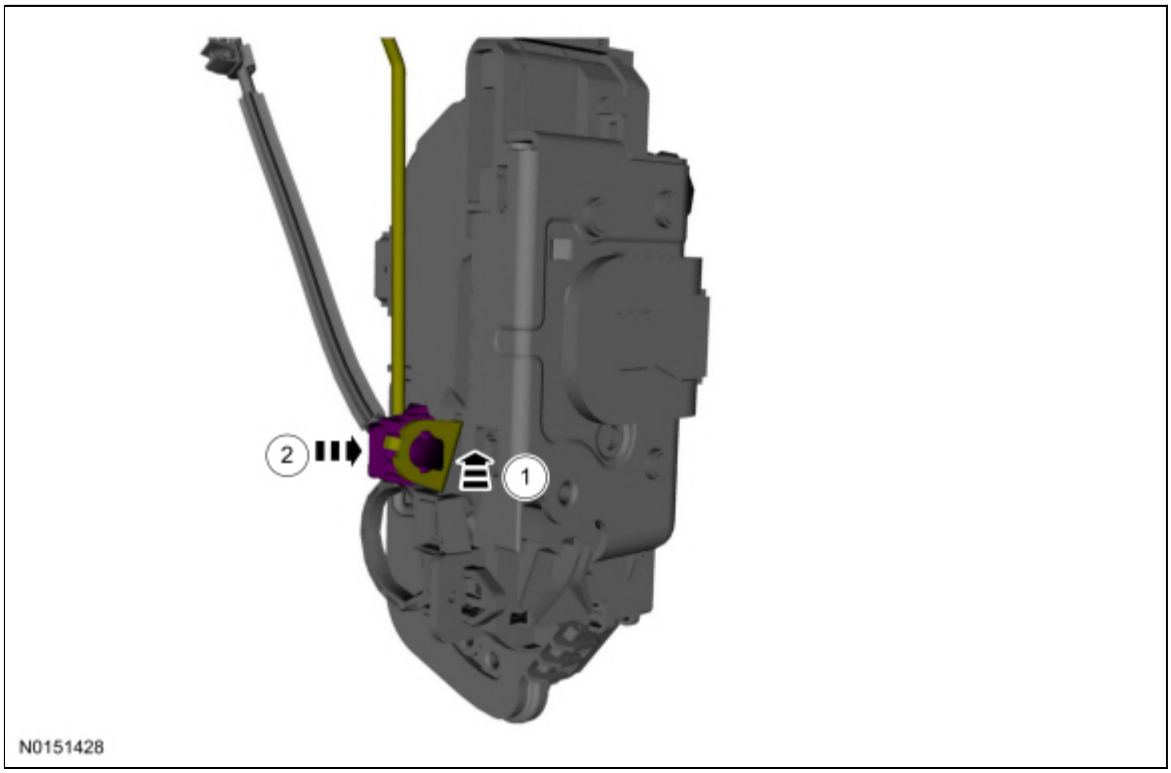
repair4less



4. Open the clip and disconnect the exterior rear door handle actuating rod from the latch.

5. Remove the 3 door latch bolts.
    - To install, tighten to 12 Nm (106 lb-in).

6. Remove the latch.

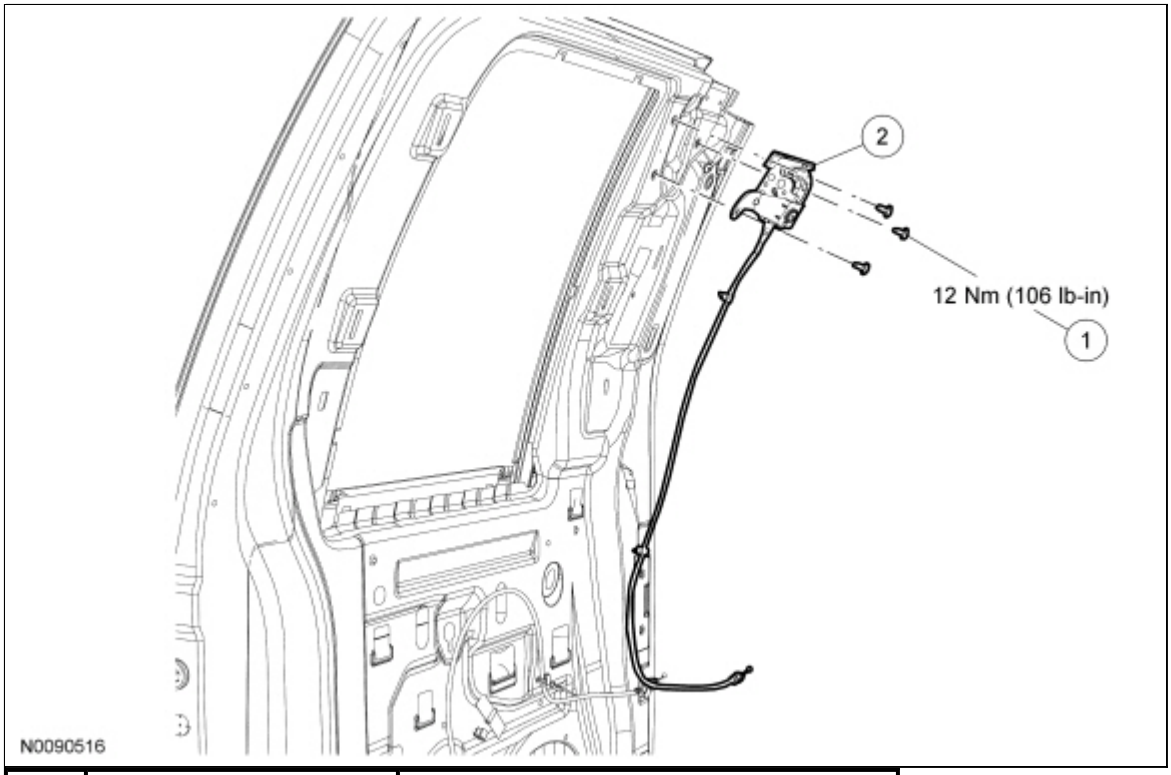


Installation

1. ***NOTICE:*** **Ensure the latch lever is in the relaxed (all the way up) position prior to connecting**

repair4less

the exterior rear door handle actuating rod to the latch. Do not apply downward pressure when connecting the exterior rear door handle actuating rod to the latch this could result in improper operation of the power door lock.



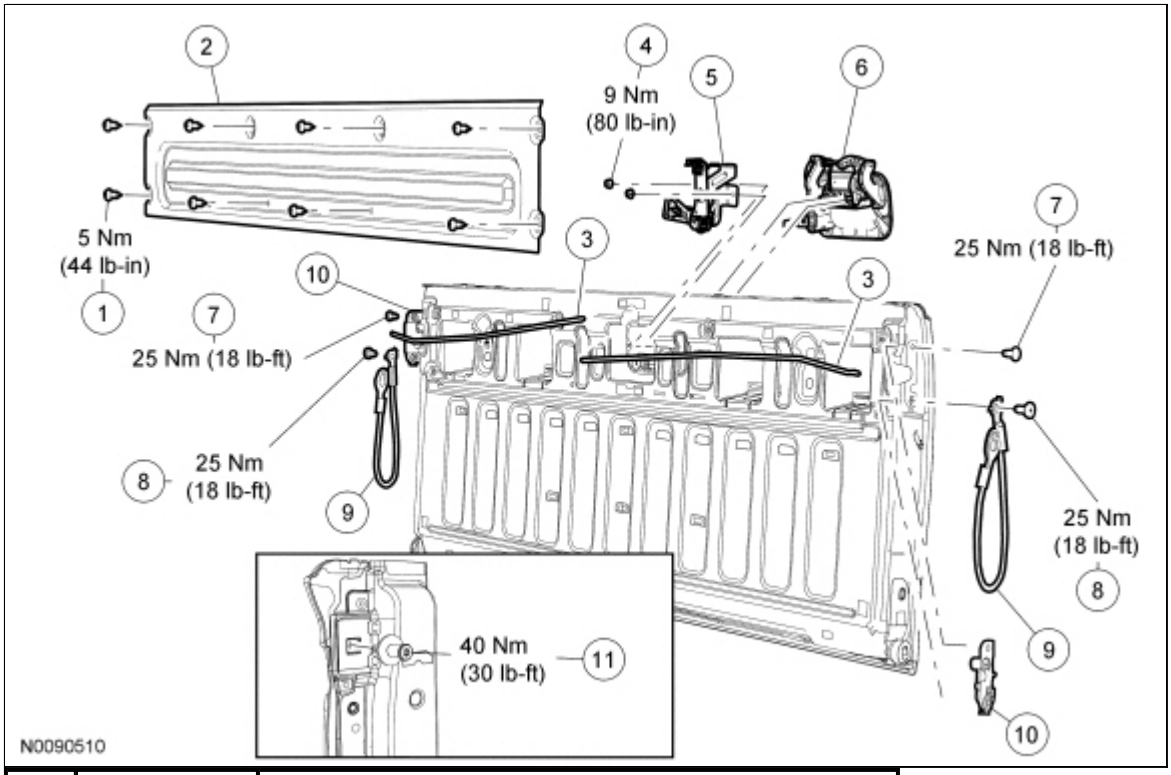
To install, reverse the removal procedure.

2. Check for proper operation.
    1. Lock the doors using the power door lock switch.
    2. Attempt to open the door using the exterior door handle.
    3. If the door opens, locate the clip on the latch and re-adjust the position of the clip on the door handle actuating rod.

repair4less

Rear Door Latch — Upper, SuperCab

Item	Part Number	Description
1	W714092	Upper door latch bolts (3 required)
2	18264A01/ 18264A00	Upper door latch and cable (LH/RH)



Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Disconnect the upper door latch actuating cable from the interior door handle.
3. Remove the interior door handle actuating cable from the guide clips.
4. Remove the 3 upper door latch bolts and the upper door latch.
    - To install, tighten to 12 Nm (106 lb-in).
5. To install, reverse the removal procedure.

repair4less

Tailgate Latch Remote Control

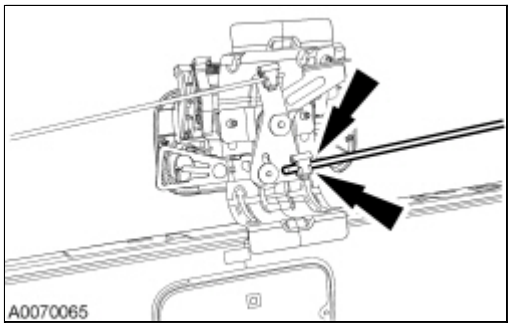
Removal and Installation

1. If equipped, remove the tailgate step assist handle. For additional information, refer to Section 501-04 .

2. Remove the bolts and the tailgate access panel (7 bolts for flareside bed, 8 for without step tailgate, or 13 with step tailgate).
   - To install, tighten to 5 Nm (44 lb-in).

3. Open the 2 clips and release the 2 tailgate latch actuating rods from the tailgate remote control.

4. If equipped, release the tailgate latch actuating rod locator from the tailgate.

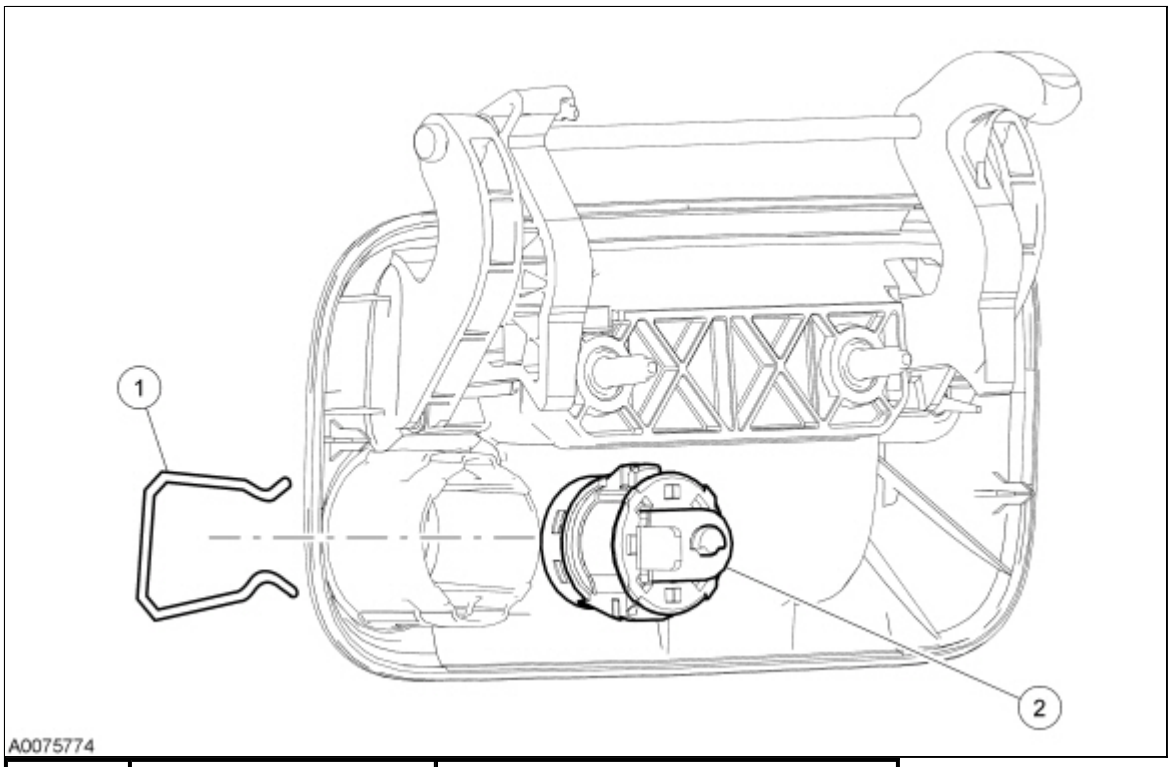


5. Remove the 2 tailgate release handle nuts and the tailgate remote control.
   - To install, tighten to 9 Nm (80 lb-in).

6. To install, reverse the removal procedure.

Tailgate Latch

Removal and Installation



1. Open and support the tailgate.
2. If equipped, remove the tailgate step assist handle. For additional information, refer to Section 501-04 .
3. Remove the bolts and the tailgate access panel (7 bolts for flareside bed, 8 for without step tailgate, or 13 with step tailgate).
   - To install, tighten to 5 Nm (44 lb-in).
4. Open the clip and release the tailgate latch actuating rod from the tailgate remote control.

5. If equipped, release the tailgate latch actuating rod locator from the tailgate.
6. Remove the upper tailgate latch bolt.
   - To install, tighten to 25 Nm (18 lb-ft).
7. Remove the lower tailgate latch bolt and the tailgate latch cable.
   - To install, tighten to 25 Nm (18 lb-ft).
8. Remove the tailgate latch.
9. To install, reverse the removal procedure.

repair4less

Tailgate Lock Cylinder

Item	Part Number	Description
1	1522023	Retaining clip
2	1521990	Tailgate lock cylinder

Removal and Installation

NOTE: When a new lock cylinder is installed, the tailgate lock cylinder, door lock cylinders and the ignition lock cylinder should be installed as a set. This eliminates carrying an extra key which fits only 1 lock. If a new key is to be used, the new key code is attached to a tag.

NOTE: The individual door lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build a new lock cylinder to the current key code of the vehicle.

1. Remove the tailgate release handle. For additional information, refer to Tailgate Release Handle in this section.
2. Remove retaining clip and the tailgate lock cylinder.
3. To install, reverse the removal procedure.

repair4less

Tailgate Release Handle

Removal and Installation

1. If equipped, remove the tailgate step assist handle. For additional information, refer to Section 501-04 .

2. Remove the bolts and the tailgate access panel (7 bolts for flareside bed, 8 for without step tailgate, or 13 with step tailgate).
   - To install, tighten to 5 Nm (44 lb-in).

3. Remove the 2 tailgate release handle nuts.
   - To install, tighten to 9 Nm (80 lb-in).

4. Remove the tailgate release handle.

5. To install, reverse the removal procedure.

repair4less

Wipers and Washers

The wiper and washer system(s) consists of the following components:

- Body Control Module (BCM)
- Front camera washer (SVT Raptor only, if equipped)
- Multifunction switch
- Rain sensor (if equipped)
- Rain sensor bracket (if equipped)
- Steering Column Control Module (SCCM)
- Washer pump
- Washer reservoir (integral to the battery tray)
- Windshield wiper blades
- Windshield wiper motor
- Windshield wiper mounting arm and pivot shaft
- Windshield wiper pivot arms
- Windshield wiper relay

Wipers

The wiper system is activated by the wiper/washer switch. The wiper/washer switch is mounted to the SCCM . The SCCM commands the windshield wiper motor to activate the appropriate low, high and intermittent modes. When commanded by the SCCM , the windshield wiper motor activates the rear window wiper motor INT 1 and INT 2 modes.

Washers

The washer system is activated by the wiper/washer switch. The wiper/washer switch is mounted to the SCCM . The SCCM commands the windshield wiper motor to activate the appropriate front or rear wash modes. The front and rear washer system share the same washer reservoir and a bi-directional washer pump. The windshield wiper motor controls the direction of the washer pump to direct washer fluid to the windshield or rear window.

Courtesy Wipe Feature

When the windshield washer system is activated, the wipers cycle 3 times with washer fluid, followed by one final wipe a few seconds later to clear any remaining fluid that is dripping from the top of the windshield. This feature can be enabled/disabled through the message center. For additional information on enabling/disabling this feature, refer to the Owner's Literature.

Rain Sensitive Wipers (if equipped)

When equipped, the rain sensitive wiper feature replaces the intermittent wiper feature. The rain sensitive feature is active when the wiper/washer switch is in any of the 5 auto/intermittent sensitivity settings. The setting closest to OFF is the least sensitive to moisture, the highest setting being the most sensitive to moisture.

The rain sensitive wiper feature can be turned enabled/disabled through the message center.

When the rain sensitive wipers are disabled from the message center, or the windshield wiper motor detects a fault with the rain sensor input, the windshield wiper motor changes to a default intermittent mode. The timing of the wipers correspond to a standard intermittent setting based on the auto/intermittent sensitivity setting on the wiper/washer switch.

The rain sensor is located on the windshield next to the rear view mirror. A gel-type lens is used as the interface between the rain sensor and the windshield. The rain sensor gel-type lens is part of the rain sensor and cannot be replaced separately on a rain sensor of this type.

Wiper Activated Headlamps (if equipped)

If equipped with automatic headlamps, the BCM illuminates the exterior lamps within 10 seconds of the windshield wipers being activated by the wiper/washer switch when the headlamp control switch is in the AUTOLAMP position. The BCM continues to illuminate the exterior lamps for approximately 30 seconds after the windshield wipers have been turned off.

If equipped with rain sensitive wipers (feature must be enabled through the message center) and the wiper/washer switch is in one of the 5 auto/intermittent settings, the BCM illuminates the exterior lamps within 30 seconds of the windshield wipers being activated by moisture detected on the windshield when the headlamp control switch is in the AUTOLAMP position. The BCM continues to illuminate the exterior lamps for approximately 60 seconds after the windshield wipers have been deactivated (moisture no longer detected on the windshield).

Speed Dependent Wipers (if equipped)

The speed dependent feature increases the frequency of wiping to compensate for the extra moisture that accumulates on the windshield as the vehicle speed increases. This feature activates when the wiper/washer switch is in any intermittent setting except the INT 1 position. As vehicle speed increases, the speed dependent feature gradually shortens the delay between wipes.

Front Video Camera Washer System (if equipped)

When the wiper/washer switch is placed in the CAMERA WASH position, the windshield wiper motor activates the washer pump to to direct washer fluid at the front video camera lens.

Principles of Operation

Windshield Wiper Operation

The wiper system is activated by the multifunction switch. The multifunction switch is mounted to the Steering Column Control Module (SCCM). The SCCM commands the wiper motor to activate the appropriate wash, low, high and intermittent modes through a private Local Interconnect Network (LIN).

When the multifunction switch is in the HIGH position, the wiper motor also receives a ground signal which is hardwired directly through the SCCM (bypassing the logic within the module). This fail-safe circuit makes sure that the wipers function in HIGH speed mode in the event of a LIN communication failure.

Vehicles equipped with a front video camera have a front camera washer control switch that is part of the multifunction switch.

repair4less

Washer System (if not equipped with front video camera)

When the multifunction switch is placed in the WASH position, the SCCM sends the request to the windshield wiper motor through the LIN . The windshield wiper motor supplies voltage to the washer pump, which then directs washer fluid to the windshield.

Washer System (if equipped with front video camera)

When the multifunction switch is placed in the WASH position, the windshield wiper motor supplies voltage to the washer pump. Ground is provided to the washer pump through the normally closed contact in the front camera washer relay (located in the auxiliary Battery Junction Box (BJB)).

When the front video camera washer control is activated, the SCCM sends the request to the windshield wiper motor through the LIN . The windshield wiper motor controls the direction of the washer pump to direct washer fluid to the front video camera.

Courtesy Wipe Feature

When the washer system is activated, the wipers cycle 3 times with washer fluid, followed by one final wipe a few seconds later to clear any remaining fluid that is dripping from the top of the windshield. This feature can be enabled/disabled through the message center. For information on enabling/disabling this feature, refer to the Owner's Literature.

Speed Dependent Wipers

If equipped, the speed dependent feature increases the frequency of wiping to compensate for the extra moisture that accumulates on the windshield as the vehicle speed increases. This feature activates when the multifunction switch is in any intermittent setting except the INT 1 position. As vehicle speed increases, the speed dependent feature gradually shortens the delay between wipes. The SCCM receives Vehicle Speed Sensor (VSS) information from the Body Control Module (BCM) through the High Speed Controller Area Network (HS-CAN). The SCCM sends the VSS information to the wiper motor through the LIN .

Rain Sensitive Wipers (if equipped)

When equipped, the rain sensitive wiper feature replaces the intermittent wiper feature. The rain sensitive feature is active when the multifunction switch is in any of the 5 auto/intermittent sensitivity settings. The setting closest to OFF is the least sensitive to moisture, the highest setting being the most sensitive to moisture.

The rain sensor optically senses water on the windshield. An infrared beam of specific intensity lights a section of the windshield. The intensity of the reflected beam is measured and compared to the intensity of the transmitted beam. If there is water on the surface of the windshield, the beam distorts, reducing the intensity of the beam. If the beam is not reflected completely, it is interpreted as rain on the windshield and the windshield wipers are started.

The rain sensor sends data through the LIN to the windshield wiper motor. When the rain sensitive wiper feature is enabled, based on the data received from the rain sensor and the auto/intermittent setting on the multifunction switch, the system automatically activates and adjusts the wiper speed and frequency when

moisture is detected on the windshield.

A gel-type lens is used as the interface between the rain sensor and the windshield. If the lens is missing or damaged, the rain sensing wipers can be inoperative. The rain sensor gel-type lens is part of the rain sensor and cannot be replaced separately on a rain sensor of this type.

The rain sensitive wiper feature can be enabled/disabled through the message center.

When the rain sensitive wipers are disabled from the message center, or the windshield wiper motor detects a fault with the rain sensor input, the windshield wiper motor changes to a default intermittent mode. The timing of the wipers correspond to a standard intermittent setting based on the auto/intermittent sensitivity setting on the multifunction switch.

Wiper Activated Headlamps

If equipped with automatic headlamps, the SCCM sends a message to the BCM over the HS-CAN to illuminate the exterior lamps within 10 seconds of the wipers being activated by the multifunction switch when the headlamp control switch is in the AUTOLAMP position. The BCM continues to illuminate the exterior lamps for approximately 30 seconds after the wipers have been turned off.

If equipped with rain sensitive wipers (feature must be enabled through the message center) and the multifunction switch is in 1 of the 5 auto/intermittent settings, the SCCM sends a message to the BCM over the HS-CAN to illuminate the exterior lamps within 30 seconds of the wipers being activated by moisture detected on the windshield when the headlamp control switch is in the AUTOLAMP position. The BCM continues to illuminate the exterior lamps for approximately 60 seconds after the wipers have been deactivated (moisture no longer detected on the windshield).

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Wiper linkage ● Washer nozzles ● Washer fluid hoses ● Wiper blades	● Battery Junction Box (BJB) fuse(s): ■ 41 (15A) (vehicles equipped with front video camera only) ■ 49 (30A) ■ 54 (5A) (vehicles equipped with front video camera only) ■ 79 (5A) ● Wiper relay ● Rain sensor (if equipped) ● Wiper motor ● Washer pump ● Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to next section.

repair4less

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the Steering Column Control Module (SCCM) and the Body Control Module (BCM).

9. If the DTCs retrieved are related to the concern, refer to the Steering Column Control Module (SCCM) DTC Chart. For all other SCCM DTCs, refer to Section 211-05. For any BCM DTCs, refer to Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

Steering Column Control Module (SCCM) DTC Chart

DTC	Description	Action
B1008:09	Wiper Mode Switch: Component Failure	INSTALL a new multifunction switch. REFER to Section 211-05. CLEAR the DTCs and REPEAT the self-test. If the DTC is retrieved again, INSTALL a new SCCM. REFER to Section 211-05.
B1051:09	Front Washer Switch: Component Failure	INSTALL a new multifunction switch. REFER to Section 211-05. CLEAR the DTCs and REPEAT the self-test. If the DTC is retrieved again, INSTALL a new SCCM. REFER to Section 211-05.

B10AD:02	Rain Sensor: General Signal Failure	GO to Pinpoint Test E .
B10AD:08	Rain Sensor: Bus Signal / Message Failure	GO to Pinpoint Test E .
B10AD:49	Rain Sensor: Internal Electronic Failure	INSTALL a new rain sensor. REFER to Rain Sensor in this section. CLEAR the DTCs. REPEAT the self-test.
B1131:02	Wiper Motor Module: General Signal Failure	GO to Pinpoint Test B .
B1131:08	Wiper Motor Module: Bus Signal / Message Failure	GO to Pinpoint Test B .
B12F7:09	Single Wipe Switch: Component Failure	INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTCs and REPEAT the self-test. If the DTC is retrieved again, INSTALL a new SCCM . REFER to Section 211-05 .
All other DTCs	—	REFER to Section 211-05 .

• The washer pump is inoperative or always on - vehicles not equipped with front video camera	• Wiring, terminals or connectors • Washer pump • Multifunction switch • Wiper motor • SCCM	• GO to Pinpoint Test G .
• The washer pump is inoperative or always on - vehicles equipped with front video camera	• Wiring, terminals or connectors • Washer pump • Multifunction switch • Wiper motor • Front camera washer relay	• GO to Pinpoint Test H .

Pinpoint Tests

Pinpoint Test A: The Windshield Wipers Are Inoperative

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

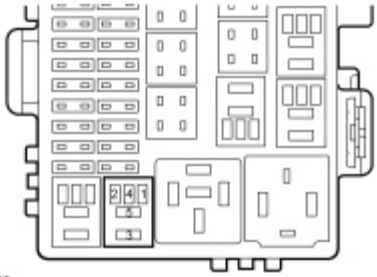
The wiper relay (located in the Battery Junction Box (BJB)) is energized when the ignition is ON. The wiper relay provides voltage to the wiper motor. The multifunction switch is mounted to the Steering Column Control Module (SCCM). The SCCM commands the wiper motor to activate the appropriate wash, low, high and intermittent modes through a Local Interconnect Network (LIN).

When the multifunction switch is in the HIGH position, the wiper motor receives ground which is hardwired directly through the SCCM (bypassing the logic within the SCCM and the wiper motor). This fail-safe circuit makes sure that the wipers function in HIGH speed mode in the event of a LIN communication failure.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Wiper relay
- Multifunction switch
- Wiper motor
- SCCM

PINPOINT TEST A: ALL WINDSHIELD WIPER MODES ARE INOPERATIVE



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

A8 CHECK THE FAIL-SAFE HIGH SPEED WIPER GROUND CIRCUIT FOR AN OPEN

NOTE: If steps A1-A7 did not identify the cause of the concern, a double fault is present. After the fail-safe ground is diagnosed and repaired, it is necessary check all operation modes and diagnose any symptom still

Yes
INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. If

present. • Disconnect: SCCM C2414A . • Measure the **resistance** between: Positive Lead: Pin C125-1, Circuit CRW15 (BN/WH) Negative Lead: Pin C2414A-12, Circuit CRW15 (BN/WH)  • **Is the resistance less than 3 ohms?**	the concern is still present, GO to A9 . **No** REPAIR the circuit.
A9 CHECK FOR CORRECT SCCM OPERATION	
• Disconnect and inspect all SCCM connectors. • Repair: ▪ corrosion (install new connector or terminals – clean module pins) ▪ damaged or bent pins – install new terminals/pins ▪ pushed-out pins – install new pins as necessary • Reconnect the SCCM connectors. Make sure they seat and latch correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** CHECK On-Line Automotive Service Information System (OASIS) for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSBs address this concern, INSTALL a new SCCM . REFER to Section 211-05 . **No** The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test B: The Intermittent And/Or Low Speed Windshield Wipers Are Inoperative

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

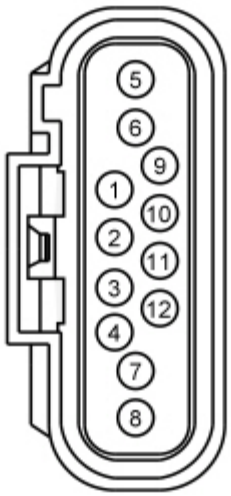
The wiper relay (located in the Battery Junction Box (BJB)) is energized when the ignition is ON. The wiper relay provides voltage to the wiper motor. The multifunction switch is mounted to the Steering Column Control Module (SCCM). The SCCM commands the wiper motor to activate the appropriate wash, low, high and intermittent modes through a Local Interconnect Network (LIN).

When the multifunction switch is in the HIGH position, the wiper motor receives ground which is hardwired

repair4less

directly through the SCCM (bypassing the logic within the SCCM and the wiper motor). This fail-safe circuit makes sure that the wipers function in HIGH speed mode in the event of a LIN communication failure.

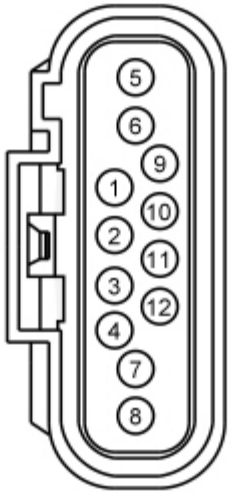
- DTC B1131:02 (Wiper Motor Module: General Signal Failure) — Sets when the SCCM detects a general signal failure occurs on the LIN .
- DTC B1131:08 (Wiper Motor Module: Bus Signal / Message Failure) — Sets when the SCCM loses communication with the windshield wiper motor over the LIN .



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- Windshield wiper motor
- Rain sensor (if equipped)
- SCCM

PINPOINT TEST B: THE INTERMITTENT AND/OR LOW SPEED WINDSHIELD WIPERS ARE INOPERATIVE



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK FOR SCCM DTC B1131:02 OR DTC B1131:08	
• Ignition ON. • Using a scan tool, perform the SCCM self-test. • **Is DTC B1131:02 or DTC B1131:08 present?**	**Yes** GO to B4 . **No** GO to B2 .
B2 CHECK THE LOW SPEED WINDSHIELD WIPER OPERATION	
• Place the multifunction switch to the low speed setting and observe the windshield wipers. Place the multifunction switch to the off setting. • **Do the windshield wipers operate with the multifunction switch in the low speed setting?**	**Yes** If not equipped with a rain sensor, GO to Pinpoint Test D . If equipped with a rain sensor, GO to Pinpoint Test E . **No** GO to B3 .
B3 CHECK THE MULTIFUNCTION SWITCH LOW SPEED SETTING INPUT	
• Using a scan tool, monitor the SCCM F_WIP_SLO_SW PID. • Place the multifunction switch to the low speed setting. • **Does the PID indicate the multifunction switch is in the low speed setting?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. If the concern is still present, INSTALL a new SCCM . REFER to Section 211-05 .

B4 CHECK THE HIGH SPEED WIPER OPERATION • Place the multifunction switch to the high speed setting and observe the windshield wipers. Place the multifunction switch to the off setting. • **Do the windshield wipers operate with the multifunction switch in the high speed setting?**	**Yes** If equipped with a rain sensor, GO to B5 . If not equipped with a rain sensor, GO to B6 . **No** GO to Pinpoint Test A .
B5 ISOLATE THE RAIN SENSOR • Ignition OFF. • Disconnect: Rain Sensor C914 . • Ignition ON. • **NOTE:** DTC B10AD:02 or DTC B10AD:08 may set and should be ignored. • Using a scan tool, clear the DTCs and then perform the SCCM self-test. • **Is DTC B1131:02 or DTC B1131:08 still present?**	**Yes** GO to B6 . **No** INSTALL a new rain sensor. REFER to Rain Sensor .
B6 CHECK THE WINDSHIELD WIPER MOTOR LOGIC GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: Windshield Wiper Motor C125 . • Measure the **resistance** between: Positive Lead: Pin C125-3, Circuit GD120 (BK/GN) Negative Lead: Pin —, Circuit Ground  • **Is the resistance less than 3 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit.
B7 CHECK THE LIN CIRCUIT FOR A SHORT TO VOLTAGE • Disconnect: SCCM C2414A . • Ignition ON. • Measure the **voltage** between:	**Yes** REPAIR the circuit. **No** GO to B8 .

repair4less

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit

Reconnect the SCCM connectors. Make sure they seat and latch correctly.
Operate the system and determine if the concern is still present.
Is the concern still present?

</td>
<td>Yes
CHECK On-Line Automotive Service Information System (OASIS) for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSBs address this concern, INSTALL a new SCCM . REFER to Section 211-05 .

No
The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.</td>
</tr>
</table>

Pinpoint Test C: The Windshield Wipers Stay On Continuously

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

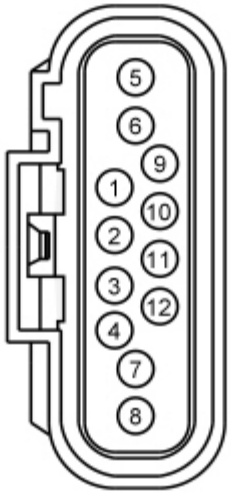
The wiper relay (located in the Battery Junction Box (BJB)) is energized when the ignition is ON. The wiper relay provides voltage to the wiper motor. The multifunction switch is mounted to the Steering Column Control Module (SCCM). The SCCM commands the wiper motor to activate the appropriate wash, low, high and intermittent modes through a Local Interconnect Network (LIN).

When the multifunction switch is in the HIGH position, the wiper motor receives ground which is hardwired directly through the SCCM (bypassing the logic within the SCCM and the wiper motor). This fail-safe circuit makes sure that the wipers function in HIGH speed mode in the event of a LIN communication failure.

This pinpoint test is intended to diagnose the following:

repair4less

- Wiring, terminals or connectors
- Wiper relay
- Multifunction switch
- Wiper motor
- SCCM



PINPOINT TEST C: THE WINDSHIELD WIPERS STAY ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE WINDSHIELD WIPER OPERATION WITH THE IGNITION OFF	
• Ignition OFF. • Observe the windshield wiper operation. • **Are the windshield wipers operating?**	**Yes** GO to C2 . **No** GO to C3 .
C2 CHECK THE WIPER RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Wiper Relay . • Observe the windshield wiper operation. • **Do the windshield wipers continue to operate?**	**Yes** REPAIR the circuit. **No** INSTALL a new wiper relay.
C3 CHECK THE MULTIFUNCTION SWITCH INPUT	

• Ignition ON.
• Make sure the multifunction switch is in the off setting.
• Using a scan tool, monitor the SCCM multifunction switch PIDs:
  • F_WASH_SW
  • F_WIP_INT_D1
  • F_WIP_INT_D2
  • F_WIP_INT_D3
  • F_WIP_INT_D4
  • F_WIP_INT_D5
  • F_WIP_SLO_SW
  • F_WIPE_FAST_SW
• **Are all of the PIDs displayed as OFF?**
	Yes
	GO to C4 .
	
	No
	INSTALL a new multifunction switch. REFER to Section 211-05 .
	
	If the concern is still present, INSTALL a new SCCM . REFER to Section 211-05 . TEST the system for normal operation.

C4 CHECK THE WINDSHIELD WIPER OPERATION WITH THE SCCM DISCONNECTED	
• Ignition OFF. • Disconnect: SCCM C2414A . • Ignition ON. • Observe the windshield wiper operation. • **Do the windshield wipers continue to operate?**	**Yes** GO to C5 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. If the concern is still present, GO to C6 .

C5 CHECK THE HIGH SPEED FAIL-SAFE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Windshield Wiper Motor C125 . • Measure the **resistance** between: Positive Lead: Pin C125-1, Circuit CRW15 (BN/WH) Negative Lead: Pin —, Circuit Ground  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor . **No** REPAIR the circuit.
C6 CHECK FOR CORRECT SCCM OPERATION	

• Disconnect and inspect all SCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals – clean module pins)
  ▪ damaged or bent pins – install new terminals/pins
  ▪ pushed-out pins – install new pins as necessary
• Reconnect the SCCM connectors. Make sure they seat and latch correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK On-Line Automotive Service Information System (OASIS) for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSBs address this concern, INSTALL a new SCCM . REFER to Section 211-05 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test D: The Windshield Wipers Do Not Operate Correctly In The Intermittent Mode

Normal Operation

The wiper relay (located in the Battery Junction Box (BJB)) is energized when the ignition is ON. The wiper relay provides voltage to the wiper motor. The multifunction switch is mounted to the Steering Column Control Module (SCCM). The SCCM commands the wiper motor to activate the appropriate wash, low, high and intermittent modes through a Local Interconnect Network (LIN).

repair4less

This pinpoint test is intended to diagnose the following:

- Multifunction switch
- Windshield wiper motor
- SCCM

PINPOINT TEST D: THE WINDSHIELD WIPERS DO NOT OPERATE CORRECTLY IN THE INTERMITTENT MODE

Test Step	Result / Action to Take
D1 VERIFY IF THE VEHICLE IS EQUIPPED WITH A RAIN SENSOR	
• Inspect the vehicle for a rain sensor. • **Is the vehicle equipped with a rain sensor?**	**Yes** GO to D2. **No** GO to D3.
D2 VERIFY THE RAIN SENSITIVE WIPER FEATURE IS DISABLED IN THE VEHICLE MESSAGE CENTER	
• Ignition ON. • Access the vehicle settings in the message center using the steering wheel controls and check the rain sensitive feature setting. • **Is the rain sensitive feature enabled?**	**Yes** GO to Pinpoint Test E. **No** GO to D3.
D3 CHECK THE LOW SPEED WIPER OPERATION	
• Ignition ON. • Place the multifunction switch to the low speed setting and observe the windshield wipers. Place the multifunction switch to the off setting. • **Do the low speed wipers operate when the low speed setting is selected?**	**Yes** GO to D4. **No** GO to Pinpoint Test B.
D4 CHECK THE INPUT FROM THE MULTIFUNCTION SWITCH	

• Using a scan tool, monitor the SCCM multifunction switch PIDs:
  • F_WIP_INT_D1
  • F_WIP_INT_D2
  • F_WIP_INT_D3
  • F_WIP_INT_D4
  • F_WIP_INT_D5
• Cycle the multifunction switch from off through each of the intermittent settings.
• **Do the PIDs correspond correctly with each setting selection?**
	Yes
	INSTALL a new windshield wiper motor. REFER to Wiper Motor.
	
	No
	INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation. If the concern is still present, INSTALL a new SCCM. REFER to Section 211-05.

Pinpoint Test E: The Rain Sensitive Wiper Feature Is Inoperative

Refer to Wiring Diagrams Cell 81, Wipers and Washers for schematic and connector information.

Normal Operation

The rain sensitive wiper feature replaces the intermittent wiper feature. The rain sensitive feature is active when the multifunction switch is in any of the 5 auto/intermittent sensitivity settings. The setting closest to OFF is the least sensitive to moisture, the highest setting being the most sensitive to moisture.

The rain sensor sends data through the LIN to the windshield wiper motor. When the rain sensitive wiper feature is enabled, based on the data received from the rain sensor and the auto/intermittent setting on the multifunction switch, the system automatically activates and adjusts the wiper speed and frequency when moisture is detected on the windshield.

The rain sensor optically senses water on the windshield. An infrared beam lights a section of the windshield. The intensity of the reflected beam is measured and compared to the intensity of the transmitted beam. If there is water on the surface of the windshield, the beam distorts, reducing the intensity of the beam. If the beam is not reflected completely, it is interpreted as rain on the windshield and the windshield wipers are activated.

A gel-type lens is used as the interface between the rain sensor and the windshield. If the lens is missing or damaged, the rain sensing wipers can be inoperative. The rain sensor gel-type lens is part of the rain sensor and cannot be replaced separately on a rain sensor of this type.

The rain sensitive wiper feature can be enabled/disabled through the message center.

When the rain sensitive wipers are disabled from the message center, or the windshield wiper motor detects a fault with the rain sensor input, the windshield wiper motor changes to a default intermittent mode. The timing of the wipers correspond to a standard intermittent setting based on the auto/intermittent sensitivity setting on the multifunction switch.

- B10AD:02 (Rain Sensor: General Signal Failure) — This DTC sets when the SCCM determines a general signal failure has occurred on the LIN .
- B10AD:08 (Rain Sensor: Bus Signal / Message Failure) — This DTC sets when the SCCM determines a communication error has occurred on the LIN . If the rain sensitive wipers are inoperative only, this DTC may be caused by an open in the rain sensor power or ground circuit or an open in the LIN circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Rain sensitive feature not enabled
- Foreign material on windshield, such as dirt, dust or bugs
- Wiper blades
- Windshield glass
- Multifunction switch
- Windshield wiper motor
- Rain sensor
- SCCM

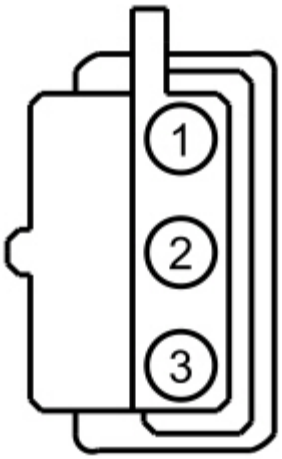
PINPOINT TEST E: THE RAIN SENSITIVE WIPER FEATURE IS INOPERATIVE

Test Step	Result / Action to Take
E1 CHECK THE LOW SPEED WIPER OPERATION	

repair4less

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.** • Ignition ON. • Place the multifunction switch to the low speed setting and observe the windshield wipers. Place the multifunction switch to the off setting. • **Do the low speed wipers operate when the low speed setting is selected?**	**Yes** GO to E2. **No** GO to Pinpoint Test B.
E2 CHECK FOR DTC B1131:02 OR DTC B1131:08	
• Ignition ON. • Using a scan tool, perform the SCCM self-test. • **Is DTC B1131:02 or DTC B1131:08 present?**	**Yes** GO to Pinpoint Test B. **No** GO to E3.
E3 CHECK FOR DTC B10AD:02 OR DTC B10AD:08	
• Review the results from the SCCM self-test. • **Is DTC B10AD:02 or DTC B10AD:08 present?**	**Yes** GO to E12. **No** GO to E4.
E4 VERIFY THE RAIN SENSITIVE WIPER FEATURE IS ENABLED IN THE VEHICLE MESSAGE CENTER	
• Access the vehicle settings in the message center using the steering wheel controls. Make sure the rain sensitive feature is enabled. • **Is the rain sensitive feature enabled?**	**Yes** GO to E5. **No** ENABLE the rain sensitive feature. INFORM the customer how to enable/disable the rain sensitive feature.
E5 CHECK THE INPUT FROM THE MULTIFUNCTION SWITCH	

• Using a scan tool, monitor the SCCM multifunction switch PIDs:
  • F_WIP_INT_D1
  • F_WIP_INT_D2
  • F_WIP_INT_D3
  • F_WIP_INT_D4
  • F_WIP_INT_D5
• Cycle the multifunction switch from off through each of the auto/intermittent sensitivity settings.
• **Do the PIDs correspond correctly with each setting selection?**
	Yes
	GO to E6.
	
	No
	INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation. If the concern is still present, INSTALL a new SCCM. REFER to Section 211-05.



E6 CHECK THE WINDSHIELD FOR DAMAGE	
• Ignition OFF. • Inspect the windshield glass for any cracks, pits or other visible damage around the area of the rain sensor. • **Is any windshield damage present near the area of the rain sensor?**	**Yes** INSTALL a new windshield. REFER to Section 501-11. **No** GO to E7.
E7 CHECK THE WINDSHIELD GLASS FOR STREAKING	
• Ignition ON.	**Yes**

• Turn the multifunction switch to the low speed wiper setting and while applying water to the windshield surface. Observe the wipe quality, especially around the area or the rain sensor. • **Is any streaking present on the windshield around the area of the rain sensor?**	GO to E8 . **No** GO to E10 .
E8 CHECK THE WINDSHIELD WIPER BLADES FOR STREAKING	
• Ignition OFF. • Clean the windshield glass with glass cleaner. • Clean the wiper blades with isopropyl alcohol swabs. Wipe the entire length of the wiper blades. • Ignition ON. • Place the multifunction switch to the low speed wiper setting and while applying water to the windshield surface. Observe the wipe quality, especially around the area or the rain sensor. • **Was there noticeable improvement in the wipe quality after cleaning the glass and the wiper blades?**	**Yes** GO to E9 . **No** INSTALL new wiper blades. GO to E9 .
E9 RECHECK THE RAIN SENSITIVE WIPERS OPERATION	
• Place the multifunction switch to the auto/intermittent 5 setting (most sensitive to moisture) while applying water on the windshield above the rain sensor. • **Do the wipers operate when water is applied to the windshield surface?**	**Yes** The system is operating correctly at this time. The concern may have been caused by poor wipe quality on the windshield around the rain sensor. **No** GO to E10 .
E10 CHECK FOR THE PRESENCE OF THE LENS GEL	
• Ignition OFF. • Lightly press the rain sensor against the windshield and release the rain sensor clips. • **Does the rain sensor remain adhered to the windshield?**	**Yes** ATTACH the retaining clips. GO to E11 . **No** The sensor gel-type lens is missing or damaged. INSTALL a new rain sensor. REFER to Rain Sensor .
E11 INSPECT THE RAIN SENSOR MOUNTING AREA	
NOTE: The rain sensor gel-type lens can be damaged or contaminated during rain sensor removal, rain sensor bracket separation or incorrect installation. • From the outside of the vehicle, inspect the area of the windshield glass where the rain sensor is mounted. The rain sensor contact area should appear black, with no bubbles, air pockets or contaminants between the windshield glass and the rain sensor. • **Does the rain sensor contact area appear black, with no bubbles, air pockets or contaminants between the windshield glass and the rain sensor?**	**Yes** GO to E12 . **No** REMOVE and INSTALL the rain sensor correctly. REFER to Rain Sensor . TEST the system for normal operation. If the concern is still present, GO to E15 .
E12 CHECK THE RAIN SENSOR VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF.	**Yes**

repair4less

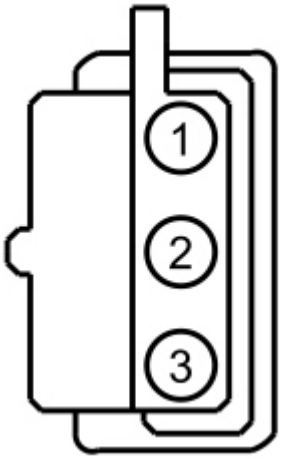
- Disconnect: Rain Sensor C914 .
- Ignition ON.
- Measure the **voltage** between:

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit
C914-1	SBB79 (YE)	—	Ground

- **Is the voltage greater than 11 volts?**

GO to E13 .

No
VERIFY BJB fuse 79 (5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.



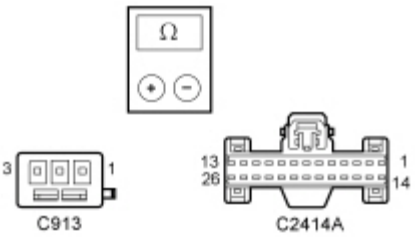
E13 CHECK THE RAIN SENSOR GROUND CIRCUIT FOR AN OPEN

- Ignition OFF.
- Measure the **resistance** between:

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit
C914-3	GD133 (BK)	—	Ground

Yes
GO to E14 .

No
REPAIR the circuit.



- **Is the resistance less than 3 ohms?**

E14 CHECK THE LIN CIRCUIT FOR AN OPEN

- Disconnect: SCCM C2414B .
- Measure the **resistance** between:

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit
C914-2	VDN05 (YE/GY)	C2414A-20	VDN05 (YE/GY)

N0136174

- **Is the resistance less than 3 ohms?**

Yes
GO to E15 .

No
REPAIR the circuit.

E15 CHECK FOR CORRECT RAIN SENSOR OPERATION

- Inspect the rain sensor connector.
- Repair:
  - corrosion (install new connector or terminals – clean module pins)
  - damaged or bent pins – install new terminals/pins
  - pushed-out pins – install new pins as necessary
- Reconnect the rain sensor connector. Make sure it seats and latches correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new rain sensor. REFER to Rain Sensor . TEST the system for normal operation.

If the concern is still present, INSTALL a new windshield wiper motor. REFER to Wiper Motor .

No
The system is operating correctly at this time. The

repair4less

	concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test F: The Windshield Wipers Do Not Park At The Correct Position

Normal Operation

When the multifunction switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position and the internal Hall-effect sensor senses the motor magnet. The output to the integral run/park relay deactivates the relay and disconnects the voltage to the motor.

This pinpoint test is intended to diagnose the following:

- Wiper mounting arm and pivot shaft
- Wiper motor

PINPOINT TEST F: THE WINDSHIELD WIPERS DO NOT PARK AT THE CORRECT POSITION

Test Step	Result / Action to Take
F1 CHECK THE WIPER MOUNTING ARE AND PIVOT SHAFT FOR DAMAGE	
• Ignition OFF. • Inspect the wiper mounting arm and pivot shaft for damage. • **Is the wiper mounting arm and pivot shaft OK?**	**Yes** GO to F2 . **No** INSTALL a wiper mounting arm and pivot shaft. REFER to Wiper Mounting Arm and Pivot Shaft .
F2 CHECK THE WINDSHIELD WIPER PARK RELAY OPERATION	
• Ignition ON. • Place the multifunction switch to the low speed setting. When the wiper blades are in the middle of a wipe, place the multifunction switch off. • **Do the windshield wipers immediately stop when the multifunction switch is turned off?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor . **No** ADJUST the pivot arms. REFER to Wiper Blade and Pivot Arm Adjustment .

Pinpoint Test G: The Washer Pump Is Inoperative Or Always On - Vehicles Not Equipped With Front Video Camera

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation

When the multifunction switch is placed in the WASH position, the Steering Column Control Module (SCCM)

sends the request to the wiper motor over the Local Interconnect Network (LIN). The wiper motor then supplies power to the washer pump, which directs washer fluid to the windshield.

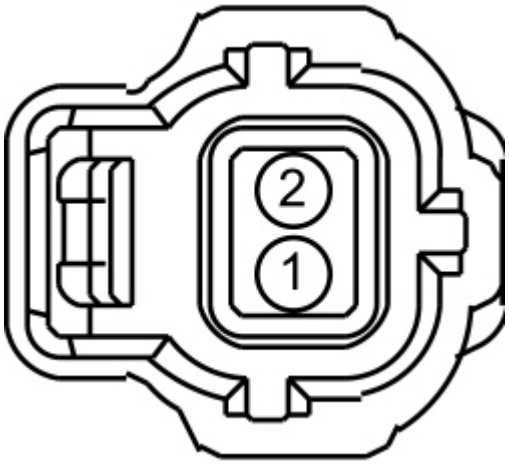
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Washer pump
- Windshield wiper motor
- SCCM

PINPOINT TEST G: THE WASHER PUMP IS INOPERATIVE OR ALWAYS ON - VEHICLES NOT EQUIPPED WITH FRONT VIDEO CAMERA

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>G1 CHECK THE MULTIFUNCTION SWITCH INPUT</td><td rowspan="2">Yes
If the washer pump is always on, GO to G2. If the washer pump is inoperative, GO to G3.



No
INSTALL a new multifunction switch. REFER to Section 211-05.

If the concern is still present, INSTALL a new SCCM. REFER to Section 211-05.</td></tr>
<tr><td>• Ignition ON.
• Using a scan tool, monitor the SCCM F_WASH_SW PID.
• Press and release the washer switch on the multifunction switch.
• Does the PID indicate correctly when the switch pressed and released?</td></tr>
<tr><td>G2 CHECK THE WASHER PUMP SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE</td><td rowspan="2">Yes
REPAIR the circuit.

No
INSTALL a new windshield wiper motor. REFER to Wiper Motor.</td></tr>

Yes
INSTALL a new washer pump. REFER to Washer Pump .

No
REPAIR the circuit.

 • **Does the test light illuminate?**	

Pinpoint Test H: The Washer Pump is Inoperative Or Always On — Vehicles Equipped With Front Video Camera

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

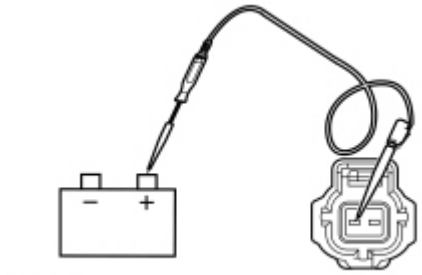
Normal Operation

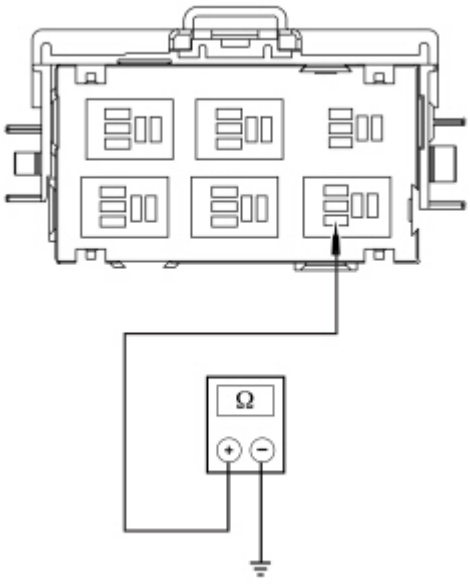
When the multifunction switch is placed in the WASH position, the Steering Column Control Module (SCCM) sends the request to the windshield wiper motor through the Local Interconnect Network (LIN). The wiper motor then supplies power to the washer pump, which directs washer fluid to the windshield. When the front camera washer control is activated, the Steering Column Control Module (SCCM) sends the request to the windshield wiper motor through the Local Interconnect Network (LIN). The windshield wiper motor controls the direction of the washer pump to direct washer fluid to the front video camera.

When a windshield wash is requested, the windshield wiper motor supplies voltage to the washer pump. Ground is provided to the washer pump through the normally closed contact in the front camera washer relay (located in the auxiliary BJB).

When a front camera wash is requested, the windshield wiper motor activates the front camera washer relay. When the front camera washer relay is energized, it provides voltage to the washer pump. Ground is provided to the washer pump through the windshield wiper motor.

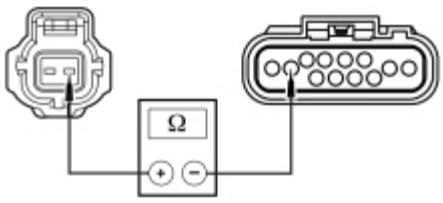
This pinpoint test is intended to diagnose the following:



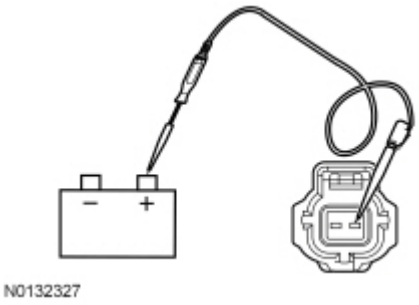


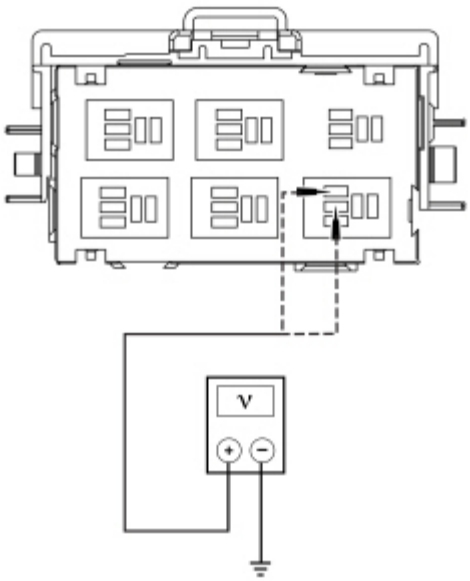
- Fuse
- Front camera washer relay
- SCCM
- Washer pump
- Wiring, terminals or connectors
- Multifunction switch
- Windshield wiper motor

PINPOINT TEST H: THE WASHER PUMP IS INOPERATIVE OR ALWAYS ON — VEHICLES EQUIPPED WITH FRONT VIDEO CAMERA



repair4less

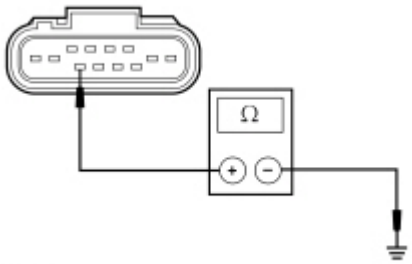




NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 CHECK THE MULTIFUNCTION SWITCH (F_WASH_SW) AND (F_CAMRA_WASHSW) PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — SCCM . • While monitoring the SCCM F_WASH_SW PID, place the multifunction switch into the windshield wiper WASH position. • While monitoring the SCCM F_CAMRA_WASHSW PID, rotate the front camera washer control to the WASH position. • **Do each of the PIDs change to the ON state when the multifunction switch and front camera washer control are in the applicable WASH positions?**	**Yes** If a washer function is inoperative, GO to H2 . If the windshield washer function is always on, GO to H12 . If the front camera washer function is always on, GO to H13 . **No** INSTALL a new multifunction switch. REFER to section Section 211-05 . TEST the system for normal operation. If the concern is still present, INSTALL a new SCCM . REFER to Section 211-05 . TEST the system for normal operation.
H2 CHECK THE WINDSHIELD WASH FUNCTION	
• Ignition ON. • Attempt to operate the windshield wash function. • **Does the washer pump operate in the windshield WASH position?**	**Yes** GO to H8 . **No** GO to H3 .
H3 CHECK THE WASHER PUMP CONTROL CIRCUIT FOR AN OPEN	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Washer Pump Motor C137 . • Connect a 12-volt incandescent test light between the positive battery post and the washer pump motor C137-1, circuit CRW24 (BU/WH), harness side.	**Yes** GO to H6 . **No** GO to H4 .

 N0132328 • **Does the test light illuminate?**	
H4 CHECK THE FRONT CAMERA WASHER RELAY (WINDSHIELD WASH)	
• Disconnect: Front Camera Washer Relay . • Carry out the front camera washer relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the front camera washer relay pass the component test?**	**Yes** GO to H5 . **No** INSTALL a new front camera washer relay. TEST the system for normal operation.
H5 CHECK THE FRONT CAMERA WASHER RELAY GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between the camera washer relay socket pin 4, circuit GD120 (BK/GN) and ground.  N0132330 • **Is the resistance less than 3 ohms?**	**Yes** REPAIR circuit CRW24 (BU/WH) for an open. TEST the system for normal operation. **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
H6 CHECK THE WASHER PUMP CONTROL CIRCUIT FOR AN OPEN	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in**	**Yes** INSTALL a new washer pump. REFER to Washer



repair4less

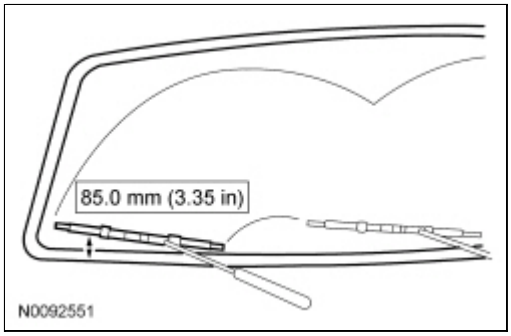
the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector. • Ignition ON. • Connect a 12-volt incandescent test light between the washer pump motor C137-1, circuit CRW24 (BU/WH), harness side and the washer pump motor C137-2, circuit CRW14 (GY), harness side.  N0119238 • Observe the test light while placing the multifunction switch into the windshield WASH position. • **Does the test light illuminate when WASH is selected?**	Pump in this section. TEST the system for normal operation. **No** GO to H7 .
H7 CHECK THE WASHER PUMP CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Windshield Wiper Motor C125 . • Measure the resistance between the washer pump C137-2, circuit CRW14 (GY), harness side and the windshield wiper motor C125-7, circuit CRW14 (GY), harness side.  N0121923 • **Is the resistance less than 3 ohms?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H8 CHECK THE WINDSHIELD WIPER MOTOR FOR AN INTERNAL OPEN	
***NOTICE:* The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Washer Pump Motor C137 . • Connect a 12-volt incandescent test light between the positive battery post and the washer pump motor C137-2, circuit CRW14	**Yes** GO to H9 . **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor in this section. TEST the system for normal operation.

(GY), harness side.  N0132327 • **Does the test light illuminate?**	
H9 CHECK THE FRONT CAMERA WASHER RELAY (INOPERATIVE)	
• Disconnect: Front Camera Washer Relay . • Carry out the front camera washer relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the front camera washer relay pass the component test?**	**Yes** GO to H10 . **No** INSTALL a new front camera washer relay. TEST the system for normal operation.
H10 CHECK FOR VOLTAGE TO THE FRONT CAMERA WASHER RELAY	
• Ignition ON. • Measure the voltage between the front camera washer relay socket pin 1, circuit CBB54 (VT/OG) and ground; and between the front camera washer relay socket pin 5, circuit SBB41 (RD) and ground.  N0132333 • **Are the voltages greater than 11?**	**Yes** GO to H11 . **No** VERIFY BJB fuses 41 (15A) and 54 (5A) are OK. If OK, REPAIR the circuit in question. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

repair4less

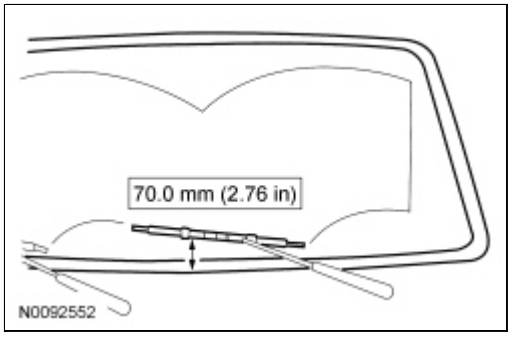
H11 CHECK THE FRONT CAMERA WASHER RELAY CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Windshield Wiper Motor C125 . • Measure the resistance between the front camera washer relay socket pin 3, circuit CRW34 (BU/BN) and the windshield wiper motor C125-12, circuit CRW34 (BU/BN), harness side.  N0133870 • **Is the resistance less than 3 ohms?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H12 CHECK THE WASHER PUMP SUPPLY CIRCUIT FROM THE WIPER MOTOR FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Windshield Wiper Motor C125 . • Ignition ON. • **Does the washer pump continue to operate?**	**Yes** REPAIR circuit CRW14 (GY) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor .
H13 CHECK THE FRONT CAMERA WASHER RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Front Camera Washer Relay . • Ignition ON. • **Does the washer pump continue to operate?**	**Yes** REPAIR circuit CRW24 (BU/WH) for a short to voltage. TEST the system for normal operation. **No** GO to H14 .
H14 CHECK THE FRONT CAMERA WASHER RELAY (ALWAYS ON)	

• Ignition OFF. • Carry out the front camera washer relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the front camera washer relay pass the component test?**	**Yes** GO to H15 . **No** INSTALL a new front camera washer relay. TEST the system for normal operation.
H15 CHECK THE FRONT CAMERA WASHER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Windshield Wiper Motor C125 . • Measure the resistance between the windshield wiper motor C125-12, circuit CRW34 (BU/BN), harness side.  N0138462 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Wiper Motor .



repair4less

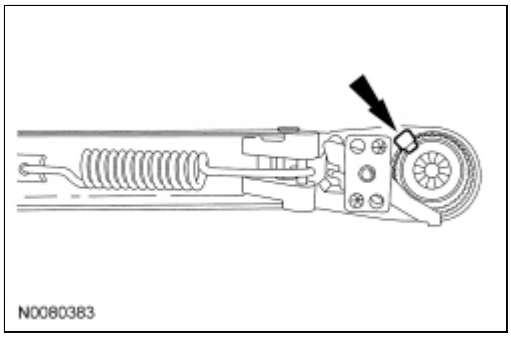
Wiper Blade and Pivot Arm Adjustment



1. Cycle and park the wipers.

2. **NOTE:** Make sure there is no mechanical binding in the linkage preventing the wiper arms from returning to the fully parked position.

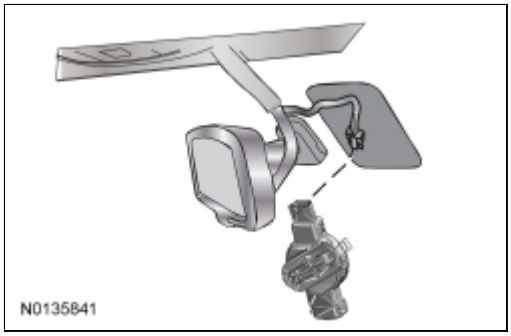
   Verify the distance between the center of the passenger wiper blade and the bottom of the windshield glass is within specifications.



3. Verify the distance between the center of the driver wiper blade and the bottom of the windshield glass is within specifications.

4. **NOTE:** The alignment key is used for production only. The alignment key does not need to be reinstalled.

   If the distance is not within specifications, remove the wiper pivot arm and with a flat-blade screwdriver, remove the alignment key (if equipped). Reposition the wiper pivot arm to specifications. For additional information, refer to Wiper Pivot Arm in this sections.



repair4less

Rain Sensor Bracket

NOTE: The rain sensor bracket primer and adhesive are not included in service kit (part number 19G382) and need to be ordered separately. The rain sensor bracket primer and adhesive part numbers and ordering instructions are available in the parts ordering system.

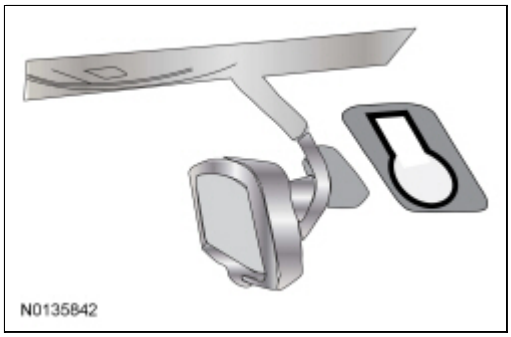
NOTE: The rain sensor bracket adhesive will take at least 6 hours to dry.

1. Disconnect the rain sensor electrical connector.

2. Disengage the metal rain sensor mounting clips from the old rain sensor bracket and separate the old rain sensor bracket from the rain sensor.
    - Discard the old rain sensor bracket, it is not to be reused.

3. Using a razor blade, carefully remove any residual glue from the windshield glass.

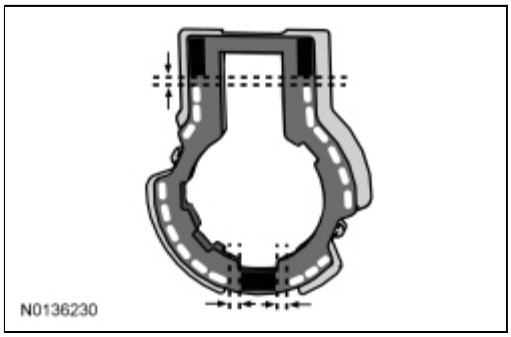
4. Using isopropyl alcohol and a clean cloth, wipe the windshield glass where the rain sensor and rain sensor bracket were mounted to remove any residual adhesive, contaminants, or loose glue particles.



5. Wipe glass with a clean cloth to make sure the glass is clean and dry.

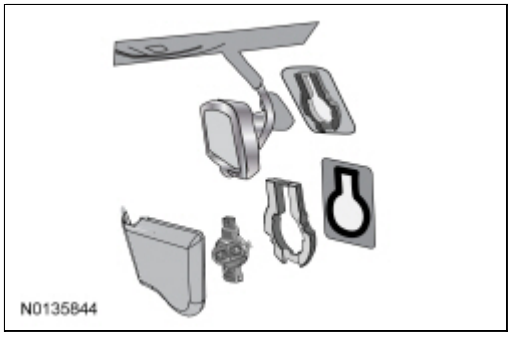
6. Apply specified primer onto a clean cloth.

7. Insert a cotton swab or equivalent, onto the wet area of the cloth.



8. ***NOTICE:*** **Do not apply primer to the rain sensor view window area.**

    Using a cotton swab or equivalent, apply the primer onto the contact area of the rain sensor bracket area of the windshield glass.



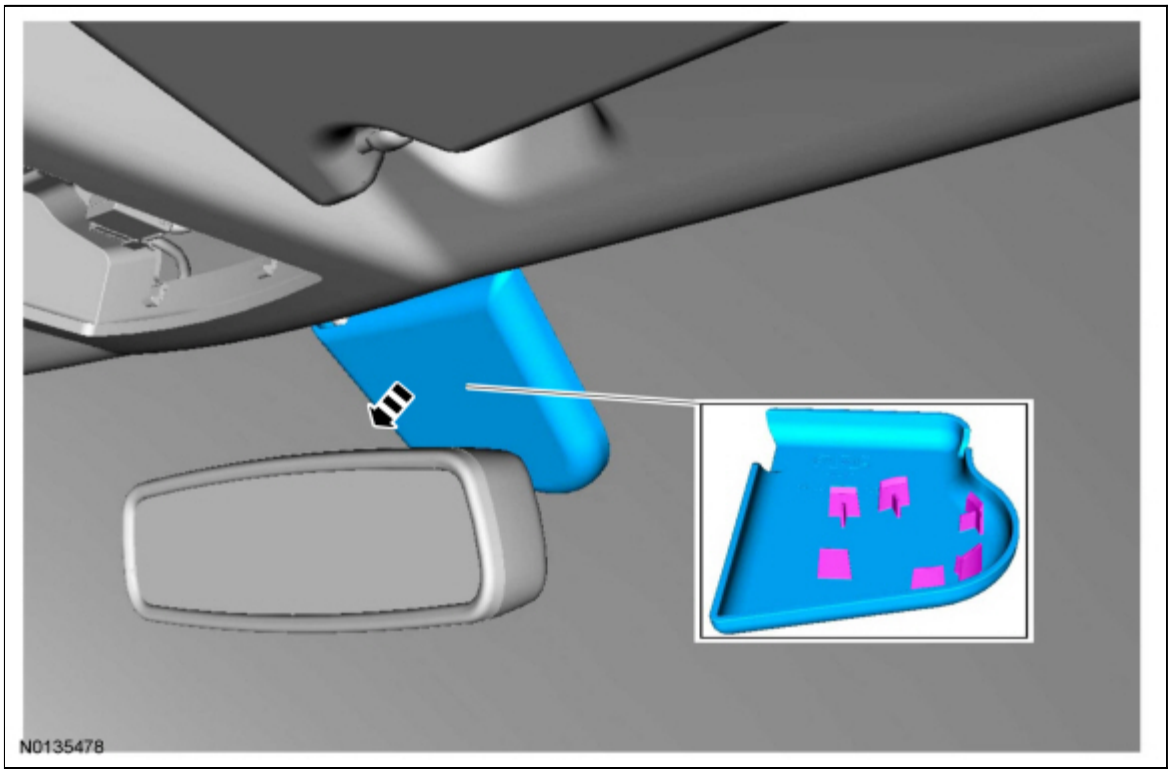
9. **NOTE:** Apply the adhesive to the outer periphery of the bracket mounting surface to prevent adhesive squeeze out toward the sensor viewing window.

   Remove release paper from the new rain sensor bracket. Using a 3M® EPX Plus II applicator or equivalent, apply a 1 to 2 mm (0.039 in to 0.078 in) bead of specified adhesive to the rain sensor bracket. Apply the bracket to the windshield within 90 seconds of applying adhesive to the bracket.
   - Adhesive path should terminate 2 mm (0.078 in) prior to running into the 3 adhesive tape pieces.
   - Remove the protective paper from the adhesive tape pieces.

10. **NOTE:** If the rain sensor bracket is not mounted in the correct location on the windshield glass the rain sensor may not function correctly, resulting in incorrect or erratic wiping. In addition, the trim cover may be misaligned once installed.

    Apply the rain sensor bracket onto the windshield making sure the open end of the bracket is facing the 12 o'clock position and that the bracket is centered around the rain sensor view window area.

11. Allow the adhesive to dry for at least 6 hours.



12. Install the rain sensor. For additional information, refer to Rain Sensor in this section.

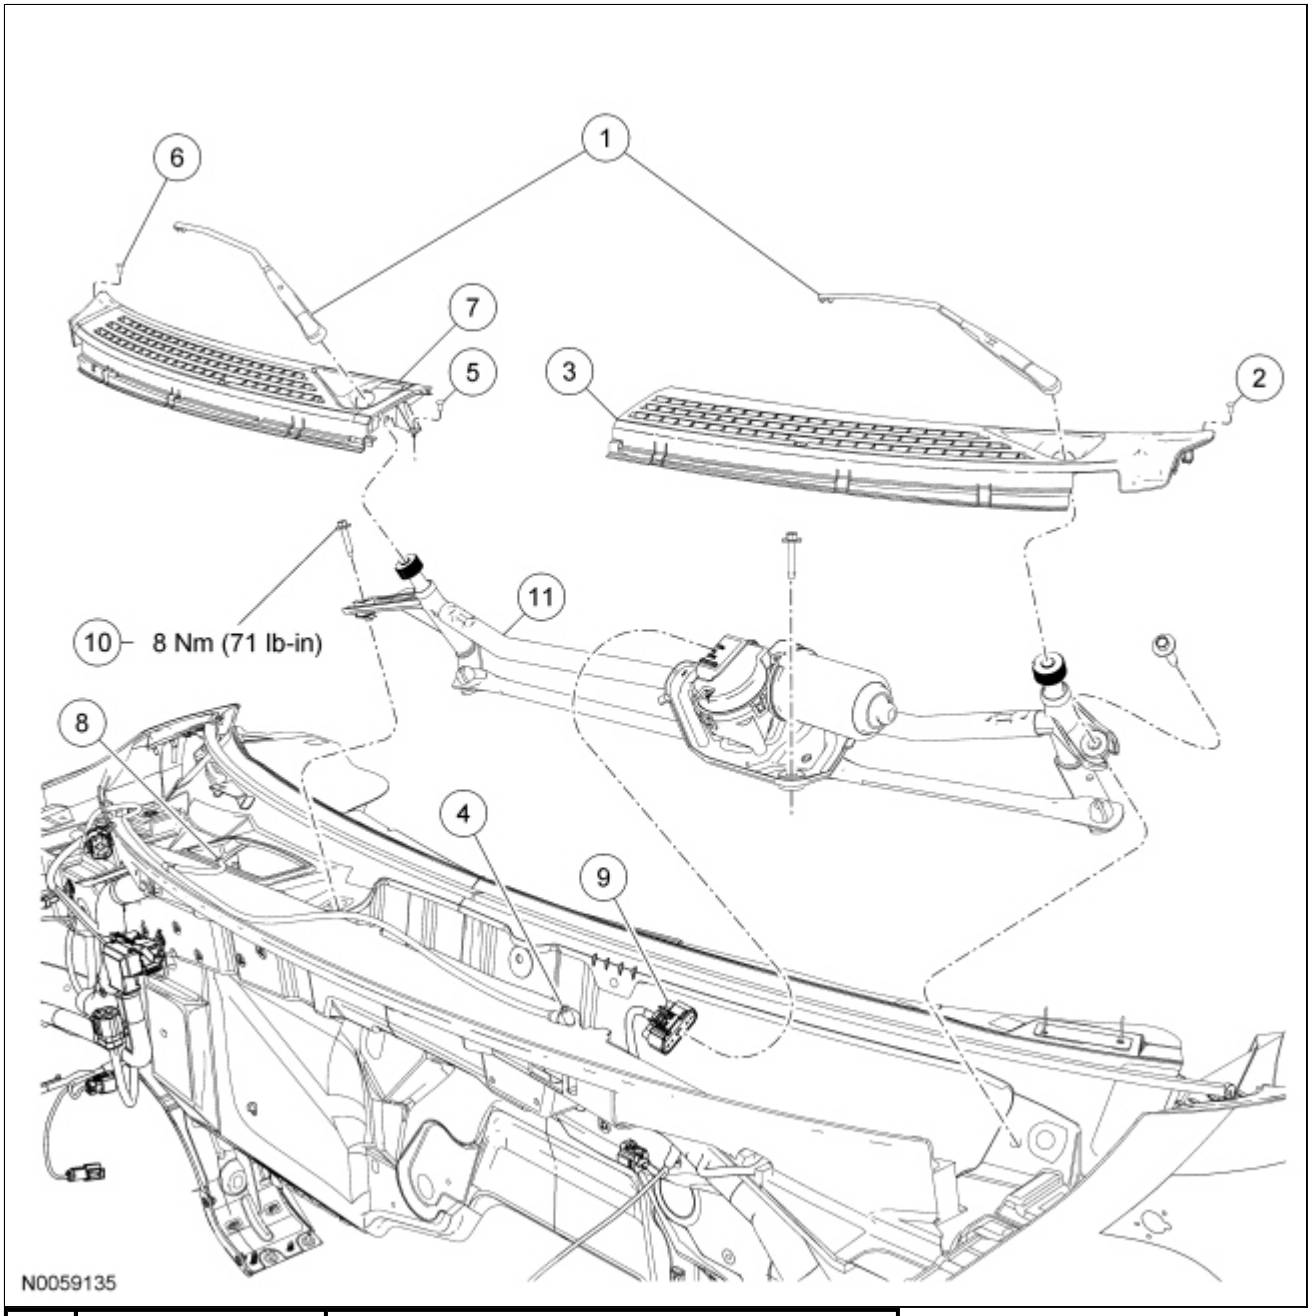
Washer Pump

Item	Part Number	Description
1	17A605A	Washer fluid hose
2	17664	Washer pump electrical connector
3	17664	Washer pump

Removal and Installation

WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.



NOTICE: **When servicing the washer pump, be careful not to damage the washer pump seal.**

NOTICE: **Do not operate the washer pump before filling the washer reservoir. Failure to do so may result in premature washer pump failure.**

1. Remove the RH headlamp assembly. For additional information, refer to Section 417-01 .
2. Drain the windshield washer reservoir.
3. Disconnect the washer reservoir hose.
4. Disconnect the washer pump electrical connector.
5. Remove the washer pump.
6. To install, reverse the removal procedure.

repair4less

Wiper and Washer System — Exploded View

Item	Part Number	Description
1	17526 RH/ 17527 LH	Wiper arms
2	W710312	Pin-type fastener
3	022A69	LH cowl grille panel
4	17A605A	Washer hose

5	—	Cowl panel grille screw (part of 022A68)
6	W710312	Pin-type fastener
7	022A68	RH cowl grille panel
8	17A605A	Washer hose
9	—	Wiper motor electrical connector (part of 12A581)
10	N807391	Wiper mounting arm and pivot shaft bolt (3 required)
11	17508A	Wiper mounting arm and pivot shaft

1. For additional information, refer to the procedures in this section.

repair4less

Wiper Motor

Removal and Installation

1. **NOTE:** The windshield wiper motor is not serviceable separately. The windshield wiper motor and the mounting arm and pivot shaft must be replaced together.

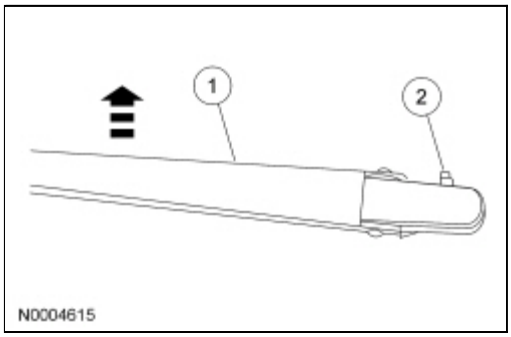
   Remove the windshield wiper mounting arm and pivot shaft. For additional information, refer to Windshield Wiper Mounting Arm and Pivot Shaft in this section.

2. To install, reverse the removal procedure.

Wiper Mounting Arm and Pivot Shaft

Removal and Installation

1. Remove the cowl panel grille. For additional information, refer to Section 501-02 .
2. Remove the 3 wiper mounting arm and pivot shaft bolts.
   - To tighten, tighten to 8 Nm (71 lb-in).
3. Disconnect the wiper motor electrical connector.
4. Remove the wiper mounting and pivot shaft assembly.
5. To install, reverse the removal procedure.



repair4less

Wiper Pivot Arm

Removal and Installation

1. Remove the wiper pivot arm.
    1. Position the wiper pivot arm upward.
    2. **NOTE:** During installation, it is necessary to pull the locking tab out to its full open (unlatched) position and hold while assembling the pivot arm onto the mounting arm and pivot shaft.

       Pull outward on the retaining tab and remove the wiper pivot arm.

2. To install, reverse the removal procedure.
    - If necessary, align the wiper blade and pivot arm. For additional information, refer to Wiper Blade and Pivot Arm Adjustment in this section.

General Specifications

Item	Specification
Roof Opening Panel Alignment	
Roof opening panel alignment, glass front edge-to-roof opening panel	-3 to 0 mm (-0.118 to 0 in)

repair4less

Roof Opening Panel

The roof opening panel system consists of:

- Roof opening panel air deflector
- Roof opening panel control switch
- Roof opening panel drain hoses
- Roof opening panel frame
- Roof opening panel glass
- Roof opening panel motor/module
- Roof opening panel rear trough guide
- Roof opening panel shield
- Roof opening panel trough
- Roof opening panel weatherstrip

Roof Opening Panel Operation

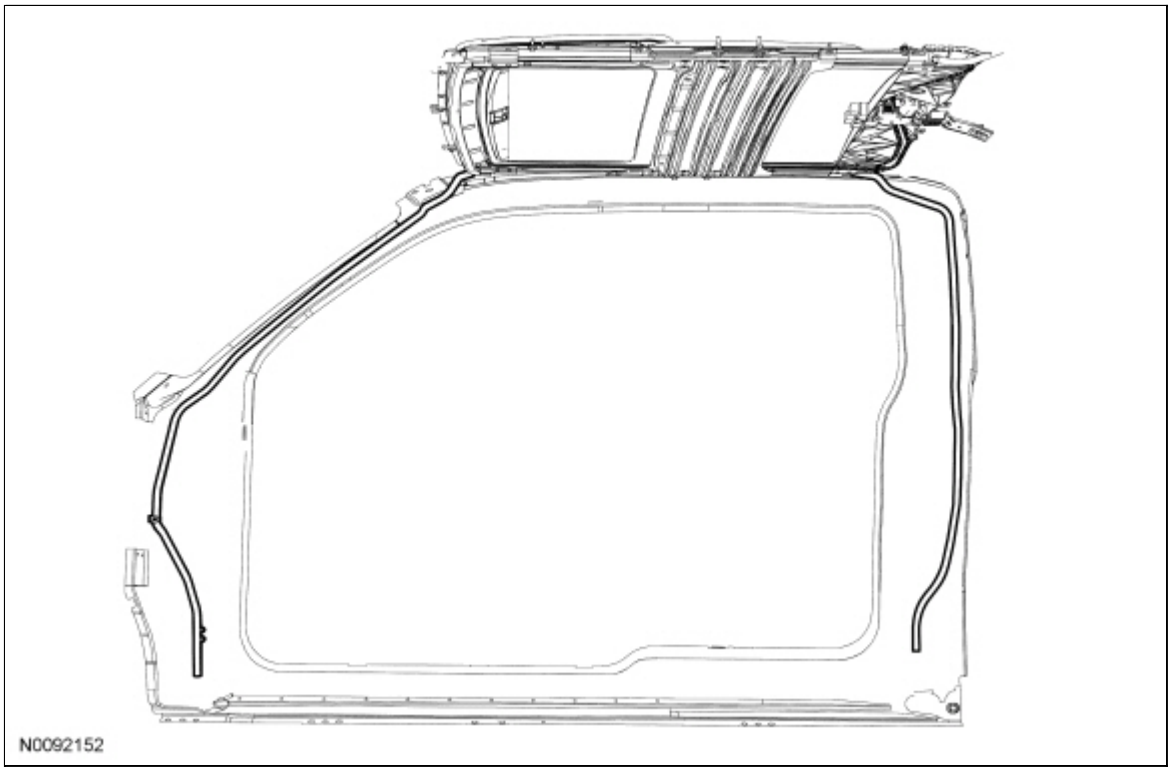
The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel. The roof opening panel is an electronically operated glass panel that has one-touch open, one-touch close and one-touch vent features.

To open the roof opening panel, press and release the SLIDE control switch. The roof opening panel will open automatically. The roof opening panel movement can be stopped at any time by pressing the switch again.

To vent the roof opening panel, the roof opening panel must first be in the CLOSED position. When the roof opening panel is in the CLOSED position, press and release the TILT control switch. The roof opening panel will move to the VENT position automatically. To close the roof opening panel from the VENT position, pull and hold the TILT control switch until the glass panel stops moving.

To close the roof opening panel, pull and release the SLIDE or TILT control switch. The roof opening panel will close automatically. The roof opening panel movement can be stopped at any time by activating the SLIDE or TILT control switch in either direction.

Bounce-Back

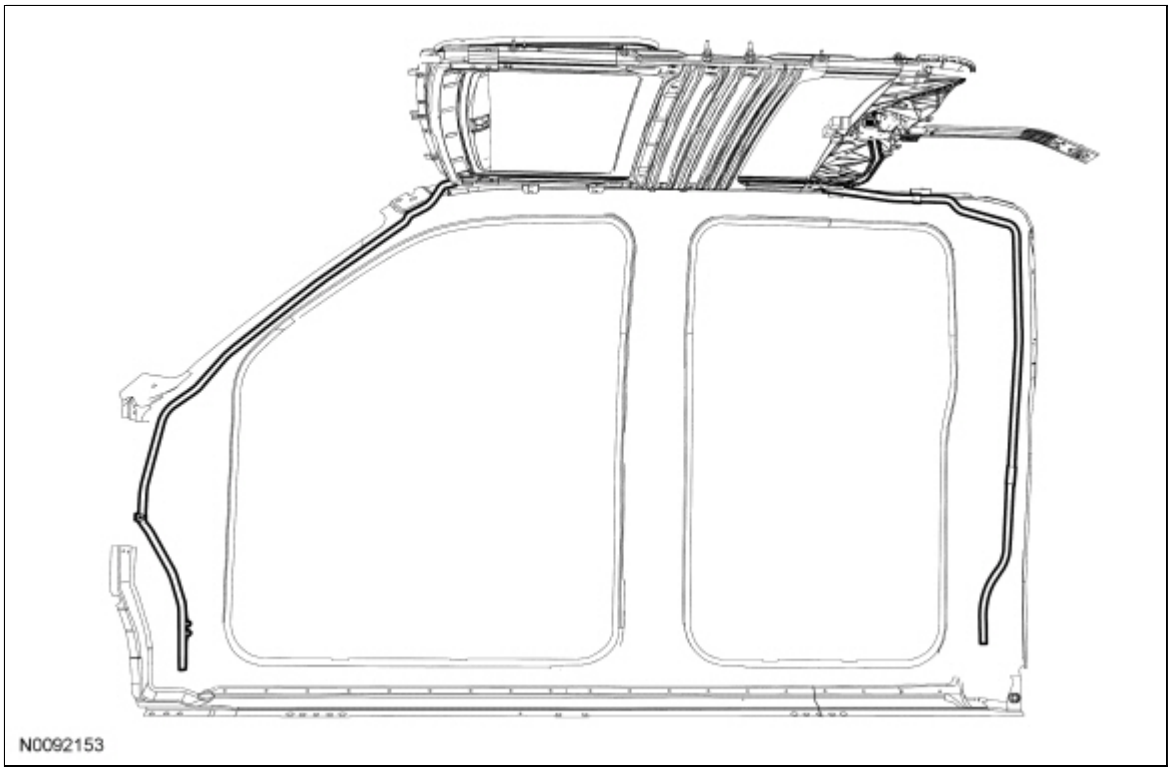


The roof opening panel has a bounce-back feature. If an obstacle has been detected in the roof opening panel as the sliding glass is closing, the roof opening panel will automatically open and stop at a predetermined position.

Security Override

To override a bounce-back condition (to overcome the resistance of ice on the roof opening panel seal for example), within 2 seconds of a bounce-back event, pull and hold the SLIDE or TILT control switch. The closing force will begin to increase each time the roof opening panel is closed for the first 3 closing cycles (bounce-back will still be enabled).

Roof Opening Panel Drain Hose Routing — SuperCab



NOTE: Passenger side shown, driver side similar.

Roof Opening Panel Drain Hose Routing — SuperCrew

Roof Opening Panel

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

Principles of Operation

The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel. The roof opening panel motor and module are installed new as an assembly. The roof opening panel is an electronically operated glass panel that can be opened, closed or vented by the roof opening panel switch.

The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including whenever:

- the roof opening panel motor has been removed from the roof opening panel system.
- the roof opening panel glass has been removed from the roof opening panel system.
- the roof opening panel assembly has been removed from the vehicle.
- a new roof opening panel motor has been installed.
- a new roof opening panel glass has been installed.
- a new roof opening panel assembly has been installed.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

repair4less

• Roof opening panel • Roof opening panel frame • Roof opening panel drain hoses • Roof opening panel lifter assemblies • Roof opening panel water trough • Roof opening panel air deflector assembly • Roof opening panel weatherstrip • Roof opening panel shield	• Battery Junction Box (BJB) fuse 48 (20A) • Body Control Module (BCM) fuse 32 (15A) • Wiring, terminals or connectors • Accessory delay relay • Overhead console switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is not visually evident, determine the symptom. GO to Symptom Chart - Roof Opening Panel or GO to Symptom Chart - NVH .

Symptom Chart — Roof Opening Panel

Symptom Chart — Roof Opening Panel

Condition	Possible Sources	Action
• The roof opening panel leaks	• Roof opening panel alignment • Roof opening panel weatherstrip • Roof opening panel rear trough guide • Damaged, clogged or obstructed roof opening panel drain hoses • Roof opening panel frame • Incorrect position of the roof opening panel glass • Sealant joints at frame (rail and track assembly) joints	• GO to Pinpoint Test B .
• The roof opening panel does not open or close	• Fuse(s) • Accessory delay relay • Wiring, terminals or connectors • Overhead console switch • Roof opening panel motor/module assembly	• GO to Pinpoint Test E .

• The roof opening panel does not open or close in VENT position	• Wiring, terminals or connectors • Overhead console switch • Roof opening panel motor/module assembly	• GO to Pinpoint Test F .
• The express open/close is inoperative	• Roof opening panel motor not initialized • Roof opening panel motor/module	• INITIALIZE the roof opening panel motor/module. REFER to Roof Opening Panel Motor Initialization in this section. If concern is still present after initialization, INSTALL a new roof opening panel motor/module. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation.
• The roof opening panel does not stop in FLUSH from any position	• Incorrect roof opening panel alignment	• ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section.
• Roof opening panel reverses during operation	• Incorrect roof opening panel alignment • Foreign material in guide track(s)	• ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. • REMOVE foreign material from guide track.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• The roof opening panel has excessive wind noise	• Roof opening panel glass alignment • Roof opening panel weatherstrip • Roof opening panel air deflector assembly	• GO to Pinpoint Test A .
• The roof opening panel rattles	• Roof opening panel glass alignment • Roof opening panel air deflector assembly • Roof opening panel water trough and guides	• GO to Pinpoint Test C .

repair4less

	• Roof opening panel lifter assemblies • Roof opening panel tracks • Roof opening panel shield (sunshade) • Roof opening panel assembly	
• The roof opening panel is noisy during operation	• Obstructed or damaged roof opening panel • Roof opening panel lifter assemblies • Roof opening panel alignment • Noisy roof opening panel motor/module assembly • Roof opening panel shield (sunshade)	• GO to Pinpoint Test D .

Pinpoint Tests

Pinpoint Test A: The Roof Opening Panel Has Excessive Wind Noise

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel.

This pinpoint test is intended to diagnose the following:

- Roof opening panel glass alignment
- Roof opening panel weatherstrip
- Roof opening panel air deflector assembly

PINPOINT TEST A: THE ROOF OPENING PANEL HAS EXCESSIVE WIND NOISE

Test Step	Result / Action to Take
A1 VERIFY ROOF OPENING PANEL NOISE	
• Road test the vehicle with the roof opening panel in the CLOSED and OPEN position. • **Is the wind noise present only in the OPEN position?**	**Yes** GO to A4 . **No** GO to A2 .
A2 CHECK THE ROOF OPENING PANEL ALIGNMENT	
• Make sure the roof opening panel glass is centered and flush with the roofline. • **Is the roof opening panel aligned correctly?**	**Yes** GO to A3 . **No** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.

A3 CHECK THE ROOF OPENING PANEL WEATHERSTRIP	
NOTE: Make sure the weatherstrip is secured to the glass, not cut, cracked, pinched, loose or obstructed in CLOSED, VENT and OPEN positions. • Check the roof opening panel weatherstrip. • **Is the roof opening panel weatherstrip OK?**	**Yes** REFER to Section 501-00 to diagnose other possible sources of the excessive wind noise. **No** INSTALL a new roof opening panel weatherstrip. TEST the system for normal operation.
A4 CHECK THE AIR DEFLECTOR	
• Make sure the air deflector is securely attached and check for torn and unsecured tethers. • **Is the air deflector OK?**	**Yes** GO to A5 . **No** REPAIR or INSTALL a new air deflector assembly. REFER to Air Deflector in this section. TEST the system for normal operation.
A5 CHECK THE AIR DEFLECTOR FOR VIBRATION	
• Road test the vehicle and check for air deflector vibration. • **Did the air deflector vibrate?**	**Yes** MODIFY the curvature of the air deflector and RETEST. **No** PARTIALLY close the roof opening panel until the noise is eliminated. If the noise is eliminated, ADVISE the customer that changing glass location eliminates the wind noise. If the wind noise is not eliminated, INSTALL a new air deflector assembly. REFER to Air Deflector in this section. TEST the system for normal operation.

Pinpoint Test B: The Roof Opening Panel Leaks

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel.

This pinpoint test is intended to diagnose the following:

- Roof opening panel alignment
- Roof opening panel weatherstrip
- Roof opening panel rear trough guide
- Damaged, clogged or obstructed roof opening panel drain hoses
- Roof opening panel frame
- Incorrect position of the roof opening panel glass
- Sealant joints at frame (rail and track assembly) joints

PINPOINT TEST B: THE ROOF OPENING PANEL LEAKS

repair4less

Test Step	Result / Action to Take
B1 VERIFY CUSTOMER OPERATION OF THE ROOF OPENING PANEL WHEN PARKED • Make sure the customer is parking with the roof opening panel in the CLOSED position. • **Is the customer parking with the roof opening panel in the CLOSED position?**	**Yes** GO to B2 . **No** ADVISE the customer to refer to the Owner's Literature for correct operation of the roof opening panel.
B2 CHECK THE ALIGNMENT OF THE ROOF OPENING PANEL • Make sure the roof opening panel glass is centered and flush with the roof line. • **Is the roof opening panel aligned correctly?**	**Yes** GO to B3 . **No** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.
B3 CHECK THE WEATHERSTRIP CONDITION **NOTE:** The weatherstrip has a bonded joint located on the passenger side or rear edge. This is not a defect. • Make sure the roof opening panel weatherstrip is not cracked, torn or loose. • Check the roof opening panel weatherstrip. • **Is the roof opening panel weatherstrip in good condition and free from damage?**	**Yes** GO to B4 . **No** INSTALL a new roof opening panel weatherstrip. TEST the system for normal operation.
B4 CHECK THE WATER TROUGH AND GUIDE CONDITION • Check the water trough and guide for damage and/or incorrect attachment and function. • **Is the water trough and guide OK?**	**Yes** GO to B5 . **No** REPAIR the water trough or INSTALL a new component as necessary. TEST the system for normal operation.
B5 CHECK THE DRAIN HOSES **NOTE:** Drain hoses can be viewed with a flashlight by removing the headliner lace around the inside opening and gently pulling down on the headliner. (On some vehicles, hook-and-loop tape style attachments have been installed in place of trim lace.) • Make sure the drain hoses are correctly attached, not cracked, slit, pinched or obstructed. • **Are all the drain hoses present and attached correctly?**	**Yes** GO to B6 . **No** REPAIR or INSTALL new drain hose (s) as necessary. TEST the system for normal operation.
B6 CHECK THE DRAIN HOSES FOR CORRECT FLOW **NOTE:** Drain hoses must flow downhill and cannot be pinched or restricted by headliner or any other trim	**Yes** INSPECT other areas of the vehicle

components. For drain hose routing information, refer to Roof Opening Panel in this section. • With the panel OPEN, slowly pour water into the water trough area and make sure that the same amount of water exits the vehicle at the bottom of the A- and C-pillars. • Check the drain hoses for obstructions by blowing compressed air through the drain spouts in the water trough area, then retest with water. • **Are the drain hoses operating correctly?**	that may cause water to enter the roof area such as the windshield. If no concern is found, GO to B7 . **No** LOWER the headliner and INSPECT the drain hoses for correct routing. REPAIR or INSTALL a new drain hose(s). TEST the system for normal operation.
B7 CHECK THE CONDITION OF THE ROOF OPENING PANEL FRAME	
• Check the roof opening panel frame for damage that may cause the roof opening panel seal to seat incorrectly. • **Is the roof opening panel frame OK?**	**Yes** INSTALL a new roof opening panel. REFER to Roof Opening Panel in this section. **No** REPAIR roof opening panel frame as necessary. TEST the system for normal operation.

Pinpoint Test C: The Roof Opening Panel Rattles

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel. All components should be secured correctly.

This pinpoint test is intended to diagnose the following:

- Roof opening panel glass alignment
- Roof opening panel air deflector assembly
- Roof opening panel water trough and guides
- Roof opening panel lifter assemblies
- Roof opening panel tracks
- Roof opening panel shield (sunshade)
- Roof opening panel assembly

PINPOINT TEST C: THE ROOF OPENING PANEL RATTLES

Test Step	Result / Action to Take
C1 CHECK THE ROOF OPENING PANEL TIGHTNESS	
• With the roof opening glass panel in the CLOSED position, manually push up and fore/aft on the glass panel. • **Is the roof opening panel glass loose?**	**Yes** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation. **No** GO to C2 .

repair4less

C2 CHECK THE ROOF OPENING PANEL TRACKS • Open the roof opening panel. • Check the roof opening panel tracks for obstructions or foreign material and damage. • **Are the roof opening panel tracks OK?**	**Yes** GO to C3 . **No** REMOVE all the roof opening panel track obstructions and REPAIR the roof opening panel tracks. TEST the system for normal operation.
C3 CHECK THE ROOF OPENING PANEL WATER TROUGH AND REAR TROUGH GUIDES • Check the roof opening panel water trough and rear trough guides for any obstructions. • **Are the roof opening panel water trough and rear trough guides installed securely and free from obstructions?**	**Yes** GO to C4 . **No** REMOVE all obstructions from the roof opening panel water trough. SECURE the trough guides or INSTALL new roof opening panel rear trough guides if damaged. REFER to Roof Opening Panel Rear Trough Guide in this section. TEST the system for normal operation.
C4 CHECK THE ROOF OPENING PANEL SHIELD (SUNSHADE) • Check the roof opening panel shield (sunshade) for correct installation with all tabs in track channels and the guide feet intact. • **Is the roof opening panel shield installed correctly?**	**Yes** GO to C5 . **No** INSTALL the roof opening panel shield correctly. REFER to Roof Opening Panel Shield in this section. TEST the system for normal operation.
C5 CHECK THE ROOF OPENING PANEL AIR DEFLECTOR ASSEMBLY • Check the roof opening panel air deflector assembly for obstructions, damage and incorrect attachments. • **Is the roof opening panel air deflector assembly OK?**	**Yes** GO to C6 . **No** REMOVE all obstructions and REPAIR or INSTALL a new roof opening panel air deflector assembly. REFER to Air Deflector in this section. TEST the system for normal operation.
C6 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES • Verify the roof opening panel lifter assemblies are free from obstructions and damage. • **Are the roof opening panel lifter assemblies OK?**	**Yes** GO to C7 . **No** REMOVE all obstructions from the roof opening panel lifter assemblies and REPAIR any damage. TEST the system for normal operation.
C7 CHECK THE ROOF OPENING PANEL FRAME ATTACHMENTS • Check for correct torque and installation of the roof opening	**Yes** GO to C8 .

panel frame. • **Is the roof opening panel correctly installed and tightened to specification?**	**No** TIGHTEN or REINSTALL the roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.
C8 CHECK THE ROOF OPENING PANEL FRAME TO HEADLINER FOR RATTLES	
• Check roof opening panel frame to headliner for any interference condition that would induce a rattle. • **Is there a condition that causes a rattle?**	**Yes** INSTALL a suitable sound damper material to correct the condition. If the rattle still persists, INSTALL a new roof opening panel frame or headliner. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.

Pinpoint Test D: The Roof Opening Panel is Noisy During Operation

Normal Operation

The roof opening panel operates smoothly while opening and closing.

This pinpoint test is intended to diagnose the following:

- Obstructed or damaged roof opening panel
- Roof opening panel lifter assemblies
- Roof opening panel alignment
- Noisy roof opening panel motor/module assembly
- Roof opening panel shield (sunshade)

PINPOINT TEST D: THE ROOF OPENING PANEL IS NOISY DURING OPERATION

Test Step	Result / Action to Take
D1 CHECK THE ROOF OPENING PANEL FOR OBSTRUCTIONS OR DAMAGE	
• Check the roof opening panel for any obstructions and damage. • **Are there any obstructions and/or damage?**	**Yes** REMOVE all obstructions. REPAIR any damage or INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** GO to D2.
D2 CHECK THE ROOF OPENING PANEL ALIGNMENT	

repair4less

• Check the roof opening panel during operation. • **Is the roof opening panel loose or incorrectly aligned?**	**Yes** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation. **No** GO to D3.
D3 CHECK THE ROOF OPENING PANEL TRACKS	
• Open the roof. • Check the roof opening panel tracks for obstructions and damage. • **Are the roof opening panel tracks OK?**	**Yes** GO to D4. **No** REMOVE all obstructions and REPAIR any damage. TEST the system for normal operation.
D4 CHECK THE ROOF OPENING PANEL SHIELD (SUNSHADE)	
• Check the roof opening panel shield (sunshade) for correct movement. • **Is the roof opening panel shield moving correctly?**	**Yes** GO to D5. **No** REMOVE and REINSTALL the roof opening panel shield. REFER to Roof Opening Panel Shield in this section. TEST the system for normal operation.
D5 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES	
• Check the roof opening panel lifter assemblies for obstructions and damage. • **Are the roof opening panel lifter assemblies OK?**	**Yes** GO to D6. **No** REMOVE all obstructions and REPAIR any damage. TEST the system for normal operation.
D6 CHECK THE ROOF OPENING PANEL MOTOR/MODULE	
• Remove the roof opening panel motor/module and leave the electrical connector connected. • Operate the roof opening panel to the full OPEN and CLOSED position. • **Does the motor/module make excessive noise?**	**Yes** INSTALL a new roof opening panel motor/module. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** REINSTALL the roof opening panel motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. If the roof opening panel is still noisy, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. If the roof opening panel is no longer noisy, the system is operating correctly. The concern may have been caused by an incorrectly installed roof opening panel motor.

Pinpoint Test E: The Roof Opening Panel Does Not Open or Close

Refer to Wiring Diagrams Cell 101 , Roof Opening Panel for schematic and connector information.

The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including whenever:

- the roof opening panel motor has been removed from the roof opening panel system.
- the roof opening panel glass has been removed from the roof opening panel system.
- the roof opening panel assembly has been removed from the vehicle.
- a new roof opening panel motor has been installed.
- a new roof opening panel glass has been installed.
- a new roof opening panel assembly has been installed.

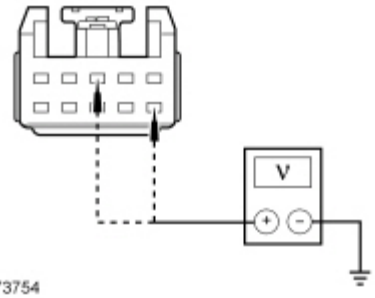
Refer to Roof Opening Panel Motor Initialization in this section.

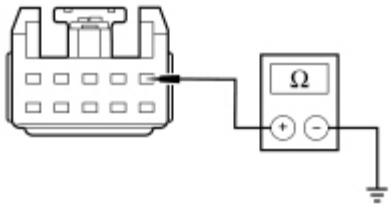
Normal Operation

The roof opening panel uses an integrated motor and module to operate the roof opening panel. A new roof opening panel motor/module is installed as an assembly.

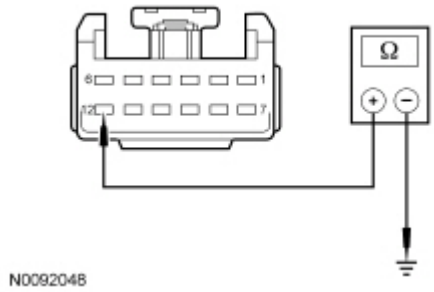
The roof opening panel motor/module receives voltage from the accessory delay relay when the ignition is in the ACC or RUN position. The overhead console switch supplies ground signals to the roof opening panel motor/module to operate the roof opening panel.

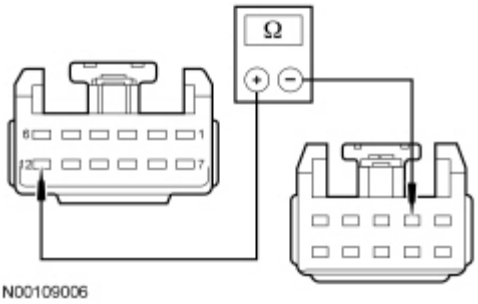
This pinpoint test is intended to diagnose the following:

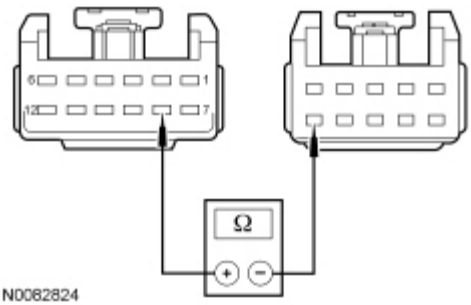




- Fuse(s)
- Accessory delay relay
- Wiring, terminals or connectors
- Overhead console switch
- Roof opening panel motor/module assembly

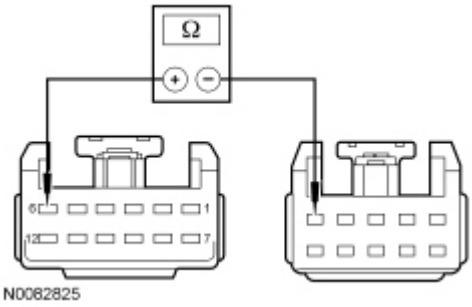


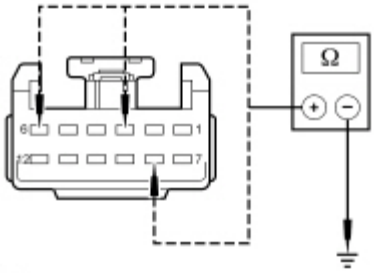




PINPOINT TEST E: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**





Test Step	Result / Action to Take
E1 CHECK THE POWER WINDOWS	
• Ignition ON. • Verify the power windows operate. • **Do the power windows operate?**	**Yes** GO to E2 . **No** REFER to Section 501-11 to diagnose the accessory delay relay circuit.
E2 CHECK THE MOTOR/MODULE FOR INITIALIZATION	
• Attempt to carry out the Roof Opening Panel Motor Initialization procedure. Refer to Roof Opening Panel Motor Initialization in this section. • **Is the concern still present, or does the roof opening**	**Yes** GO to E3 . **No**

repair4less

panel motor fail to initialize?	The system is operating normally at this time. The roof opening panel motor was not initialized.
E3 CHECK THE OVERHEAD CONSOLE SWITCH • Ignition OFF. • Disconnect: Overhead Console Switch C912. • Carry out the overhead console switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the overhead console switch OK?**	**Yes** GO to E4 . **No** INSTALL a new overhead console switch. REFER to Roof Opening Panel Control Switch in this section. TEST the system for normal operation.
E4 CHECK VOLTAGE TO THE ROOF OPENING PANEL MOTOR/MODULE • Disconnect: Roof Opening Panel Motor/Module C921. • Ignition ON. • Measure the voltage between roof opening panel motor/module C921-3, circuit CBP32 (GN/VT), harness side and roof opening panel motor/module C921-6, circuit SBB48 (VT/RD), harness side and ground.  A0073754 • **Are the voltages greater than 10 volts for both measurements?**	**Yes** GO to E5 . **No** VERIFY Battery Junction Box (BJB) fuse 48 (20A) and BCM fuse 32 (15A) are OK. If OK, REPAIR circuit SBB48 (VT/RD) and/or CBP32 (GN/VT) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
E5 CHECK THE ROOF OPENING PANEL MOTOR/MODULE GROUND • Ignition OFF. • Measure the resistance between roof opening panel motor/module C921-1, circuit GD139 (BK/YE), harness side and ground.  A0073757 • **Is the resistance less than 5 ohms?**	**Yes** GO to E6 . **No** REPAIR the circuit. TEST the system for normal operation.

E6 CHECK THE OVERHEAD CONSOLE SWITCH GROUND	
• Measure the resistance between overhead console switch C912-12, circuit CPR39 (VT/WH), harness side and ground.  N0092048 • **Is the resistance less than 5 ohms?**	**Yes** GO to E8 . **No** GO to E7 .
E7 CHECK THE COMMON CIRCUIT FOR AN OPEN	
• Measure the resistance between overhead console switch C912-12, circuit CPR39 (VT/WH), harness side and roof opening panel motor/module C921-2, circuit CPR39 (VT/WH), harness side.  N00109006 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new roof opening panel motor/module. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
E8 CHECK THE ROOF OPENING PANEL CONTROL CIRCUIT FOR AN OPEN	
• Measure the resistance between overhead console switch C912-8, circuit CPR40 (YE/OG), harness side and roof opening panel motor/module C921-10, circuit CPR40 (YE/OG), harness side.  N0082824 • **Is the resistance less than 5 ohms?**	**Yes** GO to E9 . **No** REPAIR the circuit. TEST the system for normal operation.
E9 CHECK THE ROOF OPENING PANEL CONTROL CIRCUIT FOR AN OPEN	

repair4less

• Measure the resistance between overhead console switch C912-6, circuit CPR31 (VT/BN), harness side and roof opening panel motor/module C921-5, circuit CPR31 (VT/BN), harness side.  N0082825 • **Is the resistance less than 5 ohms?**	**Yes** GO to E10 . **No** REPAIR the circuit. TEST the system for normal operation.
E10 CHECK THE ROOF OPENING PANEL CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between overhead console switch C912, harness side and ground using the following chart: **Overhead Console Switch** / **Circuit** C912-6 / CPR31 (VT/BN) C912-3 / CPR38 (WH/BU) C912-8 / CPR40 (YE/OG)  N0092049 • **Is the resistance greater than 10,000 ohms for all measurements?**	**Yes** GO to E11 . **No** REPAIR the circuit(s). TEST the system for normal operation.
E11 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR CORRECT OPERATION	

• Disconnect all roof opening panel motor/module connectors.
• Check for:
  ▪ corrosion.
  ▪ bent pins.
  ▪ pushed-out pins.
• Connect all roof opening panel motor/module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new roof opening panel motor/module. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern

	may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: The Roof Opening Panel Does Not Open or Close in VENT Position

Refer to Wiring Diagrams Cell 101 , Roof Opening Panel for schematic and connector information.

The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including whenever:

- the roof opening panel motor has been removed from the roof opening panel system.
- the roof opening panel glass has been removed from the roof opening panel system.
- the roof opening panel assembly has been removed from the vehicle.
- a new roof opening panel motor has been installed.
- a new roof opening panel glass has been installed.
- a new roof opening panel assembly has been installed.

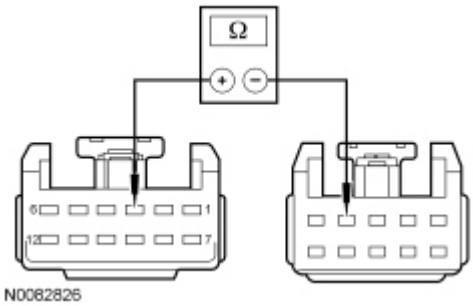
Refer to Roof Opening Panel Motor Initialization in this section.

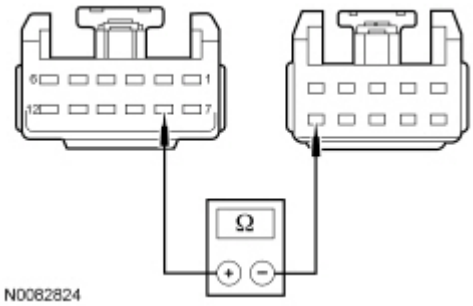
Normal Operation

The roof opening panel uses an integrated motor and module to operate the roof opening panel. A new roof opening panel motor/module is installed as an assembly.

The roof opening panel motor/module receives voltage from the accessory delay relay when the ignition is in the ACC or RUN position. The overhead console switch supplies ground signals to the roof opening panel motor/module to operate the roof opening panel.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Overhead console switch
- Roof opening panel motor/module assembly

PINPOINT TEST F: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE IN VENT POSITION

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR INITIALIZATION	
• Attempt to carry out the roof opening panel motor initialization procedure. Refer to Roof Opening Panel Motor Initialization in this section. • **Is the concern still present, or does the roof opening panel motor fail to initialize?**	**Yes** GO to F2 . **No** The system is operating

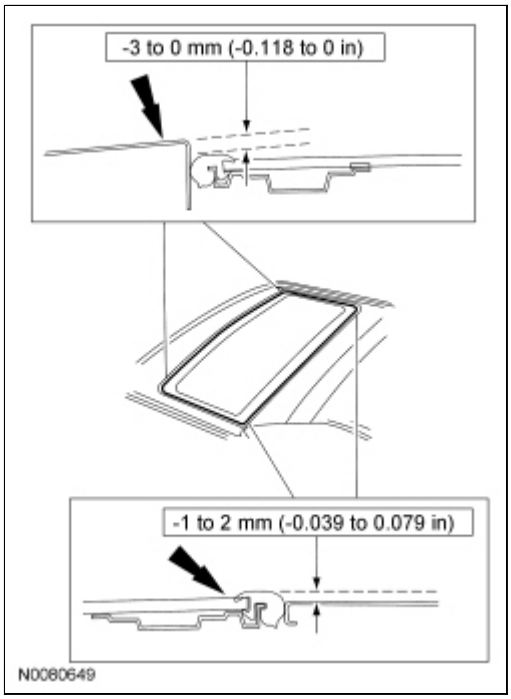
repair4less

	normally at this time. The roof opening panel motor was not initialized.
F2 CHECK THE OVERHEAD CONSOLE SWITCH • Ignition OFF. • Disconnect: Overhead Console Switch C912. • Carry out the overhead console switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the overhead console switch OK?**	**Yes** GO to F3 . **No** INSTALL a new roof opening panel switch. REFER to Roof Opening Panel Control Switch in this section. TEST the system for normal operation.
F3 CHECK THE ROOF OPENING PANEL CONTROL CIRCUIT FOR AN OPEN • Measure the resistance between overhead console switch C912-3, circuit CPR38 (WH/BU), harness side and roof opening panel motor/module C921-4, circuit CPR38 (WH/BU), harness side.  N0082826 • **Is the resistance less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR the circuit. TEST the system for normal operation.
F4 CHECK THE ROOF OPENING PANEL CONTROL CIRCUIT FOR AN OPEN • Measure the resistance between overhead console switch C912-8, circuit CPR40 (YE/OG), harness side and roof opening panel motor/module C921-10, circuit CPR40 (YE/OG), harness side.  N0082824 • **Is the resistance less than 5 ohms?**	**Yes** GO to F5 . **No** REPAIR the circuit. TEST the system for normal operation.
F5 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR CORRECT OPERATION • Disconnect all roof opening panel motor/module connectors. • Check for:	**Yes** INSTALL a new roof opening

■ corrosion. ■ bent pins. ■ pushed-out pins. ● Connect all roof opening panel motor/module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	panel motor/module. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

repair4less

Roof Opening Panel Alignment



NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Position the roof opening panel in the CLOSED position.

2. Loosen the 4 roof opening panel glass screws.

3. **NOTE:** Make sure the roof opening panel is centered in the roof opening.

   Adjust the roof opening panel glass height to specification.

4. Maintain horizontal and vertical roof opening panel positions while adjusting and tighten the 4 roof opening panel glass screws to 4 Nm (35 lb-in).

5. Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

repair4less

Roof Opening Panel Motor Initialization

WARNING: Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.

NOTE: A new roof opening panel motor will only open and must be initialized.

NOTE: The roof opening panel motor initialization procedure must be done when repairs are carried out on any part of the roof opening panel system, including: any time the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel assembly has been installed.

1. Turn the ignition to the RUN position.
   - For an existing roof opening panel motor, skip to Step 3.
   - For a new roof opening panel motor, proceed to Step 2.

2. **NOTE:** If the slide switch is released before initialization movements are complete, turn the ignition key to the OFF position, then back to the RUN position and repeat this step.

   For a new roof opening panel motor/module:
   - Press the slide switch until the roof opening panel moves past the full OPEN position and continue to hold for approximately 10 seconds. The roof opening panel will cycle slightly rearward and then slightly forward to the stored OPEN position.
   - Quickly release and re-press and hold the slide switch. The roof opening panel glass will move to the full VENT position, then back to CLOSED (initialization movements). The initialization movements will start within approximately 3 seconds after the switch is pressed. When the initialization movements are complete, go to Step 4.

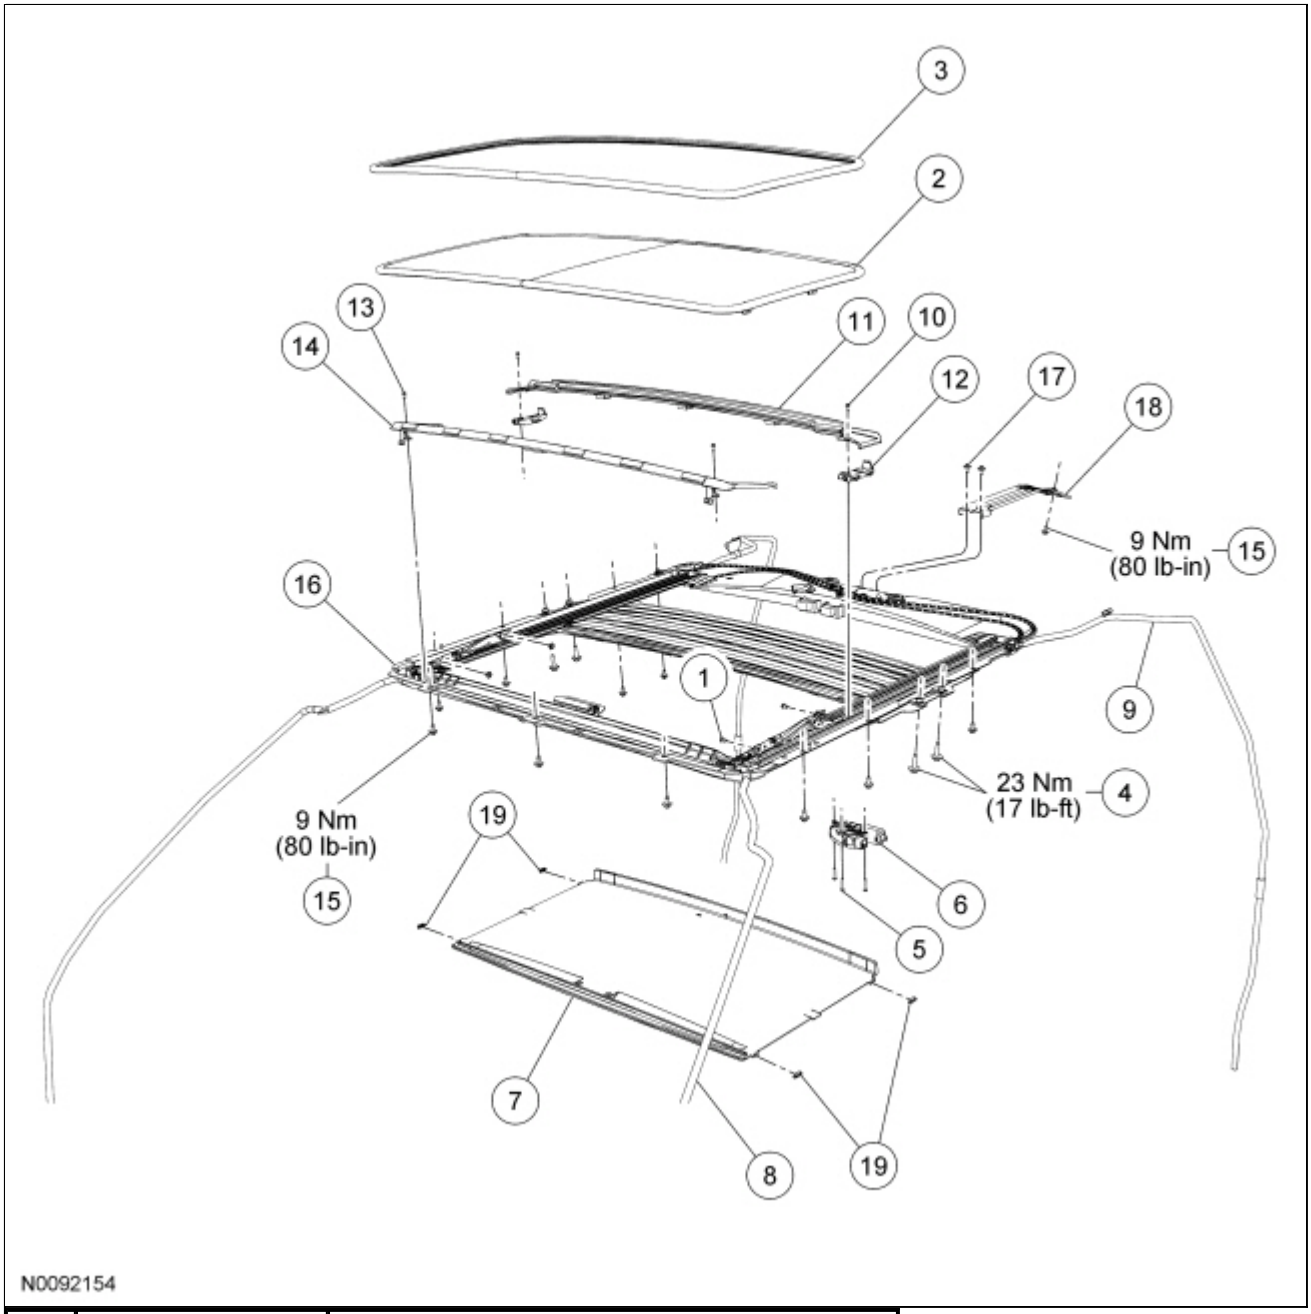
3. **NOTE:** All roof opening panel motor/module assemblies have an electronically controlled comfort stop position, which is approximately 50 mm (2 in) from the full OPEN position. When the roof opening panel is opened, the slide switch must be released when the comfort stop position has been reached and then pressed again to fully open the roof opening panel.

   NOTE: If the slide switch is released before initialization movements are complete, turn the ignition key to the OFF position, then back to the RUN position, and repeat this step.

   For an existing roof opening panel motor/module:
   - Press and hold the slide switch until the roof opening panel glass moves to the full OPEN position. Release the switch.
   - Press and hold the slide switch for approximately 10 seconds. The roof opening panel will cycle slightly rearward and then slightly forward to the stored OPEN position.
   - Quickly release and re-press and hold the slide switch. The roof opening panel glass will move to full VENT position, then back to CLOSED (initialization movements). The initialization movements will start within approximately 3 seconds after the switch is pressed.

4. Release the slide switch and test the system for normal operation by carrying out one-touch open, one-touch close and one-touch vent operations.

repair4less



Air Deflector

Removal and Installation

1. Place the roof opening panel glass in the fully OPEN position.
2. Remove the 2 air deflector screws.
3. Rotate the front of the air deflector up, and slide the pivot points toward the rear of the vehicle to release the air deflector from the retaining hooks.
4. To install, reverse the removal procedure.

Roof Opening Panel — Exploded View

NOTE: SuperCrew shown, SuperCab similar.

Item	Part Number	Description

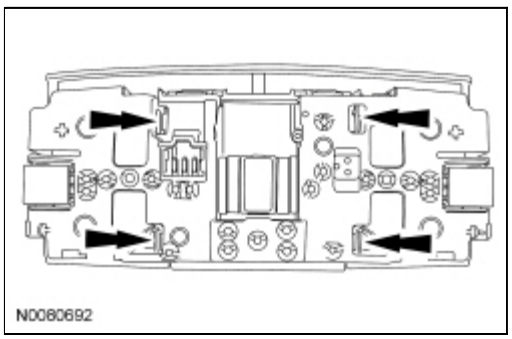
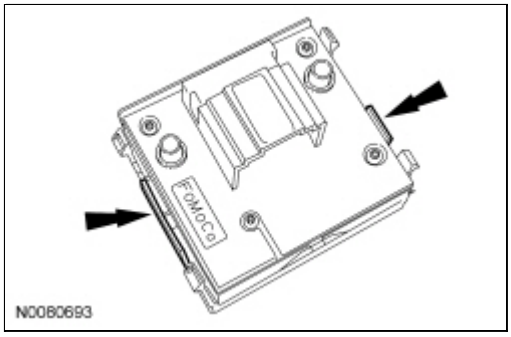
1. For additional information, refer to the procedures in this section.



Roof Opening Panel Control Switch

Removal and Installation

1. Remove the overhead console. For additional information, refer to Section 501-12 .
2. Disconnect the 2 overhead console electrical connectors.
3. Remove the light assembly from the overhead console.
    1. Carefully pull the 2 rear tabs outward and rotate the light assembly slightly away from the overhead console.
    2. Carefully pull the 2 front tabs outward and remove the light assembly from the overhead console.



4. Disengage the 4 tabs and remove the switch from the light assembly.

repair4less

5. Disengage the 2 tabs and remove the switch bezel from the switch.

6. To install, reverse the removal procedure.

Roof Opening Panel Frame

Removal and Installation

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel frame has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the roof opening panel air deflector. For additional information, refer to Air Deflector in this section.

2. Remove the roof opening panel shield. For additional information, refer to Roof Opening Panel Shield in this section.

3. Remove the overhead console. For additional information, refer to Section 501-12 .

4. Lower the headliner. For additional information, refer to Section 501-05 .
   - Remove the A-pillar, B-pillar and C-pillar (if equipped) trim panels.
   - Remove the LH and RH sun visors and clips.
   - If equipped, remove the 3 headliner pin-type retainers.
   - If equipped, remove the 2 headliner garment hooks.
   - Disconnect the front and rear headliner electrical connectors.

5. **NOTE:** Make sure the drain hoses are not kinked during installation.

   Disconnect the 2 roof opening panel front drain hoses from the frame.

6. **NOTE:** Make sure the drain hoses are not kinked during installation.

   Disconnect the 2 roof opening panel rear drain hoses from the frame.

7. Remove the 4 roof opening panel frame-to-B-pillar bolts.
   - To install, tighten to 23 Nm (17 lb-ft).

8. ***NOTICE:*** **To avoid damage to the roof opening panel frame, be sure to support the frame when removing the mounting bolts.**

   Remove the 10 roof opening panel frame mounting bolts.
   - To install, tighten to 9 Nm (80 lb-in).

9. Remove the roof opening panel frame.

10. **NOTE:** If installing a new roof opening panel frame, transfer parts as necessary from the existing roof opening panel assembly.

    To install, reverse the removal procedure.
    - Align the roof opening panel. For additional information, refer to Roof Opening Panel

repair4less

Alignment in this section.

- Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

Roof Opening Panel Glass

Removal and Installation

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel frame has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. **NOTE:** The roof opening panel glass must be in the CLOSED position.

   Remove the 4 roof opening panel glass screws.

2. Remove the roof opening panel glass.

3. To install, reverse the removal procedure.
   - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

repair4less

Roof Opening Panel Motor

Removal and Installation

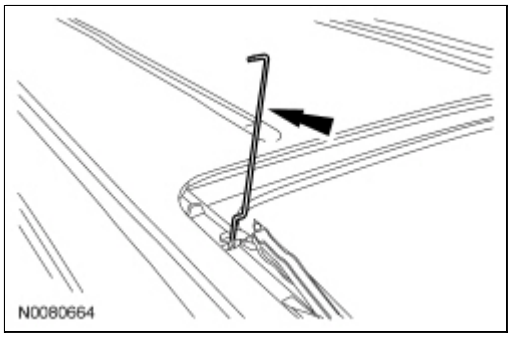
NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel frame has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Lower the rear of the headliner. For additional information, refer to Section 501-05 .
   - For SuperCab vehicles, remove the B-pillar trim panels.
   - For SuperCrew vehicles, remove the C-pillar trim panels.
   - If equipped, remove the 3 headliner pin-type retainers.
   - If equipped, remove the 2 headliner garment hooks.

2. Disconnect the roof opening panel motor electrical connector.

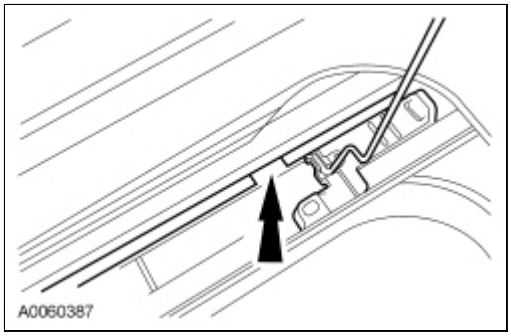
3. Remove the 3 roof opening panel motor screws.
   - To install, tighten to 4 Nm (35 lb-in).

4. Remove the roof opening panel motor.



5. To install, reverse the removal procedure.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

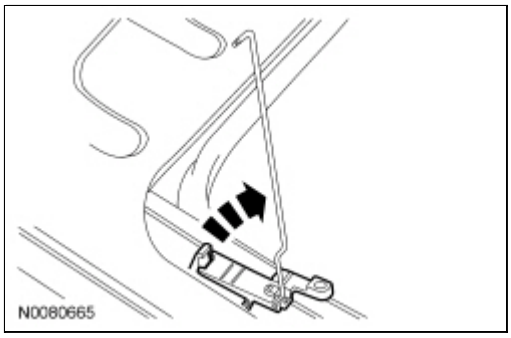
Roof Opening Panel Rear Trough Guide



Removal and Installation

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel frame has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the trough assembly. For additional information, refer to Trough Assembly in this section.
2. Disconnect the trough guide rods from the lifter arm assemblies.

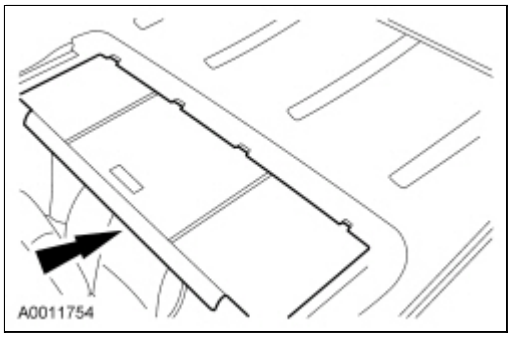


3. Slide the trough guide back to the slot (approximately 15 mm [0.6 in]) cut in the track.

4. Position the roof opening panel to the VENT position.
5. Carefully twist the trough guide through the slot in the track to remove.

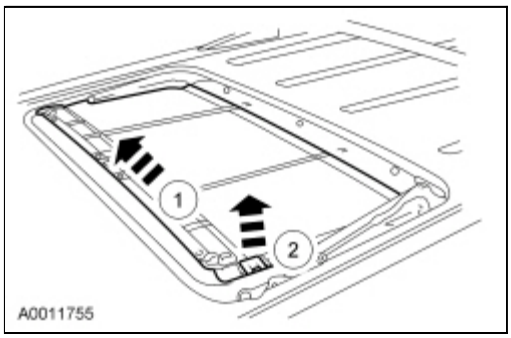
repair4less

6. Inspect the trough guide assembly for damage. If damage is found, inspect the track for broken pieces and remove them.



7. To install, reverse the removal procedure.
   - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

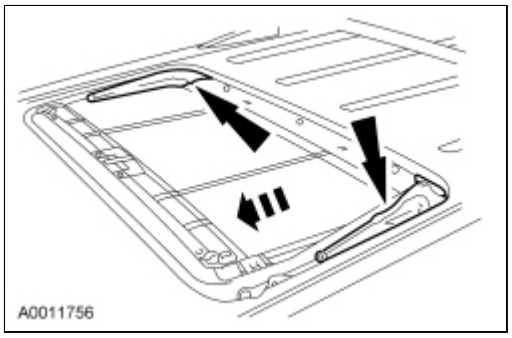
Roof Opening Panel Shield



Removal and Installation

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel frame has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the trough assembly. For additional information, refer to Trough Assembly in this section.
2. Slide the roof opening panel shield halfway forward.

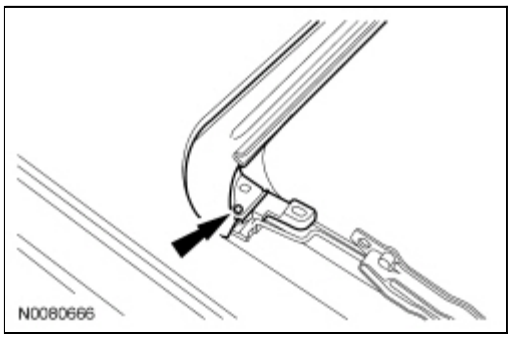


3. Disengage the front roof opening panel shield guide feet.
    1. Push the roof opening panel shield toward one side of the vehicle.
    2. Carefully flex the front portion of the roof opening panel shield upward to disengage the guide feet.

4. Slide the roof opening panel shield forward and release the rear guide feet.

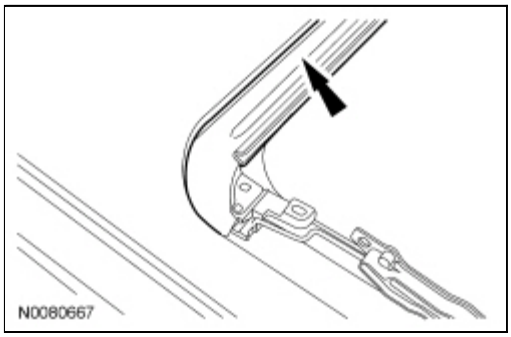
repair4less

5. To install, reverse the removal procedure.
    - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
    - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.



Trough Assembly

Removal and Installation



NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel, including: whenever the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel frame has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the roof opening panel glass. For additional information, refer to Roof Opening Panel Glass in this section.

2. Remove the 2 trough guide retaining screws.

3. Remove the trough from the trough guide assembly.

4. To install, reverse the removal procedure.
   - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

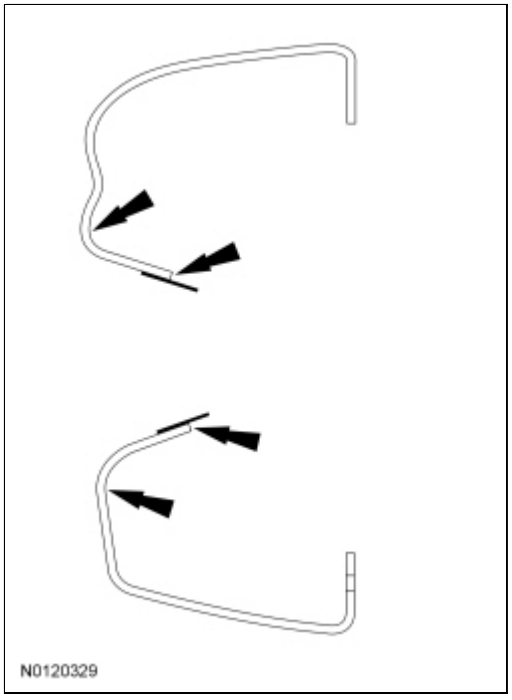
Bumper Rust Prevention — Front, Chrome

Material

Item	Specification
High Temperature Anti-Corrosion Coating PM-13-A	—
Motorcraft® Custom Bright Metal Cleaner ZC-15	ESR-M5B194-B

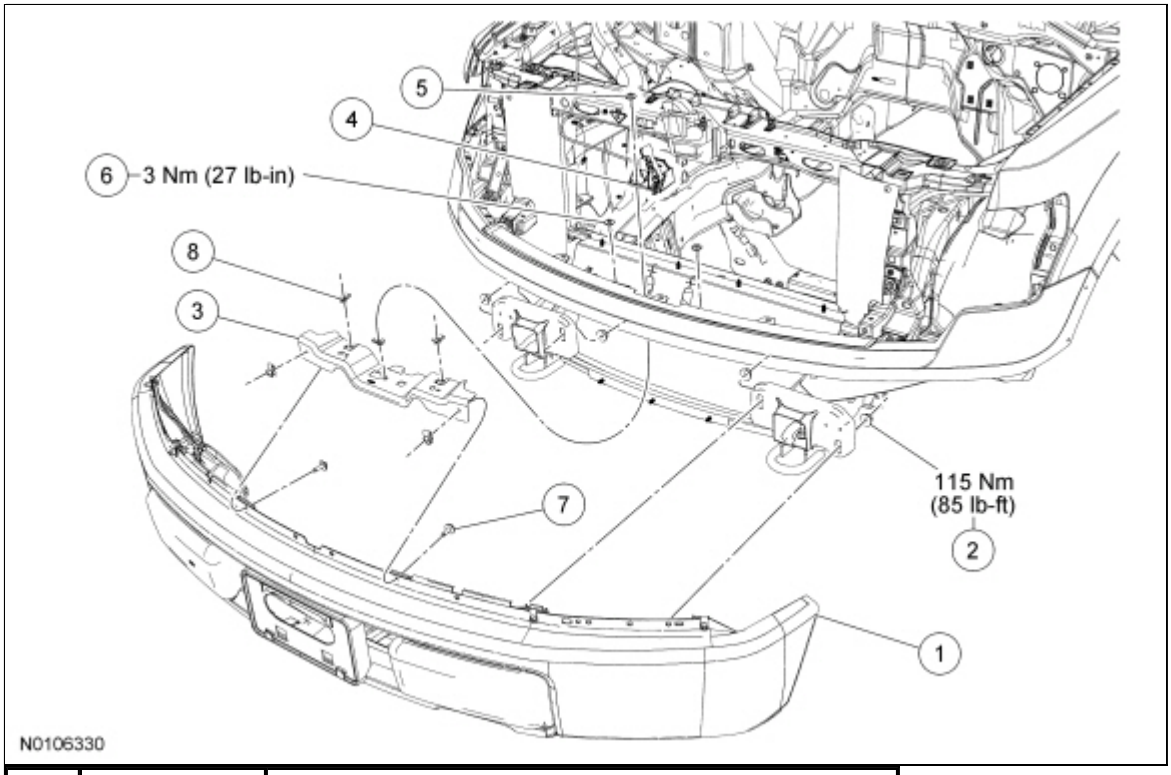


1. If equipped remove the license plate bracket.
2. If equipped, remove the foglamp assembly. For additional information, refer to Section 417-01 .
3. Remove the front bumper. For additional information, refer to Bumper — Front .
4. If equipped, remove the center vent grille pin-type retainers and the center vent grille.
5. Clean excessive dirt from an area of 2" (50 mm) around all 3 cutouts on the inside of the bumper.
6. **NOTE:** Use protective gloves when applying the Motorcraft Custom Bright Metal Cleaner.

   Clean the red rust stains from the inside edges of the center vent and fog lamp openings with Motorcraft Custom Bright Metal Cleaner.
7. Apply masking tape around the center vent and the fog lamp openings on the outside chrome part of the front bumper allowing for a 1 inch overhang into the openings.

8. **NOTE:** Use protective gloves when applying the anti-corrosion coating.

   Using a foam brush, paint the edge of the center vent and the fog lamp openings and at least 1" (25 mm) around the inside of the front bumper with the Motorcraft Anti-Corrosion Coating.

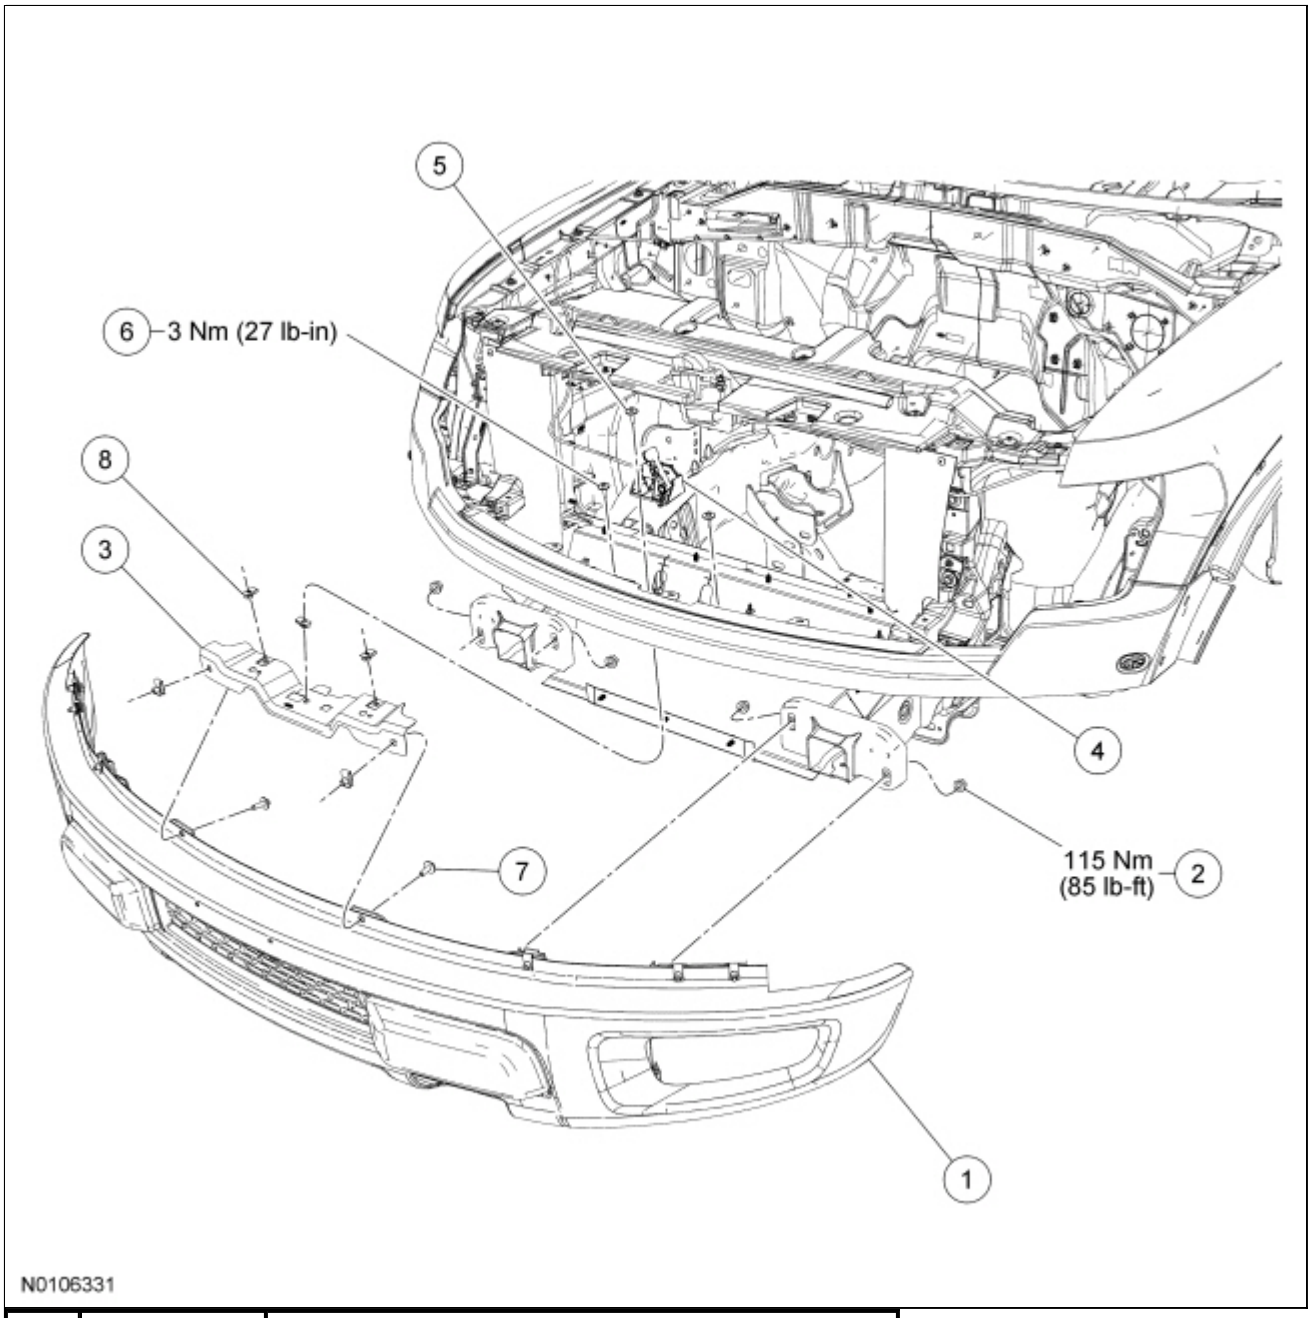


9. Remove the masking tape from around the center vent and the fog lamp openings.
10. If equipped, install the center vent grille and the center vent grille pin-type retainers.
11. Install the front bumper. For additional information, refer to Bumper — Front .

repair4less

12. If equipped, install the fog lamp assembly. For additional information, refer to Section 417-01 .
13. If equipped, install the license plate bracket.

Bumper — Front



F-150 Except F-150 SVT Raptor

Item	Part Number	Description
1	17D957	Front bumper
2	N804525-S	Front bumper nut (4 required)
3	17C947	Bumper cover-to-bumper bracket
4	16B975	Hood release
5	N811847	Hood release bolt
6	N811847	Bumper cover-to-bumper bracket bolt (2 required)
7	N811847	Bumper bracket-to-bumper bolt (2 required)
8	W520802	Bumper J-clip nut (5 required)

F-150 SVT Raptor

repair4less

Item	Part Number	Description
1	17F813	Front bumper
2	N804525-S	Front bumper nut (4 required)
3	17C947	Bumper cover-to-bumper bracket
4	16B975	Hood release
5	N811847	Hood release bolt
6	N811847	Bumper cover-to-bumper bracket bolt (2 required)
7	N811847	Bumper bracket-to-bumper bolt (2 required)
8	W520802	Bumper J-clip nut (5 required)

Removal and Installation

1. Remove the hood release retaining bolt.

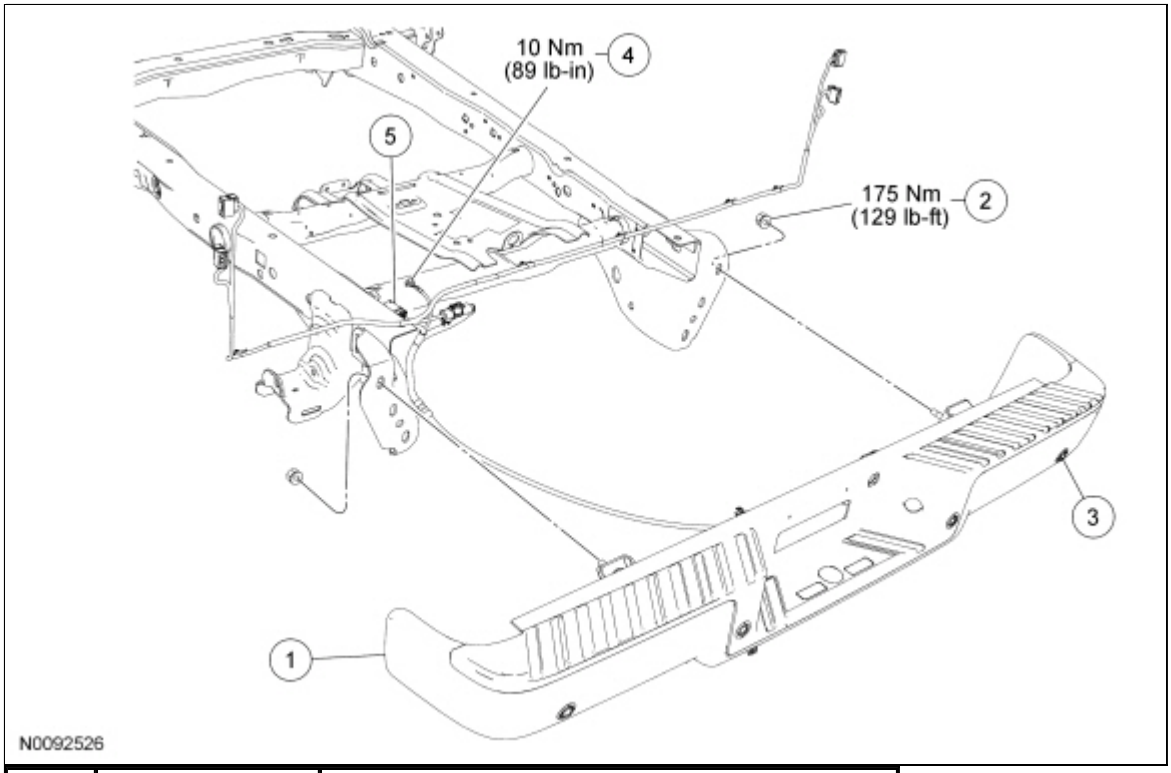
2. Position aside the hood release assembly.
    - Disconnect the hood release cable routing retainer.

3. Remove the 2 bumper cover-to-bumper bracket bolts.
    - To install, tighten to 3 Nm (27 lb-in).

4. If equipped, disconnect the fog lamp electrical connectors.

5. **NOTE:** To assist with bumper alignment, mark the 4 bumper mounting nuts to the bumper bracket.

   Remove the 4 front bumper nuts.
    - To install, tighten to 115 Nm (85 lb-ft).



6. Remove the front bumper.

7. To install, reverse the removal procedure.

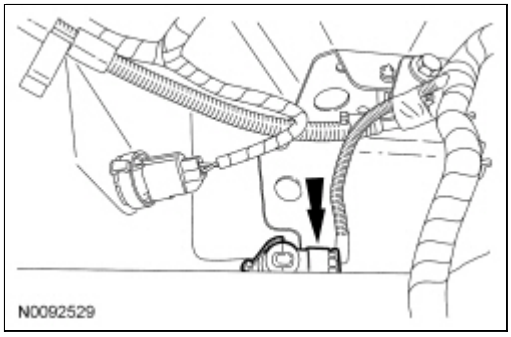
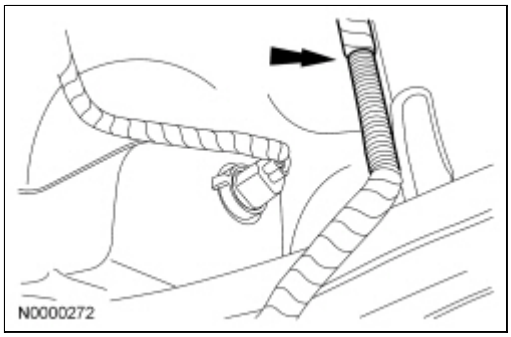
Bumper — Rear



Item	Part Number	Description
1	17775	Rear bumper
2	W708634-S	Rear bumper nut (4 required)
3	11523	Rear parking aid sensor (if equipped)
4	W701082	Ground bolt
5	—	Rear electrical harness connector

Removal and Installation

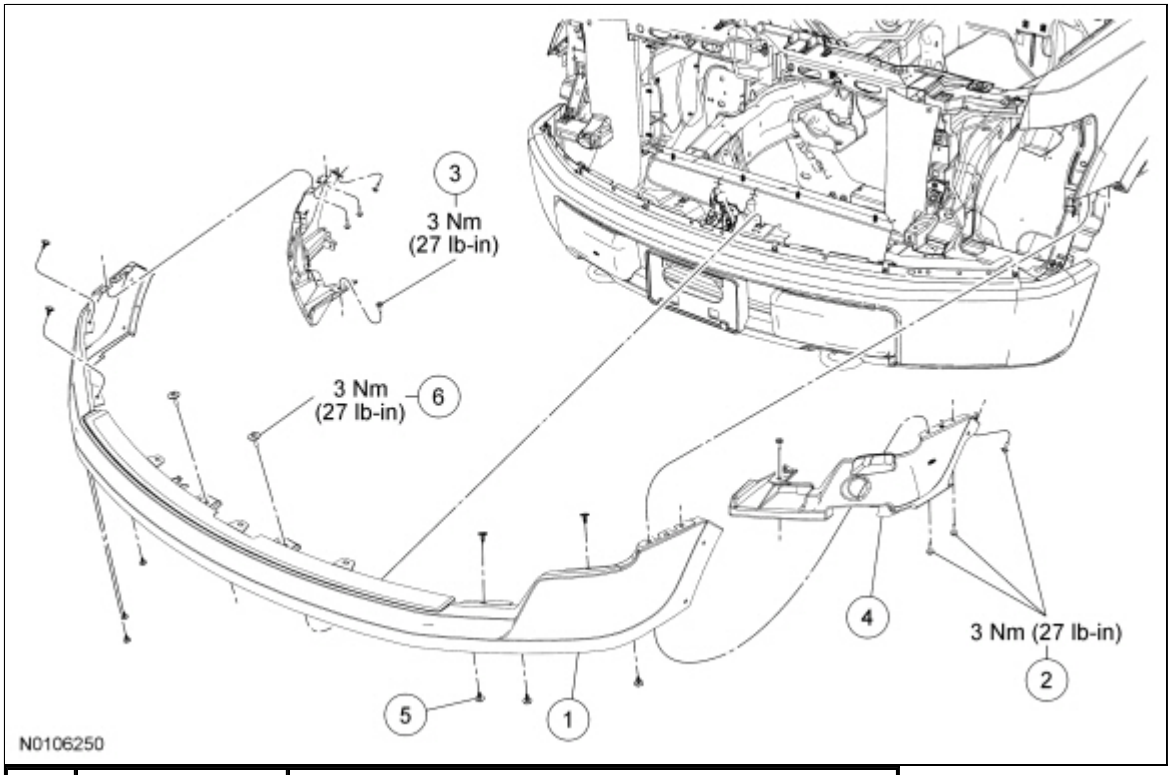


1. Disconnect the 2 license plate lamp electrical connectors and unclip the harness from the bumper.

2. If equipped, disconnect the parking aid sensors and unclip the harness from the bumper.

3. If equipped, detach the trailer harness pin-type retainer from the rear bumper.

4. Remove the rear bumper nuts.
    - To install, tighten the new nuts to 175 Nm (129 lb-ft).



5. Remove the rear bumper.

6. To install, reverse the removal procedure.
    - Transfer components as necessary. If equipped with a rear parking aid sensor, refer to Section 413-13 for additional information.

7	W705392	Fender splash shield screw (2 required)
8	W505424	Lower fender reinforcement-to-bumper cover bracket bolt (2 required)

Removal and Installation

All vehicles

1. Remove the headlamps. For additional information, refer to Section 417-01 .

2. Remove the 6 front bumper cover-to-front fender bolts.
   - To install, tighten to 3 Nm (27 lb-in).

3. **NOTE:** Any time the bumper cover-to-bumper bracket bolts are loosened or removed, new bolts must be installed.

Remove and discard the 2 bumper cover-to-bumper bracket bolts.
- To install, tighten to 3 Nm (27 lb-in).

Except F-150 SVT Raptor

4. Remove the 10 front bumper cover-to-bumper cover bracket pin-type retainers.

F-150 SVT Raptor

5. Remove the 8 front bumper cover-to-bumper cover bracket pin-type retainers.

Vehicles equipped with fender mouldings

6. Remove the fender mouldings. For additional information, refer to Section 501-08 .

All vehicles

7. **NOTE:** The rearward portion of the front bumper cover must be pulled upward and outward to release it from the bumper cover brackets.

   Remove the front bumper cover.

8. Inspect the bumper cover brackets for damage. If necessary, install new bumper cover brackets.

9. To install, reverse the removal procedure.
   - Install the 2 new bumper cover-to-bumper bolts and tighten to 3 Nm (27 lb-in).

repair4less

Safety Belt System

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

When installing new active occupant restraint components, use only replacement parts specified in the Ford Catalog Advantage™ or equivalent.

The active restraint system consists of the following serviceable items:

- Front safety belt buckles, attached to the inboard side of the driver and passenger seat tracks
- Front center safety belt retractor attached to the RH side of the front center seat back frame
- Front center safety belt buckle attached to the LH side of the front center seat base frame
- Detachable safety belt anchor attached to the RH side front center seat base frame
- Front safety belt retractors and pretensioners, located behind the B-pillar trim panels (Crew Cab and regular cab) or in the rear door (SuperCab)
- Belt Tension Sensor (BTS), located at the safety belt anchor point of the front passenger outboard safety belt
- Rear outboard safety belt retractors, located behind the B-pillar trim panels (SuperCab) or C-pillar trim panels (Crew Cab)
- Rear center safety belt retractor attached to the back panel of the cab
- RH rear safety belt buckles, attached to the floor pan (SuperCab)
- RH rear safety belt buckles, seat mounted and attached to the seat risers (Crew Cab)
- LH rear safety belt buckles attached to the floor pan (SuperCab and Crew Cab)
- Rear child safety seat tether anchors, at all seating positions, attached to the back panel of the cab
- Lower Anchors and Tethers for CHildren (LATCH) attached to the rear seat risers (Crew Cab and SuperCab only)

Safety Belt Retractors

The safety belt retractors include the following features:

- Dual locking mode
  - Emergency Locking Retractor (ELR)
  - Automatic Locking Retractor (ALR) (all except driver seat, front center seat, and rear center seat)
- Safety belt retractors and pretensioners (front outboard only)
- BTS (front outboard passenger only)
- Cinch tongue (front center and rear center seats only)

Automatic Locking Retractor (ALR)

The ALR mode is used when locking a child seat in an outboard seating position. The ALR mode is automatically activated when the safety belt webbing is fully extracted from the retractor and then allowed to retract. As the safety belt webbing is retracted back onto the spool, an audible clicking sound is made indicating the safety belt retractor is in ALR mode and the safety belt webbing will not pull back out of the safety belt retractor. To disengage the ALR mode, allow the safety belt webbing to fully retract back onto the spool. The ALR mode is disengaged when the webbing is free to extract and retract back into the retractor. For testing, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Cinch Tongue

Front center and rear center safety belt retractors are equipped with a locking cinch tongue. The locking cinch tongue slides up and down the safety belt webbing when it is in the stowed position or while putting the safety belt on. When the locking cinch tongue is latched into the buckle, the cinch tongue allows the lap portion of the safety belt to become shorter, but locks the webbing in place to restrict it from becoming longer. Before latching a cinch tongue into the buckle, the lap portion of the safety belt may have to be lengthened. To lengthen the lap belt, pull some webbing out of the safety belt retractor. While holding the webbing below the tongue, grasp the tip (metal portion) of the tongue so that it is parallel to the webbing and slide the tongue upward. Provide enough lap belt length so the tongue can reach the buckle. To fasten a cinch tongue, pull the safety belt from the retractor so the shoulder belt portion of the safety belt crosses the occupant's shoulder and chest. Be sure the belt is not twisted. If the belt is twisted, remove the twist. For instructions on how to remove a twist, refer to Safety Belt Tongue Rotated on Belt in this section. Insert the locking cinch tongue into the correct buckle for the seating position until a snap is heard and latching is felt. Make sure the tongue is securely fastened to the buckle by pulling on the tongue. Adjust the lap belt portion of the safety belt by pulling up on the shoulder belt until the lap belt fits snugly and as low as possible around the occupant's hips.

Emergency Locking Retractor (ELR)

The ELR is a vehicle-sensitive feature designed to activate and lock the safety belt webbing during hard braking, hard cornering or in an impact of approximately 24 km/h (15 mph). The ELR feature helps to reduce the forward movement of the driver and passengers. For testing, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Safety Belt Retractor Pretensioners

The pretensioner is a pyrotechnic device that deploys when activated by the Restraints Control Module (RCM) to remove excess safety belt webbing from the shoulder and lap safety belt in the event of an impact. If a deployment of the safety belt retractor pretensioners occurs, a new assembly must be installed. Refer to Safety Belt Retractor and Pretensioner — Regular Cab and Crew Cab or Safety Belt Retractor and Pretensioner — SuperCab in this section.

For safety belt retractor pretensioner diagnostic and disposal information, refer to Section 501-20B .

Belt Tension Sensor (BTS)

The BTS is located at the RH front safety belt retractor pretensioner anchor point and operates as part of the Occupant Classification Sensor (OCS) system. To diagnose the BTS , refer to Section 501-20B .

Safety Belt Buckles

Front Safety Belt Buckles

The safety belt buckles are attached to the inboard side of the driver and passenger seat tracks and, if equipped, to the LH side of the center seat base frame.

repair4less

After any crash, safety belt buckles must be inspected to verify correct function.

Rear Safety Belt Buckles

On the SuperCab, the RH rear safety belt buckles are attached to the floor and the LH rear safety belt buckle is part of the rear center safety belt retractor and attaches to the floor. On the Crew Cab, the RH rear safety belt buckles are attached to the seat risers and the LH rear safety belt buckle is part of the rear center safety belt retractor and attaches to the floor.

After any crash, safety belt system components (including retractors and buckles) must be inspected to verify correct function.

Child Safety Seat Restraints

The child safety seat restraints include the following items:

- Serviceable rear child safety seat tether anchors, at all seating positions, attached to the back panel of the cab.
- Non-serviceable Lower Anchors and Tethers for CHildren attached to the rear seat risers on the SuperCab and Crew Cab only. Regular cab vehicles are not equipped with Lower Anchors and Tethers for CHildren.

If a child safety seat was in use during a collision, inspect the child safety seat component mounting areas and repair any damage and restore the vehicle to the original production configuration.

Safety Belt System

Principles of Operation

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

Safety Belt Warning System

The conditions of operation for the driver and/or passenger safety belt warning indicator and chime operate as follows:

- If the driver and/or passenger safety belt is not buckled with the ignition ON, then the safety belt warning indicator illuminates for 1 to 2 minutes and the warning chime sounds for 4 to 8 seconds
- If the driver and/or passenger safety belt is buckled while the warning indicator is illuminated and the warning chime is sounding, then the indicator and chime will turn off
- If the driver and/or passenger safety belt is buckled before the ignition is in the ON position, the safety belt warning indicator and chime will remain off

Belt-Minder®

The Belt-Minder® feature is a supplemental warning to the safety belt warning function. This feature provides an additional reminder that the driver and/or front passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning indicator in the Instrument Panel Cluster (IPC).

Either the driver or front passenger safety belt systems may activate the Belt-Minder®. If the Belt-Minder® warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder® feature.

When a MyKey® is in the ignition, deactivation of the Belt-Minder® is ignored. The Belt-Minder® feature can be activated or deactivated by the administrator key. Using the non-administrator key overrides the deactivation of the Belt-Minder® feature. Refer to Section 419-01B or the Owner's Literature for further information on MyKey® functionality.

The passenger Belt-Minder® feature is activated only when the Occupant Classification Sensor (OCS) system detects an occupant in the right front seat and the occupants weight exceeds a programmed limit. For information on the OCS system, refer to Section 501-20B .

To activate or deactivate the Belt-Minder® feature, refer to Section 413-01 .

repair4less

If...	Then...
the driver and/or passenger safety belt is buckled before the ignition is in the ON position or less than 1-2 minutes have elapsed since the ignition has been turned ON...	the Belt-Minder® feature does not activate.
the driver and/or front passenger safety belt is not buckled before the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition has been turned ON...	the Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.
the driver or front passenger safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 5 km/h (3 mph) and more than 1-2 minutes have elapsed since the ignition has been ON...	the Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.

Inspection and Verification

1. Verify the customer concern.

2. Inspect to determine if any of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
• Safety belt webbing integrity (torn, frayed, cut or stretched) • Safety belt buckle and tongue assembly • Safety belt retractor	• Bare, broken or disconnected wire • Connector not tightly engaged • Safety belt warning indicator burned out or broken

3. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. With the exception of removing a twist from the safety belt webbing, do not attempt to repair a component of the safety belt system; new components must be installed.

4. If the concern remains after the inspection, determine the symptom. GO to Symptom Chart .

5. To check the active restraint system for correct operation, carry out the appropriate Functional Test procedure(s). Refer to Component Test in this section.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action

• The safety belt warning indicator does not operate	• Burned-out indicator/LED • Wiring, terminals or connectors • Instrument Panel Cluster (IPC) • Restraints Control Module (RCM)	• If the air bag warning indicator is illuminated, REFER to Section 501-20B . If the air bag warning indicator is not illuminated, REFER to Section 413-01 .
• The safety belt warning chime does not operate	• Wiring, terminals or connectors • Safety belt switch • IPC • RCM	• If the air bag warning indicator is illuminated, REFER to Section 501-20B . If the air bag warning indicator is not illuminated, REFER to Section 413-01 .
• The safety belt retractor webbing does not extract or exhibits excessive pressure on the occupant during use	• Safety belt retractor is in Automatic Locking Retractor (ALR) mode • Safety belt retractor binding internally	• CARRY OUT the Functional Test — Safety Belt Retractor, ALR Mode. REFER to Component Test in this section. INSTALL new components as directed.
• The safety belt retractor webbing does not retract or has excessive slack during use	• Twisted or incorrectly routed safety belt webbing • Safety belt retractor binding internally • Safety belt retractor	• CORRECT the twisted safety belt webbing. REFER to Safety Belt Tongue Rotated on Belt or Safety Belt Twisted at the Safety Belt Guide in this section. CARRY OUT the appropriate Functional Test procedure. REFER to Component Test in this section. • INSTALL a new safety belt retractor. For front safety belt retractors, REFER to Safety Belt Retractor and Pretensioner — Regular Cab and Crew Cab , Safety Belt Retractor — Front, Center or Safety Belt Retractor and Pretensioner — SuperCab in this section. For rear safety belt retractors, REFER to Safety Belt Retractor — Rear or Safety Belt Retractor — Rear, Center in this section.
• The Belt-Minder® feature is inoperative	• Wiring, terminals or connectors • Belt-Minder® feature is deactivated	• REFER to Section 413-01 or the Seating and Safety Restraints section of the Owner's Literature to activate the Belt-Minder® feature. If the Belt-Minder® is activated, REFER to Section 413-01 to diagnose.
• The safety belt tongue is rotated on the safety belt webbing	• Twisted or incorrectly routed safety belt webbing	• REFER to Safety Belt Tongue Rotated on Belt in this section.
• The safety belt	• Twisted or	• REFER to Safety Belt Twisted at the

repair4less

webbing is twisted at the safety belt guide	incorrectly routed safety belt webbing	Safety Belt Guide in this section.
• The safety belt webbing is dirty or soiled	• Dirty or soiled safety belt webbing	• REFER to Safety Belt Cleaning in this section.

Component Test

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

Carry out the appropriate Functional Test(s) as determined in Inspection and Verification.

Functional Test — Safety Belt Buckle and Tongue

The safety belt buckle and tongue assembly must operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1. Verify the following during the latching sequence:
   - Tongue insertion is not hindered by excessive effort.
   - A click is heard when the safety belt buckle latches the tongue.
2. Verify the system integrity by forcefully pulling on the safety belt webbing.
3. Unlatch the safety belt by fully depressing the safety belt buckle release button and allowing the safety belt to release and retract.
4. Verify the following during the unlatching process:
   - Push-button depression does not require excessive effort.
   - The tongue can be removed easily from the buckle.
5. Repeat the above steps 3 times.
6. If the functional test reveals a concern(s), install a new safety belt buckle or safety belt retractor as required.

Functional Test — Safety Belt Retractor

The safety belt retractor must be freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1. Extract and retract the safety belt between the full extension and stowed positions.

2. Verify the safety belt retractor operates without excessive effort or binding.

3. Install a new safety belt retractor if any concern is found or the complaint has been verified.

Functional Test — Safety Belt Retractor, Automatic Locking Retractor (ALR) Mode

1. Position the seat backrest fully upright (if adjustable).

2. Position the safety belt shoulder height adjuster (if equipped) in the full down or up position.

3. Fasten the safety belt.

4. Pull out the safety belt webbing until the Automatic Locking Retractor (ALR) feature is activated.

5. Allow the safety belt webbing to retract until it stops.

6. Pull on the safety belt webbing to check that the safety belt retractor has remained in the ALR mode. If the safety belt retractor is not locked, install a new safety belt retractor.

7. Unfasten the safety belt and allow the safety belt webbing to retract to its stowed position.

8. Pull out and retract the safety belt webbing to verify the safety belt retractor has converted automatically out of ALR mode. If the safety belt retractor remains locked in the ALR mode, install a new safety belt retractor.

Functional Test — Safety Belt Retractor, Road Test Inspection

WARNING: The driver and passenger must be prepared to brace themselves in the event the safety belt retractor does not lock. Failure to follow this instruction may result in serious personal injury.

NOTE: Make sure there is no excessive slack in the safety belt webbing across the torso during testing.

NOTE: Do not jerk on the safety belt webbing when carrying out this test.

1. Test the safety belts in the following sequence:
    1. Fasten the safety belts and proceed to a safe area.
    2. Attain a speed of 24 km/h (15 mph).
    3. **WARNING: Apply maximum brake force only on dry concrete or equivalent hard surface, never on wet pavement or gravel. Failure to follow this instruction may result in serious personal injury.**

       Grasp the shoulder harness, lean forward and apply the brakes, making a maximum braking application without a skid.
    4. The safety belts should lock up with minimum webbing extension.
    5. If there is a lockup of all safety belt retractors being tested, the safety belt retractors are functioning correctly. If any safety belt retractor fails to lock up, install a new safety belt retractor(s).

repair4less

Safety Belt Cleaning

WARNING: Do not bleach or re-dye the safety belt webbing, as the webbing may weaken. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

1. Clean the safety belt webbing only with a mild soap solution recommended for cleaning upholstery or carpets. Follow the instructions provided with the soap.

repair4less

Safety Belt Inspection and Repair After a Collision

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

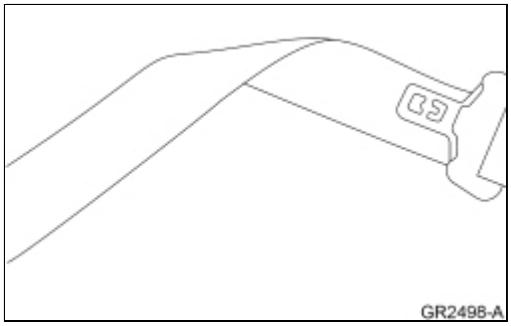
1. Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be worked back to its original shape and structural integrity.

2. Install the new safety belt(s) at any seating position(s) where deployment has occurred and the safety belt(s) were used. Carry out the Functional Test Procedure for all seating positions. For additional information, refer to the appropriate Function Test procedure in Safety Belt System in this section.

Safety Belt Maintenance

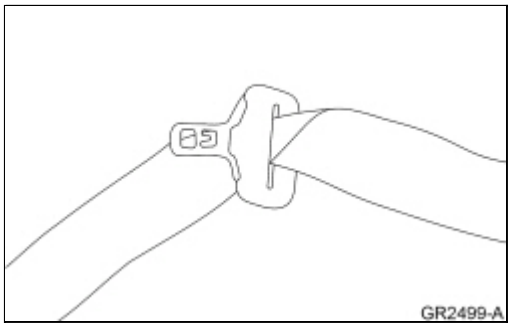
WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

1. The safety belt assemblies should be periodically inspected to make sure that they have not become damaged and that they remain in correct operating condition, particularly if they have been subjected to severe stress.



2. Before installing the new safety belt assembly, the safety belt retaining areas must be inspected for damage and distortion. If the retaining points are damaged and distorted, the sheet metal must be reworked back to its original shape and structural integrity.

3. Install the new safety belt(s). Refer to the appropriate procedure(s) in this section. Carry out the appropriate Functional Test Procedure. For additional information, refer to the appropriate Functional Test Procedure in Safety Belt System in this section.

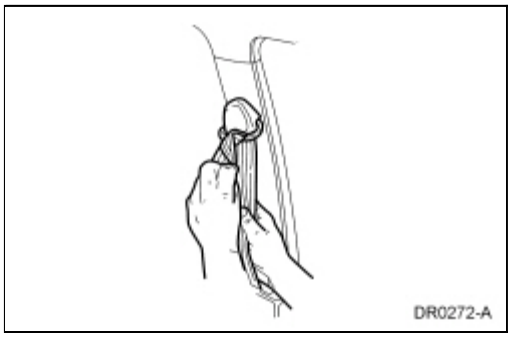


repair4less

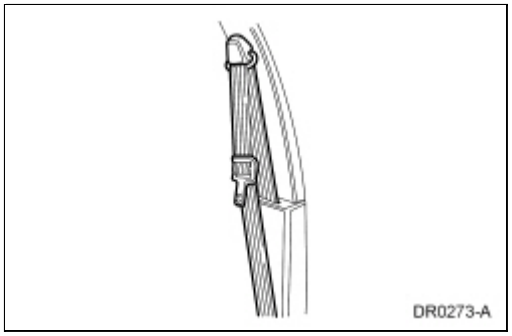
Safety Belt Tongue Rotated on Belt

1. Fold the safety belt as indicated.

2. Pull the safety belt tongue over the fold in the safety belt.



repair4less



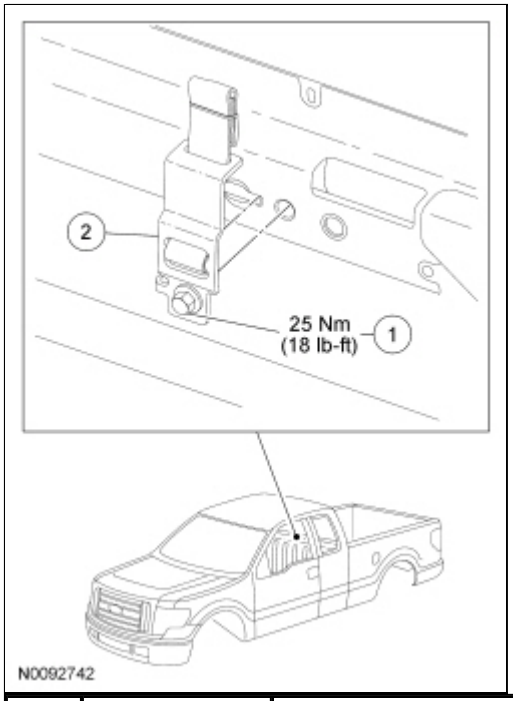
Safety Belt Twisted at the Safety Belt Guide

NOTE: These procedures apply to both wire-formed and stamped D-ring designs.

1. Grasp the safety belt webbing at the shoulder belt guide (D-ring).

2. Feed the folded portion of the safety belt webbing through the safety belt guide (D-ring) to remove the twist from the belt webbing.

repair4less



Child Safety Seat Tether Anchor — LATCH, SuperCab and Crew Cab

Removal and Installation

1. The lower anchors and tethers for children are serviced as part of the rear seat frames and are not serviceable separately.
    - For Crew Cab, install a new rear seat cushion frame. For additional information, refer to Seat Cushion — Rear, Crew Cab in the Disassembly and Assembly portion of Section 501-10 .
    - For SuperCab, install a new rear seat frame. For additional information, refer to Seat Cushion — Rear, SuperCab in the Disassembly and Assembly portion of Section 501-10 .

Child Safety Seat Tether Anchor

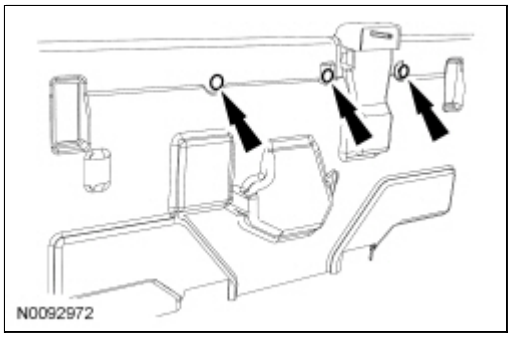
NOTE: SuperCab shown, other cab styles similar.

Item	Part Number	Description
1	—	Tether anchor bolt (part of 613D74) (3 required)
2	613D74	Tether anchor (3 required)

Removal and Installation

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

WARNING: Always tighten the child safety seat tether anchor/bolt to specification. Failure to follow this instruction may result in the child's safety seat being incorrectly secured, which increases the risk of serious personal injury or death to the child in a sudden stop or crash.

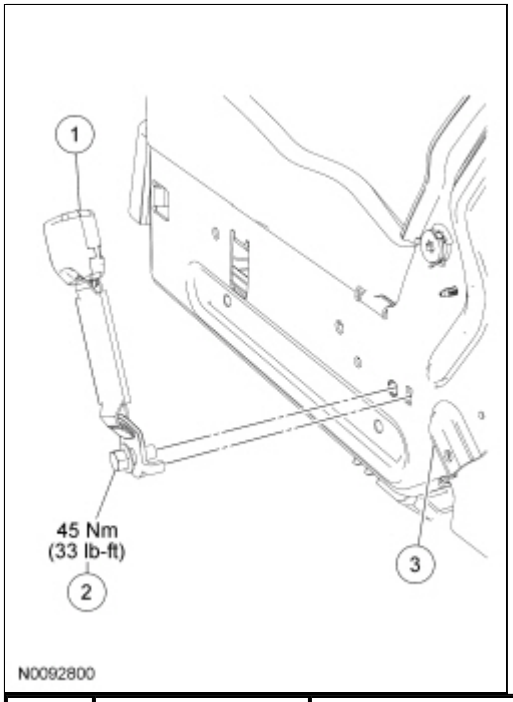


1. **For Crew Cab vehicles** , fold the rear seat backrest down. For additional information, refer to Seat — Rear, Crew Cab, 60 Percent or Seat — Rear, Crew Cab, 40 Percent in the Removal and Installation portion of Section 501-10 .

2. **For SuperCab vehicles** , remove the rear seat backrest. For additional information, refer to appropriate steps in Seat — Rear, SuperCab in the Removal and Installation portion of Section 501-

repair4less

10 .



3. **For regular cab vehicles** , fold the seat backrest down, remove the 3 pin-type retainers and position the rear sound insulator aside.

4. Remove the tether anchor bolt(s) and tether anchor(s).
    - To install, tighten to 25 Nm (18 lb-ft).

5. To install, reverse the removal procedure.

Safety Belt Buckle — Front, Center

Item	Part Number	Description
1	611B70	Safety belt buckle
2	—	Safety belt buckle bolt (part of 611B70)
3	61708	Front center seat base frame

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

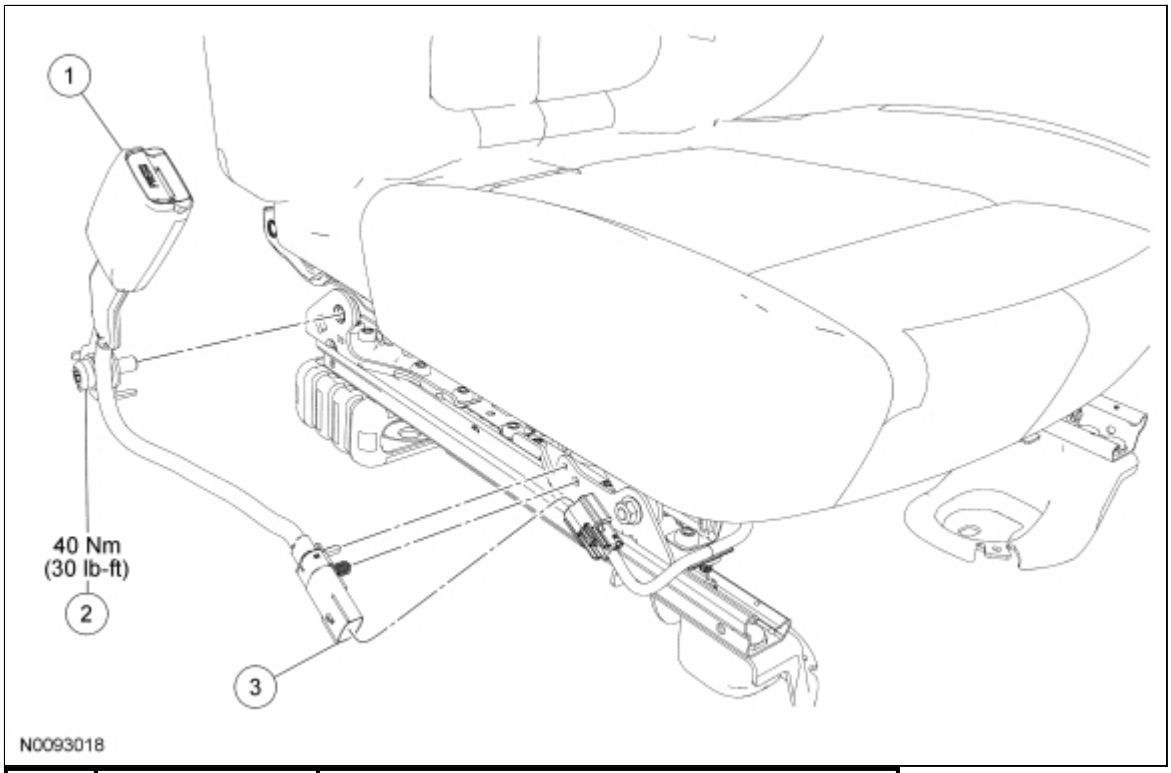
1. Remove the front center seat. For additional information, refer to the Removal and Installation portion of Section 501-10 .

2. Remove the LH side shield. For additional information, refer to the Front Center Seat Exploded View procedure in the Removal and Installation portion of Section 501-10 .

3. Remove the bolt and safety belt buckle.
   - To install, tighten to 45 Nm (33 lb-ft).

4. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.



repair4less

5. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Safety Belt Buckle — Front

NOTE: Driver seat shown, passenger similar.

NOTE: Refer to the installation steps in Section 501-10 for tightening sequence and torque specification.

Item	Part Number	Description
1	61203	Safety belt buckle
2	—	Safety belt buckle bolt (part of 61203)
3	—	Electrical connector

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

1. Remove the seat. For additional information, refer to Section 501-10 .

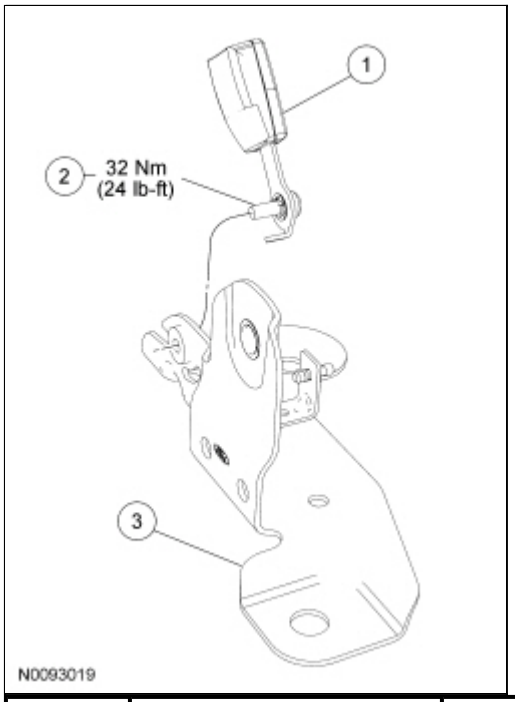
repair4less

2. Disconnect the electrical connector and detach the wiring harness pin-type retainer.

3. Remove the bolt and safety belt buckle.
    - If equipped, pull the safety belt buckle through the seat cushion trim located on the side of the seat.
    - To install, tighten to 40 Nm (30 lb-ft).

4. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

    To install, reverse the removal procedure.



5. Install the seat.
    - For passenger seat, carry out the Occupant Classification Sensor (OCS) System Reset. For additional information, refer to the General Procedures portion of Section 501-20B .

6. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Safety Belt Buckle — Rear

Crew Cab

Removal and Installation

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

NOTE: The LH rear safety belt buckle is attached to the rear center safety belt retractor anchor. For removal and installation procedures, refer to Safety Belt Retractor — Rear, Center in this section.

Crew Cab

1. Fold the rear seat cushion up.

2. Remove the bolt and safety belt buckle.
   - To install, tighten to 32 Nm (24 lb-ft).

SuperCab

3. Remove the rear seat backrest. For additional information, refer to the appropriate steps in Seat — Rear, SuperCab in the Removal and Installation portion of Section 501-10 .

4. Remove the nut and safety belt buckle assembly.
   - To install, tighten to 80 Nm (59 lb-ft).

All vehicles

5. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

6. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

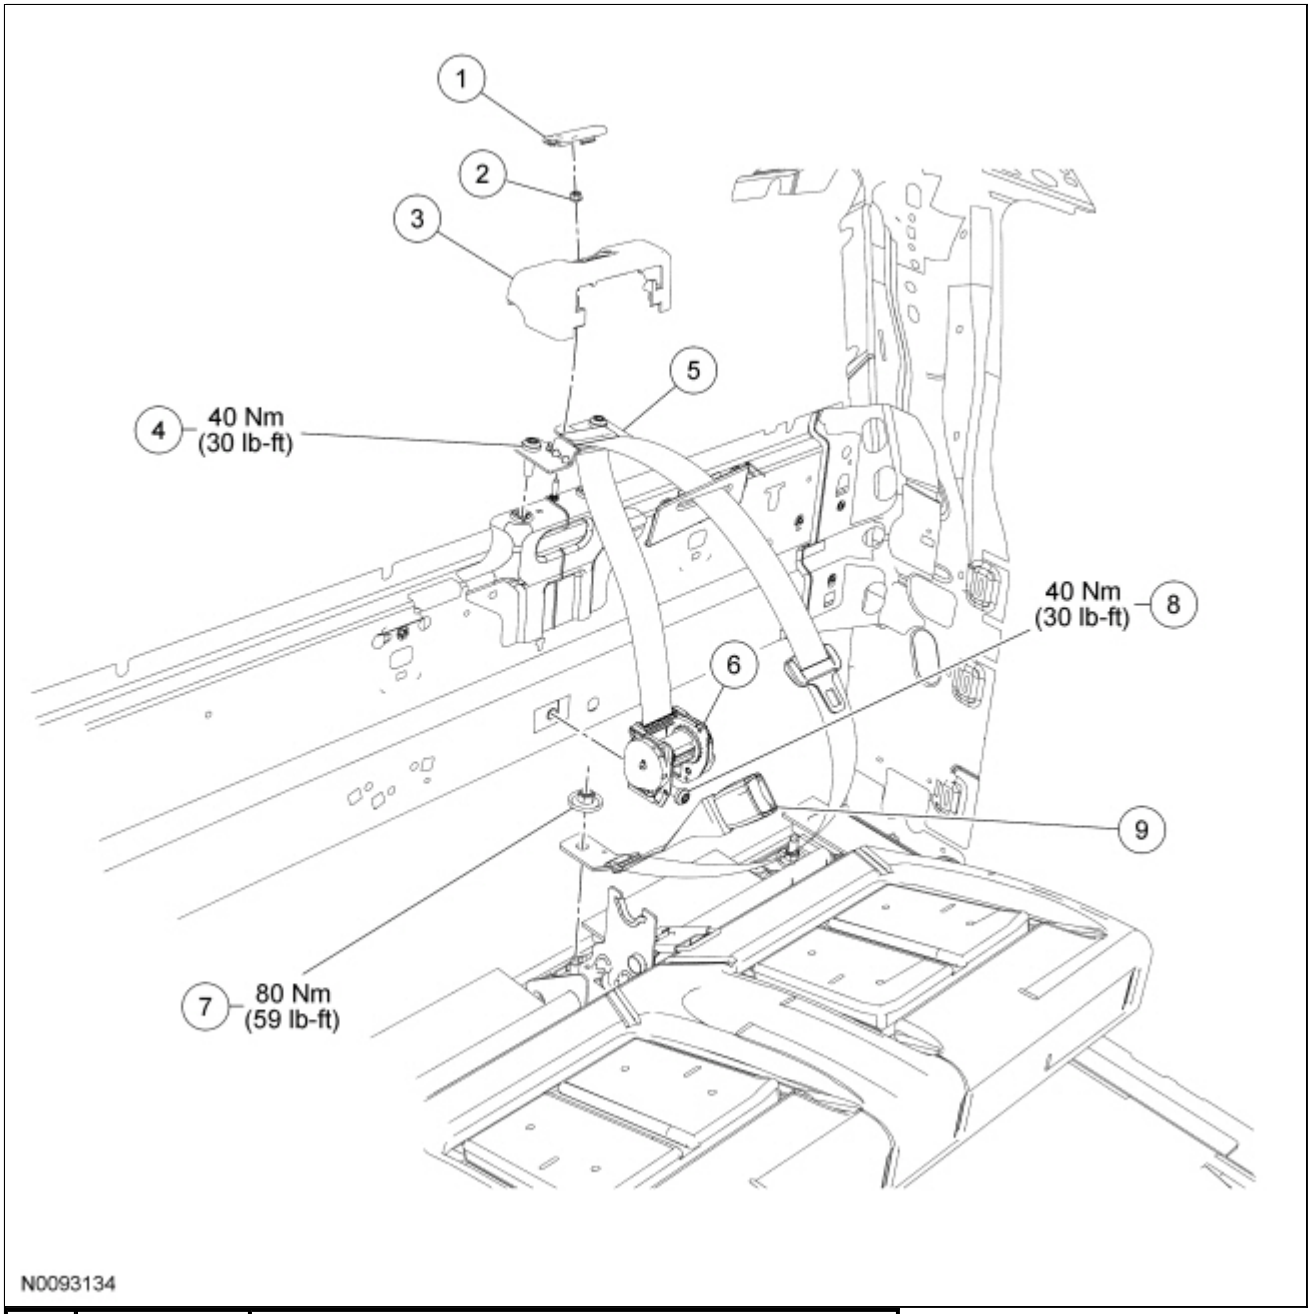
17	W505275	Safety belt retractor bolt
18	—	Safety belt anchor bolt (part of 611B64)

Removal and Installation

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.



1. Remove the front center seat. For additional information, refer to Section 501-10 .
2. Open the arm rest cover, remove the 3 screws and armrest storage bin.
3. Push the release buttons and remove the head restraint.
4. Remove and discard the 2 head restraint guide sleeves. For additional information, refer to section Section 501-10 .
5. Remove the 2 screws and center seat belt retractor bezel.
6. Detach the backrest cover from the storage bin bracket.
7. Remove the safety belt anchor bolt.
   - To install, tighten to 45 Nm (33 lb-ft).
8. Remove the 4 screws to the armrest storage bin bracket and position aside.
9. Remove the bolt and safety belt retractor.
   - To install, tighten to 45 Nm (33 lb-ft).
10. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

    To install, reverse the removal procedure.
11. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

repair4less

3	60262	D-ring cover
4	—	Safety belt shoulder height adjuster bolt (part of 602B82)
5	602B82	Safety belt shoulder height adjuster

Removal and Installation

WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

1. Remove the D-ring cover.

2. Remove the D-ring bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

3. Remove the rear door front garnish moulding.

4. Remove the bolt and safety belt shoulder height adjuster.
   - Rotate the safety belt shoulder height adjuster to remove the lower tab from the sheet metal slot.
   - To install, tighten to 40 Nm (30 lb-ft).

5. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

6. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

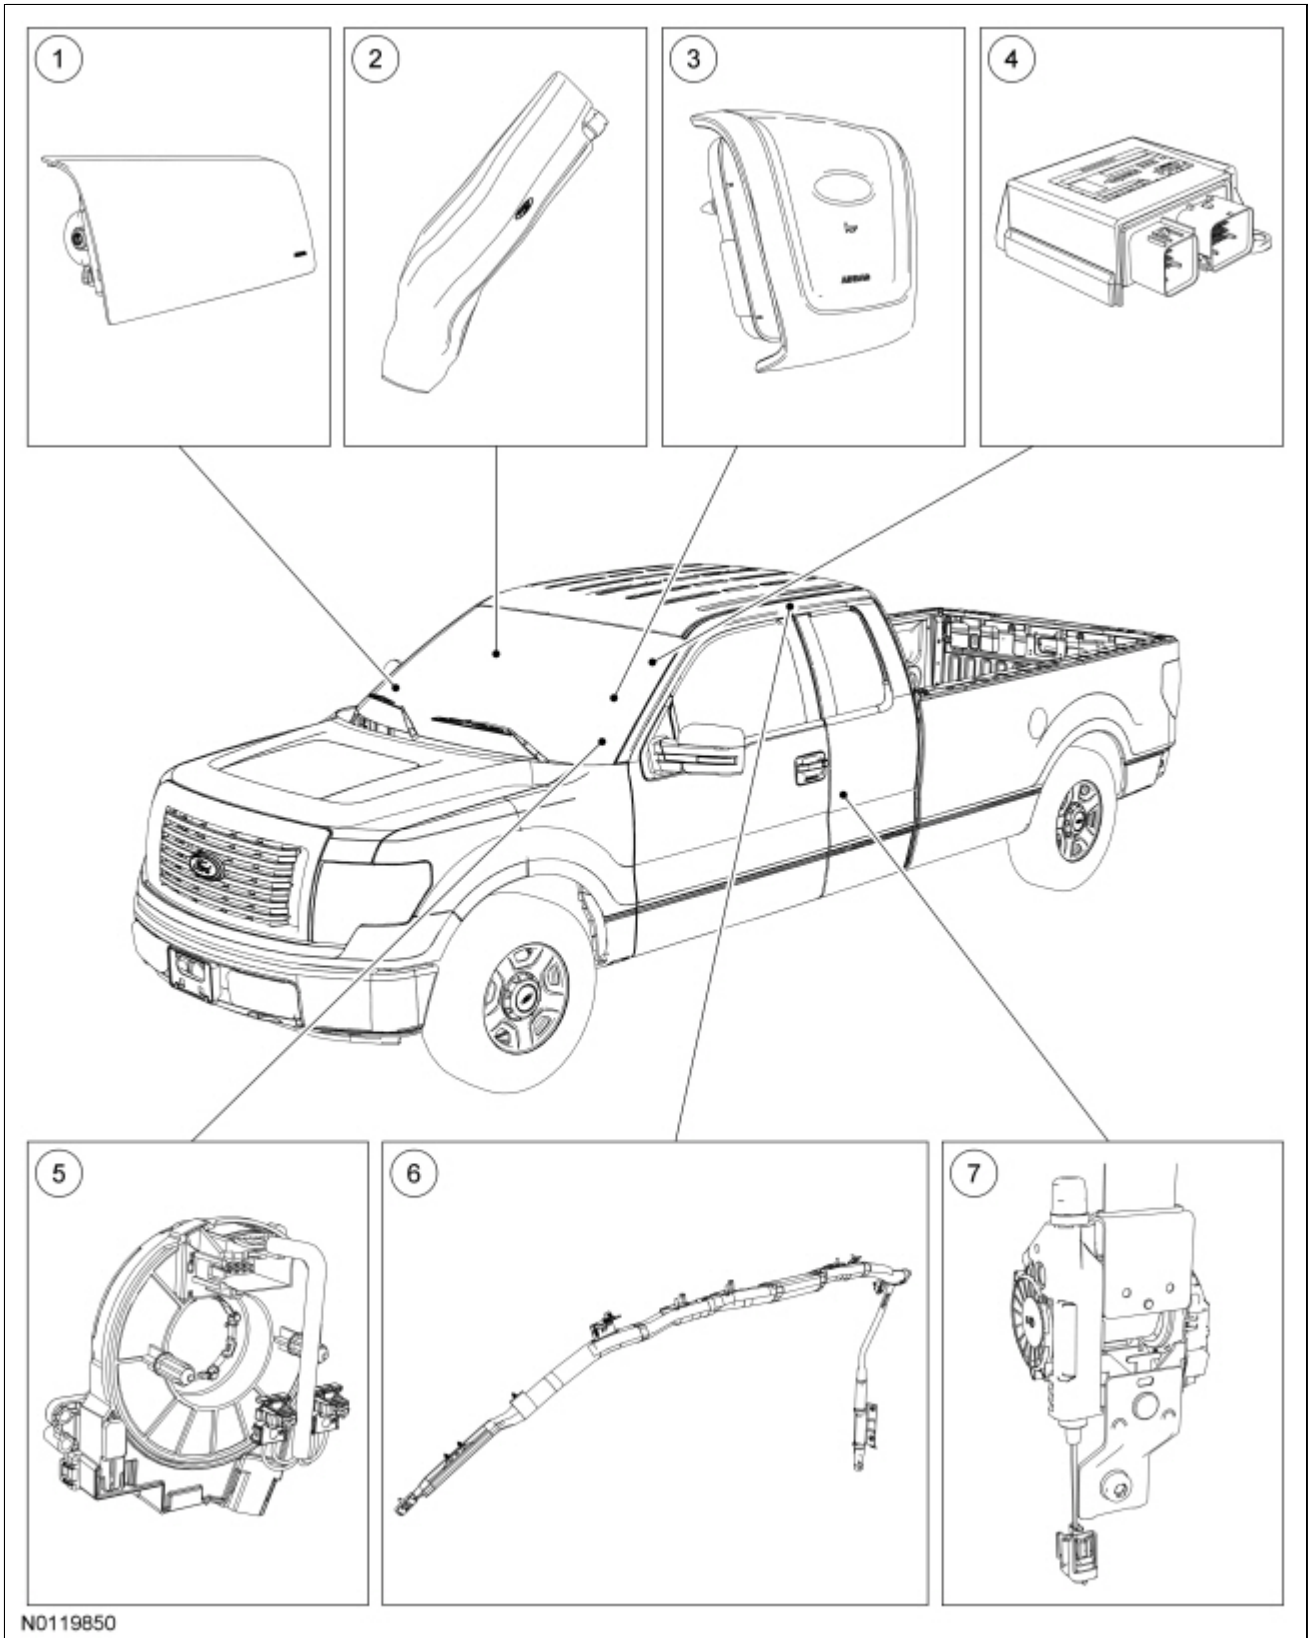
repair4less

Torque Specifications

Description	Nm	lb-in
Front impact severity sensor bolt	12	106
Passenger air bag module bolts	8	71
Restraints Control Module (RCM) bolts	12	106
Side air bag module nuts	9	80
Safety Canopy® module bolts — (all cab styles) [a]	—	—
Side impact sensor bolt — second row	12	106

[a] Refer to the procedure in this section.

Airbag and Safety Belt Pretensioner Supplemental Restraint System (SRS)



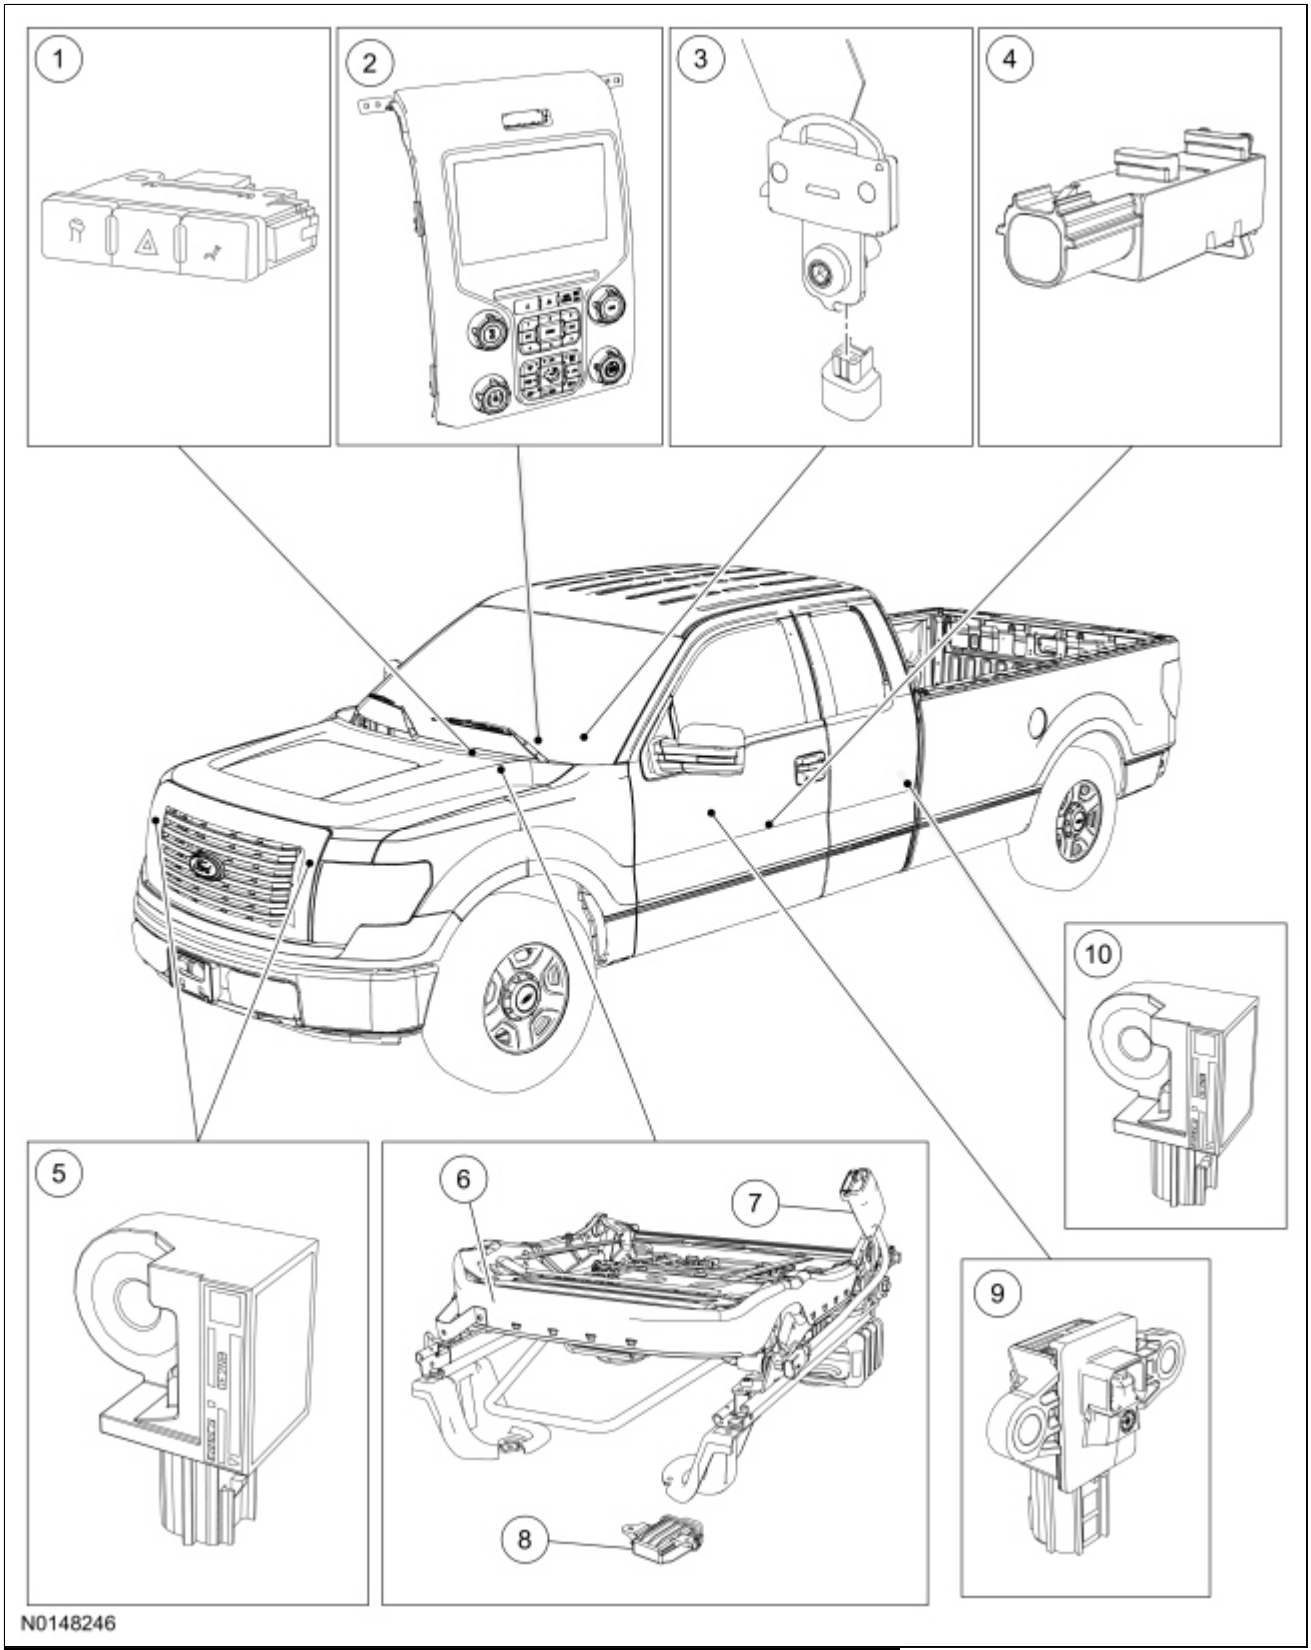
The airbag SRS is designed to provide increased collision protection for front seat occupants in addition to that provided by the 3-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantage of the SRS .

This vehicle line contains dual-stage deployment (advanced restraint system) driver and front passenger airbags.

The serviceable airbag and safety belt pretensioner SRS components are shown in the following illustrations.

Airbag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Components (Illustration 1 of 2)

repair4less



Item	Part Number	Description
1	044A74	Passenger airbag
2	611D11/611D10	Driver/passenger seat side airbag

3	043B13	Driver airbag
4	14B321	RCM
5	14A664	Clockspring
6	042D95/042D94	Driver/passenger Safety Canopy®
7	611B09/611B08	Driver/passenger safety belt retractor pretensioner assembly

Airbag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Components (Illustration 2 of 2)

Airbag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The Restraints Control Module (RCM) continuously receives/monitors all inputs from the following Supplemental Restraint System (SRS) components.

- LH and RH front impact severity sensors
- Driver and passenger front door side impact sensors
- Driver and passenger second row side impact sensors
- Safety belt buckle switches (driver and passenger)
- Driver seat track position sensor
- Occupant Classification System Module (OCSM)

If the RCM detects sudden vehicle deceleration and/or lateral deceleration based on all the information received from all sensors and switches and determines that deployment is required, the RCM sends voltage and current to deploy the appropriate SRS components.

The RCM contains an internal sensor that detects vehicle rollover angles. If the RCM determines that a rollover condition exists and deployment is required, the RCM deploys the applicable SRS components.

During a frontal or side crash, the RCM can deploy the following SRS components, based on crash severity and sensor input.

- Safety belt retractor pretensioner(s)

- Seat side air bag(s)
- Safety Canopy®
- Driver and passenger dual-stage air bag(s) (one or both stages)

The fact that the safety belt pretensioners, Safety Canopy® or air bags did not activate for both front seat occupants in a crash does not indicate that something is wrong with the system.

The RCM carries out a self-test of the SRS during each startup. If a SRS fault exists, the air bag warning indicator illuminates and remains illuminated for the rest of the ignition cycle. In addition to the self-test at start up, the RCM continuously monitors all of its SRS components and circuitry for correct operation.

Air Bag Warning Indicator

The air bag warning indicator:

- is located in the Instrument Panel Cluster (IPC) and proves out by lighting for 6 seconds and then turn off.
- flashes and/or illuminates based on the message the IPC receives from the RCM .
- illuminates if the IPC does not receive a message from the RCM .

Air Bag Module Second Stage Deployment Check

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

- For information on driver air bag module and/or passenger air bag module remote deployment, refer to Pyrotechnic Device Disposal in this section.

Clockspring

The clockspring allows for continuous electrical connections between the driver air bag module and the RCM when the steering wheel is turned.

Driver Air Bag Module

The driver air bag module is a dual-stage air bag, upon receiving a flow of current from the RCM , deploying at 1 of 2 different rates depending upon vehicle impact severity and impact sensor input.

High Speed Controller Area Network (HS-CAN)

This vehicle utilizes a communication system called a High Speed Controller Area Network (HS-CAN). The RCM communicates with various modules for required information about the vehicle. Refer to Section 418-

repair4less

00 for information about the HS-CAN .

Occupant Classification System (OCS)

The Occupant Classification System (OCS) is found only on the front passenger seat. The OCS classifies the size of the front passenger seat occupant and provides this information to the RCM . The RCM uses this information (and other inputs) in determining the deployment strategy of the passenger air bag and pretensioner. The OCS has 2 weight sensor bolts that are mounted to the inboard rail of the seat track and are only serviced with the seat track assembly. The OCSM is mounted to the electrical bracket underneath the seat cushion pan and can be serviced separately from the seat track assembly.

The OCS is also used for operation of the passenger Belt-Minder®. For information on the passenger Belt-Minder® feature, refer to Section 501-20A . To deactivate or reactivate the passenger Belt-Minder® feature, refer to Section 413-01 or the Owner's Literature.

Belt Tension Sensor (BTS)

The Belt Tension Sensor (BTS):

- is a 3-wire Hall-effect sensor located at the safety belt anchor point and is part of the front passenger safety belt and retractor assembly.
- is used in conjunction with the OCS .

The BTS is used by the OCS to identify the presence of a child safety seat on the front passenger seat. The BTS senses the tension on the safety belt assembly then provides an output to the OCSM , indicating that the safety belt assembly is cinched. After sensing the weight applied to the seat by the occupant and using the BTS input, the OCSM determines how the occupant should be classified and communicates this information to the RCM . If the occupant is classified as a child, the RCM automatically deactivates the passenger air bag module and illuminates the Passenger Air Bag Deactivation (PAD) indicator.

Passenger Air Bag Deactivation (PAD) Indicator — Vehicles without 4.2" LCD IPC display

The PAD indicator is a visual indicator used to inform the front seat occupants of the front passenger air bag state. The PAD indicator is located in the instrument panel as part of the hazard/traction control switch and is visible to each front seat occupant.

For vehicles without a 4.2" LCD IPC display, the RCM controls the state of the PAD indicator through a direct hard-wired connection. The PAD indicator output is based on information provided by the OCSM and illuminates to indicate the front passenger air bag module is disabled. An execption to this is when the front passenger seat is determined to be empty, in which case it is not necessary to indicate that the passenger airbag is disabled. In all other cases, the PAD indicator is unlit when the passenger air bag module is enabled.

The RCM briefly activates the PAD indicator to prove-out the indicator function and verify to the front occupants the PAD indicator is functioning correctly

The following table indicates the passenger air bag status and the PAD indicator status based the size of the front passenger occupant.

Passenger Air Bag and Passenger Air Bag Deactivation (PAD) Indicator Status — Vehicles without 4.2" LCD IPC display

Occupant Size	Passenger Safety Belt Buckle Status	Passenger Air Bag Status	PAD Indicator Status
Empty	Unbuckled	Disabled	Unlit
Empty	Buckled	Disabled	Lit
Small	Buckled/ Unbuckled	Disabled	Lit
Large	Buckled/ Unbuckled	Enabled	Unlit

Passenger Air Bag Deactivation (PAD) Indicator — Vehicles with 4.2" LCD IPC display

The PAD indicator is a visual indicator used to inform the front seat occupants of the front passenger air bag state. The PAD indicator is located in the instrument panel as part of the FCIM and is visible to each front seat occupant.

For vehicles with a 4.2" LCD IPC display, the RCM controls the state of the PAD indicator via the HS-CAN and I-CAN . The PAD indicator output is based on information provided by the OCSM . When the passenger airbag is activated, the PAD indicator displays ON. If the RCM has deactivated the passenger airbag, the PAD indicator displays OFF.

The RCM briefly activates the PAD indicator to prove-out the indicator function and verify to the front occupants the PAD indicator is functioning correctly.

The following table indicates the passenger air bag status and the PAD indicator status based the size of the front passenger occupant.

Passenger Air Bag and Passenger Air Bag Deactivation (PAD) Indicator Status — Vehicles with 4.2" LCD IPC display

Occupant Size	Passenger Safety Belt Buckle Status	Passenger Air Bag Status	PAD Indicator Status
Empty	Buckled/ Unbuckled	Disabled	OFF: Lit
			ON: Unlit
Small	Buckled/ Unbuckled	Disabled	OFF: Lit
			ON: Unlit
Large	Buckled/ Unbuckled	Enabled	OFF: Unlit
			ON: Lit

Passenger Air Bag Module

The passenger air bag module is a dual-stage air bag, deploying at 1 of 2 different rates depending upon vehicle impact severity and sensor input.

Restraints Control Module (RCM)

repair4less

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the airbags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: This vehicle is equipped with the SYNC® feature which contains the 911 assist option. Refer to the Owner's Literature.

The RCM carries out the following functions:

- Deploys the air bag(s)/Safety Canopy® in the event of a deployable crash
- Activates the driver and passenger retractor pretensioner(s) to control the tension of the driver and passenger safety belts in the event of a deployable crash
- Monitors the SRS for faults
- Sends a message to the IPC to illuminate the air bag warning indicator if a fault is detected
- Communicates through the Data Link Connector (DLC) the current or historical DTCs

The RCM monitors the SRS for possible faults. If a fault is detected, the RCM requests the IPC to illuminate the air bag warning indicator. When the ignition is turned OFF and then ON, the IPC proves out the air bag warning indicator by lighting for 6 seconds. If no faults are detected by the RCM, the IPC turns the air bag warning indicator off and it remains off. If the RCM detects a fault, it sends a message to the IPC to turn the air bag warning indicator on and it remains on for the rest of the ignition cycle. If the RCM requests illumination of the air bag warning indicator and the air bag warning indicator does not function, the IPC automatically activates an audible chime. The chime is a series of 5 sets of 5 tone bursts. If the chime is heard, the SRS and the air bag warning indicator require repair.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the air bags in the event that the ignition circuit is lost or damaged during impact. The backup power supply depletes its stored energy approximately one minute after power and/or ground is removed from the RCM.

Post Crash Alert Function

The post crash alert is a function controlled by the Body Control Module (BCM). If the RCM determines that an impact of a pre-determined severity (the air bags may or may not be deployed) has occurred, the RCM sends a message to the BCM over the High Speed Controller Area Network (HS-CAN) and the post crash alert function is activated. The post-crash alert function activates the hazard lamp function and cycles the horn on 3 times, then off for 4 seconds, and repeats this cycle until the battery is discharged or the function is turned off. The post crash alert function can be turned off by:

- pressing the hazard flasher lamp switch (which may need to be pressed more than once).
- pressing the Remote Keyless Entry (RKE) transmitter UNLOCK button.
- pressing the RKE transmitter PANIC button.

Safety Belt Buckle Switches

The safety belt buckle switches indicate to the RCM whether the safety belts are buckled or unbuckled.

The RCM also communicates the driver safety belt buckle switch status to the IPC, which monitors the information to control the safety belt warning indicator. For information on the safety belt warning indicator, refer to Section 413-01.

Safety Belt Retractor Pretensioner

Safety belt retractor pretensioners control the tension of the driver and passenger safety belts in the event of a deployable collision.

Safety Canopy® Module

WARNING: Anytime the Safety Canopy® or side air curtain module has deployed, a new headliner and new A-, B- and C-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the Safety Canopy® or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

NOTE: The Safety Canopy® modules are **NOT** interchangeable. If installing a new Safety Canopy® module, the correct Safety Canopy® module **MUST** be installed for the vehicle application.

The Safety Canopy® module:

- is mounted above the headliner.
- attaches from the A-pillar frame to the B-pillar or C-pillar frame.

Seat Track Position Sensor

The seat track position sensor indicates the position of the driver seat along the seat track to the RCM. The sensor detects the presence of a shunt bracket on the track, indicating that the seat has moved forward beyond a certain point of adjustment. The RCM uses seat track position sensor information to determine the deployment rate of the dual-stage driver air bag module.

Secondary Air Bag Warning (Chime)

The secondary air bag warning chime is an audible chime located in and controlled by the IPC. If a fault is detected with the air bag warning indicator, a DTC is stored in memory of the IPC. Upon receiving the message from the RCM that a SRS fault has been detected, the IPC sounds the secondary air bag warning chime in a pattern of 5 sets of 5 beeps.

Impact Sensor

repair4less

For this vehicle line, the SRS uses up to 6 satellite sensors in addition to the RCM. The RCM is mounted to the center tunnel beneath the console (if equipped) or front center seat. All vehicles have 2 front impact severity sensors located in the front of the vehicle, mounted on the radiator support. The first row impact sensors (side restraints sensor 1) are mounted in each of the front doors behind the trim panel, the second row impact sensors (side restraints sensor 2, Crew Cab and SuperCab) are located on each C-pillar. The driver/passenger front door side impact sensor are pressure sensors and are **not interchangeable** with other sensors on the vehicle. Mounting orientation is critical for correct operation of all impact sensors.

Seat Side Air Bag Module

The side air bag module:

- deploys upon receiving a flow of current from the RCM, initiated by the side restraints sensor and internal RCM circuitry.
- is mounted in the seat backrest.
- is used in conjunction with a Safety Canopy® module.

Inspection and Verification

1. Verify the customer concern by checking the air bag warning indicator in the Instrument Panel Cluster (IPC). Refer to Prove Out the System in this section.

2. Visually inspect for obvious signs of mechanical or electrical damage. Do not disconnect electrical connectors until directed to do so within the pinpoint test.

Visual Inspection Chart

Mechanical	Electrical

• Damaged Restraints Control Module (RCM) or loose mounting
• Damaged LH or RH front impact severity sensor(s)
• Damaged side impact sensor front door and/or C-pillar
• Damaged or disconnected Passenger Air Bag Deactivation (PAD) indicator
• Damaged front driver/passenger seat assembly
	• Open Body Control Module (BCM) fuse (s):
	  ▪ 36 (10A)
	  ▪ 41 (7.5A)
	• Damaged wiring harness
	• Loose, damaged or corroded connectors
	• Circuitry open/shorted
	• Damaged shorting bars
	• Loose, damaged or pinched passenger seat wire harness

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record on-demand and Continuous Memory Diagnostic Trouble Codes (CMDTCs) from the RCM and Occupant Classification System Module (OCSM).

8. If the DTCs retrieved are related to the concern, go to the DTC Charts. For all other DTCs, refer to Section 419-10 .

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

The DTCs can be retrieved from the RCM and the Occupant Classification System Module (OCSM) with a scan tool via the Data Link Connector (DLC).

Restraints Control Module (RCM) DTC Chart

NOTE: Always make sure the correct Supplemental Restraint System (SRS) component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.

B0080:12	Driver Seatbelt Load Limiter Deployment Control: Circuit Short to Battery	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0080:13	Driver Seatbelt Load Limiter Deployment Control: Circuit Open	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0080:1A	Driver Seatbelt Load Limiter Deployment Control: Circuit Resistance Below Threshold	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT Programmable Module Installation (PMI). Use As-Built data when CARRYING OUT Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0080:2B	Driver Seatbelt Load Limiter Deployment Control: Signal Cross Coupled	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0080:4A	Driver Seatbelt Load Limiter Deployment Control: Incorrect Component Installed	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0082:11	Passenger Seatbelt Load Limiter Deployment Control: Circuit Short to Ground	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0082:12	Passenger Seatbelt Load Limiter Deployment Control: Circuit Short to Battery	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation

repair4less

		(PMI). REFER to Restraints Control Module (RCM) in this section.
B0082:13	Passenger Seatbelt Load Limiter Deployment Control: Circuit Open	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0082:1A	Passenger Seatbelt Load Limiter Deployment Control: Circuit Resistance Below Threshold	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0082:2B	Passenger Seatbelt Load Limiter Deployment Control: Signal Cross Coupled	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0082:4A	Passenger Seatbelt Load Limiter Deployment Control: Incorrect Component Installed	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B0090:11	Left Frontal Restraints Sensor: Circuit Short to Ground	GO to Pinpoint Test L .
B0090:4A	Left Frontal Restraints Sensor: Incorrect Component Installed	GO to Pinpoint Test X .
B0090:81	Left Frontal Restraints Sensor: Invalid Serial Data Received	INSTALL a new LH front impact severity sensor. REFER to Front Impact Severity Sensor in this section.
B0090:93	Left Frontal Restraints Sensor: No Operation	GO to Pinpoint Test L .
B0090:96	Left Frontal Restraints Sensor: Component Internal Failure	INSTALL a new LH front impact severity sensor. REFER to Front Impact Severity Sensor in this section.
B0091:11	Left Side Restraints Sensor 1: Circuit Short to Ground	GO to Pinpoint Test M .
B0091:4A	Left Side Restraints Sensor 1: Incorrect Component Installed	GO to Pinpoint Test X .
B0091:81	Left Side Restraints Sensor 1: Invalid Serial Data Received	INSTALL a new driver front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section.

B0091:93	Left Side Restraints Sensor 1: No Operation	GO to Pinpoint Test M .
B0091:96	Left Side Restraints Sensor 1: Component Internal Failure	INSTALL a new driver front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section.
B0092:11	Left Side Restraints Sensor 2: Circuit Short to Ground	GO to Pinpoint Test N .
B0092:4A	Left Side Restraints Sensor 2: Incorrect Component Installed	GO to Pinpoint Test X .
B0092:81	Left Side Restraints Sensor 2: Invalid Serial Data Received	INSTALL a new driver second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section.
B0092:93	Left Side Restraints Sensor 2: No Operation	GO to Pinpoint Test N .
B0092:96	Left Side Restraints Sensor 2: Component Internal Failure	INSTALL a new driver second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section.
B0095:11	Right Frontal Restraints Sensor: Circuit Short to Ground	GO to Pinpoint Test O .
B0095:4A	Right Frontal Restraints Sensor: Incorrect Component Installed	GO to Pinpoint Test X .
B0095:81	Right Frontal Restraints Sensor: Invalid Serial Data Received	INSTALL a new RH front impact severity sensor. REFER to Front Impact Severity Sensor in this section.
B0095:93	Right Frontal Restraints Sensor: No Operation	GO to Pinpoint Test O .
B0095:96	Right Frontal Restraints Sensor: Component Internal Failure	INSTALL a new RH front impact severity sensor. REFER to Front Impact Severity Sensor in this section.
B0096:11	Right Side Restraints Sensor 1: Circuit Short to Ground	GO to Pinpoint Test N .
B0096:4A	Right Side Restraints Sensor 1: Incorrect Component Installed	GO to Pinpoint Test X .
B0096:81	Right Side Restraints Sensor 1: Invalid Serial Data Received	INSTALL a new passenger front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section.
B0096:93	Right Side Restraints Sensor 1: No Operation	GO to Pinpoint Test N .
B0096:96	Right Side Restraints Sensor 1: Component Internal Failure	INSTALL a new passenger front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section.
B0097:11	Right Side Restraints Sensor 2: Circuit Short to Ground	GO to Pinpoint Test M .
B0097:4A	Right Side Restraints Sensor 2: Incorrect Component Installed	GO to Pinpoint Test X .
B0097:81	Right Side Restraints Sensor 2: Invalid Serial Data Received	INSTALL a new passenger second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section.

repair4less

B0097:93	Right Side Restraints Sensor 2: No Operation	GO to Pinpoint Test M .
B0097:96	Right Side Restraints Sensor 2: Component Internal Failure	INSTALL a new passenger second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section.
B00A0:09	Occupant Classification System: Component Failure	GO to Pinpoint Test R .
B00A0:4A	Occupant Classification System: Incorrect Component Installed	GO to Pinpoint Test R .
B00A0:63	Occupant Classification System: Circuit / Component Protection Time-Out	GO to Pinpoint Test R .
B00A0:64	Occupant Classification System: Signal Plausibility Failure	GO to Pinpoint Test R .
B00A0:68	Occupant Classification System: Event Information	GO to Pinpoint Test R .
B00B5:11	Driver Seat Track Position Restraints Sensor: Circuit Short to Ground	GO to Pinpoint Test S .
B00B5:12	Driver Seat Track Position Restraints Sensor: Circuit Short to Battery	GO to Pinpoint Test S .
B00B5:13	Driver Seat Track Position Restraints Sensor: Circuit Open	GO to Pinpoint Test S .
B00B5:1D	Driver Seat Track Position Restraints Sensor: Circuit Current Out of Range	GO to Pinpoint Test S .
B00B5:2B	Driver Seat Track Position Restraints Sensor: Signal Cross Coupled	GO to Pinpoint Test W .
B00B5:4A	Driver Seat Track Position Restraints Sensor: Incorrect Component Installed	GO to Pinpoint Test X .
B00D5:01	Restraint System Passenger Disable Indicator: General Electrical Failure	CONFIGURE the RCM using As-Built data. CLEAR all RCM DTCs and REPEAT the self-test. If DTC B00D5:01 returns, the RCM has received a fault message from the FCIM indicating a fault in the PAD indicator. CARRY OUT a self-test of the FCIM and REPAIR any DTCs. Do not replace the RCM for this DTC.
B00D5:11	Restraint System Passenger Disable Indicator: Circuit Short to Ground	GO to Pinpoint Test T .
B00D5:12	Restraint System Passenger Disable Indicator: Circuit Short to Battery	GO to Pinpoint Test T .
B00D5:13	Restraint System Passenger Disable Indicator: Circuit Open	GO to Pinpoint Test T .

B00D5:4A	Restraint System Passenger Disable Indicator: Incorrect Component Installed	GO to Pinpoint Test X .
B00DF:13	Passenger Restraints Disable Switch: Incorrect Component Installed	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B1193:00	Crash Event Storage Full and Locked: No Sub Type Information	This DTC indicates the vehicle has been involved in a collision. INSTALL a new RCM and impact sensors. REFER to Inspection and Repair After a Supplemental Restraint System (SRS) Deployment in this section.
B11CD:11	Driver Frontal Airbag Canister Vent: Circuit Short to Ground	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B11CD:12	Driver Frontal Airbag Canister Vent: Circuit Short to Battery	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B11CD:13	Driver Frontal Airbag Canister Vent: Circuit Open	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B11CD:1A	Driver Frontal Airbag Canister Vent: Circuit Resistance Below Threshold	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B11CD:2B	Driver Frontal Airbag Canister Vent: Signal Cross Coupled	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI . Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this

repair4less

		section.
B11CD:4A	Driver Frontal Airbag Canister Vent: Incorrect Component Installed	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI. Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B11D8:12	Restraint Event Notification: Circuit Short to Battery	GO to Pinpoint Test AI.
B11D8:14	Restraint Event Notification: Circuit Short to Ground or Open	GO to Pinpoint Test AI.
B1202:01	Restraint System Passenger Enable Indicator: General Electrical Failure	The RCM has received a fault message from the FCIM indicating a fault in the PAD indicator. CARRY OUT a self-test of the FCIM and REPAIR any DTCs. Do not replace the RCM for this DTC.
B1211:11	Driver Seatbelt Retractor Pretensioner Deployment Control: Circuit Short to Ground	GO to Pinpoint Test U.
B1211:12	Driver Seatbelt Retractor Pretensioner Deployment Control: Circuit Short to Battery	GO to Pinpoint Test U.
B1211:13	Driver Seatbelt Retractor Pretensioner Deployment Control: Circuit Open	GO to Pinpoint Test U.
B1211:1A	Driver Seatbelt Retractor Pretensioner Deployment Control: Circuit Resistance Below Threshold	GO to Pinpoint Test U.
B1211:2B	Driver Seatbelt Retractor Pretensioner Deployment Control: Signal Cross Coupled	GO to Pinpoint Test W.
B1211:4A	Driver Seatbelt Retractor Pretensioner Deployment Control: Incorrect Component Installed	GO to Pinpoint Test X.
B1212:11	Driver Seatbelt Buckle Pretensioner Deployment Control: Circuit Short to Ground	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI. Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B1212:12	Driver Seatbelt Buckle Pretensioner Deployment Control: Circuit Short to Battery	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI. Use As-Built data when carrying out Programmable Module Installation

		(PMI). REFER to Restraints Control Module (RCM) in this section.
B1212:13	Driver Seatbelt Buckle Pretensioner Deployment Control: Circuit Open	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI. Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B1212:1A	Driver Seatbelt Buckle Pretensioner Deployment Control: Circuit Resistance Below Threshold	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI. Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B1212:2B	Driver Seatbelt Buckle Pretensioner Deployment Control: Signal Cross Coupled	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI. Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B1212:4A	Driver Seatbelt Buckle Pretensioner Deployment Control: Incorrect Component Installed	**NOTE:** This vehicle is not equipped with this component. This DTC indicates the RCM is incorrectly configured or the incorrect RCM is installed to the vehicle. INSTALL a new RCM and CARRY OUT PMI. Use As-Built data when carrying out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
B1214:11	Passenger Seatbelt Retractor Pretensioner Deployment Control: Circuit Short to Ground	GO to Pinpoint Test V.
B1214:12	Passenger Seatbelt Retractor Pretensioner Deployment Control: Circuit Short to Battery	GO to Pinpoint Test V.
B1214:13	Passenger Seatbelt Retractor Pretensioner Deployment Control: Circuit Open	GO to Pinpoint Test V.
B1214:1A	Passenger Seatbelt Retractor Pretensioner Deployment Control: Circuit Resistance Below Threshold	GO to Pinpoint Test V.
B1214:2B	Passenger Seatbelt Retractor Pretensioner Deployment Control: Signal Cross Coupled	GO to Pinpoint Test W.
B1214:4A	Passenger Seatbelt Retractor Pretensioner Deployment Control: Incorrect Component	GO to Pinpoint Test X.

repair4less

	Installed	
U0028:08	Vehicle Communication Bus A: Bus Signal / Message Failure	GO to Pinpoint Test Y .
U0028:88	Vehicle Communication Bus A: Bus Off	GO to Pinpoint Test Y .
U0140:00	Lost Communication With Body Control Module: No Sub Type Information	**NOTE:** The DTC sets in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new RCM as part of repair. REFER to Section 418-00 to diagnose no communication with the Body Control Module (BCM).
U0154:00	Lost Communication With Restraints Occupant Classification System Module: No Sub Type Information	**NOTE:** The DTC sets in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new RCM as part of repair. REFER to Section 418-00 to diagnose no communication with the Occupant Classification System Module (OCSM).
U0155:00	Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	**NOTE:** The DTC sets in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new RCM as part of repair. REFER to Section 418-00 to diagnose the communication concern.
U0253:00	Lost Communication With Accessory Protocol Interface Module: No Sub Type Information	**NOTE:** This DTC sets in the RCM if a message is not received from the Accessory Protocol Interface Module (APIM). CHECK for additional RCM and APIM DTCs. REFER to the appropriate section to diagnose the DTCs. If no other DTCs are present, REFER to Section 418-00 to diagnose the APIM communication concern.
U0300:00	Internal Control Module Software Incompatibility: No Sub Type Information	CARRY OUT Programmable Module Installation (PMI). RETRIEVE RCM DTCs. If RCM DTC U0300:00 is retrieved on-demand during self-test, INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section.
U0422:00	Invalid Data Received From Body Control Module: No Sub Type Information	CARRY OUT a self-test of the BCM . REFER to Section 419-10 to diagnose any DTCs that are retrieved.
U0554:00	Invalid Data Received From Accessory Protocol Interface Module: No Sub Type Information	CHECK for additional RCM and APIM DTCs. REFER to the appropriate section to diagnose the DTCs.
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CARRY OUT PMI . RETRIEVE RCM DTCs. If RCM DTC U2100:00 is retrieved on-demand, INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section.
U2200:00	Control Module Configuration Memory Corrupt: No Sub Type Information	INSTALL a new RCM and CARRY OUT Programmable Module Installation (PMI). Use As-Built data when CARRYING out Programmable Module Installation (PMI)

		for this DTC. REFER to Restraints Control Module (RCM) in this section.
U3000:46	Control Module: Calibration / Parameter Memory Failure	INSTALL a new RCM and CARRY OUT Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
U3000:49	Control Module: Internal Electronic Failure	INSTALL a new RCM and CARRY OUT Programmable Module Installation (PMI). If DTC U2200:00 is also present, use As-Built data when CARRYING out Programmable Module Installation (PMI). REFER to Restraints Control Module (RCM) in this section.
U3000:4A	Control Module: Incorrect Component Installed	GO to Pinpoint Test X .
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test Z .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test Z .

Occupant Classification System Module (OCSM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action To Take
B0061:11	Passenger Seatbelt Tension Sensor: Circuit Short to Ground	GO to Pinpoint Test AA .
B0061:12	Passenger Seatbelt Tension Sensor: Circuit Short to Battery	GO to Pinpoint Test AA .
B0061:13	Passenger Seatbelt Tension Sensor: Circuit Open	GO to Pinpoint Test AA .
B0061:1C	Passenger Seatbelt Tension Sensor: Circuit Voltage Out of Range	GO to Pinpoint Test AA .
B00A0:54	Occupant Classification System: Missing Calibration	GO to Pinpoint Test AB .
B00A0:67	Occupant Classification System: Signal Incorrect After Event	CARRY OUT the Occupant Classification System (OCS) zero seat weight test. REFER to Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section.
B00A0:76	Occupant Classification System: Wrong Mounting Position	GO to Pinpoint Test AB .
B00A0:97	Occupant Classification System: Component or System Operation	GO to Pinpoint Test AC .

repair4less

	Obstructed or Blocked	
B00C2:12	Passenger Seat Occupant Classification Sensor "C": Circuit Short To Battery	GO to Pinpoint Test AD .
B00C2:13	Passenger Seat Occupant Classification Sensor "C": Circuit Open	GO to Pinpoint Test AD .
B00C2:1A	Passenger Seat Occupant Classification Sensor "C": Circuit Resistance Blow Threshold	GO to Pinpoint Test AD .
B00C2:49	Passenger Seat Occupant Classification Sensor "C": Internal Electronic Failure	GO to Pinpoint Test AB .
B00C2:81	Passenger Seat Occupant Classification Sensor "C": Invalid Serial Data	REPAIR all other Occupant Classification System Module (OCSM) DTCs first. If no other OCSM DTCs are present, INSTALL a new seat track (includes OCS weight sensor bolts). REFER to Section 501-10 .
B00C3:12	Passenger Seat Occupant Classification Sensor "D": Circuit Short To Battery	GO to Pinpoint Test AE .
B00C3:13	Passenger Seat Occupant Classification Sensor "D": Circuit Open	GO to Pinpoint Test AE .
B00C3:1A	Passenger Seat Occupant Classification Sensor "D": Circuit Resistance Blow Threshold	GO to Pinpoint Test AE .
B00C3:49	Passenger Seat Occupant Classification Sensor "D": Internal Electronic Failure	GO to Pinpoint Test AB .
B00C3:81	Passenger Seat Occupant Classification Sensor "D": Invalid Serial Data	REPAIR all other Occupant Classification System Module (OCSM) DTCs first. If no other OCSM DTCs are present, INSTALL a new seat track (includes OCS weight sensor bolts). REFER to Section 501-10 .
B1193:00	Crash Event Storage Full and Locked: No Sub Type Information	INSTALL new passenger seat track assembly with weight sensor bolts. REFER to Section 501-10 . CLEAR all DTCs before carrying out the System Reset procedure. REFER to Inspection and Repair After a Supplemental Restraint System (SRS) Deployment in this section.
B1A59:01	Sensor 5 Volt Supply: General Electrical Failure	GO to Pinpoint Test AF .
B1A59:11	Sensor 5 Volt Supply: Circuit Short to Ground	GO to Pinpoint Test AF .
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	U0100:00 sets in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new OCSM as part of repair for DTC U0100:00. REFER to Section 418-00 to diagnose lost communication with the PCM.

U0140:00	Lost Communication With Body Control Module: No Sub Type Information	U0140:00 sets in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new OCSM as part of repair for DTC U0140:00. REFER to Section 418-00 to diagnose lost communication with the BCM .
U0151:00	Lost Communication With Restraints Control Module: No Sub Type Information	U0151:00 sets in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new OCSM as part of repair for DTC U0151:00. REFER to Section 418-00 to diagnose lost communication with the RCM .
U0401:00	Invalid Data Received From ECM/PCM "A": No Sub Type Information	U0401:00 sets in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new OCSM as part of repair for DTC U0401:00. CARRY OUT PCM Self Test. REPAIR any vehicle speed or communication-related DTCs. REFER to DTC Chart in Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0401:81	Invalid Data Received From ECM/PCM "A": Invalid Serial Data Received	This DTC sets when the OCSM is not receiving the vehicle speed data that it expects from the PCM. The OCSM is not the problem module. Do not install a new OCSM as part of repair for DTC U0401:81. CARRY OUT the PCM Self Test. REPAIR any DTCs. REFER to DTC Chart in Section 303-14 or the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0422:00	Invalid Data Received From Body Control Module: No Sub Type Information	U0422:00 sets in a module that is reporting a communication fault from another module on the data bus. The OCSM is not the problem module. Do not install a new OCSM as part of repair for DTC U0422:00. CARRY OUT Body Control Module (BCM) Self Test. REPAIR any ignition switch or communication-related DTCs. REFER to the DTC Chart in Section 419-10 .
U0422:81	Invalid Data Received From Body Control Module: Invalid Serial Data Received	U0422:81 sets when the OCSM is not receiving the ignition status data that it expects from the BCM . The OCSM is not the problem module. Do not install a new OCSM as part of repair for DTC U0422:81. CARRY OUT Body Control Module (BCM) Self Test. REPAIR any ignition switch or communication-related DTCs. REFER to the DTC Chart in Section 419-10 .
U0452:00	Invalid Data Received From Restraints Control Module: No Sub Type Information	U0452:00 sets in a module that is reporting a communication fault from another module on the data bus. The OCSM is not the problem module. Do not install a new OCSM as part of repair for DTC U0452:00.

repair4less

		CARRY OUT RCM Self Test. REPAIR any SRS -related DTCs. REFER to the Restraints Control Module (RCM) DTC Chart in this section.
U0452:81	Invalid Data Received From Restraints Control Module: No Sub Type Information	U0452:00 sets when the OCSM is not receiving the SRS data that it expects from the RCM . The OCSM is not the problem module. Do not install a new OCSM as part of repair for DTC U0452:81. CARRY OUT RCM Self Test. REPAIR any SRS -related DTCs. REFER to the Restraints Control Module (RCM) DTC Chart in this section.
U200D:12	Control Module Output Power A: Circuit Short To Battery	GO to Pinpoint Test AG .
U200E:11	Control Module Output Power B: Circuit Short To Ground	GO to Pinpoint Test AH .
U200E:12	Control Module Output Power B: Circuit Short To Battery	GO to Pinpoint Test AH .
U200E:1A	Control Module Output Power B: Circuit Resistance Below Threshold	GO to Pinpoint Test AH .
U3000:49	Control Module: Internal Electronic Failure	REPAIR all other OCSM DTCs first. REPEAT the self-test. If U3000:49 returns, INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section.
U3000:53	Control Module: Deactivated	CLEAR all OCSM DTCs and REPEAT the self-test. If U3000:53 returns, INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section.
U3000:54	Control Module: Missing Calibration	CARRY OUT the OCS reset. REFER to Occupant Classification Sensor (OCS) System Reset in this section.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test Z .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test Z .

FCIM DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action To Take
B00D5:01	Restraint System Passenger Disable Indicator: General Electrical Failure	Refer to the appropriate section in Group 415 for the procedure..

B1202:01	Restraint System Passenger Enable Indicator: General Electrical Failure	Refer to the appropriate section in Group 415 for the procedure..
All other DTCs	—	Refer to the appropriate section in Group 415 for the procedure..

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The air bag warning indicator is illuminated continuously	• Fuse to Restraints Control Module (RCM) • Wiring, terminals or connectors • Damaged Data Link Connector (DLC) • Instrument Panel Cluster (IPC) • RCM	• GO to Pinpoint Test A .
• Air bag indicator flashing	• Air bag/pretensioner Supplemental Restraint System (SRS) fault	• CARRY OUT RCM and Occupant Classification System Module (OCSM) self-tests. REFER to DTC Charts in this section.
• Audible tone — DTCs retrieved	• Air bag SRS fault and air bag warning indicator fault	• CARRY OUT RCM and IPC self-tests. REFER to Restraints Control Module (RCM) DTC Chart in this section and the IPC DTC Chart in Section 413-01 .
• The RCM does not respond to the scan tool	• Fuse • Scan tool • DLC • Wiring, terminals or connectors • RCM	• REFER to Section 418-00 to diagnose the no communication concern.
• The Occupant Classification System Module (OCSM) does not respond to the scan tool	• Fuse • Scan tool • DLC • Wiring, terminals or connectors • OCSM	• REFER to Section 418-00 to diagnose the no communication concern.

Pinpoint Tests

Pinpoint Test A: The Air Bag Warning Indicator is Illuminated Continuously

repair4less

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) illuminates the air bag indicator continuously for 6 seconds. If the Supplemental Restraint System (SRS) is fault free, the air bag warning indicator turns off and remains off. If a fault is detected in the SRS , the air bag warning indicator illuminates and remains illuminated for the rest of the ignition cycle until the fault is no longer detected. The Restraints Control Module (RCM) communicates to the IPC module via the High Speed Controller Area Network (HS-CAN). The IPC illuminates the air bag warning indicator based on messaging from the RCM or if there is no communication between the RCM and IPC .

This pinpoint test is intended to diagnose the following:

- IPC
- RCM

PINPOINT TEST A: THE AIR BAG WARNING INDICATOR IS ILLUMINATED CONTINUOUSLY

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

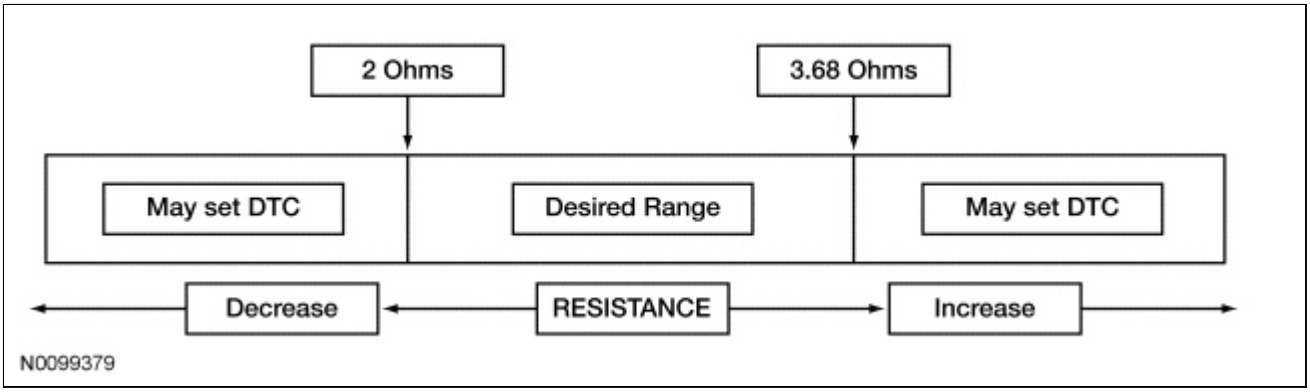
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
A1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Were any DTCs retrieved on-demand during self-test?**	**Yes** If DTCs were retrieved, GO to the DTC Charts in this section for diagnostic direction. Do not clear any DTCs until all DTCs have been resolved. **No** If the RCM **does communicate** with the scan tool, REFER to Section 413-01 to diagnose the IPC concern. If the RCM **does not communicate** with the scan tool, REFER to Section 418-00 to diagnose no power to the scan tool. Do not clear any DTCs until all DTCs have been resolved.

Pinpoint Test B: DTCs B0001:11, B0001:12, B0001:13 and B0001:1A

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation



The Restraints Control Module (RCM) continuously monitors the driver air bag module stage 1 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver air bag module

If a fault is detected, the RCM stores DTC B0001:11, B0001:12, B0001:13 or B0001:1A in memory and sends a message to the Instrument Panel Cluster (IPC) module to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement, in combination with an age correction factor, to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM . If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Clockspring
- Driver air bag module
- RCM

DTC Description	Fault Trigger Condition
• B0001:11 — Driver Frontal Stage 1 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver air bag stage 1 circuit.
• B0001:12 — Driver Frontal Stage 1	A fault is indicated when the RCM senses a short to

repair4less

Deployment Control: Circuit Short to Battery	voltage on either driver air bag stage 1 circuit.
• B0001:13 — Driver Frontal Stage 1 Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance range between driver air bag stage 1 circuits.
• B0001:1A — Driver Frontal Stage 1 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between driver air bag stage 1 circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Driver air bag module
- RCM

PINPOINT TEST B: DTCs B0001:11, B0001:12, B0001:13 AND B0001:1A

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

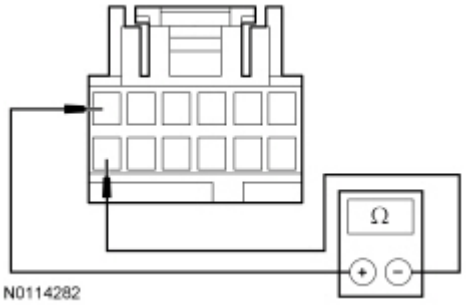
WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

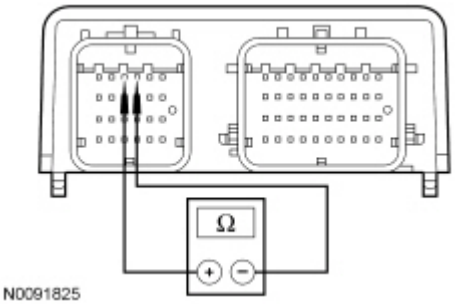


NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
B1 RETRIEVE RCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0001:11, B0001:12, B0001:13 or B0001:1A**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-

retrieved on-demand during self-test?	demand during self-test. For DTC B0001:13 or B0001:1A, GO to B2 . For DTC B0001:11, GO to B12 . For DTC B0001:12, GO to B15 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. For DTC B0001:13 or B0001:1A, GO to B20 . For DTC B0001:11, GO to B21 . For DTC B0001:12, GO to B22 .
B2 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_00_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_00_R. • **Does the PID value read between 2 and 3.68 ohms?**	**Yes** GO to B19 . **No** GO to B3 .
B3 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_00_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• Remove the lower steering column shroud to access the clockspring electrical connector. • While monitoring the DEPLOY_00_R PID, carry out the harness test of the driver air bag circuits and accessible connectors (including any in-line connectors) by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. • **Does the PID value read between 2 and 3.68 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to Clockspring in this section. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B23 . **No** For PID value less than 2 ohms, GO to B4 . For PID value greater than 3.68 ohms, GO to B8 .

repair4less



B4 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0001:1A to B0001:13?**	**Yes** GO to B17 . **No** GO to B5 .
B5 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED) (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Disconnect: Clockspring C218A . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module/clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0001:1A to B0001:13?**	**Yes** GO to B18 . **No** GO to B6 .
B6 CHECK FOR A SHORT BETWEEN DRIVER AIR BAG STAGE 1 CIRCUITS	
• Measure the resistance between C218A-6, circuit CR101 (VT/BN), harness side and C218A-12, circuit RR101 (YE/GN), harness side.	**Yes** GO to B7 . **No** REPAIR circuits CR101 (VT/BN) and RR101 (YE/GN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to B24 .

- **Is the resistance greater than 10,000 ohms?**

B7 CHECK THE RCM FOR LOW RESISTANCE

- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: RCM C310A and C310B .
- Measure the resistance between RCM C310A pins 3 and 4, component side.

- **Is the resistance greater than 10,000 ohms?**

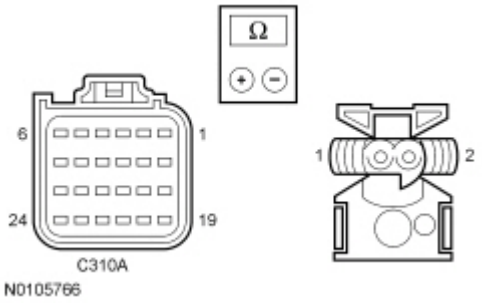
Yes
REPAIR circuits CR101 (VT/BN) and RR101 (YE/GN).

Refer to Wiring Diagrams Cell 5 for schematic and connector information.

GO to B24 .

No
GO to B19 .

B8 CHECK THE DRIVER AIR BAG STAGE 1 CIRCUITS FOR AN OPEN



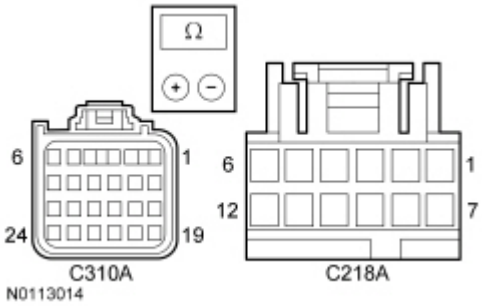
- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Remove the driver air bag module. Refer to Driver Airbag in this section.
- Disconnect: RCM C310A and C310B .
- Measure the resistance between RCM C310A, harness side and driver air bag module stage 1 C216A, harness side, using the following chart.

RCM	Circuit	Driver Air Bag Module
C310A-4	CR101 (VT/BN)/(WH)	C216A-1
C310A-3	RR101 (YE/GN)/(BU)	C216A-2

Yes
GO to B10 .

No
GO to B9 .

repair4less



- **Are the resistances less than 1 ohm?**

B9 CHECK THE DRIVER AIR BAG STAGE 1 CIRCUITS FOR AN OPEN (CLOCKSPRING DISCONNECTED)

- Disconnect: Clockspring C218A .
- Measure the resistance between RCM C310A, harness side and clockspring C218A, harness side using the following chart.

RCM	Circuit	Clockspring Electrical Connector
C310A-4	CR101 (VT/BN)	C218A-6
C310A-3	RR101 (YE/GN)	C218A-12

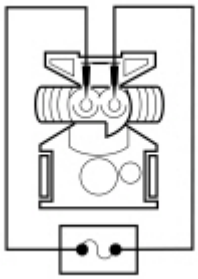
- **Are the resistances less than 0.5 ohm?**

Yes
GO to B18 .

No
REPAIR circuit CR101 (VT/BN) or RR101 (YE/GN).

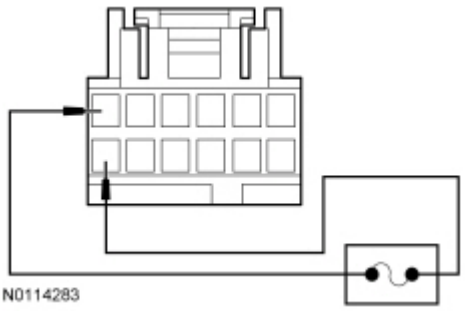
Refer to Wiring Diagrams Cell 5 for schematic and connector information.

GO to B24 .



B10 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

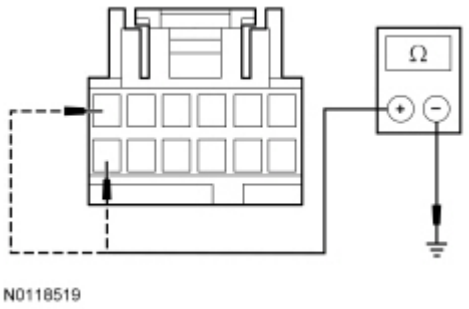


- Connect: RCM C310A and C310B .
- Connect a fused jumper wire between driver air bag module stage 1 C216A-1, circuit CR101 (WH), harness side, and C216A-2, circuit RR101 (BU), harness side.

Yes
REMOVE the fused jumper wire and GO to B17 .

No
REMOVE the fused jumper wire and GO to B11 .

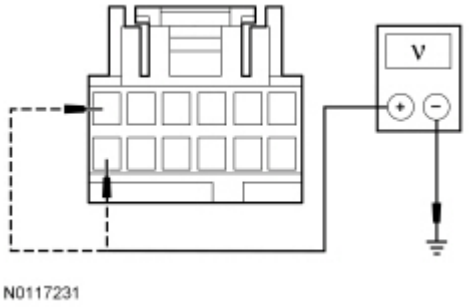
N0114275



- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test — RCM .
- **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag stage 1 circuits shorted together, a low resistance fault is normally retrieved on stage 1. Stage 2 shows an open circuit fault due to the driver air bag being disconnected.
- **Was DTC B0001:1A retrieved on-demand during self-test?**

B11 CHECK THE DRIVER AIR BAG STAGE 1 CIRCUITS FOR AN OPEN (CLOCKSPRING DISCONNECTED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Clockspring C218A . • Connect a fused jumper wire between clockspring C218A-6, circuit CR101 (VT/BN), harness side and C218A-12, circuit RR101 (YE/GN), harness side.  N0114283 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the clockspring stage 1 circuits shorted together, a low resistance fault is normally retrieved on stage 1. Stage 2 shows an open circuit fault due to the driver air bag being disconnected. • **Was DTC B0001:1A retrieved on-demand during self-test?**	**Yes** REMOVE the fused jumper wire and GO to B18 . **No** REMOVE the fused jumper wire and GO to B19 .
B12 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	

repair4less



NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0001:11 to B0001:13?**	**Yes** GO to B17 . **No** GO to B13 .
B13 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED) (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Disconnect: Clockspring C218A . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the clockspring disconnected, open circuit faults are normally retrieved on driver air bag stages 1 and 2. • **Did the on-demand DTC change from B0001:11 to B0001:13?**	**Yes** GO to B18 . **No** GO to B14 .
B14 CHECK THE DRIVER AIR BAG STAGE 1 CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between clockspring:
  ▪ C218A-6, circuit CR101 (VT/BN), harness side and ground.
  ▪ C218A-12, circuit RR101 (YE/GN), harness side and ground.
	Yes
	GO to B19 .
	
	No
	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.
	
	REPAIR circuit CR101 (VT/BN) or RR101 (YE/GN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.

 N0118519 • **Are the resistances greater than 10,000 ohms?**	GO to B24 .
B15 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO BATTERY INDICATED) (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Disconnect: Clockspring C218A . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module/clockspring disconnected, open circuit faults are normally retrieved on driver air bag stages 1 and 2. • **Did the on-demand DTC change from B0001:12 to B0001:13?**	**Yes** GO to B18 . **No** GO to B16 .
B16 CHECK THE DRIVER AIR BAG STAGE 1 CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Measure the voltage between clockspring:
  ▪ C218A-6, circuit CR101 (VT/BN), harness side and ground.
  ▪ C218A-12, circuit RR101 (YE/GN), harness side and ground.
	Yes
	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.
	
	REPAIR circuit CR101 (VT/BN) or RR101 (YE/GN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to B24 .
	
	No
	GO to B19 .

repair4less

- **Is voltage present on either circuit?**

B17 CONFIRM THE DRIVER AIR BAG MODULE FAULT	
NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Install the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new driver air bag module. REFER to Driver Airbag in this section. GO to B24 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0001:13 or B0001:1A, GO to B20 . For DTC B0001:11, GO to B21 . For DTC B0001:12, GO to B22 .
B18 CONFIRM THE CLOCKSPRING FAULT	
NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Clockspring C218A . • Install the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to B24 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0001:13 or B0001:1A, GO to B20 . For DTC B0001:11, GO to

	B21 . For DTC B0001:12, GO to B22 .
B19 CONFIRM THE RCM FAULT **NOTE:** Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damaged, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • If previously removed, install the driver air bag module. Refer to Driver Airbag in this section. • Connect: Clockspring C218A (if previously disconnected) . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to B24 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0001:13 or B0001:1A, GO to B20 . For DTC B0001:11, GO to B21 . For DTC B0001:12, GO to B22 .
B20 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_00_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT • Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_00_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does the PID value read between 2 and 3.68 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to B23 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell

repair4less

	5 , Connector Repair Procedures for schematic and connector information. GO to B24 .
B21 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO GROUND FAULT	
• Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0001:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B24 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to B23 .
B22 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO BATTERY FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0001:12 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B24 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to B23 .
B23 CHECK THE HARNESS AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module: ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and

frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. • Inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. • **Were any concerns found?**	connector information. GO to B24 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to B24 .
B24 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

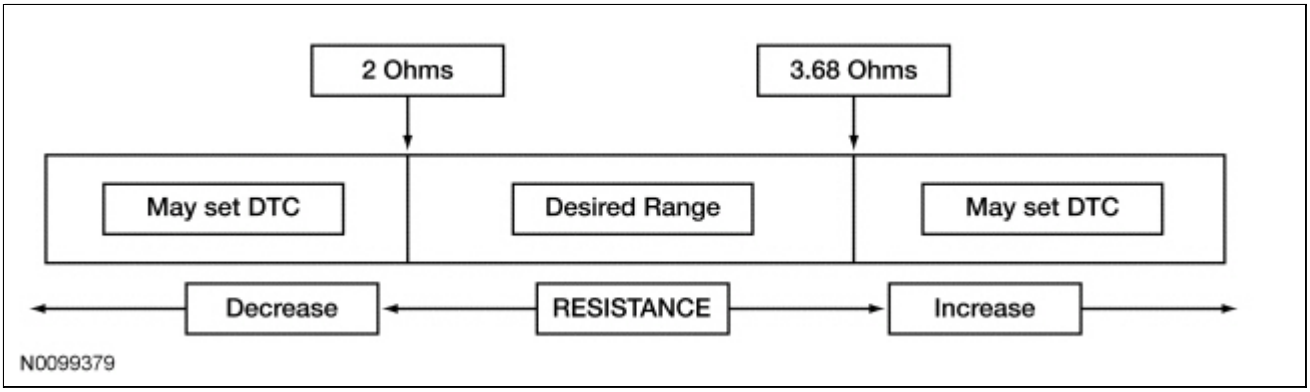
Pinpoint Test C: DTCs B0002:11, B0002:12, B0002:13 and B0002:1A

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors the driver air bag module stage 2 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver air bag module



If a fault is detected, the RCM stores DTC B0002:11, B0002:12, B0002:13 or B0002:1A in memory and sends a message to the Instrument Panel Cluster (IPC) module to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement, in combination with an age correction factor, to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM . If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle

repair4less

ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Clockspring
- Driver air bag module
- RCM

DTC Description	Fault Trigger Condition
• B0002:11 — Driver Frontal Stage 2 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver air bag stage 2 circuit.
• B0002:12 — Driver Frontal Stage 2 Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver air bag stage 2 circuit.
• B0002:13 — Driver Frontal Stage 2 Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance range between driver air bag stage 2 circuits.
• B0002:1A — Driver Frontal Stage 2 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between driver air bag stage 2 circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Driver air bag module
- RCM

PINPOINT TEST C: DTCs B0002:11, B0002:12, B0002:13 AND B0002:1A

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to

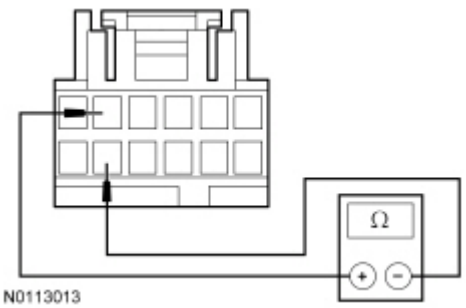
follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

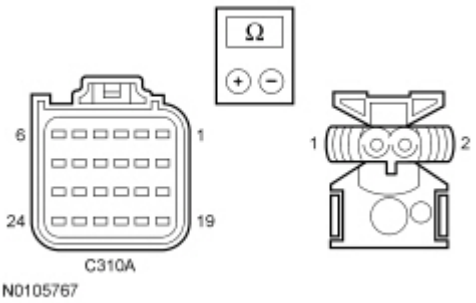
NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .



NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
C1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0002:11, B0002:12, B0002:13 or B0002:1A retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0002:13 or B0002:1A, GO to C2 . For DTC B0002:11, GO to C11 . For DTC B0002:12, GO to C14 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. For DTC B0002:13 or B0002:1A, GO to C19 . For DTC B0002:11, GO to C20 . For DTC B0002:12, GO to C21 .



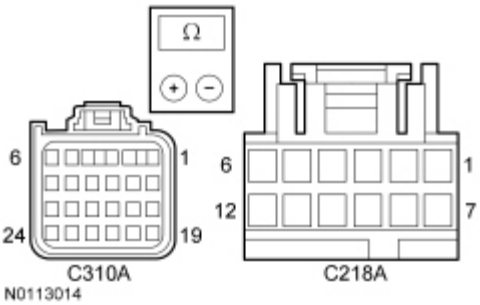
repair4less

C2 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_01_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_01_R. • **Does the PID value read between 2 and 3.68 ohms?**	**Yes** GO to C18 . **No** GO to C3 .
C3 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_01_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• Remove the lower steering column shroud to access the clockspring electrical connector. • While monitoring the DEPLOY_01_R PID, carry out the harness test of the driver air bag circuits and accessible connectors (including any in-line connectors), by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. • **Does the PID value read between 2 and 3.68 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to Clockspring in this section. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C23 . **No** For PID value less than 2 ohms, GO to C4 . For PID value greater than 3.68 ohms, GO to C7 .
C4 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0002:1A to B0002:13?**	**Yes** GO to C16 . **No** GO to C5 .
C5 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT	

CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED) (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Disconnect: Clockspring C218A . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on stage 1 and 2. • **Did the on-demand DTC change from B0002:1A to B0002:13?**	**Yes** GO to C17 . **No** GO to C6 .
C6 CHECK FOR A SHORT BETWEEN DRIVER AIR BAG STAGE 2 CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between C218A-5, circuit CR102 (BU), harness side and C218A-11, circuit RR102 (WH), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C18 . **No** REPAIR circuits CR102 (BU) and RR102 (WH). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to C23 .
C7 CHECK THE DRIVER AIR BAG STAGE 2 CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between RCM C310A, harness side and driver air bag module stage 2 C216B, harness side using the following chart.	**Yes** GO to C9 . **No** GO to C8 .

RCM	Circuit	Driver Air Bag Module
C310A-7	CR102 (BU)/(YE/GN)	C216B-1
C310A-8	RR102 (WH)/(VT/BN)	C216B-2

repair4less



- **Are the resistances less than 1 ohm?**

C8 CHECK THE DRIVER AIR BAG STAGE 2 CIRCUITS FOR AN OPEN (CLOCKSPRING DISCONNECTED)

- Disconnect: Clockspring C218A .
- Measure the resistance between RCM C310A, harness side and clockspring C218A, harness side using the following chart.

RCM	Circuit	Clockspring Electrical Connector
C310A-7	CR102 (BU)	C218A-5
C310A-8	RR102 (WH)	C218A-11

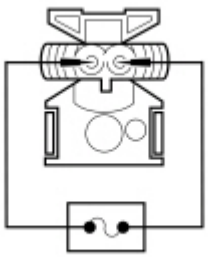
- **Are the resistances less than 0.5 ohm?**

Yes
GO to C17 .

No
REPAIR circuit CR102 (BU) or RR102 (WH).

Refer to Wiring Diagrams Cell 5 for schematic and connector information.

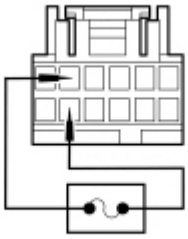
GO to C23 .



C9 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

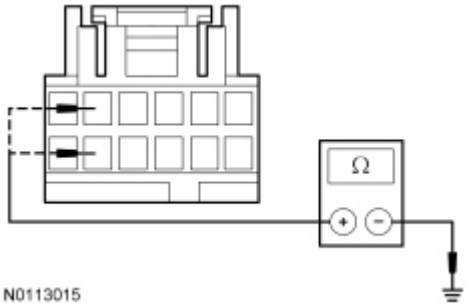
- Connect: RCM C310A and C310B .
- Connect a fused jumper wire between driver air bag module stage 2 C216B-1, circuit CR102 (YE/GN), harness side, and driver air bag module stage 2 C216B-2, circuit RR102 (VT/BN), harness side.



Yes
GO to C16 .

No
GO to C10 .

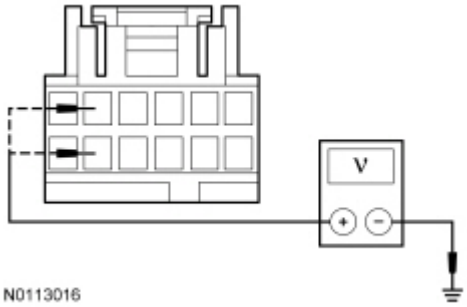
N0113511



- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test — RCM .
- **DIAGNOSTIC TIP:** When viewing DTCs with driver air bag module stage 2 circuits shorted together, a low resistance fault is normally retrieved on stage 2. Stage 1 shows an open circuit fault due to the driver air bag being disconnected.
- **Was DTC B0002:1A retrieved on-demand during self-test?**

C10 CHECK THE DRIVER AIR BAG STAGE 2 CIRCUITS FOR AN OPEN (CLOCKSPRING DISCONNECTED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Clockspring C218A . • Connect a fused jumper wire between clockspring C218A-5, circuit CR102 (BU), harness side, and C218A-11, circuit RR102 (WH), harness side.  N0114274 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the clockspring stage 2 circuits shorted together, a low resistance fault is normally retrieved on stage 2. Stage 1 shows an open circuit fault due to the driver air bag being disconnected. • **Was DTC B0002:1A retrieved on-demand during self-test?**	**Yes** GO to C17 . **No** GO to C18 .
C11 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	

repair4less



NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0002:11 to B0002:13?**	**Yes** GO to C16 . **No** GO to C12 .
C12 CHECK DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED) (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Disconnect: Clockspring C218A . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module/clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0002:11 to B0002:13?**	**Yes** GO to C17 . **No** GO to C13 .
C13 CHECK THE DRIVER AIR BAG STAGE 2 CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between clockspring:
  ▪ C218A-5, circuit CR102 (BU), harness side and ground.
  ▪ C218A-11, circuit RR102 (WH), harness side and ground.
	Yes
	GO to C18 .
	
	No
	REPAIR circuit CR102 (BU) or RR102 (WH).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to C23 .

 • **Are the resistances greater than 10,000 ohms?**	
C14 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO BATTERY INDICATED) (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Disconnect: Clockspring C218A . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver air bag module/clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0002:12 to B0002:13?**	**Yes** GO to C17 . **No** GO to C15 .
C15 CHECK THE DRIVER AIR BAG STAGE 2 CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Measure the voltage between clockspring:
  ▪ C218A-5, circuit CR102 (BU), harness side and ground.
  ▪ C218A-11, circuit RR102 (WH), harness side and ground.
	Yes
	REPAIR circuit CR102 (BU) or RR102 (WH).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to C23 .
	
	No
	GO to C18 .

repair4less

- **Is voltage present on either circuit?**

C16 CONFIRM THE DRIVER AIR BAG MODULE FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Install the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new driver air bag module. REFER to Driver Airbag in this section. GO to C23 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0002:13 or B0002:1A, GO to C19 . For DTC B0002:11, GO to C20 . For DTC B0002:12, GO to C21 .
C17 CONFIRM THE CLOCKSPRING FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Clockspring C218A . • Install the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to C23 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0002:13 or B0002:1A, GO to C19 . For DTC B0002:11, GO to

	C20 . For DTC B0002:12, GO to C21 .
C18 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • If previously removed, install the driver air bag module. Refer to Driver Airbag in this section. • Connect: Clockspring C218A (if previously disconnected) . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to C23 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0002:13 or B0002:1A, GO to C19 . For DTC B0002:11, GO to C20 . For DTC B0002:12, GO to C21 .
C19 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_01_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_01_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does the PID value read between 2 and 3.68 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to C22 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell

repair4less

	5 , Connector Repair Procedures for schematic and connector information. GO to C23 .
C20 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO GROUND FAULT	
• Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0002:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C23 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to C22 .
C21 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO BATTERY FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Airbag in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0002:12 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to C23 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to C22 .
C22 CHECK HARNESS AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and

frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. • Inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. • **Were any concerns found?**	connector information. GO to C23 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to C23 .
C23 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test D: DTCs B0010:11, B0010:12, B0010:13 and B0010:1A

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors the passenger air bag module stage 1 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger air bag module

If a fault is detected, the RCM stores DTC B0010:11, B0010:12, B0010:13 or B0010:1A in memory and sends a message to the Instrument Panel Cluster (IPC) module to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement, in combination with an age correction factor, to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM . If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle

repair4less

ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger air bag module
- RCM

DTC Description	Fault Trigger Condition
• B0010:11 — Passenger Frontal Stage 1 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger air bag stage 1 circuit.
• B0010:12 — Passenger Frontal Stage 1 Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger air bag stage 1 circuit.
• B0010:13 — Passenger Frontal Stage 1 Deployment Control: Circuit Open	A fault is indicated when the RCM measures greater than the desired resistance range between passenger air bag stage 1 circuits.
• B0010:1A — Passenger Frontal Stage 1 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between passenger air bag stage 1 circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger air bag module
- RCM

PINPOINT TEST D: DTCs B0010:11, B0010:12, B0010:13 AND B0010:1A

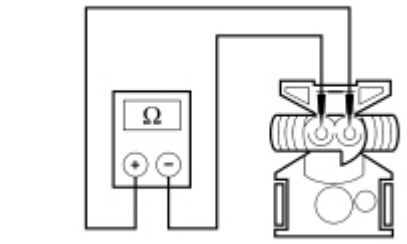
WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

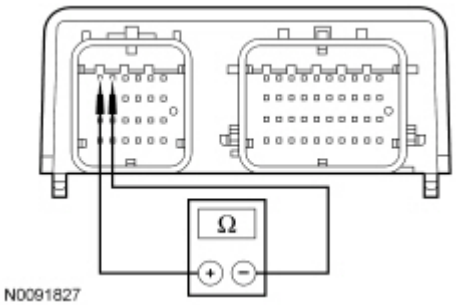
NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .



NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

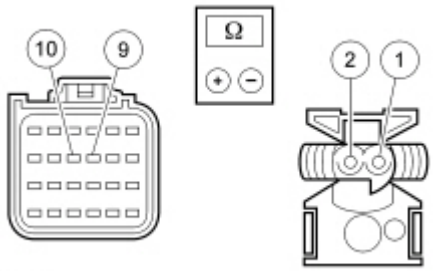
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
D1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0010:11, B0010:12, B0010:13 or B0010:1A retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0010:13 or B0010:1A, GO to D2 . For DTC B0010:11, GO to D9 . For DTC B0010:12, GO to D11 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. For DTC B0010:13 or B0010:1A, GO to D14 . For DTC B0010:11, GO to D15 . For DTC B0010:12, GO to D16 .
D2 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_05_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_05_R.	**Yes** GO to D13 .



repair4less

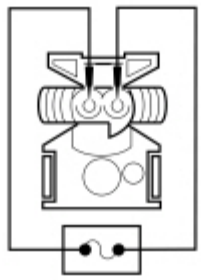
• **Does the PID value read between 1.7 and 2.78 ohms?**	**No** GO to D3 .
D3 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_05_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• While monitoring the DEPLOY_05_R PID, carry out the harness test of the passenger air bag module circuits and accessible connectors (including any in-line connectors), by wiggling connectors and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to D18 . **No** For PID value less than 1.7 ohms, GO to D4 . For PID value greater than 2.78 ohms, GO to D7 .
D4 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger air bag module disconnected, open circuit faults are normally retrieved on passenger air bag stages 1 and 2. • **Did the on-demand DTC change from B0010:1A to B0010:13?**	**Yes** GO to D12 . **No** GO to D5 .
D5 CHECK FOR A SHORT BETWEEN PASSENGER AIR BAG STAGE 1 CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between passenger air bag C256A-2, circuit CR103 (GY/BU), harness side and C256A-1, circuit RR103 (VT/GN), harness side.	**Yes** GO to D13 . **No** GO to D6 .



N0093109

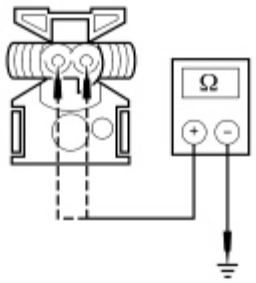
- **Is the resistance greater than 10,000 ohms?**

D6 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310A and C310B . • Measure the resistance between RCM C310A pins 1 and 2, component side.  N0091827 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR103 (GY/BU) and RR103 (VT/GN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to D18 . **No** GO to D13 .



D7 CHECK THE PASSENGER AIR BAG STAGE 1 CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Disconnect: RCM C310A and C310B . • Measure the resistance between RCM C310A, harness side and passenger air bag module C256A, harness side using the following chart. **RCM** / **Circuit** / **Passenger Air Bag Module Stage 1 Electrical Connector** C310A-1 / CR103 (GY/BU) / C256A-2 C310A-2 / RR103 (VT/GN) / C256A-1	**Yes** GO to D8 . **No** REPAIR circuit CR103 (GY/BU) or RR103 (VT/GN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to D18 .

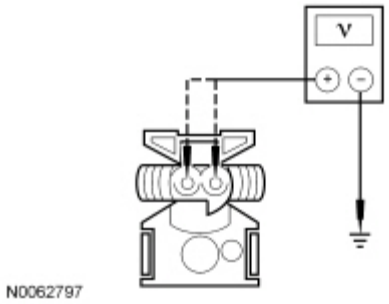
repair4less



N0093290

- **Are the resistances less than 0.5 ohm?**

D8 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Connect: RCM C310A and C310B . • Connect a fused jumper wire between passenger air bag module stage 1 C256A-2, circuit CR103 (GY/BU), harness side, and C256A-1, circuit RR103 (VT/GN), harness side.  N0114275 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger air bag module stage 1 circuits shorted together, a low resistance fault is normally retrieved on stage 1. Stage 2 shows an open circuit fault due to the passenger air bag being disconnected. • **Did the on-demand DTC change from B0010:13 to B0010:1A?**	**Yes** REMOVE the fused jumper wire and GO to D12 . **No** REMOVE the fused jumper wire and GO to D13 .
D9 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** GO to D12 . **No** GO to D10 .



• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger air bag module disconnected, open circuit faults are normally retrieved on passenger air bag stages 1 and 2. • **Did the on-demand DTC change from B0010:11 to B0010:13?**	
D10 CHECK THE PASSENGER AIR BAG STAGE 1 CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between passenger air bag module:
  ▪ C256A-2, circuit CR103 (GY/BU), harness side and ground.
  ▪ C256A-1, circuit RR103 (VT/GN), harness side and ground.

 	
N0061730
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to D13 .
	
	No
	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.
	
	REPAIR circuit CR103 (GY/BU) or RR103 (VT/GN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to D18 .

D11 CHECK THE PASSENGER AIR BAG STAGE 1 CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Air Bag Module C256A and C256B .
• Disconnect: RCM C310A and C310B .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Measure the voltage between passenger air bag module:
  ▪ C256A-2, circuit CR103 (GY/BU), harness side and ground.
  ▪ C256A-1, circuit RR103 (VT/GN), harness side and ground.
	Yes
	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.
	
	REPAIR circuit CR103 (GY/BU) or RR103 (VT/GN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.

repair4less

 N0062797 • **Is voltage present on either circuit?**	GO to D18 . **No** GO to D13 .
D12 CONFIRM THE PASSENGER AIR BAG MODULE FAULT **NOTE:** Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Air Bag Module C256A and C256B (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new passenger air bag module. REFER to Passenger Airbag in this section. GO to D18 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0010:13 or B0010:1A, GO to D14 . For DTC B0010:11, GO to D15 . For DTC B0010:12, GO to D16 .
D13 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found.	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to D18 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0010:13 or B0010:1A, GO to D14 .

Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: Passenger Air Bag Module C256A and C256B (if previously disconnected) . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	For DTC B0010:11, GO to D15 . For DTC B0010:12, GO to D16 .
D14 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_05_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_05_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to D17 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to D18 .
D15 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT	
• Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0010:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to D18 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time.**

repair4less

	Install SRS components only when directed to do so in the pinpoint test. GO to D17 .
D16 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0010:12 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to D18 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to D17 .

D17 CHECK THE HARNESS AND CONNECTORS
• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Air Bag Module C256A (if not previously disconnected) .
• Disconnect: Passenger Air Bag Module C256B (if not previously disconnected) .
  ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section.
• **Were any concerns found?**
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to D18 .
	
	No
	The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to D18 .

D18 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete.

Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	RETURN the vehicle to the customer.

Pinpoint Test E: DTCs B0011:11, B0011:12, B0011:13 and B0011:1A

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors the passenger air bag module stage 2 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger air bag module

If a fault is detected, the RCM stores DTC B0011:11, B0011:12, B0011:13 or B0011:1A in memory and sends a message to the Instrument Panel Cluster (IPC) module to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement in combination with an age correction factor to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM . If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger air bag module
- RCM

repair4less

DTC Description	Fault Trigger Condition
• B0011:11 — Passenger Frontal Stage 2 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger air bag stage 2 circuit.
• B0011:12 — Passenger Frontal Stage 2 Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger air bag stage 2 circuit.
• B0011:13 — Passenger Frontal Stage 2 Deployment Control: Circuit Open	A fault is indicated when the RCM measures greater than the desired resistance range between passenger air bag stage 2 circuits.
• B0011:1A — Passenger Frontal Stage 2 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between passenger air bag stage 2 circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger air bag module
- RCM

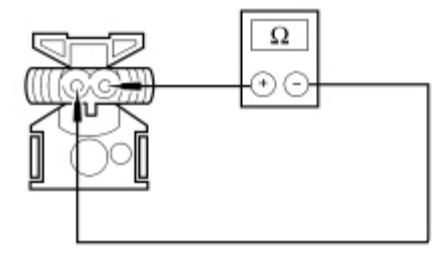
PINPOINT TEST E: DTCs B0011:11, B0011:12, B0011:13 AND B0011:1A

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.



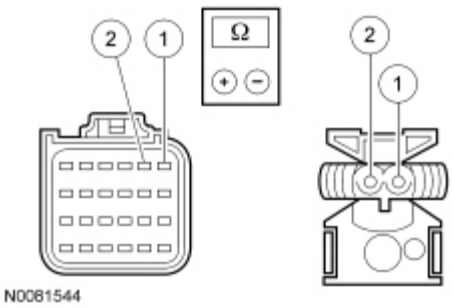
NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
E1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0011:11, B0011:12, B0011:13 or B0011:1A retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0011:13 or B0011:1A, GO to E2 . For DTC B0011:11, GO to E8 . For DTC B0011:12, GO to E10 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. For DTC B0011:13 or B0011:1A, GO to E13 . For DTC B0011:11, GO to E14 . For DTC B0011:12, GO to E15 .
E2 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_06_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_06_R. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** GO to E12 . **No** GO to E3 .
E3 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_06_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• While monitoring the DEPLOY_06_R PID, carry out the harness test of the passenger air bag module circuits and accessible connectors (including any in-line connectors), by wiggling connectors and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms while**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed.

repair4less



carrying out the harness test?	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to E17 . **No** For PID value less than 1.7 ohms, GO to E4 . For PID value greater than 2.78 ohms, GO to E6 .
E4 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger air bag module disconnected, open circuit faults are normally retrieved on passenger air bag stages 1 and 2. • **Did the on-demand DTC change from B0011:1A to B0011:13?**	**Yes** GO to E11 . **No** GO to E5 .
E5 CHECK FOR A SHORT BETWEEN PASSENGER AIR BAG STAGE 2 CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between C256B-2, circuit CR104 (YE/GY), harness side and C256B-1, circuit RR104 (WH/BU), harness side.  A0030495	**Yes** GO to E12 . **No** REPAIR circuits CR104 (YE/GY) and RR104 (WH/BU). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to E17 .

- **Is the resistance greater than 10,000 ohms?**

E6 CHECK THE PASSENGER AIR BAG STAGE 2 CIRCUITS FOR AN OPEN

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Passenger Air Bag Module C256A and C256B .
- Disconnect: RCM C310A and C310B .
- Measure the resistance between RCM C310A, harness side and passenger air bag module C256B, harness side using the following chart.

RCM	Circuit	Passenger Air Bag Module Stage 2 Electrical Connector
C310A-10	CR104 (YE/GY)	C256B-2
C310A-9	RR104 (WH/BU)	C256B-1

- **Are the resistances less than 0.5 ohm?**

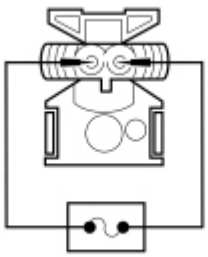
Yes
GO to E7 .

No
REPAIR circuit CR104 (YE/GY) or RR104 (WH/BU).

Refer to Wiring Diagrams Cell 5 for schematic and connector information.

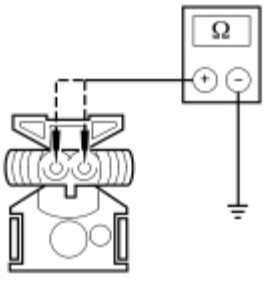
GO to E17 .

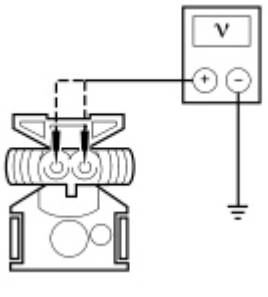
E7 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)



NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Connect: RCM C310A and C310B .
- Connect a fused jumper wire between passenger air bag module stage 2 C218A-2, circuit CR104 (YE/GY), harness side, and C218A-1, circuit RR104 (WH/BU), harness side.





Yes
REMOVE the fused jumper wire and GO to E11 .

No
REMOVE the fused jumper wire and GO to E12 .

repair4less

 N0113511 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger air bag module stage 2 circuits shorted together, a low resistance fault is normally retrieved on stage 2. Stage 1 shows an open circuit fault due to the passenger air bag module being disconnected. • **Did the on-demand DTC change from B0011:13 to B0011:1A?**	
E8 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger air bag module disconnected, open circuit faults are normally retrieved on stages 1 and 2. • **Did the on-demand DTC change from B0011:11 to B0011:13?**	**Yes** GO to E11 . **No** GO to E9 .
E9 CHECK THE PASSENGER AIR BAG STAGE 2 CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between passenger air bag module:
  ▪ C256B-2, circuit CR104 (YE/GY), harness side and ground.
  ▪ C256B-1, circuit RR104 (WH/BU), harness side and
	Yes
	GO to E12 .
	
	No
	REPAIR circuit CR104 (YE/GY) or RR104 (WH/BU).
	
	Refer to Wiring Diagrams Cell 5

ground.  A0094161 • **Are the resistances greater than 10,000 ohms?**	for schematic and connector information. GO to E17 .
E10 CHECK THE PASSENGER AIR BAG STAGE 2 CIRCUITS FOR A SHORT TO VOLTAGE • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Disconnect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between passenger air bag module: ▪ C256B-2, circuit CR104 (YE/GY), harness side and ground. ▪ C256B-1, circuit RR104 (WH/BU), harness side and ground.  A0094162 • **Is voltage present on either circuit?**	**Yes** REPAIR circuit CR104 (YE/GY) or RR104 (WH/BU). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to E17 . **No** GO to E12 .
E11 CONFIRM THE PASSENGER AIR BAG MODULE FAULT **NOTE:** Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Air Bag Module C256A and C256B (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering	**Yes** INSTALL a new passenger air bag module. REFER to Passenger Airbag in this section. GO to E17 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS**

repair4less

and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0011:13 or B0011:1A, GO to E13 . For DTC B0011:11, GO to E14 . For DTC B0011:12, GO to E15 .
E12 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: Passenger Air Bag Module C256A and C256B (if previously disconnected) . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to E17 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0011:13 or B0011:1A, GO to E13 . For DTC B0011:11, GO to E14 . For DTC B0011:12, GO to E15 .
E13 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_06_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_06_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the**

	pinpoint test. GO to E16 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to E17 .
E14 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO GROUND FAULT	
• Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0011:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to E17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to E16 .
E15 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO BATTERY FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256A and C256B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0011:12 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to E17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to E16 .

repair4less

E16 CHECK THE HARNESS AND CONNECTORS	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Air Bag Module C256A (if not previously disconnected) .
• Disconnect: Passenger Air Bag Module C256B (if not previously disconnected) .
  ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section.
• **Were any concerns found?**
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to E17 .
	
	No
	The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to E17 .

E17 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test F: DTCs B0020:11, B0020:12, B0020:13 and B0020:1A

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors the driver seat side air bag module and circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver seat side air bag module

If a fault is detected, the RCM stores DTC B0020:11, B0020:12, B0020:13 or B0020:1A in memory and

sends a message to the Instrument Panel Cluster (IPC) module to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement in combination with an age correction factor to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM . If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Driver seat side air bag module
- RCM

DTC Description	Fault Trigger Condition
• B0020:11 — Left Side Airbag Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver seat side air bag circuit.
• B0020:12 — Left Side Airbag Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver seat side air bag circuit.
• B0020:13 — Left Side Airbag Deployment Control: Circuit Open	A fault is indicated when the RCM measures greater than the desired resistance range between the driver seat side air bag circuits.
• B0020:1A — Left Side Airbag Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between the driver seat side air bag circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat side air bag module
- RCM

repair4less

PINPOINT TEST F: DTCs B0020:11, B0020:12, B0020:13 AND B0020:1A

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
F1 RETRIEVE RCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0020:11, B0020:12, B0020:13 or B0020:1A retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0020:13 or B0020:1A, GO to F2 . For DTC B0020:11, GO to F8 . For DTC B0020:12, GO to F10 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only.

	For DTC B0020:13 or B0020:1A, GO to F13. For DTC B0020:11, GO to F14. For DTC B0020:12, GO to F15.
F2 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL RESISTANCE (DEPLOY_10_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM. ▪ Monitor and record PID DEPLOY_10_R. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** GO to F12. **No** GO to F3.
F3 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL RESISTANCE (DEPLOY_10_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• While monitoring the DEPLOY_10_R PID, carry out the harness test of the driver seat side air bag circuits and accessible connectors (including any in-line connectors) by wiggling connectors and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information. GO to F17. **No** For PID value less than 1.7 ohms, GO to F4. For PID value greater than 2.78 ohms, GO to F6.
F4 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Side Air Bag Module C367. • **NOTE:** Unzip the trim cover to access the driver seat side air bag module electrical connector. • Repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM. • **DIAGNOSTIC TIP:** When viewing DTCs with the driver seat	**Yes** GO to F11. **No** GO to F5.

repair4less

side air bag module disconnected, an open circuit fault is normally retrieved.
- **Did the on-demand DTC change from B0020:1A to B0020:13?**

F5 CHECK FOR A SHORT BETWEEN DRIVER SEAT SIDE AIR BAG CIRCUITS

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: RCM C310A and C310B .
- Measure the resistance between driver seat side air bag module C367-1, circuit CR105 (GN/BU), harness side and C367-2, circuit RR105 (GY/YE), harness side.

N0093121

- **Is the resistance greater than 10,000 ohms?**

Yes
GO to F12 .

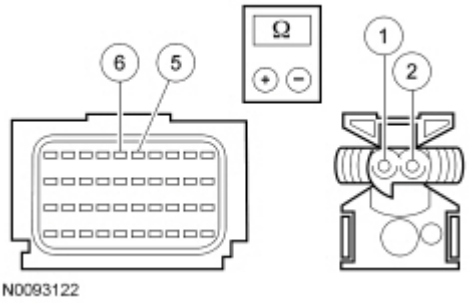
No
REPAIR circuits CR105 (GN/BU) and RR105 (GY/YE).

Refer to Wiring Diagrams Cell 5 for schematic and connector information.

GO to F17 .

F6 CHECK THE DRIVER SEAT SIDE AIR BAG CIRCUITS FOR AN OPEN

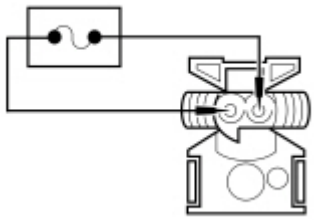
- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Driver Seat Side Air Bag Module C367 .
- **NOTE:** Unzip the trim cover to access the driver seat side air bag module electrical connector.
- Disconnect: RCM C310A and C310B .
- Measure the resistance between RCM C310B, harness side and driver seat side air bag module C3051, harness side using the following chart.



RCM	Circuit	Driver Seat Side Air Bag Module Electrical Connector
C310B-6	CR105 (GN/BU)	C367-1
C310B-5	RR105 (GY/YE)	C367-2

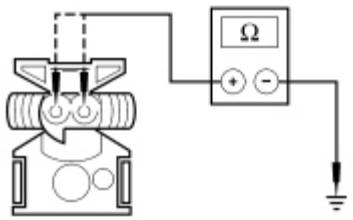
Yes
GO to F7 .

No
REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE).



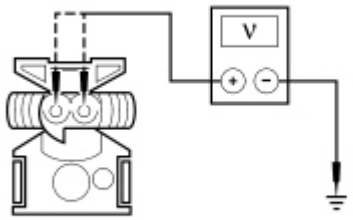
Refer to Wiring Diagrams Cell 5 for schematic and connector information.

GO to F17 .



N0093122

- **Are the resistances less than 0.5 ohm?**



F7 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Connect: RCM C310A and C310B . • Connect a fused jumper wire between driver seat side air bag C367-1, circuit CR105 (VT/GY), harness side and C367-2, circuit RR105 (YE/OG), harness side.  N0119863 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver seat side air bag module circuits shorted together, a low resistance fault is normally retrieved. • **Did the on-demand DTC change from B0020:13 to B0020:1A?**	**Yes** REMOVE the fused jumper wire and GO to F11 . **No** REMOVE the fused jumper wire and GO to F12 .
F8 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** GO to F11 . **No** GO to F9 .

repair4less

• Disconnect: Driver Seat Side Air Bag Module C367 . • **NOTE:** Unzip the trim cover to access the driver seat side air bag module electrical connector. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver seat side air bag module disconnected, an open circuit fault is normally retrieved. • **Did the on-demand DTC change from B0020:11 to B0020:13?**	
F9 CHECK THE DRIVER SEAT SIDE AIR BAG CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between driver seat side air bag module:
  ▪ C367-1, circuit CR105 (GN/BU), harness side and ground.
  ▪ C367-2, circuit RR105 (GY/YE), harness side and ground.

 	
N0093123
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to F12 .
	
	No
	REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to F17 .

F10 CHECK THE DRIVER SEAT SIDE AIR BAG CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Side Air Bag Module C367 . • **NOTE:** Unzip the trim cover to access the driver seat side air bag module electrical connector. • Disconnect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between driver seat side air bag module: ▪ C367-1, circuit CR105 (GN/BU), harness side and ground.	**Yes** REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to F17 . **No** GO to F12 .

▪ C367-2, circuit RR105 (GY/YE), harness side and ground.  N0093124 • **Is voltage present on either circuit?**	
F11 CONFIRM THE DRIVER SEAT SIDE AIR BAG MODULE FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Driver Seat Side Air Bag Module C367 . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** REMOVE and INSPECT the driver seat side air bag module harness for damage. REFER to Side Airbag in this section. If a concern is found, REPAIR as necessary. Refer to Wiring Diagrams Cell 5 for schematic and connector information. If a concern **was not** found, INSTALL a new driver seat side air bag module. REFER to Side Airbag in this section. GO to F17 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0020:13 or B0020:1A, GO to F13 . For DTC B0020:11, GO to F14 . For DTC B0020:12, GO to F15 .
F12 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the	**Yes**

repair4less

RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded.
• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Prior to reconnecting any previously disconnected SRS component:
  ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section.
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
 	
• Connect: Driver Seat Side Air Bag Module C367 .
• Connect: RCM C310A and C310B (if previously disconnected) .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM .
• **Was the original DTC retrieved on-demand during self-test?**
	INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to F17 .
	
	No
	In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.**
	
	For DTC B0020:13 or B0020:1A, GO to F13 .
	
	For DTC B0020:11, GO to F14 .
	
	For DTC B0020:12, GO to F15 .

F13 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL RESISTANCE (DEPLOY_10_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_10_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to F16 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to F17 .
F14 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO GROUND	

FAULT	
• Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0020:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to F17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to F16 .
F15 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO BATTERY FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Side Air Bag Module C367 . • **NOTE:** Unzip the trim cover to access the driver seat side air bag module electrical connector. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0020:12 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to F17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to F16 .
F16 CHECK THE HARNESS AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Side Air Bag Module C367 . • **NOTE:** Unzip the trim cover to access the driver seat side air bag module electrical connector. ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B CPA lever/lock for	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to F17 . **No** The fault is not present and

repair4less

correct operation. Refer to Restraints Control Module (RCM) in this section. • **Were any concerns found?**	cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to F17.
F17 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints. • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM. • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs. PROVE OUT the SRS. The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test G: DTCs B0021:11, B0021:12, B0021:13 and B0021:1A

Normal Operation

The Restraints Control Module (RCM) continuously monitors the driver Safety Canopy® and circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver Safety Canopy®

If a fault is detected, the RCM stores DTC B0021:11, B0021:12, B0021:13 or B0021:1A in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement in combination with an age correction factor to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring

- Connections
- Driver Safety Canopy® module
- RCM

DTC Description	Fault Trigger Condition
• B0021:11 — Left Curtain Deployment Control 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver Safety Canopy® circuit.
• B0021:12 — Left Curtain Deployment Control 1: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver Safety Canopy® circuit.
• B0021:13 — Left Curtain Deployment Control 1: Circuit Open	A fault is indicated when the RCM measures greater than the desired resistance range between the driver Safety Canopy® circuits.
• B0021:1A — Left Curtain Deployment Control 1: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between the driver Safety Canopy® circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver Safety Canopy® module
- RCM

PINPOINT TEST G: DTCs B0021:11, B0021:12, B0021:13 AND B0021:1A

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

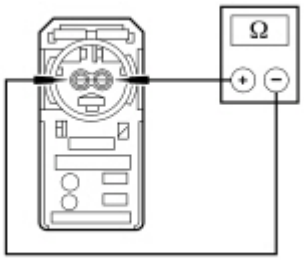
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and

repair4less

verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .



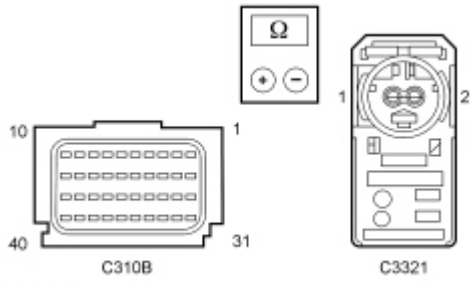
NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
G1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0021:11, B0021:12, B0021:13 or B0021:1A retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0021:13 or B0021:1A, GO to G2 . For DTC B0021:11, GO to G8 . For DTC B0021:12, GO to G10 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. For DTC B0021:13 or B0021:1A, GO to G13 . For DTC B0021:11, GO to G14 . For DTC B0021:12, GO to G15 .
G2 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 RESISTANCE (DEPLOY_11_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_11_R. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** GO to G12 . **No** GO to G3 .
G3 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 RESISTANCE (DEPLOY_11_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• While monitoring the DEPLOY_11_R PID, carry out the harness test of the driver Safety Canopy® circuits and accessible connectors (including any in-line connectors) by wiggling connectors and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed.

while carrying out the harness test?	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G17 . **No** For PID value less than 1.7 ohms, GO to G4 . For PID value greater than 2.78 ohms, GO to G6 .
G4 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy® C9018 . ▪ For regular cab, remove the LH side B-pillar trim panel. ▪ For SuperCab and Crew Cab, remove the LH C-pillar trim panel. ▪ Refer to Interior Trim in Section 501-05 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver Safety Canopy® disconnected, an open circuit fault is normally retrieved. • **Did the on-demand DTC change from B0021:1A to B0021:13?**	**Yes** GO to G11 . **No** GO to G5 .
G5 CHECK FOR A SHORT BETWEEN DRIVER SAFETY CANOPY® CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between driver Safety Canopy® C3321-1, circuit CR109 (BN/BU), harness side and C3321-2, circuit RR109 (BU/GN), harness side.	**Yes** GO to G12 . **No** REPAIR circuits CR109 (BN/BU) and RR109 (BU/GN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to G17 .

repair4less

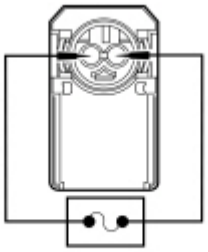


N0102657

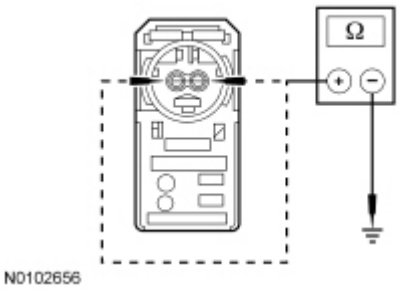
- **Is the resistance greater than 10,000 ohms?**

G6 CHECK THE DRIVER SAFETY CANOPY® CIRCUITS FOR AN OPEN	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Driver Safety Canopy® C3321 .
  ▪ For regular cab, remove the LH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the LH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05 .
• Disconnect: RCM C310A and C310B .
• Measure the resistance between RCM C310B, harness side and driver Safety Canopy® C3321, harness side using the following chart.
	Yes
	GO to G7 .
	
	No
	REPAIR circuit CR109 (BN/BU) or RR109 (BU/GN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to G17 .

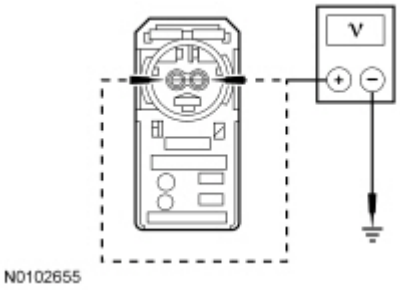


RCM	Circuit	Driver Safety Canopy® Module Electrical Connector
C310B-7	CR109 (BN/BU)	C3321-1
C310B-8	RR109 (BU/GN)	C3321-2



N0102653

- **Are the resistances less than 0.5 ohm?**



G7 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** REMOVE the fused jumper wire and GO to G11 .

• Connect: RCM C310A and C310B . • Connect a fused jumper wire between driver Safety Canopy® C3321-1, circuit CR109 (BN/BU), harness side and C3321-2, circuit RR109 (BU/GN), harness side.  N0114277 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver Safety Canopy® circuits shorted together, a low resistance fault is normally retrieved. • **Did the on-demand DTC change from B0021:13 to B0021:1A?**	**No** REMOVE the fused jumper wire and GO to G12 .
G8 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy® C3321 . ▪ For regular cab, remove the LH side B-pillar trim panel. ▪ For SuperCab and Crew Cab, remove the LH C-pillar trim panel. ▪ Refer to Interior Trim in Section 501-05 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver Safety Canopy® disconnected, an open circuit fault is normally retrieved. • **Did the on-demand DTC change from B0021:11 to B0021:13?**	**Yes** GO to G11 . **No** GO to G9 .
G9 CHECK THE DRIVER SAFETY CANOPY® CIRCUITS FOR A SHORT TO GROUND	

repair4less

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between driver Safety Canopy®:
  ▪ C3321-1, circuit CR109 (BN/BU), harness side and ground.
  ▪ C3321-2, circuit RR109 (BU/GN), harness side and ground.

 	
N0102656
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to G12 .
	
	No
	REPAIR circuit CR109 (BN/BU) or RR109 (BU/GN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to G17 .

G10 CHECK THE DRIVER SAFETY CANOPY® CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Driver Safety Canopy® C3321 .
  ▪ For regular cab, remove the LH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the LH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05 .
• Disconnect: RCM C310A and C310B .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Measure the voltage between driver Safety Canopy®:
  ▪ C3321-1, circuit CR109 (BN/BU), harness side and ground.
  ▪ C3321-2, circuit RR109 (BU/GN), harness side and ground.

 	
N0102655
• **Is voltage present on either circuit?**
	Yes
	REPAIR circuit CR109 (BN/BU) or RR109 (BU/GN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to G17 .
	
	No
	GO to G12 .

G11 CONFIRM THE DRIVER SAFETY CANOPY® MODULE FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Driver Safety Canopy® C3321 . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new driver Safety Canopy®. REFER to Safety Canopy Module in this section. GO to G17 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0021:13 or B0021:1A, GO to G13 . For DTC B0021:11, GO to G14 . For DTC B0021:12, GO to G15 .
G12 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: Driver Safety Canopy® C3321 . • Connect: RCM C310A and C310B (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM .	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to G17 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0021:13 or B0021:1A, GO to G13 . For DTC B0021:11, GO to G14 . For DTC B0021:12, GO to G15 .

repair4less

• **Was the original DTC retrieved on-demand during self-test?**	
G13 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 RESISTANCE (DEPLOY_11_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_11_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to G16 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G17 .
G14 CHECK FOR AN INTERMITTENT LEFT CURTAIN DEPLOYMENT CONTROL 1 SHORT TO GROUND FAULT	
• Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0021:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to G16 .
G15 CHECK FOR AN INTERMITTENT LEFT CURTAIN DEPLOYMENT CONTROL 1 SHORT TO BATTERY FAULT	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Driver Safety Canopy® C3321 .
  ▪ For regular cab, remove the LH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the LH C-pillar trim panel.
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.

▪ Refer to Interior Trim in Section 501-05 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0021:12 retrieved on-demand during self-test?**	GO to G17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to G16 .
G16 CHECK THE HARNESS AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy® C3321 . ▪ For regular cab, remove the LH side B-pillar trim panel. ▪ For SuperCab and Crew Cab, remove the LH C-pillar trim panel. ▪ Refer to Interior Trim in Section 501-05 . ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. • **Were any concerns found?**	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to G17 .
G17 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test H: DTCs B0028:11, B0028:12, B0028:13 and B0028:1A

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

repair4less

Normal Operation

The Restraints Control Module (RCM) continuously monitors the passenger seat side air bag module circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger seat side air bag module

If a fault is detected, the RCM stores DTC B0028:11, B0028:12, B0028:13 or B0028:1A in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement in combination with an age correction factor to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM . If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger seat side air bag module
- RCM

DTC Description	Fault Trigger Condition
• B0028:11 — Right Side Airbag Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger seat side air bag circuit.
• B0028:12 — Right Side Airbag Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger seat side air bag circuit.
• B0028:13 — Right Side Airbag Deployment Control: Circuit Open	A fault is indicated when the RCM measures greater than the desired resistance range between the passenger seat side air bag circuits.

• B0028:1A — Right Side Airbag Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between the passenger seat side air bag circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger seat side air bag module
- RCM

PINPOINT TEST H: DTCs B0028:11, B0028:12, B0028:13 AND B0028:1A

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

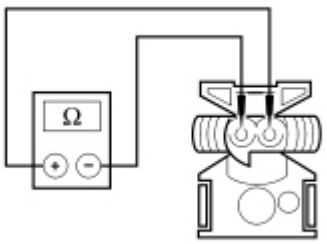
WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .



NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
H1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0028:11, B0028:12, B0028:13 or B0028:1A retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.

repair4less

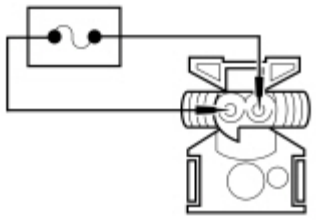
	For DTC B0028:13 or B0028:1A, GO to H2. For DTC B0028:11, GO to H8. For DTC B0028:12, GO to H10. **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. For DTC B0028:13 or B0028:1A, GO to H13. For DTC B0028:11, GO to H14. For DTC B0028:12, GO to H15.
H2 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL RESISTANCE (DEPLOY_13_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM. ▪ Monitor and record PID DEPLOY_13_R. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** GO to H12. **No** GO to H3.
H3 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL RESISTANCE (DEPLOY_13_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• While monitoring the DEPLOY_13_R PID, carry out the harness test of the passenger side air bag circuits and accessible connectors (including any in-line connectors) by wiggling connectors and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information. GO to H17. **No** For PID value less than 1.7 ohms, GO to H4. For PID value greater than 2.78 ohms, GO to H6.
H4 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** GO to H11. **No** GO to H5.

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C337 . • **NOTE:** Unzip the trim cover to access the passenger seat side air bag module electrical connector. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger seat side air bag module disconnected, an open circuit fault is normally retrieved. • **Did the on-demand DTC change from B0028:1A to B0028:13?**	
H5 CHECK FOR A SHORT BETWEEN PASSENGER SEAT SIDE AIR BAG CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between passenger seat side air bag C337-1, circuit CR106 (VT/GY), harness side and C337-2, circuit RR106 (YE/OG), harness side.  N0093121 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H12 . **No** REPAIR circuits CR106 (VT/GY) and RR106 (YE/OG). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to H17 .
H6 CHECK THE PASSENGER SEAT SIDE AIR BAG CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C337 . • Disconnect: RCM C310A and C310B . • Measure the resistance between RCM C310B, harness side and passenger seat side air bag module C337, harness side using the following chart.	**Yes** GO to H7 . **No** REPAIR circuit CR106 (VT/GY) or RR106 (YE/OG). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to H17 .

RCM	Circuit	Passenger Seat Side Air Bag Module Electrical Connector
C310B-16	CR106 (VT/GY)	C337-1
C310B-	RR106	C337-2

repair4less

15	(YE/OG)	



N0093125

- **Are the resistances less than 0.5 ohm?**

H7 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)

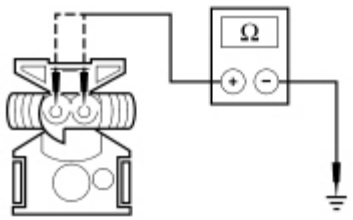
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Connect: RCM C310A and C310B .
- Connect a fused jumper wire between passenger seat side air bag C337-1, circuit CR106 (VT/GY), harness side and C337-2, circuit RR106 (YE/OG), harness side.

N0119863

- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test — RCM .
- **DIAGNOSTIC TIP:** When viewing DTCs with the passenger side air bag circuits shorted together, a low resistance fault is normally retrieved.
- **Did the on-demand DTC change from B0028:13 to B0028:1A?**

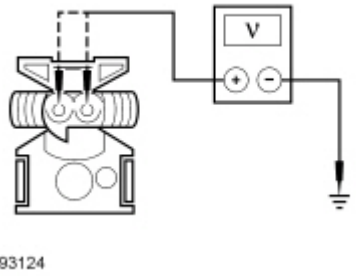
Yes
REMOVE the fused jumper wire and GO to H11 .



No
REMOVE the fused jumper wire and GO to H12 .

H8 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If



Yes
GO to H11 .

the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C337 . • **NOTE:** Unzip the trim cover to access the passenger seat side air bag module electrical connector. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger seat side air bag module disconnected, an open circuit fault is normally retrieved. • **Did the on-demand DTC change from B0028:11 to B0028:13?**	**No** GO to H9 .
H9 CHECK THE PASSENGER SEAT SIDE AIR BAG CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between passenger seat side air bag:
  ▪ C337-1, circuit CR106 (VT/GY), harness side and ground.
  ▪ C337-2, circuit RR106 (YE/OG), harness side and ground.

 	
N0093123
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to H12 .
	
	No
	REPAIR circuit CR106 (VT/GY) or RR106 (YE/OG).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to H17 .

H10 CHECK THE PASSENGER SEAT SIDE AIR BAG CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C337 . • **NOTE:** Unzip the trim cover to access the passenger seat side air bag module electrical connector. • Disconnect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering	**Yes** REPAIR circuit CR106 (VT/GY) or RR106 (YE/OG). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to H17 .

repair4less

and Repowering in this section. • Ignition ON. • Measure the voltage between passenger seat side air bag: ▪ C337-1, circuit CR106 (VT/GY), harness side and ground. ▪ C337-2, circuit RR106 (YE/OG), harness side and ground.  N0093124 • **Is voltage present on either circuit?**	**No** GO to H12 .
H11 CONFIRM THE PASSENGER SEAT SIDE AIR BAG MODULE FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Seat Side Air Bag Module C337 . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** REMOVE and INSPECT the passenger seat side air bag module wire harness for damage. REFER to Side Airbag in this section. If a concern is found, REPAIR the seat side air bag wire harness. If a concern **was not** found, INSTALL a new passenger seat side air bag module. REFER to Side Airbag in this section. GO to H17 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0028:13 or B0028:1A, GO to H13 . For DTC B0028:11, GO to H14 . For DTC B0028:12, GO to H15 .
H12 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the	**Yes** INSTALL a new RCM . REFER

RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded.
• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Prior to reconnecting any previously disconnected SRS component:
  ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section.
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
 	
• Connect: Passenger Seat Side Air Bag Module C337 .
• Connect: RCM C310A and C310B (if previously disconnected) .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM .
• **Was the original DTC retrieved on-demand during self-test?**
	to Restraints Control Module (RCM) in this section. GO to H17 .
	
	No
	In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.**
	
	For DTC B0028:13 or B0028:1A, GO to H13 .
	
	For DTC B0028:11, GO to H14 .
	
	For DTC B0028:12, GO to H15 .

H13 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL RESISTANCE (DEPLOY_13_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_13_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to H16 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H17 .
H14 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO GROUND	

repair4less

FAULT	
• Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0028:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to H16 .
H15 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL FOR AN INTERMITTENT SHORT TO BATTERY FAULT	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C337 . • **NOTE:** Unzip the trim cover to access the passenger seat side air bag module electrical connector. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0028:12 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to H16 .
H16 CHECK THE HARNESS AND CONNECTORS	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Seat Side Air Bag Module C337 .
• **NOTE:** Unzip the trim cover to access the passenger seat side air bag module electrical connector.
  ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B CPA lever/lock for
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to H17 .
	
	No
	The fault is not present and

correct operation. Refer to Restraints Control Module (RCM) in this section. • **Were any concerns found?**	cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to H17 .
H17 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test I: DTCs B0029:11, B0029:12, B0029:13 and B0029:1A

Normal Operation

The Restraints Control Module (RCM) continuously monitors the passenger Safety Canopy® circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger Safety Canopy®

If a fault is detected, the RCM stores DTC B0029:11, B0029:12, B0029:13 or B0029:1A in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

The RCM analyzes the deployment loop resistance and uses this measurement in combination with an age correction factor to determine if a fault exists. The value displayed in the PID is the deployment loop resistance as measured by the RCM . If the value displayed is lower or higher than the desired range (refer to diagram below), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. The RCM fault trigger threshold may vary as the vehicle ages. Small variations in resistance can occur due to the effect of road vibrations on terminal fit and/or temperature changes. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring

repair4less

- Connections
- Passenger Safety Canopy® module
- RCM

DTC Description	Fault Trigger Condition
• B0029:11 — Right Curtain Deployment Control 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger Safety Canopy® circuit.
• B0029:12 — Right Curtain Deployment Control 1: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger Safety Canopy® circuit.
• B0029:13 — Right Curtain Deployment Control 1: Circuit Open	A fault is indicated when the RCM measures greater than the desired resistance range between the passenger Safety Canopy® circuits.
• B0029:1A — Right Curtain Deployment Control 1: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between the passenger Safety Canopy® circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger Safety Canopy® module
- RCM

PINPOINT TEST I: DTCs B0029:11, B0029:12, B0029:13 AND B0029:1A

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

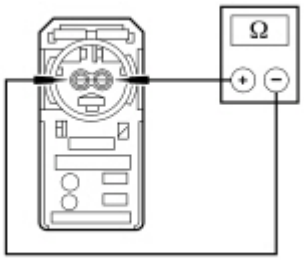
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and

verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.



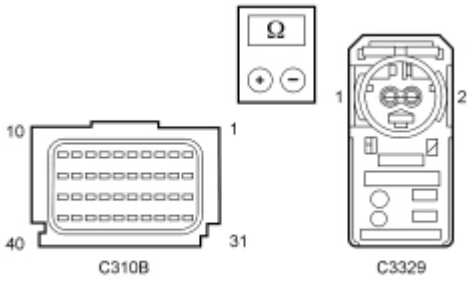
Test Step	Result / Action to Take
I1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0029:11, B0029:12, B0029:13 or B0029:1A retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0029:13 or B0029:1A, GO to I2 . For DTC B0029:11, GO to I8 . For DTC B0029:12, GO to I10 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. For DTC B0029:13 or B0029:1A, GO to I13 . For DTC B0029:11, GO to I14 . For DTC B0029:12, GO to I15 .
I2 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 RESISTANCE (DEPLOY_14_R) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_14_R. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** GO to I12 . **No** GO to I3 .
I3 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 RESISTANCE (DEPLOY_14_R) PID WHILE CARRYING OUT THE HARNESS TEST	
• While monitoring the DEPLOY_14_R PID, carry out the harness test of the passenger Safety Canopy® circuits and accessible connectors (including any in-line connectors), by wiggling connectors and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed.

repair4less

while carrying out the harness test?	Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information. GO to I17. **No** For PID value less than 1.7 ohms, GO to I4. For PID value greater than 2.78 ohms, GO to I6.
I4 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 DTC FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)	

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.
• Ignition OFF.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Safety Canopy® C3329.
  ▪ For regular cab, remove the RH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the RH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05.
• Repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM.
• **DIAGNOSTIC TIP:** When viewing DTCs with the passenger Safety Canopy® disconnected, an open circuit fault is normally retrieved.
• **Did the on-demand DTC change from B0029:1A to B0029:13?**
	Yes
	GO to I11.
	
	No
	GO to I5.

I5 CHECK FOR A SHORT BETWEEN PASSENGER SAFETY CANOPY® CIRCUITS	
• Ignition OFF. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B. • Measure the resistance between passenger Safety Canopy® C3329-1, circuit CR111 (BN/WH), harness side and C3329-2, circuit RR111 (YE/VT), harness side.	**Yes** GO to I12. **No** REPAIR circuits CR111 (BN/WH) and RR111 (YE/VT). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to I17.



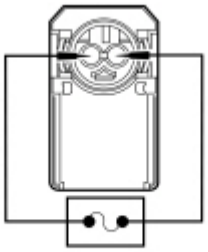
N0102657

- **Is the resistance greater than 10,000 ohms?**

I6 CHECK THE PASSENGER SAFETY CANOPY® CIRCUITS FOR AN OPEN	

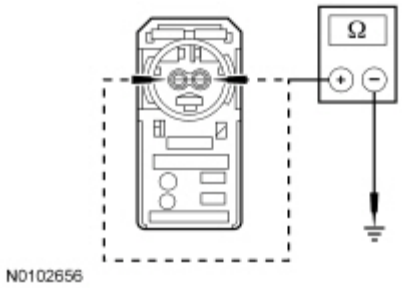
• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Safety Canopy® C3329 .
  ▪ For regular cab, remove the RH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the RH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05 .
• Disconnect: RCM C310A and C310B .
• Measure the resistance between RCM C310B, harness side and passenger Safety Canopy® C3329, harness side using the following chart.
	Yes
	GO to I7 .
	
	No
	REPAIR circuit CR111 (BN/WH) or RR111 (YE/VT).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to I17 .

RCM	Circuit	Passenger Safety Canopy® Electrical Connector
C310B-17	CR111 (BN/WH)	C3329-1
C310B-18	RR111 (YE/VT)	C3329-2



N0102654

- **Are the resistances less than 0.5 ohm?**

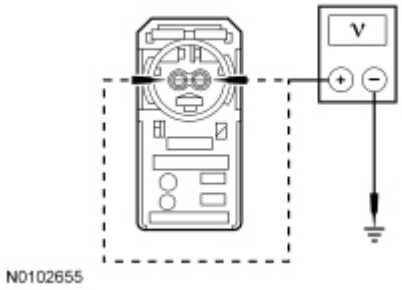


I7 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** REMOVE the fused jumper wire and GO to I11 .

repair4less

• Connect: RCM C310A and C310B . • Connect a fused jumper wire between passenger Safety Canopy® C3329-1, circuit CR111 (BN/WH), harness side and C3329-2, circuit RR111 (YE/VT), harness side.  N0114277 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger Safety Canopy® circuits shorted together, a low resistance fault is normally retrieved. • **Did the on-demand DTC change from B0029:13 to B0029:1A?**	**No** REMOVE the fused jumper wire and GO to I12 .
I8 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.
• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Safety Canopy® C3329 .
  ▪ For regular cab, remove the RH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the RH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05 .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM .
• **DIAGNOSTIC TIP:** When viewing DTCs with the passenger Safety Canopy® disconnected, an open circuit fault would normally be retrieved.
• **Did the on-demand DTC change from B0029:11 to B0029:13?**
	Yes
	GO to I11 .
	
	No
	GO to I9 .



I9 CHECK THE PASSENGER SAFETY CANOPY® CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: RCM C310A and C310B .
• Measure the resistance between passenger Safety Canopy®:
  ▪ C3329-1, circuit CR111 (BN/WH), harness side and ground.
  ▪ C3329-2, circuit RR111 (YE/VT), harness side and ground.

 	
N0102656
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to I12 .
	
	No
	REPAIR circuit CR111 (BN/WH) or RR111 (YE/VT).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to I17 .

I10 CHECK THE PASSENGER SAFETY CANOPY® CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Safety Canopy® C3329 .
  ▪ For regular cab, remove the RH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the RH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05 .
• Disconnect: RCM C310A and C310B .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Measure the voltage between passenger Safety Canopy® C9019:
  ▪ C3329-1, circuit CR111 (BN/WH), harness side and ground.
  ▪ C3329-2, circuit RR111 (YE/VT), harness side and ground.
	Yes
	REPAIR circuit CR111 (BN/WH) or RR111 (YE/VT).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to I17 .
	
	No
	GO to I12 .

repair4less

- **Is voltage present on either circuit?**

I11 CONFIRM THE PASSENGER SAFETY CANOPY® MODULE FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Safety Canopy® C3329 . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new passenger Safety Canopy®. REFER to Safety Canopy Module in this section. GO to I17 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** For DTC B0029:13 or B0029:1A, GO to I13 . For DTC B0029:11, GO to I14 . For DTC B0029:12, GO to I15 .
I12 CONFIRM THE RCM FAULT	

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded.
• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Prior to reconnecting any previously disconnected SRS component:
  ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section.
  ▪ repair any concerns found.
	Yes
	INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to I17 .
	
	No
	In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.**
	
	For DTC B0029:13 or B0029:1A, GO to I13 .
	
	For DTC B0029:11, GO to I14 .

Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: Passenger Safety Canopy® C3329 . • Connect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	For DTC B0029:12, GO to I15 .
I13 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 RESISTANCE (DEPLOY_14_R) PID FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT	
• Enter the following diagnostic mode on the scan tool: DataLogger — RCM . ▪ Monitor and record PID DEPLOY_14_R. • Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • **Does the PID value read between 1.7 and 2.78 ohms?**	**Yes** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to I16 . **No** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I17 .
I14 CHECK FOR AN INTERMITTENT RIGHT CURTAIN DEPLOYMENT CONTROL 1 SHORT TO GROUND FAULT	
• Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0029:11 retrieved on-demand during self-test?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I17 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to I16 .

repair4less

I15 CHECK FOR AN INTERMITTENT RIGHT CURTAIN DEPLOYMENT CONTROL 1 SHORT TO BATTERY FAULT	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Safety Canopy® C3329 .
  ▪ For regular cab, remove the RH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the RH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05 .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Attempt to recreate the fault by wiggling connectors (including any in-line connectors) and flexing the wire harness frequently.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM .
• **Was DTC B0029:12 retrieved on-demand during self-test?**
	Yes
	DEPOWER the SRS and REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to I17 .
	
	No
	The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to I16 .

I16 CHECK THE HARNESS AND CONNECTORS	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Driver Safety Canopy® C3329 .
  ▪ For regular cab, remove the RH side B-pillar trim panel.
  ▪ For SuperCab and Crew Cab, remove the RH C-pillar trim panel.
  ▪ Refer to Interior Trim in Section 501-05 .
  ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section.
• **Were any concerns found?**
	Yes
	REPAIR as necessary.
	
	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
	
	GO to I17 .
	
	No
	The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to I17 .

I17 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints .	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

• **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	

Pinpoint Test J: DTCs B0050:11, B0050:12, B0050:13 and B0050:1D

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors the driver safety belt buckle switch circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Current out of range
- Faulted driver safety belt buckle switch

If a fault is detected, the RCM stores DTC B0050:11, B0050:12, B0050:13 or B0050:1D in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

DTC Description	Fault Trigger Condition
• B0050:11 — Driver Seatbelt Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the driver safety belt buckle switch circuit.
• B0050:12 — Driver Seatbelt Sensor: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the driver safety belt buckle switch circuit.
• B0050:13 — Driver Seatbelt Sensor: Circuit Open	A fault is indicated when the RCM senses an open on either driver safety belt buckle switch circuit.
• B0050:1D — Driver Seatbelt Sensor: Circuit Current Out of Range	A fault is indicated when the RCM senses current out of an acceptable range between the driver safety belt buckle switch circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver safety belt buckle and pretensioner
- RCM

PINPOINT TEST J: DTCs B0050:11, B0050:12, B0050:13 AND B0050:1D

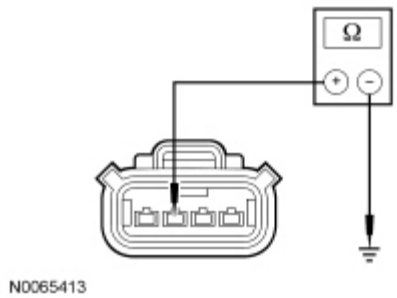
WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

repair4less

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

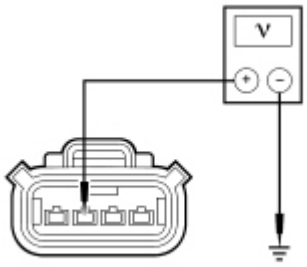
WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

***NOTICE:* Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

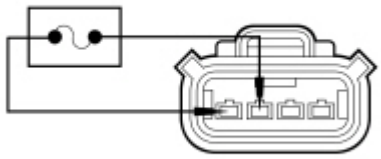
NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .



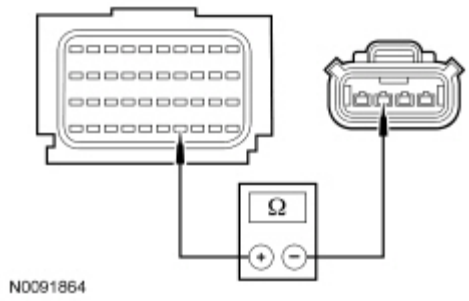
NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

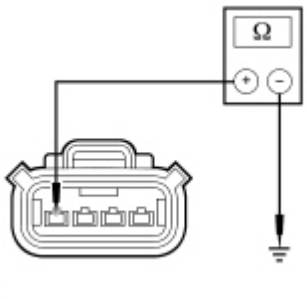
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
J1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0050:11, B0050:12, B0050:13 or B0050:1D retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0050:11 or B0050:1D, GO to J2 . For DTC B0050:12, GO to J4 . For DTC B0050:13, GO to J5 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to J10 .
J2 CHECK THE DRIVER SEATBELT SENSOR DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND OR CURRENT OUT OF RANGE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** GO to J8 . **No**



• Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Disconnect: Driver Safety Belt Buckle C3065 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver safety belt buckle disconnected, an open circuit fault is normally retrieved. • **Did the on-demand DTC change from B0050:11 or B0050:1D to B0050:13?**	For DTC B0050:11, GO to J3 . For DTC B0050:1D, GO to J9 .
J3 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between driver safety belt buckle C3065-3, circuit CR201 (GN/BU), harness side and ground.  N0065413 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J9 . **No** REPAIR circuit CR201 (GN/BU). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to J11 .
J4 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Side Air Bag Module C3051 . • Disconnect: Driver Safety Belt Buckle C3065 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between driver safety belt buckle C3065-3, circuit CR201 (GN/BU), harness side and ground.	**Yes** REPAIR circuit CR201 (GN/BU). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to J11 . **No** GO to J9 .





repair4less

N0065410

- **Is any voltage present?**

J5 CHECK THE DRIVER SEATBELT SENSOR DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Drive Seat Side Air Bag Module C3051 . • Disconnect: Driver Safety Belt Buckle C3065 . • Connect a fused jumper wire between driver safety belt buckle C3065-3, circuit CR201 (GN/BU), harness side and C3065-4, circuit RR137 (BU/GY), harness side.	**Yes** REMOVE the fused jumper wire and GO to J8 . **No** REMOVE the fused jumper wire and GO to J6 .
 N0119864 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver safety belt buckle switch circuits shorted together, a short to ground fault is normally retrieved. • **Did the on-demand DTC change from B0050:13 to B0050:11?**	
J6 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between RCM C310B-34, circuit	**Yes** GO to J7 . **No** REPAIR circuit CR201 (GN/BU).

CR201 (GN/BU), harness side and driver safety belt buckle C3065-3, circuit CR201 (GN/BU), harness side.  • **Is the resistance less than 0.5 ohm?**	Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to J11 .
J7 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between driver safety belt buckle C3065-4, circuit RR137 (BU/GY)/GD174 (BK/WH), harness side and ground.  • **Is the resistance less than 3 ohms?**	**Yes** GO to J9 . **No** REPAIR circuit RR137 (BU/GY)/GD174 (BK/WH). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to J11 .
J8 CONFIRM THE DRIVER SAFETY BELT BUCKLE SWITCH FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair	**Yes** INSTALL a new driver safety belt buckle and pretensioner. REFER to Section 501-20A . GO to J11 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to J10 .

repair4less

Procedures for schematic and connector information. • Connect: RCM C310A and C310B (if previously disconnected) . • Connect: Driver Safety Belt Buckle C3065 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	
J9 CONFIRM THE RCM FAULT	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to J11 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to J10 .
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: Driver Safety Belt Buckle C3065 . • Connect: RCM C310A and C310B (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	
J10 CHECK FOR AN INTERMITTENT FAULT	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle C3065 . ▪ inspect connector(s) (including any in-line	

connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ■ inspect wire harness for any damage, pinched, cut or pierced wires. ■ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0050:11, B0050:12, B0050:13 or B0050:1D retrieved on-demand during self-test?**	For DTC B0050:11 or B0050:1D, GO to J2 . For DTC B0050:12, GO to J4 . For DTC B0050:13, GO to J5 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to J11 .
J11 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test K: DTCs B0052:11, B0052:12, B0052:13 and B0052:1D

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors the passenger safety belt buckle switch circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground

repair4less

- Current out of range
- Faulted passenger safety belt buckle switch

If a fault is detected, the RCM stores DTC B0052:11, B0052:12, B0052:13 or B0052:1D in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

DTC Description	Fault Trigger Condition
• B0052:11 — Passenger Seatbelt Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the passenger safety belt buckle switch circuit.
• B0052:12 — Passenger Seatbelt Sensor: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the passenger safety belt buckle switch circuit.
• B0052:13 — Passenger Seatbelt Sensor: Circuit Open	A fault is indicated when the RCM senses an open on either passenger safety belt buckle switch circuit.
• B0052:1D — Passenger Seatbelt Sensor: Circuit Current Out of Range	A fault is indicated when the RCM senses current out of an acceptable range between the passenger safety belt buckle switch circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle and pretensioner
- RCM

PINPOINT TEST K: DTCs B0052:11, B0052:12, B0052:13 AND B0052:1D

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

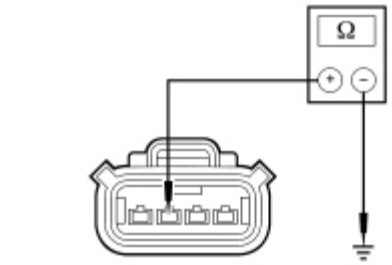
WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

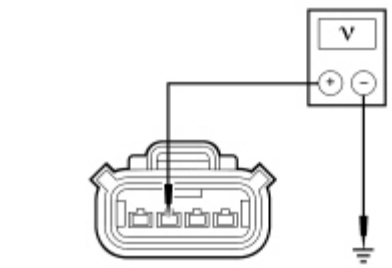
WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

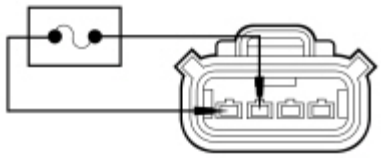
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

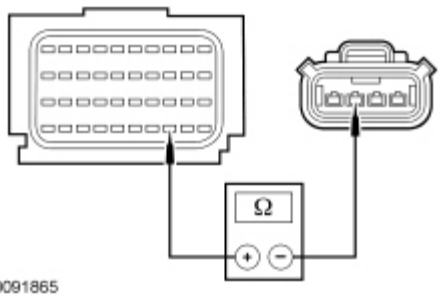
NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in





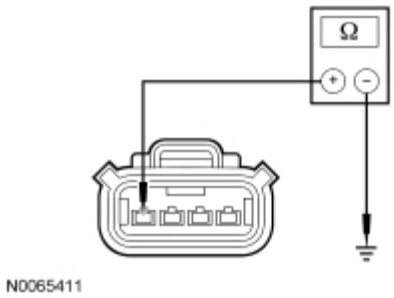
incorrect diagnosis of the SRS .





NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.



Test Step	Result / Action to Take
K1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0052:11, B0052:12, B0052:13 or B0052:1D retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0052:11 or B0052:1D, GO to K2 . For DTC B0052:12, GO to K4 . For DTC B0052:13, GO to K5 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to K10 .
K2 CHECK THE PASSENGER SEATBELT SENSOR DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND OR CURRENT OUT OF RANGE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Disconnect: Passenger Safety Belt Buckle C3066 . • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger safety belt buckle disconnected, an open circuit fault is normally retrieved. • **Did the on-demand DTC change from B0052:11 or B0052:1D to B0052:13?**	**Yes** GO to K8 . **No** For DTC B0052:11, GO to K3 . For DTC B0052:1D, GO to K9 .

repair4less

K3 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between passenger safety belt buckle C3066-3, circuit CR203 (GY/VT), harness side and ground.  N0065413 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K9 . **No** REPAIR circuit CR203 (GY/VT). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to K11 .
K4 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: Passenger Safety Belt Buckle C3066 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between passenger safety belt buckle C3066-3, circuit CR203 (GY/VT), harness side and ground.  N0065410 • **Is any voltage present?**	**Yes** REPAIR circuit CR203 (GY/VT). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to K11 . **No** GO to K9 .
K5 CHECK THE PASSENGER SEATBELT SENSOR DTC FOR A FAULT STATUS CHANGE (OPEN INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF.	**Yes** REMOVE the fused jumper wire and GO to K8 . **No** REMOVE the fused jumper wire

• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C339 . • Disconnect: Passenger Safety Belt Buckle C3066 . • Connect a fused jumper wire between passenger safety belt buckle C3066-3, circuit CR203 (GY/VT), harness side and C3066-4, circuit GD901 (BK), harness side.  N0119864 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger safety belt buckle circuits shorted together, a short to ground fault is normally retrieved. • **Did the on-demand DTC change from B0052:13 to B0052:11?**	and GO to K6 .
K6 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between RCM C310B-33, circuit CR203 (GY/VT), harness side and the passenger safety belt buckle C3066-3, circuit CR203 (GY/VT), harness side.  N0091865 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to K7 . **No** REPAIR circuit CR203 (GY/VT). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to K11 .
K7 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between passenger safety belt buckle C3066-4, circuit GD901 (BK)/GD174 (BK/WH), harness side and ground.	**Yes** GO to K9 .

repair4less

 N0065411 • **Is the resistance less than 3 ohms?**	**No** REPAIR circuit GD901 (BK)/GD174 (BK/WH). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to K11 .
K8 CONFIRM THE PASSENGER SAFETY BELT BUCKLE SWITCH FAULT **NOTE:** Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: RCM C310A and C310B (if previously disconnected) . • Connect: Passenger Safety Belt Buckle C3066 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new passenger safety belt buckle and pretensioner. REFER to Section 501-20A . GO to K11 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to K10 .
K9 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to K11 . **No** In the process of diagnosing the

• Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: Passenger Safety Belt Buckle C3066 . • Connect: RCM C310A and C310B (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to K10 .
K10 CHECK FOR AN INTERMITTENT FAULT • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle C3066 . ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0052:11, B0052:12, B0052:13 or B0052:1D retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0052:11 or B0052:1D, GO to K2 . For DTC B0052:12, GO to K4 . For DTC B0052:13, GO to K5 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to K11 .
K11 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for

repair4less

follow this instruction may result in serious personal injury or death in the event of an accidental deployment. • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test L: DTCs B0090:11 or B0090:93

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors the LH front impact severity sensor and circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground

If a fault is detected, the RCM stores DTC B0090:11 or B0090:93 in memory and sends a message to theInstrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

- B0090:11 (Left Frontal Restraints Sensor: Circuit Short to Ground) — A fault is indicated when the RCM senses a short to ground on the LH front severity impact sensor feed circuit.
- B0090:93 (Left Frontal Restraints Sensor: No Operation) — A fault is indicated when the RCM senses a faulted sensor, a short to voltage on the feed circuit or an open feed or return circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- LH front impact severity sensor
- RCM

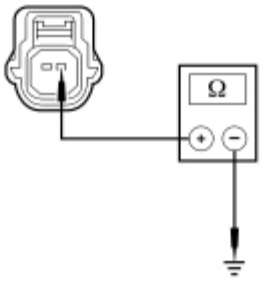
PINPOINT TEST L: DTCs B0090:11 OR B0090:93

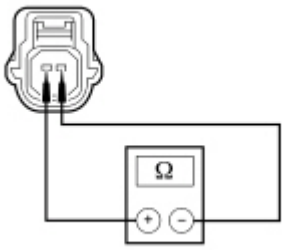
WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

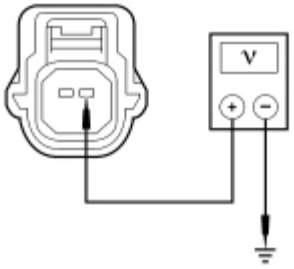
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .





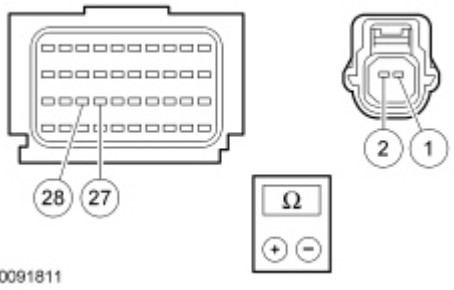
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.



NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

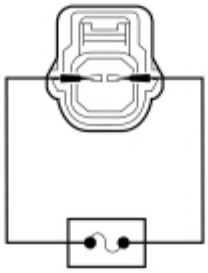
NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter.

Test Step	Result / Action to Take
L1 RETRIEVE RCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0090:11 or B0090:93 retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0090:11, GO to L2 . For DTC B0090:93, GO to L5 . **No** The fault is intermittent when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to L10 .
L2 CHECK THE LEFT FRONTAL RESTRAINTS SENSOR DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED) **NOTE:** This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: LH Front Impact Severity Sensor C1465 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Did the on-demand DTC change from B0090:11 to B0090:93?**	**Yes** INSTALL a new LH front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to L11 . **No** GO to L3 .



repair4less

L3 CHECK THE LH FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between LH front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side and ground.  N0092553 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L4 . **No** REPAIR circuit VR213 (VT/GN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to L11 .
L4 CHECK FOR A SHORT BETWEEN LH FRONT IMPACT SEVERITY SENSOR CIRCUITS	
• Measure the resistance between LH front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side and C1465-2, circuit RR129 (YE/GY), harness side.  N0036987 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L9 . **No** REPAIR circuits VR213 (VT/GN) and RR129 (YE/GY). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to L11 .
L5 CHECK THE LH FRONT IMPACT SEVERITY SENSOR AND RCM CONNECTIONS (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Inspect LH front impact severity sensor C1465 to be fully seated and locked. Seat and lock connector as necessary. • Gain access to the RCM and inspect C310A and C310B to be fully seated and locked. Seat and lock the connector(s) as necessary. Refer to Restraints Control Module (RCM) in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self	**Yes** GO to L6 . **No** Fault corrected. GO to L11 .



Test — RCM . • **Was DTC B0090:93 retrieved on-demand during self-test?**	
L6 CHECK THE LH FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: LH Front Impact Severity Sensor C1465 . • Disconnect: RCM C310A and C310B . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between LH front impact severity sensor: ▪ C1465-1, circuit VR213 (VT/GN), harness side and ground.  N0106003 • **Is any voltage present?**	**Yes** REPAIR circuit VR213 (VT/GN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to L11 . **No** GO to L7 .
L7 CHECK THE LH FRONT IMPACT SEVERITY SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure the resistance between RCM C310B, harness side and LH front impact severity sensor C1465, harness side using the following chart.	**Yes** GO to L8 . **No** REPAIR circuit VR213 (VT/GN) or RR129 (YE/GY). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to L11 .

RCM	Circuit	LH Front Impact Severity Sensor
C310B-27	VR213 (VT/GN)	C1465-1
C310B-28	RR129 (YE/GY)	C1465-2

repair4less

- **Are the resistances less than 0.5 ohm?**

L8 CHECK THE LEFT FRONTAL RESTRAINTS SENSOR DTC FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Connect: RCM C310A and C310B . • Connect a fused jumper wire between LH front impact severity sensor C1465-1, circuit VR213 (WH/BU), harness side and C1465-2, circuit RR129 (GN/BU), harness side.  N0114279 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Did the on-demand DTC change from B0090:93 to B0090:11?**	**Yes** REMOVE the fused jumper wire and INSTALL a new LH front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to L11 . **No** REMOVE the fused jumper wire and GO to L9 .
L9 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to L11 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when**

terminals. ■ inspect wire harness for any damage, pinched, cut or pierced wires. ■ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ■ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: RCM C310A and C310B . • Connect: LH Front Impact Severity Sensor C1465 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**directed to do so in the pinpoint test.** GO to L10 .
L10 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: LH Front Impact Severity Sensor C1465 . • Disconnect: RCM C310A and C310B . • Inspect for the following: ■ inspect harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals. ■ inspect wire harness for any damage, pinched, cut or pierced wires. ■ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ■ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0090:11 or B0090:93 retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0090:11, GO to L2 . For DTC B0090:93, GO to L5 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to L11 .
L11 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to

repair4less

• Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test M: DTCs B0091:11, B0091:93, B0097:11 and B0097:93

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors the driver front door impact sensor and passenger second row side impact sensor (SuperCab and Crew Cab vehicles only) circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted driver front door side impact sensor
- Faulted passenger second row side impact sensor (SuperCab and Crew Cab vehicles only)

If a fault is detected, the RCM stores DTC B0091:11, B0091:93, B0097:11 or B0097:93 in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

The RCM communicates with each impact sensor, if the RCM is unable to communicate with the sensor, a DTC is stored in memory. A Continuous Memory Diagnostic Trouble Code (CMDTC) **no operation** (failure type :93) can be set by a short to voltage on the return circuit of the impact sensor.

NOTE: A short to ground on either impact sensor feed circuit sets DTCs B0091:11 and B0097:11 on SuperCab and Crew Cab vehicles.

A short to voltage on either impact sensor feed or return circuit sets DTCs B0091:93 and B0097:93 on SuperCab and Crew Cab vehicles.

DTC Description	Fault Trigger Condition
• B0091:11 — Left Side Restraints Sensor 1: Circuit Short to Ground	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a shorted driver front door side impact sensor, a shorted passenger second row side impact sensor, a short to ground on the driver front door side impact sensor feed circuit or a short to ground on the passenger second row side impact sensor feed circuit. For regular cab vehicles, a fault is indicated when the RCM senses a shorted driver front door side impact sensor or a short to ground on the driver front

	door side impact sensor feed circuit.
• B0091:93 — Left Side Restraints Sensor 1: No Operation	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a faulted driver front door side impact sensor, a short to voltage on the feed or return circuit of the driver front door side impact sensor, a short to voltage on the feed or return circuit of passenger second row side impact sensor or an open feed or return circuit of the driver front door side impact sensor. For regular cab vehicles, a fault is indicated when the RCM senses a faulted driver front door side impact sensor, a short to voltage on the feed or return circuit of the driver front door side impact sensor or an open feed or return circuit of the driver front door side impact sensor.
• B0097:11 — Right Side Restraints Sensor 2: Circuit Short to Ground	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a shorted driver front door side impact sensor, a shorted passenger second row side impact sensor, a short to ground on the driver front door side impact sensor feed circuit or a short to ground on the passenger second row side impact sensor feed circuit.
• B0097:93 — Right Side Restraints Sensor 2: No Operation	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a faulted passenger second row side impact sensor, a short to voltage on the feed or return circuit of passenger second row side impact sensor, a short to voltage on the feed or return circuit of the driver front door side impact sensor or an open feed or return circuit of the passenger second row side impact sensor.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver front door side impact sensor
- Passenger second row side impact sensor
- RCM

PINPOINT TEST M: DTCs B0091:11, B0091:93, B0097:11 AND B0097:93

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

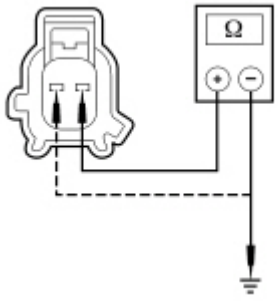
NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

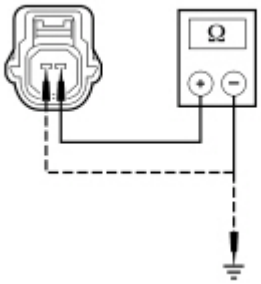
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts

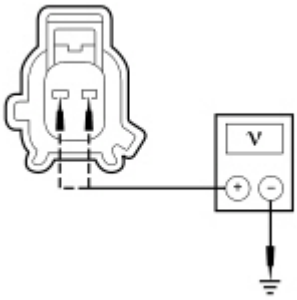
repair4less

catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

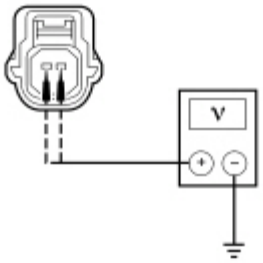




NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter.



Test Step	Result / Action to Take
M1 RETRIEVE RCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Were any DTCs retrieved on-demand during self-test?**	**Yes** Fault(s) cannot be cleared until corrected and the DTC(s) are no longer retrieved on-demand during self-test. **SuperCab and Crew Cab Vehicles** For DTC B0091:11 **AND** B0097:11, GO to M2 . For DTC B0091:93 **AND** B0097:93, GO to M6 . For DTC B0091:93 **ONLY** , GO to M8 . For DTC B0097:93 **ONLY** , GO to M11 . **Regular Cab Vehicles** For DTC B0091:11, GO to M2 . For DTC B0091:93, GO to M8 . **No** The fault is intermittent when present as a CMDTC only. GO to M15 .
M2 CHECK THE LEFT SIDE RESTRAINTS SENSOR 1 DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED) **NOTE:** This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Front Door Side Impact Sensor C567 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver front	**Yes** INSTALL a new driver front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to M16 . **No** For SuperCab and Crew Cab vehicles, GO to M3 . For regular cab vehicles, GO to M4 .



door side impact sensor disconnected, an open circuit (no operation) fault is normally retrieved. • **For SuperCab and Crew Cab vehicles, did the on-demand DTCs change from B0091:11 and B0097:11 to B0091:93?** **For regular cab vehicles, did the on-demand DTC change from B0091:11 to B0091:93?**	
M3 CHECK THE RIGHT SIDE RESTRAINTS SENSOR 2 DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	**Yes** INSTALL a new passenger second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section. GO to M16. **No** GO to M4.
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Driver Front Door Side Impact Sensor C567. • Disconnect: Passenger Second Row Side Impact Sensor C3249. • Repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM. • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger second row side impact sensor disconnected, an open circuit (no operation) fault is normally retrieved. • **Did the on-demand DTC change from B0091:11 and B0097:11 to B0097:93?**	
M4 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS	**Yes** For SuperCab and Crew Cab vehicles, GO to M5. For regular cab vehicles, GO to M14. **No** REPAIR circuit VR217 (GY/YE) and/or RR131 (VT/GY). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to M16.

• Ignition OFF.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Driver Front Door Side Impact Sensor C567 (if not previously disconnected).
• Disconnect: RCM C310A and C310B.
• Measure the resistance between driver front door side impact sensor:
  ▪ C567-1, circuit VR217 (GY/YE), harness side and ground.
  ▪ C567-1, circuit VR217 (GY/YE), harness side and C567-2, circuit RR131 (VT/GY), harness side.	

repair4less

 N0106402 • **Are the resistances greater than 10,000 ohms?**	
M5 CHECK THE PASSENGER SECOND ROW SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS	
• Measure the resistance between passenger second row side impact sensor: ▪ C3249-1, circuit VR220 (VT/OG), harness side and ground. ▪ C3249-1, circuit VR220 (VT/OG), harness side and C3249-2, circuit RR134 (BN/BU), harness side.  N0106403 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M14 . **No** REPAIR circuit VR220 (VT/OG) and/or RR134 (BN/BU). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to M16 .
M6 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B (if not previously disconnected) . • Disconnect: Driver Front Door Side Impact Sensor C567 (if not previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between driver front door side impact sensor: ▪ C567-1, circuit VR217 (GY/YE), harness side and ground. ▪ C567-2, circuit RR131 (VT/GY), harness side and ground.	**Yes** REPAIR circuit VR217 (GY/YE) or RR131 (VT/GY). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to M16 . **No** For SuperCab and Crew Cab vehicles, GO to M7 . For regular cab vehicles, GO to M9 .

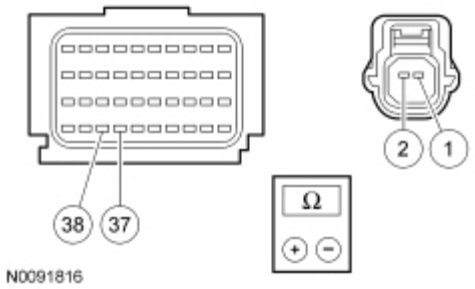
 N0052817 • **Is voltage present on either circuit?**	
M7 CHECK THE PASSENGER SECOND ROW SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)	

• Ignition OFF.
• Disconnect: Passenger Second Row Side Impact Sensor C3249 .
• Ignition ON.
• Measure the voltage between passenger second row side impact sensor:
  ▪ C3249-1, circuit VR220 (VT/OG), harness side and ground.
  ▪ C3249-2, circuit RR134 (BN/BU), harness side and ground.

N0036990
• **Is voltage present on either circuit?**
	Yes
	REPAIR circuit VR220 (VT/OG) or RR134 (BN/BU).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to M16 .
	
	No
	GO to M14 .

M8 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR AND RCM CONNECTIONS (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Gain access to the driver front door side impact sensor and inspect C567 to be fully seated and locked. Seat and lock the connector as necessary. Refer to Side Impact Sensor — Front Door in this section. • Gain access to the RCM and inspect C310A and C310B to be fully seated and locked. Seat and lock the connector(s) as necessary. Refer to Restraints Control Module (RCM) in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON.	**Yes** For SuperCab and Crew Cab vehicles, GO to M9 . For regular cab vehicles, GO to M6 . **No** Fault corrected. GO to M16 .

repair4less



• Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0091:93 retrieved on-demand during self-test?**	
M9 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B (if not previously disconnected) . • Disconnect: Driver Front Door Side Impact Sensor C567 (if not previously disconnected) . • Measure the resistance between RCM C310B, harness side and driver front door side impact sensor C567, harness side using the following chart. **RCM** / **Circuit** / **Driver Front Door Side Impact Sensor** C310B-36 / VR217 (GY/YE) / C567-1 C310B-35 / RR131 (VT/GY) / C567-2  N0091245 • **Are the resistances less than 0.5 ohm?**	**Yes** GO to M10 . **No** REPAIR circuit VR217 (GY/YE) or RR131 (VT/GY). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to M16 .
M10 CHECK THE LEFT SIDE RESTRAINTS SENSOR 1 DTC FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Connect: RCM C310A and C310B . • Connect a fused jumper wire between driver front door side impact sensor C567-1, circuit VR217 (GY/YE), harness side and C567-2, circuit RR131 (VT/GY), harness side.	**Yes** REMOVE the fused jumper wire and INSTALL a new driver front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to M16 . **No** REMOVE the fused jumper wire and GO to M14 .

 N0109792 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver front door side impact sensor circuits shorted together, a short to ground fault is normally retrieved. • **For SuperCab and Crew Cab vehicles, did the DTC change from B0091:93 to B0091:11 and B0097:11?** **For regular cab vehicles, did the DTC change from B0091:93 to B0091:11?**	
M11 CHECK THE PASSENGER SECOND ROW SIDE IMPACT SENSOR AND RCM CONNECTIONS (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Gain access to the passenger second row side impact sensor and inspect C3249 to be fully seated and locked. Seat and lock the connector as necessary. Refer to Side Impact Sensor — Second Row in this section. • Gain access to the RCM and inspect C310A and C310B to be fully seated and locked. Seat and lock the connector(s) as necessary. Refer to Restraints Control Module (RCM) in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0097:93 retrieved on-demand during self-test?**	**Yes** GO to M12 . **No** Fault corrected. GO to M16 .
M12 CHECK THE PASSENGER SECOND ROW SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Disconnect: Passenger Second Row Side Impact Sensor C3249 . • Measure the resistance between RCM C310B, harness side	**Yes** GO to M13 . **No** REPAIR circuit VR220 (VT/OG) or RR134 (BN/BU).

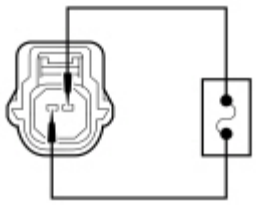
repair4less

and passenger second row side impact sensor C3249, harness side using the following chart.

RCM	Circuit	Passenger Second Row Side Impact Sensor
C310B-37	VR220 (VT/OG)	C3249-1
C310B-38	RR134 (BN/BU)	C3249-2

N0091816

- **Are the resistances less than 0.5 ohm?**



Refer to Wiring Diagrams Cell 5 for schematic and connector information.

GO to M16 .

M13 CHECK THE RIGHT SIDE RESTRAINTS SENSOR 2 DTC FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Connect: RCM C310A and C310B .
- Connect a fused jumper wire between passenger second row side impact sensor C3249-1, circuit VR220 (VT/OG), harness side and C3249-2, circuit RR134 (BN/BU), harness side.

N0109791

- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test — RCM .
- **DIAGNOSTIC TIP:** When viewing DTCs with the passenger

Yes
REMOVE the fused jumper wire and INSTALL a new passenger second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section. GO to M16 .

No
REMOVE the fused jumper wire and GO to M14 .

second row side impact sensor circuits shorted together, a short to ground fault is normally retrieved. • **Did the DTC change from B0097:93 to B0097:11 and B0091:11?**	
M14 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: RCM C310A and C310B . • Connect: Driver Front Door Side Impact Sensor C567 (if previously disconnected) . • Connect: Passenger Second Row Side Impact Sensor C3249 (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to M16 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to M15 .
M15 CHECK FOR AN INTERMITTENT FAULT • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Affected Impact Sensor Driver Front Door Side Impact Sensor C567 and/or Passenger Second Row Side Impact Sensor C3249 (if equipped) . • Disconnect: RCM C310A and C310B . • Inspect for the following: ▪ inspect harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B CPA lever/lock for	**Yes** Fault(s) cannot be cleared until corrected and the DTC(s) are no longer retrieved on-demand during self-test. **SuperCab and Crew Cab Vehicles** For DTC B0091:11 **AND** B0097:11, GO to M2 . For DTC B0091:93 **AND** B0097:93, GO to M6 .

repair4less

correct operation. Refer to Restraints Control Module (RCM) in this section. ■ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0091:11, B0091:93, B0097:11 or B0097:93 retrieved on-demand during self-test?**	For DTC B0091:93 **ONLY** , GO to M8 . For DTC B0097:93 **ONLY** , GO to M11 . **Regular Cab Vehicles** For DTC B0091:11, GO to M2 . For DTC B0091:93, GO to M8 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to M16 .
M16 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • If not previously directed to do so, depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Reconnect all SRS components (if previously disconnected). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test N: DTCs B0092:11, B0092:93, B0096:11 and B0096:93

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors the passenger front door impact sensor, driver second row side impact sensor (SuperCab and Crew Cab vehicles only) circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted passenger front door side impact sensor
- Faulted driver second row side impact sensor (SuperCab and Crew Cab vehicles only)

If a fault is detected, the RCM stores DTC B0092:11, B0092:93, B0096:11 or B0096:93 in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

The RCM communicates with each impact sensor, if the RCM is unable to communicate with the sensor, a DTC is stored in memory. A Continuous Memory Diagnostic Trouble Code (CMDTC) **no operation** (failure type :93) can be set by a short to voltage on the return circuit of the impact sensor.

NOTE: A short to ground on either impact sensor feed circuit sets DTCs B0092:11 and B0096:11 on SuperCab and Crew Cab vehicles.

A short to voltage on either impact sensor feed or return circuit sets DTCs B0092:93 and B0096:93 on SuperCab and Crew Cab vehicles.

DTC Description	Fault Trigger Condition
• B0092:11 — Left Side Restraints Sensor 2: Circuit Short to Ground	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a shorted passenger front door side impact sensor, a shorted driver second row side impact sensor, a short to ground on the passenger front door side impact sensor feed circuit or a short to ground on the driver second row side impact sensor feed circuit.
• B0092:93 — Left Side Restraints Sensor 2: No Operation	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a faulted driver second row side impact sensor, a short to voltage on the feed or return circuit of driver second row side impact sensor, a short to voltage on the feed or return circuit of the passenger front door side impact sensor or an open feed or return circuit of the driver second row side impact sensor.
• B0096:11 — Right Side Restraints Sensor 1: Circuit Short to Ground	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a shorted passenger front door side impact sensor, a shorted driver second row side impact sensor, a short to ground on the passenger front door side impact sensor feed circuit or a short to ground on the driver second row side impact sensor feed circuit. For regular cab vehicles, a fault is indicated when the RCM senses a shorted passenger front door side impact sensor or a short to ground on the passenger front door side impact sensor feed circuit.
• B0096:93 — Right Side Restraints Sensor 1: No Operation	For SuperCab and Crew Cab vehicles, a fault is indicated when the RCM senses a faulted passenger front door side impact sensor, a short to voltage on the feed or return circuit of the passenger front door side impact sensor, a short to voltage on the feed or return circuit of driver second row side impact sensor or an open feed or return circuit of the passenger front door side impact sensor. For regular cab vehicles, a fault is indicated when the RCM senses a faulted passenger front door side impact sensor, a short to voltage on the feed or return circuit of the passenger front door side impact sensor or an open feed or return circuit of the passenger front door side impact sensor.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger front door side impact sensor
- Driver second row side impact sensor
- RCM

repair4less

PINPOINT TEST N: DTCs B0092:11, B0092:93, B0096:11 AND B0096:93

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

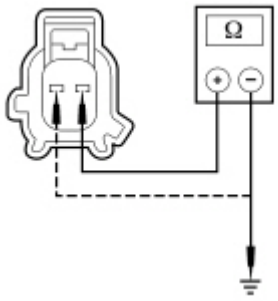
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

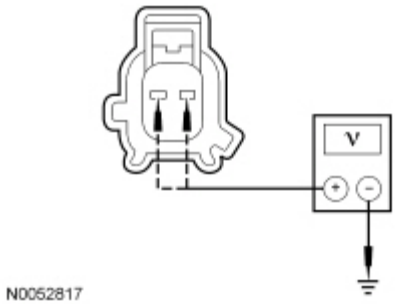


NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter.

Test Step	Result / Action to Take
N1 RETRIEVE RCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Were any DTCs retrieved on-demand during self-test?**	**Yes** Fault(s) cannot be cleared until corrected and the DTC(s) are no longer retrieved on-demand during self-test. **SuperCab and Crew Cab Vehicles** For DTC B0092:11 **AND** B0096:11, GO to N2 . For DTC B0092:93 **AND** B0096:93, GO to N6 . For DTC B0092:93 **ONLY** , GO to N11 . For DTC B0096:93 **ONLY** , GO to N8 . **Regular Cab Vehicles** For DTC B0096:11, GO to N2 .

	For DTC B0096:93, GO to N8 . **No** The fault is intermittent when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to N15 .
N2 CHECK THE RIGHT SIDE RESTRAINTS SENSOR 1 DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Front Door Side Impact Sensor C644 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the passenger front door side impact sensor disconnected, an open circuit (no operation) fault is normally retrieved. • **For SuperCab and Crew Cab vehicles, did the on-demand DTCs change from B0092:11 and B0096:11 to B0096:93?** **For regular cab vehicles, did the on-demand DTC change from B0096:11 to B0096:93?**	**Yes** INSTALL a new passenger front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to N16 . **No** For SuperCab and Crew Cab vehicles, GO to N3 . For regular cab vehicles, GO to N4 .
N3 CHECK THE LEFT SIDE RESTRAINTS SENSOR 2 DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Front Door Side Impact Sensor C644 . • Disconnect: Driver Second Row Side Impact Sensor C3248 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver second row side impact sensor disconnected, an open	**Yes** INSTALL a new driver second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section. GO to N16 . **No** GO to N4 .

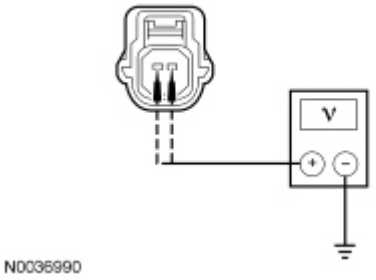
repair4less



circuit (no operation) fault is normally retrieved. • **Did the on-demand DTC change from B0092:11 and B0096:11 to B0092:93?**	
N4 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Passenger Front Door Side Impact Sensor C644 (if not previously disconnected) .
• Disconnect: RCM C310A and C310B .
• Measure the resistance between passenger front door side impact sensor:
  ▪ C644-1, circuit VR218 (YE/OG), harness side and ground.
  ▪ C644-1, circuit VR218 (YE/OG), harness side and C644-2, circuit RR132 (BU/WH), harness side.

 	
N0106402
• **Are the resistances greater than 10,000 ohms?**
	Yes
	For SuperCab and Crew Cab vehicles, GO to N5 .
	
	For regular cab vehicles, GO to N14 .
	
	No
	REPAIR circuit VR218 (YE/OG) and/or RR132 (BU/WH).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to N16 .



N5 CHECK THE DRIVER SECOND ROW SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS	

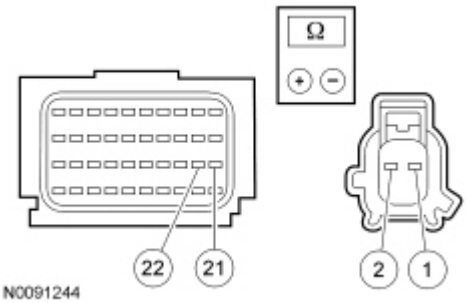
• Measure the resistance between driver second row side impact sensor:
  ▪ C3248-1, circuit VR219 (GN/WH), harness side and ground.
  ▪ C3248-1, circuit VR219 (GN/WH), harness side and C3248-2, circuit RR133 (GY/BN), harness side.

 	
N0106403
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to N14 .
	
	No
	REPAIR circuit VR219 (GN/WH) and/or RR133 (GY/BN).
	
	Refer to Wiring Diagrams Cell 5 for schematic and connector information.
	
	GO to N16 .

N6 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT	

SENSOR CIRCUITS FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B (if not previously disconnected) . • Disconnect: Passenger Front Door Side Impact Sensor C644 (if not previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between passenger front door side impact sensor: ▪ C644-1, circuit VR218 (YE/OG), harness side and ground. ▪ C644-2, circuit RR132 (BU/WH), harness side and ground.  N0052817 • **Is voltage present on either circuit?**	**Yes** REPAIR circuit VR218 (YE/OG) or RR132 (BU/WH). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to N16 . **No** For SuperCab and Crew Cab vehicles, GO to N7 . For regular cab vehicles, GO to N9 .
N7 CHECK THE DRIVER SECOND ROW SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Second Row Side Impact Sensor C3248 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure the voltage between driver second row side impact sensor: ▪ C3248-1, circuit VR219 (GN/WH), harness side and ground. ▪ C3248-2, circuit RR133 (GY/BN), harness side and ground.	**Yes** REPAIR circuit VR219 (GN/WH) or RR133 (GY/BN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to N16 . **No** GO to N14 .

repair4less

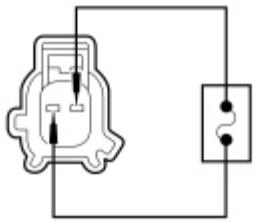


- **Is voltage present on either circuit?**

N8 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT SENSOR AND RCM CONNECTIONS (NO OPERATION INDICATED)	
• Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Gain access to the passenger front door side impact sensor and inspect C644 to be fully seated and locked. Seat and lock the connector as necessary. Refer to Side Impact Sensor — Front Door in this section. • Gain access to the RCM and inspect C310A and C310B to be fully seated and locked. Seat and lock the connector(s) as necessary. Refer to Restraints Control Module (RCM) in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0096:93 retrieved on-demand during self-test?**	**Yes** For SuperCab and Crew Cab vehicles, GO to N9 . For regular cab vehicles, GO to N6 . **No** Fault corrected. GO to N16 .
N9 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B (if not previously disconnected) . • Disconnect: Passenger Front Door Side Impact Sensor C644 (if not previously disconnected) . • Measure the resistance between RCM C310B, harness side and passenger front door side impact sensor C644, harness side using the following chart.	**Yes** GO to N10 . **No** REPAIR circuit VR218 (YE/OG) or RR132 (BU/WH). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to N16 .

RCM	Circuit	Passenger Front Door Side Impact Sensor

C310B-22	VR218 (YE/OG)	C644-1
C310B-21	RR132 (BU/WH)	C644-2



- **Are the resistances less than 0.5 ohm?**

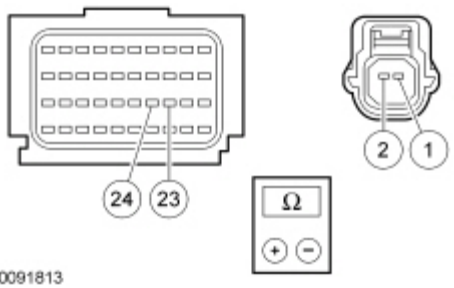
N10 CHECK THE RIGHT SIDE RESTRAINTS SENSOR 1 DTC FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Connect: RCM C310A and C310B .
- Connect a fused jumper wire between passenger front door side impact sensor C644-1, circuit VR218 (YE/OG), harness side and C644-2, circuit RR132 (BU/WH), harness side.

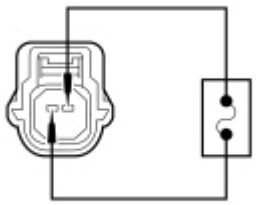
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test — RCM .
- **DIAGNOSTIC TIP:** When viewing DTCs with the passenger front door side impact sensor circuits shorted together, a short to ground fault is normally retrieved.
- **For SuperCab and Crew Cab vehicles, did the DTC change from B0096:93 to B0092:11 and B0096:11?**

  For regular cab vehicles, did the DTC change from B0096:93 to B0096:11?



Yes
REMOVE the fused jumper wire and INSTALL a new passenger front door side impact sensor. REFER to Side Impact Sensor — Front Door in this section. GO to N16 .

No
REMOVE the fused jumper wire and GO to N14 .



repair4less

N11 CHECK THE DRIVER SECOND ROW SIDE IMPACT SENSOR AND RCM CONNECTIONS (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Gain access to the driver second row side impact sensor and inspect C3248 to be fully seated and locked. Seat and lock the connector as necessary. Refer to Side Impact Sensor — Second Row in this section. • Gain access to the RCM and inspect C310A and C310B to be fully seated and locked. Seat and lock the connector(s) as necessary. Refer to Restraints Control Module (RCM) in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0092:93 retrieved on-demand during self-test?**	**Yes** GO to N12 . **No** Fault corrected. GO to N16 .
N12 CHECK THE DRIVER SECOND ROW SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Disconnect: Driver Second Row Side Impact Sensor C3248 . • Measure the resistance between RCM C310B, harness side and driver second row side impact sensor C3248, harness side using the following chart.	**Yes** GO to N13 . **No** REPAIR circuit VR219 (GN/WH) or RR133 (GY/BN). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to N16 .

RCM	Circuit	Driver Second Row Side Impact Sensor
C310B-23	VR219 (GN/WH)	C3248-1
C310B-24	RR133 (GY/BN)	C3248-2

- **Are the resistances less than 0.5 ohm?**

N13 CHECK THE LEFT SIDE RESTRAINTS SENSOR 2 DTC FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Connect: RCM C310A and C310B . • Connect a fused jumper wire between driver second row side impact sensor C3248-1, circuit VR219 (GN/WH), harness side and C3248-2, circuit RR133 (GY/BN), harness side.  N0109791 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **DIAGNOSTIC TIP:** When viewing DTCs with the driver second row side impact sensor circuits shorted together, a short to ground fault would normally be retrieved. • **Did the DTC change from B0092:93 to B0092:11 and B0096:11?**	**Yes** REMOVE the fused jumper wire and INSTALL a new driver second row side impact sensor. REFER to Side Impact Sensor — Second Row in this section. GO to N16 . **No** REMOVE the fused jumper wire and GO to N14 .
N14 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to N16 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to N15 .

repair4less

Procedures for schematic and connector information. • Connect: RCM C310A and C310B . • Connect: Passenger Front Door Side Impact Sensor C644 (if previously disconnected) . • Connect: Driver Second Row Side Impact Sensor C3248 (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	

N15 CHECK FOR AN INTERMITTENT FAULT
 	
• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Disconnect: Affected Impact Sensor Passenger Front Door Side Impact Sensor C644 and/or Driver Second Row Side Impact Sensor C3248 (if equipped) .
• Disconnect: RCM C310A and C310B .
• Inspect for the following:
  ▪ inspect harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section.
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
 	
• Connect: All Previously Disconnected Component (s)/Connector(s) .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM .
• **Was DTC B0092:11, B0092:93, B0096:11 or B0096:93 retrieved on-demand during self-test?**
	Yes
	Fault(s) cannot be cleared until corrected and the DTC(s) are no longer retrieved on-demand during self-test.
	
	SuperCab and Crew Cab Vehicles
	
	For DTC B0092:11 **AND** B0096:11, GO to N2 .
	
	For DTC B0092:93 **AND** B0096:93, GO to N6 .
	
	For DTC B0092:93 **ONLY** , GO to N11 .
	
	For DTC B0096:93 **ONLY** , GO to N8 .
	
	Regular Cab Vehicles
	
	For DTC B0096:11, GO to N2 .
	
	For DTC B0096:93, GO to N8 .
	
	No
	The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to N16 .

N16 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • If not previously directed to do so, depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Reconnect all SRS components (if previously	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction.

disconnected). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test O: DTCs B0095:11 and 0095:93

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors the RH front impact severity sensor circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted RH front impact severity sensor

If a fault is detected, the RCM stores DTC B0095:11 or B0095:93 in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

- B0095:11 (Right Frontal Restraints Sensor: Circuit Short to Ground) — A fault is indicated when the RCM senses a short to ground on the RH front impact severity sensor feed circuit.
- B0095:93 (Right Frontal Restraints Sensor: No Operation) — A fault is indicated when the RCM senses a faulted sensor, a short to voltage on the feed circuit or an open feed or return circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RH front impact severity sensor
- RCM

PINPOINT TEST O: DTCs B0095:11 AND B0095:93

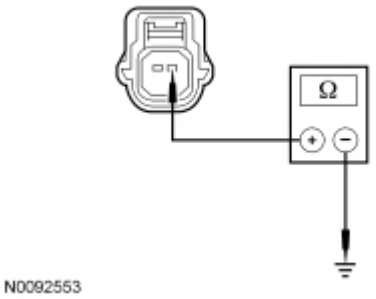
WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

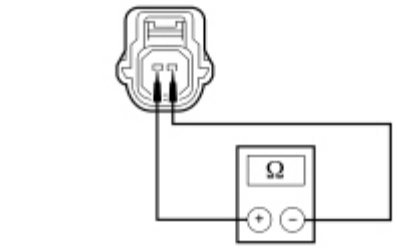
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and

repair4less

verification before proceeding with the pinpoint test.



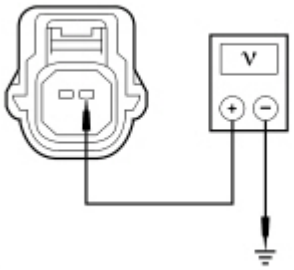


NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter.



Test Step	Result / Action to Take
O1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0095:11 or B0095:93 retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0095:11, GO to O2 . For DTC B0095:93, GO to O5 . **No** The fault is intermittent when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to O10 .
O2 CHECK THE RIGHT FRONTAL RESTRAINTS SENSOR DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RH Front Impact Severity Sensor C1466 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Did the on-demand DTC change from B0095:11 to B0095:93?**	**Yes** INSTALL a new RH front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to O11 . **No** GO to O3 .
O3 CHECK THE RH FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF.	**Yes**

• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310A and C310B . • Measure the resistance between RH front impact severity sensor C1466-1, circuit VR214 (WH/BU), harness side and ground.  N0092553 • **Is the resistance greater than 10,000 ohms?**	GO to O4 . **No** REPAIR circuit VR214 (WH/BU). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to O11 .
O4 CHECK FOR A SHORT BETWEEN RH FRONT IMPACT SEVERITY SENSOR CIRCUITS	
• Measure the resistance between RH front impact severity sensor C1466-1, circuit VR214 (WH/BU), harness side and C1466-2, circuit RR130 (GN/BU), harness side.  N0036987 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O9 . **No** REPAIR circuits VR214 (WH/BU) and RR130 (GN/BU). Refer to Wiring Diagrams Cell 5 for schematic and connector information. GO to O11 .
O5 CHECK THE RH FRONT IMPACT SEVERITY SENSOR AND RCM CONNECTIONS (NO OPERATION INDICATED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Inspect RH front impact severity sensor C1466 to be fully seated and locked. Seat and lock the connector as necessary. • Gain access to the RCM and inspect C310A and C310B to be fully seated and locked. Refer to Restraints Control Module (RCM) in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0095:93 retrieved on-demand during self-test?**	**Yes** GO to O6 . **No** Fault corrected. GO to O11 .

repair4less

O6 CHECK THE RH FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: RH Front Impact Severity Sensor C1466 .
- Disconnect: RCM C310A and C310B .
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Measure the voltage between RH front impact severity sensor:
  - C1466-1, circuit VR214 (WH/BU), harness side and ground.

N0105003

- **Is any voltage present?**

Yes
REPAIR circuit VR214 (WH/BU).

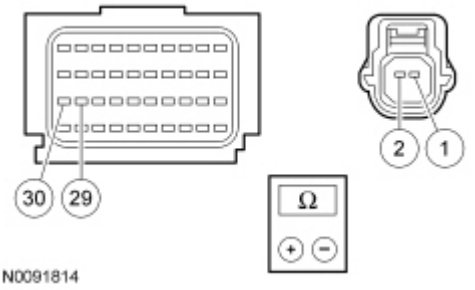
Refer to Wiring Diagrams Cell 5 for schematic and connector information.

GO to O11 .

No
GO to O7 .

O7 CHECK THE RH FRONT IMPACT SEVERITY SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)

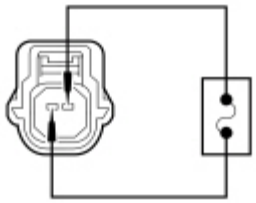
- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Measure the resistance between RCM C310B, harness side and RH front impact severity sensor C1466, harness side using the following chart.



RCM	Circuit	RH Front Impact Severity Sensor
C310B-30	VR214 (WH/BU)	C1466-1
C310B-29	RR130 (GN/BU)	C1466-2

Yes
GO to O8 .

No
REPAIR circuit VR214 (WH/BU) or RR130 (GN/BU).



Refer to Wiring Diagrams Cell 5 for schematic and connector information.

GO to O11 .

N0091814

- **Are the resistances less than 0.5 ohm?**

O8 CHECK THE RIGHT FRONTAL RESTRAINTS SENSOR DTC FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Connect: RCM C310A and C310B . • Connect a fused jumper wire between RH front impact severity sensor C1466-1, circuit VR214 (WH/BU), harness side and C1466-2, circuit RR130 (GN/BU), harness side.  N0109791 • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Did the DTC change from B0095:93 to B0095:11?**	**Yes** REMOVE the fused jumper wire and INSTALL a new RH front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to O11 . **No** REMOVE the fused jumper wire and GO to O9 .
O9 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to O11 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the**

repair4less

▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information. • Connect: RH Front Impact Severity Sensor C1466 . • Connect: RCM C310A and C310B (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was the original DTC retrieved on-demand during self-test?**	**pinpoint test.** GO to O10 .
O10 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RH Front Impact Severity Sensor C1466 . • Disconnect: RCM C310A and C310B . • Inspect for the following: ▪ inspect harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) in this section. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B0095:11 or B0095:93 retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0095:11, GO to O2 . For DTC B0095:93, GO to O5 . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to O11 .
O11 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • If not previously directed to do so, depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to

Repowering in this section. • Reconnect all SRS components (if previously disconnected). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . The repair is complete. RETURN the vehicle to the customer.

Pinpoint Test R: DTCs B00A0:09, B00A0:4A, B00A0:63, B00A0:64 and B00A0:68

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) is in constant communication with various control modules on the High Speed Controller Area Network (HS-CAN), one of them is the Occupant Classification System Module (OCSM). The RCM continuously monitors the HS-CAN for fault messages reported by the OCSM . The RCM also checks for the correct identification of the OCSM . If the RCM receives fault message(s) from the OCSM , it stores DTC B00A0:09, B00A0:4A, B00A0:63, B00A0:64 or B00A0:68 in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

This pinpoint test is intended to diagnose the following:

- OCSM
- RCM

DTC Description	Fault Trigger Condition
• B00A0:09 — Occupant Classification System: Component Failures	A fault is indicated when the RCM receives a message from the OCSM that a fault exists within the OCS .
• B00A0:4A — Occupant Classification System: Incorrect Component Installed	A fault is indicated when the RCM senses the OCSM is present but not configured.
• B00A0:63 — Occupant Classification System: Circuit / Component Protection Time-Out	A fault is indicated when the RCM receives 8 or more invalid states from the OCSM .
• B00A0:64 — Occupant Classification System: Signal Plausibility Failure	A fault is indicated when the RCM receives messages containing upper or lower data limits other than limits stored in memory.
• B00A0:68 — Occupant Classification System: Event Information	A fault is indicated when the RCM receives a message from the OCSM containing incorrect data.

PINPOINT TEST R: DTCs B00A0:09, B00A0:4A, B00A0:63, B00A0:64 AND B00A0:68

repair4less

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

***NOTICE:* Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
R1 RETRIEVE RCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B00A0:09, B00A0:4A, B00A0:63, B00A0:64 or B00A0:68 retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B00A0:09, B00A0:63 or B00A0:68, RETRIEVE DTCs from the OCSM and REFER to the Occupant Classification System Module (OCSM) DTC Chart for diagnostic direction. For DTC B00A0:4A or B00A0:64, GO to R2 . **No** CHECK for causes of the intermittent fault. Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

	ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.** GO to R5.
R2 VERIFY THE OCSM PART NUMBER • Enter the following diagnostic mode on the scan tool: Log Viewer . • Retrieve and record the OCSM part number from Log Viewer. • Check the part number recorded against the part number listed in the parts catalog. • **Is the correct OCSM installed in the vehicle?**	**Yes** GO to R3. **No** INSTALL the correct OCSM. REFER to Occupant Classification System Module (OCSM) in this section. GO to R5.
R3 VERIFY THE RCM PART NUMBER • Retrieve and record the RCM part number from Log Viewer. • Check the part number recorded against the part number listed in the parts catalog. • **Is the correct RCM installed in the vehicle?**	**Yes** GO to R4. **No** INSTALL the correct RCM. REFER to Restraints Control Module (RCM) in this section. GO to R5.
R4 CHECK THE RCM • Ignition ON. • Carry out Programmable Module Installation (PMI) for the RCM. Manually enter As-Built data. Refer to Section 418-01. • Enter the following diagnostic mode on the scan tool: Self Test — RCM. • **Was DTC B00A0:4A retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to R5. **No** Fault corrected. GO to R5.
R5 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — Restraints . • **NOTE:** When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM. • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs. PROVE OUT the SRS. The repair is complete. RETURN the vehicle to the customer.

repair4less

Pinpoint Test S: DTCs B00B5:11, B00B5:12, B00B5:13 and B00B5:1D

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors the driver seat track position sensor circuits for the following faults:

- Short to ground
- Short to voltage
- Open circuit
- Current out of range
- Faulted driver seat track position sensor

If a fault is detected, the RCM stores DTC B00B5:11, B00B5:12, B00B5:13 or B00B5:1D in memory and sends a message to the Instrument Panel Cluster (IPC) to illuminate the air bag warning indicator.

DTC Description	Fault Trigger Condition
• B00B5:11 — Driver Seat Track Position Restraints Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the driver seat track position sensor circuit.
• B00B5:12 — Driver Seat Track Position Restraints Sensor: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the driver seat track position sensor circuit.
• B00B5:13 — Driver Seat Track Position Restraints Sensor: Circuit Open	A fault is indicated when the RCM senses an open on the driver seat track position sensor circuit. An open driver seat track position sensor ground circuit sets this fault.
• B00B5:1D — Driver Seat Track Position Restraints Sensor: Circuit Current Out of Range	A fault is indicated when the RCM senses current out of an acceptable range between the driver seat track position sensor circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST S: DTCs B00B5:11, B00B5:12, B00B5:13 AND B00B5:1D

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect Supplemental Restraint System (SRS) components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
S1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — RCM . • **Was DTC B00B5:11, B00B5:12, B00B5:13 or B00B5:1D retrieved on-demand during self-test?**	**Yes** This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B00B5:11 or B00B5:1D, GO to S2 . For DTC B00B5:12, GO to S4 . For DTC B00B5:13, GO to S5 . **No** This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to S10 .
S2 CHECK THE DRIVER SEAT TRACK POSITION RESTRAINTS SENSOR DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND OR CURRENT OUT OF RANGE INDICATED)	
NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is	**Yes** GO to S8 .

repair4less

Inspection and Repair After a Supplemental Restraint System (SRS) Deployment

WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

NOTE: After diagnosing or repairing a SRS , the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.

NOTE: Deployable devices (such as air bag modules, pretensioners) may deploy alone or in various combinations depending on the impact event.

NOTE: Always refer to the appropriate workshop manual procedures prior to carrying out vehicle repairs affecting the SRS and safety belt system.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. **NOTE:** Refer to the correct removal and installation procedure for all SRS components being installed.

   When any deployable device or combination of devices have deployed and/or the RCM has DTC B1231/B1193:00 (Event Threshold Exceeded) in memory, the repair of the vehicle SRS is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors and the removal and installation of a new RCM . DTCs must be cleared from all required modules after repairs are carried out.

Vehicles with an OCS

2. **NOTE:** After installation of new OCS components, carry out the OCS Reset procedure as instructed in the workshop manual. Refer to the appropriate workshop manual for OCS removal and installation procedure.

   When a vehicle has been involved in a collision and the OCSM has DTC B1231/B1193:00 stored in memory, the repair of the OCS is to include the following procedures for the specified system:
   - For rail-type OCS , inspect the passenger side floorpan for damage and repair as necessary. Install new OCS rails. Do not install a new OCSM unless DTC B1231 cannot be cleared.
   - For weight sensor bolt-type OCS , inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS weight sensor bolts. DTC must be cleared from the OCSM before carrying out OCS Reset. Do not install a new OCSM unless DTC B1231/B1193:00 cannot be cleared.
   - For bladder-type OCS , inspect for damage and repair as necessary. If installation of an OCS component is required, an OCS service kit must be installed.

All vehicles

3. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.

4. When the driver air bag module has deployed, a new clockspring must be installed.

5. New driver and/or front passenger safety belt systems (including retractors, buckles, anchors and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners. For additional information, refer to Section 501-20A .

6. Inspect the entire vehicle for damage, including the following components:
   - Steering column (deployable column if equipped)
   - Instrument panel knee bolsters and mounting points
   - Instrument panel braces and brackets
   - Instrument panel and mounting points
   - Seats and seat mounting points
   - Safety belts, safety belt buckles, safety belt retractors and safety belt anchors. For additional information, refer to Section 501-20A .
   - SRS wiring, wiring harnesses and connectors

7. After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.

---

repair4less

Occupant Classification Sensor (OCS) System Reset

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

WARNING: The following precautions must be taken before carrying out the following procedure on the front passenger seat:

- **Park the vehicle on level ground.**
- **Make sure the occupant classification system (OCS) is stabilized at a temperature in the range of 5□C to 48□C (41□F to 118□F) and is not exposed to temperatures outside that range.**
- **Make sure the front passenger seat is empty and dry.**
- **Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.**
- **Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.**
- **Make sure nothing is underneath the front passenger seat.**
- **Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS. Refer to the Owner's Literature.**
- **Make sure the seat is correctly installed in the vehicle.**

Failure to follow these instructions may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.

After Deployment

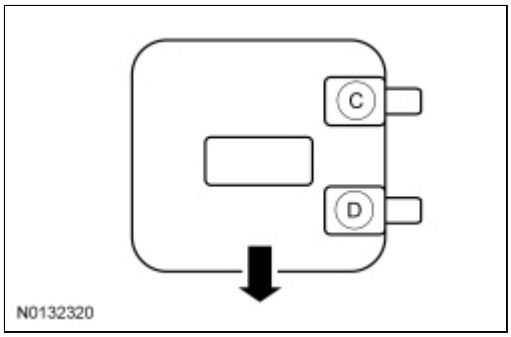
NOTE: After installation of new OCS system components and completion of Inspection and Repair After a Supplemental Restraint System (SRS) Deployment , the OCSM will have DTCs stored in memory. These DTCs will clear after a successful System Reset.

1. Check that all steps have been carried out as outlined in the Inspection and Repair After a Supplemental Restraint System (SRS) Deployment procedure in this section.

2. If no concerns are found, **proceed to Step 4 to carry out the System Reset** .

No Deployment

NOTE: After installation of new OCS system components (seat track assembly or OCSM), the OCSM will have DTCs stored in memory. These DTCs will clear after a successful System Reset.



3. Carry out the RCM self-test. If DTC B00A0:09 is retrieved on-demand, retrieve OCSM DTCs.

- If DTCs are retrieved on-demand in the OCSM and **NO** new components have been installed, refer to the Occupant Classification System Module (OCSM) DTC Chart for diagnostic direction.
- If no DTCs are retrieved on-demand in the OCSM , CLEAR the DTC from the RCM and carry out the System Reset.

OCS System Reset

4. Turn the ignition to the OFF position.

5. Prepare the passenger seat for a System Reset and make sure:
   - the OCS weight sensor bolt harness connections are correct for each sensor at the correct locations. Refer to Wiring Diagrams cell 46 for schematic and connector information. Refer to the illustration for correct sensor location on the seat.
   - the seat wiring harnesses are routed and secured correctly and are not twisted, pinched, pulling down or pushing up on any seat component. Refer to Seat Wire Harness Routing in Section 501-10 .
   - all seat fasteners have been tightened to specification as identified in the Workshop Manual. Refer to Section 501-10 .
   - the seat track is correctly aligned (manual seat track) — check the seat track fastener hole alignment, lift the seat adjust bar to align the holes in the track bracket to the holes in the floor.
   - the seat is correctly installed in the vehicle.
   - the passenger safety belt buckle is unbuckled.
   - the front passenger seat is empty and there is nothing underneath the seat. Remove any items from the seat that were not factory installed.
   - the seat backrest is in the upright (vertical) position.
   - the seat is at the mid-point of the seat track travel.
   - the seat height is in its middle position (power seat only).
   - the hysteresis has been removed from the front passenger seat by firmly hitting the back of the seat head restraint 3 times.
   - the vehicle electrical system voltage is **below 18 volts and above 11.5 volts** before continuing with the OCS System Reset.

6. Turn the ignition ON, **wait 8 seconds** .

7. Carry out the OCS System Reset.
   - If the System Reset was successful, carry out the Occupant Classification System (OCS) Zero Seat Weight Test. Refer to Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section.
   - If the System Reset was unsuccessful, **proceed to Step 8** .

8. **NOTE: Do not install any new OCS system components at this time. OCS system components should only be installed when directed to do so.**

repair4less

Carry out the OCSM self-test.

- If DTC B00A0:54 is retrieved on-demand, refer to the DTC Charts for diagnostic direction of this DTC.
- If any other DTCs are retrieved on-demand from the OCSM , **proceed to Step 9** .

9. Inspect all the items listed in **Step 5** for causes of an unsuccessful System Reset, repair as necessary. **Retest the system** .

10. If the System Reset was successful, carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section.
    If the System Reset was unsuccessful, install a new passenger seat track assembly. For additional information, refer to Section 501-10 .

Pyrotechnic Device Disposal

Disposal of Deployable Devices and Pyrotechnic Devices That are Undeployed/Inoperative

NOTE: All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned.

1. Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the undeployed/inoperative device. Refer to the appropriate procedure in this section or Section 501-20A .

3. **NOTE:** When installing a new air bag module or inflatable safety belt inflator, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the VIN must be recorded and sent to Ford Motor Company.

   If installing a new air bag module or inflatable safety belt inflator, record the necessary information and return the inoperative air bag module to Ford Motor Company.

Disposal of Deployable Devices and Pyrotechnic Devices That Are Deployed

1. Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the deployed device. Refer to the appropriate procedure in this section or Section 501-20A .

3. **NOTE:** If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages and the active canister vent have deployed before scrapping the vehicle or disposing of the air bag module. To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

   Dispose of the deployed device in the same manner as any other part to be scrapped.

Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment

1. Safety and environmental concerns require consideration and treatment of restraints system deployable and pyrotechnic devices when disposing of vehicles, deployable devices or pyrotechnic devices. Deploying deployable and pyrotechnic devices before scrapping a vehicle or the device eliminates the potential for hazardous exposures or reactions during processing. If special handling procedures are followed, deployable and pyrotechnic devices can be deployed safely and recycled with the vehicle, shipped separately to a recycling facility or disposed of safely.

repair4less

NOTE: To determine the deployable devices a vehicle is equipped with, refer to the Description and Operation portion of this section.

A vehicle equipped with any of the following deployable devices requires manual deployment of the devices before scrapping the vehicle or component. Refer to the appropriate portion of this procedure.

- Driver air bag module
- Inflatable safety belt inflators
- Knee air bag module
- Passenger air bag module
- Seat side air bag modules
- Safety Canopy® modules
- Side air curtain modules

2. **NOTE:** To determine the pyrotechnic devices a vehicle is equipped with, refer to the Description and Operation portion of this section.

   A vehicle equipped with any of the following pyrotechnic devices requires manual deployment of the devices before scrapping the vehicle or component. Refer to the appropriate portion of this procedure.
   - Safety belt buckle pretensioners
   - Safety belt retractor pretensioners
   - Safety belt anchor pretensioners
   - Adaptive load-limiting retractors
   - Deployable steering column

3. **NOTE:** To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

   If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages and the active canister vent have deployed before scrapping the vehicle or disposing of the air bag module. Refer to Driver Air Bag Module, Passenger Air Bag Module, Knee Air Bag Module and Seat Side Air Bag Module — Remote Deployment in this procedure.

Driver Air Bag Module, Passenger Air Bag Module, Knee Air Bag Module and Seat Side Air Bag Module — Remote Deployment

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

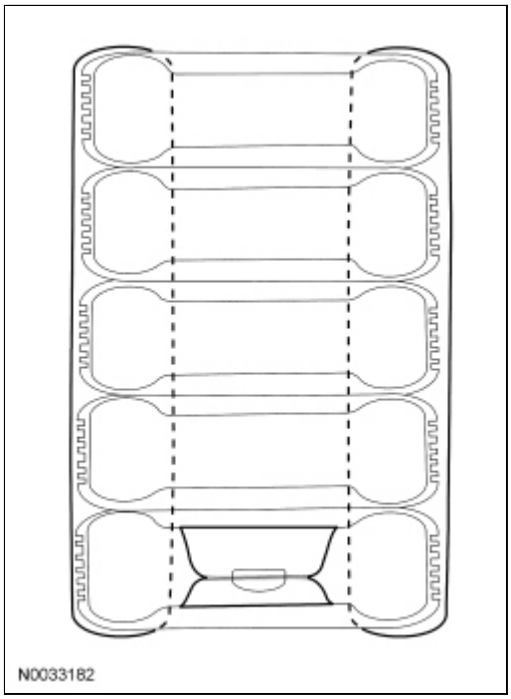
WARNING: Always carry a live airbag with the deployment door, trim cover or tear seam pointed away from the body. Do not place a live airbag down with the deployment door, trim cover or tear seam facing down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: Always carry a live Safety Canopy or side air curtain assembly with the tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

WARNING: Deploy all supplemental restraint system (SRS) devices (airbags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: For air bag modules with multiple loops, deploy all of the loops on the air bag module.

NOTE: Some driver and passenger front air bags have 2 deployment stages and an active canister vent. After a collision it is possible that Stage 1 has deployed and Stage 2 and the active canister vent have not.



If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

NOTE: A typical air bag disposal is shown that is similar for all vehicles.

All driver, passenger, knee and seat side air bag modules

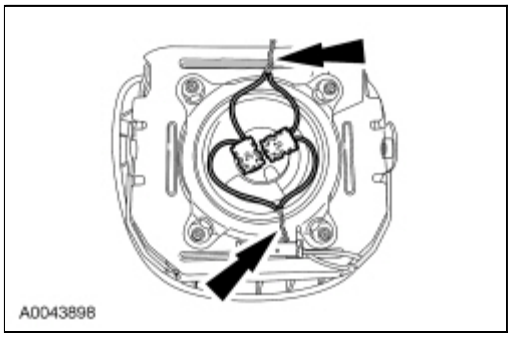
1. Make a container to house the air bag module for deployment.
    - **NOTE:** The tires must be of sufficient size to accommodate the air bag module.

      Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
    - With the tire and wheel assembly on the bottom, stack the tires.
    - Securely tie all of the tires together.

2. Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the air bag module. Refer to the appropriate procedure in this section.

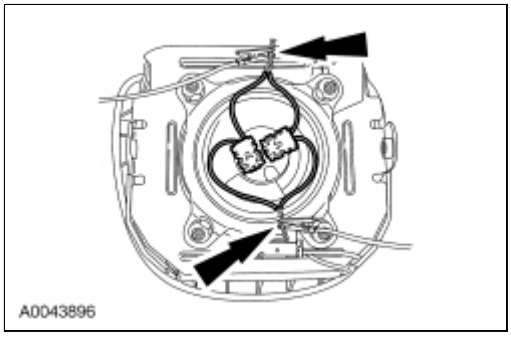
4. **NOTE:** If the air bag module does not have a hard-wired pigtail, cut the wires and connector(s) from the vehicle wire harness and reconnect to the air bag module.



repair4less

Cut each of the air bag module wires near the electrical connector that connects to the vehicle wire harness.

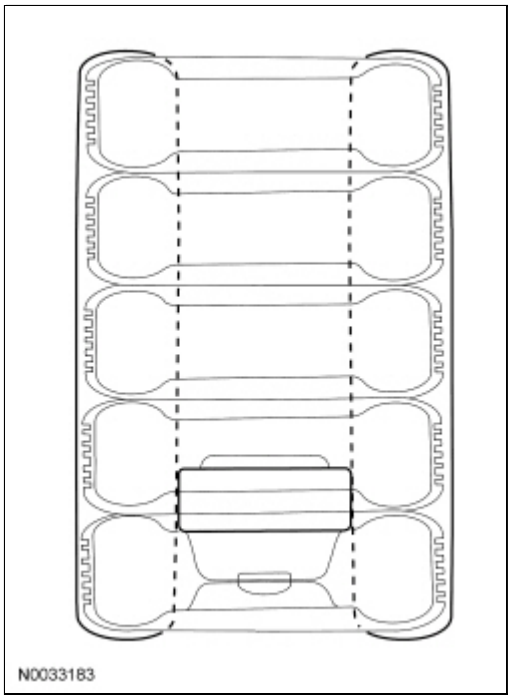
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.



6. **NOTE:** Typical driver air bag module with 2 loops shown, other air bag modules with multiple loops or multiple features (canister vent, active tether) similar.

   For air bag modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

7. Make a jumper harness to deploy the air bag module.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

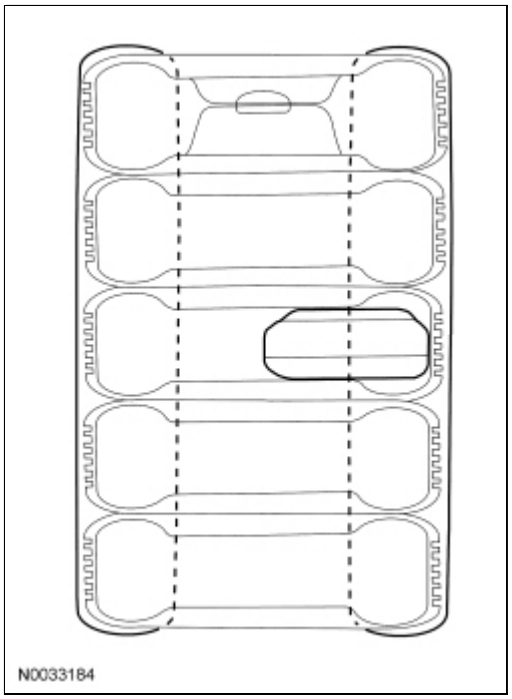


8. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the air bag module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

Driver air bag modules

9. **NOTE:** Make sure the air bag connections are maintained.

   For driver air bag modules, with the stack of tires upright and the wheel on the bottom, carefully place the driver air bag module, with the trim cover facing up, on the wheel.



Passenger, knee and seat side air bag modules

10. **NOTE:** Make sure the air bag connections are maintained.

    Tip the stack of tires on its side and place the air bag module inside the center tire, making sure that there are 2 tires beneath the tire containing the air bag module and 2 tires (including the tire and wheel assembly) above the tire containing the air bag module.

11. Place the tire stack upright, with the wheel on top.

repair4less

All driver, passenger, knee and seat side air bag modules

12. Remain at least 9.14 m (30 ft) away from the air bag module.

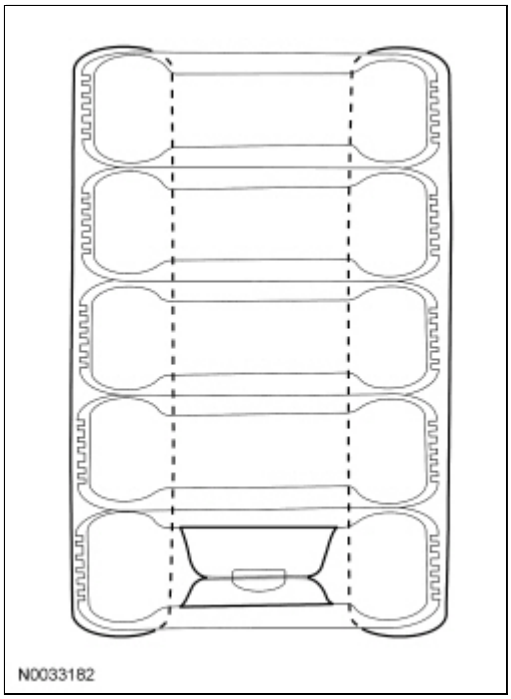
13. From the end of the jumper harness that is not connected to the air bag module, disconnect the 2 wires of the jumper harness from each other.

14. Deploy the air bag module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

15. To allow for cooling, wait at least 10 minutes before approaching the deployed air bag module.

16. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

Safety Belt Anchor Pretensioners, Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners, Adaptive Load Limiting Safety Belt Retractors and Safety Belt Inflators — Remote Deployment



WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

WARNING: Deploy all supplemental restraint system (SRS) devices (airbags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: A typical safety belt buckle, retractor and inflator disposal is shown that is similar for all vehicles.

1. Make a container to house the safety belt buckle or retractor for deployment.
    - **NOTE:** The tires must be of sufficient size to accommodate the safety belt buckle, retractor or inflator.

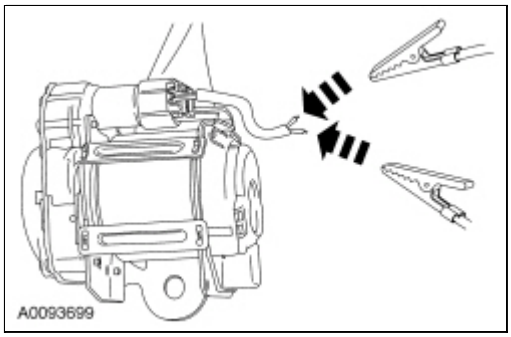
      Obtain a tire and wheel assembly and 4 additional tires (without wheels) of the same size.
    - With the tire and wheel assembly on the bottom, stack the tires.
    - Securely tie all of the tires together.

2. Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the safety belt buckle, retractor or inflator. Refer to the appropriate procedure in Section 501-20A .
   - When deploying a safety belt buckle pretensioner, install a nut and bolt of sufficient length and of the same diameter as was used to retain it to the seat.

4. **NOTE:** If the safety belt anchor, buckle, retractor or inflator does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the safety belt buckle, retractor or inflator.

   Cut each of the safety belt anchor, buckle, retractor or inflator wires near the electrical connector that connects to the vehicle wire harness.

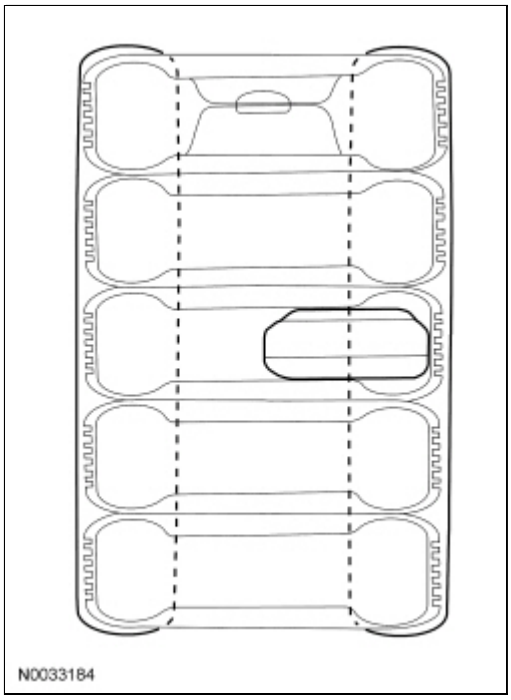


5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

6. Make a jumper harness to deploy the safety belt buckle, retractor or inflator.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

7. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt anchor pretensioners, buckle pretensioners, load-limiting retractors and safety belt inflators similar.

   Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt anchor, buckle, retractor or inflator. Use tape or other insulating material to make sure that the leads do not make contact with each other.



repair4less

8. **NOTE:** Make sure the safety belt anchor, buckle, retractor or inflator connections are maintained.

   Tip the stack of tires on its side and place the safety belt anchor, buckle, retractor or inflator inside the center tire, making sure that there are 2 tires beneath the tire containing the safety belt anchor, buckle, retractor or inflator and 2 tires (including the tire and wheel assembly) above the tire containing the safety belt anchor, buckle, retractor or inflator.

9. Place the tire stack upright, with the wheel on top.

10. Remain at least 9.14 m (30 ft) away from the safety belt anchor, buckle, retractor or inflator.

11. From the end of the jumper harness that is not connected to the safety belt anchor, buckle, retractor or inflator, disconnect the 2 wires of the jumper harness from each other.

12. Deploy the safety belt anchor pretensioner, buckle pretensioner, retractor pretensioner or inflator by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

13. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt anchor pretensioner, buckle pretensioner, retractor pretensioner or inflator.

14. Dispose of the deployed safety belt anchor, buckle, retractor or inflator in the same manner as any

other part to be scrapped.

Safety Belt Anchor Pretensioners, Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Load Limiting Safety Belt Retractors — In-Vehicle Deployment

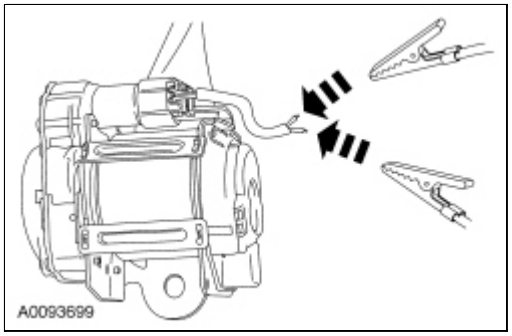
WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

WARNING: Deploy all supplemental restraint system (SRS) devices (airbags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Access the safety belt anchor, buckle or retractor electrical connectors. For additional information, refer to Section 501-20A .



3. Cut each of the safety belt anchor, buckle or retractor wires, leaving at least 101.6 mm (4 in) to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

5. Make a jumper harness to deploy the safety belt anchor, buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

6. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt anchor pretensioners, buckle pretensioners and load-limiting retractors are similar.

   Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt anchor, buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

repair4less

7. Remain at least 9.14 m (30 ft) away from the safety belt anchor, buckle or retractor.

8. From the end of the jumper harness that is not connected to the safety belt anchor, buckle or retractor, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the safety belt anchor pretensioner, buckle pretensioner or retractor pretensioner by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt anchor pretensioner, buckle pretensioner or retractor pretensioner.

11. Dispose of the deployed safety belt anchor, buckle or retractor in the same manner as any other part to be scrapped.

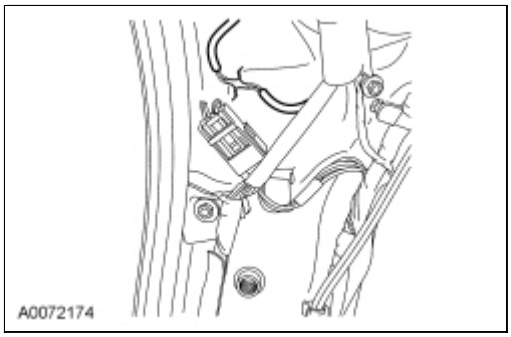
Safety Canopy® Modules and Side Air Curtain Modules — In-Vehicle Deployment

WARNING: Deploy all supplemental restraint system (SRS) devices (airbags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: The Safety Canopy® module deployment for a scrapped vehicle will occur in its installed position in the vehicle.

NOTE: A typical Safety Canopy® module disposal is shown that is similar for all vehicles.

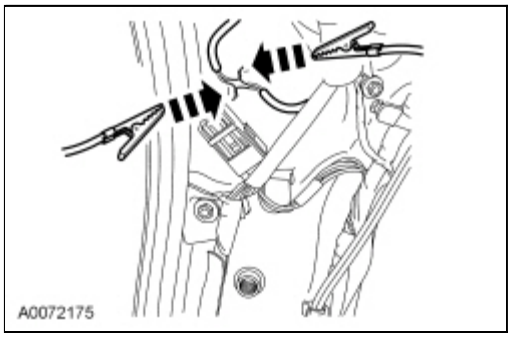
1. Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.



2. Access the Safety Canopy®/side air curtain module electrical connectors. For additional information, refer to the appropriate procedure in this section.

3. Cut each of the Safety Canopy®/side air curtain module wires leaving at least 101.6 mm (4 in) to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.



5. **NOTE:** Typical Safety Canopy®/side air curtain module with 2 loops shown, other Safety Canopy®/side air curtain modules with 2 loops are similar.

   For Safety Canopy®/side air curtain modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

6. Make a jumper harness to deploy the Safety Canopy®/side air curtain module.
    - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
    - At one end of the jumper harness, connect the wires together.

7. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the Safety Canopy®/side air curtain module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

8. From the end of the jumper harness that is not connected to the Safety Canopy®/side air curtain module, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the Safety Canopy®/side air curtain module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed Safety Canopy®/side air curtain module.

11. Dispose of the deployed Safety Canopy®/side air curtain module in the same manner as any other part to be scrapped.

Deployable Steering Column — In-Vehicle Deployment

WARNING: Deploy all supplemental restraint system (SRS) devices (airbags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

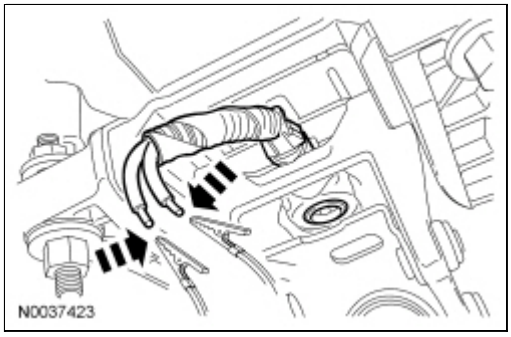
1. Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in

repair4less

the General Procedures portion of this section.

2. **NOTE:** It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering column electrical connector.

   Access the deployable steering column electrical connector.



3. **NOTE:** If the deployable steering column does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the deployable steering column.

   Cut each of the deployable steering column wires, leaving at least 101.6 mm (4 in) to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

5. Make a jumper harness to deploy the deployable steering column.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

6. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.

7. Remain at least 9.14 m (30 ft) away from the deployable steering column.

8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column.

11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.

repair4less

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Deactivation

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

2. **WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches. Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s). To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.**

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

3. Remove the driver air bag module. For additional information, refer to Driver Airbag in this section.

4. Remove the 3 passenger air bag module bolts.

5. ***NOTICE:*** **Do not handle the passenger air bag module by grabbing the edges of the passenger air bag cover. Damage to the passenger air bag module may occur.**

   Partially remove the passenger air bag module from the instrument panel.

6. Disconnect the 2 passenger air bag module electrical connectors.

7. Under the passenger seat, slide and disengage the locking clip, release the tab and disconnect inline electrical connector C339.

8. Under the driver seat, slide and disengage the locking clip, release the tab and disconnect inline electrical connector C3051.

9. Disconnect the LH side safety canopy module electrical connector.
   - For regular cab, remove the LH side B-pillar trim panel.
   - For SuperCab and SuperCrew, remove the LH side C-pillar trim panel.
     For additional information, refer to Section 501-05 .

10. Disconnect the RH side safety canopy module electrical connector.
    - For regular cab, remove the RH side B-pillar trim panel.
    - For SuperCab and SuperCrew, remove the RH side C-pillar trim panel.
      For additional information, refer to Section 501-05 .

11. Install the RCM fuse 31 (10A) in the SJB .

12. Connect the battery ground cable. For additional information, refer to Section 414-01 .

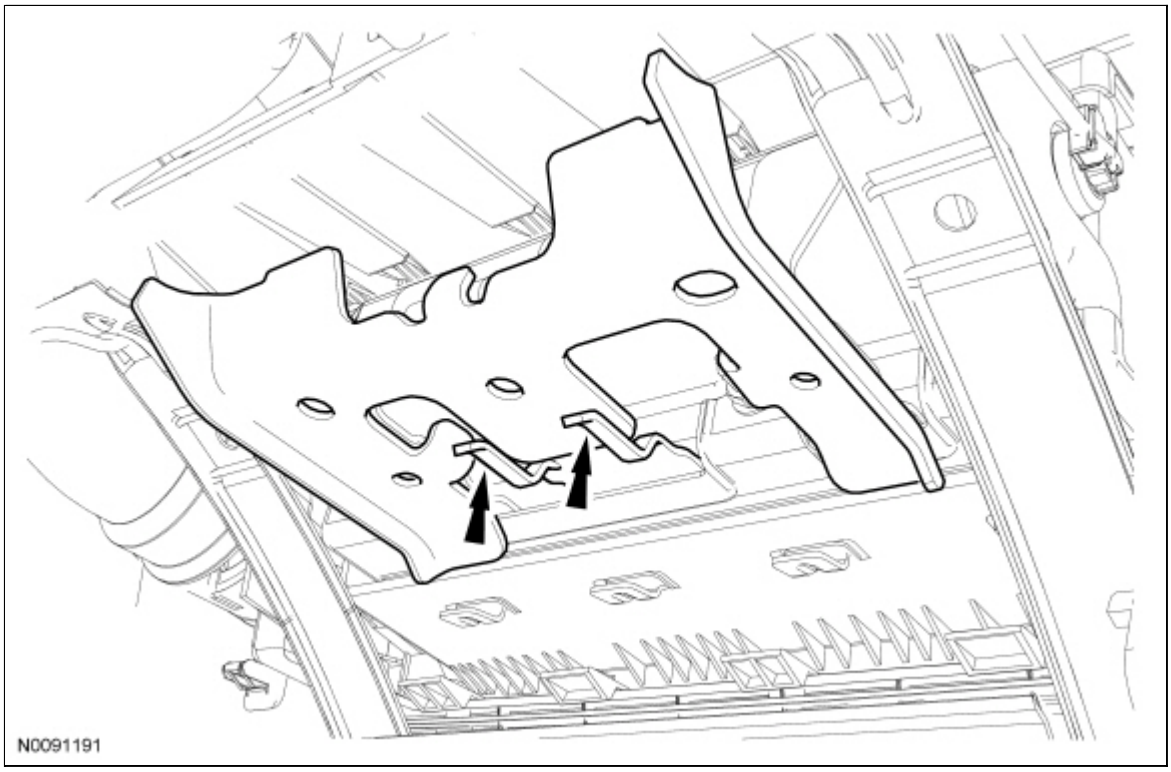
Reactivation

1. Remove RCM fuse 31 (10A) from the SJB .

2. Disconnect the battery ground cable and wait at least one minute.

3. Connect the LH side safety canopy module electrical connector.
   - For regular cab, install the LH side B-pillar trim panel.
   - For SuperCab and SuperCrew, install the LH side C-pillar trim panel.
     For additional information, refer to Section 501-05 .

4. Connect the RH side safety canopy module electrical connector.
   - For regular cab, install the RH side B-pillar trim panel.
   - For SuperCab and SuperCrew, install the RH side C-pillar trim panel.
     For additional information, refer to Section 501-05 .



5. Under the driver seat, connect inline electrical connector C339, slide and engage the locking clip.

6. Under the driver seat, connect inline electrical connector C3051, slide and engage the locking clip.

repair4less

7. Connect the 2 passenger air bag module electrical connectors.

8. Position the passenger air bag module so that the tabs are oriented as shown.

9. Install the 3 passenger air bag module bolts.
    - Tighten to 8 Nm (71 lb-in).

10. Install the driver air bag module. Refer to Driver Airbag in this section.

11. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

repair4less

Supplemental Restraint System (SRS) Depowering and Repowering

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Depowering Procedure

WARNING: Wear eye and ear protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

WARNING: To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF.
2. Turn the ignition OFF.
3. At the Body Control Module (BCM), located below the RH side of the instrument panel, remove the cover and RCM fuse 36 (10A) from the BCM . For additional information, refer to the Wiring Diagrams manual.
4. Turn the ignition ON and monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain illuminated continuously, remove the correct RCM

fuse before proceeding.

5. Turn the ignition OFF.

6. **WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches. Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s). To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.**

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

Repowering Procedure

1. Turn the ignition from OFF to ON.

2. Install RCM fuse 36 (10A) to the BCM and close the cover.

3. **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any airbag when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

   Connect the battery ground cable.

4. Prove out the SRS as follows:
   Turn the ignition from ON to OFF. Wait 10 seconds, then turn the ignition back to ON and monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:
   - fail to light.
   - remain lit continuously.
   - flash at a 5 Hz rate (RCM not configured).

   The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.
   Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM) using a scan tool.

repair4less

Clockspring

Item	Part Number	Description
1	3530	Upper steering column shroud
2	14A644	Clockspring
3	W506943	Clockspring screws (3 required)
4	—	Clockspring electrical connector (part of 14401)
5	3530	Lower steering column shroud
6	—	Lower steering column shroud screw (3 required)
7	3F791	Steering Column Control Module (SCCM)

Removal

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

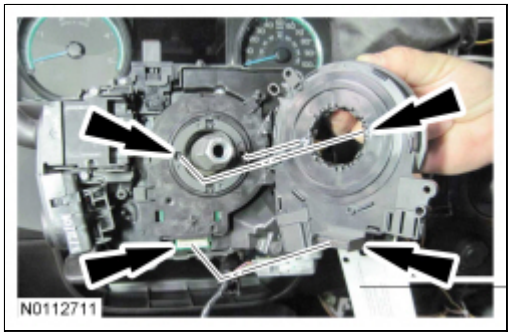
1. Remove the driver air bag module. For additional information, refer to Driver Airbag in the Removal and Installation portion of this section.

2. Remove the steering wheel. For additional information, refer to Section 211-04 .

repair4less

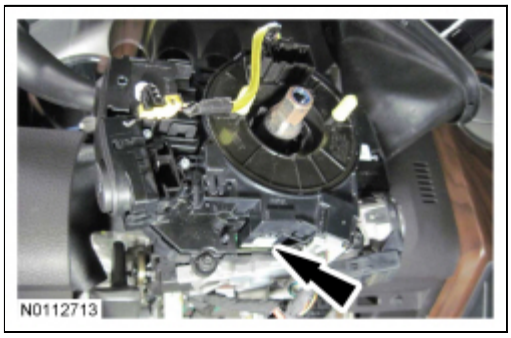
3. Remove the upper and lower steering column shrouds.
    1. Remove the 3 screws.
    2. Unclip the lower steering column shroud from the upper steering column shroud and remove.
        - If equipped, position the selector lever boot aside.

4. Disconnect the clockspring electrical connector.



5. Remove the 3 screws and clockspring.

Installation



WARNING: If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.

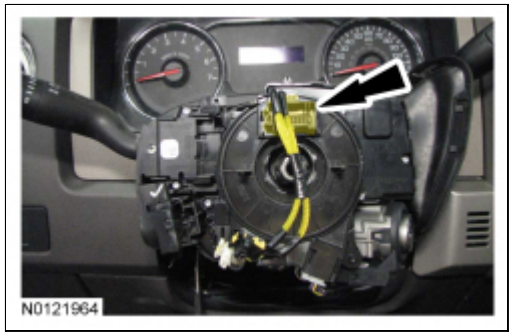
NOTE: Typical clockspring shown. Only the 6.2L application is equipped with the steering wheel rotation sensor located behind the clockspring. All other engine applications, the steering wheel rotation sensor is part of the Electronic Power Assist Steering (EPAS) and is not serviced separately.

1. Position the clockspring onto the steering column.
    - Align the electrical connector ends and the 2 clockspring pins on the back of the clockspring to the 2 steering wheel rotation sensor pin holes.

2. With the clockspring pins aligned to the steering wheel rotation sensor pin holes, push the clockspring in, seating the electrical connector.

3. ***NOTICE:*** **If installing a new clockspring, do not remove the clockspring anti-rotation key until the steering wheel is installed. If the anti-rotation key has been removed before installing the steering wheel, the clockspring must be centered. Failure to follow this instruction may result in component damage and/or system failure.**

   Install the 3 clockspring screws.



4. Connect the clockspring electrical connector.

5. **WARNING: If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.**

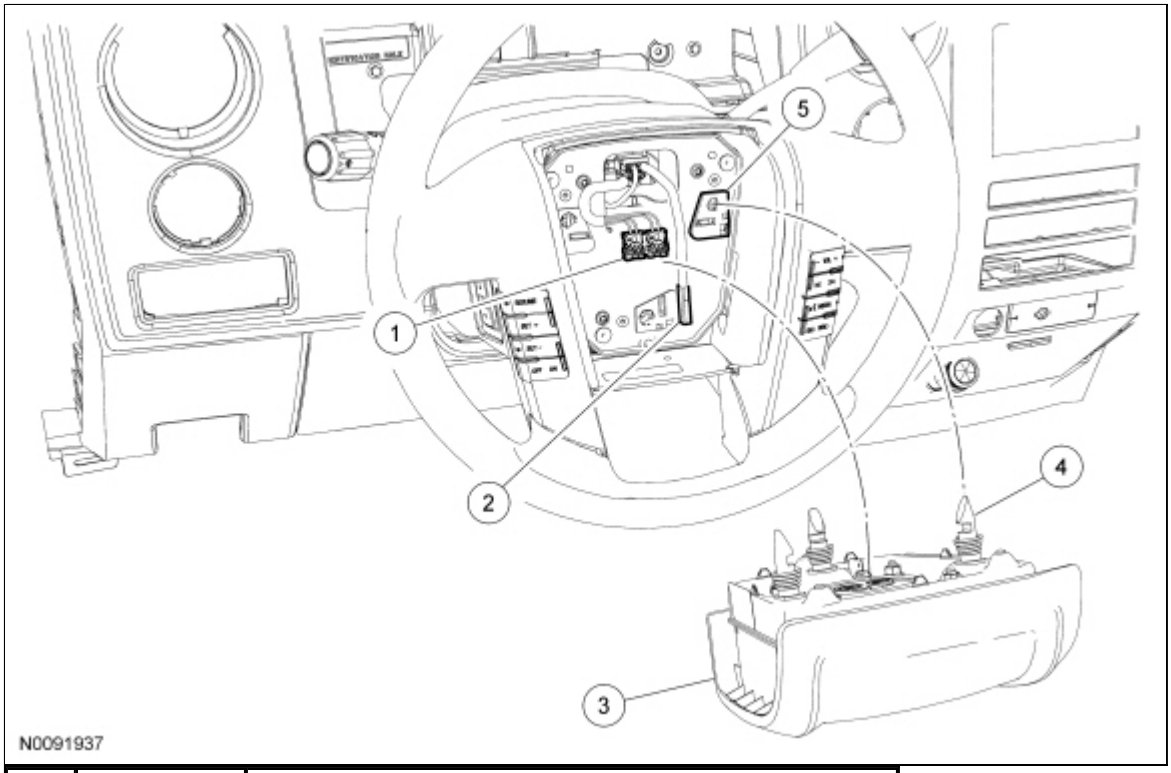
   NOTICE: **Do not over-rotate the clockspring inner rotor. The internal ribbon wire is connected to the clockspring rotor. The internal ribbon wire acts as a stop and can be broken from its internal connection. Failure to follow this instruction may result in component damage and/or system failure.**

   If a new clockspring was installed and the anti-rotation key has not been removed **proceed to Step 7** .
   If a new clockspring was installed and the anti-rotation key has been removed before the steering wheel is installed, or the same clockspring is being installed, rotate the clockspring inner rotor **counterclockwise** . Carefully feel for the ribbon wire to run out of length with slight resistance and stop rotating the clockspring inner rotor.

6. To center the clockspring, start with the clockspring rotated fully counterclockwise as indicated in Step 5. Rotate the clockspring inner rotor, wiring and connector clockwise through 3.5 full revolutions with the connector up in the 12 o'clock position. Verify that the clockspring is correctly centralized by observing that the clockspring rotor, wiring and connector are in the 12 o'clock position.

7. Install the lower steering column shroud and 3 screws.

8. Attach the upper steering column shroud to the lower steering column shroud.
   - If equipped, position back the selector lever boot.



9. Install the steering wheel. For additional information, refer to Section 211-04 .

10. If a new clockspring was installed, remove the anti-rotation key.

11. Install the driver air bag module. For additional information, refer to Driver Airbag in the Removal and Installation portion of this section.

repair4less

Driver Airbag

Item	Part Number	Description
1	—	Driver air bag module electrical connector (part of 14A664)
2	—	Horn electrical connector (part of 14A664)
3	043B13	Driver air bag module
4	—	Attachment pin (part of 043B13) (1 of 3)
5	—	Wire clip (1 of 3)

Removal

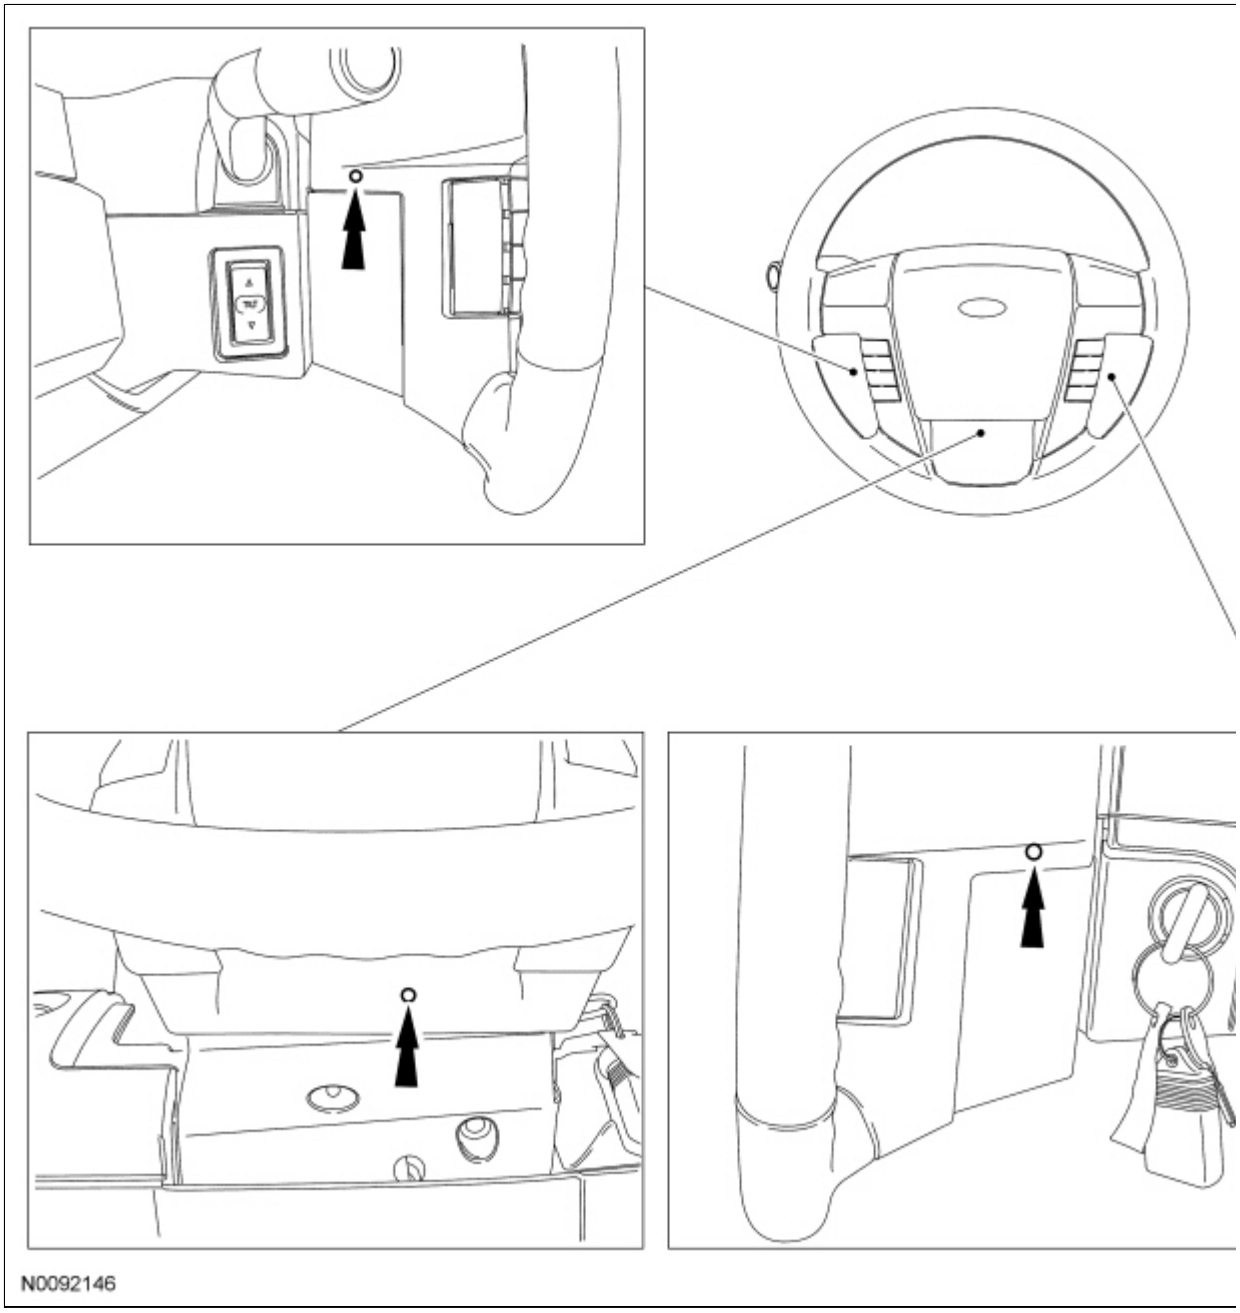
WARNING: Always carry a live airbag with the deployment door, trim cover or tear seam pointed away from the body. Do not place a live airbag down with the deployment door, trim cover or tear seam facing down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is

repair4less

removed and the ignition is ON.



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

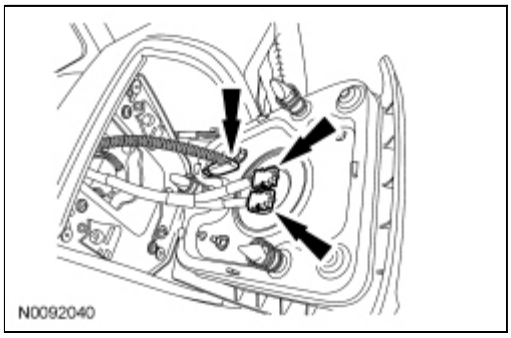
1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

2. **NOTE:** The bottom, LH and RH wire clip access hole locations are shown.

   NOTE: The attachment pin at the bottom of the steering wheel must be released from the wire clip before the LH and RH side.

   Starting with the wire clip at the bottom of the steering wheel, release the attachment pin from the wire clip.
   - Insert a 3-mm hex key or a suitable tool through the access hole, position the tool against the wire clip to disengage the attachment pin.
   - Push the wire clip inward and pull the driver air bag module away from the steering wheel.
   - Repeat for the 2 attachment pins on the LH and RH side of the steering wheel.

3. Remove the driver air bag module.
    - Compress the tabs and disconnect the 2 driver air bag module electrical connectors.
    - Disconnect the horn electrical connector.
    - Remove the driver air bag module.

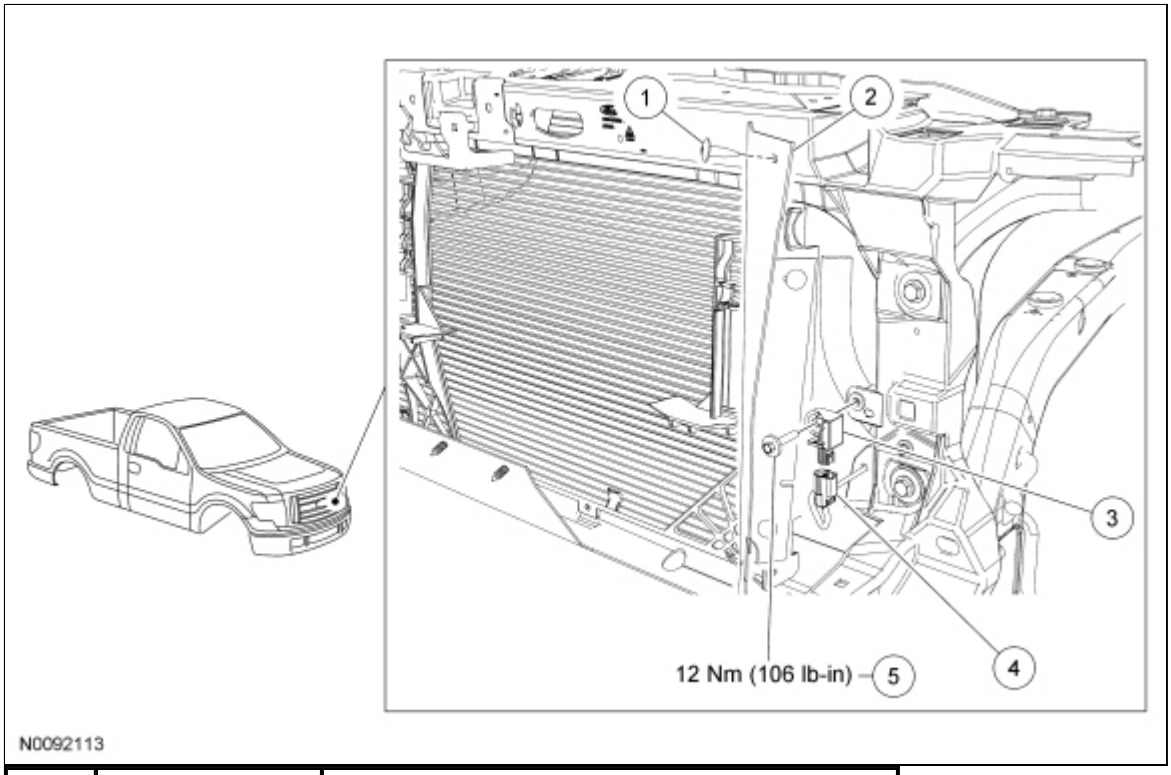


repair4less

Installation

WARNING: Prior to reinstalling a previously removed driver air bag module, make sure to correctly position the wire clip that retains the driver air bag module to the steering wheel. Failure to follow this instruction will result in incorrect installation of the driver air bag module and increases the risk of serious personal injury or death in a crash.

1. Connect the driver air bag module and horn electrical connectors.



2. Align the 3 attachment pins to the wire clip openings in the steering wheel and position the driver air bag module in place.
3. With the attachment pins aligned, push inward to seat the driver air bag module.
4. Pull firmly on the driver air bag module corners to make sure that the attachment pins are completely engaged.
5. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

repair4less

Front Impact Severity Sensor

NOTE: LH front impact severity sensor shown, RH similar.

Item	Part Number	Description
1	W706350	Scrivet
2	8310	LH air deflector
3	14B004	LH front impact severity sensor
4	—	Electrical connector (part of 12A581)
5	W713506	Front impact severity sensor bolt

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the airbags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

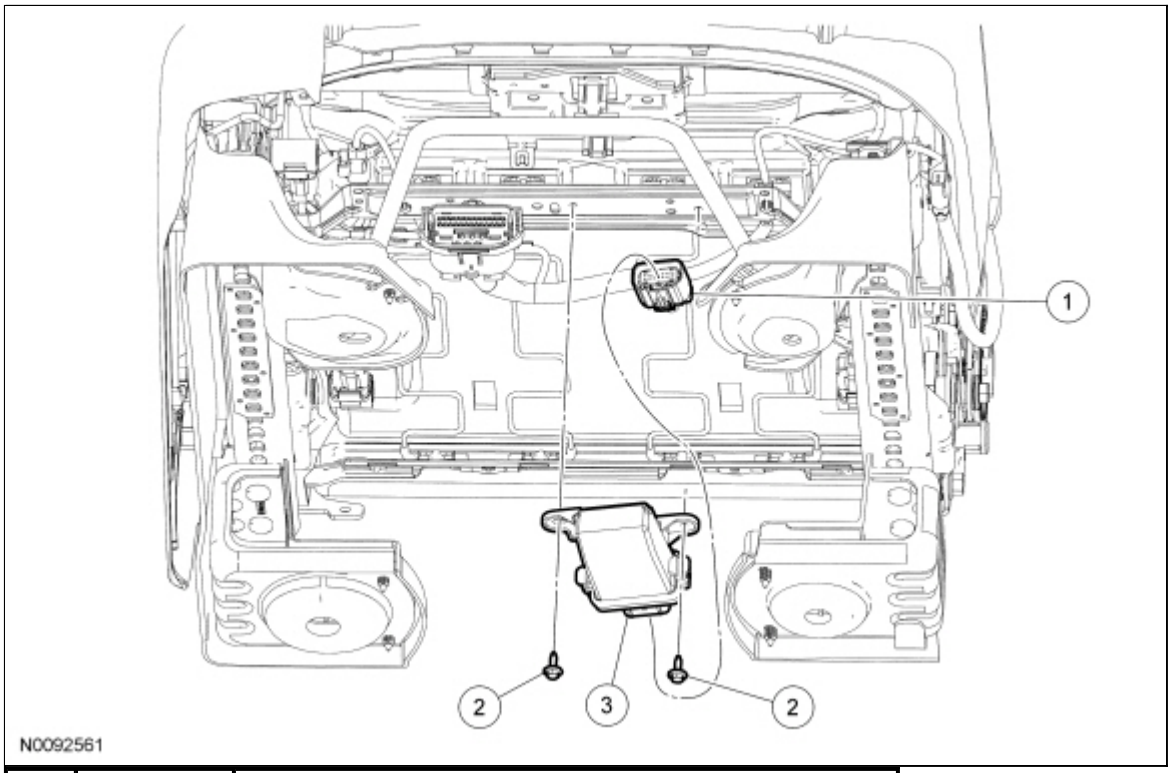
2. Remove the scrivet and fold the LH air deflector back.

3. Disconnect the electrical connector.

4. **WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   Remove the bolt and LH front impact severity sensor.
   - To install, tighten to 12 Nm (106 lb-in).

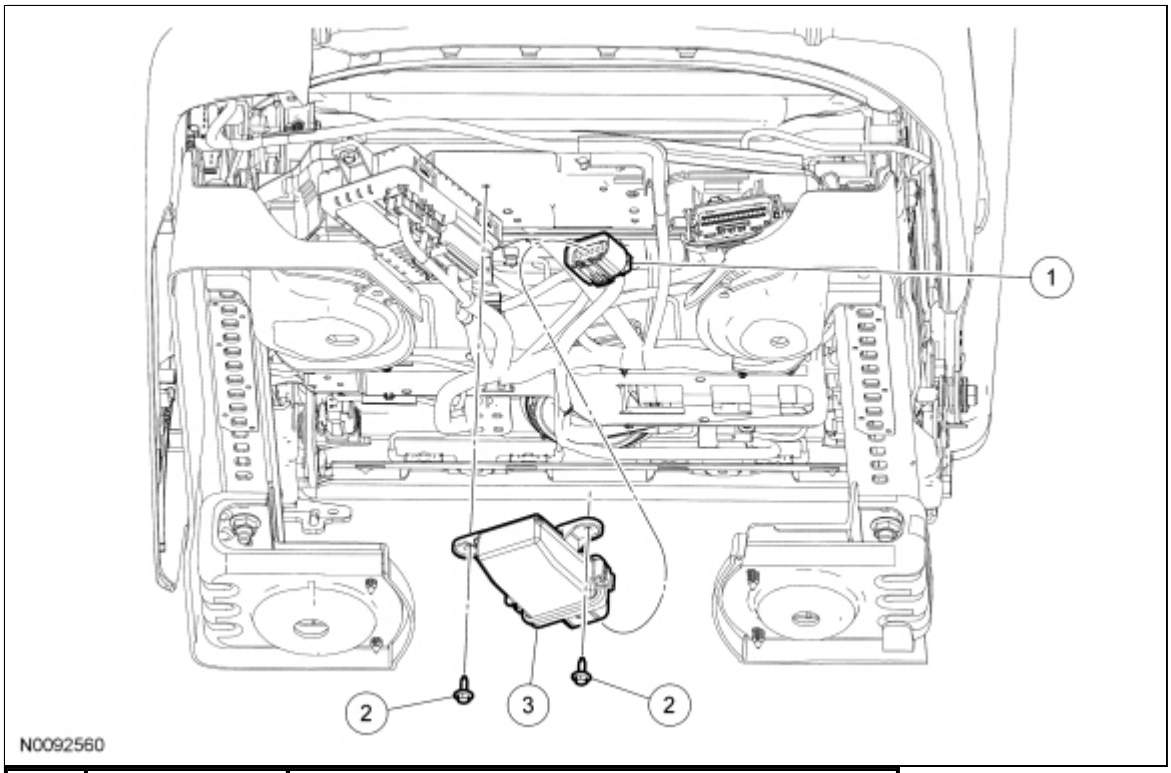
5. To install, reverse the removal procedure.



6. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

---

repair4less



Occupant Classification System Module (OCSM)

Manual Seat

Item	Part Number	Description
1	—	Occupant Classification System Module (OCSM) electrical connector (part of 14A699)
2	W505153	OCSM screws
3	14B056	OCSM

Power Seat

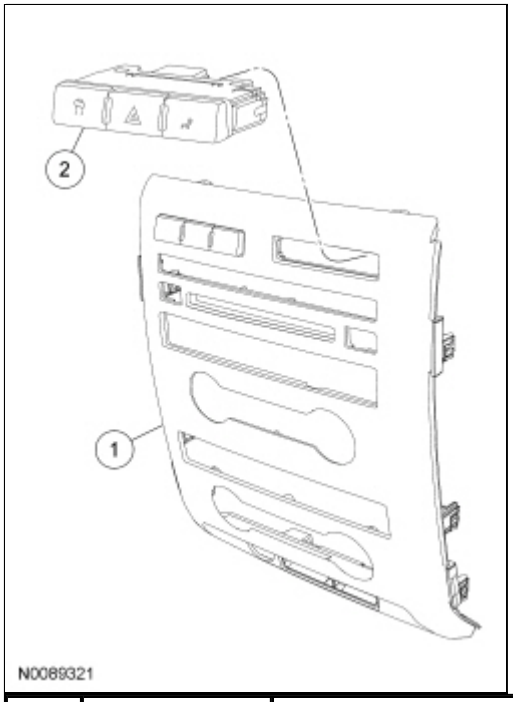
Item	Part Number	Description
1	—	OCSM electrical connector (part of 14A699)
2	W505153	OCSM screws
3	14B056	OCSM

Removal and Installation

1. **NOTE:** Ignition must be OFF when disconnecting the Occupant Classification System Module (OCSM) electrical connector. Otherwise, a DTC will set in the Restraints Control Module (RCM) memory and must be cleared before releasing the vehicle.

   Turn the ignition OFF and wait at least one minute.

2. Disconnect the OCSM electrical connector.



3. Remove the 2 screws and OCSM .

4. To install, reverse the removal procedure.

5. If a new OCSM has been installed, carry out the Occupant Classification System (OCS) System Reset procedure. For additional information, refer to Occupant Classification Sensor (OCS) System Reset in the General Procedures portion of this section.

repair4less

Passenger Airbag Deactivation (PAD) Indicator

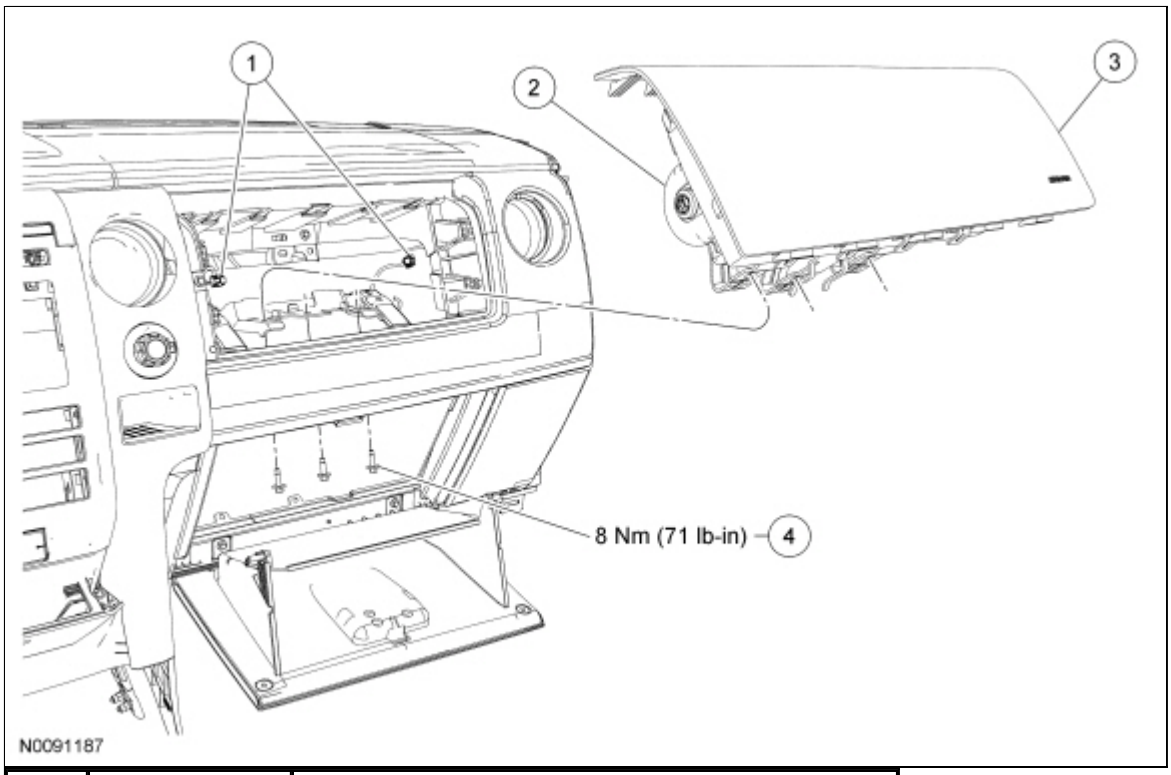
Item	Part Number	Description
1	04302	Instrument panel center finish panel
2	13350	Passenger Air Bag Deactivation (PAD) indicator

NOTE: The Passenger Air Bag Deactivation (PAD) indicator is part of the hazard/ traction control switch.

1. **NOTE:** Ignition must be OFF when disconnecting the PAD indicator electrical connector. Otherwise, a DTC will be set in the Restraints Control Module (RCM) memory and must be cleared before releasing the vehicle.

   Turn the ignition OFF and wait at least one minute.

2. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .



3. Disconnect the PAD indicator electrical connector.

4. Press the 2 tabs inward and remove the PAD indicator.

5. To install, reverse the removal procedure.

repair4less

Passenger Airbag

Item	Part Number	Description
1	—	Electrical connectors (part of 14401)
2	044A74	Passenger air bag module assembly
3	04338	Passenger air bag cover
4	W708568	Passenger air bag module bolt (3 required)

Removal and Installation

WARNING: Always carry a live airbag with the deployment door, trim cover or tear seam pointed away from the body. Do not place a live airbag down with the deployment door, trim cover or tear seam facing down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before

repair4less

releasing the vehicle to the customer.

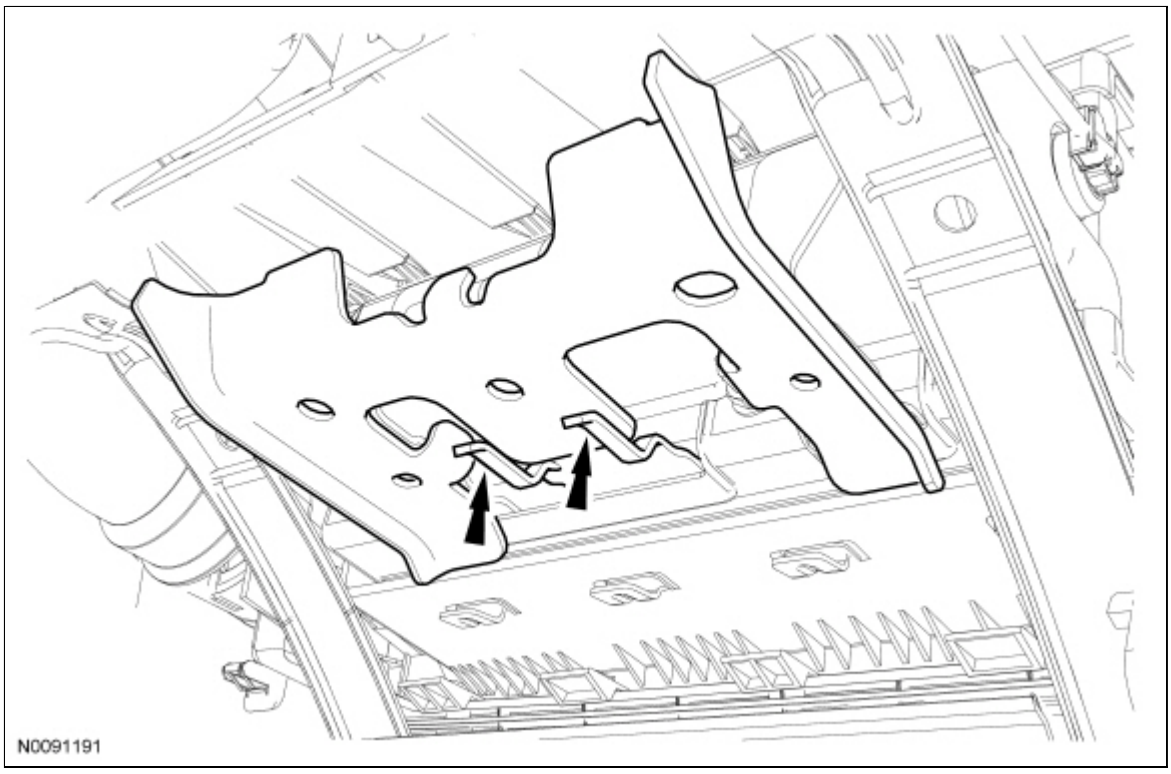
1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the 3 passenger air bag module bolts.

3. ***NOTICE:*** **Do not handle the passenger air bag module by grabbing the edges of the passenger air bag cover. Damage to the passenger air bag module may occur.**

   Partially remove the passenger air bag module from the instrument panel.

4. Disconnect the 2 electrical connectors and remove the passenger air bag module.



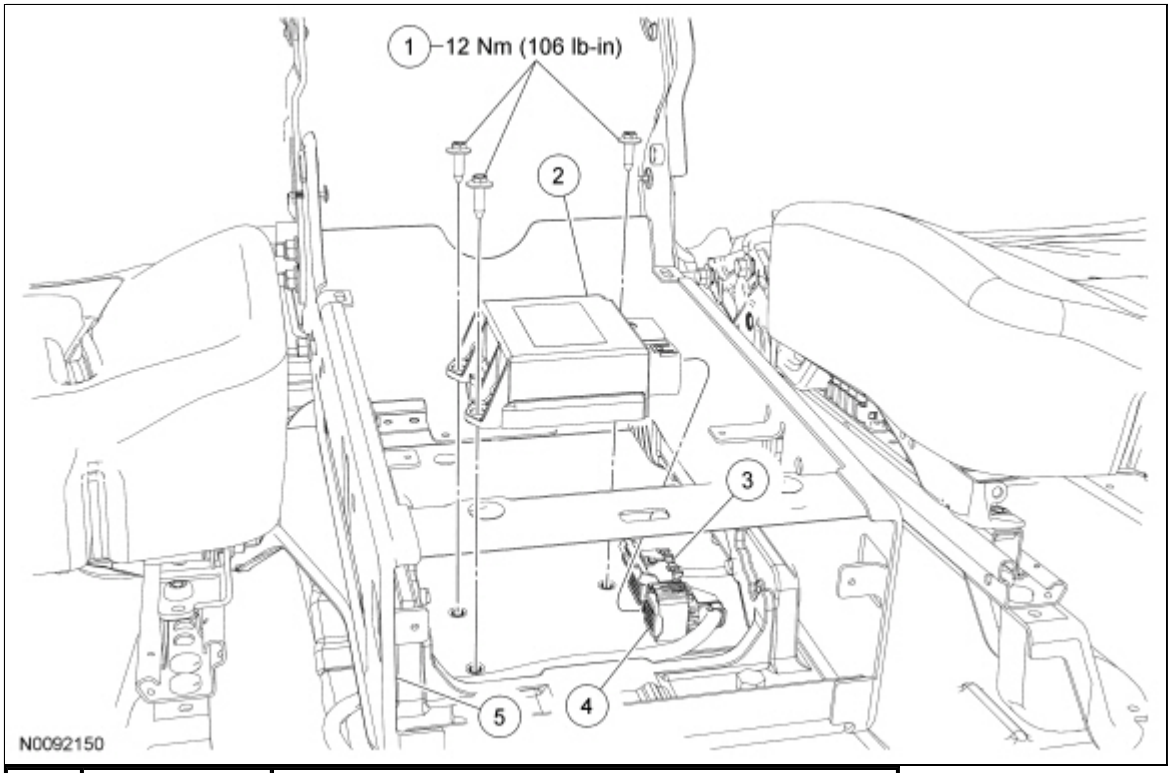
Installation

1. ***NOTICE:*** **Do not handle the passenger air bag module by grabbing the edges of the passenger air bag cover. Damage to the passenger air bag module may occur.**

   Partially install the passenger air bag module in the instrument panel.

2. Connect the 2 electrical connectors.

3. Position the passenger air bag module so that the tabs are oriented as shown.



4. Install the 3 passenger air bag module bolts.
   - Tighten to 8 Nm (71 lb-in).

5. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

repair4less

Restraints Control Module (RCM)

Item	Part Number	Description
1	W707722	Restraints Control Module (RCM) bolts
2	14B321	RCM
3	—	RCM large electrical connector (part of 14A005)
4	—	RCM small electrical connector (part of 14401)
5	61708	Front center seat base frame

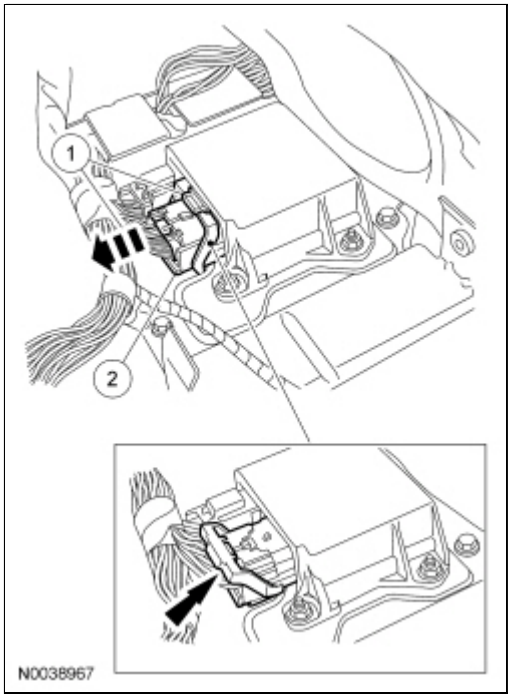
WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the airbags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

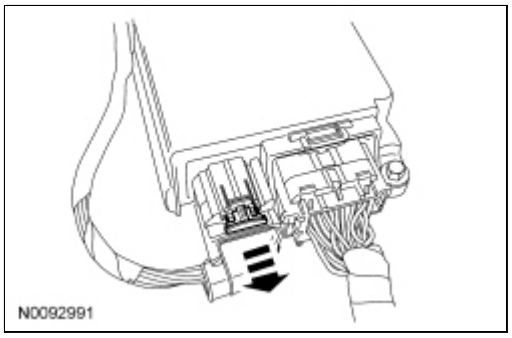
NOTE: This vehicle is equipped with the SYNC® feature which contains the 911 assist option. Refer to the Owners' Literature.



1. When installing a new RCM , carry out the appropriate steps necessary for the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

3. If equipped, remove the floor console. For additional information, refer to Section 501-12 .



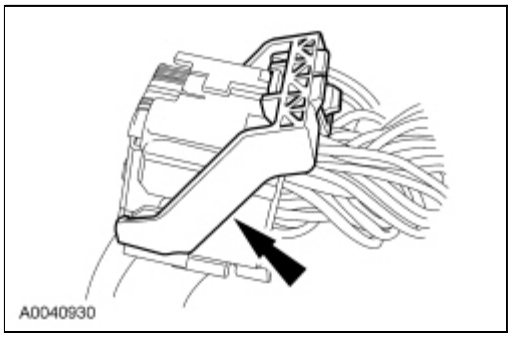
4. If equipped, remove the front center seat cushion and cupholder assembly. For additional information, refer to Section 501-10 .

5. Disconnect the RCM large electrical connector.
    1. Pinch the thumb tab and pivot the connector position assurance lever all the way back until it stops.
    2. Disconnect the RCM electrical connector.

6. Disengage the lock tab, press and disconnect the RCM small electrical connector.

repair4less

7. Remove the 3 RCM bolts.

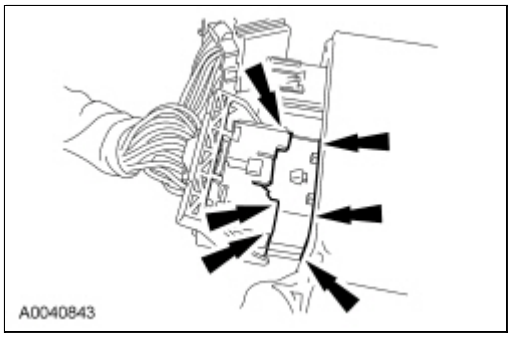


8. Remove the RCM .

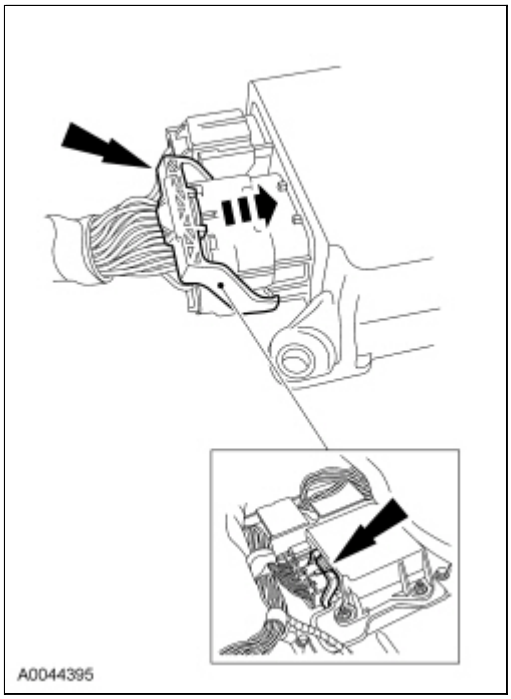
Installation

WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

1. Position the RCM and install the bolts.
   - Tighten to 12 Nm (106 lb-in).



2. Make sure the connector position assurance lever is in the full RELEASE position before attempting to connect the connector.



3. ***NOTICE:*** **Putting the large Restraints Control Module (RCM) electrical connector into the RCM on an angle can cause incorrect electrical connections and damage components.**

   Position the large RCM electrical connector into the RCM .
   - ***NOTICE:*** **Do not push the connector on to where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the Restraints Control Module (RCM) before using the lever to fully seat the connector. Failure to follow this instruction may result in component damage and/or system failure.**

     With the large RCM electrical connector uniformly aligned to the RCM , lightly push in until a click is heard and a slight resistance is felt.

4. Connect the large RCM electrical connector.
    - Using the connector position assurance lever, pivot it toward the RCM , drawing the connector into the RCM .
        - Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.

5. Connect the small RCM electrical connector and push the lock tab in.

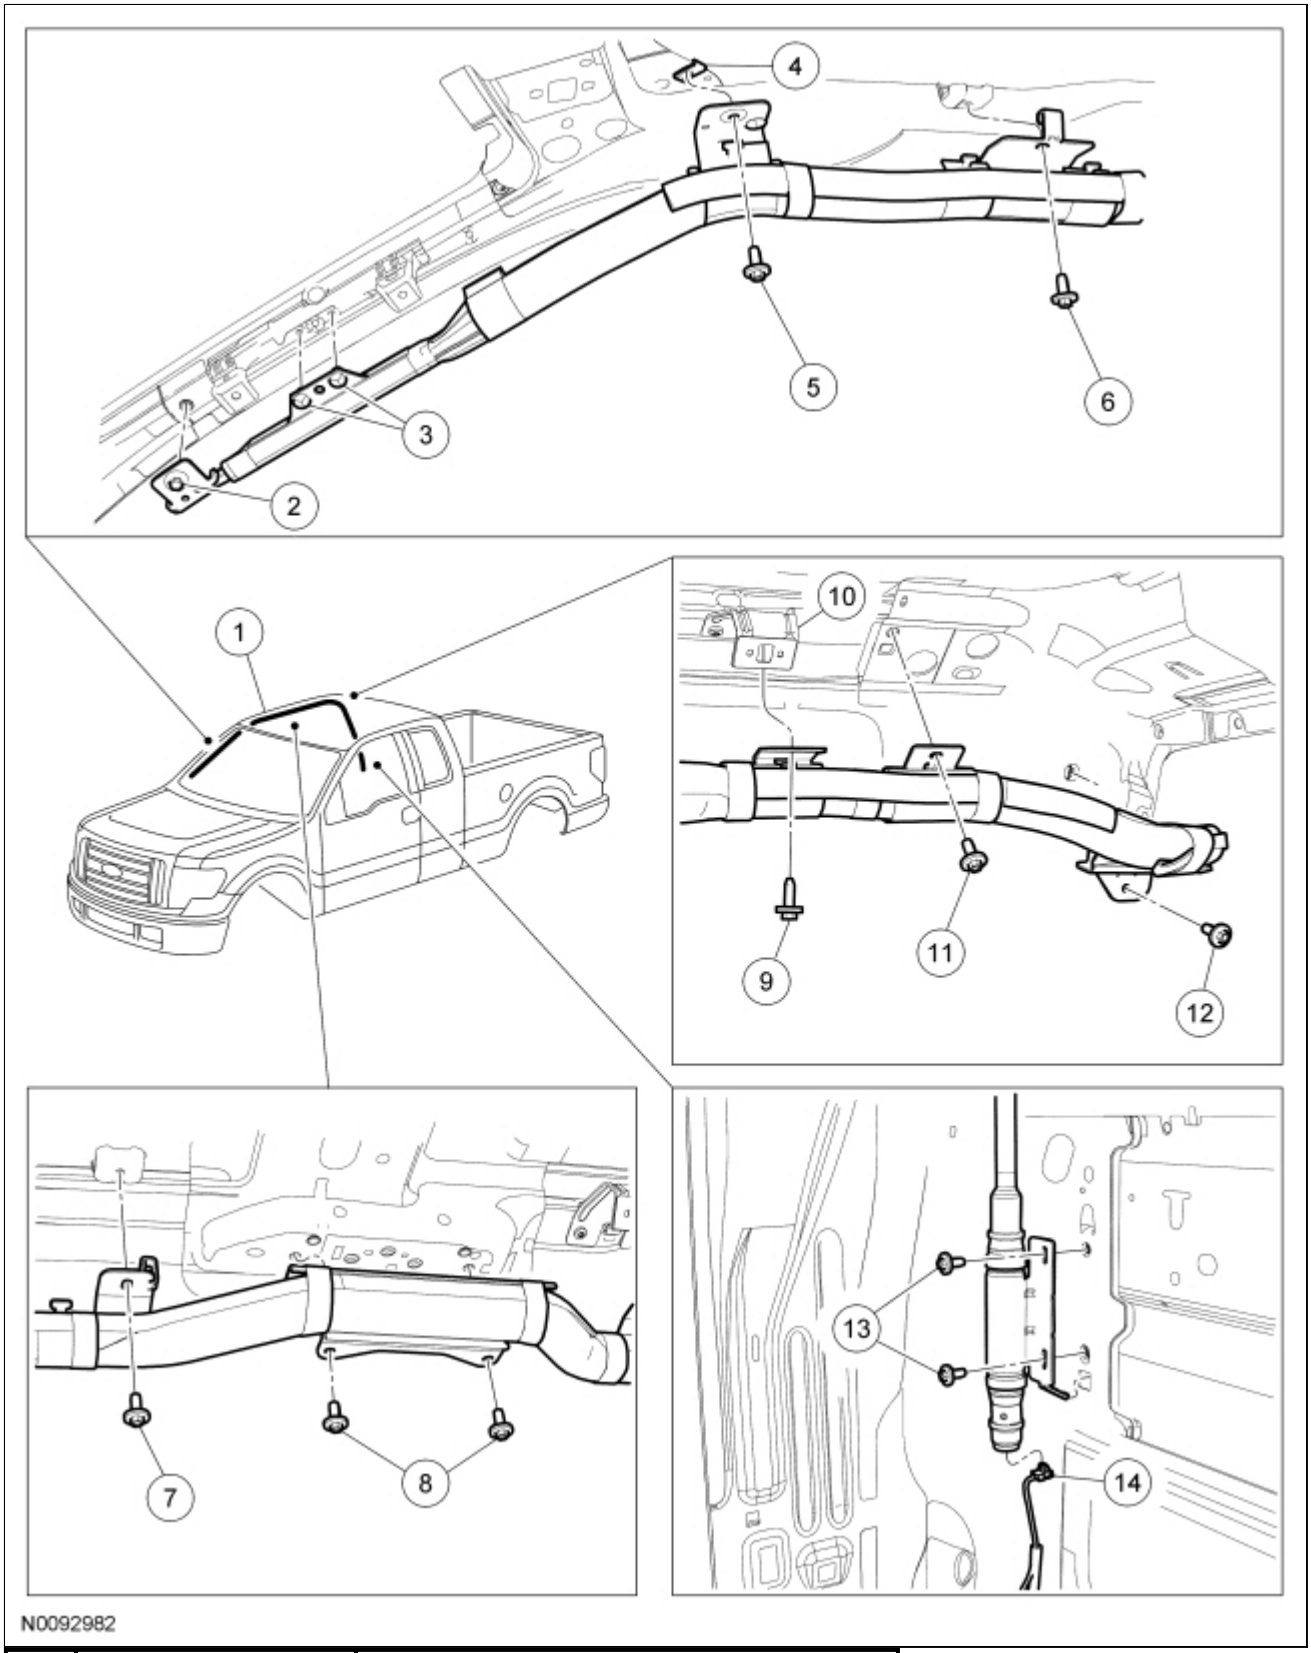
6. If equipped, install the floor console. For additional information, refer to Section 501-12 .

7. If equipped, install the front center seat cushion and cupholder assembly. For additional information,

repair4less

refer to Section 501-10 .

8. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.



9. If a new RCM was installed, carry out the appropriate steps to complete the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

Safety Canopy Module

NOTE: SuperCab shown, other cab styles similar.

NOTE: The Safety Canopy® module bolts must be tightened in the sequence described in this procedure.

repair4less

N0092982

Item	Part Number	Description
1	042D94 RH/ 042D95 LH	Safety Canopy® module

2	—	A-pillar tether bolt (part of 04D94 RH/ 042D95 LH)
3	—	Pin-type retainers (part of 04D94 RH/ 042D95 LH)
4	—	J-nut
5	W713976	Bolt
6	W713976	Bolt
7	W713976	Bolt
8	W713976	Center locator bolts
9	W713976	Bolt
10	29019	Roof opening panel bracket (if equipped)
11	W713976	Bolt
12	W713976	Bolt
13	W713976	Safety Canopy® module canister bolts
14	—	Electrical connector (part of 14A005)

Removal

WARNING: Always carry a live Safety Canopy or side air curtain assembly with the tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

WARNING: Anytime the Safety Canopy® or side air curtain module has deployed, a new headliner and new A-, B- and C-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the Safety Canopy® or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

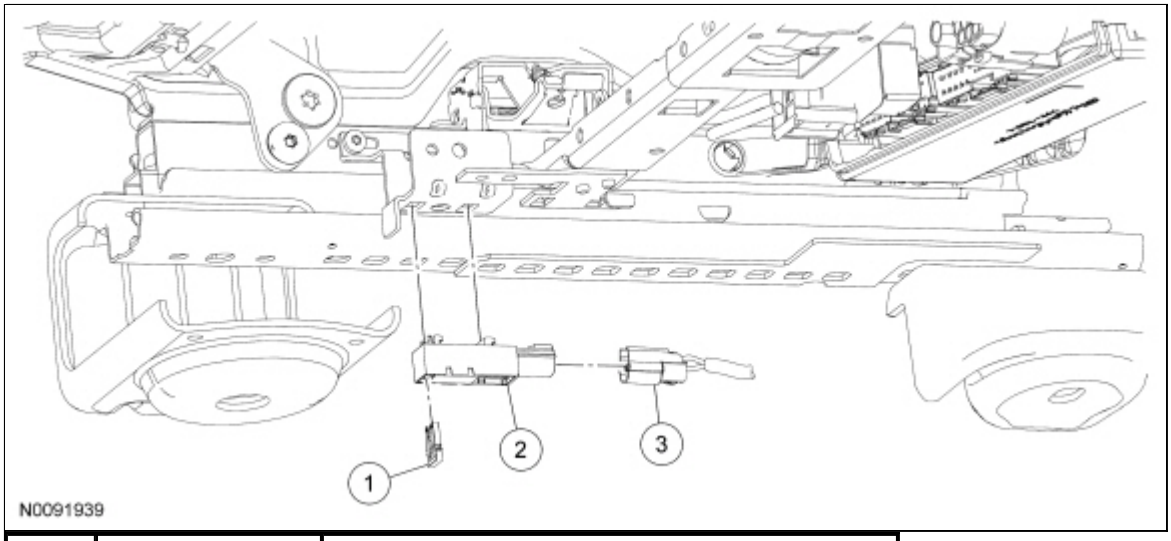
2. Remove the headliner. For additional information, refer to Section 501-05 .

3. Detach the 2 Safety Canopy® module pin-type retainers from the A-pillar.
   - If equipped with a satellite radio, on the RH side detach the pin-type retainers and position the antenna lead aside.

repair4less

4. Remove the A-pillar tether bolt.
5. Remove the 10 Safety Canopy® module bolts.
6. Disconnect the Safety Canopy® module electrical connector.
7. Detach the Safety Canopy® module canister hook from the sheet metal slot.

8. Remove the Safety Canopy® module.



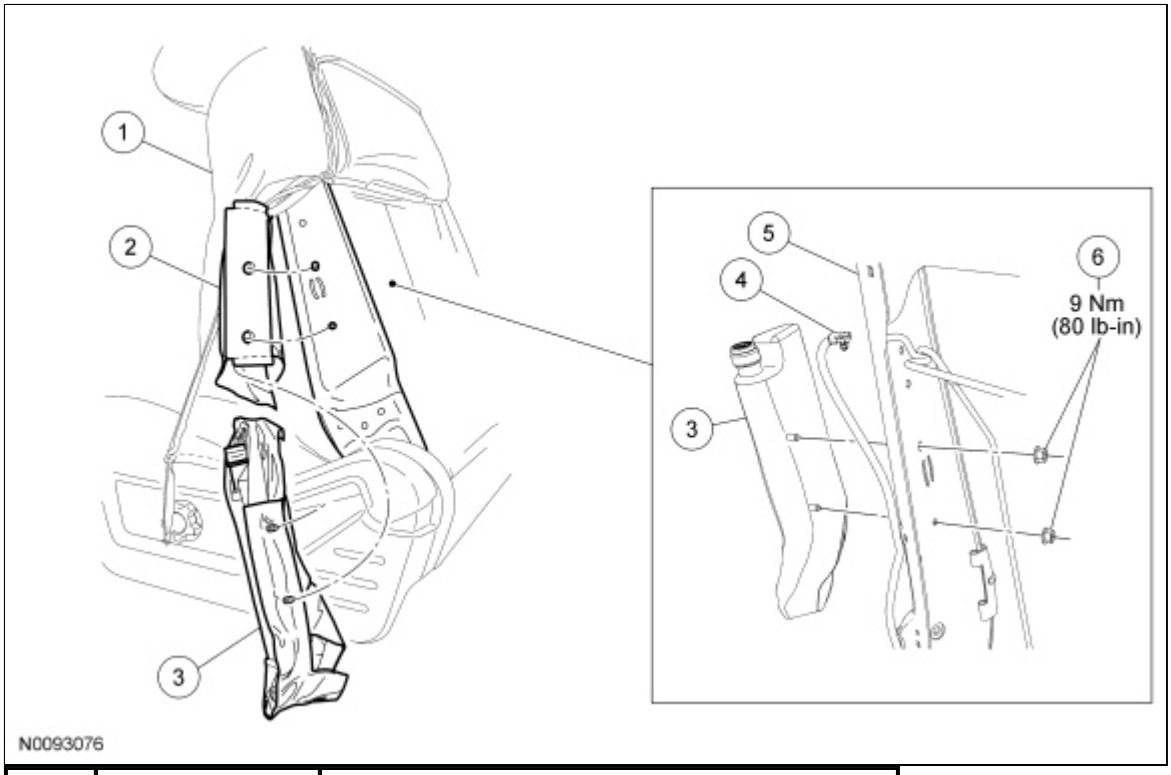
Installation

WARNING: Before installing a Safety Canopy or side air curtain assembly, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the Safety Canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: Inspect a Safety Canopy® or side air curtain module before installation. If the module is damaged, the cover has separated or the Safety Canopy® or side air curtain material has been exposed, install a new module. Do not attempt to repair the module. Failure to follow these instructions may result in the Safety Canopy® or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: Never put any type of fastener or tie strap around any part of a Safety Canopy® module, side air curtain module or interior trim panel. This will prevent the Safety Canopy® or side air curtain module from deploying correctly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

Seat Position Sensor



Item	Part Number	Description
1	—	Lock tab
2	14B416	Seat position sensor
3	—	Electrical connector (part of 14A699)

1. Remove the driver seat. For additional information, refer to Seat Removal and Installation in Section 501-10 .
2. Disconnect the seat position sensor electrical connector.
3. Remove the lock tab.
4. Remove the seat position sensor.
5. To install, reverse the removal procedure.

repair4less

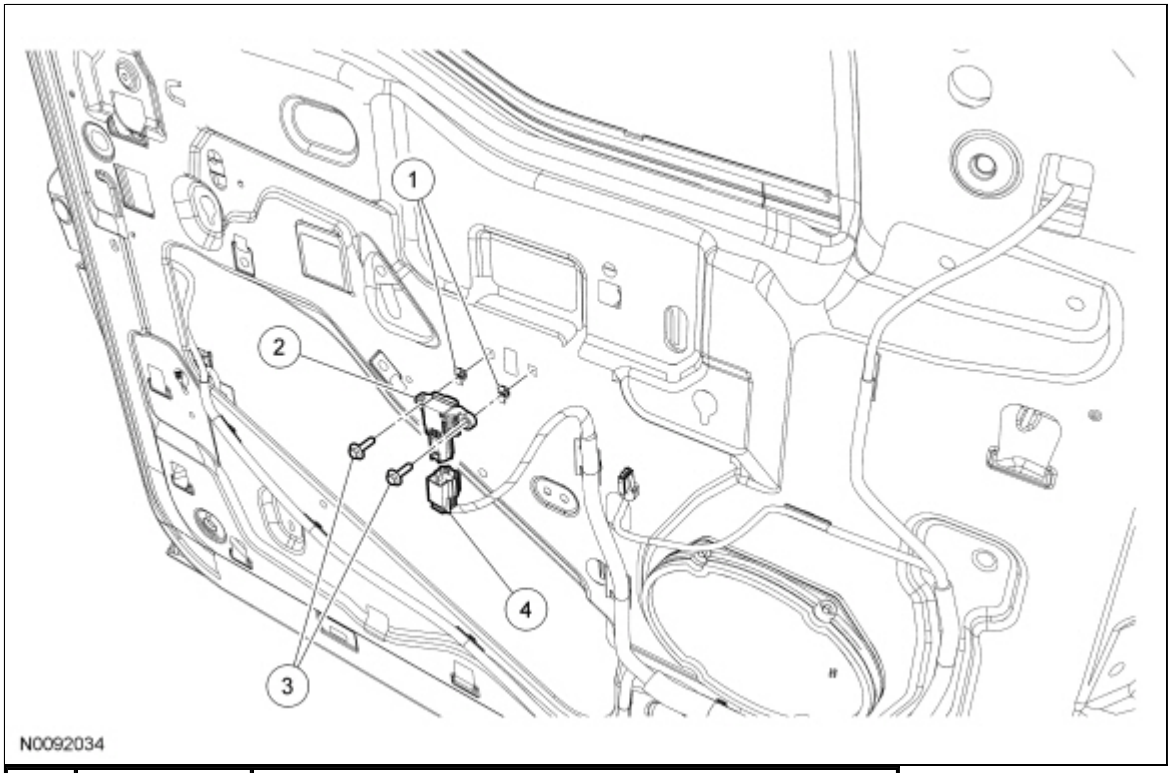
Side Airbag

NOTE: Driver seat shown, passenger similar.

Item	Part Number	Description
1	64417	Backrest cover
2	—	Deployment chute (part of 64417)
3	611D10	Side air bag module
4	—	Electrical connector (part of 14K155)
5	61018	Seat backrest frame
6	W520111	Side air bag module nuts (2 required)

Removal and Installation

WARNING: Always carry a live airbag with the deployment door, trim cover or tear seam pointed away from the body. Do not place a live airbag down with the deployment door, trim cover or tear seam facing down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.



WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

repair4less

WARNING: If the seat side airbag cover has been damaged or separated from its mounting, or if the airbag material has been exposed, install a new seat side airbag assembly. Never try to repair the seat side airbag assembly. Failure to follow these instructions may result in the seat side airbag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

Side Impact Sensor — Front Door

NOTE: LH door shown, RH door similar.

Item	Part Number	Description
1	W710564	Insert nuts (2 required)
2	14B345	Side impact sensor (pressure sensor)
3	W705314	Side impact sensor bolts (2 required)
4	—	Side impact sensor electrical connector (part of 14631)

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the airbags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

repair4less

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

2. Remove the front door trim panel. For additional information, refer to Section 501-05 .

3. Disconnect the electrical connector.

4. ***NOTICE:*** **To prevent stripping the insert nuts, tighten the side impact sensor bolts only enough to secure the side impact sensor.**

   Remove the bolts and side impact sensor.

5. To install, reverse the removal procedure.

6. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

Side Impact Sensor — Second Row

NOTE: RH side shown, LH similar.

Item	Part Number	Description
1	—	Electrical connector (part of 14A005)
2	14B345	Side impact sensor
3	W505256	Side impact sensor bolt

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the airbags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

repair4less

2. **SuperCab:** remove the B-pillar trim panel.
   SuperCrew: remove the C-pillar trim panel.
   For additional information, refer to the Removal and Installation procedures in Section 501-05 .

3. Disconnect the side impact sensor electrical connector.

4. **WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   NOTE: Make sure the B- or C-pillar and side impact sensor mating surface is clean and free of foreign material.

   Remove the bolt and side impact sensor.
   - To install, tighten to 12 Nm (106 lb-in).

5. To install, reverse the removal procedure.

6. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

Boron) [e]								
Transformation Induced Plasticity Steel (TRIP)	TRIP 590, TRIP 780, TRIP 980	N/A	N/A	N/A	N/A	N/A	N/A	N/A

[a] Cold repairs can be performed if damage excludes kinks. May section only if approved procedure in workshop manual.

[b] MIG braze allowed for non-structural applications only.

[c] Dual phase steels DP 700, DP 780, DP 980 and DP 1000 must be replaced at factory joints, no sectioning unless approved procedure in workshop manual.

[d] For DP 980 and DP 1,000 class, use Metal Inert Gas (MIG) plug welding only, no stitch welding.

[e] Boron components must be replaced at factory joints, no sectioning allowed.

Adhesives

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Metal Bonding Adhesive TA-1	—
Plastic Bonding Adhesive TA-9	—
Trim and Weatherstrip Adhesive TA-14-A	—

Adhesives are used in a variety of applications. Typical uses for adhesives include roof panels, door skins and quarter panels. Trim applications include body side mouldings, emblems, stationary glass and weatherstripping. Combination sealer/adhesives are also used. Surface preparation is critical to a high quality repair. Following the label instructions for the product is essential.

Work in a well-ventilated area and protect adjacent surfaces when working with adhesives. The use of eye protection and protective clothing is also recommended when working with adhesives. Carry out a trial fit, mark and align the surfaces before bonding the materials together.

Seam sealers and corrosion protection may be necessary once the adhesive(s) has cured, depending on the application. The following is a list of adhesives recommended for certain types of applications:

- Metal Bonding Adhesive — For bonding cold-rolled steel, galvanized steel, aluminum and correctly prepared E-coat. It is used for door skin and roof panel replacement and OEM structural adhesive replacement.
- Plastic Bonding Adhesive — For bonding a variety of plastics to plastics and plastics to primed, painted or E-coated metals. Also for general purpose bonding of trim components.
- Trim and Weatherstrip Adhesive — For use on body side moulding, emblems, trim, bumper impact strips and carpeting.
- Clear Silicone Rubber — Used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

Structural Adhesive

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Observe the prescribed welding procedures when carrying out sheet metal repairs. Refer to Weld-Bonding in this section.**

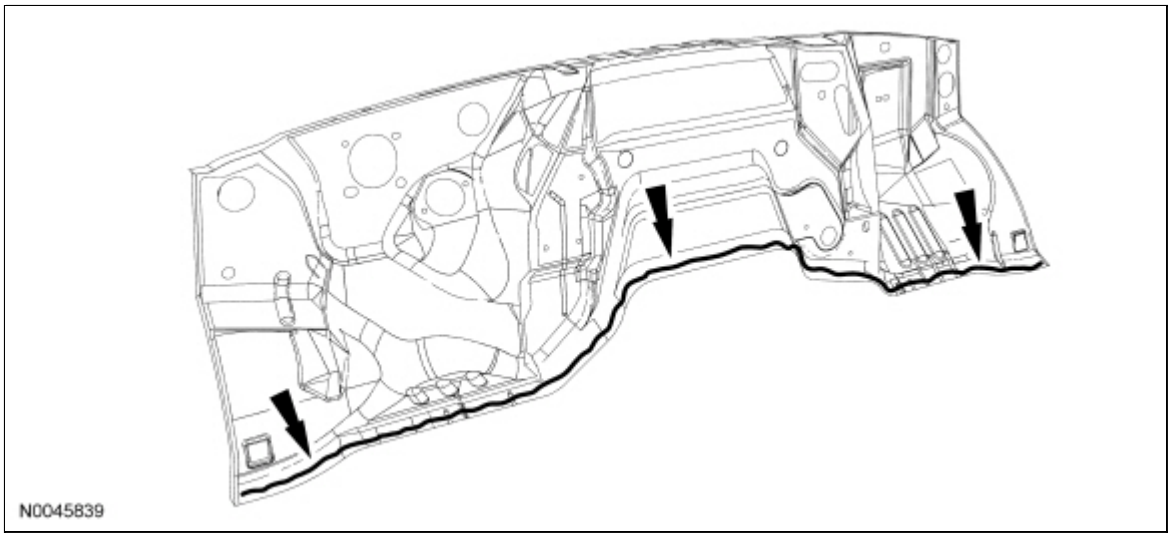
repair4less

NOTE: Ford Motor Company does not approve or recognize structural repair procedures using anything but genuine Ford parts.

Structural repairs (frames, rails, aprons and body panels) carried out using other than Ford Motor Company parts have not been tested. In addition, structural equivalence and corrosion protection cannot be assured.

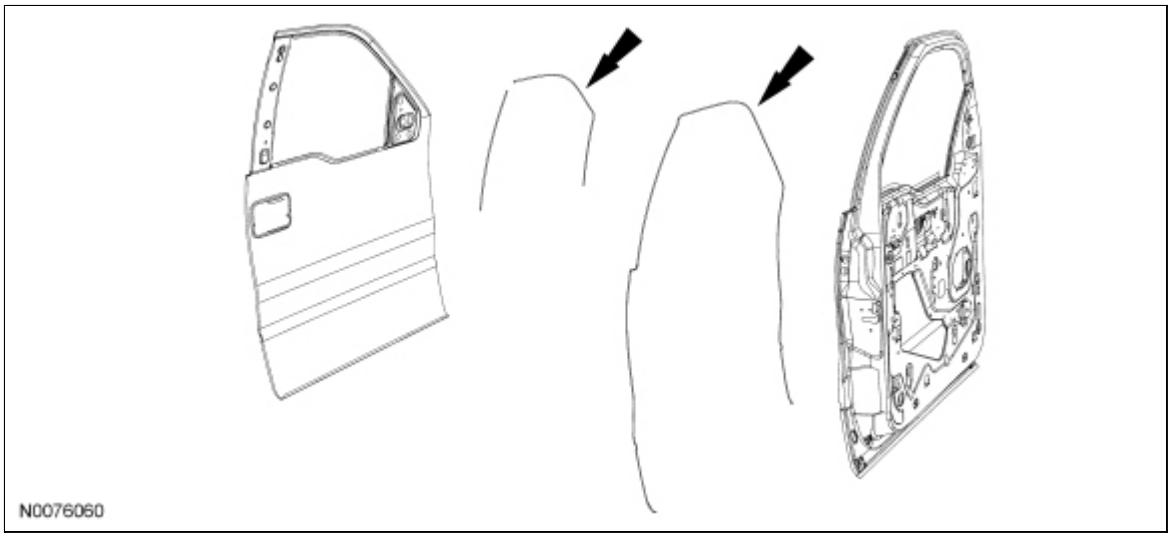
Returning a vehicle to pre-accident condition can only be assured if repair procedures are carried out by skilled technicians using genuine Ford Motor Company parts and approved methods.

Structural component repair procedures approved by Ford using genuine parts have been validated through testing by Ford Motor Company engineers. Should alternative structural component repair procedures and/or parts be used, repairers should be aware of the potential liability they incur.



NOTE: Factory spot welds may be substituted with either Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

NOTE: Remove the outer body sheet metal from the affected area prior to carrying out any reinforcing panel replacement. Refer to Sectioning Guidelines in this section.



NOTE: The following illustrations show the application and location of structural adhesives.

NOTE: Arrows indicate adhesive application locations.

Body

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

The body consists of the following:

- Cab-forward design
- Full frame bolted to the body
- Aluminum hood
- Body side outer panel constructed of dent resistant High-Strength Steel (HSS) and mild steels
- Magnesium radiator support
- Front structure inner reinforcement is hydroformed High-Strength Low Alloy (HSLA) rail assembly
- Lightweight steel welded panel construction
- Extensive use of HSLA , Dual Phase Steel (DP) and Boron steel in the cab body structure(s)
- Dash panel constructed of laminated sound/vibration steel
- Bolted, removable front fenders, hinged doors, tailgate and hood
- Fender outer panels constructed of dent resistant HSS steel
- Front and rear door outer panels constructed of dent resistant HSS steel
- Structural adhesive used throughout the body shell and underbody
- Regular cab, SuperCab and SuperCrew cab styles
- Styleside pickup bed available with 1.67 m (5.5 ft), 1.98 m (6.5 ft) and 2.44 m (8.0 ft) pickup bed length
- 3,198 mm (126 in) wheelbase
- 3,365 mm (133 in) wheelbase
- 3,671 mm (145 in) wheelbase
- 3,988 mm (157 in) wheelbase
- 4,140 mm (163 in) wheelbase
- **NOTE:** For information regarding cab style and pickup bed configurations, refer to Section 100-01 .

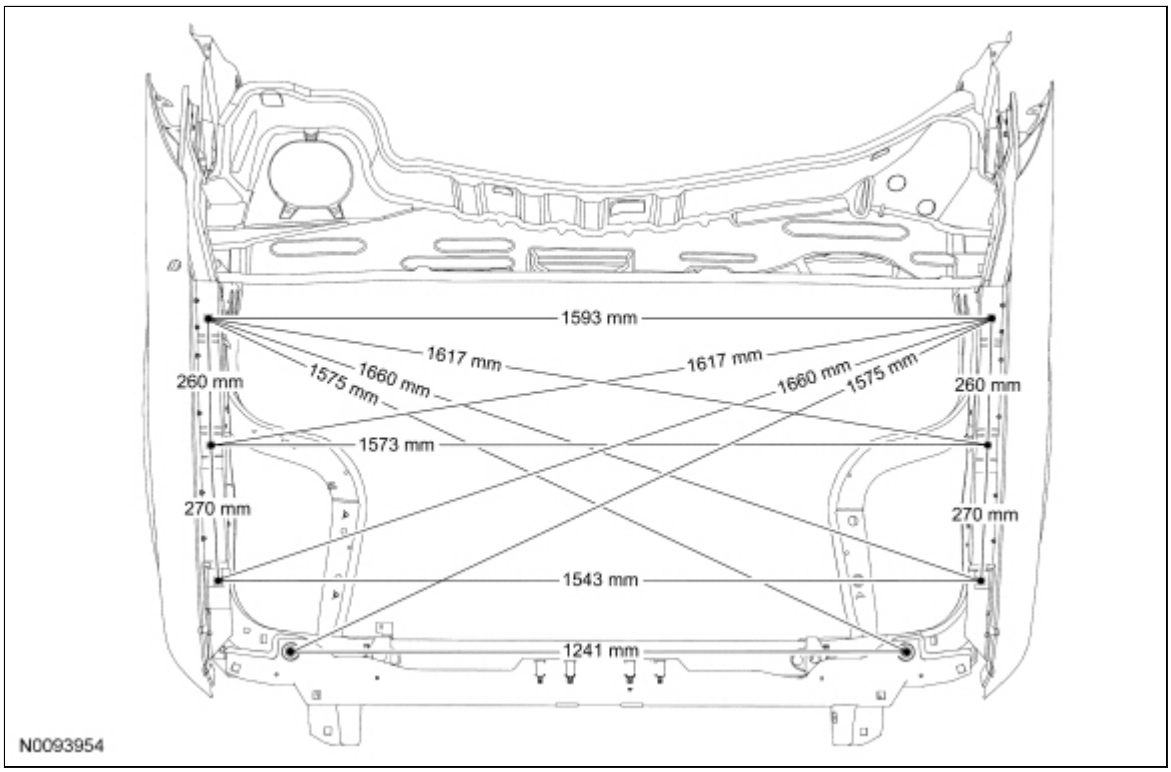
  Platinum edition available in SuperCrew cab style only
- Platinum edition has unique chrome body side cladding
- Platinum edition has unique chrome pickup bed rail bars
- Mastic sound deadener material used on floor pans

F-150 SVT Raptor package contains the following:

- SuperCab
- 1.67 m (5.5 ft) pickup bed length
- Steel pickup bed outer panels

- 3,365 mm (133 in) wheelbase
- Sheet-Molded Composite (SMC) hood and front fenders
- Unique grille
- Modified front and rear bumpers

Lincoln Mark LT (Mexico only) contains the following:



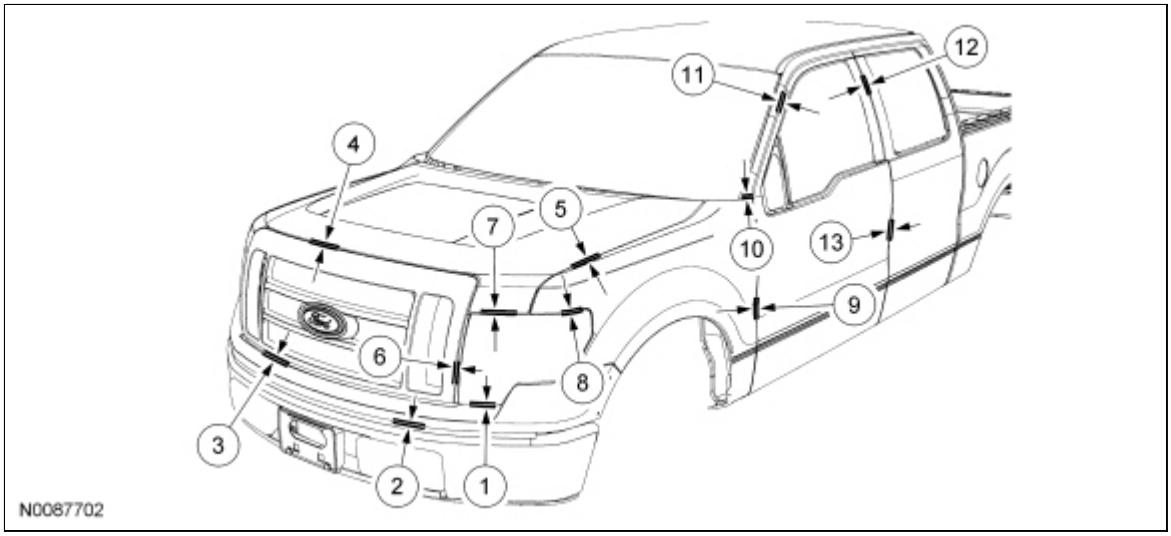
- Lincoln Mark LT available in SuperCrew cab, styleside
- Lincoln Mark LT has unique chrome grille
- Lincoln Mark LT has unique chrome body side cladding
- Lincoln Mark LT has unique chrome pickup bed rail bars
- Lincoln Mark LT has unique tailgate applique

For dimensional information, refer to the following illustrations.

Underhood Dimensions

NOTICE: **The front structure rails cannot be sectioned and must be serviced at the original factory seam locations or as an assembly if damaged. It is mandatory that the replacement section be installed as delivered at the original factory seam locations or energy collision management can be compromised.**

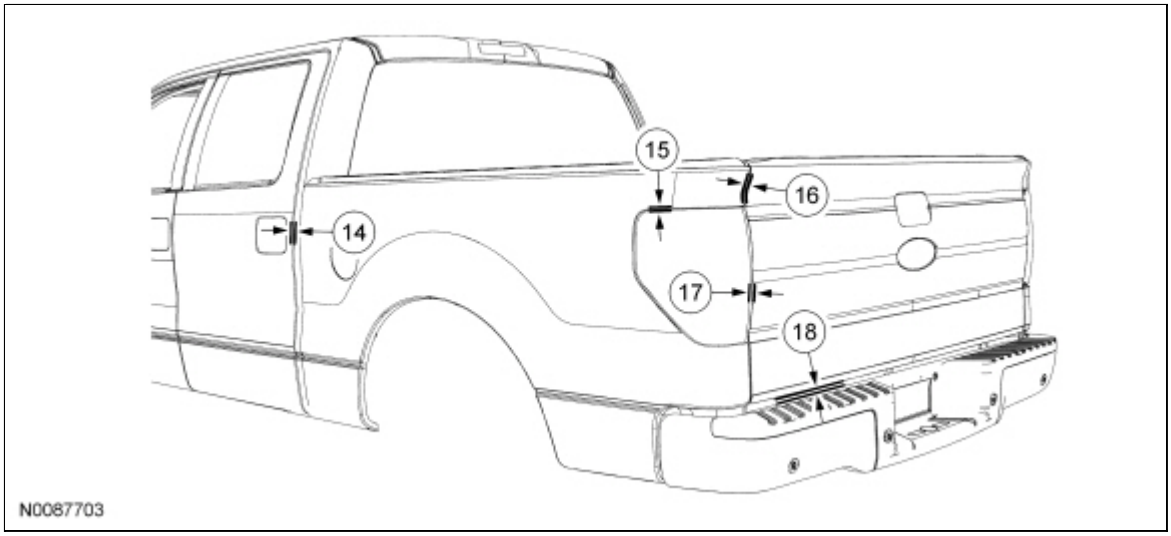
NOTE: Measurements are obtained on center, unless otherwise indicated.



Body Margins

NOTE: Dimensions apply to all cab and box styles unless otherwise indicated. Dimensions apply to right and left side. SuperCrew cab shown.

repair4less



NOTE: F-150 SVT Raptor hood, grille and fender margin specifications are identical with F-150.

Item	Description	Specification	Flushness Specification
1	Headlamp to upper fascia	3.0 mm (0.118 in) ± 3.0 mm (0.118 in)	—

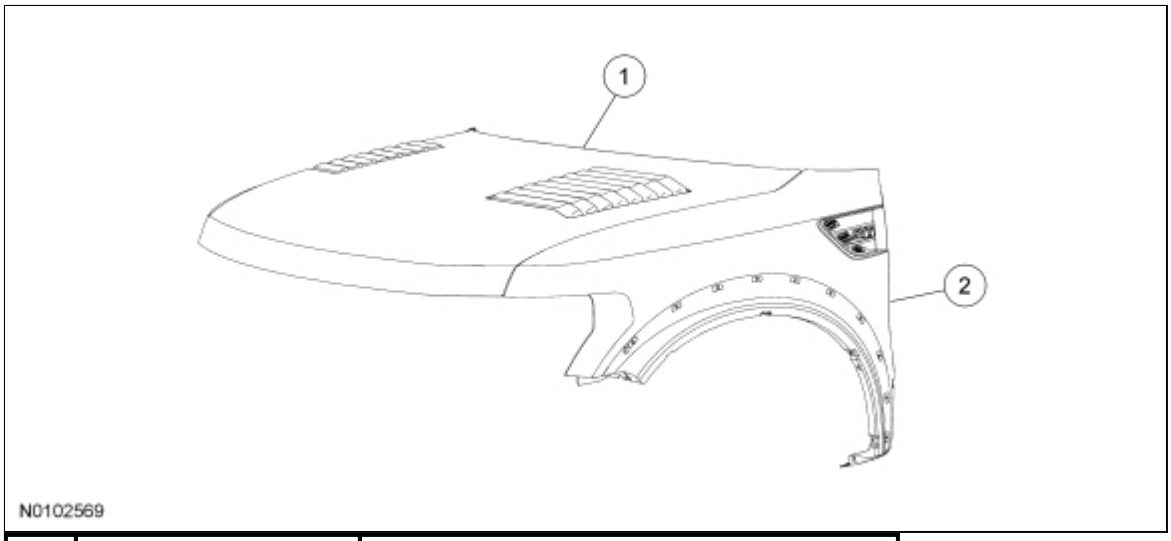
Plastic Components



Exterior Plastic Components — Painted

NOTE: The following illustration(s) are not all-inclusive of trim levels available. The actual trim level of the vehicle will determine the viability of carrying out a plastic repair.

Item	Part Number	Description
1	29165 LH/ 29164 RH	Wheel arch moulding (rear) — Thermoplastic Olefin (TPO)
2	16039 LH/ 16038 RH	Wheel arch moulding (front) — TPO
3	17D957	Bumper cover (front) — TPO

F-150 SVT Raptor

Item	Part Number	Description
1	16612	Hood panel — Sheet-Molded Composite (SMC)
2	16006A LH/ 16005A RH	Fender — SMC

Several considerations will determine viability of plastic repair procedure(s):

- Is the damage cosmetic or structural?
- Can the repair be carried out on the vehicle?
- Is the part readily available?
- Is component repair the most cost effective method?
- Can the component be economically restored to original strength and appearance?
- Will the repair provide for the fastest, highest quality repair?

Several types of plastic are in use for automotive application. However, all plastics will fall into 2 primary categories of thermoplastic or thermosetting plastic.

Thermosetting Plastic

Generally, thermosetting plastics are made with 2-part thermosetting resins. When mixed together, heat is generated, producing a cure that is irreversible. Because of this, thermosetting plastics will require the use of a 2-part adhesive for repair.

Sheet-Molded Composite (SMC)

Sheet-Molded Composite (SMC) is a type of thermosetting plastic that uses glass fibers or nylon fibers in combination with thermosetting polyester resins. When fully cured, SMC is strong and rigid.

SMC is similar to, but not identical to fiberglass. Ford Motor Company uses SMC in components such as fenders, hoods and liftgates.

Thermoplastic Compounds

Thermoplastic compounds are manufactured by a process that is reversible. Thermoplastics can be remolded repeatedly by reheating. This characteristic of thermoplastics makes plastic welding a possible

repair4less

repair alternative. A repair of thermoplastic compounds is still possible through the use of 2-part adhesive and filler repair materials and reinforcements as needed. Thermoplastics are widely used in interior trim components, wheel flares, body side cladding and bumper covers.

Polyolefin

Polyolefins fall into the family of thermoplastics with one unique characteristic: An oily or waxy feel to the material when sanded or ground. Polyolefin lends itself very well to remolding through the use of heat. Because of this, components made of this material lend themselves well to the possibility of plastic welding. Most adhesive repair materials and paint will not bond to surface of a polyolefin unless an adhesion promoter specially formulated for plastic is first applied to the exposed raw surface. Otherwise, polyolefins are repaired like most other thermoplastics. Some typical uses of polyolefins are bumper covers, fan shrouds and wheel housings.

Correct identification of the various types of plastic is necessary to select the appropriate repair method(s) to carry out high quality plastic repairs. Refer to Plastics Identification in this section.

Sealers

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

The correct sealing of joints is essential to repairing the vehicle correctly. Sealers are used to prevent wind noise, water leaks, exhaust fumes and dust from entering the vehicle. They also provide anti-corrosion barriers. Sealers are applied to areas such as door and rear compartment hem flanges, wheelhouse, quarter outer, floor, cowl, roof and other panel-to-panel attaching points. The following joint sealers are recommended for use depending upon the application:

- Brushable Seam Sealer — A sealer intended to restore the original brushed seam appearance. It is used to seal lap joints in sheet metal that are spot welded (for example, floorpans and cowls). Use a product obtained locally.
- Roof Ditch Sealer — A self-leveling sealer used for drip rails, roof seams, quarter panels to rear deck and for water leaks.
- Seam Sealer — Heavy-bodied, non-sag adhesive/sealer for use on standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans. Also used for water leaks and noise concerns.

Sealers should remain flexible after curing and must be paintable. Follow the manufacturer's directions for correct application of these materials.

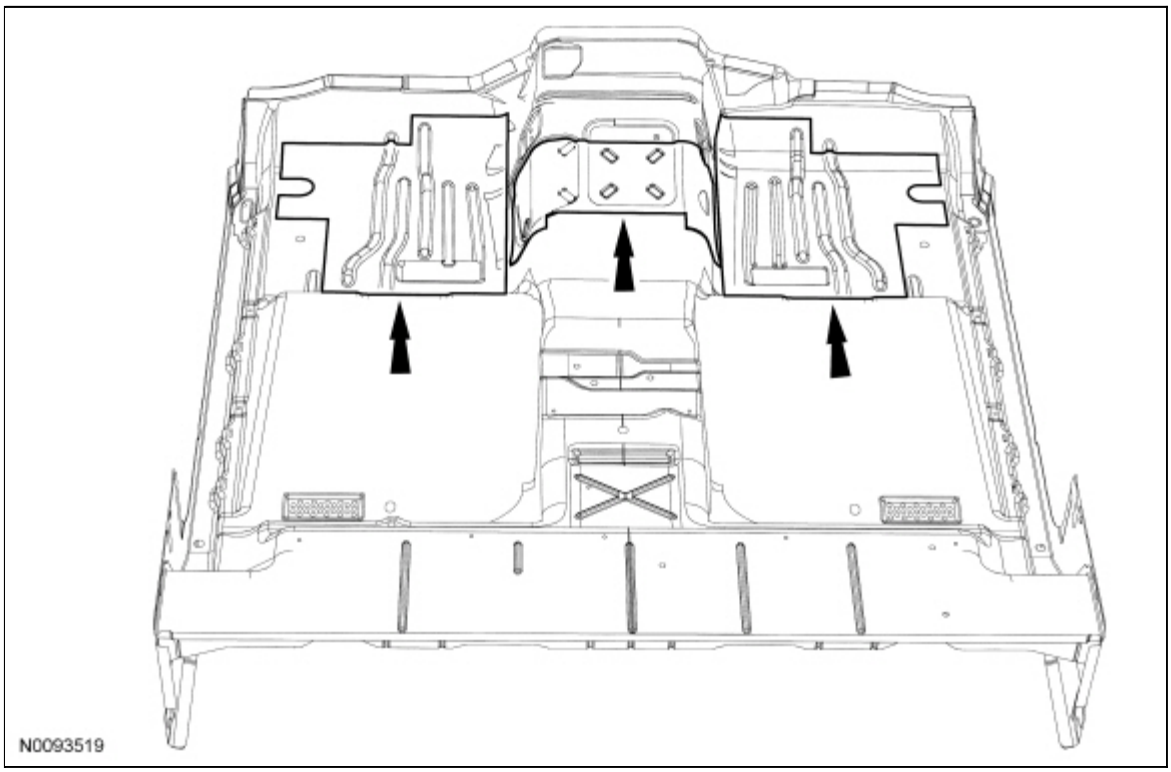
Any damage to originally sealed joints should be repaired by resealing. Along with attaching points of new panels, open joints that require bridging of sealer to close a gap should be sealed using a heavy-bodied sealer.

repair4less

Sound Deadeners and Insulators

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Mastic is made of a combustible material and should be removed prior to carrying out welding procedures to the area. Heat zones from welding near the mastic can cause the mastic material to burn.**

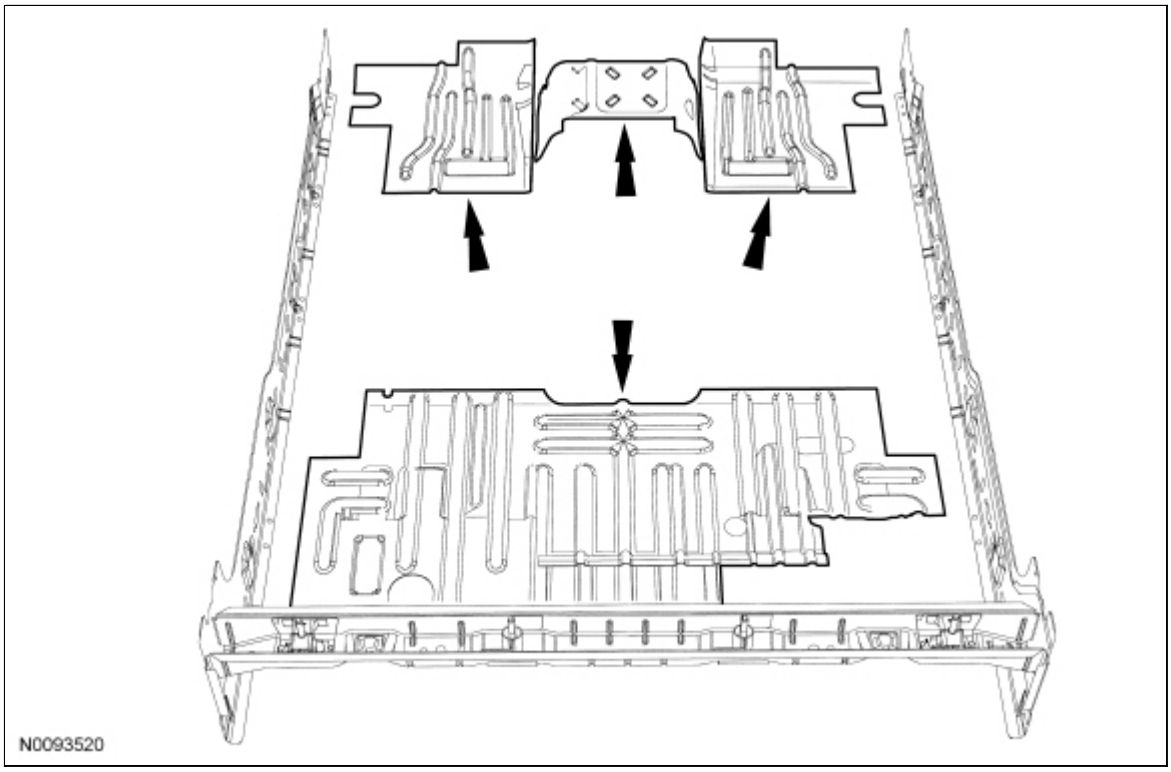


NOTICE: **Corrosion protection must be restored to the area AFTER the mastic material is applied. Corrosion protection products may be wax based and loss of adhesion may occur.**

NOTE: The following illustrations serve as a reference to indicate mastic patch (butyl pad) locations. Additional insulators and sound deadeners are used beyond those indicated in the illustration.

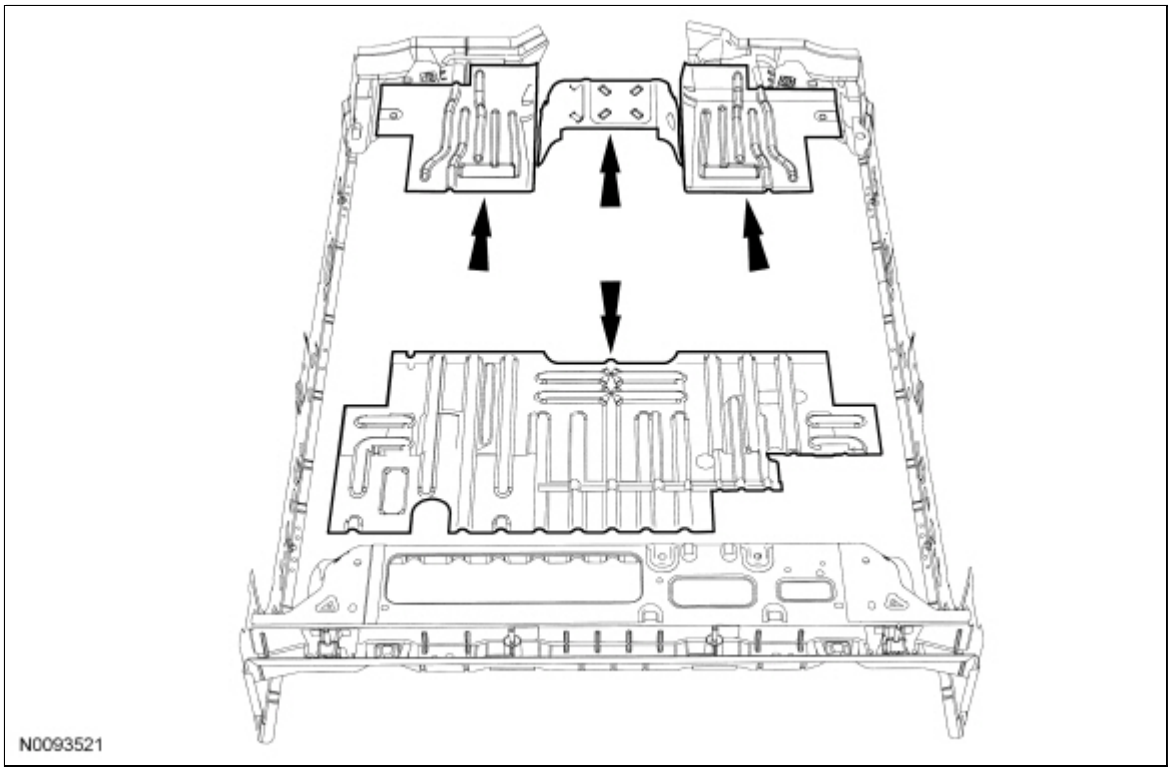
NOTE: To restore the vehicle to design intent, missing or damaged sound deadeners and insulators should be replaced with the equivalent service replacement component. In instances where pumpable material is applied when manufactured and can not be duplicated, cut-to-fit mastic material is an acceptable replacement.

Regular Cab



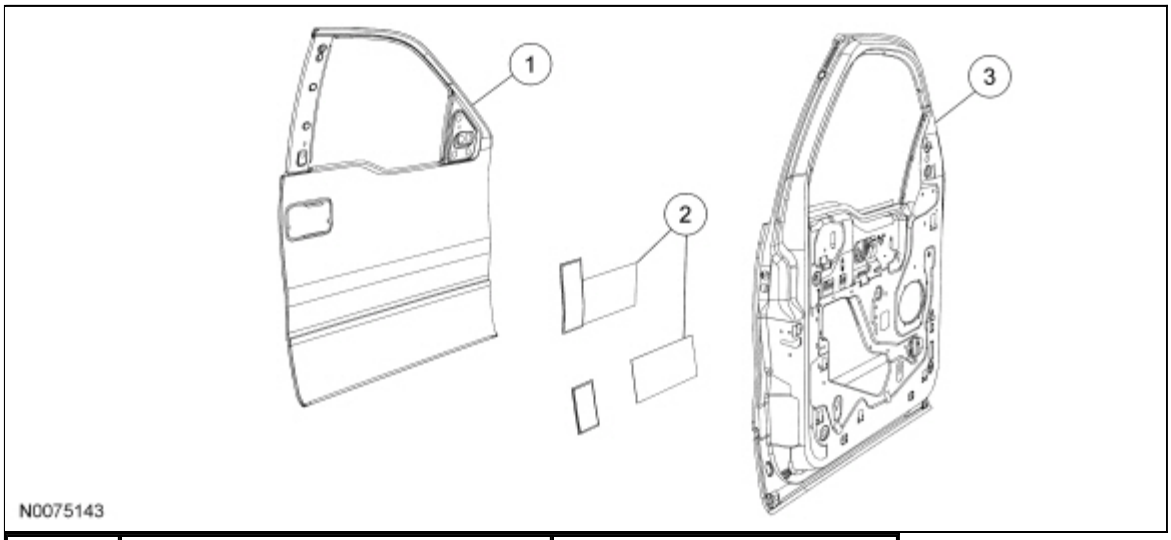
NOTE: Floor pan interior view.

repair4less



SuperCab

NOTE: Floor pan interior view.



SuperCrew Cab

NOTE: Floor pan interior view.

Door

NOTE: Front door shown, rear door(s) similar.

Item	Part Number	Description
1	20201 LH/ 20200 RH	Door outer panel
2	99P30A2	Mastic material
3	20125 LH/ 20124 RH	Door assembly

1. Whenever replacement of an existing mastic insulator is carried out, the surface must be thoroughly cleaned to make sure correct adhesion will occur. The surface should be 10°C (50°F) or greater before applying the mastic. The use of a heat gun to warm the metal surface will aid in adhesion.

repair4less

Welding Precautions — Steel

Material

General Specifications -Welding Specifications

 **WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.**

repair4less

Anchoring and Pulling Guidelines

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

NOTICE: **The unique cab structure design and material characteristics of the cab(s) require unique and specific anchoring equipment to ensure proper restoration of pre-accident condition of the vehicle. In instances of crash damage extending in to the cab platform, the cab may need to be removed from the frame for correct repair. Failure to use the correct equipment or technique recommendations may result in inadvertent additional damage to the cab structure and floor.**

NOTICE: **Anchoring equipment must be used to hold the cab at both the pinch welds and at all the cab mount isolator locations. Failure to use the correct equipment or technique recommendations may result in inadvertent additional damage to the cab structure and floor.**

NOTE: Crew Cab shown, others similar.

1. Anchor the vehicle at both the pinch weld locations and the cab mount locations as indicated in the illustrations. Use the original cab mounting hardware with the anchoring equipment. For dimensional information of the frame and body, refer to Body in this section.

Plastics Identification

repair4less

Plastics Repair

Material

Item	Specification
Plastic Bonding Adhesive TA-9	—

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

1. In deciding whether to repair or install a new component, follow these guidelines.
   - Is a part readily available?
   - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
   - Will repair provide for the fastest, highest quality repair?

2. ***NOTICE:*** **Never apply solvents such as lacquer thinner or reducer at any stage of plastic repair. Solvents, cleaners and water are absorbed by many types of plastics and by the glass fibers used for reinforcements. If this occurs, the plastic may swell in the area of repair and cause the repair to fail. Remove cleaners and water quickly and use air and heat to speed up drying.**

   NOTICE: **During the repair of many plastics and particularly polyolefin plastics, an adhesion promoter must be applied to the substrate to allow repair materials and paint to bond correctly. Reapplication is required when grinding or sanding through the sealer or primered layers.**

   NOTE: When possible, it is recommended to carry out as much of the plastic repair as possible on the vehicle. Parts mounted on the vehicle are held in correct alignment throughout the repair. Attempting to repair the part off the vehicle may cause misalignment. This could lead to failure of the repair.

   Select the correct repair method by identifying the type of plastic being repaired. For additional information, refer to Plastics Identification in this section to determine the type of plastic being repaired.

3. **NOTE:** Always refer to the manufacturer's label directions for the type of repair materials, fillers and bonding agents being used as they are material specific.

   Determine whether a reinforcement piece is needed as a backer on large repairs.
   - Construct a reinforcement piece from a scrap piece of the type of plastic being repaired and

follow manufacturer's label directions for the type of system being used.

- When repairing Sheet-Molded Composite (SMC), a reinforcement piece can be constructed using several layers of glass cloth saturated with resin or structural adhesive. The weave of the cloth or screening should be loose enough to allow the resin to thoroughly penetrate. Reinforcement should cover the entire area of damage and extend outward beyond the damage or joint area.

Sheet-Molded Composite (SMC) Panel Repair

NOTE: The following procedure applies to repair of structural cracks and large gouges. If damage is cosmetic, use of reinforcing cloth may not be necessary.

1. Panels to be repaired should be dry and at room temperature 18°C (65°F) to 24°C (75°F) prior to carrying out any repairs. Both sides of the panel must be thoroughly cleaned before sanding or grinding.

2. Cover the break in the SMC (front and back) with masking tape. This protects the damaged area from absorbing the prep cleaner and eliminates wicking of the cleaner through the fibers into the SMC .

3. Remove all waxes, silicones, dirt and road oils from the area surrounding both sides of the damaged area with a plastics wax and grease remover.
    - Remove the tape and sand the back of the repair area with an angle grinder, Dual Action (D/A) sander or by hand using 80-grit sandpaper. Remove all dust with a vacuum and tack cloth.

4. Create a reinforcing patch using a piece of scrap SMC that conforms well to the back of the damaged area or form a patch from fiberglass cloth.
    - Cut a section of cloth large enough to cover the repair, plus 25.4 mm (1 in) around the repair area.
    - Cut a section of plastic film backing approximately 25.4 mm (1 in) larger than the cloth. Lay the plastic on a smooth, flat surface where it will be used to create a pyramid patch.

5. Follow manufacturer's directions and apply plastic repair adhesive to the plastic film backing and smooth with plastic spreader to recommended thickness. Place the pre-cut fiberglass cloth on the adhesive-coated plastic film. Cover the cloth with a coat of repair adhesive and spread to the recommended thickness.

6. Apply the prepared patch to the backside of the panel and compress. Follow manufacturer's instructions for adhesive cure. Remove plastic film after adhesive cures and sand as necessary to remove roughness.

7. Remove masking tape from the front side of damaged area and grind down to the backing patch. Use an angle grinder with a 30- to 40-grit wheel. Make a gradual taper in the area, this will prevent bull's-eyes or read-through in the finished repair. Sand prepared area with a D/A sander or hand-sand with 80-grit sandpaper.

8. Build a pyramid patch using fiberglass cloth or equivalent and plastic repair adhesive. Following manufacturer's directions, apply patch to damaged area.

9. Rough-grind area to remove excess adhesive. Sand repair area with 80-grit sandpaper, making sure to cut slightly below the SMC finished surface. This will allow for a finish coat of plastic body repair material.

10. Apply a finish coat of plastic repair filler material per manufacturer's directions.

repair4less

11. Finish-sand, prime and topcoat using Ford-approved paint systems.

Thermoplastic Compounds

1. In deciding whether to repair or install a new component, follow these guidelines.
    - Is a part readily available?
    - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
    - Will repair provide for the fastest, highest quality repair?

2. **NOTE:** The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

   Thoroughly clean the damaged area with wax and grease remover formulated for use with plastics.

3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.

4. Apply a plastics adhesion promoter per label directions to the repair area.

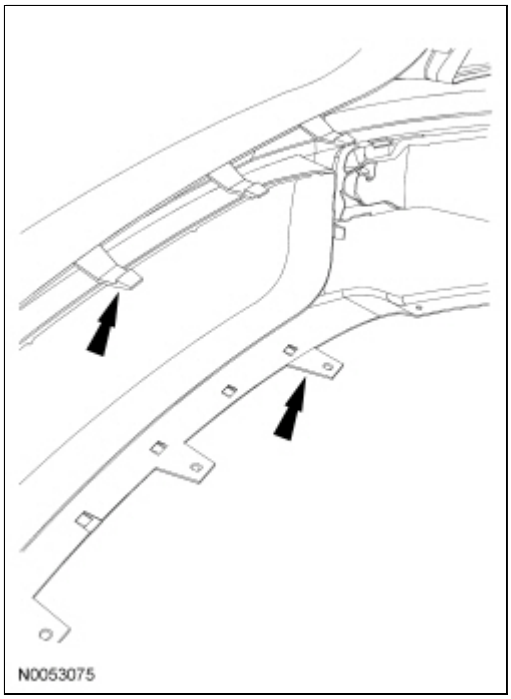
5. For small repairs, a plastic adhesive filler can be applied to the damaged area. Follow manufacturer's directions and build layers to form a thickness above the damaged area. This will allow the area to be sanded smooth.

6. To repair large holes or cracks, measure and cut a piece of fiberglass cloth or equivalent 25.4 mm (1 in) larger than the crack or hole.
    - Apply plastic repair adhesive to the damaged area and immediately apply fiberglass cloth into plastic adhesive for reinforcement. Apply additional plastic repair adhesive for strength and shape as required.

7. Contour and shape the repair as necessary with a D/A sander. Avoid sanding through the repair.

8. Finish-sand the area and carry out any required paint operations using Ford-approved paint systems.

Tab Repair — Bumper



1. **NOTE:** Inspect the bumper cover to determine if part of it can be repaired to an acceptable level of quality of appearance, fit and durability. Will labor and material cost of the repair meet or exceed the cost of a new replacement bumper cover? If the bumper cover is determined to be repairable, proceed to the following steps.

   NOTE: The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

   Remove the affected bumper. For additional information, refer to Section 501-19 .

NOTE: Illustration is not vehicle specific.

2. Clean the broken tab(s) with a plastics wax and grease remover.

3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.

4. Apply a plastics adhesion promoter per label directions to the repair area.

5. Measure and cut a patch of fiberglass cloth or equivalent large enough to form the front of the tab, then slope back in a wedge shape approximately 51 mm (2 in) from original tab.

6. Prepare the repair adhesive cloth patch per manufacturer's instructions and apply to the affected area.
    - Immediately position the plastic repair material patch to form the tab shape.

7. Allow appropriate cure time and shape the repair tab using a small angle sander. Use extreme care to not sand through the exterior surface.

8. Carry out any required paint repair operations to the bumper cover using Ford-approved paint systems.

9. Reassemble and install the bumper cover. For additional information, refer to Section 501-19 .

Refinishing — Environmental Damage

Material

Item	Specification
Motorcraft® Acid Neutralizer ZC-1-A	—
Motorcraft® Alkaline Neutralizer ZC-2-A	—
3M™ Perfect-It™ Show Car Liquid Wax 39026	—
Motorcraft® Detail Wash ZC-3-A	—

Iron Oxide (Rail Dust) or Acid Rain Decontamination

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

***NOTICE:* In extreme cases of contamination, the vehicle may require refinishing. To avoid paint failure, follow the appropriate decontamination procedure prior to carrying out any panel refinishing procedure.**

NOTE: Iron oxide contamination appears as tiny rust spots on horizontal surfaces and in severe cases can be felt. This damage is typically caused from rail shipment, storage near railroad tracks or fallout from industrial manufacturing facilities.

NOTE: Acid rain contamination can be identified as water spotting and, in severe cases, staining within the water spots.

1. ***NOTICE:* Never paint over iron particles as rust spots will reoccur. Use only the recommended decontamination procedure detailed below.**

   Rinse any dust, dirt and foreign material from the vehicle body with cold water. Flush liberally.

2. Prepare the acid neutralizer by mixing 8 parts of water to 1 part neutralizer in a bucket.

3. ***NOTICE:* To avoid paint failure, do not allow the product to dry on the vehicle.**

repair4less

NOTE: Use a separate wash mitt for each product applied to the vehicle.

Working quickly and beginning at the top of the vehicle and working to the sides, apply the acid neutralizer mix to the entire vehicle. Keep the vehicle wet with the solution and lightly agitate for 5 to 7 minutes. Continue around the vehicle 4 to 5 times. For severe conditions, work the product for up to 8 minutes.

4. Rinse the vehicle completely with cold water to remove the product.
5. Dry only the horizontal surfaces of the vehicle, do not dry the glass at this time.
6. ***NOTICE:*** **To avoid damage to the paint surface, do not apply the alkaline neutralizer directly to the vehicle plastic trim.**

   NOTE: Use a separate wash mitt for each product applied to the vehicle.

   NOTE: Alkaline neutralizer is a ready-to-use product. Do not mix with water.

   Pour the alkaline neutralizer into a squirt bottle and apply the solution to a clean wash mitt.
7. ***NOTICE:*** **To avoid paint failure, do not allow the alkaline neutralizer to dry on the vehicle.**

   Apply the product to the vehicle keeping the solution wet and lightly agitate for 5 to 7 minutes. For severe conditions, work the product for up to 8 minutes.
8. Rinse the vehicle completely with cold water to remove the product.
9. Prepare the detail wash by mixing 29.5 ml (1 oz) with 3.78L (1 gal) of water.
10. Using a clean wash mitt, shampoo the entire vehicle and rinse with cold water. Dry the vehicle completely.
11. Visually inspect the paint surface for any remaining evidence of ferrous metal particles. Repeat procedure as necessary.

Surface Finishing Following Decontamination

1. ***NOTICE:*** **When attempting to affect a repair by buffing, polishing or color sanding, do not remove an excess of 0.3 mil of paint film or refinishing will be required.**

   NOTE: Acid rain discoloring or etching may require color sanding in addition to buffing and polishing. In extreme cases, refinishing may be required if the following procedure does not restore the vehicle finish.

   NOTE: Do not intermix buffing products. Use only one manufacturer's product.

   NOTE: Always follow the manufacturer's product usage sequence. Use the appropriate buffing or polishing pad at the recommended buffing speed as specified by the product manufacturer.

   Apply rubbing compound to the vehicle surface as recommended by the product manufacturer.
2. Apply machine glaze to the vehicle surface as recommended by the product manufacturer.

3. Use an alcohol and water mixture (1 to 1) to clean the buffed and polished areas. Verify removal of scratches and swirls before the application of the final polish.

4. Apply a final polish material by hand, with a dual-action sander and foam pad, or with an orbital polisher and appropriate polishing bonnet.

5. Wash and dry the vehicle.

repair4less

Refinishing — Manufacturing Damage

Material

Item	Specification
3M™ Perfect-It™ Show Car Liquid Wax 39026	—
Motorcraft® Detail Wash ZC-3-A	—

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTICE: **To avoid overspray damage to adjacent panels, protect adjacent areas/substrates when preparing for and during refinishing.**

NOTE: Peeling/delamination concerns can be described as lack of adhesion, either between the substrate and topcoats or between individual coats of paint.

1. Wash the repair area with detail wash or pH-neutral soap and water.
2. Remove any trim, emblems and hardware from the area to be repaired.
3. **NOTE:** All delamination must be removed.

   Sand or media blast the damaged surface, keeping the repair area as minimal as possible.
4. Treat any bare metal surface to prevent flash corrosion, and prime and block sand as necessary prior to refinishing.
5. Mask the adjacent panels to protect from overspray.
6. Spot repair the base coat as necessary, following the paint manufacturer's prescribed procedures.
7. Following the paint manufacturer's prescribed procedure, apply clear coat to the entire panel.

repair4less

Restoring Corrosion Protection Following Repair

Special Tool(s)

 ST3049-A	Rust Inhibitor Installation Kit 286-00002
 ST3048-A	Undercoating Spray Gun 286-00001

Material

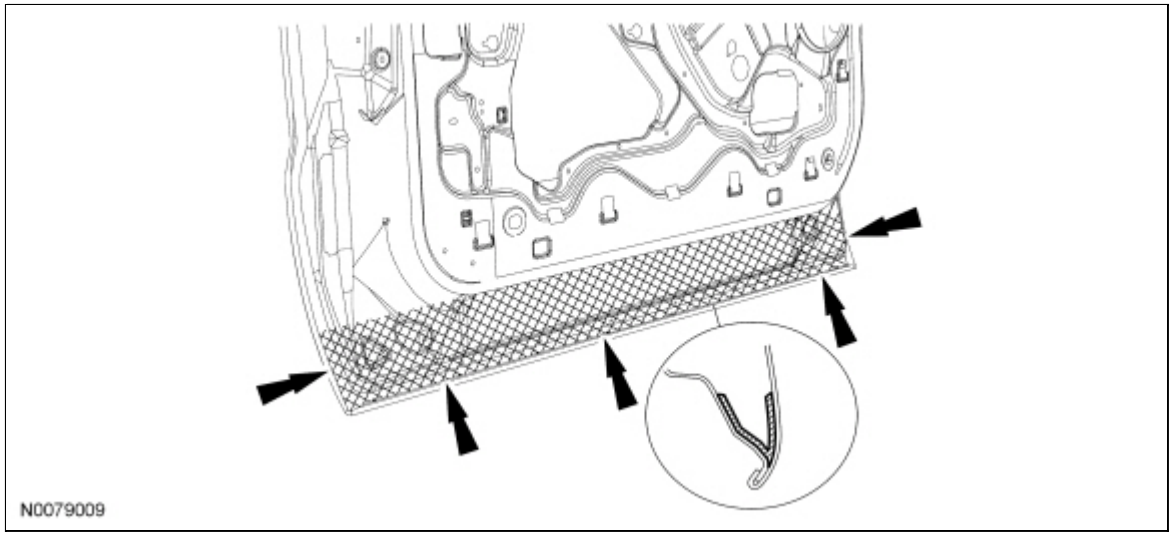
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Premium Undercoating ValuGard™ VG101, VG101A (aerosol)	—
Rust Inhibitor ValuGard™ VG104, VG104A (aerosol)	—

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Drilling access holes in body panels is not recommended. Drilling holes will break the original paint finish and promote corrosion.**

NOTE: Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made.



NOTE: Refer to product label for preparation and handling instructions.

1. The surfaces must be free of oil, dirt and other foreign material. Carry out the process in the following sequence.
    1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.
    2. For best results, the vehicle should be at room temperature. Attach the rust inhibitor canister to the Rust Inhibitor Installation Kit 286-00002.
    3. Rust inhibitor should be applied after the welding and refinishing process. Product cannot be welded through.
    4. Air pressure setting for applicator gun is 448-517 kPa (65-75 psi).
        - Use the long wand when spraying enclosed areas. The spray nozzle provides a 360-degree spray pattern. Insert the wand as far as possible into the access hole, pull the trigger and wait 2-3 seconds and slowly pull the wand out of the access hole.
        - The short, hook-shaped wand sprays in one direction and must be rotated to provide complete coverage.
        - Apply the material in light mist coats.
        - Material displaces moisture.
    5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

NOTE: The following illustrations provide typical applications of body seams and spot welded flanges and are not vehicle specific.

2. **NOTE:** Door assembly lower view.

    Apply rust inhibitor as shown to the inside of the door shell on all the interior metal surfaces using the most suitable applicator wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion. Keep door drain holes clear to prevent moisture buildup.

3. **NOTE:** Quarter panel inner view.

    Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

repair4less

4. **NOTE:** Door frame opening view.

   Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

Body and Frame Undercoating

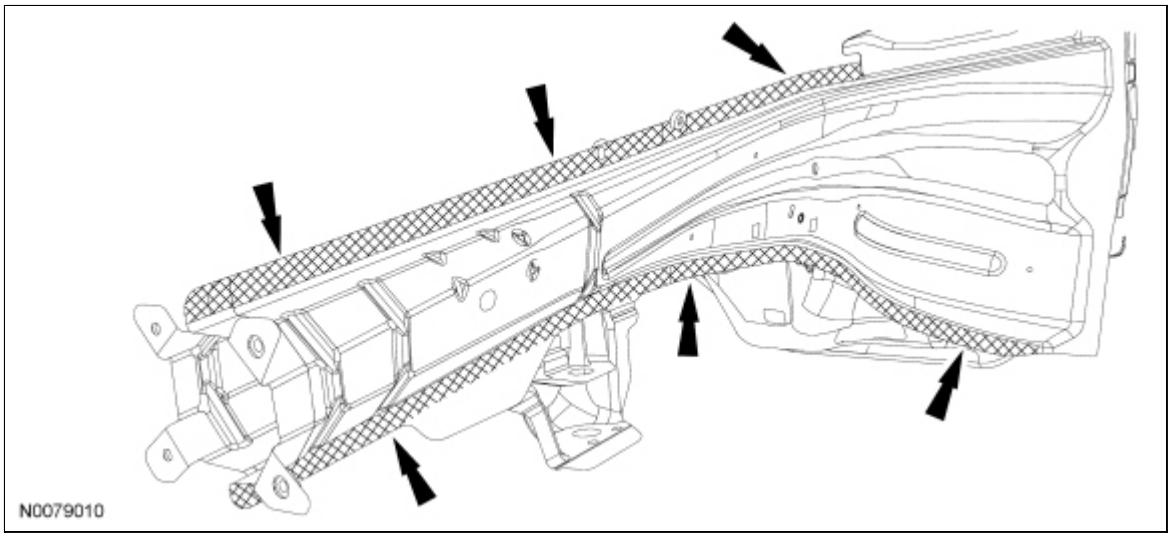
1. **WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

   WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not allow undercoating on powertrain components. Failure to follow these instructions may result in incorrect operation of these components.**

NOTE: Refer to product label for preparation and handling instructions.

NOTE: Avoid high-pressure water spray cleaning to treated underbody area for 24 hours.



Wire brush the area and make sure the surfaces are free of oil, dirt and other foreign material. Carry out the undercoating process in the following sequence.

1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.
2. For best results, the vehicle should be at room temperature.
    - Canister attaches directly to the dispensing gun. Attach the undercoating canister to the Undercoating Spray Gun 286-00001.
3. Undercoat should be applied after the welding and refinishing process. Product cannot be welded through.
4. Air pressure setting for applicator gun is 552-621 kPa (80-90 psi).
    - Apply light mist coats, applicator sprays in fogging pattern.
    - Material displaces moisture.
5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

NOTE: The following illustrations provide typical applications to frame rails and are not vehicle specific.

2. **NOTE:** Frame rail exterior spot-weld flange view.

   Apply undercoat material to the exterior exposed edges after carrying out the welding and refinishing process.

3. **NOTE:** Cross section view of typical unibody frame rail shown.

   Apply rust inhibitor to the inner surfaces of the rail after carrying out welding process. Use the long wand and insert as far as possible, depress trigger and wait 2-3 seconds and slowly pull the wand to make sure the area is completely fogged.

repair4less

4. **NOTE:** Full frame vehicle, front rail-to-mid rail section repair shown.

   Apply undercoat material to the exposed surfaces after carrying out the welding process. Make sure to completely cover any bare metal areas.

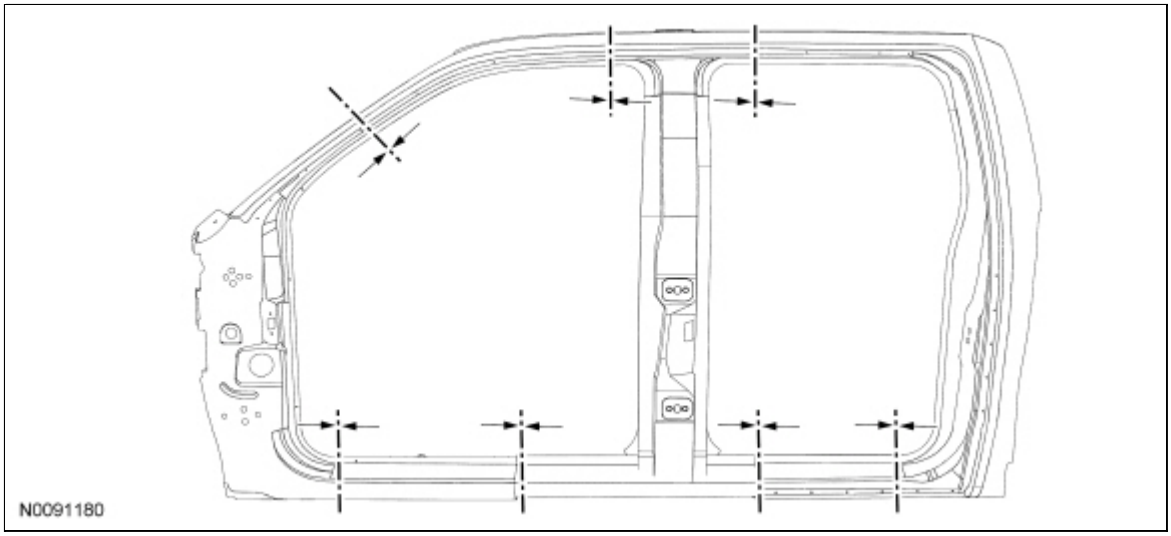
Regular Cab

NOTE: Left side shown, right side similar.



SuperCab

NOTE: Left side shown, right side similar.

SuperCrew

NOTE: Left side shown, right side similar.

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to

repair4less

follow these instructions may result in serious personal injury.

WARNING: Do not carry out body side sectioning repairs in areas of laser welds. Factory laser welds cannot be duplicated with conventional welding equipment and structural integrity may be compromised. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

WARNING: Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. Welding within 50 mm (1.96 in) of restraint anchoring points may result in incorrect operation of restraint devices. For additional restraints anchoring location information, refer to Section 501-20A and Section 501-20B . Failure to follow these instructions may result in serious injury to vehicle occupant(s).

WARNING: Do not carry out body side sectioning repairs in areas of door hinge or striker anchoring points. Welding within 50 mm (1.96 in) of door hinge or striker locations may compromise structural integrity during a collision. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

***NOTICE:* Electronic modules and related wiring may be damaged when exposed to heat from welding procedures. Carefully disconnect and remove, or position away from heat affected areas. For additional information, refer to Welding Precautions — Steel in this section.**

1. ***NOTICE:* Sectioning procedures can only be carried out on the outer body side panel. No sectioning repairs can be carried out on inner reinforcement panels. Failure to follow these instructions may compromise structural integrity of the cab structure.**

   Correct vehicle dimensions must be maintained when carrying out sectioning procedures to body side panels or pillar areas. Refer to Body for dimensional information.

2. **NOTE:** Factory spot welds may be substituted with either Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

   Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

3. Detrim the vehicle as necessary and drill out the spot welds from the damaged area. Using an air chisel or reciprocating saw, cut off the portion of the panel to be replaced.

4. Where possible, create a backer piece using a portion of the old panel. This will create a stronger joint.

5. When welding overlapping surfaces or substrates, apply a weld-through between the surfaces prior to welding. When the surfaces have been welded, apply corrosion protection material to the surfaces or substrates.
   - Make sure horizontal joints and flanges are correctly sealed with seam sealer to prevent moisture intrusion. Water and moisture migrate to horizontal joints and corrosion tends to occur more rapidly in these areas. Metal surfaces must be clean and dry before applying seam sealer.

6. Proceed with refinish procedures following Ford-approved paint guidelines. After refinishing, apply corrosion protection material as required.

repair4less

Metal Bonding Adhesive TA-1	—
Motorcraft® Metal Surface Prep ZC-31-A	—
Rust Inhibitor ValuGard™ VG104, VG104A (aerosol)	—
Seam Sealer TA-2	—

Weld-Bonding — Squeeze-Type Resistance Spot Welding (STRW) Method

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety

restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

NOTE: On door shells that are manufactured with structural adhesives only, weld bonding door skins is not recommended. Only metal bonding adhesive should be used.

NOTE: Weld-bonding is a method used to join metals using Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) welding and structural adhesive. The steps listed in this procedure apply to both types of welding. STRW is the preferred method. MIG welding should only be used when areas to be welded cannot be accessed using STRW -type machinery.

NOTE: Factory spot welds should be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Verify the vehicle is dimensionally correct on a frame machine. Straighten if necessary.

2. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.

3. Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.

4. Prepare any damaged flanges on the vehicle using hammer and dolly.

5. Grind the mating surface of the original flanges no greater than 25 mm (0.98 in) where the metal bonding adhesive will be applied.
   - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
   - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed. Clean surfaces with metal surface prep or equivalent.

6. Dry-fit and clamp the replacement service parts to verify a correct fit.
   - Remove the service part after verifying correct fit and alignment.

7. **NOTE:** The ends of welding clamps should be insulated on the ends using tape or similar material when welding is carried out.

   Follow manufacturer's prescribed welding procedures and settings. For additional information, refer to Welding Precautions — Steel in this section.

8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of a correct mix ratio.

9. **NOTE:** Welding can be carried out anytime during the adhesive curing process, or after the adhesive is fully cured. Welder settings will vary when welding through wet adhesive versus welding through fully cured adhesive. Refer to welder manufacturer's recommended settings for welding through fully cured adhesive. It is recommended to place a shunt weld in an area with no adhesive to make sure of conductivity, particularly when welding through fully cured adhesive.

   NOTE: Refer to the product label for handling and preparation instructions.

repair4less

Create a test sample.

1. Prepare the metal and adhesive as described. Apply a 6-9 mm (0.23-0.35 in) bead of adhesive and weld the sample.
2. Place the welded sample in a vice and carry out destructive weld tests by peeling the scrap metal apart using large lock-type pliers. Measure the weld nugget to determine that the nugget meets Ford weld nugget requirements. If the weld nugget does not meet required size, adjust welder settings until the correct weld nugget size is achieved.
3. When the correct weld nugget size is achieved, the service part can be weld-bonded. For additional information, refer to the weld nugget table in Specifications in this section.

10. Apply a 6-9 mm (0.23-0.35 in) bead of metal bonding adhesive to the vehicle prepared flange surface.

11. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.

12. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

13. **NOTE:** Refer to product label for cure times and handling instructions. Clamps may be removed immediately after the component is welded.

    Wipe excess adhesive from the panel before it cures.

14. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.

15. Use seam sealer wherever a cosmetic seam sealer is required.

16. Mix and apply primer surfacer per Ford-approved paint recommendations.

17. Mix and apply basecoat per Ford-approved paint recommendations.

18. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.

19. Apply anti-corrosion treatment to the repair area as required. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

Weld-Bonding — Metal Inert Gas (MIG) Welding Method

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: Metal Inert Gas (MIG) weld-bonding can be substituted as an alternative to Squeeze-Type Resistance Spot Welding (STRW). It may only be used to weld areas that are inaccessible to STRW machinery. However, when accessible, STRW is the preferred method.

NOTE: On door shells that are manufactured with structural adhesives only, weld-bonding door skins is not recommended. Only metal bonding adhesive should be used.

NOTE: Factory spot welds should be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.
    - Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.

2. After removing the damaged sheet metal panel(s), repair any damaged flanges on the vehicle using a hammer and dolly.

3. Using an appropriate grinder, carefully grind around the entire receiving flange area following the original welds. Be sure to remove all E-coat, paint or galvanized coating from the mating surfaces of the joint.
    - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
    - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed. Clean the surface with metal surface prep or equivalent.

4. Repeat the procedure from Step 3 on the mating surface of the replacement service part(s).

5. Prepare the new service panel for plug welds.
    - Using the original panel as a reference, drill or punch 8 mm (0.31 in) diameter holes in the exact number as the original spot welds. The holes should be positioned as close as possible to the original spot weld locations, without lining up exactly on top of an original spot weld site.
    - To make sure of correct weld performance, grind the immediate perimeter of the plug weld hole. Grind only in the area of the plug weld; this will keep corrosion to a minimum.

6. Dry-fit and clamp the replacement service parts to verify a correct fit and alignment.

repair4less

- Remove the service part after verifying correct fit and alignment.

7. The vehicle prepared flange areas where plug welds will be located must be kept free of adhesive. Apply 25 mm (0.98 in) tape to the plug weld areas to prevent contamination from the adhesive.

8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of correct mix ratio.

9. **NOTE:** Refer to product label for cure times and handling instructions.

   Apply a 6-9 mm (0.23-0.35 in) bead of adhesive to the vehicle prepared flange surface. Remove the tape from the plug weld areas.

10. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.

11. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

12. **NOTE:** Welding can be carried out anytime during the adhesive curing process or after the adhesive is fully cured.

    NOTE: If welding will not be carried out immediately, refer to product label for cure times and handling instructions. Clamps may be removed immediately after the component is welded.

    Wipe excess adhesive from the panel before it cures.

13. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.

14. Use seam sealer wherever a cosmetic seam sealer is required.

15. Mix and apply primer surfacer per Ford-approved paint recommendations.

16. Mix and apply basecoat per Ford-approved paint recommendations.

17. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.

18. Apply anti-corrosion treatment to the repair area as required. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

Door Assembly

NOTE: Door intrusion beam is constructed of Boron steel and is non-serviceable.

Item	Part Number	Description
1	20125 LH/ 20124 RH	Door assembly — mild and boron steel
2	20201 LH/ 20200 RH	Door outer panel — mild steel

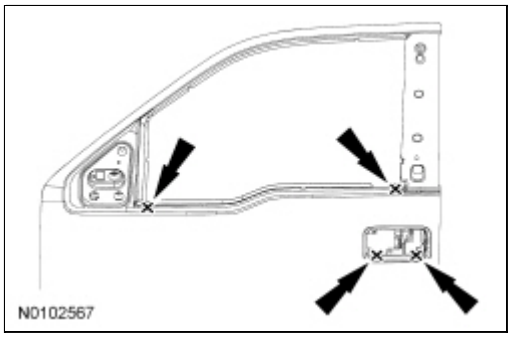
WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

1. Remove the outside door handle and mirror assembly. For additional information, refer to Section 501-09 .



2. Remove the outer door trim, including mouldings and weatherstrips.

3. Remove the door assembly and secure on a workstand.

4. ***NOTICE:*** **Use care when drilling out spot welds to avoid drilling through door shell assembly and damaging the door shell.**

   Using a spot weld cutter or equivalent, locate and drill out the spot welds on the door panel.

repair4less

5. ***NOTICE:*** **Use extreme care to avoid cutting the door shell or inner belt reinforcement and damaging the door shell assembly.**

   Using a disc grinder, grind along the perimeter of the outer door panel hem to separate the hem edges as indicated in the illustration.

6. **NOTE:** The use of a Heat Gun may aid in softening the door panel adhesive.

   Prior to removing the outer panel, use a sharp knife to cut the adhesive between the door outer panel, beltline reinforcement and intrusion beam.
   - Using a flat-blade chisel or equivalent, remove the original panel.
   - Using a sharp knife or broad edge scraper, remove the remaining portion of the hem flange from the door shell.
   - Remove any remaining adhesive from the door shell flange.

7. Trial fit the service replacement panel to the door shell assembly.

8. Prepare the service replacement panel joint areas by sanding clean all mating surfaces.

9. Prepare the door shell assembly by grinding all the mating surfaces including the inner hem and outer belt reinforcement and the intrusion beam.

10. Apply metal bonding adhesive to the following areas: service replacement hem flange and outer belt reinforcement-to-outer panel.

11. Position and align the new door outer panel to the door shell assembly, carefully turn the assembly over and begin the hemming process.
    - Using a door panel installation tool or the hammer and dolly method, close the perimeter door hem and smooth any residual adhesive in the joints.

12. Temporarily install the door assembly on the vehicle to verify correct alignment and fit.

13. Apply 2 to 3 spot welds to hold the door panel in position on the door assembly.

14. Place the door assembly back on a workstand and weld the door, replacing the original spot welds, using a Squeeze-Type Resistance Spot Welding (STRW) machine. Finish grind as necessary and trial fit the upper beltline moulding and mirror.

15. Prime and apply seam sealer in the lower hem flange area.

16. Prime and paint the door using Ford-approved paint system.

17. Apply flexible foam repair to the intrusion beam and upper belt reinforcement areas of the door assembly to maintain original equipment performance.

18. Apply rust inhibitor inside the door to all hem areas and upper beltline area. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

19. Reassemble and install door and align. For additional information regarding door fitment specifications, refer to Body in this section.

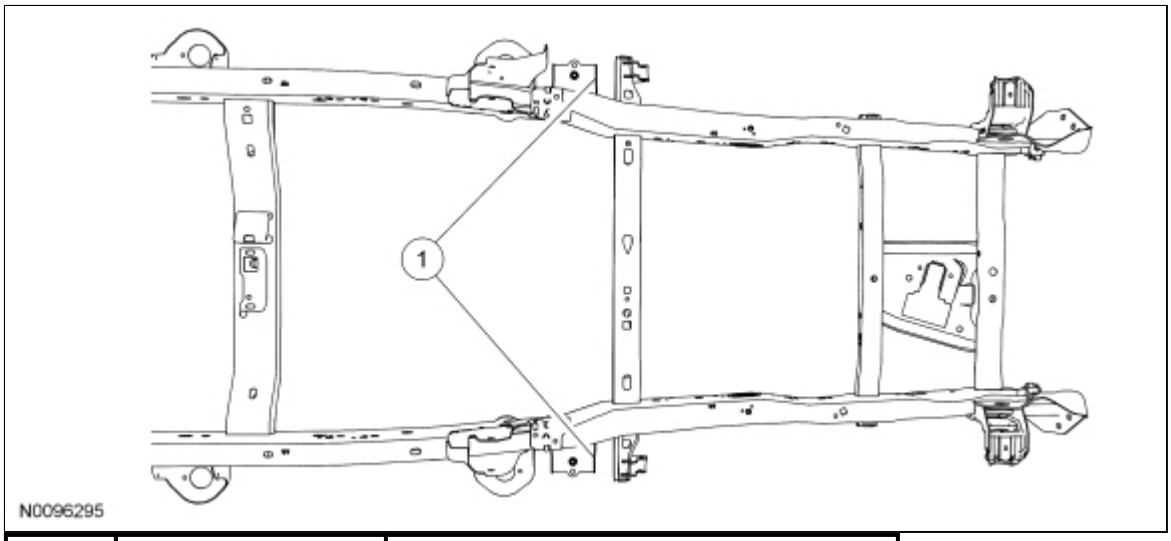
WARNING: Frame rail crush zones absorb crash energy during a collision and must be replaced if damaged. Prior to replacement of frame rail crush zones, straighten damaged frame rails to correct frame dimensions. Failure to follow these instructions may adversely affect frame rail crush zone performance and may result in serious personal injury to vehicle occupants in a crash.



WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to

follow these instructions may result in serious personal injury.

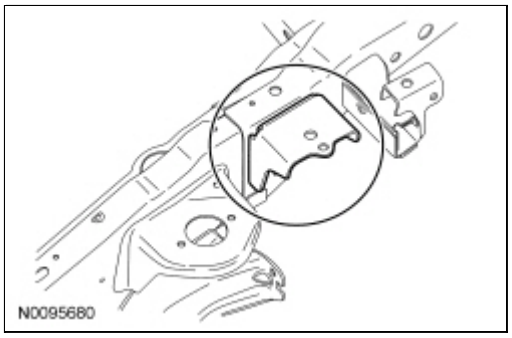
WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: Observe prescribed welding procedures when carrying out repairs to the frame assembly. For additional information, refer to Welding Precautions — Steel in this section.

NOTE: This procedure applies to vehicles with 1.67 m (5.5 ft) pickup bed.

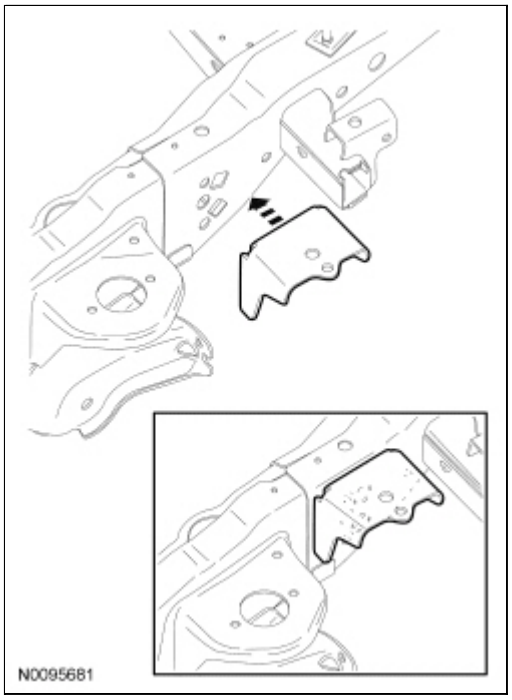
Item	Part Number	Description
1	102C60	Bed attachment bracket kit

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.



Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

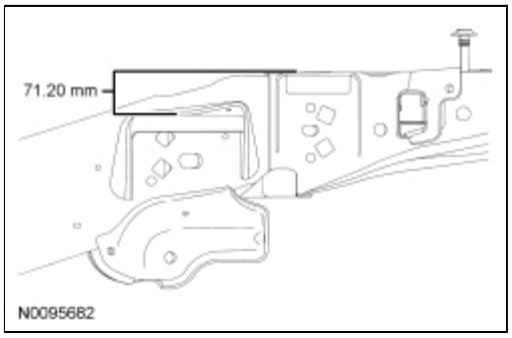
1. Remove the rear tailgate assembly and complete pickup bed assembly. For additional information, refer to Section 501-04 .



2. Cover the evaporative emissions fuel line, tie back the fuel filler tube and any wire harnesses from the repair area.

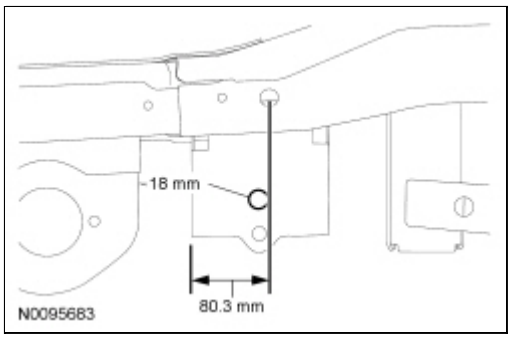
3. Grind the welds that retain the attachment bracket and remove the forward bed-to-frame retention bracket from the frame.

repair4less

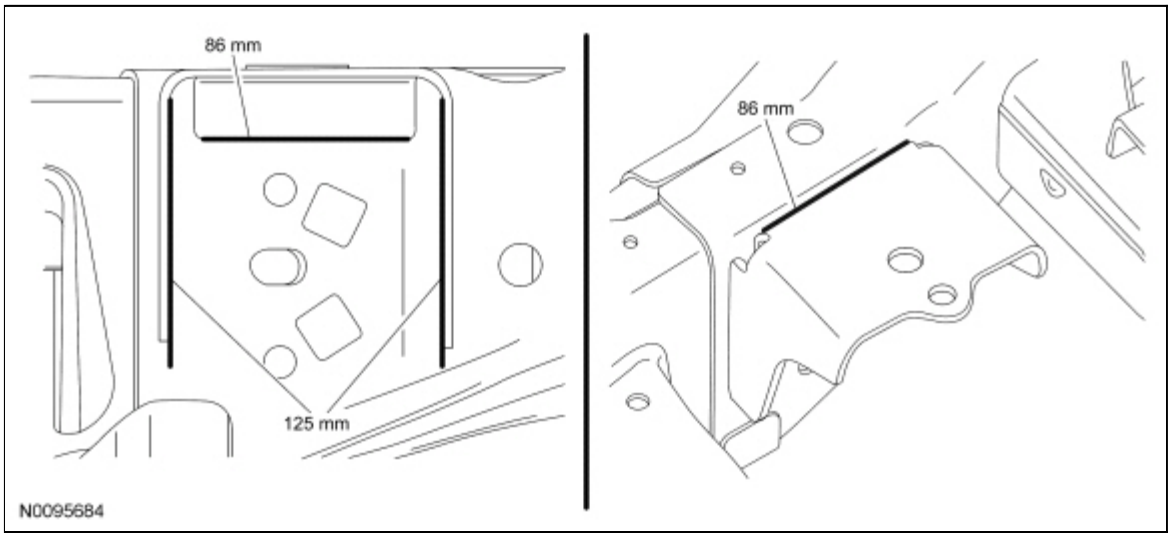


4. Using a wire brush or sanding disc, remove E-coat paint from the surrounding frame rail area within approximately 15 mm (0.59 in) of the intended weld location.

5. Using a wire brush or sanding disc, remove the E-coat paint from the replacement bracket edges.



6. Locate the correct mounting position of the new brackets, relative the rear body mount frame bracket and existing hole in the top of the frame rail. Tack weld the brackets in position.



7. **NOTE:** Using the replacement pickup bed, locate pickup bed holes to the existing frame attachment holes maintaining correct front-of-bed to cab cross car flushness and fore-aft-margins equal from left

hand side to right hand side. Check to make sure the character line on the cab and the character line on the bed match on left hand and right hand side. Adjust the bracket as necessary to match cab and bed character lines.

Mark the position of the attachment hole, on the new frame bracket, by inserting a marker through the existing forward bed floor pan hole. Drill an 18 mm (0.708 in) hole into the new frame bracket.

8. Remove the pickup bed and complete welding the new frame bracket to the frame side rail. Use a MIG welding machine capable of producing 200 amps minimum must be used. Use 0.9-1.1 mm (0.035-0.045 in) ER70S-3 or equivalent weld wire that is compatible with mild (Society of Automotive Engineers (SAE) 1010) steel.
    - Dress welds as necessary.

9. Clean exposed metal surfaces with metal surface prep or equivalent.

10. Apply corrosion protection to the repair area as required. For additional information regarding corrosion protection, refer to Restoring Corrosion Protection Following Repair in this section.

11. **NOTE:** New attachment clips must be installed whenever the pickup bed is removed. Install new attachment clips, part number W708605, before installing the pickup bed. Make sure the anti-squeak pads, part number F0TA-5C036-AA and YL34-5C036-AA, are located in the correct positions before installing the pickup bed.

    Reinstall the pickup bed. For additional information, refer to Section 501-04 .

repair4less

Item	Part Number	Description
1	5D059 LH/ 5D058 RH	Frame rail replacement kit
2	5005	Frame assembly

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

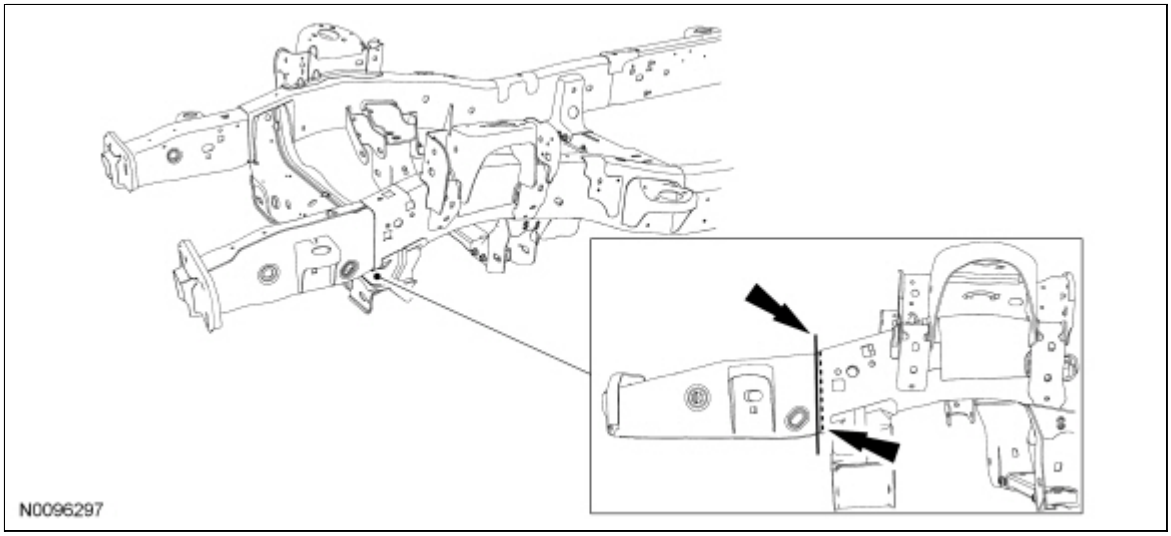
Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Frame rail crush zones absorb crash energy during a collision and must be replaced if damaged. Prior to replacement of frame rail crush zones, straighten damaged frame rails to correct frame dimensions. Failure to follow these instructions may adversely affect frame rail crush zone performance and may result in serious personal injury to vehicle occupants in a crash.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: Observe prescribed welding procedures when carrying out repairs to the frame assembly. For additional information, refer to Welding Precautions — Steel in this section.



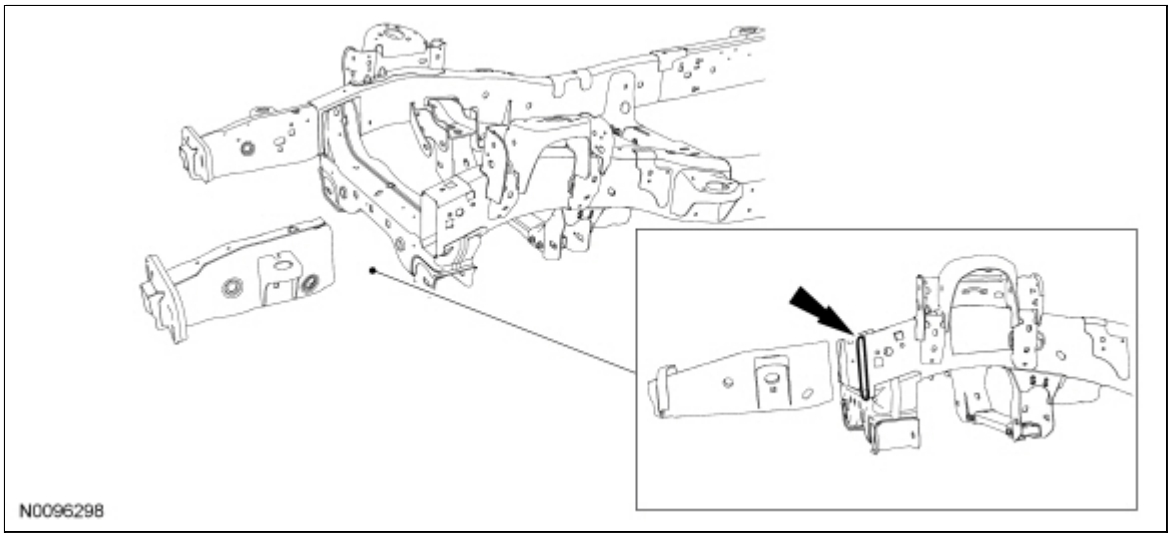
1. **NOTE:** All body alignment measurements are carried out with the vehicle detrimmed. Measurements are made metal to metal, on center, unless otherwise specified.

Measure the vehicle to determine if the body requires straightening and alignment. The vehicle must be restored its correct overall dimensions prior to beginning this procedure. For body dimensional information, refer to Body in this section.
- Anchor the vehicle to a frame rack following the equipment manufacturer's instructions.

2. Remove the bumper. For additional information, refer to Section 501-19 .

3. Unbolt the Front End Sheet Metal (FESM) body mount bolts.
   - Raise the body if required. For additional information, refer to Section 502-02 .

4. Locate the vertical weld of the front frame horn to center rail.



5. Using a plasma cutter, reciprocating saw or cut-off wheel, remove the damaged front frame horn section. Do not cut directly along the weld line. Leave enough material on the front side of the weld line to allow the edge to be ground back exactly to the line. This is necessary to make sure of correct fit between the frame and the replacement frame section.

6. Grind off the excess welding material that remains in front of the weld line on the existing frame.
   - Remove the remaining piece (ring-like) of the front frame horn from inside the mid-rail.

7. Using a wire brush or sandpaper, remove the E-coat from the outer surfaces of the replacement service section within approximately 15 mm (0.59 in) of the repair joint.
   - Using a wire brush, remove any foreign material from the frame within approximately 15 mm (0.59 in) of the repair joint.

repair4less

8. **NOTE:** The front frame rail replacement section is tapered at the ends to fit into the frame.

   NOTE: The frame rail service component must be located to maintain original factory dimensions. For additional information, refer to Body in this section for correct frame dimensional information.

   Install the replacement front frame horn section inside the center rail of the frame. Support the replacement service section in position. Check that the FESM body mount bracket lines up with the sheet metal hole for the body mount.

9. Make sure the repair joint and surrounding repair area have attained a minimum temperature of 10°C (50°F) before carrying out the weld procedure.

10. Tack weld at the 4 corners and check the fit and alignment.
    - Lower the body onto the frame and recheck fit and alignment, then raise it.

11. Weld the joint completely around the perimeter, if fit and alignment are correct, using a Metal Inert Gas (MIG) welding machine capable of producing a minimum of 200 amps. Use 0.9-1.1 mm (0.035-0.045 in) ER70S-3 or equivalent weld wire that is compatible with mild (Society of Automotive Engineers (SAE) 1010) steel.

12. Dress the weld(s) as necessary.

13. Use a dye penetrant to determine if any cracks or large voids exist in the weld joint. If cracks or other defects exist, grind out the defect and repair until the weld is free of defects.
    - Clean the repair area with metal surface prep and apply anti-corrosion coating to the affected areas of the frame and service replacement section. For additional information regarding corrosion protection, refer to Restoring Corrosion Protection Following Repair in this section.

14. Reinstall components removed during disassembly. Make sure all fasteners are tightened to the correct specification.

It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: Observe prescribed welding procedures when carrying out repairs to the frame assembly. For additional information, refer to Welding Precautions — Steel in this section.

1. **NOTE:** All body alignment measurements are carried out with the vehicle detrimmed. Measurements are made metal to metal, on center, unless otherwise specified.

   Measure the vehicle to determine if the body requires straightening and alignment. The vehicle must be restored its correct overall dimensions prior to beginning this procedure. For body dimensional information, refer to Body in this section.

2. Remove the bumper assembly. For additional information, refer to Section 501-19 .

3. Remove the grille assembly and reinforcement.

repair4less

4. Remove the front fenders. For additional information, refer to Section 501-02 .

5. Remove the front skid plate (if equipped). For additional information, refer to Section 205-03 .

6. Remove the engine mount retaining bolts and loosen the exhaust manifold-to-cylinder head fasteners. For additional information, refer to Section 303-00 .

7. Loosen the radiator shroud retainer bolts. For additional information, refer to Section 303-03 .

8. Anchor the vehicle to a frame rack following the equipment manufacturer's instructions.
    - Remove the front wheels. For additional information, refer to Section 204-04 .

9. **NOTE:** All body alignment measurements are carried out with the vehicle detrimmed. Measurements are made metal to metal, on center unless otherwise specified.

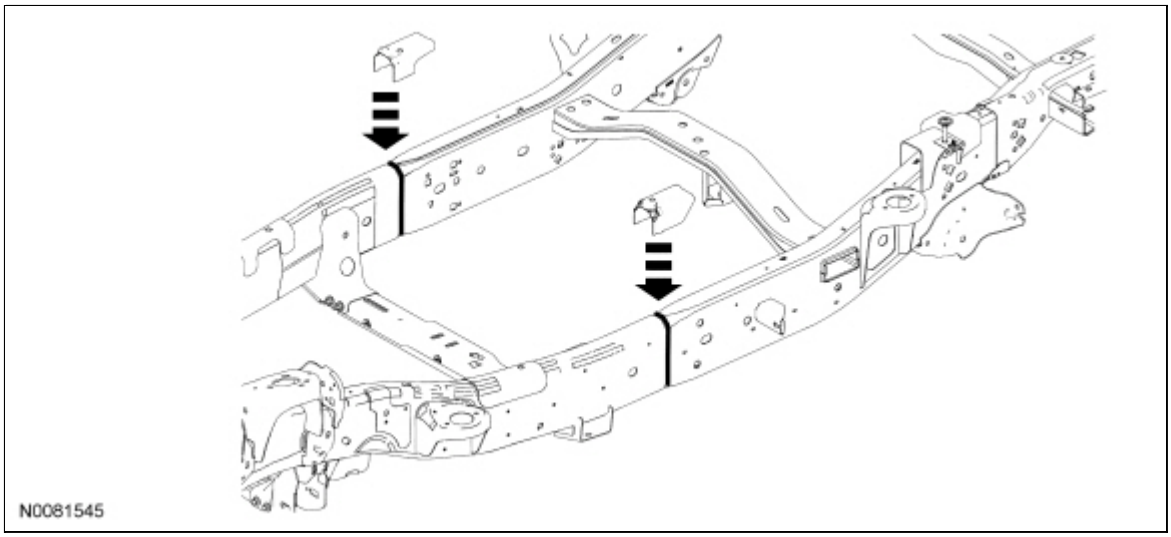
    Measure the vehicle to determine if the body and frame requires straightening and alignment. For additional dimensional information, refer to Body in this section.

10. Carry out complete removal of front suspension and steering components including upper and lower control arms, steering gear, steering linkages, sway bar, springs and shocks. For additional information, refer to Section 204-01A , Section 204-01B and Section 211-02 .

11. Remove the front drive axle and half shafts. For additional information, refer to Section 205-03 .

12. Raise and support the engine/transmission assembly and remove the transmission support crossmember. For additional information, refer to Section 502-02 .
    - Inspect the transmission crossmember for twists, bends or cracks.

13. Loosen the body mount-to-frame bushing bolts from the radiator support and the forward cab support. For additional information, refer to Section 502-02 .



14. Using the frame rack towers and light tension, support the front radiator support of the vehicle by raising it slightly above the frame rail mounts.

15. Disconnect and remove any remaining wiring, lines, and related fittings from the frame section.

16. ***NOTICE:*** **Do not damage the center side rail during removal, it will be reused. Only cut through the depth of the weld, as the center rail underlaps the front frame rail.**

    NOTE: The front frame section is retained by welded lap joints and an additional reinforcement bracket at the section joint. This procedure calls for grinding of the original welded joints for removal, followed by welding the section into position.

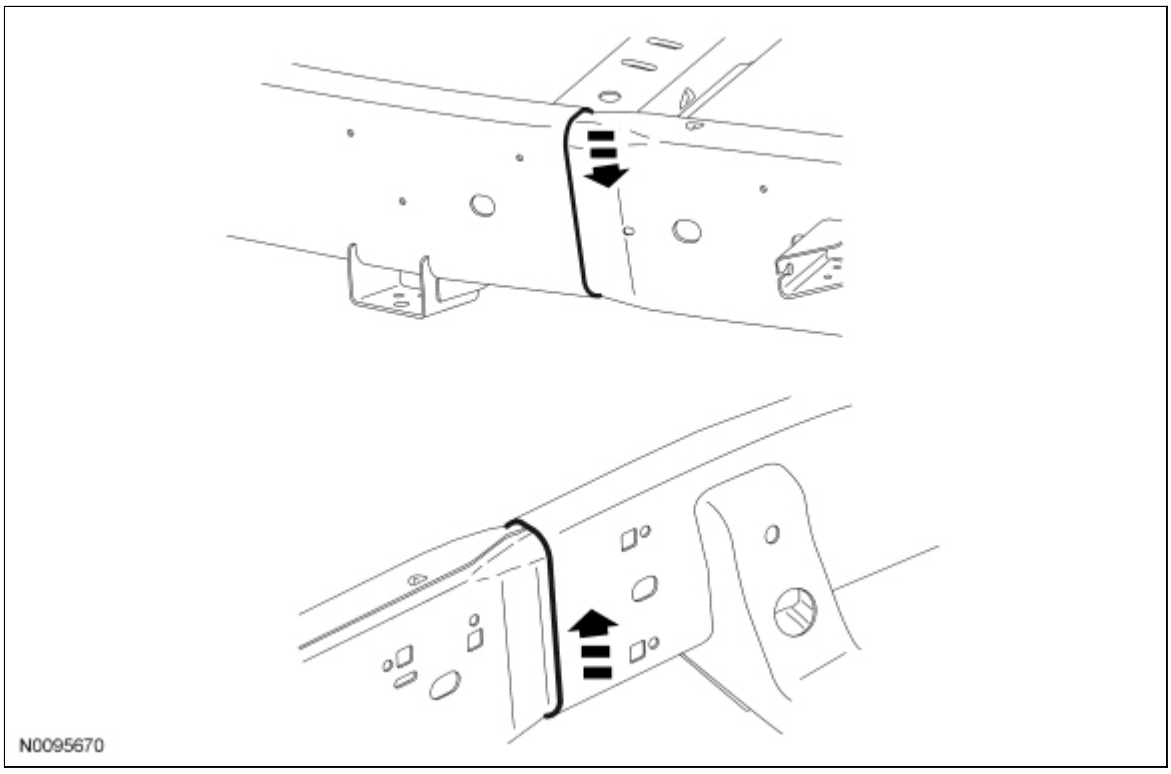
    Using a plasma cutter, reciprocating saw or cut-off wheel, remove the damaged front frame horn section. Do not cut directly along the weld line. Leave enough material on the front side of the weld line to allow the edge to be ground back exactly to the line. This is necessary to make sure of correct fit between the frame and the replacement frame section.

17. Grind off the excess welding material that remains in front of the weld line on the existing frame.
    - Remove only the weld material. Do not grind out the center frame rail that must be reused.

18. Using an air chisel with a sharp one-inch wedge-type chisel, separate the ground area of the joints.

19. With help of an assistant, remove the complete front section of the frame.

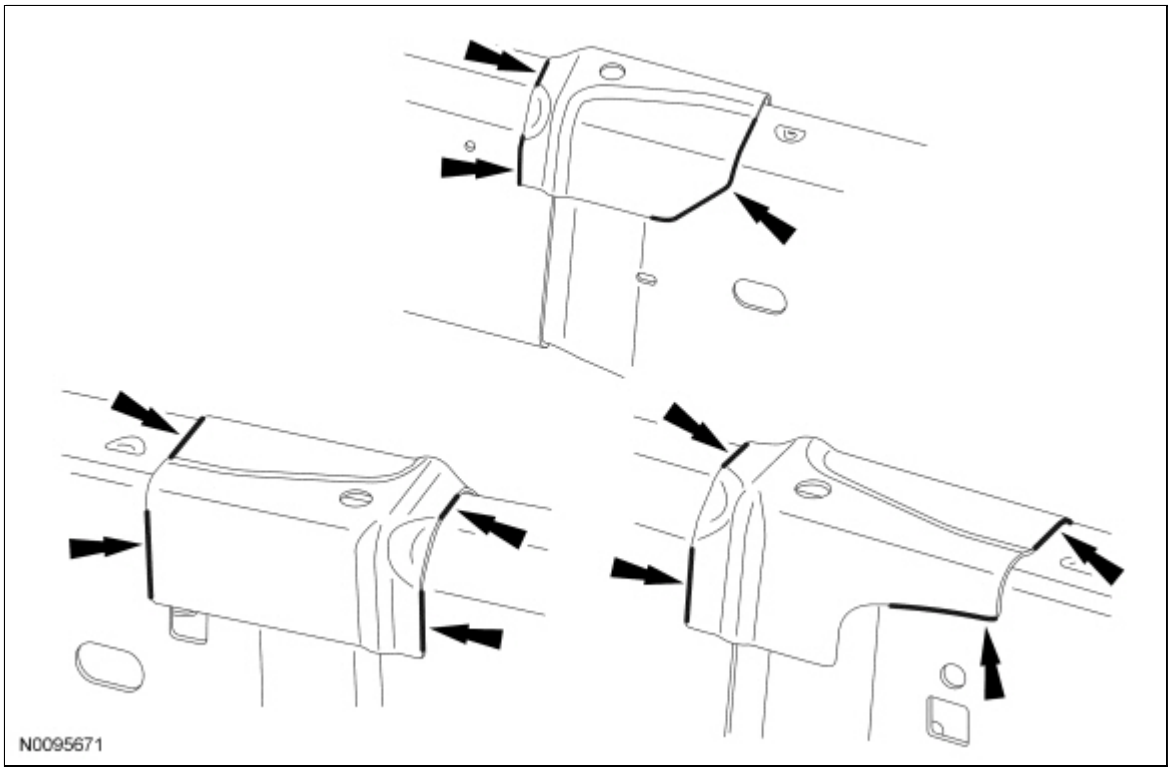
20. Using a wire brush or sandpaper, remove the E-coat from the outer surfaces of the replacement service section within approximately 15 mm (0.59 in) of the repair joint.
    - Using a wire brush, remove any foreign material from the frame within approximately 15 mm (0.59 in) of the repair joint. Clean the surface with metal surface prep or equivalent.



21. With the help of an assistant, position the new frame section into place on the vehicle and support with jackstands or a transmission style jack.
    - Loosely clamp the replacement section in a preliminary position.

22. Carry out frame measurements to verify correct position of the replacement section and clamp firmly into position. For additional dimensional information, refer to Body in this section.
    - Apply a weld-through primer locally in the areas to be welded.

repair4less



23. Make sure the repair joint and surrounding repair area have attained a minimum temperature of 10°C (50°F) before carrying out the weld procedure.

24. Weld the joint completely around the front-to-center rail joints, if fit and alignment are correct, using a Metal Inert Gas (MIG) welding machine capable of producing a minimum of 200 amps. Use 0.9-1.1 mm (0.035-0.045 in) ER70S-3 or equivalent weld wire that is compatible with mild (Society of Automotive Engineers (SAE) 1010) steel.

25. **NOTE:** Illustration indicates weld locations for outboard and inboard reinforcement of the left hand and right hand reinforcements.

    Position the reinforcement brackets at the section joint in the original location. Clamp in place, apply a weld-through primer and weld the brackets as indicated.

26. Use a dye penetrant to determine if any cracks or large voids exist in the weld joint. If cracks or other defects exist, grind out the defect and repair until the weld is free of defects.
    - Clean the repair area with metal surface cleaner and apply anti-corrosion coating to the affected areas of the frame and service replacement section. For additional information regarding corrosion protection, refer to Restoring Corrosion Protection Following Repair in this section.

27. Reinstall the transmission crossmember and the lower engine/transmission assembly, and tighten fasteners to correct specification.

28. Inspect for damage and reinstall the suspension, steering and driveline components previously removed.

29. Remove the vehicle from the frame rack and carry out reassembly and installation of any remaining components.

1	5F040	Rear frame section

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: Leaf spring front attachment brackets are not required when carrying out rear frame section replacement. These are available separately (base part number 5775/6) if they have been damaged and require replacement.

NOTE: Observe prescribed welding procedures when carrying out repairs to the frame assembly. For additional information, refer to Welding Precautions — Steel in this section.

1. **NOTE:** All body alignment measurements are carried out with the vehicle detrimmed. Measurements are made metal to metal, on center, unless otherwise specified.

   Measure the vehicle to determine if the body requires straightening and alignment. The vehicle must be restored its correct overall dimensions prior to beginning this procedure. For body dimensional information, refer to Body in this section.
   - Anchor the vehicle to a frame rack following the equipment manufacturer's instructions.

2. Remove the rear bumper assembly. For additional information, refer to Section 501-19 .

3. Remove the rear tailgate assembly and complete pickup box assembly. For additional information, refer to Section 501-04 .

4. Lower and remove the spare tire and remove the spare tire carrier assembly from the frame section.

5. If equipped, remove the frame dampener located on the left rear frame rail.

6. Drain and remove the fuel tank assembly. For additional information, refer to Section 310-00 . Plug the open lines.
    - Disconnect and remove the evaporative emissions unit from the frame section.

7. Remove exhaust hangers and the exhaust system. For additional information, refer to Section 309-00 .

8. Remove the running board step (if equipped). For additional information, refer to Section 501-08 .

9. Position the vehicle on a frame rack and anchor in place following the equipment manufacturer's guidelines.

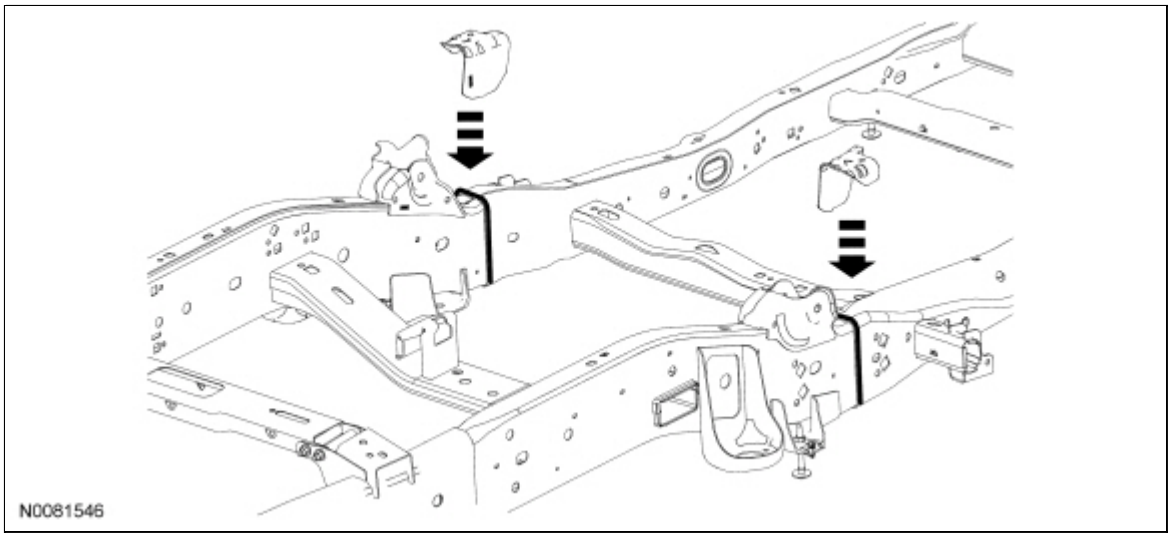
10. **NOTE:** All body alignment measurements are carried out with the vehicle detrimmed. Measurements are made metal-to-metal, on center unless otherwise specified.

    Measure the vehicle to determine if the body and frame requires straightening and alignment. For additional dimensional information, refer to Body in this section.

11. Position and tighten fixtures to hold the front eye bolts of the leaf spring attachments. This will secure the rear axle and spring assembly in place as the frame section is removed and replaced.

12. Using the frame rack towers, position a support chain under the rear cab mount area of the center section of the frame and apply light tension to secure the cab and center section in place.

13. Remove the rear shock absorbers. For additional information, refer to Section 204-04 .



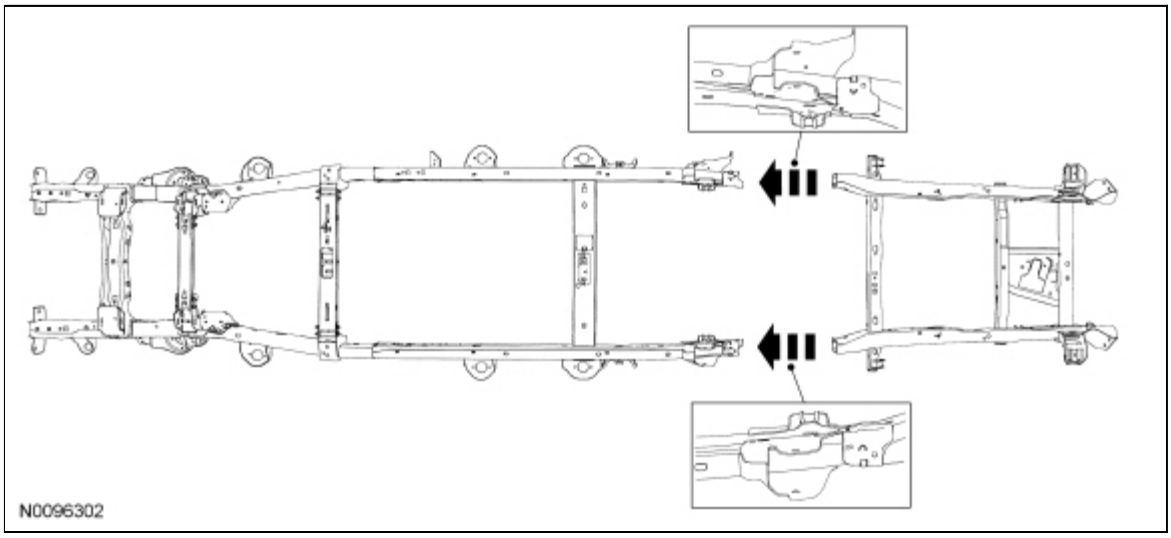
14. **WARNING: Adjust the rear axle height to relieve spring tension before removing any shackle bolts, nuts or spring pins. Springs under tension may release with great force. Failure to follow this instruction may result in serious personal injury.**

    Remove the rear spring eye bolts. With the help of an assistant, hold the spring down with a large pry bar, then slowly release tension after removing the bolt. For additional information, refer to Section 204-04 .

15. **NOTE:** The rear frame section on this vehicle is retained by a welded joint and reinforcement bracket near the forward leaf spring eye brackets.

    Using a high-speed grinder and correct eye, face and ear protection, grind the welds holding the rear frame reinforcement brackets to the frame rail and remove the brackets completely.

repair4less

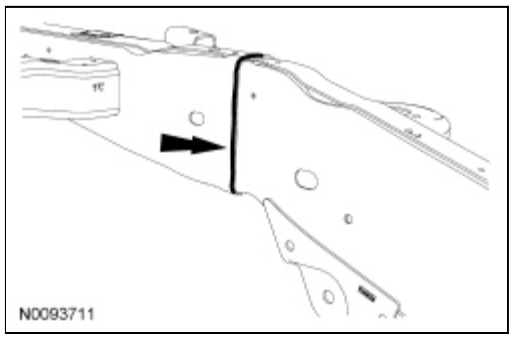


16. Using a high-speed grinder and correct eye, face and ear protection, grind the welds holding the center and rear frame sections together. Make sure not cut into the center side rail as it must be reused.

17. Grind off the excess welding material that remains in front of the weld line on the existing frame.
    - Remove only the weld material. Do not grind out the center frame rail as it will be reused.

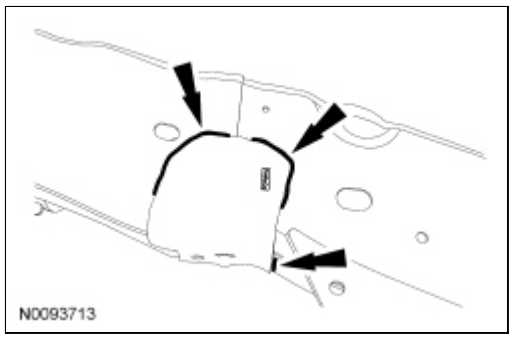
18. Using an air chisel with a sharp one-inch, wedge-type chisel, separate the ground area of the joints.

19. With the help of an assistant, remove the complete rear frame section.

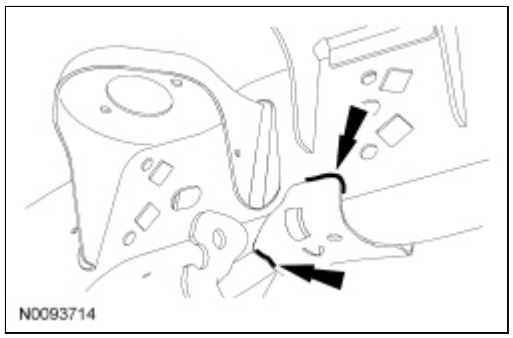


20. With the help of an assistant, position the replacement section into the center section of the frame.
    - Loosely clamp the replacement section in place.

21. Carry out frame measurements to verify correct position of the replacement section and clamp firmly into position. For additional dimensional information, refer to Body in this section.
    - Apply a weld-through primer locally in the areas to be welded.



22. Make sure the repair joint and surrounding repair area have attained a minimum temperature of 10°C (50°F) before carrying out the weld procedure.

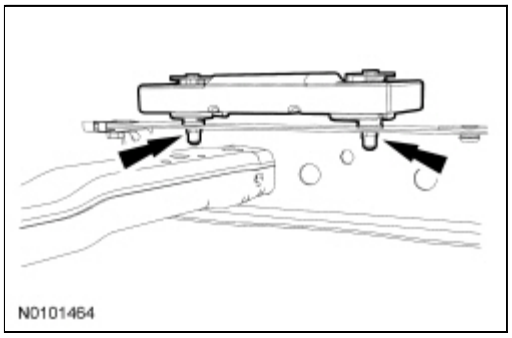


23. With correct measurements verified and the replacement section in position, tack weld the replacement section to the center section.

24. When fit and alignment are correct, weld the new section to the original center section on all overlap joints using a MIG welding machine capable of producing a minimum of 200 amps. Use 0.9-1.1 mm (0.035-0.045 in) ER70S-3 or equivalent weld wire that is compatible with mild (Society of Automotive Engineers (SAE) 1010) steel.
    - Dress weld(s) as necessary.

25. Position the rear reinforcement brackets and clamp in place. Apply a weld-through primer to the areas to be welded and weld as shown.

26. Use a dye penetrant to determine if any cracks or large voids exist in the weld joint. If cracks or other defects exist, grind out the defect and repair until the weld is free of defects.
    - Clean the repair area with metal surface cleaner and apply anti-corrosion coating to the affected areas of the frame and service replacement section. For additional information regarding corrosion protection, refer to Restoring Corrosion Protection Following Repair in this section.



27. Reinstall the rear springs and shocks. For additional information, refer to Section 204-04 .

repair4less

28. Reinstall the spare tire carrier assembly.

29. Reinstall the fuel tank and evaporative emissions unit. For additional information, refer to Section 310-00 .

30. If equipped, reinstall the frame dampener on the frame rail of service replacement frame.
    - Tighten to 47 Nm (35 lb-ft).

31. Reinstall the exhaust system. For additional information, refer to Section 309-00 .

32. Reinstall the pickup bed assembly. For additional information, refer to Section 501-04 .

33. Remove the vehicle from the frame rack and complete any final assembly required.

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. Welding within 50 mm (1.96 in) of restraint anchoring points may result in incorrect operation of restraint devices. For additional restraints anchoring location information, refer to Section 501-20A and Section 501-20B . Failure to follow these instructions may result in serious injury to vehicle occupant(s).

WARNING: Do not carry out body side sectioning repairs in areas of laser welds. Factory laser welds cannot be duplicated with conventional welding equipment and structural integrity may be compromised. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: Whenever it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

repair4less

NOTE: Factory spot welds may be substituted with either Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. ***NOTICE:*** **Electronic modules and related wiring may be damaged when exposed to heat from welding procedures. Carefully disconnect and remove, or position away from heat affected areas. For additional information, refer to Welding Precautions — Steel in this section.**

   Remove the outer body sheet metal from the affected area prior to carrying out any reinforcing panel replacement. For additional information, refer to Sectioning Guidelines in this section.

2. When welding overlapping surfaces or substrates, apply a weld-through primer between the surfaces prior to welding. When the surfaces have been welded, apply corrosion protection material to the surfaces or substrates. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

3. Where possible, create a backer piece using a portion of the old panel. This will create a stronger joint.

4. Appropriate seam sealer needs to be applied to exposed joints and seams in addition to corrosion protection, particularly horizontal surfaces where moisture collects and migrates. Exposed seams and joints can corrode or rust prematurely if seam sealer is not applied correctly. Clean surfaces with metal surface prep or equivalent prior to applying seam sealer. For additional information, refer to Sealers in this section.

5. Proceed with refinish procedures following Ford-approved paint guidelines.

Pickup Bed Side Panel — Styleside

NOTE: Factory spray in bedliner (Tough Bed®) is made of a special highly durable multi-part resin. Repairs cannot be performed using conventional body shop chemical or spray equipment. To ensure proper adhesion, correct surface texture and a lasting repair, all work must be done using products that have been tested and approved by Ford Motor Company. There are 2 repair procedure levels for repairing the Tough Bed® material. Refer to www.fordbedlinerrepair.com for further instruction.

NOTE: Left side shown, right side similar.

2	27841 LH/ 27840 RH	Panel assembly — mild steel

All Methods

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

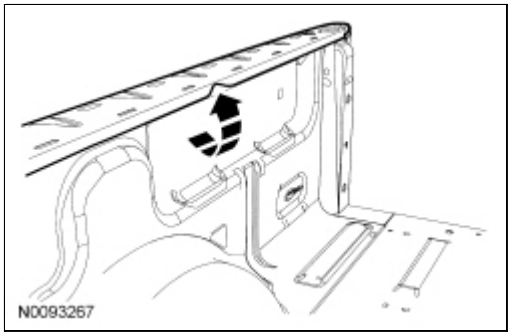
Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Appropriate seam sealer needs to be applied to exposed joints and seams in addition to corrosion protection, particularly horizontal surfaces where moisture collects and migrates. Exposed seams and joints can corrode or rust prematurely if seam sealer is not applied correctly. For additional information, refer to Sealers in this section.**

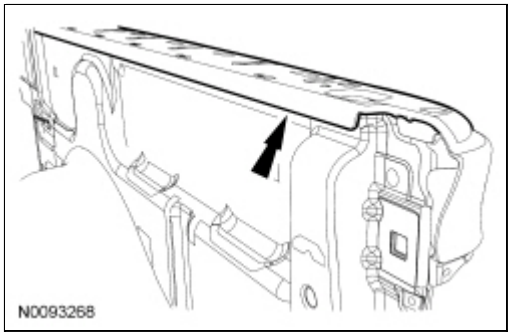


NOTE: Factory spot welds may be substituted with either Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

NOTE: Observe prescribed welding procedures when carrying out any body side section repair. For additional information, refer to Welding Precautions — Steel in this section.

1. Remove the tailgate assembly. For additional information, refer to Section 501-04 .
2. Remove the rear lamp assembly from the affected side. For additional information, refer to Section 417-01 .
3. If equipped, remove the wheelhouse opening moulding(s).
4. Remove the pickup bed upper rail moulding from the affected side.
5. Remove the pickup bed assembly and place on suitable workstands. For additional information, refer to Section 501-04 .

repair4less

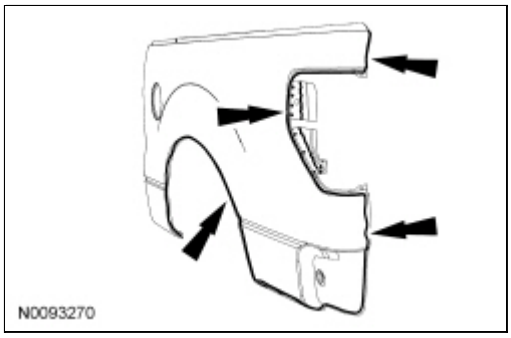


6. Using suitable pliers, bend the inner flange upwards along the bed upper rail to allow access for a spot weld cutting tool.

7. ***NOTICE:*** **Use caution to only drill through the spot welds in the outer panel to avoid damage to the inner panel.**

   Using a commercially available spot weld cutter or equivalent, drill out the spot welds that are accessible.

8. Using an air chisel or hand-held weld splitter, separate the weld flanges at the bed rail and front laps of the panel.

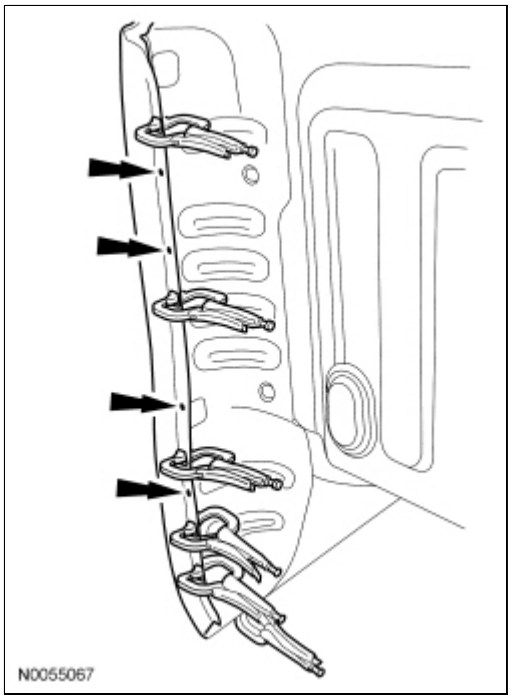


9. **NOTE:** DO NOT remove the foam sealer from around the inside of the wheel opening.

   Using an air saw or air chisel, cut the outer panel, making sure not to cut into the mating flanges or adjacent parts.

10. Continue cutting along the lines until the panel can be completely removed.

11. Drill out the remaining spot welds.

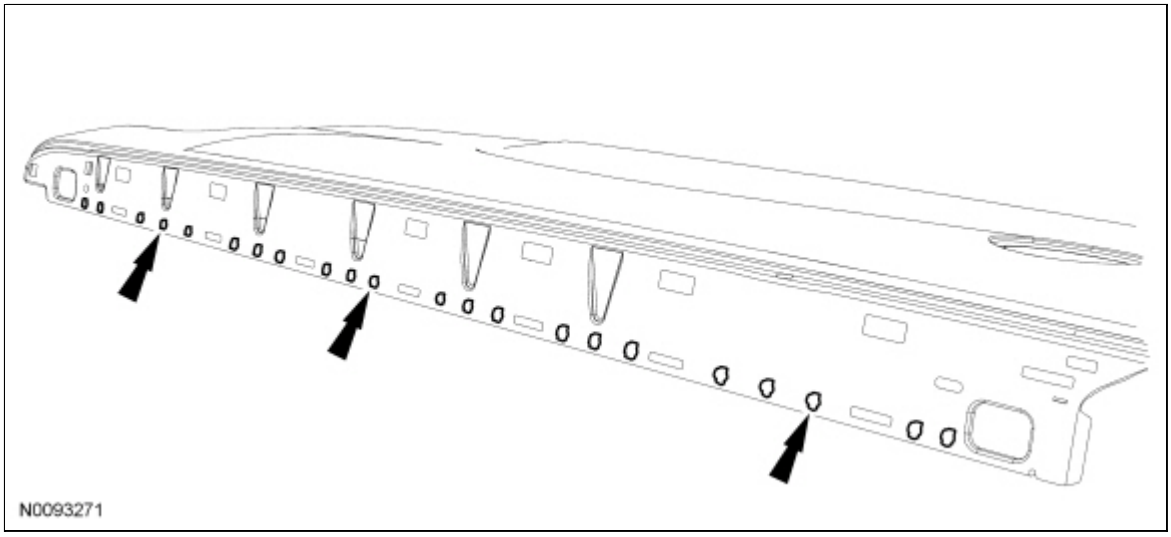


12. Using an air chisel or hand-held splitter, separate and remove the remaining outer panel material.

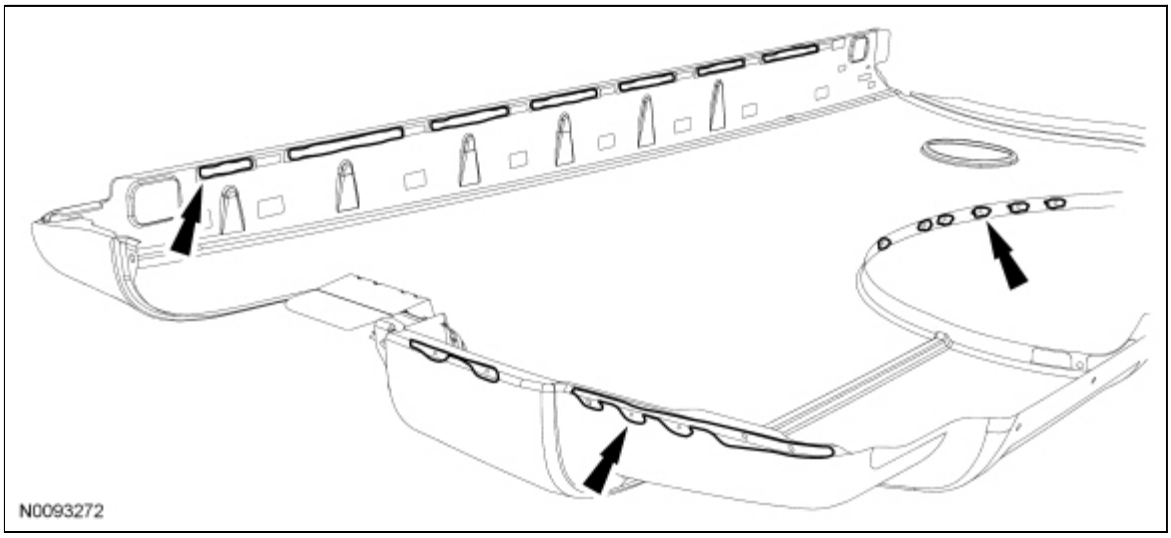
13. Straighten all flanges as necessary using a hammer and dolly.

14. Using a suitable grinder and grinding disc, carefully grind the mating surfaces of the receiving flanges on the vehicle as follows:
    - Make sure to remove all E-coat, paint or galvanized coating from the mating surfaces. If the metal has a pewter appearance, the galvanized coating has not been completely removed. A shiny appearance must be left after grinding.
    - DO NOT damage the corners or thin the metal.
    - DO NOT GRIND above the mating surface area. This will help eliminate the possibility of corrosion formation after the repair is completed.

15. Dry-fit and clamp the new outer panel to check fit.



16. Using the original spot welds as a guide, mark the new spot weld locations next to, but not on top of, the original spot weld locations on the new outer panel.



17. Remove the panel and place on suitable work stands.

repair4less

Squeeze-Type Resistance Spot Welding (STRW) Method

18. Using a suitable grinder and grinding disc, carefully grind only the spots marked earlier in the new outer panel as follows:
    - Make sure to remove all E-coat, paint or galvanized coating from the mating surfaces. If the metal has a pewter appearance, the galvanized coating has not been completely removed. A shiny appearance must be left after grinding.
    - DO NOT damage the corners or thin the metal.
    - DO NOT GRIND above the mating surface area. This will help eliminate the possibility of corrosion formation after the repair is completed.

19. **NOTE:** Set up spot welder per manufacturer's recommendations for metal thickness.

    Prepare the metal bonding adhesive by placing the cartridge into an applicator gun and dispense a small amount of adhesive to level plungers. Install a mixing tip onto the cartridge and dispense a 75 mm (2.95 in) bead of adhesive onto a scrap piece of cardboard to make sure the components are correctly mixed and ready to apply.

20. **NOTE:** Refer to the adhesive product label for use and preparation instructions.

Perform a weld bond test as follows:

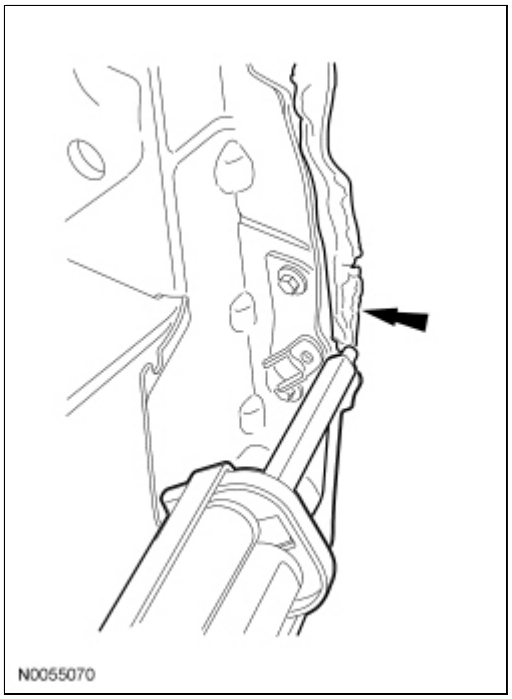
- Prepare 2 pieces of scrap for bonding. These will be used for a test weld.

21. Verify the resistance spot welder is set to manufacturer's recommended settings for the thickness of the metal.

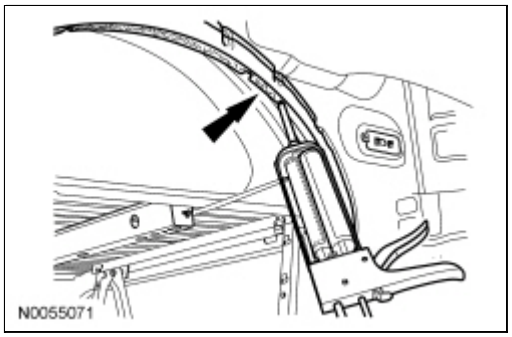
22. Apply a 6 mm (0.23 in) to 9 mm (0.35 in) bead of adhesive onto the test pieces of metal.

23. **NOTE:** Clamps should have tape over the ends to insulate them during welding.

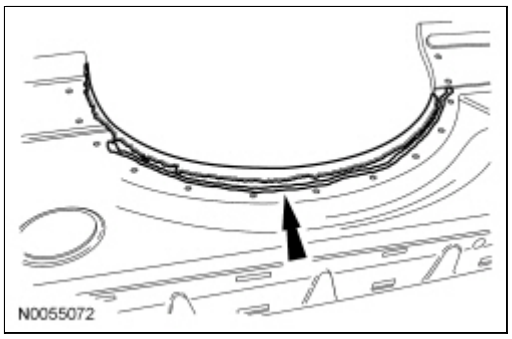
    Clamp the pieces together and apply one weld.



24. Remove the clamp, then place the welded pieces in a vise and perform destructive weld test by peeling the scrap metal apart using large channel lock pliers. Measure the size of the weld nugget to verify it meets Ford Motor Company weld nugget requirements. For additional information, refer to the weld nugget table in Specifications in this section.



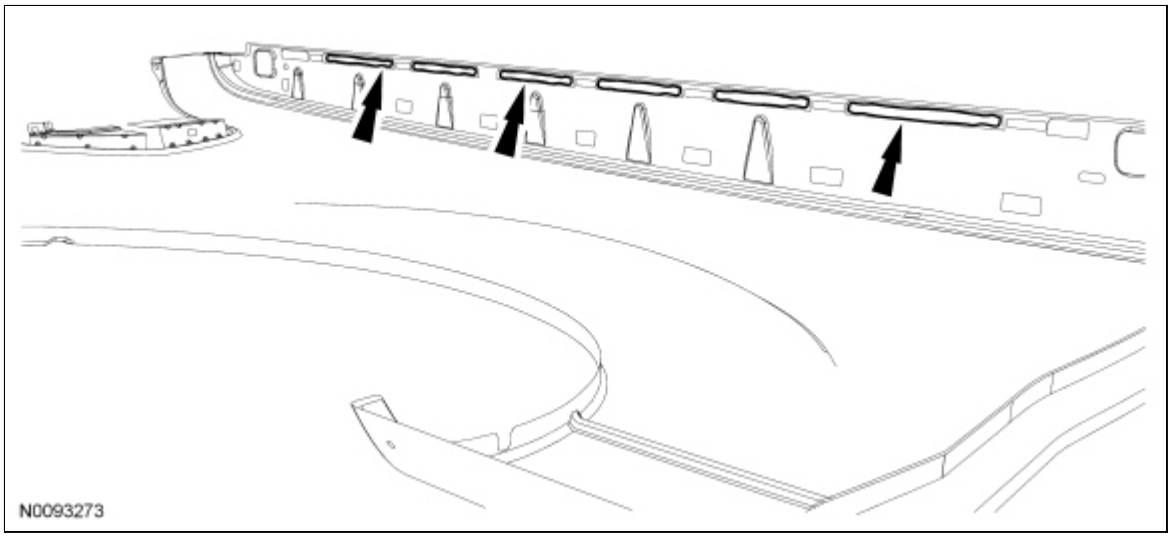
25. Proceed with the panel installation once the correct weld nugget size is achieved.



26. Wipe all dust and grit off the panel to prepare the service replacement outer panel for installation.
    - Remove any foreign material from the vehicle in the repair area.

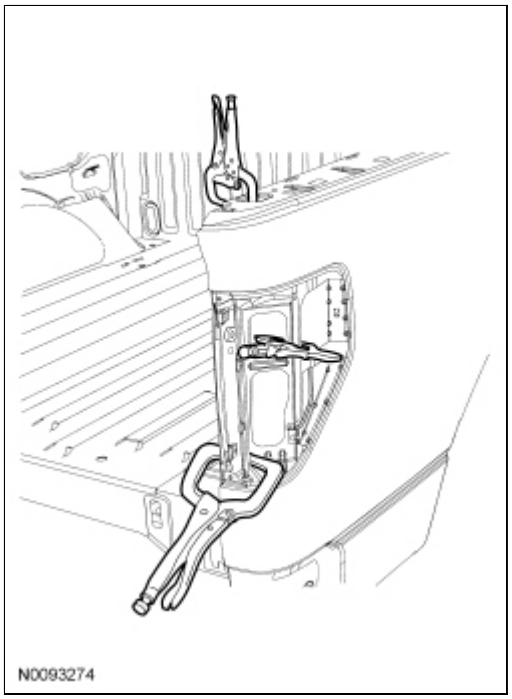
27. Apply a bead of adhesive approximately 6 mm (0.23 in) to 10 mm (0.39 in) wide, to the flanges on the vehicle and the mating surfaces of the new outer panel in the following locations:
    - Top rail flange
    - Short vertical flange at front top of bed
    - Forward vertical flange
    - Small area at bottom of inner panel just behind forward vertical flange
    - Rear vertical flange
    - Around tail lamp area
    - Small area behind wheel opening beneath tail lamp area
    - Wheel opening flange
    - The area of the panel that contacts the wheel opening foam sealer
    - Apply an extra bead of adhesive to the inside corner around the wheel opening on the new outer panel

repair4less



28. **NOTE:** Do not scrape off the adhesive. Do not spread out the extra bead of adhesive that was applied to the inside corner at the wheel opening.

    Using a paint stick or equivalent, spread the adhesive to cover the entire area where the E-coat was ground off.

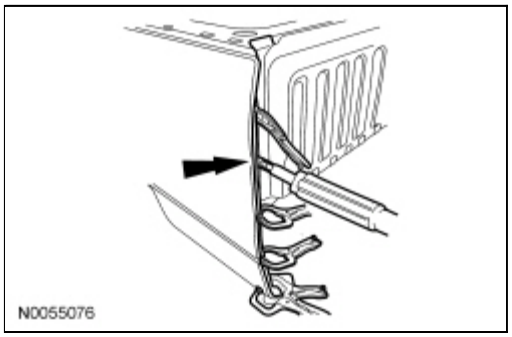


29. Position the new outer panel onto the bed. Once positioned, DO NOT PULL the panel away from the bed. If repositioning is necessary, SLIDE the panel. This maintains correct contact between the components and the adhesive.

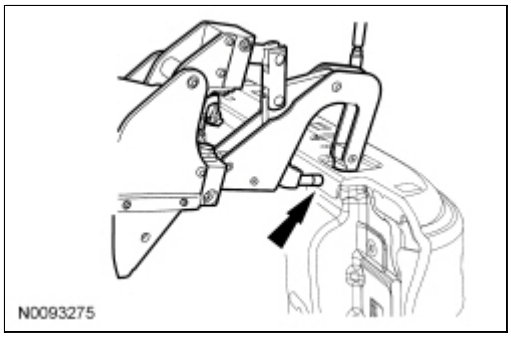
30. **NOTE:** Clamps should have tape over the ends to insulate them during welding.

    Clamp the panel in place evenly and tightly. Glass beads in the adhesive will prevent over-clamping the components.

repair4less



31. Wipe away any excess adhesive, where possible, before it cures.



32. **NOTE:** Welding can be carried out anytime during the adhesive curing process or after the adhesive is fully cured. Welder settings will vary when welding through wet adhesive versus welding through cured adhesive. Use the welder manufacturer's recommended settings for welding through adhesive.

    NOTE: It is best to place a shunt weld (in an area with no adhesive) as the first weld to make sure you have correct conductivity, particularly when welding through cured adhesive.

    NOTE: If welding will not be carried out immediately, follow the adhesive product label for cure times.

    Spot weld the new panel in place, maintaining original spot weld spacing. Welds should be placed as close as possible to the original welds, BUT NOT DIRECTLY OVER AN ORIGINAL SPOT WELD.

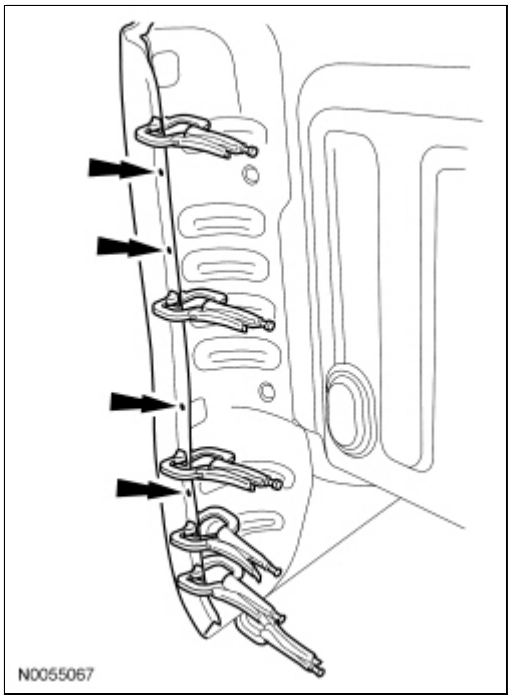
Metal Inert Gas (MIG) Welding Method

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

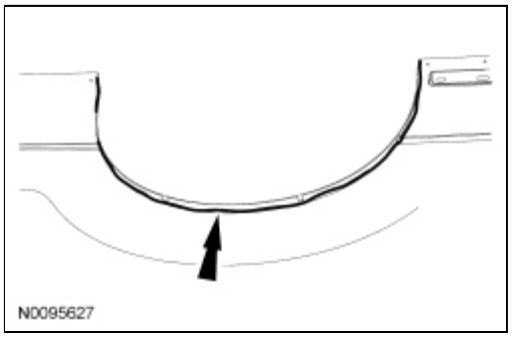
NOTICE: **Appropriate seam sealer needs to be applied to exposed joints and seams in addition to corrosion protection, particularly horizontal surfaces where moisture collects and migrates. Exposed seams and joints can corrode or rust prematurely if seam sealer is not applied correctly. For additional information, refer to Sealers in this section.**



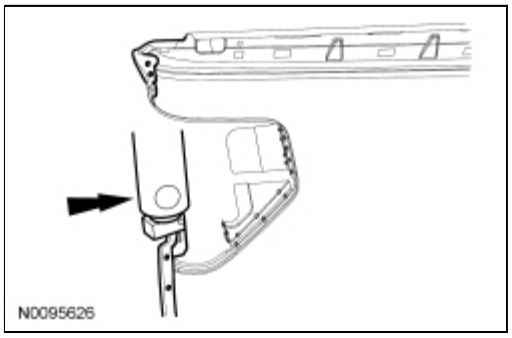
33. Straighten all flanges as necessary using hammer and dolly.

34. Using a suitable grinder and grinding disc, carefully grind the mating surfaces of the receiving flanges on the vehicle as follows:
    - Make sure to remove all E-coat, paint or galvanized coating from the mating surfaces. If the metal has a pewter appearance, the galvanized coating has not been completely removed. A shiny appearance must be left after grinding.
    - DO NOT damage the corners or thin the metal.
    - DO NOT GRIND above the mating surface area. This will help eliminate the possibility of corrosion formation after the repair is completed.

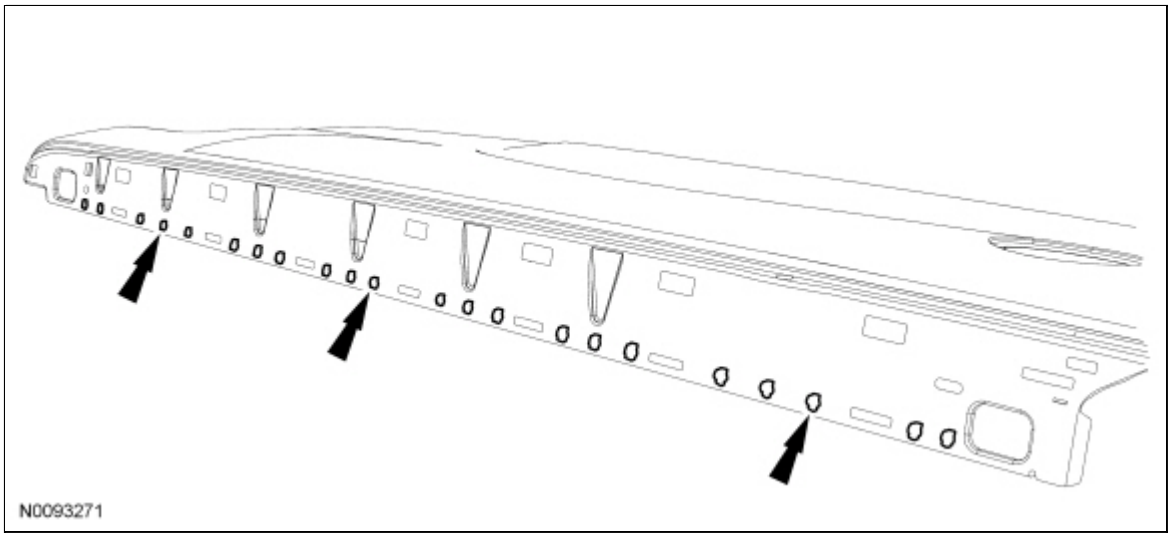
35. Dry-fit and clamp the new outer panel to check fit.



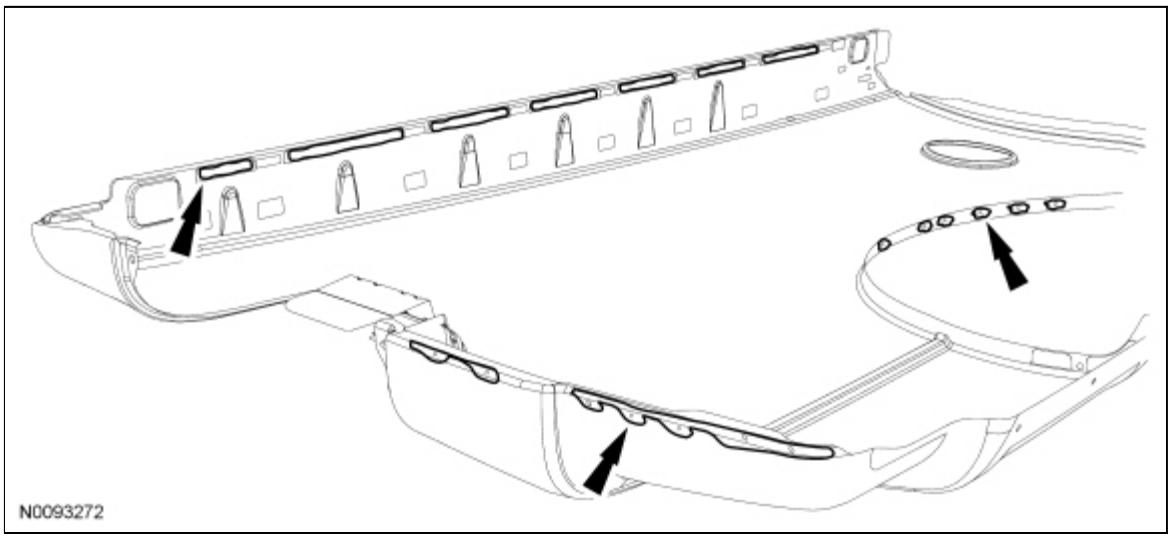
36. Using the original spot welds as a guide, mark the new spot weld locations next to, but not on top of, the original spot weld locations on the new outer panel.



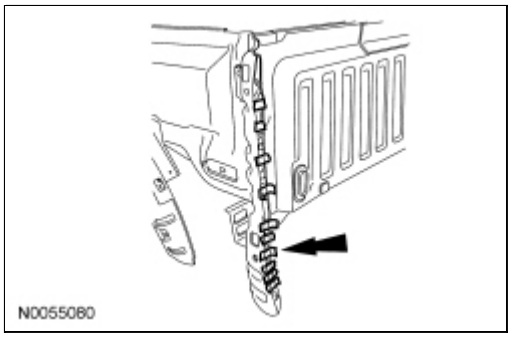
repair4less



37. Remove the panel and place on suitable work stands.



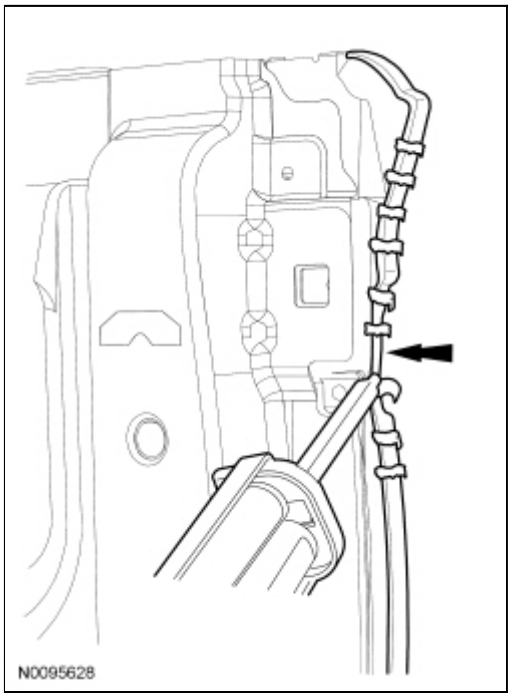
38. Drill or punch the exact number of holes to match the number of spot welds that secured the original panel. The holes should be 8 mm (0.31 in) diameter and as close to the original spot welds without lining up exactly on top of the original spot welds.



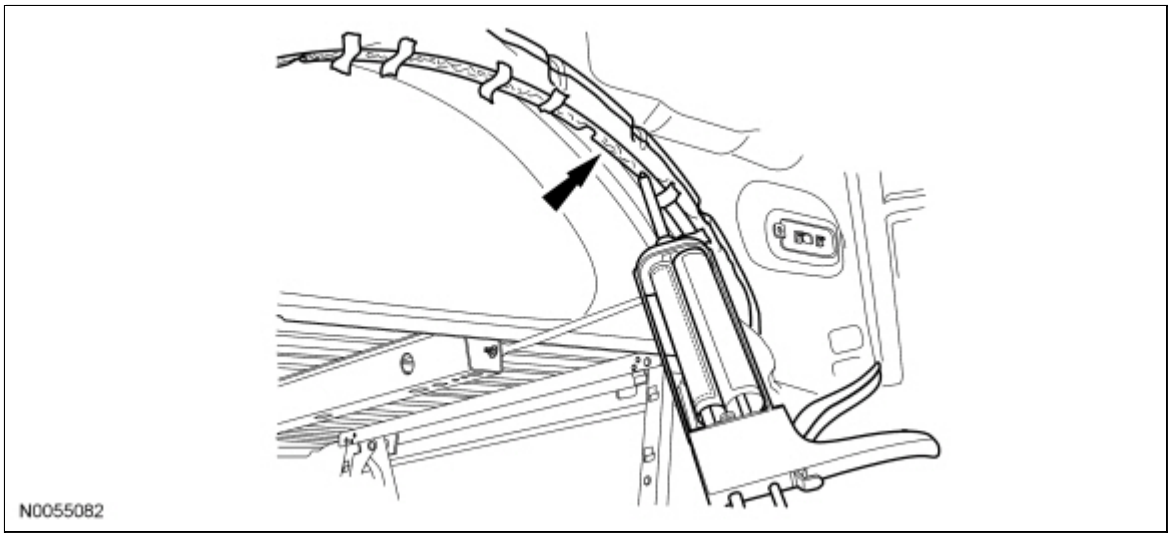
39. Using a suitable grinder and grinding disc, carefully grind only the spots marked earlier in the new outer panel as follows:
    - Make sure to remove all E-coat, paint or galvanized coating from the mating surfaces. If the metal has a pewter appearance, the galvanized coating has not been completely removed. A shiny appearance must be left after grinding.
    - DO NOT damage the corners or thin the metal.
    - DO NOT GRIND above the mating surface area. This will help eliminate the possibility of corrosion formation after the repair is completed.

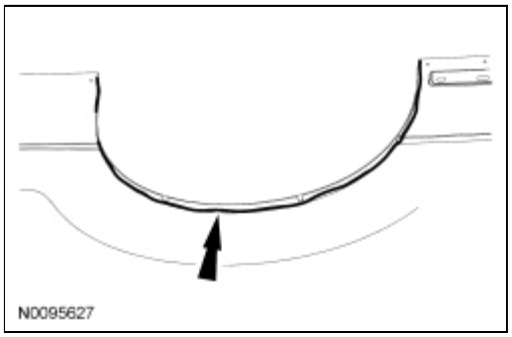
40. Wipe all dust and grit off the panel to prepare the service replacement outer panel for installation.
    - Remove any foreign material from the vehicle in the repair area.

41. Apply 25.4 mm (1 in) masking tape over the plug weld locations marked earlier to prevent contamination from the adhesive.



repair4less

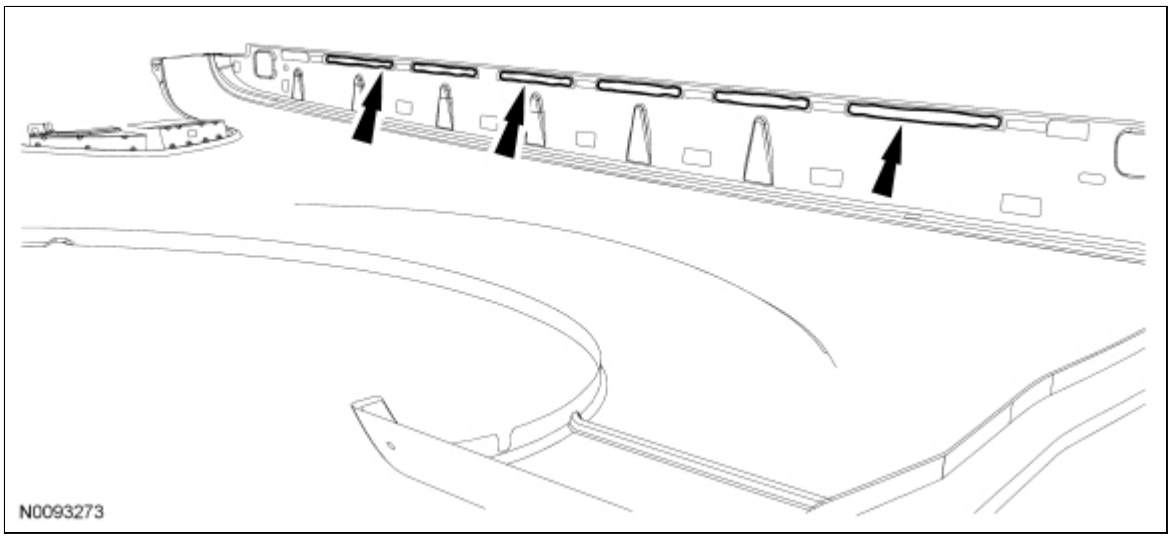




42. **NOTE:** Refer to the adhesive product label for use and preparation instructions.

    Prepare the metal bonding adhesive by placing the cartridge into an applicator gun and dispense a small amount of adhesive to level plungers. Install a mixing tip onto the cartridge and dispense a 75 mm (2.95 in) bead of adhesive onto a scrap piece of cardboard to make sure the components are correctly mixed and ready to apply.

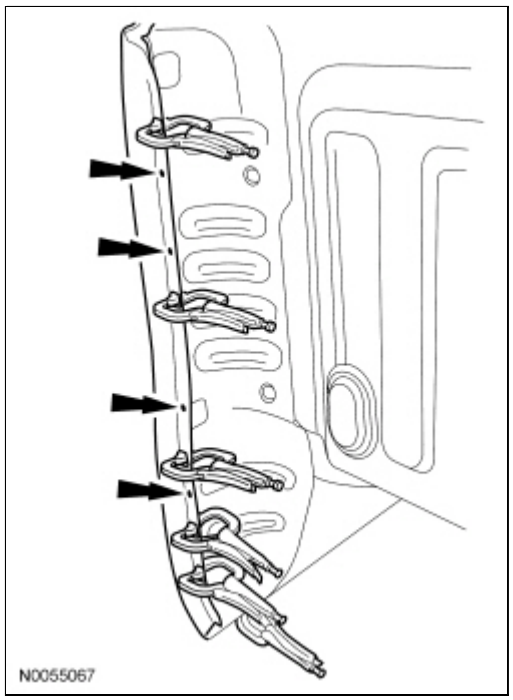
43. Apply a bead of adhesive approximately 6 mm (0.23 in) to 10 mm (0.39 in) wide to the flanges on the vehicle and the mating surfaces of the new outer panel in the following locations:
    - Top rail flange
    - Short vertical flange at front top of bed
    - Forward vertical flange
    - Small area at bottom of inner panel just behind forward vertical flange
    - Rear vertical flange
    - Around tail lamp area
    - Small area behind wheel opening beneath tail lamp area
    - Wheel opening flange
    - The area of the panel that contacts the wheel opening foam sealer
    - Apply an extra bead of adhesive to the inside corner around the wheel opening on the new outer panel



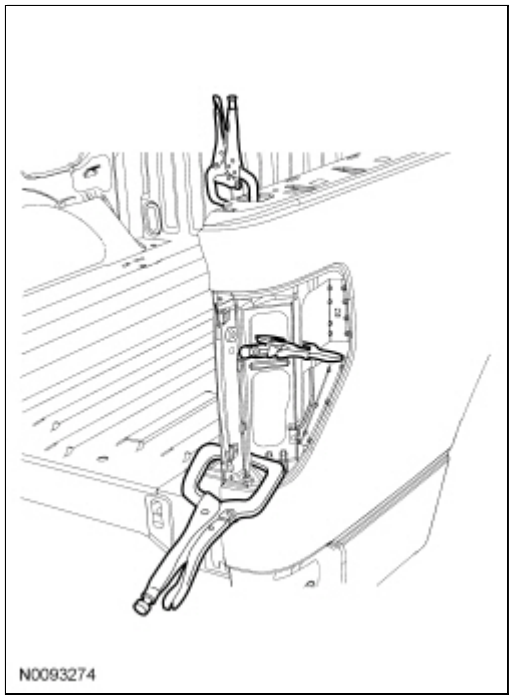
44. **NOTE:** Do not scrape off the adhesive. Do not spread out the extra bead of adhesive that was applied to the inside corner at the wheel opening.

    Using a paint stick or equivalent, spread the adhesive to cover the entire area where the E-coat was ground off.

45. Remove the tape to expose the bare metal around the plug weld areas.

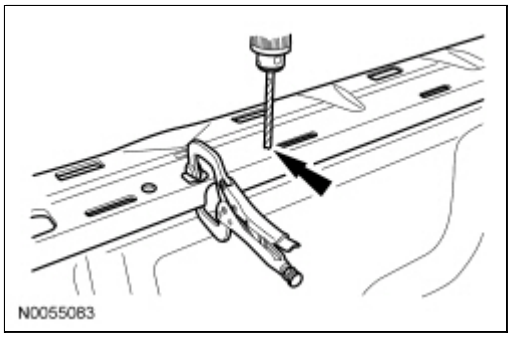


46. Position the new outer panel onto the bed. Once positioned, DO NOT PULL the panel away from the



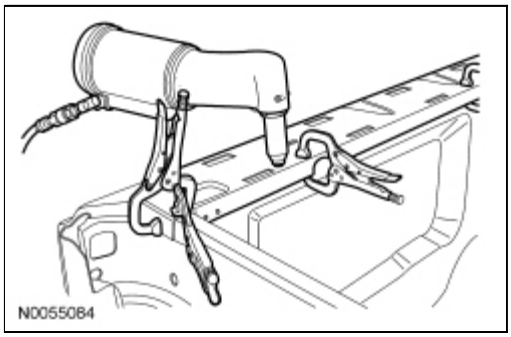
repair4less

bed. If repositioning is necessary, SLIDE the panel. This maintains correct contact between the components and the adhesive.



47. **NOTE:** Clamps should have tape over the ends to insulate them during welding.

    Clamp the panel in place evenly and tightly. Glass beads in the adhesive will prevent over-clamping the components.



48. Using an 8 mm (0.31 in) bit, drill through the top rail in the new panel and the inner panel in the locations marked indicating the original spot welds.

49. Using locally procured rivets (3/16 x 0.440 oval head blind steel rivet), rivet the new panel in place along the upper rail.

50. **NOTE:** Welding can be carried out anytime, while the adhesive cures or after the adhesive is fully cured. Follow the adhesive label instructions for cure times.

    Weld the new panel in place. Welds should be placed as close as possible to the original welds, BUT NOT DIRECTLY OVER AN ORIGINAL SPOT WELD.

All methods

51. Remove the clamps after welding is completed.

52. Apply flexible foam sealer to the outer panel-to-inner panel wheel opening joint.

53. Restore corrosion protection to all bare metal surfaces. Finish any cosmetic seams with seam sealer. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

54. Proceed with the refinish process and follow Ford-approved paint procedures.

55. Reinstall the pickup bed assembly. For additional information, refer to Section 501-04 .

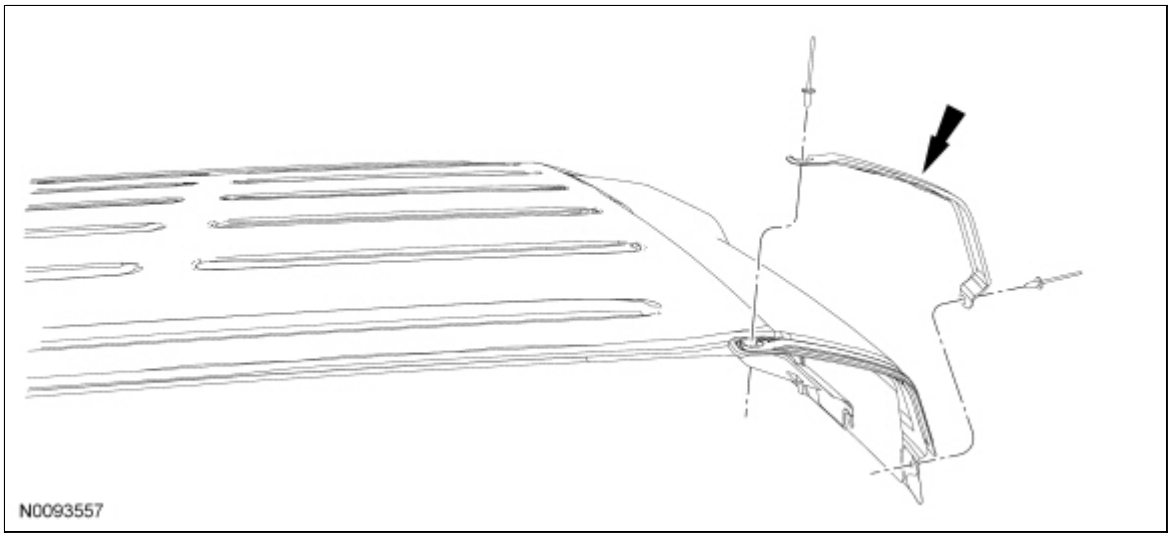
Removal

WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

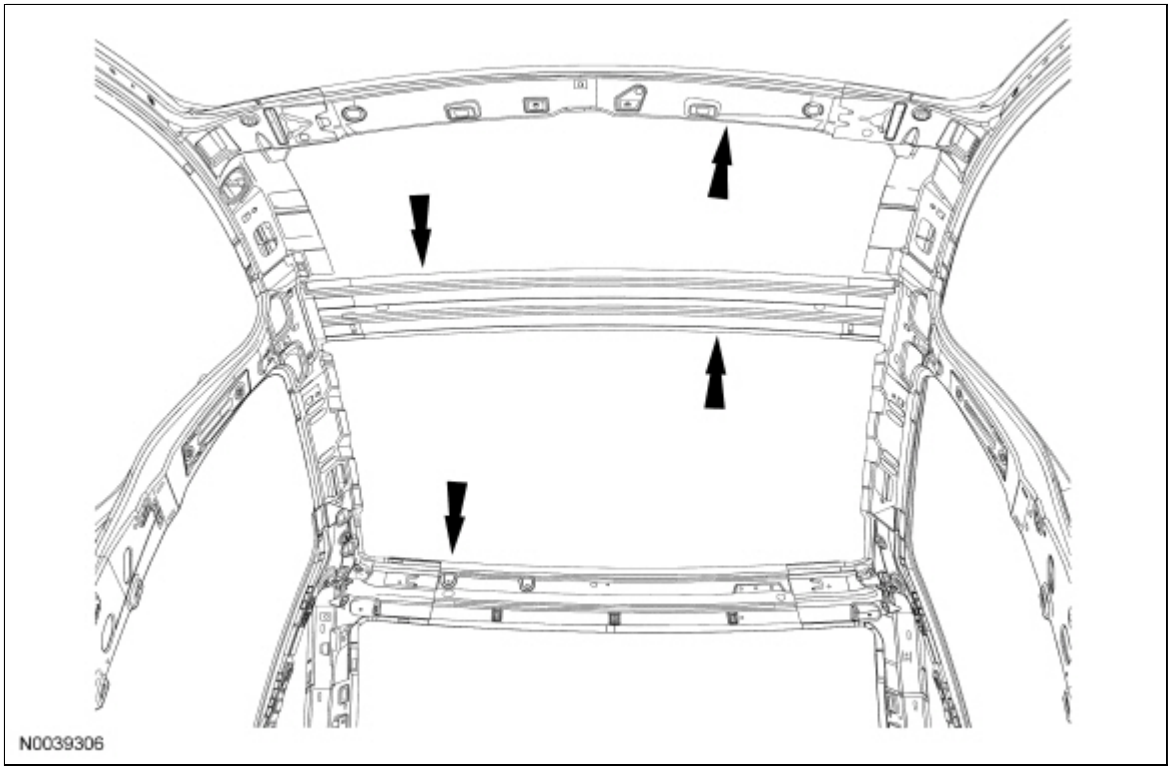


WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

***NOTICE:* Be sure to adequately protect all glass, exterior finish and interior trim to avoid surface contamination from repair materials.**

NOTE: The driver and passenger sides of the roof panel are laser welded. Installation of a new roof panel will employ a weld-bonding technique. The use of mechanical welding and chemical bonding are both part of the installation technique.

1. Remove the windshield and rear window glass. For additional information, refer to Section 501-05 .
2. Remove the headliner. For additional information, refer to Section 501-05 .
3. Remove the roof rear corner mouldings. The moulding is attached with rivets which must be drilled out to remove.



repair4less

4. **NOTE:** For installation purpose, particular attention must be paid to the depth (thickness) of the sealer removed.

   Using a heat gun and a narrow scraper, remove the sealer along the entire length of the roof sides. Remove the sealer as completely as possible.

5. From inside the vehicle, leaving as much of the foam as possible intact, separate the NVH foam along the roof bows from the roof panel using a flexible and sharp broad scraper or knife.

6. Remove (drill out) all the roof panel spot welds from the windshield header and back panel assembly.

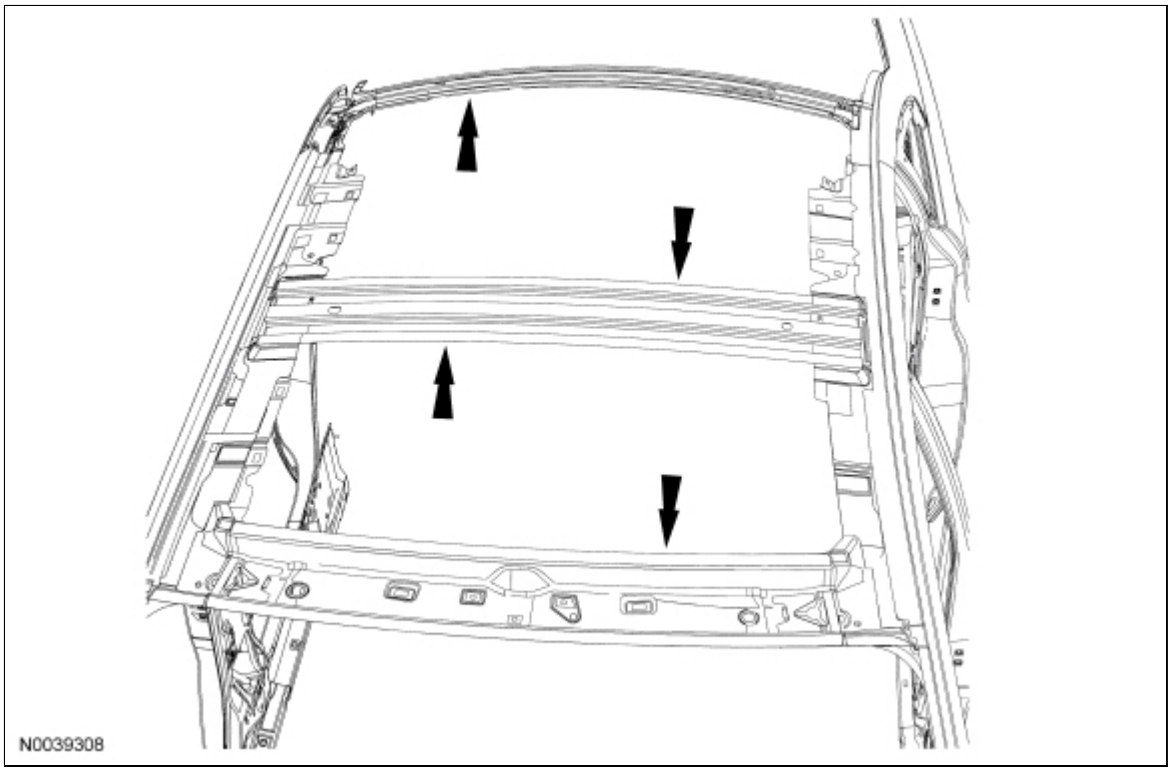
7. Using a die grinder, carefully cut along the upper flange of the roof panel, the entire length of the panel.

8. With the help of an assistant, remove the roof panel from the vehicle.

9. Using an air chisel equipped with a flat chisel or similar, remove the remaining portion of the roof panel from the roof ditch area.

Installation

1. Using a hammer and dolly, straighten any damage caused to flange areas during removal.



2. Using a grinder, carefully prepare the roof ditch area for the new roof panel.

3. With the help of an assistant, position the new roof panel on the vehicle.

4. Correctly align and index-mark the positioning of the panel-to-vehicle and remove the panel.

5. Apply a 13 mm (0.51 in) tall bead of seam sealer directly to the NVH foam remaining on the roof bows. Apply a bead of metal bonding adhesive following label instructions, along the roof ditch area on each side.

repair4less

6. Reinstall the roof panel aligning it to the index marks made during the test fitting. If adjustment is necessary, do not lift the roof panel, slide to reposition. Make sure good contact is made with the sealer and adhesive and carefully clamp the roof panel on all sides.

7. **NOTE:** The roof panel is not welded along the roof ditch flange, only metal bonding adhesive is used.

   Using a resistance spot welder, weld the roof panel to the vehicle in the windshield and back panel assembly areas. Spot welds should match factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

8. Using a Metal Inert Gas (MIG) welder, seam weld the roof panel at each corner with 10 mm (0.39 in) long weld beads.
   - Apply flexible foam as necessary between roof panel and reinforcements to maintain NVH performance.

9. Prepare the repair area for refinish material application following Ford-approved paint recommendations.

10. Apply a quality primer-sealer following the paint manufacturer's recommendation for both compatibility and application.

11. **NOTE:** Always use refinishing materials from a single paint manufacturer. Combining products from more than one manufacturer may result in refinishing material incompatibility issues and potential void of warranty for each product applied.

    If required, follow up with a quality primer-surfacer following Ford-approved paint recommendations. Block sand to level using the recommended grit sandpaper.

12. ***NOTICE:*** **Failure to purge air bubbles from the roof ditch sealer may result in air trapped in the roof ditch which may cause refinishing materials to pop.**

Stand the roof ditch sealer vertically (nose up) for a minimum of 30 minutes prior to application to permit trapped air to rise to the top so it may be purged.

13. Position the vehicle so it is level front-to-rear.
    - Using masking tape, form a dam at each end of the roof ditch (both sides) to prevent sealer run-off.

14. Apply the roof ditch sealer following product directions to a depth equal to the sealer noted during removal.

15. Allow the sealer to cure 40-60 minutes at room temperature before refinishing. If roof ditch sealer has been allowed to cure in excess of 2 hours, scuff the surface using a red scuff pad.

16. Refinish the roof and repair area following Ford-approved paint recommendations.

17. Allow refinishing materials sufficient cure time to permit safe handling (refer to paint manufacturer's specification) and install the roof corner mouldings.

18. Install the headliner. For additional information, refer to Section 501-05 .

19. Install the windshield and rear window glass. For additional information, refer to Section 501-11 .

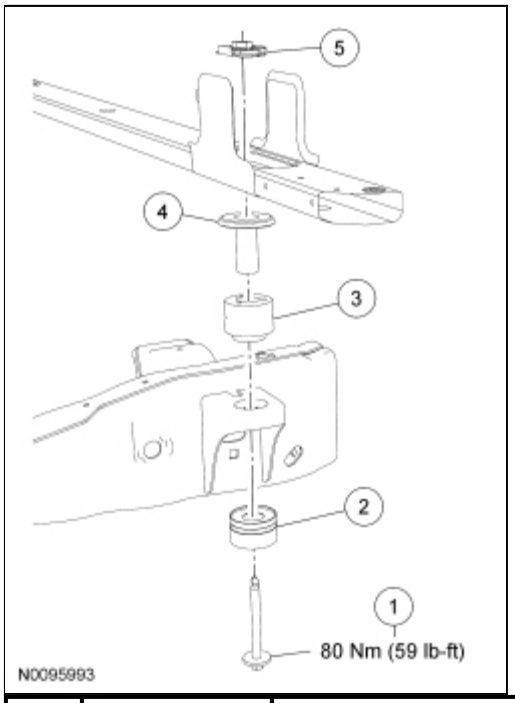
Heat shield screws	20	—	177
Trailer hitch assembly-to-bumper bolts	175	129	—
Transmission mount nuts	103	76	—
Transmission support crossmember nuts	103	76	—

Frame and Body Mounting

The frame consists of 2 steel channel rails, a front crossmember, transmission support crossmember and a rear crossmember (trailer hitch). The side rails and welded crossmembers are not replaced separately. A front frame rail repair kit (5D058 and 5D059) is available if the front rail is to be repaired.

For diagonal or X-frame checking, refer to Section 501-35 . When welding is carried out on a vehicle, refer to Section 501-35 .

Body Mounts

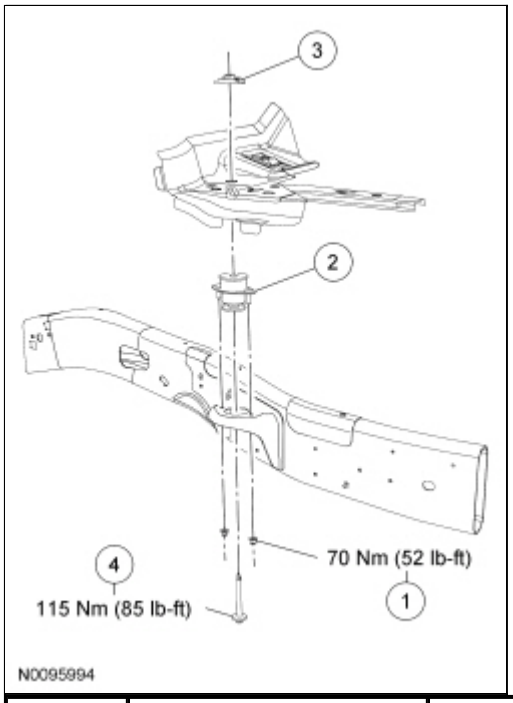


The body support mounts:

- secure the body to the frame.
- cannot be lubricated during body support mount installation.

NOTE: Body fasteners are reusable if the following steps are followed:

- Body bolt threads must be cleaned of thread sealer by using a wire wheel or wire brush.
- Apply a new treatment of threadlock and sealer to the body bolt threads.
- Install the body bolts. For additional torque and material information refer to Specifications in this section.



Body — Front End Sheet Metal (FESM) Body Mount

Body Retainer Cage Nuts

Front End Sheet Metal (FESM)

1. Remove the headlamp assembly. For additional information, refer to Section 417-01 .
2. Bend the tabs of the damaged cage nut retainer upward to access the cage nut.

3. Using a suitable tool, hold the cage nut and remove the Front End Sheet Metal (FESM) body mount bolt.
   - Discard the FESM bolt.
4. ***NOTICE:*** **Do not use a standard nut as a replacement for the nut being removed. Failure to use the correct part number for the nut may result in damage to the vehicle.**

   NOTE: If the cage nut is not damaged, it is not necessary to replace it with a new cage nut. The old cage nut may be used if the threads of the nut are not damaged.

   NOTE: Remove the new cage nut from the cage and install the cage nut into the pre-existing cage.

   Install the new cage nut into the location from which the damaged nut was removed.
5. Bend the tabs of the cage nut retainer back into position to secure the cage nut.
6. Install a new FESM body mount bolt.
   - Tighten the new bolt to 80 Nm (59 lb-ft).
7. Install the headlamp assembly. For additional information, refer to Section 417-01 .

Body mount No. 1 (all cabs)

8. Remove the front seat. For additional information, refer to Section 501-10 .
9. Remove the scuff plate trim panel.
   - Pull upward to release the scuff plate trim panel clips from the body.
10. Peel the carpet back to gain access to the No. 1 body mount retainer cage nut location.

11. Mark the location of the body retainer cage nut.
    - Measure 244.48 mm (9.625 in) from the body side-to-floor pan seam towards the inside of the vehicle.
    - Measure 107.95 mm (4.25 in) from the cowl-to-floor pan seam towards the inside of the vehicle.

12. Using a 50 mm (1.968 in) hole saw, drill a hole into the floor pan.

13. Bend the tabs of the damaged cage nut upward to access the cage nut.

14. Using a suitable tool, hold the cage nut and remove the body mount bolt.
    - Discard the body mount bolt.

15. ***NOTICE:*** **Do not use a standard nut as a replacement for the nut being removed. Failure to use the correct part number for the nut may result in damage to the vehicle.**

    NOTE: If the cage nut is not damaged, it is not necessary to replace it with a new cage nut. The old cage nut may be used if the threads of the nut are not damaged.

    NOTE: Make sure that the surface of the cage nut retainer is flat prior to installing the cage nut.

    NOTE: Remove the new cage nut from the cage and install the cage nut into the pre-existing cage.

    Install the new cage nut into the location from which the damaged nut was removed.

16. Install a new body mount bolt.
    - Tighten the new bolt to 115 Nm (85 lb-ft).

17. Install the new service plug (W651023-S300).

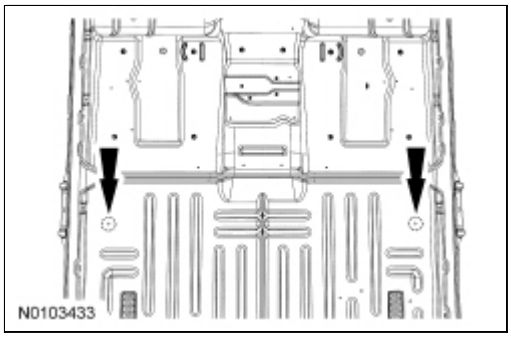
18. Position the carpet into the correct orientation.

19. ***NOTICE:*** **To avoid damage to the scuff plate trim panel, remove any retaining clips from the body and attach them to the scuff plate trim panel before installing.**

    Install the scuff plate trim panel.

Body mount No. 2 (SuperCab and SuperCrew only)

20. Remove the scuff plate trim panel.
    - Pull upward to release the scuff plate trim panel clips from the body.



repair4less

21. Remove the front seat. For additional information, refer to Section 501-10 .

22. Remove the console. For additional information, refer to Section 501-12 .

23. **NOTE:** The No. 2 body mounts are located directly under the locations shown.

    Peel the carpet back to gain access to the body mount No. 2 location.

24. Using a 50 mm (1.968 in) hole saw, drill a hole through the floor pan to gain access to the body mount No. 2 cage nut.

25. Bend the tabs of the damaged cage nut upward to access the cage nut.

26. Using a suitable tool, hold the cage nut and remove the body mount bolt.
    - Discard the body mount bolt.

27. ***NOTICE:*** **Do not use a standard nut as a replacement for the nut being removed. Failure to use the correct part number for the nut may result in damage to the vehicle.**

    NOTE: If the cage nut is not damaged, it is not necessary to replace it with a new cage nut. The old cage nut may be used if the threads of the nut are not damaged.

    NOTE: Make sure that the surface of the cage nut retainer is flat prior to installing the cage nut.

    NOTE: Remove the new cage nut from the cage and install the cage nut into the pre-existing cage.

    Install the new cage nut into the location from which the damaged nut was removed.

28. Install a new body mount bolt.
    - Tighten the new bolt to 115 Nm (85 lb-ft).

29. Install the new service plug (W651023-S300).

30. Position the carpet into the correct orientation.

31. ***NOTICE:*** **To avoid damage to the scuff plate trim panel, remove any retaining clips from the body and attach them to the scuff plate trim panel before installing.**

    Install the scuff plate trim panel.

Body mount No. 3 (regular cab)

32. Remove the scuff plate trim panel.
    - Pull upward to release the scuff plate trim panel clips from the body.

33. Peel back the carpet to gain access to the body retainer cage nut location.

34. Mark the location of the body retainer cage nut.
    - Measure 184.15 mm (7.25 in) from the body side-to-floor pan seam towards the interior of the vehicle.
    - Measure 82.55 mm (3.25 in) from the body rear end-to-floor pan seam towards the interior of the vehicle.

35. Using a 50 mm (1.968 in) hole saw, drill a hole in the marked location.

36. Bend the tabs of the damaged cage nut upward to access the cage nut.

37. Using a suitable tool, hold the cage nut and remove the body mount bolt.
    - Discard the body mount bolt.

38. ***NOTICE:*** **Do not use a standard nut as a replacement for the nut being removed. Failure to use the correct part number for the nut may result in damage to the vehicle.**

    NOTE: If the cage nut is not damaged, it is not necessary to replace it with a new cage nut. The old cage nut may be used if the threads of the nut are not damaged.

    NOTE: Make sure that the surface of the cage nut retainer is flat prior to installing the cage nut.

    NOTE: Remove the new cage nut from the cage and install the cage nut into the pre-existing cage.

    Install the new cage nut into the location from which the damaged nut was removed.

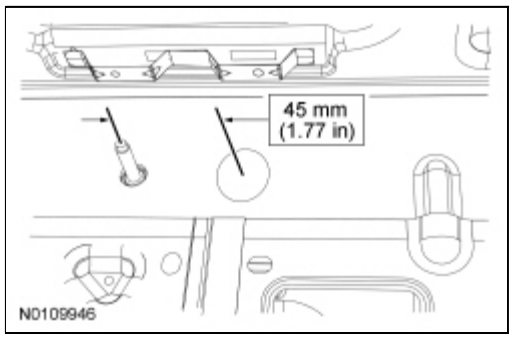
39. Install a new body mount bolt.
    - Tighten the new bolt to 115 Nm (85 lb-ft).

40. Install the new service plug (W651023-S300).

41. Position the carpet into the correct orientation.

42. ***NOTICE:*** **To avoid damage to the scuff plate trim panel, remove any retaining clips from the body and attach them to the scuff plate trim panel before installing.**

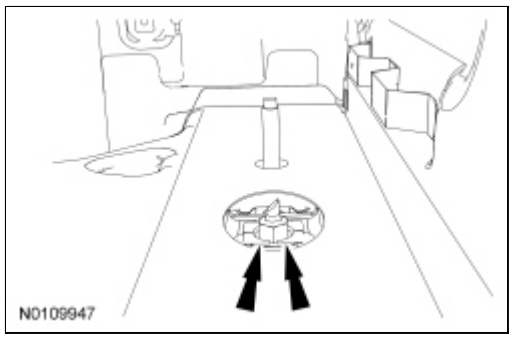
    Install the scuff plate trim panel.



repair4less

Body mount No. 3 (SuperCab and SuperCrew)

43. Remove the scuff plate trim panel.
    - Pull upward to release the scuff plate trim panel clips from the body.



44. Remove the rear seat. For additional information, refer to Section 501-10 .

45. Mark the location for the access hole.
    - Measure 45 mm (1.77 in) from the center of the rear seat stud toward the interior of the vehicle.

46. Using a 50 mm (1.968 in) hole saw, drill a hole in the marked location.

47. Looking in the access hole toward the exterior wall of the vehicle, bend the tabs of the damaged cage nut upward to access the cage nut.

48. Using a suitable tool, hold the cage nut and remove the body mount bolt.
    - Discard the body mount bolt.

49. ***NOTICE:*** **Do not use a standard nut as a replacement for the nut being removed. Failure to use the correct part number for the nut may result in damage to the vehicle.**

    NOTE: If the cage nut is not damaged, it is not necessary to replace it with a new cage nut. The old cage nut may be used if the threads of the nut are not damaged.

    NOTE: Make sure that the surface of the cage nut retainer is flat prior to installing the cage nut.

    NOTE: Remove the new cage nut from the cage and install the cage nut into the pre-existing cage.

    Install the new cage nut into the location from which the damage nut was removed.

50. Install a new body mount bolt.
    - Tighten the new bolt to 115 Nm (85 lb-ft).

51. Install the new service plug (W651023-S300).

52. Position the carpet into the correct orientation.

53. Install the rear seat. For additional information, refer to Section 501-10 .

54. ***NOTICE:*** **To avoid damage to the scuff plate trim panel, remove any retaining clips from the body and attach them to the scuff plate trim panel before installing.**

    Install the scuff plate trim panel.

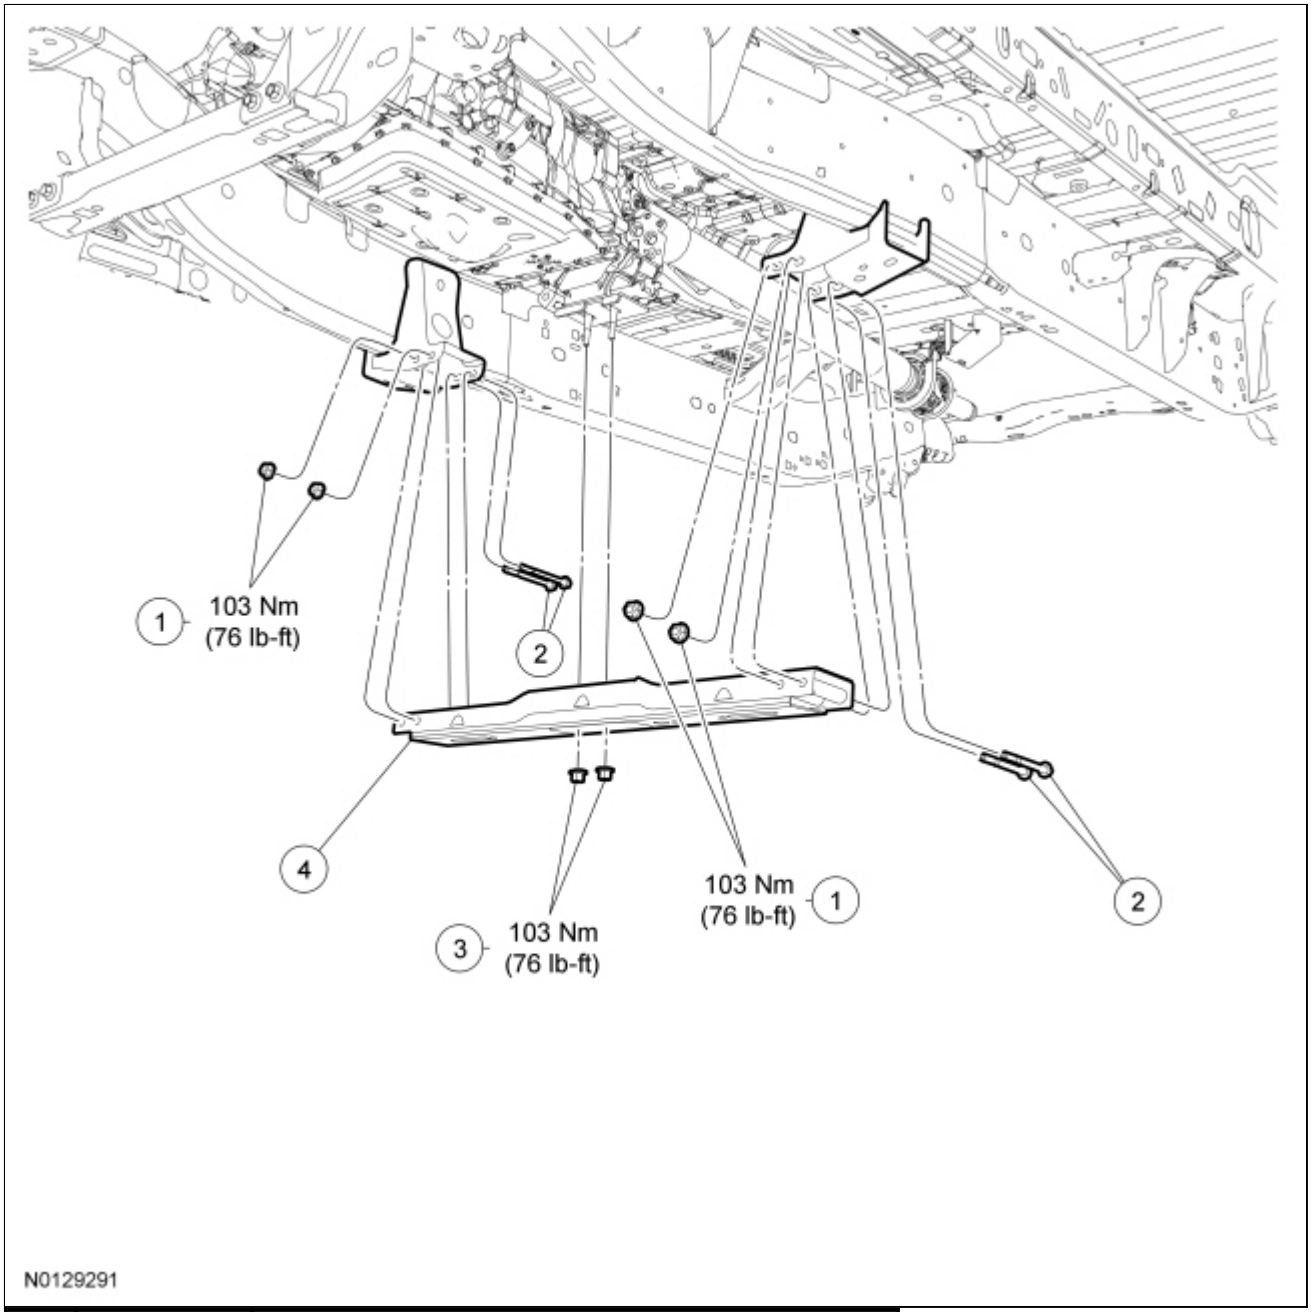
Frame Drilling

1. If a hole must be drilled in the frame, make sure the hole meets the following requirements:
    - The hole is at least the specified distance from the edge of the nearest hole.
    - The edge of the drilled hole is at least the specified distance from the edge of the flange.
    - The hole is at least the specified distance above the frame centerline.
    - The drilled hole is at least the specified distance from any other existing bracket or component of the frame.

Trailer Hitch

Removal and Installation



Item	Part Number	Description
1	—	Trailer light/brake electrical connector
2	N811645-S	Trailer hitch bolts
3	W504042-S	Trailer hitch

1. Remove the rear bumper. For additional information, refer to Section 501-19 .
2. Disconnect the trailer light/brake electrical connector.
3. Remove the trailer hitch bolts and remove the trailer hitch.
   - To install, tighten to 175 Nm (129 lb-ft).
4. To install, reverse the removal procedure.

Transmission Support Crossmember

Item	Part Number	Description
1	W520114	Transmission support crossmember nuts (4 required)
2	W714418	Transmission support crossmember bolts (4 required)
3	W520114	Transmission mount nuts (2 required)

repair4less

4	7H474	Transmission support crossmember

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the 2 heat shield screws.
3. Support the transmission with a suitable jack.
4. Remove the 2 transmission support nuts.
5. Remove the 4 transmission support crossmember nuts.
6. Remove the 4 transmission support crossmember support bolts.
7. Remove the transmission support crossmember.

Installation

1. Position the transmission support crossmember and install the transmission support crossmember support nuts and bolts.
    - Tighten the nuts to 103 Nm (76 lb-ft).
2. Remove the transmission jack.
3. Install the 2 transmission support nuts.
    - Tighten to 103 Nm (76 lb-ft).
4. Install the 2 heat shield screws.
    - Tighten to 20 Nm (177 lb-in).
