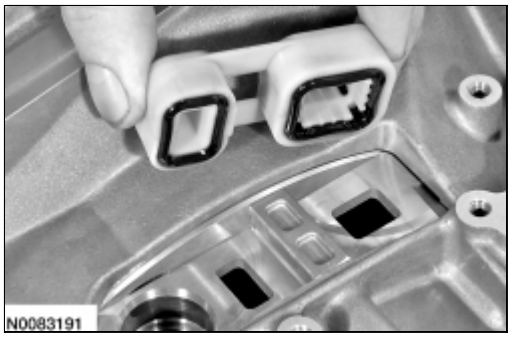
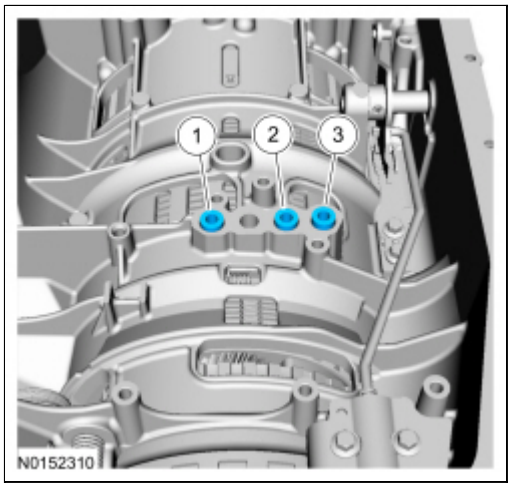
repair4less

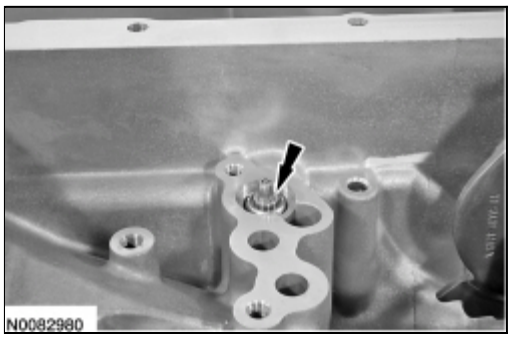


9. Remove the 11 bolts from the main control assembly.

10. Remove the main control assembly.

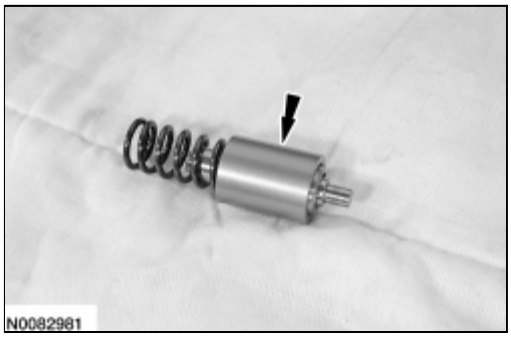


11. Remove the front pump adapter seal and the transmission fluid filter seal. Inspect for cracks or damage.



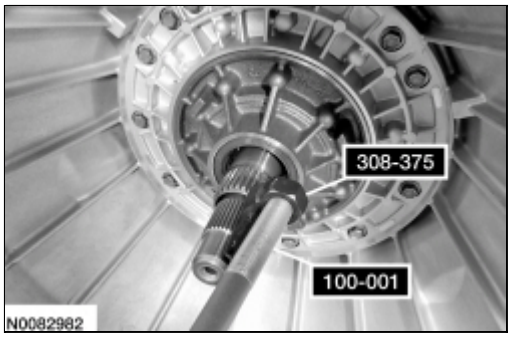
12. **NOTE:** Note the color, size and location while removing for correct assembly.

    Remove and discard the 3 center support feed tube seals.

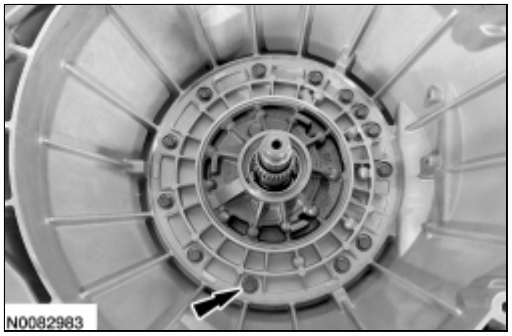


1. Center support feed tube seal (7G199 Black)
2. Center support feed tube seal (7G087 Green)
3. Center support feed tube seal (7G084 Blue)

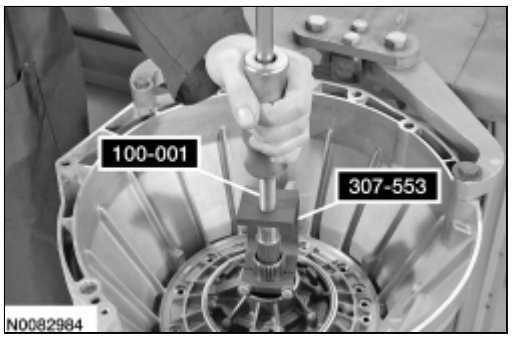
13. Remove the thermal bypass valve from the case.



14. Inspect the thermal bypass valve for damage and install a new valve if damaged.

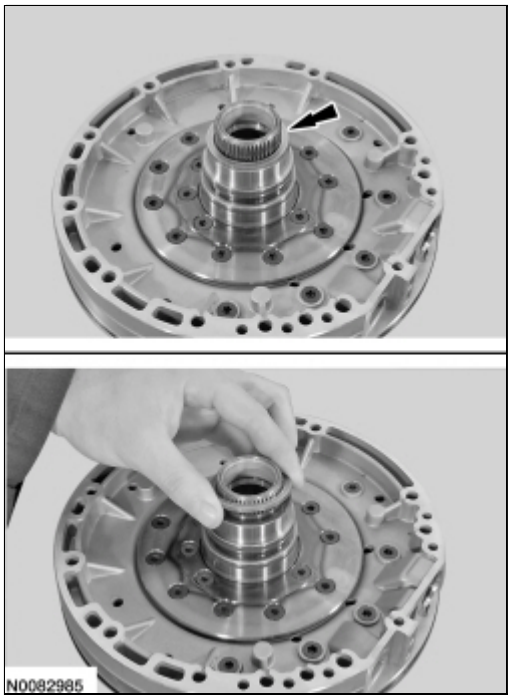


15. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove and discard the front pump seal.

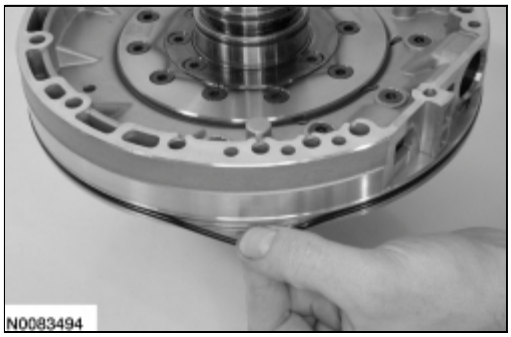


repair4less

16. Remove and discard the 13 front pump-to-case bolts and washers.

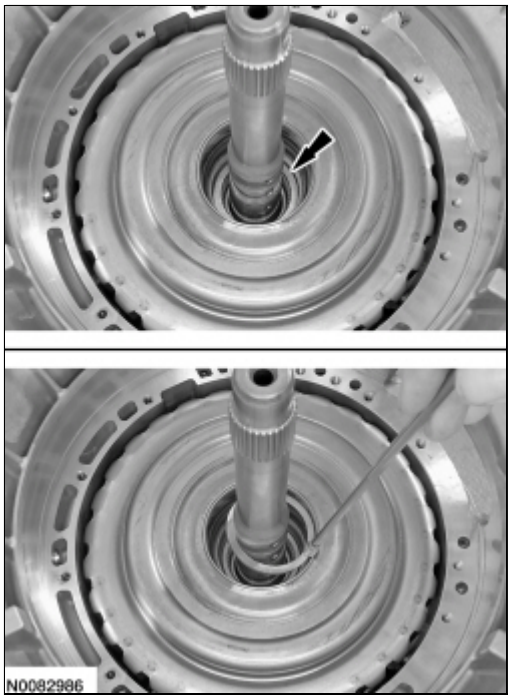


17. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the front pump support.

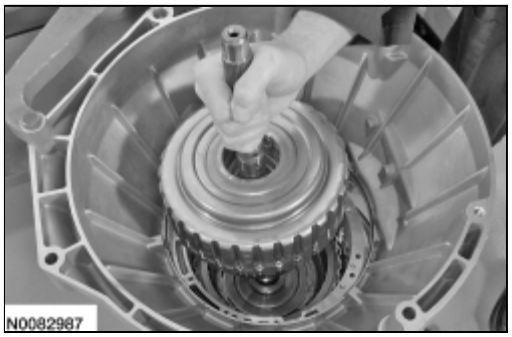


18. **NOTE:** The selective shim may come out while removing the front pump.

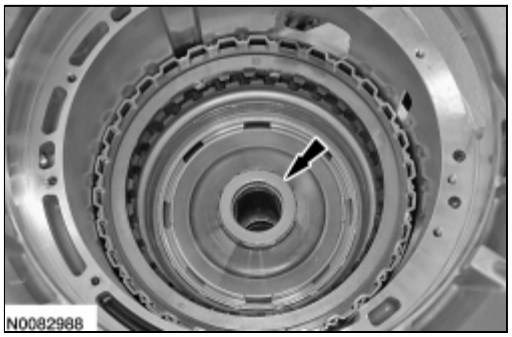
    Inspect the back of the front pump for the selective shim and remove If necessary.



19. Remove and discard the front pump O-ring seal.

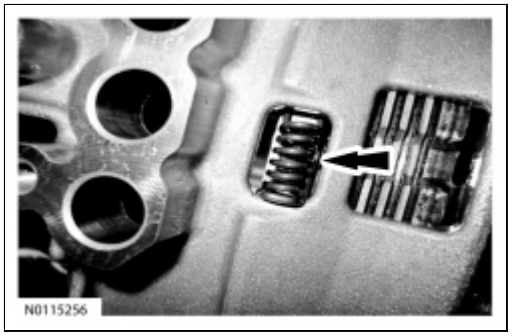


20. If the selective shim is not on the pump, using a magnet, remove it from the forward (A)/overdrive (E) clutch assembly.

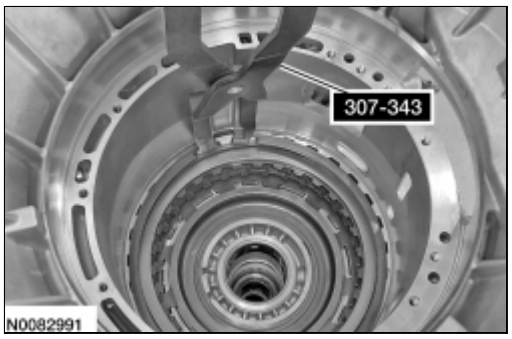


repair4less

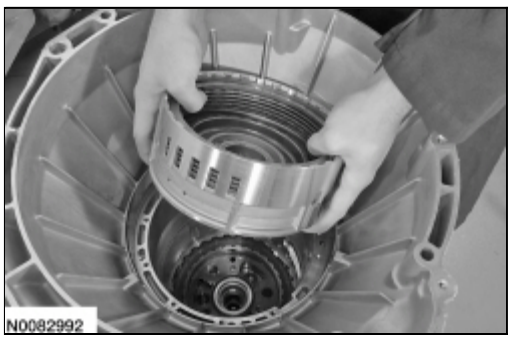
21. Remove the forward (A)/overdrive (E) clutch assembly.



22. Remove the caged T5 roller bearing from the direct (B) clutch assembly.

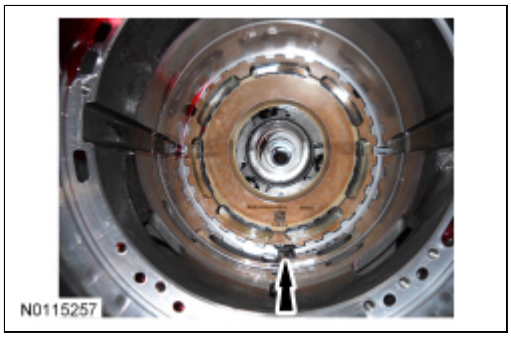


23. Remove the direct (B) clutch assembly.



24. Remove the bias spring.

25. Using the Retaining Ring Pliers, remove the center support snap ring.

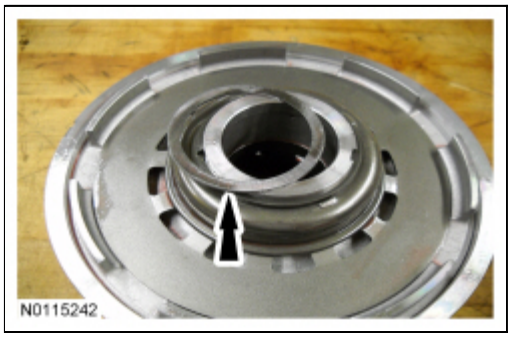


26. Remove the center support and T6 bearing.

27. **NOTE:** When removing the OWC , note the position for assembly.

    Remove the OWC .

repair4less

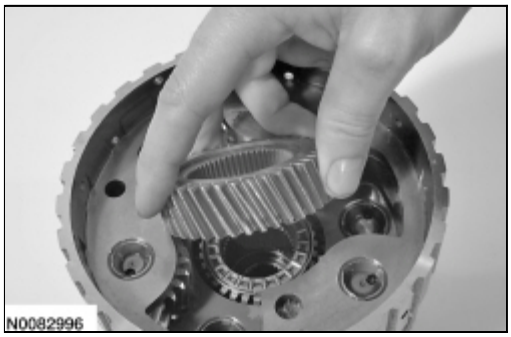


28. **NOTE:** The selective shim might stick to the T7 thrust bearing during removal of the center support.

    Remove the selective shim and the T7 thrust bearing.

29. **NOTE:** The selective shim might stick to the back of the center support assembly during removal.

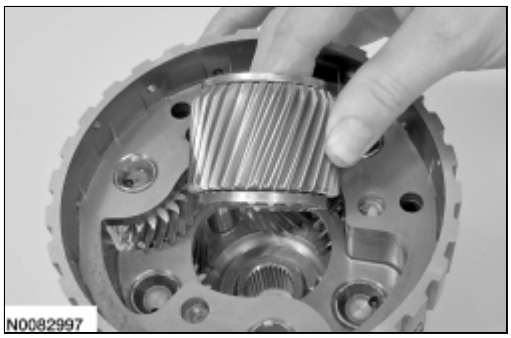
    Remove the selective shim from the center support assembly.



30. **NOTE:** Some of the clutch plates may stay in the case when removing the planetary carrier and the low/reverse clutch pack. Remove any clutch plates from the transmission that were not removed with

the carrier and keep the clutch plates together.

Remove the planetary carrier and the low/reverse clutch pack as an assembly.



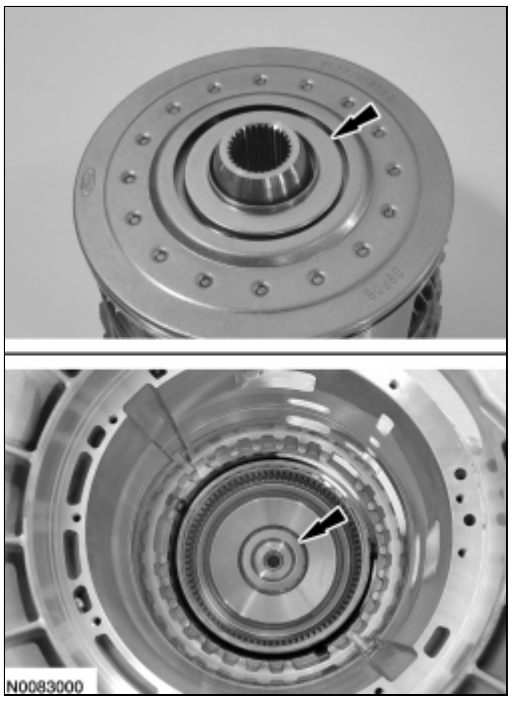
31. Remove the No. 2 sun gear and race.

32. **NOTE:** Remove the bearings with the sun gear.

    NOTE: When removing the sun gear, note that the tapered edge is facing up toward the torque converter housing.

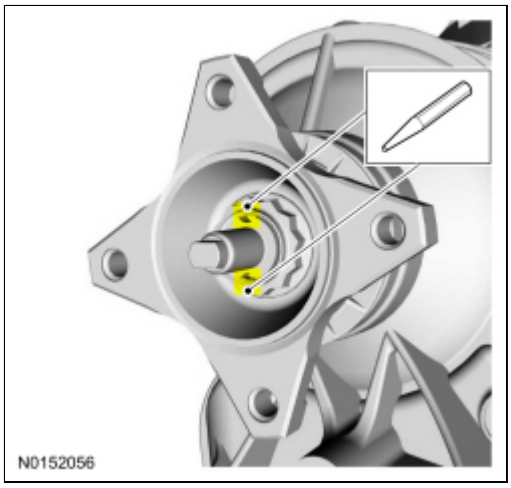
    Remove the No. 3 sun gear from the planetary assembly.

33. Remove the top T8 and the bottom T9 roller bearings from the sun gear.

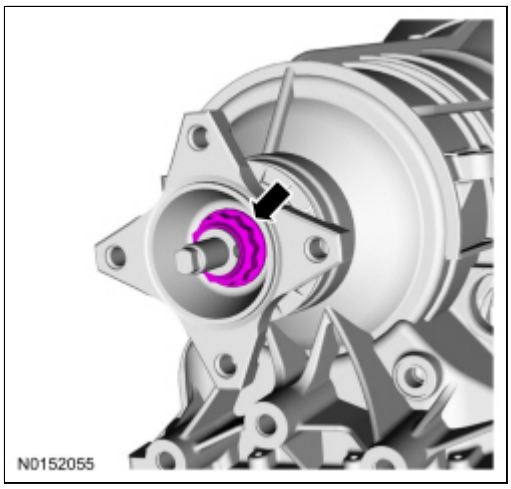


repair4less

34. Remove the T9 roller bearing race from the bottom of the carrier.

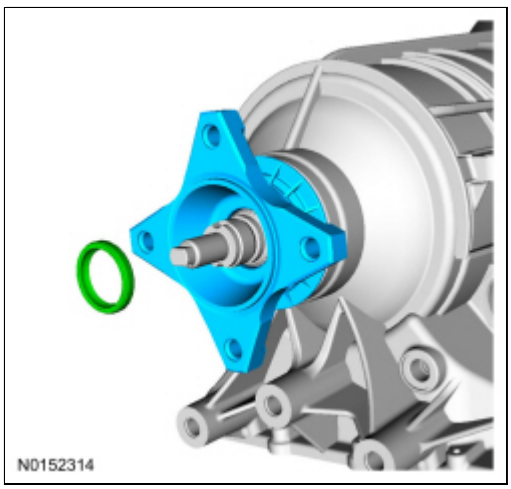


35. Remove the T10 thrust bearing from either the rear planetary carrier or the output shaft assembly.



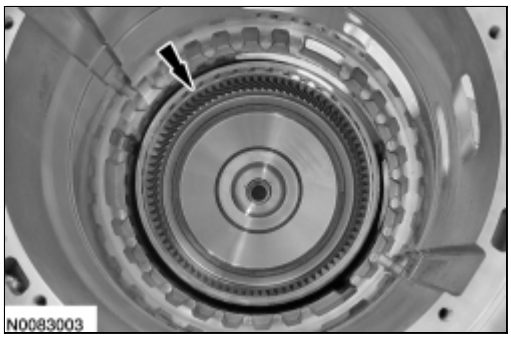
Rear Wheel Drive (RWD) vehicles

36. Remove the stakes from the output shaft flange retaining nut.

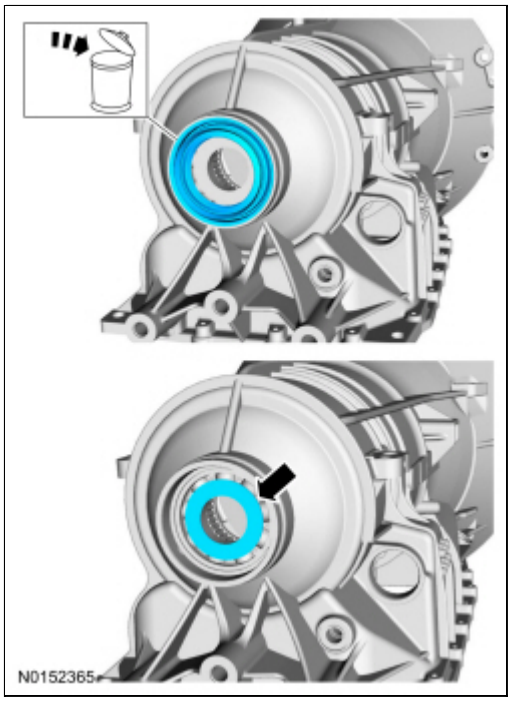


37. ***NOTICE:*** **The output shaft flange retaining nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.**

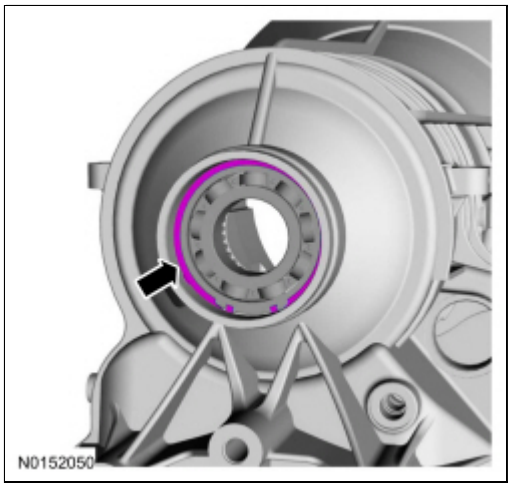
    Place the manual control lever in the PARK position and remove and discard the output shaft flange retaining nut.



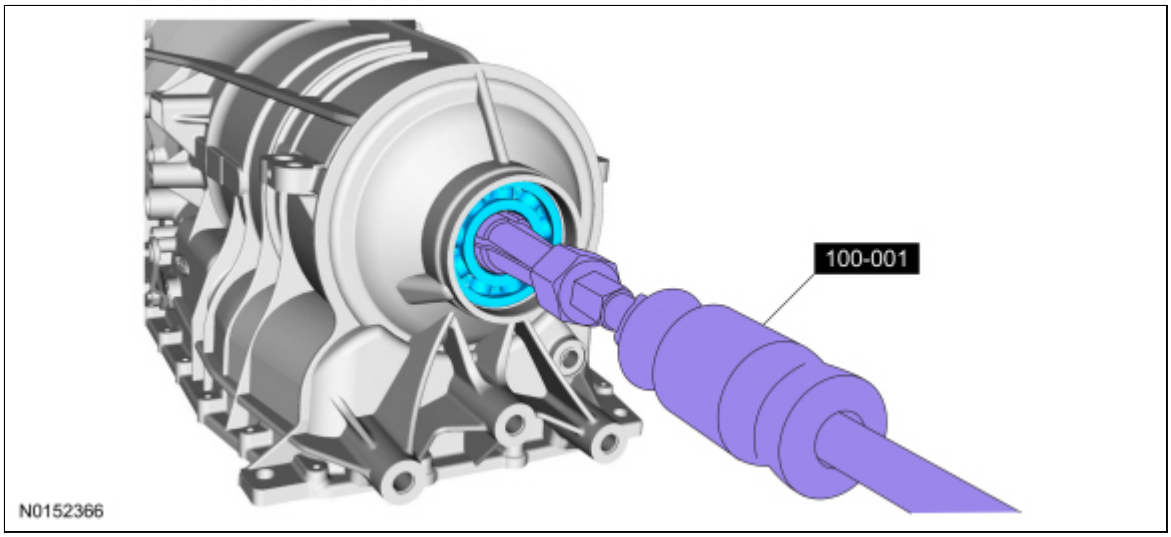
38. Remove the output shaft flange and the output shaft flange seal.



repair4less

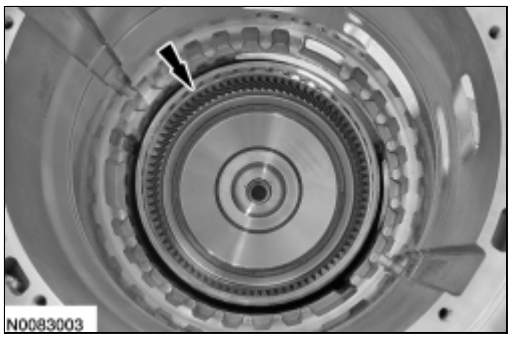


39. Remove the planetary carrier hub, output shaft assembly and T11 bearing.

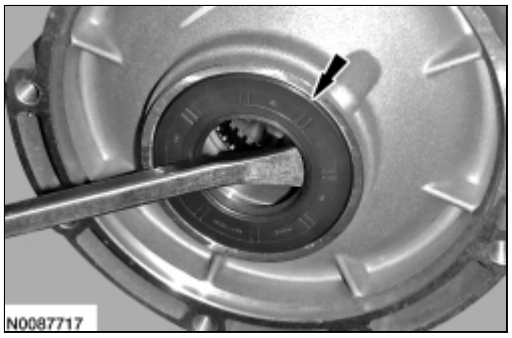


40. Remove the output shaft seal and the slip plane washer.
    - Discard the output shaft seal.

41. Remove the output shaft ball bearing snap ring.



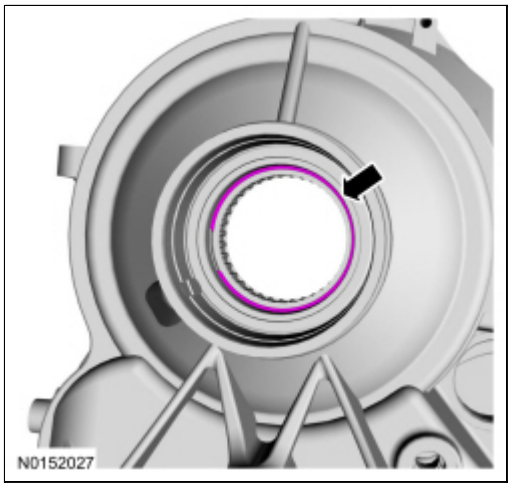
42. Using the Slide Hammer, Actuator Pin 303-D012, Collet, 1 1/4 Inch to 1 1/2 Inch 303-D022, remove the output shaft ball bearing.



Four-Wheel Drive (4WD) vehicles

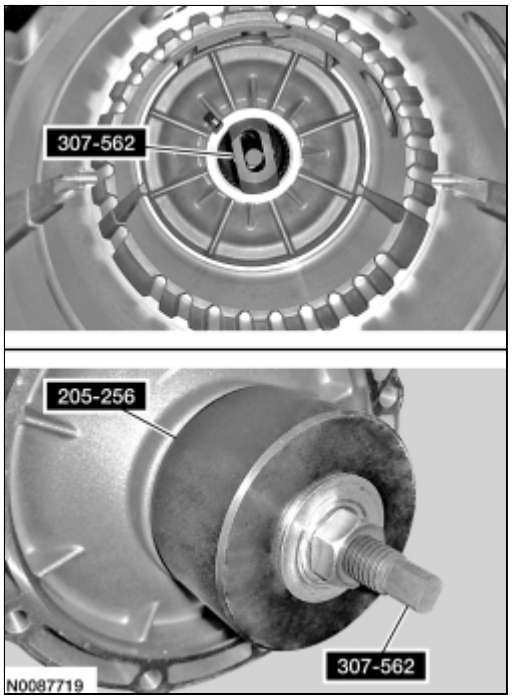
43. Remove the planet carrier hub, output shaft assembly and T11 bearing.

44. Remove and discard the output shaft seal.



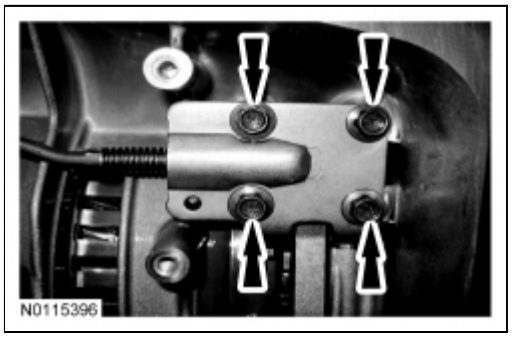
repair4less

All vehicles



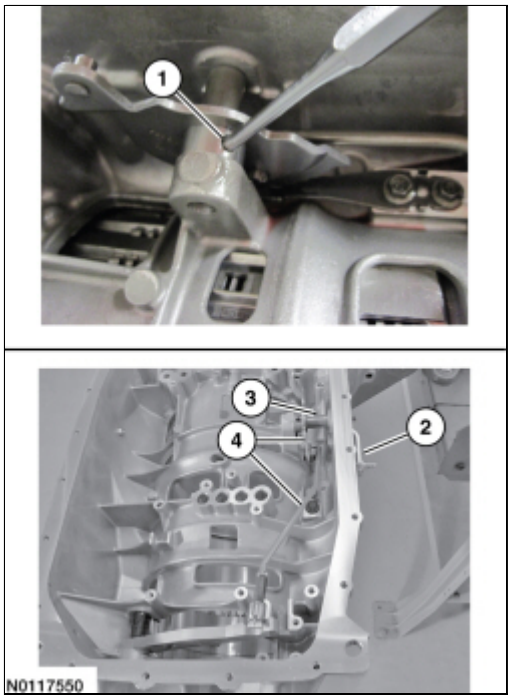
45. **NOTE:** RWD case shown, 4WD case similar.

    Remove the snap ring.

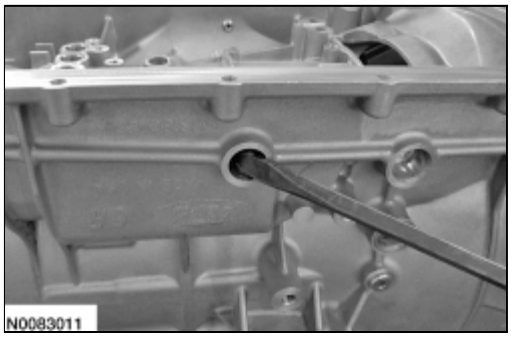


46. ***NOTICE:*** **Use care when installing the Needle Bearing Remover. Look inside the transmission case to make sure that the Needle Bearing Remover contacts the bearing only and not the lip of the case, or damage to the case will occur.**

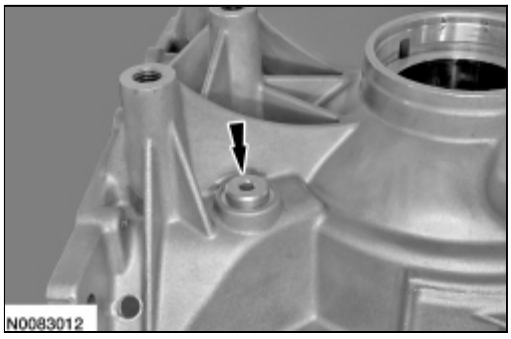
    Using the Needle Bearing Remover and the Front Wheel Hub Oil Seal Installer, remove the bearing assembly.



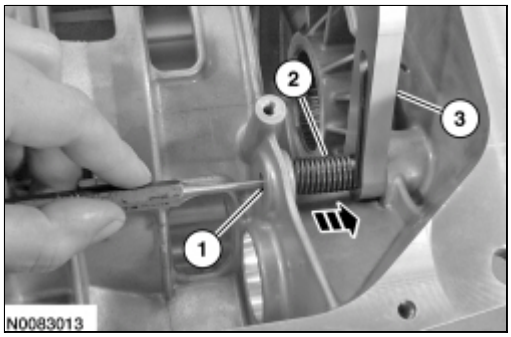
47. Remove and discard the 4 park rod actuating plate bolts and the park rod actuating plate.



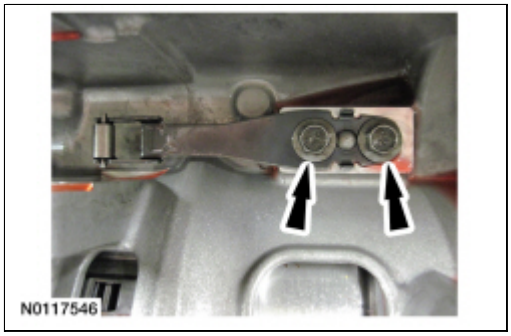
48. Remove the manual control lever detent plate and park pawl actuator rod from the transmission case.
    1. Remove and discard the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the manual control lever spacer to keep it from falling into the case.
    4. Remove the manual valve detent lever and park pawl actuator rod as an assembly.



repair4less

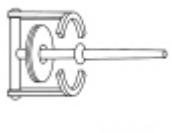


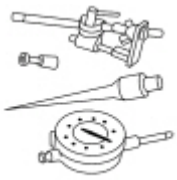
49. Remove and discard the manual control lever shaft seal.



50. Remove the bolt from the back of the case to gain access to the park pawl pin.

51. From the inside of the case, push the park pawl pin out toward the back side of the case while holding the park pawl return spring and the park pawl. Remove the park pawl pin then remove the park pawl and spring.
    1. Park pawl pin
    2. Park pawl return spring
    3. Park pawl

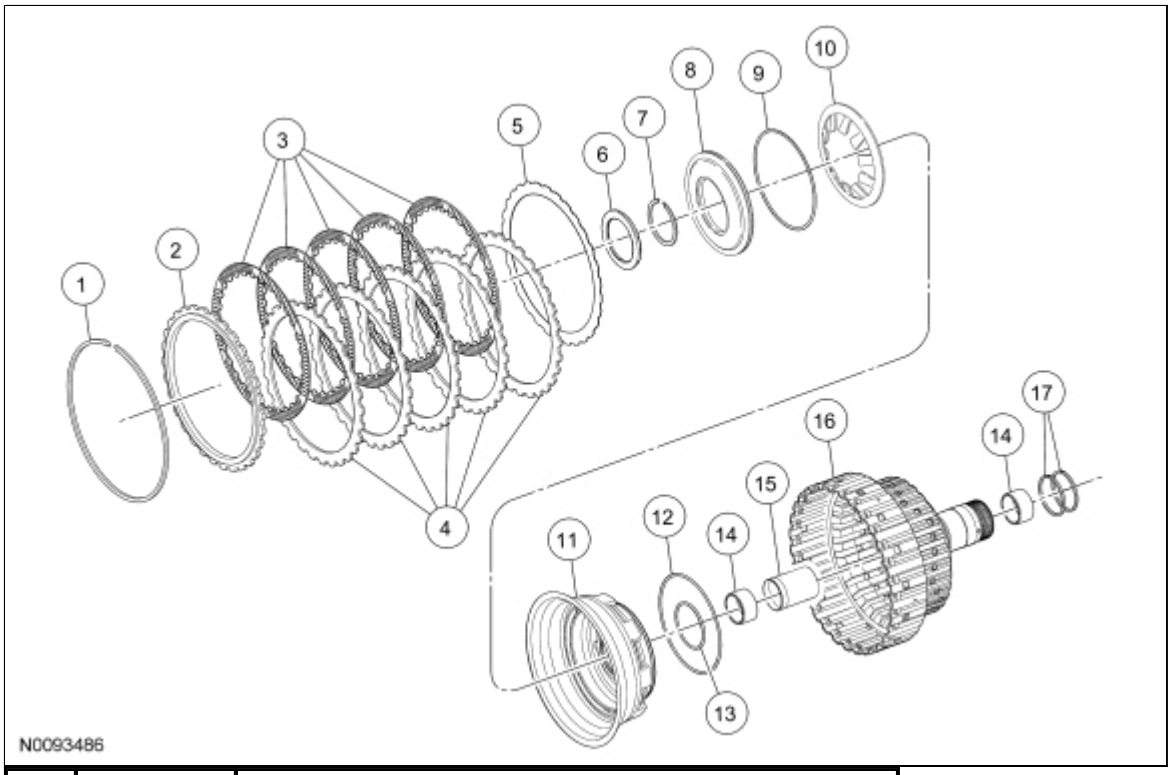




52. Remove and discard the 2 bolts and the park detent spring.

repair4less

Direct Clutch Assembly



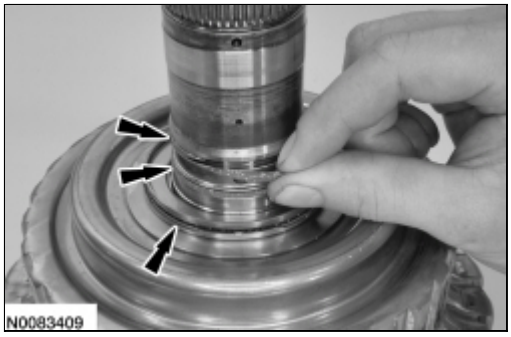
Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST2893-A	Compressor, Clutch Spring 307-552
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST2892-A	End Play Gauge, Clutch 307-555

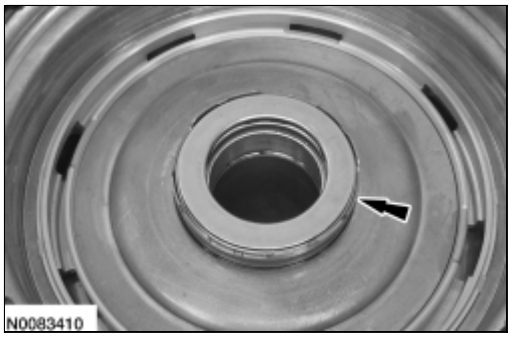
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

Direct Clutch Assembly

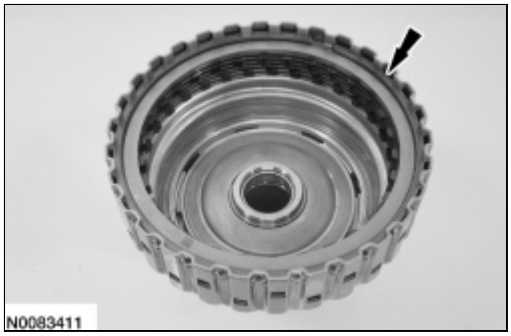


Item	Part Number	Description
1	7D483	Direct clutch pressure plate retaining ring
2	7B066	Direct clutch pressure plate (thickness model dependant)
3	7B164	Direct clutch internal splined friction plates (quantity model dependant)
4	7B442	Direct clutch external splined steel plates (quantity model dependant)
5	—	Direct clutch cushion plate (wave spring)
6	7C096	Bearing (T5)
7	7A577	Piston retaining ring
8	7A262	Direct clutch balance piston
9	7A548	Direct clutch balance piston seal
10	7B488	Return spring
11	7A262	Direct clutch apply piston
12	7A548	Direct clutch apply piston outer seal
13	7C099	Direct clutch apply piston inner seal
14	—	Direct clutch bushing hubs (part of 7F283) (2 required)
15	—	Gear shaft tube sleeve (part of 7F283)
16	7F283	Direct clutch cylinder
17	7D020	Seal shell cylinders

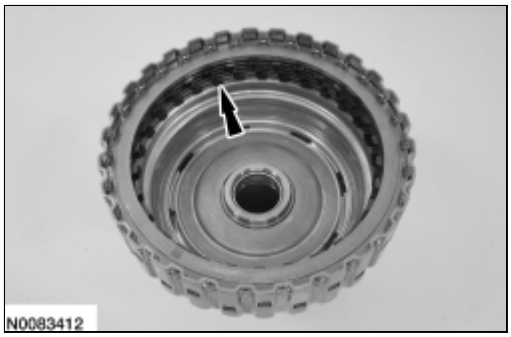


Disassembly

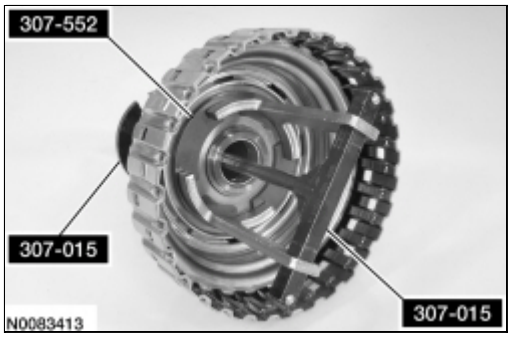
repair4less



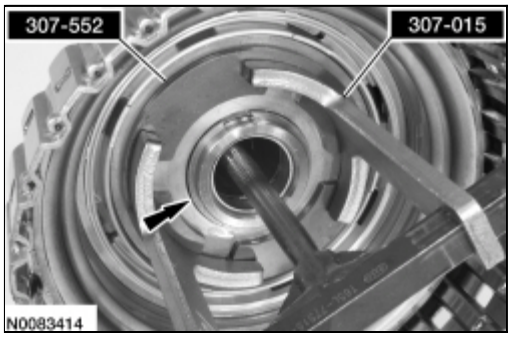
1. Remove and discard the 2 scarf cut seals and the roller bearing.



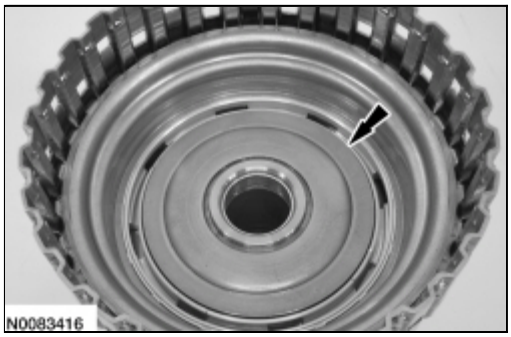
2. Remove the T5 thrust bearing.



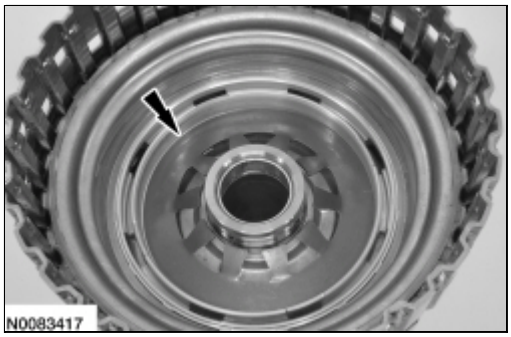
3. Remove the direct clutch snap ring.



4. Remove the direct clutch steel and friction plates.

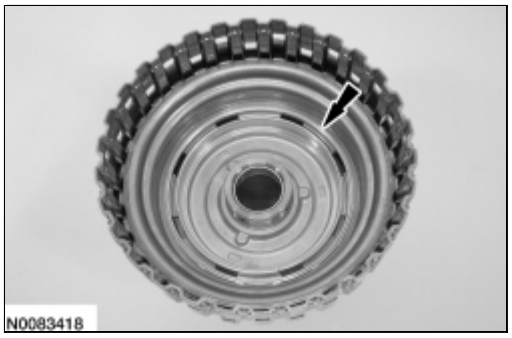


5. Install the Clutch Spring Compressors onto the direct clutch assembly.



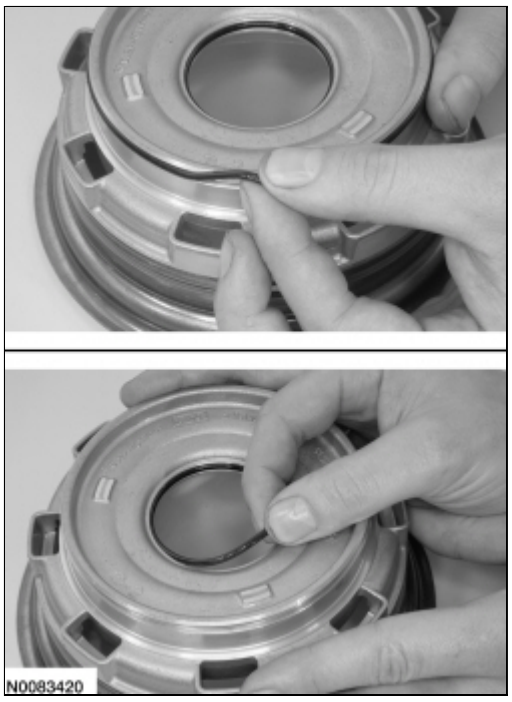
6. Using the Clutch Spring Compressors, compress the direct clutch return spring and remove the direct clutch return spring retainer.

7. Remove the balance piston.



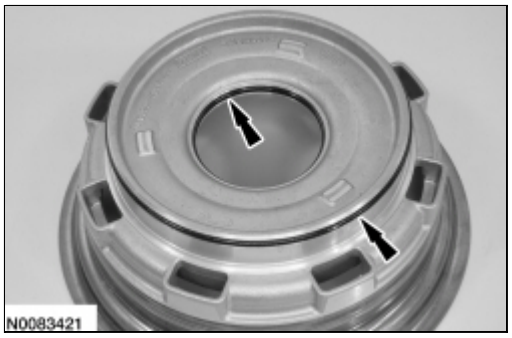
8. Remove the direct clutch return spring.

9. Remove the direct clutch piston.



repair4less

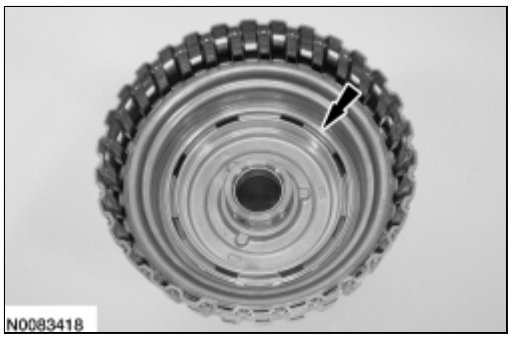
10. Remove and discard the outer O-ring seal from the balance piston.



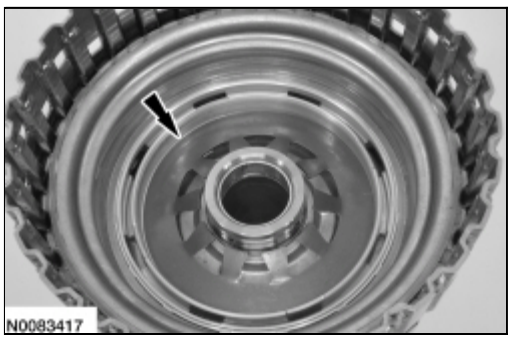
11. Remove and discard the outer and inner O-ring seals from the apply piston.

12. Inspect the components of the direct clutch for damage. If damage is indicated, install new components as necessary.

Assembly

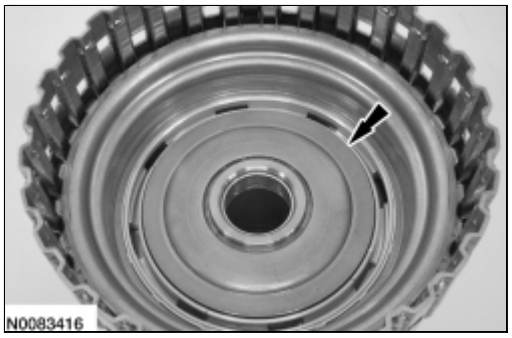


1. Install a new inner and outer O-ring seal on the apply piston.

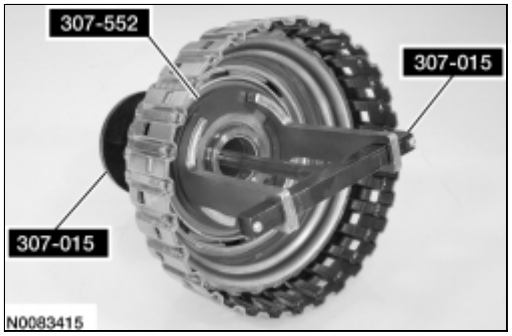


2. Install a new outer O-ring seal on the balance piston.

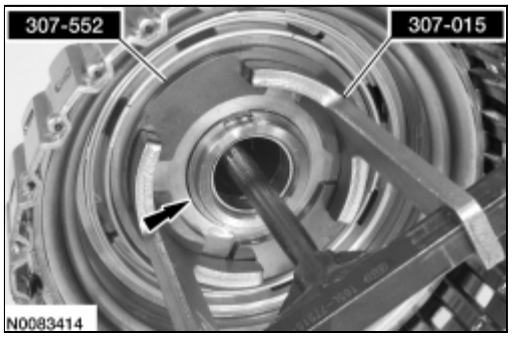
3. Lightly coat the O-ring seals in clean transmission fluid and install the direct clutch piston.



4. Install the direct clutch return spring.

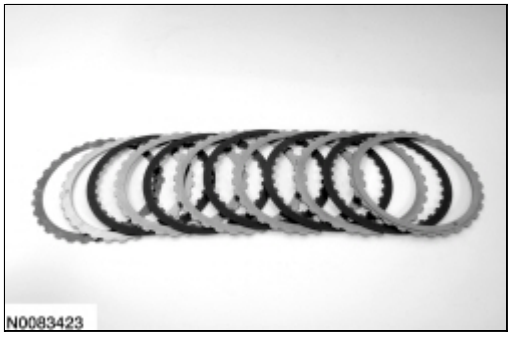


5. Install the balance piston.

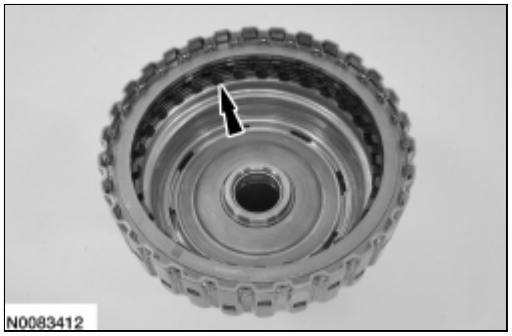


repair4less

6. Install the Clutch Spring Compressors onto the direct clutch assembly.



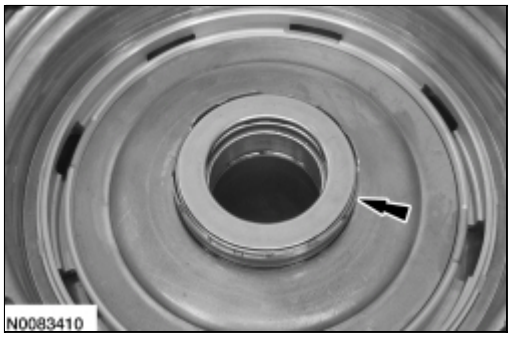
7. Using the Clutch Spring Compressors, compress the direct clutch return spring and install the direct clutch return spring retainer.



8. **NOTE:** Friction and steel plate quantity will vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

   Soak the new direct clutch in clean transmission fluid.

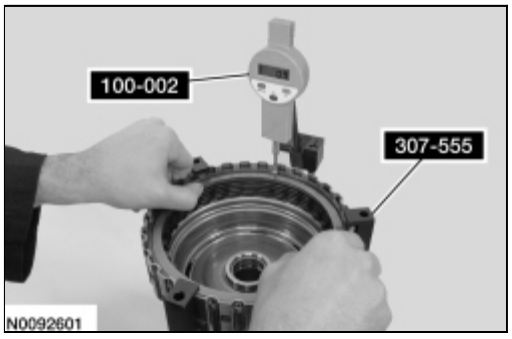
9. Install the new direct clutch plates, starting with the wave spring then a steel plate and alternating between steel and friction plates, and ending with the pressure plate on the top.



10. Install the direct clutch snap ring.

11. **NOTE:** Inspect and install a new thrust bearing as required.

    Install the T5 thrust bearing.



12. **NOTE:** All direct clutch plates, friction and steel are of a wave-type design.

    Install the direct clutch assembly into the Clutch End Play Gauge and install the Dial Indicator Gauge with Holding Fixture and position the plunger so it fits into the opening of the snap ring.

repair4less

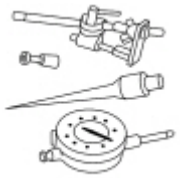
13. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

14. Rotate the direct clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

15. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 0.5-1.3 mm (0.019-0.051 in).

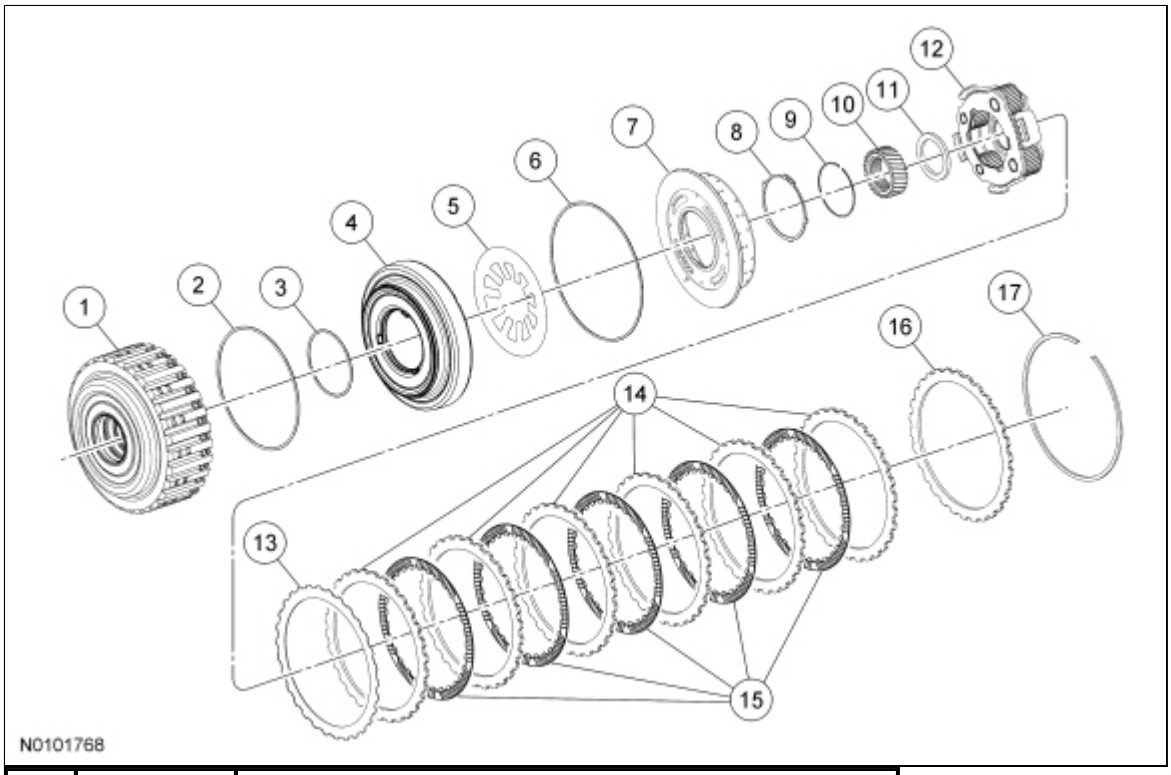
    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.



16. Install 2 new scarf cut seals and the roller bearing.

repair4less

Forward Clutch Assembly



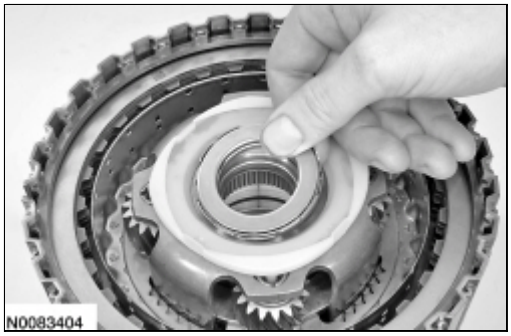
Special Tool(s)

 ST2881-A	Compressor, Clutch Spring 307-525
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST2892-A	End Play Gauge, Clutch 307-555

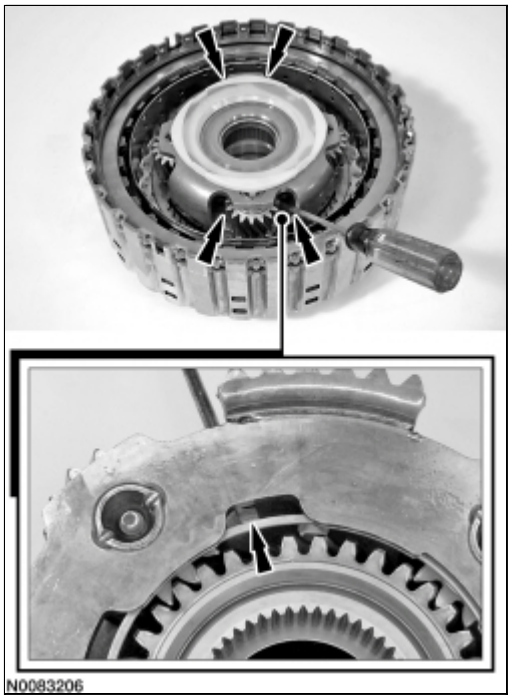
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

Forward Clutch Assembly (A Clutch)

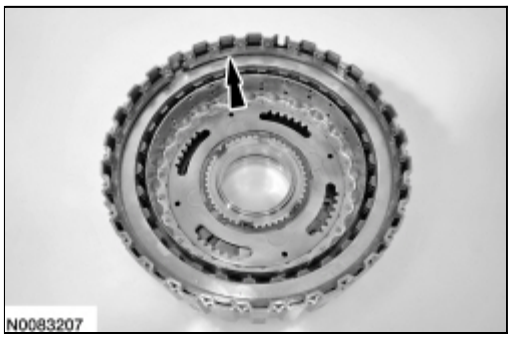


Item	Part Number	Description
1	7A360	Forward clutch drum
2	7A548	Forward clutch piston outer O-ring seal
3	7A548	Forward clutch piston inner O-ring seal
4	7A262	Forward clutch piston
5	7A480	Forward clutch piston return spring
6	7A548	Forward clutch balance dam O-ring seal
7	7H360	Forward clutch balance dam
8	7H365	Forward clutch balance dam retaining ring
9	7H579	Sun gear retaining ring
10	7D063	Sun gear
11	7H375	Bearing (T1)
12	7A398	Planetary gear
13	7E085	Forward clutch cushion spring
14	7E314	Forward clutch external splined steel plates (quantity model dependent)
15	7B164	Forward clutch internal splined friction plates (quantity model dependent)
16	7B066	Forward clutch pressure plate
17	7D483	Forward clutch plate retaining ring



Disassembly

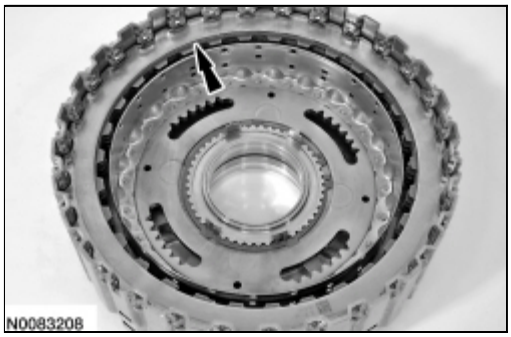
repair4less



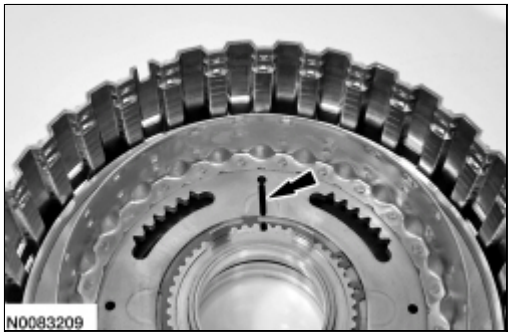
1. If the T2 thrust bearing is on the forward clutch assembly, remove it from the forward clutch assembly.

2. Remove the front planetary carrier and sun gear from the forward clutch assembly.
    - With a small screwdriver or a suitable pick inserted into the front planetary assembly, push on the retaining ring in 4 places while lifting up on the front planetary assembly.

3. Remove the forward clutch pack snap ring.



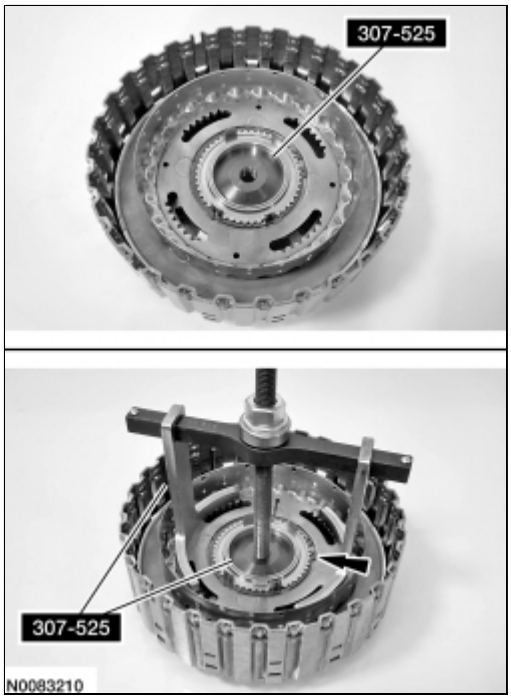
4. **NOTE:** Inspect the forward clutch drum and the friction and steel plates for damage. Install new



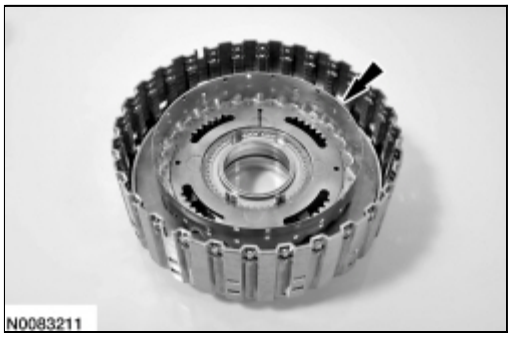
components as necessary.

Remove and inspect the forward clutch steel and friction plates.

- If the plates are damaged, install a new forward clutch assembly.
- If no damage is indicated, the forward clutch may be reassembled.

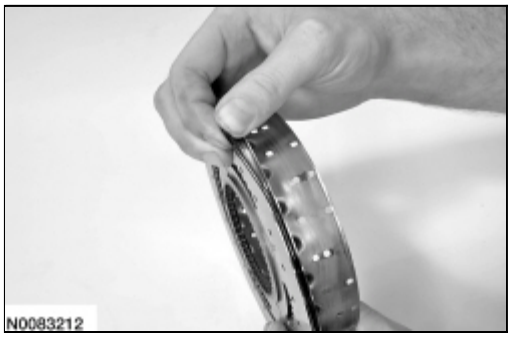


5. For correct alignment during assembly, make an identifying mark on the balance dam and the center part of the housing.

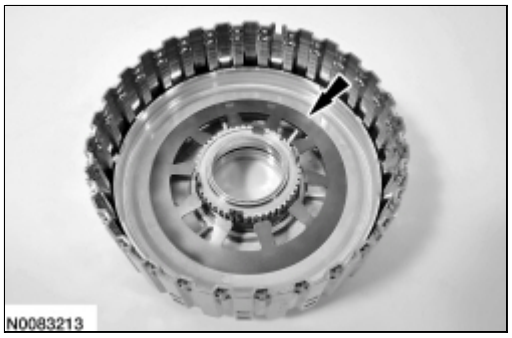


6. **NOTE:** The bottom of the Clutch Spring Compressor will need to be installed from the back side of the forward clutch assembly.

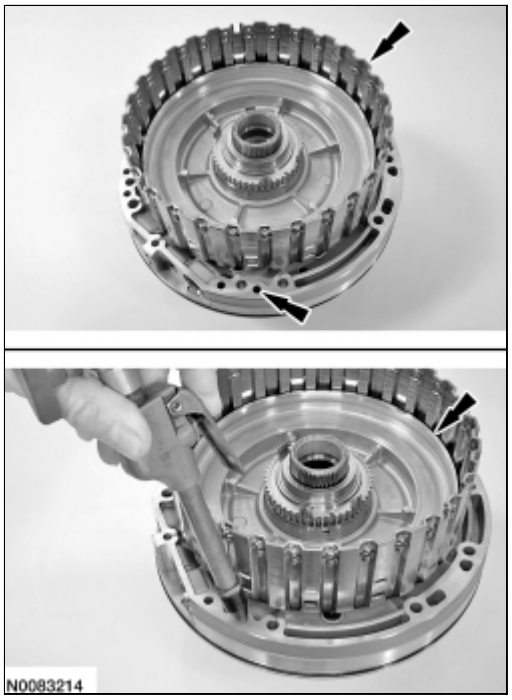
   Using the Clutch Spring Compressor, slightly collapse the balance dam to gain access to the retaining ring and remove the retaining ring.



repair4less



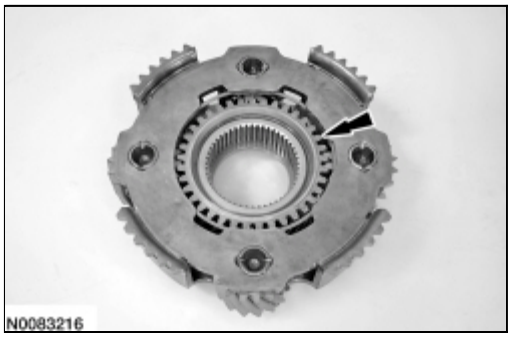
7. Remove the balance dam.



8. Remove and discard the O-ring seal from the balance dam.

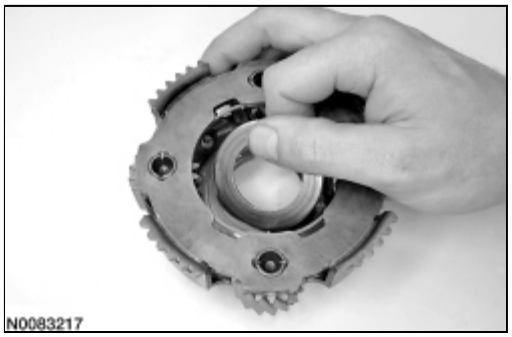
9. Remove the forward clutch return spring.

10. Install the forward clutch on the front pump to remove the forward clutch piston. Apply a small amount of shop air to remove the piston.

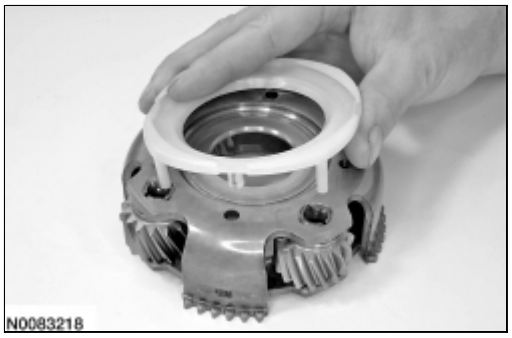


11. Remove and discard the inner and outer piston O-ring seals.

repair4less



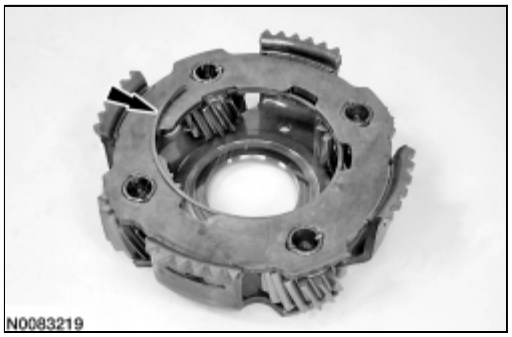
12. Remove the sun gear from the planet assembly.



13. **NOTE:** The T1 thrust bearing may have stuck to the sun gear when it was removed.

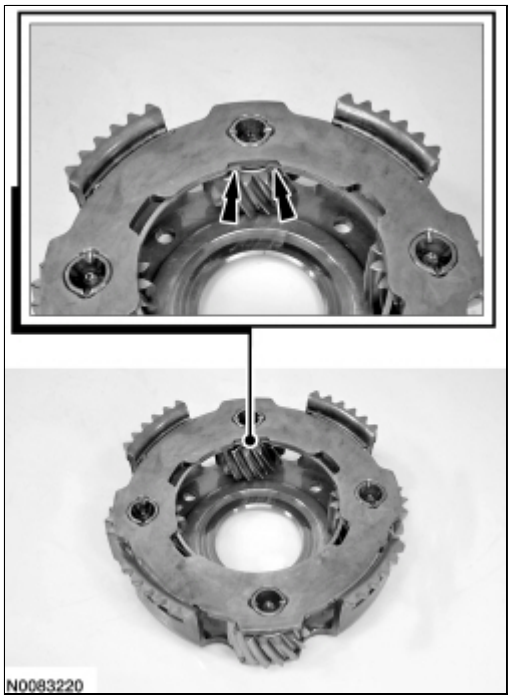
    Remove the T1 bearing from the planetary carrier.

14. Remove the transmission fluid collector plate from the front planetary carrier.



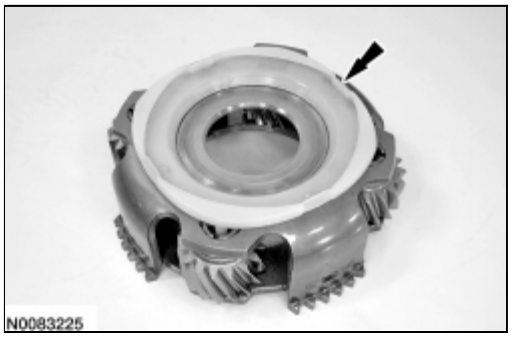
15. Clean and inspect the components of the forward clutch assembly for damage and install new components as necessary.

Assembly

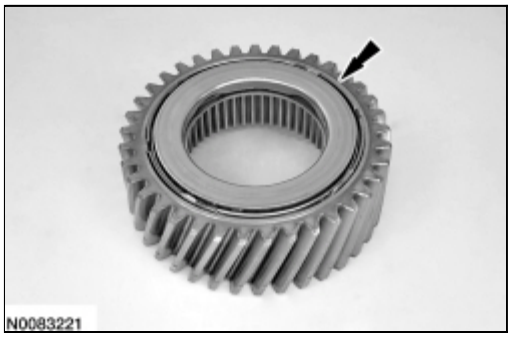


1. **NOTE:** If a new planetary assembly is being installed, the new planetary assembly may not come with the snap ring installed.

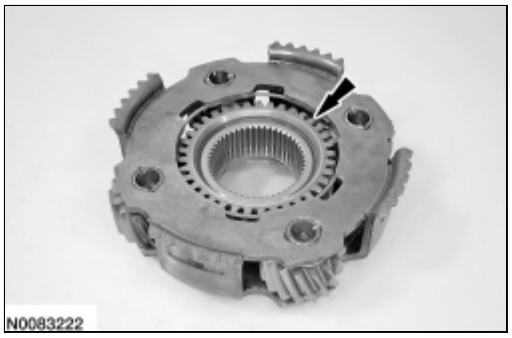
   Install the planetary assembly snap ring, if necessary.



2. Make sure the planetary snap ring is oriented as shown.

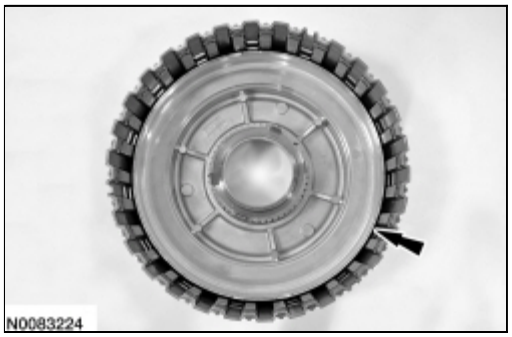


repair4less

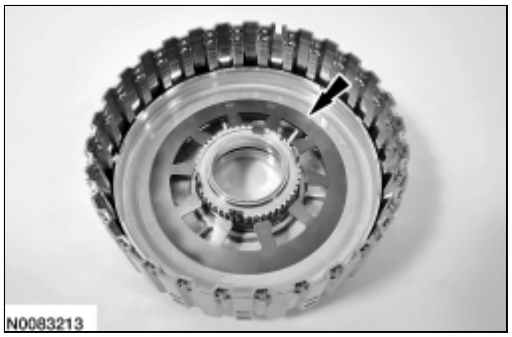


3. Install the transmission fluid collector plate on the front planetary carrier.

4. Install the T1 bearing onto the sun gear.



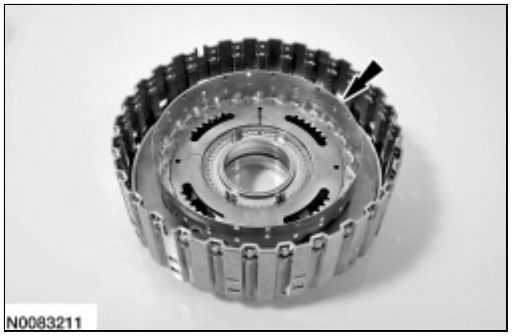
5. Install the sun gear into the planet assembly with the T1 bearing facing down and the recessed part of the gear up.



6. Install new O-ring seals onto the forward clutch piston.

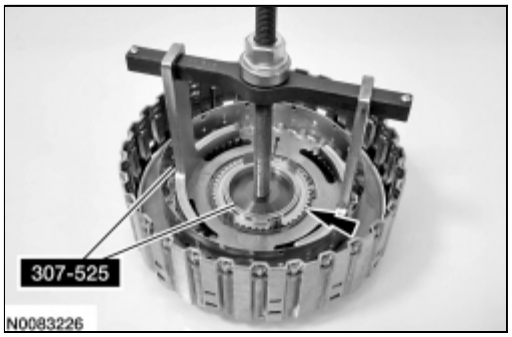
7. Lightly coat the O-ring seals with clean transmission fluid and install the forward clutch piston into the forward clutch drum.

8. Install the forward clutch return spring.

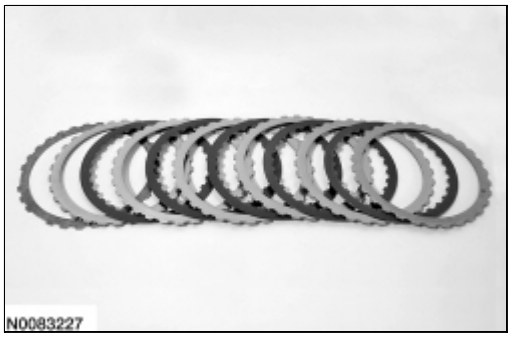


9. Install a new O-ring seal onto the forward clutch balance dam. Lightly coat the O-ring seal with clean transmission fluid.

repair4less

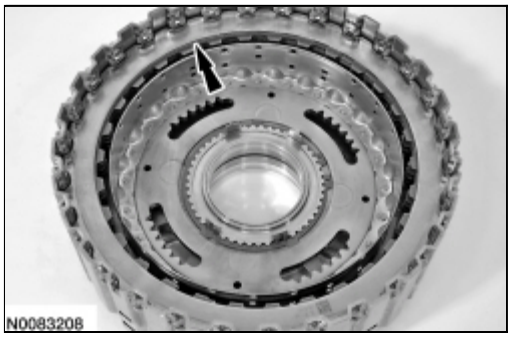


10. Align the marks made during disassembly and install the balance dam into the forward clutch drum.



11. **NOTE:** Prior to releasing the Clutch Spring Compressor, make sure that the snap ring is fully seated.

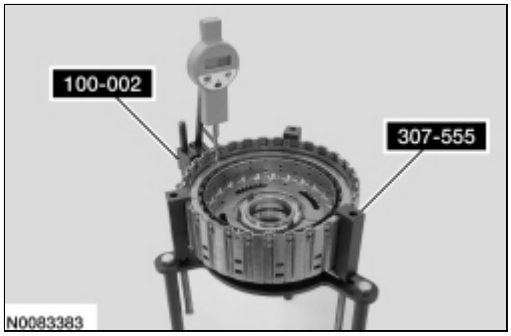
    Using the Clutch Spring Compressor, slightly collapse the balance dam to install the retaining ring. Install the retaining ring.



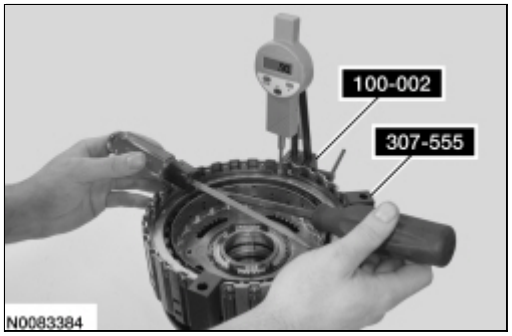
12. **NOTE:** Friction and steel plate quantity will vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity chart in the Specifications portion of this section.

    Soak the new forward clutch plates in clean transmission fluid.

13. Install the new forward clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates and install the pressure plate.



14. Install the forward clutch plate snap ring.

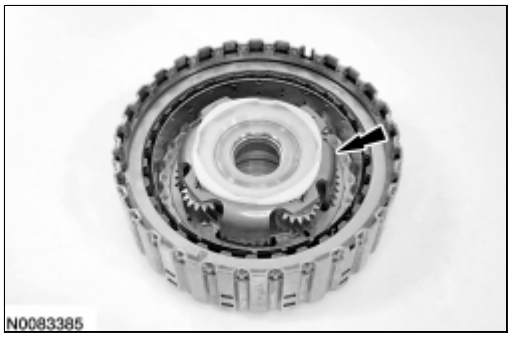


15. **NOTE:** All forward clutch plates, friction and steel are of a wave-type design.

    Install the forward clutch assembly into the Clutch End Play Gauge and install the Dial Indicator Gauge with Holding Fixture and position the plunger so it fits into the opening of the snap ring.

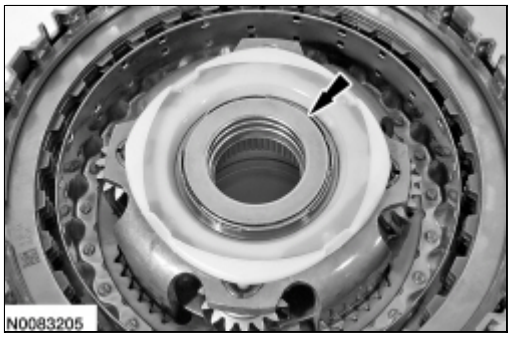
repair4less

16. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.



17. Rotate the forward clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	



18. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 0.71-1.10 mm (0.028-0.043 in)

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

19. Install the sun gear and planetary gearset into the forward clutch drum. Make sure it snaps and locks in place.

20. Install the T2 thrust bearing.

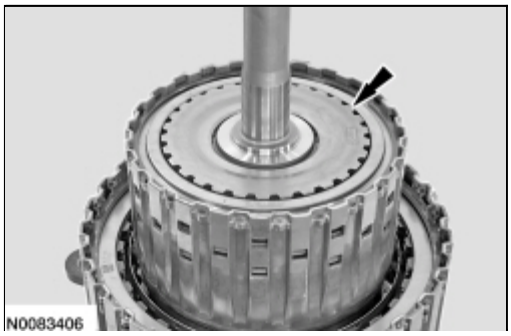
repair4less

Forward/Overdrive Clutch Assembly — Assembly

Special Tool(s)

 ST2892-A	End Play Gauge, Clutch 307-555

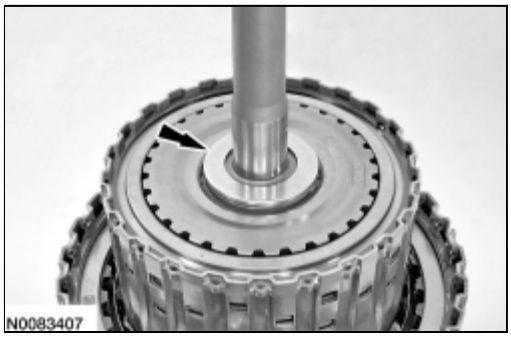
Material



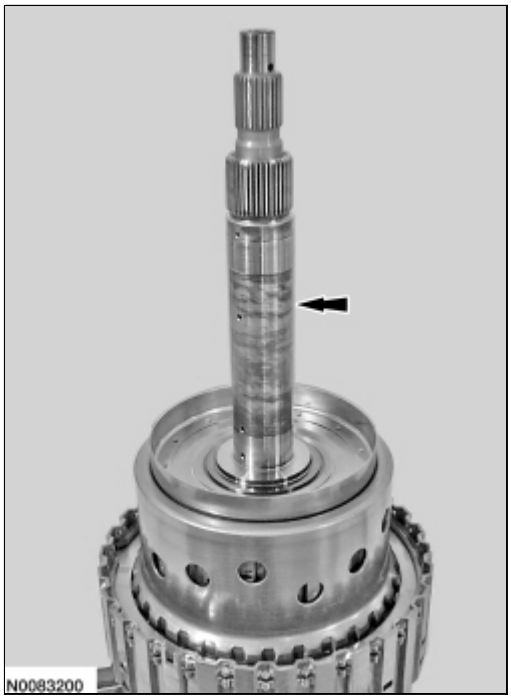
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

Assembly

1. Position the forward clutch assembly in the Clutch End Play Gauge and install the overdrive clutch pack onto the forward clutch and planetary gear set.



2. Install the intermediate shaft assembly.

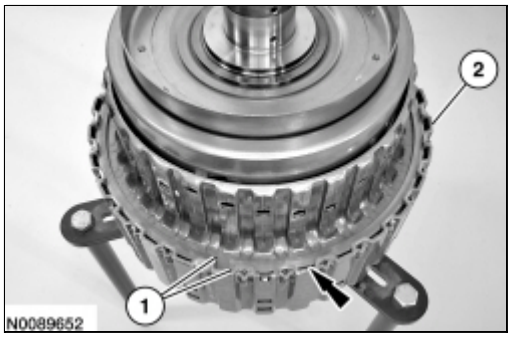


3. **NOTE:** Inspect and install new thrust bearings as required.

   Install the T4 intermediate shaft bearing.

4. Install the forward clutch hub and sun shaft assembly.

5. Install a new the direct clutch hub.



6. ***NOTICE:*** **Do not install the snap ring on the forward clutch hub with the snap ring gap in the same position as the original snap ring or damage to the transmission can occur.**

repair4less

Install a new direct clutch outer shell retaining ring with the snap ring gap positioned approximately 120 degrees from the index mark made on the forward clutch hub during disassembly.

1. New snap ring gap
2. Index mark from original snap ring gap

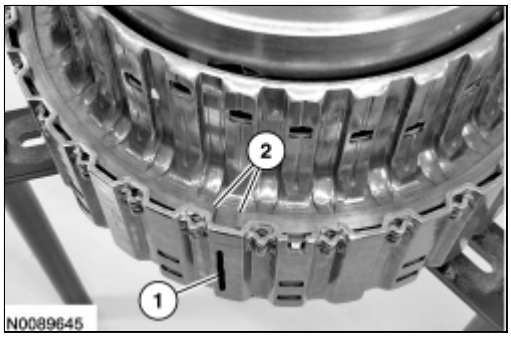
Forward/Overdrive Clutch Assembly — Disassembly

Special Tool(s)

 ST2892-A	End Play Gauge, Clutch 307-555

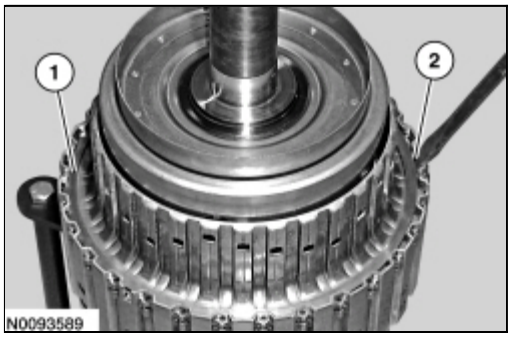
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV



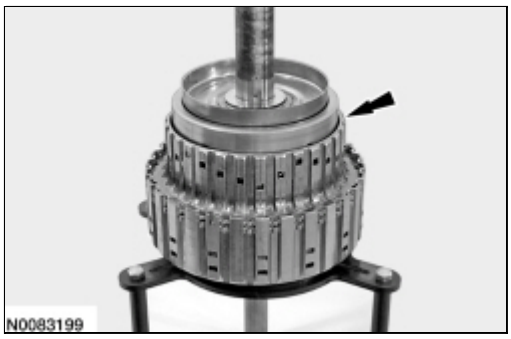
Disassembly

1. Position the forward/overdrive clutch assembly in the Clutch End Play Gauge 307-555.



2. Index-mark the direct clutch outer shell snap ring gap location to the side of the forward clutch hub using a suitable paint marker.
    1. Index mark
    2. Snap ring gap

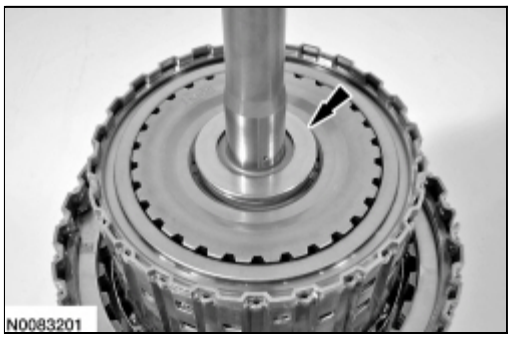
repair4less



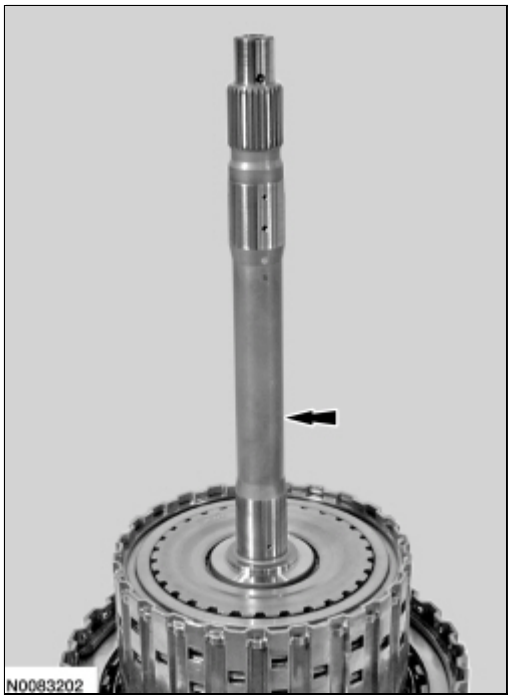
3. ***NOTICE:*** **Compress the snap ring out of the groove 180 degrees from the snap ring gap or damage to the forward clutch hub can occur.**

   Using a suitable tool, remove and discard the direct clutch outer shell retaining ring by compressing the snap ring 180 degrees from the snap ring gap.
   1. Snap ring gap
   2. 180 degrees from the snap ring gap

4. Remove and discard the direct clutch hub.

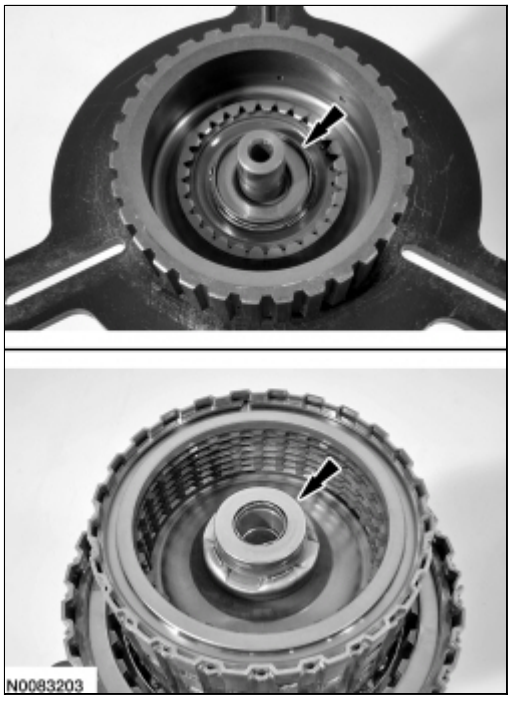


5. Remove the forward clutch and sun shaft assembly.

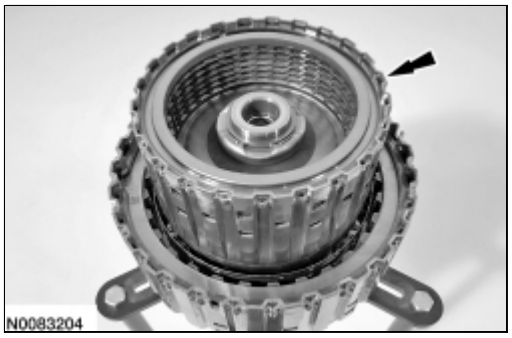


6. **NOTE:** The bearing may stick in the forward clutch drum.

   Remove the intermediate shaft bearing.

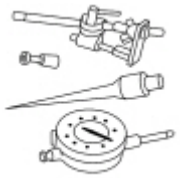


7. Remove the intermediate shaft assembly.



repair4less

8. If the T3 thrust bearing stuck to the intermediate shaft assembly, remove it from the intermediate shaft assembly. If the T3 thrust bearing is on the overdrive clutch, remove it from the overdrive clutch assembly.



9. Remove the overdrive clutch pack from the forward clutch pack.

repair4less

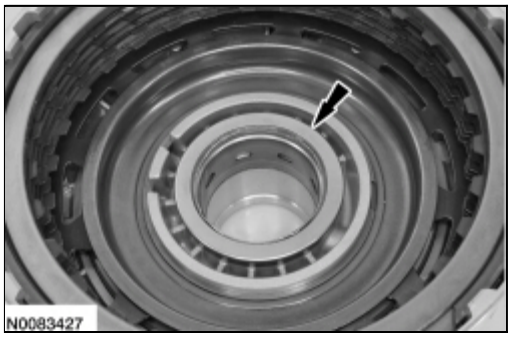
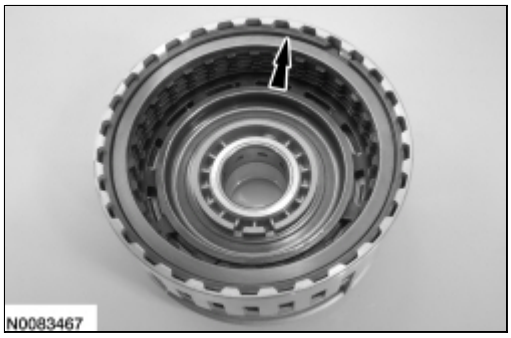
11	7F225	Intermediate clutch piston inner seal
12	7F224	Intermediate clutch piston outer seal
13	7F373	Bearing (T6)
14	7A130	Intermediate/low/reverse clutch center support
15	7G199	Center support seals (2 — 7G199, 1 — 7G087, 1 — 7G484)

Disassembly



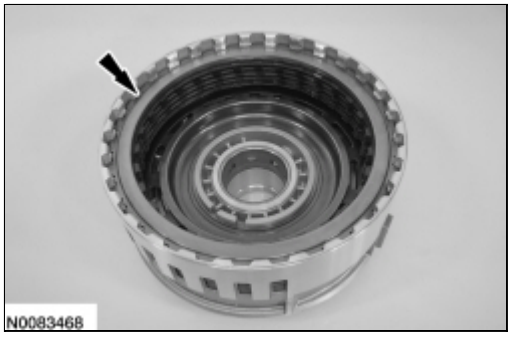
NOTICE: **The intermediate clutch plate quantity is model dependent on engine size. Check the clutch plate quantity charts in specifications for the correct clutch plate quantity. Failure to install the**

repair4less

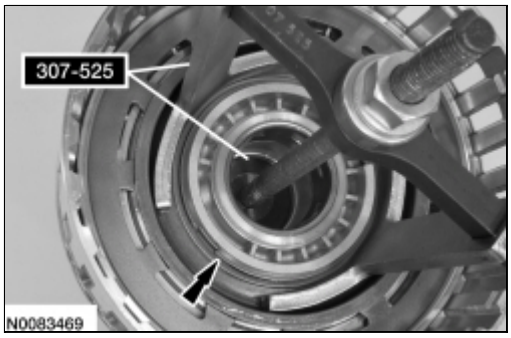


correct clutch plate quantity will result in transmission failure.

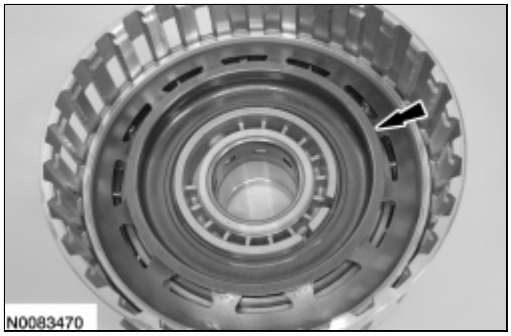
NOTICE: **The intermediate clutch piston is model dependent on engine size due to the different quantity of intermediate clutch plates. If installing a new intermediate clutch piston, check to make sure the height of the new piston is the same as the original piston. Failure to install the correct piston will result in transmission failure.**



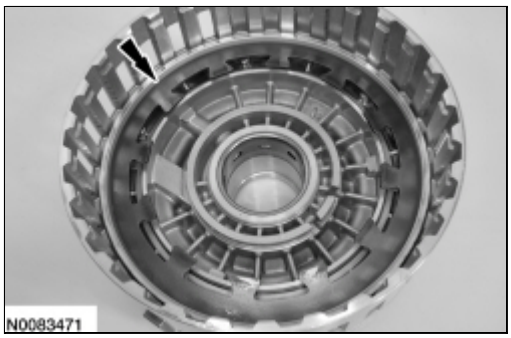
1. Remove the T6 thrust bearing.



2. Remove the intermediate clutch plate snap ring.

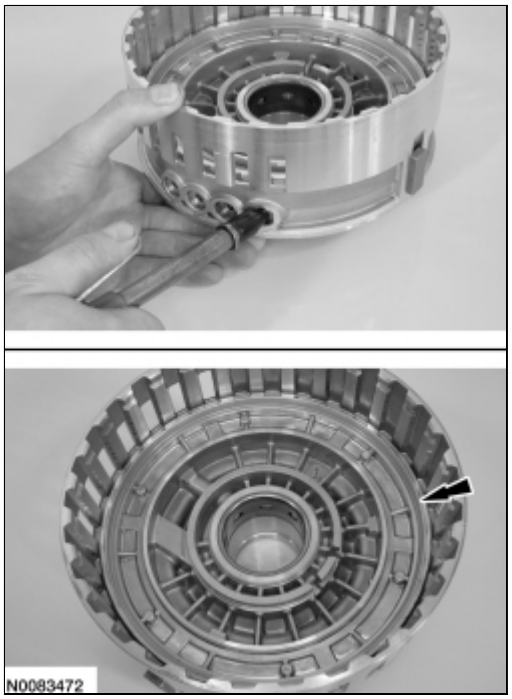


3. Remove the intermediate clutch plates.

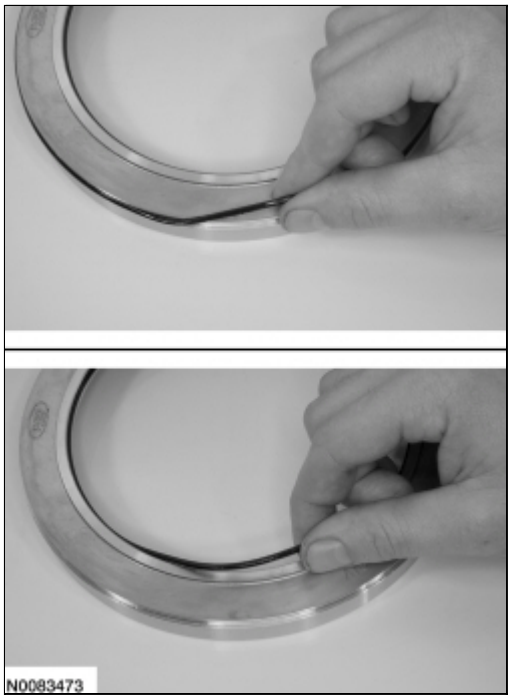


4. Using the Clutch Spring Compressor, remove and discard the intermediate clutch return spring retainer.

5. Remove the intermediate clutch return spring top plate.

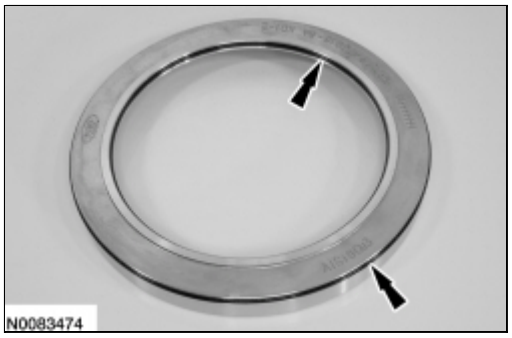


6. Remove the intermediate clutch return spring.

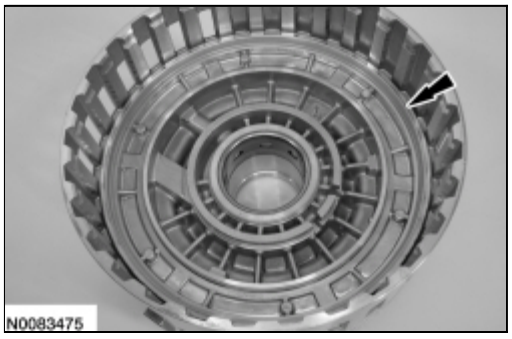


7. Applying a slight amount of air to the port, remove the intermediate clutch piston.

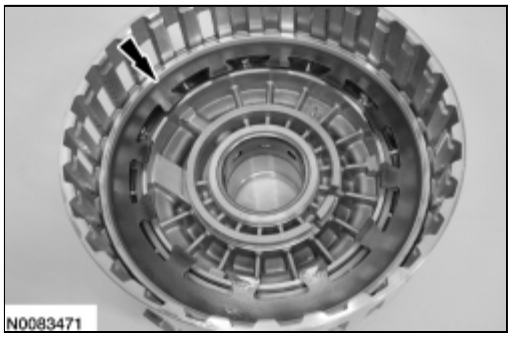
repair4less



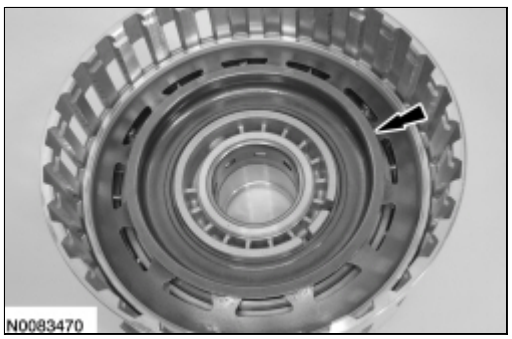
8. Remove and discard the inner and outer intermediate clutch piston O-ring seals.



Assembly

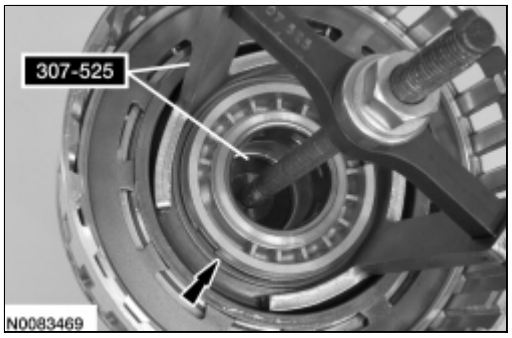


1. Install new inner and outer intermediate clutch piston O-ring seals.

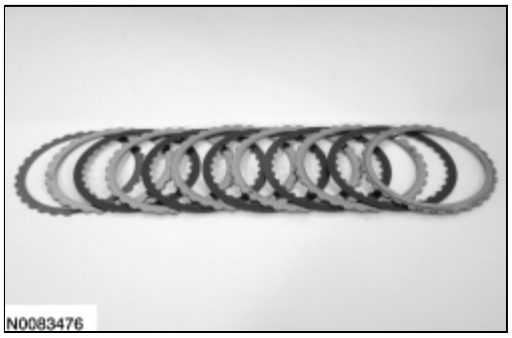


2. Lightly coat the O-ring seals in clean automatic transmission fluid and install the intermediate clutch piston.

3. Install the intermediate clutch return spring.

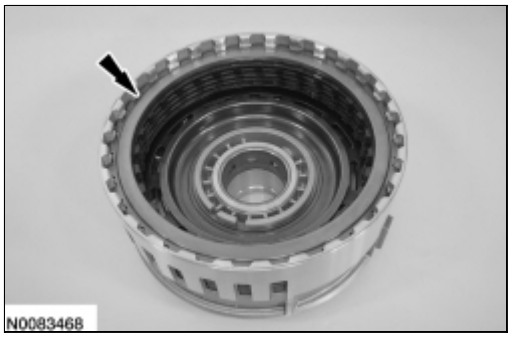


4. Install the intermediate clutch return spring top plate.



5. Using the Clutch Spring Compressor, install a new intermediate clutch return spring retainer.

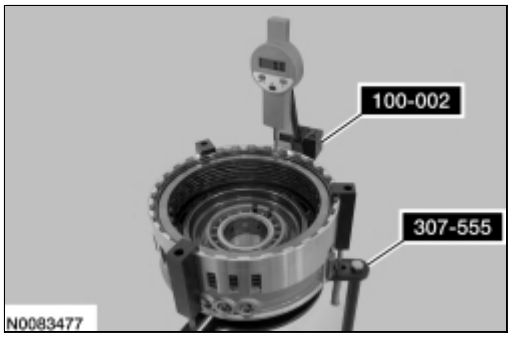
repair4less



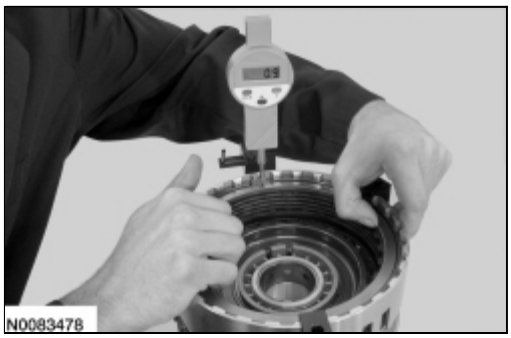
6. **NOTE:** Friction and steel plate quantity will vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

   Soak the new intermediate clutch plates in clean automatic transmission fluid.

7. Install the new intermediate clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending with the pressure plate.



8. Install the intermediate clutch plate snap ring.

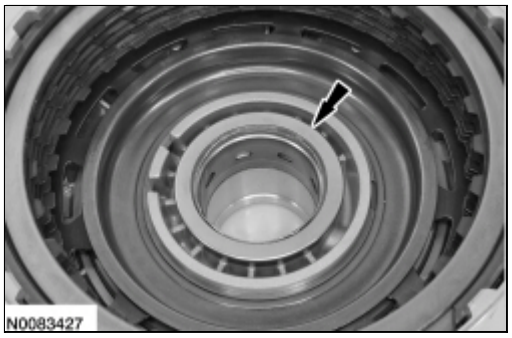


9. **NOTE:** All intermediate clutch plates, friction and steel are of a wave-type design.

   Install the intermediate clutch assembly into the Clutch End Play Gauge and install the Dial Indicator Gauge with Holding Fixture and position the plunger so it fits into the opening of the snap ring.

10. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

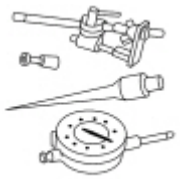
11. Rotate the intermediate clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

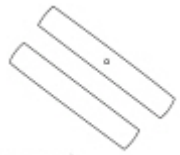


Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

12. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 0.7-1.1 mm (0.027-0.043 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.





13. Install the T6 thrust bearing.

Low/Reverse Clutch Assembly

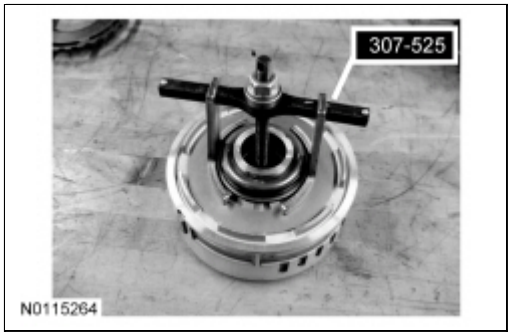
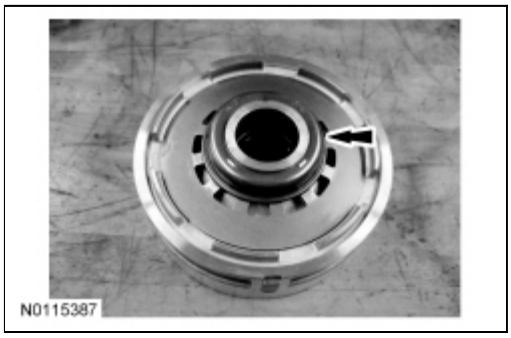
repair4less



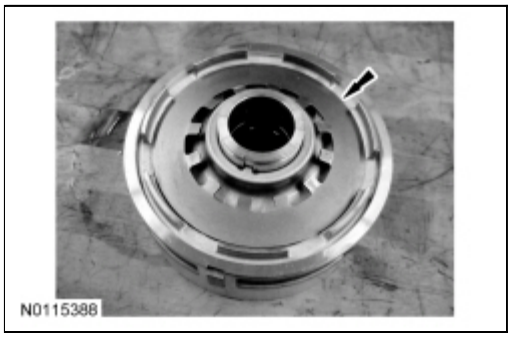
Item	Part Number	Description
1	7A130	Intermediate/low/reverse clutch center support
2	7B220	Center support keys (2 required)
3	7F225	Low/reverse clutch piston center seal
4	7D403	Low/reverse clutch cylinder outer seal
5	7A262	Low/reverse clutch piston
6	7B070	Low/reverse clutch return spring
7	7H318	Low/reverse clutch return spring retainer
8	7D483	Low/reverse clutch return spring snap ring
9	7E085	Low/reverse clutch cushion spring
10	7B164	Low/reverse clutch internal splined friction plates (internally splined to the rear planetary carrier)
11	7B442	Low/reverse clutch external splined steel plates (externally splined to the case)
12	7B066	Low/reverse clutch pressure plate (externally splined to the case) (select fit)

Disassembly

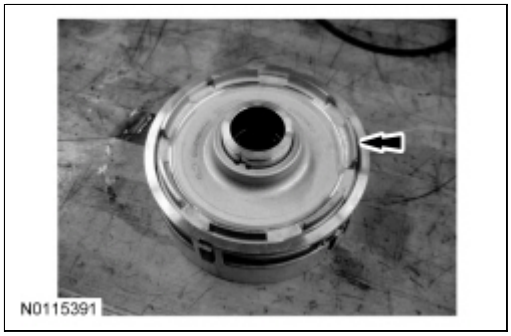


NOTICE: **The low/reverse clutch plate quantity is model dependent on engine size. Check the clutch plate quantity charts in specifications for the correct clutch plate quantity. Failure to install the correct clutch plate quantity will result in transmission failure.**

NOTE: The low/reverse clutch plates are installed in the case during the transmission assembly procedure.

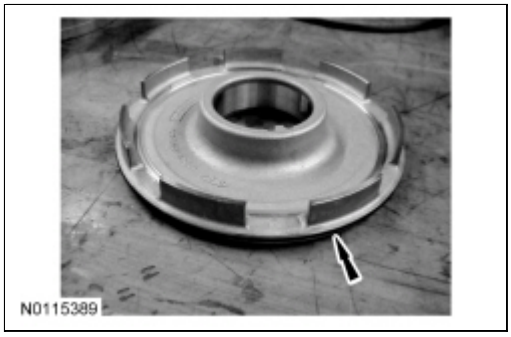


1. Using the Clutch Spring Compressor, remove and discard the low/reverse clutch return spring retainer.



2. Remove and discard the low/reverse clutch return spring retainer.

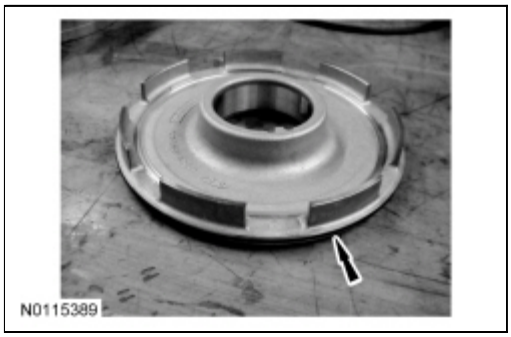
3. Remove the low/reverse clutch return spring.



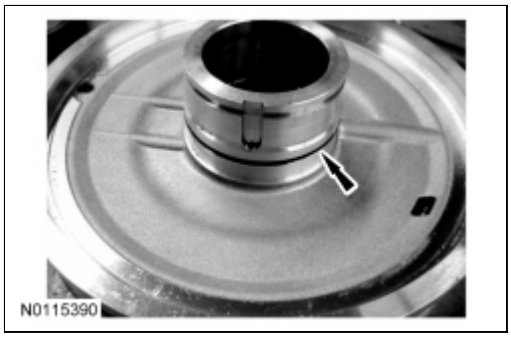
4. Apply a slight amount of air to the port, remove the low/reverse clutch piston from the low/reverse clutch drum.

repair4less

5. Remove and discard the low/reverse outer piston O-ring seal.

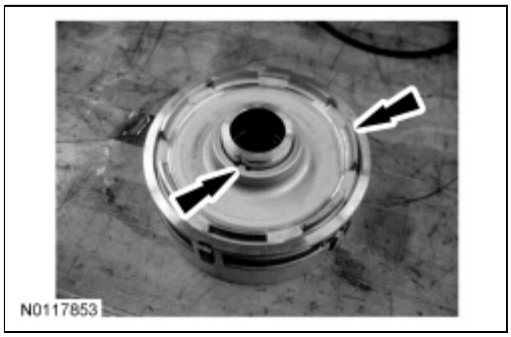


6. Remove and discard the low/reverse drum O-ring seal.

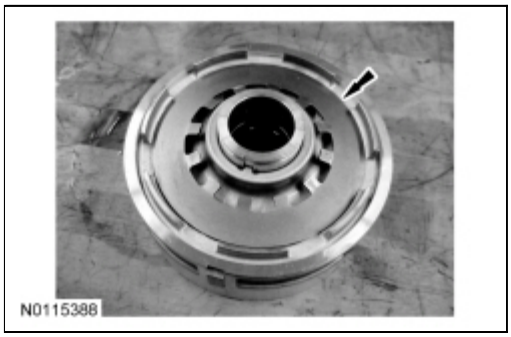


Assembly

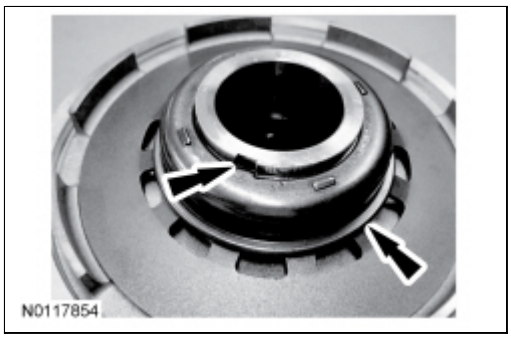
Low/reverse piston



1. Install new low/reverse outer piston O-ring seal.

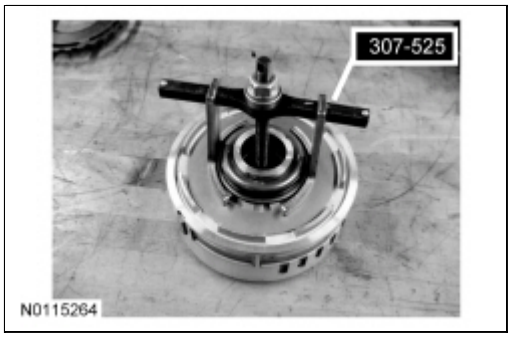


2. Install new low/reverse drum O-ring seal.



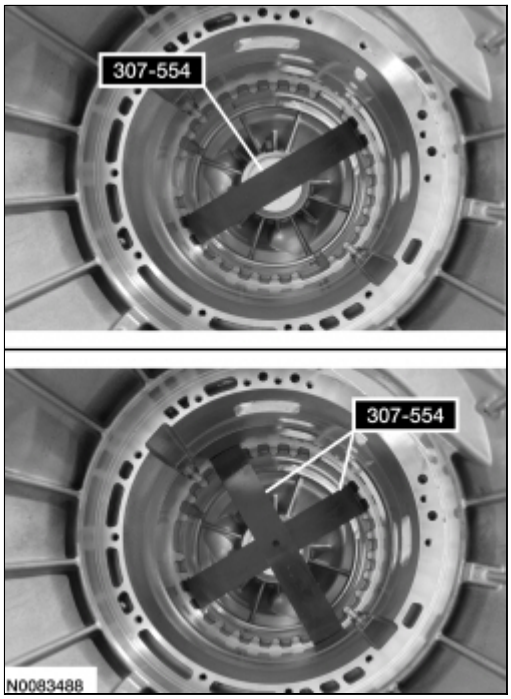
3. Lubricate the O-ring seal with clean transmission fluid. Align the alignment tab on the piston with the groove in the center support and install the low/reverse piston.

4. Install the low/reverse clutch return spring.



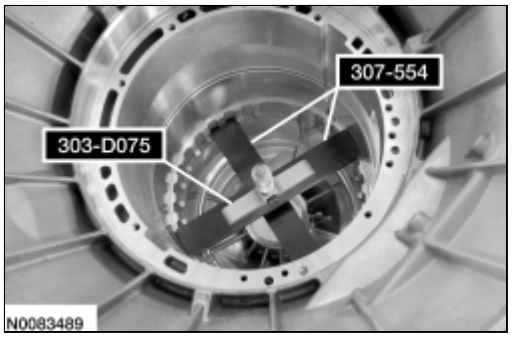
5. Install a new low/reverse clutch return spring retainer. Align the alignment tab on the retainer with the groove in the center support and install the low/reverse piston return spring retainer.

6. Using the Clutch Spring Compressor, compress the low/reverse clutch return spring and install the retaining ring.



repair4less

Low/reverse clutch stackup



7. **NOTE:** All low/reverse clutch plates, friction and steel are of a wave-type design.

   Install the D-Clutch Measurement Gauge into the case.

8. With the D-Clutch Measurement Gauge positioned in the case, use the Depth Micrometer to measure the case stop depth.

Description	Reading
Measure the distance from the top of the upper gauge bar to the top of the lower gauge bar. Record this reading as the case measurement. Record as reading A.	

9. Measure the clutch pack height.

	Description	Reading
A.	Place the low/reverse clutch pack on the Clutch End Play Gauge with the wave spring down and the pressure plate on top. Using the Dial Indicator Gauge with Holding Fixture, place the plunger on the pressure plate. Slide the clutch to the side so the plunger of the Dial Indicator is touching the gauge plate of the Clutch End Play Gauge. Zero out the Dial Indicator Gauge.	
B.	Carefully lift the plunger enough to slide the clutch pack under the plunger to take a reading. Record this reading. Rotate the clutch pack 180 degrees and take a second reading. Add the first and second readings together and divide the total by 2. Record this reading as B.	

10. Using the Depth Micrometer, measure the piston to center support shoulder height.

Description	Reading
Measure the piston to center support shoulder height. Record this measurement. Rotate the center support 180 degrees and record this measurement. Add the first and the second measurements, then divide by 2. Record this as reading C.	

repair4less

11. Calculate the end clearance.

Description	Reading
Subtract B and C from A to determine end clearance	
Total C measurement	
End clearance specification	1.0-1.6 mm (0.039-0.062 in)

Compare the end clearance to the specification. If the end clearance is out of specification, select the next thinner or thicker plate as required and repeat Steps 10, 11 and 12.

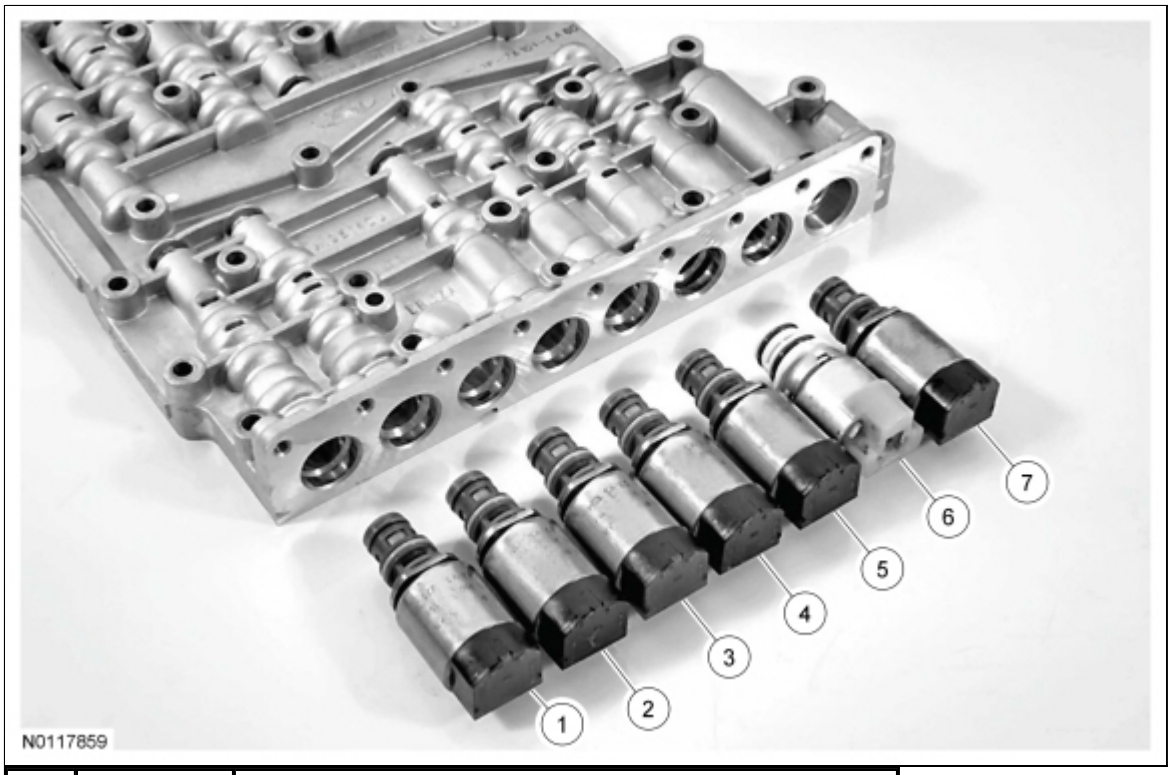
Check Ball Location



Item	Description
1	Reverse/drive control check ball

repair4less

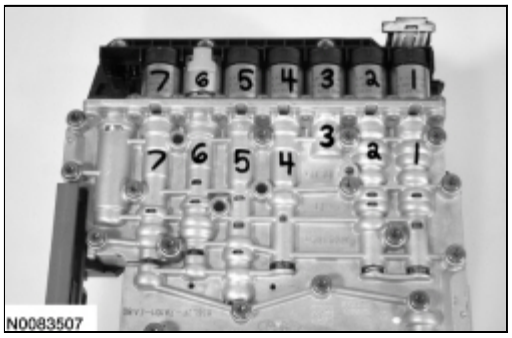
2	Shift solenoid control check ball
3	Intermediate clutch exhaust control check ball
4	Direct clutch exhaust control check ball
5	Low/reverse clutch exhaust control check ball
6	Forward clutch exhaust control check ball
7	Overdrive clutch exhaust control check ball
8	Reverse exhaust control check ball
9	Clutch exhaust valve
10	Converter drain back valve
11	Large filter screen
12	Small filter screen

Shift Solenoid Location

Item	Part Number	Description
1	7G383	SSA , Forward (1,2,3,4) clutch, normally low VFS (brown nozzle).
2	7G383	SSB , Direct (3,5,R) clutch, normally high VFS (black nozzle).
3	7G383	SSC , Intermediate (2,6) clutch, normally low VFS (brown nozzle).

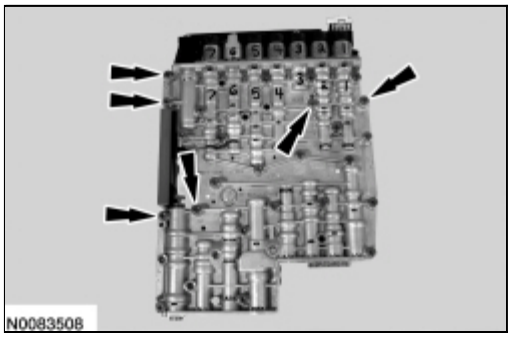
4	7G383	LPC solenoid, normally high VFS (black nozzle).
5	7G383	SSD , low/reverse/overdrive clutch, normally high VFS (black nozzle).
6	7G484	SSE , normally off ON/OFF solenoid.
7	7G383	TCC solenoid, normally low VFS (brown nozzle).

Disassembly



NOTE: Make an identifying mark on each solenoid and the corresponding bore for correct assembly.

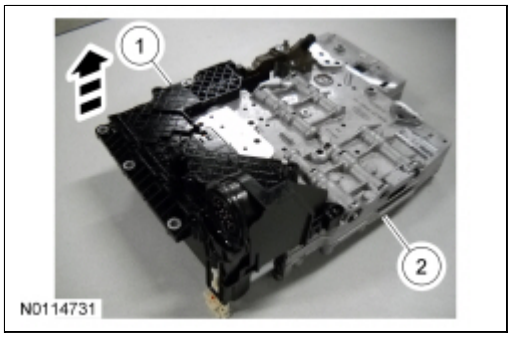
NOTE: Solenoids may visually appear the same but their designs/functions are different. Use care not to assemble the main control assembly incorrectly. Incorrect solenoid installation results in poor transmission shift quality.



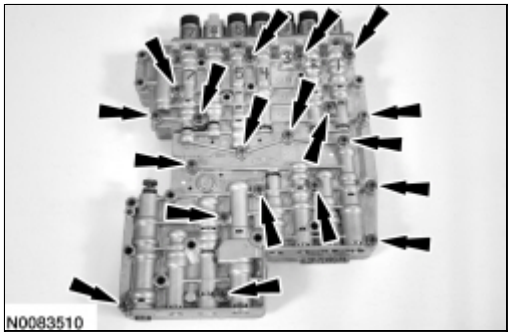
NOTE: Note the location of the 8 check balls, 6 solenoid dampers, 2 internal valves and springs and 2 filter screens for reassembly.

Main Control Upper Half

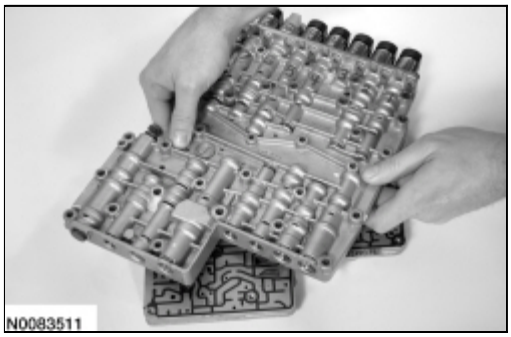
1. Make an identifying mark on each solenoid and the corresponding bore for correct assembly.



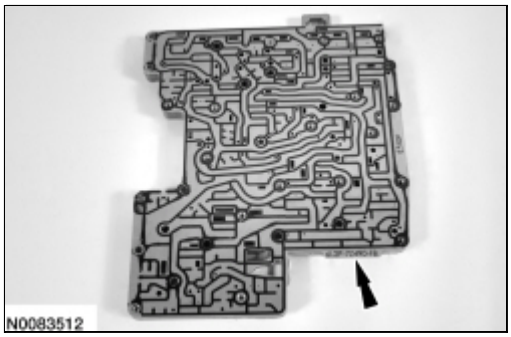
2. Remove the 6 long molded leadframe-to-valve body bolts from the molded leadframe.



3. Carefully separate the molded leadframe from the main control assembly.
    1. Molded leadframe
    2. Main control assembly

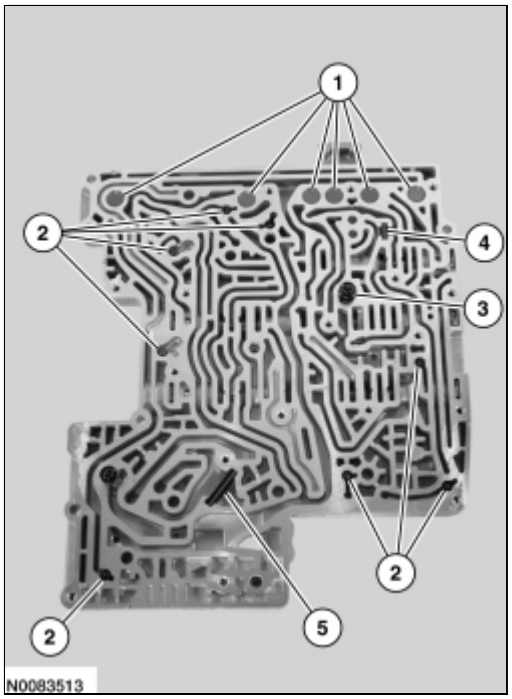


repair4less

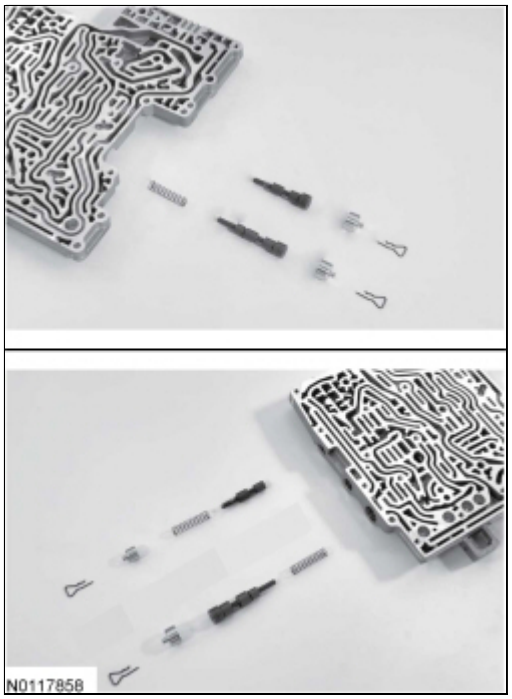


4. Remove 19 short molded leadframe-to-valve body bolts from the main control assembly.

5. Separate the lower half of the main control assembly from the upper half of the main control assembly.



6. Remove and discard the main control valve body separator plate.

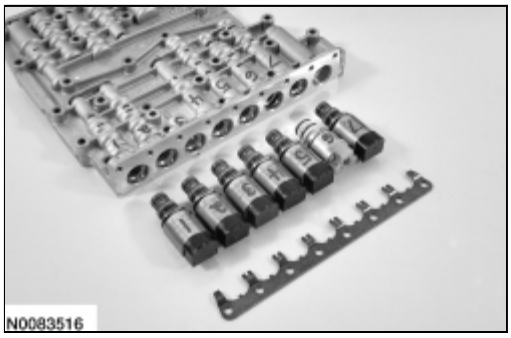


7. Remove the solenoid dampers, check balls, converter drain back valve and filter screens from the main control assembly. Note the location for assembly.
    1. Solenoid dampers

2. Check balls
3. Converter drain back valve
4. Small filter screen
5. Large filter screen

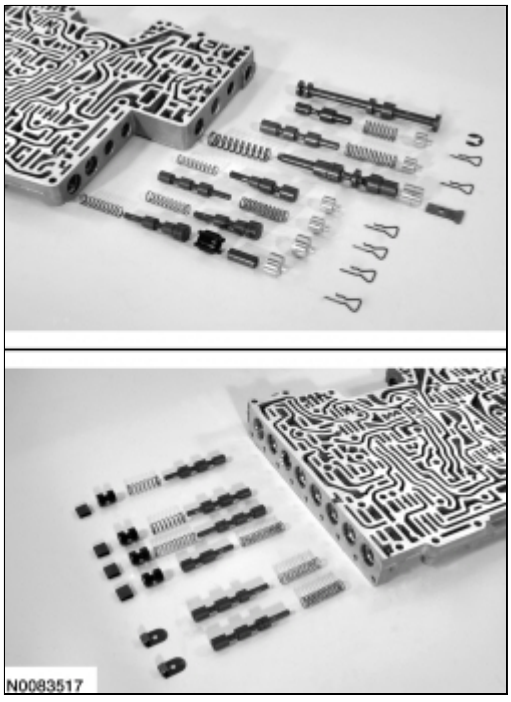
8. Remove the retaining clips, caps, valves and valve springs from each bore of the main control assembly. Note the location and order for assembly.

9. Using clean mineral spirits, clean the upper half of the main control assembly.



repair4less

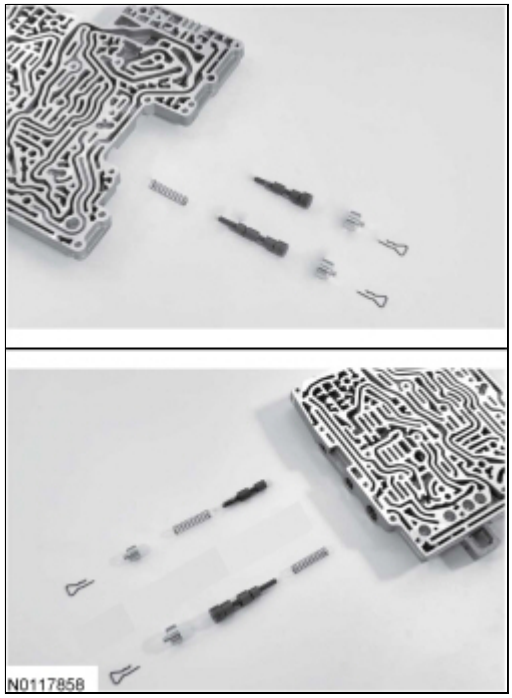
Main Control Lower Half



10. Remove the 8 solenoid hold down bracket bolts and the solenoid hold down bracket.

11. Remove the solenoids.

12. Remove the retaining clips, caps, valves and valve springs from each bore of the main control assembly. Note the location and order for assembly.



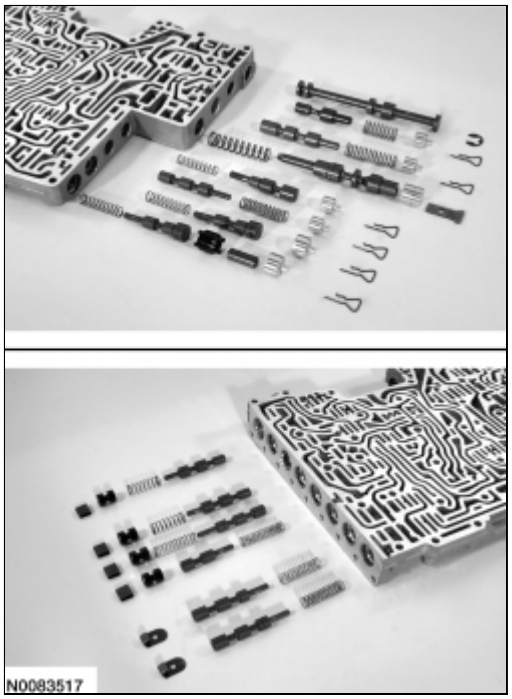
13. Using clean mineral spirits, clean the lower half of the main control assembly.

Assembly

Main Control Upper Half

1. **NOTE:** Many components and surfaces in the main control valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly prevents unnecessary damage to machined surfaces.

   Install the retaining clips, caps, valves and valve spring into each bore.

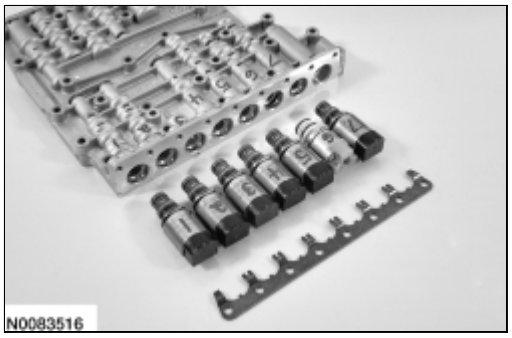


Main Control Lower Half

2. **NOTE:** Many components and surfaces in the main control valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly prevents unnecessary damage to machined surfaces.

   Install the retaining clips, caps, valves and valve spring into each bore.

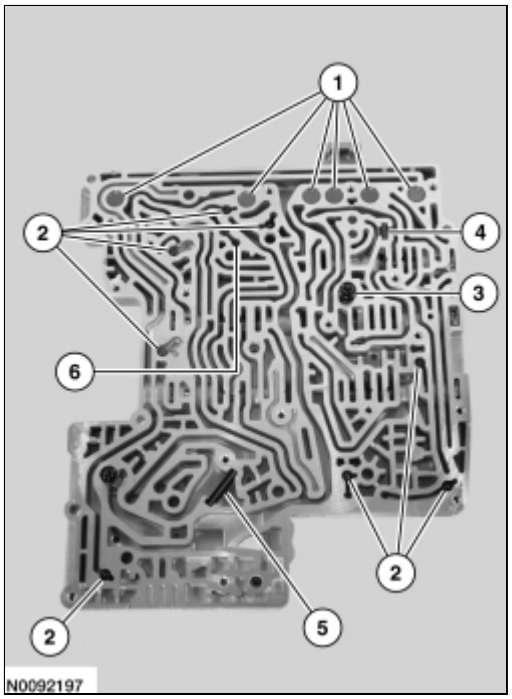
repair4less



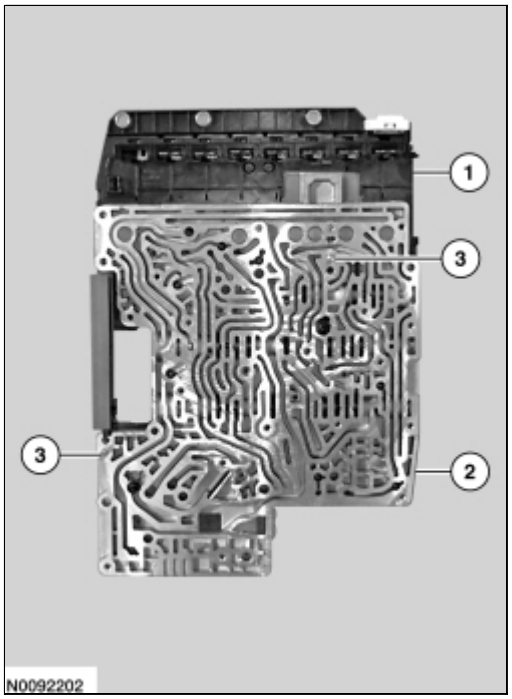
3. ***NOTICE:*** **A VFS is calibrated from the factory and are not all the same. To replace a VFS , match the replacement solenoid nozzle color and the band number with the original solenoid or harsh/erratic shifts, harsh/soft engagement or damage to the transmission can occur.**

   Inspect the solenoid screens for contamination and install new solenoids if needed. Lubricate the solenoid O-rings with clean transmission fluid.
   If replacing a solenoid, use the solenoid exploded view at the beginning of this procedure to identify what type of solenoid is being replaced. The solenoid can be a normally high VFS with a black nozzle, normally low VFS with a brown nozzle or an ON/OFF solenoid.
   If replacing a VFS , record the band number and the solenoid nozzle color to get the correct part number for the solenoid.
   1. Screens
   2. O-rings
   3. Solenoid nozzle
   4. Solenoid band number

4. Install the solenoids into their correct bores as indicated during disassembly.



5. Install the shift control solenoid hold down bracket and the 8 hold down bracket bolts.
    - Tighten to 6 Nm (53 lb-in).

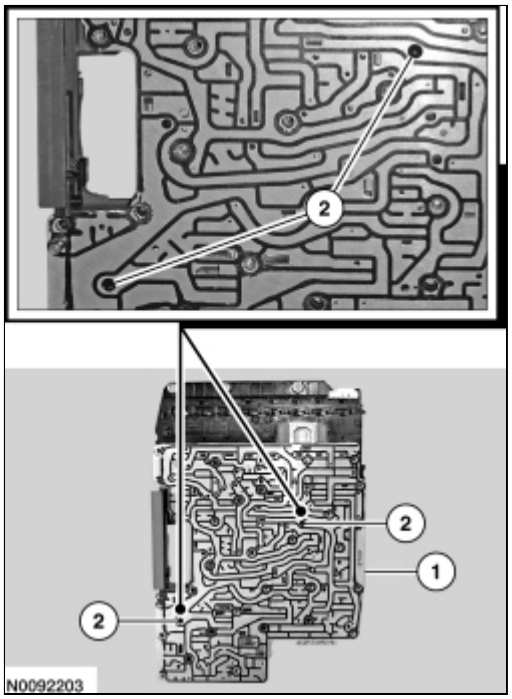


6. ***NOTICE:*** **Toward the back of the upper valve body there is a hydraulic passage that is shaped as though it receives a check ball. This passage does not require a check ball. Be sure not to mistake this hydraulic passage for a passage that does require a check ball or damage to the transmission can occur.**

    Install the solenoid dampers, check balls, converter drain back valve and filter screens.
    1. Solenoid dampers
    2. Check balls
    3. Converter drain back valve
    4. Small filter screen
    5. Large filter screen
    6. Empty hydraulic passage (no check ball)

repair4less

7. Align the guide pins on the molded leadframe with the holes in the main control upper valve body and install the valve body onto the molded leadframe.
    1. Molded leadframe
    2. Main control upper valve body
    3. Guide pins

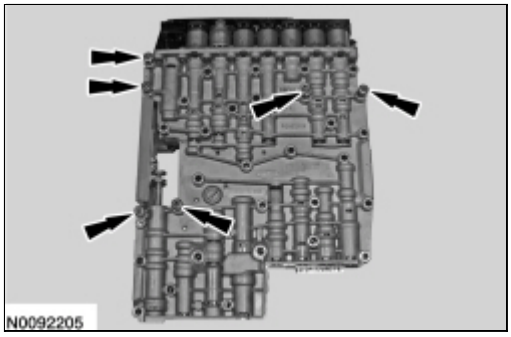


8. ***NOTICE:*** **If the drain back valves are not installed correctly in the separator plate, damage to the transmission can occur.**

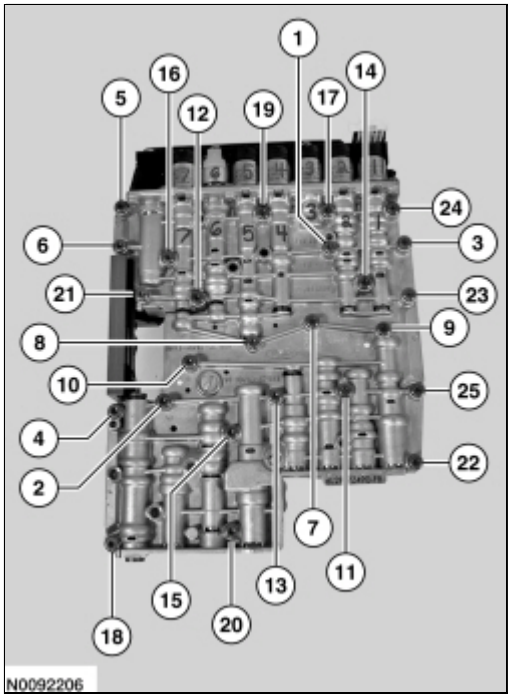
    Position the new main control separator plate on the main control upper valve body.

Check the 2 drain back valves to be sure they are correctly positioned in the separator plate when the separator plate is pressed flush against the main control upper valve body.

1. Main control separator plate
2. Drain back valves

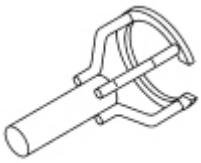


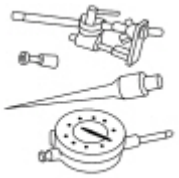
9. Position the main control lower valve body on the 2 molded leadframe alignment studs, align the manual valve with the TR sensor on the molded leadframe and install the main control lower valve body.
    1. Main control lower valve body
    2. Manual valve
    3. TR sensor



repair4less

10. Install the 6 long molded leadframe-to-valve body bolts hand-tight.

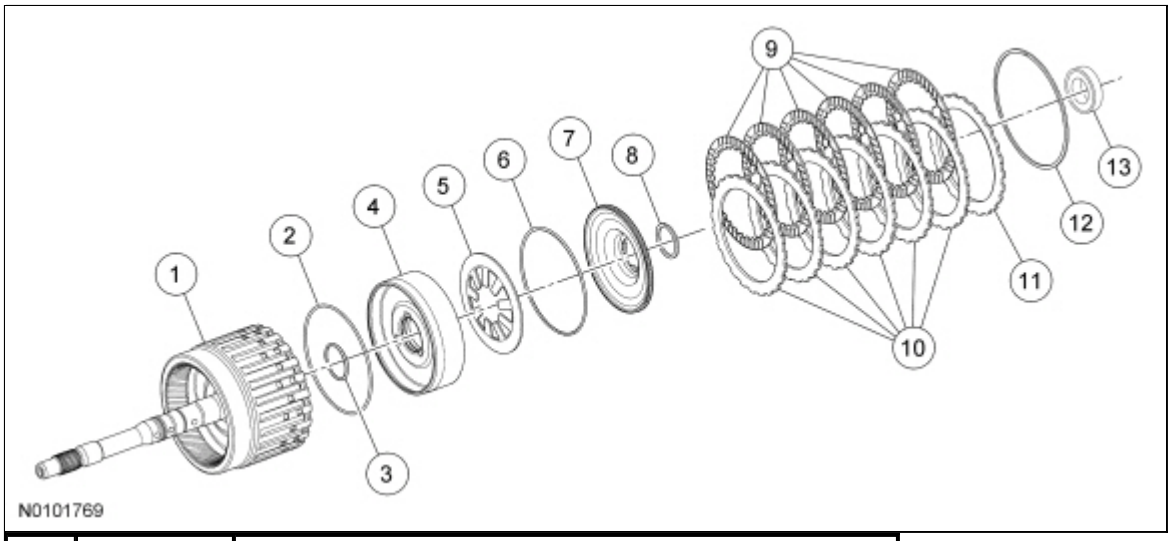




11. Install the 19 short main control assembly lower-to-upper valve body bolts. Tighten the bolts in the sequence shown.
    - Tighten bolts 1 through 6 to 6 Nm (53 lb-in).
    - Tighten bolts 7 through 25 to 7 Nm (62 lb-in).

repair4less

Overdrive Clutch Assembly

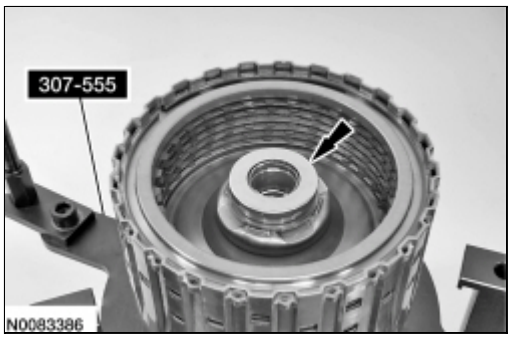


Special Tool(s)

 ST2497-A	Compressor, Spring Washer 307-209
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST2892-A	End Play Gauge, Clutch 307-555

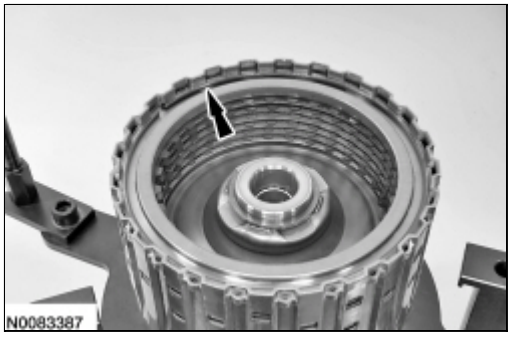
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV



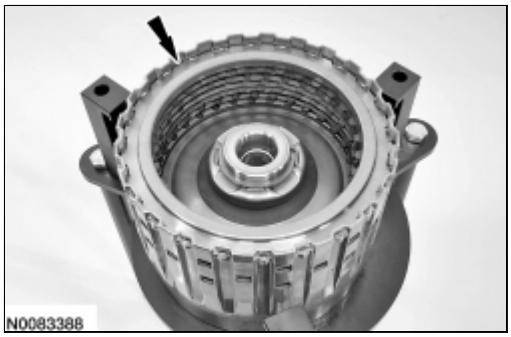
Overdrive (O/D) Clutch Assembly

Item	Part Number	Description
1	7F207	Input shaft
2	7A548	Overdrive (O/D) clutch piston outer seal
3	7A548	O/D clutch piston inner seal
4	7A262	O/D clutch piston
5	7B070	O/D clutch piston spring
6	7A548	O/D balance piston outer seal
7	7H360	O/D balance piston
8	7C122	O/D balance piston snap ring
9	7B164	O/D clutch internal splined clutch friction plates (quantity model dependent)
10	7B442	O/D clutch external splined clutch steel plates (quantity model dependent)
11	7B066	O/D pressure plate
12	7D483	O/D clutch retaining ring
13	7C096	Bearing T3



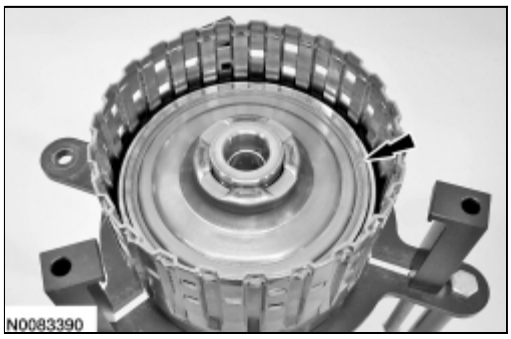
Disassembly

1. Position the Overdrive (O/D) clutch assembly in the Clutch End Play Gauge and remove the T3 thrust bearing.

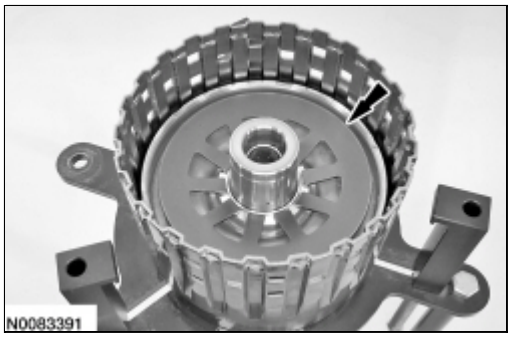


repair4less

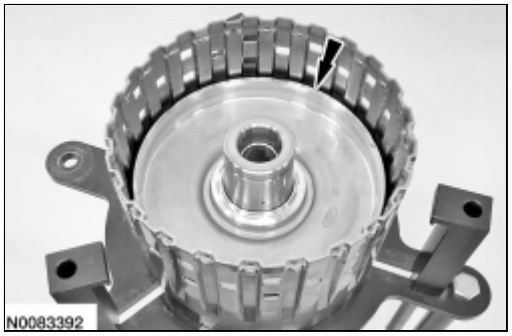
2. Remove the O/D clutch pack snap ring.



3. Remove the O/D clutch pack.



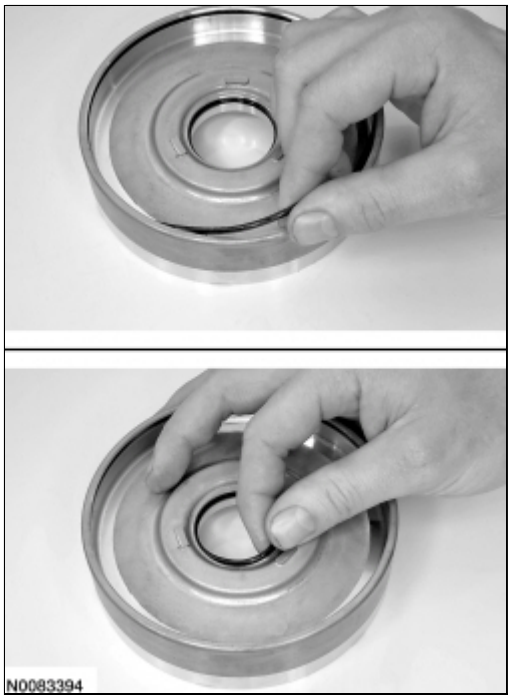
4. Using the Spring Washer Compressor and a press, remove and discard the O/D clutch balance piston retaining ring.



5. Remove the O/D clutch balance piston.

6. Remove the O/D clutch return spring.

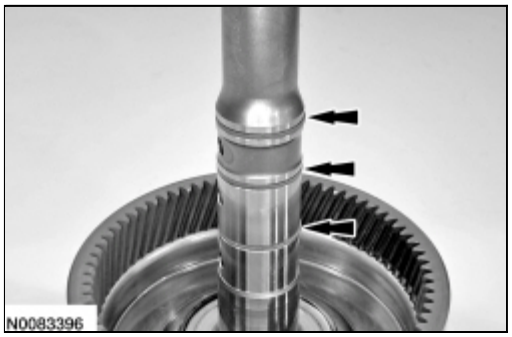
7. Remove the O/D clutch apply piston.



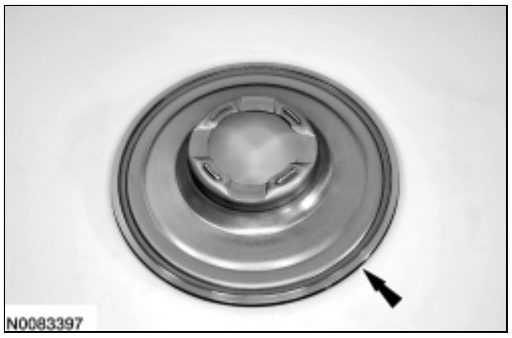
8. Remove and discard the outer O-ring seal on the O/D clutch balance piston.

9. Remove and discard both the inner (one large and one small) O-ring seals on the O/D clutch apply piston.

repair4less

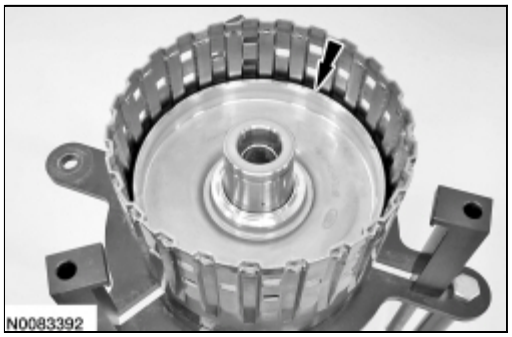


10. Remove and discard the 3 scarf cut seals.



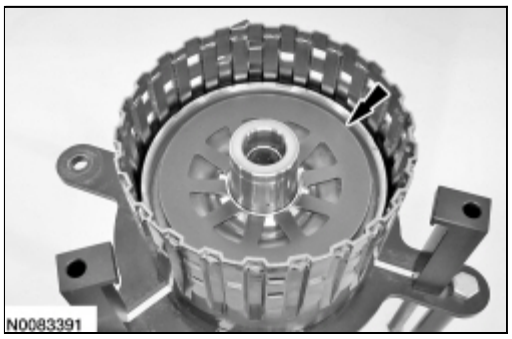
Assembly

1. Install the 3 new scarf cut seals and the roller bearing.



2. Install a new outer O-ring seal on the O/D clutch balance piston.

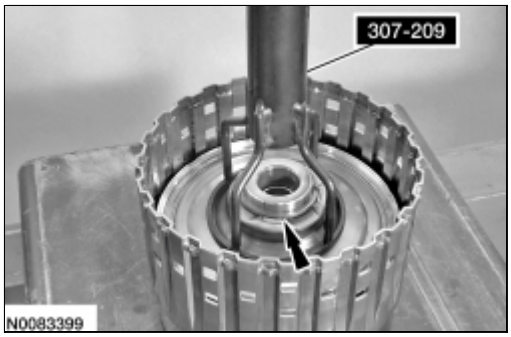
3. Install 2 new inner O-ring seals on the O/D clutch apply piston.



4. Lubricate all the O-ring seals with clean transmission fluid. Install the O/D clutch apply piston into the drum with the O-ring seals and the 3 pads facing down toward the drum.

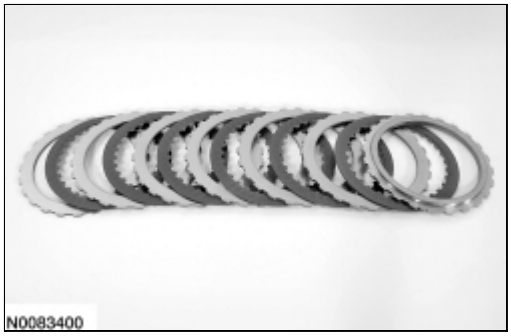
5. **NOTE:** The fingers on the return spring are facing down toward the piston.

   Install the O/D clutch return spring.



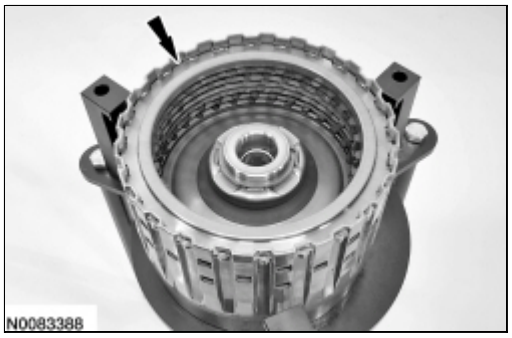
6. **NOTE:** The cone shape of the balance piston must face up when installed correctly.

repair4less

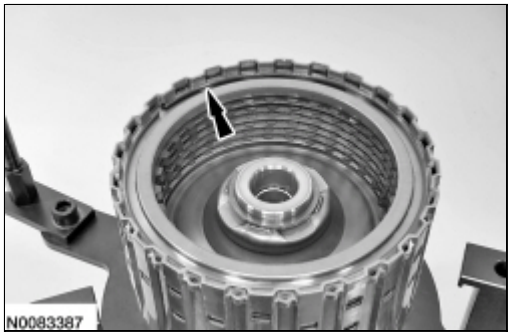


Lubricate all the O-ring seals with clean transmission fluid. Install the O/D clutch balance piston.

7. Using the Spring Washer Compressor, install a new O/D clutch balance piston retaining ring.

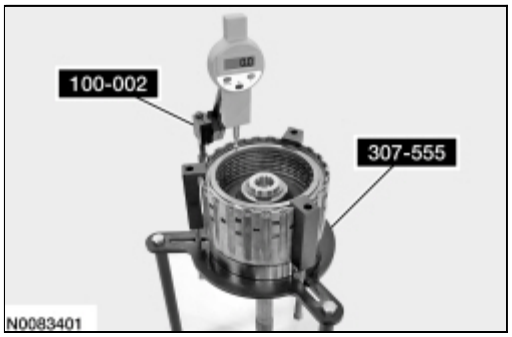


8. Soak the new O/D clutch plates in clean transmission fluid.



9. **NOTE:** Friction and steel plate quantity will vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity chart in the Specifications portion of this section.

   Install the new O/D clutch plates, starting with a steel plate and alternating between friction and steel plates, and ending with the pressure plate on the top.



10. Install the O/D clutch pack snap ring.

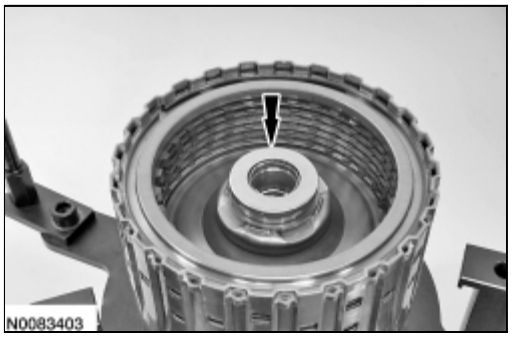
11. **NOTE:** All O/D clutch plates, friction and steel are of a wave-type design.

    Install the O/D clutch assembly into the Clutch End Play Gauge and install the Dial Indicator Gauge with Holding Fixture and position the plunger so it fits into the opening of the snap ring.

12. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

repair4less

13. Rotate the O/D clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.



Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

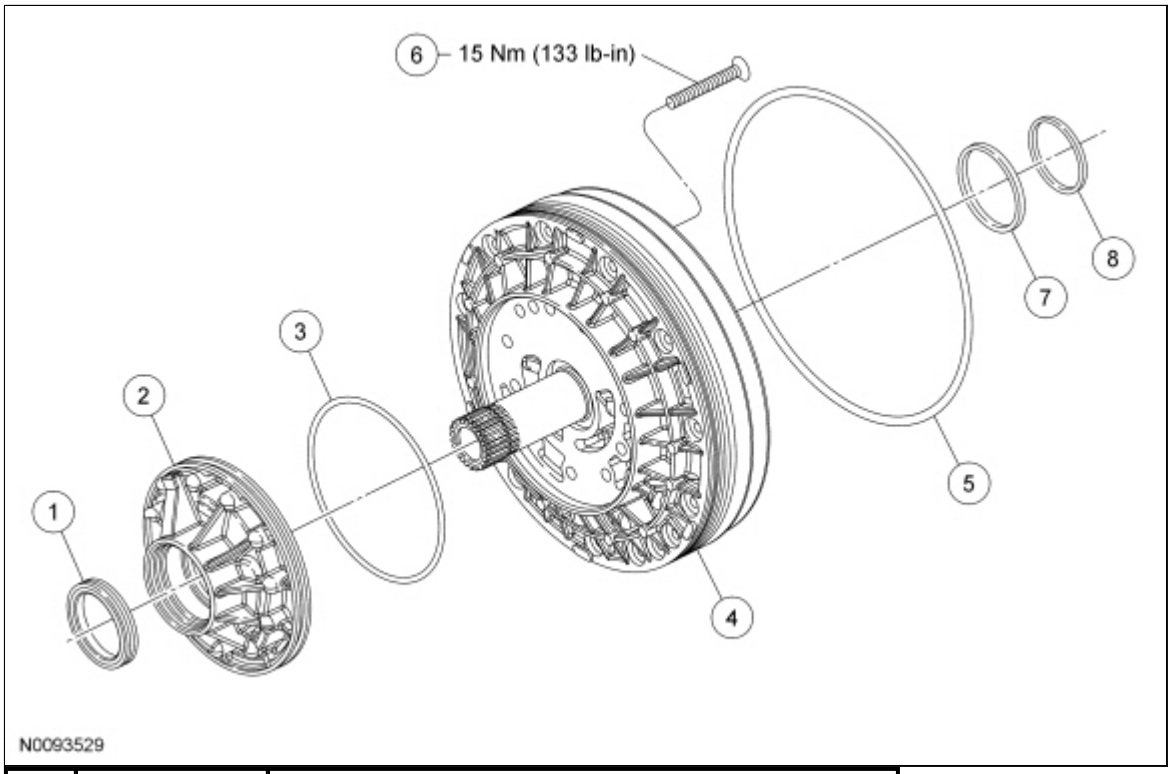
14. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 0.5-0.9 mm (0.019-0.035 in)

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

15. **NOTE:** Inspect and install new thrust bearings as required.

    Install the T3 thrust bearing.

repair4less



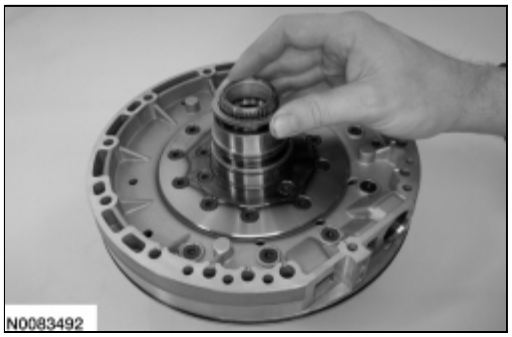
Pump Assembly

Special Tool(s)

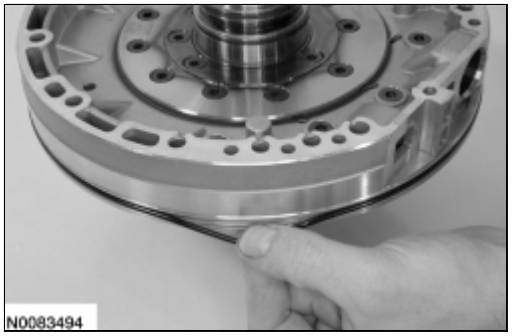
 ST2887-A	Installer, Fluid Pump Seal 307-556

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

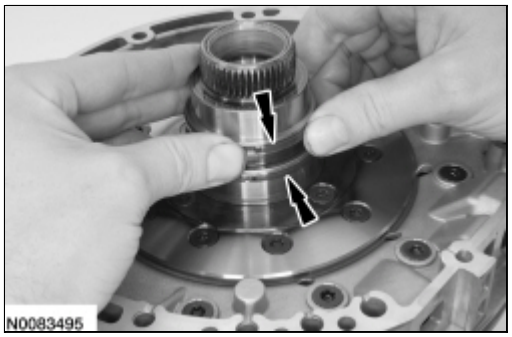


Item	Part Number	Description
1	7A248	Front pump oil seal
2	—	Pump body (part of 7A103)
3	7A248C	Pump body seal



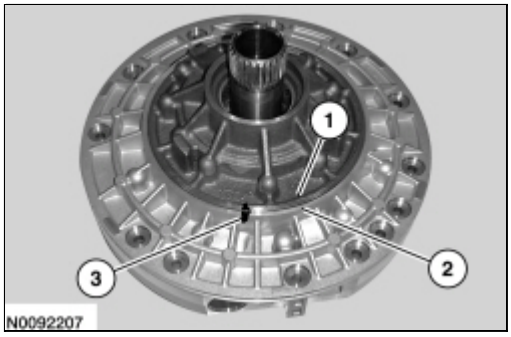
4	7A103	Pump plate assembly
5	7A248A	Pump plate assembly seal
6	W707871-S300	Pump plate assembly-to-front pump body bolt (11 required)
7	7D019	Clutch support fluid seal
8	7L323	Front pump support seal

Disassembly

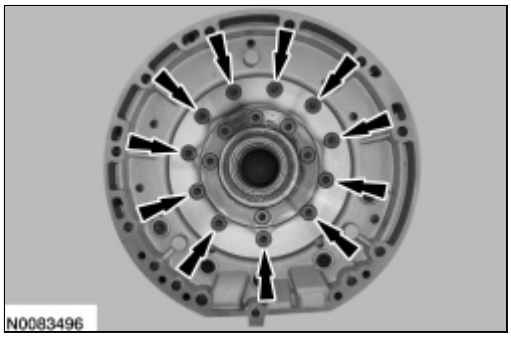


1. Remove the front pump washer.

2. If the O-ring seal was not removed during disassembly, remove and discard the front pump O-ring seal from the pump assembly.

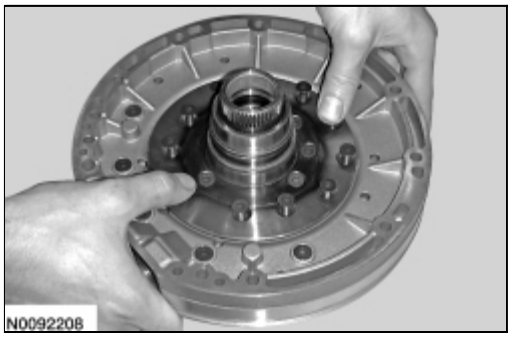


3. Remove and discard the front pump seal rings from the stator support.

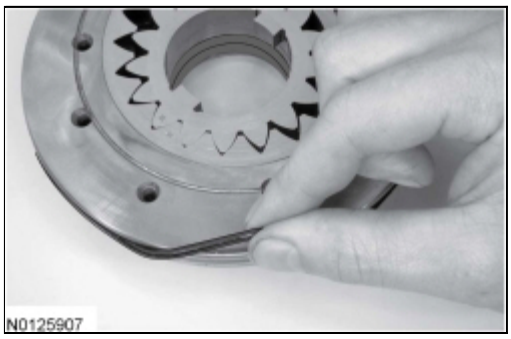


4. Index-mark the pump body to the pump plate assembly.
    1. Pump body
    2. Pump plate assembly

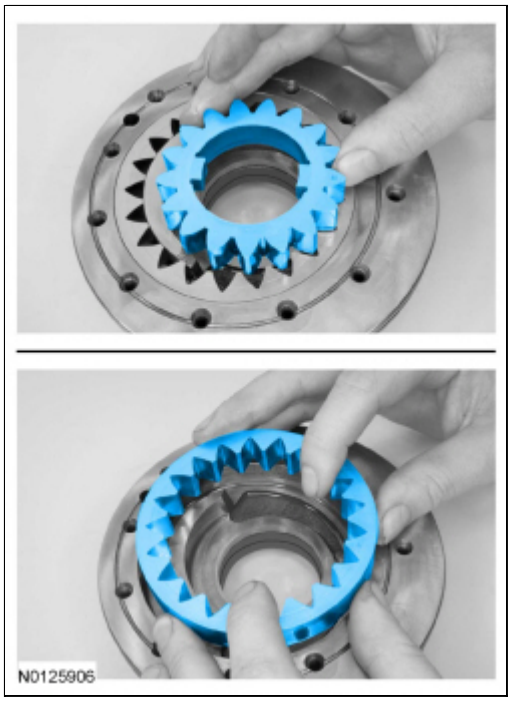
repair4less



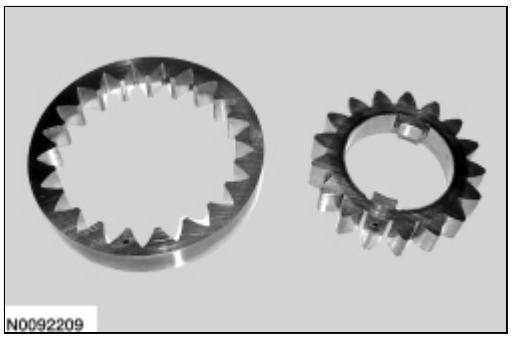
3. Index mark



5. Remove the 11 pump plate assembly-to-pump body bolts.

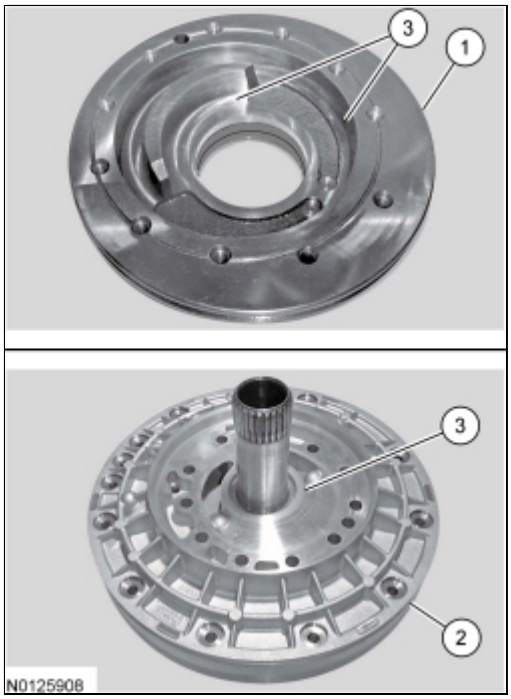


6. Push down on the loose pump plate assembly-to-pump body bolts to remove the pump body from the pump plate assembly and remove the 11 bolts.



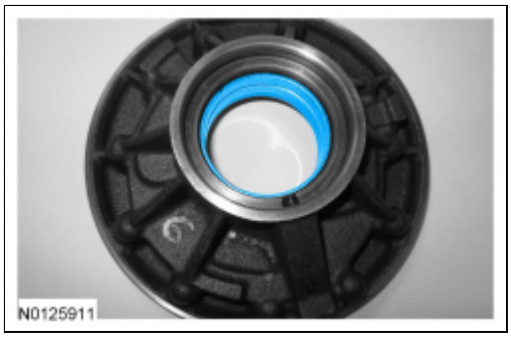
7. Remove and discard the pump body outer seal.

8. Remove the fluid pump gears.



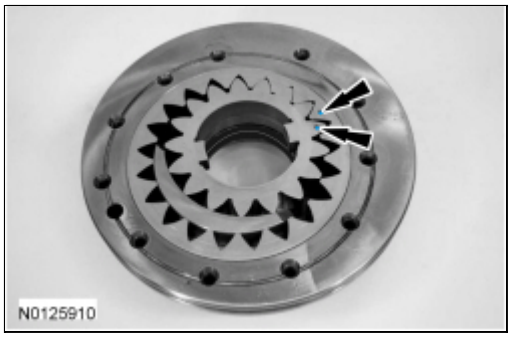
9. Inspect the inner and the outer pump gears for damage.
    - Clean all pump components in solvent.
    - Dry the parts with compressed air.
    - Inspect the pump gears, faces, gear teeth and mating surfaces for damage or scoring.
    - Install a new pump as necessary.

10. Inspect the pump body and pump plate thrust surfaces for damage or scoring.
    1. Pump body
    2. Pump plate assembly
    3. Pump gear thrust surfaces

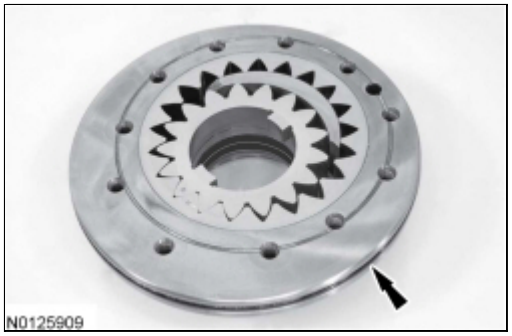


repair4less

11. Inspect the input shaft bushing for damage or scoring. If the bushing is damaged, install a new pump.



12. Inspect the torque converter hub bushing for damage or scoring. If the bushing is damaged, install a new pump.

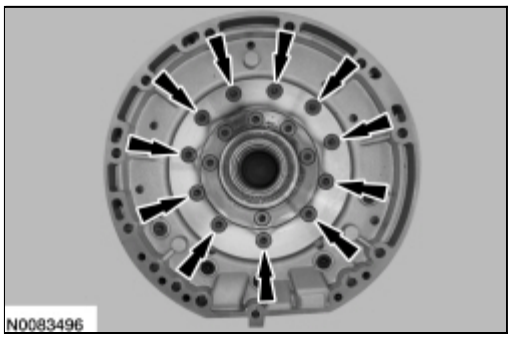


Assembly

1. **NOTE:** Prior to installation, lightly lubricate the pump gears with clean automatic transmission fluid.

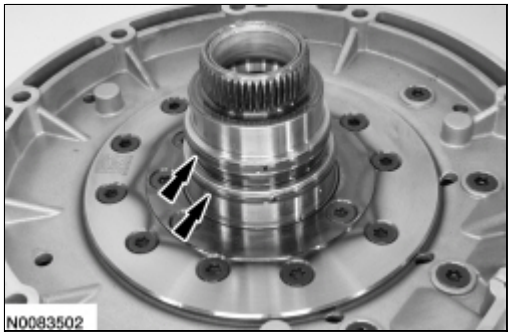
   Install the pump gears with the dot facing the pump plate assembly.

2. Install a new pump body outer seal.



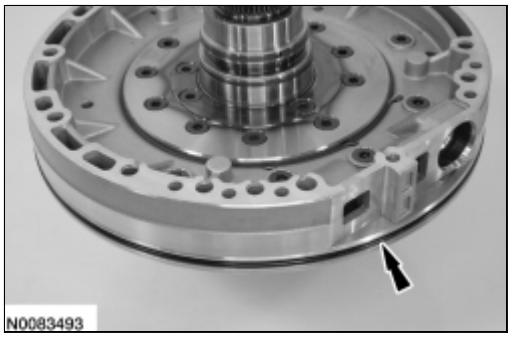
3. Align the marks made during disassembly to correctly assemble the pump. Press the pump body into the pump plate assembly. Visually inspect the pump body-to-pump plate assembly bolt holes to be sure that the pump body and pump plate are correctly aligned.
    1. Pump body
    2. Pump plate assembly
    3. Pump gear thrust surfaces

4. Install the pump plate assembly-to-front pump body bolts.



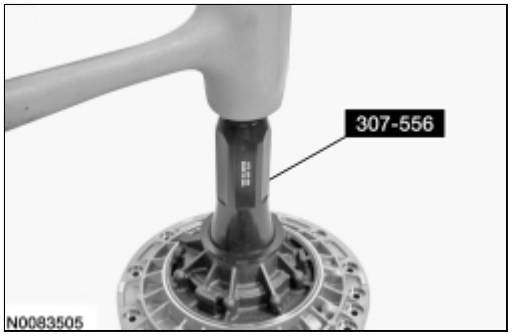
repair4less

- Tighten to 15 Nm (133 lb-in).



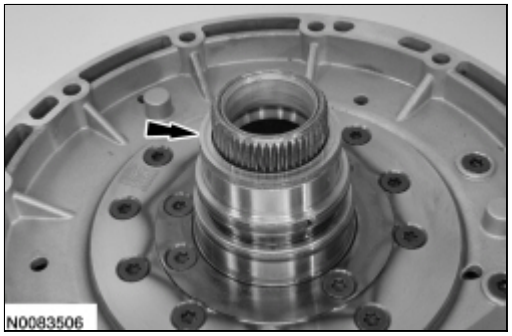
5. ***NOTICE:*** **Make sure that the seal ends of each seal ring are hooked together or fluid leakage can occur.**

   Install the 2 front pump seal rings onto the stator support. Make sure the seals are fully seated in the stator support seal grooves and the seal ends are oriented 180 degrees apart.



6. Install the pump outer diameter front pump O-ring seal.

7. Install a new front pump seal on the Fluid Pump Seal Installer 307-556.



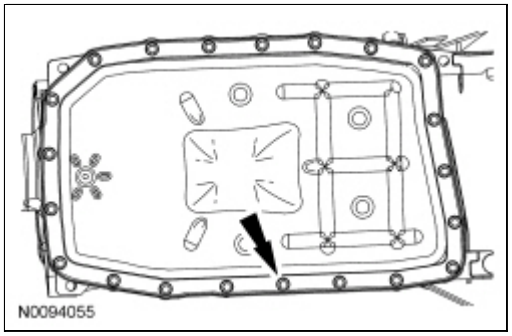
8. Using the Fluid Pump Seal Installer 307-556, install the front pump seal.

9. **NOTE:** Lightly lubricate the thrust washer with petroleum jelly to hold it in place during assembly.

   Install the pump thrust washer.

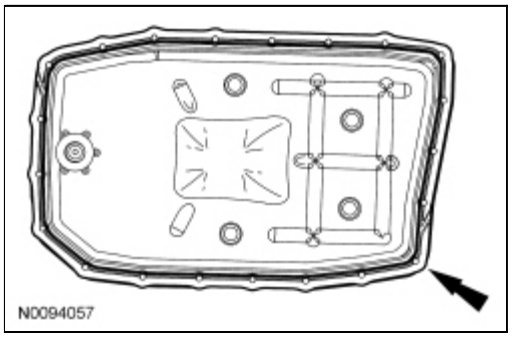
repair4less

Fluid Pan, Gasket and Filter



Material

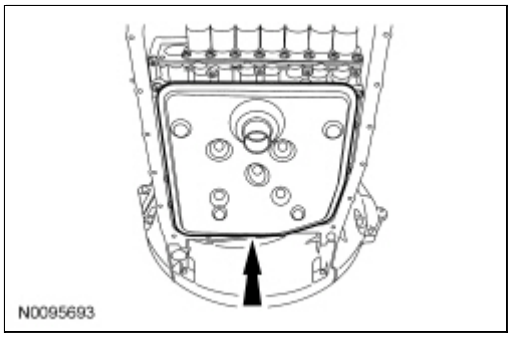
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV



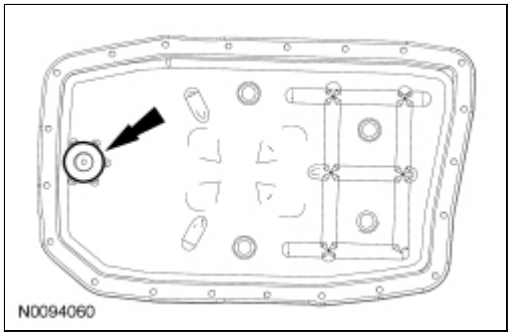
Removal

NOTICE: **The use of any transmission fluid other than specified can result in the transmission failing to operate in a normal manner or transmission failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. Remove the transmission fluid pan and allow the transmission fluid to drain.



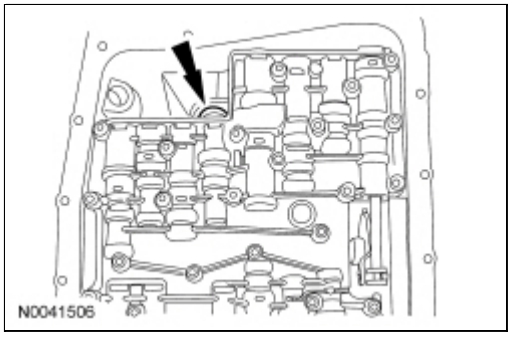
3. Remove the transmission fluid pan gasket.



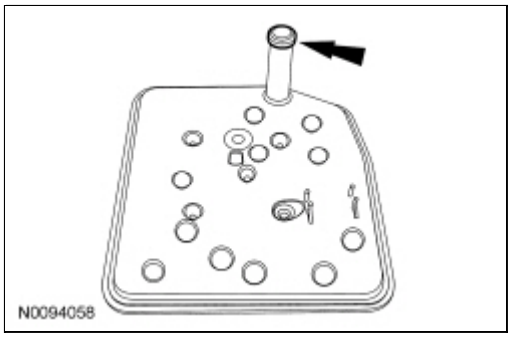
4. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

   Remove and discard the transmission fluid filter.

repair4less



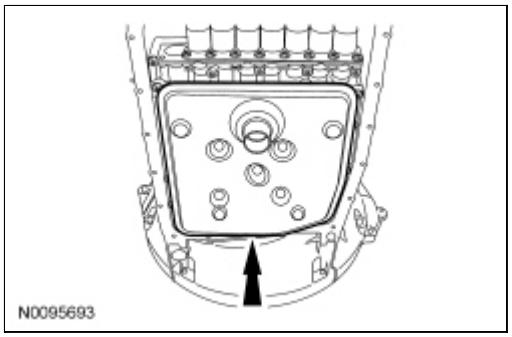
5. Clean and inspect the transmission fluid pan and magnet.



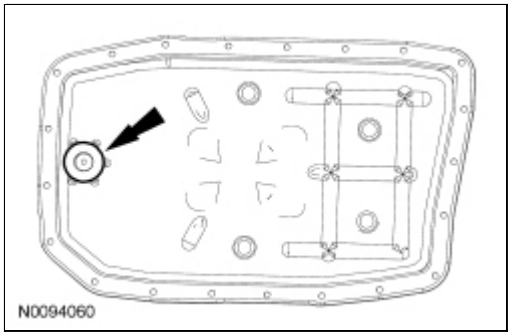
Installation

NOTE: If the transmission is being repaired for a contamination-related failure, install a new transmission fluid filter and seal assembly. The transmission fluid filter may be reused if no excessive contamination is indicated.

1. Inspect the transmission case for the transmission fluid filter seal. If the seal is in the case, carefully remove the seal without scratching the case.

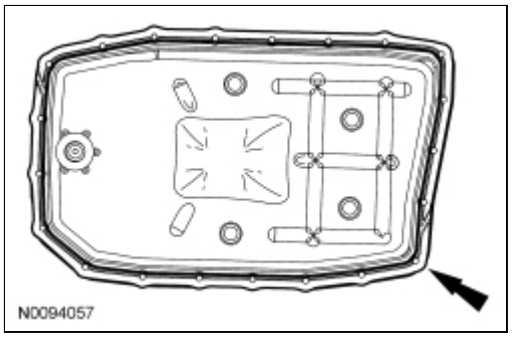


2. Make sure that the seal is on the transmission fluid filter and lubricate the seal with automatic transmission fluid.

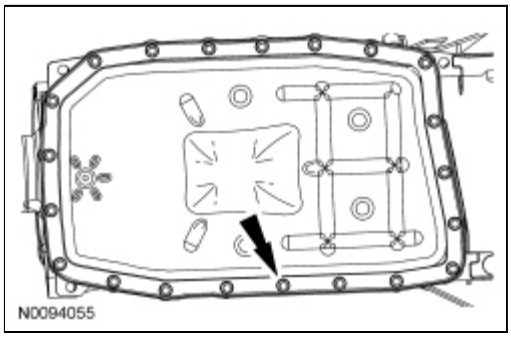


3. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

   If required, install a new transmission fluid filter.



4. Position the magnet in the transmission fluid pan.



5. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

   Install a new transmission fluid pan gasket if required.

repair4less

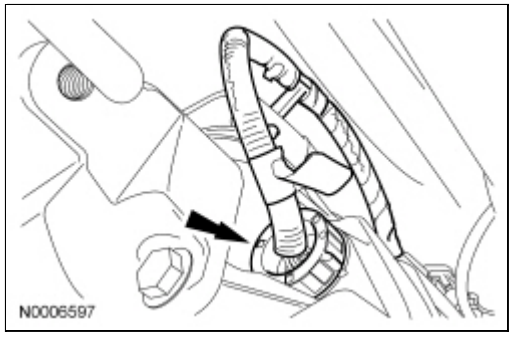
6. Install the transmission fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 9 Nm (80 lb-in).

7. Using the Adding Additional Transmission Fluid procedure, fill and check the transmission fluid. Refer to Transmission Fluid Drain and Refill .

Main Control

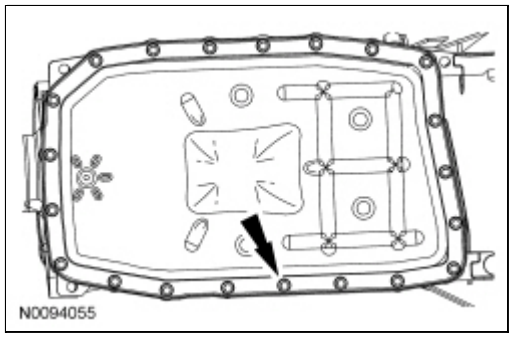
Special Tool(s)

 E173280	Remover, Koastal Sleeve 307-717



Removal

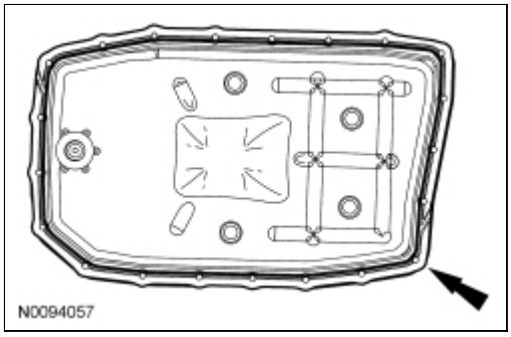
NOTE: The Solenoid Body Strategy Data Download procedure must be performed if a new main control assembly is installed.



1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

2. ***NOTICE:*** **Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

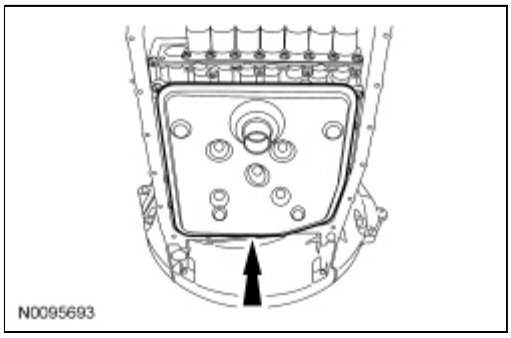
   Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.



N0006597

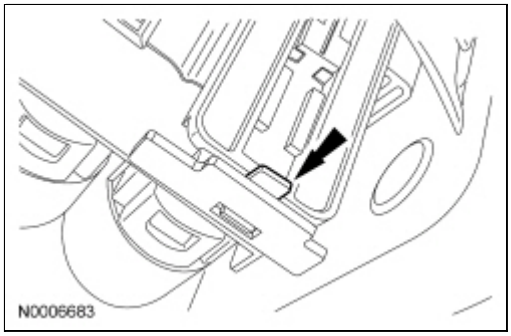
3. Remove the transmission fluid pan and allow the transmission fluid to drain.

N0094055



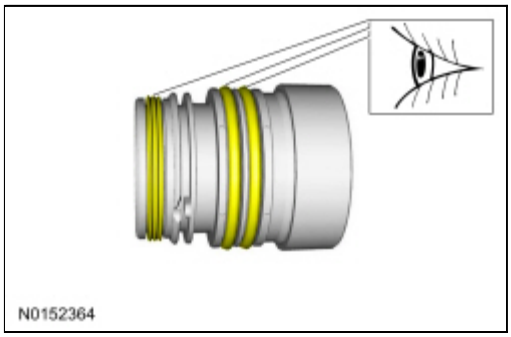
repair4less

4. Remove the transmission fluid pan gasket.



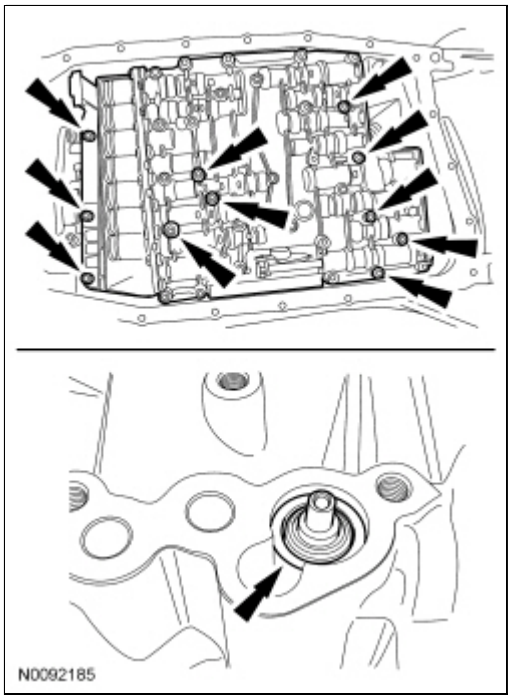
5. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

   Remove and discard the transmission fluid filter.



6. Pull the release tab and pull down on the bulkhead connector sleeve retainer.

7. With the transmission bulkhead connector sleeve retainer released, use the Koastal Sleeve Remover to pull the outer shell of the bulkhead connector sleeve out of the transmission.

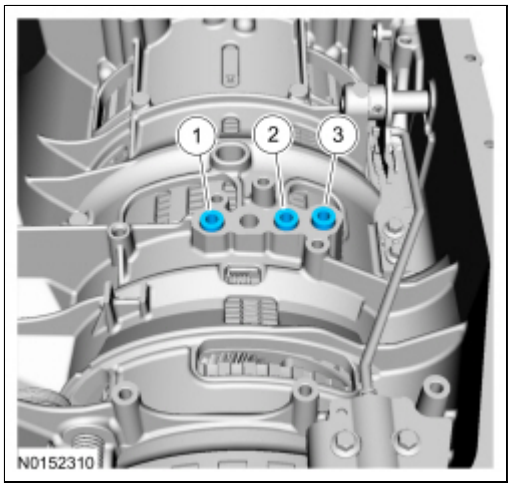


8. Inspect the bulkhead connector sleeve seals.
    - If necessary, replace the seals.

9. ***NOTICE:*** **During removal of the main control assembly, the thermal bypass valve may fall out of the transmission case. Damage to the valve may occur if the valve falls out.**

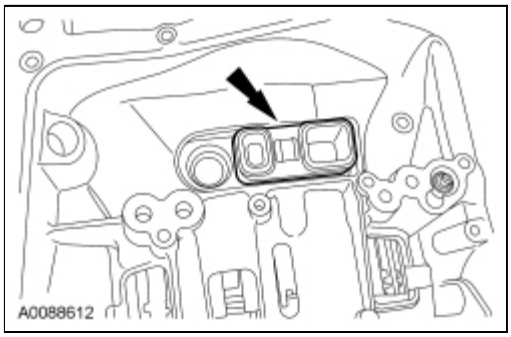
   Remove the 11 bolts from the main control assembly and remove the main control assembly and the bypass valve.

repair4less



Installation

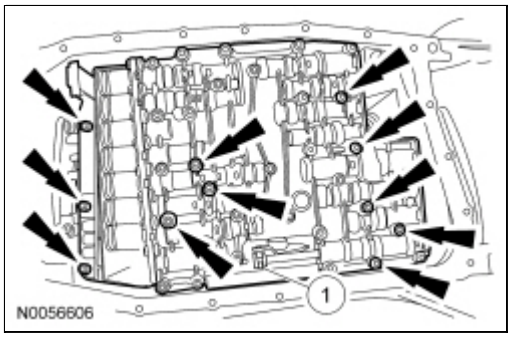
1. Inspect the bias spring to make sure it is positioned correctly in the transmission case.



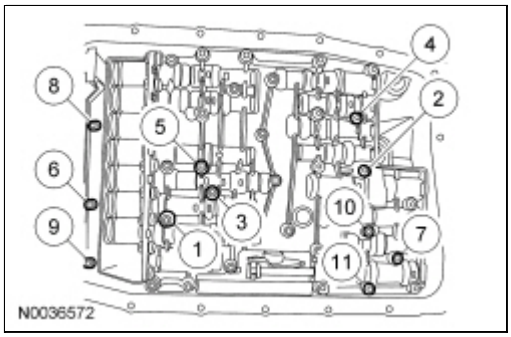
2. **NOTE:** Before installing the main control assembly into the transmission case, verify the presence and orientation of the thermal bypass valve, pump adapter seal and center support feed tube seals. Also note that one or more of the center support feed tube seals may have remained in the main control assembly during removal and should be installed into the transmission case at this time.

   Verify the 3 center support feed tube seals are in place.
   1. Center support feed tube seal (7G199 Black)
   2. Center support feed tube seal (7G087 Green)
   3. Center support feed tube seal (7G084 Blue)

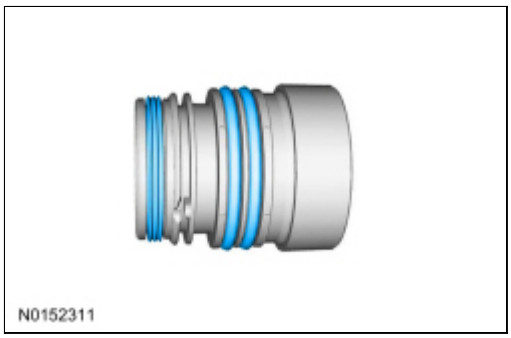
3. Verify the rubber adapter is in place.



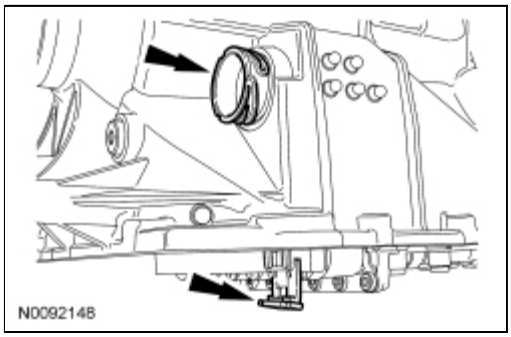
4. Coat the thermal bypass valve with petroleum jelly to hold it in place and install the thermal bypass valve into the transmission case.



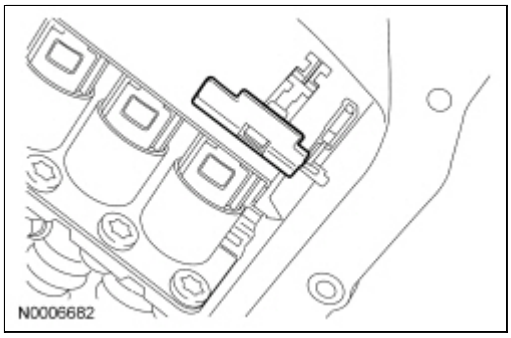
5. Position the main control assembly in place and loosely install the 11 bolts.
    1. Align the manual valve and control lever linkage.



repair4less

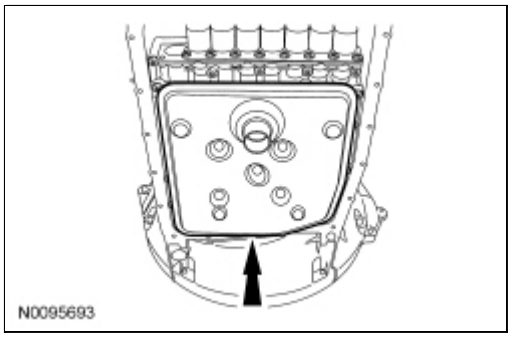


6. Tighten the main control bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in).

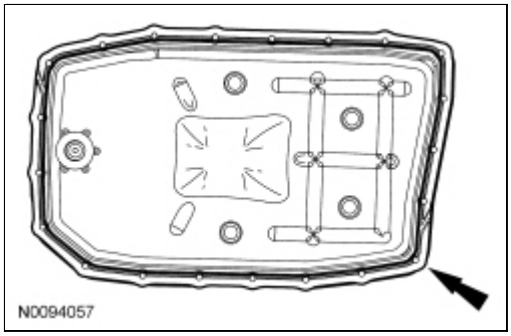


7. If removed, install the bulkhead connector sleeve seals.

8. With the release tab down and unlocked, push the outer shell of the bulkhead connector sleeve into the transmission. Make sure the bulkhead connector sleeve is fully seated into the molded leadframe.

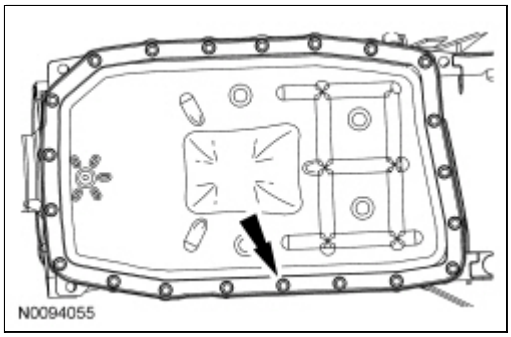


9. Press up on the tab and lock the outer shell of the bulkhead connector sleeve in place. Make sure that the locking tab is securely locked.



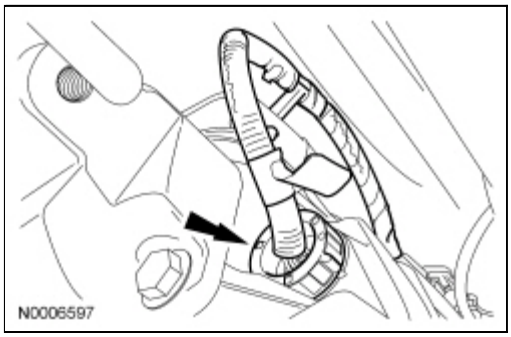
10. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

    If required, install a new transmission fluid filter.



11. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

    Install a new transmission fluid pan gasket, if required.



12. Install the transmission fluid pan and tighten the transmission fluid pan bolts in a crisscross pattern.
    - Tighten to 9 Nm (80 lb-in).

repair4less

13. Connect the transmission vehicle harness connector by pushing it in and twisting the outer shell to lock it in place.

14. Make sure the transmission fluid is at the correct level. Refer to Transmission Fluid Drain and Refill .

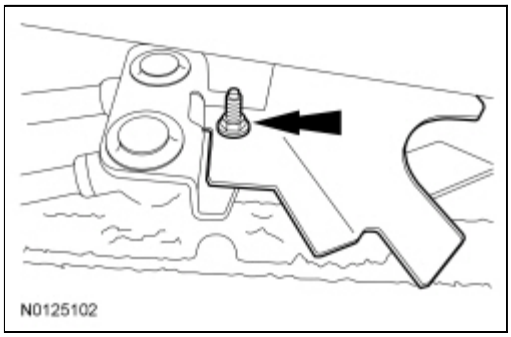
15. **NOTE:** If an individual solenoid was replaced clear the adaptive strategy.

    Perform a Road Test — Adaptive Drive Cycle after the adaptive strategy is cleared. Refer to Shift Point Road Test .

16. **NOTE:** If the main control assembly was replaced, perform the Solenoid Body Strategy Data Download. Refer to Solenoid Body Strategy .

    Perform a Road Test — Adaptive Drive Cycle after the Solenoid Body Strategy Data Download. Refer to Shift Point Road Test .

repair4less



Manual Control Lever Shaft and Seal

Special Tool(s)

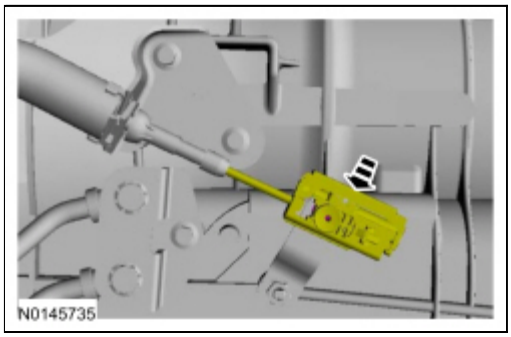
 ST2890-A	Installer, Shifter Fluid Seal 307-559
 E173280	Remover, Koastal Sleeve 307-717

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. If equipped, remove the nut and the selector lever cable splash shield.

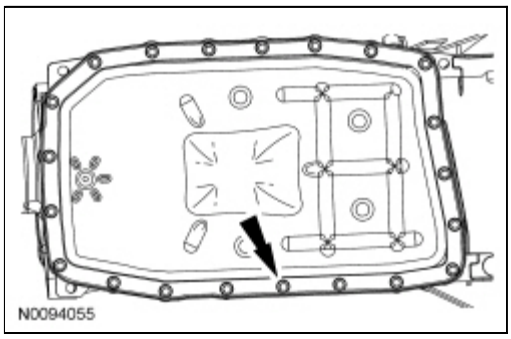
N0125102

3. Clean the cable adjustment lock of any debris.



N0145728

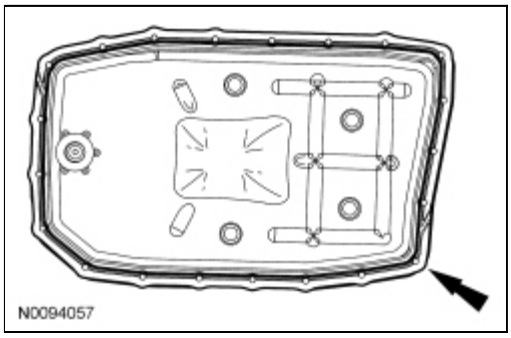
4. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable**



between the manual control lever and the selector lever cable bracket.

NOTE: The column shift is shown, the floor shift is similar.

Disconnect the transmission selector lever cable end from the manual control lever.



5. Remove the transmission fluid pan and allow the transmission fluid to drain.

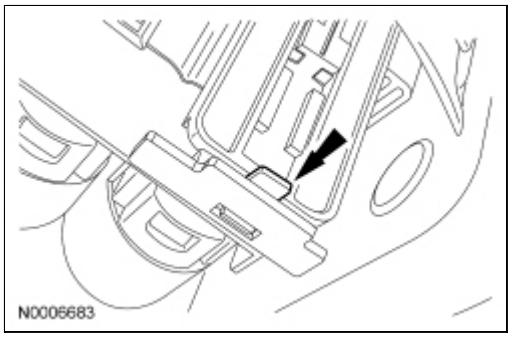
6. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

   Remove the transmission fluid pan gasket.

7. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

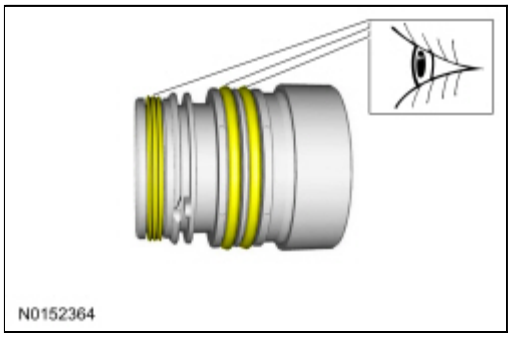
   Remove and discard the transmission fluid filter.

repair4less



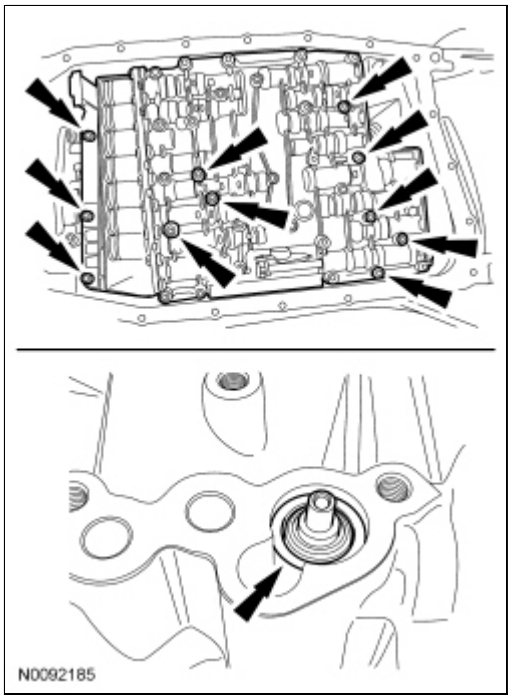
8. ***NOTICE:*** **Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

   Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.

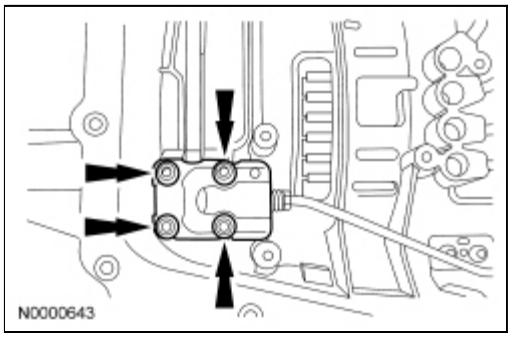


9. Pull the release tab and pull down on the bulkhead connector sleeve retainer.

10. With the transmission bulkhead connector sleeve retainer released, use the Koastal Sleeve Remover to pull the outer shell of the bulkhead connector sleeve out of the transmission.

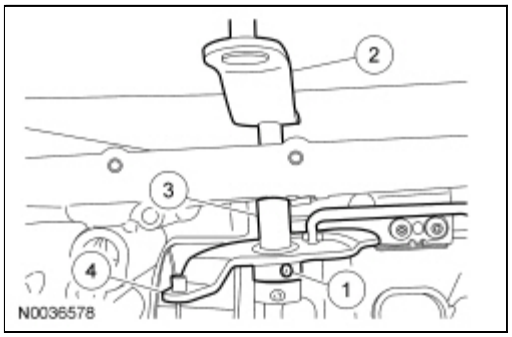


11. Inspect the bulkhead connector sleeve seals.
    - If necessary, replace the seals.

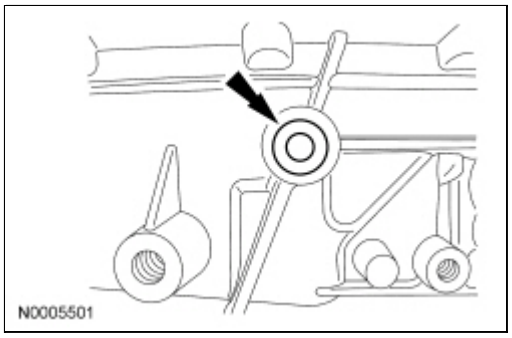


12. ***NOTICE:*** **During removal of the main control, the thermal bypass valve will fall out of the transmission case. Damage to the valve will occur if the valve falls out.**

    Remove the 11 bolts from the main control and remove the main control assembly and the bypass valve.

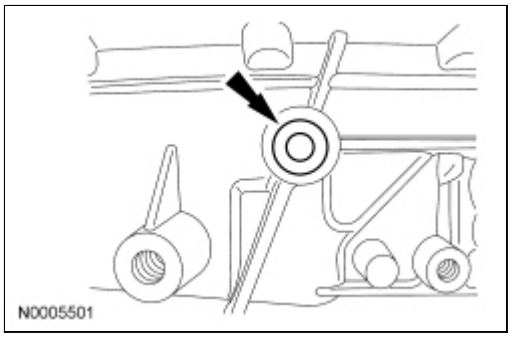


repair4less

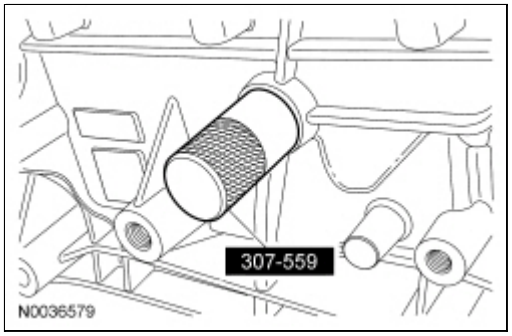


13. Remove the park rod actuating plate.

14. Remove the manual control lever.
    1. Remove the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the spacer to keep it from falling out of the case.
    4. Remove the manual valve inner lever and the park rod as an assembly.

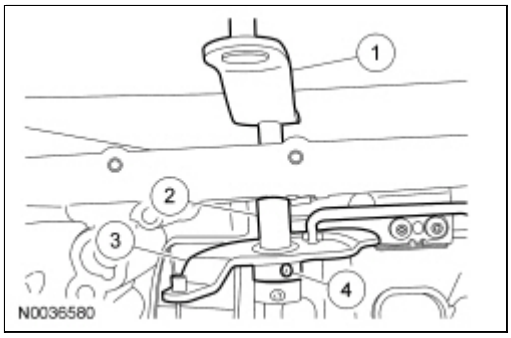


15. Remove and discard the manual control lever seal.

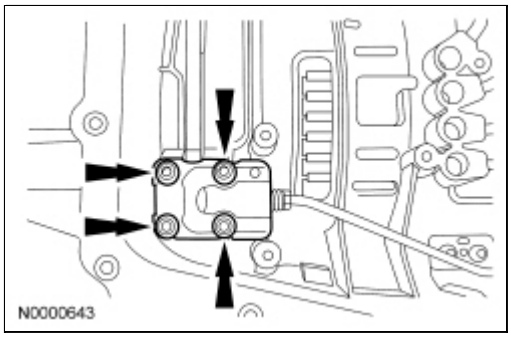


Installation

1. Position a new manual control lever seal in place.

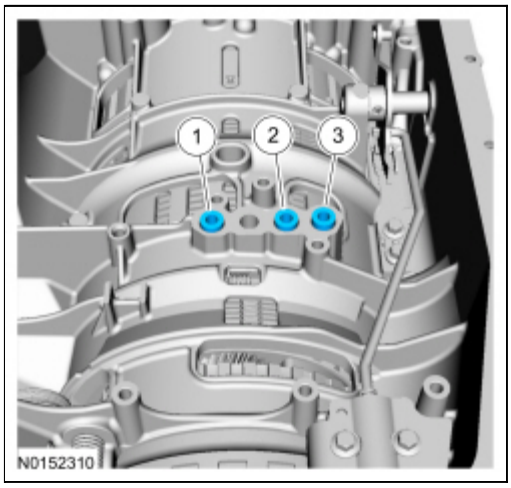


2. Using the Shifter Fluid Seal Installer, install a new manual control lever shaft seal.



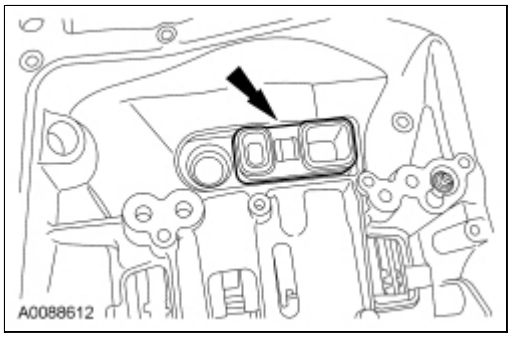
3. Install the manual control lever in the case.
    1. Slide the manual control lever in the case.
    2. Position the spacer in place while sliding the manual control lever into the spacer.
    3. Position the manual valve inner lever while sliding the manual control lever and lining up the roll pin hole.
    4. Install the roll pin.

repair4less



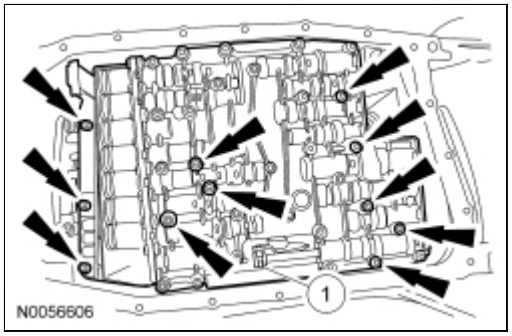
4. Position the park rod in place. Push down on the park pawl and position the park rod in place.

5. While holding the park rod down, install the park rod actuating plate.
   - Tighten to 12 Nm (106 lb-in).

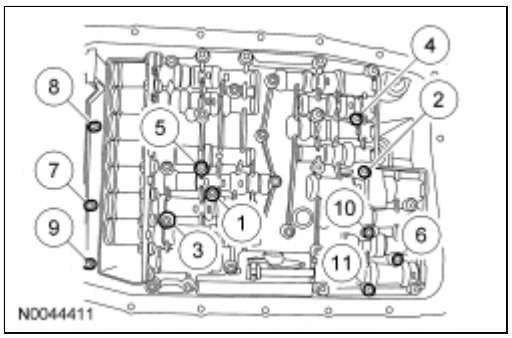


6. **NOTE:** Before installing the main control assembly into the transmission case, verify the presence and orientation of the thermal bypass valve, pump adapter seal and center support feed tube seals. Also note that one or more of the center support feed tube seals may have remained in the main control assembly during removal and should be installed into the transmission case at this time.

   Verify the 3 center support feed tube seals are in place.
   1. Center support feed tube seal (7G199 Black)
   2. Center support feed tube seal (7G087 Green)
   3. Center support feed tube seal (7G084 Blue)

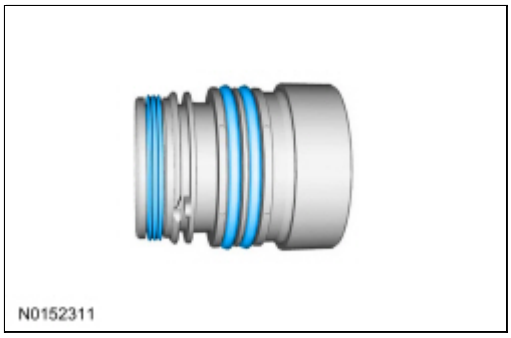


7. Verify the rubber adapter is in place.

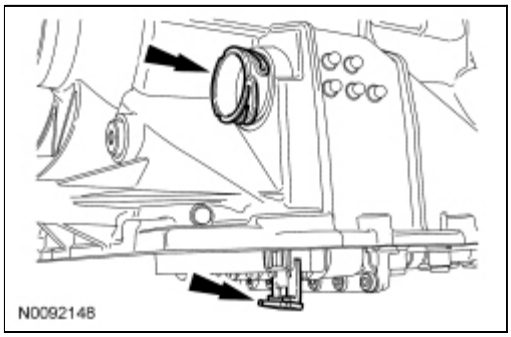


8. Coat the thermal bypass valve with petroleum jelly to hold it in place and install the thermal bypass valve in the transmission case.

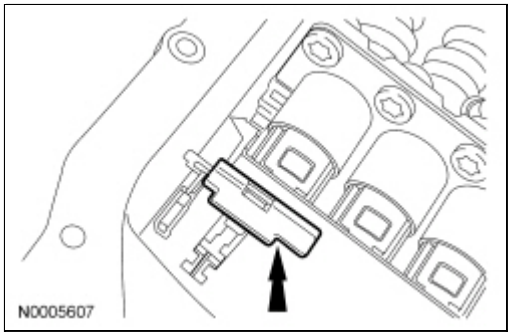
9. Position the main control in place and loosely install the 11 bolts.
    1. Align the manual valve and control lever linkage.



10. Tighten the main control bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in).

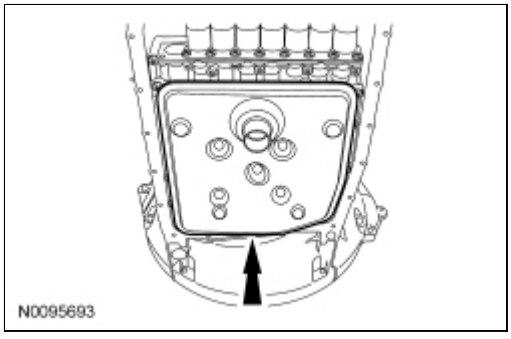


11. If removed, install the bulkhead connector sleeve seals.

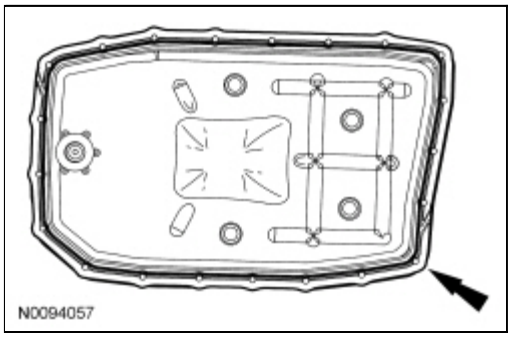


repair4less

12. With the release tab down and unlocked, push the outer shell of the bulkhead connector sleeve into the transmission. Make sure the bulkhead connector sleeve is fully seated into the molded leadframe.

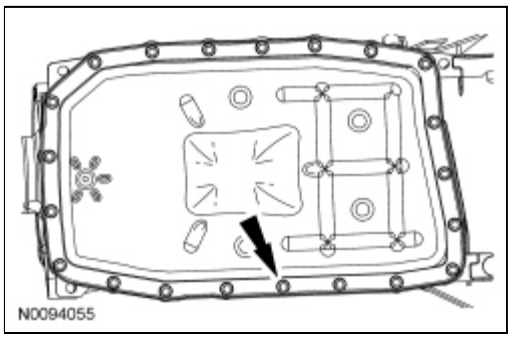


13. Press up on the tab and lock the outer shell of the bulkhead connector sleeve in place. Make sure that the locking tab is securely locked.



14. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

    If required, install a new transmission fluid filter.

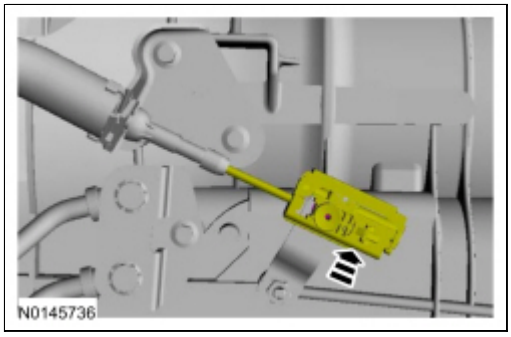


15. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

    If necessary, install a new transmission fluid pan gasket.

16. Install the transmission fluid pan and tighten the transmission fluid pan bolts in a crisscross pattern.
    - Tighten to 9 Nm (80 lb-in).

17. Connect the transmission vehicle harness connector by pushing it in and twisting the outer shell to lock it in place.

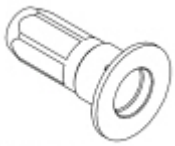


18. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: The column shift is shown, the floor shift is similar.

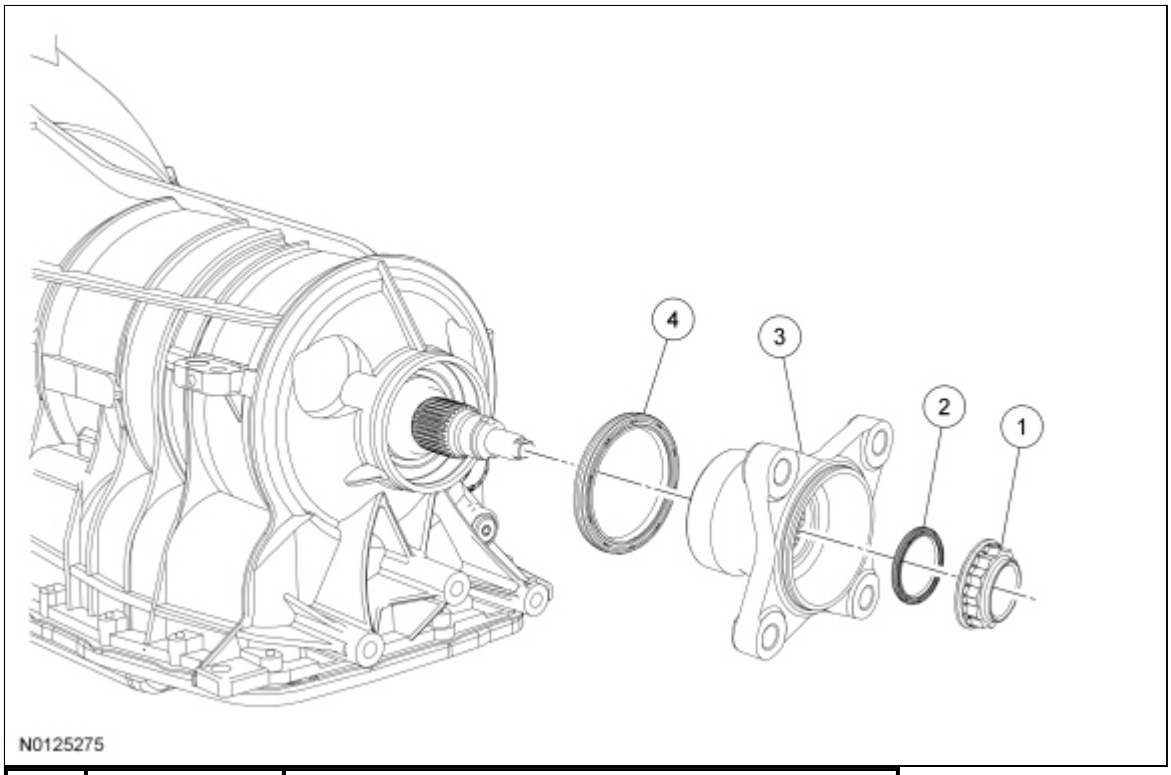
    Install the selector lever cable end on the manual control lever.

repair4less



19. If equipped, install the selector lever cable splash shield and the nut.

20. Fill the transmission with clean transmission fluid. Refer to Transmission Fluid Drain and Refill .



Output Shaft Seal

Special Tool(s)

 E173278	Installer, Output Seal (4X2) 307-715
 ST2216-A	Installer, Spindle/Axle Shaft 205-199 (T83T-3132-A1)
 ST3059-A	Installer, 6R80 Rear Seal 4X4 307-637
 ST3060-A	Installer, 6R80 Rear Seal 4X2 307-638
 ST2381-A	Remover, Input Shaft Oil Seal 308-375
 ST1187-A	Slide Hammer 100-001 (T50T-100-A)

NOTE: Early build RWD shown, late build RWD and 4WD similar.

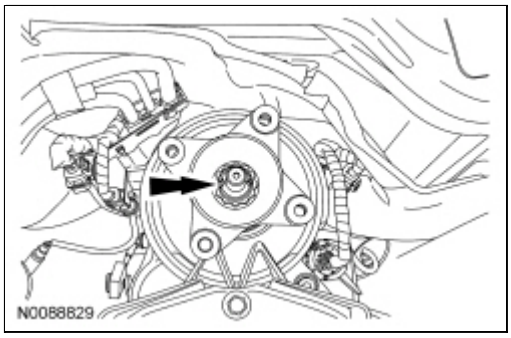
repair4less

Item	Part Number	Description
1	7045	Output shaft flange retaining nut RWD
2	7052	Output shaft flange seal RWD
3	—	Output shaft flange (model dependent) RWD
4	7052	Output shaft seal (model dependent)

Removal

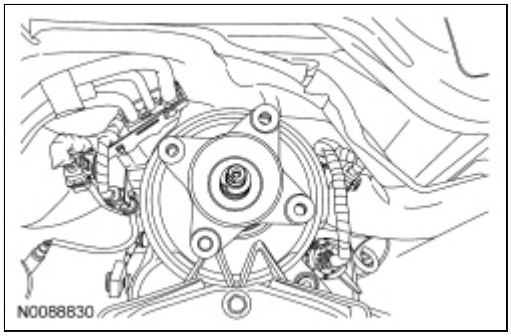
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .



All Rear Wheel Drive (RWD) vehicles

2. Remove the rear driveshaft. Refer to Section 205-01 .

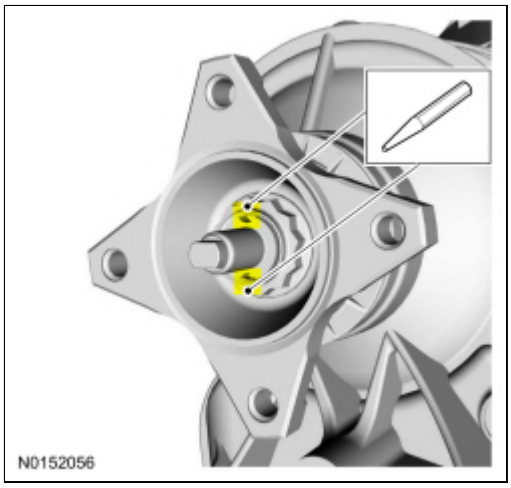


Early Build Rear Wheel Drive (RWD) vehicles

3. **NOTE:** The output shaft flange reatining nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.

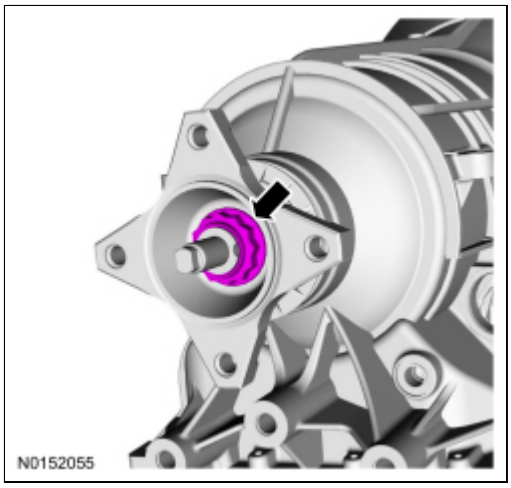
   Remove and discard the output shaft flange retaining nut.

4. Remove the output shaft flange seal and the output shaft flange.



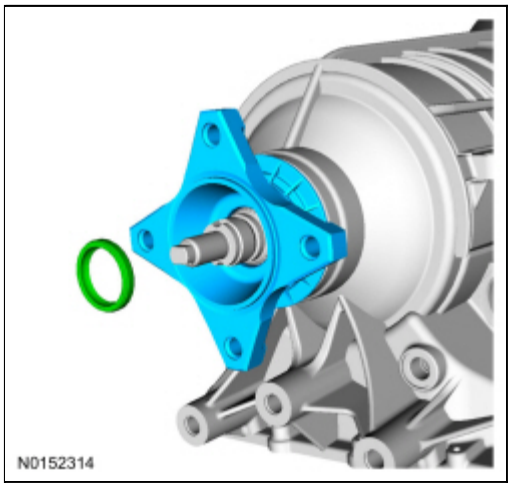
5. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the output shaft seal.

Late Build Rear Wheel Drive (RWD) vehicles



6. Remove the stakes from the output shaft flange retaining nut.

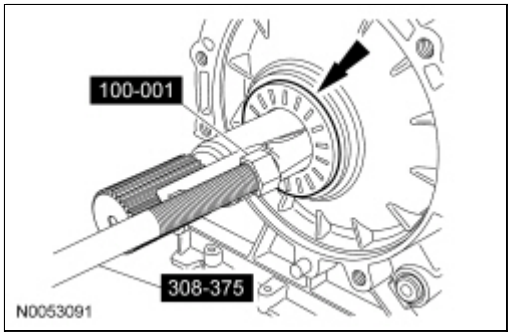
repair4less



7. ***NOTICE:*** **The output shaft flange retaining nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.**

   Remove and discard the output shaft flange retaining nut.

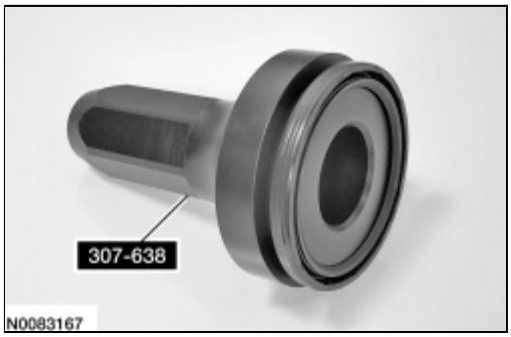
8. Remove the output shaft flange seal and the output shaft flange.



9. Remove and discard the output shaft seal.

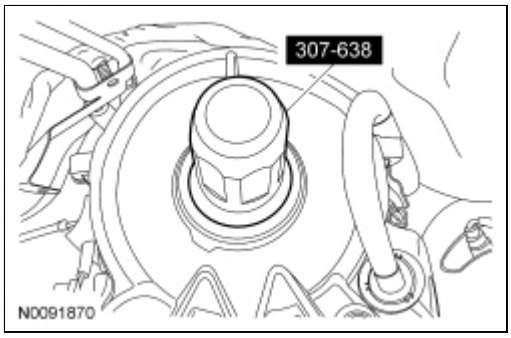
Four-Wheel Drive (4WD) vehicles

10. Remove the transfer case. Refer to Section 308-07B .



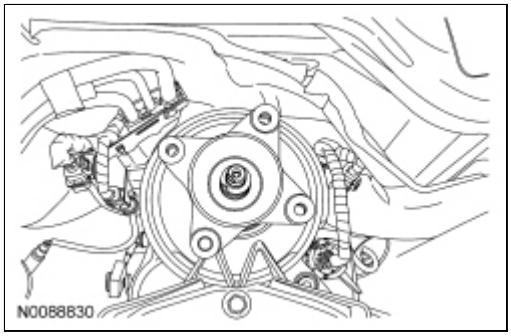
11. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the output shaft seal.

Installation

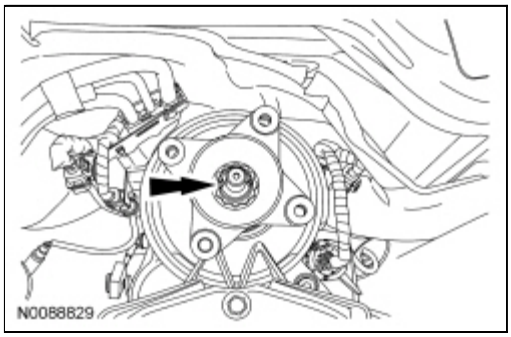


Early Build Rear Wheel Drive (RWD) vehicles

1. Position a new output shaft seal on the 6R80 Rear Seal 4X2 Installer.

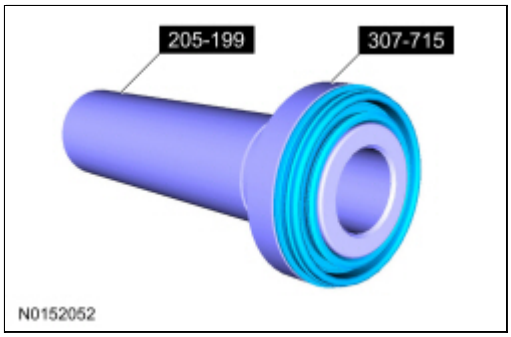


2. Using the 6R80 Rear Seal 4X2 Installer, install the output shaft seal.

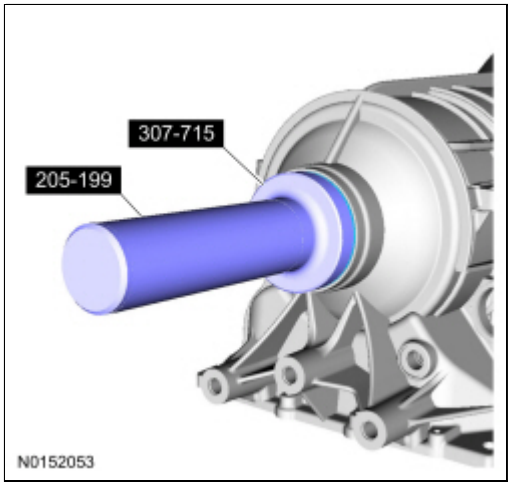


repair4less

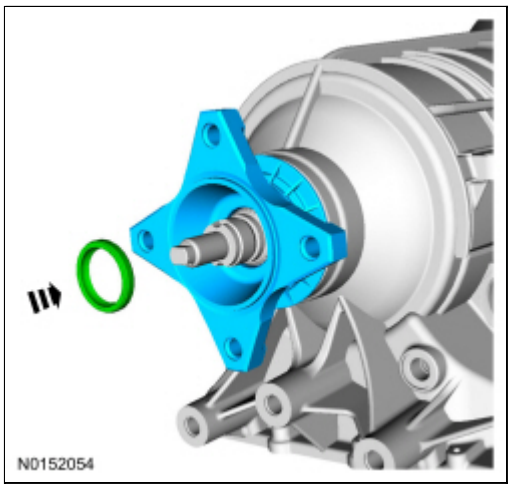
3. Install the output shaft flange.



4. Install the output shaft flange seal and a new output shaft flange nut.
    - Tighten to 80 Nm (59 lb-ft).
    - After installing the new output shaft flange nut, it must be staked at the slots to prevent it from coming loose.

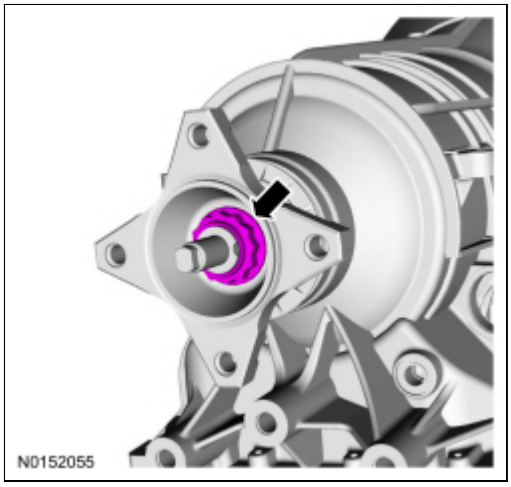


Late Build Rear Wheel Drive (RWD) vehicles

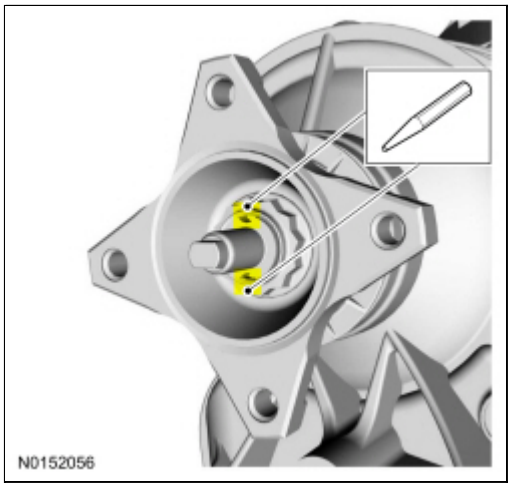


5. Position a new output shaft seal on the Output Seal (4X2) Installer and Spindle/Axle Shaft Installer.

6. Using the Output Seal (4X2) Installer and Spindle/Axle Shaft Installer, install the output shaft seal.



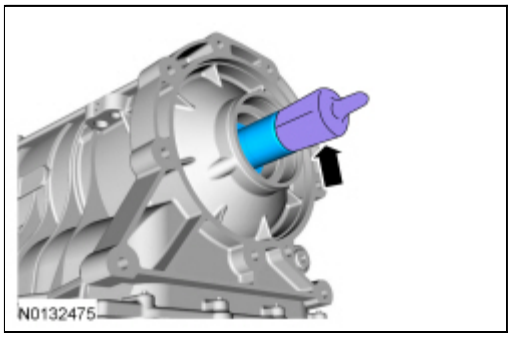
7. Install the output shaft flange and the output shaft flange seal.



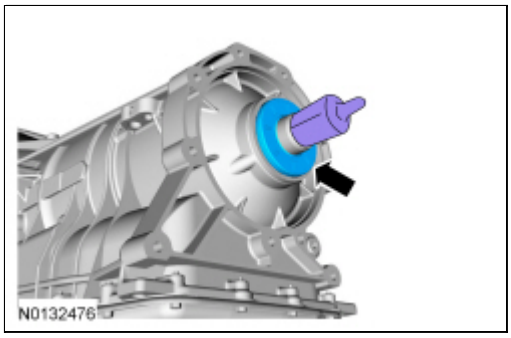
8. Install the new output shaft flange retaining nut.
    - Tighten to 80 Nm (59 lb-ft).

repair4less

9. After installing the output shaft flange retaining nut, stake the slots to prevent it from coming loose.

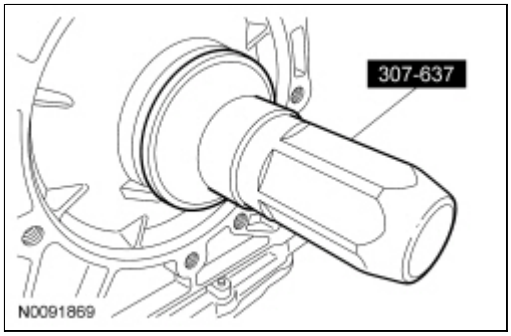


All Rear Wheel Drive (RWD) vehicles



10. Install the rear driveshaft. Refer to Section 205-01 .

Four-Wheel Drive (4WD) vehicles



11. Install the seal protector provided with the new output shaft seal on the output shaft.

12. Slide the output shaft seal over the output shaft seal protector onto the output shaft. Remove the output shaft seal protector.

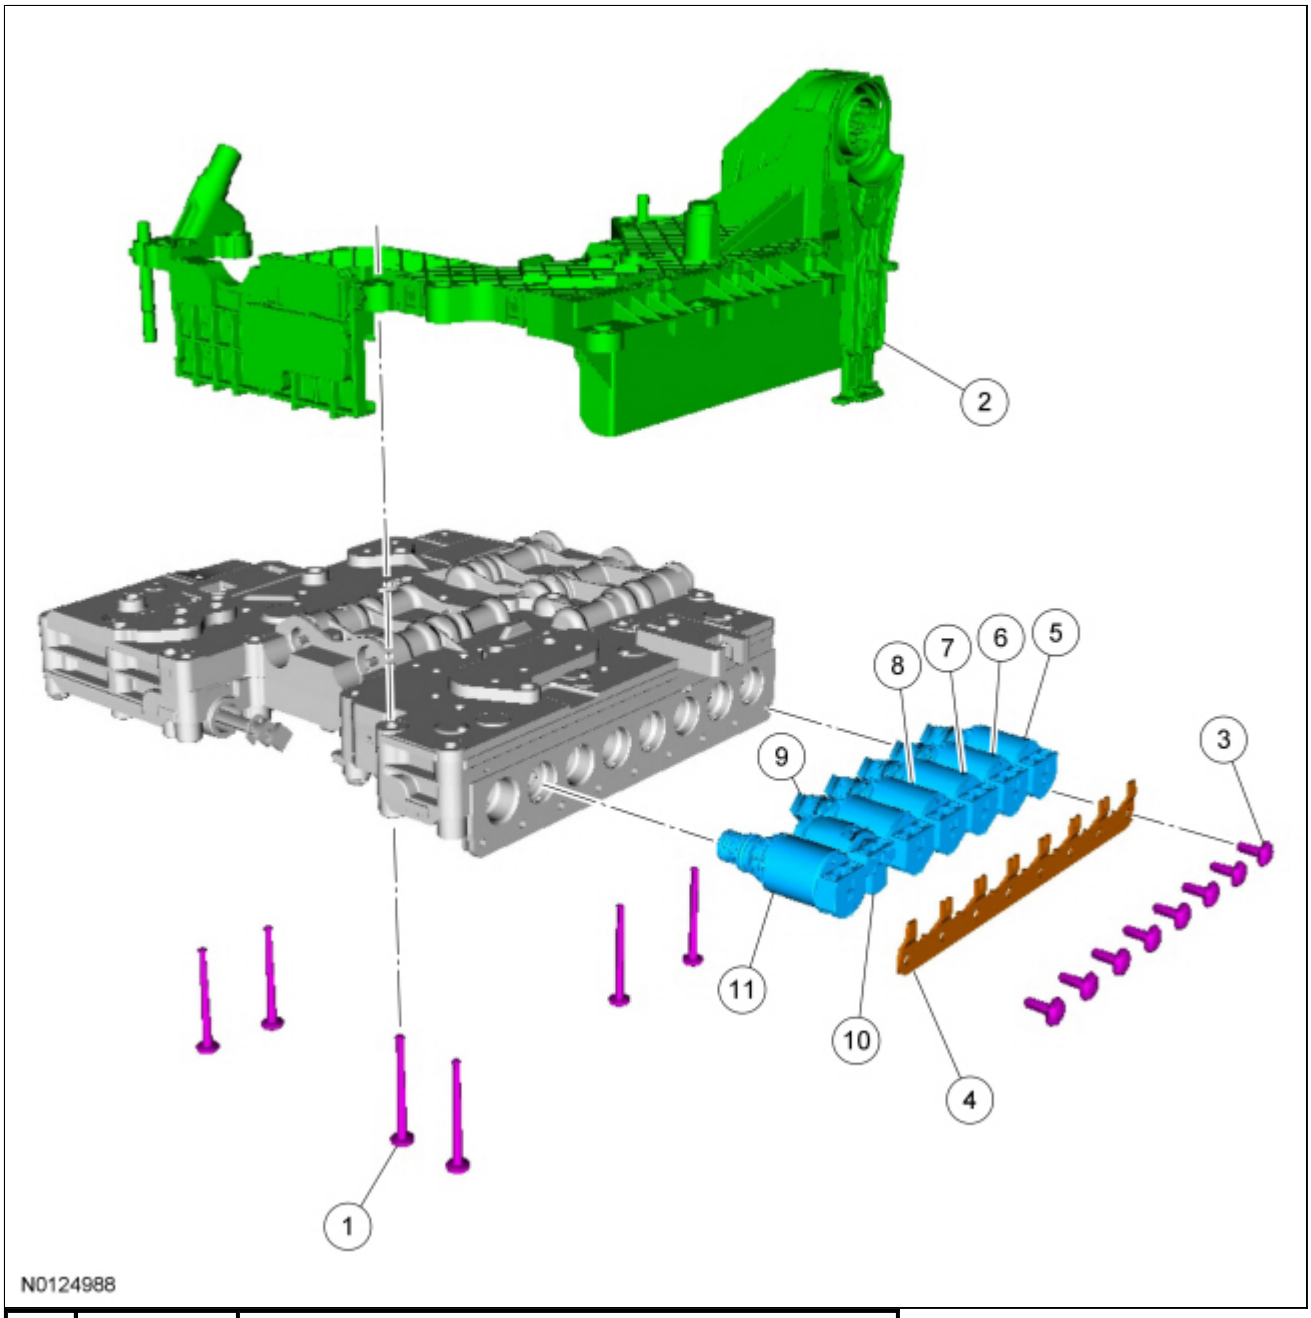
13. Using the 6R80 Rear Seal 4X4 Installer, install a new output shaft seal.

14. Install the transfer case. Refer to Section 308-07B .

All vehicles

15. Fill and check the transmission fluid. Refer to Transmission Fluid Level Check .

repair4less



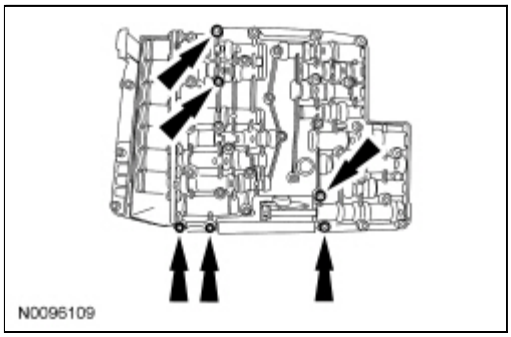
Shift Solenoids (SS)

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.

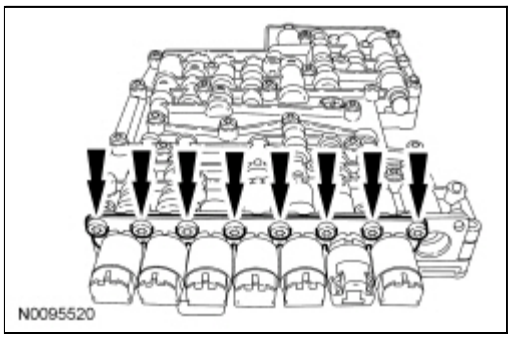


Item	Part Number	Description
1	W707884	Main control-to-molded leadframe bolts
2	7G267	Molded leadframe
3	W707885	Solenoid hold-down bracket bolt (8 required)
4	7Z369	Solenoid hold-down bracket
5	7G383	SSA , Forward (1,2,3,4) clutch, normally low VFS (brown nozzle).
6	7G383	SSB , Direct (3,5,R) clutch, normally high VFS (black nozzle).
7	7G383	SSC , Intermediate (2,6) clutch, normally low VFS

repair4less

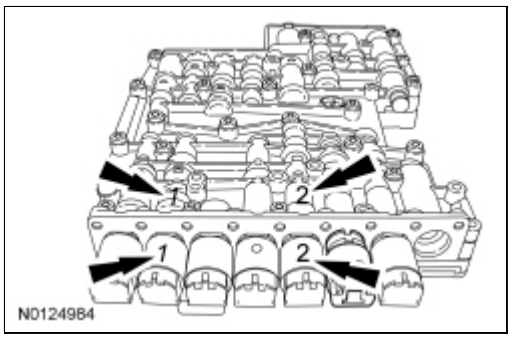
		(brown nozzle).
8	7G383	LPC solenoid, normally high VFS (black nozzle).
9	7G383	SSD , low/reverse/overdrive clutch, normally high VFS (black nozzle).
10	7G484	SSE , normally off ON/OFF solenoid.
11	7G383	TCC solenoid, normally low VFS (brown nozzle).

Removal



1. Remove the main control. Refer to Main Control .
2. Remove the 6 long bolts from the molded leadframe.

3. Carefully separate the molded leadframe from the main control assembly.
   1. Molded leadframe.
   2. Main control.

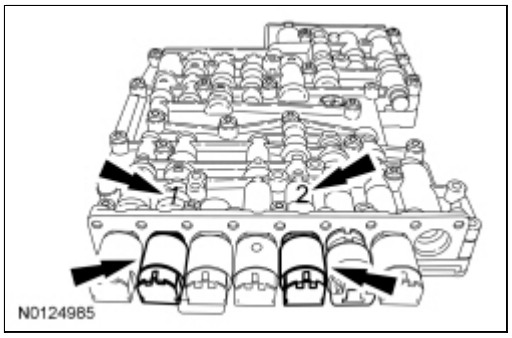


4. Remove the 8 solenoid bracket bolts and the solenoid bracket.

5. ***NOTICE:*** **A VFS is calibrated from the factory and are not all the same. To replace a VFS , match the replacement solenoid nozzle color and the band number with the original solenoid or harsh/erratic shifts, harsh/soft engagement or damage to the transmission can occur.**

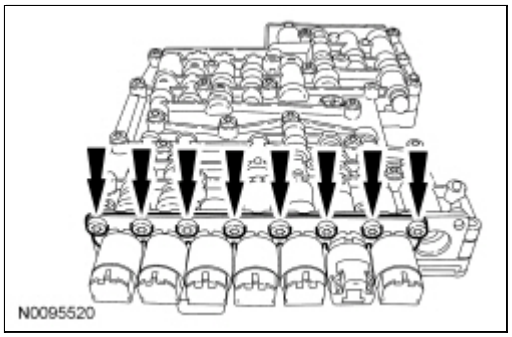
   If replacing more then 1 solenoid, number the solenoids and number the main control solenoid ports to correspond to the solenoid. Pull the solenoid(s) out of the main control valve body.

Installation



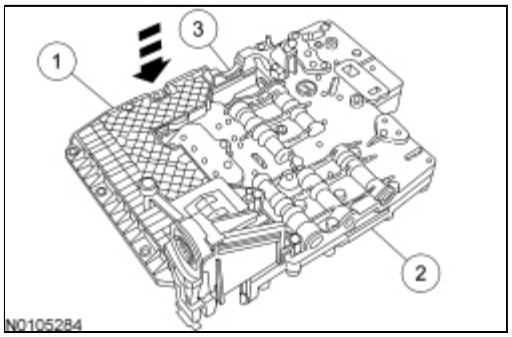
1. ***NOTICE:*** **A VFS is calibrated from the factory and are not all the same. To replace a VFS , match the replacement solenoid nozzle color and the band number with the original solenoid or harsh/erratic shifts, harsh/soft engagement or damage to the transmission can occur.**

   Use the solenoid exploded view at the beginning of this procedure to identify what type of solenoid is being replaced. The solenoid can be a normally high VFS with a black nozzle, normally low VFS with a brown nozzle or an ON/OFF solenoid.
   If replacing a VFS , record the band number and the solenoid nozzle color to get the correct part number for the solenoid.
   Lubricate the solenoid O-rings with clean transmission fluid.
   1. Solenoid Nozzle
   2. Solenoid band number

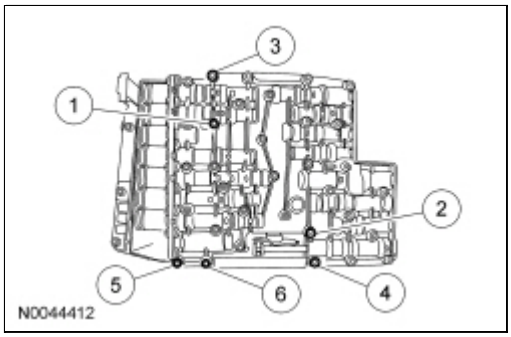


2. Position the solenoid(s) in the main control in the correct port(s) as marked during removal.

repair4less



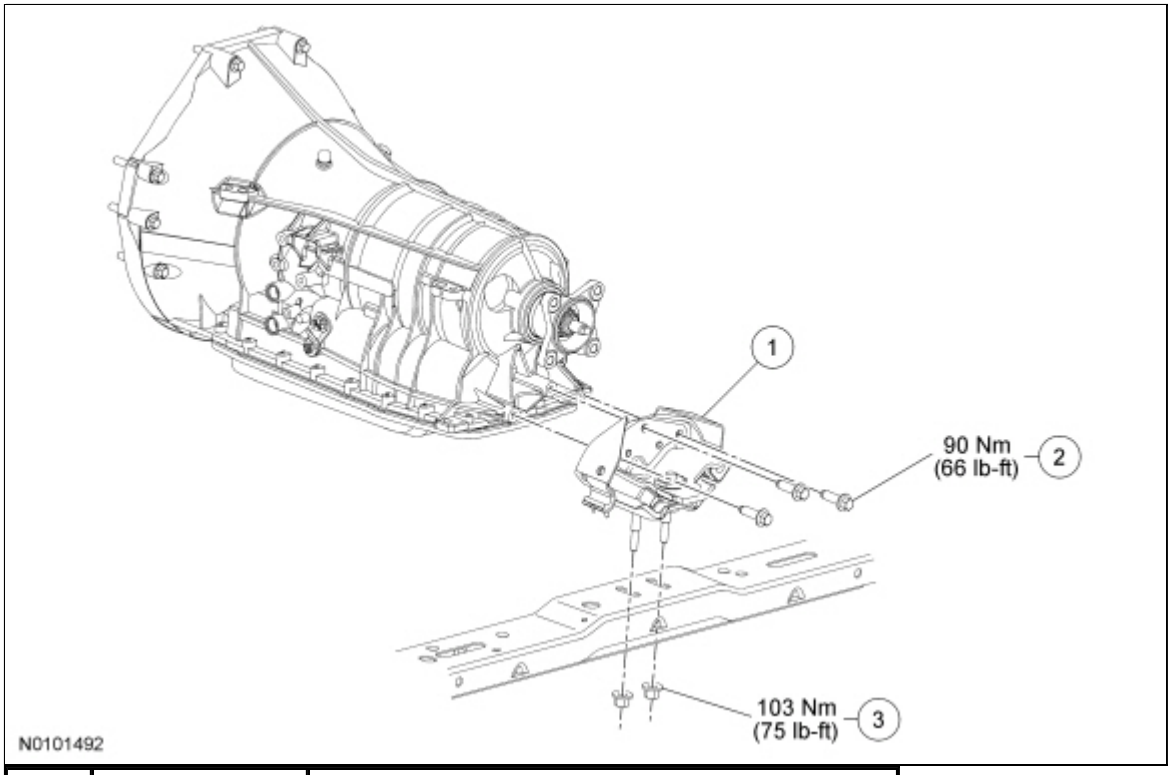
3. Position the solenoid bracket in place and install the 8 bolts.
    - Tighten to 6 Nm (53 lb-in).



4. **NOTE:** The TR sensor pin must be aligned with the manual control valve during installation.

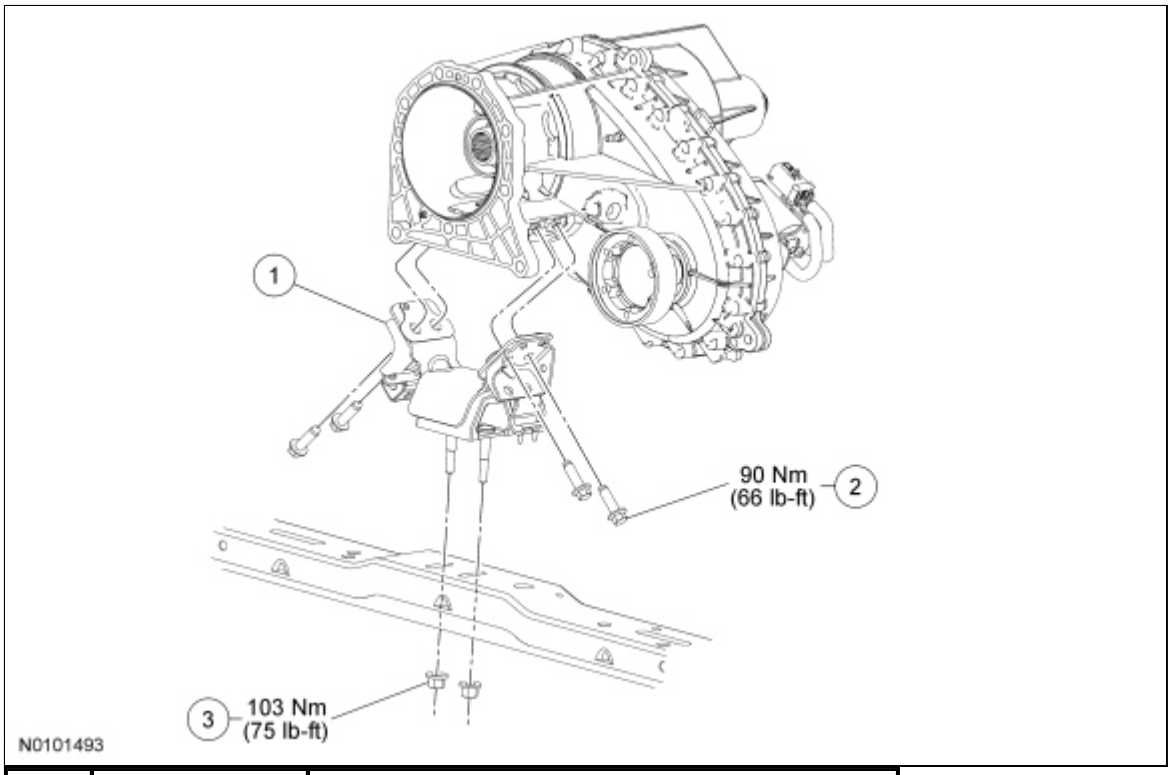
    Position the molded leadframe on the main control.
    1. Molded leadframe.
    2. Main control.
    3. TR sensor pin.

5. Install the 6 long bolts into the molded leadframe. Tighten the bolts in the sequence shown.
    - Tighten to 6 Nm (53 lb-in).



6. Install the main control. Refer to Main Control .

repair4less

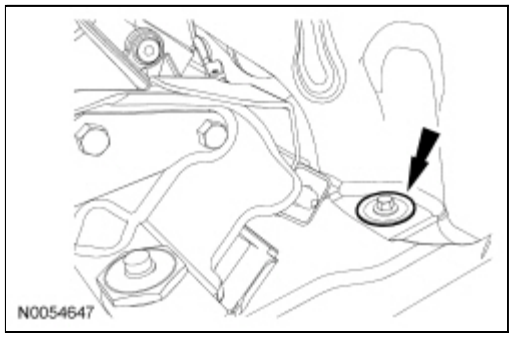


Transmission Insulator and Retainer

Transmission Insulator and Retainer Rear Wheel Drive (RWD)

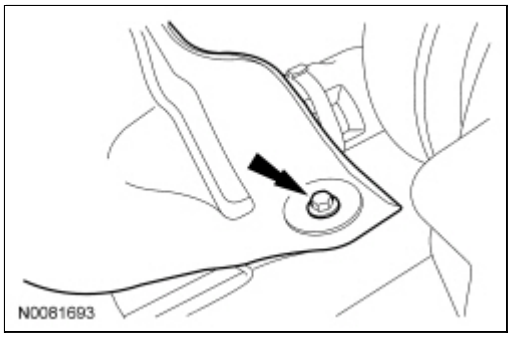
Item	Part Number	Description
1	6068	Transmission insulator and retainer
2	W713728	Transmission insulator and retainer bolt
3	N621945	Transmission insulator and retainer nut

Transmission Insulator and Retainer 4WD



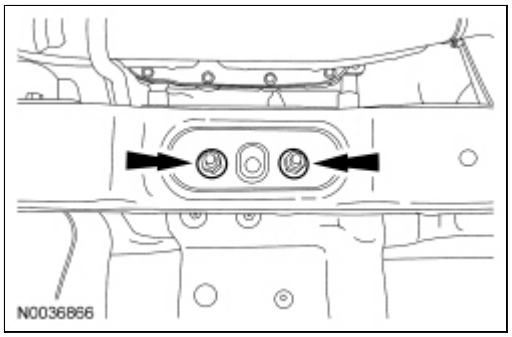
Item	Part Number	Description
1	6068	Transmission insulator and retainer
2	W713728	Transmission insulator and retainer bolt
3	N621945	Transmission insulator and retainer nut

Removal



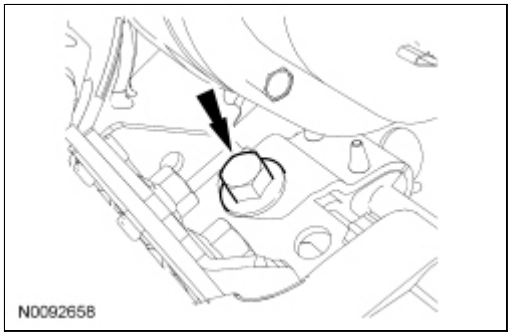
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. Remove the RH exhaust heat shield bolt from the transmission support crossmember.



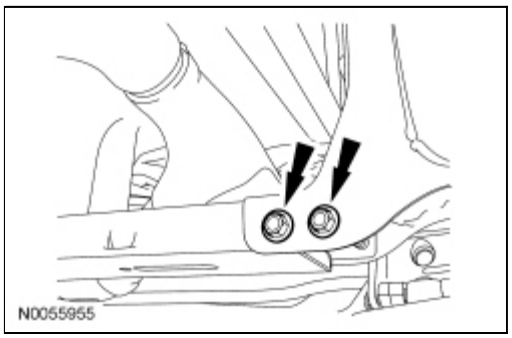
3. Remove the LH exhaust heat shield bolt from the transmission support crossmember.

repair4less

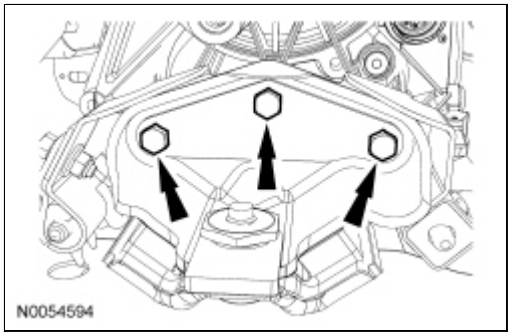


RWD vehicles

4. Remove the 2 transmission insulator and retainer nuts.

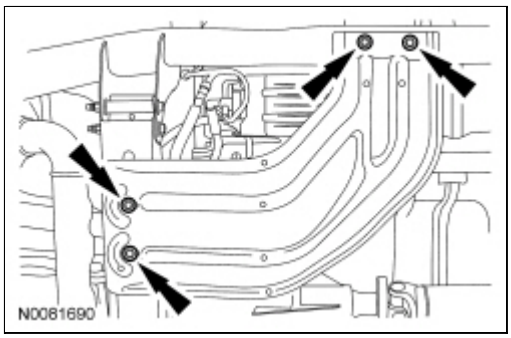


5. Remove the LH isolator cap bolt.

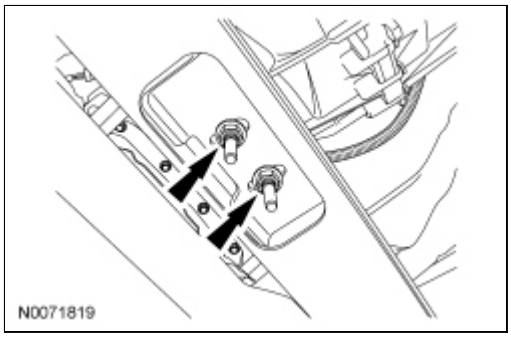


6. Position a high-lift transmission jack under the transmission.

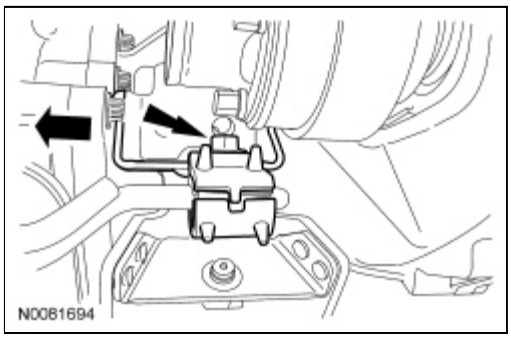
7. Remove and discard the 4 transmission support crossmember nuts and bolts (2 each side) and remove the transmission support crossmember.



8. Remove the 3 transmission insulator and retainer bolts and remove the transmission insulator and retainer.

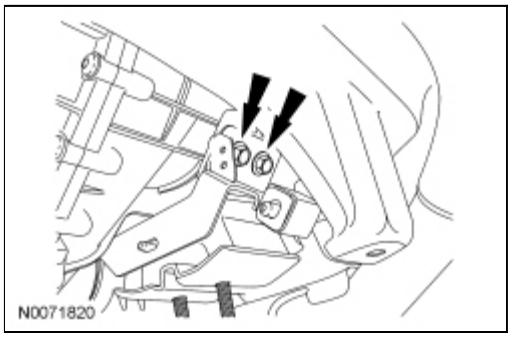


4WD vehicles

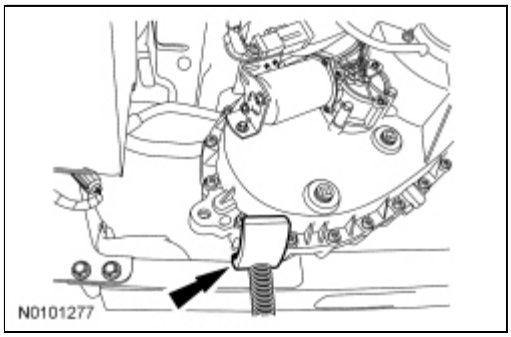


9. If equipped, remove the 4 skid plate bolts and remove the skid plate.

10. Remove the 2 transmission insulator and retainer nuts.



11. Remove the LH insolator cap bolt.



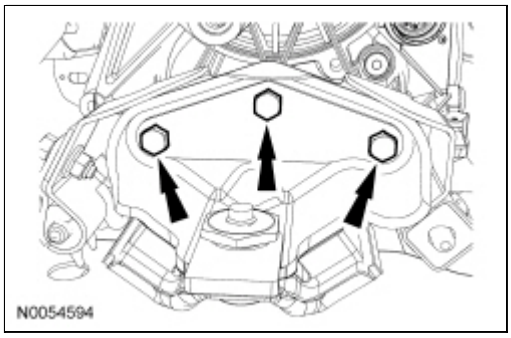
repair4less

12. **NOTE:** Right side shown, left side similar. Transmission crossmember removed for clarity.

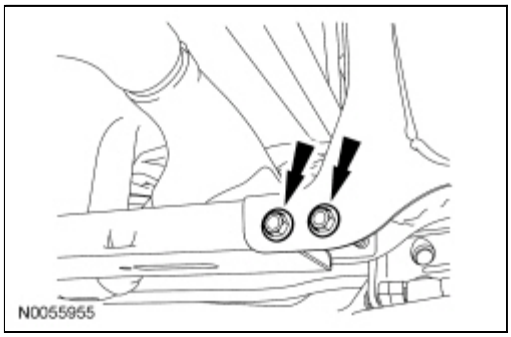
    Remove the 4 transmission insulator and retainer bolts.

13. Support the transfer case.

14. Remove and discard the 4 transmission support crossmember nuts and bolts.

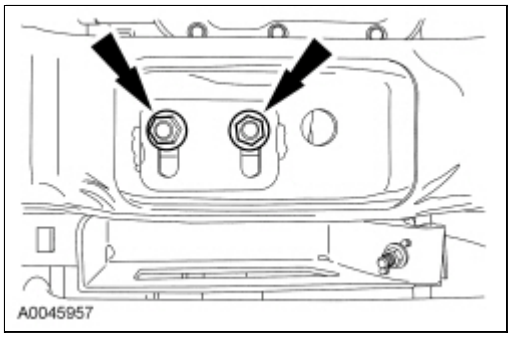


15. Remove the transmission insulator and retainer.



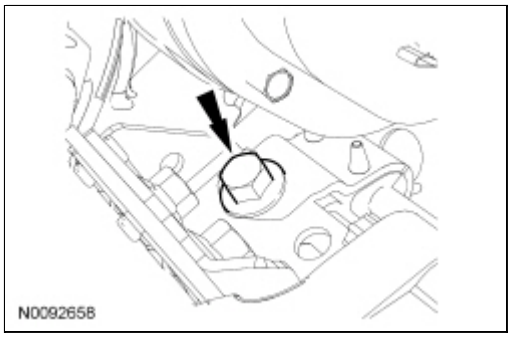
Installation

RWD vehicles

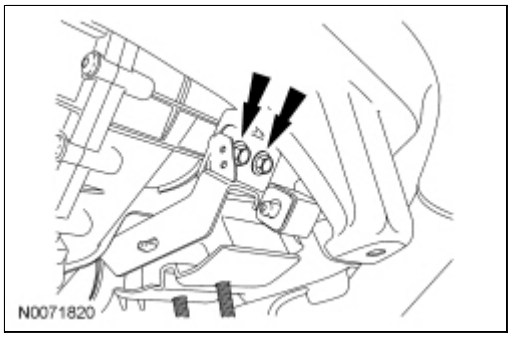


1. Install the transmission insulator and retainer and the 3 bolts.
    - Tighten to 90 Nm (66 lb-ft).

2. Install the transmission support crossmember and the 4 new transmission support crossmember nuts and bolts (2 each side).
    - Tighten to 90 Nm (66 lb-ft).

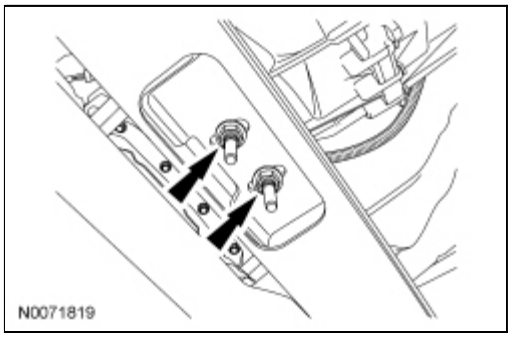


3. Lower the transmission onto the transmission support crossmember and install the 2 transmission insulator and retainer nuts.
    - Tighten to 103 Nm (75 lb-ft).

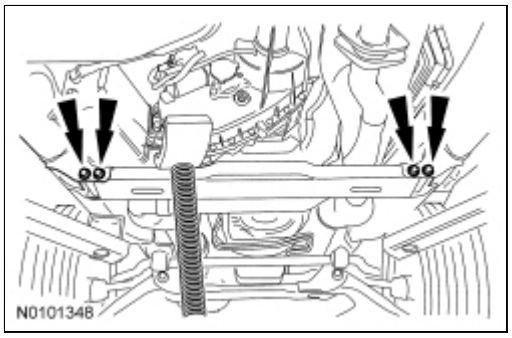


4. Install the LH isolator cap bolt.
    - Tighten to 35 Nm (26 lb-ft).

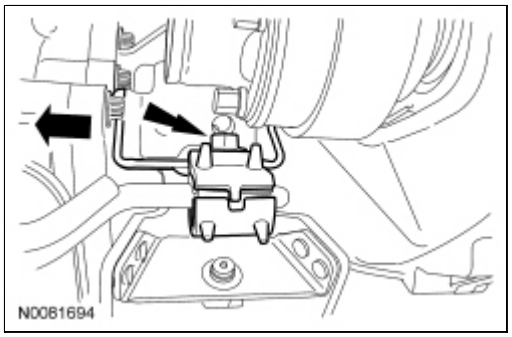
repair4less



4WD vehicles

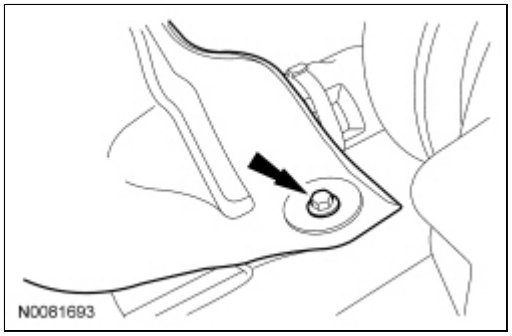


5. Loosely install the transmission insulator and retainer and the 4 bolts.

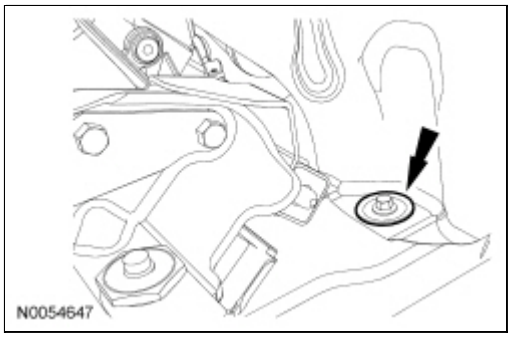


6. Position the transmission support crossmember and loosely install the 2 transmission insulator and retainer nuts.

7. Install the 4 new transmission support crossmember bolts and nuts.
    - Tighten the transmission insulator and retainer bolts to 90 Nm (66 lb-ft).
    - Tighten the transmission support crossmember bolts and nuts to 90 Nm (66 lb-ft).
    - Tighten the transmission insulator and retainer nuts to 103 Nm (75 lb-ft).

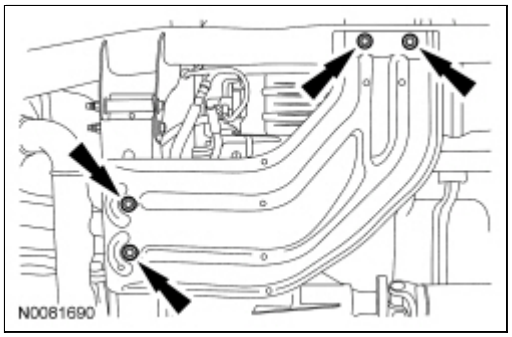


8. Install the bolt for the LH isolator cap bolt.
    - Tighten to 35 Nm (26 lb-ft).



All vehicles

9. Install the LH exhaust heat shield bolt to the transmission support crossmember.
    - Tighten to 15 Nm (133 lb-in).



10. Install the RH exhaust heat shield bolt to the transmission support crossmember.
    - Tighten to 15 Nm (133 lb-in).

repair4less

4WD vehicles

11. If equipped, install the skid plate and the 4 skid plate bolts.
    - Tighten to 40 Nm (30 lb-ft).

Transmission — Four Wheel Drive (4WD)

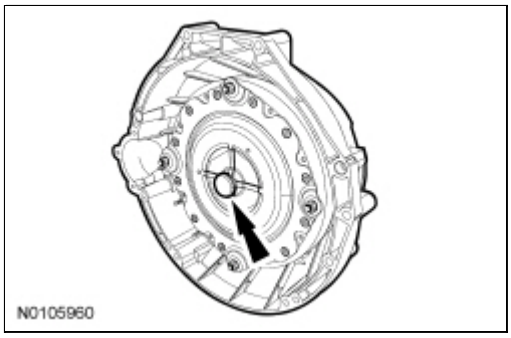
Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

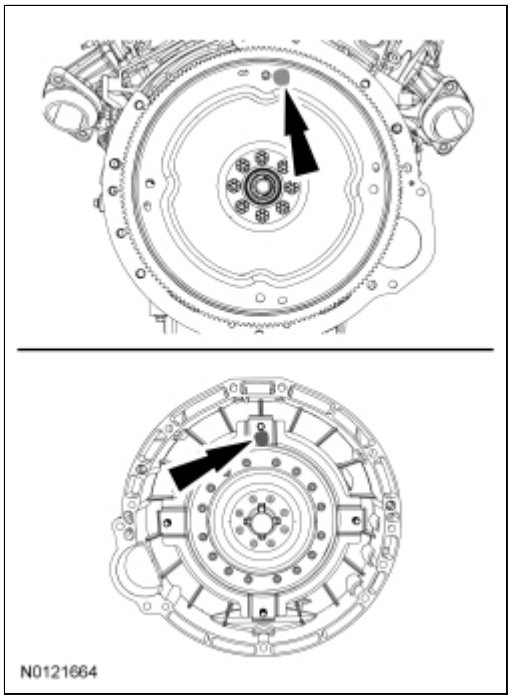
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV
Motorcraft® Multi-Purpose Grease XL-5	ESB-M1C93-B

Installation



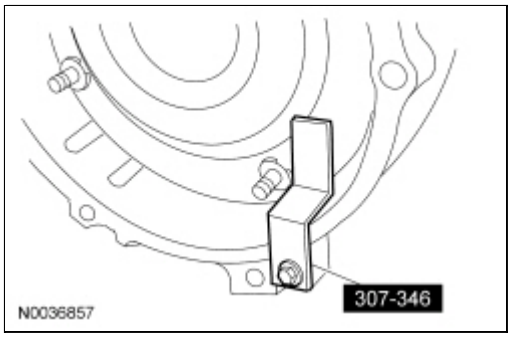
All vehicles

NOTE: Prior to installing a new transmission or an overhauled transmission with a new main control, record the solenoid strategy identification tag. If a new main control was installed, install the replacement solenoid body tag over the original identification tag. REFER to Solenoid Body Strategy .



1. ***NOTICE:*** **Prior to installation of the transmission, lubricate the torque converter pilot hub with multi-purpose grease or damage to the torque converter or engine crankshaft can occur.**

   Lubricate the torque converter pilot hub with multi-purpose grease.



repair4less

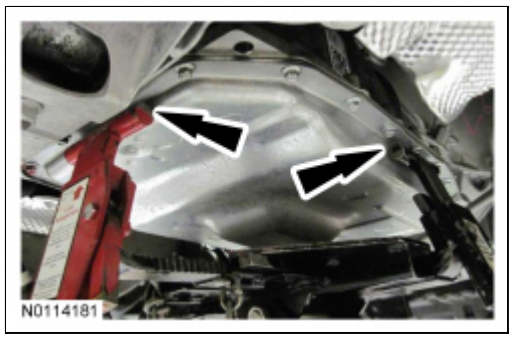
2. If equipped, align the torque converter stud and flexplate hole near the paint marks at the 12 o'clock position.

3. Install the Torque Converter Retainer.

4. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

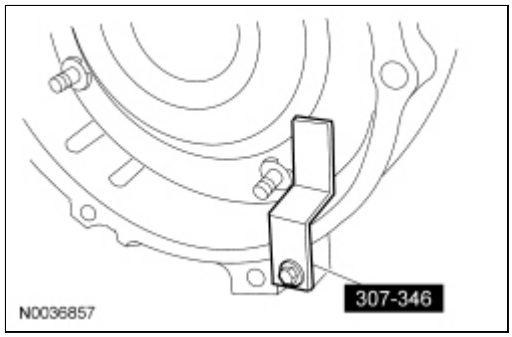
NOTICE: **The torque converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates the torque converter pilot is not binding in the engine crankshaft.**

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.



NOTE: If transmission was disassembled, follow the add transmission fluid to the transmission steps. If transmission is being replaced, remove the transmission fluid fill plug and verify transmission is filled with transmission fluid.

Add transmission fluid to the transmission.



- Slightly tilt the transmission rearward.
- Remove the transmission fluid fill plug transmission fluid level indicator assembly.
- Add 11.35L (12 qt) of transmission fluid to the transmission through the transmission fluid fill hole.
- Install the transmission fluid fill plug.
    - Tighten to 26 Nm (19 lb-ft).

5. ***NOTICE:*** **The torque converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates the torque converter pilot is not binding in the engine crankshaft.**

   Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle behind the engine.

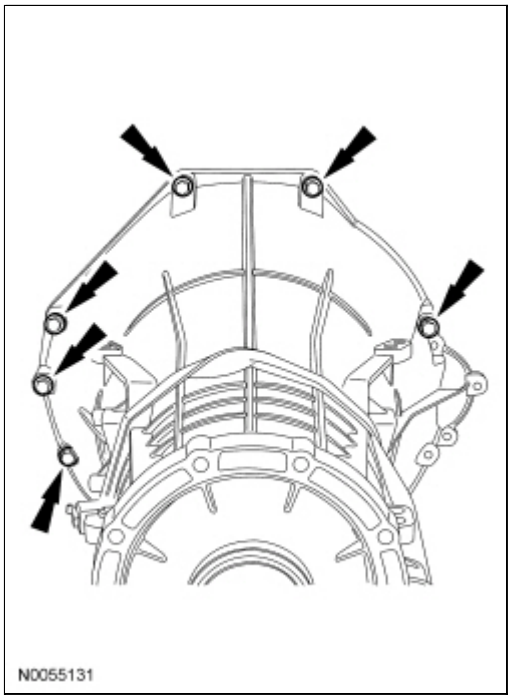
6. Remove the Torque Converter Retainer.

7. ***NOTICE:*** **Make sure the transmission wiring harness is not between the engine block and transmission prior to moving the transmission toward the engine or damage can occur.**

   NOTE: Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

repair4less

With the transmission in a horizontal position, move it toward the engine and position it on the dowel pins.



Vehicles equipped with a 5.0L or 6.2L engine

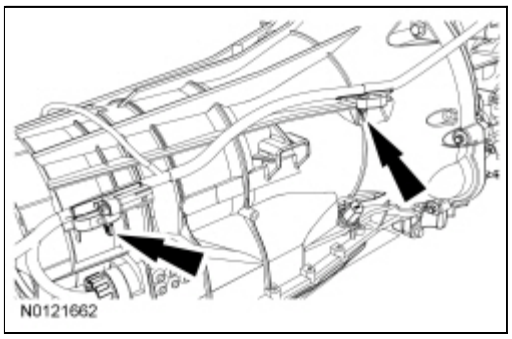
8. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

   NOTE: Install the top 2 transmission-to-engine bolts before installing the rest of the bolts.

   NOTE: Install the top left transmission-to-engine bolt through the fuel line bracket first, then through the transmission case.

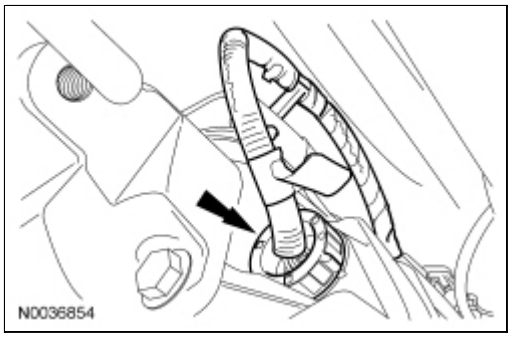
   Install 6 of the 7 transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

Vehicles equipped with a 3.5L or 3.7L engine



9. **NOTE:** Install the top 2 transmission-to-engine bolts through the fuel line bracket first, then through the transmission case.

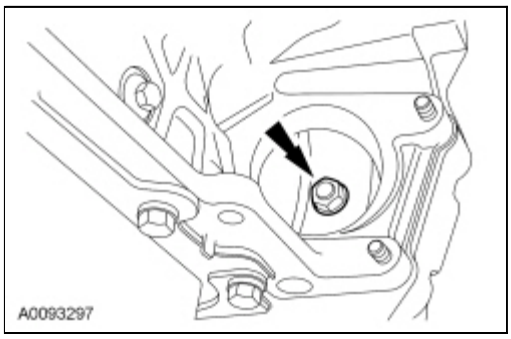
   Install the 10 transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).



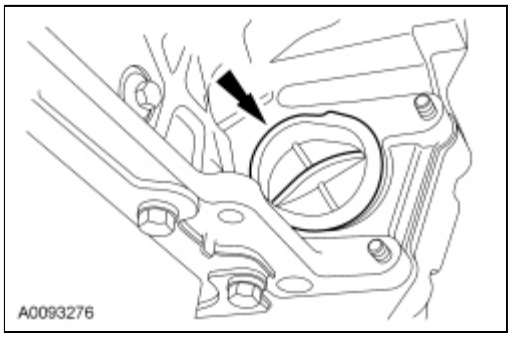
All vehicles

10. Connect the wiring harness retainers to the top of the transmission.

11. Connect the transmission electrical connector by pushing it in and twisting the outer shell to lock it in place.

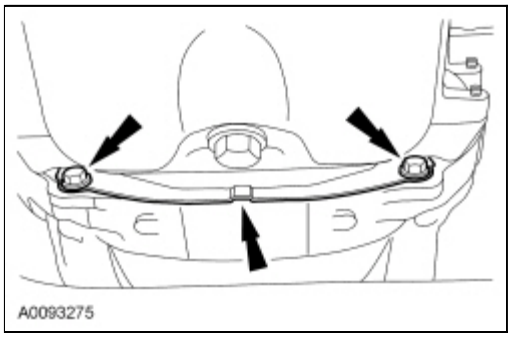


Vehicles equipped with a 5.0L or 6.2L engine



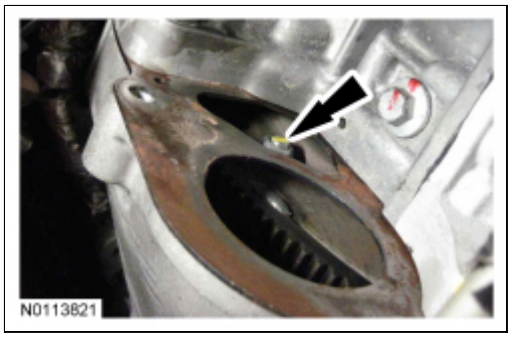
12. Install 4 new flexplate-to-torque converter nuts.

repair4less

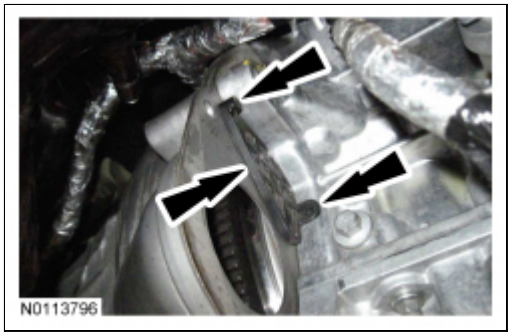


- Tighten to 40 Nm (30 lb-ft).

13. Install the rubber torque converter nut access cover.

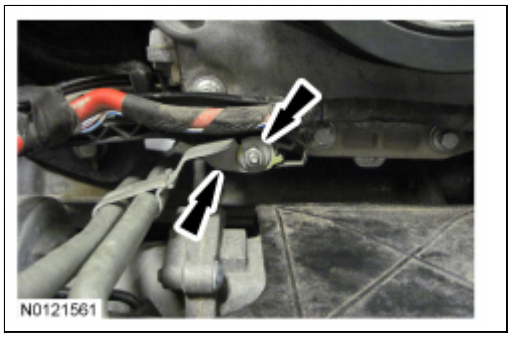


14. Install the flexplate inspection cover and the flexplate inspection cover bolts.
    - Tighten to 48 Nm (35 lb-ft).



Vehicles equipped with a 3.5L or 3.7L engine

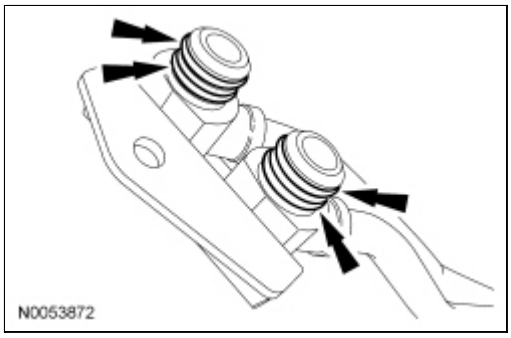
15. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 40 Nm (30 lb-ft).



16. Install the access cover and the 2 pin-type retainers.

All vehicles

17. Install the starter motor. REFER to Section 303-06 .

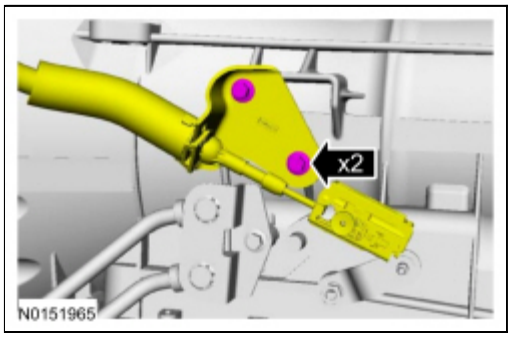


18. Reposition the transmission fluid cooler tubes and bracket and install the transmission fluid cooler tube bracket nut.
    - Tighten to 12 Nm (106 lb-in).

19. **NOTE:** Inspect the case to make sure the old transmission fluid cooler tube O-rings are not stuck in the case.

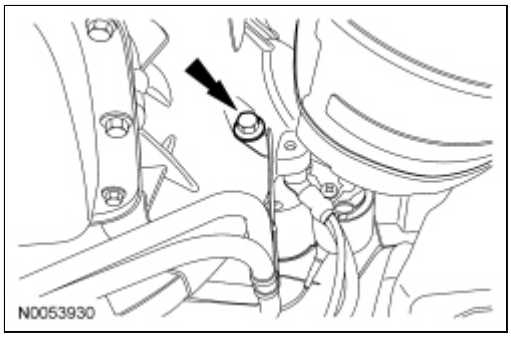
    Install new transmission fluid cooler tube O-rings on the transmission fluid cooler tubes.

repair4less



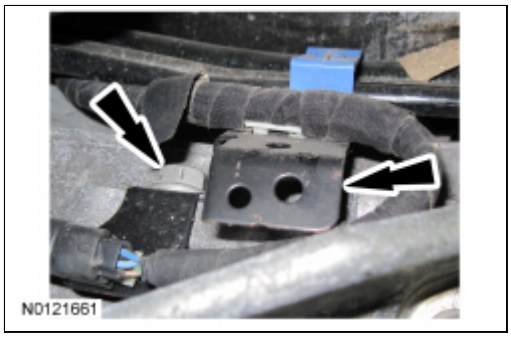
20. ***NOTICE:*** **Install a new transmission fluid cooler tube bracket bolt.**

    Install the transmission fluid cooler tubes and a new transmission fluid cooler tube bracket bolt.
    - Tighten to 30 Nm (22 lb-ft).



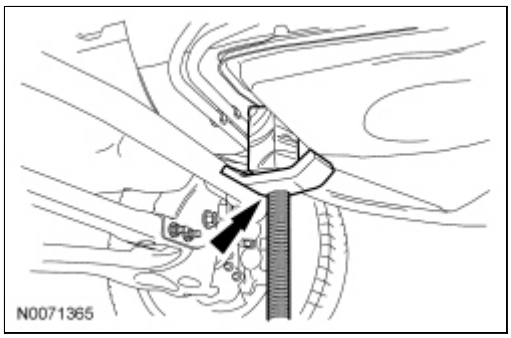
21. **NOTE:** The column shift is shown, the floor shift similar.

    Install the selector lever cable bracket and selector lever cable bracket bolts.
    - Tighten to 25 Nm (18 lb-ft).



Vehicles equipped with a 5.0L or 6.2L engine

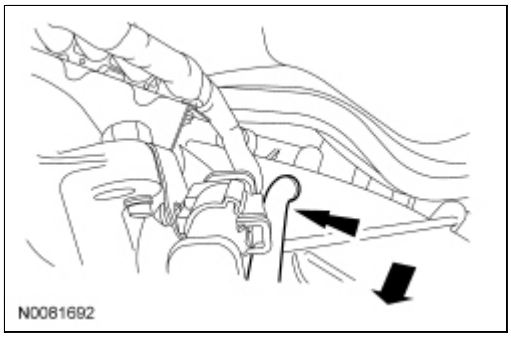
22. Align the transmission fluid cooler tube bracket and install the remaining transmission-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).



All vehicles

23. Install the fuel line bracket and the fuel line bracket bolt.
    - Tighten to 25 Nm (18 lb-ft).

24. Position a jack stand under the transmission, and remove the high-lift transmission jack.



25. **NOTE:** Do not reuse the old transfer case-to-transmission bolts.

    If the transfer case was removed from the transmission during removal, install the transfer case using a high-lift transmission jack. Install 9 new transfer case-to-transmission bolts.
    - Tighten the bolts evenly in a cross pattern to 17 Nm (150 lb-in).

26. Connect the vent hose to the transfer case.

repair4less

27. Connect the electrical connector and attach the 2 harness retainer clips to the transfer case.

28. Install the shift cable mounting bracket and the 2 nuts.
    - Tighten to 28 Nm (21 lb-ft).

29. Connect the cable end to the shift lever.

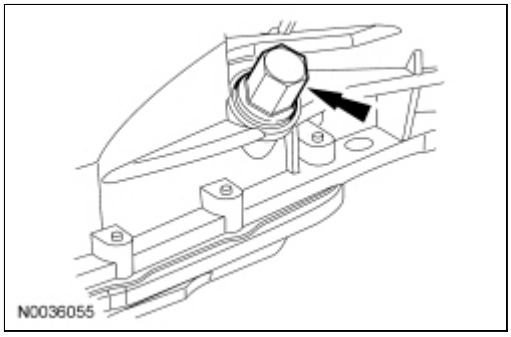
30. Install the front and rear driveshafts. REFER to Section 205-01 .

31. Install the exhaust Y-pipe. REFER to Section 309-00 .

32. Connect the battery ground cable. REFER to Section 414-01 .

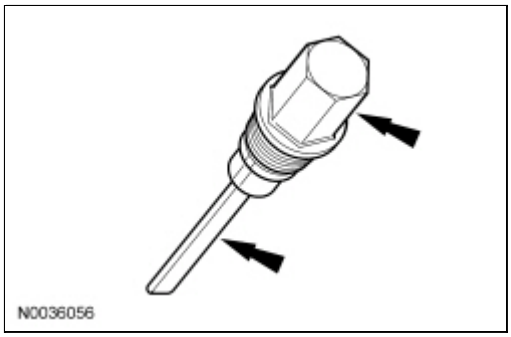
33. Adjust the selector lever cable and install the selector lever cable end on the manual control lever. Verify the selector lever cable is correctly adjusted. REFER to Section 307-05 .

34. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.



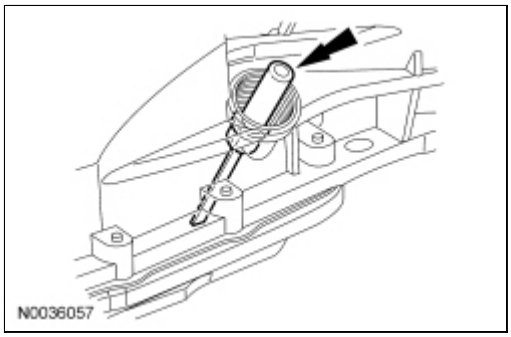
35. If a new transmission or a new main control was installed, the solenoid body strategy must be updated. REFER to Solenoid Body Strategy .

36. If the transmission was overhauled, the adaptive drive cycle must be updated. REFER to Shift Point Road Test .



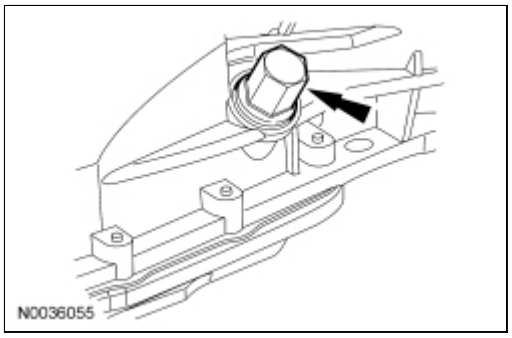
37. While driving the vehicle, use the scan tool to verify that the TFT has reached a temperature of 91°C (195°F). This will circulate the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system.
    - With the engine idling (600-750 rpm) in PARK, verify that the TFT is between 91ºC-102ºC (195ºF-215ºF).

38. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the



passenger side front portion of the transmission case.

39. Separate the transmission fluid level indicator from the transmission fluid fill plug.



40. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.

41. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid. REFER to Transmission Fluid Drain and Refill .

    Install the transmission fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).

repair4less

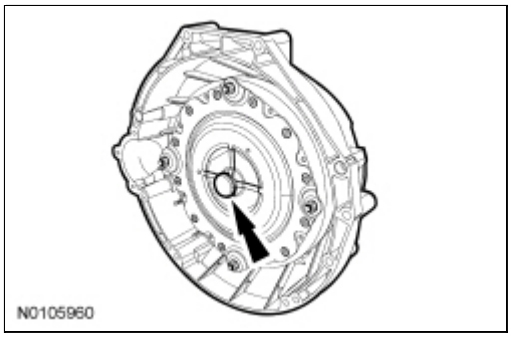
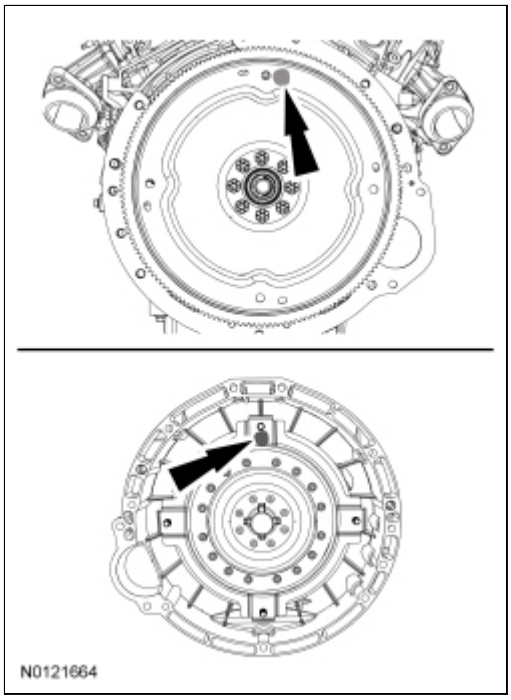
Installation



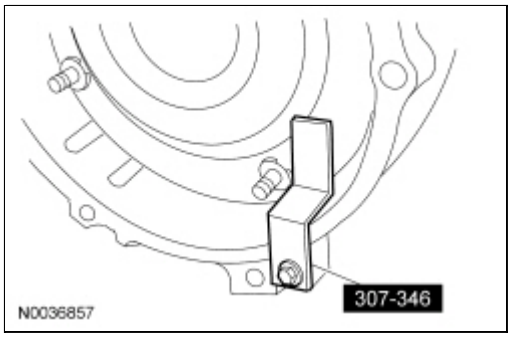
All vehicles

NOTE: Prior to installing a new transmission or an overhauled transmission with a new main control, record the solenoid strategy identification tag. If a new main control was installed, install the replacement solenoid body tag over the original identification tag. REFER to Solenoid Body Strategy .



1. ***NOTICE:*** **Prior to installation of the transmission, lubricate the torque converter pilot hub with multi-purpose grease or damage to the torque converter or engine crankshaft can occur.**

   Lubricate the torque converter pilot hub with multi-purpose grease.



repair4less

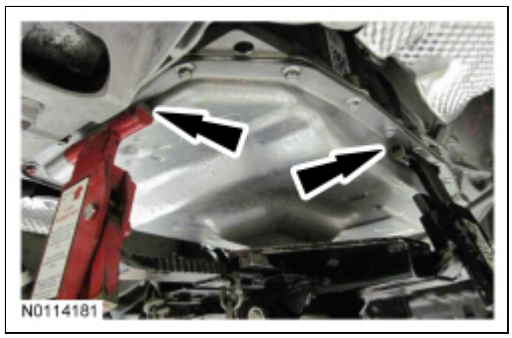
2. If equipped, align the torque converter stud and flexplate hole near the paint marks at the 12 o'clock position.

3. Install the Torque Converter Retainer.

4. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

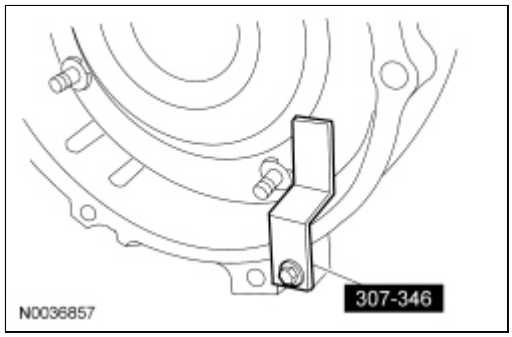
NOTICE: **The torque converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates the torque converter pilot is not binding in the engine crankshaft.**

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.



NOTE: If transmission was disassembled, follow the add transmission fluid to the transmission steps. If transmission is being replaced, remove the transmission fluid fill plug and verify transmission is filled with transmission fluid.

Add transmission fluid to the transmission.



- Slightly tilt the transmission rearward.
- Remove the transmission fluid fill plug transmission fluid level indicator assembly.
- Add 11.35L (12 qt) of transmission fluid to the transmission through the transmission fluid fill hole.
- Install the transmission fluid fill plug.
    - Tighten to 26 Nm (19 lb-ft).

5. ***NOTICE:*** **The torque converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates the torque converter pilot is not binding in the engine crankshaft.**

   Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle behind the engine.

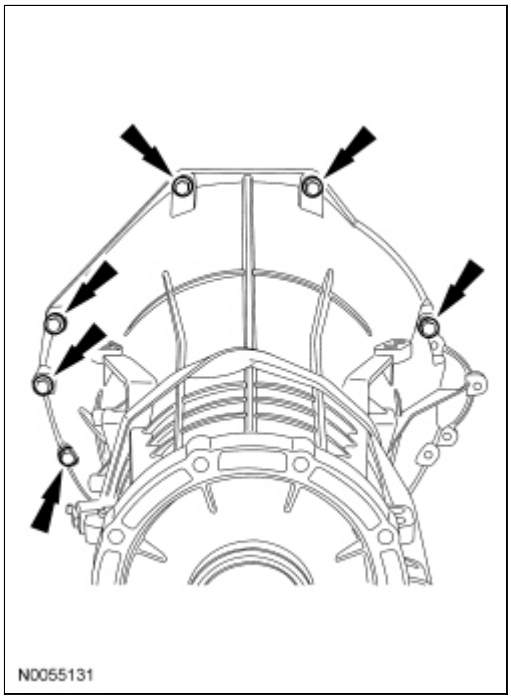
6. Remove the Torque Converter Retainer.

7. ***NOTICE:*** **Make sure the transmission wiring harness is not between the engine block and transmission prior to moving the transmission toward the engine or damage can occur.**

   NOTE: Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

repair4less

With the transmission in a horizontal position, move it toward the engine and position it on the dowel pins.



Vehicles equipped with a 5.0L or 6.2L engine

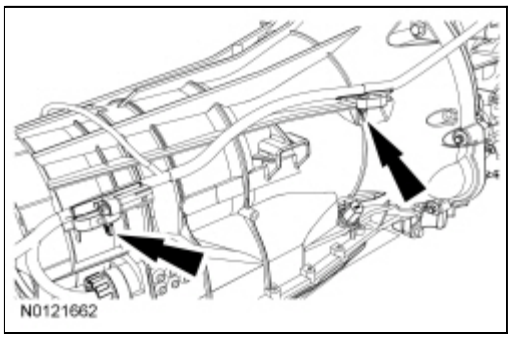
8. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

   NOTE: Install the top 2 transmission-to-engine bolts before installing the rest of the bolts.

   NOTE: Install the top left transmission-to-engine bolt through the fuel line bracket first, then through the transmission case.

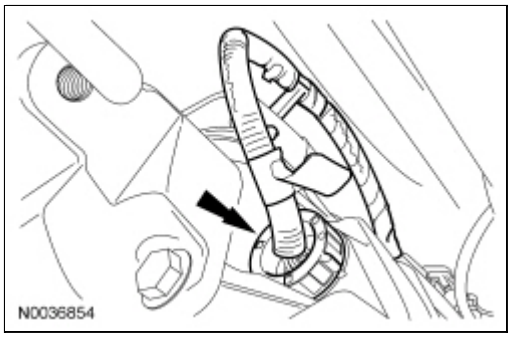
   Install 6 of the 7 transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

Vehicles equipped with a 3.5L or 3.7L engine



9. **NOTE:** Install the top 2 transmission-to-engine bolts through the fuel line bracket first, then through the transmission case.

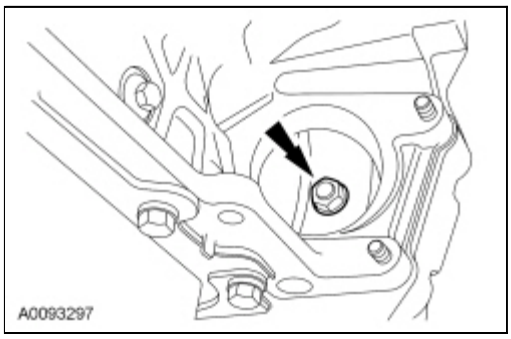
   Install the 10 transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).



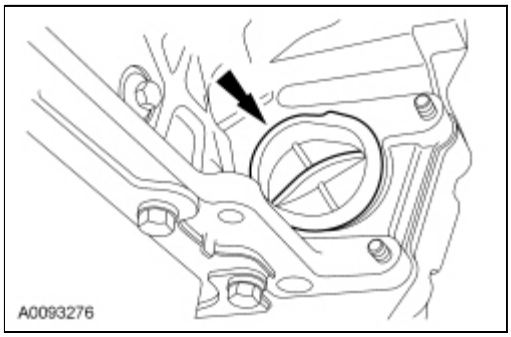
All vehicles

10. Connect the wiring harness retainers to the top of the transmission.

11. Connect the transmission electrical connector by pushing it in and twisting the outer shell to lock it in place.

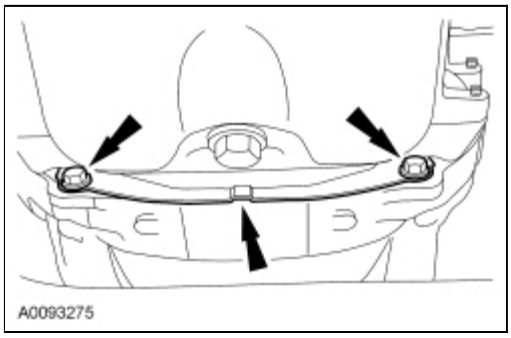


Vehicles equipped with a 5.0L or 6.2L engine



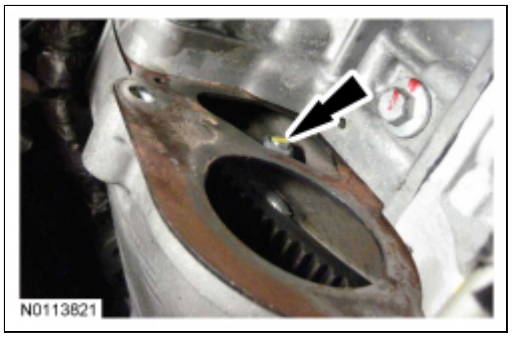
12. Install 4 new flexplate-to-torque converter nuts.

repair4less

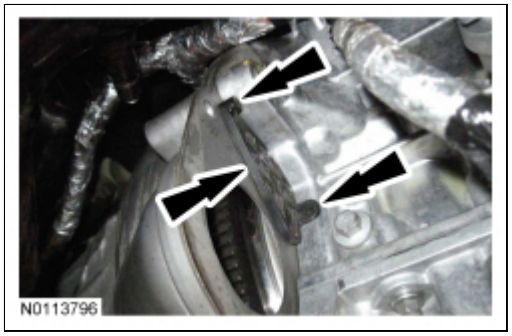


- Tighten to 40 Nm (30 lb-ft).

13. Install the rubber torque converter nut access cover.

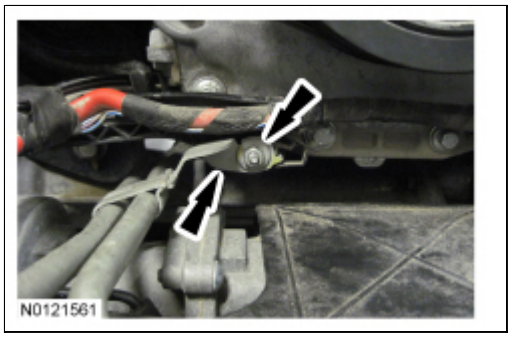


14. Install the flexplate inspection cover and the flexplate inspection cover bolts.
    - Tighten to 48 Nm (35 lb-ft).



Vehicles equipped with a 3.5L or 3.7L engine

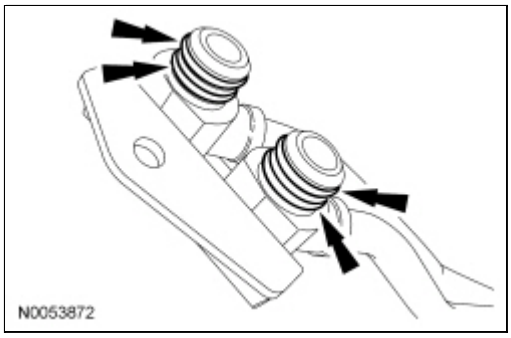
15. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 40 Nm (30 lb-ft).



16. Install the access cover and the 2 pin-type retainers.

All vehicles

17. Install the starter motor. REFER to Section 303-06 .

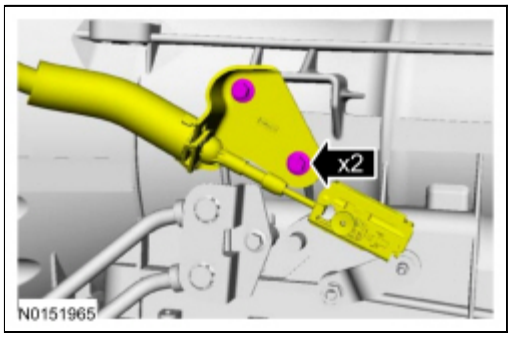


18. Reposition the transmission fluid cooler tubes and bracket and install the transmission fluid cooler tube bracket nut.
    - Tighten to 12 Nm (106 lb-in).

19. **NOTE:** Inspect the case to make sure the old transmission fluid cooler tube O-rings are not stuck in the case.

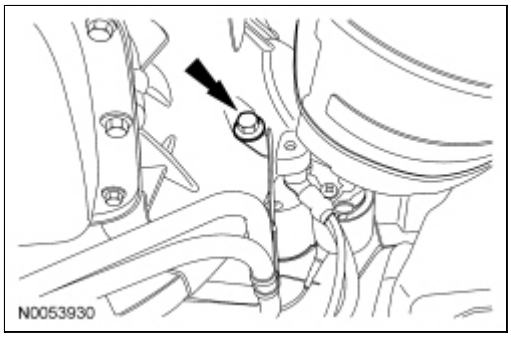
    Install new transmission fluid cooler tube O-rings on the transmission fluid cooler tubes.

repair4less



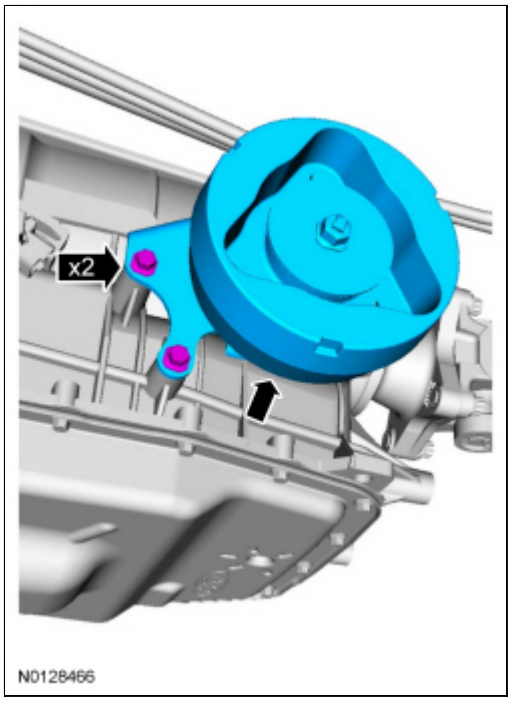
20. ***NOTICE:*** **Install a new transmission fluid cooler tube bracket bolt.**

    Install the transmission fluid cooler tubes and a new transmission fluid cooler tube bracket bolt.
    - Tighten to 30 Nm (22 lb-ft).



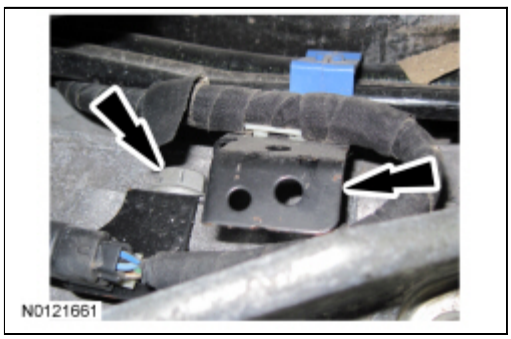
21. **NOTE:** The column shift is shown, the floor shift similar.

    Install the selector lever cable bracket and selector lever cable bracket bolts.
    - Tighten to 25 Nm (18 lb-ft).



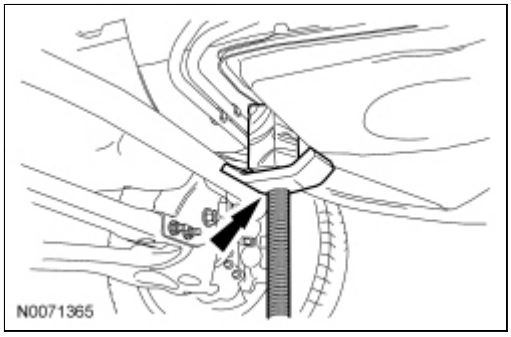
Vehicles equipped with a 5.0L or 6.2L engine

22. Align the transmission fluid cooler tube bracket and install the remaining transmission-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).



Vehicles equipped with 3.7L engine

23. Install the transmission damper and the 2 transmission damper bolts.
    - Tighten to 25 Nm (18 lb-ft).



All vehicles

24. Install the fuel line bracket and the fuel line bracket bolt.
    - Tighten to 25 Nm (18 lb-ft).

repair4less

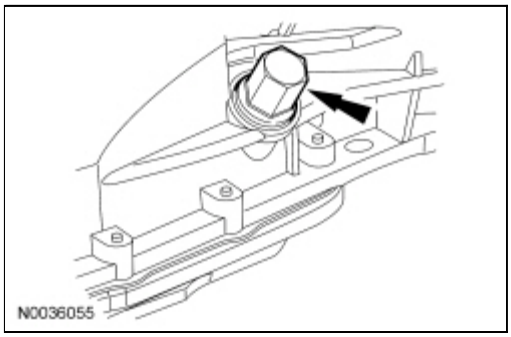
25. Position a jack stand under the transmission, and remove the high-lift transmission jack.

26. Install the driveshaft. REFER to Section 205-01 .

27. Install the exhaust Y-pipe. REFER to Section 309-00 .

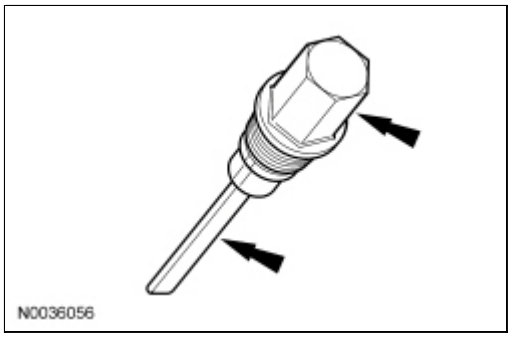
28. Connect the battery ground cable. REFER to Section 414-01 .

29. Adjust the selector lever cable and install the selector lever cable end on the manual control lever. Verify the selector lever cable is correctly adjusted. REFER to Section 307-05 .



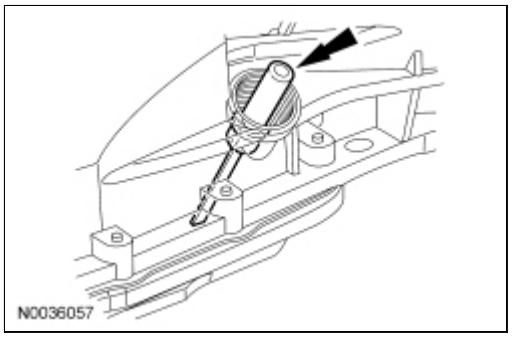
30. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

31. If a new transmission or a new main control was installed, the solenoid body strategy must be updated. REFER to Solenoid Body Strategy .



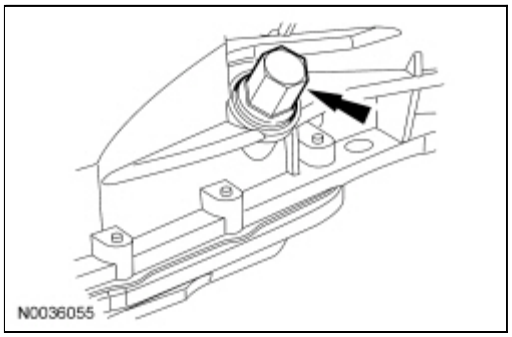
32. If the transmission was overhauled, the adaptive drive cycle must be updated. REFER to Shift Point Road Test .

33. While driving the vehicle, use the scan tool to verify that the TFT has reached a temperature of 91°C (195°F). This will circulate the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system.
    - With the engine idling (600-750 rpm) in PARK, verify that the TFT is between 91ºC-102ºC (195ºF-215ºF).



34. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the passenger side front portion of the transmission case.

35. Separate the transmission fluid level indicator from the transmission fluid fill plug.



36. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.

37. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid. REFER to Transmission Fluid Drain and Refill .

    Install the transmission fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).

repair4less

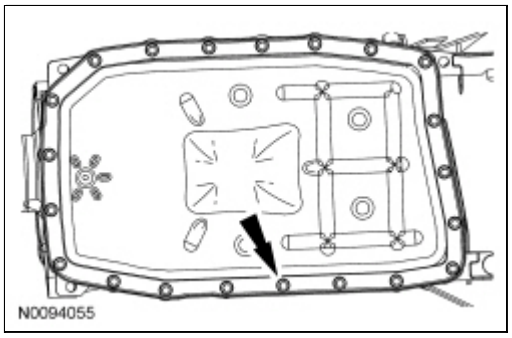
Transmission — Four Wheel Drive (4WD)

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

Removal

NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.



All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. REFER to Section 100-02 .
2. Disconnect the battery ground cable. REFER to Section 414-01 .
3. If transmission disassembly or installation of a new transmission is necessary, remove the 21 transmission fluid pan bolts and remove the transmission fluid pan. Drain the transmission fluid into a container.

N0094055

4. Install the transmission fluid pan and the 21 transmission fluid pan bolts. Tighten transmission fluid pan bolts in a crisscross pattern.
   - Tighten to 9 Nm (80 lb-in).

repair4less

5. Remove the exhaust Y-pipe. REFER to Section 309-00 .

6. **NOTE:** It is only necessary to remove the transfer case from the transmission if a new transmission is being installed or if the transmission is going to be disassembled for a transmission related repair.

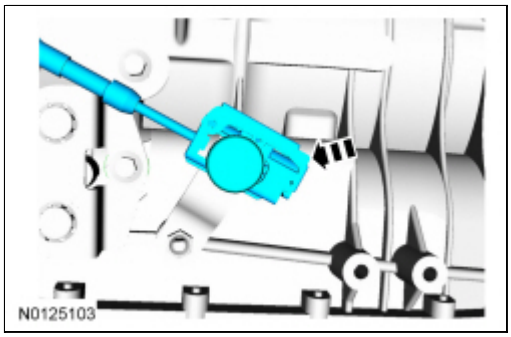
   Remove the transfer case. REFER to Section 308-07B .

7. **NOTE:** Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

   NOTE: Make sure the transmission is securely fastened to the transmission jack.

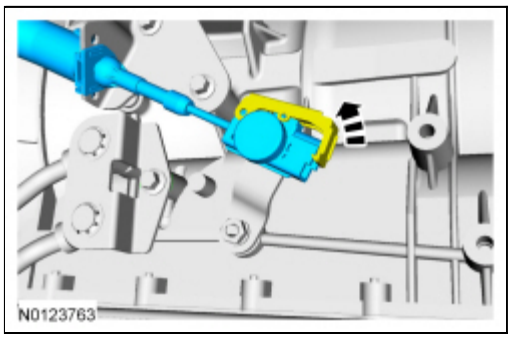
   Using a high-lift transmission jack, support the transmission and remove the jack stand.

8. Remove the fuel line bracket bolt from the left side of the transmission and position the fuel line bracket aside.



9. If equipped, remove the nut and the selector lever cable splash shield.

Vehicles equipped with a floor shift

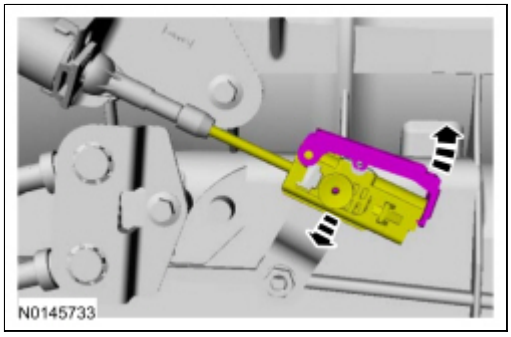


10. Clean the cable adjustment lock of any debris.

11. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: The 3.5L engine is shown, the 3.7L, 5.0L and 6.2L engines are similar.

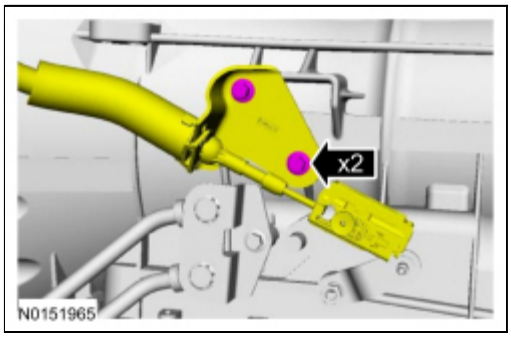
    Rotate the cable adjustment lock upward and remove the selector lever cable from the manual control lever.



Vehicles equipped with a column shift

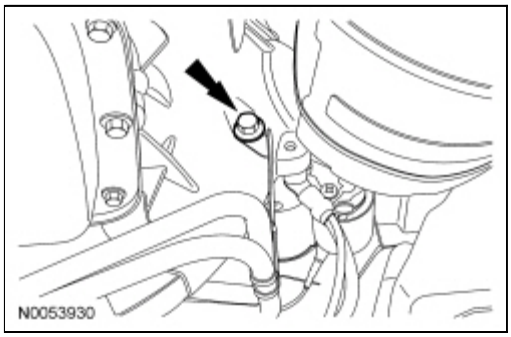
12. Clean the cable adjustment lock of any debris.

13. Rotate the cable adjustment lock upward and remove the selector lever cable from the manual control lever.



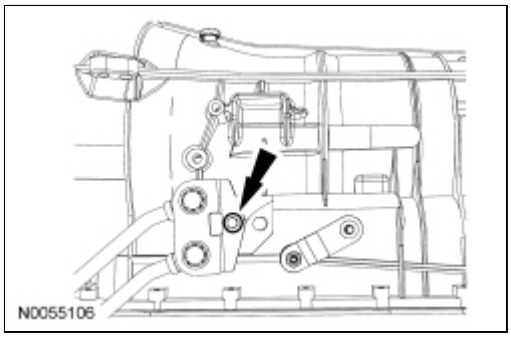
repair4less

All vehicles



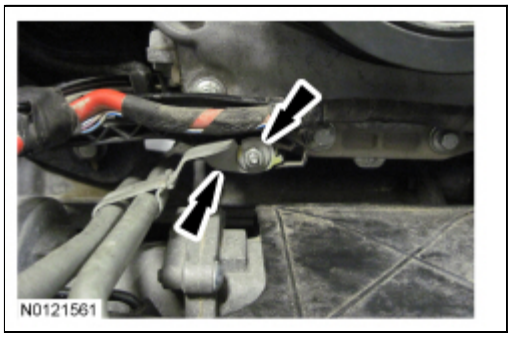
14. **NOTE:** The column shift is shown, the floor shift is similar.

    Remove the selector lever cable bracket bolts and remove the selector lever cable bracket.



Vehicles equipped with a 5.0L or 6.2L engine

15. Remove the transmission-to-engine bolt.



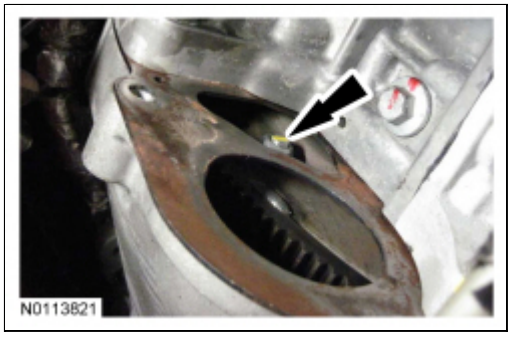
All vehicles

16. Remove and discard the transmission fluid cooler tube bracket bolt.

17. **NOTE:** The 3.5L and 3.7L engine is shown, the 5.0L and the 6.2L engines are similar.

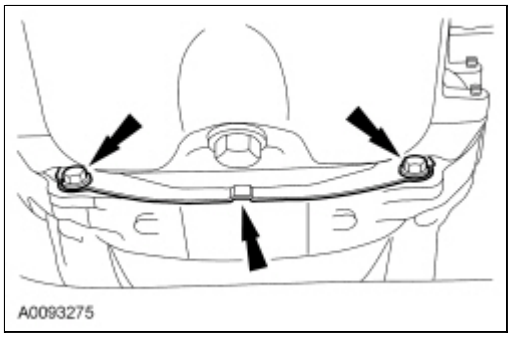
    Remove the transmission fluid cooler tube bracket nut and position the transmission fluid cooler tube bracket and tubes aside.

18. Remove the starter motor. REFER to Section 303-06 .



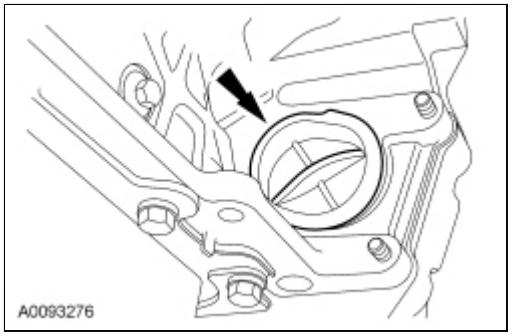
Vehicles equipped with a 3.5L or 3.7L engine

19. Remove the 2 pin-type retainers and the access cover.

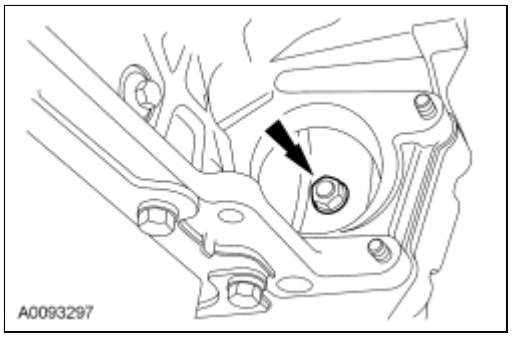


20. Remove and discard the 4 flexplate-to-torque converter nuts.

repair4less

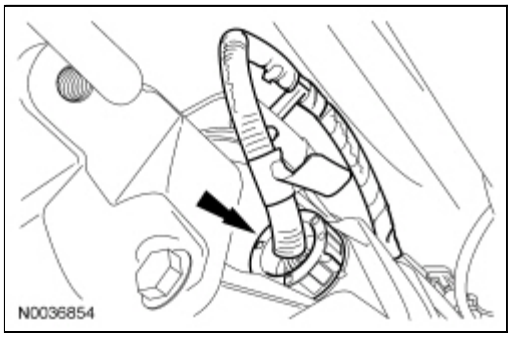


Vehicles equipped with a 5.0L or 6.2L engine

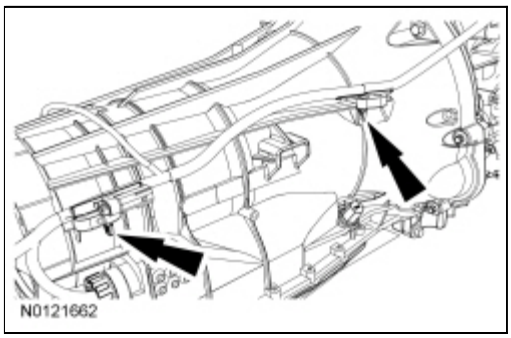


21. Remove the flexplate inspection cover bolts and the flexplate inspection cover.

22. Remove the rubber torque converter nut access cover.



23. Remove and discard the 4 flexplate-to-torque converter nuts.



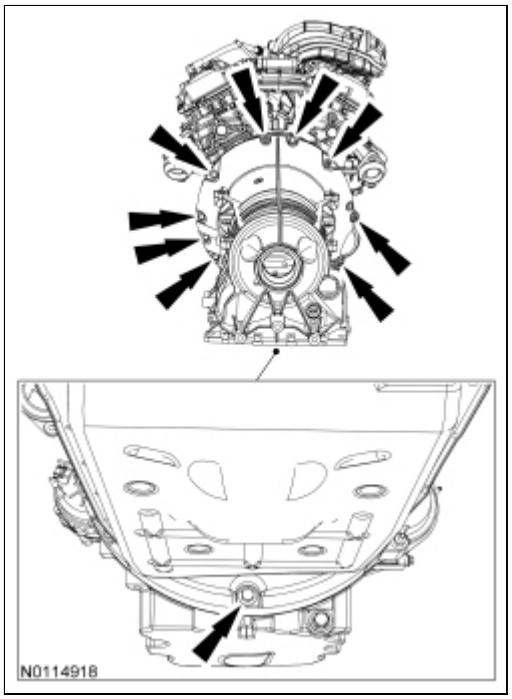
All vehicles

24. ***NOTICE:*** **Do not pull on the wiring harness to disconnect the electrical connector or damage to the electrical connector will occur.**

    Disconnect the electrical connector by twisting the outer shell and pulling back on the electrical connector.

25. Disconnect the wiring harness retainers from the top of the transmission.

Vehicles equipped with a 3.5L or 3.7L engine



26. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

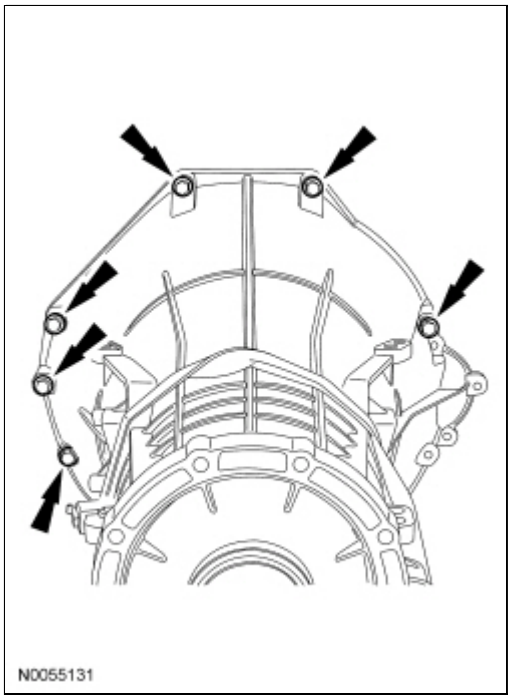
    NOTICE: **Make sure to not pinch the transmission wiring harness between the transmission and the body or damage can occur.**

    NOTE: The top 2 transmission-to-engine bolts secure the fuel line bracket to the transmission case.

    Remove the 10 transmission-to-engine bolts.

repair4less

Vehicles equipped with a 5.0L or 6.2L engine



27. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

    NOTICE: **Make sure to not pinch the transmission wiring harness between the transmission and the body or damage can occur.**

    NOTE: Remove the top 2 transmission-to-engine bolts before removing the rest of the bolts.

    NOTE: The top left transmission-to-engine bolt secures the fuel line bracket to the transmission case.

    Remove the 6 remaining transmission-to-engine bolts.

All vehicles

28. Slide the transmission back enough to install the Torque Converter Retainer.

29. Remove the transmission from the vehicle.

30. If the transmission is being disassembled to install new parts, or if a new or remanufactured transmission is being installed, clean and backflush the transmission fluid cooler, the auxiliary transmission fluid cooler (if equipped) and the transmission fluid cooler tubes to prevent contaminants from entering the transmission. REFER to Transmission Fluid Cooler Backflushing and Cleaning .

repair4less

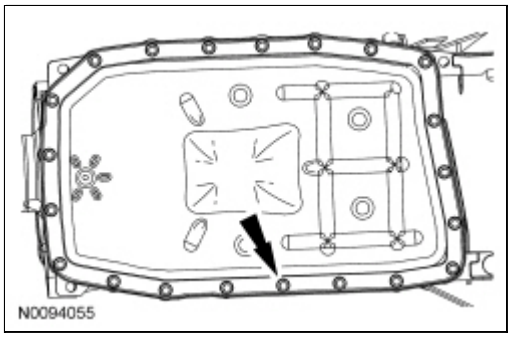
Transmission — Rear Wheel Drive (RWD)

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

Removal

NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.

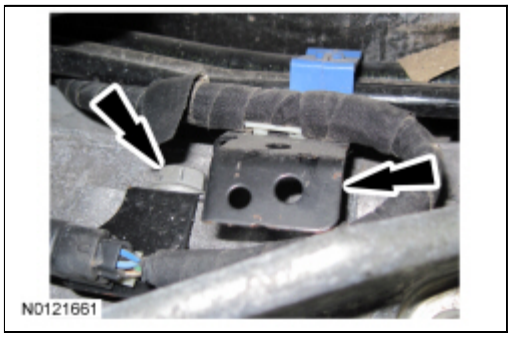


All vehicles

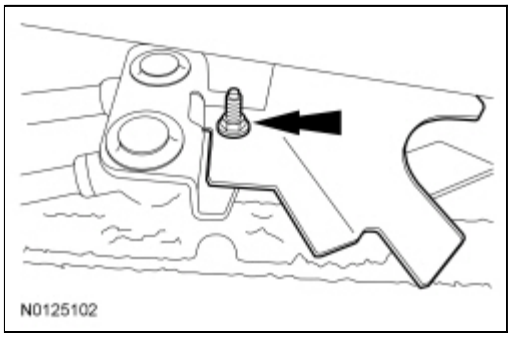
1. With the vehicle in NEUTRAL, position it on a hoist. REFER to Section 100-02 .
2. Disconnect the battery ground cable. REFER to Section 414-01 .
3. If transmission disassembly or installation of a new transmission is necessary, remove the 21 transmission fluid pan bolts and remove the transmission fluid pan. Drain the transmission fluid into a container.

N0094055

4. Install the transmission fluid pan and the 21 transmission fluid pan bolts. Tighten transmission fluid pan bolts in a crisscross pattern.
   - Tighten to 9 Nm (80 lb-in).



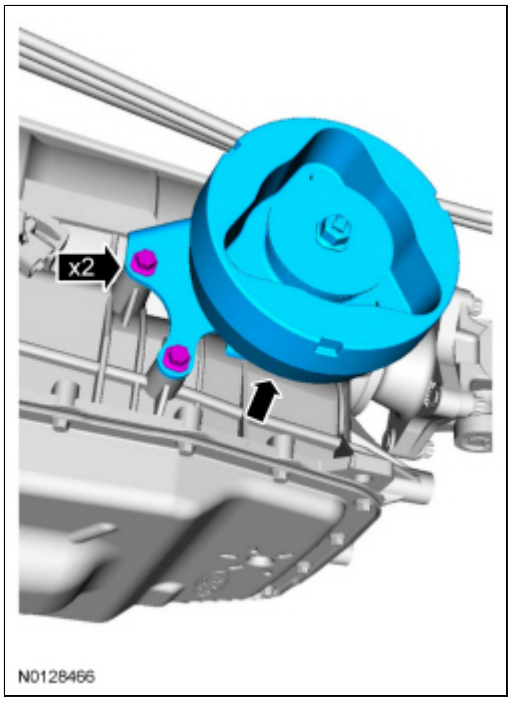
repair4less



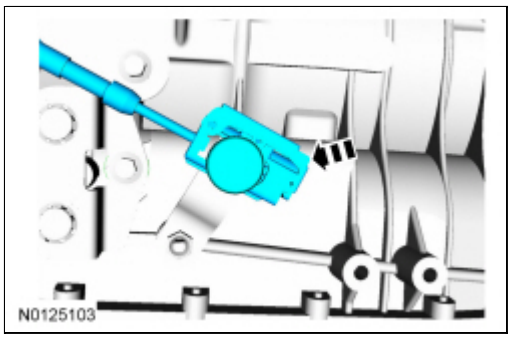
5. Remove the exhaust Y-pipe. REFER to Section 309-00 .
6. Remove the driveshaft. REFER to Section 205-01 .
7. **NOTE:** Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

   NOTE: Make sure the transmission is securely fastened to the transmission jack.

   Using a high-lift transmission jack, support the transmission and remove the jack stand.
8. Remove the fuel line bracket bolt from the left side of the transmission and position the fuel line bracket aside.



9. If equipped, remove the nut and the selector lever cable splash shield.

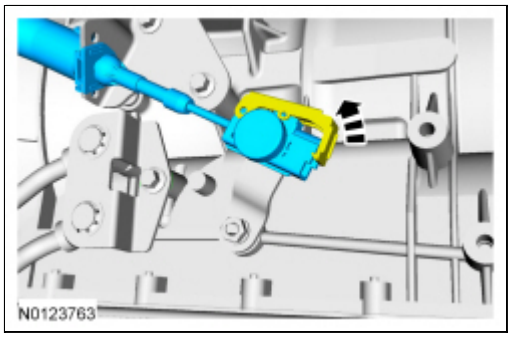


Vehicles equipped with 3.7L engine Rear Wheel Drive (RWD)

10. Remove the 2 transmission damper bolts and remove the transmission damper.

Vehicles equipped with a floor shift

11. Clean the cable adjustment lock of any debris.

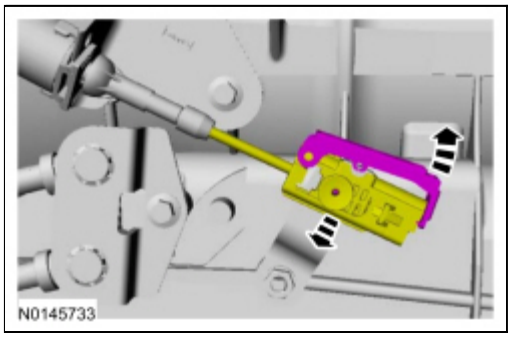


12. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: The 3.5L engine is shown, the 3.7L, 5.0L and 6.2L engines are similar.

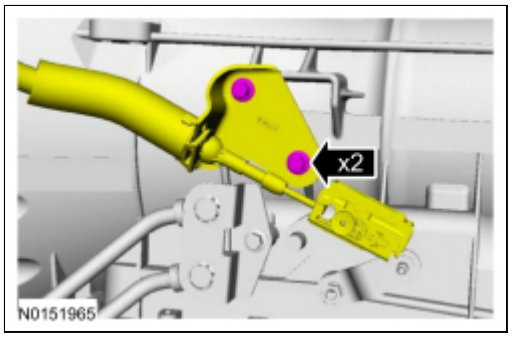
    Rotate the cable adjustment lock upward and remove the selector lever cable from the manual control lever.

repair4less



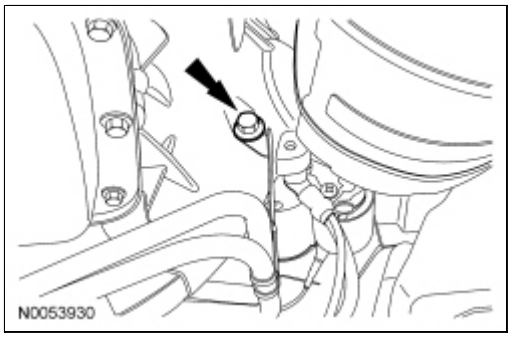
Vehicles equipped with a column shift

13. Clean the cable adjustment lock of any debris.



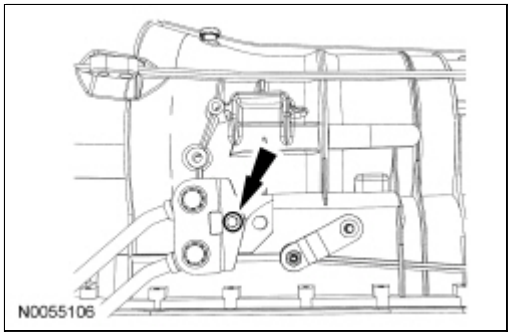
14. Rotate the cable adjustment lock upward and remove the selector lever cable from the manual control lever.

All vehicles



15. **NOTE:** The column shift is shown, the floor shift is similar.

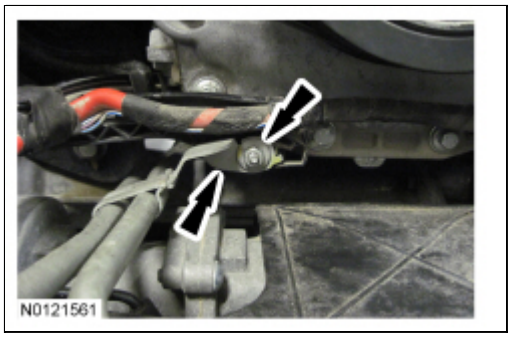
    Remove the selector lever cable bracket bolts and remove the selector lever cable bracket.



Vehicles equipped with a 5.0L or 6.2L engine

16. Remove the transmission-to-engine bolt.

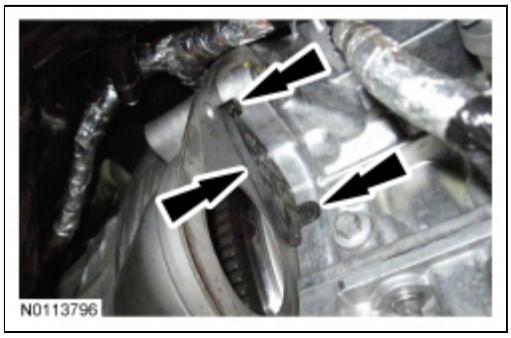
All vehicles



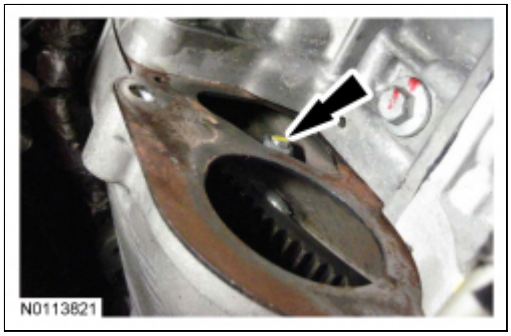
17. Remove and discard the transmission fluid cooler tube bracket bolt.

18. **NOTE:** The 3.5L and 3.7L engine is shown, the 5.0L and the 6.2L engines are similar.

    Remove the transmission fluid cooler tube bracket nut and position the transmission fluid cooler tube bracket and tubes aside.



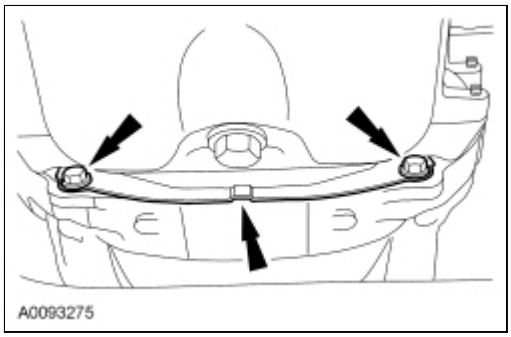
repair4less



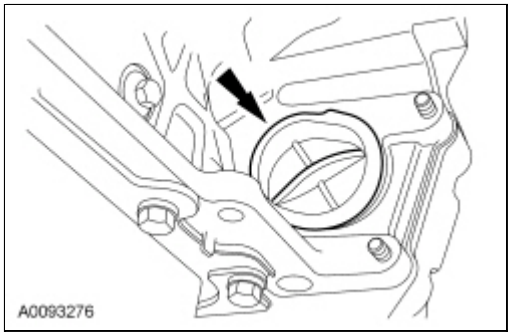
19. Remove the starter motor. REFER to Section 303-06 .

Vehicles equipped with a 3.5L or 3.7L engine

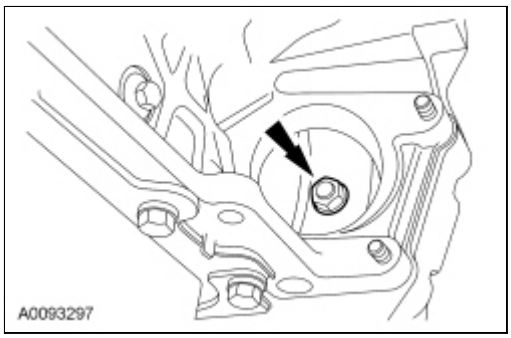
20. Remove the 2 pin-type retainers and the access cover.



21. Remove and discard the 4 flexplate-to-torque converter nuts.



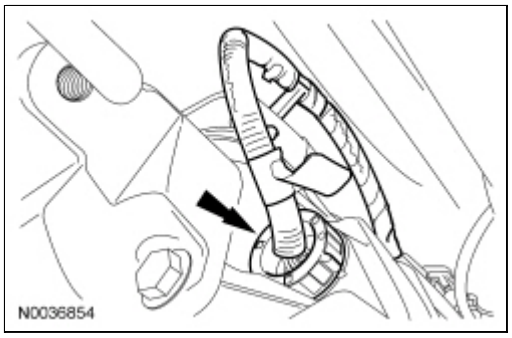
Vehicles equipped with a 5.0L or 6.2L engine



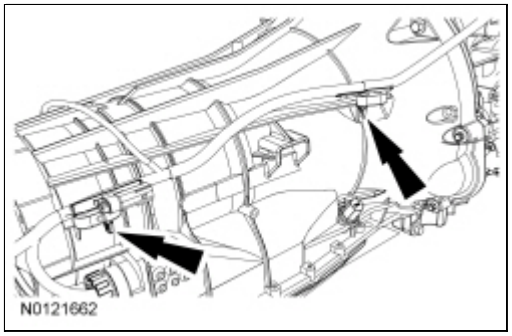
22. Remove the flexplate inspection cover bolts and the flexplate inspection cover.

23. Remove the rubber torque converter nut access cover.

24. Remove and discard the 4 flexplate-to-torque converter nuts.



All vehicles

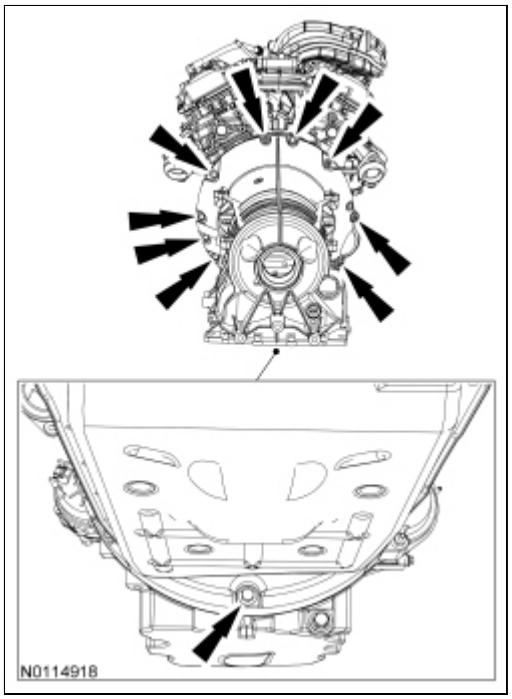


25. ***NOTICE:*** **Do not pull on the wiring harness to disconnect the electrical connector or damage to the electrical connector will occur.**

    Disconnect the transmission electrical connector by twisting the outer shell and pulling back on the electrical connector.

repair4less

26. Disconnect the wiring harness retainers from the top of the transmission.



Vehicles equipped with a 3.5L or 3.7L engine

27. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

    NOTE: The top 2 transmission-to-engine bolts secure the fuel line bracket to the transmission case.

    Remove the 10 transmission-to-engine bolts.

Vehicles equipped with a 5.0L or 6.2L engine

28. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

    NOTICE: **Make sure to not pinch the transmission wiring harness between the transmission and the body or damage can occur.**

    NOTE: Remove the top 2 transmission-to-engine bolts before removing the rest of the bolts.

    NOTE: The top left transmission-to-engine bolt secures the fuel line bracket to the transmission case.

    Remove the 6 remaining transmission-to-engine bolts.

repair4less

All vehicles

29. Slide the transmission back enough to install the Torque Converter Retainer.

30. Remove the transmission from the vehicle.

31. If the transmission is being disassembled to install new parts, or if a new or remanufactured transmission is being installed, clean and backflush the transmission fluid cooler, the auxiliary transmission fluid cooler (if equipped) and the transmission fluid cooler tubes to prevent contaminants from entering the transmission. Transmission Cooling

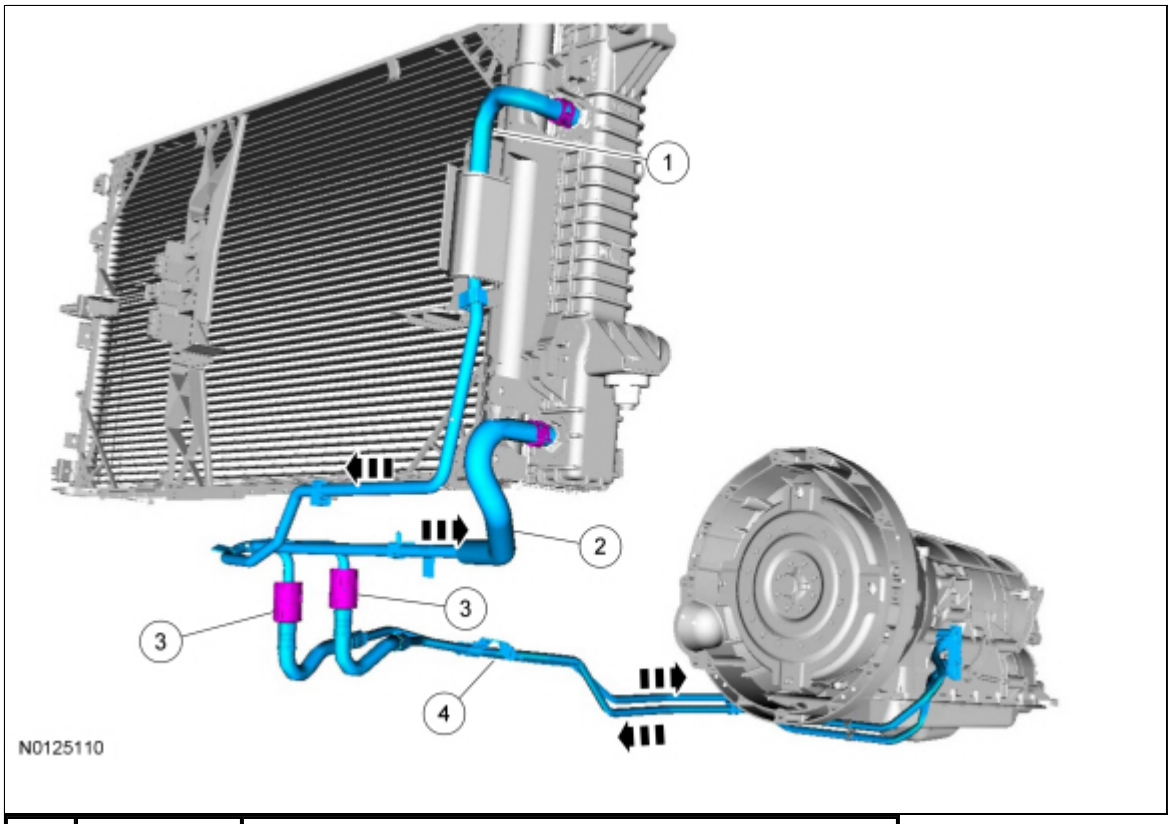
The transmission fluid cooling system without an auxiliary transmission fluid cooler consists of the following:

- An in-tank transmission fluid cooler inlet tube
- A non-repairable in-tank transmission fluid cooler
- An in-tank transmission fluid cooler outlet tube

The transmission fluid cooling system with an auxiliary transmission fluid cooler consists of the following:

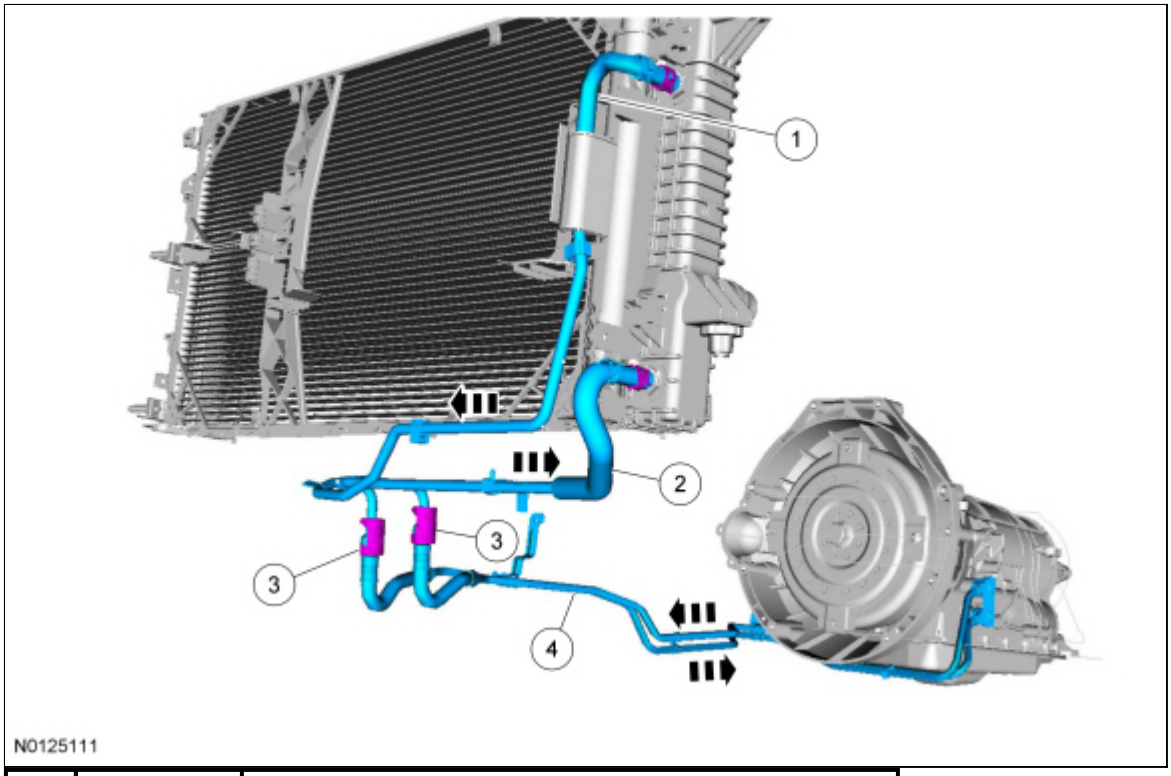


- An in-tank transmission fluid cooler inlet tube
- A non-repairable in-tank transmission fluid cooler
- An auxiliary transmission fluid cooler inlet tube
- An auxiliary transmission fluid cooler
- An auxiliary transmission fluid cooler outlet tube

Located inside the transmission case is a thermal bypass valve. The thermal bypass is used to route fluid to the cooler when operating temperatures increase, or to return fluid directly to the transmission lube circuit. When the transmission fluid temperature is below 185°F (85°C) no fluid is routed to the cooler. It is essential that the transmission fluid level be checked and adjusted only when the fluid temperature is verified with a scan tool.

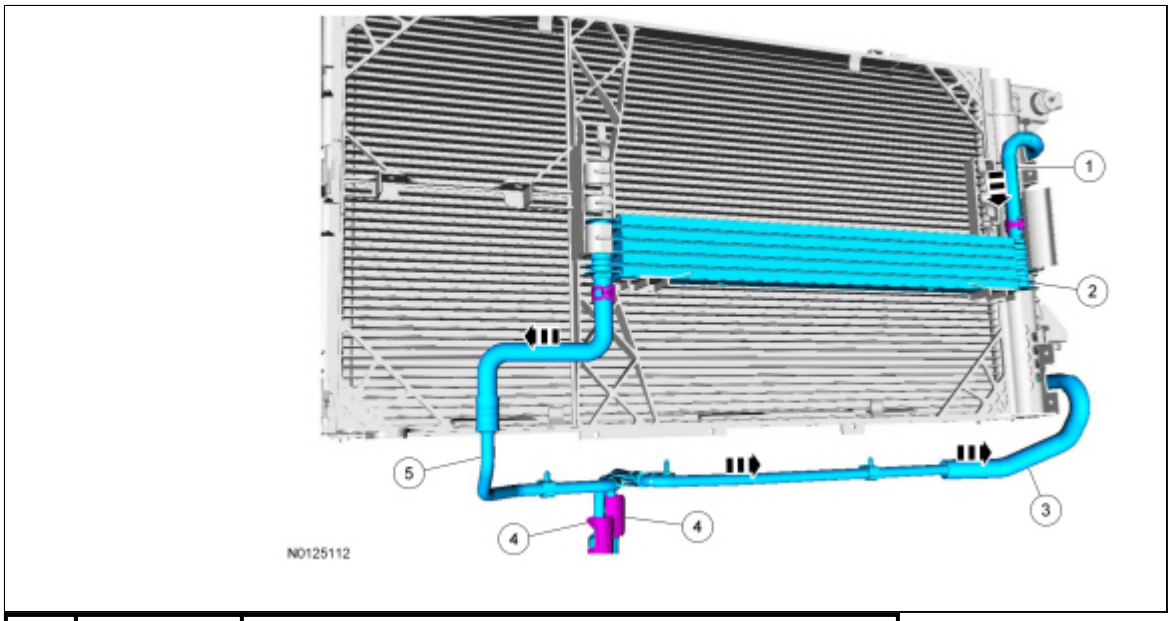
The transmission fluid flows from the transmission bottom fitting, to the in-tank transmission fluid cooler, to the auxiliary transmission fluid cooler, if so equipped, and returns to the transmission top fitting.

For the transmission fluid cooler backflushing and cleaning procedure, refer to Section 307-01.



3.5L GTDI and 3.7L Engines Without an Auxiliary Transmission Fluid Cooler

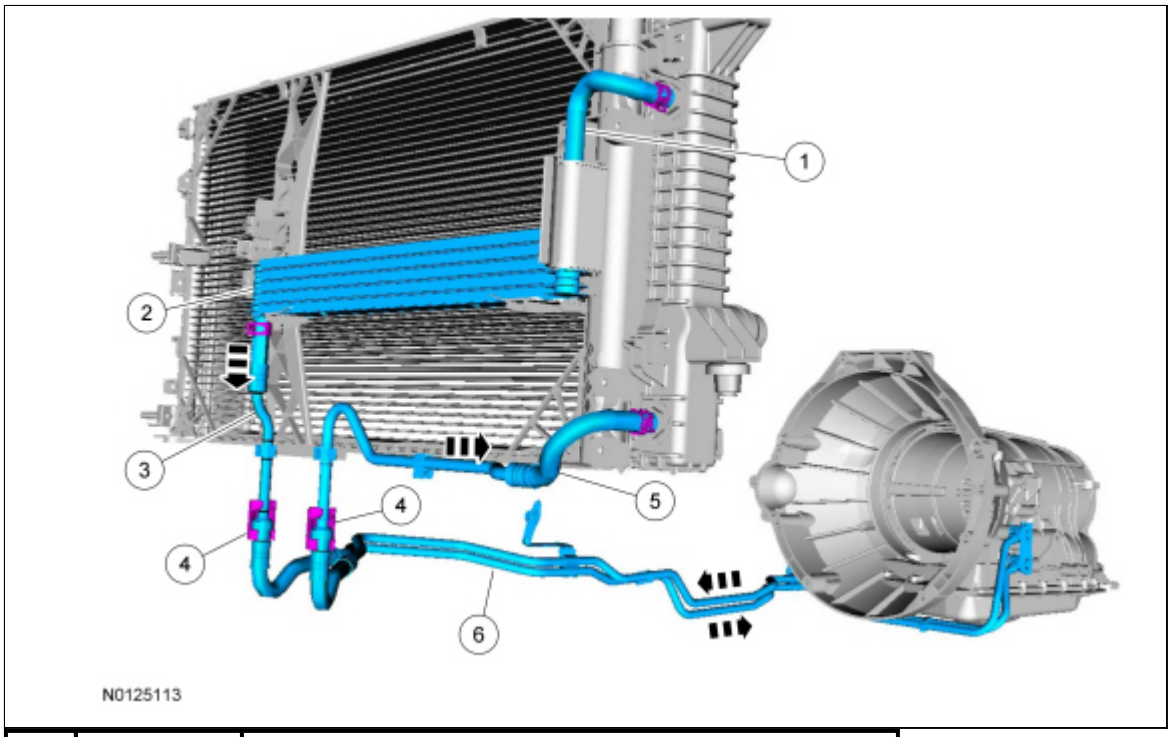
Item	Part Number	Description
1	7B028	In-tank transmission fluid cooler outlet tube
2	7B028	Transmission fluid cooler tube radiator inlet
3	7Z465	Transmission fluid cooler inlet and outlet tube secondary latches
4	7R081	Transmission fluid cooler tubes



5.0L (4V) Engine Without an Auxiliary Transmission Fluid Cooler

repair4less

Item	Part Number	Description
1	7B028	In-tank transmission fluid cooler outlet tube
2	7B028	Transmission fluid cooler tube radiator inlet
3	7Z465	Transmission fluid cooler inlet and outlet tube secondary latches
4	7R081	Transmission fluid cooler tubes



3.5L GTDI, 3.7L and 5.0L Engines With an Auxiliary Transmission Fluid Cooler

Item	Part Number	Description
1	7C410	Auxiliary transmission fluid cooler inlet hose
2	7A095	Auxiliary transmission fluid cooler
3	7B028	In-tank transmission fluid cooler inlet tube
4	7Z465	Transmission fluid cooler inlet and outlet tube secondary latches
5	7B028	Auxiliary transmission fluid cooler outlet hose

6.2L (2V) Engine With an Auxiliary Transmission Fluid Cooler

repair4less

Item	Part Number	Description

Transmission Cooling

Inspection and Verification

NOTICE: **When internal wear/damage occurs in the transmission, metal particles, clutch plate material and band material can travel into the torque converter, the transmission fluid cooler tubes, the in-tank transmission fluid cooler and the auxiliary transmission fluid cooler, if so equipped. These contaminants are a major cause of recurring transmission concerns. To prevent future concerns, remove these contaminants from the cooling system before placing the transmission back into use.**

1. Visually inspect for obvious signs of mechanical damage, incorrect component installation and system leaks. Repair as necessary.
    - Install a new or remanufactured radiator when transmission fluid is found leaking from the in-tank transmission fluid cooler. Refer to Section 303-03 .
    - Install a new auxiliary transmission fluid cooler if there is leakage from the auxiliary transmission fluid cooler.

2. If the fault is not visually evident, GO to Symptom Chart - Transmission Cooling or GO to Symptom Chart - NVH .

Symptom Chart — Transmission Cooling

Symptom Chart — Transmission Cooling

Condition	Possible Sources	Action
• Transmission overheating	• Excessive vehicle or towing loads, severe vehicle use	• REFER to the Vehicle Specification Manual for load and GVW information. REFER to the Owner's Literature.
	• Incorrect transmission fluid level	• CHECK and if necessary, ADJUST the transmission fluid to the correct level.
	• Transmission fluid condition	• CHECK transmission fluid condition.
	• Incorrect transmission fluid type	• REFER to Specifications in this section.
	• Transmission cooling system damaged, blocked, restricted or installed incorrectly	• CARRY OUT the Transmission Fluid Cooler Backflushing and Cleaning. REFER to Section 307-01 .
	• System leaks	• INSPECT for leakage.
	• Engine overheating	• REFER to Section 303-03 .

	• Powertrain control system electrical inputs/outputs, vehicle wiring harnesses, PCM, Torque Converter Clutch (TCC) solenoid • Internal transmission concerns	• CARRY OUT On-Board Diagnostic (OBD) test. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • REPAIR as necessary.
• Transmission fluid leak at radiator in-tank cooler	• Transmission fluid cooler tubes-to-transmission fluid cooler fitting	• REFER to the Component Test in this section.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Vibration — a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	• Transmission fluid cooler tubes grounded out	• CHECK the transmission fluid cooler tubes. REPAIR as necessary.

Component Test

Transmission Fluid Cooler Leaks at Radiator

Transmission fluid may leak between the radiator transmission fluid cooler and the transmission fluid cooler fitting (not the transmission fluid cooler tube into the transmission fluid cooler fitting), which may result in a residue of transmission fluid on the radiator tank around the transmission fluid cooler fitting. Insufficient thread sealer on the transmission fluid cooler fitting may cause this.

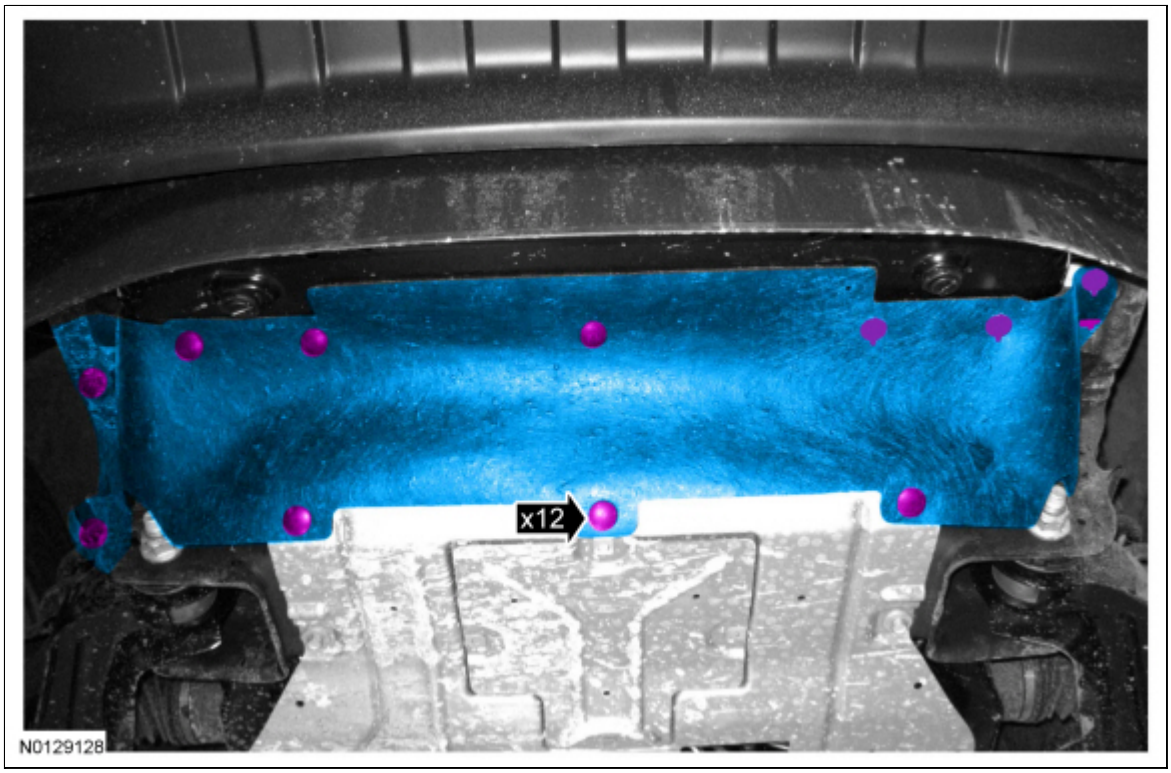
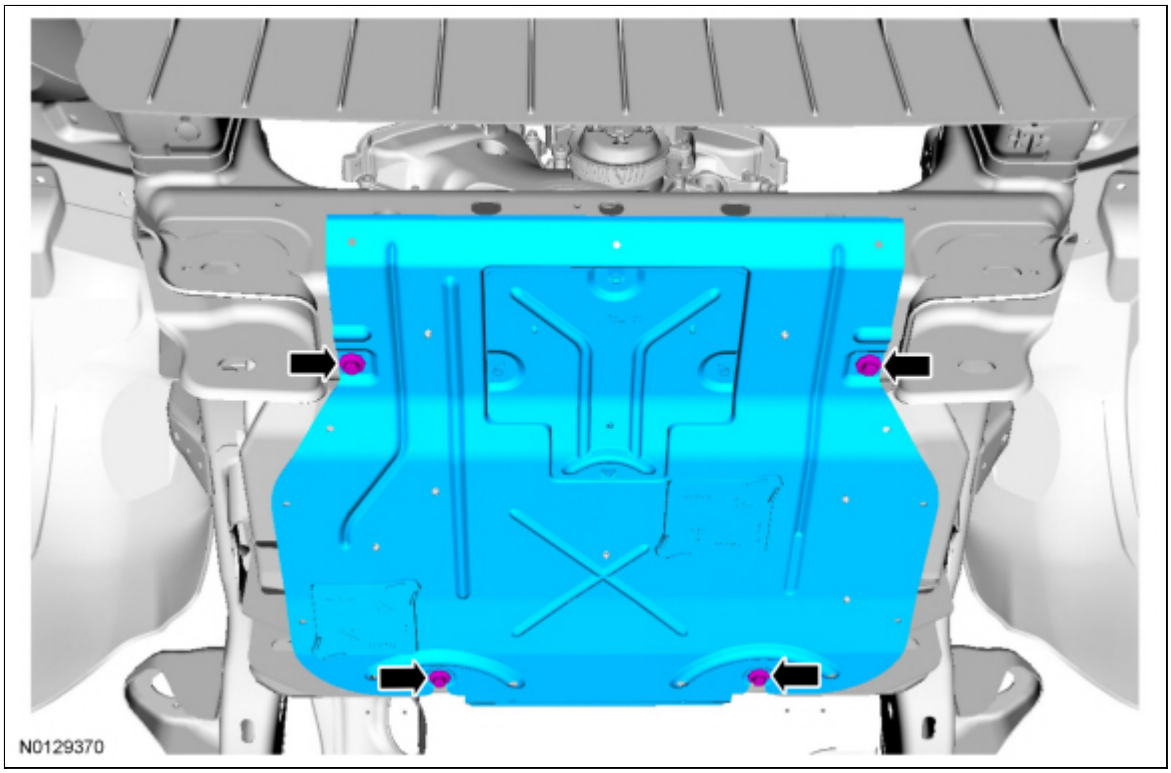
3	7A095	Auxiliary transmission fluid cooler
4	7B028	Auxiliary transmission fluid cooler outlet hose

Removal



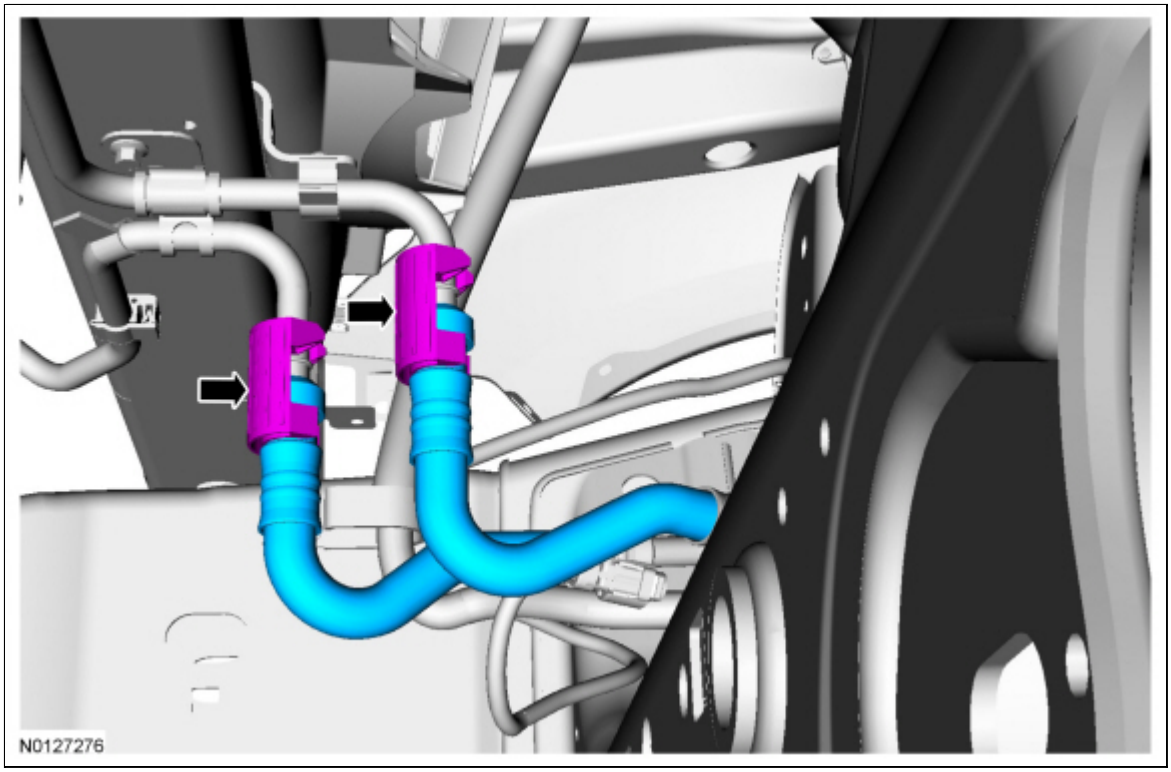
repair4less

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

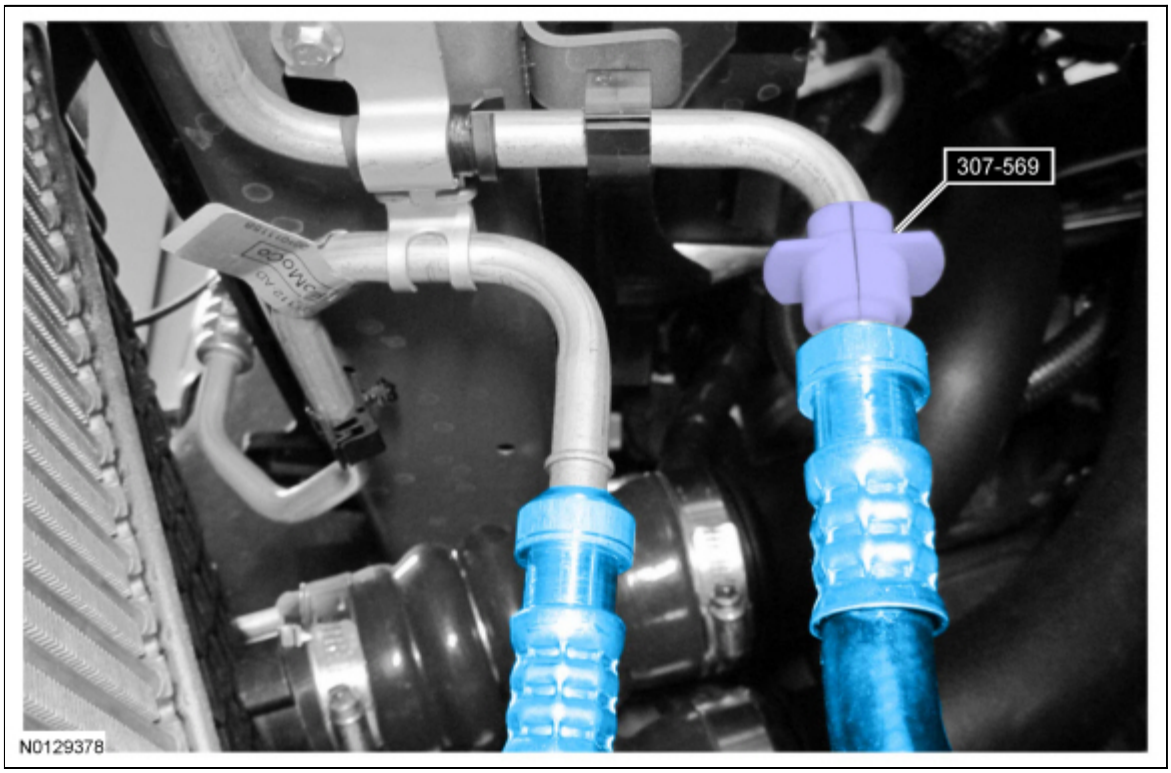


2. If equipped, remove the 4 fasteners and the splash shield.

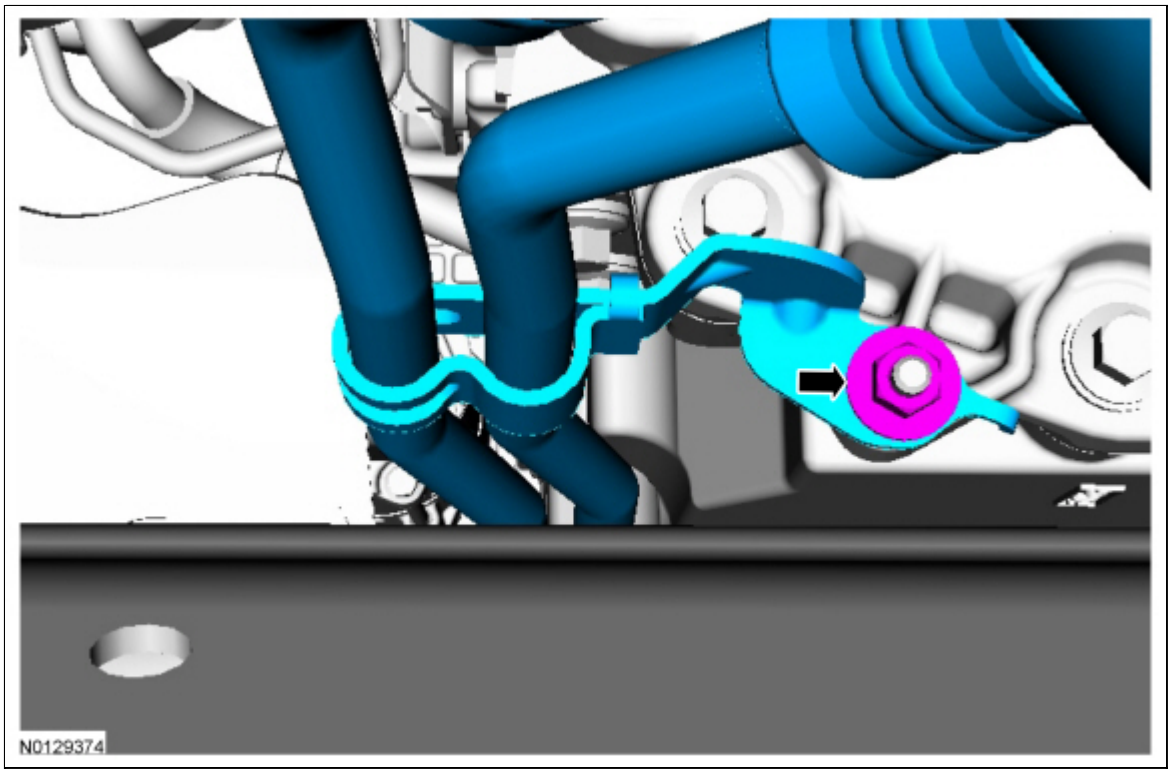
3. If equipped, remove the 12 pushpins and the air deflector.



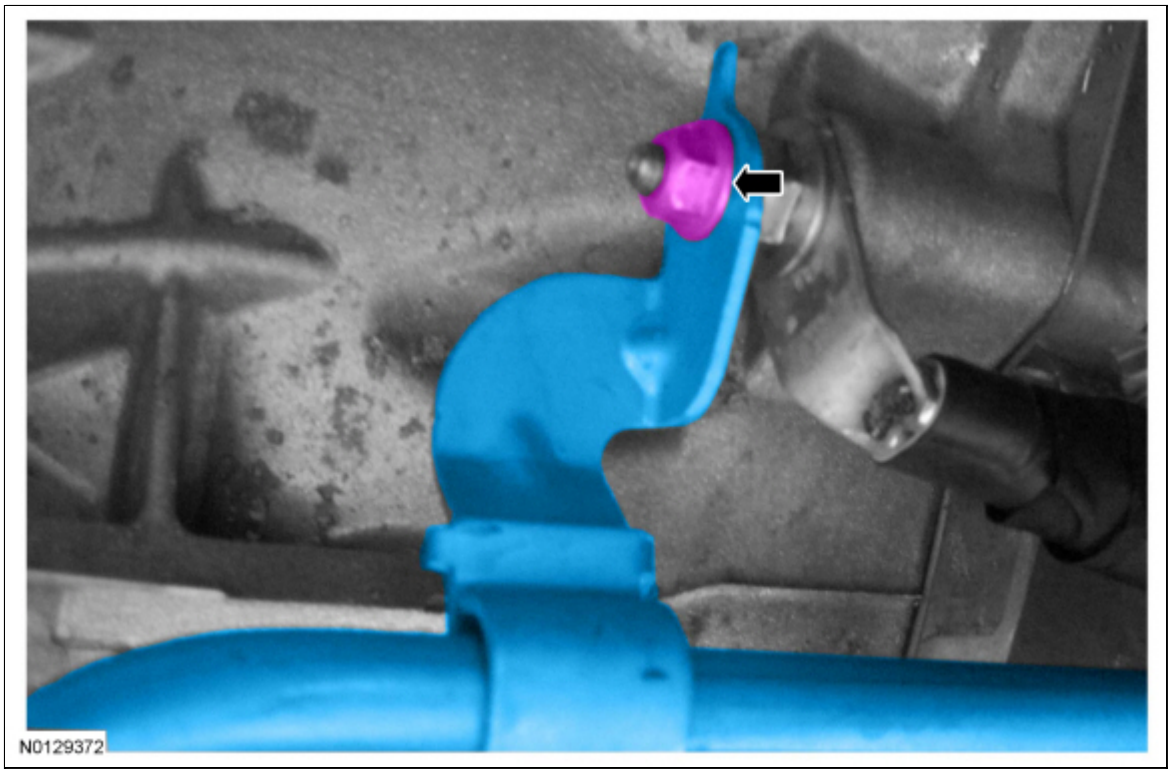
4. If equipped, remove the 4 bolts and the skid plate.



5. Remove the transmission fluid cooler tube secondary latches.

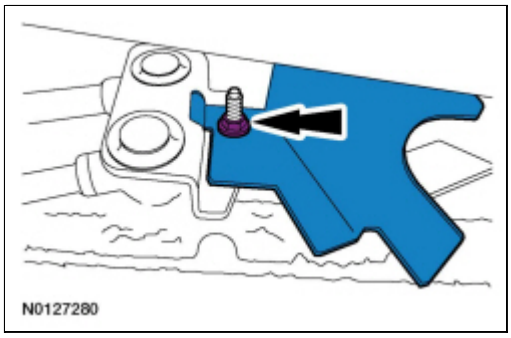


repair4less

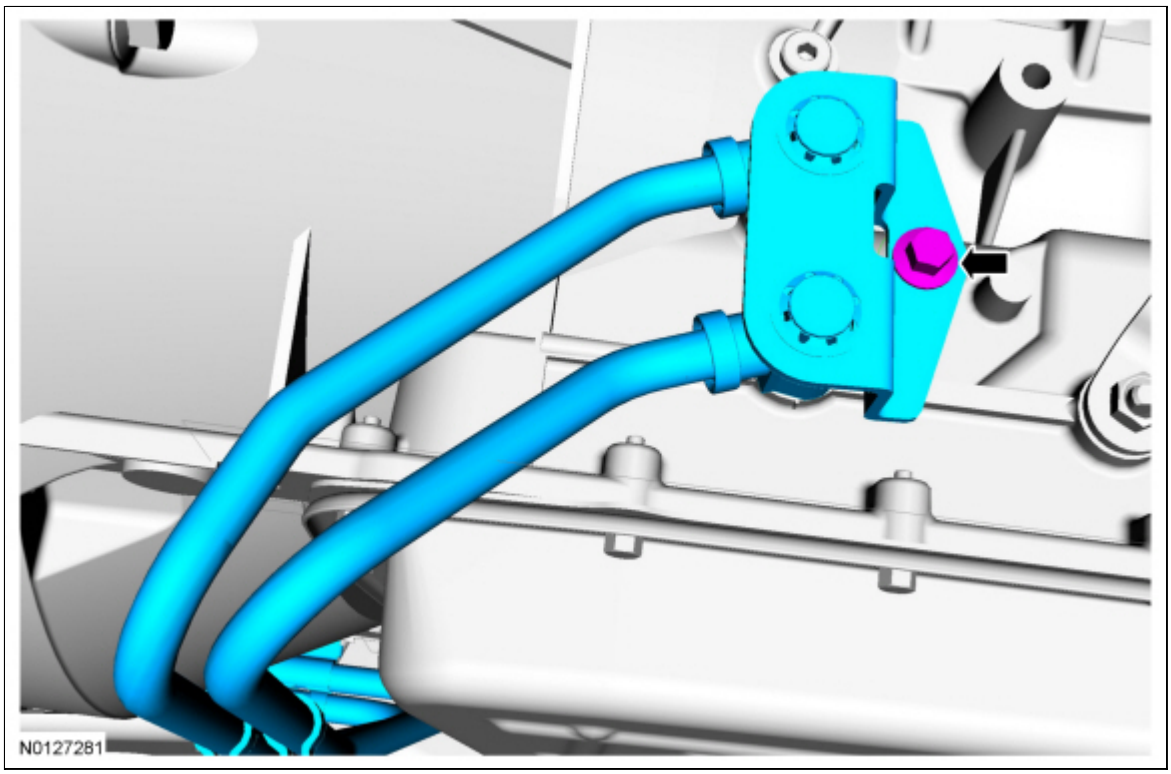


6. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes from the transmission fluid cooler hoses.

7. Remove the transmission fluid cooler tube bracket nut from the front of the engine.

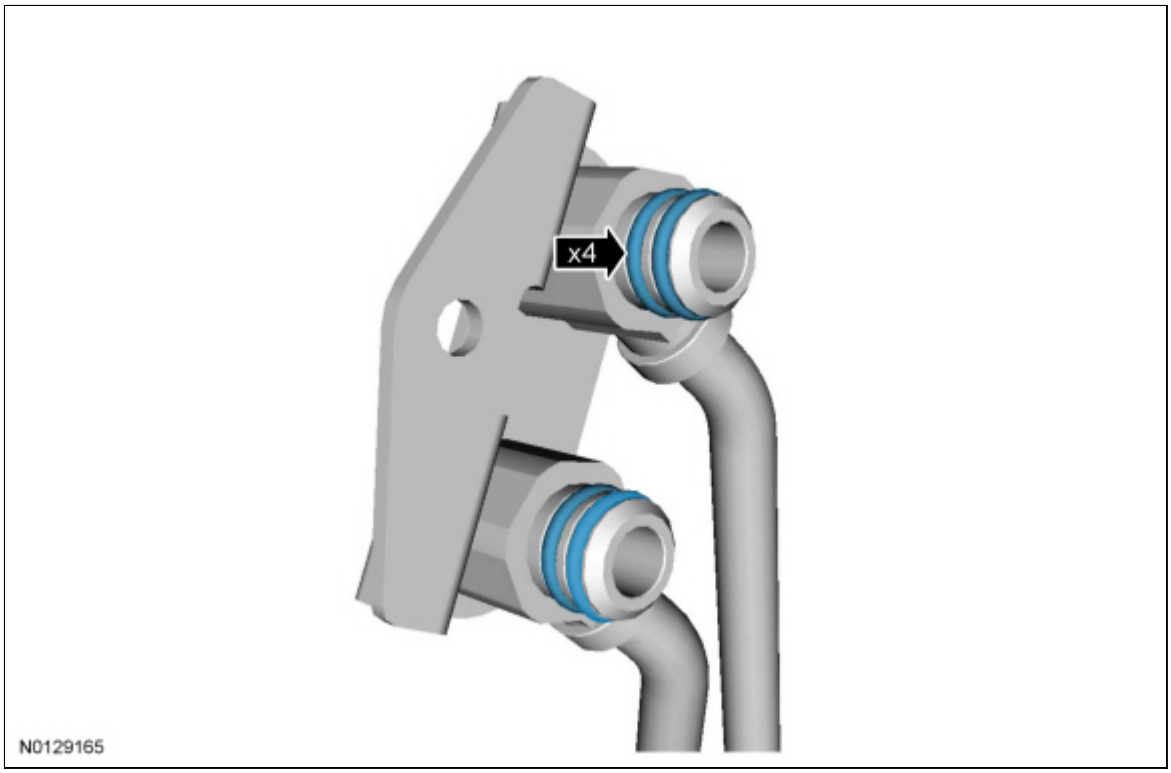


8. Remove the transmission fluid cooler tube bracket nut from the starter motor stud bolt.



9. If equipped, remove the selector lever cable splash shield nut and the selector lever cable splash shield.

repair4less

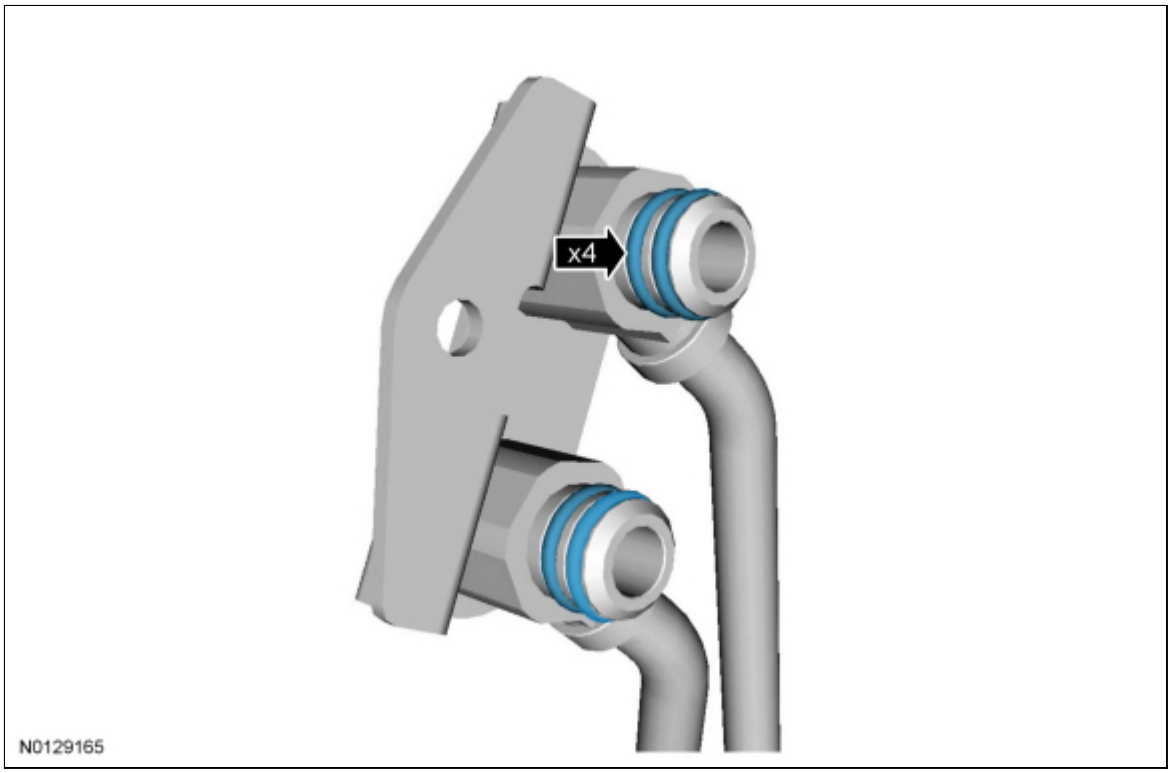


10. **NOTE:** The transmission fluid cooler tube O-rings may remain in the transmission case. Carefully remove them from the case if retained.

    Remove and discard the transmission fluid cooler tubes-to-transmission bolt and separate the transmission fluid cooler tubes from the transmission.

11. Remove and discard the 4 O-rings on the transmission fluid cooler tubes.

12. Remove the transmission fluid cooler tubes from the transmission.



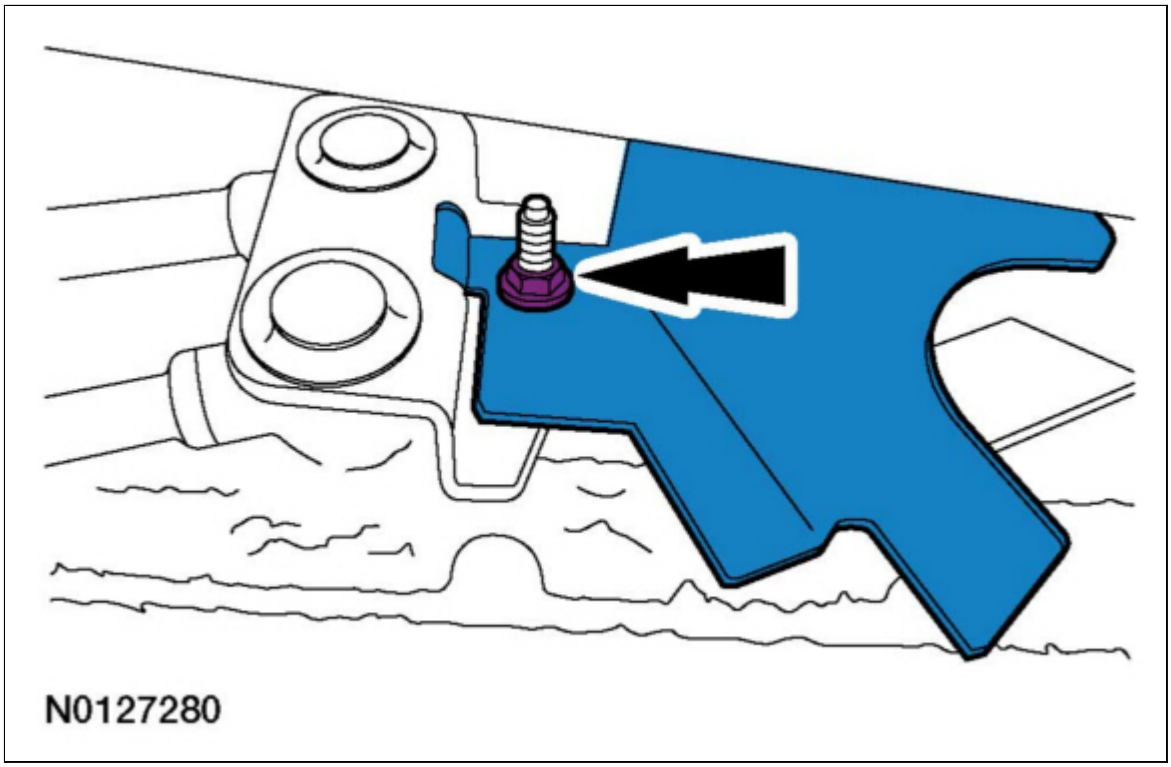
Installation

1. Route the transmission fluid cooler tubes and position them in place.

2. **NOTE:** Inspect the transmission case to make sure that the transmission fluid cooler tube O-rings did not remain in the transmission case. Carefully remove and discard them from the case if retained.

   Install 4 new O-rings on the transmission fluid cooler tubes.

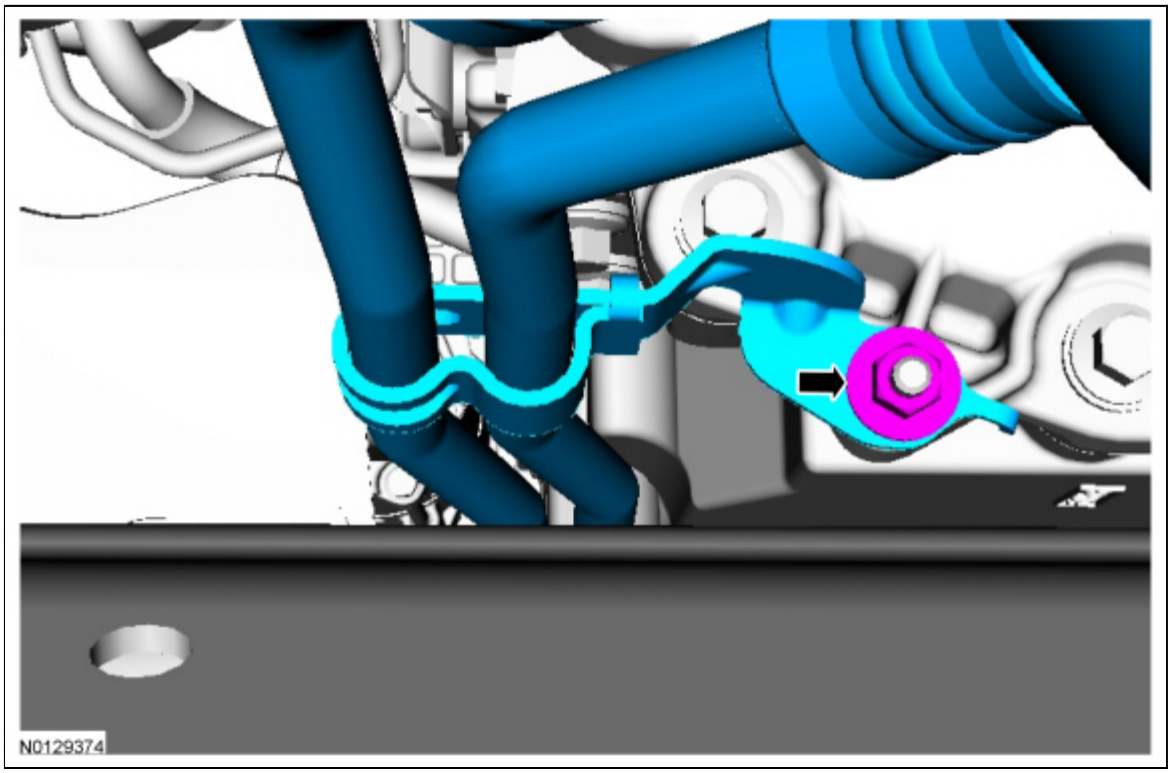
repair4less



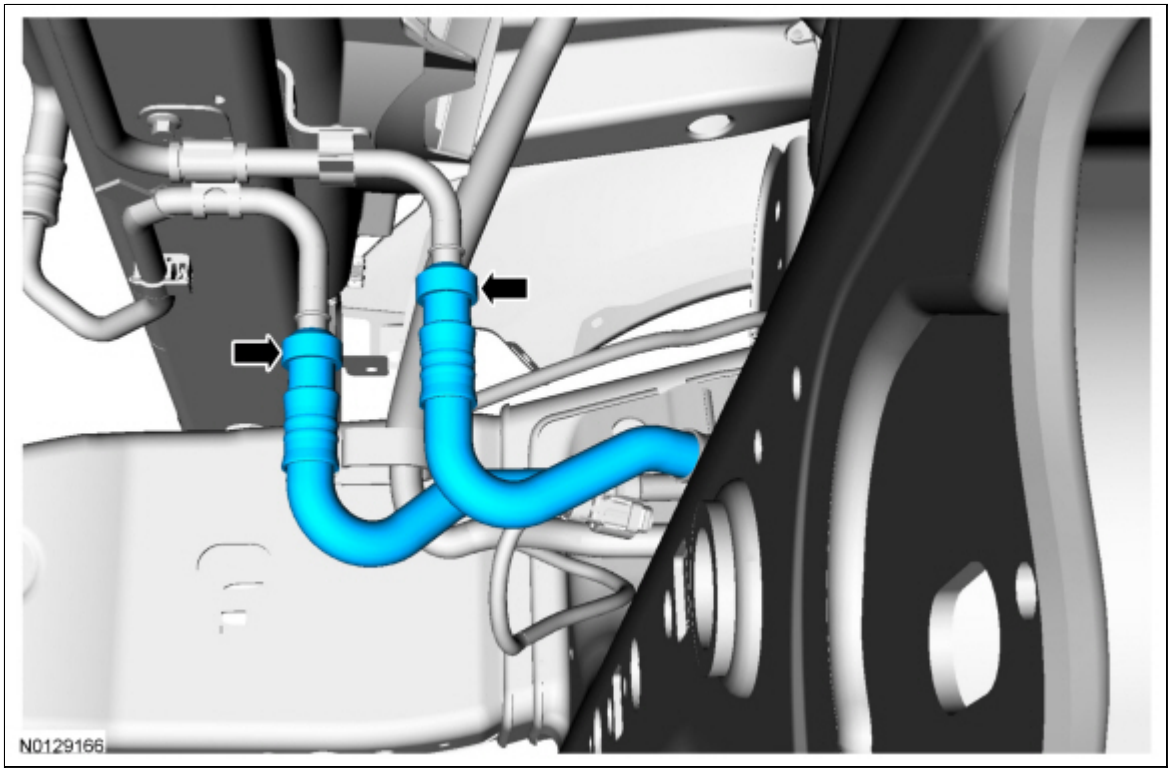
3. ***NOTICE:*** **Install a new transmission fluid cooler tubes-to-transmission bolt.**

   Install the transmission fluid cooler tubes and a new transmission fluid cooler tubes-to-transmission bolt.
   - Tighten to 30 Nm (22 lb-ft).

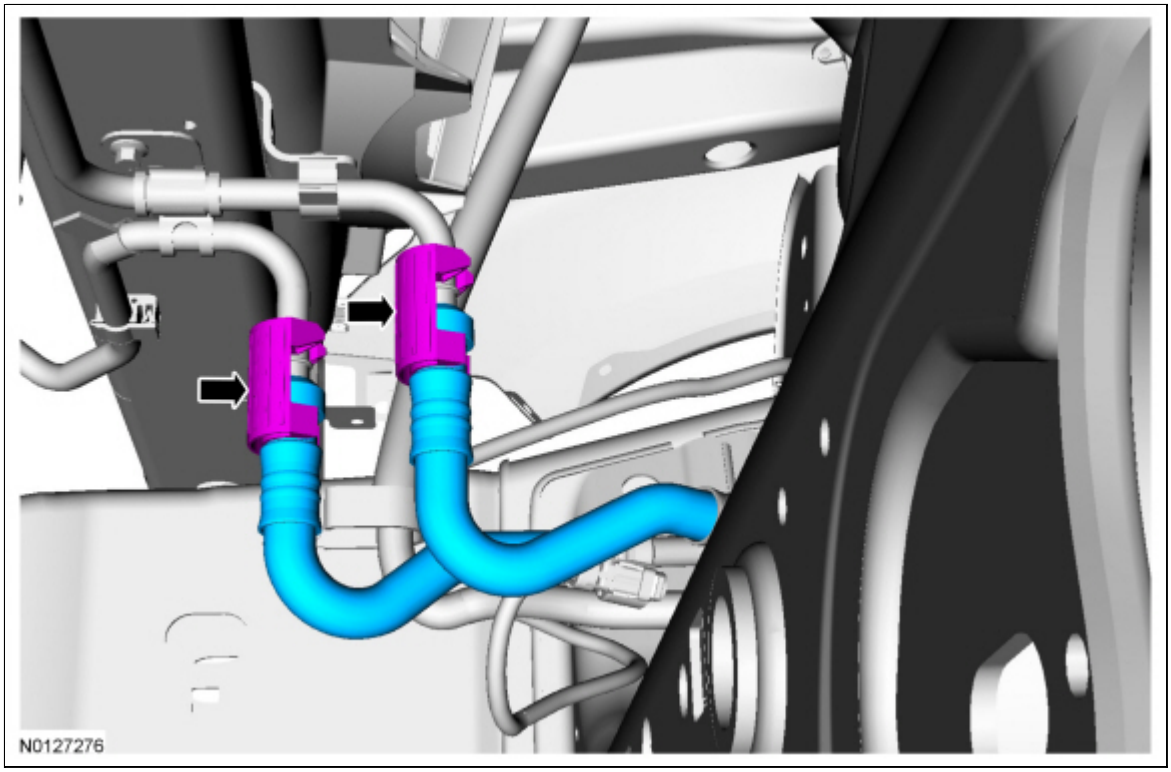
4. If equipped, install the selector lever cable splash shield and the splash shield nut.
    - Tighten to 12 Nm (106 lb-in).



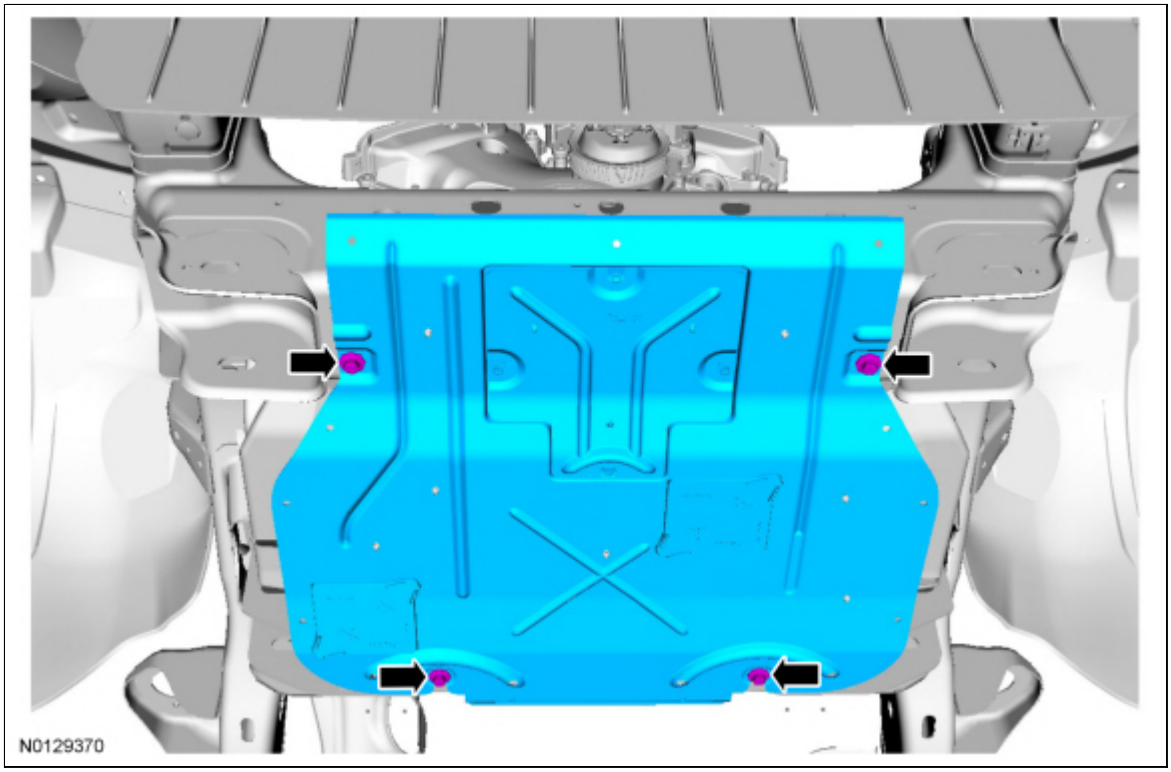
5. Install the transmission fluid cooler tube bracket nut to the starter motor stud bolt.
    - Tighten to 12 Nm (106 lb-in).



repair4less

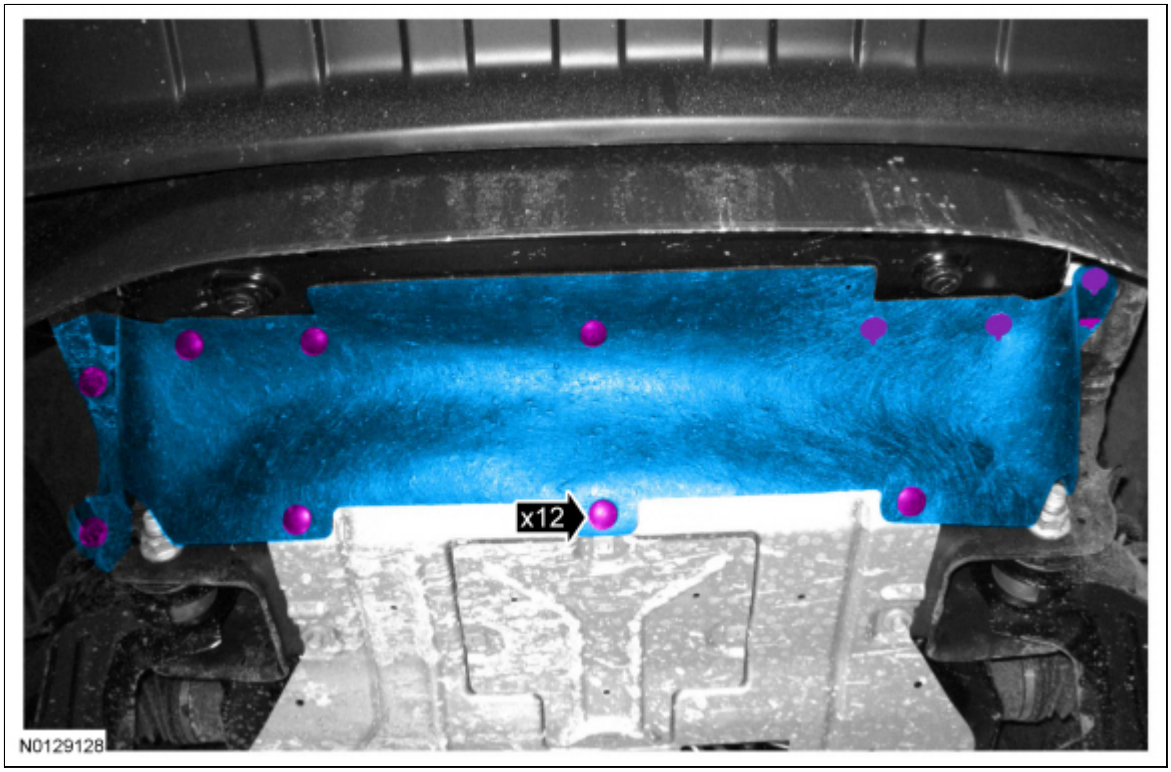


6. Install the transmission fluid cooler tube bracket nut to the front of the engine.
    - Tighten to 12 Nm (106 lb-in).

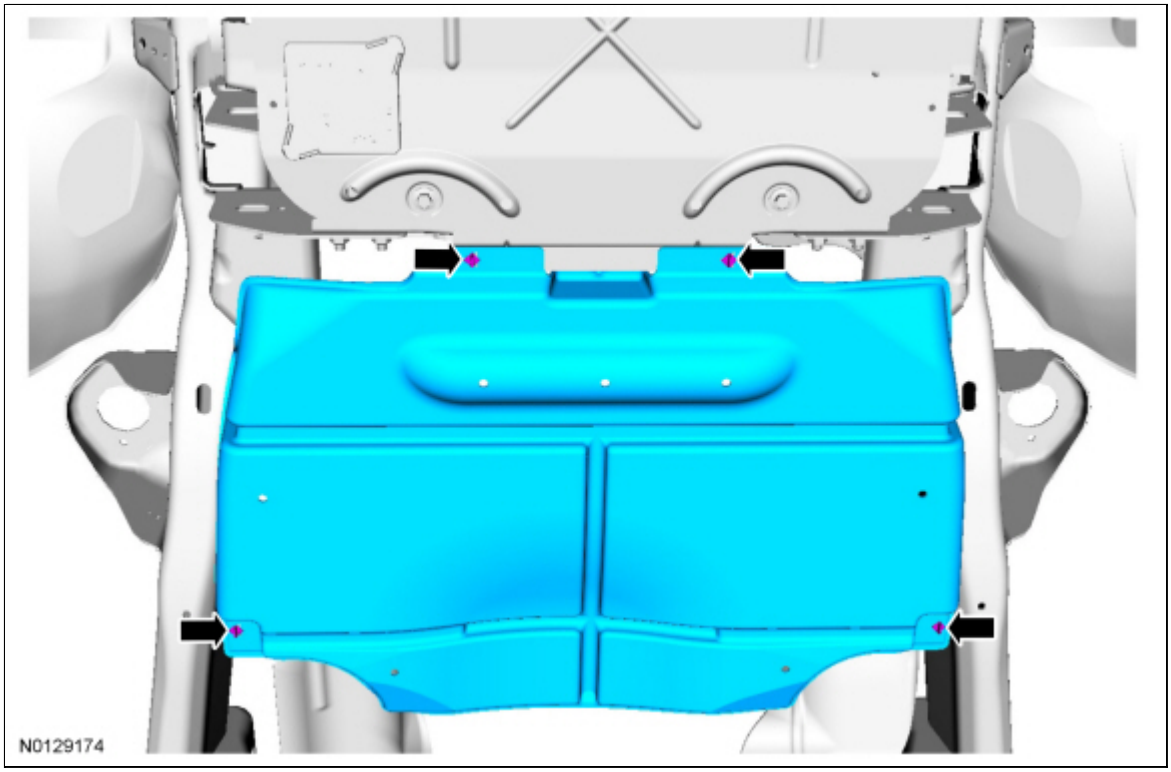


7. Connect the transmission fluid cooler tubes to the transmission fluid cooler hoses.

8. Install the transmission fluid cooler tube secondary latches.



9. If equipped, install the skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).



repair4less

10. If equipped, install the air deflector and the 12 pushpins.

11. If equipped, install the splash shield and the 4 fasteners.

12. Fill the transmission with fluid and verify correct operation. For additional information, refer to

Transmission Fluid Level Check in Section 307-01 .

13. Check for leaks.

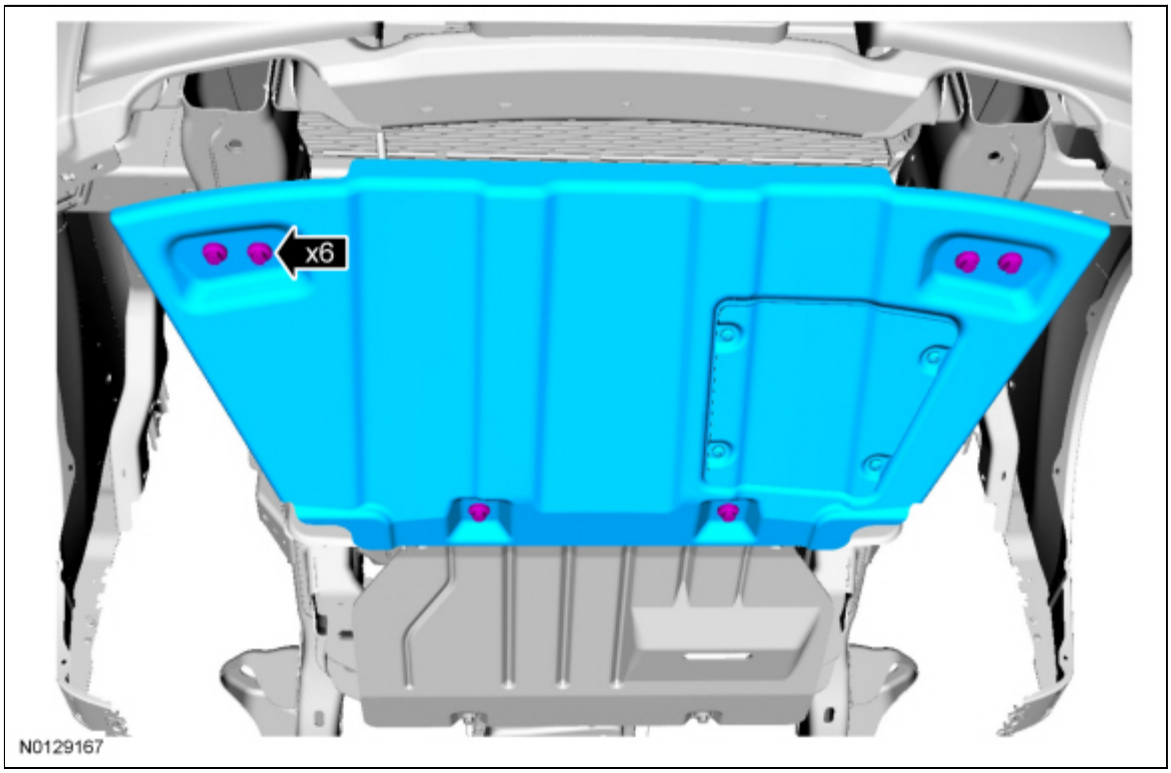
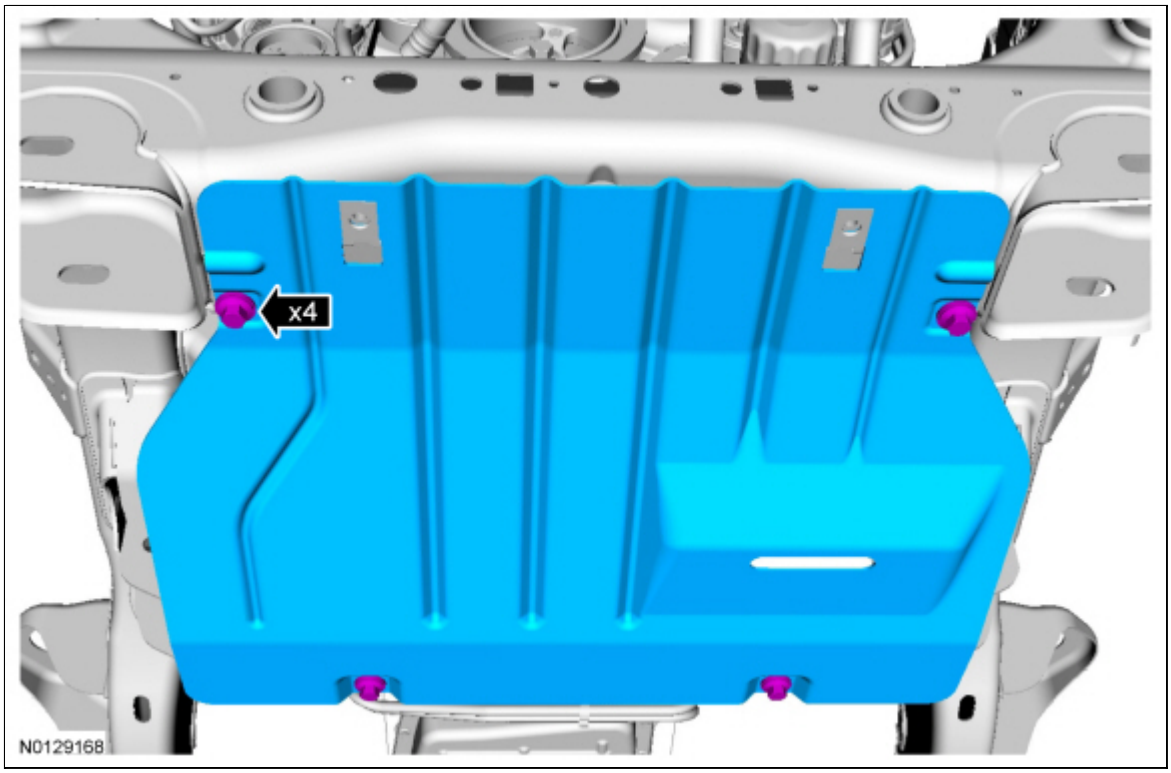
Removal



All vehicles

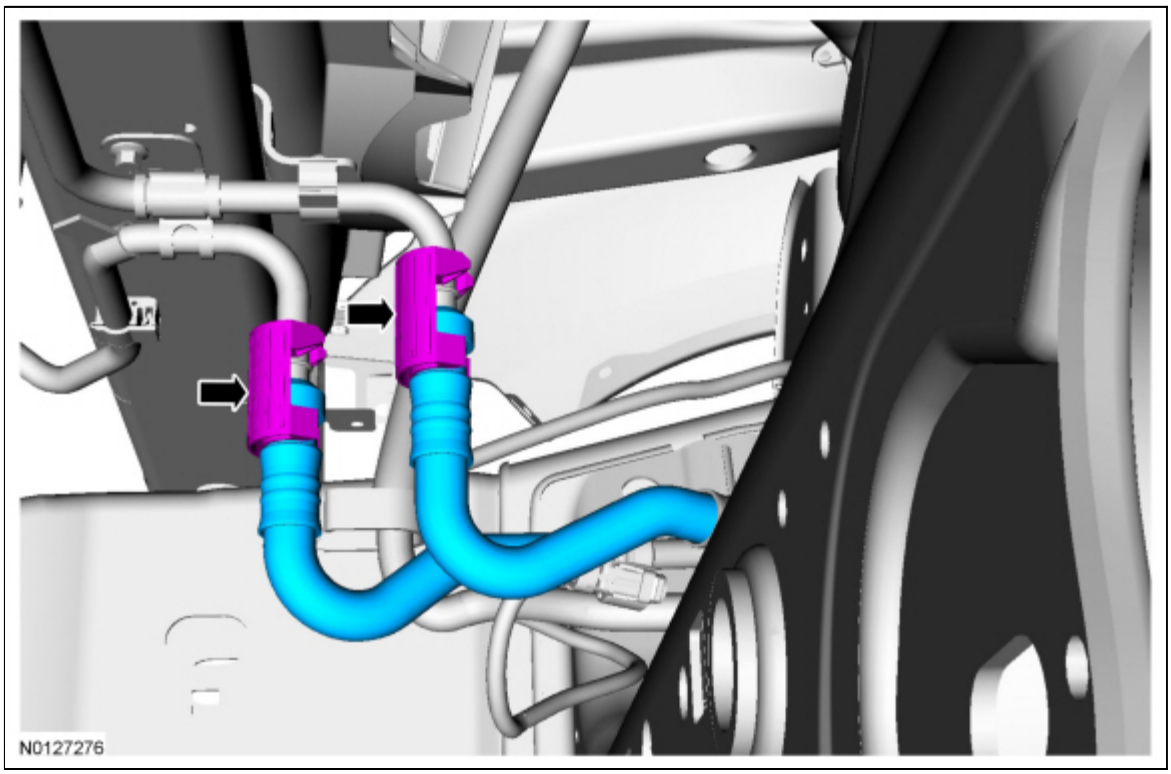
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



repair4less

4WD

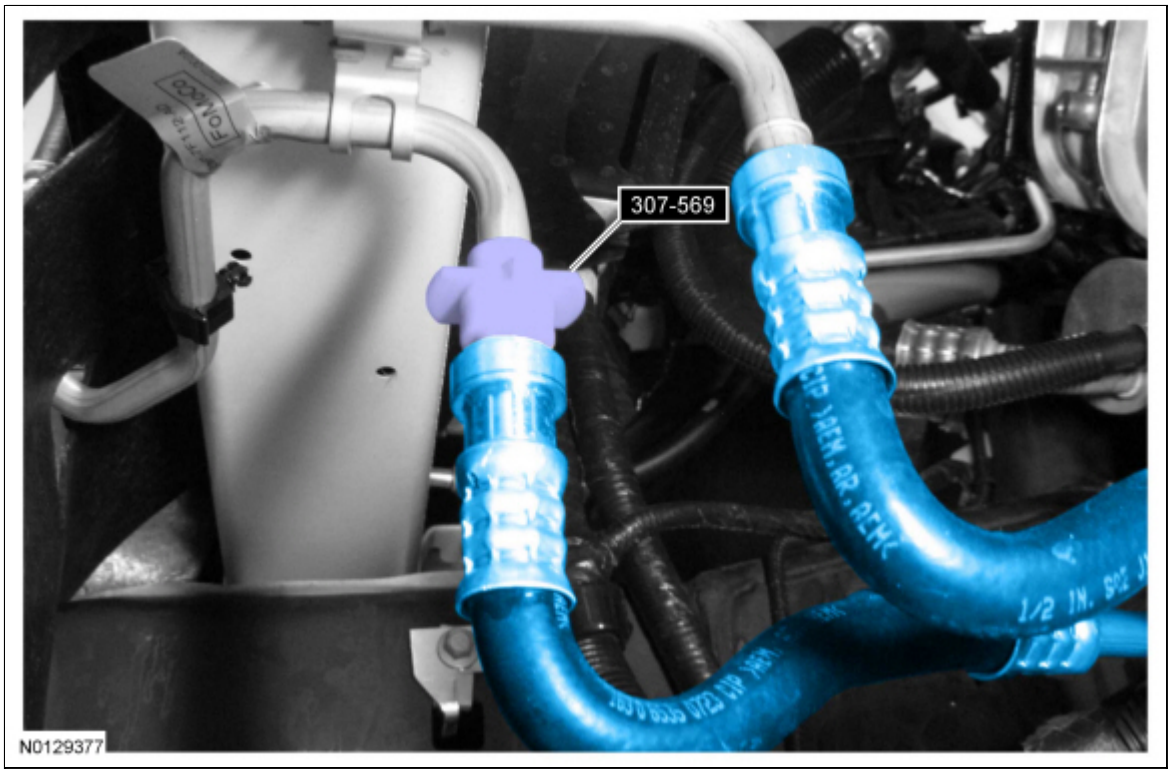
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. If equipped, remove the 6 bolts and the forward skid plate.



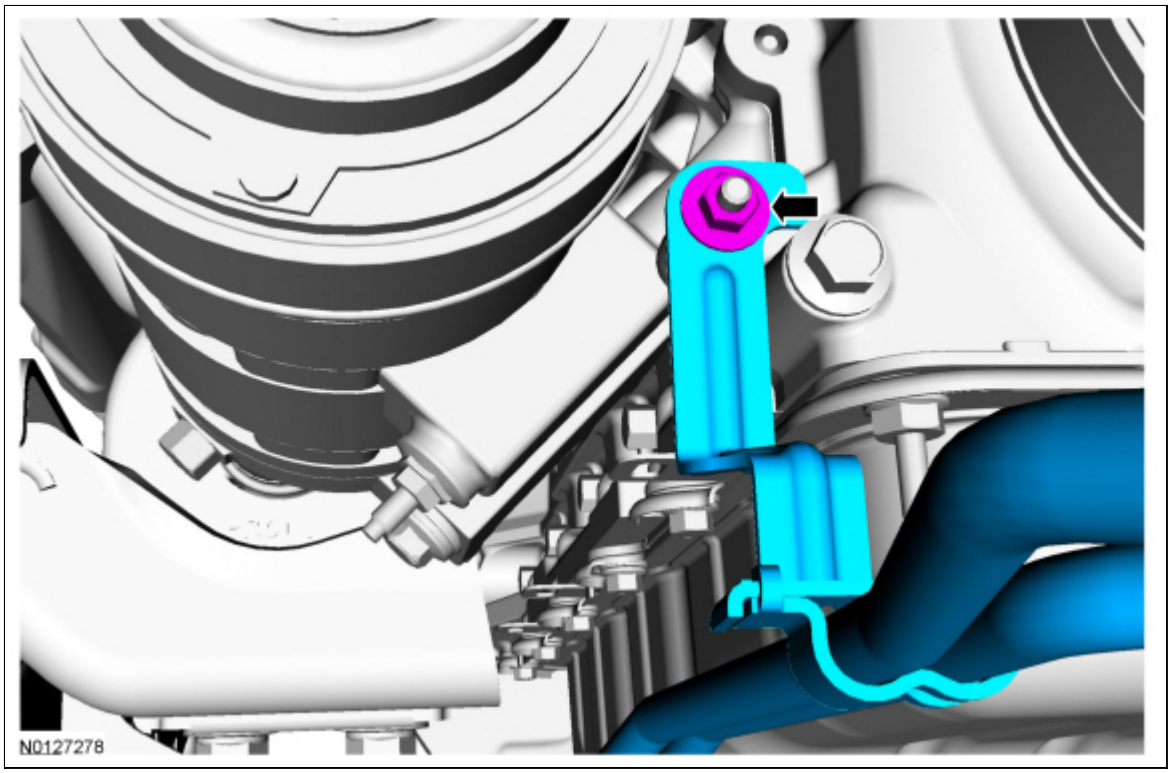
4. Remove the 4 bolts and the rearward skid plate.

All vehicles

NOTE: 5.0L (4V) Shown, 6.2L (2V) similar.

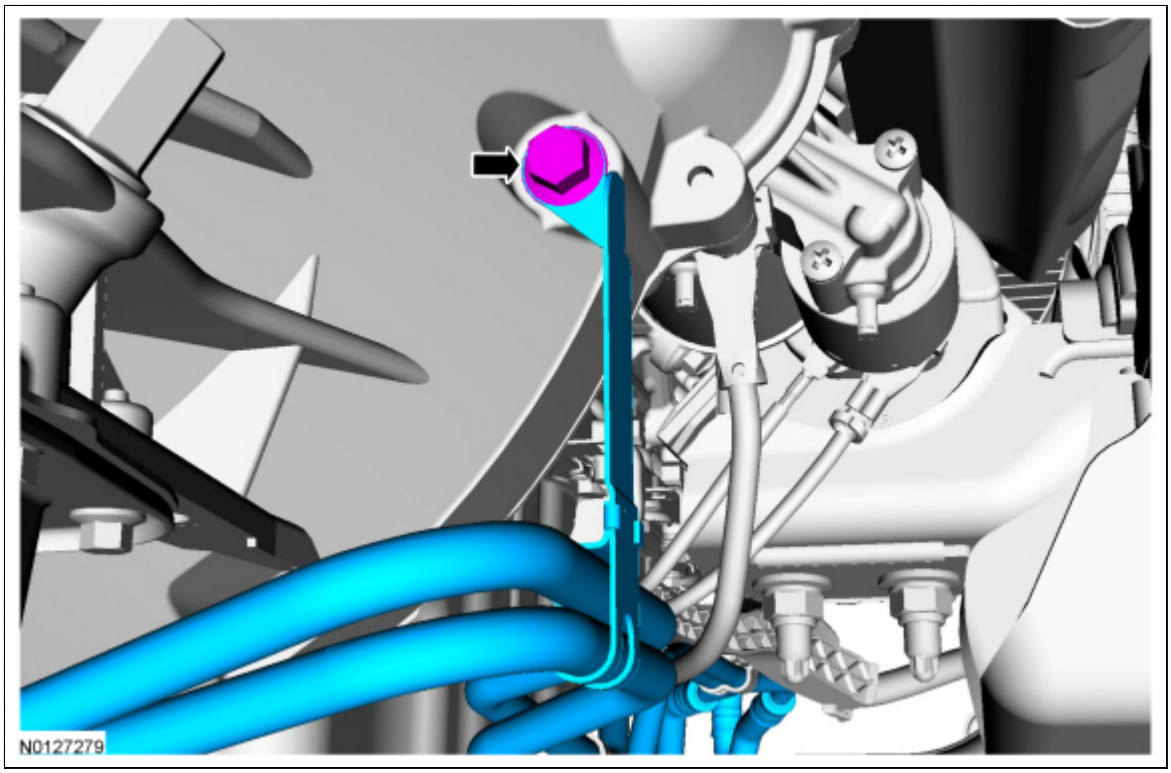


5. Remove the transmission fluid cooler tube secondary latches.



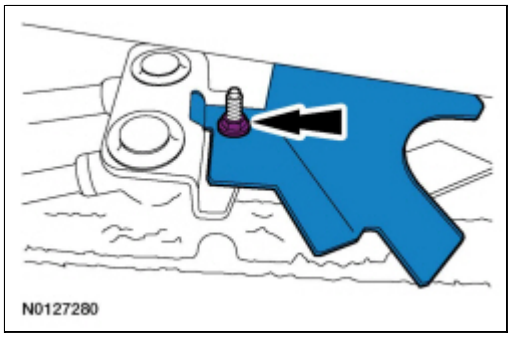
repair4less

NOTE: 5.0L (4V) Shown, 6.2L (2V) similar.

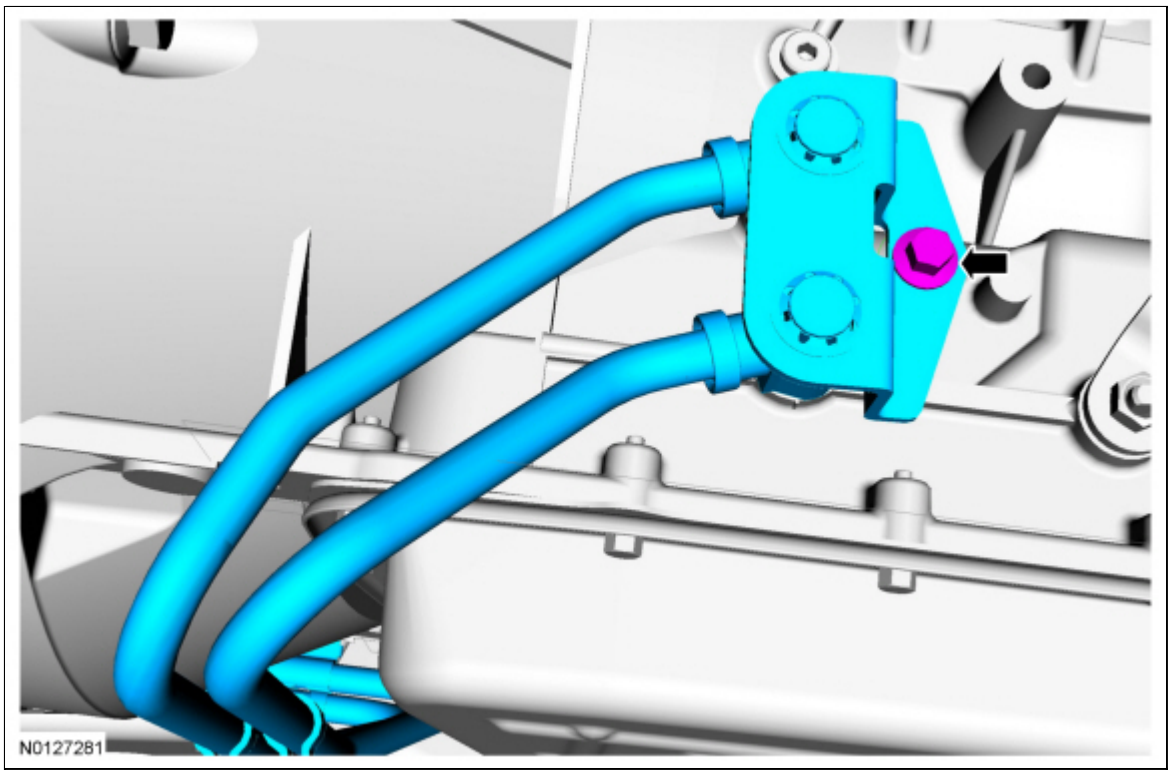


6. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes from the transmission fluid cooler hoses.

7. Remove the transmission fluid cooler tube bracket nut from the front of the engine.

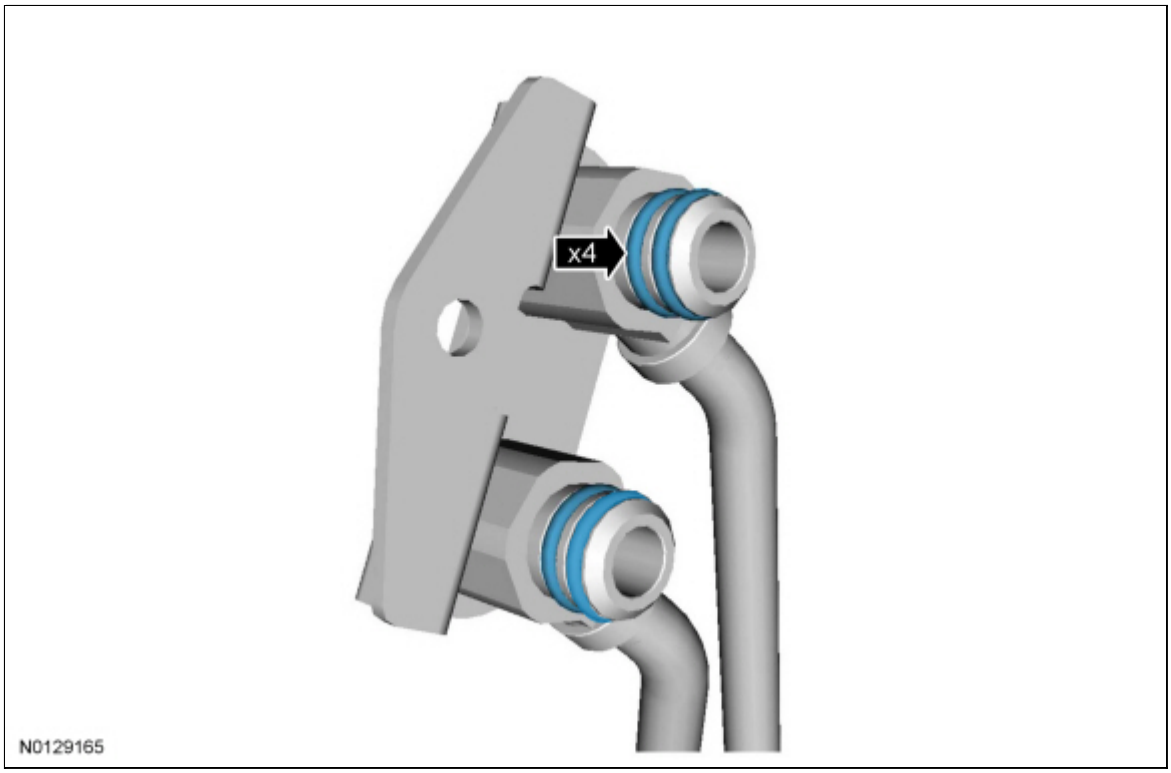


8. Remove the transmission-to-engine bolt and transmission fluid cooler tube bracket from the engine.



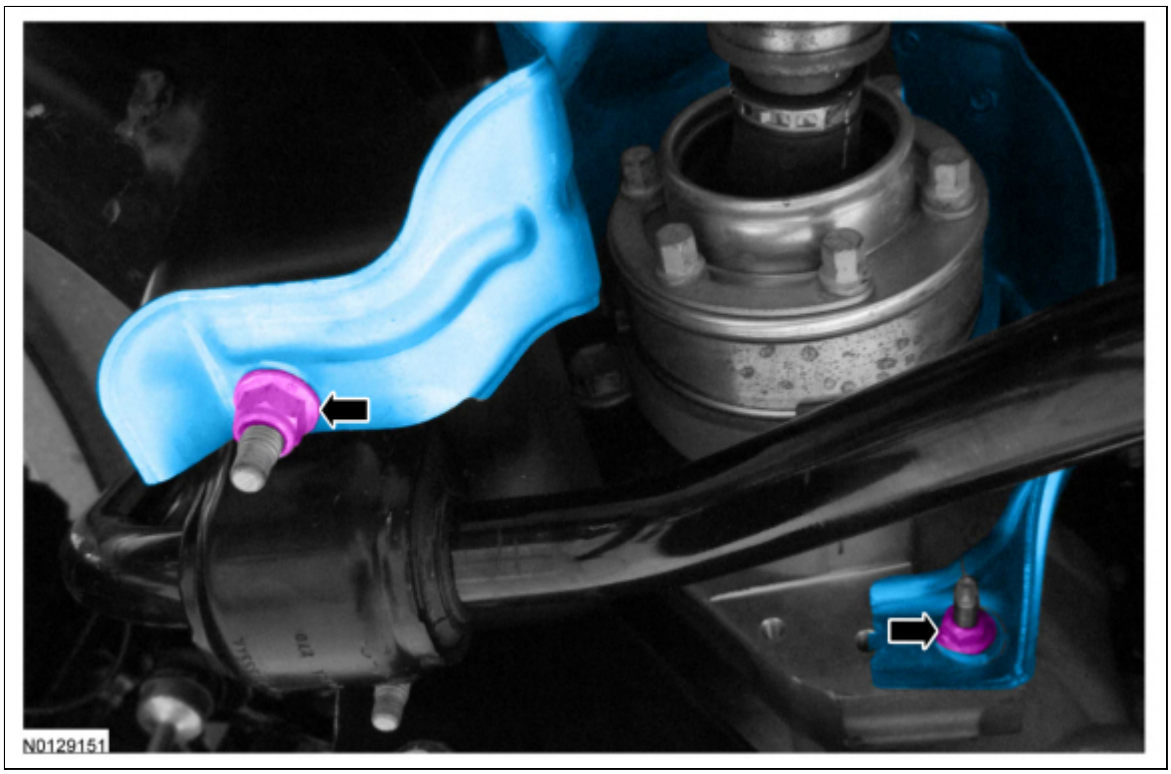
9. If equipped, remove the nut and the selector lever cable splash shield.

repair4less



10. **NOTE:** The transmission fluid cooler tube O-rings may remain in the transmission case. Carefully remove them from the case if retained.

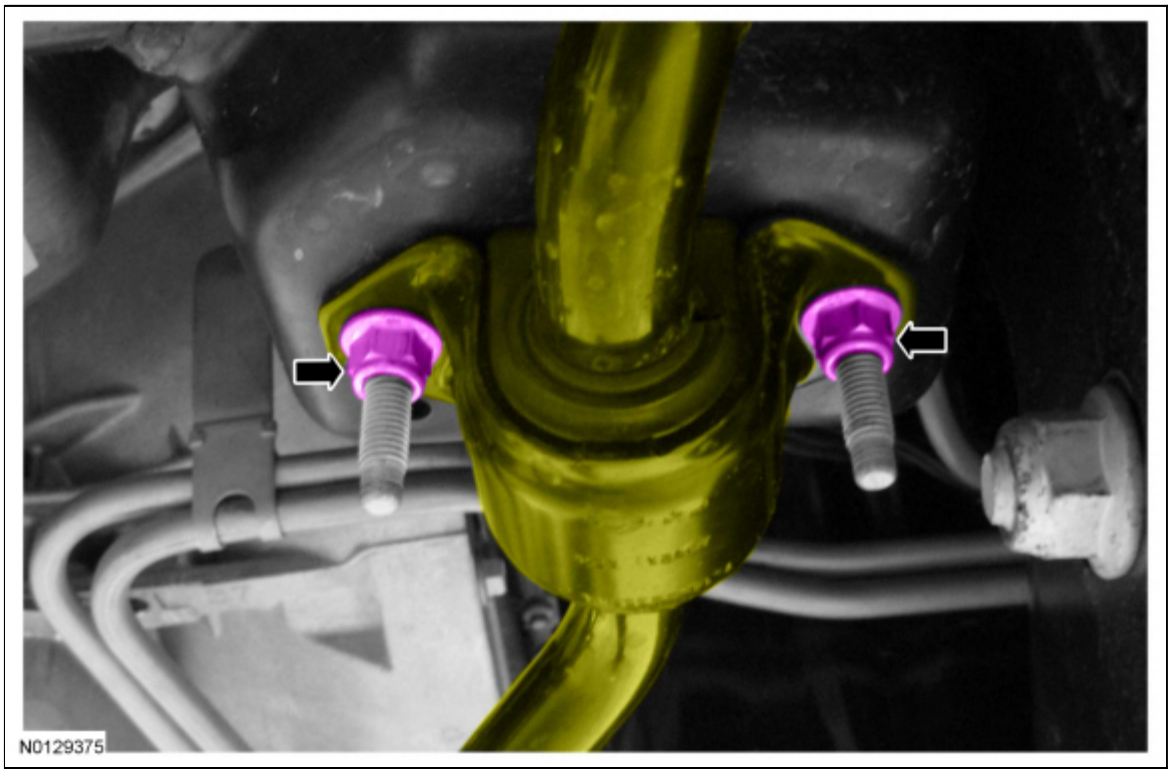
    Remove and discard the transmission fluid cooler tubes-to-transmission bolt and separate the transmission fluid cooler tubes from the transmission.



11. Remove and discard the 4 O-rings on the transmission fluid cooler tubes.

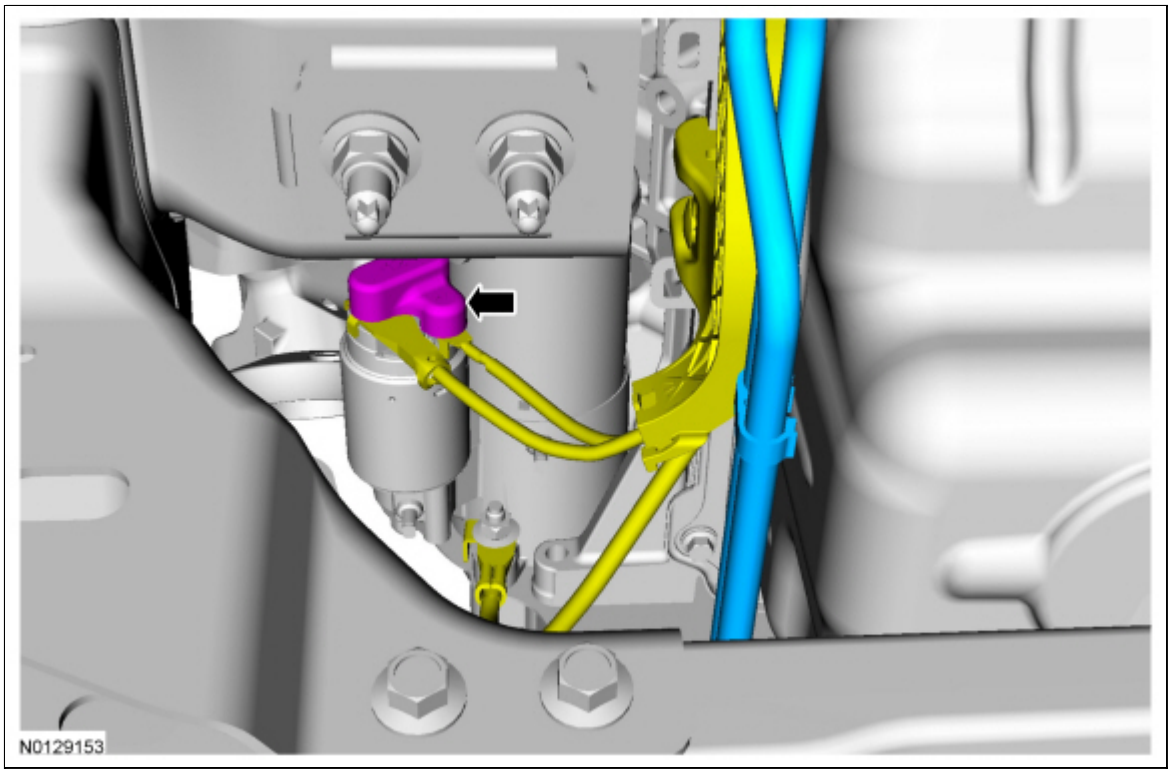
Raptor

12. Remove the 2 nuts and the heat shield.



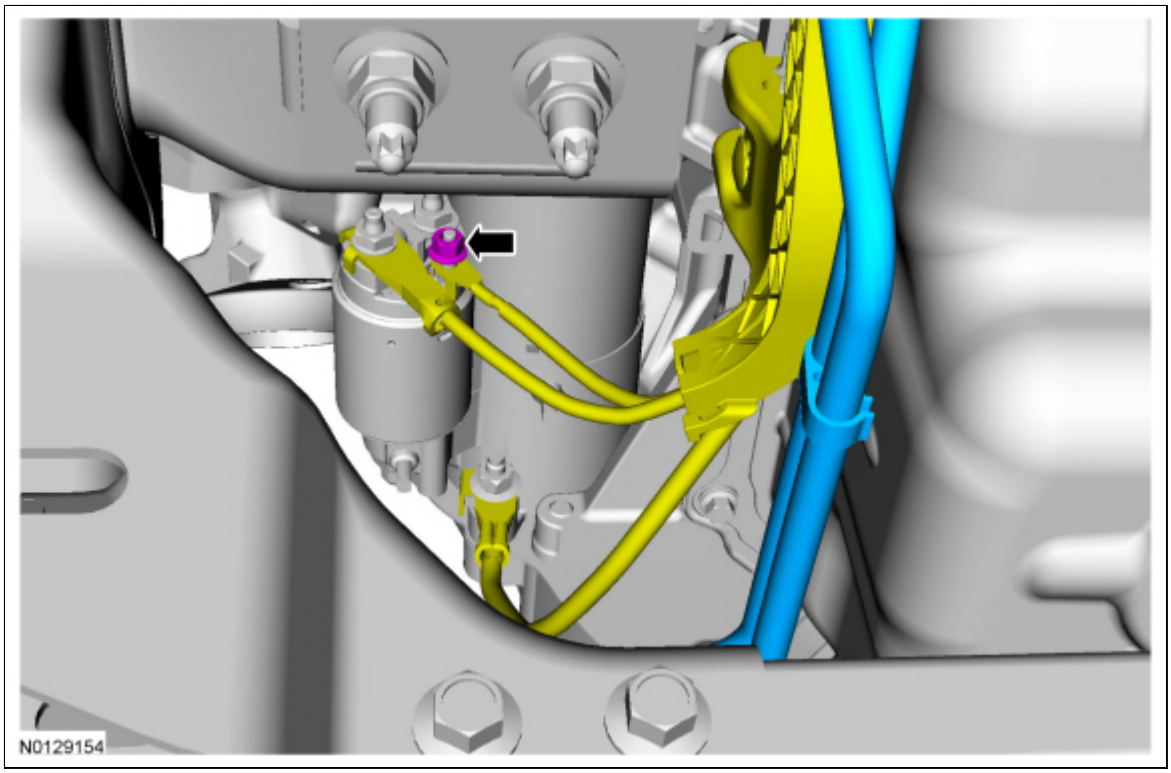
All vehicles

repair4less



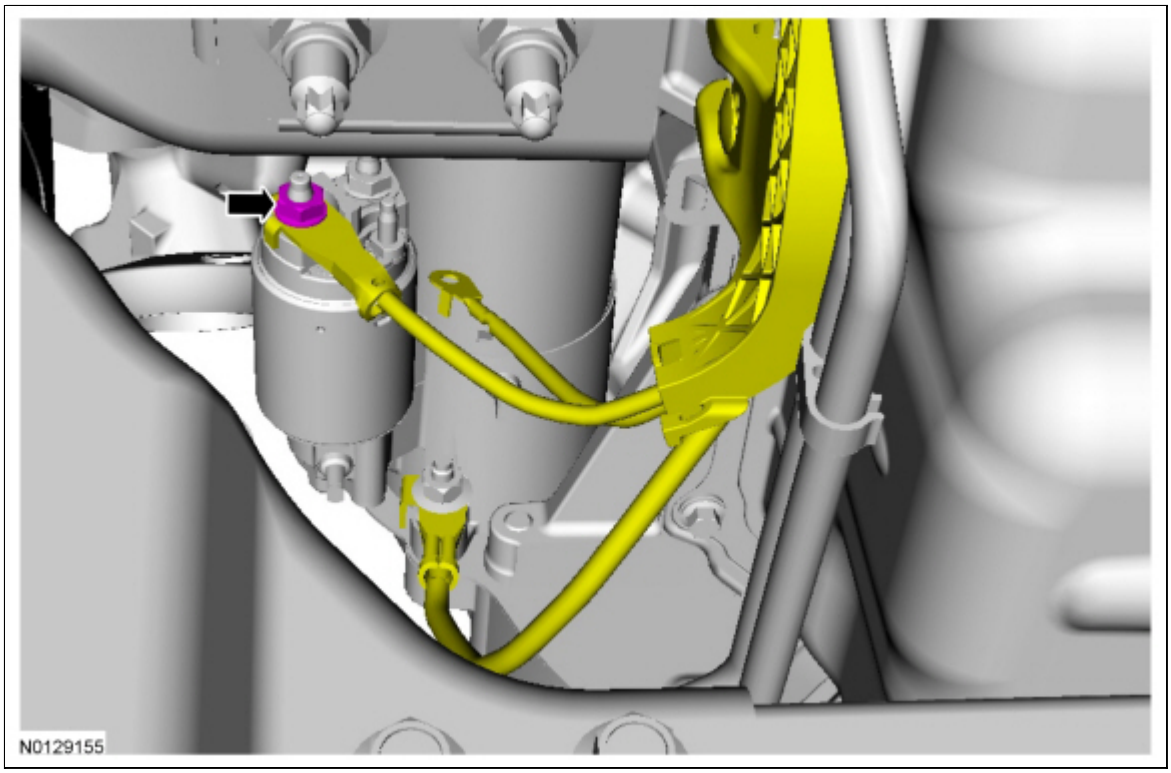
13. **NOTE:** Right side shown, left side similar.

    Remove and discard the 4 nuts and lower the front sway bar.

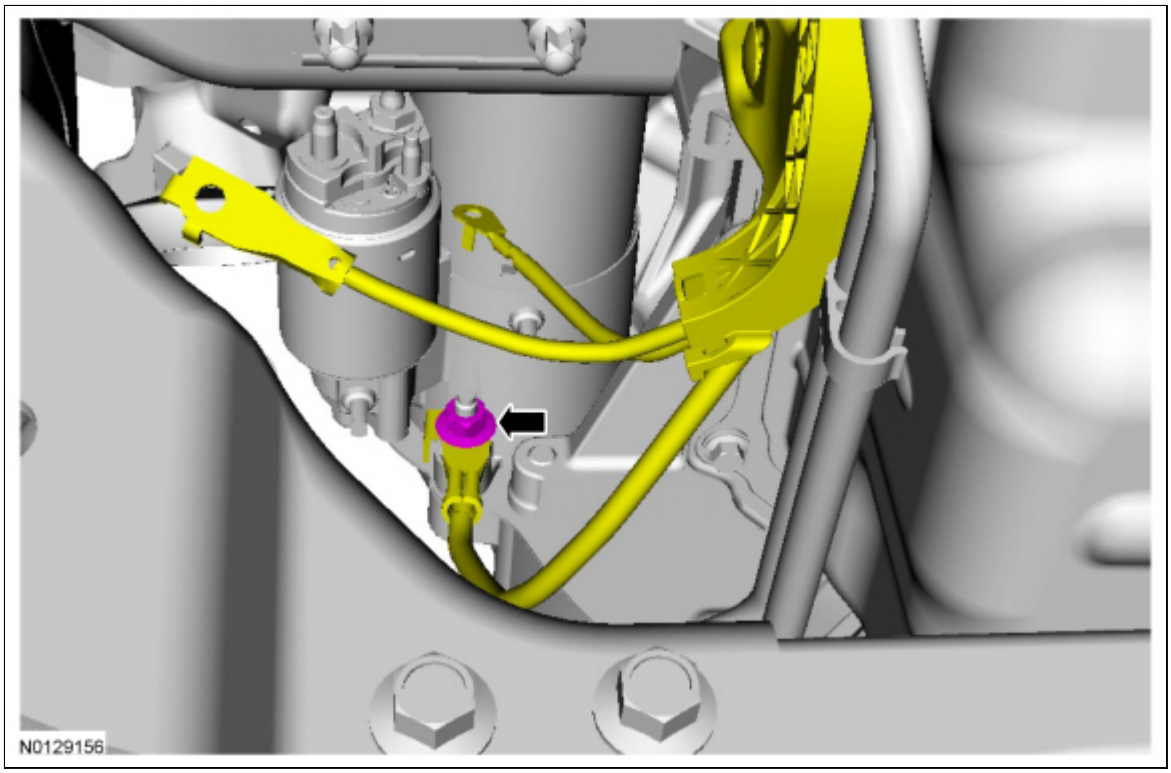


4WD

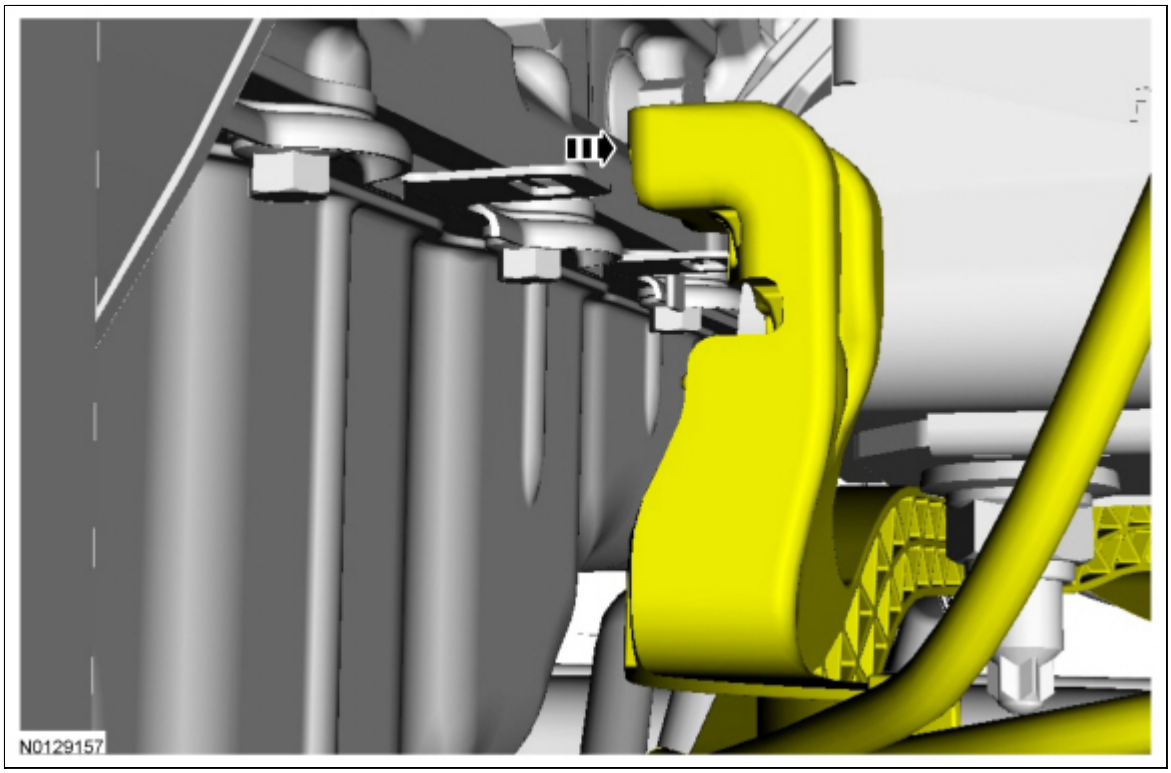
14. Remove the starter terminal cover.



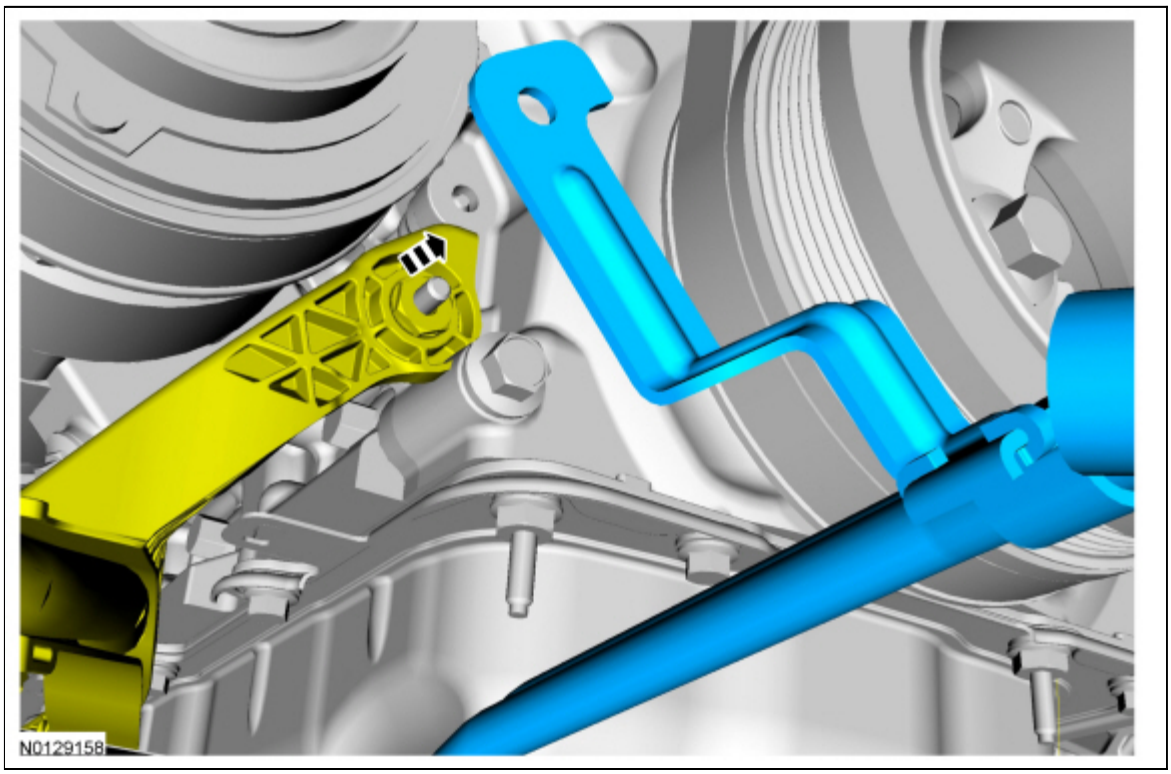
15. Remove the nut and disconnect the starter solenoid S-terminal eyelet.



16. Remove the nut and disconnect the starter solenoid B-terminal eyelet.

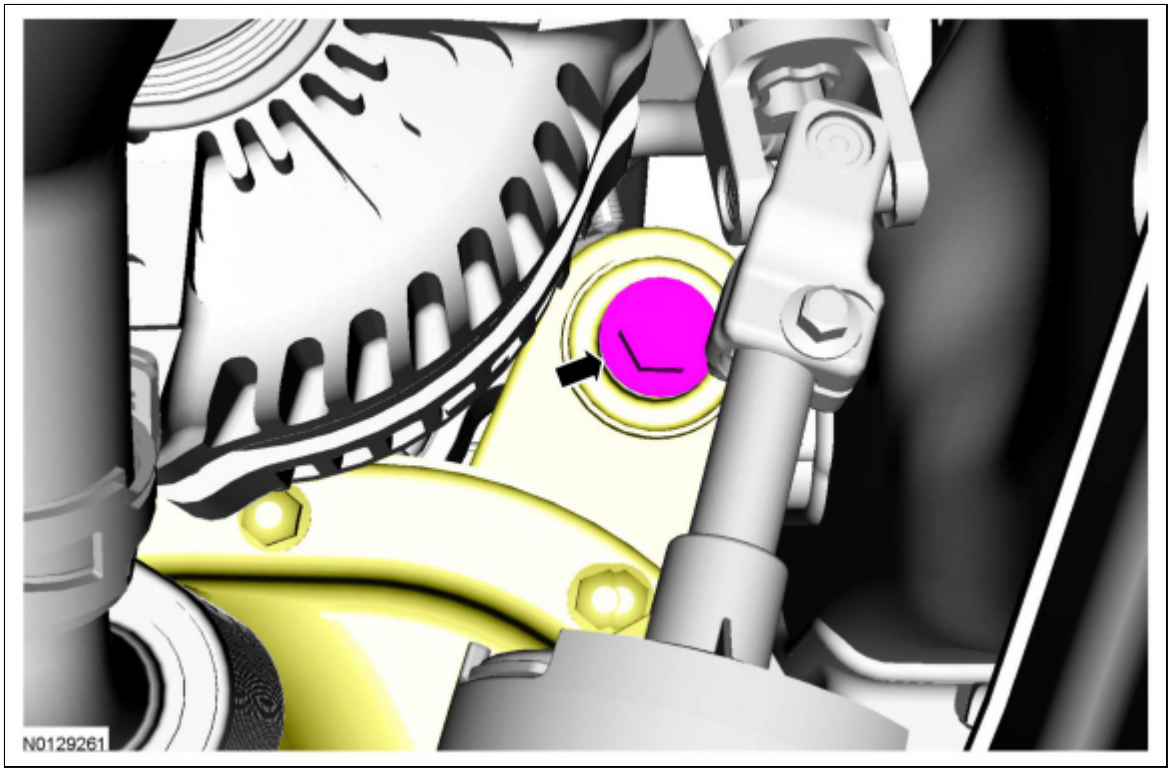


repair4less

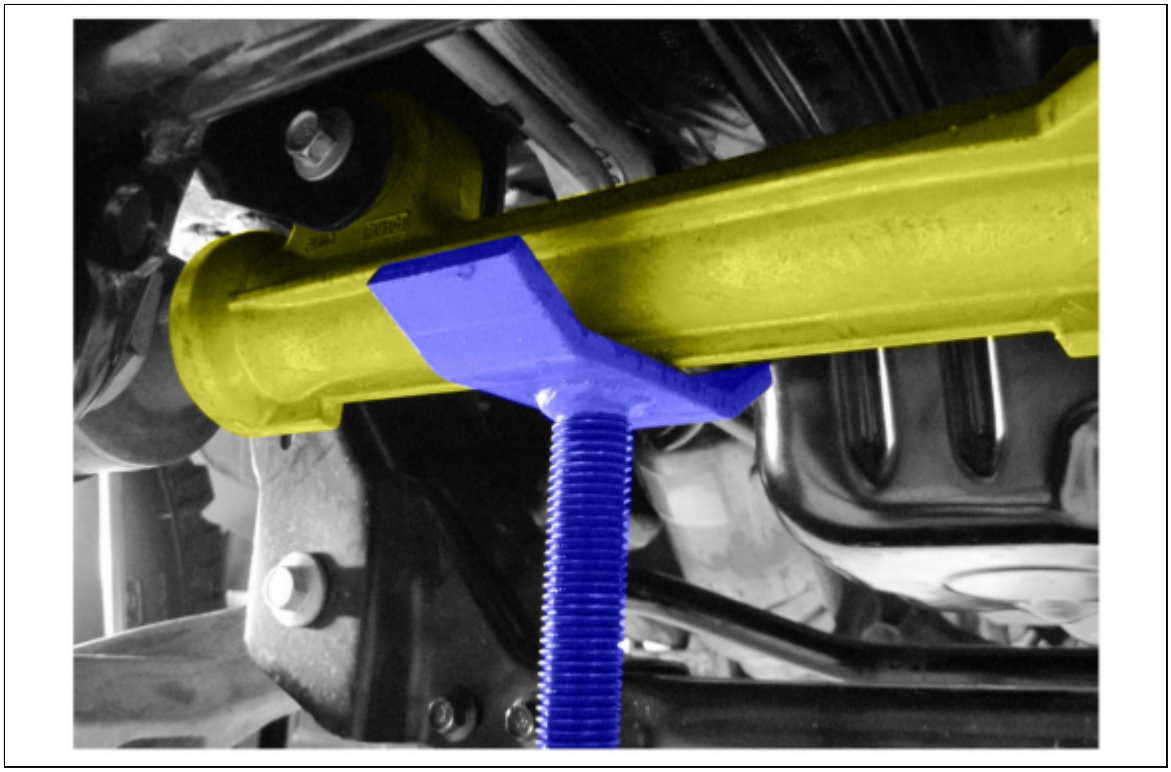


17. Remove the nut and disconnect the starter motor ground cable eyelet.

18. Detach the starter wiring harness from the oil pan.

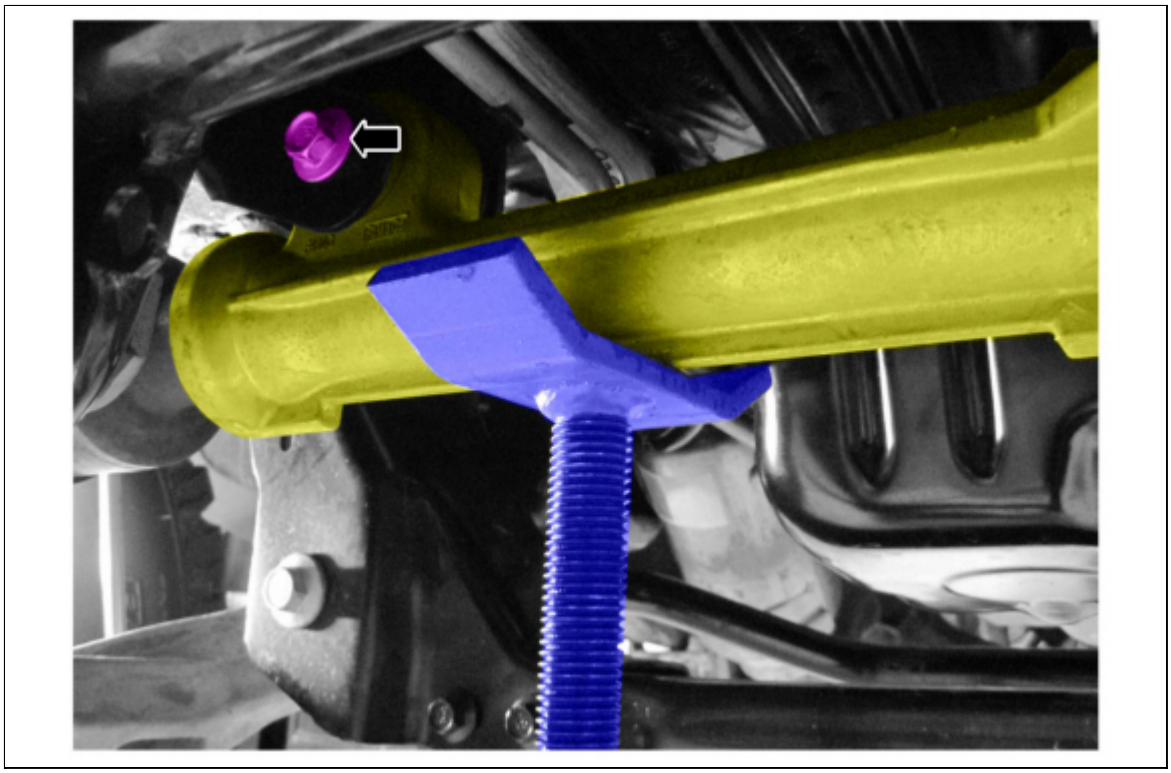


19. Remove the starter wiring harness form the front engine cover stud and position the starter wiring harness aside.



20. **NOTE:** Rotate the steering column so that the pinch bolt for the steering column coupler allows clearance for the upper front axle carrier mounting bushing bolt.

repair4less



Remove the upper front axle carrier mounting bushing bolt.

21. Position a jack stand under the right side of the front axle.

22. Remove the axle shaft housing carrier bushing bolt.

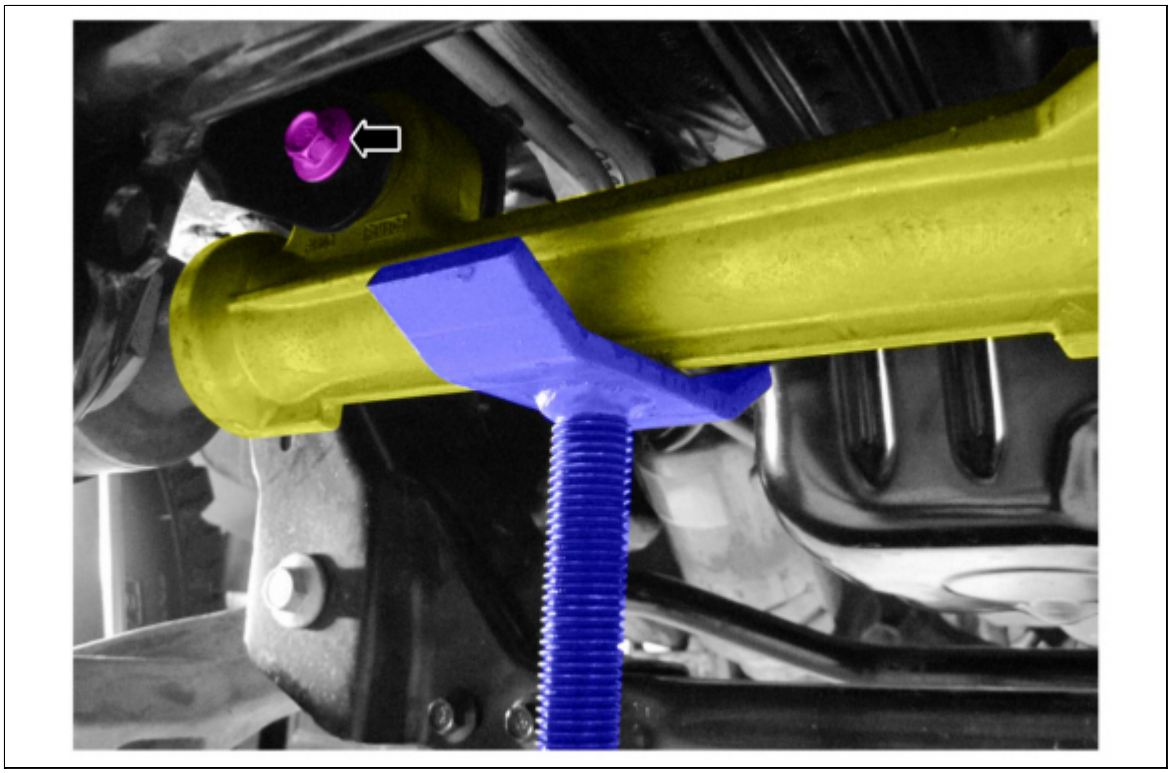
23. Lower the right side of the front axle.

All vehicles

24. Remove the transmission fluid cooler tubes.

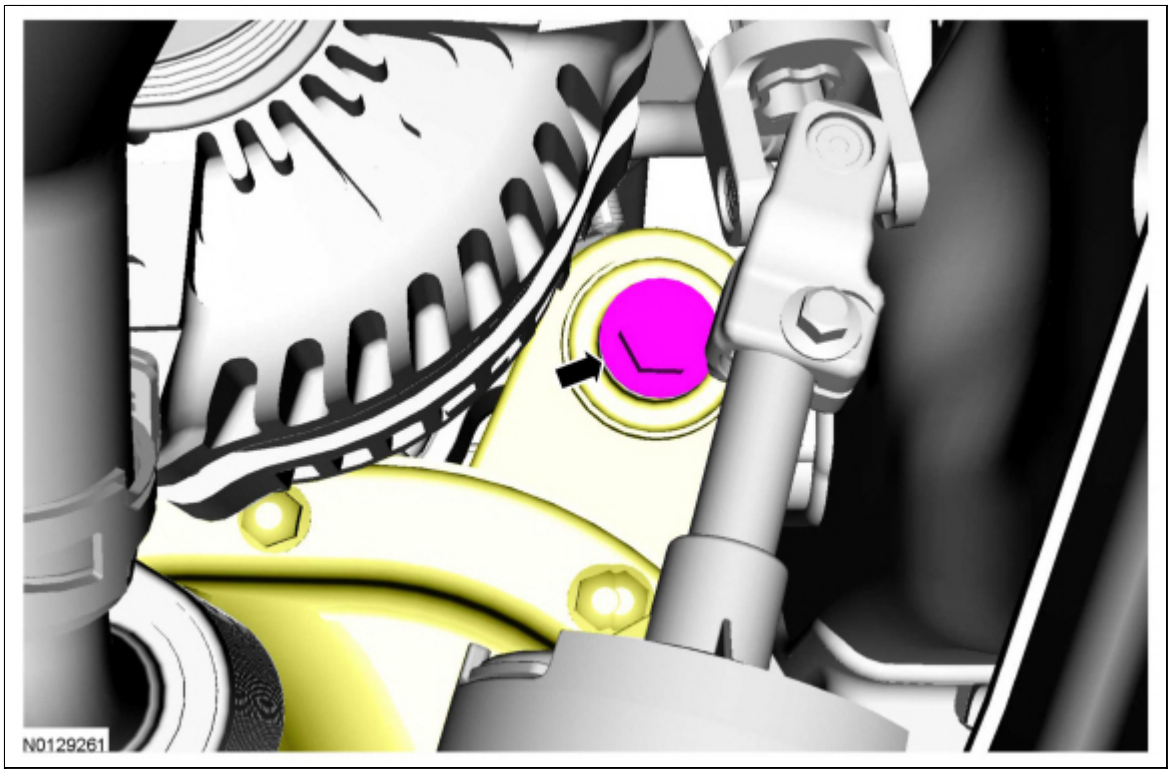
Installation

All vehicles



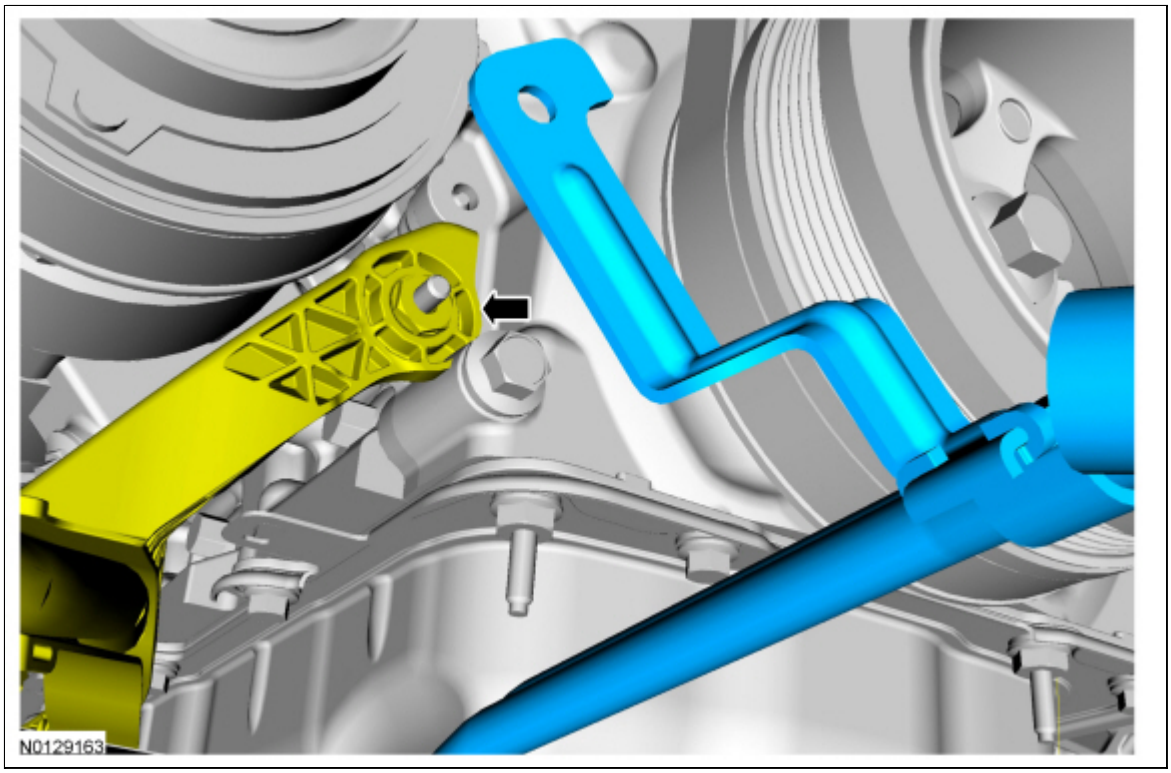
1. Route the transmission fluid cooler tubes and position them in place.

4WD

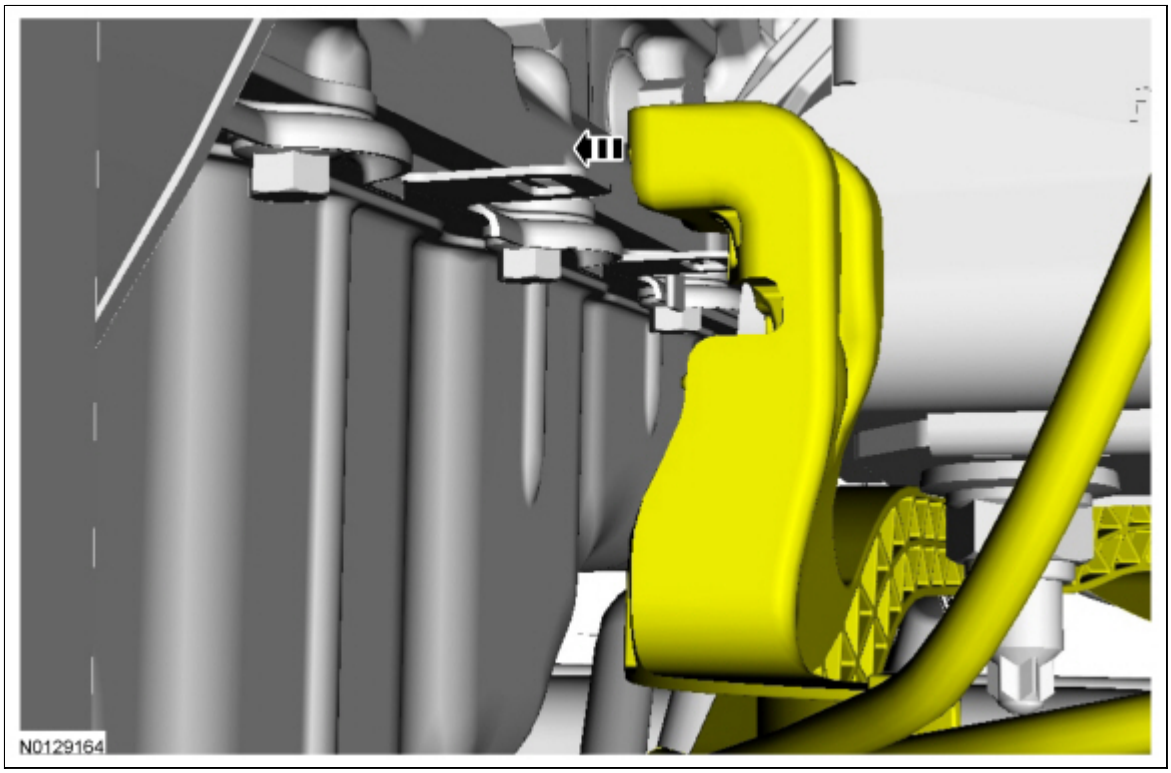


2. Raise the right side of the front axle.

3. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

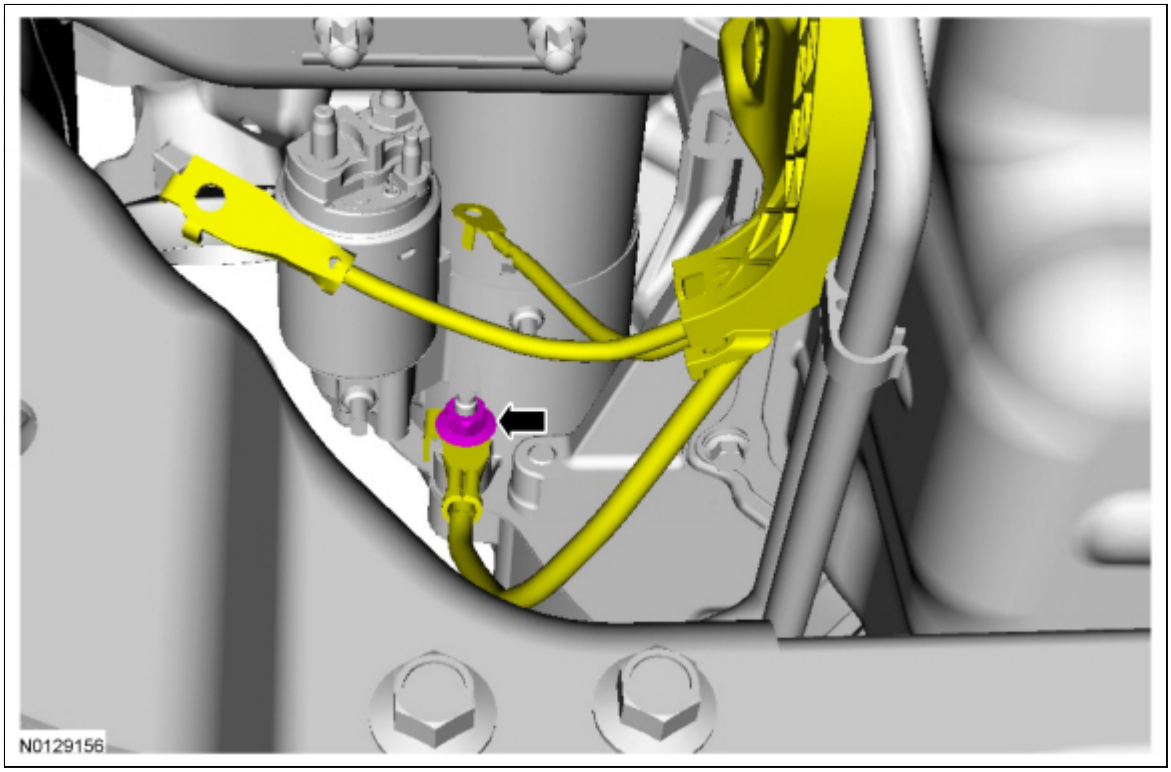


repair4less

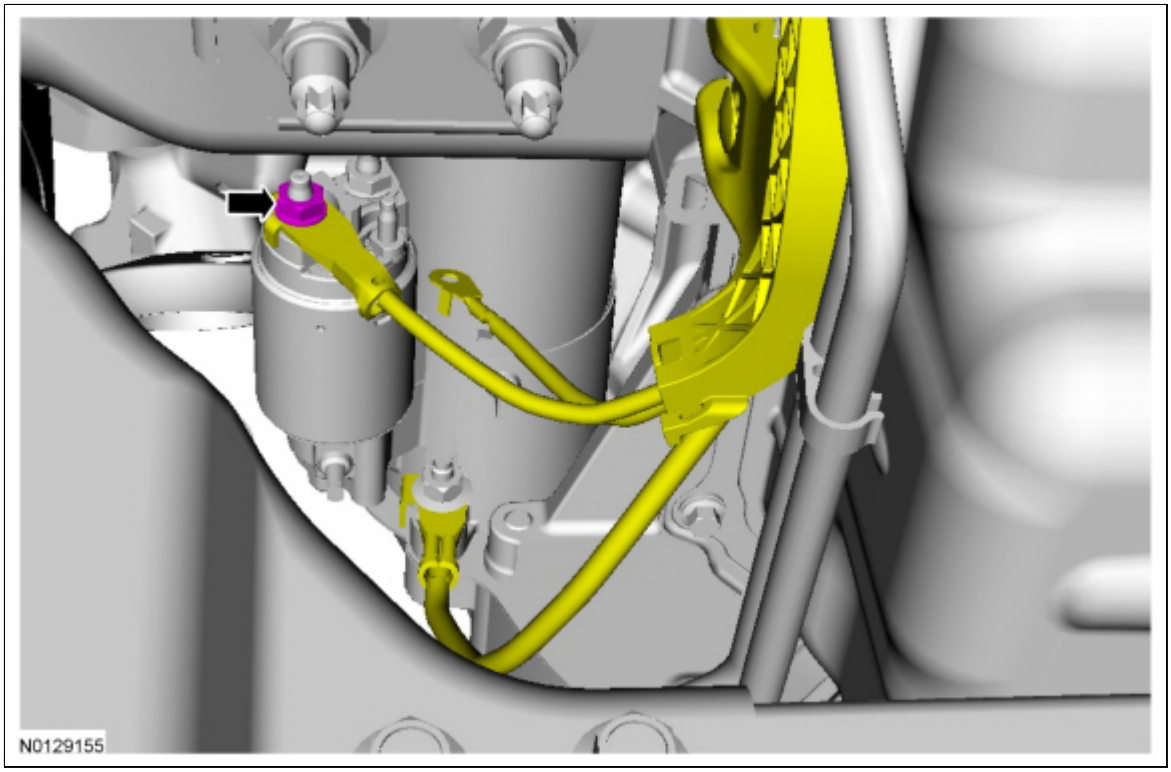


4. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

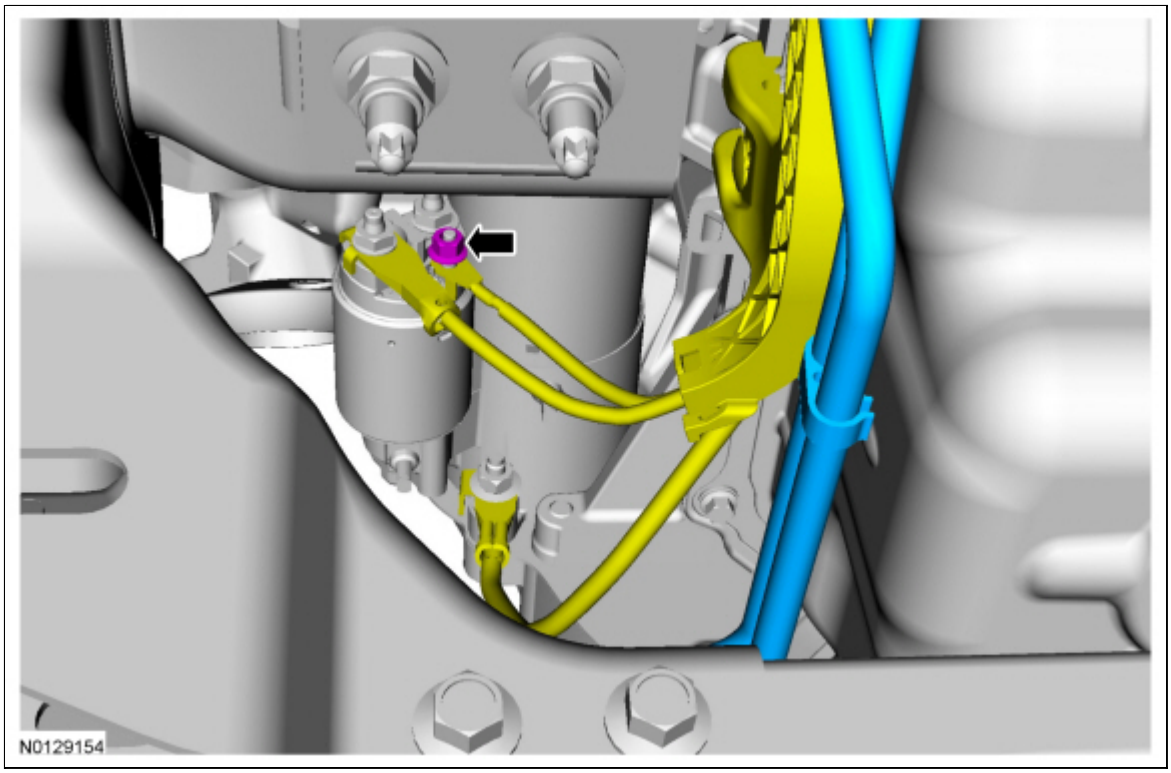
5. Position the starter wiring harness to the front of the engine cover stud.



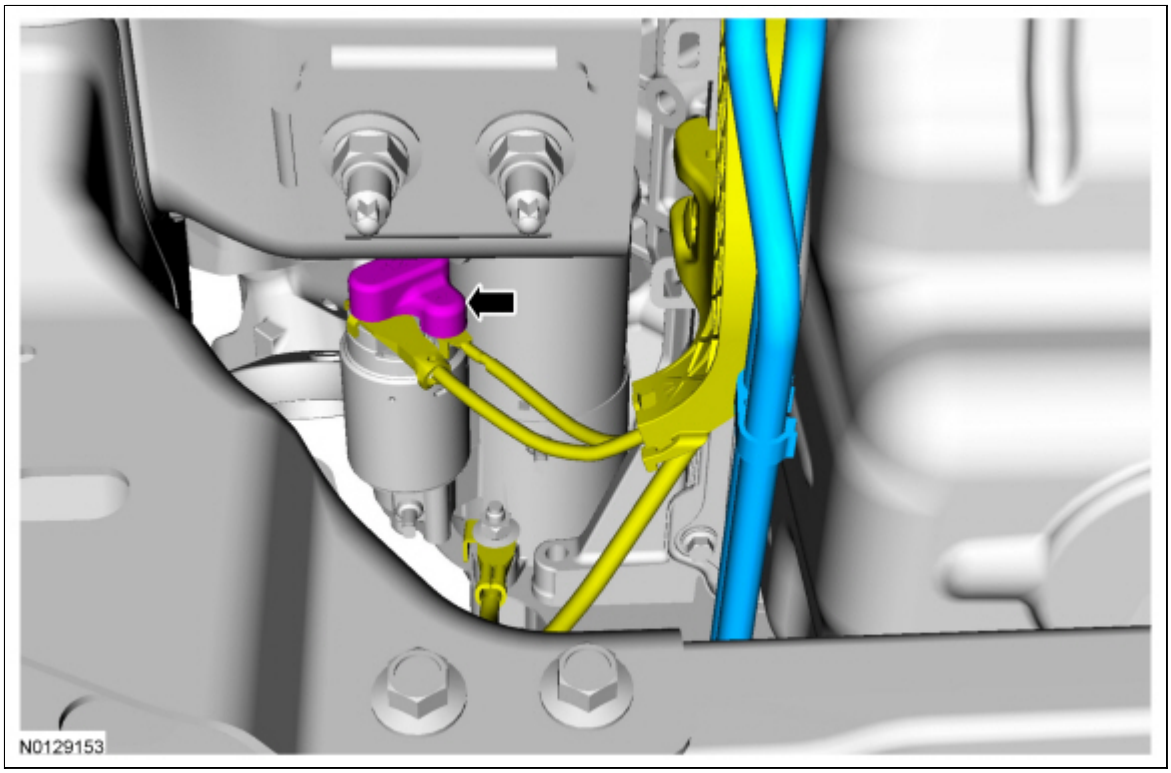
6. Attach the starter wiring harness to the oil pan.



7. Connect the starter motor ground cable eyelet and install the nut.
   - Tighten to 25 Nm (18 lb-ft).



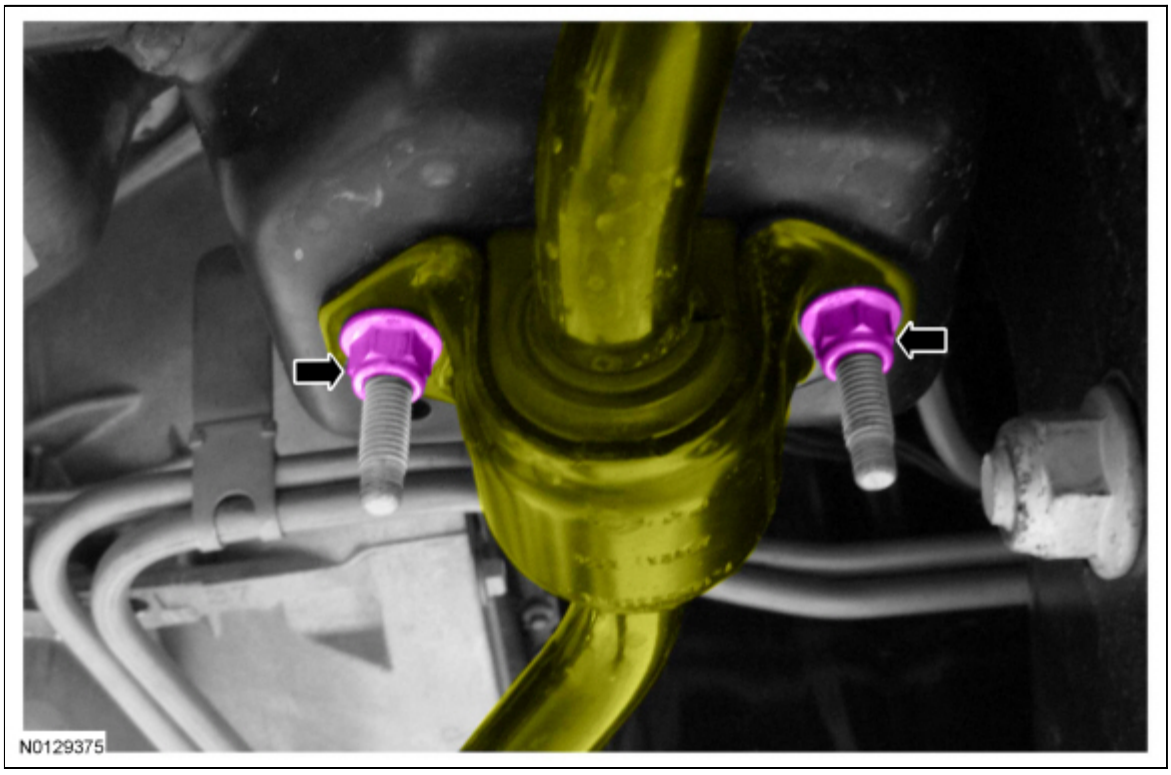
repair4less



8. Connect the starter solenoid B-terminal eyelet and install the nut.
    - Tighten to 12 Nm (106 lb-in).

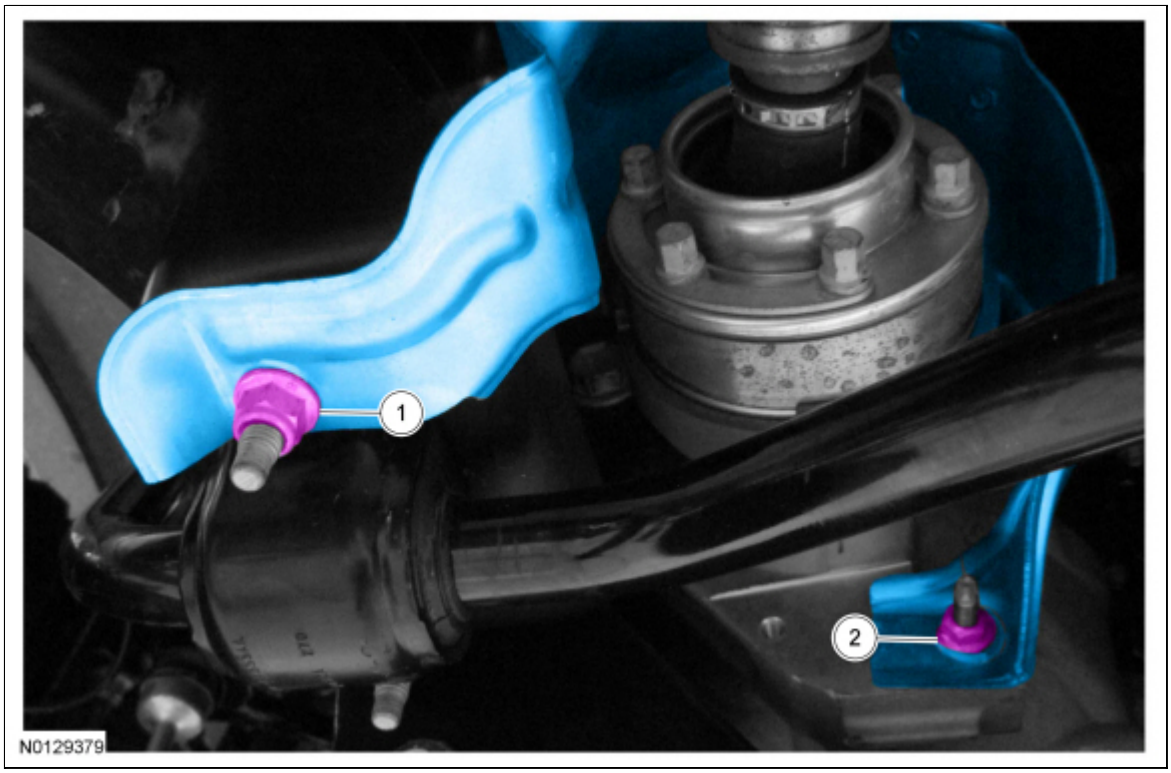
9. Connect the starter solenoid S-terminal eyelet and install the nut.
    - Tighten to 5 Nm (44 lb-in).

10. Install the terminal cover.



All vehicles

NOTE: Right side shown, left side similar.

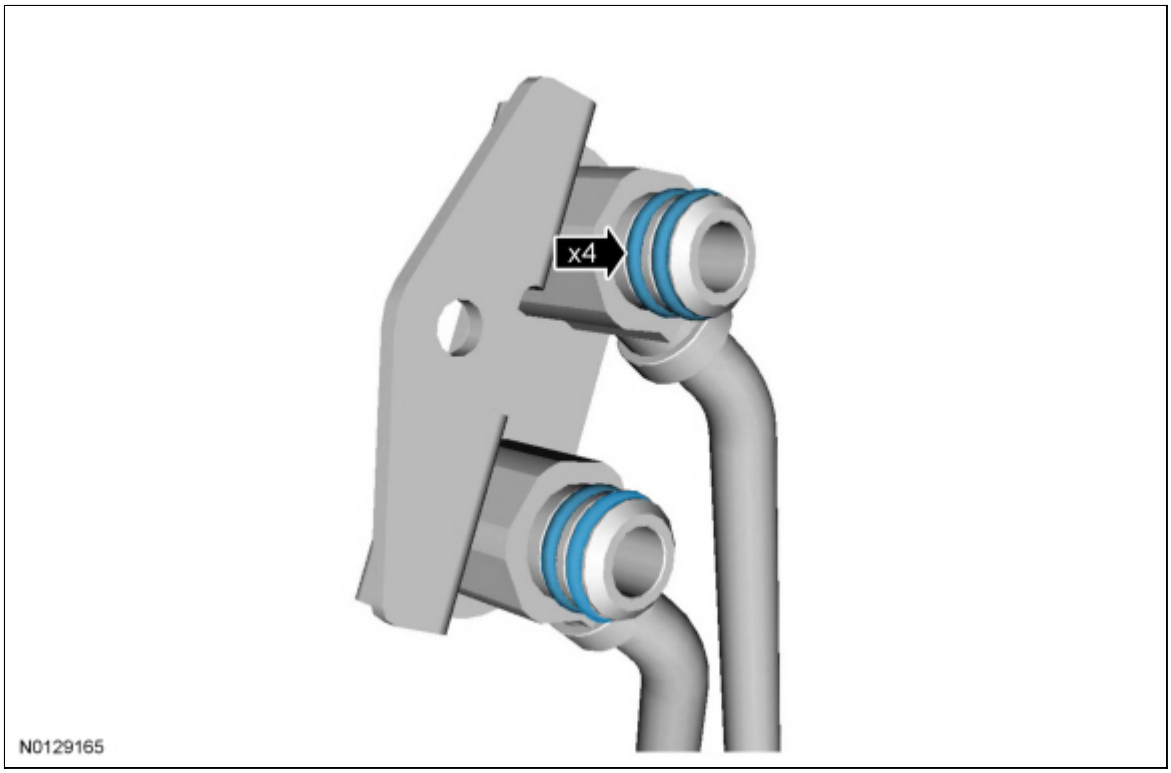


repair4less

11. Position the sway bar in place and install 4 new nuts.
    - Tighten to 55 Nm (41 lb-ft).

Raptor

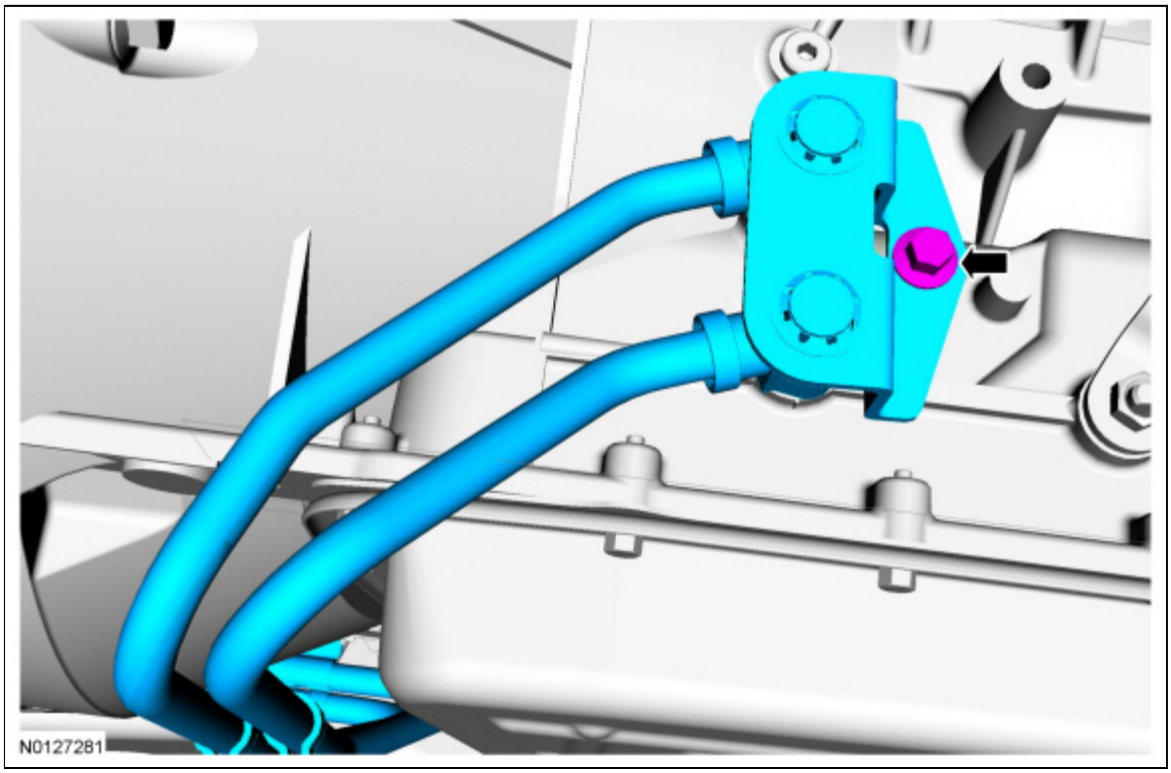
12. Install the heat shield and the 2 nuts.
    1. Tighten to 48 Nm (35 lb-ft).
    2. Tighten to 23 Nm (17 lb-ft).



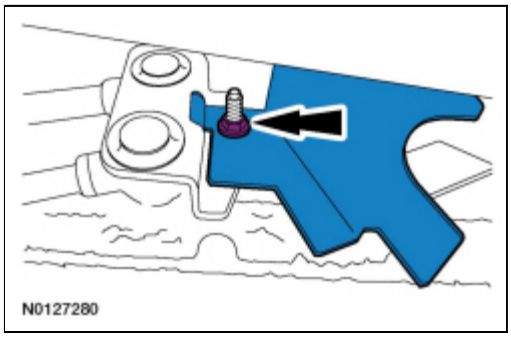
All vehicles

13. **NOTE:** Inspect the transmission case to make sure that the transmission fluid cooler tube O-rings did not remain in the transmission case. Carefully remove and discard them from the case if retained.

    Install 4 new O-rings on the transmission fluid cooler tubes.



repair4less

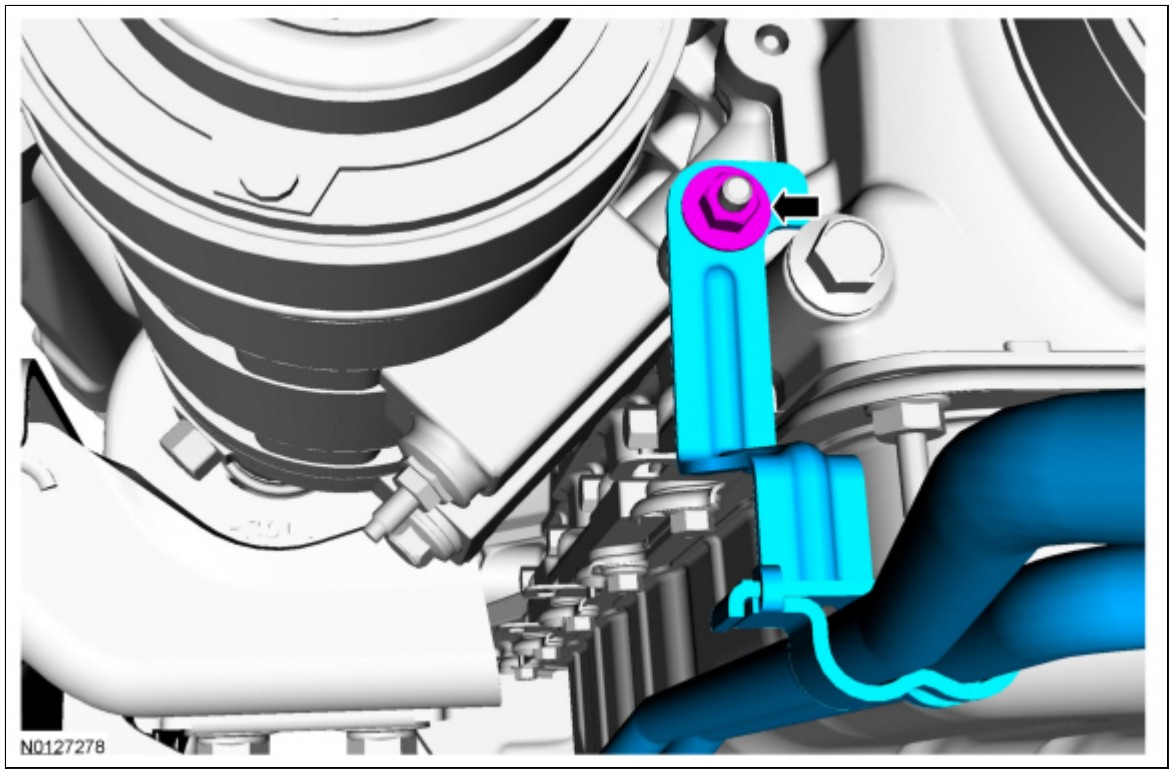


14. ***NOTICE:*** **Install a new transmission fluid cooler tubes-to-transmission bolt.**

    Install the transmission fluid cooler tubes and a new transmission fluid cooler tubes-to-transmission bolt.

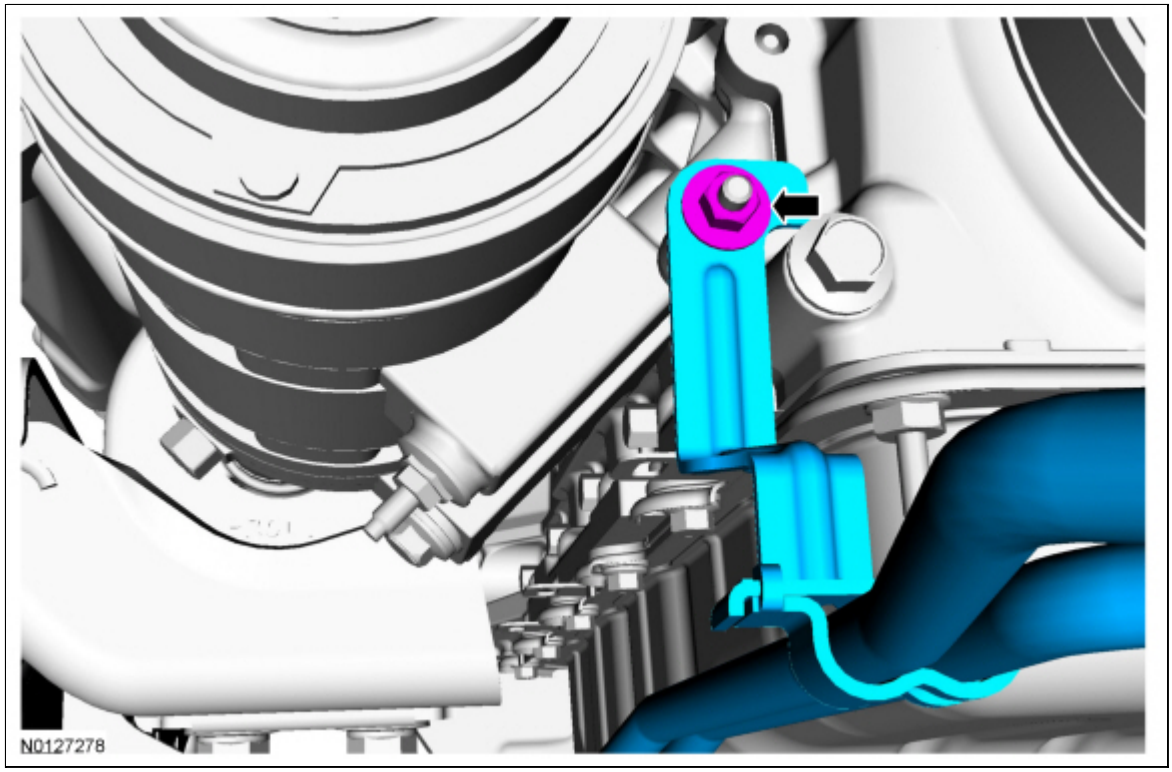
    - Tighten to 30 Nm (22 lb-ft).

15. If equipped, install the selector lever cable splash shield and the nut.
    - Tighten to 12 Nm (106 lb-in).



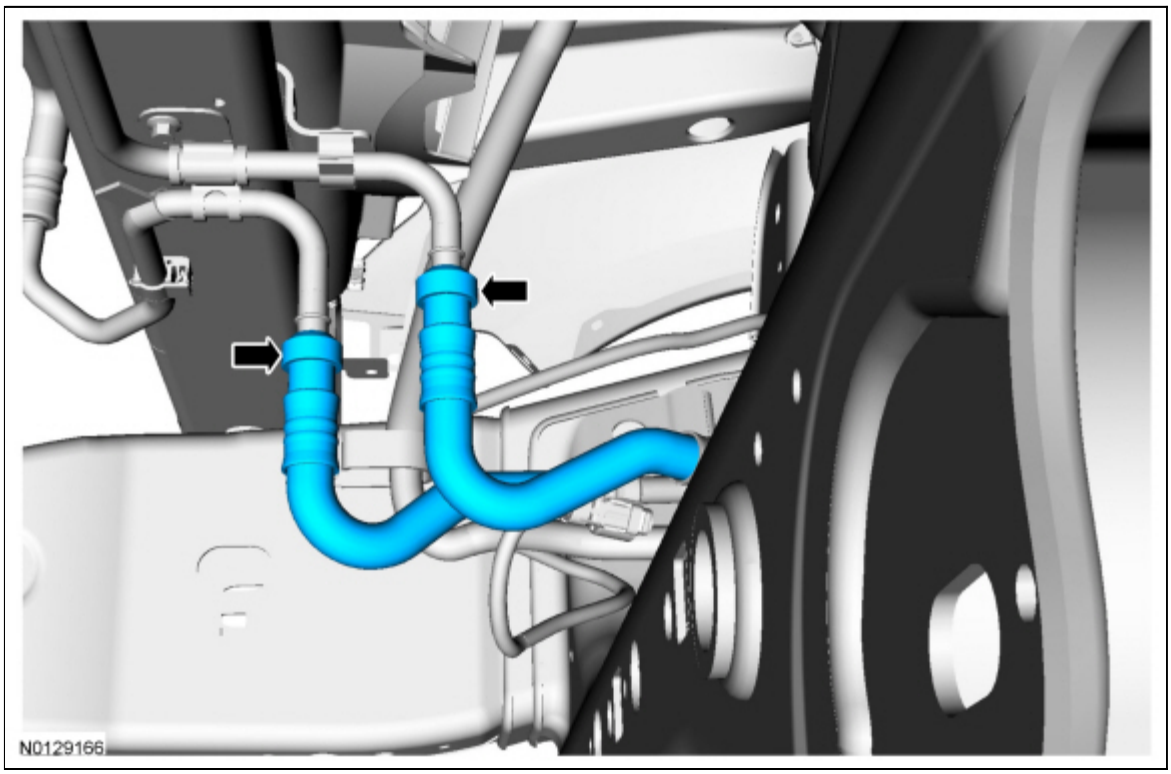
16. Install the transmission fluid cooler tube bracket and the transmission-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

5.0L (4V)



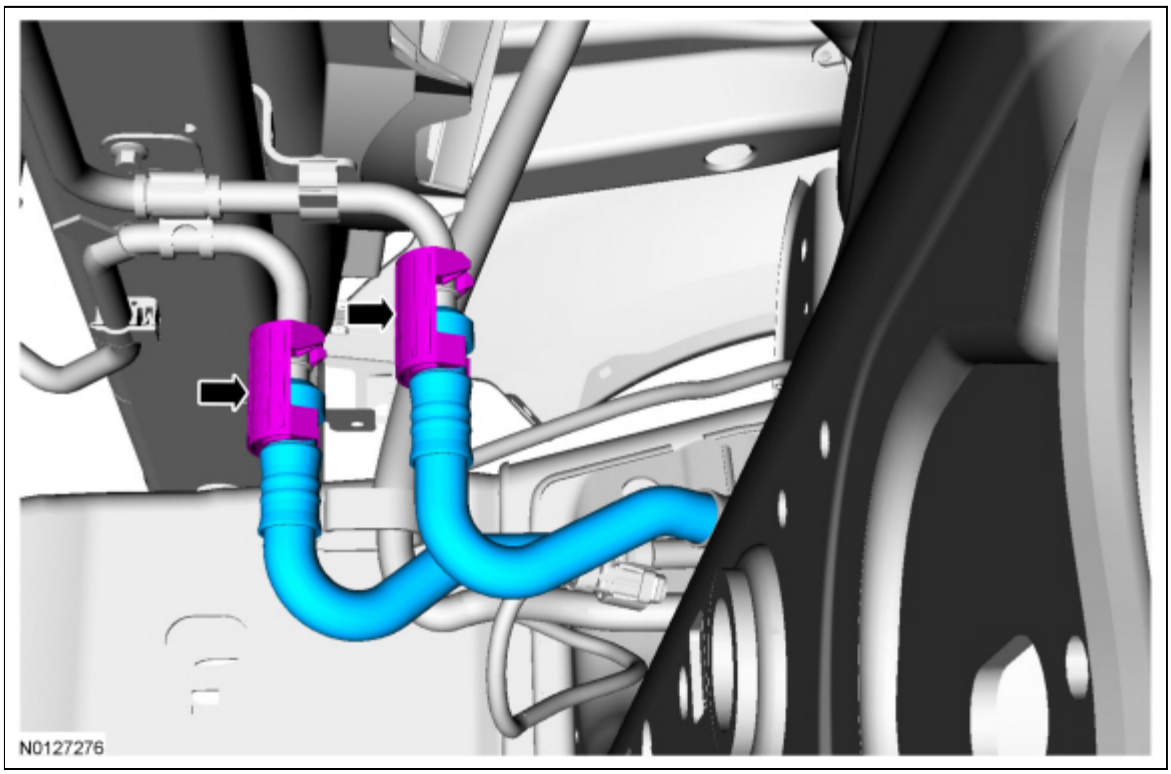
17. Install the transmission fluid cooler tube bracket and the nut to the front of the engine.
    - Tighten to 12 Nm (106 lb-in).

repair4less



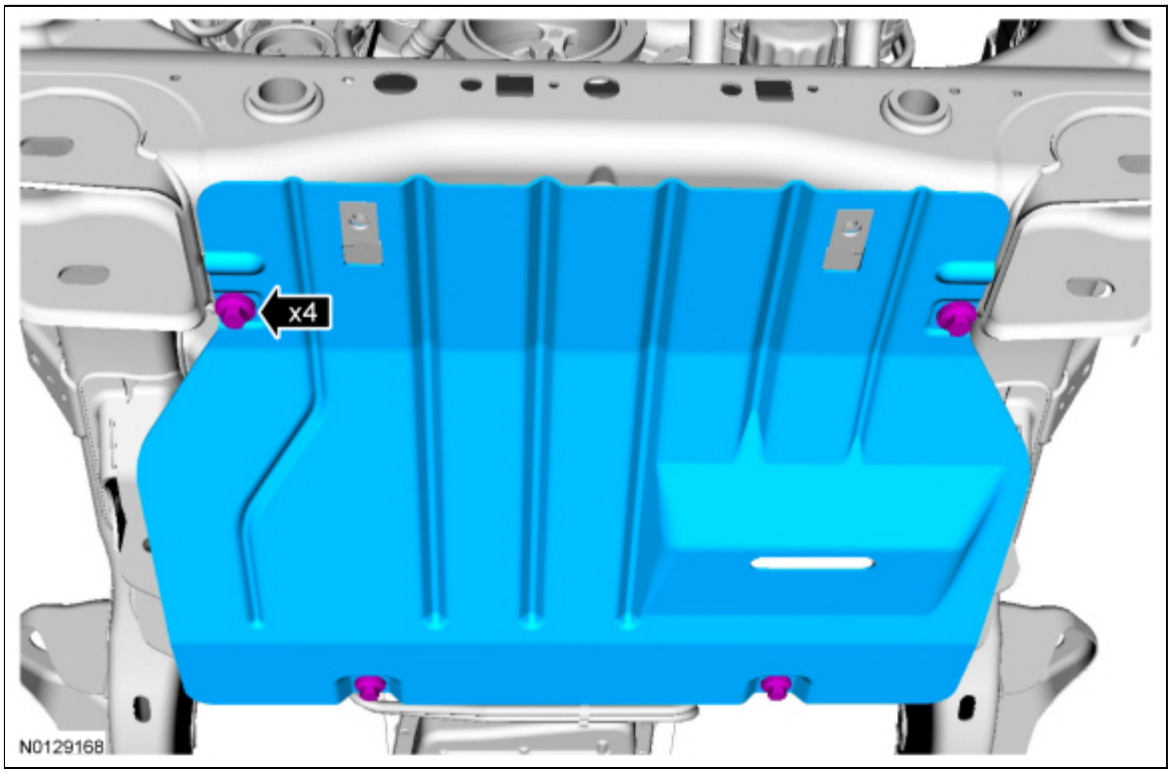
6.2L (2V)

18. Install the transmission fluid cooler tube bracket and the nut to the front of the engine.
    - Tighten to 40 Nm (30 lb-ft).

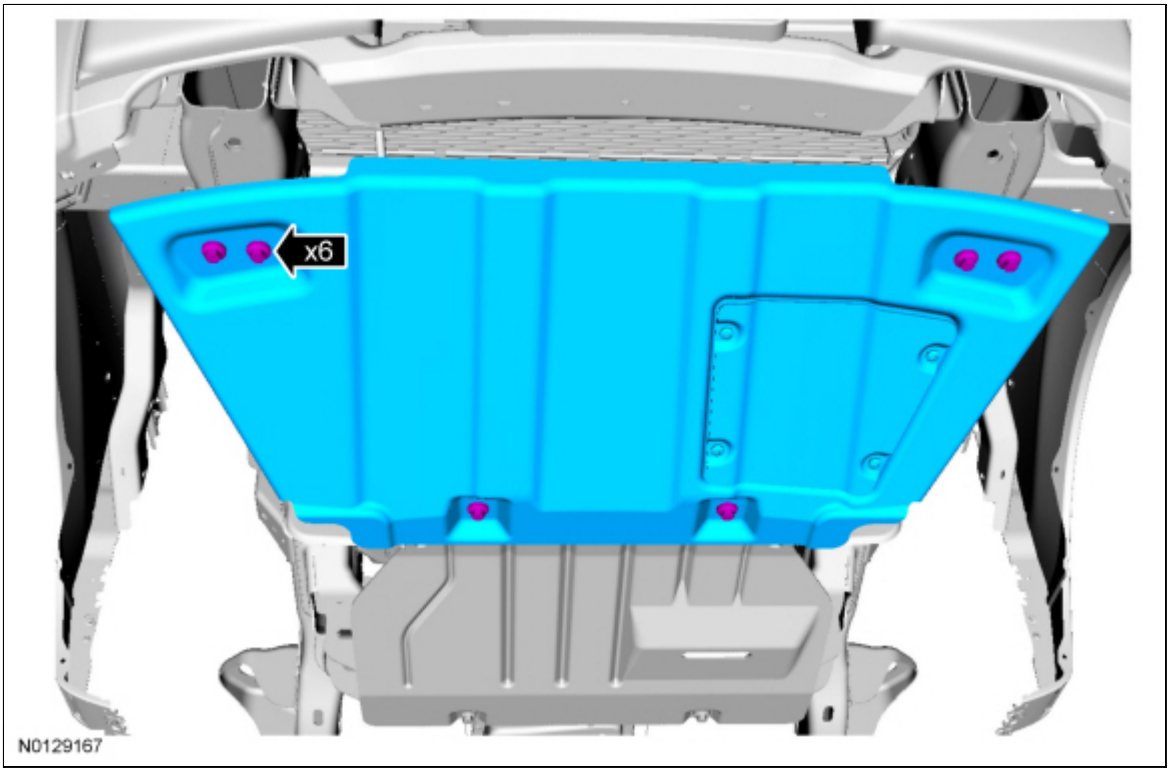


All vehicles

19. Connect the transmission fluid cooler tubes to the transmission fluid cooler hoses.



20. Install the transmission fluid cooler tube secondary latches.



repair4less

4WD

21. Install the rearward skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).

22. If equipped, install the forward skid plate and the 6 bolts.
    - Tighten to 48 Nm (35 lb-ft).

23. Connect the battery ground cable. For additional information, refer to Section 414-01 .

All vehicles

24. Fill the transmission with fluid and verify correct operation. For additional information, refer to Transmission Fluid Level Check in Section 307-01 .

25. Check for leaks.

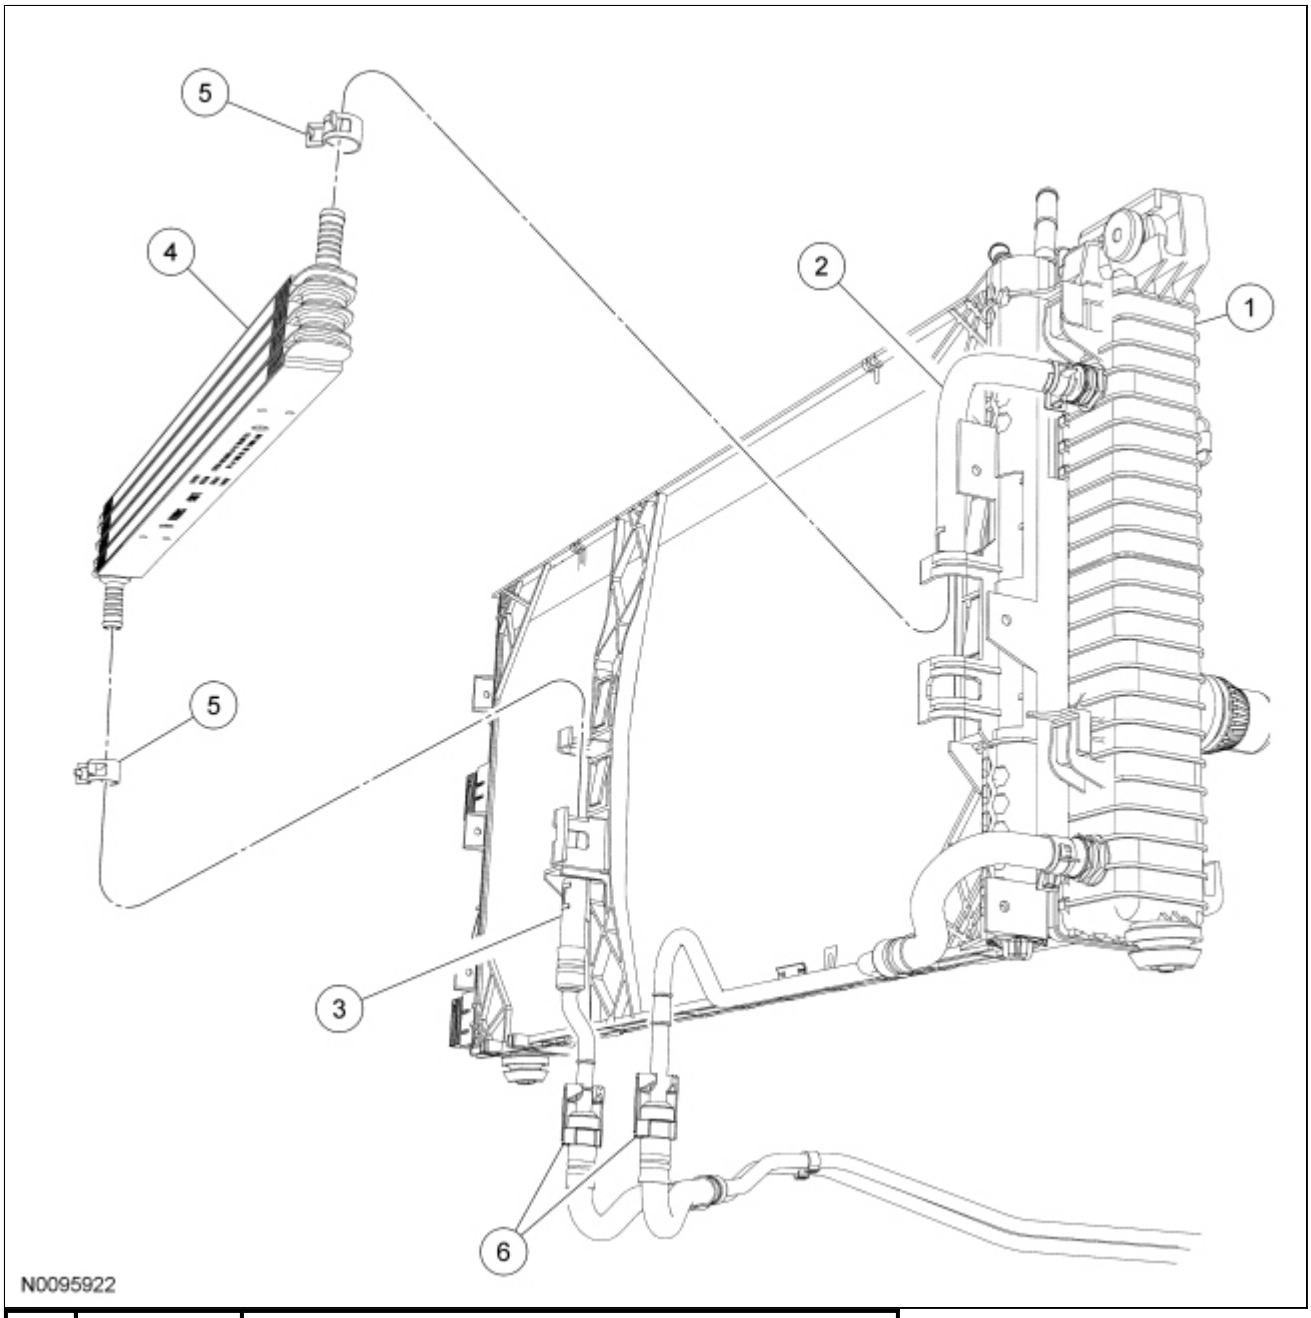
repair4less

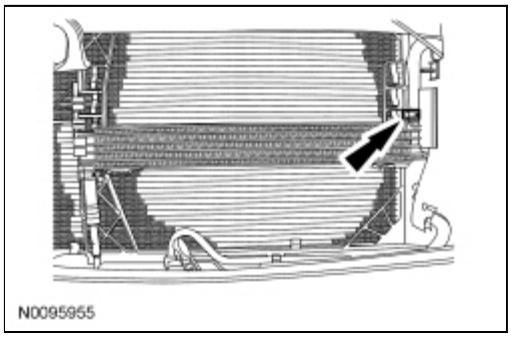


Transmission Fluid Cooler

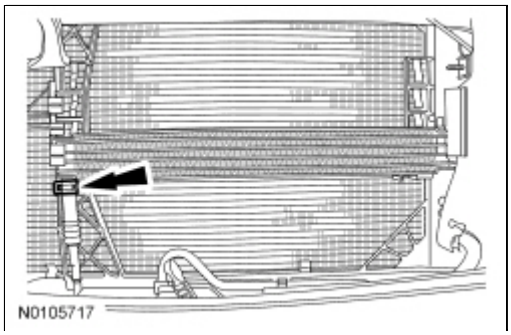
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Transmission Cooling



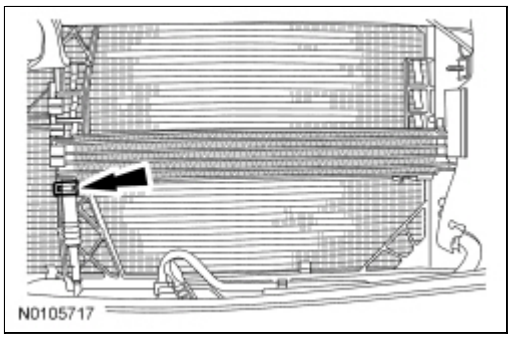
repair4less



Item	Part Number	Description
1	8005	Radiator
2	7C410	In-tank transmission fluid cooler outlet hose
3	7B028	Auxiliary transmission fluid cooler outlet hose
4	7A095	Auxiliary transmission fluid cooler
5	7C107	Clamps
6	7Z465	Transmission fluid cooler inlet and outlet tube secondary latches

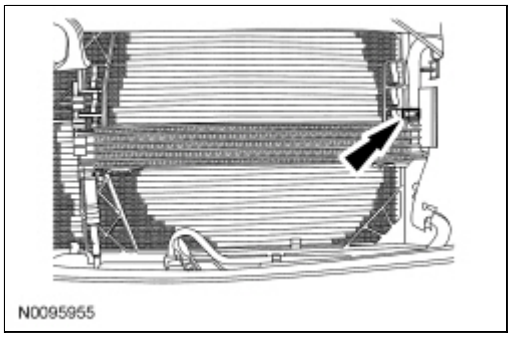
Removal

1. Remove the transmission fluid cooler inlet hose from the transmission fluid cooler.
    - Discard the clamp.



2. Remove the transmission fluid cooler outlet hose from the transmission fluid cooler.
    - Discard the clamp.

3. Remove the transmission fluid cooler.



Installation

1. Install the transmission fluid cooler.
2. Install a new transmission fluid cooler outlet hose clamp.
3. Install the transmission fluid cooler outlet hose to the transmission fluid cooler.

4. Install a new transmission fluid cooler inlet hose clamp.
5. Install the transmission fluid cooler inlet hose to the transmission fluid cooler.

repair4less

6. Fill the transmission with transmission fluid. For additional information, refer to Transmission Fluid Level Check in Section 307-01 .

7. Check for leaks.

External Controls — Column Shift

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Inspection and Verification

1. Verify the customer concern by operating the transmission external control.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical

• Damaged Brake Shift Interlock Actuator (BSIA)
• Damaged Tow/Haul switch
• Damaged SelectShift™ switch
	• Failed fuse(s):
	  ▪ Body Control Module (BCM) 18 (10A)
	  ▪ BCM 42 (5A)
	• PCM
	• Loose or damaged connections
	• Damaged wiring harness
	• Corroded or damaged terminals

3. If the fault is not visually evident, determine the symptom. GO to Symptom Chart - External Controls, Column Shift or GO to Symptom Chart - NVH Column Shift .

• Excessive shift effort	• Selector lever cable	• INSTALL a new selector lever cable. REFER to Selector Lever Cable — Column Shift in this section.
	• Cable bracket	• ADJUST cable. REFER to Selector Lever Cable Adjustment — Column Shift in this section. TIGHTEN cable bracket screws. REFER to Specifications in this section.
• Selector lever will not shift from PARK	• Selector lever cable	• VERIFY selector lever cable adjustment. REFER to Selector Lever Cable Adjustment — Column Shift in this section.
	• Column bracket clip	• INSTALL a new bracket clip. REFER to Selector Lever Cable — Column Shift in this section.
	• Broken selector lever cable	• INSTALL a new selector lever cable. REFER to Selector

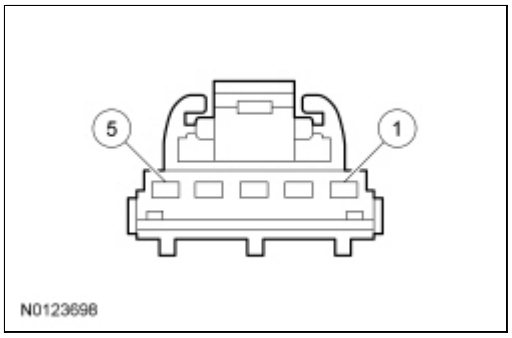
		Lever Cable — Column Shift in this section. • Brake Shift Interlock Actuator (BSIA) system failure • GO to Pinpoint Test A .
• Vehicle will not crank/start in park but will crank/start in neutral	• Selector lever cable • TR sensor	• VERIFY selector lever cable adjustment. REFER to Selector Lever Cable Adjustment — Column Shift in this section. • CHECK for TR sensor DTCs. REFER to Section 307-01 .

Symptom Chart — NVH Column Shift

Symptom Chart — NVH Column Shift

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Vibration — a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	• Selector lever cable incorrectly routed, grounded out or loose	• CHECK the selector lever cable. REPAIR as necessary. REFER to Selector Lever Cable — Column Shift in this section.
• Rattle, buzz or other noise	• Selector lever loose • Selector lever • Cable assembly grommet	• TIGHTEN the selector lever bolts. REFER to Selector Lever — Column Shift in this section. • INSTALL a new selector lever. REFER to Selector Lever — Column Shift in this section. • SECURE the grommet to the floor panel. REFER to Selector Lever Cable — Column Shift in this section.



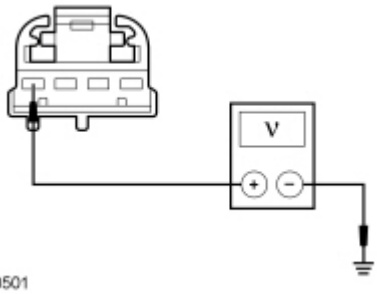
Pinpoint Tests

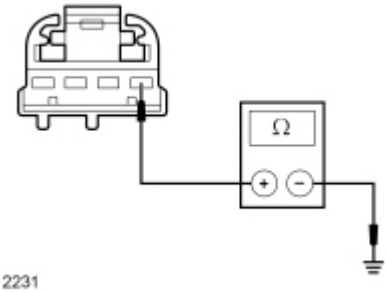
Refer to Wiring Diagrams Cell 30 , Transmission Controls for schematic and connector information.

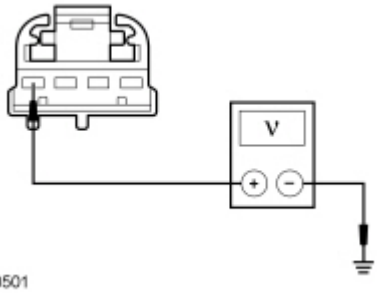
Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

Tow/Haul Connector — C2399

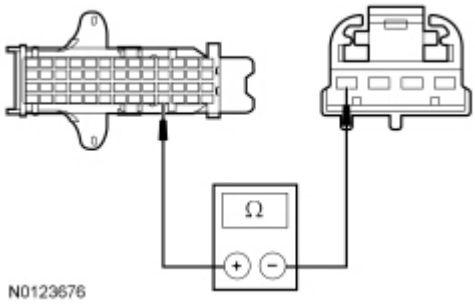
repair4less







Pin Number	Circuit Function
1	Tow/Haul Power
2	Tow/Haul Signal
3	SelectShift™ Upshift
4	SelectShift™ Ground
5	SelectShift™ Downshift



PINPOINT TEST A: THE BSIA SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

NOTE: Inspect the selector lever cable before proceeding with this pinpoint test.

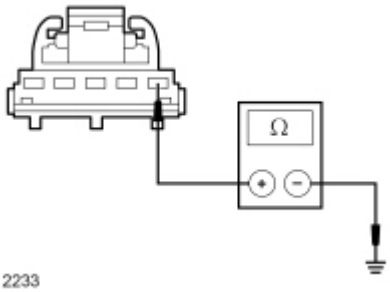
Test Step	Result / Action to Take
A1 CHECK THE STOPLAMPS	
• Apply the brake pedal and observe the stoplamps. • **Do the stoplamps illuminate?**	**Yes** VERIFY the BCM fuse 18 (10A) is OK, If OK GO to A2. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. **No** REFER to Section 417-01.
A2 CHECK THE BSIA OUTPUT CIRCUIT	
• Disconnect: Brake Shift Interlock Actuator (BSIA) C2008. • Ignition ON. • Measure the voltage between the BSIA C2008-4, circuit CET53 (BU/OG), harness side and ground.	**Yes** GO to A3. **No** If the voltage was greater than 10 volts with the brake pedal applied or not applied, GO to A4. Otherwise, GO to A5.

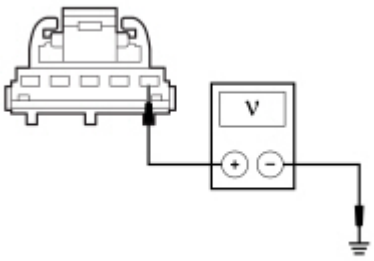
 N0130501 • Depress the brake pedal. • With the brake pedal depressed, measure the voltage between the BSIA C2008-4, circuit CET53 (BU/OG), harness side and ground. • **Is the voltage greater than 10 volts with the brake pedal applied and 0 volts with the brake pedal not applied?**	
A3 CHECK THE BSIA GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Measure the resistance between the BSIA C2008-1, circuit GD133 (BK), harness side and ground.  N0112231 • **Is the resistance less than 5 ohms?**	**Yes** REPLACE the BSIA . REFER to Brake Shift Interlock Actuator — Column Shift in this section. CLEAR the DTC. TEST the system for normal operation. **No** REPAIR circuit GD133 (BK) for an open. CLEAR the DTC. TEST the system for normal operation.
A4 CHECK THE BSIA OUTPUT CIRCUIT FOR A SHORT TO POWER • Ignition OFF. • Disconnect: BCM C2280B. • Inspect C2008 and C2280B for damaged, pushed-out terminals or loose wires. • Ignition ON. • Measure the voltage between the BSIA C2008-4, circuit CET53 (BU/OG), harness side and ground.  N0130501 • **Is any voltage present?**	**Yes** REPAIR circuit CET53 (BU/OG) for a short to power. CLEAR the DTC. TEST the system for normal operation. **No** GO to A5 .

repair4less

A5 CHECK THE BSIA POWER CIRCUIT FOR AN OPEN	
• Measure the resistance between the BSIA C2008-4, circuit CET53 (BU/OG) and BCM C2280B-49, CET53 (BU/OG) harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR circuit CET53 (BU/OG) for an open. CLEAR the DTC. TEST the system for normal operation.
A6 CHECK FOR CORRECT BCM OPERATION	

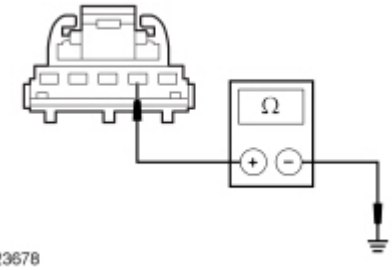
• Disconnect all BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	REPLACE the BCM . REFER to Section 418-00 . CLEAR the DTC. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

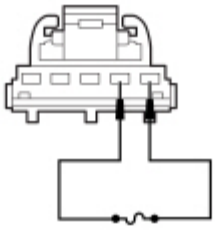




PINPOINT TEST C: THE TOW/HAUL SWITCH DOES NOT OPERATE CORRECTLY

NOTE: Vehicles equipped with a 3.7L engine use PCM C175T.





NOTE: Vehicles equipped with a 5.0L or 6.2L engine use PCM C1381T.

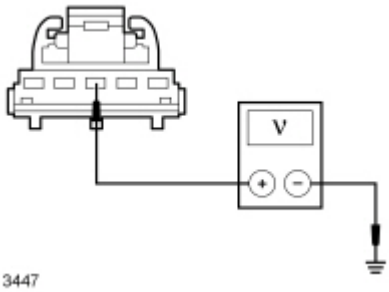
NOTE: Vehicles equipped with a 3.5L engine use PCM C1551B.

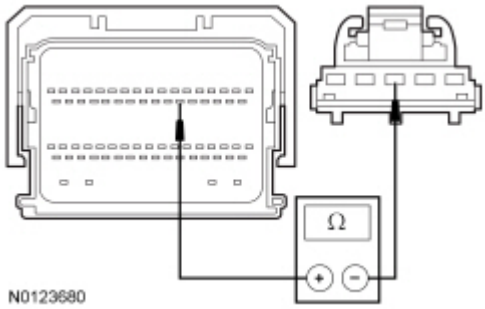
Test Step	Result / Action to Take
C1 CHECK DTCs	
• Ignition ON. • Connect the scan tool. • Start the engine and RUN the Key ON Engine Running (KOER) self-test. • **Is DTC P1780 set?**	**Yes** GO to C2 . **No** No trouble found with the Tow/Haul system. REFER to Section 413-01 if the Tow/Haul lamp does not illuminate.
C2 CHECK THE BCM FUSE 42 (5A)	
• Ignition OFF. • Remove Body Control Module (BCM) fuse 42 (5A). • Check fuse: BCM 42 (5A).	**Yes** GO to C4 . **No**

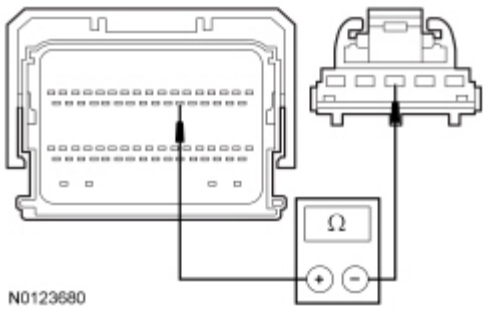
• **Is the resistance less than 5 ohms?**	GO to C3 .
C3 CHECK THE TOW/HAUL POWER CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Tow/Haul C2399. • Disconnect: BCM C2280B. • Inspect C2399 and C2280B for damaged, pushed-out terminals or loose wires. • Measure the resistance between the Tow/Haul C2399-1, circuit CBP42 (GN), harness side and ground.  N0112233 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit CBP42 (GN) for a short to ground. CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation.
C4 CHECK THE TOW/HAUL POWER CIRCUIT FOR VOLTAGE	
• Disconnect: Tow/Haul C2399. • Inspect C2399 for damaged, pushed-out terminals or loose wires. • Ignition ON. • Measure the voltage between the Tow/Haul switch C2399-1, circuit CBP42 (GN), harness side and ground.  N0123677 • **Is the voltage greater than 10 volts?**	**Yes** GO to C5 . **No** REPAIR circuit CBP42 (GN) for an open. CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation.
C5 CHECK THE TOW/HAUL INPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: PCM C175T. • Disconnect: PCM C1381T. • Disconnect: PCM C1551B. • Inspect the connector for damaged, pushed-out terminals, corrosion or loose wires. • Measure the resistance between Tow/Haul switch C2399-2, circuit CET34 (BN/GN) and ground.	**Yes** GO to C6 . **No** REPAIR circuit CET34 (BN/GN) for a short to ground. REPLACE the BCM 42 (5A). CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation.

repair4less

 N0123678 • **Is the resistance greater than 10,000 ohms?**	
C6 CHECK THE TOW/HAUL INPUT CIRCUIT FOR AN OPEN	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: TCS_DEPRES. • Connect a fused jumper from Tow/Haul switch, C2399-1 to C2399-2, harness side.  N0123679 • **Does the TCS_DEPRES PID display YES?**	**Yes** REPLACE the selector lever. REFER to Selector Lever — Column Shift in this section. CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation. **No** INSPECT and REPAIR circuit CET34 (BN/GN) for an open. If an open circuit is not found, REPLACE the PCM. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Section 307-01 . RERUN the KOER self-test and test the system for normal operation.

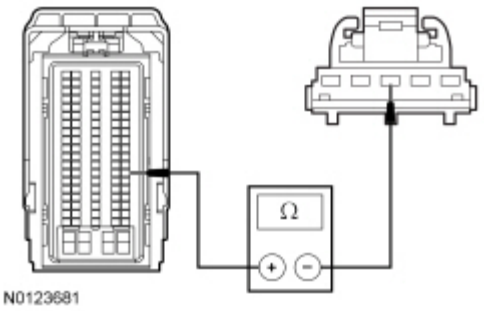


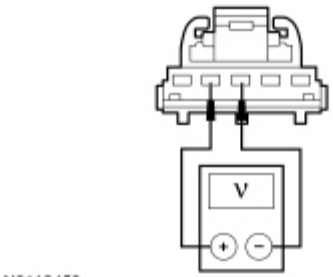


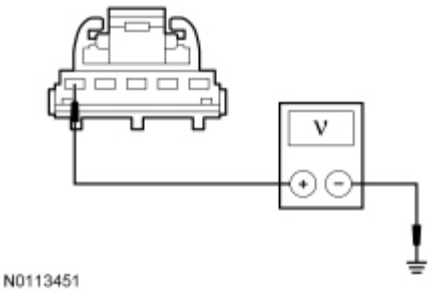


PINPOINT TEST D: THE SELECTSHIFT™ SWITCH IS NOT OPERATING CORRECTLY

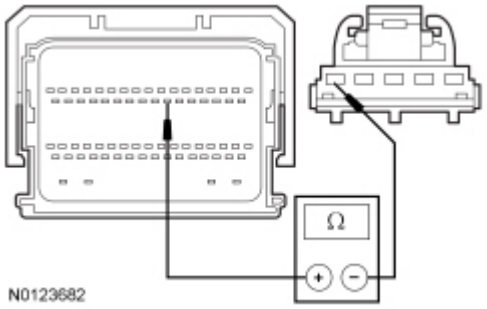
NOTE: Vehicles equipped with a 3.7L engine use PCM C175B.

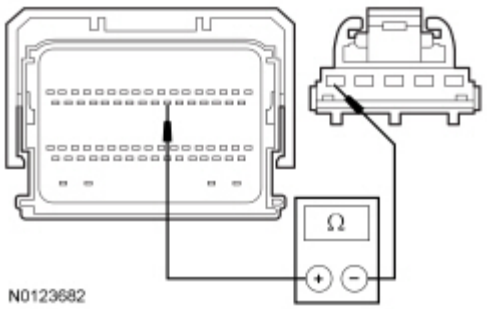


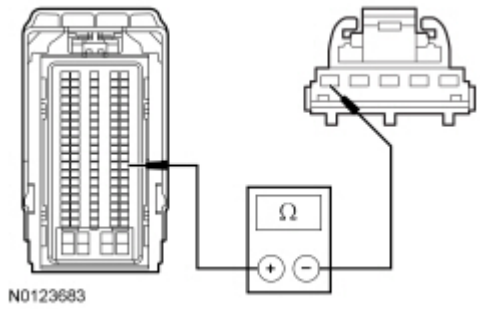




NOTE: Vehicles equipped with a 5.0L or 6.2L engine use PCM C1381B.

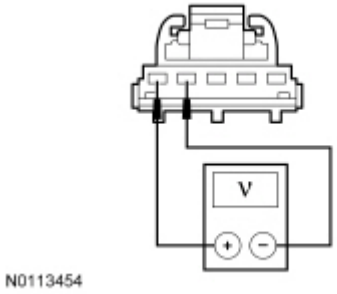






NOTE: Vehicles equipped with a 3.5L engine use PCM C1551B.

Test Step	Result / Action to Take
D1 CHECK DTCs	
• Ignition ON. • Connect the scan tool. • Start the engine and RUN the Key ON Engine Running (KOER) self-test. • **Is DTC P0815 set?**	**Yes** GO to D2 . **No** GO to D5 .
D2 CHECK THE UPSHIFT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: Tow/Haul C2399. • Inspect C2399 for damaged, pushed-out terminals, corrosion or loose wires.	**Yes** GO to D4 . **No**



• Ignition ON. • Measure the voltage between the Tow/Haul switch C2399-3, circuit CET43 (GY), harness side and ground.  N0113447 • **Is the voltage greater than 10 volts?**	GO to D3 .
D3 CHECK THE UPSHIFT CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: PCM C175B. • Disconnect: PCM C1381B. • Disconnect: PCM C1551B. • Inspect the connector for damaged, pushed-out terminals, corrosion or loose wires. • For 3.7L engine vehicles, measure the resistance between the Tow/Haul switch C2399-3, circuit CET43 (GY) and PCM C175B-23, harness side.  N0123680 • For 5.0L or 6.2L engine vehicles, measure the resistance between the Tow/Haul switch C2399-3, circuit CET43 (GY) and PCM C1381B-23, harness side.  N0123680 • For 3.5L engine vehicles, measure the resistance between the Tow/Haul switch C2399-3, circuit CET43 (GY) and PCM C1551B-89, harness side.	**Yes** GO to D4 . **No** REPAIR circuit CET43 (GY) for an open. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation.

repair4less

 N0123681 • **Is the resistance less than 5 ohms?**	
D4 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	
• Connect: PCM C175B. • Connect: PCM C1381B. • Connect: PCM C1551B. • Ignition ON. • Measure the voltage between Tow/Haul switch C2399-3 and C2399-4 harness side.  N0113450 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new selector lever, REFER to Selector Lever — Column Shift in this section. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation. **No** INSPECT and REPAIR the signal return circuit RE407 (YE/VT) for an open. If an open circuit is not found, REPLACE the PCM. PROGRAM the PCM with the latest calibration level. PERFORM the solenoid strategy download procedure, REFER to solenoid body strategy in Section 307-01. RERUN the KOER self-test and test the system for normal operation.
D5 CHECK THE DOWNSHIFT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: Tow/Haul C2399. • Inspect C2399 for damaged, pushed-out terminals, corrosion or loose wires. • Ignition ON. • Measure the voltage between the Tow/Haul switch C2399-5, circuit CET42 (GN/VT), harness side and ground.  N0113451 • **Is the voltage greater than 10 volts?**	**Yes** GO to D7. **No** GO to D6.

D6 CHECK THE DOWNSHIFT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175B. • Disconnect: PCM C1381B. • Disconnect: PCM C1551B. • Inspect the connector for damaged, pushed-out terminals, corrosion or loose wires. • For 3.7L engine vehicles, measure the resistance between the Tow/Haul switch C2399-5, circuit CET42 (GN/VT) and PCM C175B-24, harness side.  • For 5.0L or 6.2L engine vehicles, measure the resistance between the Tow/Haul switch C2399-5, circuit CET42 (GN/VT) and PCM C1381B-24, harness side.  • For 3.5L engine vehicles, measure the resistance between the Tow/Haul switch C2399-5, circuit CET42 (GN/VT) and PCM C1551B-88, harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to D7 . **No** REPAIR circuit CET42 (GN/VT) for an open. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation.
D7 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	

repair4less

• Connect: PCM C175B. • Connect: PCM C1381B. • Connect: PCM C1551B. • Ignition ON. • Measure the voltage between tow/haul switch C2399-5 and C2399-4 harness side.  N0113454 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new selector lever, REFER to Selector Lever — Column Shift in this section. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation. **No** INSPECT and REPAIR the signal return circuit RE407 (YE/VT) for an open. If an open circuit is not found, REPLACE the PCM. PROGRAM the PCM with the latest calibration level. PERFORM the solenoid strategy download procedure, REFER to solenoid body strategy in Section 307-01 . RERUN the KOER self-test and test the system for normal operation.

External Controls — Floor Shift

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Inspection and Verification

1. Verify the customer concern by operating the transmission external control.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical

• Damaged Brake Shift Interlock Actuator (BSIA)
• Damaged Tow/Haul switch
• Damaged SelectShift™ switch
	• Failed fuse(s):
	  ▪ Body Control Module (BCM) 18 (10A)
	  ▪ BCM 42 (5A)
	• PCM
	• Loose or damaged connections
	• Damaged wiring harness
	• Corroded or damaged terminals

3. If the fault is not visually evident, determine the symptom. GO to Symptom Chart - External Controls, Floor Shift or GO to Symptom Chart - NVH Floor Shift .

PINPOINT TEST E: THE BSIA SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

NOTE: Inspect the selector lever cable before proceeding with this pinpoint test.

Test Step	Result / Action to Take
E1 CHECK THE STOPLAMPS	
• Apply the brake pedal and observe the stoplamps. • **Do the stoplamps operate correctly?**	**Yes** GO to E2. **No** REFER to Section 417-01.
E2 CHECK THE BSIA POWER CIRCUIT FOR VOLTAGE	
• Disconnect: Floor Shifter C3245. • Ignition ON. • Measure the voltage between the BSIA C3245-1, circuit CET53 (BU/OG), harness side and ground.  N0123687 • Apply the brake pedal. • With the brake pedal applied, measure the voltage between the BSIA C3245-1, circuit CET53 (BU/OG), harness side and ground. • **Is the voltage greater than 10 volts with the brake pedal applied and 0 volts with the brake pedal not applied?**	**Yes** GO to E3. **No** VERIFY the BCM fuse 18 (10A) is OK, If OK REPAIR circuit CET53 (BU/OG) for an open. CLEAR the DTC. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. If voltage was present with the brake pedal not applied, GO to E4.
E3 CHECK THE BSIA GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the selector lever C3245-5, circuit GD138 (BK/WH), harness side and ground.	**Yes** INSTALL a new selector lever. REFER to Selector Lever — Floor Shift in this section. CLEAR the DTC. TEST the system for normal operation.

 N0123686 • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit GD138 (BK/WH) for an open. CLEAR the DTC. TEST the system for normal operation.
E4 CHECK THE BSIA OUTPUT CIRCUIT FOR A SHORT TO POWER	
• Disconnect: BCM C2280B. • Inspect C3245 and C2280B for damaged, pushed-out terminals or loose wires. • Ignition ON. • Measure the voltage between the selector lever C3245-1, circuit CET53 (BU/OG), harness side and ground.  N0123687 • **Is any voltage present?**	**Yes** REPAIR circuit CET53 (BU/OG) for a short to power. CLEAR the DTC. TEST the system for normal operation. **No** GO to E5.
E5 CHECK FOR CORRECT BCM OPERATION	

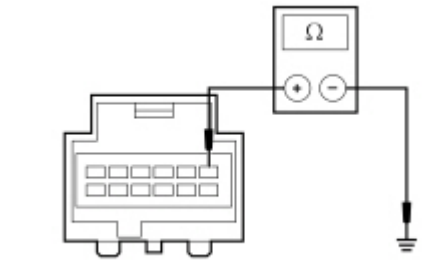
• Disconnect all BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	Install a new BCM. REFER to Section 418-00. CLEAR the DTC. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

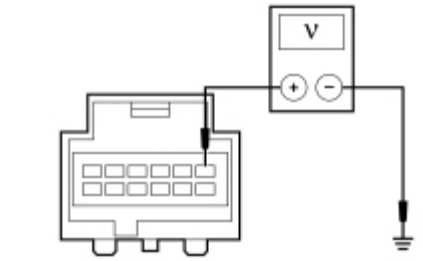
PINPOINT TEST F: THE SHIFT CONTROL IS OUT OF CORRECT GEAR RELATIONSHIP

Test Step	Result / Action to Take
F1 CHECK THE SHIFT CONTROL LINKAGE	
• Ignition ON. • Apply the brake pedal.	**Yes** INSTALL a new selector lever. REFER to Selector Lever — Floor Shift in this section. TEST the system for normal

repair4less

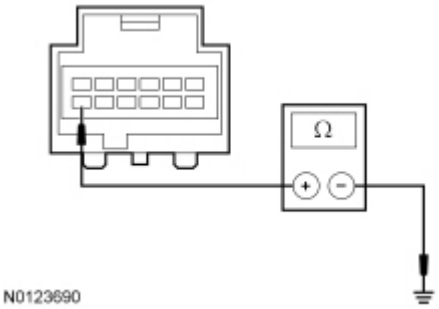
• Gain access to the selector lever linkage. • Position the selector lever in all ranges. • Observe all selector lever linkage during operation. • **Is the selector lever linkage damaged?**	operation. **No** GO to F2 .
F2 CHECK THE SELECTOR LEVER CABLE	
• Check the selector lever cable and bracket installation and tightness. • **Is the selector lever cable correctly installed and adjusted?**	**Yes** VERIFY the selector lever cable adjustment. ADJUST the selector lever cable if necessary. REFER to Selector Lever Cable Adjustment — Floor Shift in this section. GO to F3 . **No** REPAIR as necessary. TEST the system for normal operation.
F3 CHECK THE LINKAGE/CABLE FOR CORRECT GEAR RELATIONSHIP	
• Apply the brake pedal. • Position the selector lever in all ranges. • **Does the indicator match the gear selection?**	**Yes** System OK. TEST the system for normal operation. **No** REFER to Selector Lever Cable — Floor Shift in this section. TEST the system for normal operation.

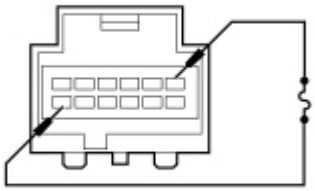




PINPOINT TEST G: THE TOW/HAUL SWITCH DOES NOT OPERATE CORRECTLY

NOTE: Vehicles equipped with a 3.7L engine use PCM C175T.





NOTE: Vehicles equipped with a 5.0L or 6.2L engine use PCM C1381T.

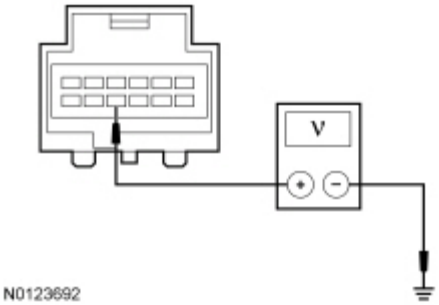
NOTE: Vehicles equipped with a 3.5L engine use PCM C1551B.

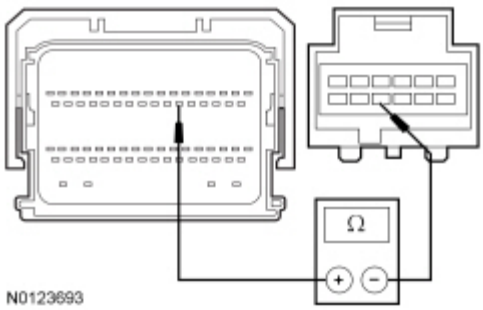
Test Step	Result / Action to Take
G1 CHECK DTCs	
• Ignition ON. • Connect the scan tool. • Start the engine and RUN the Key ON Engine Running (KOER) self-test. • **Is DTC P1780 set?**	**Yes** GO to G2 . **No** No trouble found with the Tow/Haul system. REFER to Section 413-01 if Tow/Haul lamp does not illuminate.
G2 CHECK THE BCM FUSE 42 (5A)	
• Ignition OFF. • Remove Body Control Module (BCM) fuse 42 (5A). • Check fuse: BCM 42 (5A). • **Is the resistance less than 5 ohms?**	**Yes** GO to G4 . **No** GO to G3 .
G3 CHECK THE TOW/HAUL POWER CIRCUIT FOR A	

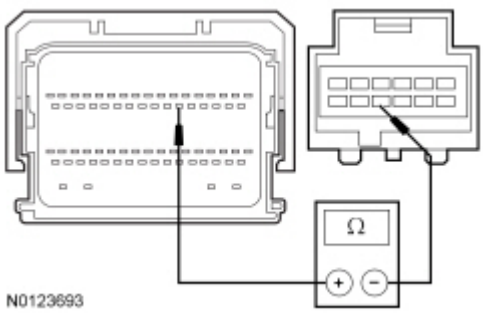
SHORT TO GROUND	
• Disconnect: Selector Lever C3245. • Disconnect: BCM C2280B. • Inspect C3245 and C2280B for damaged, pushed-out terminals or loose wires. • Measure the resistance between the selector lever C3245-6, circuit CBP42 (GN), harness side and ground.  N0123688 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit CBP42 (GN) for a short to ground. CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation.
G4 CHECK THE TOW/HAUL POWER CIRCUIT FOR VOLTAGE	
• Disconnect: Selector Lever C3245. • Inspect C3245 for damaged, pushed-out terminals or loose wires. • Ignition ON. • Measure the voltage between the selector lever C3245-6, circuit CBP42 (GN), harness side and ground.  N0123689 • **Is the voltage greater than 10 volts?**	**Yes** GO to G5 . **No** REPAIR circuit CBP42 (GN) for an open. CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation.
G5 CHECK THE TOW/HAUL INPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: PCM C175T. • Disconnect: PCM C1381T. • Disconnect: PCM C1551B. • Inspect the connector for damaged, pushed-out terminals, corrosion or loose wires. • Measure the resistance between the selector lever C3245-7, circuit CET34 (BN/GN) and ground.	**Yes** GO to G6 . **No** REPAIR circuit CET34 (BN/GN) for a short to ground. CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation.

repair4less

 N0123690 • **Is the resistance greater than 10,000 ohms?**	
G6 CHECK THE TOW/HAUL INPUT CIRCUIT FOR AN OPEN	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: TCS_DEPRES. • Connect a fused jumper from the selector lever switch, C3245-6 circuit CBP42 (GN) to C3245-7 circuit CET34 (BN/GN) harness side.  N0123691 • **Does the TCS_DEPRES PID display YES?**	**Yes** REPLACE the selector lever. REFER to Selector Lever — Floor Shift in this section. CLEAR the DTC. RERUN the KOER self-test and test the system for normal operation. **No** INSPECT and REPAIR circuit CET34 (BN/GN) for an open. If an open circuit is not found, REPLACE the PCM. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Section 307-01 . RERUN the KOER self-test and test the system for normal operation.

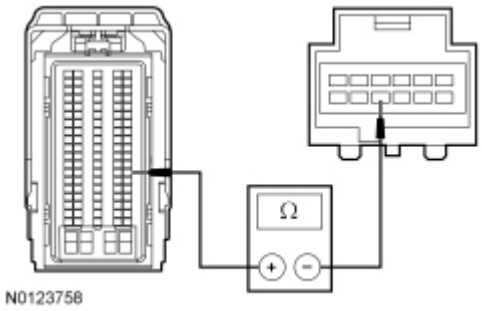


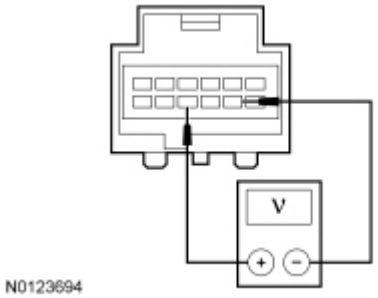


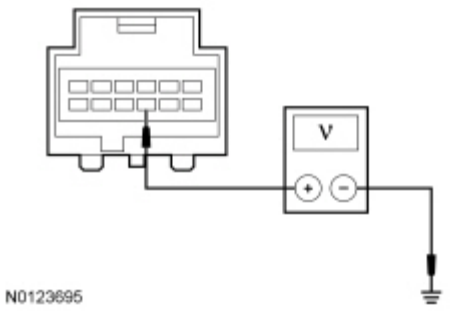


PINPOINT TEST H: THE SELECTSHIFT™ SWITCH IS NOT OPERATING CORRECTLY

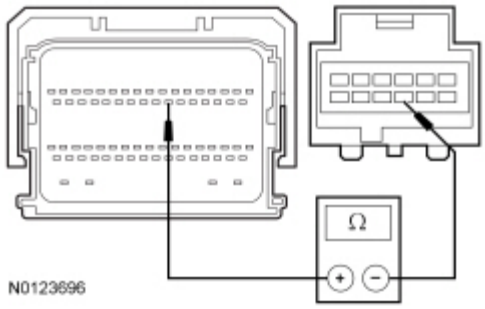
NOTE: Vehicles equipped with a 3.7L engine use PCM C175B.

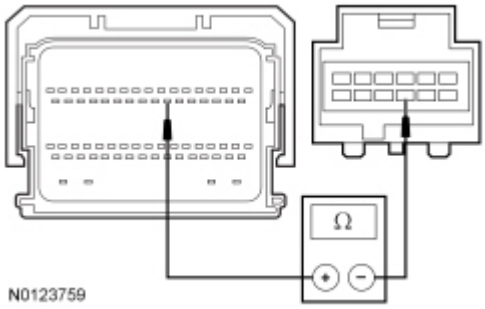


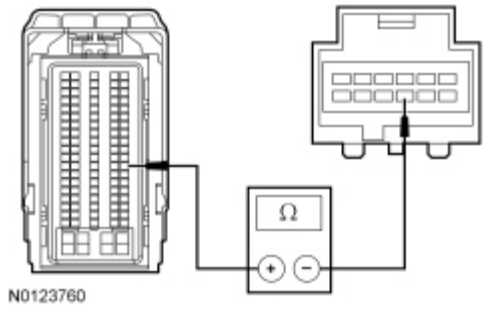




NOTE: Vehicles equipped with a 5.0L or 6.2L engine use PCM C1381B.

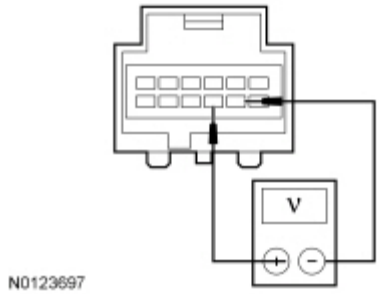






NOTE: Vehicles equipped with a 3.5L engine use PCM C1551B.

Test Step	Result / Action to Take
H1 CHECK DTCs	
• Ignition ON. • Connect the scan tool. • Start the engine and RUN the Key ON Engine Running (KOER) self-test. • **Is DTC P0815 set?**	**Yes** GO to H2 . **No** GO to H5 .
H2 CHECK THE UPSHIFT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: Selector Lever C3245. • Inspect C3245 for damaged, pushed-out terminals,	**Yes** GO to H4 .



corrosion or loose wires. • Ignition ON. • Measure the voltage between the selector lever C3245-9, circuit CET43 (GY), harness side and ground.  N0123692 • **Is the voltage greater than 10 volts?**	**No** GO to H3 .
H3 CHECK THE UPSHIFT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175B. • Disconnect: PCM C1381B. • Disconnect: PCM C1551B. • Inspect the connector for damaged, pushed-out terminals, corrosion or loose wires. • For 3.7L engine vehicles, measure the resistance between the Tow/Haul switch C3245-9, circuit CET43 (GY) and PCM C175B-23, harness side.  N0123693 • For 5.0L or 6.2L engine vehicles, measure the resistance between the Tow/Haul switch C3245-9, circuit CET43 (GY) and PCM C1381B-23, harness side.  N0123693 • For 3.5L engine vehicles, measure the resistance between the Tow/Haul switch C3245-9, circuit	**Yes** GO to H4 . **No** REPAIR circuit CET43 (GY) for an open. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation.

repair4less

CET43 (GY) and PCM C1551B-89, harness side.  N0123758 • **Is the resistance less than 5 ohms?**	
H4 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	
• Connect: PCM C175B. • Connect: PCM C1381B. • Connect: PCM C1551B. • Ignition ON. • Measure the voltage between the selector lever C3245-9, circuit CET43 (GY) and C3245-11, circuit RE407 (YE/VT) harness side.  N0123694 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new selector lever, REFER to Selector Lever — Floor Shift in this section. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation. **No** REPAIR the signal return circuit RE407 (YE/VT) for an open. If an open circuit is not found, REPLACE the PCM. PROGRAM the PCM with the latest calibration level. PERFORM the solenoid strategy download procedure, REFER to solenoid body strategy in Section 307-01 . RERUN the KOER self-test and test the system for normal operation.
H5 CHECK THE DOWNSHIFT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: Selector Lever C3245. • Inspect C3245 for damaged, pushed-out terminals, corrosion or loose wires. • Ignition ON. • Measure the voltage between the selector lever C3245-10, circuit CET42 (GN/VT), harness side and ground.  N0123695	**Yes** GO to H7 . **No** GO to H6 .

• **Is the voltage greater than 10 volts?**	
H6 CHECK THE DOWNSHIFT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175B. • Disconnect: PCM C1381B. • Disconnect: PCM C1551B. • Inspect the connector for damaged, pushed-out terminals, corrosion or loose wires. • For 3.7L engine vehicles, measure the resistance between the selector lever C3245-10, circuit CET42 (GN/VT) and PCM C175B-24, harness side.  • For 5.0L or 6.2L engine vehicles, measure the resistance between the Tow/Haul switch C3245-10, circuit CET42 (GN/VT) and PCM C1381B-24, harness side.  • For 3.5L engine vehicles, measure the resistance between the Tow/Haul switch C3245-10, circuit CET42 (GN/VT) and PCM C1551B-88, harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to H7 . **No** REPAIR circuit CET42 (GN/VT) for an open. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation.
H7 CHECK THE SIGNAL RETURN CIRCUIT FOR AN	

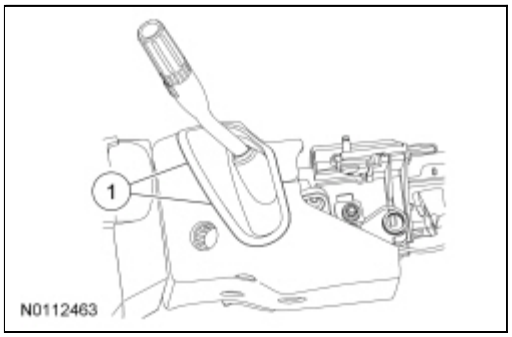
repair4less

OPEN	
• Connect: PCM C175B. • Connect: PCM C1381B. • Connect: PCM C1551B. • Measure the voltage between the selector lever C3245-10, circuit CET42 (GN/VT) and C3245-11, circuit RE407 (YE/VT) harness side.  N0123697 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new selector lever, REFER to Selector Lever — Floor Shift in this section. CLEAR the DTCs. RERUN the KOER self-test and test the system for normal operation. **No** INSPECT and REPAIR the signal return circuit RE407 (YE/VT) for an open. If an open circuit is not found, REPLACE the PCM. PROGRAM the PCM with the latest calibration level. PERFORM the solenoid strategy download procedure, REFER to solenoid body strategy in Section 307-01 . RERUN the KOER self-test and test the system for normal operation.

Brake Shift Interlock Override — Column Shift

NOTE: If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown. GO to Pinpoint Test A .

This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON position until the brake pedal is applied.



If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is applied:

1. Apply the parking brake. Turn the ignition key to the off position and remove the key.

2. Tilt and telescope the steering column to the full downward and rearward position.

3. ***NOTICE:*** **Make sure to use extra care when detaching the selector lever boot clips from steering column shrouds or damage to the selector lever boot may occur causing replacement of the selector lever assembly. The selector lever boot is not serviceable separately.**

   Position the selector lever boot aside.
   1. Push forward on the selector lever boot at the area indicated and remove the boot from the upper and lower steering column shrouds.

4. **NOTE:** The BSIA spindle can be accessed through the selector lever boot opening.

   Move the BSIA spindle outward, apply the brake pedal and position the selector lever into NEUTRAL.

repair4less

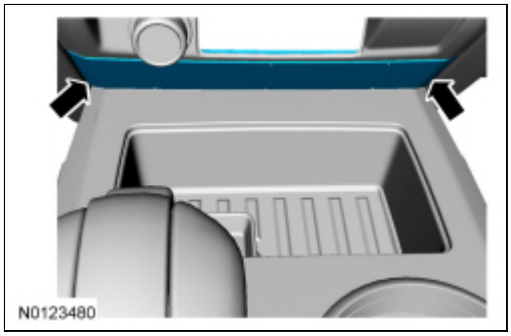
5. ***NOTICE:*** **Make sure to use extra care and follow the installation sequence when installing the selector lever boot to the steering column shrouds or damage to the boot may occur causing replacement of the selector lever assembly. the selector lever boot is not serviceable separately.**

   Install the selector lever boot in the sequence shown.
   1. Install the front of the selector lever boot.
   2. Install the bottom of the selector lever boot.
   3. Install the top of the selector lever boot.
   4. Install the back of the selector lever boot.

6. Start the vehicle.

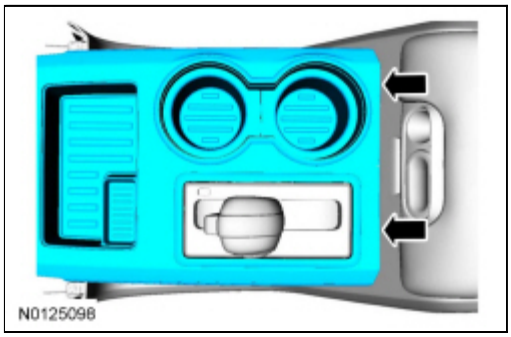
repair4less

Brake Shift Interlock Override — Floor Shift



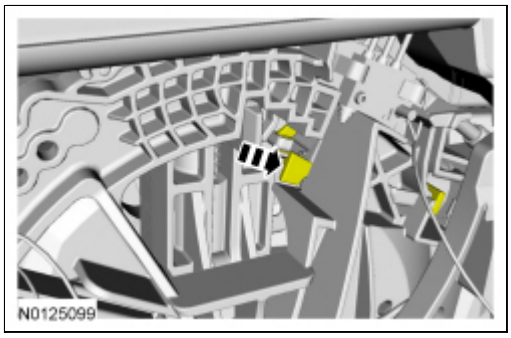
NOTE: If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown. GO to Pinpoint Test A .

This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON position, until the brake pedal is applied.

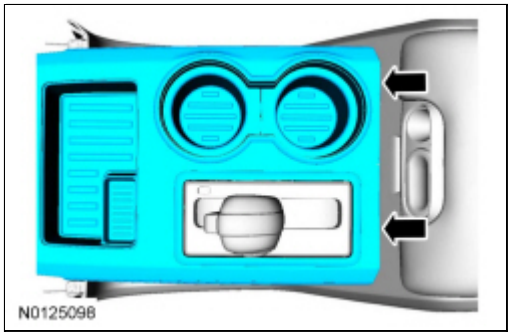


If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is applied:

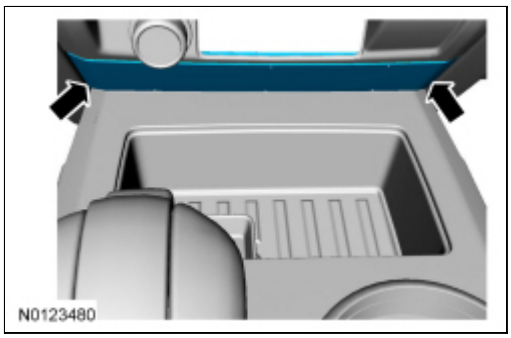
1. Apply the park brake and remove the ignition key.



2. Remove the instrument panel to floor console finish panel.



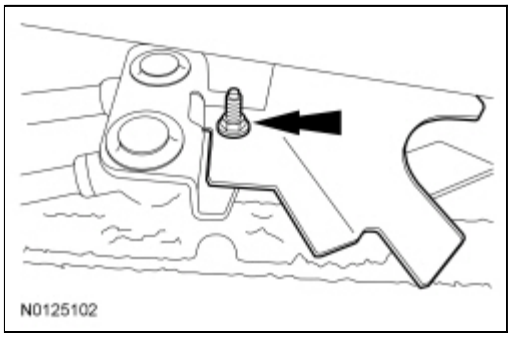
3. Remove the floor console upper finish panel.
    - Starting at the rear of the upper finish panel, carefully pry up the upper finish panel and disconnect the electrical connectors.



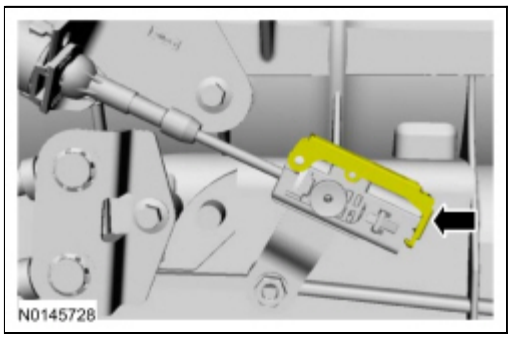
4. Apply the brake pedal. Press and hold the Brake Shift Interlock Actuator (BSIA) lever while moving the selector lever into NEUTRAL.

5. Connect and install the floor console upper finish panel.

6. Install the instrument panel to floor console finish panel.



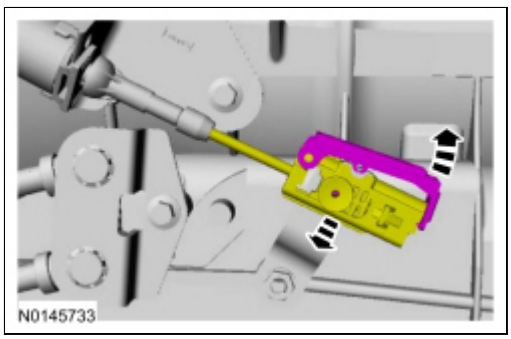
7. Start the vehicle.



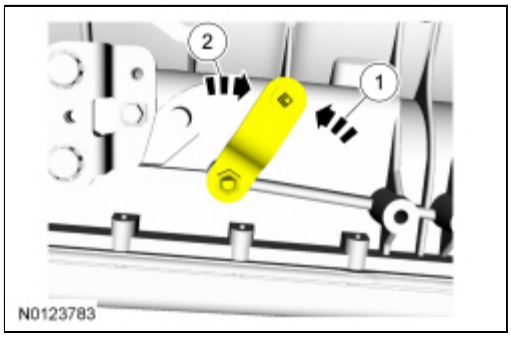
repair4less

Selector Lever Cable Adjustment — Column Shift

1. With the vehicle in NEUTRAL, position it on a hoist. REFER to Section 100-02 .
2. Place the selector lever in DRIVE.
3. If equipped, remove the nut and the selector lever cable splash shield.

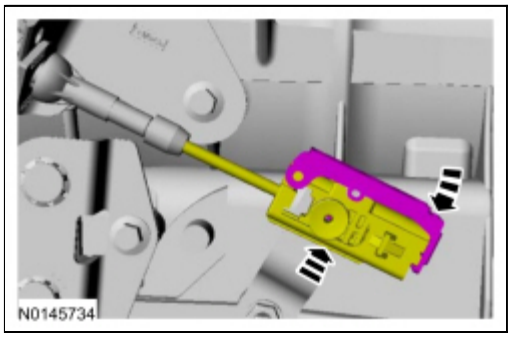


4. Clean the cable adjustment lock of any debris.

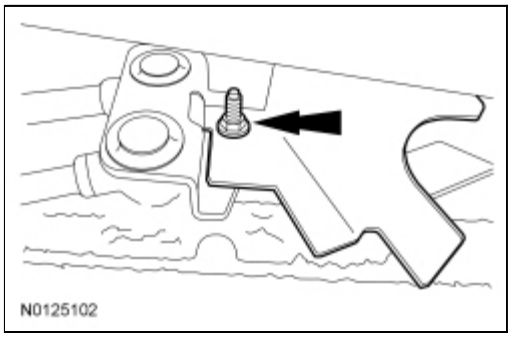


5. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Rotate the cable adjustment lock upward and remove the selector lever cable from the manual control lever.



repair4less

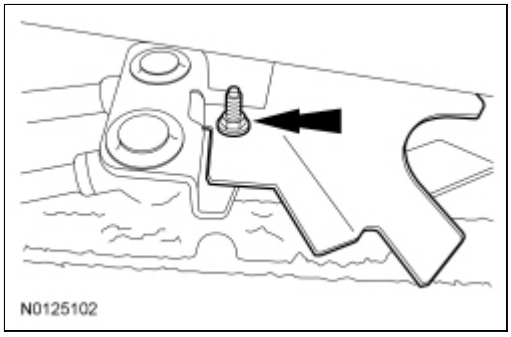


6. Place the manual control lever in the (D) position.
    1. Rotate the manual control lever counterclockwise 3 detents into the manual 1st position.
    2. Rotate the manual control lever clockwise 3 detents into the (D) position.

7. Connect the selector lever cable onto the manual control lever and move the locking tab down.
    - Listen for the audible click, then push back on the locking tab to verify it is locked.
    - Pull back on the selector lever cable to verify it is installed correctly to the manual lever.

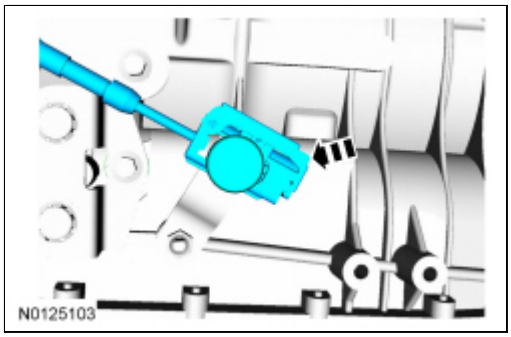
8. If equipped, install the selector lever cable splash shield and the nut.
    - Tighten to 12 Nm (106 lb-in).

9. Verify the vehicle will start in PARK or NEUTRAL and the backup lamps illuminate in REVERSE.



repair4less

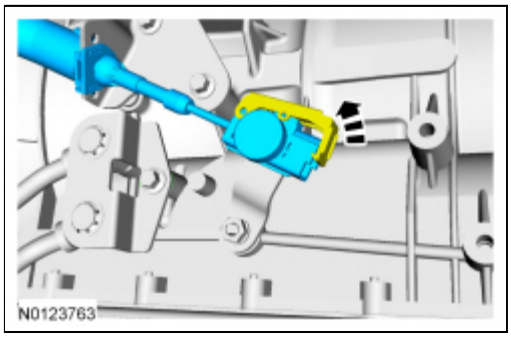
Selector Lever Cable Adjustment — Floor Shift



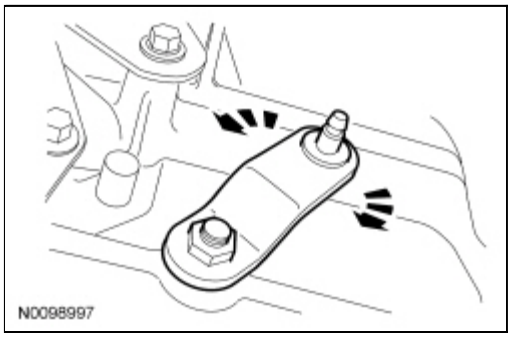
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Place the selector lever in DRIVE.

3. If equipped, remove the nut and the selector lever cable splash shield.

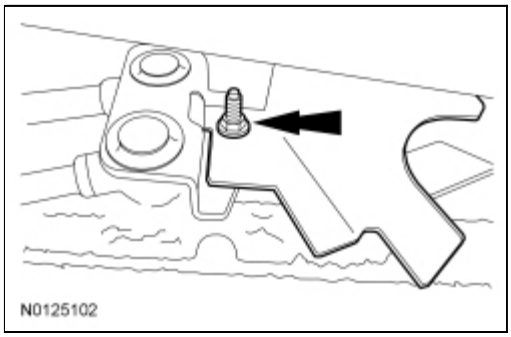


4. Clean the cable adjustment lock of any debris.



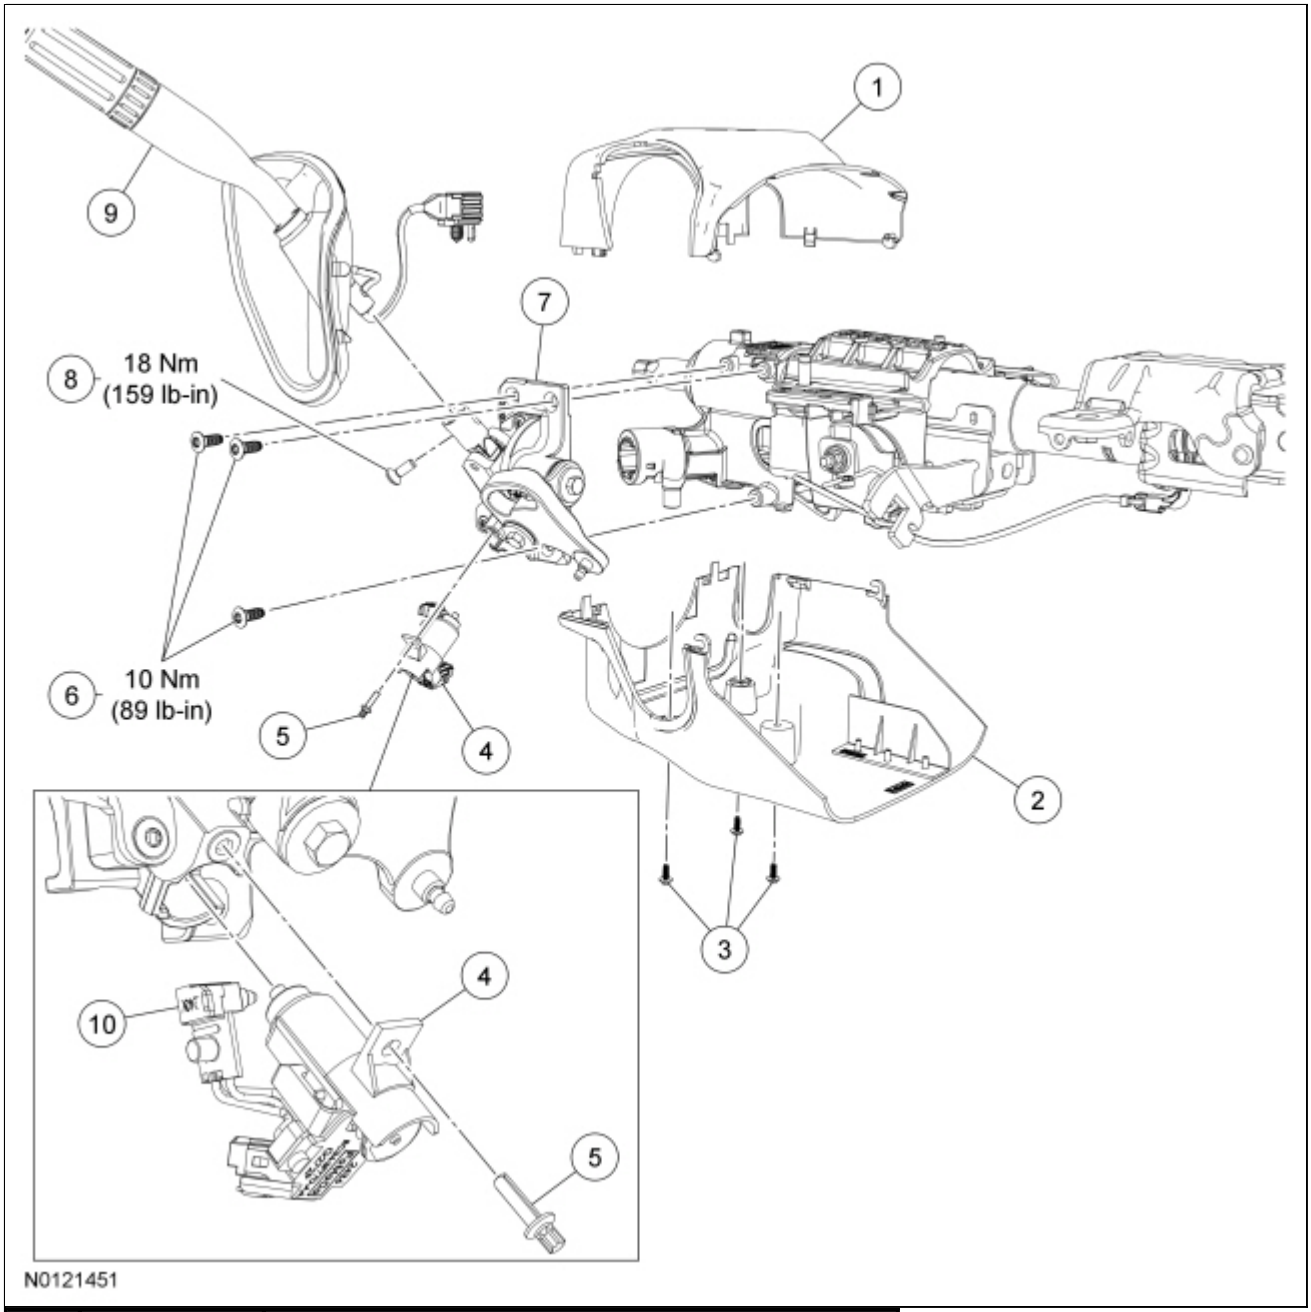
5. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Rotate the cable adjustment lock upward and remove the selector lever cable from the manual control lever.



6. Place the manual control lever in the (D) position.
    - Rotate the manual control lever counterclockwise 3 detents into the manual 1st position.
    - Rotate the manual control lever clockwise 3 detents into the (D) position.

7. Connect the selector lever cable onto the manual control lever and move the locking tab down.
    - Listen for the audible click, then push back on the locking tab to verify it is locked.
    - Pull back on the selector lever cable to verify it is installed correctly to the manual lever.



8. If equipped, install the selector lever cable splash shield and the nut.
    - Tighten to 12 Nm (106 lb-in).

9. Verify the vehicle will start in PARK or NEUTRAL and the backup lamps illuminate in REVERSE.

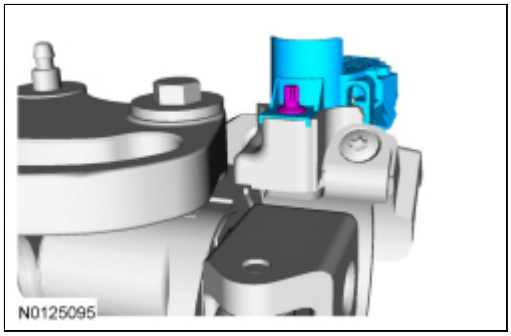
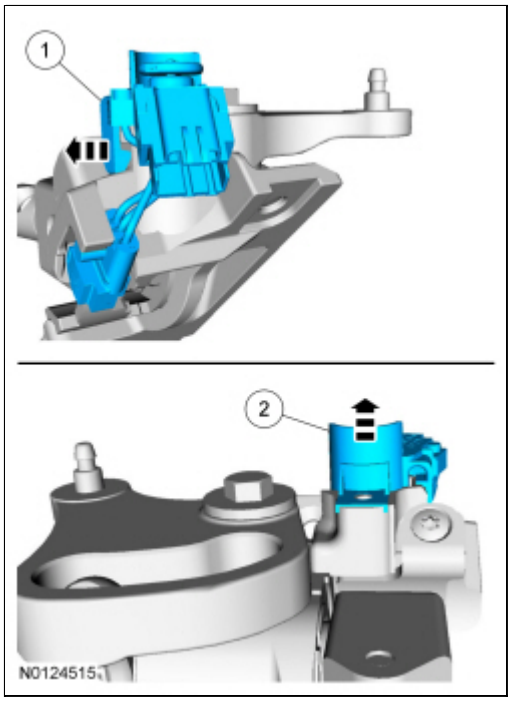
Brake Shift Interlock Actuator — Column Shift

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3530	Lower steering column shroud
3	W710485	Lower steering column shroud screws (3 required)
4	3Z719	Brake Shift Interlock Actuator (BSIA)



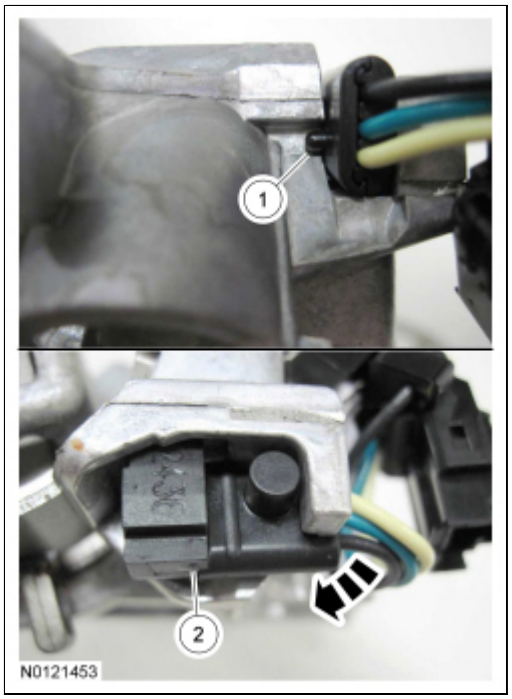
repair4less

5	3F907	BSIA screw
6	W790181	Selector lever mechanism bolts (3 required)
7	7210B	Selector lever mechanism
8	W712000	Selector lever bolt
9	7210A	Selector lever
10	—	Park position switch (part of 3Z719)



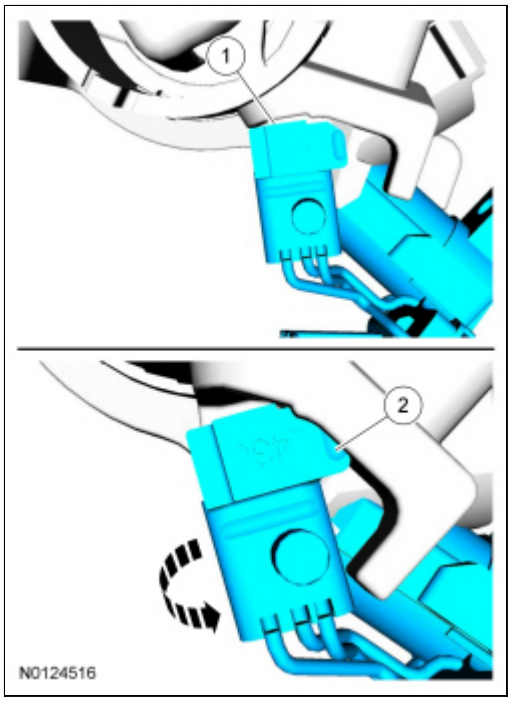
Removal and Installation

1. Remove the selector lever mechanism. For additional information, refer to Selector Lever Mechanism — Column Shift in this section.

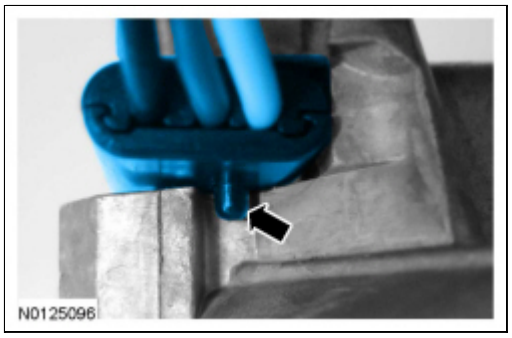


2. Remove the Brake Shift Interlock Actuator (BSIA) screw.

3. Remove the BSIA .
    1. Gently pry out the clip.
    2. While prying out the clip, simultaneously remove the BSIA from the selector lever mechanism housing.

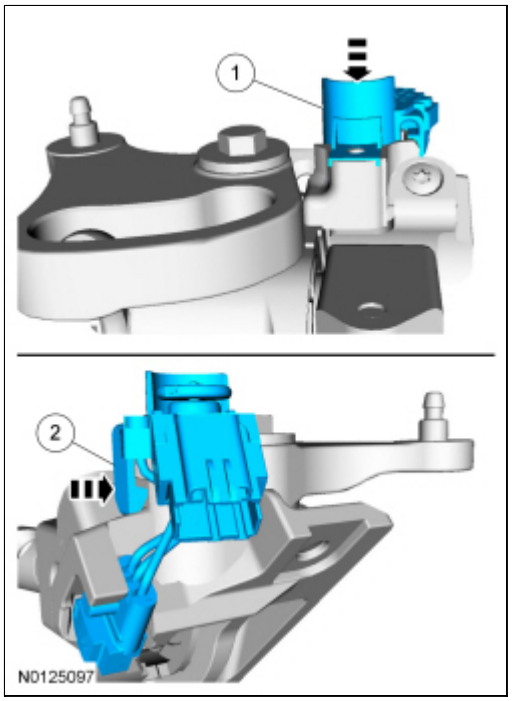


4. Remove the park position switch.
    1. Press the spring loaded pin.
    2. While pressing in on the spring loaded pin, rotate the park position switch clockwise and remove it from the selector lever mechanism.

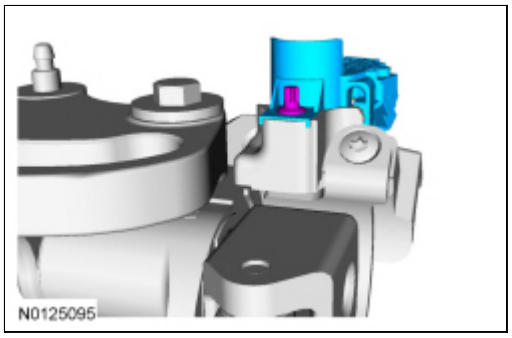


Installation

1. Install the park position switch.
    1. Place the large plunger on the park position switch in the locating hole and position the switch as shown.
    2. Rotate the park position switch counterclockwise making sure the tab locks under the housing lip.



repair4less



2. Verify small plunger is fully extended.

3. Install the BSIA .
    1. Insert the BSIA into the selector lever mechanism housing.
    2. Gently push the snap lock clip in place.

4. Install the BSIA screw.
    - Tighten to 2 Nm (18 lb-in).

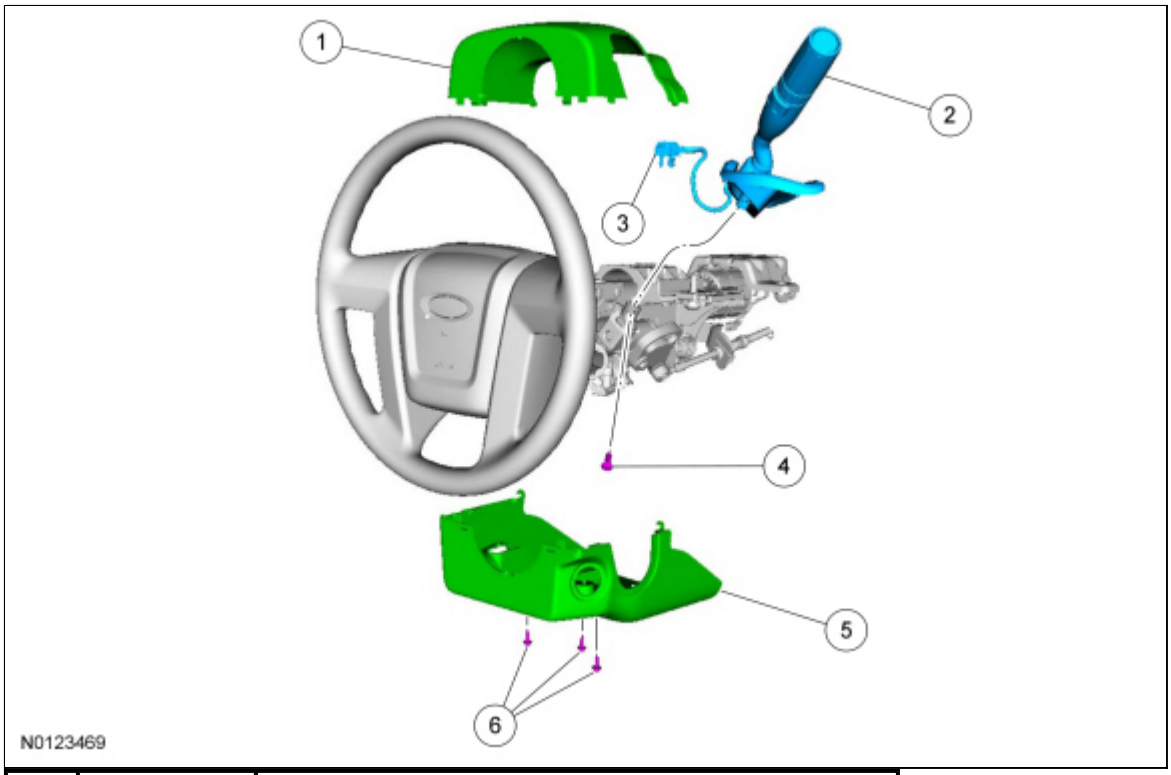
5. Install the selector lever mechanism. For additional information, refer to Selector Lever Mechanism — Column Shift in this section.

repair4less

Brake Shift Interlock Actuator — Floor Shift

Removal and Installation

NOTE: The Brake Shift Interlock Actuator (BSIA) is not serviced separately. If a new BSIA is required, install a new floor shift selector lever assembly.

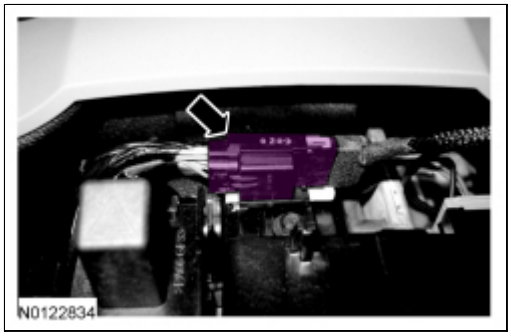


1. For additional information, refer to Selector Lever — Floor Shift in this section.

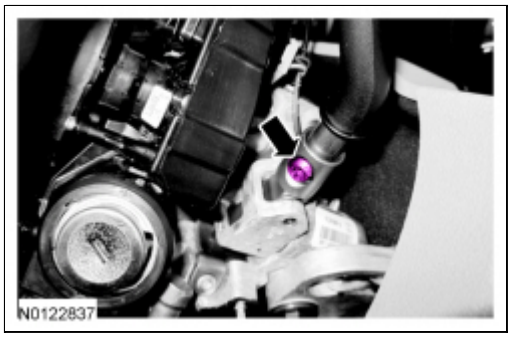
repair4less

Selector Lever — Column Shift

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.



NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.



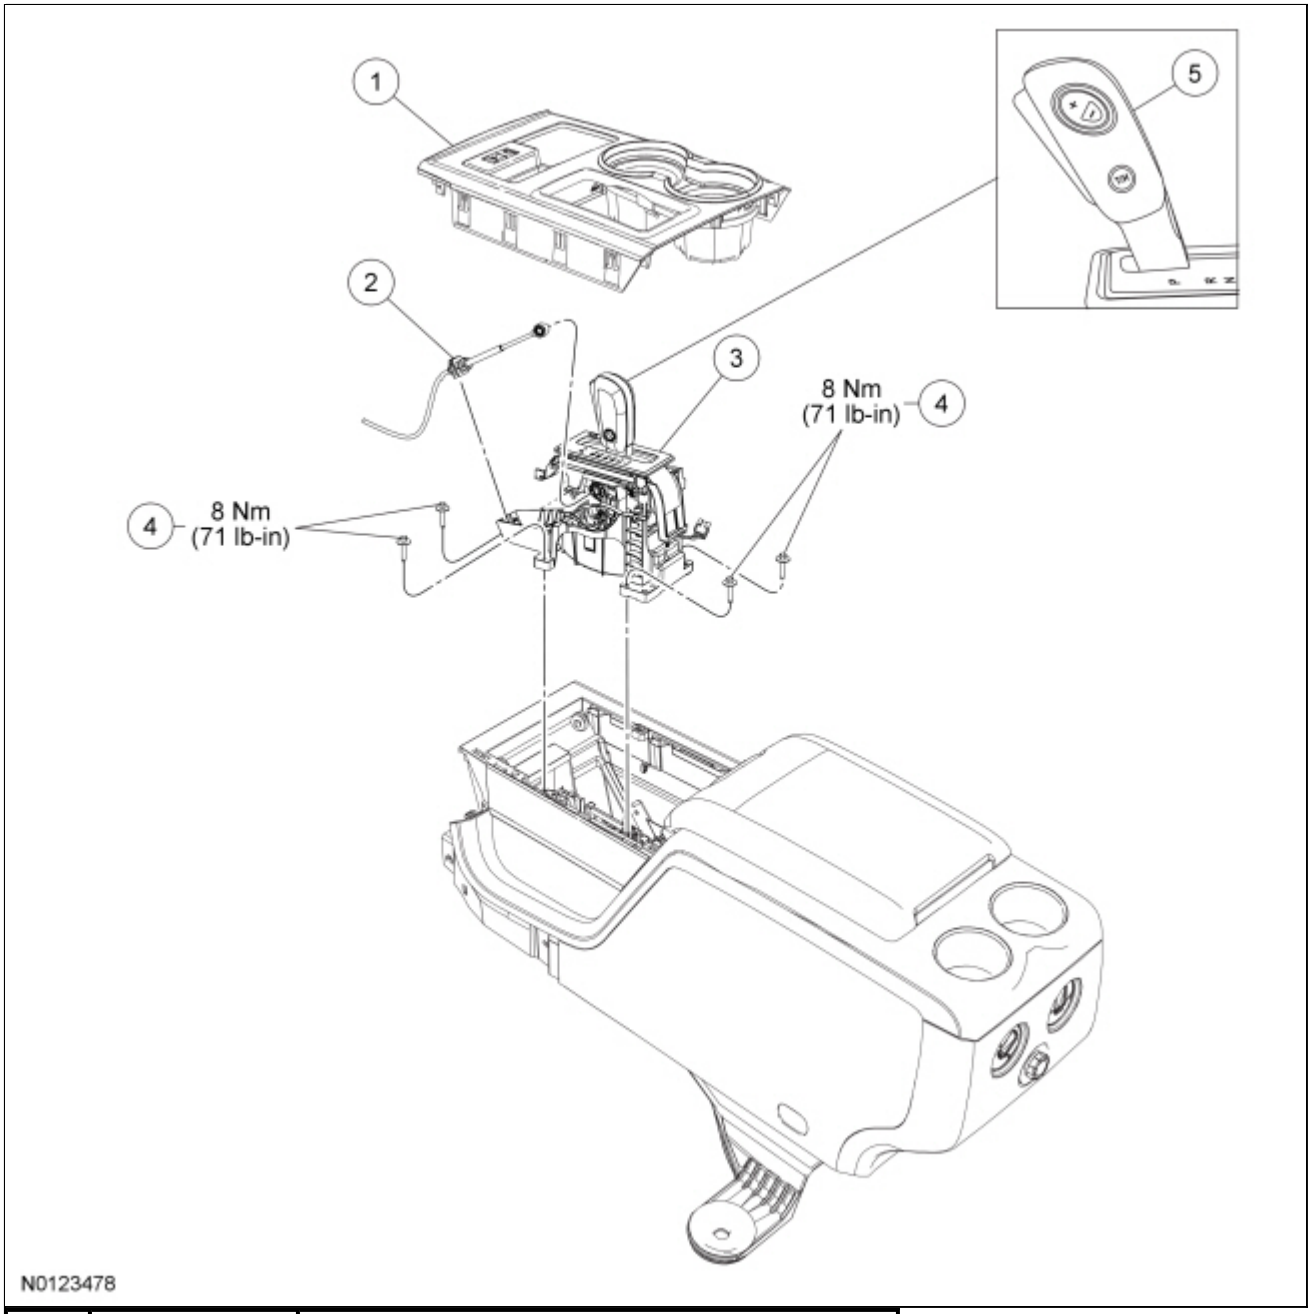
Item	Part Number	Description
1	3530	Upper steering column shroud
2	7210A	Selector lever
3	—	Tow/Haul switch electrical connector (part of 7210A)
4	W712000	Selector lever bolt
5	3530	Lower steering column shroud
6	W710485	Lower steering column shroud screws (3 required)

Removal and Installation

1. Remove the steering column shrouds. For additional information, refer to Section 211-04 .
2. Disconnect the Tow/Haul switch electrical connector.

3. Remove and discard the selector lever bolt.
    - To install, tighten to 18 Nm (159 lb-in).

4. Remove the selector lever.



5. To install, reverse the removal procedure.

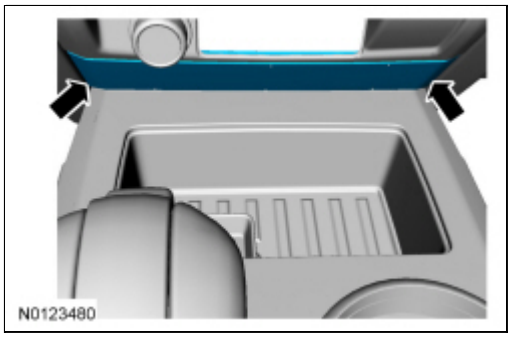
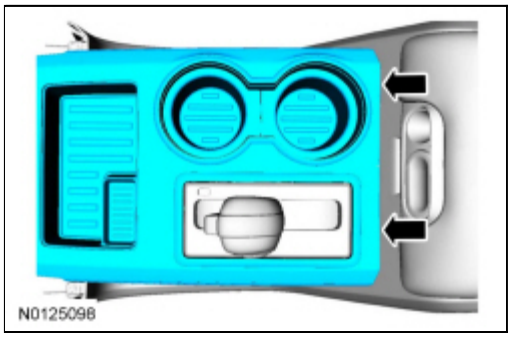
Selector Lever — Floor Shift

Selector Lever — Floor Shift



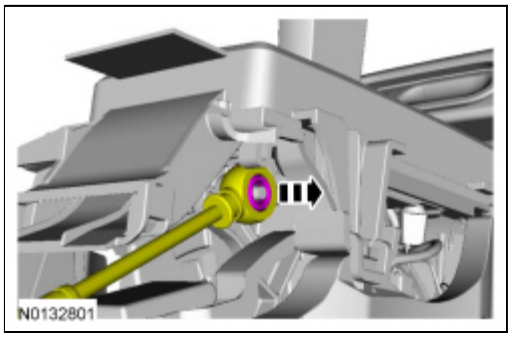
Item	Part Number	Description
1	—	Console upper trim panel
2	7E395	Selector lever cable
3	7210	Selector lever assembly



4	N606678-S	Selector lever assembly bolts (4 required)
5	7213	Selector lever knob

Removal

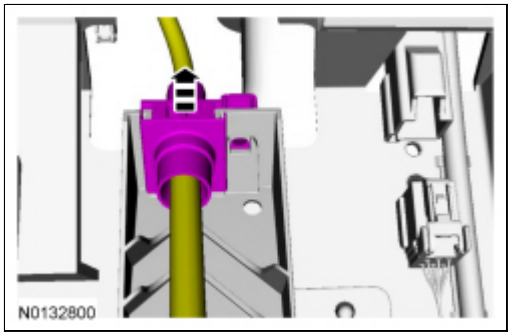
1. Remove the instrument panel to floor console finish panel.



2. Remove the floor console upper finish panel.
   - Starting at the rear of the upper finish panel, carefully pry up the upper finish panel and disconnect the electrical connectors.

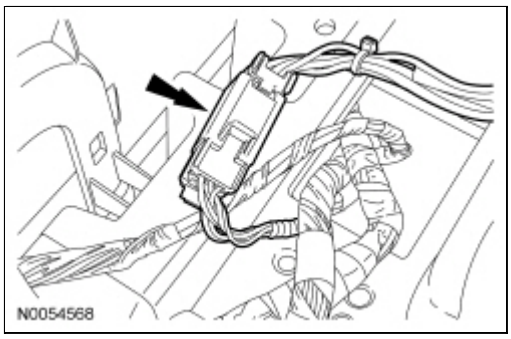
3. ***NOTICE:*** **Do not pry on selector lever cable or the selector lever pin may be damaged.**

   Disconnect the selector lever cable end from the selector lever pin by gently pulling the selector lever cable end straight off the selector lever arm.



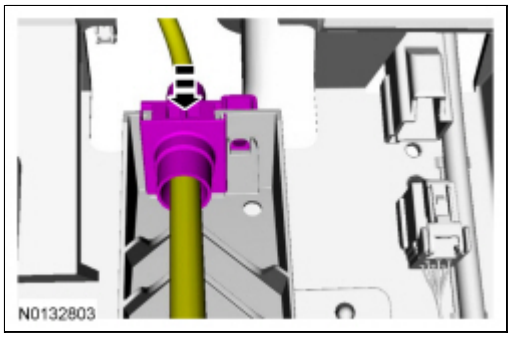
4. **NOTE:** The selector lever bezel has been removed for clarity. Do not remove the selector lever bezel.

   Remove the 4 selector lever assembly bolts.

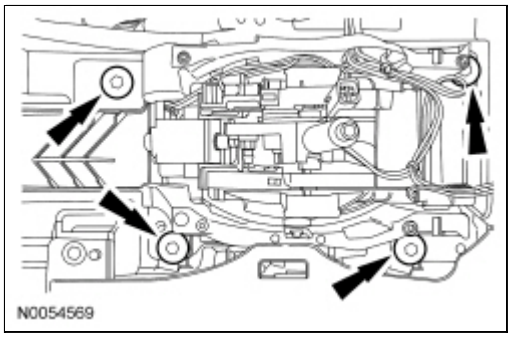


repair4less

5. Disconnect the selector lever cable from the selector lever cable bracket.



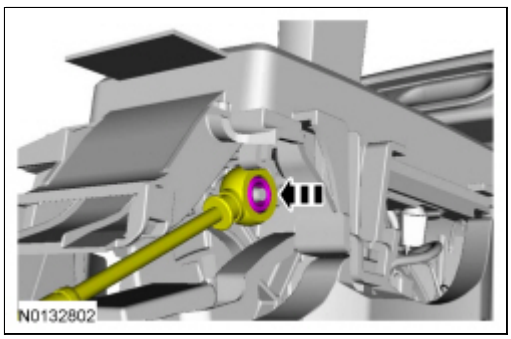
6. Disconnect the selector lever harness connector and remove the selector lever from the vehicle.



Installation

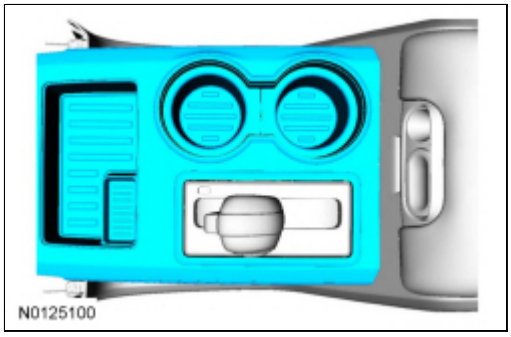
1. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place. Press the selector lever cable into the bracket and listen for the selector lever cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the bracket.

   Install the selector lever cable in the selector lever cable bracket.

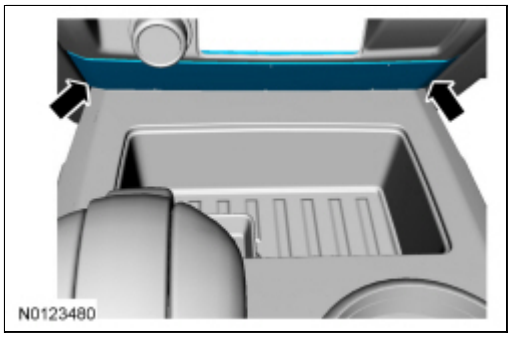


2. Position the selector lever assembly in the console and install the 4 bolts.
    - Tighten to 8 Nm (71 lb-in).

3. Connect the selector lever harness connector.



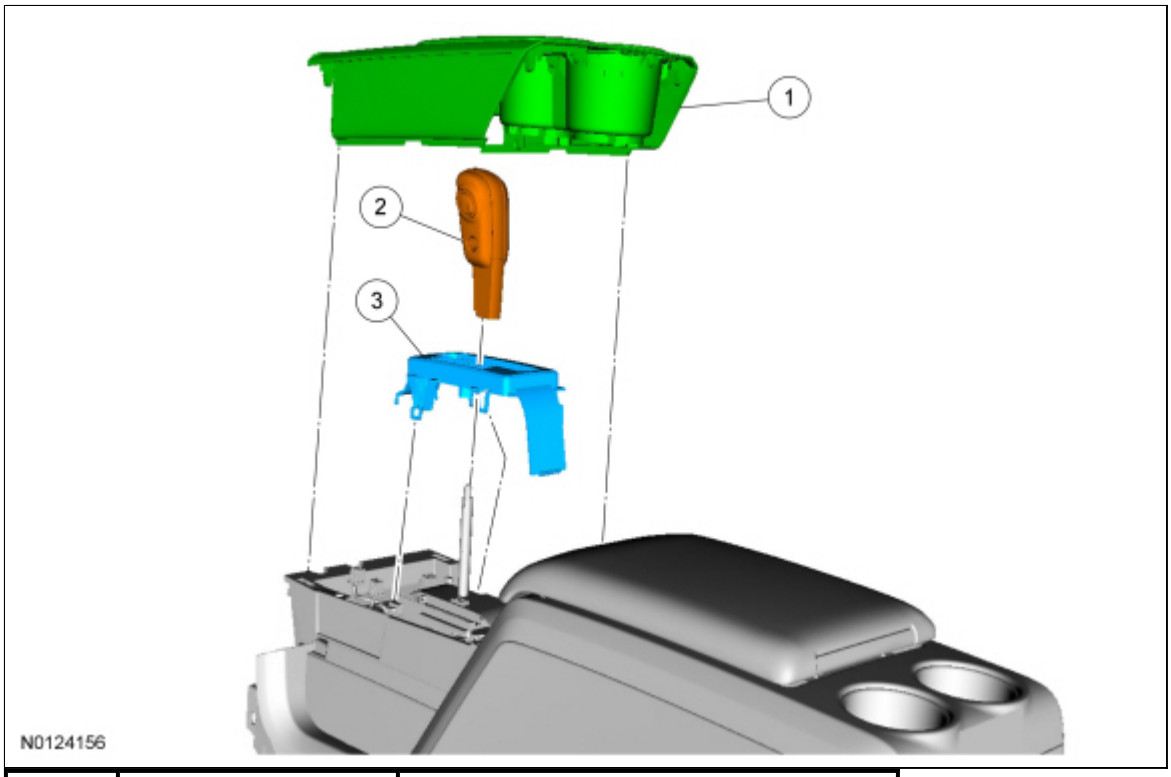
4. Connect the selector lever cable onto the selector lever arm.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is installed correctly.



repair4less

5. Connect and install the floor console upper finish panel.

6. Install the instrument panel to floor console finish panel.



7. Adjust the selector lever cable. For additional information, refer to Selector Lever Cable Adjustment — Floor Shift in this section.

Selector Lever Bezel

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

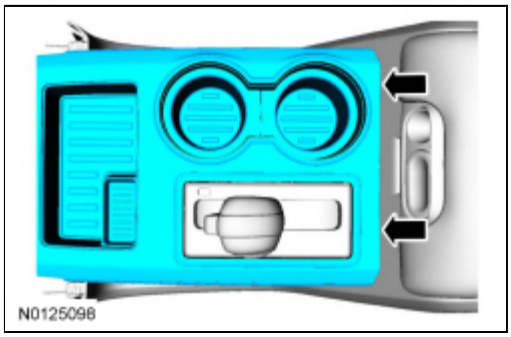
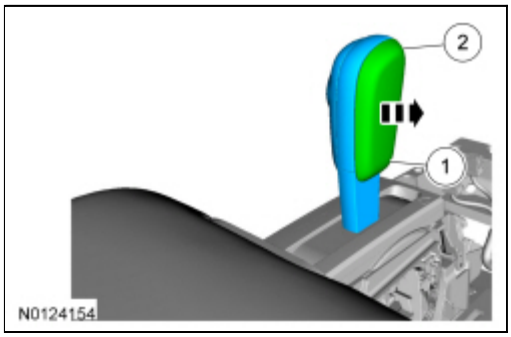
Item	Part Number	Description
1	045A76	Console upper trim panel
2	7213	Selector lever knob
3	7D443	Selector lever bezel

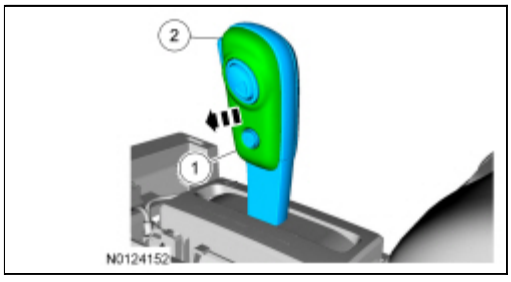


Removal

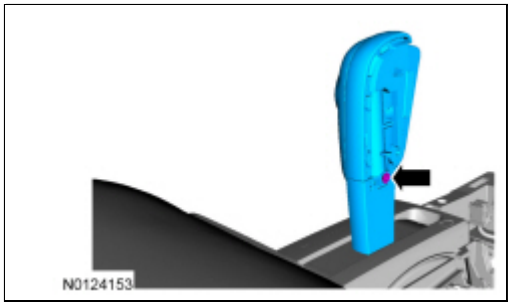
1. Remove the instrument panel to floor console finish panel.



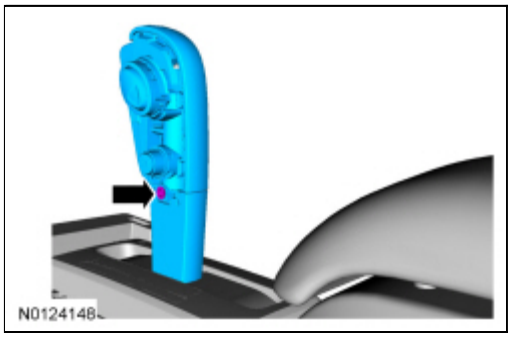
repair4less



2. Remove the floor console upper finish panel.
    - Starting at the rear of the upper finish panel, carefully pry up the upper finish panel and disconnect the electrical connectors.

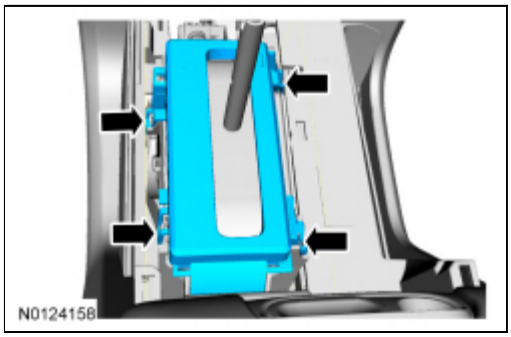


3. Remove and discard the RH selector lever knob cover.
    1. Start at the bottom front.
    2. Move towards the top front and remove the cover.

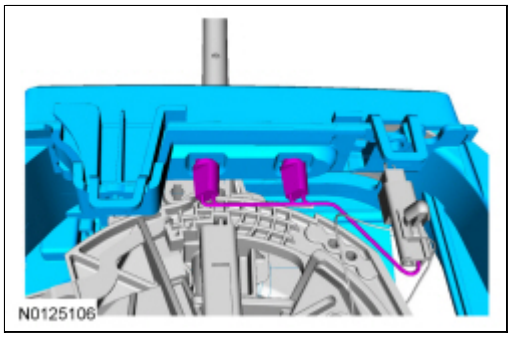


4. Remove and discard the LH selector lever knob cover.
    1. Start at the bottom front.
    2. Move towards the top front and remove the cover.

5. Remove and discard the RH selector lever knob screw.

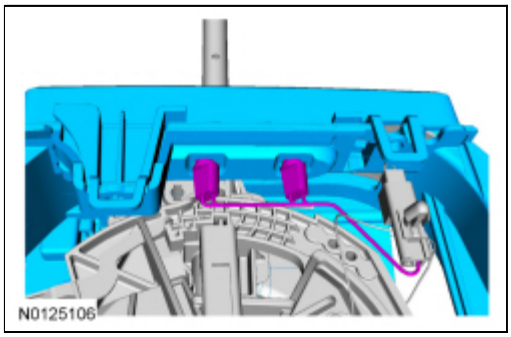


6. Remove and discard the LH selector lever knob screw.

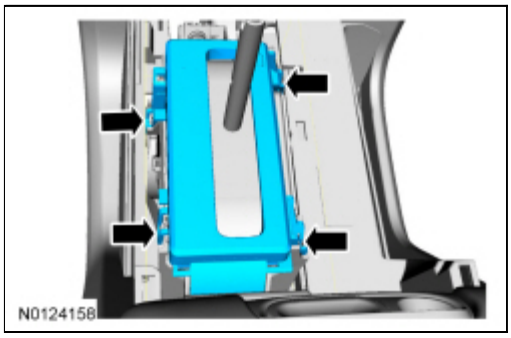


7. Disconnect the select shift and the Tow/Haul electrical connectors and remove the selector lever knob.

8. Lift the tabs on the selector lever bezel and lift the bezel.

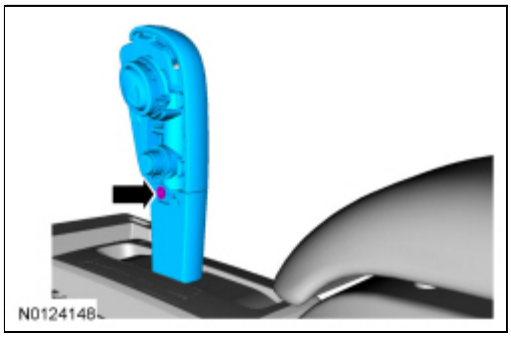


9. Disconnect the electrical harness from the bezel and remove the selector lever bezel.

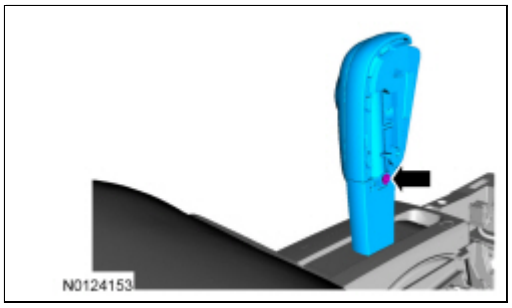


repair4less

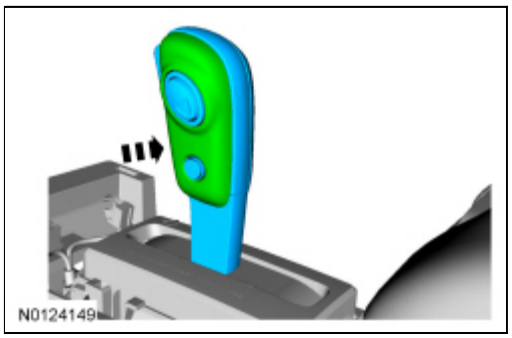
Installation



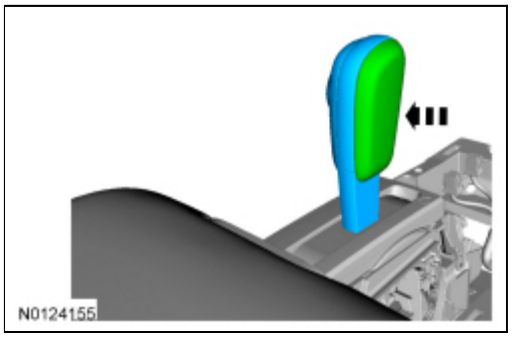
1. Connect the electrical harness to the selector lever bezel.



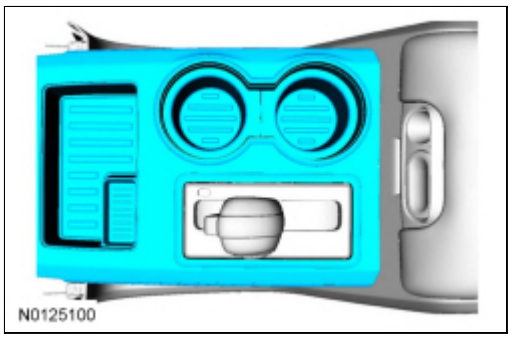
2. Install the selector lever bezel onto the selector lever housing.



3. Connect the select shift and the Tow/Haul electrical connectors and install the selector lever knob.
4. Install a new LH selector lever knob screw.

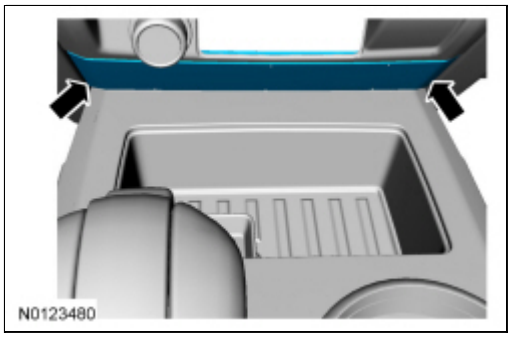


5. Install a new RH selector lever knob screw.



6. Install a new LH selector lever knob cover.

7. Install a new RH selector lever knob cover.



8. Connect and install the floor console upper finish panel.

9. Install the instrument panel to floor console finish panel.

Selector Lever Cable — Column Shift

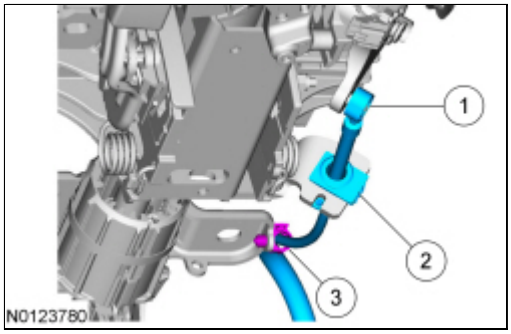
NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.

Item	Part Number	Description
1	W708211	Selector lever cable routing clip

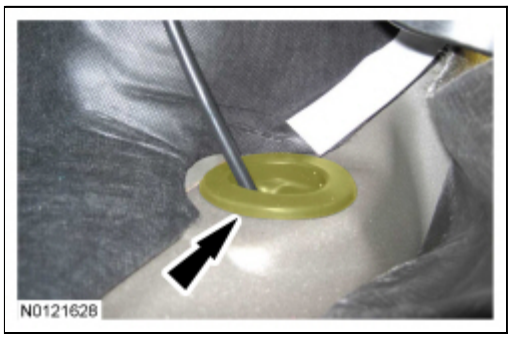
2	—	Grommet (part of 7E395)
3	7E395	Selector lever cable
4	7H181	Retaining clip
5	3530	Upper steering column shroud
6	—	Retaining pushpin (part of 7E395)
7	—	Retainer (part of 7E395)
8	3530	Lower steering column shroud
9	W710485	Lower steering column shroud screws (3 required)

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. REFER to Section 100-02 .

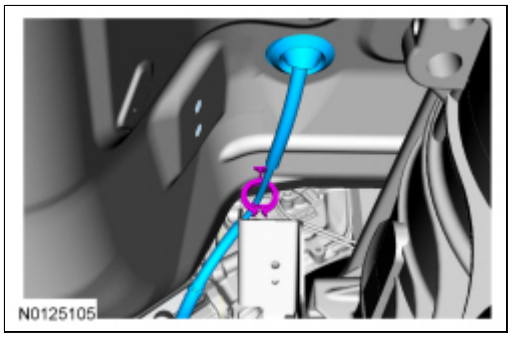
2. Remove the steering column shrouds. REFER to Section 211-04 .



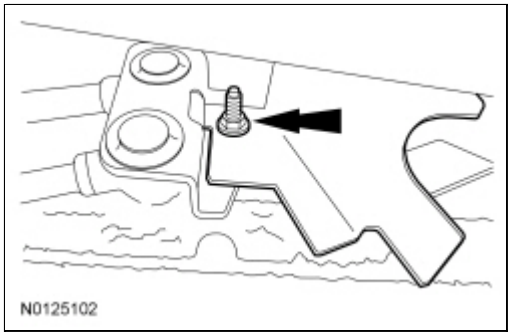
3. Position the selector lever into the D position.

4. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable assembly between the selector lever mechanism and the steering column bracket.**

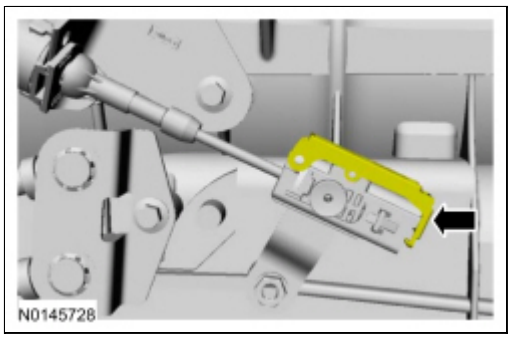
   Disconnect the selector lever cable from the steering column.
   1. Disconnect the selector lever cable from the selector lever mechanism.
   2. Carefully lift the locking tab and disconnect the selector lever cable from the steering column bracket.
   3. Disconnect the selector lever cable retainer.



5. Push the rubber grommet and selector lever cable through the floor pan.

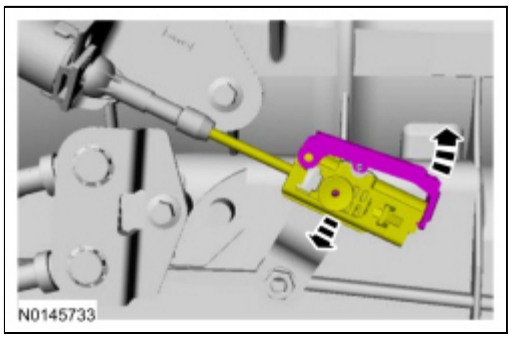


6. Detach the selector lever cable from the routing clip.

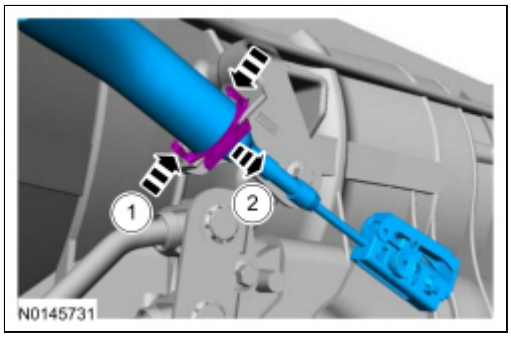


repair4less

7. If equipped, remove the nut and the selector lever cable splash shield.

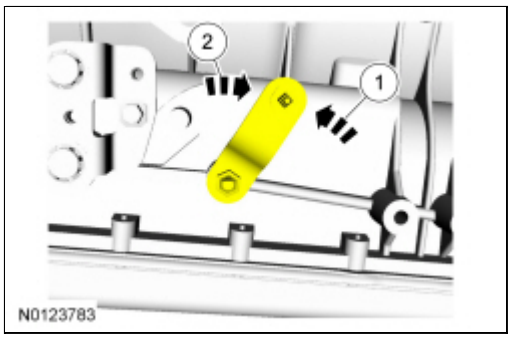


8. Clean cable adjustment lock of any debris.

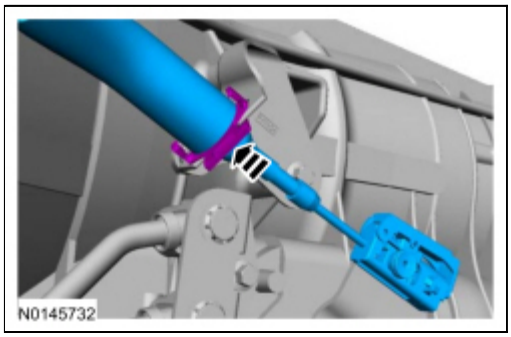


9. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable assembly between the manual control lever and the selector lever cable bracket.**

   Move the locking tab up and disconnect the selector lever cable from the manual control lever.

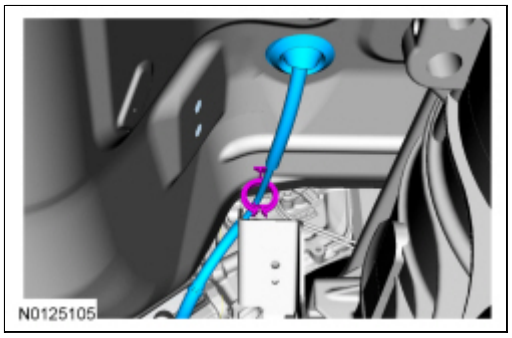


10. Remove the selector lever cable from the selector lever cable bracket.



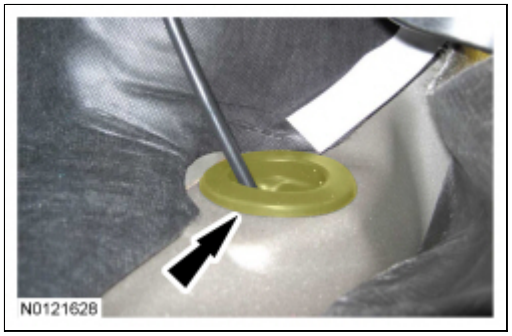
Installation

1. Place the manual control lever in DRIVE.
    1. Rotate the manual lever counterclockwise 3 detents into the manual 1st position.
    2. Rotate the manual lever clockwise 3 detents into Drive.



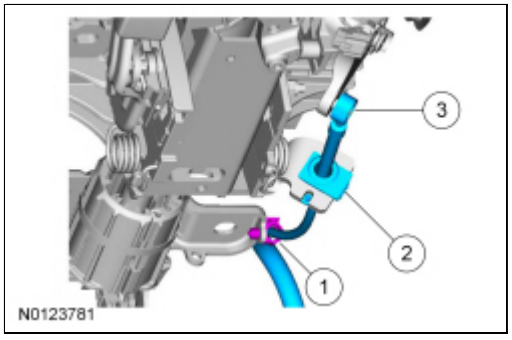
2. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place. Press the selector lever cable into the bracket and listen for the cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the bracket.

   Install the selector lever cable into the selector lever cable bracket.

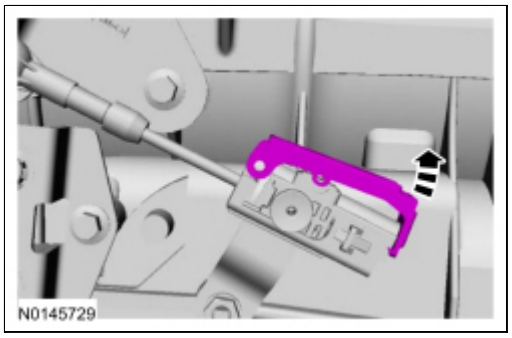


3. Attach the selector lever cable to the routing clip.

repair4less

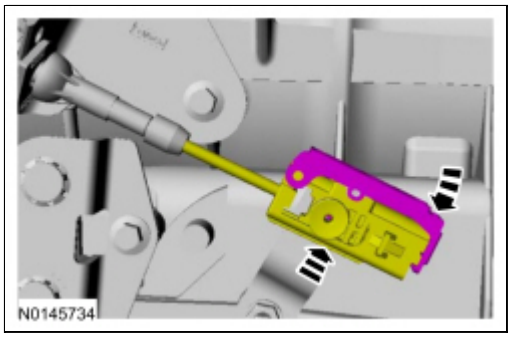


4. Push the rubber grommet and selector lever cable up through the floor pan.

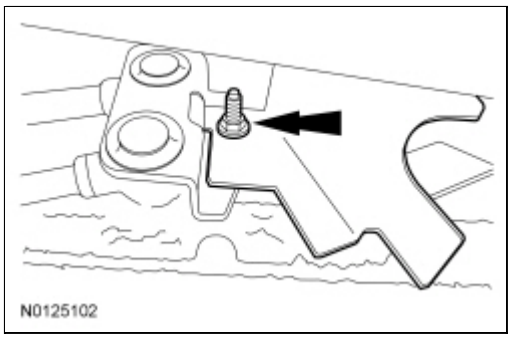


5. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place. Press the selector lever cable into the bracket and listen for the cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the bracket.

   Connect the selector lever cable onto the steering column.
   1. Connect the selector lever cable retainer.
   2. Connect the selector lever cable onto the steering column bracket.
   3. Connect the selector lever cable onto the selector lever mechanism.
      - Listen for the audible click.
      - Pull back on the selector lever cable to make sure that it is correctly installed.



6. Install the steering column shrouds. REFER to Section 211-04 .



7. Unlock the lock tab on the selector lever cable by sliding it up.

8. Connect the selector lever cable onto the manual control lever and move the locking tab down.
    - Listen for the audible click, then push back on the locking tab to verify it is locked.
    - Pull back on the selector lever cable to verify it is installed correctly to the manual lever.

9. If equipped, install the selector lever cable splash shield and the nut.
    - Tighten to 12 Nm (106 lb-in).

10. Verify the vehicle will start in PARK or NEUTRAL and the backup lamps illuminate in REVERSE.

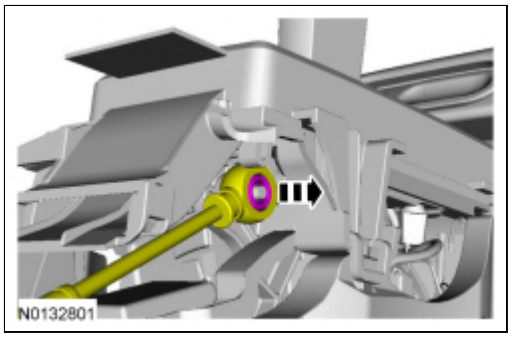
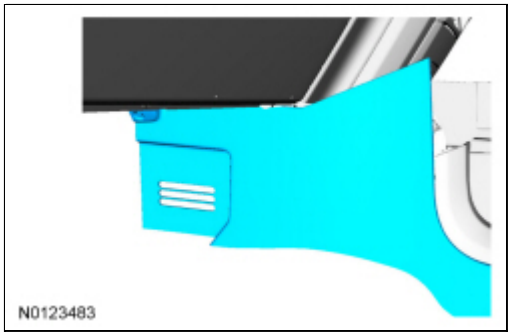
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the instrument panel to floor console finish panel.

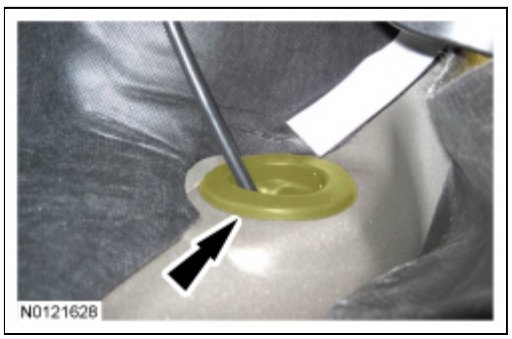


3. Remove the floor console upper finish panel.
   - Starting at the rear of the upper finish panel, carefully pry up the upper finish panel and disconnect the electrical connectors.



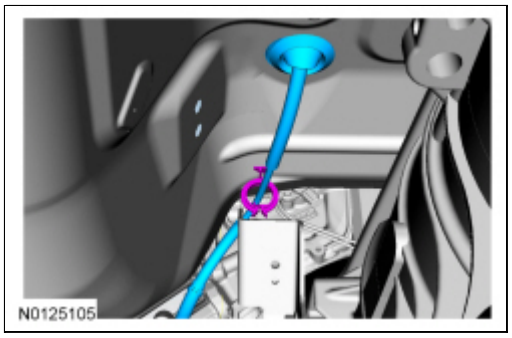
4. ***NOTICE:*** **Do not pry on selector lever cable or the selector lever pin may be damaged.**

   Disconnect the selector lever cable end from the selector lever pin by gently pulling the selector lever cable end straight off the selector lever arm.

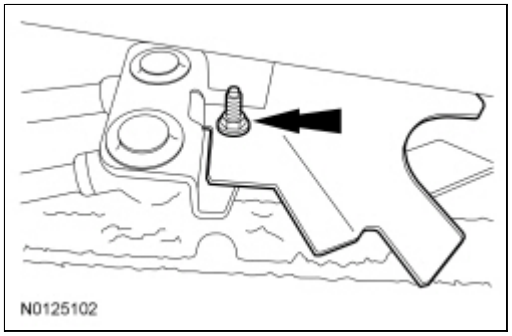


5. Remove the center console LH kick panel.

6. Disconnect the selector lever cable from the selector lever cable bracket.

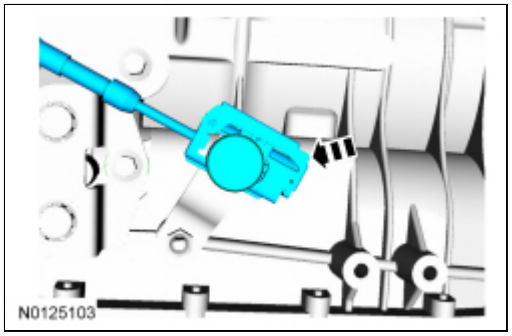


7. Push the rubber grommet and selector lever cable through the floor panel.

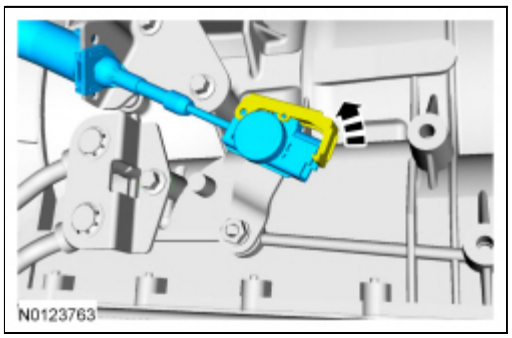


8. Detach the selector lever cable from the routing clip.

repair4less

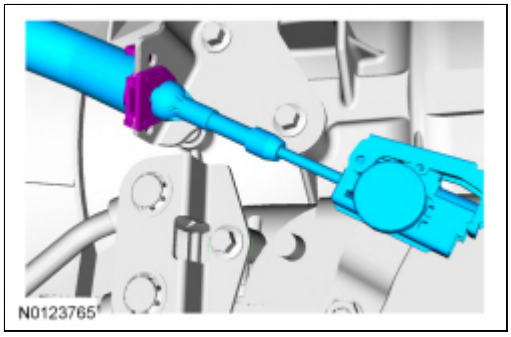


9. If equipped, remove the nut and the selector lever cable splash shield.



10. **NOTE:** The 3.5L is shown. The 3.7L, 5.0L and 6.2L do not have a heat shield.

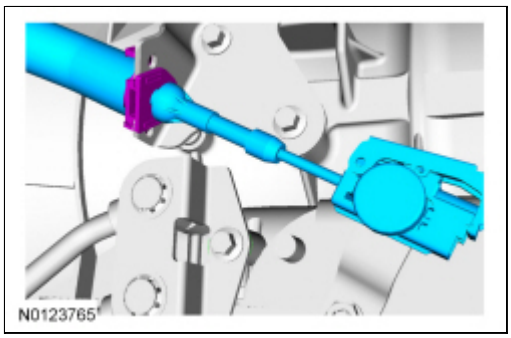
    Clean cable adjustment lock of any debris.



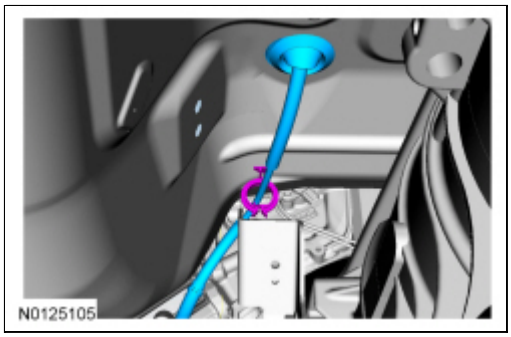
11. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    Move the locking tab up and disconnect the selector lever cable from the manual control lever.

12. Remove the selector lever cable from the selector lever cable bracket.



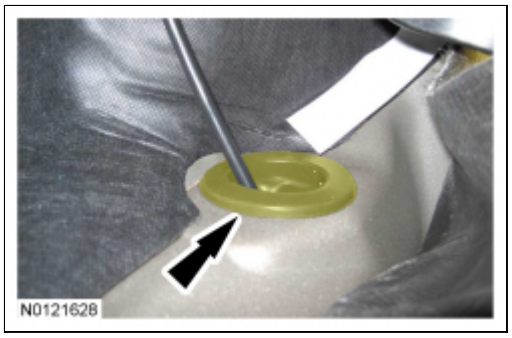
Installation



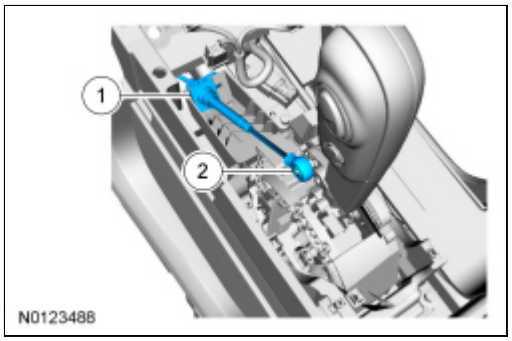
1. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place. Press the selector lever cable into the selector lever cable bracket and listen for the selector lever cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the selector lever cable bracket.

   Attach the selector lever cable to the selector lever cable bracket.

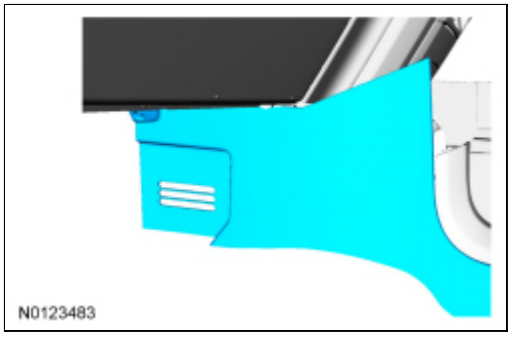


2. Attach the selector lever cable to the routing clip.



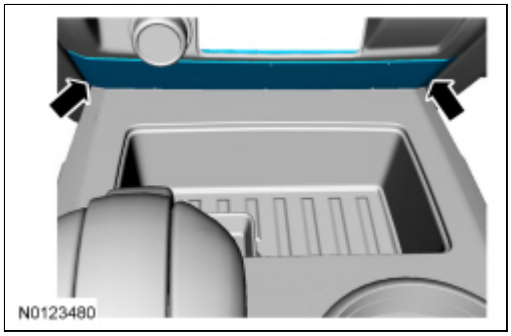
3. Install the rubber grommet and selector lever cable through the floor panel.

repair4less



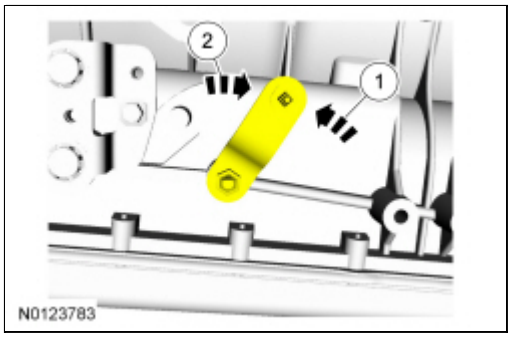
4. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place. Press the selector lever cable into the selector lever cable bracket and listen for the selector lever cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the selector lever cable bracket.

   Connect the selector lever cable onto the selector lever.
   1. Connect the selector lever cable onto the selector lever cable bracket.
   2. Connect the selector lever cable onto the selector lever arm.
      - Listen for the audible click.
      - Pull back on the selector lever cable to make sure that it is installed correctly.

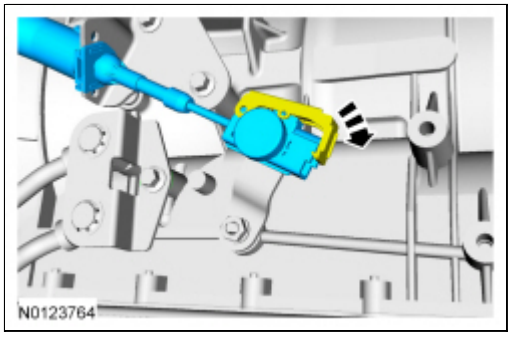


5. Install the center console LH kick panel.

6. Connect and install the floor console upper finish panel.

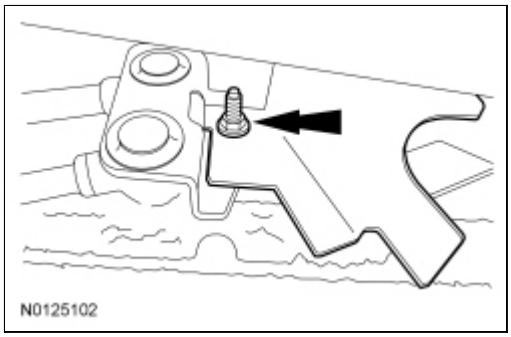


7. Install the instrument panel to floor console finish panel.



8. Place the selector lever in DRIVE.

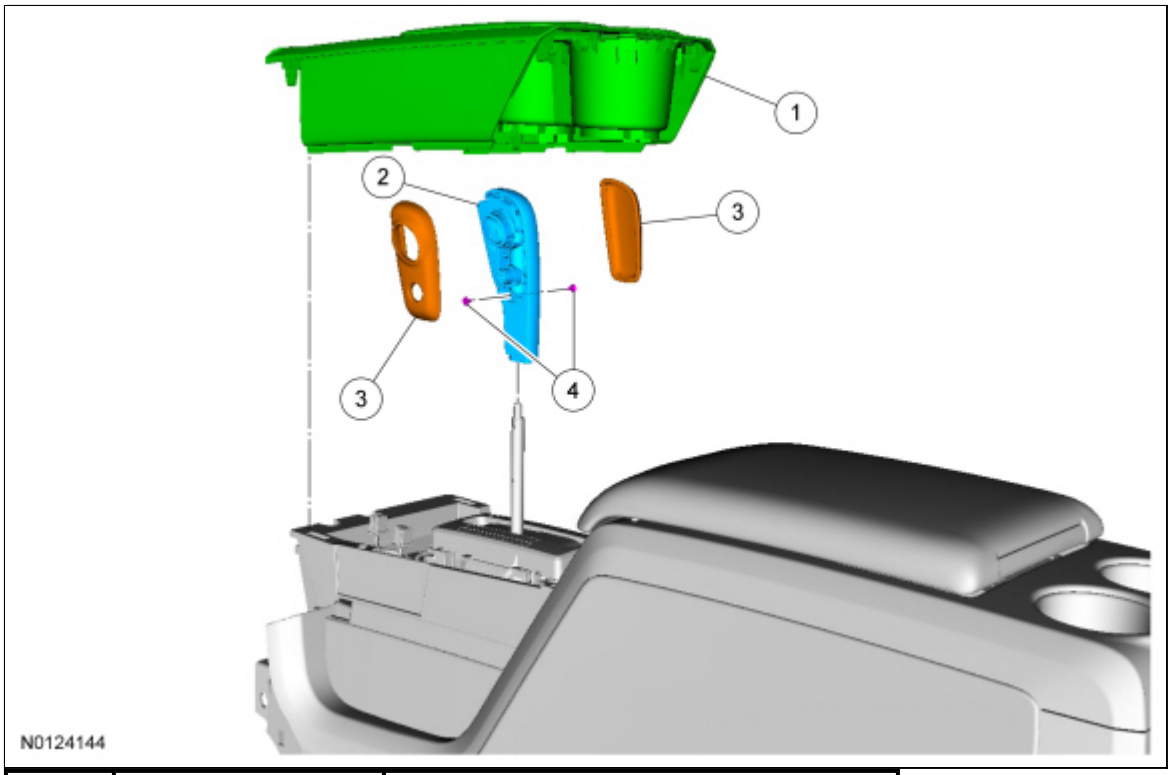
9. Place the manual control lever in DRIVE.
    1. Rotate the manual lever counterclockwise 3 detents into the manual 1st position.
    2. Rotate the manual lever clockwise 3 detents into Drive.



10. Connect the selector lever cable onto the manual control lever and move the locking tab down.
    - Listen for the audible click, then push back on the locking tab to verify it is locked.
    - Pull back on the selector lever cable to verify it is installed correctly to the manual lever.

repair4less

11. If equipped, install the selector lever cable splash shield and the nut.
    - Tighten to 12 Nm (106 lb-in).

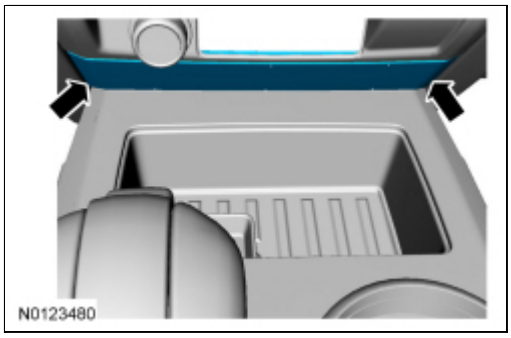


12. Verify the vehicle will start in PARK or NEUTRAL and the backup lamps illuminate in REVERSE.

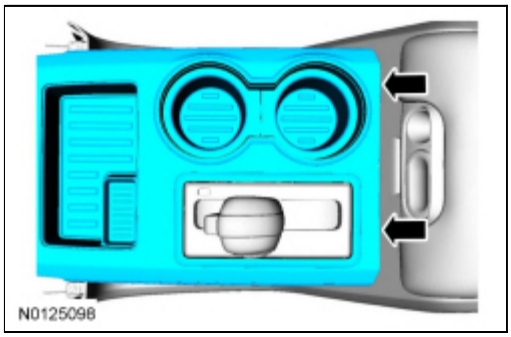
Selector Lever Knob

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.

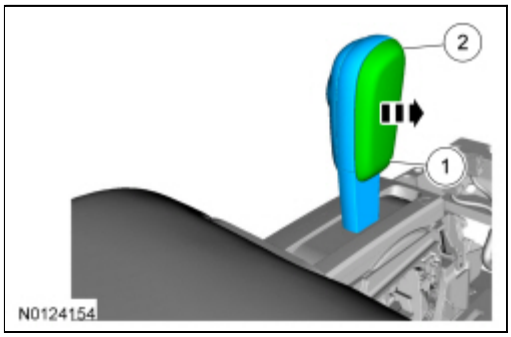


Item	Part Number	Description
1	—	Console upper trim panel
2	7213	Selector lever knob
3	7L468	Selector lever knob covers
4	W790088	Selector lever knob screws

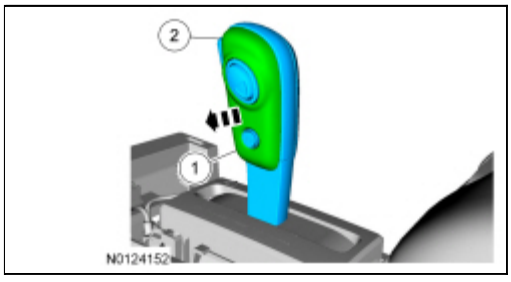


Removal

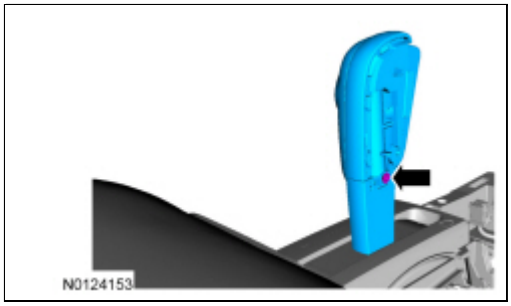
1. Remove the instrument panel to floor console finish panel.



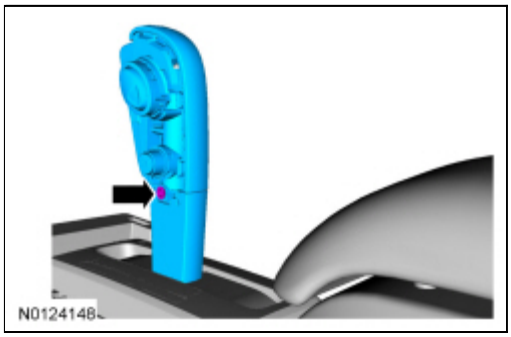
repair4less



2. Remove the floor console upper finish panel.
    - Starting at the rear of the upper finish panel, carefully pry up the upper finish panel and disconnect the electrical connectors.

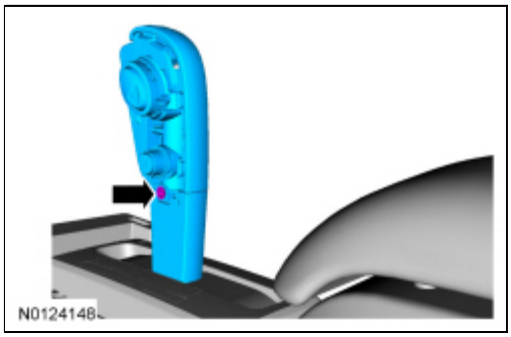


3. Remove and discard the RH selector lever knob cover.
    1. Start at the bottom front.
    2. Move towards the top front and remove the cover.



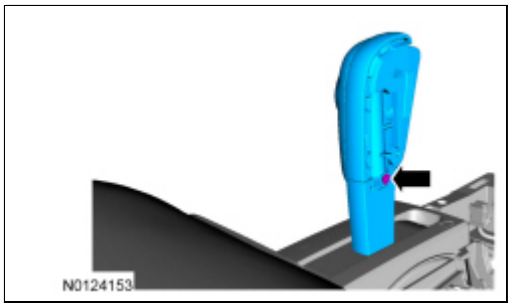
4. Remove and discard the LH selector lever knob cover.
    1. Start at the bottom front.
    2. Move towards the top front and remove the cover.

5. Remove and discard the RH selector lever knob screw.



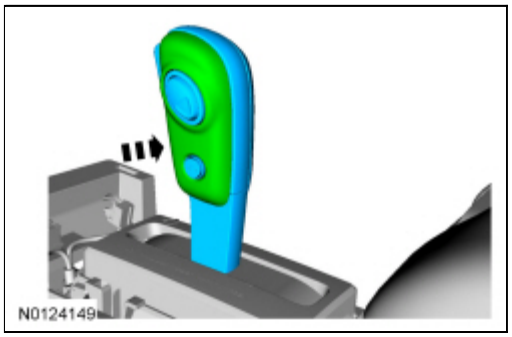
6. Remove and discard the LH selector lever knob screw.

7. Disconnect the SelectShift™ and the Tow/Haul electrical connectors and remove the selector lever knob.

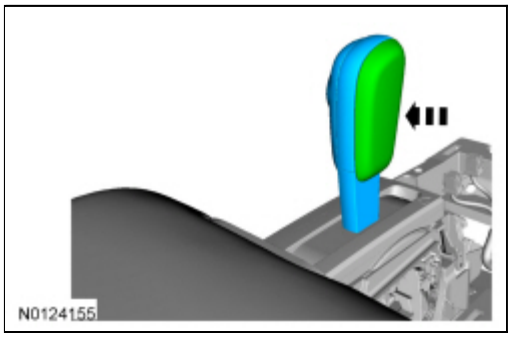


Installation

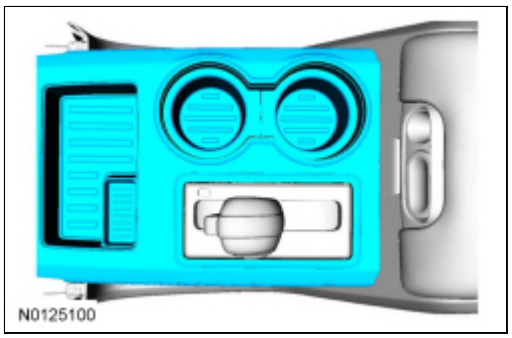
1. Connect the SelectShift™ and the Tow/Haul electrical connectors and install the selector lever knob.
2. Install a new LH selector lever knob screw.



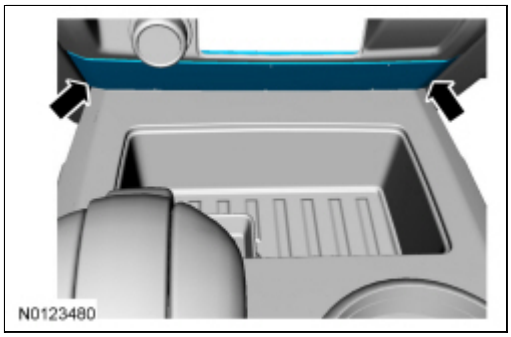
3. Install a new RH selector lever knob screw.



repair4less

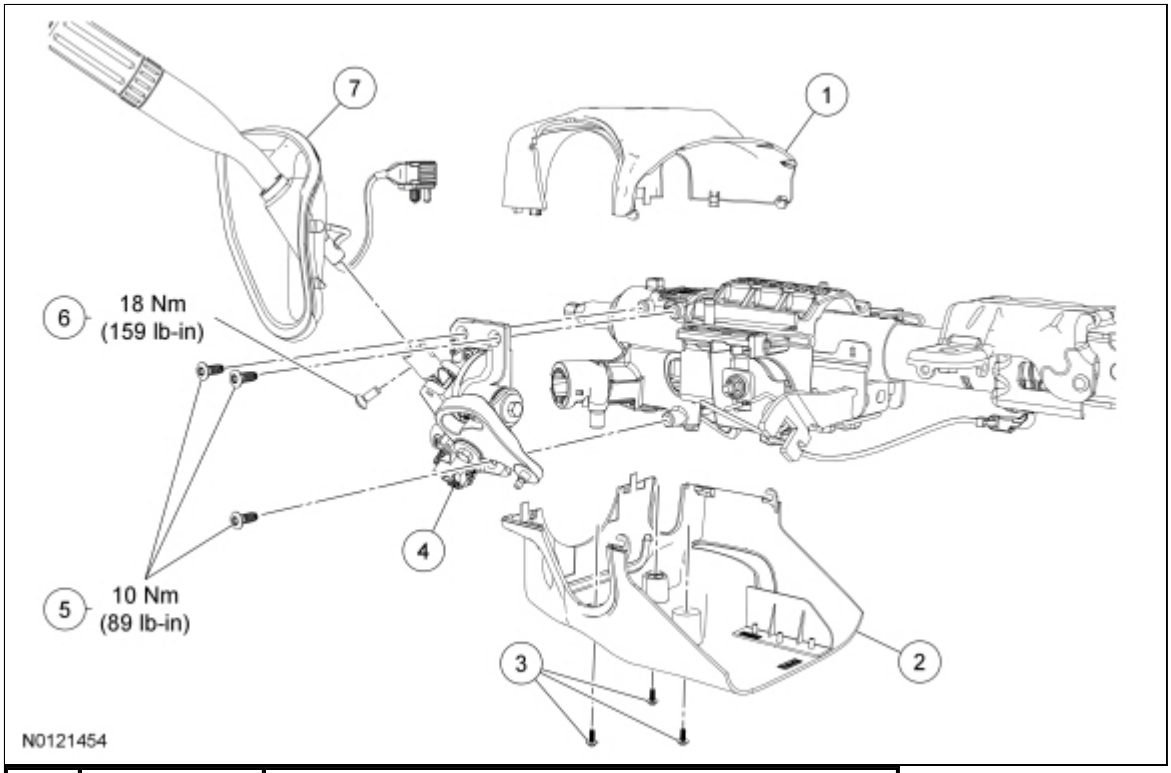


4. Install a new LH selector lever knob cover.



5. Install a new RH selector lever knob cover.

6. Connect and install the floor console upper finish panel.



7. Install the instrument panel to floor console finish panel.

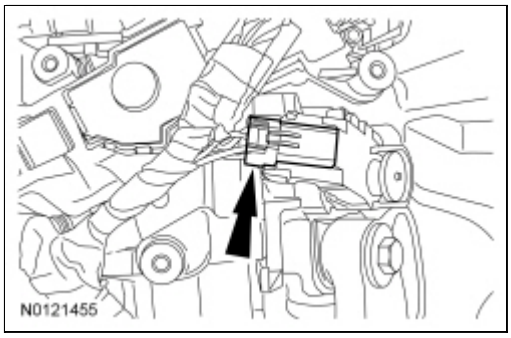
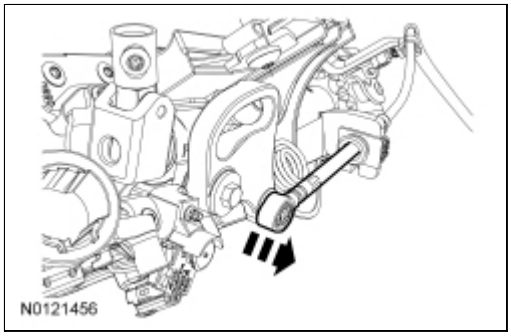
Selector Lever Mechanism — Column Shift



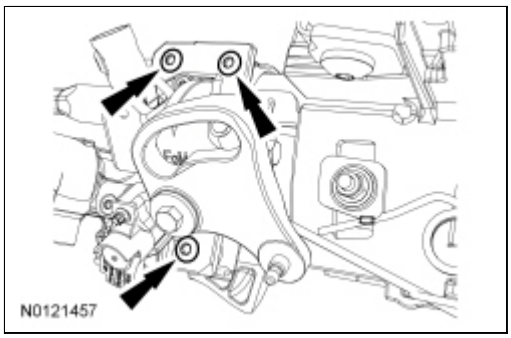
Item	Part Number	Description
1	3530	Upper steering column shroud
2	3530	Lower steering column shroud
3	W710485	Lower steering column shroud screws (3 required)
4	7210B	Selector lever mechanism
5	W790181	Selector lever mechanism bolts (3 required)
6	—	Selector lever bolt (part of 7210A)
7	7210A	Selector lever

Removal and Installation



1. **NOTE:** To access the top selector lever mechanism bolts, position the selector lever in NEUTRAL before removing the selector lever.

   Remove the selector lever. For additional information, refer to Selector Lever — Column Shift in this section.



2. Disconnect the Brake Shift Interlock Actuator (BSIA) electrical connector.

3. Disconnect the selector lever cable.

4. Remove and discard the 3 bolts and remove the selector lever mechanism.
    - To install, tighten to 10 Nm (89 lb-in).

5. To install, reverse the removal procedure.

repair4less

SelectShift™ Switch — Column Shift

Removal and Installation

NOTE: The SelectShift™ switch is part of the selector lever.

1. To install a new SelectShift™ switch, a new selector lever must be installed. For additional information, refer to Selector Lever — Column Shift in this section.

repair4less

SelectShift™ Switch — Floor Shift

NOTE: The SelectShift™ switch is part of the selector lever knob.

1. To install a new SelectShift™ switch, a new selector lever knob must be installed. For additional information, refer to Selector Lever Knob in this section.

Tow/Haul Switch — Column Shift

Removal and Installation

NOTE: The Tow/Haul switch is part of the selector lever.

1. To install a new Tow/Haul switch, a new selector lever must be installed. For additional information, refer to Selector Lever — Column Shift in this section.

repair4less

Tow/Haul Switch — Floor Shift

NOTE: The Tow/Haul switch is part of the selector lever knob.

1. To install a new Tow/Haul switch, a new selector lever knob must be installed. For additional information, refer to Selector Lever Knob in this section.

Four Wheel Drive (4WD) Systems

Electronic Shift-On-The-Fly (ESOF) System

The Electronic Shift-On-The-Fly (ESOF) system consists of the following components:

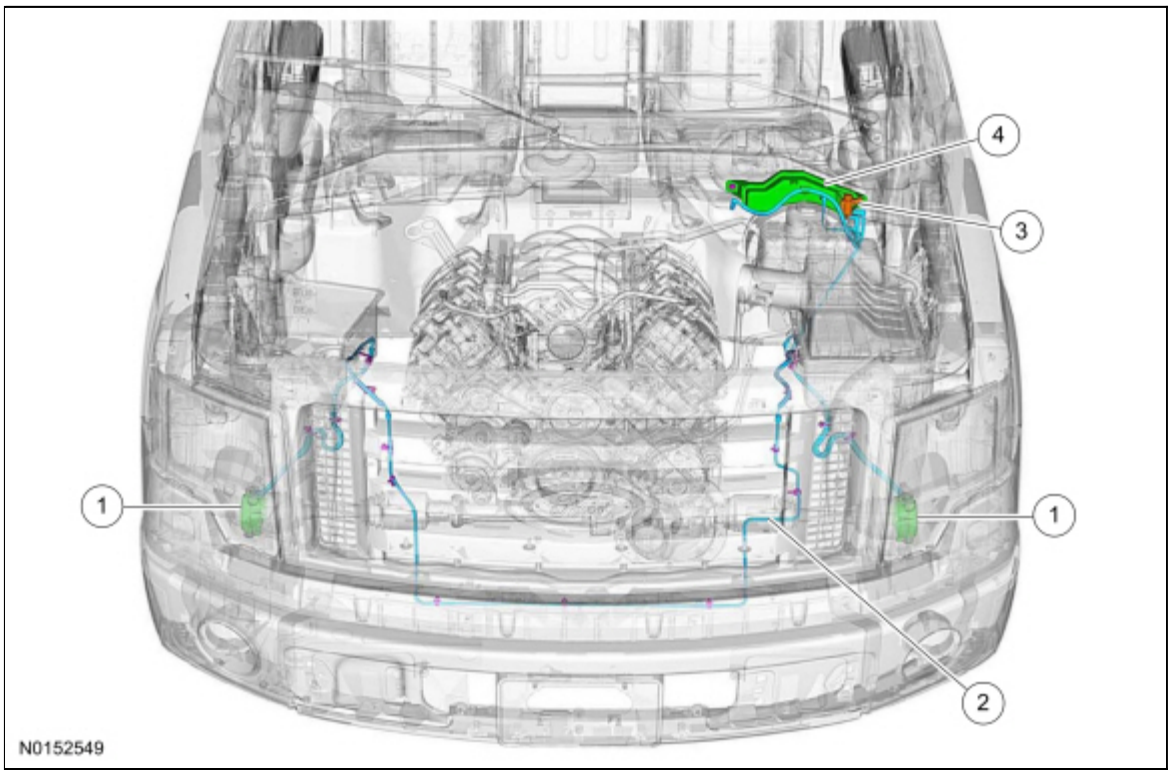
- Mode Select Switch (MSS), located on the instrument panel
- Transfer Case Control Module (TCCM), located near the passenger kick panel
- Integrated Wheel End (IWE) solenoid, located in left rear of the engine compartment
- Integrated Wheel Ends (IWEs), located at each front wheel hub
- Transfer case assembly (includes shift motor and synchronization clutch)

Vehicles equipped with an ESOF system allow the operator to choose between 2-Wheel Drive (2WD) (2H) and 2 different Four-Wheel Drive (4WD) modes. The transfer case is shifted electronically based on the MSS position. Under normal driving conditions, the transfer case is in 2WD (2H), but when desired, the operator may shift into 4WD high (4H) or 4WD low (4L). The operator can shift between 2WD (2H) and 4WD high (4H) at any speed. When shifting into or out of 4WD low (4L) range, the TCCM requires that the vehicle speed is less than 5 km/h (3 mph) and the transmission in NEUTRAL.

The transfer case is equipped with an electronically controlled clutch which is located inside the case. This clutch is used to synchronize the speed of the front driveline with the rear driveline during 2WD (2H) to 4WD high (4H) shifts.

2-Speed Torque-On-Demand

The 2-speed torque-on-demand system consists of the following components:



- MSS , located on the instrument panel
- TCCM , located near the passenger kick panel
- IWE solenoid, located in left rear of the engine compartment
- IWEs , located at each front wheel hub
- Transfer case assembly (includes shift motor and synchronization clutch)

Vehicles equipped with the 2-speed torque-on-demand system allow the operator to choose between 2WD and 3 different 4WD modes. The transfer case is shifted electronically based on the MSS position. Under normal driving conditions, the unit is in 2WD (2H), but when desired, the operator may shift into 4WD AUTO (4A), 4WD high (4H), or 4WD low (4L). When shifting into or out of 4WD (4L) range, the TCCM requires that the vehicle speed is less than 5 km/h (3 mph) and the transmission is in NEUTRAL.

The transfer case is equipped with an electronically controlled clutch which is located inside the case. This clutch is used to synchronize the speed of the front driveline with the rear driveline during 2WD (2H) to 4WD high (4H) or 4WD AUTO (4A) shifts. The clutch also provides torque to the front driveline in all 4WD modes.

Integrated Wheel End (IWE) System

The IWE system consists of the following components:

1	IWEs (spring-loaded vacuum hubs)
2	Vacuum hoses
3	IWE solenoid
4	Vacuum reservoir

The IWE system, used on ESOF and 2-speed torque-on-demand equipped vehicles, uses vacuum hubs that engage or disengage the front wheel hubs from the front halfshafts.

The IWE solenoid receives engine vacuum from the vacuum reservoir. When the 4WD system is in 2H mode, the TCCM supplies a ground path to the IWE solenoid to apply vacuum to the IWEs (disengaging the front hubs from the front halfshafts). When operating in any 4x4 mode, the TCCM does not supply the ground path to the IWE solenoid, vacuum is not applied to the IWEs and an internal spring keeps the front hubs engaged to the front halfshafts. Vehicles equipped with a 3.5L engine are also equipped with an electrically-driven brake booster vacuum pump located behind the LH headlamp assembly. For additional information, refer to Section 206-07 . As a first step in service, eliminate obvious items such as loose wiring connections, loose vacuum connections or damaged vacuum lines.

Electronic Locking Differential (ELD) System

The Electronic Locking Differential (ELD) system consists of the following components:

- ELD field coil, located at the rear differential

repair4less

- Rear differential
- MSS (unique for ELD equipped vehicles, the ELD switch is integrated with the MSS), located on instrument panel

The optional ELD system, allows the operator to lock the rear differential side gears on slippery and/or off road surfaces. ELD operation is requested by pulling out on the MSS on 4X4 equipped vehicles, and by rotating the switch from OFF to ON on 4x2 vehicles.

Off-Road Mode

NOTE: Off-road mode is specifically calibrated for off-road driving conditions and should never be used on pavement.

The SVT Raptor comes equipped with a special off-road function. An off-road button is located on the floor console. A light on the button illuminates when this feature is activated.

The off-road function consists of the following components:

- Off-road mode switch
- TCCM

Off-road mode affects 4 vehicle functions:

- It allows unique transmission shifting that optimizes off-road performance.
- Off-road mode provides optimized throttle response tailored for off-road performance driving.
- When off-road mode is engaged, the standard vehicle speed thresholds for the ELD are lifted.
- When off-road mode is engaged, the AdvanceTrac settings are altered for optimized off-road performance.

Neutral Flat Tow

***NOTICE:* 2WD vehicles cannot be towed with any wheels on the ground as vehicle or transmission damage may occur.**

***NOTICE:* Failing to put the transfer case in the NEUTRAL position will damage vehicle components.**

Vehicles equipped with a Four-Wheel Drive (4WD) system have neutral flat tow software in the TCCM . Following the neutral flat tow activation procedure commands the transfer case shift motor into a neutral position. Locking the transfer case in neutral will prevent damage to the transmission while towing a 4WD vehicle on all 4 wheels (such as when being towed behind a motorhome).

repair4less

Neutral Flat Tow Activation and Deactivation

Activation

WARNING: Shifting the transfer case to its neutral position for neutral flat towing may allow the vehicle to be able to roll even if the transmission is in park (P). Make sure the foot brake is depressed and the vehicle is in a secure and safe position while the transfer case is being shifted to its neutral position. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not disconnect the battery during neutral flat towing. Doing so will prevent the transfer case from shifting properly and may allow the vehicle to roll even if the transmission is in park (P). Failure to follow this instruction may result in serious personal injury.

***NOTICE:* 2-Wheel Drive (2WD) vehicles cannot be flat towed with any of the wheels on the ground. Vehicle or transmission damage will occur.**

***NOTICE:* Failure to put the transfer case in its NEUTRAL position will damage vehicle components.**

NOTE: Four-Wheel Drive (4WD) vehicles can be flat towed by placing the transfer case in its NEUTRAL position.

NOTE: Neutral flat tow status can be checked at any time by opening the driver door or turning the ignition to the ACC or ON position and checking the display in the IPC .

1. Turn the ignition to the ON position. Do not start the engine.
2. Press and hold the brake pedal.
3. Shift the Mode Select Switch (MSS) to 2H.
4. Shift the transmission to NEUTRAL.
5. Rotate the MSS from 2H to 4L and back to 2H 5 times within 7 seconds.
   - If completed successfully, the Instrument Panel Cluster (IPC) displays "NEUTRAL TOW LEAVE IN N" or "NEUTRAL TOW ENABLED LEAVE TRANSMISSION IN NEUTRAL", indicating that the vehicle is safe to tow with all wheels on the ground.
   - If the message is not shown in the display, the entire procedure must be performed again.
   - An audible noise may be heard as the transfer case shifts into neutral position, this is normal operation.
6. Leave the transmission in NEUTRAL and turn the ignition as far as it will go toward the OFF position (it will not turn fully off when the transmission is in NEUTRAL). The key must be left in the ignition while towing. To lock and unlock your vehicle, use the keyless entry keypad or extra set of keys.
7. Release the brake pedal.

Deactivation

WARNING: Shifting the transfer case to its neutral position for neutral flat towing may allow the vehicle to be able to roll even if the transmission is in park (P). Make sure the foot brake is depressed and the vehicle is in a secure and safe position while the transfer case is being shifted to its neutral position. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not disconnect the battery during neutral flat towing. Doing so will prevent the transfer case from shifting properly and may allow the vehicle to roll even if the transmission is in park (P). Failure to follow this instruction may result in serious personal injury.

NOTE: Neutral flat tow status can be checked at any time by opening the driver door or turning the ignition to the ACC or ON position and checking the display in the IPC .

1. Press and hold the brake pedal.
2. Turn the ignition to the ON position. Do not start the engine.
3. Shift the transmission out of NEUTRAL and into any gear.
4. Release the brake pedal.
    - If completed successfully, the IPC displays 4X2, then "NEUTRAL TOW DISABLED".
    - If the indicator light and message do not display, the entire procedure must be performed again.
    - An audible noise may be heard as the transfer case shifts out of NEUTRAL position, this is normal operation.

repair4less

Electronic Locking Differential (ELD) System

Special Tool(s)

 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Electronic Locking Differential (ELD) System

The ELD system allows the operator to lock the rear differential side gears. When the ELD is engaged both rear wheels turn at the same speed, providing added traction on slippery and/or off road surfaces. The operator can engage the ELD per the charts below:

ELD Engagement Speeds — 4WD Vehicles

Switch Position	Engage	Disengage	Re-engage
2H/4A/4H	31 km/h (19 mph) [a]	42 km/h (25 mph)	31 km/h (19 mph) [a]
4L	90 km/h (56 mph) [a]	100 km/h (62 mph)	90 km/h (56 mph) [a]

[a] The ELD system engages/re-engages at or below the speed noted.

ELD Engagement Speeds — 2WD Vehicles

Switch Position	Engage	Disengage	Re-engage
Off	N/A	N/A	N/A

On	31 km/h (19 mph) [a]	42 km/h (25 mph)	31 km/h (19 mph) [a]

[a] The ELD system engages/re-engages at or below the speed noted.

When the operator activates the ELD , the ELD icon displays in the IPC message center. If the vehicle is driven above the disengage speed, the IPC message center no longer displays the ELD icon, alerting the operator that the ELD is disengaged. Once the vehicle drops below the re-engage speed, the IPC message center displays the ELD icon again. If there is a malfunction with the ELD system, a "CHECK LOCKING DIFFERENTIAL" message is displayed in the IPC message center, letting the operator know the ELD is not engaged.

The differential locks when a PWM controlled magnetic field coil located inside the differential energizes. A collar within the differential moves toward a differential side gear and engages a dog clutch within the differential. This locks the differential side gears and creates the locked differential.

The TCCM activates the ELD . When the ELD is engaged, the TCCM sends PWM voltage to the ELD field coil located in the differential. This voltage is initially 98% duty cycle, and then tapers off to 40% duty cycle after 30 seconds. In order for the TCCM to activate the ELD , certain conditions must be met.

TCCM Input Conditions

- MSS set to ELD position
- Average rear wheel speed versus average front wheel speed must be less than 7 km/h (4.3 mph) (via HS-CAN communication from ABS module)
- Operating range (voltage between 9-16 volts)
- DTC setting range (voltage between 10-15 volts)
- Ignition in the ON position
- Throttle Position (TP) less than 50%

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

• Rear axle assembly
• Matching tire sizes
	• Battery Junction Box (BJB) fuses:
	  ▪ 20 (20A)
	  ▪ 29 (10A)
	  ▪ 54 (5A)
	  ▪ 68 (25A)
	• Body Control Module (BCM) fuse 34 (10A) (vehicles with ELD only)
	• Wiring, terminals or connectors
	• Mode Select Switch (MSS)
	• Electronic Locking Differential (ELD) field coil
	• Transfer Case Control Module (TCCM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

repair4less

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the DLC .

5. **NOTE:** The VCM LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record CMDTCs .

8. Carry out the self-test diagnostics for the TCCM .

9. If the DTCs retrieved are related to the concern, go to the TCCM DTC Chart in this section. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Electronic Locking Differential (ELD) System in this section.

DTC Charts

Transfer Case Control Module (TCCM) DTC Chart — ELD System

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. have an additional 2-character DTC status code suffix to assist in determining DTC history.

NOTE: Network DTCs (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle repair procedures such as module reprogramming often set network DTCs. Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery, refer to Section 414-01 .

DTC	Description	Action
P0562:00	System Voltage Low: No Sub Type Information	GO to Pinpoint Test M .
P0563:00	System Voltage High: No Sub Type Information	GO to Pinpoint Test M .
P185A:00	Differential Lock-Up Input Switch Circuit High: No	GO to Pinpoint Test Y .

	Sub Type Information	
P185B:00	Differential Lock-Up Indicator Circuit Low: No Sub Type Information	GO to Pinpoint Test Z .
P185C:00	Differential Lock-Up Indicator Circuit High: No Sub Type Information	GO to Pinpoint Test AA .
P185D:00	Differential Lock-Up Control Circuit Performance: No Sub Type Information	GO to Pinpoint Test AB .
P187C:00	Differential Lock-Up Control Circuit/Open: No Sub Type Information	GO to Pinpoint Test AC .
P187D:00	Differential Lock-Up Control Circuit Low: No Sub Type Information	GO to Pinpoint Test AC .
P187E:00	Differential Lock-Up Control Circuit High: No Sub Type Information	GO to Pinpoint Test AD .
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	GO to Pinpoint Test AE .
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	GO to Pinpoint Test AF .
U0140:00	Lost Communication With Body Control Module (BCM): No Sub Type Information	GO to Pinpoint Test AG .
U0418:00	Invalid Data Received From Brake System Control Module: No Sub Type Information	REFER to Section 206-09 to diagnose the wheel speed sensor concern.
U2300:54	Central Configuration: Missing Calibration	This DTC can set if one or more expected configuration data identifications is missing (gearbox type, tire circumference) from the BCM . CARRY OUT a self-test of the BCM . If DTCs are present, REFER to Section 419-10 . If no DTCs are present, CLEAR the DTCs. CARRY OUT a self-test. If U2300:54 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U2300:55	Central Configuration: Not Configured	This DTC can set upon power up only until all expected configuration data parameters (gearbox type, axle ratio, tire circumference) is received from the BCM . CARRY OUT a self-test of the BCM . If DTCs are present, REFER to Section 419-10 . If no DTCs are present, CLEAR the DTCs. CARRY OUT self-test. If U2300:55 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U2300:56	Central Configuration: Invalid / Incompatible Configuration	This DTC can set if one expected configuration data parameter is out of range (gearbox type, axle ratio, tire circumference) from the BCM . CARRY OUT a self-test of the BCM . If DTCs are present,

repair4less

		REFER to Section 419-10 . If no DTCs are present, CLEAR the DTCs. CARRY OUT a self-test. If U2300:56 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U2300:64	Central Configuration: Signal Plausibility Failure	This DTC can set if the expected axle ratio or tire circumference is out of range from the BCM . CARRY OUT a self-test of the BCM . If DTCs are present, REFER to Section 419-10 . If no DTCs are present, CLEAR the DTCs. CARRY OUT a self-test. If U2300:64 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:41	Control Module: General Checksum Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:41 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:46	Control Module: Calibration / Parameter Memory Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:46 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:49	Control Module: Internal Electronic Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:49 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U300D:11	Ignition Input On/Start: Circuit Short To Ground	GO to Pinpoint Test L .
All other TCCM DTCs	—	REFER to the TCCM DTC Chart in of this section.

Symptom Chart — Electronic Locking Differential (ELD) System

Symptom Chart

Condition	Possible Sources	Action
• No communication with the TCCM	• Wiring, terminals or connectors • Scan tool • DLC • TCCM	• CHECK the module communications network. REFER to Section 418-00 .
• Rear wheels binding when turning corners with the MSS in 2WD or OFF	• Wiring, terminals or connectors • ELD field coil • TCCM • Rear differential	• GO to Pinpoint Test AD .

Pinpoint Tests

Pinpoint Test Y: DTC P185A:00

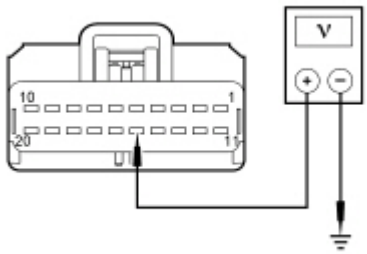
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

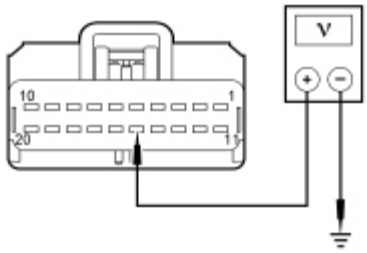
Normal Operation

When the MSS is engaged to lock the rear differential, a PWM signal is sent to the ELD field coil by the TCCM through the differential lock control circuit. This PWM signal is initially 98% duty cycle to lock the differential and decreases to 40% duty cycle once the differential is locked. If the differential does not lock, the TCCM continues to send the signal for a set amount of time. Once the differential is locked, the indicator will illuminate steady.

- DTC P185A:00 (Differential Lock-Up Input Switch Circuit High: No Sub Type Information) — When not in locking mode, the TCCM C2371A pin 15 senses whether the ELD mode switch circuit has high voltage and if the differential is always engaged. This DTC will not set unless the MSS is set to 2H or OFF. If the ELD is functioning normally, the differential will immediately lock when the MSS is activated and the ELD operating conditions are qualified. This DTC will only display during the self-test function.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- TCCM

PINPOINT TEST Y: DTC P185A:00

NOTE: Make sure the battery is fully charged before carrying out this pinpoint test.

Test Step	Result / Action to Take
Y1 CHECK FOR TCCM DTCs	
NOTE: Failure to place the MSS in 2H or OFF prior to carrying out a self-test of the TCCM (to disable the ELD field coil) results in inaccurate self-test. • Ignition ON. • Set the MSS in 2H (ESOF or 2 speed-torque-on-demand). • Set the MSS in OFF (2WD). • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** If only DTC P185A:00 is retrieved, GO to Y2 . For any other DTCs, REFER to the TCCM DTC Chart in this section. **No** IDENTIFY the customer concern and GO to Symptom Chart - Electronic Locking Differential (ELD) System in this section.
Y2 CHECK FOR A SHORT TO VOLTAGE ON THE LOCKER MODE SWITCH CIRCUIT	
• Ignition OFF. • Disconnect: TCCM C2371A. • Ignition ON. • With the MSS in 2H or OFF (depending upon vehicle option content), measure the voltage between TCCM C2371A-15, circuit CCF32 (WH/GN), harness side and ground.	**Yes** GO to Y3 . **No** GO to Y4 .

repair4less

 N0090953 • **Is any voltage present?**	
Y3 CHECK FOR A SHORT TO VOLTAGE ON THE LOCKER MODE SWITCH CIRCUIT WITH THE MSS DISCONNECTED	
• Ignition OFF. • Disconnect: MSS . • Ignition ON. • Measure the voltage at TCCM C2371A-15, circuit CCF32 (WH/GN), harness side and ground.  N0090953 • **Is any voltage present?**	**Yes** REPAIR circuit CCF32 (WH/GN). CLEAR the DTCs. TEST the system for normal operation. **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. TEST the system for normal operation.
Y4 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

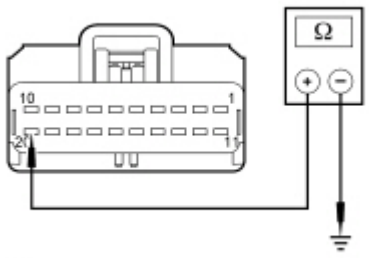
Pinpoint Test Z: DTC P185B:00

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

Normal Operation

When the MSS is engaged to lock the rear differential, a PWM signal is sent to the ELD field coil by the TCCM through the differential lock control circuit. This PWM signal is initially 98% duty cycle to lock the

differential and decreases to 40% duty cycle once the differential is locked. If the differential does not lock, the TCCM continues to send the signal for a set amount of time. Once the differential is locked, the indicator will illuminate steady.



- DTC P185B:00 (Differential Lock-Up Indicator Circuit Low: No Sub Type Information) — When not in locking mode, the TCCM C2371A-20 senses the indicator circuit is shorted to ground and the indicator is always illuminated. This DTC should not set for an open circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TCCM

PINPOINT TEST Z: DTC P185B:00

NOTE: Make sure the battery is fully charged before performing this pinpoint test.

Test Step	Result / Action to Take
Z1 CHECK THE TCCM 4WD SWITCH STATUS (4X4_SW) PID • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Set the MSS to 4H and pull the knob to lock the rear differential. • Monitor the 4X4_SW PID. • **Does the 4X4_SW PID indicate 4H mode?**	**Yes** GO to Z2 . **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. TEST the system for normal operation.
Z2 CHECK THE REAR ELD INDICATOR CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: TCCM C2371A. • Disconnect: MSS . • Measure the resistance between TCCM C2371A-20, circuit CCF33 (GY/YE), harness side and ground.  N0090963 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Z3 . **No** REPAIR circuit CCF33 (GY/YE). CLEAR the DTCs. TEST the system for normal operation.
Z3 CHECK FOR CORRECT TCCM OPERATION • Ignition OFF. • Disconnect and inspect all TCCM connectors. • Repair: ▪ corrosion (install new connector or terminals -	**Yes** INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for

repair4less

clean module pins) ▪ damaged or bent pins - install new terminals/pins ▪ pushed-out pins - install new pins as necessary • Connect all TCCM connectors. Make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

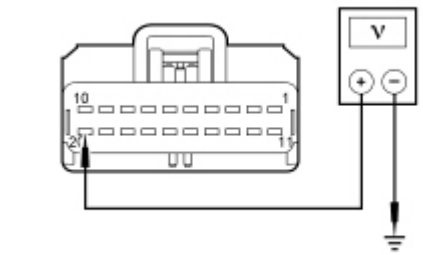
Pinpoint Test AA: DTC P185C:00

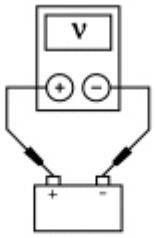
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

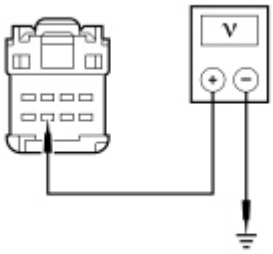
Normal Operation

When the MSS is engaged to lock the rear differential, a PWM signal is sent to the ELD field coil by the TCCM through the differential lock control circuit. This PWM signal is initially 98% duty cycle to lock the differential and decreases to 40% duty cycle once the differential is locked. When the differential is fully locked, the indicator will illuminate steady.

- DTC P185C:00 (Differential Lock-Up Indicator Circuit High: No Sub Type Information) — When the driver engages the ELD the TCCM C2371A-20 senses the indicator circuit has high voltage and is not illuminated.

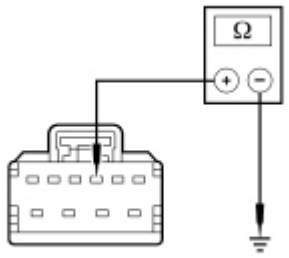






This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TCCM



PINPOINT TEST AA: DTC P185C:00

NOTE: Make sure the battery is fully charged before performing this pinpoint test.

Test Step	Result / Action to Take
AA1 OPERATE THE ELD INDICATOR USING THE TCCM REAR LOCKING DIFF LAMP OUTPUT CONTROL OPTIONAL (DIFF_LAMP_OS) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Command the DIFF_LAMP_OS PID on. • **Does the ELD indicator in the MSS illuminate?**	**Yes** GO to AA5 . **No** GO to AA2 .
AA2 CHECK THE ELD INDICATOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: TCCM C2371A. • Disconnect: MSS . • Ignition ON. • Measure the voltage between TCCM C2371A-20,	**Yes** REPAIR circuit CCF33 (GY/YE). CLEAR the DTCs. TEST the system for normal operation.

circuit CCF33 (GY/YE), harness side and ground.  N0090961 • **Is any voltage present?**	**No** GO to AA3 .
AA3 CHECK FOR VOLTAGE TO THE MSS	
• Measure and record the battery voltage at the battery.  AJ0210-A • Measure the voltage between MSS C284-7, circuit CBP34 (VT/BN), harness side and ground.  N0090958 • **Does the voltage equal the recorded battery voltage?**	**Yes** GO to AA4 . **No** VERIFY BCM fuse 34 (10A) is OK. If OK, REPAIR circuit CBP34 (VT/BN). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. TEST the system for normal operation.
AA4 CHECK THE TCCM GROUND CIRCUIT	
• Ignition OFF. • Disconnect: TCCM C2371B. • Measure the resistance between C2371B-3, circuit GD123 (BK/GY), harness side and ground.	**Yes** GO to AA5 . **No** REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. TEST the system for normal operation.

repair4less

 N0090962 • **Is the resistance less than 3 ohms?**	

AA5 CHECK FOR CORRECT TCCM OPERATION
• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM. REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test AB: DTC P185D:00

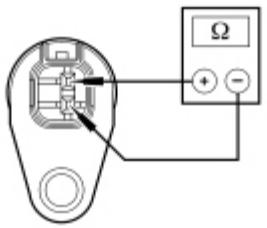
Refer to Wiring Diagrams Cell 34, Four-Wheel Drive Systems for schematic and connector information.

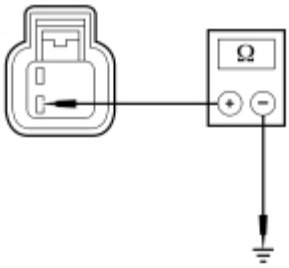
Normal Operation

When the MSS is engaged to lock the rear differential, a PWM signal is sent to the ELD field coil by the TCCM through the differential lock control circuit. This PWM signal is initially 98% duty cycle to lock the differential and decreases to 40% duty cycle once the differential is locked. If the differential does not lock, the TCCM continues to send the signal for a set amount of time. Once the differential is locked, the indicator will illuminate steady.

- DTC P185D:00 (Differential Lock-up Control Circuit Performance: No Sub Type Information) — The TCCM sends a signal to the lock up solenoid to lock the differential. After several unsuccessful attempts, the TCCM sets this DTC alerting the driver the ELD is inoperative. Fault may be due to a wheel speed condition or due to a mechanical failure within the driveline/axle subsystem.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- ELD field coil

PINPOINT TEST AB: DTC P185D:00

NOTE: Make sure the battery is fully charged before carrying out this pinpoint test.

Test Step	Result / Action to Take

AB1 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs
• Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module.
• While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs:
  ▪ Left Front Wheel Speed Sensor (LF_WSPD)
  ▪ Left Rear Wheel Speed Sensor (LR_WSPD)
  ▪ Right Front Wheel Speed Sensor (RF_WSPD)
  ▪ Right Rear Wheel Speed Sensor (RR_WSPD)
• Compare the speedometer reading to the wheel speed sensor PIDs.
• **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**
	Yes
	GO to AB2.
	
	No
	VERIFY that the 4 road wheels are the same size and have similar tread depth. CHECK the ABS for faults. REFER to Section 206-09. TEST the system for normal operation.

AB2 CHECK RESISTANCE OF THE ELD FIELD COIL • Ignition OFF. • Disconnect: ELD Field Coil. • **NOTE:** If the temperatures are exceptionally high, a higher than normal resistance reading could result. A lower temperature could result in a lower resistance reading. • Measure the resistance between ELD field coil C4359 pins 1 and 2, component side.  N0091387 • **Is the resistance between 2-4 ohms?**	**Yes** GO to AB3. **No** INSTALL a new ELD field coil. REFER to Section 205-02B. CLEAR the DTCs. TEST the system for normal operation.
AB3 CHECK THE ELD FIELD COIL GROUND • Measure the resistance between ELD field coil C4359-2, circuit GD123 (BK/GY), harness side and ground.  N0090955 • **Is the resistance less than 3 ohms?**	**Yes** REFER to Section 205-02B to repair the rear differential. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. TEST the system for normal operation.

Pinpoint Test AC: DTC P187C:00 and P187D:00

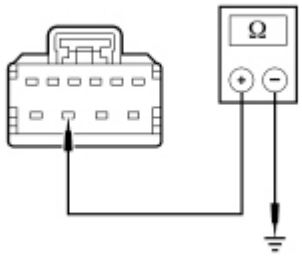
repair4less

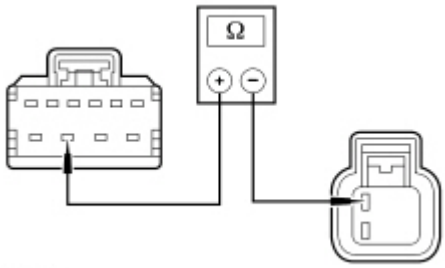
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

Normal Operation

When the MSS is engaged to lock the rear differential, a PWM signal is sent to the ELD field coil by the TCCM through the differential lock control circuit. This PWM signal is initially 98% duty cycle to lock the differential and decreases to 40% duty cycle once the differential is locked. If the differential lock control circuit is open or shorted to ground, the TCCM senses a signal is not reaching the differential and sets a DTC.

- DTC P187C:00 (Differential Lock-Up Control Circuit/Open: No Sub Type Information) — The TCCM sends a signal to the differential to lock the differential. The TCCM C2371B pin 9 senses that the differential lock control circuit is open. The ELD differential is not engaged.
- DTC P187D:00 (Differential Lock-Up Control Circuit Low: No Sub Type Information) — The TCCM sends a signal to lock the differential. The TCCM C2371B pin 9 senses that the differential lock control circuit is shorted to ground. The ELD differential is not engaged.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TCCM

PINPOINT TEST AC: DTC P187C:00 AND P187D:00

NOTE: Make sure the battery is fully charged before carrying out this pinpoint test.

Test Step	Result / Action to Take
AC1 CHECK FOR TCCM DTCs	**Yes** For DTC P187C:00, GO to AC4 . For DTC P187D:00, GO to AC2 . For all other DTCs, REFER to the TCCM DTC Chart in this section. **No** IDENTIFY the customer concern and GO to Symptom Chart - Electronic Locking Differential (ELD) System in this section.
NOTE: Failure to place the MSS in 2H or OFF prior to carrying out a self-test of the TCCM (to disable the ELD field coil) results in inaccurate self-test. • Ignition ON. • Set the MSS in 2H (ESOF or 2 speed-torque-on-demand). • Set the MSS in OFF (2WD). • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	
AC2 CHECK FOR TCCM DTCs WITH THE ELD FIELD COIL DISCONNECTED	**Yes** GO to AC3 . **No** INSTALL a new field coil. REFER to Section 205-02B . CLEAR the DTCs. TEST the system for normal operation.
• Ignition OFF. • Disconnect: ELD Field Coil. • Ignition ON. • Set the MSS in 2H (ESOF or 2 speed-torque-on-demand). • Set the MSS in OFF (2WD). • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **CLEAR the DTCs. REPEAT the self-test. Does DTC P187D:00 return?**	

AC3 CHECK THE ELD DIFFERENTIAL LOCK CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: TCCM C2371B. • Measure the resistance between TCCM C2371B-9, circuit CCF31 (BN/VT), harness side and ground.  N0090960 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AC4 . **No** REPAIR circuit CCF31 (BN/VT). CLEAR the DTCs. TEST the system for normal operation.
AC4 CHECK THE ELD DIFFERENTIAL LOCK CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: TCCM C2371B. • Disconnect: ELD Field Coil. • Measure the resistance between TCCM C2371B-9, circuit CCF31 (BN/VT), harness side and ELD field coil C4359-1, circuit CCF31 (BN/VT), harness side.  N0090956 • **Is the resistance less than 3 ohms?**	**Yes** GO to AC5 . **No** REPAIR circuit CCF31 (BN/VT). CLEAR the DTCs. TEST the system for normal operation.
AC5 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

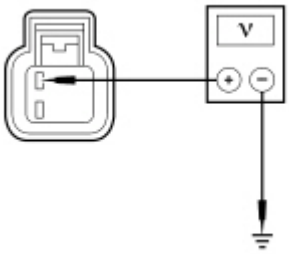
repair4less

Pinpoint Test AD: Rear Wheels Binding When Turning Corners With the ELD OFF

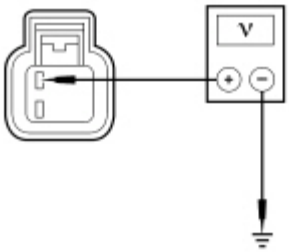
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

Normal Operation

When the MSS is engaged to lock the rear differential, a PWM signal is sent to the ELD field coil by the TCCM through the differential lock control circuit. This PWM signal is initially 98% duty cycle to lock the differential and decreases to 40% duty cycle once the differential is locked. If the differential does not lock, the TCCM continues to send the signal for a set amount of time. Once the differential is locked, the indicator will illuminate steady.



- DTC P187E:00 (Differential Lock-Up Control Circuit High: No Sub Type Information) — The TCCM sends a signal to lock the differential. This DTC sets when the TCCM C2371B-9 senses that the differential lock control circuit is shorted to battery voltage. The differential is constantly engaged.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- ELD field coil
- TCCM

PINPOINT TEST AD: REAR WHEELS BINDING WHEN TURNING CORNERS WITH THE ELD OFF

NOTE: Make sure the battery is fully charged before carrying out this pinpoint test.

Test Step	Result / Action to Take
AD1 CHECK FOR VOLTAGE TO THE ELD FIELD COIL	
• Ignition OFF. • Disconnect: ELD Field Coil. • Ignition ON. • Set the MSS in 2H (ESOF or 2 speed-torque-on-demand). • Set the MSS in OFF (2WD). • Measure the voltage between ELD field coil C4359-1, circuit CCF31 (BN/VT), harness side and ground.  N0090954 • **Is any voltage present?**	**Yes** GO to AD2 . **No** REFER to Section 205-02B to repair the rear differential. CLEAR the DTCs. TEST the system for normal operation.
AD2 CHECK THE ELD FIELD COIL CIRCUIT FOR A SHORT TO VOLTAGE	
	Yes

• Ignition OFF. • Disconnect: TCCM C2371B. • Ignition ON. • Measure the voltage between field coil C4359-1, circuit CCF31 (BN/VT), harness side and ground.  N0090954 • **Is any voltage present?**	REPAIR circuit CCF31 (BN/VT). CLEAR the DTCs. TEST the system for normal operation. **No** GO to AD3 .
AD3 CHECK THE TCCM REAR LOCKING DIFFERENTIAL PWM OUTPUT CONTROL (DIFF_PWM_OS) PID	
• Ignition OFF. • Connect: ELD Field Coil. • Connect: TCCM C2371B. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • With the MSS in 2H or OFF (depending upon vehicle option content), monitor the DIFF_PWM_OS PID. • **Does the DIFF_PWM_OS PID read OFF?**	**Yes** GO to AD4 . **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. TEST the system for normal operation.
AD4 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test AE: DTC U0100:00

Normal Operation

- DTC U0100:00 (Lost Communication With ECM/PCM "A": No Sub-Type Information) — sets in continuous memory in the TCCM if data messages received from the PCM over the HS-CAN are missing for 5 seconds or longer with ignition in RUN and battery voltage in range. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

repair4less

- PCM
- TCCM

PINPOINT TEST AE: DTC U0100:00

Test Step	Result / Action to Take
AE1 CHECK THE TCCM CONTINUOUS MEMORY DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: TCCM Self-Test. • Clear the DTCs. • Wait 10 seconds. • Repeat the TCCM self-test. • **Is DTC U0100:00 retrieved again?**	**Yes** GO to AE2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AE2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded DTCs from the PCM KOEO self-test. • **Is DTC P0562:00 or P0563:00 recorded?**	**Yes** REFER to Section 414-00 . **No** GO to AE3 .
AE3 RETRIEVE THE RECORDED DTCs FROM THE TCCM SELF-TEST	
• Check for recorded DTCs from the TCCM self-test. • **Is DTC P0562:00 or P0563:00 recorded?**	**Yes** REFER to GO to Pinpoint Test M . **No** GO to AE4 .
AE4 CHECK FOR DTC U0100:00 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — All CMDTCs . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0100:00 in the RCM , or DTC U0100:87 in the BCM ?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.

Pinpoint Test AF: DTC U0121:00

Normal Operation

- DTC U0121:00 (Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub-Type Information) — sets in continuous memory in the TCCM if data messages received from the ABS module over the HS-CAN are missing for 5 seconds or longer with ignition in RUN and battery voltage in range. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- ABS module
- TCCM

PINPOINT TEST AF: DTC U0121:00

Test Step	Result / Action to Take
AF1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AF2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AF2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the ABS module pass the network test?**	**Yes** GO to AF3 . **No** REFER to Section 418-00 .
AF3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST • Check for recorded DTCs from the ABS module self-test. • **Is DTC B11E8:16 (B1318) or DTC B11E8:17 (B1317) recorded?**	**Yes** REFER to Section 206-09 . **No** GO to AF4 .
AF4 RETRIEVE THE RECORDED DTCs FROM THE TCCM SELF-TEST • Check for recorded DTCs from the TCCM self-test. • **Is DTC P0562:00 or P0563:00 recorded?**	**Yes** GO to Pinpoint Test M . **No** GO to AF5 .
AF5 RECHECK THE TCCM DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the PMI or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the TCCM self-test. • **Is DTC U0121:00 still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the TCCM self-test. If DTC U0121:00 is still present, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

repair4less

Pinpoint Test AG: DTC U0140:00

Normal Operation

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub-Type Information) — sets in continuous memory in the TCCM if data messages received from the BCM over the HS-CAN are missing for 5 seconds or longer with ignition in RUN and battery voltage in range. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- BCM
- TCCM

PINPOINT TEST AG: DTC U0140:00

Test Step	Result / Action to Take
AG1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AG2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AG2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the pass the network test?**	**Yes** GO to AG3 . **No** REFER to Section 418-00 .
AG3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded DTCs from the BCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** Section 419-10 . **No** GO to AG4 .
AG4 RETRIEVE THE RECORDED DTCs FROM THE TCCM SELF-TEST	
• Check for recorded DTCs from the TCCM self-test. • **Is DTC P0562:00 or P0563:00 recorded?**	**Yes** GO to Pinpoint Test M . **No** GO to AG5 .
AG5 RECHECK THE TCCM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the or the may not have been	**Yes** GO to AG6 . **No**

carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the TCCM self-test. • **Is DTC U0140:00 still present?**	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AG6 CHECK FOR DTC U0140 OR DTC U0140:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test — All CMDTCs . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 or U0140:00 set in more than one module?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.

Pinpoint Test AH: Neutral Flat Tow Functional Test

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

Neutral flat tow operates by shifting the transfer case shift motor into the NEUTRAL position, locking the transfer case in NEUTRAL. The TCCM sends the transfer case shift motor NEUTRAL position status to the IPC over the HS-CAN .

This pinpoint test is intended to diagnose the following:

- IPC
- TCCM
- TR sensor from PCM
- Ignition switch

PINPOINT TEST AH: NEUTRAL FLAT TOW FUNCTIONAL TEST

WARNING: Shifting the transfer case to its neutral position for neutral flat towing may allow the vehicle to be able to roll even if the transmission is in park (P). Make sure the foot brake is depressed and the vehicle is in a secure and safe position while the transfer case is being shifted to its neutral position. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not disconnect the battery during neutral flat towing. Doing so will prevent the transfer case from shifting properly and may allow the vehicle to roll even if the transmission is in park (P). Failure to follow this instruction may result in serious personal injury.

***NOTICE:* 2WD vehicles cannot be towed with any wheels on the ground as vehicle or transmission damage may occur.**

***NOTICE:* Failing to put the transfer case in its NEUTRAL position will damage vehicle components.**

repair4less

NOTE: 4WD vehicles can only be flat towed with all wheels on the ground by placing the transfer case in its NEUTRAL position.

Test Step	Result / Action to Take
AH1 CHECK NEUTRAL FLAT TOW ACTIVATION AND DEACTIVATION	
• Activate neutral flat tow. Refer to Neutral Flat Tow Activation and Deactivation in this section. • **Does the IPC indicate neutral flat tow is activated?**	**Yes** RETURN the vehicle to the customer. ADVISE the customer about the correct Neutral Flat Tow Activation and Deactivation procedure. **No** GO to AH2.
AH2 CHECK NEUTRAL FLAT TOW ACTIVATION WHILE MONITORING THE TCCM 4WD MODES (4WD_MODES) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the 4WD_MODES PID. • **Does the PID indicate NEUTRAL?**	**Yes** REFER to Section 413-01 to diagnose IPC faults. After the repair is complete, CLEAR the DTCs. TEST the system for normal operation. **No** GO to AH3.
AH3 CHECK FOR TCCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section. After the repair is complete, CLEAR the DTCs. TEST the system for normal operation. **No** GO to AH4.
AH4 CHECK TCCM BRAKE ON/OFF (4X4_BOO) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the 4X4_BOO PID while pressing the brake pedal. • **Does the PID agree with the brake pedal position?**	**Yes** GO to AH5. **No** REFER to Section 417-01 to diagnose stoplamp system faults. After the repair is complete, CLEAR the DTCs. TEST the system for normal operation.
AH5 CHECK THE TCCM IGNITION POSITION (KEY_POS_4X4) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the KEY_POS_4X4 PID with the ignition in the ON position. • **Does the PID indicate Ignition On?**	**Yes** GO to AH6. **No** REFER to Section 211-05 for further diagnosis of the ignition switch.
AH6 CHECK THE TCCM NEUTRAL INDICATOR (NEUTRAL) PID	
• Enter the following diagnostic mode	**Yes** For vehicles equipped with the ESOF system, GO to

on the scan tool: DataLogger — TCCM . • Monitor the NEUTRAL PID with the gear selector in neutral position. • **Does the PID indicate TRUE?**	Pinpoint Test B to diagnose the transfer case shift motor. For vehicles equipped with the 2-speed torque-on-demand system, GO to Pinpoint Test P to diagnose the transfer case shift motor. **No** REFER to Section 307-01 for diagnosis of the TR sensor.

repair4less

Four Wheel Drive (4WD) Systems — 2-Speed Torque-On-Demand

Special Tool(s)

 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The 2-speed torque-on-demand system is an automatic electronic-shift system that allows the operator to choose between 2-Wheel Drive (2WD) and 3 different Four-Wheel Drive (4WD) modes. The operator can switch between 2WD (2H) mode, 4X4 AUTO (4A) mode or 4X4 (4H) mode at any speed or at a stop. To engage or disengage 4X4 LOW (4L) mode, the vehicle speed must be less than 5 km/h (3 mph) and the transmission must be in NEUTRAL.

Wheel slip is sensed by monitoring the average front and rear wheel speeds. Based on steering wheel angle, Accelerator Pedal Position (APP) and wheel slip, a Pulse-Width Modulation (PWM) signal is transmitted to the transfer case as torque is required.

The Transfer Case Control Module (TCCM) will provide the ABS with current clutch duty cycle and whether or not ABS may command the clutch duty cycle.

The brake subsystem sends the following information signals to the 4WD system over the High Speed Controller Area Network (HS-CAN):

- Occurrences of brake events and failures. Refer to Section 206-09 .
- Steering wheel angle status. Refer to Section 206-09 .
- Wheel speeds. Refer to Section 206-09 .

A concern with any of the above listed brake system signals HS-CAN will affect operation of the 4WD system.

The APP output signal is provided to the TCCM from the PCM. This signal is used by the TCCM in controlling the transfer case clutch.

The shift motor sense plate, an integral part of the shift motor assembly, informs the TCCM of the transfer case position.

The electric shift motor is mounted externally to the transfer case. It drives a rotary cam which moves the range fork within the transfer case between the HIGH range (2H, 4A and 4H) and LOW range (4L) positions. **The shift motor only moves during a shift to/from 4L on the 2 speed torque on demand system; it does not move during any other mode shift.**

The TCCM sends a duty cycle command to the clutch coil which activates the clutch within the transfer case.

The TCCM varies the torque sent to the front driveline by controlling the transfer case clutch. At rest and under cruising conditions, the TCCM activates the transfer case clutch a minimum duty cycle (percentage of time the clutch is turned on), which allows for the slight difference between the front and rear driveshafts which normally occurs when negotiating a corner on dry pavement. Under any of the following conditions, the TCCM will increase the duty cycle in order to prevent or control slip:

- Slip is detected
- Heavy acceleration (throttle position)
- Straight-ahead steering wheel angle

Feature inputs:

- MSS
- Steering wheel angle (from the ABS module)
- TR position (from the PCM)
- Transmission output torque (from the PCM)
- Wheel speed signal (transmitted from the ABS module)
- APP (from the PCM)
- Transfer case shift motor contact plate position inputs A, B, C, D

Feature outputs:

- PWM signal to the transfer case clutch
- 4WD message center indicators
- Transfer case shift motor outputs

Shifts between 4X4 AUTO (4A) and 4X4 (4H) modes can be made at any speed. Listed below are the inputs and outputs needed by the to execute a change between any of these modes.

Feature inputs:

- Wheel speed signal
- APP (from the PCM)
- MSS

Feature outputs:

- Transfer case shift motor outputs
- PWM signal to the transfer case clutch

repair4less

- 4WD message center indicators

When shifting into or out of 4X4 LOW (4L) mode, TCCM the requires that the vehicle speed is less than 5 km/h (3 mph) and the transmission is in NEUTRAL.

Feature inputs:

- APP (from the PCM)
- MSS
- Transfer case shift motor encoder contact plate position inputs A, B, C, D
- Wheel speed signal (transmitted from ABS module)

Feature outputs:

- Transfer case shift motor outputs
- 4WD message center indicators
- PWM signal to the transfer case clutch

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Mechanical	Electrical

• Halfshafts
• IWEs
• Driveshaft and U-joints
• Vacuum leaks
• Fluid leaks
• Matching tire sizes
• Transfer case
	• BJB fuses:
	  ▪ 20 (20A)
	  ▪ 29 (10A)
	  ▪ 54 (5A)
	  ▪ 68 (25A)
	• BCM fuse 34 (10A) (vehicles with ELD only)
	• Wiring, terminals or connectors
	• MSS
	• Synchronization clutch
	• IWE solenoid
	• Transfer case shift motor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :
- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Carry out the self-test diagnostics for the TCCM .

9. If the DTCs retrieved are related to the concern, go to the TCCM DTC Chart in this section. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Four-Wheel Drive System or GO to Symptom Chart - NVH .

DTC Charts

Transfer Case Control Module (TCCM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
C1979:11	IWE Solenoid Circuit Failure: Circuit Short To Ground	GO to Pinpoint Test N .
C1979:12	IWE Solenoid Circuit Failure: Circuit Short To Battery	GO to Pinpoint Test N .
C1979:13	IWE Solenoid Circuit Failure: Circuit Open	GO to Pinpoint Test N .
P0562:00	System Voltage Low: No Sub Type Information	GO to Pinpoint Test M .
P0563:00	System Voltage High: No Sub Type Information	GO to Pinpoint Test M .
P1812:00	4-Wheel Drive Mode Select Circuit Failure: No Sub Type Information	GO to Pinpoint Test X .
P1815:00	4-Wheel Drive Mode Select Short To Ground: No Sub Type Information	GO to Pinpoint Test X .
P1825:00	4-Wheel Drive Clutch Relay Open	GO to Pinpoint Test Q .

repair4less

	Circuit: No Sub Type Information	
P1826:00	4-Wheel Drive Low Clutch Relay Circuit To Battery: No Sub Type Information	GO to Pinpoint Test Q .
P1827:00	4-Wheel Drive Low Clutch Relay Circuit To Ground: No Sub Type Information	GO to Pinpoint Test Q .
P1839:00	Transfer Case Shift Motor Open Circuit: No Sub Type Information	GO to Pinpoint Test P .
P1840:00	Transfer Case Shift Motor Short Circuit To Battery: No Sub Type Information	GO to Pinpoint Test P .
P1841:00	Transfer Case Shift Motor Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test P .
P1849:00	Transfer Case Contact Plate 'A' Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test P .
P184B:00	Transfer Case Unable To Transition Between 4H and 4L: No Sub Type Information	GO to Pinpoint Test P .
P1853:00	Transfer Case Contact Plate 'B' Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test P .
P1857:00	Transfer Case Contact Plate 'C' Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test P .
P185A:00	Differential Lock-Up Input Switch Circuit High: No Sub Type Information	Go to Pinpoint Test Y in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P185B:00	Differential Lock-Up Indicator Circuit Low: No Sub Type Information	Go to Pinpoint Test Z in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P185C:00	Differential Lock-Up Indicator Circuit High: No Sub Type Information	Go to Pinpoint Test AA in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P185D:00	Differential Lock-Up Control Circuit Performance: No Sub Type Information	Go to Pinpoint Test AB in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P1861:00	Transfer Case Contact Plate 'D' Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test P .
P1867:00	Transfer Case Contact Plate General Circuit Failure: No Sub Type Information	GO to Pinpoint Test P .
P187C:00	Differential Lock-Up Control Circuit/Open: No Sub Type Information	Go to Pinpoint Test AC in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P187D:00	Differential Lock-Up Control Circuit Low: No Sub Type Information	Go to Pinpoint Test AC in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P187E:00	Differential Lock-Up Control Circuit High: No Sub Type Information	Go to Pinpoint Test AD in Electronic Locking Differential (ELD) System, Diagnosis and Testing,

		Section 308-07A .
P1886:00	4X4 Initialization Failure: No Sub Type Information	CLEAR the DTC. REPEAT the self-test. If the DTC still reports, CONFIRM the TCCM part number is correct for the vehicle.
P1891:00	Transfer Case Contact Plate Ground Return Open Circuit: No Sub Type Information	GO to Pinpoint Test P .
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	Go to Pinpoint Test AB in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	Go to Pinpoint Test AF in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
U0418:00	Invalid Data Received From Brake System Control Module: No Sub Type Information	REFER to Section 206-09 to diagnose the wheel speed sensor concern.
U3000:04	Control Module: System Internal Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:04 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:41	Control Module: General Checksum Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:41 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:46	Control Module: Calibration / Parameter Memory Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:46 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:49	Control Module: Internal Electronic Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:49 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U300D:11	Ignition Input On/Start: Circuit Short To Ground	GO to Pinpoint Test L .

Symptom Chart — Four-Wheel Drive System

Symptom Chart —

Condition	Possible Sources	Action
• No communication with the TCCM	• Scan tool • DLC • TCCM • Wiring, terminals or connectors	• REFER to Section 418-00 .
• The 4X4 mode indicators do not operate correctly/do not operate	• Instrument Panel Cluster (IPC) • 4WD system fault • HS-CAN	• GO to Pinpoint Test V .

repair4less

	• TCCM	
• The vehicle does not shift between 2H (2WD) and 4X4 modes correctly	• Wiring, terminals or connectors • MSS • Transfer case • TCCM	• GO to Pinpoint Test X .
• The vehicle does not shift between 4A (4X4 AUTO) and 4H (4X4) modes correctly	• MSS • IWEs • IWE solenoid • Transfer case • Vacuum leaks • Front axle assembly • TCCM • Wiring, terminals or connectors	• GO to Pinpoint Test O .
• Vehicle has no torque or inadequate torque at front wheels in 4A (4X4 AUTO) mode	• Transfer case and related components • IWEs and related components • Wheel/tire assemblies	• CARRY OUT the 4WD System Functional Test. GO to Pinpoint Test U .
• The vehicle does not shift between 4H (4X4) and 4L (4X4 LOW) modes correctly	• Wiring, terminals or connectors • Transfer case • TR • ABS wheel speed inputs • IWEs • TCCM • Transmission drag torque	• GO to Pinpoint Test P .
• 4WD does not engage at speed correctly	• Transfer case synchronization clutch • Transfer case • TCCM • Front axle assembly • Wiring, terminals or connectors	• GO to Pinpoint Test Q .
• The front axle does not engage/disengage correctly	• MSS • IWEs • IWE solenoid • Transfer case • Vacuum leaks • Front axle assembly • TCCM • Wiring, terminals or connectors • Fuses	• GO to Pinpoint Test N .
• The 4WD system jumps out of gear	• IWE vent line(s) • MSS	• GO to Pinpoint Test R .

	• Transfer case	
• Unable to duplicate customer concern	• 4WD system and/or related components	• CARRY OUT the 4WD System Functional Test. GO to Pinpoint Test U .
• Unable to achieve flat tow (neutral tow) mode	• Wiring, terminals or connectors • HS-CAN • IPC • TCCM • Door ajar switch • Ignition switch	• Go to Pinpoint Test AH in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Symptom Chart — NVH

Condition	Possible Sources	Action
• Grinding noise during 4WD system engagement, especially at high speeds	• Front halfshaft speeds not turning at the same speed • Synchronization clutch	• GO to Pinpoint Test N .
• Vehicle Pulsates or Shudders in a Straight Line (Straightline Driveline Wind-up)	• Unequal tire inflation pressures • Unmatched tire and wheel size • Unequal amounts of tire wear • Unmatched front and rear axle ratios	• GO to Pinpoint Test S .
• The front axle makes noise in 2H mode only and generally under heavy throttle	• Vacuum leaks • Vacuum check valve • Vacuum reservoir • IWE solenoid • IWEs	• GO to Pinpoint Test T .
• The transfer case makes noise	• Tire inflation pressure • Tire and wheel size • Tire tread wear	• MAKE SURE that all tires and wheels are the same size and that the inflation pressures are correct. • CHECK tire tread wear to see if there is more than 0.15 mm (0.06 in) difference in tread wear between front and rear. INTERCHANGE one front wheel

repair4less

		and one rear wheel. ROAD TEST again.
	• Internal components	• OPERATE the vehicle in all transmission gears. If there is noise in the transmission in NEUTRAL, or in some gears and not in others, REMOVE and REPAIR the transmission. REFER to Section 307-01 . If there is noise in all gears, DISASSEMBLE the transfer case. REFER to Section 308-07B . CHECK the planetary gears, the bearings, the upper and lower drive sprockets and drive chain for damage. INSTALL new parts as necessary.
	• Fluid level	• FILL with automatic transmission fluid. REFER to Section 308-07B .
• Transfer case whine — noise at all ranges	• Incorrect fluid level or fluid quality • Worn oil pump • Under-inflated or oversized tires	• CHECK that the transfer case is filled to the correct level and with the specified fluid. REFER to Section 308-07B . • DISASSEMBLE the transfer case. CHECK the oil pump for wear or damage. REPAIR as necessary. REFER to Section 308-07B . • CONFIRM that the tires and wheels are correct for the vehicle. CHECK that the tire inflation pressures are correct.
• Transfer case growl/rumble — noise at all ranges	• Damaged or worn bearings or planetary gear	• DISASSEMBLE the transfer case. CHECK the bearings or planetary gear for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case scraping/grating — noise at all ranges	• Excessively stretched drive chain hitting the case	• DISASSEMBLE the transfer case. CHECK the drive chain for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum — noise at all ranges or 4H only	• Worn or damaged sun (input) gear, clutch pack (intermediate) gear or output shaft gear	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Vehicle binds in a turn/resists turning/pulsates in a straightline in 4WD mode	• Unmatched tire sizes • Unequal amounts of tire wear • Unequal tire inflation pressures • Throttle position failure • Transfer case • TCCM	• GO to Pinpoint Test W .

Pinpoint Tests

Pinpoint Test L: DTC U300D:11

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

Normal Operation

The TCCM receives ignition switch position status from the hardwired run/start input circuit and the ignition switch position status message communicated by the BCM over the HS-CAN .

- DTC U300D:11 (Ignition Input On/Start: Circuit Short To Ground) — Fault sets when short to ground is sensed by TCCM C2371A pin 7. If the ignition switch is not in RUN for the self-test, this code will set.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Ignition switch
- HS-CAN

PINPOINT TEST L: U300D:11

Test Step	Result / Action to Take
L1 CHECK THE TCCM IGNITION POSITION (KEY_POS_4X4) AND IGNITION STATUS (KEY_STATUS_4X4) PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the KEY_POS_4X4 and KEY_STATUS_4X4 PIDs. • **Do the ignition PIDs match the ignition switch positions?**	**Yes** The system is functioning correctly at this time. CLEAR the DTCs. TEST the system for normal operation. **No** If the KEY_STATUS_4X4 PID did not match, CHECK BJB fuse 54 (5A). If the fuse is OK, REPAIR circuit CBB54 (VT/OG). If the fuse is not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. After the fault is repaired, CLEAR the DTCs. TEST the system for normal operation. If the KEY_POS_4X4 PID did not match, REFER to Section 211-05 to diagnose the ignition switch. After the fault is repaired, CLEAR the DTCs. TEST the system for normal operation.

Pinpoint Test M: DTC P0562:00 or P0563:00

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

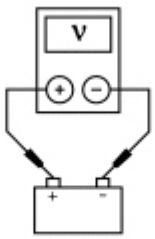
repair4less

Normal Operation

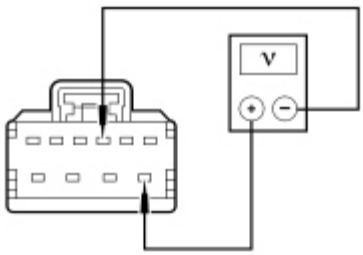
If the TCCM observes an overpower or underpower voltage condition, a DTC is set and all TCCM outputs are turned off (IWEs engaged).

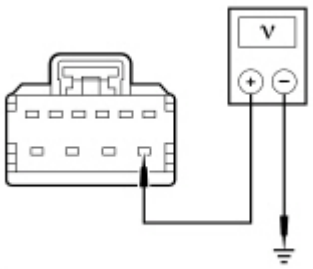
- DTC P0562:00 (Battery Voltage Low: No Sub Type Information) — Fault sets when the TCCM detects battery voltage less than 9 volts for 5 seconds or more at TCCM C2371B pin 7.
- DTC P0563:00 (Battery Voltage High: No Sub Type Information) — Fault sets when the TCCM detects battery voltage greater than 16 volts for 5 seconds or more at TCCM C2371B pin 7.

This pinpoint test is intended to diagnose the following:



- Fuses
- Wiring, terminals or connectors
- TCCM





PINPOINT TEST M: DTC P0562:00 OR P0563:00

NOTE: DTC P0562:00 or P0563:00 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
M1 RETRIEVE ALL CMDTCs IN ALL MODULES • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — All CMDTCs . • **Is P0562:00 or P0563:00 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to M2 .
M2 CHECK BATTERY CONDITION • Ignition OFF. • Refer to Section 414-01 and carry out the Battery — Condition Test. • **Does the battery pass the condition test?**	**Yes** GO to M3 . **No** CHARGE or INSTALL a new battery. REFER to Section 414-01 . CLEAR all CMDTCs . TEST the system for normal operation.
M3 CHECK THE CHARGING SYSTEM VOLTAGE **NOTE:** Do not allow the engine rpm to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine rpm has gone above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step.	**Yes** For DTC P0562:00, GO to M4 . For DTC P0563:00, GO to M6 .

• Start the engine.
• Measure the voltage of the battery:
  ■ For DTC P0562:00, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes.
  ■ For DTC P0563:00, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes.

AJ0210-A
• **Is the battery voltage between 13-15.2 volts?**
	No
	REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.

M4 CHECK VOLTAGE AND GROUND TO THE TCCM	
• Ignition OFF. • Disconnect: TCCM C2371B . • Ignition ON. • Measure the voltage between TCCM C2371B-3, circuit GD123 (BK/GY), harness side and TCCM C2371B-7, circuit SBB68 (GN/RD), harness side.  N0091388 • **Is the voltage greater than 11 volts?**	**Yes** GO to M6 . **No** GO to M5 .
M5 CHECK VOLTAGE TO THE TCCM	
• Measure the voltage between TCCM C2371B-7, circuit SBB68 (GN/RD), harness side and ground.  N0091389 • **Is the voltage greater than 11 volts?**	**Yes** REPAIR circuit GD123 (BK/GY). CLEAR all CMDTCs . TEST the system for normal operation. **No** VERIFY BJB fuse 68 (20A) is OK. If OK, REPAIR circuit SBB68 (GN/RD). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR all CMDTCs. TEST the system for normal

repair4less

	operation.

M6 CHECK FOR CORRECT TCCM OPERATION
• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM. REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test N: The Front Axle Does Not Engage/Disengage Correctly

Refer to Wiring Diagrams Cell 34, Four-Wheel Drive Systems for schematic and connector information.

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A.

Normal Operation

In 2H mode, the TCCM supplies a ground path to the IWE solenoid to apply vacuum to the IWEs (disengaging the front hubs from the front axle). In 4H or 4L modes, the TCCM does not supply the ground path to the IWE solenoid, vacuum is not applied to IWEs the and an internal spring in the IWEs keeps the hubs engaged.

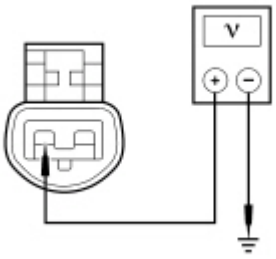
- DTC C1979:11 (IWE Solenoid Circuit Failure: Short Circuit To Ground) — Fault sets when TCCM C2371A pin 6 detects a short to ground. Fault results in IWEs hubs disengaged all the time.
- DTC C1979:12 (IWE Solenoid Circuit Failure: Short Circuit To Battery) — Fault sets when TCCM C2371A pin 6 detects a short to voltage. Fault results in IWEs hubs engaged all the time.
- DTC C1979:13 (IWE Solenoid Circuit Failure: Circuit Open) — Fault sets when TCCM C2371A pin 6 detects an open circuit. Fault results in IWEs hubs engaged all the time.

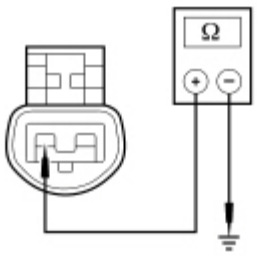
This pinpoint test is intended to diagnose the following:

- MSS
- IWEs
- IWE solenoid
- Transfer case
- Vacuum leaks
- Front axle assembly
- TCCM
- Wiring, terminals or connectors
- Fuses

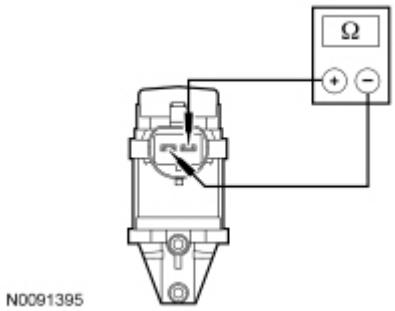
PINPOINT TEST N: THE FRONT AXLE DOES NOT ENGAGE/DISENGAGE CORRECTLY

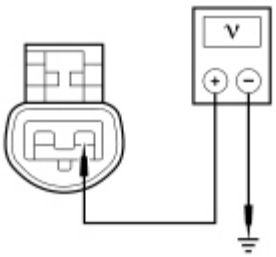
WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

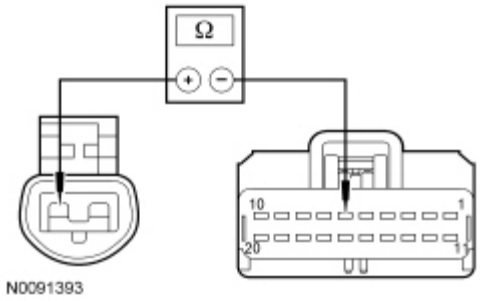




Test Step	Result / Action to Take
N1 CHECK FOR TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** For DTC C1979:11, GO to N19. For DTC C1979:12, GO to N18. For DTC C1979:13, GO to N20. For all other DTCs, REFER to the TCCM - DTC Chart. **No** GO to N2.
N2 CHECK FOR GRINDING NOISES AT HIGH SPEEDS	
• With the vehicle warm and the MSS in 2H mode, drive the vehicle at sustained WOT for 5 seconds. • **Is there a grinding noise from the axle system during WOT?**	**Yes** GO to Pinpoint Test T. **No** GO to N3.
N3 CHECK TCCM OPERATION	
• Ignition ON. • Monitor the 4X4 indicator on the IPC while moving the MSS between 2H and 4H modes. • **Does the 4X4 indicator illuminate when the MSS is in the 4H position and turn off when the MSS is in the 2H position?**	**Yes** GO to N4. **No** GO to Pinpoint Test X.
N4 CHECK THE IWE DISENGAGEMENT	
NOTE: The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02. • Place the MSS in 2H. • Start the engine. • Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft. • Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft. • **Did either front halfshaft rotate?**	**Yes** GO to N8. **No** GO to N5.
N5 CHECK THE IWE ENGAGEMENT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02. • Place the MSS in 4H. • Start the engine. • Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft. • Rotate the RH front tire one revolution forward and one	**Yes** The front axle is operating properly at this time. CARRY OUT the 4WD Functional Test. GO to Pinpoint Test U. **No**







repair4less

revolution backward while observing the RH front halfshaft. • **Did both front halfshafts rotate?**	GO to N6.
N6 CHECK THE IWE SOLENOID OUTPUT IN 4H • Disconnect the output vacuum line at the IWE solenoid. • Switch the MSS to 4H. • With the engine running, measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** The IWE is mechanically stuck in the disengaged position. INSTALL a new IWE on the halfshaft(s) that did not rotate. REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation. **No** GO to N7.
N7 CHECK THE IWE SOLENOID • Ignition OFF. • Disconnect: IWE Solenoid . • Start the engine. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** GO to N20. **No** INSTALL a new IWE solenoid. TEST the system for normal operation.
N8 CHECK THE IWE SOLENOID OUTPUT VACUUM IN 2H • Disconnect the output vacuum line at the IWE solenoid. • With the engine running and the MSS in 2H, measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to N11. **No** GO to N9.
N9 CHECK THE IWE SOLENOID INPUT VACUUM • Disconnect the supply vacuum line at the IWE solenoid. • With the engine running, measure the supply line vacuum to the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to N20. **No** GO to N10.
N10 CHECK THE VACUUM RESERVOIR • Ignition OFF. • With the source vacuum line still disconnected, connect a vacuum pump to the vacuum port on the vacuum reservoir and apply 508 mm (20 in) Hg of vacuum. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** REPAIR or INSTALL new vacuum lines or INSTALL a check valve. TEST the system for normal operation. **No** INSTALL a new vacuum reservoir. TEST the system for normal operation.
N11 CHECK THE IWE VACUUM LINES • Ignition OFF. • Disconnect the output vacuum line from the IWE solenoid. • Disconnect and plug the LH and RH IWE vacuum lines at the IWEs. • Connect a vacuum pump to the IWE output vacuum circuit at the IWE solenoid connection. Apply 508 mm (20 in) Hg of vacuum and observe the vacuum reading.	**Yes** GO to N14. **No** GO to N12.

• **Does the vacuum drop more than 25 mm (1 in) Hg per minute?**	
N12 CHECK THE LH IWE VACUUM LINE FOR AN OBSTRUCTION	
• REMOVE the plug from the vacuum line at the LH IWE . • Connect a hand vacuum pump to the LH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the LH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. CLEAR the DTCs. TEST the system for normal operation. **No** GO to N13 .
N13 CHECK THE RH IWE VACUUM LINE FOR AN OBSTRUCTION	
• REMOVE the plug from the vacuum line at the RH IWE . • Connect a vacuum pump to the RH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the RH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. CLEAR the DTCs. TEST the system for normal operation. **No** GO to N14 .
N14 CHECK THE RH IWE LEAK RATE	
• Apply 508 mm (20 in) Hg of vacuum to the RH IWE port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to N15 . **No** INSTALL a new RH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
N15 CHECK THE RH IWE OPERATION	
• Connect a vacuum pump with gauge to the larger port of the RH IWE . • Observe the RH halfshaft while rotating the RH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg of vacuum and release the vacuum to manually disengage and engage the RH IWE . • **Did the RH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	**Yes** CONNECT the vacuum line to the RH IWE . GO to N16 . **No** INSTALL a new RH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
N16 CHECK THE LH IWE LEAK RATE	
• Disconnect the vacuum line from the larger port at the LH IWE . • Apply 508 mm (20 in) Hg of vacuum to the LH IWE port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to N17 . **No** INSTALL a new LH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
N17 CHECK THE LH IWE OPERATION	
• Connect a vacuum pump with gauge to the larger port of the LH IWE . • Observe the LH halfshaft while rotating the LH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg of vacuum	**Yes** CONNECT the vacuum line to the LH IWE . GO to N18 .

repair4less

and release the vacuum to manually disengage and engage the LH IWE . • **Did the LH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	**No** INSTALL a new LH IWE . REFER to Integrated Wheel End (IWE) in this section. CLEAR the DTCs. TEST the system for normal operation.
N18 CHECK THE IWE SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IWE Solenoid . • Disconnect: TCCM C2371A . • Ignition ON. • Measure the voltage between IWE solenoid C1291-2, circuit CCF05 (BN/BU), harness side and ground.  N0091392 • **Is any voltage present?**	**Yes** REPAIR circuit CCF05 (BN/BU). CLEAR the DTCs. TEST the system for normal operation. **No** GO to N19 .
N19 CHECK THE IWE SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IWE Solenoid . • Disconnect: TCCM C2371A . • Measure the resistance between solenoid C1291-2, circuit CCF05 (BN/BU), harness side and ground.  N0091394 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N20 . **No** REPAIR circuit CCF05 (BN/BU). CLEAR the DTCs. TEST the system for normal operation.
N20 CHECK THE IWE SOLENOID RESISTANCE	
NOTE: If the temperatures (either ambient or in the engine compartment) are exceptionally high, a higher than normal resistance reading could result. A lower temperature could result in a lower resistance reading. • Measure the resistance between IWE solenoid C1291 pins 1 and 2, component side.	**Yes** GO to N21 . **No** INSTALL a new IWE solenoid. CLEAR the DTCs. TEST the system for normal operation.

 N0091395 • **Is the resistance between 44 and 70 ohms?**	
N21 CHECK FOR VOLTAGE TO THE IWE SOLENOID	
• Measure the voltage between IWE solenoid C1291-1, circuit SBB29 (GY/RD), harness side and ground.  N0091391 • **Is the voltage greater than 11 volts?**	**Yes** GO to N22 . **No** CHECK BJB fuse 29 (10A). If OK, REPAIR circuit SBB29 (GY/RD). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR the DTCs. TEST the system for normal operation.
N22 CHECK THE IWE SOLENOID CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: IWE Solenoid . • Disconnect: TCCM C2371A . • Measure the resistance between IWE solenoid C1291-2, circuit CCF05 (BN/BU), harness side and TCCM C2371A-6, circuit CCF05 (BN/BU), harness side.  N0091393 • **Is the resistance less than 3 ohms?**	**Yes** GO to N23 . **No** REPAIR circuit CCF05 (BN/BU). CLEAR the DTCs. TEST the system for normal operation.
N23 CHECK FOR CORRECT TCCM OPERATION	
• Ignition OFF. • Disconnect and inspect all TCCM connectors. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new terminals/pins	**Yes** INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.

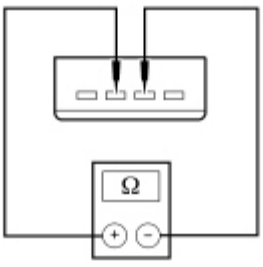
repair4less

▪ pushed-out pins - install new pins as necessary • Connect all TCCM connectors. Make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test O: The Vehicle Does Not Shift Between 4A (4X4 AUTO) and 4H (4X4) Modes Correctly

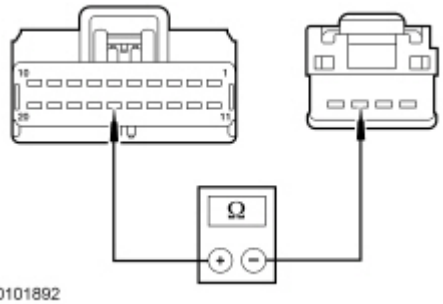
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

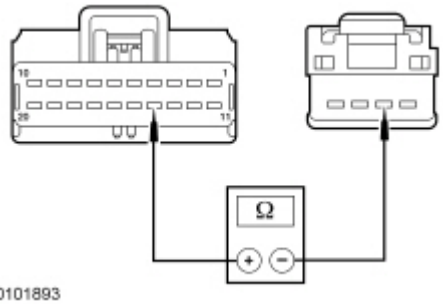
Normal Operation



In 2H mode, the TCCM supplies a ground path to the IWE solenoid to apply vacuum to the IWEs (disengaging the front hubs from the front axle). In AUTO, 4H and 4L modes, the TCCM does not supply the ground path to the IWE solenoid, vacuum is not applied to the IWEs and an internal spring keeps the hubs engaged. Systematically check the necessary inputs and outputs at the TCCM , internal components of the transfer case, MSS , IWE components and drive axles.

This pinpoint test is intended to diagnose the following:

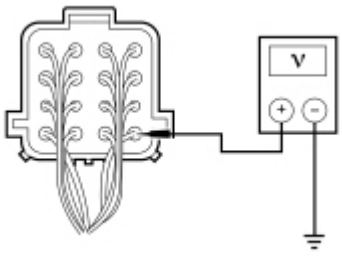


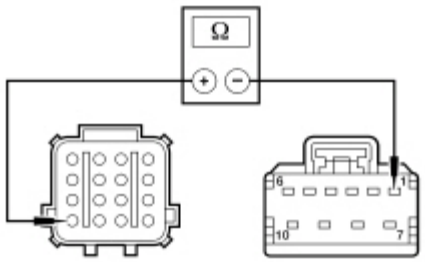


- MSS
- IWEs
- IWE solenoid
- Transfer case
- Vacuum leaks
- Front axle assembly
- TCCM
- Wiring, terminals or connectors

PINPOINT TEST O: THE VEHICLE DOES NOT SHIFT BETWEEN 4A (4X4 AUTO) AND 4H (4X4) MODES CORRECTLY

Test Step	Result / Action to Take
O1 CHECK FOR TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs retrieved?**	**Yes** REFER to the TCCM DTC Chart in this section. **No** GO to O2 .
O2 CHECK THE 4H INDICATOR	
• Select 4H mode and observe the IPC . • **Does the IPC indicator lamp indicate 4H (4X4) mode?**	**Yes** GO to O8 . **No** GO to O3 .
O3 CHECK THE TCCM IGNITION POSITION (KEY_POS_4X4) PID	
• Enter the following diagnostic mode on the scan tool:	**Yes**





DataLogger — TCCM . • Monitor the KEY_POS_4X4 PID while cycling through each position: • **Does the ignition position PID match the ignition switch positions?**	GO to O4 . **No** REFER to Section 211-05 to diagnose the ignition switch concern.
O4 CHECK THE TCCM 4WD SWITCH STATUS (4X4_SW) PID • Monitor 4X4_SW PID while cycling the MSS through each position. **MSS Position** / **PID Status**: 2H — 2-W Drive; 4A — A4WD; 4H — 4W Auto/Hi; 4L — 4W Low • **Does each PID status agree with each MSS position?**	**Yes** GO to O7 . **No** GO to O5 .
O5 CHECK THE MSS RESISTANCE VALUES • Ignition OFF. • Disconnect: MSS . • Measure the resistance between C284 pin 2 and pin 3, component side. Refer to the following chart: **MSS Position** / **Resistance (±1%)**: 2H — 619 ohms; 4A — 270 ohms; 4H — 130 ohms; 4L — 62 ohms  N0063005 • **Are the resistance values within specification?**	**Yes** GO to O6 . **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. TEST the system for normal operation.
O6 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR AN OPEN • Disconnect: TCCM C2371A . • Measure the resistance between MSS C284-2, circuit CCF13 (WH/BU), harness side and TCCM C2371A-16, circuit CCF13 (WH/BU), harness side.	**Yes** GO to O19 . **No** REPAIR the affected circuit

repair4less

 N0101892 • Measure the resistance between MSS C284-3, circuit RCF13 (WH/BN), harness side and TCCM C2371A-14, circuit RCF13 (WH/BN), harness side.  N0101893 • **Are the resistances less than 3 ohms?**	(s). CLEAR the DTCs. TEST the system for normal operation.
O7 CHECK THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID IN 4H • Switch the MSS to 4H mode. • Monitor the 4WD_CLTCH_OUT PID. • **Does the PID read 2 to 10% at closed throttle?**	**Yes** GO to O19 . **No** DIAGNOSE the PCM. REFER to PC/ED manual and the HS-CAN . REFER to Section 418-00 . CLEAR the DTCs. TEST the system for normal operation.
O8 CHECK FOR WIND-UP IN 4H MODE • Switch the MSS to 4H mode. • Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to O13 . **No** GO to O9 .
O9 CHECK THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID AT WOT • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the 4WD_CLTCH_OUT PID at WOT , KOEO . • **Does the 4WD_CLTCH_OUT PID read 98% at WOT ?**	**Yes** GO to O11 . **No** GO to O10 .
O10 CHECK THE TCCM ABSOLUTE THROTTLE POSITION (TP_TCCM) PID • **NOTE:** The TP_TCCM PID is APP as communicated by the	**Yes**

PCM via HS-CAN . • Slowly move the accelerator pedal from closed throttle to WOT and observe the TP_TCCM PID. • **Does the TP_TCCM PID vary between 0% at closed throttle and 100% at WOT ?**	GO to O11 . **No** DIAGNOSE the PCM. REFER to PC/ED manual and the HS-CAN . REFER to Section 418-00 . CLEAR the DTCs. TEST the system for normal operation.
O11 CHECK FOR TRANSFER CASE CLUTCH ENGAGEMENT WITH THE TCCM 4WD PWM CLUTCH STATUS COMMAND (4WD_CLTCH_OUT) ACTIVE COMMAND AND 4WD CLUTCH STATUS (4WD_CLTCH_OUT) PIDs	
• Using the 4WD_CLTCH_OUT active command, engage the transfer case clutch to 100% while monitoring the 4WD_CLTCH_OUT PID. • **Does the 4WD_CLTCH_OUT PID read 100%?**	**Yes** END the active command. CHECK the transfer case. REFER to Section 308-07B . **No** END the active command. GO to O12 .
O12 CHECK THE IPC INDICATOR IN AUTO MODE	
• Select 4A mode and observe the IPC . • **Does the message center indicate 4A (4X4 AUTO) mode?**	**Yes** GO to O13 . **No** GO to Pinpoint Test V .
O13 CHECK FOR WIND-UP IN AUTO MODE	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to O14 . **No** The system is operating correctly.
O14 CHECK THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID AT CLOSED THROTTLE	
• Monitor the 4WD_CLTCH_OUT PID at closed throttle, KOEO . • **Does the 4WD_CLTCH_OUT PID indicate 2 to 10% clutch application at closed throttle?**	**Yes** GO to O15 . **No** GO to O17 .
O15 CHECK VOLTAGE ON THE CLUTCH CONTROL CIRCUIT USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) ACTIVE COMMAND	
• Using the 4WD_CLTCH_OUT active command, command the transfer case clutch to 4%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.	**Yes** END the active command. CHECK the transfer case. REFER to Section 308-07B . **No** GO to O16 .

repair4less

 N0133480 • **Is the voltage approximately 0.2 to 0.4 volt?**	
O16 CHECK THE CLUTCH CONTROL CIRCUIT FOR AN OPEN	**Yes** GO to O17 . **No** REPAIR circuit CCF03 (GY/BN). CLEAR the DTCs. TEST the system for normal operation.
• Ignition OFF. • Disconnect: Transfer Case . • Disconnect: TCCM C2371B . • Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN), harness side and TCCM C2371B-1, circuit CCF03 (GY/BN), harness side.  N0093126 • **Are the resistances less than 3 ohms?**	
O17 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	**Yes** GO to O18 . **No** CHECK the ABS for faults. REFER to Section 206-09 .
• Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module . • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ▪ Left Front Wheel Speed Sensor (LF_WSPD) ▪ Left Rear Wheel Speed Sensor (LR_WSPD) ▪ Right Front Wheel Speed Sensor (RF_WSPD) ▪ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	
O18 CHECK THE TCCM ABSOLUTE THROTTLE POSITION (TP_TCCM) PID	**Yes** GO to O19 . **No** DIAGNOSE the PCM. REFER to PC/ED manual and the HS-CAN . REFER to Section 418-00 . CLEAR the DTCs. TEST the system for normal
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • **NOTE:** The TP_TCCM PID is APP as communicated by the PCM via HS-CAN . • Slowly move the accelerator pedal from closed throttle to and observe the TP_TCCM PID. • **Does the TP_TCCM PID vary between 0% at closed throttle and 100% at WOT ?**	

	operation.

O19 CHECK FOR CORRECT TCCM OPERATION
• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM. REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test P: The Vehicle Does Not Shift Between 4H (4X4) and 4L (4X4 Low) Modes Correctly

Refer to Wiring Diagrams Cell 34, Four-Wheel Drive Systems for schematic and connector information.

Normal Operation

The high-low shift occurs when the reduction shift fork moves the high-low collar to lock the planetary gear set to the output shaft. The torque transmitted through the sun gear from the input shaft turns the front planetary gear set assembly. The front planetary gear set assembly, now engaged, provides transfer case speed reduction. Certain criteria, such as vehicle speed and TR selection must be met before this shift can occur. Systematically check the necessary inputs and outputs of the TCCM, components of the transfer case, IWE components and halfshafts.

DTC Description	Fault Trigger Condition
• P1839:00 — Transfer Case Shift Motor Open Circuit: No Sub Type Information	Fault sets when TCCM C2371B pin 4 or 5 detects an open circuit. Shift motor moves are prevented when this DTC is set.
• P1840:00 — Transfer Case Shift Motor Short Circuit To Battery: No Sub Type Information	Fault sets when TCCM C2371B pin 4 or 5 detects a short to voltage. Shift motor moves are prevented when this DTC is set.
• P1841:00 — Transfer Case Shift Motor Short Circuit To Ground: No Sub Type Information	Fault sets when TCCM C2371B pin 4 or 5 detects a short to ground. Shift motor moves are prevented when this DTC is set.
• P1849:00 — Transfer Case Contact Plate 'A' Short Circuit To Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 1 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P184B:00 — Transfer Case Unable to Transition Between 4H and 4L: No Sub Type Information	Fault sets when target shift motor position is not reached after the maximum number of allowed blocked shift retries for 4H to 4L. Requested shift motor position is not reached.

repair4less

• P1853:00 — Transfer Case Contact Plate 'B' Short Circuit to Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 2 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P1857:00 — Transfer Case Contact Plate 'C' Short Circuit to Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 3 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P1861:00 — Transfer Case Contact Plate 'D' Short Circuit to Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 4 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P1867:00 — Transfer Case Contact Plate General Circuit Failure: No Sub Type Information	Fault sets when an invalid shift motor position is detected during selection of a new 4WD mode or during a motor movement. If the shift motor is not moving, shift motor movement will be prevented. If the shift motor is moving when this DTC sets, the shift motor will move to the high-side mechanical stop.
• P1891:00 — Transfer Case Contact Plate Ground Return Open Circuit: No Sub Type Information	Fault sets when TCCM C2371A pin 5 detects a short to ground, a short to voltage or open circuit. The TCCM will not complete mode change if a change in shift motor position is required.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Transfer case
- TR
- ABS wheel speed inputs
- IWEs
- TCCM
- Transmission drag torque

PINPOINT TEST P: THE VEHICLE DOES NOT SHIFT BETWEEN 4H (4X4) AND 4L (4X4 LOW) MODES CORRECTLY

WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

Test Step	Result / Action to Take
P1 CHECK FOR TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** For DTC P184B:00, GO to P2. For DTC P1839:00, GO to P22. For DTC P1840:00, GO to P23.

	For DTC P1841:00, GO to P24 . For DTC P1849:00, P1853:00, P1857:00, P1861:00, GO to P17 . For DTC P1867:00, GO to P7 . For DTC P1891:00, GO to P15 . For all other DTCs, REFER to the TCCM DTC Chart in this section. **No** GO to P2 .
P2 CHECK THE 2H TO 4H SHIFT	
• Drive the vehicle and shift MSS from 2H to 4H. • **Does the vehicle shift between 2H and 4H correctly?**	**Yes** GO to P3 . **No** GO to Pinpoint Test O .
P3 CHECK THE 4H TO 4L SHIFT	
• **NOTE:** When switching in or out of 4L, the transmission must be in NEUTRAL and the vehicle stopped or moving less than 5 km/h (3 mph). • Drive the vehicle and shift MSS from 4H to 4L. • **Does the transfer case shift from 4H to 4L correctly and the complaint is related to a clunk noise during the shift?**	**Yes** Transmission neutral drag is excessive. REFER to Section 307-01 for transmission diagnosis. **No** GO to P4 .
P4 CHECK THE NEUTRAL INDICATOR (NEUTRAL) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the NEUTRAL TCCM PID while shifting the transmission through gear ranges. • **Does the NEUTRAL PID indicate True when the transmission is shifted to NEUTRAL?**	**Yes** GO to P5 . **No** REFER to Section 307-01 for further diagnosis of the TR sensor.
P5 CHECK THE TCCM AVERAGE FRONT WHEEL SPEED (FRT_WHL_SPD) AND AVERAGE REAR WHEEL SPEED (REAR_WHL_SPD) PIDs	
• Ignition OFF. • Connect: TCCM C2371A . • Connect: MSS . • Ignition ON. • Switch the MSS to 2H. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM .	**Yes** GO to P6 . **No** REFER to Section 206-09 to diagnose the wheel speed concern.

repair4less

• Monitor the FRT_WHL_SPD and REAR_WHL_SPD PIDs with the vehicle stopped and while driving. • **Do the FRT_WHL_SPD and REAR_WHL_SPD PIDs match with the vehicle stopped and at all speeds?**	After the repair is complete, CLEAR the DTCs. TEST the system for normal operation.
P6 CHECK THE ABS MODULE WHEEL SPEED PIDs	

• Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module .
• Monitor the wheel speed PIDs:
  ▪ Left Front Wheel Speed Sensor (LF_WSPD)
  ▪ Left Rear Wheel Speed Sensor (LR_WSPD)
  ▪ Right Front Wheel Speed Sensor (RF_WSPD)
  ▪ Right Rear Wheel Speed Sensor (RR_WSPD)
• **Do the wheel speed PIDs indicate 0 km/h (0 mph)?**
	Yes
	GO to P7 .
	
	No
	REFER to Section 206-09 for further diagnosis of the ABS system.

P7 CHECK THE TCCM 4WD MODES (4WD_MODES) PID WITH THE MSS IN 4H	
• Start the engine. • Switch the MSS to 4H. • Monitor the 4WD_MODES PID. • **Does the 4WD_MODES PID indicate 4WD High?**	**Yes** GO to P10 . **No** GO to P8 .
P8 CHECK FOR 4H WIND-UP	
• Switch the MSS to 4H. • Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to P11 . **No** GO to P9 .
P9 CHECK FOR TRANSFER CASE ENGAGEMENT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the rear driveshaft. • Observe the front driveshaft. • **Did the front driveshaft rotate?**	**Yes** GO to P10 . **No** GO to P14 .
P10 CHECK FOR IWE ENGAGEMENT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Switch the MSS to 4H. • Start the engine. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft and U-joint. • Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft and U-joint. • **Did both front halfshafts rotate?**	**Yes** GO to P12 . **No** GO to Pinpoint Test N .
P11 CHECK THE TRANSFER CASE SHIFT TO 2H	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Command the Transfer Case Contact Plate Power (PLATE_PWR_OS) PID to energize the transfer case gearmotor encoder assembly. • Monitor the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs for the contact	**Yes** GO to P12 . **No** GO to P15 .

plate position with the MSS in the 2H position.

MSS Position	Contact Plate Position			
	PLATE_A	PLATE_B	PLATE_C	PLATE_D
2H/4A/4H Mode	CLOSED	OPEN	CLOSED	CLOSED
4L Mode	OPEN	CLOSED	OPEN	CLOSED

- **Do the PIDs and message center indicate that vehicle shifted into 2H (4X2 displayed in message center for approximately 4 seconds)?**

P12 CHECK FOR IWE DISENGAGEMENT

- With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
- Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft and U-joint.
- Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft and U-joint.
- **Did either of the front halfshafts rotate?**

Yes
GO to Pinpoint Test N .

No
GO to P13 .

P13 CHECK FOR TRANSFER CASE DISENGAGEMENT

- Rotate the rear driveshaft while observing the front driveshaft.
- **Does the front driveshaft rotate?**

Yes
The system is functioning correctly. CARRY OUT the Functional Test. GO to Pinpoint Test u .

No
GO to P14 .

P14 CHECK THE TCCM TRANSFER CASE CONTACT PLATE POSITION PIDs

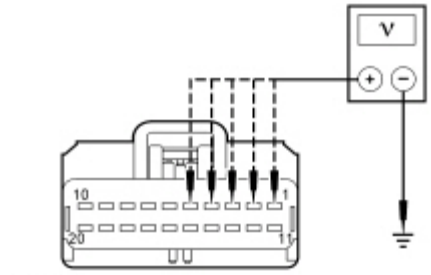
- Enter the following diagnostic mode on the scan tool: DataLogger — TCCM .
- Command the Transfer Case Contact Plate Power (PLATE_PWR_OS) PID to energize the transfer case gearmotor encoder assembly.
- Monitor the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE C) and D (PLATE_D) PIDs for the contact plate position with the MSS in the 4H position.

MSS Position	Contact Plate Position			
	PLATE_A	PLATE_B	PLATE_C	PLATE_D
2H/4A/4H Mode	CLOSED	OPEN	CLOSED	CLOSED
4L Mode	OPEN	CLOSED	OPEN	CLOSED

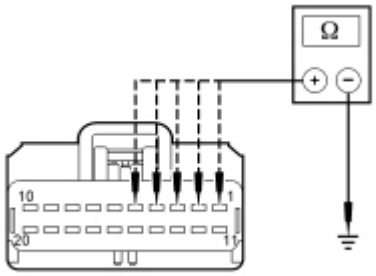
- **Did the PIDs and message center indicate that the vehicle shifted into 4H (4X4 HIGH)?**

Yes
GO to P25 .

No
GO to P15 .



P15 CHECK THE TRANSFER CASE SHIFT MOTOR OPERATION



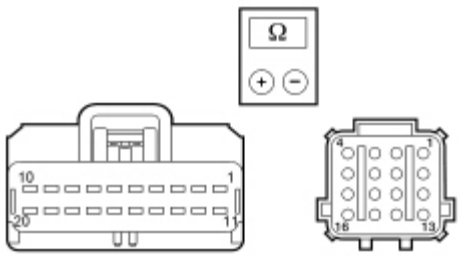
- Remove the transfer case shift motor from the transfer case, leaving the wiring connector connected.
- Observe the transfer case shift motor while switching the MSS from 2H to 4H.

Yes
GO to P25 .

No

repair4less

• **Does the transfer case shift motor rotate from the 2H position to the 4H position?**	GO to P16 .
P16 CHECK TRANSFER PLATE CONTACT PLATE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between the following circuits at C2371A, harness side and ground: **Circuit** / **C2371A Pin** CCF14 (WH) / 1 CCF15 (BN/YE) / 2 CCF16 (VT/GN) / 3 CCF17 (WH/OG) / 4 RCF09 (BN/WH) / 5  N0091402 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation. **No** GO to P17 .
P17 CHECK TRANSFER PLATE CONTACT PLATE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Transfer Case (if not previously disconnected) . • Disconnect: TCCM C2371A (if not previously disconnected) . • Measure the resistance between the following circuits at C2371A, harness side and ground: **Circuit** / **C2371A Pin** CCF14 (WH) / 1 CCF15 (BN/YE) / 2 CCF16 (VT/GN) / 3 CCF17 (WH/OG) / 4 RCF09 (BN/WH) / 5	**Yes** GO to P18 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation.

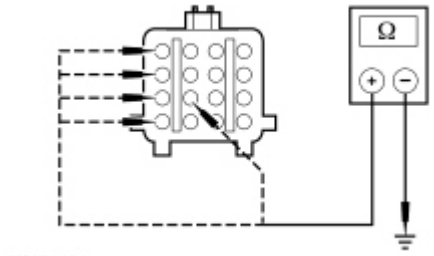


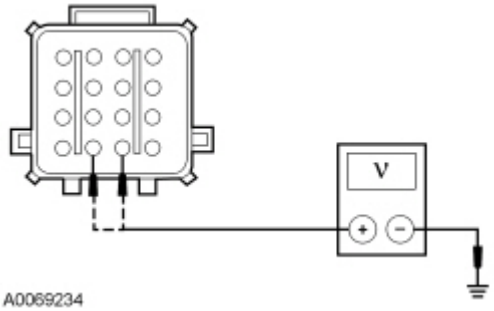
N0091403

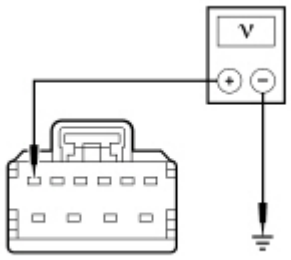
- **Are the resistances greater than 10,000 ohms?**

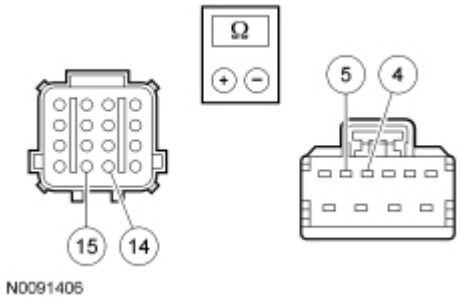
P18 CHECK THE TRANSFER PLATE CONTACT PLATE CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Transfer Case . • Disconnect: TCCM C2371A . • Measure the resistance of the following circuits between TCCM C2371A, harness side and transfer case C350, harness side:	**Yes** GO to P19 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation.

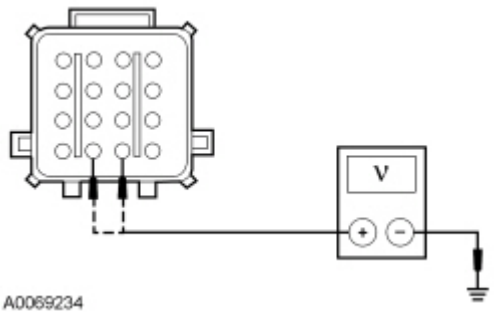
Circuit	C2371A Pin	C350 Pin
CCF14 (GN/OG)	1	5
CCF15 (BN/YE)	2	1
CCF16 (VT/GN)	3	9
CCF17 (WH/OG)	4	13
RCF09 (BN/WH)	5	10





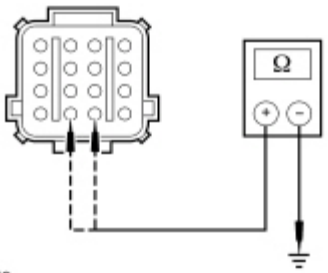






N0091401

- **Are the resistances less than 3 ohms?**



P19 CHECK THE SHIFT MOTOR FOR AN INTERNAL SHORT TO GROUND	
• Measure the resistance between transfer case C350 pins 1, 5, 9, 10 and 13, component side and ground.	**Yes** GO to P20 . **No** INSTALL a new transfer case shift motor. REFER to Transfer Case Shift Motor in this section. CLEAR the DTCs.

repair4less

 N0091404 • **Are the resistances greater than 10,000 ohms?**	REPEAT the self-test. If the concern is still present, GO to P26 .
P20 CHECK THE SHIFT MOTOR CIRCUITS FOR POWER WHILE COMMANDING THE TCCM CW RELAY (CW_SMD_OS) AND CCW RELAY (CCW_SMD_OS) PIDs ON	
• Connect: TCCM C2371A . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Command the CW_SMD_OS PID ON and OFF while measuring the voltage between transfer case C350-14, circuit CCF08 (GY/OG), harness side and ground. Then command the CCW_SMD_OS PID ON and OFF while measuring the voltage between transfer case C350-15, circuit CCF07 (BN/GN), harness side and ground.  A0069234 • **Are the voltages 10 volts or greater on the circuits when commanding the PIDs ON?**	**Yes** GO to P25 . **No** GO to P21 .
P21 CHECK THE TCCM VOLTAGE CIRCUIT	
• Ignition OFF. • Disconnect: TCCM C2371B . • Measure the voltage between TCCM C2371B-6, circuit SBB20 (GN/RD), harness side and ground.  N0091405 • **Is the voltage greater than 11 volts?**	**Yes** GO to P22 . **No** VERIFY BJB fuse 20 (20A) is OK. If OK, REPAIR circuit SBB20 (GN/RD). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR the DTCs. TEST the system for normal operation.

P22 CHECK THE TRANSFER CASE SHIFT MOTOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: TCCM C2371B . • Disconnect: Transfer Case . • Measure the resistance between transfer case C350, harness side and TCCM C2371B, harness side. Refer to the following chart. **Transfer Case / Circuit / TCCM** C350-14 / CCF08 (GY/OG) / C2371B-5 C350-15 / CCF07 (BN/GN) / C2371B-4  N0091405 • **Are the resistances less than 3 ohms?**	**Yes** GO to P23 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation.
P23 CHECK THE TRANSFER CASE SHIFT MOTOR CIRCUITS FOR SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: TCCM C2371B (if not previously disconnected) . • Disconnect: Transfer Case (if not previously disconnected) . • Measure the voltage between transfer case C350-14, circuit CCF08 (GY/OG), harness side and ground; and between transfer case C350-15, circuit CCF07 (BN/GN), harness side and ground.  A0069234 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation. **No** GO to P24 .
P24 CHECK THE TRANSFER CASE SHIFT MOTOR CIRCUITS FOR SHORT TO GROUND	
• Ignition OFF. • Disconnect: TCCM C2371B (if not previously disconnected) . • Disconnect: Transfer Case (if not previously disconnected) . • Measure the resistance between transfer case C350-14, circuit CCF08 (GY/OG), harness side and ground; and between the transfer case C350-15, circuit CCF07 (BN/GN), harness side and ground.	**Yes** GO to P25 . **No** REPAIR the affected circuit(s). CLEAR the

repair4less

 • **Are the resistances greater than 10,000 ohms?**	DTCs. TEST the system for normal operation.

P25 CHECK FOR CORRECT TCCM OPERATION
• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM. REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

P26 SHIFT THE TRANSFER CASE TO 4H MANUALLY • Remove the transfer case shift motor from the transfer case. • Using a wrench, rotate the shift cam to the 4H position. • Rotate the rear driveshaft and watch the front driveshaft. • **Does the transfer case shift to 4H and the front driveshaft rotates?**	**Yes** GO to P27. **No** REPAIR the transfer case. REFER to Section 308-07B.
P27 CHECK THE TORQUE REQUIRED TO SHIFT THE TRANSFER CASE • Rotate the shift cam by hand through 4L, 4H and 2H positions. • Measure the torque required to perform the shift. • **Is the torque required to shift 45 Nm (33 lb-ft) or less?**	**Yes** GO to P28. **No** REPAIR the transfer case. REFER to Section 308-07B.
P28 SHIFT THE TRANSFER CASE TO 2H MANUALLY • Rotate the shift cam to the 2H position. • Rotate the rear driveshaft and watch the front driveshaft. • **Does the transfer case shift to 2H and the front driveshaft does not rotate?**	**Yes** GO to P29. **No**

	REPAIR the transfer case. REFER to Section 308-07B .
P29 SHIFT THE TRANSFER CASE TO 4L MANUALLY • Rotate the shift cam by hand to the 4L position. • Rotate the rear driveshaft and watch the front driveshaft. • **Does the transfer case shift to 4L and the front driveshaft rotates?**	**Yes** INSTALL a new transfer case shift motor. REFER to Transfer Case Shift Motor in this section. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the transfer case. REFER to Section 308-07B .

Pinpoint Test Q: Four-Wheel Drive (4WD) Does Not Engage at Speed Correctly

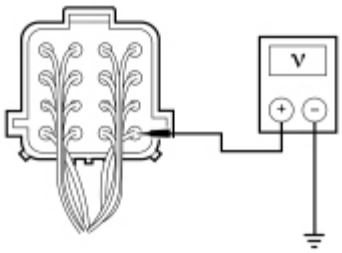
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

When the operator selects a transfer case mode from 2H mode, the TCCM engages a clutch for approximately 5 seconds to synchronize the front and rear driveshafts allowing a mechanical engagement of the transfer case. The TCCM also removes the ground path from the IWE solenoid, which removes vacuum from the IWEs , allowing them to engage the front axle shaft. Systematically check the necessary inputs and outputs at the TCCM , internal components of the transfer case, IWE components and drive axles.

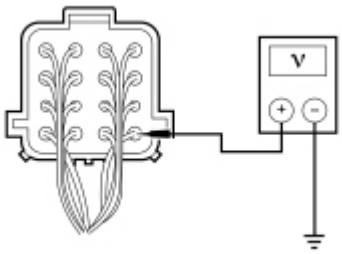
- DTC P1825:00 (4-Wheel Drive Clutch Relay Open Circuit: No Sub Type Information) — Fault sets when TCCM C2371B pin 1 detects an open circuit. The TCCM disables transfer case synchronization clutch operation.
- DTC P1826:00 (4-Wheel Drive Low Clutch Relay Circuit To Battery: No Sub Type Information) — Fault sets when TCCM C2371B pin 1 detects a short to voltage. Transfer case synchronization clutch operation, though disabled by the TCCM , is fully engaged when this DTC is present.
- DTC P1827:00 (4-Wheel Drive Low Clutch Relay Circuit To Ground) — Fault sets when TCCM C2371B pin 1 detects a short to ground. The TCCM disables transfer case synchronization clutch operation.

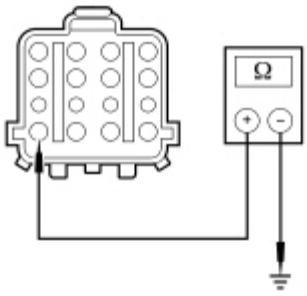
This pinpoint test is intended to diagnose the following:

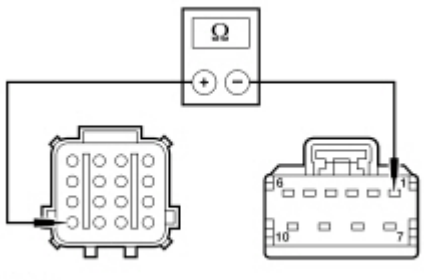


- Transfer case synchronization clutch
- Transfer case
- TCCM
- Front axle assembly
- Wiring, terminals or connectors

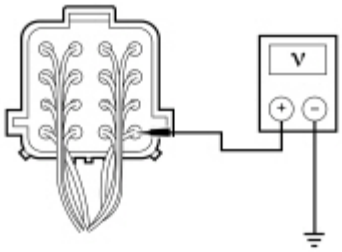
PINPOINT TEST Q: 4WD DOES NOT ENGAGE AT SPEED CORRECTLY

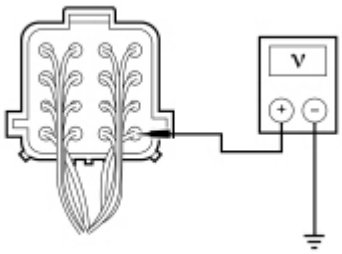






Test Step	Result / Action to Take





repair4less

Q1 RETRIEVE TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs retrieved?**	**Yes** For DTC P1825:00, GO to Q11. For DTC P1826:00, GO to Q13. For DTC P1827:00, GO to Q10. For all other DTCs, GO to the TCCM DTC Chart in this section. **No** GO to Q2.
Q2 CHECK 4X4 MODE ENGAGEMENT AT REST	
• Switch the Mode Select Switch (MSS) from 4X2 mode to 4X4 mode. • **Does 4X4 mode engage at rest correctly?**	**Yes** GO to Q3. **No** GO to Pinpoint Test N.
Q3 CHECK 4X2 MODE TO 4X4 MODE SHIFT AT SPEED	
• Switch the MSS to 4X2 mode. • Drive the vehicle and carry out a 4X2 mode to 4X4 mode shift while driving at approximately 16 km/h (10 mph). • Stop the vehicle, shift to 4X2 mode, drive the vehicle and carry out a 4X2 mode to 4X4 mode shift while driving at approximately 64 km/h (40 mph). • **Does 4X4 mode engage correctly at 16 km/h (10 mph) and at 64 km/h (40 mph)?**	**Yes** GO to Pinpoint Test U. **No** GO to Q4.
Q4 CHECK THE TCCM AVERAGE FRONT WHEEL SPEED (FRT_WHL_SPD) AND AVERAGE REAR WHEEL SPEED (REAR_WHL_SPD)	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the FRT_WHL_SPD and REAR_WHL_SPD PIDs while driving in a straight line. • **Do the FRT_WHL_SPD and REAR_WHL_SPD PIDs match?**	**Yes** GO to Q5. **No** REFER to Section 206-09 to diagnose the wheel speed sensor concern.
Q5 CHECK THE TRANSFER CASE CLUTCH LOCKUP USING TCCM 4WD PWM CLUTCH STATUS (4WD CLTCH_OUT) PID ACTIVE COMMAND	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Switch the MSS to AUTO mode. • Using the 4WD CLTCH_OUT active command, command the PID to 98%. • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	**Yes** GO to Q6. **No** GO to Q9.
Q6 CHECK THE TRANSFER CASE CLUTCH RELEASE USING TCCM 4WD PWM CLUTCH STATUS (4WD	

CLTCH_OUT) PID ACTIVE COMMAND	
• With the vehicle still in NEUTRAL and on a hoist, using the 4WD_CLTCH_OUT active command, command the transfer case clutch to 0%. • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	**Yes** GO to Q15 . **No** End the active command. GO to Q7 .
Q7 CHECK THE TRANSFER CASE ENGAGEMENT (ON A HOIST)	
• Start the engine, switch the MSS to 4X2 mode. • Place the transmission in DRIVE and increase speed to between 16 km/h (10 mph) and 24 km/h (15 mph). • While observing the front driveshaft, switch the MSS to 4X4 mode. • **Did the front driveshaft start to spin?**	**Yes** GO to Q8 . **No** GO to Q15 .
Q8 CHECK THE TRANSFER CASE DISENGAGEMENT	
• Switch the MSS to 4X2 mode while observing the front driveshaft. • **Does the front driveshaft rotate?**	**Yes** GO to Q15 . **No** GO to Pinpoint Test N .
Q9 CHECK CLUTCH CONTROL CIRCUIT FOR VOLTAGE USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) ACTIVE COMMAND	
• Using the 4WD_CLTCH_OUT active command, command the transfer case clutch to 98%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and the transfer case housing.  N0133480 • **Is the voltage greater than 9 volts?**	**Yes** END the active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. TEST the system for normal operation. **No** GO to Q10 .
Q10 CHECK THE TRANSFER CASE-TO-CHASSIS GROUND USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) ACTIVE COMMAND	
• Using the 4WD_CLTCH_OUT active command, command the transfer case clutch to 98%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and chassis ground.	**Yes** END the active command. REPAIR the transfer case ground connection between the transfer case and the chassis. CLEAR the DTCs. TEST the system for normal operation. **No**

repair4less

 N0133480 • **Is the voltage greater than 9 volts?**	GO to Q11 .
Q11 CHECK CLUTCH CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Transfer Case . • Disconnect: TCCM C2371B . • Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.  N0057998 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Q12 . **No** REPAIR circuit CCF03 (GY/BN). CLEAR the DTCs. TEST the system for normal operation.
Q12 CHECK CLUTCH CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Transfer Case (if not previously disconnected) . • Disconnect: TCCM C2371B (if not previously disconnected) . • Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN), harness side and TCCM C2371B-1, circuit CCF03 (GY/BN), harness side.  N0093126 • **Is the resistance less than 3 ohms?**	**Yes** GO to Q13 . **No** REPAIR circuit CCF03 (GY/BN). CLEAR the DTCs. TEST the system for normal operation.
Q13 CHECK CLUTCH CONTROL CIRCUIT FOR VOLTAGE USING THE TCCM 4WD PWM CLUTCH STATUS	

(4WD_CLTCH_OUT) PID ACTIVE COMMAND	
• Connect: Transfer Case . • Connect: TCCM C2371B . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Using the 4WD_CLTCH_OUT active command, command the transfer case clutch to greater than 10%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.  N0133480 • **Is any voltage present?**	**Yes** END the active command. GO to Q14 . **No** END the active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. TEST the system for normal operation.
Q14 CHECK CLUTCH CONTROL CIRCUIT FOR A SHORT TO VOLTAGE USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) ACTIVE COMMAND	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Using the 4WD_CLTCH_OUT active command, command the transfer case clutch to 0%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.  N0133480 • **Is any voltage present?**	**Yes** REPAIR circuit CCF03 (GY/BN). CLEAR the DTCs. TEST the system for normal operation. **No** GO to Q15 .
Q15 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated
	Yes
	INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at

repair4less

correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of connector or pin issue.

Pinpoint Test R: The Four-Wheel Drive (4WD) System Jumps Out of Gear

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A .

Normal Operation

When the 4WD system engages the user selected mode, that mode should be maintained. If the 4WD system does not stay in the selected mode, systematically check the 4WD system components.

This pinpoint test is intended to diagnose the following:

- IWE vent line(s)
- MSS
- Transfer case

PINPOINT TEST R: THE 4WD SYSTEM JUMPS OUT OF GEAR

Test Step	Result / Action to Take
R1 CHECK FOR OBSTRUCTED IWE VENT LINES • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • **NOTE:** The IWE vent port is the smaller of the 2 vacuum ports. • Disconnect the LH IWE line from the vent port. • Attach a hand vacuum pump to the IWE vent line. • Attempt to draw and hold a vacuum. • Connect the LH IWE line. • Disconnect the RH IWE line from the vent port. • Attempt to draw and hold a vacuum. • **Can a vacuum be held on either IWE vent line?**	**Yes** INSTALL new IWE vent lines as necessary. TEST the system for normal operation. **No** GO to R2 .
R2 CHECK THE TCCM 4WD SWITCH STATUS (4X4_SW) PID • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Drive the vehicle. • Monitor the 4X4_SW PID while driving the vehicle in each MSS position. **MSS Position** | **PID Status**	**Yes** GO to R3 . **No** GO to Pinpoint Test N .

2H	2-W Drive
4A	A4WD
4H	4W Auto/Hi
4L	4W Low

- **Does the PID always agree with the MSS position?**

R3 CHECK THE 4WD INDICATORS	
• Stop the vehicle. • Shift the transmission into the NEUTRAL position. • **NOTE:** 2H is indicated by the absence of 4X4 AUTO, 4H or 4L mode indicators in the IPC message center. • Observe the 4WD indicators in the IPC while cycling through each MSS position. • **Do the 4WD indicators match MSS switch positions?**	**Yes** GO to Pinpoint Test N . **No** GO to R4 .
R4 CHECK FOR TCCM DTCs	
• Shift the transmission into the PARK position. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** CHECK the transfer case fluid level. REFER to Section 308-07B . If the fluid level is OK, CHECK for internal transfer case faults. REFER to Section 308-07B . TEST the system for normal operation.

Pinpoint Test S: Vehicle Pulsates or Shudders in a Straight Line (Straightline Driveline Wind-up)

Normal Operation

In order for the 4WD system to function correctly, tires and wheels must be the same size, be in good condition and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST S: VEHICLE PULSATES OR SHUDDERS IN A STRAIGHT LINE (STRAIGHTLINE DRIVELINE WIND-UP)

NOTE: 4X4 is not intended for driving on hard/dry surfaces; using 4X4 mode while driving on these surfaces may produce noises like intermittent clunking, but will not damage driveline components.

repair4less

Test Step	Result / Action to Take
S1 VERIFY THE CONCERN • Drive the vehicle and shift from 2H mode to 4H mode. There should be minimal wind-up in 4H mode during straightline maneuvers (wind-up in turns is normal; 4H/4L is not intended for driving on hard/dry surfaces). • **Is excessive wind-up present?**	**Yes** GO to S2. **No** RETURN the vehicle to the customer. ADVISE about correct 4WD system operation and normal vehicle behavior.
S2 CHECK FOR MATCHING WHEEL AND TIRE SIZES • Check the wheel and tire sizes. • **Do the 4 wheels and tire sizes match?**	**Yes** GO to S3. **No** ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
S3 CHECK TIRE WEAR • Check each of the 4 tires for wear. • **Are the 4 tires worn evenly?**	**Yes** GO to S4. **No** ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly rotated tires to operate correctly.
S4 CHECK TIRE INFLATION PRESSURE • Check the inflation pressure in each tire. Refer to the Safety Certification Label on driver door or door pillar. • **Are the tire inflation pressures correct?**	**Yes** GO to S5. **No** ADJUST the tire pressure as necessary. TEST the vehicle for normal operation. ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
S5 CHECK THE FRONT AND REAR AXLE RATIOS • Check that front and rear axle ratios match. Refer to Section 205-00. • **Do the front and rear axle ratios match?**	**Yes** RETURN the vehicle to the customer and ADVISE about correct 4WD system usage and normal vehicle behavior. **No** CHECK the VC label. INSTALL the correct axle(s). REFER to Section 205-02A or Section 205-02B or Section 205-03. TEST the system for normal operation.

Pinpoint Test T: The Front Axle Makes Noise in 2H Mode Only and Generally Under Heavy Throttle

Refer to Wiring Diagrams Cell 34, Four-Wheel Drive Systems for schematic and connector information.

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A .

Normal Operation

In 2H mode, the TCCM provides a ground path to the IWE solenoid to supply vacuum to each IWE (disengaging the front hubs from the front axle). During certain conditions such as WOT maneuvers, manifold vacuum is lower than desired. To maintain uninterrupted IWE function in 2H, stored engine vacuum is sourced from the vacuum reservoir. A one-way check valve is implemented between the vacuum reservoir and the IWE solenoid to prevent the stored vacuum from escaping into the manifold during low engine vacuum conditions. For noise-free IWE operation under all conditions, the check valve must be operating correctly.

This pinpoint test is intended to diagnose the following:

- Vacuum leaks
- Vacuum check valve
- Vacuum reservoir
- IWE solenoid
- IWE

PINPOINT TEST T: THE FRONT AXLE MAKES NOISE IN 2H MODE ONLY AND GENERALLY UNDER HEAVY THROTTLE

Test Step	Result / Action to Take
T1 CHECK FOR GRINDING NOISES AT HIGH SPEEDS	**Yes** GO to T2 . **No** IDENTIFY the customer concern and GO to the Symptom Charts in this section.
WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury. • With the vehicle warm and the MSS in 2H mode, drive the vehicle at sustained WOT for 5 seconds. • **Is there a grinding noise from the axle system during WOT ?**	
T2 CHECK THE IWE SOLENOID OUTPUT VACUUM IN 2H	**Yes** GO to T7 . **No** GO to T3 .
• **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Disconnect the output vacuum line at the IWE solenoid while having the vacuum supply attached to the solenoid. • With the engine running and the in 2H mode, measure the vacuum at the output port of the solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	
T3 CHECK THE IWE SOLENOID INPUT VACUUM	**Yes** INSTALL a new IWE solenoid. TEST the system for normal operation. **No** GO to T4 .
• Disconnect the supply vacuum line at the IWE solenoid. • With the engine still running, measure the supply line vacuum to the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	

repair4less

T4 CHECK SOURCE VACUUM TO THE VACUUM RESERVOIR	
• Disconnect the source vacuum line from the vacuum reservoir. • With the engine still running, measure the source vacuum being supplied to the vacuum reservoir. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to T5 . **No** REPAIR or INSTALL a new source vacuum line. TEST the system for normal operation.
T5 CHECK THE VACUUM RESERVOIR	
• Ignition OFF. • Disconnect the vacuum line from the vacuum reservoir. • Connect a hand vacuum pump to the source vacuum port on the vacuum reservoir and apply 508 mm (20 in) Hg of vacuum. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to T6 . **No** INSTALL a new vacuum reservoir. TEST the system for normal operation.
T6 CHECK THE ONE-WAY VACUUM CHECK VALVE	
• **NOTE:** The check valve is between the IWE solenoid and the vacuum reservoir. • Connect the vacuum lines to the IWE solenoid. • Connect a hand vacuum pump to the IWE solenoid vacuum line at the vacuum reservoir and apply 508 mm (20 in) Hg of vacuum. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** Concern not present at this time. CARRY OUT the Four-Wheel Drive (4WD) System Functional Test. GO to Pinpoint Test u . **No** REPAIR or INSTALL new vacuum lines or INSTALL a new one-way check valve. TEST the system for normal operation.
T7 CHECK THE IWE VACUUM SYSTEM	
• Ignition OFF. • Disconnect both vacuum lines from the IWE solenoid. • Using a hand vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE system through the apply vacuum circuit. • Observe the vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** CONNECT the vacuum lines to the solenoid. GO to T11 . **No** GO to T8 .
T8 CHECK THE RH IWE LEAK RATE	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line from the larger port on the RH IWE . • Apply 508 mm (20 in) Hg of vacuum to the RH port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to T9 . **No** INSTALL a new RH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
T9 CHECK THE LH IWE LEAK RATE	
• Disconnect the vacuum line from the larger port at the LH IWE . • Apply 508 mm (20 in) Hg of vacuum to the LH port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to T10 . **No** INSTALL a new LH IWE . REFER to Integrated Wheel End (IWE) in

	this section. TEST the system for normal operation.
T10 CHECK THE IWE VACUUM SUPPLY TUBE • Disconnect both vacuum lines from the IWE solenoid. • Plug both LH and RH IWE vacuum lines. Apply 508 mm (20 in) Hg of vacuum to the IWE apply vacuum circuit and observe the vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to T11 . **No** INSTALL new vacuum lines as necessary. TEST the system for normal operation.
T11 CHECK THE IWE VACUUM SUPPLY AT EACH IWE IN 2H • Connect a hand-held vacuum gauge to the LH vacuum supply tube. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWE to engage and disengage. • Start the engine. • Switch the to 2H mode while observing the vacuum gauge. • Repeat these steps for the RH IWE . • **Are the vacuum readings greater than 254 mm (10 in) Hg?**	**Yes** GO to T12 . **No** INSTALL new vacuum lines as necessary. TEST the system for normal operation.
T12 CHECK THE LH IWE VACUUM LINE FOR AN OBSTRUCTION • Ignition OFF. • Disconnect both vacuum lines from the IWE solenoid. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line at the LH IWE . • Connect a hand vacuum pump to the LH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the hand vacuum pump draw a vacuum on the LH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. TEST the system for normal operation. **No** CONNECT the vacuum line to the LH IWE . GO to T13 .
T13 CHECK THE RH IWE VACUUM LINE FOR AN OBSTRUCTION • Disconnect the larger vacuum line at the RH IWE . • Connect a hand vacuum pump to the RH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the hand vacuum pump draw a vacuum on the RH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. TEST the system for normal operation. **No** CONNECT the vacuum line to the RH IWE . GO to T14 .
T14 CHECK THE LH IWE OPERATION • Ignition OFF. • Connect a hand vacuum pump with gauge to the larger port of the LH IWE . • Observe the LH halfshaft while rotating the LH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg of vacuum and release the vacuum to manually disengage and engage the LH IWE . • **Did the LH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	**Yes** GO to T15 . **No** INSTALL a new LH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
T15 CHECK THE RH IWE OPERATION	

repair4less

• Connect a hand vacuum pump with gauge to the larger port of the RH IWE . • Observe the RH halfshaft while rotating the RH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg of vacuum and release the vacuum to manually disengage and engage the RH IWE . • **Did the RH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	**Yes** GO to Pinpoint Test U . **No** INSTALL a new RH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.

Pinpoint Test U: Four-Wheel Drive (4WD) System Functional Test

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A .

Normal Operation

When operating in 4WD modes, the transfer case clutch is energized and both IWEs are locked. When in 4L mode, the transfer case low range gear set provides an additional 2.64 gear reduction. When operating in 2H mode, the transfer case clutch is de-energized and both IWEs are unlocked.

This pinpoint test is intended to diagnose the following:

- Transfer case and related components
- IWEs and related components
- Wheel/tire assemblies

PINPOINT TEST U: FOUR-WHEEL DRIVE (4WD) SYSTEM FUNCTIONAL TEST

NOTE: 4X4 High and 4X4 Low are not intended for driving on hard/dry surfaces; using these modes while driving on these surfaces may produce noises like intermittent clunking, but will not damage driveline components.

Test Step	Result / Action to Take
U1 CHECK 2H MODE OPERATION	
• Shift the transmission into the NEUTRAL position. • Switch the MSS to 2H mode. • **Are there any 4WD mode indicators present in the IPC message center?**	**Yes** GO to U2 . **No** GO to U4 .
U2 CHECK FOR TCCM DTCs	
• Shift the transmission into the PARK position. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs retrieved?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** GO to U3 .
U3 CHECK FOR WIND-UP IN 2H MODE	
• Drive the vehicle on a dry, hard surface while	**Yes**

executing turns. • **Is wind-up present in turns?**	GO to Pinpoint Test P . **No** GO to Pinpoint Test V .
U4 CHECK AUTO MODE OPERATION	
• Switch the MSS to 4A mode. • **Is the 4X4 auto (4A) mode indicator on in the IPC message center?**	**Yes** GO to U7 . **No** GO to U5 .
U5 CHECK FOR TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** GO to U6 .
U6 CHECK FOR WIND-UP IN 4A MODE	
• Drive the vehicle on a dry, hard surface, executing turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to U7 . **No** GO to U8 .
U7 CHECK THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the 4WD_CLTCH_OUT PID. • **Does the PID indicate 2 to 10% clutch application at closed throttle?**	**Yes** GO to U8 . **No** GO to U9 .
U8 CHECK FOR WIND-UP IN 4A MODE WITH 100% CLUTCH USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) ACTIVE COMMAND	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Command the 4WD_CLTCH_OUT to 100%. • Drive the vehicle on a dry, hard surface, executing turns. • **Is wind-up present in turns?**	**Yes** GO to U9 . **No** CHECK the transfer case. REFER to Section 308-07B .
U9 CHECK THE TCCM AVERAGE FRONT WHEEL SPEED (FRT_WHL_SPD) AND AVERAGE REAR WHEEL SPEED (REAR_WHL_SPD) PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the FRT_WHL_SPD and REAR_WHL_SPD PIDs. • Drive the vehicle 30 km/h (18 mph). • Record and compare the FRT_WHL_SPD and REAR_WHL_SPD PIDs. • **Do the FRT_WHL_SPD and REAR_WHL_SPD PID values match within 1.5 km/h (1 mph)?**	**Yes** GO to U10 . **No** VERIFY all 4 tires are the same size and brand. INSTALL new tires as necessary. If the tires are OK, CHECK the ABS. REFER to Section 206-09 and VERIFY that the 4 road tire sizes match. TEST the system for normal operation.

repair4less

U10 CHECK THE TCCM ABSOLUTE THROTTLE POSITION (TP_TCCM) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Ignition ON. • Monitor the TP_TCCM PID. • **NOTE:** The TP_TCCM PID is APP as communicated by the PCM via HS-CAN . • Slowly move throttle from closed throttle to WOT and observe the TP_TCCM PID. • **Does the TP_TCCM PID value vary between 0% at closed throttle and 100% at WOT ?**	**Yes** GO to U11 . **No** CHECK the APP sensor and/or the PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U11 CHECK 4H MODE OPERATION	
• Switch the MSS to 4H mode. • **Does the 4X4 (4H) indicator illuminate in the IPC message center correctly?**	**Yes** GO to U14 . **No** GO to U12 .
U12 CHECK FOR TCCM DTCs	
• Shift the transmission into the PARK position. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs retrieved?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** GO to U13 .
U13 CHECK FOR WIND-UP IN 4H MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test Q . **No** GO to Pinpoint Test O .
U14 CHECK FOR STRAIGHTLINE WIND-UP IN 4H MODE	
• Drive the vehicle on a dry, hard surface. • **Is straightline wind-up present?**	**Yes** GO to Pinpoint Test S . **No** GO to U15 .
U15 CHECK WIND-UP IN TURNS IN 4H MODE	
• Drive the vehicle in 4H mode while turning. • **Is wind-up present in turns?**	**Yes** GO to U16 . **No** GO to Pinpoint Test O .
U16 CHECK 4L MODE OPERATION	
• Bring the vehicle to a stop with the transmission in NEUTRAL, switch the MSS to 4L mode. • **Does the 4WD LOW (4L) indicator in the IPC message center illuminate correctly?**	**Yes** GO to U19 . **No** GO to U17 .
U17 CHECK FOR TCCM DTCs	

• Shift the transmission into the PARK position. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs retrieved?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** GO to U18 .
U18 CHECK FOR WIND-UP IN 4L MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test V . **No** GO to Pinpoint Test P .
U19 CHECK FOR WIND-UP IN TURNS IN 4L MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present and 4L mode functioning?**	**Yes** GO to U20 . **No** CHECK for DTCs. REFER to the Inspection and Verification procedure in this section. If no DTCs are present, GO to Pinpoint Test P .
U20 CHECK 4L MODE TO 2H MODE SHIFT	
• With the vehicle at a stop and transmission in NEUTRAL, switch the MSS from 4L mode to 2H mode. • **Are there any 4WD mode indicators present in the message center?**	**Yes** GO to U21 . **No** GO to U23 .
U21 CHECK FOR TCCM DTCs	
• Shift the transmission into the PARK position. • Release the brake pedal. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs retrieved?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** GO to U22 .
U22 CHECK FOR WIND-UP IN 2H MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test P . **No** GO to Pinpoint Test V .
U23 CHECK FOR TRANSFER CASE DISENGAGEMENT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate?**	**Yes** REFER to Section 308-07B . **No** GO to U24 .
U24 CHECK FOR LH AND RH DISENGAGEMENT	
NOTE: The engine must be at idle during the following steps to supply vacuum for IWE engagement/disengagement.	**Yes** GO to Pinpoint Test N . **No**

repair4less

• Start the engine and allow to idle. • Rotate the LF tire one revolution forward and one revolution backward while observing the LF halfshaft and U-joint. • Rotate the RF tire one revolution forward and one revolution backward while observing the RF halfshaft and U-joint. • **Does the LH or RH front halfshaft rotate?**	GO to U25.
U25 CHECK FOR VACUUM LEAKS	
• Ignition OFF. • Disconnect both vacuum lines from the IWE solenoid. • Using a hand vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE apply vacuum circuit. • Observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** CHECK the IWE and related components for leaks. GO to Pinpoint Test N. **No** GO to U26.
U26 CHECK 2H MODE TO 4H MODE SHIFT AT SPEED ABOVE 32 KM/H (20 MPH)	
• Switch the MSS to 2H mode. • Drive the vehicle on the road and shift from 2H mode to 4H mode while driving above 32 km/h (20 mph). • **Does the transfer case shift to 4H mode satisfactorily?**	**Yes** The 4WD system is functioning correctly. **No** GO to Pinpoint Test Q.

Pinpoint Test V: The 4X4 Mode Indicators Do Not Operate Correctly/Do Not Operate

Refer to Wiring Diagrams Cell 34, Four-Wheel Drive Systems for schematic and connector information.

Normal Operation

The 4WD system status is transmitted to the IPC from the TCCM through the HS-CAN to the 4WD indicator. A steady indicator displays if the vehicle is in 4X4 auto (4A), 4X4 (4H) or 4X4 low (4L). When in 2WD, the message center will display 4X2 for approximately 4 seconds, then the message center will no longer provide 4WD system indication until another shift mode is attained. A system fault condition will illuminate the powertrain malfunction indicator. The powertrain malfunction indicator includes other general powertrain system failures. For information about HS-CAN, refer to Section 418-00.

This pinpoint test is intended to diagnose the following:

- IPC
- 4WD system fault
- HS-CAN circuits
- TCCM

PINPOINT TEST V: THE 4X4 MODE INDICATORS DO NOT OPERATE CORRECTLY/DO NOT OPERATE

Test Step	Result / Action to Take
V1 CHECK FOR TCCM DTCs	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** GO to V2 .
V2 CHECK FOR IPC DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — IPC . • **Are DTCs present?**	**Yes** REFER to Section 413-01 . **No** GO to V3 .
V3 CHECK 4WD SYSTEM OPERATION	
• Test drive the vehicle and operate the 4WD system. • **Does the 4WD system operate correctly?**	**Yes** REFER to Section 413-01 . **No** GO to Symptom Chart - Four Wheel Drive (4WD) in this section.

Pinpoint Test W: Vehicle Binds in a Turn/Resists Turning/Pulsates in a Straightline in 4WD Mode

Normal Operation

When the vehicle is operating in 4WD modes, all 4 wheels receive the same amount of torque and rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the 4WD system to function correctly, each tire must be in good condition and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Throttle position failure
- Transfer case
- TCCM

PINPOINT TEST W: VEHICLE BINDS IN A TURN/RESISTS TURNING/PULSATES IN A STRAIGHTLINE IN 4WD MODE

NOTE: 4X4 is not intended for driving on hard/dry surfaces; using 4X4 mode while driving on these surfaces may produce noises like intermittent clunking, but will not damage driveline components.

Test Step	Result / Action to Take
W1 VERIFY THE CONCERN	
• Test drive the vehicle on a straight stretch of road in 4A mode. • Drive the vehicle through turns and parking lot maneuvers.	**Yes** If the problem occurs in 4A mode, GO to W2 ; If 4H mode or 4L mode, binding is a normal condition.

repair4less

• **Does the vehicle bind, pulsate or shudder?**	**No** GO to Pinpoint Test S .
W2 CHECK THE 4H AND 4L INDICATORS • Review the test drive notes. • **Did the 4X4 (4H) or 4X4 LOW (4L) or powertrain malfunction indicator (wrench light) illuminate in the IPC message center?**	**Yes** If the powertrain malfunction indicator (wrench light) illuminated, GO to W4 . If the 4H mode or 4L mode indicators illuminated, GO to W3 . **No** GO to W5 .
W3 VERIFY THE FAULT • Review the test drive notes. • **Was 4H mode or 4L mode selected when the 4H or 4L indicators were illuminated in the IPC message center?**	**Yes** The system is functioning correctly. **No** The fault may have been caused by an intermittent, uncommanded or autolock shift. TEST the system for normal operation. GO to Pinpoint Test S .
W4 CHECK FOR TCCM DTCs • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are DTCs retrieved?**	**Yes** REFER to the TCCM DTC Chart for diagnosis. **No** GO to W5 .
W5 VERIFY THE CONCERN WITH TRANSFER CASE CONNECTOR DISCONNECTED • Disconnect: Transfer Case . • Test drive the vehicle on a straight stretch of road and in turns, and shift the transfer case through each mode. Record any fault conditions. • **Is the concern present?**	**Yes** INSPECT the driveline components for damage or wear. REFER to Inspection and Verification in this section. TEST the system for normal operation. **No** GO to W6 .
W6 CHECK THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID • Connect: Transfer Case . • Using the scan tool, clear the DTCs. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the 4WD_CLTCH_OUT PID at closed throttle, KOEO . • Select 4H mode. • **Does the PID indicate 2 to 10% clutch application at closed throttle?**	**Yes** GO to W7 . **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.
W7 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs • Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module .	**Yes** GO to W8 .

• While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs:
  ▪ Left Front Wheel Speed Sensor (LF_WSPD)
  ▪ Left Rear Wheel Speed Sensor (LR_WSPD)
  ▪ Right Front Wheel Speed Sensor (RF_WSPD)
  ▪ Right Rear Wheel Speed Sensor (RR_WSPD)
• Compare the speedometer reading to the wheel speed sensor PIDs.
• **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**
	No
	VERIFY that the 4 road wheels are the same size and have similar tread depth. CHECK the ABS for faults. REFER to Section 206-09 . TEST the system for normal operation.

W8 CHECK THE TCCM ABSOLUTE THROTTLE POSITION (TP_TCCM) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • **NOTE:** The TP_TCCM PID is APP as communicated by the PCM via HS-CAN . • Slowly move accelerator pedal from closed throttle to and observe the TP_TCCM PID. • **Does the TP_TCCM PID value vary between 0% at closed throttle and 100% at WOT ?**	**Yes** GO to W9 . **No** DIAGNOSE the PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation.
W9 CHECK THE TRANSFER CASE FRONT DRIVESHAFT OUTPUT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the front driveshaft by hand. • **Does the front driveshaft rotate freely (does it require less than 45 Nm [33 lb-ft] to rotate)?**	**Yes** GO to W10 . **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.
W10 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test X: The Vehicle Does Not Shift Between 2H (2WD) and 4X4 Modes Correctly

repair4less

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

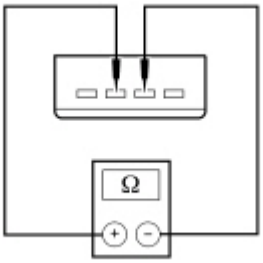
Normal Operation

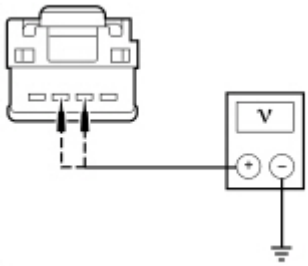
The MSS communicates the operator's choice to the TCCM . The TCCM then controls the transfer case synchronization clutch, transfer case motor and IWEs as necessary. If the vehicle is not responding as intended, systematically check the necessary inputs and outputs of the TCCM , components of the transfer case, IWE components and halfshafts. Check all circuits for opens and shorts to power or ground.

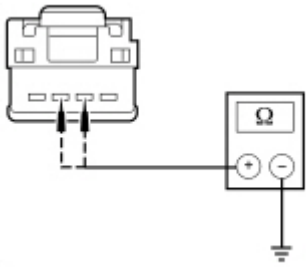
DTC Description	Fault Trigger Condition
• P1812:00 — 4-Wheel Drive Mode Select Circuit Failure: No Sub Type Information	Fault sets when TCCM C2371A pin 16 senses an open circuit. 4WD system mode cannot be changed.
• P1815:00 — 4-Wheel Drive Mode Select Short To Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 16 detects a short to ground. 4WD system mode cannot be changed.

This pinpoint test is intended to diagnose the following:

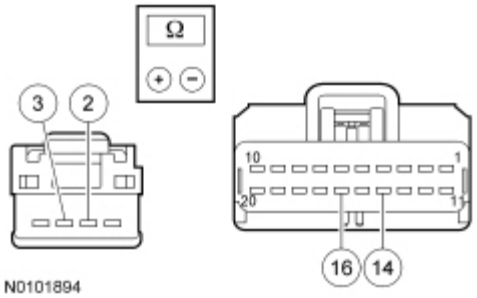
- Wiring, terminals or connectors
- MSS
- Transfer case
- TCCM

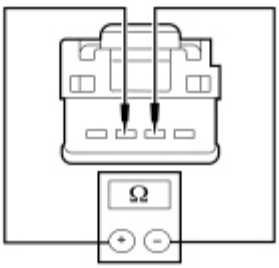






PINPOINT TEST X: THE VEHICLE DOES NOT SHIFT BETWEEN 2H (2WD) AND 4X4 MODES CORRECTLY





WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

Test Step	Result / Action to Take
X1 CHECK FOR TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** For DTC P1812:00, GO to X5 . For DTC P1815:00, GO to X7 . For all other DTCs, REFER to the DTC Chart in this section. **No** GO to X2 .
X2 CHECK THE TCCM IGNITION POSITION (KEY_POS_4X4) AND IGNITION STATUS (KEY_STATUS_4X4) PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the KEY_POS_4X4 and	**Yes** GO to X3 .

KEY_STATUS_4X4 PIDs while cycling through each position. • **Do the ignition PIDs match the ignition switch positions?**	**No** If the KEY_STATUS_4X4 PID did not match, CHECK BJB fuse 54 (5A). If the fuse is OK, REPAIR circuit CBB54 (VT/OG). If the fuse is not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. After the fault is repaired, CLEAR the DTCs. TEST the system for normal operation. If the KEY_POS_4X4 PID did not match, REFER to Section 211-05 to diagnose the ignition switch. After the fault is repaired, CLEAR the DTCs. TEST the system for normal operation.
X3 CHECK THE TCCM MODULE SUPPLY VOLTAGE (VBAT_4X4) PID • Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the VBAT_4X4 PID. • **Is the VBAT_4X4 PID greater than 12 volts?**	**Yes** GO to X4. **No** REFER to Section 414-00 to DIAGNOSE the low battery voltage and/or charging system concern. CLEAR the DTCs. TEST the system for normal operation.
X4 CHECK THE MSS POSITION MONITORING THE TCCM 4WD SWITCH STATUS (4X4_SW) PID • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the 4X4_SW PID while switching to each MSS position. • **Does the PID match the MSS position?**	**Yes** GO to X10. **No** GO to X5.
X5 CHECK THE MSS RESISTANCE VALUES • Ignition OFF. • Disconnect: MSS. • Measure the resistance between MSS C284 pins 2 and 3, component side, while rotating the MSS through all positions. Refer to the following chart. **MSS Position** / **Resistance (±1%)** 2H — 619 ohms 4A — 270 ohms 4H — 130 ohms 4L — 62 ohms	**Yes** GO to X6. **No** INSTALL a new MSS. REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. TEST the system for normal operation.

repair4less

 N0063005 • **Are the resistance values within specification?**	
X6 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR SHORT TO VOLTAGE	
• Disconnect: TCCM C2371A . • Ignition ON. • Measure the voltage between MSS C284-3, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-2, circuit CCF13 (WH/BU), harness side and ground.  A0092316 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation. **No** GO to X7 .
X7 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR SHORT TO GROUND	
• Ignition OFF. • Disconnect: TCCM C2371A . • Disconnect: MSS . • Measure the resistance between MSS C284-3, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-2, circuit CCF13 (WH/BU), harness side and ground.  A0092317 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X8 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation.
X8 CHECK THE MSS CONTROL AND RETURN	

CIRCUITS FOR AN OPEN	
• Disconnect: TCCM C2371A . • Measure the resistance between MSS C284, and TCCM C2371A, harness side. Refer to the following chart. **MSS** / **Circuit** / **TCCM** C284-3 / RCF13 (WH/BN) / C2371A-14 C284-2 / CCF13 (WH/BU) / C2371A-16  N0101894 • **Are the resistances less than 3 ohms?**	**Yes** GO to X9 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. TEST the system for normal operation.
X9 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Measure the resistance between MSS C284-3, circuit RCF13 (WH/BN), harness side and MSS C284-2, circuit CCF13 (WH/BU), harness side.  N0132538 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X10 . **No** REPAIR the affected circuit(s). CLEAR the DTCs.
X10 CHECK FOR CORRECT TCCM OPERATION	
• Ignition OFF. • Disconnect and inspect all TCCM connectors. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new terminals/pins ▪ pushed-out pins - install new pins as necessary • Connect all TCCM connectors. Make sure they are	**Yes** INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

repair4less

seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	ADDRESS the root cause of the connector or pin issues.

Four Wheel Drive (4WD) Systems — Electronic Shift

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3094-A	Test Light SGT27000 or equivalent 250-300 mA incandescent bulb test light
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The Electronic Shift-On-The-Fly (ESOF) system has 3 modes of operation: 2H (4X2), 4H (4X4 HIGH) and 4L (4X4 LOW). Integrated Wheel Ends (IWEs) are used at each front wheel to reduce rolling resistance when 2H is selected. The Transfer Case Control Module (TCCM) sends a duty cycle command to the synchronization coil which activates the clutch within the transfer case. Refer to Section 308-07B .

Engagement and disengagement of the front wheels is done by the IWEs . The IWEs are normally engaged (no vacuum). Vacuum is supplied to the IWEs by actuation of the IWE solenoid when commanded by the TCCM . When actuated, the IWE solenoid allows manifold vacuum to pass through to each IWE . The IWEs disengage and allow the front wheel hubs to be turned freely from the front axle.

The electric shift motor is mounted externally to the transfer case. It drives a rotary cam which moves the 2 shift forks in the transfer case to change between the 2H and 4H modes and between the 4H and 4L modes. For information on transfer case mechanical operation, refer to Section 308-07B . The TCCM directly controls the electric shift motor and can reverse motor polarity to reverse rotary cam/shift fork direction. The shift motor sense plate, an integral part of the shift motor assembly, informs the TCCM of the transfer case position.

repair4less

The transfer case is equipped with an electronically controlled clutch which is located inside the case. This clutch is used to synchronize the speed of the front driveline with the rear driveline during 2H to 4H shifts. When the Mode Select Switch (MSS) is switched between 2H and 4H modes, the TCCM energizes the synchronization clutch. When the transfer case front and rear output shafts are synchronized, the spring-loaded lockup collar mechanically engages (4H) or disengages (2H) the mainshaft hub to the drive sprocket. Finally, the front axle IWEs are engaged (4H) or disengaged (2H) and the synchronization clutch is deactivated.

Shifts from 2H mode to 4H mode can be made at any speed. The synchronization clutch is applied to equalize output shaft speeds before 4H mode is engaged. The following are the inputs and outputs needed by the TCCM to execute a change between these modes.

Feature inputs:

- Ambient air temperature from the PCM
- MSS
- Wheel speed signal from ABS module
- APP from PCM
- Transfer case shift motor contact plate position inputs A, B, C and D

Feature outputs:

- Transfer case electric shift motor outputs
- PWM signal to transfer case clutch
- 4WD message center and indicators

When shifting into or out of 4L mode, the TCCM requires the vehicle speed to be less than 5 km/h (3 mph) and the transmission in NEUTRAL. The following are the inputs and outputs needed by the TCCM to execute a change into or out of 4L mode.

Feature inputs:

- MSS
- Wheel speed signal from ABS module
- TR position from PCM
- Transfer case shift motor contact plate position inputs A, B, C and D

Feature outputs:

- Transfer case electric shift motor outputs
- PWM signal to transfer case clutch
- 4WD message center and indicators

Off-Road Mode

NOTE: Off-road mode is specifically calibrated for off-road driving conditions and should never be used on pavement.

The SVT Raptor comes equipped with a special off-road function. An off-road button is located on the floor console. A light on the button will illuminate when this feature is activated.

Off-road mode affects 4 vehicle functions:

- It allows unique transmission shifting that optimizes off-road performance. Off-road mode shifting differs from standard on-road shifting in several ways:
  - Transmission upshifts are delayed and occur less frequently. This ensures the best possible vehicle response and acceleration if the driver needs to briefly lift off the throttle to negotiate an obstacle or corner.
  - Transmission downshifts occur more quickly improving vehicle response.
  - Sixth gear (overdrive) will not engage. This prevents engine lugging (6.2L equipped vehicles only).
- Off-road mode provides optimized throttle response tailored for off-road performance driving.
- When off-road mode is engaged, the standard vehicle speed thresholds for the ELD are lifted and the ELD will remain locked until the operator manually disengages it with the control knob. If the operator disengages off-road mode and exceeds the standard ELD speed thresholds, the ELD will disengage.
- When off-road mode is engaged, the AdvanceTrac settings are altered for optimized off-road performance.

To engage off-road mode, slow the vehicle to a speed of 5 km/h (3 mph) or less. Release the accelerator pedal then press and release the off-road mode button. The message center will display OFF ROAD MODE ENABLED once off-road mode has been enabled. If any of the above conditions are not met, off-road mode will not enable and the message center will display information guiding the driver through the proper off-road mode enabling procedures. To disable off-road mode, press and release the off-road mode button. The message center will display EXITING OFF ROAD MODE.

The operator can engage the ELD per the following table:

Switch Position	Engage	Disengage	Re-engage
2H (off-road off) [a]	31 km/h (19 mph)	42 km/h (25 mph)	31 km/h (19 mph) [a]
2H (off-road on)	unlimited	unlimited	unlimited
4H (off-road on)	unlimited	unlimited	unlimited
4L (off-road on)	unlimited	unlimited	unlimited

[a] The 4WD system engages/re-engages at or below the speed noted.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

• Halfshafts
• IWEs
• Driveshaft and U-joints
• Vacuum leaks
• Fluid leaks
	• BJB fuses:
	  ▪ 20 (20A)
	  ▪ 29 (10A)
	  ▪ 54 (5A)
	  ▪ 68 (25A)

repair4less

• Matching tire sizes • Transfer case	• BCM fuse 34 (10A) (vehicles with ELD only) • Wiring, terminals or connectors • MSS • Synchronization clutch • IWE solenoid • Transfer case shift motor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The VCM LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record CMDTCs.

8. Carry out the self-test diagnostics for the TCCM.

9. If the DTCs retrieved are related to the concern, go to the TCCM DTC Chart in this section. For all other DTCs, refer to Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Four-Wheel Drive (4WD) System or GO to Symptom Chart - NVH.

DTC Charts

Transfer Case Control Module (TCCM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B12E0:11	Off Road Indicator: Circuit	GO to Pinpoint Test J.

	Short To Ground	
B12E0:12	Off Road Indicator: Circuit Short To Battery	GO to Pinpoint Test J .
B12E0:13	Off Road Indicator: Circuit Open	GO to Pinpoint Test J .
B12E5:00	Off Road Mode Select Switch: No Sub Type Information	GO to Pinpoint Test K .
B12E5:11	Off Road Mode Select Switch: Circuit Short To Ground	GO to Pinpoint Test K .
C1979:11	IWE Solenoid Circuit Failure: Circuit Short To Ground	GO to Pinpoint Test D .
C1979:12	IWE Solenoid Circuit Failure: Circuit Short To Battery	GO to Pinpoint Test D .
C1979:13	IWE Solenoid Circuit Failure: Circuit Open	GO to Pinpoint Test D .
P0562:00	System Voltage Low: No Sub Type Information	Go to Pinpoint Test M in 2-Speed Torque-On-Demand, Diagnosis and Testing, Section 308-07A .
P0563:00	System Voltage High: No Sub Type Information	Go to Pinpoint Test M in 2-Speed Torque-On-Demand, Diagnosis and Testing, Section 308-07A .
P1812:00	4-Wheel Drive Mode Select Circuit Failure: No Sub Type Information	GO to Pinpoint Test B .
P1815:00	4-Wheel Drive Mode Select Short To Ground: No Sub Type Information	GO to Pinpoint Test B .
P1825:00	4-Wheel Drive Clutch Relay Open Circuit: No Sub Type Information	GO to Pinpoint Test G .
P1826:00	4-Wheel Drive Low Clutch Relay Circuit To Battery: No Sub Type Information	GO to Pinpoint Test G .
P1827:00	4-Wheel Drive Low Clutch Relay Circuit To Ground: No Sub Type Information	GO to Pinpoint Test G .
P1839:00	Transfer Case Shift Motor Open Circuit: No Sub Type Information	GO to Pinpoint Test B .
P1840:00	Transfer Case Shift Motor Short Circuit To Battery: No Sub Type Information	GO to Pinpoint Test B .
P1841:00	Transfer Case Shift Motor Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test B .
P1849:00	Transfer Case Contact Plate 'A' Short Circuit To	GO to Pinpoint Test B .

repair4less

	Ground: No Sub Type Information	
P184A:00	Transfer Case Unable To Transition Between 4x2 and 4x4 Mode: No Sub Type Information	GO to Pinpoint Test B .
P184B:00	Transfer Case Unable To Transition Between 4x4 High and 4x4 Low Range: No Sub Type Information	GO to Pinpoint Test C .
P1853:00	Transfer Case Contact Plate 'B' Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test B .
P1857:00	Transfer Case Contact Plate 'C' Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test B .
P185A:00	Differential Lock-Up Input Switch Circuit High: No Sub Type Information	Go to Pinpoint Test Y in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P185B:00	Differential Lock-Up Indicator Circuit Low: No Sub Type Information	Go to Pinpoint Test Z in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P185C:00	Differential Lock-Up Indicator Circuit High: No Sub Type Information	Go to Pinpoint Test AA in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P185D:00	Differential Lock-Up Control Circuit Performance: No Sub Type Information	Go to Pinpoint Test AB in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P1861:00	Transfer Case Contact Plate 'D' Short Circuit To Ground: No Sub Type Information	GO to Pinpoint Test B .
P1867:00	Transfer Case Contact Plate General Circuit Failure: No Sub Type Information	GO to Pinpoint Test B .
P187C:00	Differential Lock-Up Control Circuit/Open: No Sub Type Information	Go to Pinpoint Test AC in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P187D:00	Differential Lock-Up Control Circuit Low: No Sub Type Information	Go to Pinpoint Test AC in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P187E:00	Differential Lock-Up Control Circuit High: No Sub Type Information	Go to Pinpoint Test AD in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
P1891:00	Transfer Case Contact Plate Ground Return Open Circuit: No Sub	GO to Pinpoint Test B .

	Type Information	
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	Go to Pinpoint Test AE in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	Go to Pinpoint Test AF in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
U0140:00	Lost Communication With Body Control Module (BCM): No Sub Type Information	Go to Pinpoint Test AG in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
U0418:00	Invalid Data Received From Brake System Control Module: No Sub Type Information	REFER to Section 206-09 to diagnose the wheel speed sensor concern.
U2300:54	Central Configuration: Missing Calibration	This DTC can set if one or more expected configuration data identifications is missing (gearbox type, axle ratio, tire circumference) from the BCM . CARRY OUT a self-test of the BCM . If BCM DTCs are present, REFER to Section 419-10 . If no BCM DTCs are present, CLEAR the DTCs. CARRY OUT a TCCM self-test. If U2300:54 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U2300:55	Central Configuration: Not Configured	This DTC can set upon TCCM power up only until all expected configuration data parameters (gearbox type, axle ratio, tire circumference) is received from the BCM . CARRY OUT a self-test of the BCM . If BCM DTCs are present, REFER to Section 419-10 . If no BCM DTCs are present, CLEAR the DTCs. CARRY OUT TCCM self-test. If U2300:55 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U2300:56	Central Configuration: Invalid / Incompatible Configuration	This DTC can set if one expected configuration data parameter is out of range (gearbox type, axle ratio, tire circumference) from the BCM . CARRY OUT a self-test of the BCM . If DTCs are present, REFER to Section 419-10 . If no BCM DTCs are present, CLEAR the DTCs. CARRY OUT a TCCM self-test. If U2300:56 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U2300:64	Central Configuration: Signal Plausibility Failure	This DTC can set if the expected axle ratio or tire circumference is out of range from the BCM . CARRY OUT a self-test of the BCM . If BCM DTCs are present, REFER to Section 419-10 . If no BCM DTCs are present, CLEAR the DTCs. CARRY OUT a TCCM self-test. If U2300:64 returns, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:04	Control Module: System Internal Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:04 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:41	Control Module: General Checksum Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:41 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:46	Control Module: Calibration / Parameter Memory Failure	CLEAR the DTC. REPEAT the self-test. If DTC U3000:46 is retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U3000:49	Control Module: Internal	CLEAR the DTC. REPEAT the self-test. If DTC U3000:49 is

repair4less

	Electronic Failure	retrieved, INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section.
U300D:11	Ignition Input On/Start: Circuit Short To Ground	GO to Pinpoint Test B .

Symptom Chart — Four-Wheel Drive (4WD) System

Symptom Chart — System

Condition	Possible Sources	Action
• No communication with the TCCM	• Scan tool • DLC • TCCM • Wiring, terminals or connectors	• REFER to Section 418-00 .
• The 4WD indicators do not operate correctly	• Wiring, terminals or connectors • 4WD system fault • IPC • TCCM	• GO to Pinpoint Test A .
• The vehicle does not shift between 2H and 4H modes correctly	• Wiring, terminals or connectors • MSS • Transfer case • Transfer case synchronization clutch • IWEs • IWE solenoid • TCCM • Front axle assembly	• GO to Pinpoint Test B .
• The vehicle does not shift between 4H and 4L modes correctly	• TR • Transmission drag torque • ABS wheel speed inputs • HS-CAN	• GO to Pinpoint Test C .
• The 4WD does not engage at speed correctly	• Transfer case synchronization clutch • Transfer case • TCCM • Front axle assembly • Wiring, terminals or connectors	• GO to Pinpoint Test G .
• The front axle does not engage/disengage correctly	• MSS • IWEs • IWE solenoid • Transfer case • Vacuum leaks	• GO to Pinpoint Test D .

	• Front axle assembly • TCCM • Wiring, terminals or connectors • Fuses	
• The transfer case jumps out of gear	• IWE vent line(s) • MSS • Transfer case	• GO to Pinpoint Test E .
• Unable to duplicate customer concern	• 4WD system and/or related components	• CARRY OUT the ESOF Functional Test. GO to Pinpoint Test I .
• Rear wheels binding when turning corners with the MSS in 2WD or OFF	• Wiring, terminals or connectors • ELD field coil • Differential	• Go to Pinpoint Test AD in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
• Off-road mode is inoperative	• Wiring, terminals or connectors • Off-road mode switch • TCCM	• GO to Pinpoint Test K .
• Off-road mode switch indicator is inoperative	• Wiring, terminals or connectors • Off-road mode switch • TCCM	• GO to Pinpoint Test J .
• Unable to achieve flat tow (neutral tow) mode	• Wiring, terminals or connectors • HS-CAN • IPC • TCCM • Door ajar switch • Ignition switch	• Go to Pinpoint Test AH in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Grinding noise during 4WD engagement, especially at high speeds	• Front halfshaft speeds not turning at the same speed • Synchronization clutch	• GO to Pinpoint Test B .

repair4less

• Vehicle pulsates or shudders in a straight line (straightline driveline wind-up)	• Unequal tire inflation pressures • Unmatched tire and wheel size • Unequal amounts of tire wear • Unmatched front and rear axle ratios	• GO to Pinpoint Test H .
• The front axle makes noise in 2H mode only and generally under heavy throttle	• Vacuum leaks • Vacuum check valve • Vacuum reservoir • IWE solenoid • IWEs	• GO to Pinpoint Test F .
• The transfer case makes noise	• Tire inflation pressure • Tire and wheel size	• MAKE SURE that all tires and wheels are the same size and that the inflation pressures are correct.
	• Tire tread wear	• CHECK tire tread wear to see if there is more than 0.15 mm (0.06 in) difference in tread wear between front and rear. INTERCHANGE one front wheel and one rear wheel. ROAD TEST again.
	• Internal components	• OPERATE the vehicle in all transmission gears. If there is noise in the transmission in NEUTRAL, or in some gears and not in others, REMOVE and REPAIR the transmission. REFER to Section 307-01 . If there is noise in all gears, DISASSEMBLE the transfer case. REFER to Section 308-07B . CHECK the planetary gears, the bearings, the upper and lower drive sprockets and drive chain for damage. INSTALL new parts as necessary.
	• Fluid level	• FILL with transfer case fluid. REFER to Section 308-07B .
• Transfer case whine — noise at all ranges	• Incorrect fluid level or fluid quality • Worn oil pump • Under-inflated or oversized tires	• CHECK that the transfer case is filled to the correct level and with the specified fluid. REFER to Section 308-07B . • DISASSEMBLE the transfer case. CHECK the oil pump for wear or damage. REPAIR as necessary. REFER to Section 308-07B . • CONFIRM that the tires and wheels are correct for the vehicle. CHECK that the tire inflation pressures are correct.
• Transfer case growl/rumble —	• Damaged or worn bearings or	• DISASSEMBLE the transfer case. CHECK the bearings or planetary

noise at all ranges	planetary gear	gear for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case scraping/grating — noise at all ranges	• Excessively stretched drive chain hitting the case	• DISASSEMBLE the transfer case. CHECK the drive chain for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum — noise at all ranges or 4WD only	• Worn or damaged sun (input) gear, clutch pack (intermediate) gear or output shaft gear	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .

Pinpoint Tests

Pinpoint Test A: The 4WD Indicators Do Not Operate Correctly

Refer to Wiring Diagrams Cell 34 , Four Wheel Drive System for schematic and connector information.

Normal Operation

Indicator status of the 4WD system is transmitted to the Instrument Panel Cluster (IPC) from the TCCM through the HS-CAN then displayed in the message center of the IPC . The message center displays 4X4 HIGH when in 4H and 4X4 LOW in 4L. When in 2H, the message center will display 4X2 for approximately 4 seconds then no longer provides 4WD system indication until another shift mode is attained. For information about HS-CAN , refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- 4WD system fault
- IPC
- TCCM

PINPOINT TEST A: THE 4WD INDICATORS DO NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
A1 CHECK FOR IPC DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — IPC . • **Are any DTCs present?**	**Yes** If DTC U0102:00 is retrieved, REFER to Section 418-00 to diagnose lost communication with TCCM . For all other IPC DTCs, REFER to Section 413-01 . **No** GO to A2 .

repair4less

A2 CHECK FOR TCCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section for diagnosis. **No** GO to A3 .
A3 CHECK THE TCCM IGNITION POSITION (KEY_POS_4X4) AND IGNITION STATUS (KEY_STATUS_4X4) PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the KEY_POS_4X4 and KEY_STATUS_4X4 PIDs while cycling through each position. • **Do the ignition PIDs match the ignition switch positions?**	**Yes** GO to A4 . **No** If the KEY_STATUS_4X4 PID did not match, CHECK BJB fuse 54 (5A). If the fuse is OK, REPAIR circuit CBB54 (VT/OG). If the fuse is not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. If the KEY_POS_4X4 PID did not match, REFER to Section 211-05 to diagnose the ignition switch.
A4 CHECK THE 4WD SYSTEM INDICATION IN 2H	
• Switch the MSS to 2H while monitoring the message center. • **Does 4X2 display in the message center for approximately 4 seconds?**	**Yes** GO to A5 . **No** GO to A6 .
A5 CHECK THE 4WD SYSTEM INDICATION IN 4H	
• Switch the MSS to 4H while monitoring the message center. • **Does 4X4 HIGH display in the message center?**	**Yes** GO to A8 . **No** GO to A9 .
A6 CHECK THE MSS USING THE TCCM 4WD SWITCH STATUS (4X4_SW) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the 4X4_SW PID while switching to each MSS position. • **Does the 4X4_SW PID match the MSS position?**	**Yes** GO to A7 . **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. TEST the system for normal operation.
A7 CHECK THE TCCM PIDs IN 2H	
• Enter the following diagnostic mode on the scan tool:	**Yes**

DataLogger — TCCM .
- Command the Transfer Case Shift Motor Position Sense Contact Plate Power Circuit Status (PLATE_PWR_OS) PID to energize the transfer case gearmotor encoder assembly.
- Monitor the Integrated Wheel Ends Output Control (IWE_OS) PID and the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs with the MSS in the 2H position.

MSS Position	Contact Plate Position			
	PLATE_A	PLATE_B	PLATE_C	PLATE_D
2H Mode	CLOSED	OPEN	CLOSED	CLOSED
4H Mode	OPEN	CLOSED	CLOSED	OPEN
4L Mode	OPEN	CLOSED	OPEN	CLOSED

- **Do the PIDs indicate the IWE solenoid is energized (PID status No) and that the shift motor is in 2H position?**

END the active command.
CHECK the IPC for faults.
REFER to Section 413-01 .

No
END the active command.
GO to Pinpoint Test B .

A8 CHECK THE 4WD SYSTEM INDICATION IN 4L

- **NOTE:** When shifting in or out of 4L, the transmission must be in NEUTRAL and the vehicle stopped or moving less than 5 km/h (3 mph).
- With the vehicle at a stop and transmission in NEUTRAL, switch the MSS to 4L while monitoring the message center.
- **Does the message center display 4X4 LOW ?**

Yes
The 4WD indicators are operating correctly. CARRY OUT the ESOF Functional Test. GO to Pinpoint Test I .

No
GO to A10 .

A9 CHECK THE TCCM PIDs IN 4H

- Switch the MSS to 4H.
- Enter the following diagnostic mode on the scan tool: DataLogger — TCCM .
- Command the Transfer Case Shift Motor Position Sense Contact Plate Power Circuit Status (PLATE_PWR_OS) PID to energize the transfer case gearmotor encoder assembly.
- Monitor the Integrated Wheel Ends Output Control (IWE_OS) PID and the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs with the MSS in the 4H position.

MSS Position	Contact Plate Position			
	PLATE_A	PLATE_B	PLATE_C	PLATE_D
2H Mode	CLOSED	OPEN	CLOSED	CLOSED
4H Mode	OPEN	CLOSED	CLOSED	OPEN
4L Mode	OPEN	CLOSED	OPEN	CLOSED

- **Do the PIDs indicate the IWE solenoid is de-energized (PID status Yes) and that the shift motor is in 4H position?**

Yes
END the active command.
CHECK the IPC for faults.
REFER to Section 413-01 .

No
END the active command.
GO to Pinpoint Test B .

A10 CHECK THE TCCM PIDs IN 4L

- Enter the following diagnostic mode on the scan tool: DataLogger — TCCM .
- Command the Transfer Case Shift Motor Position Sense

Yes
CHECK the IPC for faults.
REFER to Section 413-01 .

repair4less

Contact Plate Power Circuit Status (PLATE_PWR_OS) PID to energize the transfer case gearmotor encoder assembly. • Monitor the Integrated Wheel Ends Output Control (IWE_OS) PID and the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs with the MSS in the 4L position. **Contact Plate Position** **MSS Position** / **PLATE_A** / **PLATE_B** / **PLATE_C** / **PLATE_D** 2H Mode / CLOSED / OPEN / CLOSED / CLOSED 4H Mode / OPEN / CLOSED / CLOSED / OPEN 4L Mode / OPEN / CLOSED / OPEN / CLOSED • **Do the PIDs indicate the IWE solenoid is de-energized (PID status Yes) and that the shift motor is in 4L position?**	**No** END the active command. GO to Pinpoint Test C .

Pinpoint Test B: The Vehicle Does Not Shift Between 2H and 4H Correctly and/or Grinding Noise Heard During 4WD Engagement at High Speeds

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

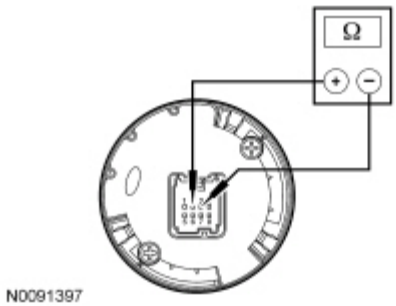
Normal Operation

The MSS communicates the operator's choice to the TCCM . The TCCM then controls the transfer case synchronization clutch, transfer case motor and IWEs as necessary. If the vehicle is not responding to the operator's intentions, systematically check the necessary inputs and outputs of the TCCM , components of the transfer case, IWE components and halfshafts. Check all circuits for opens and shorts to power or ground.

DTC Description	Fault Trigger Condition
• P1812:00 — 4-Wheel Drive Mode Select Circuit Failure: No Sub Type Information	Fault sets when TCCM C2371A pin 16 detects an open circuit or short to battery. Four-Wheel Drive (4WD) system mode cannot be changed.
• P1815:00 — 4-Wheel Drive Mode Select Short Circuit To Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 16 detects a short to ground. 4WD system mode cannot be changed.
• P1839:00 — Transfer Case Shift Motor Open Circuit: No Sub Type Information	Fault sets when TCCM C2371B pin 4 or 5 detects an open circuit. Shift motor moves are prevented when this DTC is set.
• P1840:00 — Transfer Case Shift Motor Short Circuit To Battery: No Sub Type Information	Fault sets when TCCM C2371B pin 4 or 5 detects a short to voltage. Shift motor moves are prevented when this DTC is set.
• P1841:00 — Transfer Case Shift Motor Short Circuit To Ground: No Sub Type Information	Fault sets when TCCM C2371B pin 4 or 5 detects a short to ground. Shift motor moves are prevented when this DTC is set.

• P1849:00 — Transfer Case Contact Plate 'A' Short Circuit To Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 1 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P184A:00 — Transfer Case Unable To Transition Between 4x2 and 4x4 Mode: No Sub Type Information	Fault sets when target shift motor position is not reached after the maximum number of allowed blocked shift retries for 2H to 4H or 4H to 2H. Requested shift motor position is not reached.
• P1853:00 — Transfer Case Contact Plate 'B' Short Circuit to Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 2 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P1857:00 — Transfer Case Contact Plate 'C' Short Circuit to Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 3 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P1861:00 — Transfer Case Contact Plate 'D' Short Circuit to Ground: No Sub Type Information	Fault sets when TCCM C2371A pin 4 detects a short to ground. Shift motor moves are prevented when this DTC is set. The TCCM will not complete mode change if a change in shift motor position is required.
• P1867:00 — Transfer Case Contact Plate General Circuit Failure: No Sub Type Information	Fault sets when an invalid shift motor position is detected during selection of a new 4WD mode or during a motor movement. If the shift motor is not moving, shift motor movement will be prevented. If the shift motor is moving when this DTC sets, the shift motor will move to the high-side or low-side mechanical stop position.
• P1891:00 — Transfer Case Contact Plate Ground Return Open Circuit: No Sub Type Information	Fault sets when TCCM C2371A pin 5 detects a short to ground, a short to voltage or open circuit. The TCCM will not complete mode change if a change in shift motor position is required.
• U300D:11 — Ignition Input On/Start: Circuit Short To Ground	Fault sets when TCCM C2371A pin 7 detects a short to ground.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- MSS
- Transfer case
- Transfer case synchronization clutch
- IWEs
- IWE solenoid
- TCCM
- Front axle assembly

PINPOINT TEST B: THE VEHICLE DOES NOT SHIFT BETWEEN 2H AND 4H CORRECTLY AND/OR GRINDING NOISE HEARD DURING 4WD ENGAGEMENT AT HIGH SPEEDS

WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

repair4less

Test Step	Result / Action to Take
B1 CHECK FOR TCCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** For DTC P184A:00, GO to B19. For DTC P1812:00, GO to B5. For DTC P1815:00, GO to B7. For DTC P1839:00, GO to B28. For DTC P1840:00, GO to B26. For DTC P1841:00, GO to B27. For DTC P1849:00, DTC P1853:00, DTC P1857:00, DTC P1861:00, GO to B21. For DTC P1867:00, GO to B4. For DTC P1891:00, GO to B20. For DTC U300D:11, GO to B2. For all other DTCs, REFER to the DTC Chart in this section. **No** GO to B2.
B2 CHECK THE TCCM IGNITION POSITION (KEY_POS_4X4) AND IGNITION STATUS (KEY_STATUS_4X4) PIDs • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the KEY_POS_4X4 and KEY_STATUS_4X4 PIDs while cycling through each ignition switch position. • **Do the ignition PIDs match the ignition switch positions?**	**Yes** GO to B3. **No** If the KEY_STATUS_4X4 PID did not match, CHECK BJB fuse 54 (5A). If the fuse is OK, REPAIR circuit CBB54 (VT/OG). If the fuse is not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. After the fault is repaired, CLEAR the DTCs. TEST the system for

	normal operation. If the KEY_POS_4X4 PID did not match, REFER to Section 211-05 to diagnose the ignition switch. After the fault is repaired, CLEAR the DTCs. TEST the system for normal operation.
B3 CHECK THE TCCM MODULE SUPPLY VOLTAGE (VBAT_4X4) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Start the engine and monitor the VBAT_4X4 PID. • **Is the VBAT_4X4 PID greater than 12 volts?**	**Yes** GO to B4 . **No** REFER to Section 414-00 to DIAGNOSE the low battery voltage and/or charging system concern. After the repair is complete, CLEAR the DTCs. TEST the system for normal operation.
B4 CHECK THE MSS POSITION MONITORING THE TCCM 4WD SWITCH STATUS (4X4_SW) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the 4X4_SW PID while switching to each MSS position. • **Does the 4X4_SW PID match the MSS position?**	**Yes** GO to B11 . **No** GO to B5 .
B5 CHECK THE MSS RESISTANCE VALUES	
• Ignition OFF. • Disconnect: MSS . • Measure the resistance between MSS C284 pins 2 and 3, component side, while rotating the MSS through all positions. Refer to the following chart. **MSS Position** / **Resistance** 2H — 606 - 632 ohms 4H — 265 - 275 ohms 4L — 127 - 133 ohms  N0091397	**Yes** GO to B6 . **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. TEST the system for normal operation.

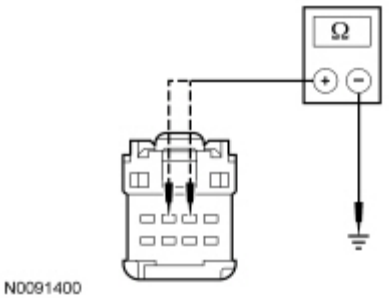
repair4less

- **Are the resistance values within specification?**

B6 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: TCCM C2371A .
- Ignition ON.
- Measure the voltage between MSS C284-2, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-3, circuit CCF13 (WH/BU), harness side and ground.

N0091399



- **Is any voltage present?**

Yes
REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation.

No
GO to B7 .

B7 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR SHORT TO GROUND

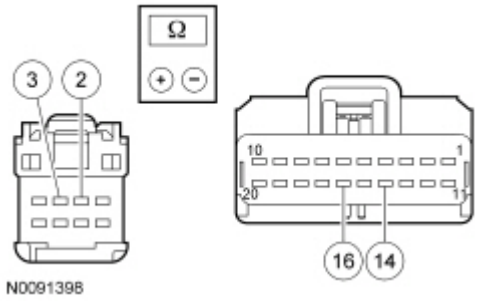
- Ignition OFF.
- Measure the resistance between MSS C284-2, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-3, circuit CCF13 (WH/BU), harness side and ground.

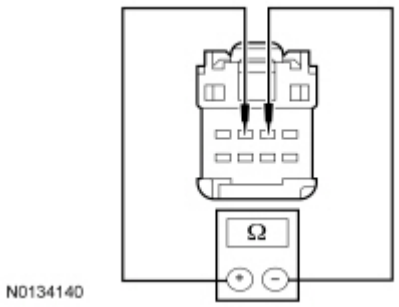
N0091400

- **Is the resistance greater than 10,000 ohms?**

Yes
GO to B8 .

No
REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation.





B8 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR AN OPEN

- Measure the resistance between MSS C284 and TCCM C2371A as shown below:

MSS	Circuit	TCCM
C284-2	RCF13 (WH/BN)	C2371A-14
C284-3	CCF13 (WH/BU)	C2371A-16

Yes
GO to B9 .

No
REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation.

 N0091398 • **Are the resistances less than 3 ohms?**	
B9 CHECK THE MSS CONTROL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Measure the resistance between MSS C284-2, circuit RCF13 (WH/BN), harness side and MSS C284-3, circuit CCF13 (WH/BU), harness side.  N0134140 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B10 . **No** REPAIR the affected circuit (s). CLEAR the DTCs.
B10 CHECK THE TCCM AVERAGE FRONT WHEEL SPEED (FRT_WHL_SPD) AND AVERAGE REAR WHEEL SPEED (REAR_WHL_SPD) PIDs	
• Connect: TCCM C2371A . • Connect: MSS . • Ignition ON. • Set the MSS to 2H. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the FRT_WHL_SPD and REAR_WHL_SPD PIDs with the vehicle stopped and while driving. • **Do the FRT_WHL_SPD and REAR_WHL_SPD PIDs match with the vehicle stopped and at all speeds?**	**Yes** GO to B11 . **No** REFER to Section 206-09 to diagnose the wheel speed concern. After the repair is complete, CLEAR the DTCs. TEST the system for normal operation.
B11 CHECK THE TCCM 4WD MODES (4WD_MODES) PID WITH THE MSS IN 4H	
• Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Set the MSS to 4H. • Monitor the 4WD_MODES PID. • **Does the 4WD_MODES PID indicate 4WD High?**	**Yes** GO to B14 . **No** GO to B12 .
B12 CHECK FOR 4H WIND-UP	
• Switch the MSS to 4H. • Drive the vehicle on a dry, hard surface in turns.	**Yes** GO to B15 .

repair4less

<table>
<tr><td>

- **Is wind-up present in turns?**

</td><td>

No
GO to B13 .

</td></tr>
<tr><td>

B13 CHECK FOR TRANSFER CASE ENGAGEMENT

- With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
- Rotate the rear driveshaft.
- Observe the front driveshaft.
- **Did the front driveshaft rotate?**

</td><td>

Yes
GO to B14 .

No
GO to B18 .

</td></tr>
<tr><td>

B14 CHECK FOR IWE ENGAGEMENT

- **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage.
- Start the engine.
- Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft and U-joint.
- Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft and U-joint.
- **Did both front halfshafts rotate?**

</td><td>

Yes
CHECK that all driveline fasteners are present and tightened to specification. REFER to Section 205-00 for further diagnosis of the front axle.

No
GO to Pinpoint Test D .

</td></tr>
<tr><td>

B15 CHECK THE TRANSFER CASE SHIFT TO 2H

- Ignition ON.
- Enter the following diagnostic mode on the scan tool: DataLogger — TCCM .
- Command the Transfer Case Contact Plate Power (PLATE_PWR_OS) PID to energize the transfer case gearmotor encoder assembly.
- Monitor the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs for the contact plate position with the MSS in the 2H position.

MSS Position	Contact Plate Position			
	PLATE_A	PLATE_B	PLATE_C	PLATE_D
2H Mode	CLOSED	OPEN	CLOSED	CLOSED
4H Mode	OPEN	CLOSED	CLOSED	OPEN
4L Mode	OPEN	CLOSED	OPEN	CLOSED

- **Do the PIDs and message center indicate that vehicle shifted into 2H (4X2) displayed in message center for approximately 4 seconds)?**

</td><td>

Yes
GO to B16 .

No
GO to B20 .

</td></tr>
<tr><td>

B16 CHECK FOR IWE DISENGAGEMENT

- With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
- Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft and U-joint.
- Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft and U-joint.
- **Did either of the front halfshafts rotate?**

</td><td>

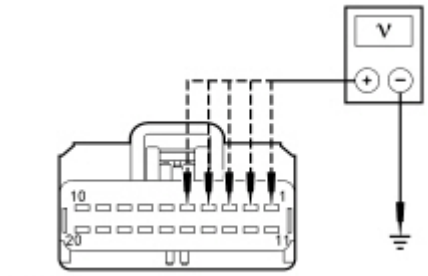
Yes
GO to Pinpoint Test D .

No
GO to B17 .

</td></tr>
<tr><td>

B17 CHECK FOR TRANSFER CASE DISENGAGEMENT

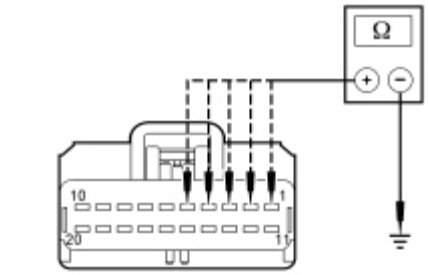
- Rotate the rear driveshaft while observing the front driveshaft.



</td><td>

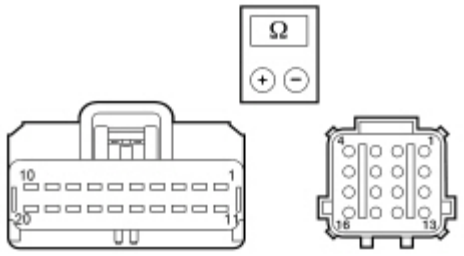
Yes

</td></tr>
</table>



• **Does the front driveshaft rotate?**	The system is functioning correctly. CARRY OUT the ESOF Functional Test. GO to Pinpoint Test I . **No** GO to B18 .
B18 CHECK THE TRANSFER CASE CONTACT PLATE POSITION PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Command the Transfer Case Contact Plate Power (PLATE_PWR_OS) PID to energize the transfer case gearmotor encoder assembly. • Monitor the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE C) and D (PLATE_D) PIDs for the contact plate position with the MSS in the 4H position. **MSS Position** / **Contact Plate Position**: **PLATE_A** / **PLATE_B** / **PLATE_C** / **PLATE_D** 2H Mode: CLOSED / OPEN / CLOSED / CLOSED 4H Mode: OPEN / CLOSED / CLOSED / OPEN 4L Mode: OPEN / CLOSED / OPEN / CLOSED • **Do the transfer case contact plate PIDs indicate 4H?**	**Yes** GO to B29 . **No** GO to B19 .
B19 CHECK THE TRANSFER CASE SHIFT MOTOR OPERATION	
• Remove the transfer case shift motor from the transfer case, leaving the wiring connector connected. • Observe the transfer case shift motor while switching the MSS from 2H to 4H. • **Does the transfer case shift motor rotate from the 2H position to the 4H position?**	**Yes** GO to B29 . **No** GO to B20 .
B20 CHECK TRANSFER CASE CONTACT PLATE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Transfer Case . • Disconnect: TCCM C2371A . • Ignition ON. • Measure the voltage between the following circuits at TCCM C2371A, harness side and ground: **Circuit** / **C2371A Pin** CCF14 (GN/OG) / 1 CCF15 (BN/YE) / 2 CCF16 (VT/GN) / 3 CCF17 (WH/OG) / 4 RCF09 (BN/WH) / 5	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation. **No** GO to B21 .

repair4less



N0091402

- **Is any voltage present?**

B21 CHECK TRANSFER CASE CONTACT PLATE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Transfer Case . • Disconnect: TCCM C2371A . • Measure the resistance between the following circuits at TCCM C2371A, harness side and ground: **Circuit** / **C2371A Pin** CCF14 (GN/OG) — 1 CCF15 (BN/YE) — 2 CCF16 (VT/GN) — 3 CCF17 (WH/OG) — 4 RCF09 (BN/WH) — 5  N0091403 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B22 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation.

B22 CHECK THE TRANSFER CASE CONTACT PLATE CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Transfer Case . • Disconnect: TCCM C2371A . • Measure the resistance of the following circuits between TCCM C2371A, harness side and transfer case C350, harness side: **C2371A Pin** / **Circuit** / **C350 Pin** 1 — CCF14 (GN/OG) — 5 2 — CCF15 (BN/YE) — 1	**Yes** GO to B23 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation.

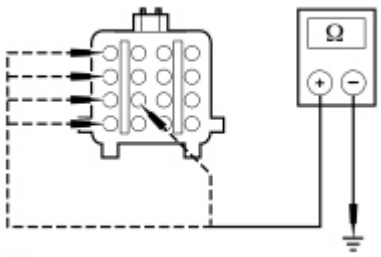
4	CCF17 (WH/OG)	13
5	RCF09 (BN/WH)	10



N0091401

- **Are the resistances less than 3 ohms?**

B23 CHECK THE SHIFT MOTOR FOR AN INTERNAL SHORT TO GROUND

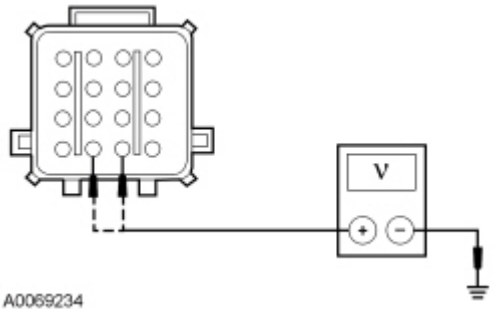
- Measure the resistance between transfer case C350 pins 1, 5, 9, 10 and 13, component side and ground.

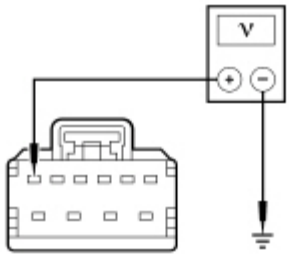
N0091404

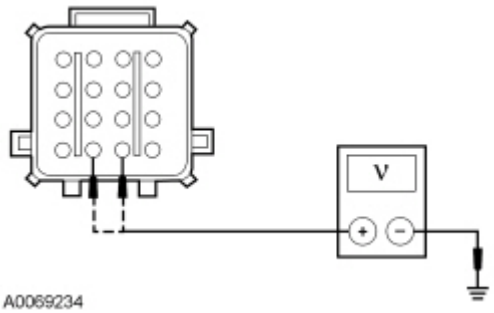
- **Are the resistances greater than 10,000 ohms?**

Yes
GO to B24 .

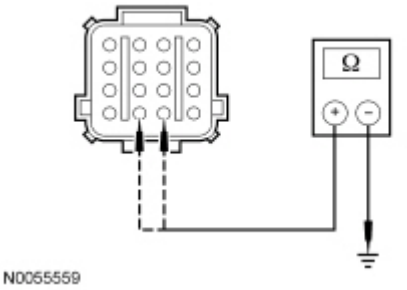
No
INSTALL a new transfer case shift motor. REFER to Transfer Case Shift Motor in this section. CLEAR the DTCs. REPEAT the self-test, if the concern is still present, GO to B30 .

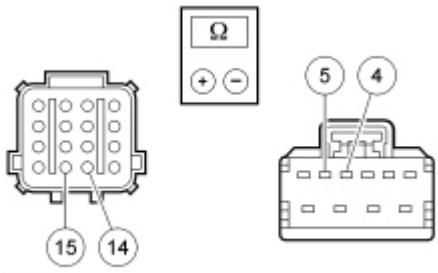






B24 CHECK THE SHIFT MOTOR CIRCUITS FOR POWER WHILE COMMANDING THE TCCM CW RELAY (CW_SMD_OS) AND CCW RELAY (CCW_SMD_OS) PIDs ON





- Ignition ON.
- Connect: TCCM C2371A .
- Enter the following diagnostic mode on the scan tool: DataLogger — TCCM .
- Command the CW_SMD_OS PID ON and OFF while measuring the voltage between transfer case C350-14, circuit CCF08 (GY/OG), harness side and ground. Then command the CCW_SMD_OS PID ON and OFF while measuring the voltage between transfer case C350-15, circuit CCF07 (BN/GN), harness side and ground.

Yes
GO to B29 .

No
GO to B25 .

repair4less

 A0069234 • **Are the voltages 9 volts or greater on the circuits when commanding the PIDs ON?**	
B25 CHECK THE TCCM VOLTAGE CIRCUIT	
• Ignition OFF. • Disconnect: TCCM C2371B . • Measure the voltage between TCCM C2371B-6, circuit SBB20 (GN/RD), harness side and ground.  N0091405 • **Is the voltage greater than 11 volts?**	**Yes** GO to B26 . **No** VERIFY BJB fuse 20 (20A) is OK. If OK, REPAIR circuit SBB20 (GN/RD). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR the DTCs. TEST the system for normal operation.
B26 CHECK THE TRANSFER CASE SHIFT MOTOR CIRCUITS FOR SHORT TO VOLTAGE	
• Ignition ON. • Disconnect: TCCM C2371B . • Disconnect: Transfer Case . • Measure the voltage between transfer case C350-14, circuit CCF08 (GY/OG), harness side and ground; and between transfer case C350-15, circuit CCF07 (BN/GN), harness side and ground.  A0069234 • **Is any voltage present?**	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation. **No** GO to B27 .
B27 CHECK THE TRANSFER CASE SHIFT MOTOR CIRCUITS FOR SHORT TO GROUND	
• Ignition OFF.	**Yes**

• Disconnect: TCCM C2371B . • Disconnect: Transfer Case . • Measure the resistance between transfer case C350-14, circuit CCF08 (GY/OG), harness side and ground; and between the transfer case C350-15, circuit CCF07 (BN/GN), harness side and ground.  N0055559 • **Are the resistances greater than 10,000 ohms?**	GO to B28 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. TEST the system for normal operation.
B28 CHECK THE TRANSFER CASE SHIFT MOTOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: TCCM C2371B . • Disconnect: Transfer Case . • Measure the resistance between transfer case C350 and TCCM C2371B as shown below: **Transfer Case** / **Circuit** / **TCCM** C350-14 / CCF08 (GY/OG) / C2371B-5 C350-15 / CCF07 (BN/GN) / C2371B-4  N0091406 • **Are the resistances less than 3 ohms?**	**Yes** GO to B29 . **No** REPAIR the affected circuit. CLEAR the DTCs. TEST the system for normal operation.
B29 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
	Yes
	INSTALL a new TCCM .
	REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No

repair4less

• Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.
B30 SHIFT THE TRANSFER CASE TO 4H MANUALLY	
• Remove the transfer case shift motor from the transfer case. • Using a wrench, rotate the shift cam to the 4H position. • Rotate the rear driveshaft and watch the front driveshaft. • **Does the transfer case shift to 4H and the front driveshaft rotates?**	**Yes** GO to B31 . **No** REPAIR the transfer case. REFER to Section 308-07B .
B31 CHECK THE TORQUE REQUIRED TO SHIFT THE TRANSFER CASE	
• Rotate the shift cam by hand through 4L, 4H and 2H positions. • Measure the torque required to perform the shift. • **Is the torque required to shift 45 Nm (33 lb-ft) or less?**	**Yes** GO to B32 . **No** REPAIR the transfer case. REFER to Section 308-07B .
B32 SHIFT THE TRANSFER CASE TO 2H MANUALLY	
• Rotate the shift cam to the 2H position. • Rotate the rear driveshaft and watch the front driveshaft. • **Does the transfer case shift to 2H and the front driveshaft does not rotate?**	**Yes** GO to B33 . **No** REPAIR the transfer case. REFER to Section 308-07B .
B33 SHIFT THE TRANSFER CASE TO 4L MANUALLY	
• Rotate the shift cam by hand to the 4L position. • Rotate the rear driveshaft and watch the front driveshaft. • **Does the transfer case shift to 4L and the front driveshaft rotates?**	**Yes** INSTALL a new transfer case shift motor. REFER to Transfer Case Shift Motor in this section. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the transfer case. REFER to Section 308-07B .

Pinpoint Test C: The Vehicle Does Not Shift Between 4H and 4L Modes Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

Normal Operation

The high-low shift occurs when the reduction shift fork moves the high-low collar to lock the planetary gear set to the output shaft. The torque transmitted through the sun gear from the input shaft turns the front planetary gear set assembly. The front planetary gear set assembly, now engaged, provides transfer case speed reduction. Certain criteria, such as vehicle speed and TR selection must be met before this shift can occur. Systematically check the necessary inputs and outputs of the TCCM , components of the transfer

case, IWE components and halfshafts.

- DTC P184B:00 (Transfer Case Unable To Transition Between 4x4 High and 4x4 Low Range) — Fault sets when target shift motor position is not reached after the maximum number of allowed blocked shift retries for 4H to 4L. Requested shift motor position is not reached.

This pinpoint test is intended to diagnose the following:

- TR
- Transmission drag torque
- ABS wheel speed inputs
- HS-CAN

PINPOINT TEST C: THE VEHICLE DOES NOT SHIFT BETWEEN 4H AND 4L MODES CORRECTLY

WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

Test Step	Result / Action to Take
C1 CHECK FOR TCCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** For DTC P184B:00, GO to C2. For all other DTCs, REFER to the TCCM DTC Chart in this section. **No** GO to Pinpoint Test B.
C2 CHECK THE 2H TO 4H SHIFT • Drive the vehicle and shift MSS from 2H to 4H. • **Does the vehicle shift between 2H and 4H correctly?**	**Yes** GO to C3. **No** GO to Pinpoint Test B.
C3 CHECK THE 4H TO 4L SHIFT • **NOTE:** When shifting in or out of 4L, the transmission must be in NEUTRAL and the vehicle stopped or moving less than 5 km/h (3 mph). • Drive the vehicle and shift MSS from 4H to 4L. • **Does the transfer case shift from 4H to 4L correctly and the complaint is related to a clunk noise during the shift?**	**Yes** Transmission neutral drag is excessive. REFER to Section 307-01 for transmission diagnosis. **No** GO to C4.
C4 CHECK THE TCCM NEUTRAL INDICATOR (NEUTRAL) AND ABS MODULE WHEEL SPEED PIDs • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • A. Monitor the NEUTRAL PID while shifting the transmission through gear ranges. • Enter the following diagnostic mode on the scan tool:	**Yes** If all 5 PIDs are accurate, GO to Pinpoint Test B. **No** **A.** REFER to Section 307-01 for

repair4less

DataLogger — ABS Module .
• B. Monitor the wheel speed PIDs:
  ▪ Left Front Wheel Speed Sensor (LF_WSPD)
  ▪ Left Rear Wheel Speed Sensor (LR_WSPD)
  ▪ Right Front Wheel Speed Sensor (RF_WSPD)
  ▪ Right Rear Wheel Speed Sensor (RR_WSPD)
• **A. Does the NEUTRAL PID indicate True when the transmission is shifted to NEUTRAL?**
 	
B. Do the wheel speed PIDs indicate 0 km/h (0 mph)?
	further diagnosis of the TR sensor.
	
	B. REFER to Section 206-09 for further diagnosis of the ABS system.

Pinpoint Test D: The Front Axle Does Not Engage/Disengage Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A .

Normal Operation

In 2H mode, the TCCM supplies a ground path to the IWE solenoid to apply vacuum to the IWEs (disengaging the front hubs from the front axle). In 4H or 4L modes, the TCCM does not supply the ground path to the IWE solenoid, vacuum is not applied to IWEs the and an internal spring in the IWEs keeps the hubs engaged.

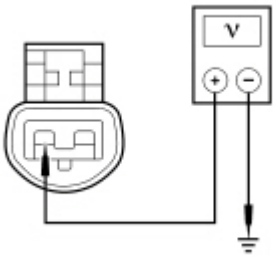
- DTC C1979:11 (IWE Solenoid Circuit Failure: Short Circuit To Ground) — Fault sets when TCCM C2371A pin 6 detects a short to ground. Fault results in IWEs hubs disengaged all the time.
- DTC C1979:12 (IWE Solenoid Circuit Failure: Short Circuit To Battery) — Fault sets when TCCM C2371A pin 6 detects a short to voltage. Fault results in IWEs hubs engaged all the time.
- DTC C1979:13 (IWE Solenoid Circuit Failure: Circuit Open) — Fault sets when TCCM C2371A pin 6 detects an open circuit. Fault results in IWEs hubs engaged all the time.

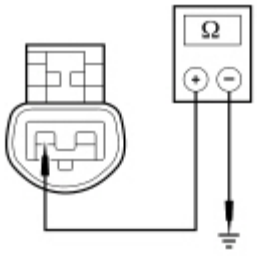
This pinpoint test is intended to diagnose the following:

- MSS
- IWEs
- IWE solenoid
- Transfer case
- Vacuum leaks
- Front axle assembly
- TCCM
- Wiring, terminals or connectors
- Fuses

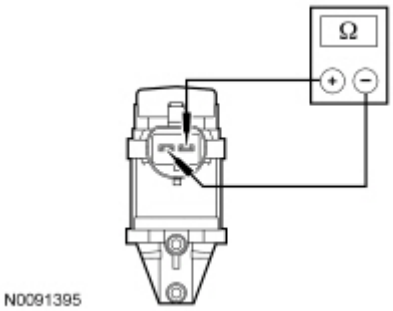
PINPOINT TEST D: THE FRONT AXLE DOES NOT ENGAGE/DISENGAGE CORRECTLY

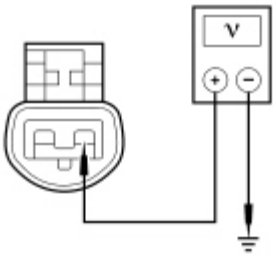
WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

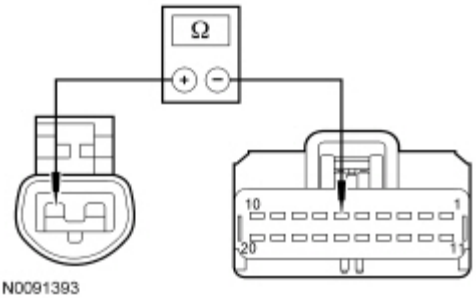




Test Step	Result / Action to Take
D1 CHECK FOR TCCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** For DTC C1979:11, GO to D19 . For DTC C1979:12, GO to D18 . For DTC C1979:13, GO to D20 . For all other DTCs, REFER to the TCCM DTC Chart in this section. **No** GO to D2 .
D2 CHECK FOR GRINDING NOISES AT HIGH SPEEDS • With the vehicle warm and the MSS in 2H mode, drive the vehicle at sustained WOT for 5 seconds. • **Is there a grinding noise from the axle system during WOT ?**	**Yes** GO to Pinpoint Test F . **No** GO to D3 .
D3 CHECK TCCM OPERATION • Ignition ON. • Monitor the 4X4 indicator on the IPC while moving the MSS between 2H and 4H modes. • **Does the 4X4 indicator illuminate when the MSS is in the 4H position and turn off when the MSS is in the 2H position?**	**Yes** GO to D4 . **No** GO to Pinpoint Test B .
D4 CHECK THE IWE DISENGAGEMENT **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Place the MSS in 2H. • Start the engine. • Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft. • Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft. • **Did either front halfshaft rotate?**	**Yes** GO to D8 . **No** GO to D5 .
D5 CHECK THE IWE ENGAGEMENT • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • With the engine running, place the MSS in 4H. • Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft. • Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft. • **Did both front halfshafts rotate?**	**Yes** The front axle is operating properly at this time. CARRY OUT the ESOF Functional Test. GO to Pinpoint Test I . **No** GO to D6 .
D6 CHECK THE IWE SOLENOID OUTPUT IN 4H • Disconnect the output vacuum line at the IWE solenoid. • With the engine running and the MSS In 4H, measure the	**Yes** The IWE is mechanically stuck in







repair4less

vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	the disengaged position. INSTALL a new IWE on the halfshaft(s) that did not rotate. REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation. **No** GO to D7.
D7 CHECK THE IWE SOLENOID	
• Ignition OFF. • Disconnect: IWE Solenoid . • Start the engine. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** GO to D20. **No** INSTALL a new IWE solenoid. TEST the system for normal operation.
D8 CHECK THE IWE SOLENOID OUTPUT VACUUM IN 2H	
• Disconnect the output vacuum line at the IWE solenoid. • With the engine running and the MSS in 2H, measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to D11. **No** GO to D9.
D9 CHECK THE IWE SOLENOID INPUT VACUUM	
• Disconnect the supply vacuum line at the IWE solenoid. • With the engine running, measure the supply line vacuum to the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to D20. **No** GO to D10.
D10 CHECK THE VACUUM RESERVOIR	
• Ignition OFF. • With the source vacuum line still disconnected, connect a vacuum pump to the vacuum port on the vacuum reservoir and apply 508 mm (20 in) Hg of vacuum. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** REPAIR or INSTALL new vacuum lines or INSTALL a check valve. TEST the system for normal operation. **No** INSTALL a new vacuum reservoir. TEST the system for normal operation.
D11 CHECK THE IWE VACUUM LINES	
• Ignition OFF. • Disconnect the output vacuum line from the IWE solenoid. • Disconnect and plug the LH and RH IWE vacuum lines at the IWEs. • Connect a vacuum pump to the IWE output vacuum circuit at the IWE solenoid connection. Apply 508 mm (20 in) Hg of vacuum and observe the vacuum reading. • **Does the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** GO to D14. **No** GO to D12.
D12 CHECK THE LH IWE VACUUM LINE FOR AN OBSTRUCTION	
• REMOVE the plug from the vacuum line at the LH IWE.	**Yes**

• Connect a hand vacuum pump to the LH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the LH IWE vacuum line?**	INSTALL a new vacuum line. CLEAR the DTCs. TEST the system for normal operation. **No** GO to D13.
D13 CHECK THE RH IWE VACUUM LINE FOR AN OBSTRUCTION	
• REMOVE the plug from the vacuum line at the RH IWE. • Connect a vacuum pump to the RH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the RH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. CLEAR the DTCs. TEST the system for normal operation. **No** GO to D14.
D14 CHECK THE RH IWE LEAK RATE	
• Apply 508 mm (20 in) Hg of vacuum to the RH IWE port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to D15. **No** INSTALL a new RH IWE. REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
D15 CHECK THE RH IWE OPERATION	
• Connect a vacuum pump with gauge to the larger port of the RH IWE. • Observe the RH halfshaft while rotating the RH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg of vacuum and release the vacuum to manually disengage and engage the RH IWE. • **Did the RH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	**Yes** CONNECT the vacuum line to the RH IWE. GO to D16. **No** INSTALL a new RH IWE. REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
D16 CHECK THE LH IWE LEAK RATE	
• Disconnect the vacuum line from the larger port at the LH IWE. • Apply 508 mm (20 in) Hg of vacuum to the LH IWE port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to D17. **No** INSTALL a new LH IWE. REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
D17 CHECK THE LH IWE OPERATION	
• Connect a vacuum pump with gauge to the larger port of the LH IWE. • Observe the LH halfshaft while rotating the LH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg of vacuum and release the vacuum to manually disengage and engage the LH IWE. • **Did the LH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	**Yes** CONNECT the vacuum line to the LH IWE. GO to D18. **No** INSTALL a new LH IWE. REFER to Integrated Wheel End (IWE) in this section. CLEAR the DTCs. TEST the system for normal operation.

repair4less

D18 CHECK THE IWE SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IWE Solenoid . • Disconnect: TCCM C2371A . • Ignition ON. • Measure the voltage between IWE solenoid C1291-2, circuit CCF05 (BN/BU), harness side and ground.  N0091392 • **Is any voltage present?**	**Yes** REPAIR circuit CCF05 (BN/BU). CLEAR the DTCs. TEST the system for normal operation. **No** GO to D19 .
D19 CHECK THE IWE SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IWE Solenoid C1291 . • Disconnect: TCCM C2371A . • Measure the resistance between solenoid C1291-2, circuit CCF05 (BN/BU), harness side and ground.  N0091394 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D20 . **No** REPAIR circuit CCF05 (BN/BU). CLEAR the DTCs. TEST the system for normal operation.
D20 CHECK THE IWE SOLENOID RESISTANCE	
NOTE: If the temperatures (either ambient or in the engine compartment) are exceptionally high, a higher than normal resistance reading could result. A lower temperature could result in a lower resistance reading. • Measure the resistance between IWE solenoid C1291 pins 1 and 2, component side.	**Yes** GO to D21 . **No** INSTALL a new IWE solenoid. CLEAR the DTCs. TEST the system for normal operation.

 N0091395 • **Is the resistance between 44 and 70 ohms?**	
D21 CHECK FOR VOLTAGE TO THE IWE SOLENOID	
• Ignition OFF. • Disconnect: IWE Solenoid . • Measure the voltage between IWE solenoid C1291-1, circuit SBB29 (GY/RD), harness side and ground.  N0091391 • **Is the voltage greater than 11 volts?**	**Yes** GO to D22 . **No** CHECK BJB fuse 29 (10A). If OK, REPAIR circuit SBB29 (GY/RD). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR the DTCs. TEST the system for normal operation.
D22 CHECK THE IWE SOLENOID CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: IWE Solenoid . • Disconnect: TCCM C2371A . • Measure the resistance between IWE solenoid C1291-2, circuit CCF05 (BN/BU), harness side and TCCM C2371A-6, circuit CCF05 (BN/BU), harness side.  N0091393 • **Is the resistance less than 3 ohms?**	**Yes** GO to D23 . **No** REPAIR circuit CCF05 (BN/BU). CLEAR the DTCs. TEST the system for normal operation.
D23 CHECK FOR CORRECT TCCM OPERATION	
• Ignition OFF. • Disconnect and inspect all TCCM connectors. • Repair: ▪ corrosion (install new connector or terminals - clean	**Yes** INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the

repair4less

module pins) ■ damaged or bent pins - install new terminals/pins ■ pushed-out pins - install new pins as necessary • Connect all TCCM connectors. Make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test E: The Transfer Case Jumps Out of Gear

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A .

Normal Operation

Once the 4WD system engages the user selected mode, that mode should be maintained. If the 4WD system does not stay in the selected position systematically check the 4WD system components.

This pinpoint test is intended to diagnose the following:

- Integrated Wheel Ends (IWEs) vent line(s)
- MSS
- Transfer case

PINPOINT TEST E: THE TRANSFER CASE JUMPS OUT OF GEAR

WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

Test Step	Result / Action to Take
E1 CHECK FOR OBSTRUCTED IWE VENT LINES	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • **NOTE:** The IWE vent port is the smaller of the 2 vacuum ports. • Disconnect the LH IWE line from the vent port. • Attach a vacuum pump to the IWE vent line and attempt to hold a vacuum. • Disconnect the RH IWE line from the vent port. • Attach a vacuum pump to the IWE vent line and attempt to hold a vacuum. • **Can a vacuum be held on either IWE vent line?**	**Yes** INSTALL new IWE vent lines as necessary. TEST the system for normal operation. **No** GO to E2 .
E2 VERIFY THE CONCERN	
	Yes

• Drive the vehicle and attempt to duplicate the concern. • **Is the concern an uncommanded range shift (in or out of low range)?**	GO to E5. **No** GO to E3.
E3 CHECK THE MSS POSITION MONITORING THE TCCM 4WD SWITCH STATUS (4X4_SW) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Drive the vehicle. • Dynamically monitor the 4X4_SW PID while driving the vehicle in each shift position. • **Does the 4X4_SW PID always agree with the switch position?**	**Yes** GO to E4. **No** GO to Pinpoint Test B.
E4 CHECK FOR TCCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section. **No** CARRY OUT the ESOF Functional Test. GO to Pinpoint Test I.
E5 CHECK THE 4WD INDICATORS	
• Stop the vehicle. • Transmission in NEUTRAL. • Depress the brake pedal. • Observe the 4WD indication in the message center while cycling through each MSS position. • **Does the 4WD indicator(s) match the MSS?**	**Yes** GO to E6. **No** GO to Pinpoint Test A.
E6 CHECK FOR TCCM DTCs	
• Transmission in PARK. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section. **No** CHECK the transfer case fluid level. REFER to Section 308-07B. If the fluid level is OK, CHECK for internal transfer case faults. REFER to Section 308-07B.

Pinpoint Test F: The Front Axle Makes Noise in 2H Mode Only and Generally Under Heavy Throttle

Refer to Wiring Diagrams Cell 34, Four-Wheel Drive Systems for schematic and connector information.

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A.

Normal Operation

In 2H mode, the TCCM provides a ground path to the IWE solenoid to supply vacuum to each IWE (disengaging the front hubs from the front axle). During certain conditions such as WOT maneuvers,

repair4less

manifold vacuum is lower than desired. To maintain uninterrupted IWE function in 2H mode, stored engine vacuum is sourced from the vacuum reservoir. A one-way check valve is implemented between the manifold and IWE solenoid/vacuum reservoir to prevent the stored vacuum from escaping into the manifold during low engine vacuum conditions. For noise-free IWE operation under all conditions, the check valve must be operating correctly.

This pinpoint test is intended to diagnose the following:

- Vacuum leaks
- Vacuum check valve
- Vacuum reservoir
- IWE solenoid
- IWEs

PINPOINT TEST F: THE FRONT AXLE MAKES NOISE IN 2H MODE ONLY AND GENERALLY UNDER HEAVY THROTTLE

 **WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.**

Test Step	Result / Action to Take
F1 CHECK FOR GRINDING NOISES AT HIGH SPEEDS	
• With the vehicle warm and the MSS in 2H mode, drive the vehicle at sustained WOT for 5 seconds. • **Is there a grinding noise from the axle system during WOT ?**	**Yes** GO to F2 . **No** IDENTIFY the customer concern and GO to Symptom Chart - Four-Wheel Drive (4WD) System or GO to Symptom Chart - NVH in this section.
F2 CHECK THE IWE SOLENOID OUTPUT VACUUM IN 2H	
• **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Start the engine. • Disconnect the output vacuum line at the IWE solenoid while having the vacuum supply attached to the solenoid. • With the engine running and the transfer case in 2H mode, measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to F7 . **No** GO to F3 .
F3 CHECK THE IWE SOLENOID INPUT VACUUM	
• Disconnect the supply vacuum line at the IWE solenoid. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • With the engine still running, measure the supply line vacuum to the IWE solenoid.	**Yes** INSTALL a new IWE solenoid. TEST the system for normal operation. **No** GO to F4 .

• **Is the vacuum greater than 254 mm (10 in) Hg?**	
F4 CHECK SOURCE VACUUM TO THE VACUUM RESERVOIR	
• Disconnect the source vacuum line from the vacuum reservoir. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • With the engine still running, measure the source vacuum being supplied to the vacuum reservoir. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to F5 . **No** REPAIR or INSTALL a new source vacuum line. TEST the system for normal operation.
F5 CHECK THE VACUUM RESERVOIR	
• Ignition OFF. • Disconnect the vacuum line from the vacuum reservoir. • Connect a vacuum pump to the source vacuum port on the vacuum reservoir and apply 508 mm (20 in) Hg of vacuum. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to F6 . **No** INSTALL a new vacuum reservoir. TEST the system for normal operation.
F6 CHECK THE VACUUM CHECK VALVE	
• **NOTE:** The check valve is between the vacuum source and the IWE solenoid and vacuum reservoir. • Connect the vacuum lines to the IWE solenoid. • Connect a vacuum pump to the IWE solenoid vacuum line at the vacuum reservoir and apply 508 mm (20 in) Hg of vacuum. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** Concern not present at this time. CARRY OUT the ESOF Functional Test. GO to Pinpoint Test I . **No** REPAIR or INSTALL new vacuum lines or INSTALL a new check valve. TEST the system for normal operation.
F7 CHECK THE IWE VACUUM SYSTEM	
• Ignition OFF. • Disconnect both vacuum lines from the IWE solenoid. • Using a vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE system through the apply vacuum circuit. • Observe the vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** CONNECT the vacuum lines to the IWE solenoid. GO to F11 . **No** GO to F8 .
F8 CHECK THE RH IWE LEAK RATE	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line from the larger port on the RH IWE . • Apply 508 mm (20 in) Hg of vacuum to the RH IWE port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to F9 . **No** INSTALL a new RH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
F9 CHECK THE LH IWE LEAK RATE	
• Disconnect the vacuum line from the larger port at the LH IWE . • Apply 508 mm (20 in) Hg of vacuum to the LH IWE	**Yes** GO to F10 .

repair4less

port and observe vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**No** INSTALL a new LH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
F10 CHECK THE IWE VACUUM SUPPLY TUBE	
• Disconnect both vacuum lines from the IWE solenoid. • Plug both LH and RH IWE vacuum lines. Apply 508 mm (20 in) Hg of vacuum to the IWE apply vacuum circuit and observe the vacuum reading. • **Does the vacuum maintain or drop less than 25 mm (1 in) Hg per minute?**	**Yes** GO to F11 . **No** INSTALL new vacuum lines as necessary. TEST the system for normal operation.
F11 CHECK THE IWE VACUUM SUPPLY AT EACH IWE IN 2H	
• Connect the vacuum lines to the IWE solenoid. • Connect a hand-held vacuum gauge to the LH IWE vacuum supply tube. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Start the engine. • Switch the MSS to 2H mode while observing the vacuum gauge. • Repeat these steps for the RH IWE . • **Are the vacuum readings greater than 254 mm (10 in) Hg?**	**Yes** GO to F12 . **No** INSTALL new vacuum lines as necessary. TEST the system for normal operation.
F12 CHECK THE LH IWE VACUUM LINE FOR AN OBSTRUCTION	
• Ignition OFF. • Disconnect both vacuum lines from the IWE solenoid. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line at the LH IWE . • Connect a hand vacuum pump to the LH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the LH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. TEST the system for normal operation. **No** CONNECT the vacuum line to the LH IWE . GO to F13 .
F13 CHECK THE RH IWE VACUUM LINE FOR AN OBSTRUCTION	
• Disconnect the larger vacuum line at the RH IWE . • Connect a vacuum pump to the RH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the RH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. TEST the system for normal operation. **No** CONNECT the vacuum line to the RH IWE . GO to F14 .
F14 CHECK THE LH IWE OPERATION	
• Connect a vacuum pump with gauge to the larger port of the LH IWE . • Observe the LH halfshaft while rotating the LH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg	**Yes** GO to F15 . **No**

of vacuum and release the vacuum to manually disengage and engage the LH IWE . • **Did the LH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	INSTALL a new LH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.
F15 CHECK THE RH IWE OPERATION	
• Connect a vacuum pump with gauge to the larger port of the RH IWE . • Observe the RH halfshaft while rotating the RH front tire. Apply between 152 and 203 mm (6 to 8 in) Hg of vacuum and release the vacuum to manually disengage and engage the RH IWE . • **Did the RH IWE disengage between 152 and 203 mm (6 to 8 in) Hg and engage when the vacuum is released?**	**Yes** CARRY OUT the ESOF Functional Test. GO to Pinpoint Test I . **No** INSTALL a new RH IWE . REFER to Integrated Wheel End (IWE) in this section. TEST the system for normal operation.

Pinpoint Test G: The 4WD Does Not Engage at Speed Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

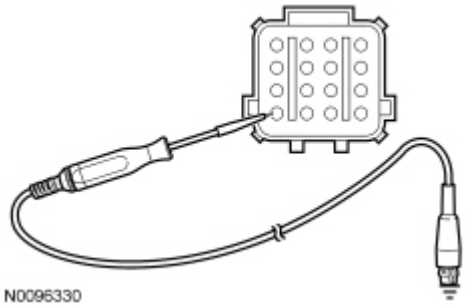
Normal Operation

When the operator selects a transfer case mode from 2H mode, the Transfer Case Control Module (TCCM) engages the synchronization clutch for approximately 5 seconds to synchronize the front and rear driveshafts allowing a further mechanical engagement of the transfer case. The TCCM also removes the ground path from the IWE solenoid, which removes vacuum from the IWEs , allowing them to engage. Systematically check the necessary inputs and outputs at the TCCM , internal components of the transfer case, IWE components and drive axles.

- DTC P1825:00 (4-Wheel Drive Clutch Relay Open Circuit: No Sub Type Information) — Fault sets when TCCM C2371B pin 1 detects an open circuit. The TCCM disables transfer case synchronization clutch operation.
- DTC P1826:00 (4-Wheel Drive Low Clutch Relay Circuit To Battery: No Sub Type Information) — Fault sets when TCCM C2371B pin 1 detects a short to voltage. Transfer case synchronization clutch operation, though disabled by the TCCM , is fully engaged when this DTC is present.
- DTC P1827:00 (4-Wheel Drive Low Clutch Relay Circuit To Ground) — Fault sets when TCCM C2371B pin 1 detects a short to ground. The TCCM disables transfer case synchronization clutch operation.

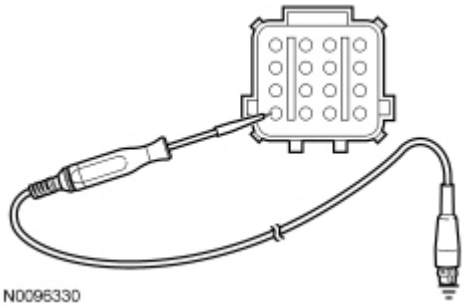
This pinpoint test is intended to diagnose the following:

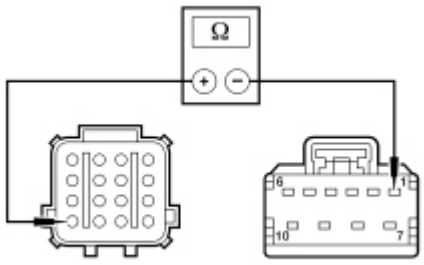
- Transfer case synchronization clutch
- Transfer case
- TCCM
- Front axle assembly
- Wiring, terminals or connectors

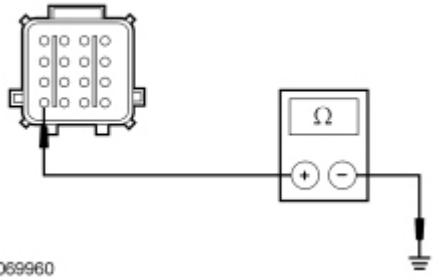


PINPOINT TEST G: THE 4WD DOES NOT ENGAGE AT SPEED CORRECTLY

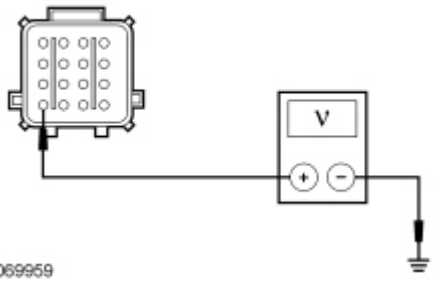
WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in

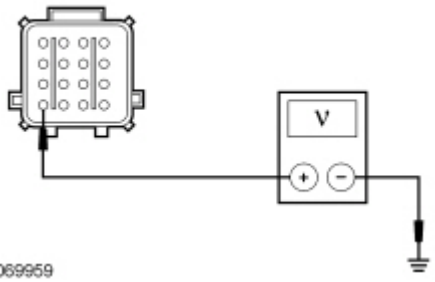






repair4less





personal injury.

Test Step	Result / Action to Take
G1 CHECK FOR TCCM DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** For DTC P1825:00, GO to G7. For DTC P1826:00, GO to G12. For DTC P1827:00, GO to G10. For all other DTCs, REFER to the TCCM DTC Chart for diagnosis. **No** GO to G2.
G2 CHECK 4H ENGAGEMENT AT REST • Switch the MSS from 2H to 4H. • Confirm 4H engagement by driving the vehicle and check for wind-up in turns. • **Does 4H engage at rest correctly?**	**Yes** GO to G3. **No** GO to Pinpoint Test B.
G3 CHECK 2H TO 4H SHIFT AT SPEED • Switch the MSS to 2H. • Drive the vehicle and carry out a 2H to 4H shift while driving approximately at 16 km/h (10 mph). • Stop the vehicle, shift to 2H, drive the vehicle and carry out a 2H to 4H shift while driving at approximately 64 km/h (40 mph). • **Does 4H engage correctly (or much better) at 16 km/h (10 mph) than at 64 km/h (40 mph)?**	**Yes** GO to Pinpoint Test D. **No** GO to G4.
G4 CHECK THE TCCM AVERAGE FRONT WHEEL SPEED (FRT_WHL_SPD) AND AVERAGE REAR WHEEL SPEED (REAR_WHL_SPD) PIDs • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM. • Monitor the FRT_WHL_SPD and REAR_WHL_SPD PIDs while driving in a straight line. • **Do the FRT_WHL_SPD and REAR_WHL_SPD PIDs match?**	**Yes** GO to G5. **No** REFER to Section 206-09 to diagnose the wheel speed sensor concern.
G5 CHECK THE TRANSFER CASE SYNCHRONIZATION CLUTCH LOCK-UP USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID • Ignition ON. • Switch the MSS to 4H. • Active command the 4WD_CLTCH_OUT PID to 98%. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02. • Remove the transfer case shift motor from the transfer case, leaving the electrical connector connected.	**Yes** GO to G6. **No** GO to G7.

• Using a wrench, shift the transfer case shift cam to 2H. • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	
G6 CHECK THE TRANSFER CASE SYNCHRONIZATION CLUTCH RELEASE USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID • Active command the 4WD_CLTCH_OUT PID to 0%. • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	**Yes** GO to G11 . **No** END the active command. GO to G7 .
G7 CHECK FOR VOLTAGE TO THE TRANSFER CASE SYNCHRONIZATION CLUTCH USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID ***NOTICE:* The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Transfer Case . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Active command the 4WD_CLTCH_OUT PID at 98%.  N0096330 • Connect a 12-volt incandescent test light between transfer case C350-16, circuit CCF03 (GY/BN), harness side and the transfer case housing. • **Does the test light illuminate?**	**Yes** END the active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. TEST the system for normal operation. **No** GO to G8 .
G8 CHECK THE TRANSFER CASE CHASSIS GROUND USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID ***NOTICE:* The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Active command the 4WD_CLTCH_OUT PID at 98%.	**Yes** END the active command. REPAIR the transfer case ground connection between the transfer case and the chassis. CLEAR the DTCs. TEST the system for normal operation.

repair4less

 N0096330 • Connect a 12-volt incandescent test light between transfer case C350-16, circuit CCF03 (GY/BN), harness side and chassis ground. • **Does the test light illuminate?**	**No** END the active command. GO to G9 .
G9 CHECK THE TRANSFER CASE SYNCHRONIZATION CLUTCH CONTROL CIRCUIT FOR AN OPEN	
• Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN), harness side and TCCM C2371B-1, circuit CCF03 (GY/BN), harness side.  N0093126 • **Is the resistance less than 3 ohms?**	**Yes** GO to G10 . **No** REPAIR circuit CCF03 (GY/BN). CLEAR the DTCs. TEST the system for normal operation.
G10 CHECK THE TRANSFER CASE SYNCHRONIZATION CLUTCH CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: TCCM C2371B . • Disconnect: Transfer Case . • Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.  A0069960 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G13 . **No** REPAIR circuit CCF03 (GY/BN) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
G11 CHECK THE TRANSFER CASE SYNCHRONIZATION CLUTCH CONTROL CIRCUIT FOR VOLTAGE USING THE TCCM 4WD PWM CLUTCH STATUS (4WD_CLTCH_OUT) PID	

• Ignition OFF. • Disconnect: Transfer Case . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Active command the 4WD_CLTCH_OUT PID 98%.  A0069959 • Measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground. • **Is any voltage present?**	**Yes** END the active command. GO to G12 . **No** END the active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. TEST the system for normal operation.
G12 CHECK THE TRANSFER CASE SYNCHRONIZATION CLUTCH CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: Transfer Case . • Disconnect: TCCM C2371B . • Ignition ON. • Measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.  A0069959 • **Is any voltage present?**	**Yes** REPAIR circuit CCF03 (GY/BN). CLEAR the DTCs. TEST the system for normal operation. **No** GO to G13 .
G13 CHECK TRANSFER CASE SYNCHRONIZATION CLUTCH • Ignition OFF. • Measure the resistance between transfer case C350-16, component side and the transfer case housing. • **Is the resistance between 1-3 ohms?**	**Yes** GO to G14 . **No** INSTALL a new transfer case synchronization clutch. REFER to Transfer Case Disassembly and Assembly in Section 308-07B . CLEAR the DTCs. TEST the system for normal operation.
G14 CHECK FOR CORRECT TCCM OPERATION	

repair4less

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM. REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

Pinpoint Test H: Vehicle Pulsates or Shudders in a Straight Line (Straightline Driveline Wind-up)

Normal Operation

In order for the 4WD system to function correctly, tires and wheels must be the same size, be in good condition and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:

- Unequal tire inflation pressures
- Unmatched and wheel size
- Unequal amounts of tire wear
- Unmatched front and rear axle ratios

PINPOINT TEST H: VEHICLE PULSATES OR SHUDDERS IN A STRAIGHT LINE (STRAIGHTLINE DRIVELINE WIND-UP)

WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

NOTE: 4X4 high/low (4H/4L) is not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
H1 VERIFY THE CONCERN	
• Drive the vehicle and shift from 2H to 4H. There should be minimal wind-up in 4H mode during straight line maneuvers (wind-up in turns is normal; 4X4 high/low is not intended for driving on hard/dry surfaces). • **Is excessive wind-up present?**	**Yes** GO to H2. **No** RETURN the vehicle to the customer. ADVISE about correct system operation and normal vehicle behavior.
H2 CHECK FOR MATCHING WHEEL AND TIRE	

SIZES	
• Check the wheel and tire sizes. • **Do the 4 wheel and tire sizes match?**	**Yes** GO to H3 . **No** ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
H3 CHECK TIRE WEAR	
• Check each of the 4 tires for wear. • **Are the 4 tires worn evenly?**	**Yes** GO to H4 . **No** ADVISE the customer that Four-Wheel Drive (4WD) systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
H4 CHECK TIRE INFLATION PRESSURE	
• Check the inflation pressure in each tire. Refer to VC label. • **Are the tire inflation pressures correct?**	**Yes** GO to H5 . **No** ADJUST the tire pressure as necessary. TEST the vehicle for normal operation. ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
H5 CHECK THE FRONT AND REAR AXLE RATIOS	
• Check that front and rear axle ratios match. Refer to Section 205-00 . • **Do the front and rear axle ratios match?**	**Yes** RETURN the vehicle to the customer and ADVISE about correct 4WD usage and normal vehicle behavior. **No** CHECK the vehicle VC label. INSTALL the correct axle(s). REFER to Section 205-00 .

Pinpoint Test I: Electronic Shift-On-The-Fly (ESOF) Functional Test

Locator views for the vacuum lines and vacuum reservoir are located in Description and Operation. Refer to Section 308-07A .

Normal Operation

When operating in 4H or 4L mode, the transfer case and both IWEs are locked. When in 4L mode, the transfer case low range gear set provides an additional 2.64 gear reduction. When operating in 2H mode, the transfer case and both IWEs are unlocked.

This pinpoint test is intended to diagnose the following:

- 4WD system and/or related components

repair4less

PINPOINT TEST I: ESOF FUNCTIONAL TEST

WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

NOTE: 4X4 high/low (4H/4L) is not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
I1 CHECK FOR IPC DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — IPC. • **Are any DTCs present?**	**Yes** If DTC U0102:00 is retrieved, REFER to Section 418-00 to diagnose lost communication with TCCM. For all other DTCs, REFER to Section 413-01. **No** GO to I2.
I2 CHECK 2H OPERATION • Switch the MSS to 2H while monitoring the message center. • **Does the message center display 4X2 for approximately 4 seconds?**	**Yes** GO to I5. **No** GO to I3.
I3 CHECK FOR TCCM DTCs • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section. **No** GO to I4.
I4 CHECK FOR WIND-UP IN 2H • Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test B. **No** GO to I5.
I5 CHECK 4H OPERATION • Switch the MSS to 4H while monitoring the message center. • **Does the message center display 4X4 HIGH?**	**Yes** GO to I8. **No** GO to I6.
I6 CHECK FOR TCCM DTCs • Transmission in PARK. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM. • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section. **No** GO to I7.
I7 CHECK FOR WIND-UP IN 4H • Drive the vehicle on a dry, hard surface	**Yes**

while executing turns. • **Is wind-up present in turns?**	Go to Pinpoint Test AB in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A . **No** Go to Pinpoint Test AC in Electronic Locking Differential (ELD) System, Diagnosis and Testing, Section 308-07A .
I8 CHECK FOR STRAIGHT LINE 4H WIND-UP	
• Drive the vehicle on a dry, hard surface. • **Is straightline wind-up present?**	**Yes** GO to Pinpoint Test H . **No** GO to I9 .
I9 CHECK 4H WIND-UP IN TURNS	
• Drive the vehicle in 4H while turning. • **Is wind-up present in turns?**	**Yes** GO to I10 . **No** GO to Pinpoint Test B .
I10 CHECK 4L OPERATION	
• Bring the vehicle to a stop with the transmission in NEUTRAL and switch the MSS to 4L. • **Does the 4X4 LOW indicator illuminate correctly?**	**Yes** GO to I13 . **No** GO to I11 .
I11 CHECK FOR TCCM DTCs	
• Transmission in PARK. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section. **No** GO to I12 .
I12 CHECK FOR WIND-UP IN 4L	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test A . **No** GO to Pinpoint Test C .
I13 CHECK FOR 4L WIND-UP IN TURNS	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present and 4L functioning?**	**Yes** GO to I14 . **No** CHECK for TCCM DTCs. REFER to the TCCM DTC Chart in this section. If no DTCs are present, GO to Pinpoint Test C .
I14 CHECK 4L TO 2H SHIFT	
• With the vehicle at a stop and transmission in NEUTRAL, switch the MSS from 4L to 2H. • **Does the message center display 4X2 for approximately 4 seconds?**	**Yes** GO to I17 . **No** GO to I15 .

repair4less

I15 CHECK FOR TCCM DTCs • Transmission in PARK. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** REFER to the TCCM DTC Chart in this section. **No** GO to I16 .
I16 CHECK FOR WIND-UP IN 2H • Switch the MSS to 2H. • Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test C . **No** GO to Pinpoint Test A .
I17 CHECK FOR TRANSFER CASE DISENGAGEMENT • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate?**	**Yes** REFER to Section 308-07B . **No** GO to I18 .
I18 CHECK FOR LH AND RH IWE DISENGAGEMENT **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Start the engine. • Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft and U-joint. • Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft and U-joint. • **Does the LH or RH front halfshaft rotate?**	**Yes** GO to Pinpoint Test D . **No** GO to I19 .
I19 CHECK FOR IWE VACUUM LEAKS • Ignition OFF. • Disconnect both vacuum lines from the IWE solenoid. • Using a vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE apply vacuum circuit. • Observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** CHECK the IWE and related components for leaks. GO to Pinpoint Test D . **No** GO to I20 .
I20 CHECK 2H TO 4H SHIFT AT SPEED ABOVE 32 KM/H (20 MPH) • Switch the MSS to 2H. • Drive the vehicle on the road and shift from 2H to 4H while driving above 32 km/h (20 mph). • **Does the transfer case shift to 4H satisfactorily?**	**Yes** The 4WD system is functioning correctly. **No** GO to Pinpoint Test G .

Pinpoint Test J: Off-Road Mode Switch Indicator Is Inoperative

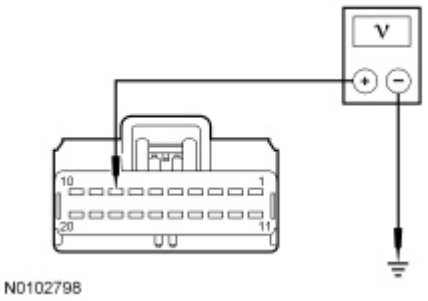
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

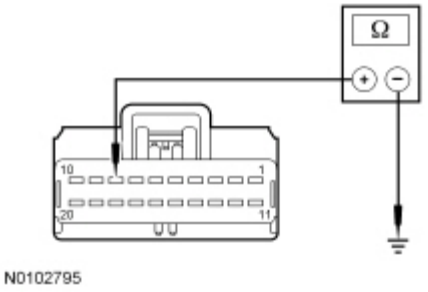
Normal Operation

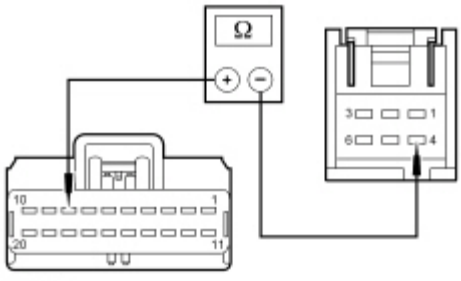
When the off-road switch is depressed, a signal is sent to the TCCM which alerts other modules along the HS-CAN that off-road mode is being requested. Other vehicle functions change to accommodate off-road mode and an indicator illuminates on the off-road mode switch confirming off-road mode.

- DTC B12E0:11 (Off Road Indicator: Circuit Short to Ground) — When in off-road mode, the TCCM senses the indicator circuit has low voltage and is always illuminated.
- DTC B12E0:12 (Off Road Indicator: Circuit Short to Battery) — When in off-road mode, the TCCM senses the indicator circuit has high voltage and never illuminates.
- DTC B12E0:13 (Off Road Indicator: Circuit Open) — When in off-road mode, the TCCM senses the indicator lamp circuit is open and never illuminates.

This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Off-road mode switch
- TCCM

PINPOINT TEST J: OFF-ROAD MODE SWITCH INDICATOR IS INOPERATIVE

NOTE: Make sure the battery is fully charged before performing this pinpoint test.

Test Step	Result / Action to Take
J1 CHECK FOR TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** For DTC B12E0:11, GO to J3 . For DTC B12E0:12, GO to J2 . For DTC B12E0:13, GO to J4 For all other DTCs, REFER to the TCCM DTC Chart in this section. **No** IDENTIFY the customer concern and GO to Symptom Chart - Four-Wheel Drive (4WD) System in this section.
J2 CHECK THE OFF-ROAD MODE INDICATOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: TCCM C2371A . • Disconnect: Off-Road Mode Switch . • Ignition ON. • Measure the voltage between TCCM C2371A-8, circuit CCF01 (BN), harness side and ground.	**Yes** REPAIR circuit CCF01 (BN). CLEAR the DTCs. TEST the system for normal operation. **No** GO to J3 .

repair4less

 N0102798 • **Is any voltage present?**	
J3 CHECK THE OFF-ROAD MODE INDICATOR CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: TCCM C2371A . • Disconnect: Off-Road Mode Switch . • Measure the resistance between TCCM C2371A-8, circuit CCF01 (BN), harness side and ground.  N0102795 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J4 . **No** REPAIR circuit CCF01 (BN). CLEAR the DTCs. TEST the system for normal operation.
J4 CHECK THE OFF-ROAD MODE INDICATOR CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: TCCM C2371A . • Disconnect: Off-Road Mode Switch . • Measure the resistance between TCCM C2371A-8, circuit CCF01 (BN), harness side and off-road mode switch C3393-4, circuit CCF01 (BN), harness side.  N0102796 • **Is the resistance less than 3 ohms?**	**Yes** GO to J5 . **No** REPAIR circuit CCF01 (BN). CLEAR the DTCs. TEST the system for normal operation.
J5 CHECK THE TCCM OFF-ROAD INPUT SWITCH STATUS (OFF_RD_SW) PID	
• Connect: TCCM C2371A .	**Yes**

• Connect: Off-Road Mode Switch . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Monitor the OFF_RD_SW PID. • **Does the OFF_RD_SW PID status indicate Not Pressed?**	GO to J6 . **No** INSTALL a new off-road mode switch. REFER to the Console — Floor exploded view in Section 501-12 . PRESS the tab on each side of the switch to remove it from the bezel. CLEAR the DTCs. TEST the system for normal operation.
J6 CHECK THE TCCM OFF-ROAD STATUS (OFF_RD_STAT) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCCM . • Press the off-road mode switch button. • Monitor the OFF_RD_STAT PID. • **Does the PID status indicate Off-Road Mode?**	**Yes** GO to J7 . **No** INSTALL a new off-road mode switch. REFER to the Console — Floor exploded view in Section 501-12 . PRESS the tab on each side of the switch to remove it from the bezel. CLEAR the DTCs. TEST the system for normal operation.
J7 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

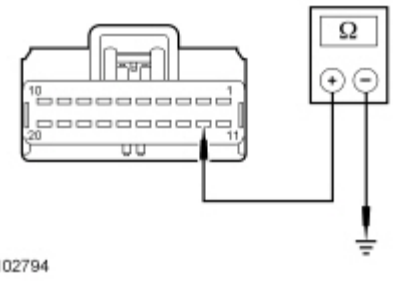
Pinpoint Test K: Off-Road Mode Is Inoperative

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive Systems for schematic and connector information.

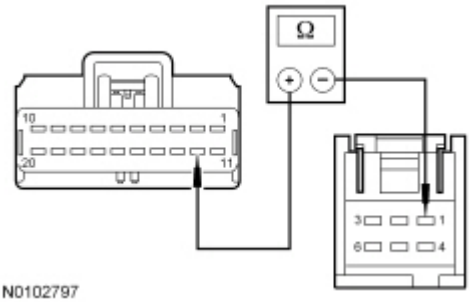
Normal Operation

When the off-road switch is depressed, a signal is sent to the TCCM which alerts other modules along the HS-CAN that off-road mode is being requested. Other vehicle functions change to accommodate off-road mode and an indicator illuminates on the off-road mode switch confirming off-road mode.

- DTC B12E5:00 (Off Road Mode Select Switch: No Sub Type Information) — When in off-road mode, the TCCM C2371A-12 senses if the switch is pressed for more than 30 seconds or if a short to ground on the switch circuit has occurred.
- DTC B12E5:11 (Off Road Mode Select Switch: Circuit Short To Ground) — The TCCM C2371A-12 senses a short to ground on the switch control circuit.



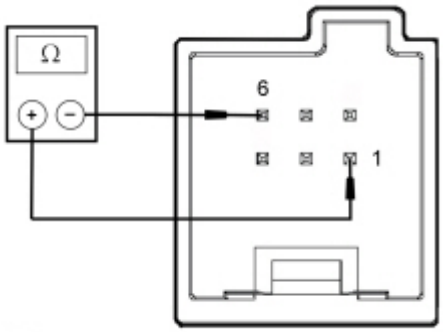
This pinpoint test is intended to diagnose the following:



repair4less

- Wiring, terminals or connectors
- Off-road mode switch
- TCCM

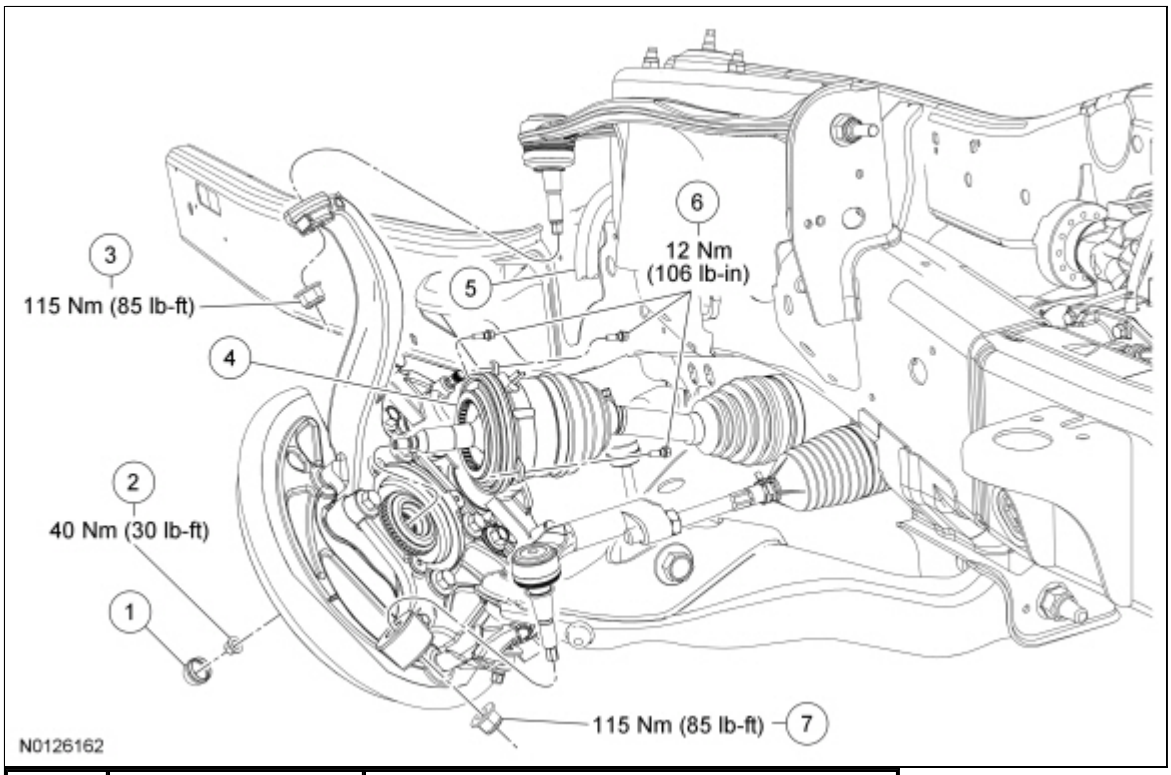
PINPOINT TEST K: OFF-ROAD MODE IS INOPERATIVE



NOTE: Make sure the battery is fully charged before performing this pinpoint test.

Test Step	Result / Action to Take
K1 CHECK FOR TCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — TCCM . • **Are any DTCs present?**	**Yes** If DTCs B12E5:00 or B12E5:11 are retrieved, GO to K2 . For all other DTCs, REFER to the TCCM DTC Chart in this section. **No** IDENTIFY the customer concern and GO to Symptom Chart - Four-Wheel Drive (4WD) System in this section.
K2 CHECK THE OFF-ROAD MODE SWITCH CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: TCCM C2371A . • Disconnect: Off-Road Mode Switch . • Measure the resistance between TCCM C2371A-12, circuit CCF11 (YE/VT), harness side and ground.  N0102794 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K3 . **No** REPAIR circuit CCF11 (YE/VT). CLEAR the DTCs. TEST the system for normal operation.
K3 CHECK THE OFF-ROAD MODE SWITCH CIRCUIT FOR AN OPEN	
• Measure the resistance between TCCM C2371A-12, circuit CCF11 (YE/VT), harness side and off-road mode switch C3393-1, circuit CCF11 (YE/VT), harness side.	**Yes** GO to K4 . **No** REPAIR circuit CCF11 (YE/VT). CLEAR the DTCs. TEST the system for normal operation.

N0102797



- **Is the resistance less than 3 ohms?**

K4 CHECK THE OFF-ROAD MODE SWITCH	
• Measure the resistance between off-road mode switch C3393-6, circuit CCF11, component side and off-road mode switch C3393-1, circuit CCF11, component side.  N0133483 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K5 . **No** INSTALL a new off-road mode switch. REFER to the Console — Floor exploded view in Section 501-12 . PRESS the tab on each side of the switch to remove it from the bezel. CLEAR the DTCs. TEST the system for normal operation.
K5 CHECK FOR CORRECT TCCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all TCCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all TCCM connectors. Make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCCM . REFER to Transfer Case Control Module (TCCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. ADDRESS the root cause of the connector or pin issues.

repair4less

Integrated Wheel End (IWE)

Item	Part Number	Description
1	1131	Dust cap
2	N802827-S	Axle nut
3	W520215-S	Upper ball joint nut
4	3C247	Integrated Wheel End (IWE)
5	—	Vacuum vent and supply tube
6	W710279-S	IWE bolts (3 required)
7	W520215-S	Tie-rod nut

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. Remove the front wheel and tire. Refer to Section 204-04 .
3. Remove the dust cap.
4. Remove and discard the axle nut.
5. Disconnect the vacuum tubes from the Integrated Wheel End (IWE).

repair4less

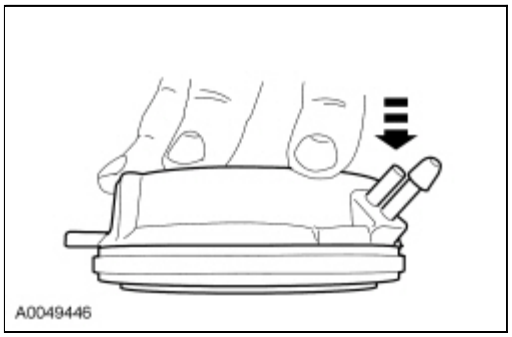
6. Remove the 3 IWE -to-wheel knuckle retaining bolts.

7. Remove the tie-rod nut and separate the tie rod from the wheel knuckle.
    - Discard the tie-rod nut.

8. Remove the wheel speed sensor harness bracket bolt and position the harness aside.

9. Remove the front brake flexible hose bracket bolt and position the brake hose aside.

10. Remove the upper ball joint nut and separate the upper ball joint from the wheel knuckle.
    - Discard the upper ball joint nut.



11. **NOTE:** Allow the wheel knuckle to swing outward while keeping the halfshaft pushed inward.

    Once clearance is available, remove the halfshaft outboard end from the wheel knuckle hub bearing.

12. Remove the IWE from the halfshaft outboard end.

Installation

1. Compress the IWE and install a vacuum cap on the vacuum port.

2. ***NOTICE:*** **Do not dislodge the Integrated Wheel End (IWE) seal spring when installing the IWE on halfshaft outboard end or component damage may occur.**

    Install the IWE onto the halfshaft outboard end.

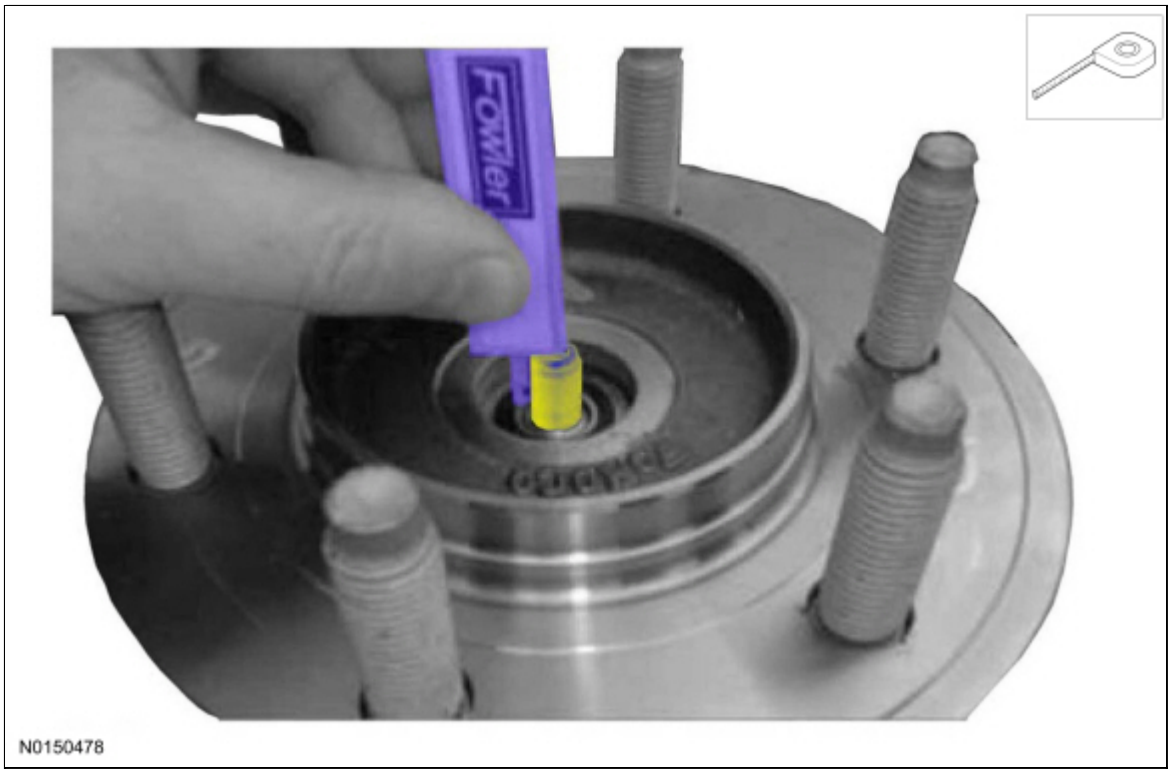
3. **NOTE:** Allow the wheel knuckle to swing outward while keeping the halfshaft pushed inward.

    Once clearance is available, install the halfshaft outboard end into the wheel knuckle hub bearing.

4. Connect the upper ball joint and install a new nut.
    - Tighten to 115 Nm (85 lb-ft).

5. Connect the tie rod and install a new nut.
    - Tighten to 115 Nm (85 lb-ft).

6. Position the front brake flexible hose bracket and install the bolt.
    - Tighten to 12 Nm (106 lb-in).



7. Position the wheel speed sensor harness bracket and install the bolt.
    - Tighten to 12 Nm (106 lb-in).

8. Install the 3 IWE -to-wheel knuckle retaining bolts.
    - Tighten to 12 Nm (106 lb-in).

9. Remove the IWE vacuum cap and connect the vacuum tubes.

10. ***NOTICE:*** **Measure the depth of the CV Shaft threaded end to the inner bearing race (shown in illustration). The minimum depth is 15.5 mm (0.61 in). If the depth is less than 15.5 mm (0.61 in) rotate the CV shaft to clear a binding condition between the IWE and CV splines. Installing the axle nut and tightening without the proper depth of protrusion will result in damage to the IWE .**

    Measure the CV shaft threaded end to the inner bearing race.

11. ***NOTICE:*** **Verify the spline engagement by checking for spline lash before installing the axle nut or component damage may occur.**

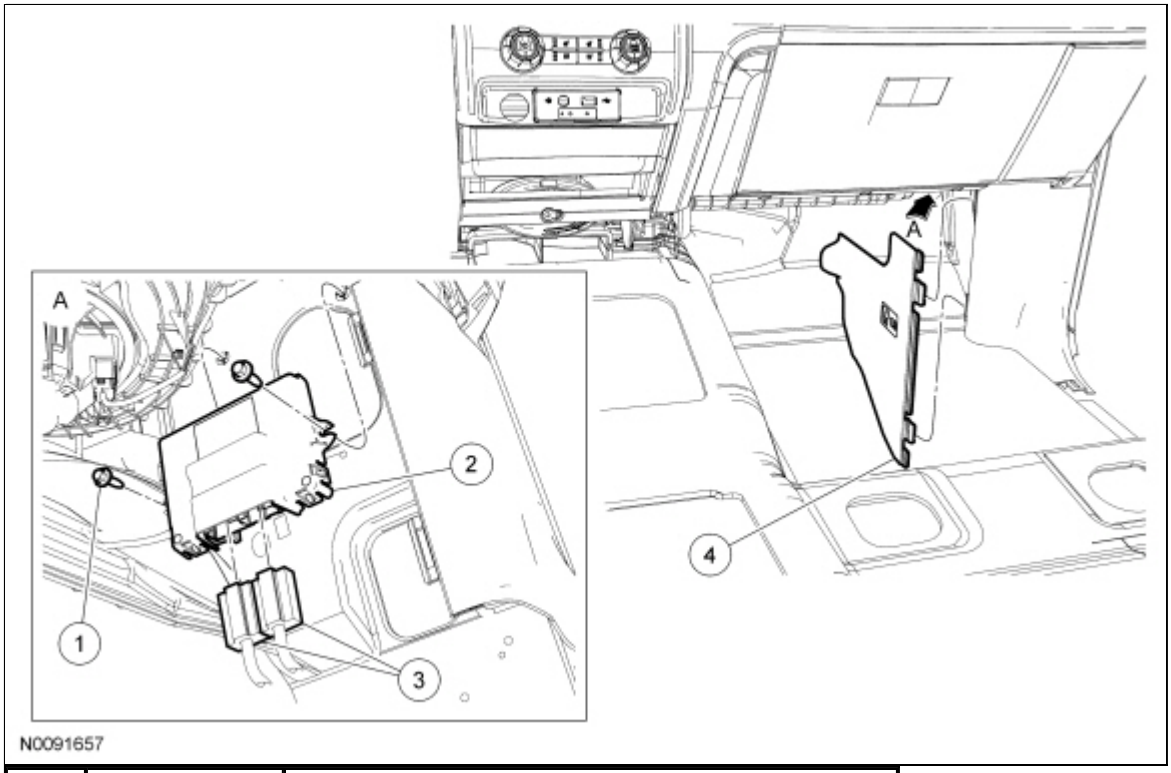
    Install the new axle nut.
    - Tighten to 40 Nm (30 lb-ft).

12. Install the dust cap.

13. Install the front wheel and tire. Refer to Section 204-04 .

repair4less

Mode Select Switch (MSS)



Item	Part Number	Description
1	14B166	Mode Select Switch (MSS)
2	—	MSS electrical connector (part of 14401)

1. Carefully pry the Mode Select Switch (MSS) from the instrument panel.
2. Disconnect the MSS harness connector and remove the switch.
3. To install, reverse the removal procedure.

repair4less

Transfer Case Control Module (TCCM)

Removal and Installation

Item	Part Number	Description
1	W706287	Screw (2 required)
2	7E453	Transfer Case Control Module (TCCM)
3	—	TCCM electrical connectors (part of 12A581)
4	023A98	Central Junction Box (CJB) cover

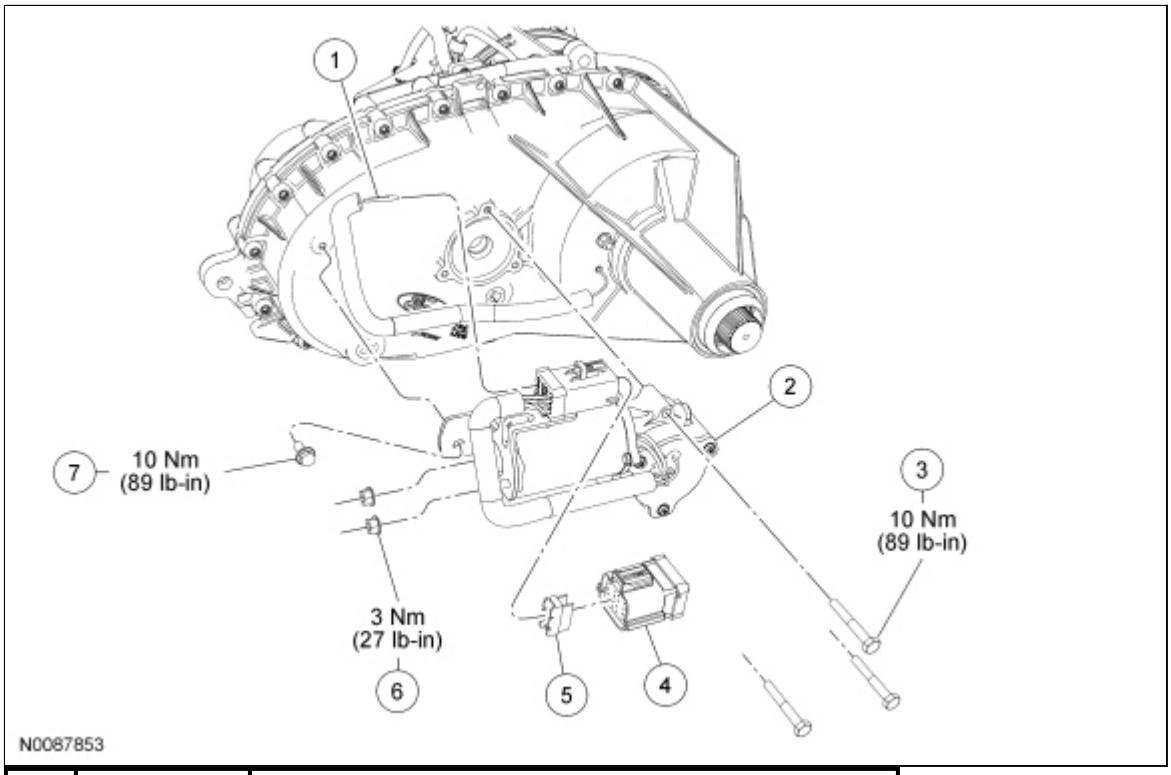
1. Remove the Central Junction Box (CJB) cover to gain access to the Transfer Case Control Module (TCCM).

NOTE: The TCCM has slotted mounting holes. It is not necessary to remove the LH TCCM screw when removing the TCCM .

2. Loosen the LH TCCM screw and remove the RH TCCM screw.
   - To install, tighten to 7 Nm (62 lb-in).

3. Disconnect the 2 electrical connectors.

4. Remove the TCCM .



5. To install, reverse the removal procedure.

repair4less

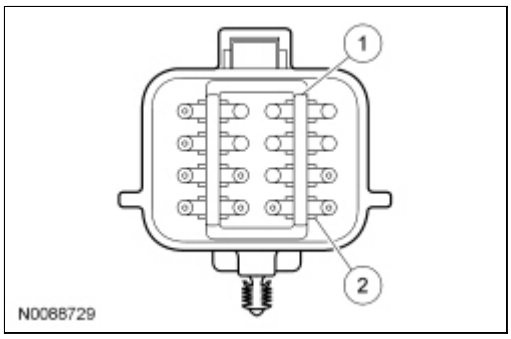
Transfer Case Shift Motor

Material

Item	Specification
Ultra Silicone Sealant TA-29	—

Item	Part Number	Description
1	—	Coil wire (part of 7G361)
2	7G360	Transfer case shift motor
3	N800670-S	Transfer case shift motor bolt (3 required)
4	15525	Connector
5	—	Connector inner retainer (part of 15525)
6	—	Transfer case shift motor nut (part of 7G360) (2 required)
7	7A443	Transfer case shift motor bolt

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-

repair4less

02 .

2. Disconnect the harness connector.

3. Remove the coil wire pin from the electrical connector.
    1. Remove the inner retainer from the wire connector.
    2. Press the release tab and remove the coil wire pin.

4. Remove the transfer case shift motor bracket bolt and the 3 mounting bolts, then remove the transfer case shift motor.

Installation

1. Apply a small bead of silicone sealant to the transfer case shift motor mating surface.

NOTICE: **New shift motor bracket nuts are loose and are tightened last. Failure to follow the steps in the correct order may result in damage to the component.**

2. Install the transfer case shift motor and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

3. Install the transfer case shift motor bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

4. Secure the transfer case shift motor bracket nuts.
    - Tighten to 3 Nm (27 lb-in).

5. **NOTE:** After the wire is inserted into the connector, gently pull the wire back to verify the pin is locked inside the connector.

    Insert the coil wire pin in the electrical connector and install the inner connector retainer.

Transfer Case

Electronic Shift-On-The-Fly (ESOF) System

The ESOF transfer case system consists of the following components:

- Mode Select Switch (MSS), located on the instrument panel
- Transfer case assembly (includes shift motor and synchronization clutch)
- Transfer Case Control Module (TCCM)

The Borg-Warner 4419 electronic shift transfer case is a 2-piece magnesium design. The unit transfers engine power from the transmission to the front and rear axles. Vehicles equipped with an ESOF system allow the operator to choose between 2-Wheel Drive (2WD) (2H) and 2 different 4WD modes. The transfer case is shifted electronically based on the MSS position. Under normal driving conditions, the transfer case is in 2WD (2H), but when desired, the operator may shift into 4WD high (4H) or 4WD low (4L). The operator can shift between 2WD (2H) and 4WD high (4H) at any speed. When shifting into or out of 4WD low (4L) range, the TCCM requires that the vehicle speed is less than 5 km/h (3 mph) and the transmission in NEUTRAL.

The transfer case is equipped with an electronically controlled high torque capacity clutch which is located inside the case. This clutch is used to synchronize the speed of the front driveline with the rear driveline during 2WD (2H) to 4WD high (4H) shifts. The transfer case is lubricated by a positive displacement fluid pump that channels fluid flow through holes in the rear output shaft.

2-Speed Torque-On-Demand

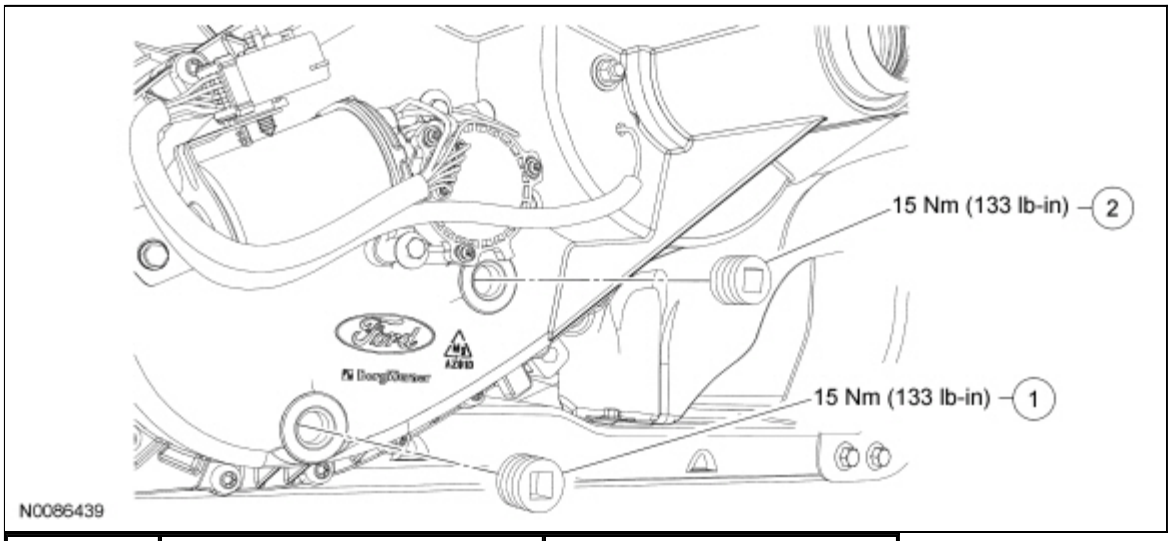
The 2-speed torque-on-demand transfer case system consists of the following components:

- MSS , located on the instrument panel
- Transfer case assembly (includes shift motor and synchronization clutch)
- TCCM

The Borg-Warner 2-speed torque-on-demand transfer case is a 2-piece magnesium design. The transfer case transfers engine power from the transmission to the front and rear axles. Vehicles equipped with the 2-speed torque-on-demand system allow the operator to choose between 2WD and 3 different 4WD modes. The transfer case is shifted electronically based on the MSS position. Under normal driving conditions, the unit is in 2WD (2H), but when desired, the operator may shift into 4WD high (4H), 4WD low (4L) or 4WD AUTO (4A). When shifting into or out of 4WD (4L) range, the TCCM requires that the vehicle speed is less than 5 km/h (3 mph) and the transmission is in NEUTRAL.

The transfer case is equipped with an electronically controlled high torque capacity clutch which is located inside the case. This clutch is used to synchronize the speed of the front driveline with the rear driveline during 2WD (2H) to 4WD high (4H) or 4WD AUTO (4A) shifts. The clutch also provides torque to the front driveline in all 4WD modes. The transfer case is lubricated by a positive displacement fluid pump that channels fluid flow through holes in the rear output shaft.

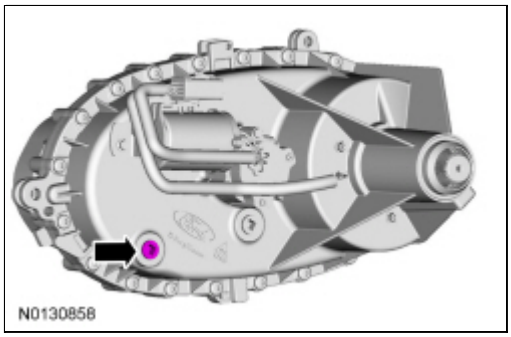
repair4less



Transfer Case Draining and Filling

Special Tool(s)

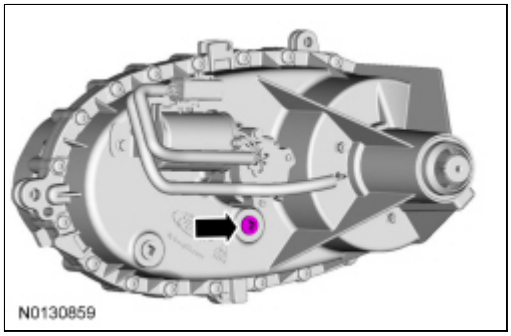
 ST2323-A	Oil Suction Gun 303-D104 (D94T-9000-A)



Material

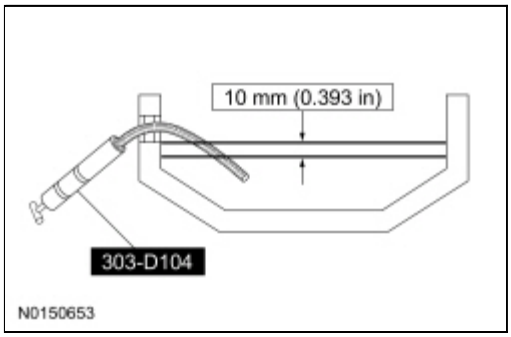
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV
Motorcraft® Transfer Case Fluid XL-12	ESP-M2C166-H
Thread Sealant with PTFE TA-24	WSK-M2G350-A2

Item	Part Number	Description
1	7A110	Drain plug
2	7A110	Fill plug



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the drain plug and drain the fluid.

3. Clean the drain plug and the drain plug area. Apply thread sealant to the drain plug threads and install the drain plug.
    - To install, tighten to 15 Nm (133 lb-in).

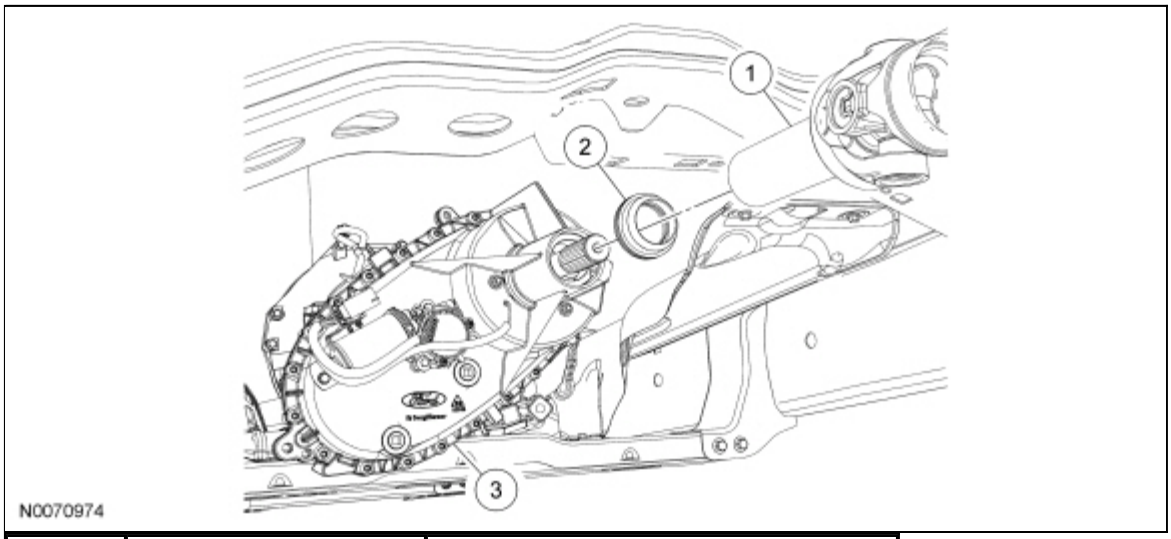


4. **NOTE:** Prior to removal, clean the area around the fill plug.

   Remove the fill plug.

5. ***NOTICE:*** **In the Electronic Shift-On-The-Fly (ESOF) transfer case use Motorcraft® Transfer Case Fluid and in the 2-speed torque-on-demand transfer case use Motorcraft® MERCON® LV Automatic Transmission Fluid. Incorrect fluid fill will result in transfer case failure.**

   Using the Oil Suction Gun, fill the transfer case with the recommended fluid, to specification.
    - Transfer case capacity is 1.4L (2.9 pt).
    - The fluid must be 10 mm (0.393 in) below the fill plug hole.



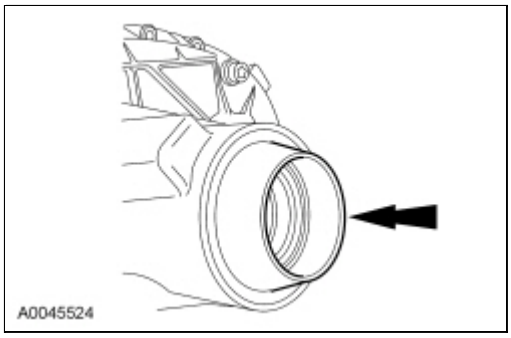
6. Apply thread sealant to the fill plug threads and install the fill plug.
    - Tighten to 15 Nm (133 lb-in).

repair4less

Transfer Case Rear Output Shaft Seal

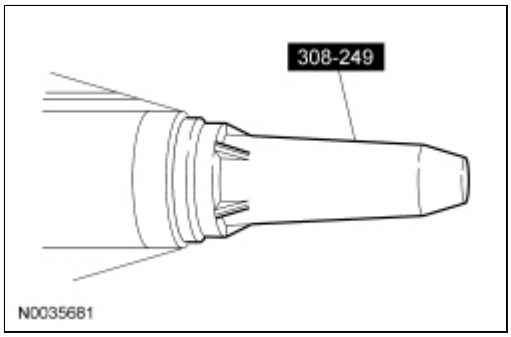
Special Tool(s)

 ST2261-A	Installer, Input Shaft Oil Seal 308-249 (T96T-7127-A)



Item	Part Number	Description
1	4602	Driveshaft
2	7B215	Rear output shaft seal
3	7A195	Transfer case

Removal



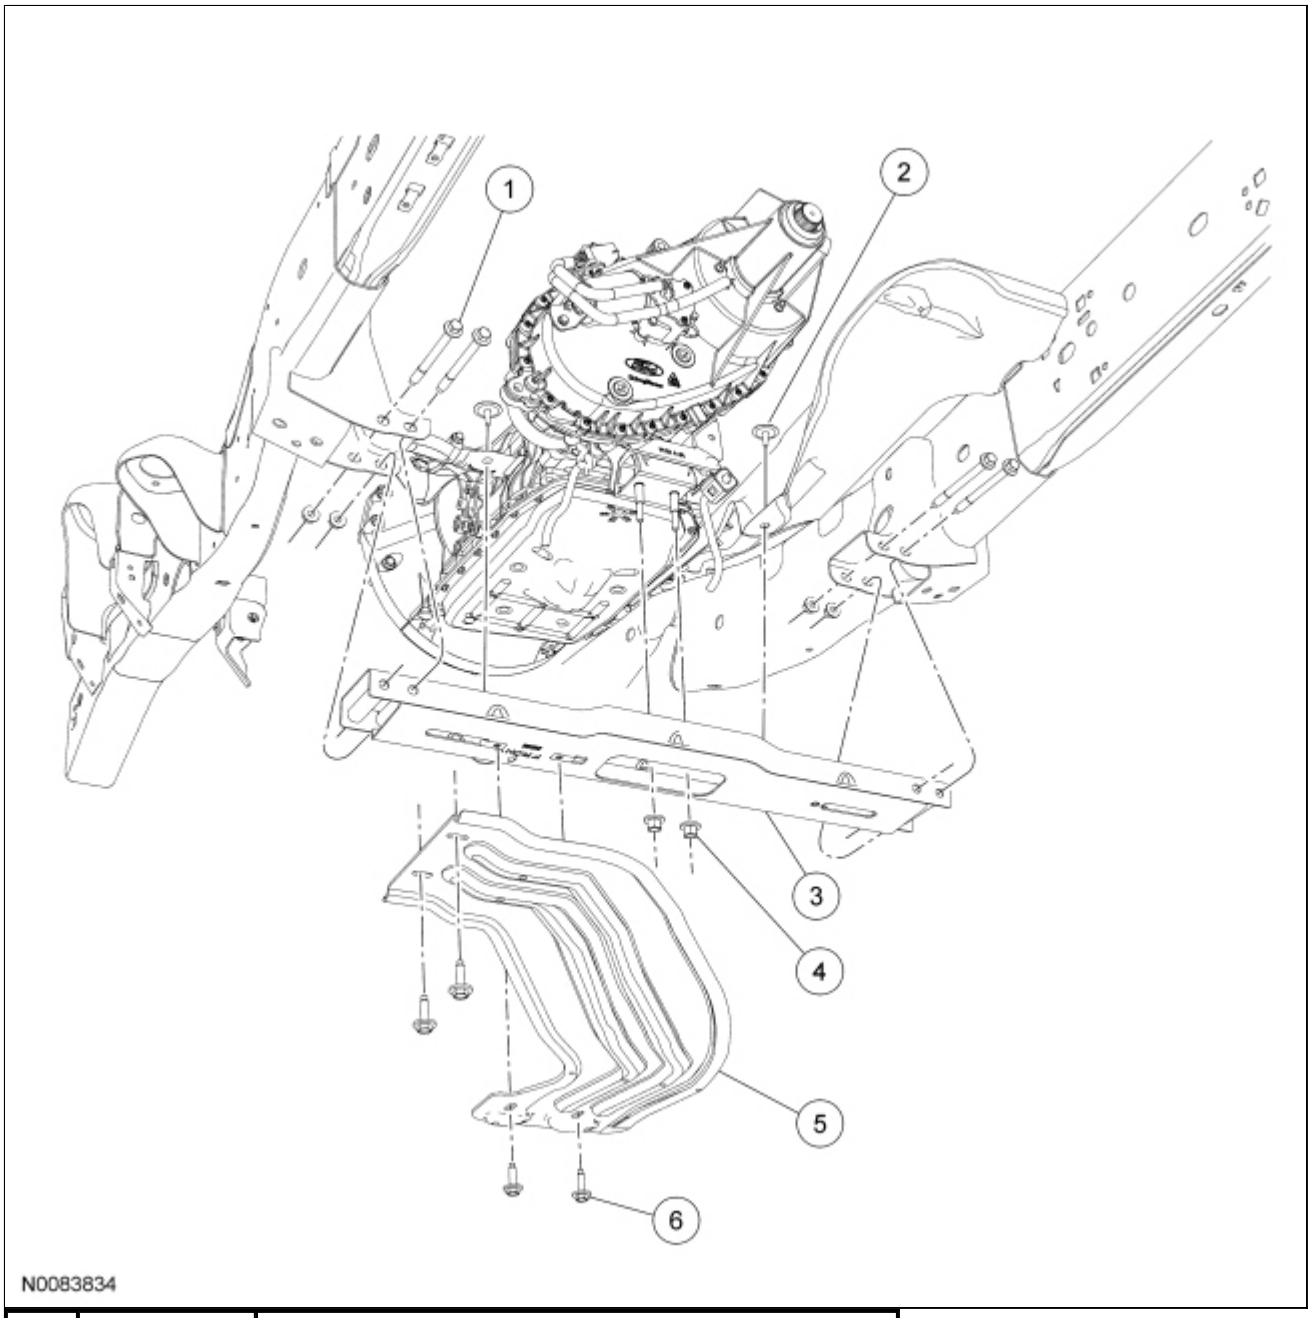
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear driveshaft. For additional information, refer to Section 205-01 .
3. Using a suitable seal puller, remove the rear output shaft seal.

repair4less

Installation

1. Using the Input Shaft Oil Seal Installer, install the rear output shaft seal.

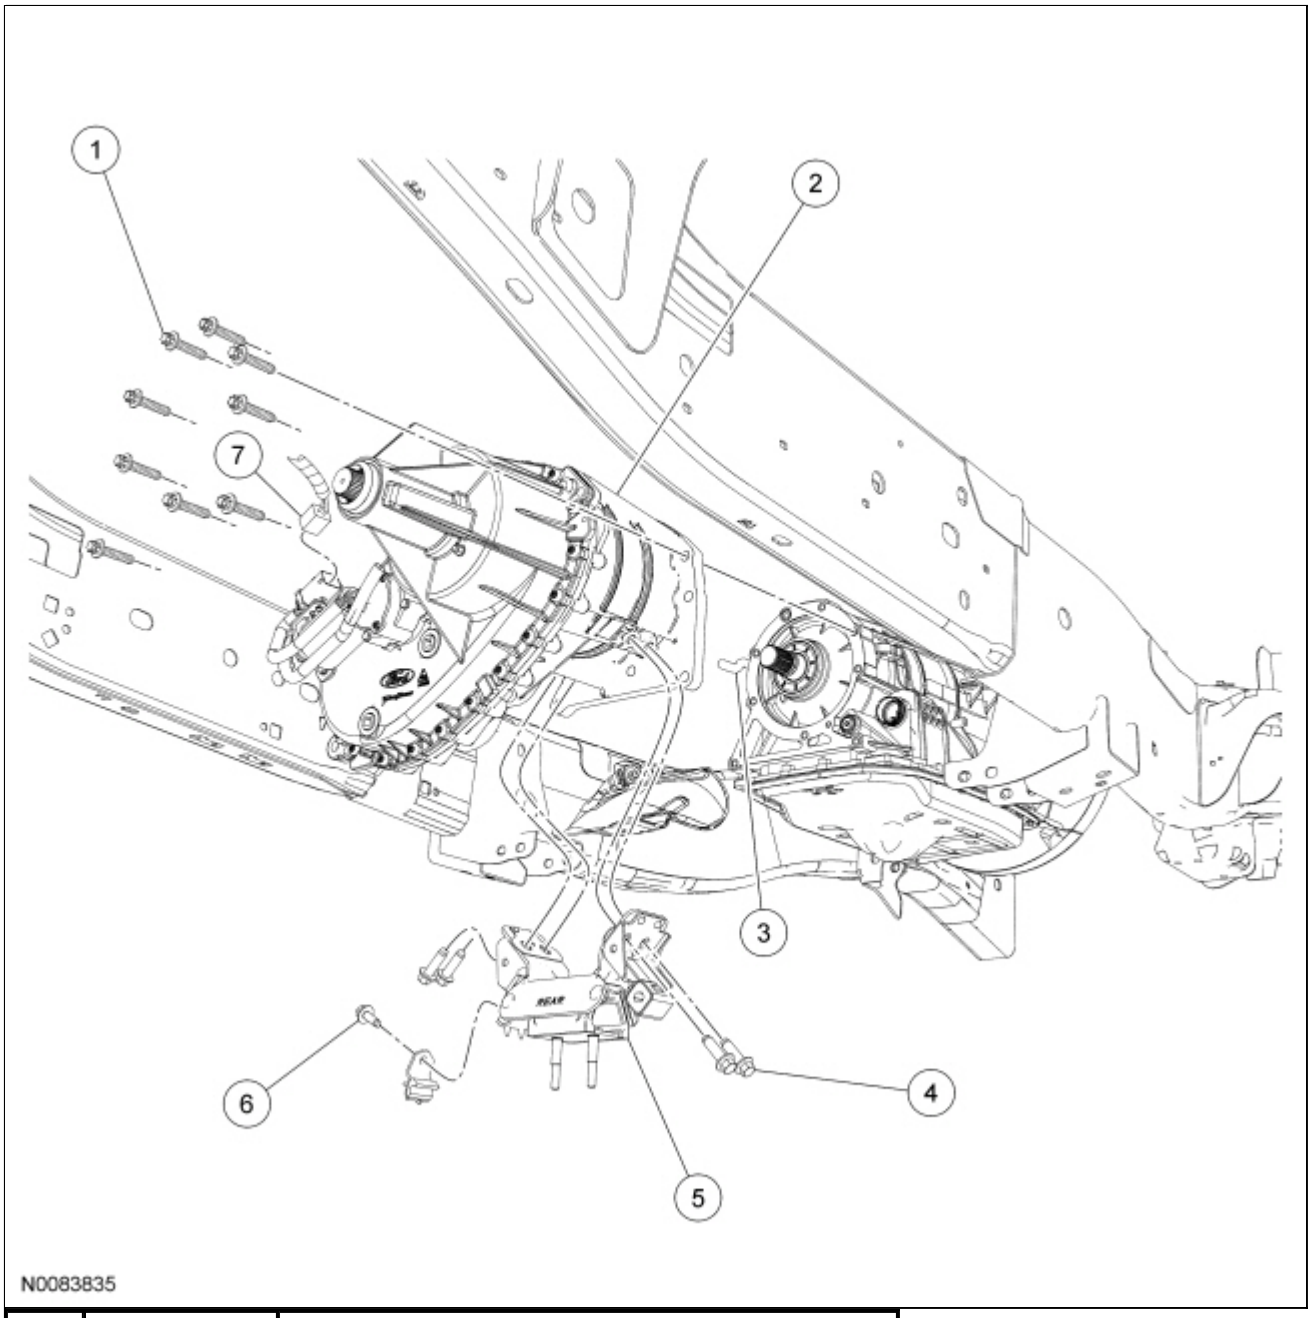
2. Install the rear driveshaft. For additional information, refer to Section 205-01 .



Transfer Case

Material

Item	Specification
Thread Sealant with PTFE TA-24	WSK-M2G350-A2

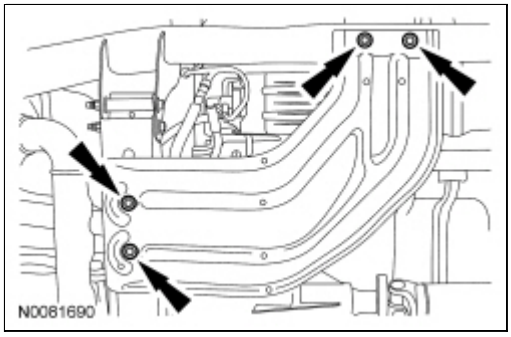


Transfer Case — Left Side

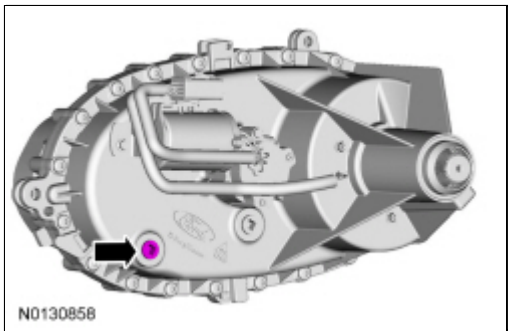
repair4less

Item	Part Number	Description
1	637077	Transmission support crossmember bolt (4 required)
2	W707959-S	Heat shield bolt (2 required)
3	9740124	Transmission support crossmember
4	N621945-S	Transmission mount nut (2 required)
5	7E063	Skid plate
6	W503932-S	Skid plate-to-frame bolt (4 required)

Transfer Case — Right Side



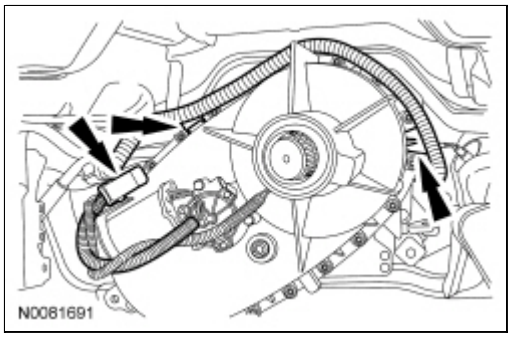
Item	Part Number	Description
1	7A443	Transfer case-to-transmission bolt (9 required)
2	7A195	Transfer case
3	7D494	Vent tube
4	W713728-S	Transmission mount bolt (4 required)
5	6D091	Transmission mount
6	W709341-S	Exhaust support bracket bolt
7	14489	Shift motor electrical connector — ESOF



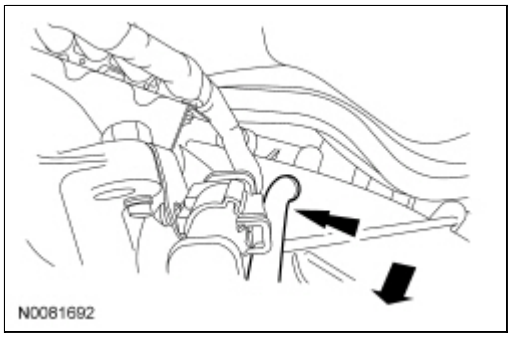
1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

repair4less

2. If equipped, remove the 4 skid plate bolts and remove the skid plate.

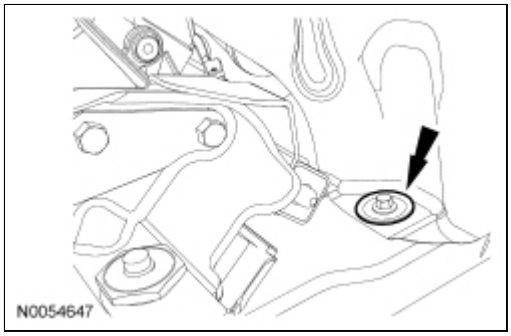


3. Drain the fluid if the transfer case is to be disassembled.
    - Apply thread sealant to the drain plug threads and install the drain plug when finished draining.
        - Tighten to 15 Nm (133 lb-in).

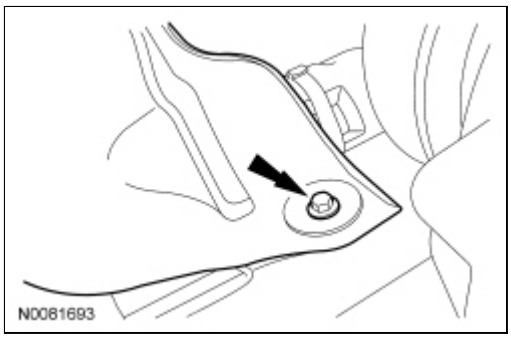


4. Remove the front driveshaft. Refer to Section 205-01 .

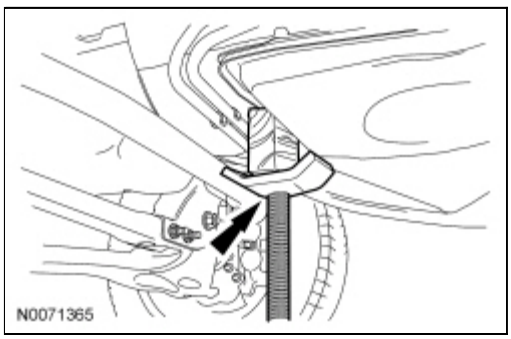
5. Remove the rear driveshaft. Refer to Section 205-01 .



6. Disconnect the shift motor electrical connector and detach the 2 harness retainer clips from the transfer case.

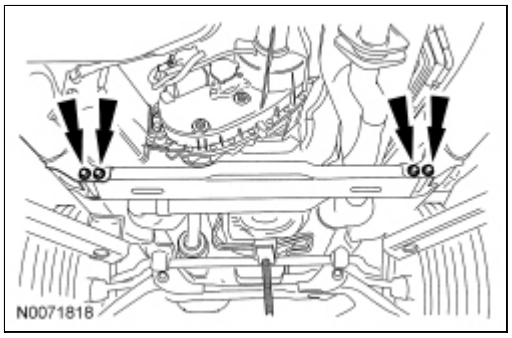


7. Disconnect the vent hose from the transfer case.

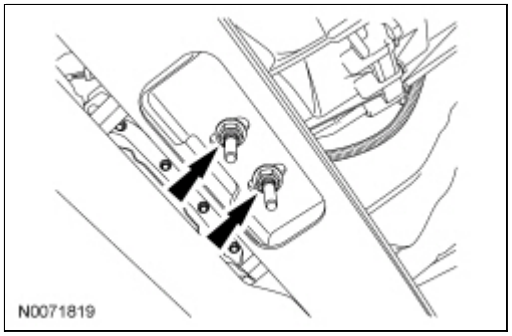


8. Remove the RH exhaust heat shield bolt from the transmission support crossmember.

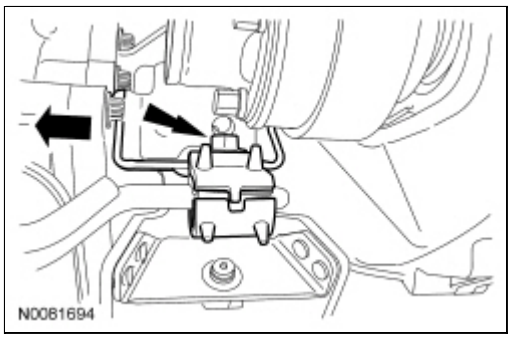
9. Remove the LH exhaust heat shield bolt from the transmission support crossmember.



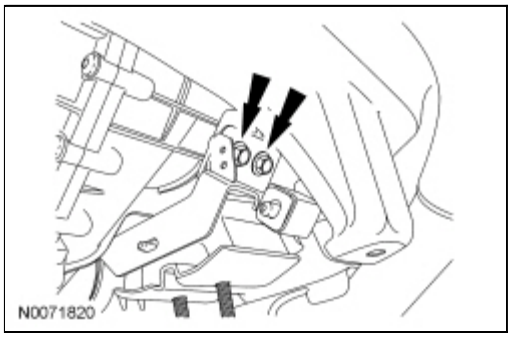
10. Support the front of the transmission.



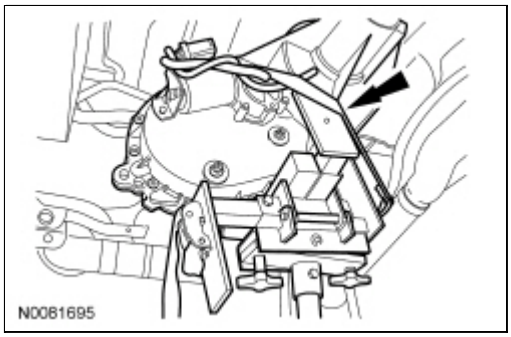
11. Remove and discard the 4 transmission support crossmember nuts and bolts.



repair4less

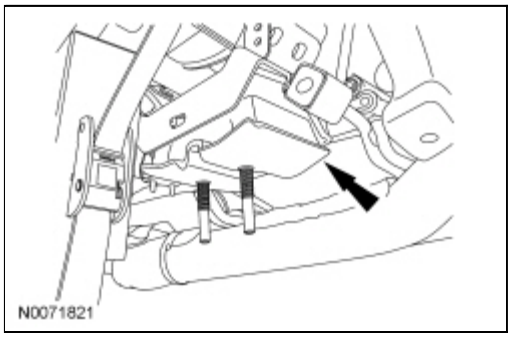


12. Remove the 2 transmission mount nuts and the transmission support crossmember.



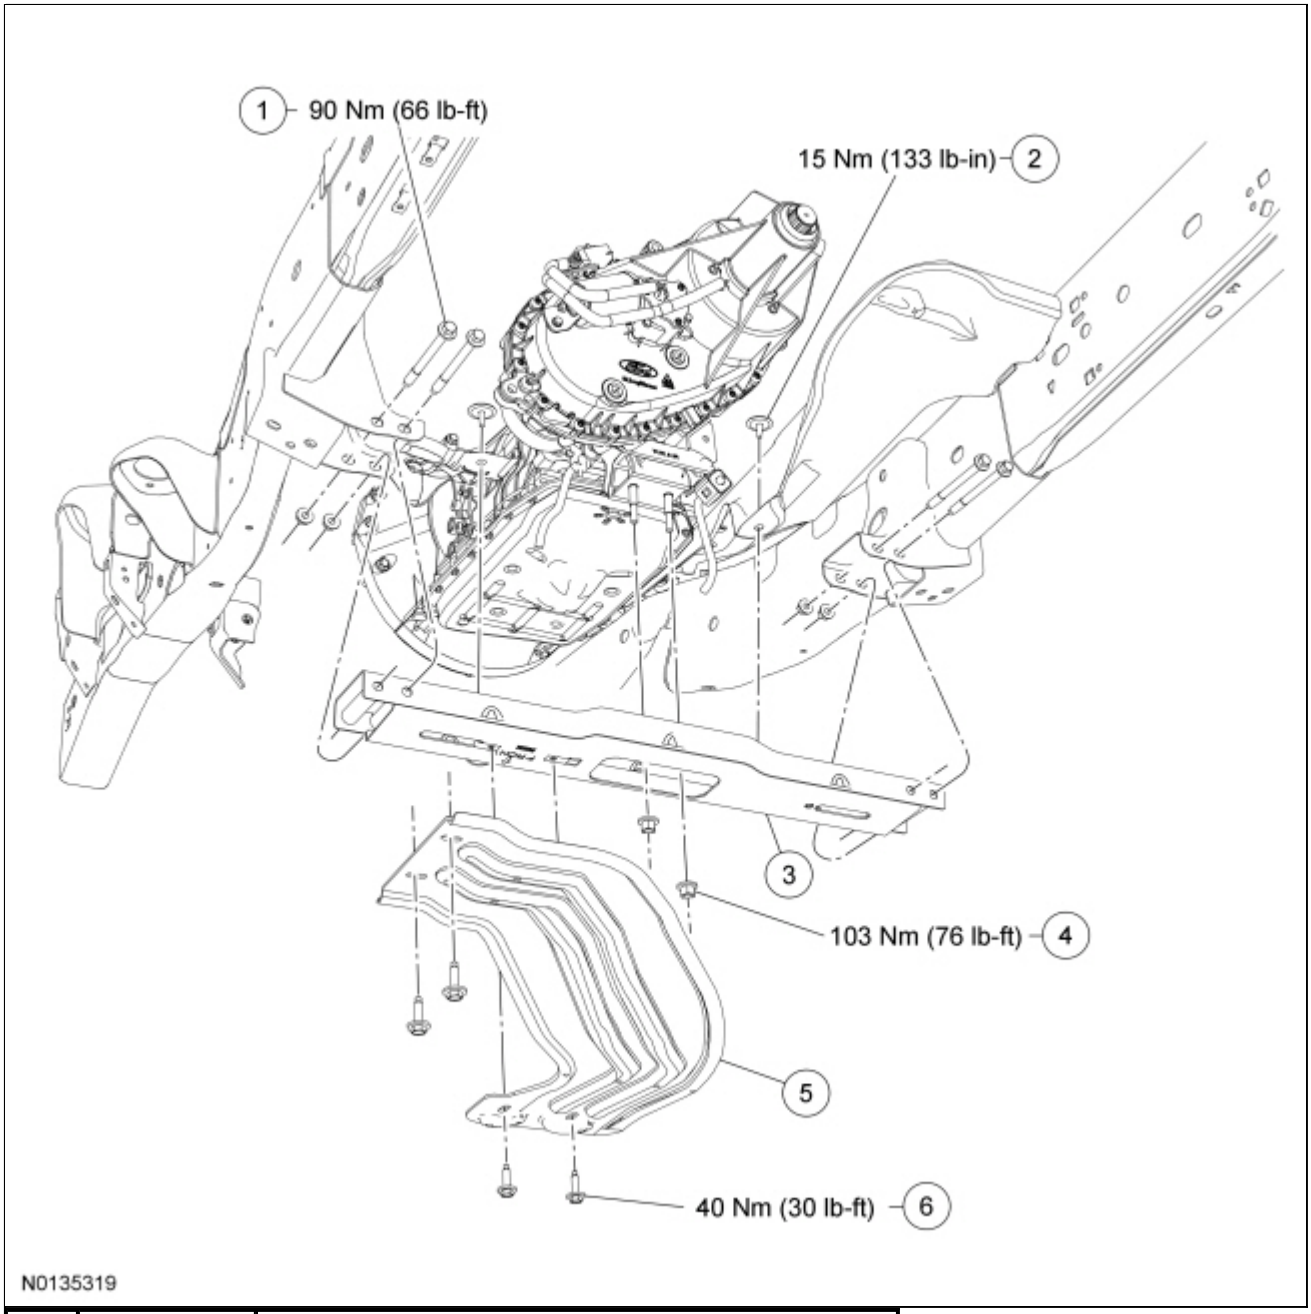
13. Remove the bolt from the LH exhaust support bracket.

14. Remove the 4 transmission mount bolts and the transmission mount.



15. Using a transmission jack, position it to the transfer case. Secure the transfer case to the jack with a safety strap.

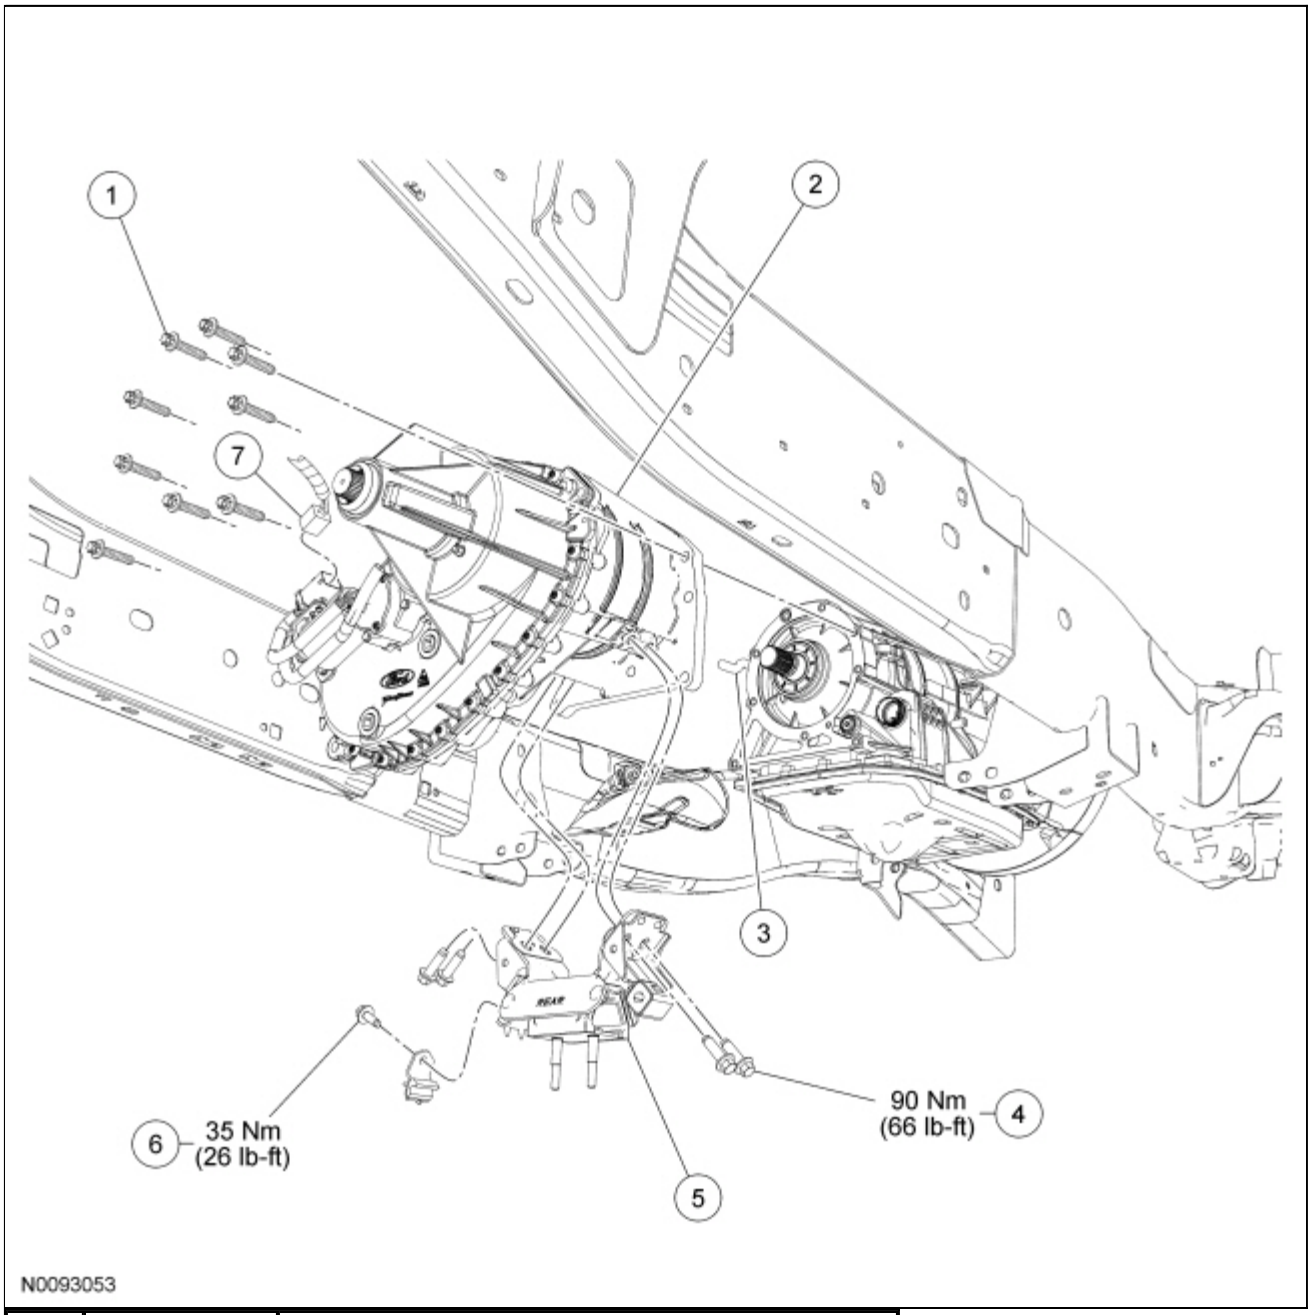
16. Remove and discard the 9 transfer case-to-transmission bolts.



17. Separate the transfer case from the transmission and move the transfer case rearward 25.4 mm (1 in). Move the transfer case rearward off the output shaft and lower it from the vehicle.

repair4less

Transfer Case



Transfer Case — Left Side

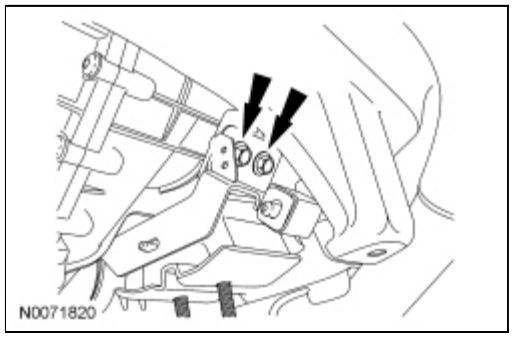
Item	Part Number	Description
1	637077	Transmission support crossmember bolt (4 required)
2	W707959-S	Heat shield bolt (2 required)
3	9740124	Transmission support crossmember

4	N621945-S	Transmission mount nut (2 required)
5	7E063	Skid plate
6	W503932-S	Skid plate bolt (4 required)

Transfer Case — Right Side

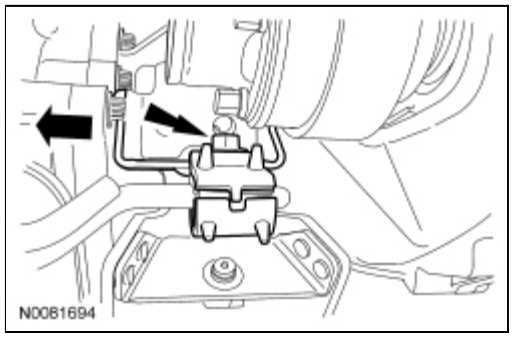
Item	Part Number	Description
1	7A443	Transfer case-to-transmission bolt (9 required)
2	7A195	Transfer case
3	7D494	Vent tube

repair4less



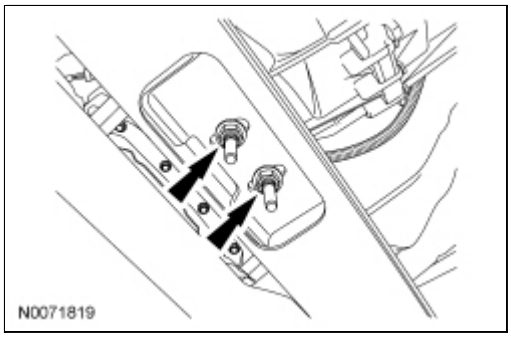
4	W713728-S	Transmission mount bolt (4 required)
5	6D091	Transmission mount
6	W709341-S	Exhaust support bracket bolt
7	14489	Shift motor electrical connector

1. Position the transfer case to the transmission and onto the output shaft. With the transfer case 25.4 mm (1 in) from the transmission, push the transfer case to the transmission.

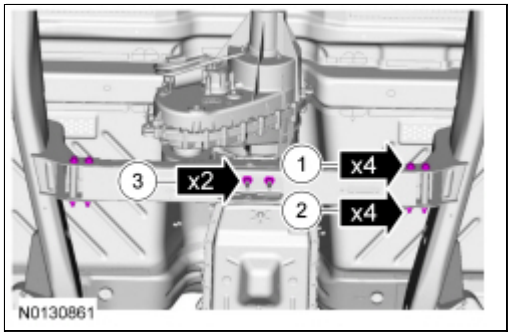


2. **NOTE:** Do not reuse the old transfer case-to-transmission bolts.

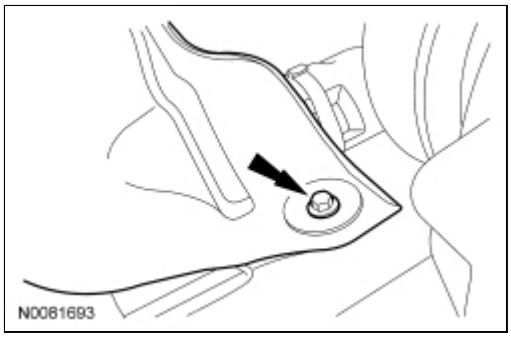
   Install 9 new transfer case-to-transmission bolts.
   - Tighten the bolts evenly in a cross pattern to 17 Nm (150 lb-in).



3. Install the transmission mount and the 4 transmission mount bolts.
   - Tighten to 90 Nm (66 lb-ft).

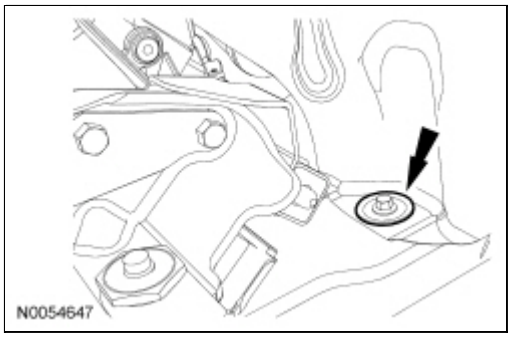


4. Install the LH exhaust support bracket and bolt.
   - Tighten to 35 Nm (26 lb-ft).

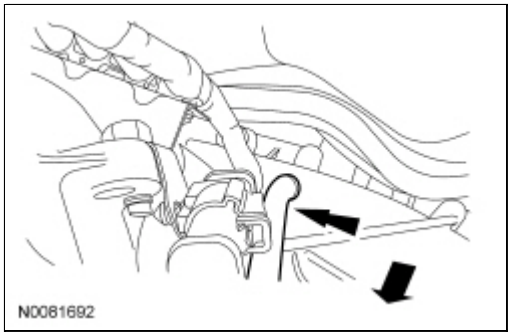


5. Position the transmission support crossmember and the 2 transmission mount nuts.
   - Do not tighten at this time.

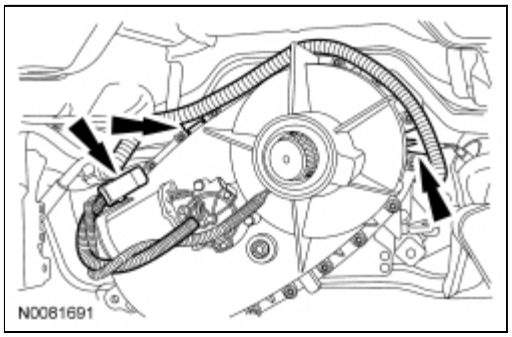
6. Install the 4 new transmission support crossmember bolts and nuts, then tighten the transmission support crossmember and transmission mount nuts.
    1. Install the transmission support crossmember bolts.
        - Remove the transmission jack from under the transmission pan rail.
    2. Install the transmission support crossmember nuts and tighten to 90 Nm (66 lb-ft).
    3. Tighten the transmission mount nuts to 103 Nm (76 lb-ft).



7. Install the LH exhaust heat shield bolt to the transmission support crossmember.
    - Tighten to 15 Nm (133 lb-in).



8. Install the RH exhaust heat shield bolt to the transmission support crossmember.
    - Tighten to 15 Nm (133 lb-in).



repair4less

9. Connect the vent hose to the transfer case.

10. Connect the shift motor electrical connector and attach the 2 harness retainer clips to the transfer case.

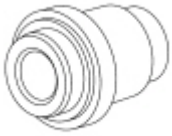
11. **NOTE:** Align the index marks made during removal.

    Install the rear driveshaft. Refer to Section 205-01 .

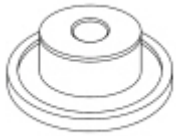
12. **NOTE:** Align the index marks made during removal.

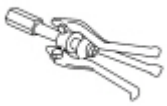
    Install the front driveshaft. Refer to Section 205-01 .

13. Fill the transfer case. Refer to Transfer Case Draining and Filling .



14. If equipped, position the skid plate and install the 4 skid plate bolts.
    - Tighten to 40 Nm (30 lb-ft).





repair4less

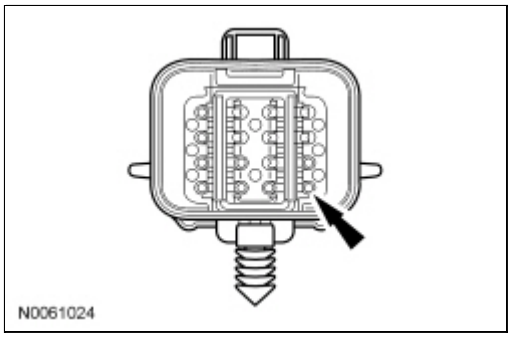
53	7N063	Driven sprocket spacer

Disassembly

1. ***NOTICE:*** **Seal all openings before cleaning the transfer case exterior. This will prevent entry of dirt and water, which may cause damage to internal components.**

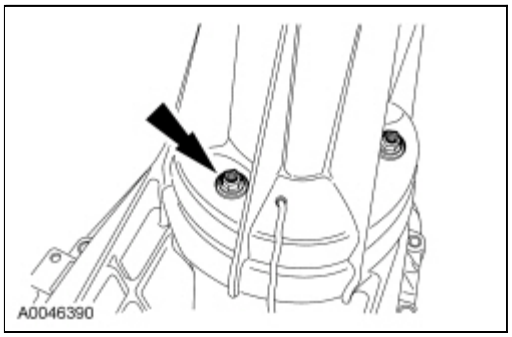
   Clean the transfer case exterior with solvent and dry with compressed air.

2. Using the Transmission Holding Fixture, secure the transfer case to a work bench. Rotate the transfer case so that the output shaft is pointing upward.



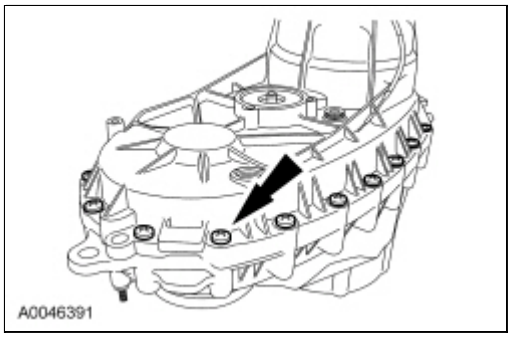
3. Remove and discard the rear output shaft seal.

repair4less



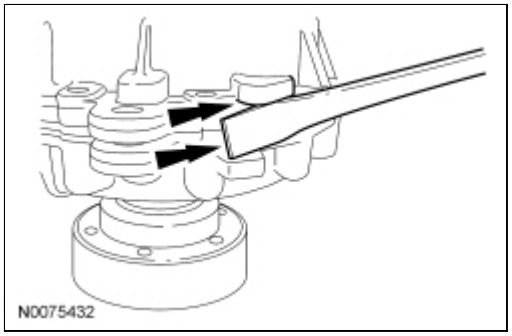
4. Remove the coil wire pin from the electrical connector.
    - Remove the wire connector inner retainer.
    - Press the release tab and remove the coil wire pin (tan wire).

5. Loosen the 2 transfer case shift motor bracket nuts and remove the bracket bolt.



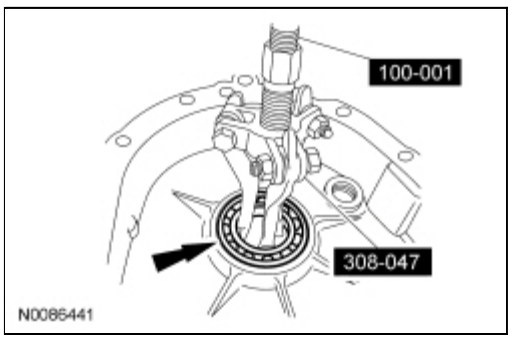
6. Remove the 3 transfer case shift motor bolts and transfer case shift motor.

7. Remove the 3 coil nuts and washers.



8. **NOTE:** It is normal to find metal shavings after removing the self-tapping transfer case bolts.

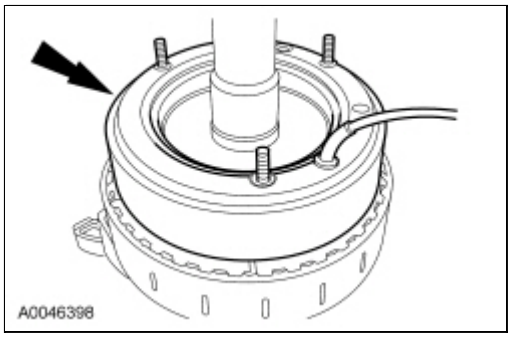
   Remove the 20 transfer case cover bolts.



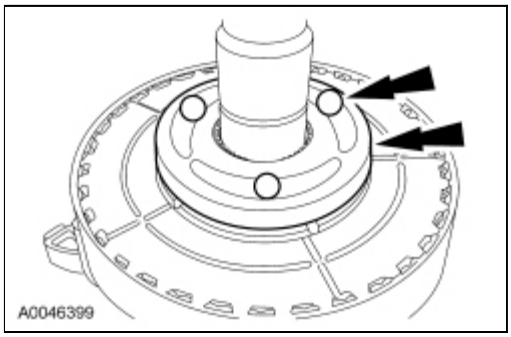
9. Using the pry bosses, separate the transfer case halves.

10. Using the Bearing Cup Remover and the Slide Hammer, remove the rear output shaft support bearing.
    - Inspect the bearing for wear or damage. Install a new bearing as necessary.

11. Using the Bearing Cup Remover and the Slide Hammer, remove the front output shaft rear bearing.
    - Inspect the bearing for wear or damage. Install a new bearing as necessary.



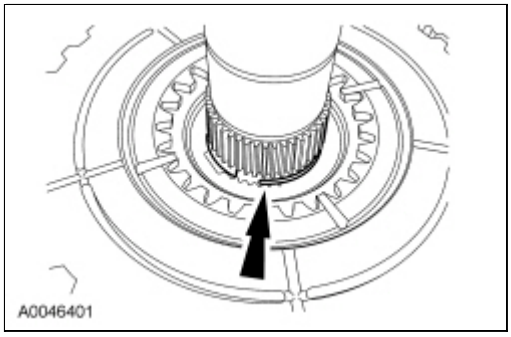
repair4less



12. Remove the snap ring.
    - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.

13. Remove the caged thrust bearing assembly.
    - Inspect the bearing for wear or damage. Install a new bearing as necessary.

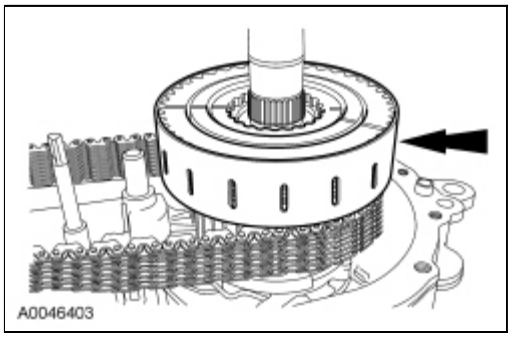
14. Remove the cam/coil housing.



15. Remove the steel balls and the cam.

16. Remove the wave spring.

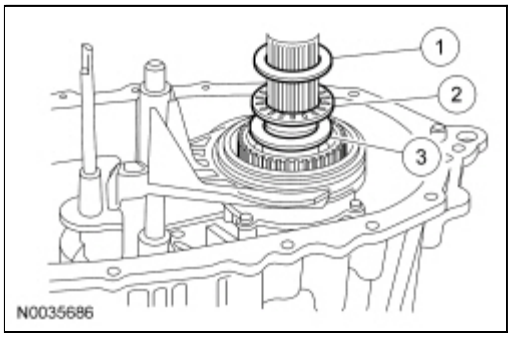
17. Remove and discard the snap ring.



18. ***NOTICE:*** **When removing the clutch pack assembly, do not separate the clutch pack assembly. Keep tension on the clutch pack during removal. Set the clutch pack assembly on the bench in the same position as located in the transfer case. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem will occur.**

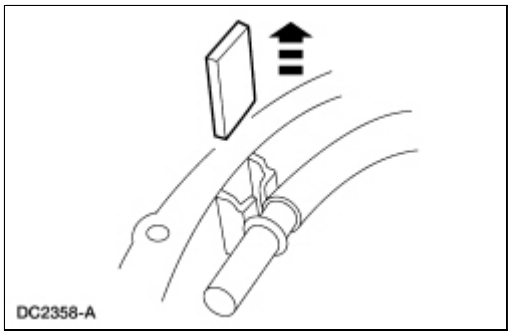
    NOTICE: **If the clutch pack is disassembled, a new clutch pack must be installed and the**

armature transferred. Failure to install a new clutch pack can result in component failure.

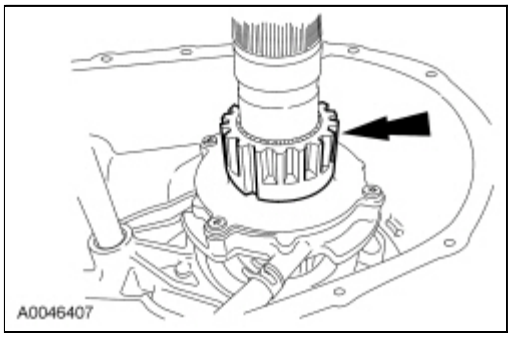


Remove the clutch pack assembly with the armature.

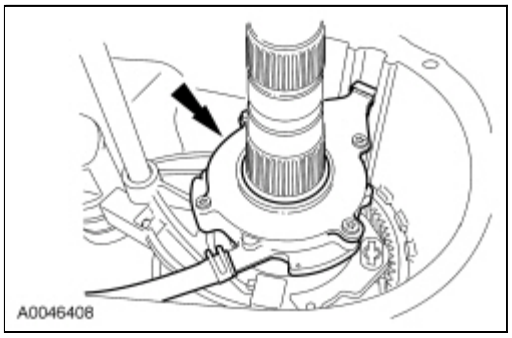
19. Remove the drive chain and the sprockets as an assembly.
    - Inspect the drive chain for wear or damage. Inspect the sprockets for broken or cracked teeth. Install new components as necessary.



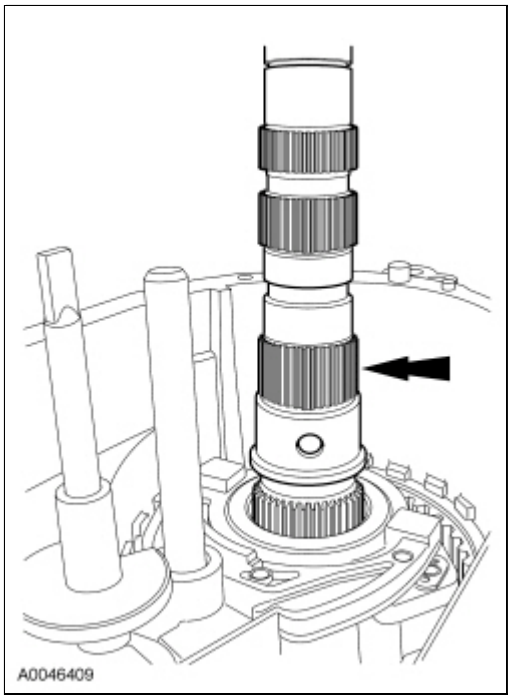
20. Remove the thrust bearing assembly.
    1. Remove the thrust washer.
        - The upper thrust washer may be attached to the sprocket.
    2. Remove the thrust bearing.
    3. Remove the thrust washer.
    - Inspect the washers and bearing for wear or damage. Install new components as necessary.



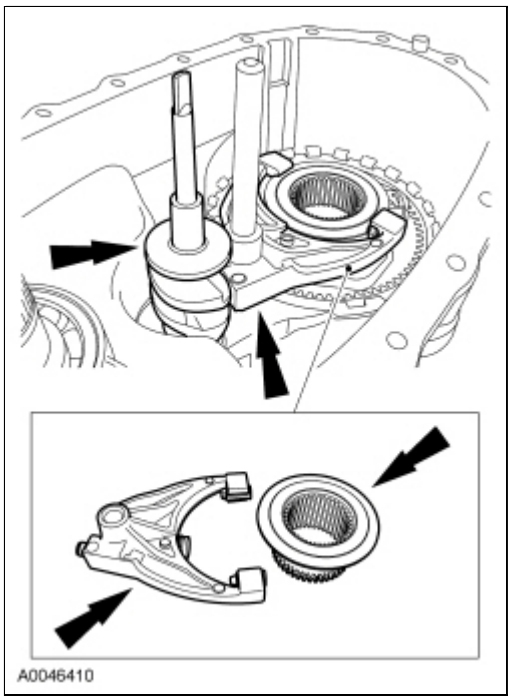
21. Remove and clean the oil pan magnet.



repair4less

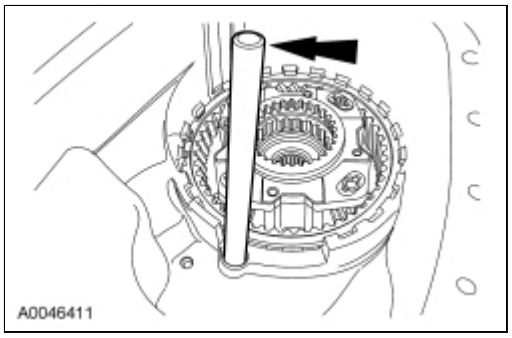


22. Remove the output shaft sprocket.

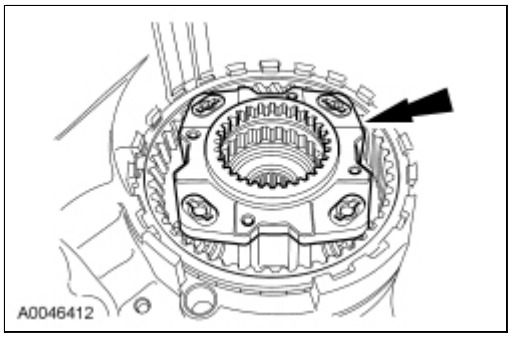


23. Remove the oil pump assembly.

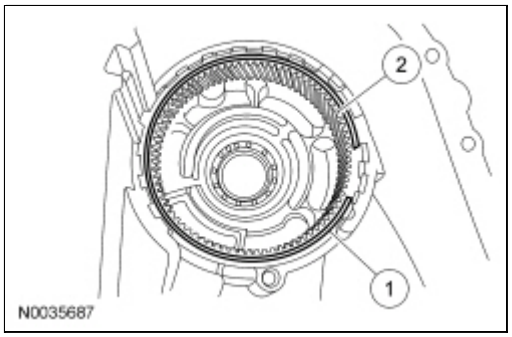
24. Remove the output shaft.



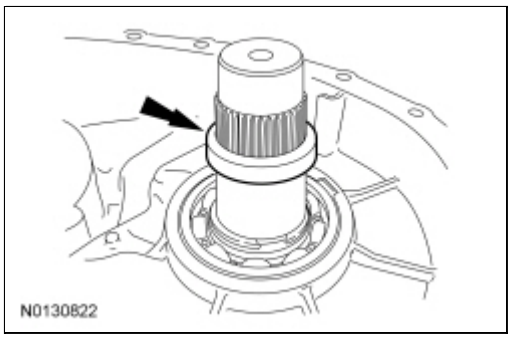
25. Remove the reduction shift fork, the reduction hub and the shift cam as an assembly.
    - Separate and inspect the reduction hub and the reduction shift fork for wear or damage. Do not disassemble the shift cam assembly.



26. Remove the shift fork shaft.

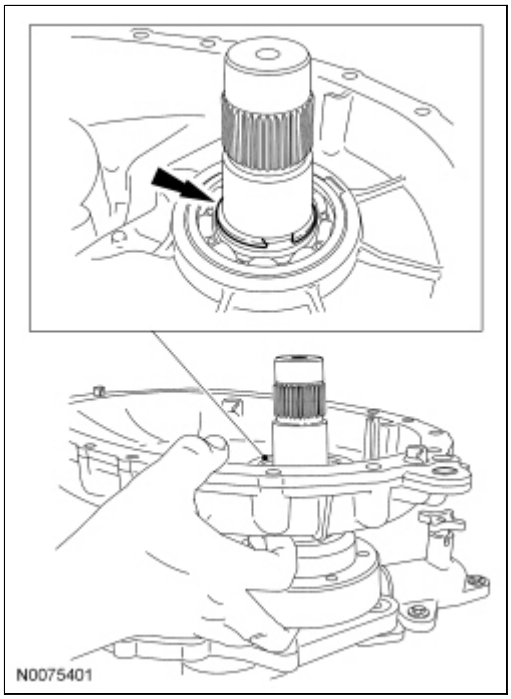


repair4less

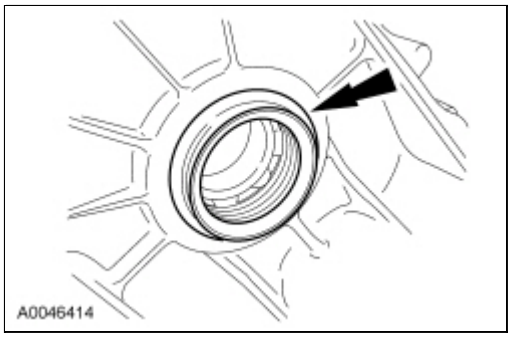


27. Remove the front planet.
    - Remove the front planet needle bearing, if necessary.

28. Remove the ring gear.
    1. Remove the snap ring.
        - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.
    2. Remove the ring gear.



29. Remove the driven sprocket spacer.

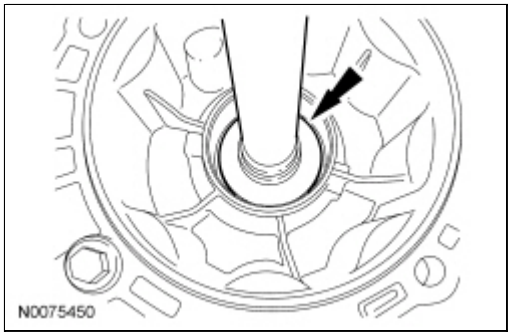


30. **NOTE:** Do not let the front output shaft fall when removing the snap ring.

    Remove the snap ring and the front output shaft.
    - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.

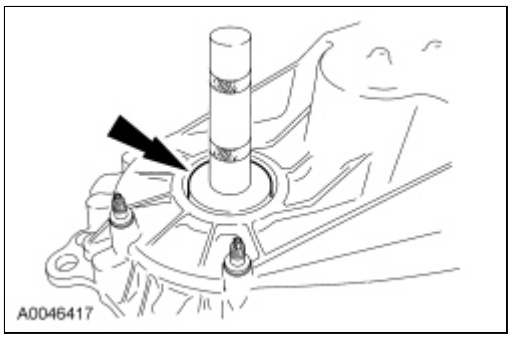
31. ***NOTICE:*** **Carefully remove the seal, do not damage the seal bore.**

    Remove and discard the front output shaft oil seal.

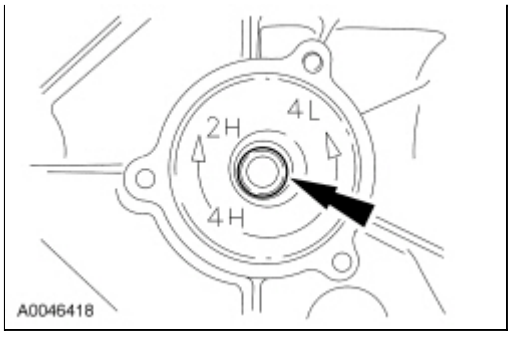


32. ***NOTICE:*** **Carefully remove the seal, do not damage the seal bore.**

    Remove and discard the front input shaft seal.



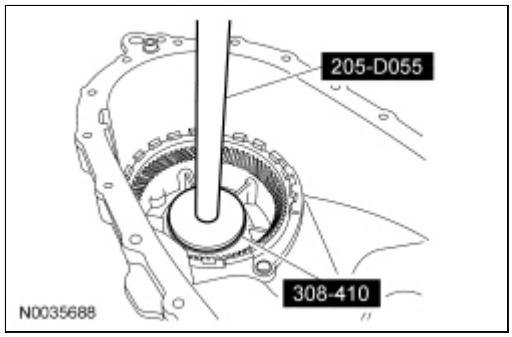
repair4less



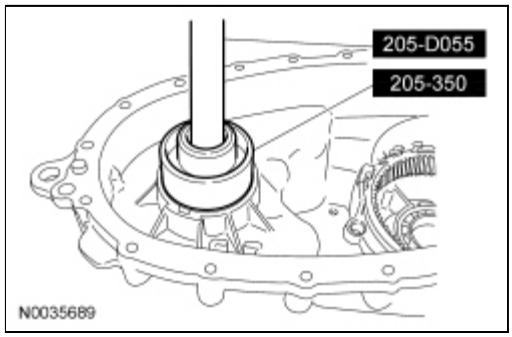
33. Remove the front planet support bearing.

34. Remove the front output shaft support bearing.
    - Inspect the bearing for wear or damage. Install a new bearing as necessary.

35. Remove and discard the shift shaft seal.

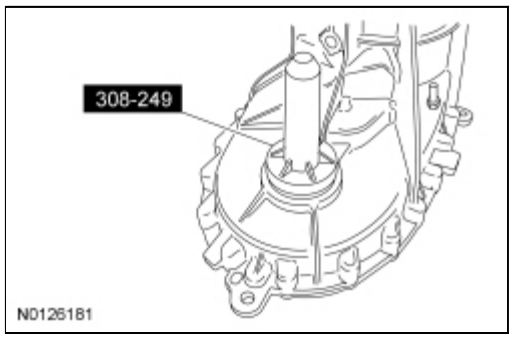


Assembly



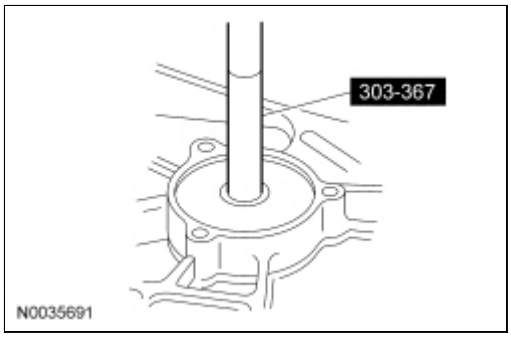
1. Lubricate all internal components with the recommended transfer case lubricant during reassembly.

2. Clean the mating surfaces of the cases.

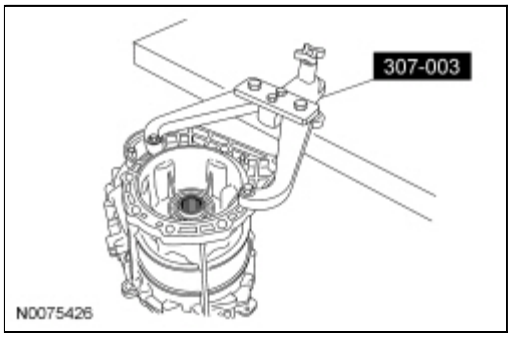


3. Using a press and the Output Shaft Front Bearing Installer with the Handle, install the front planet support bearing.

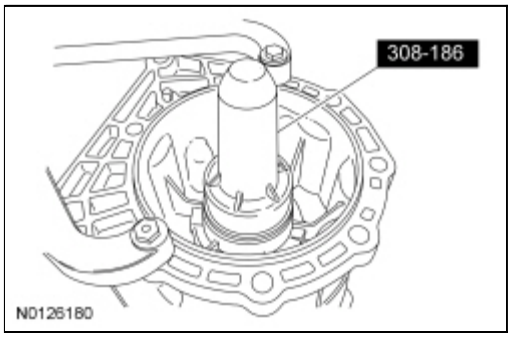
4. Using a press and the Front Axle Oil Seal Installer with the Handle, install the front output shaft support bearing.



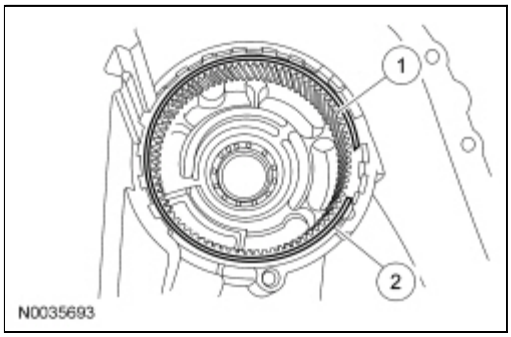
5. Using the Input Shaft Oil Seal Installer, install a new front output shaft seal.



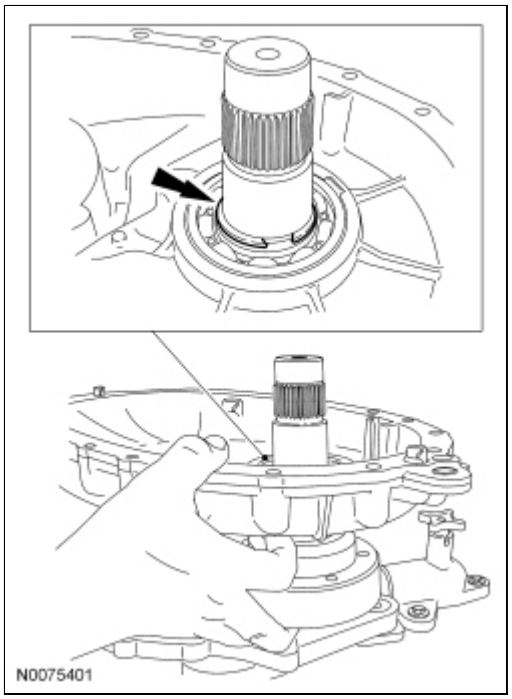
6. Using the Valve Stem Oil Seal Installer, install a new shift shaft seal.



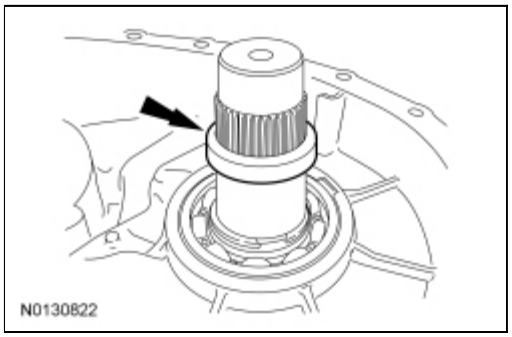
repair4less



7. Install the case to the Transmission Holding Fixture. Secure the case and the Transmission Holding Fixture to the work bench.

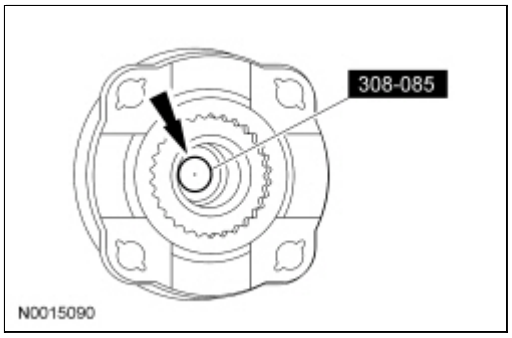


8. Using Input Shaft Oil Seal Installer, install a new front input shaft seal.

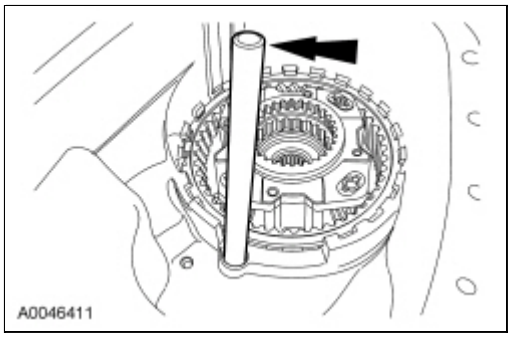


9. Install the ring gear.
    1. Position the ring gear in the case.
    2. Install the snap ring.

10. Install the front output shaft and the snap ring.

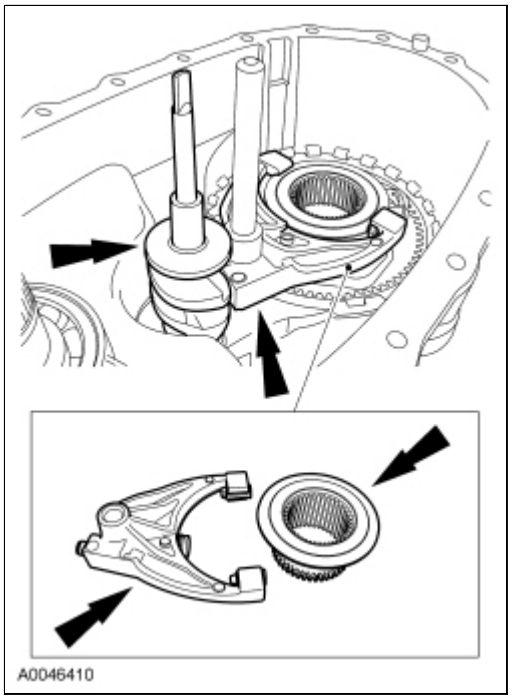


11. Install the driven sprocket spacer.

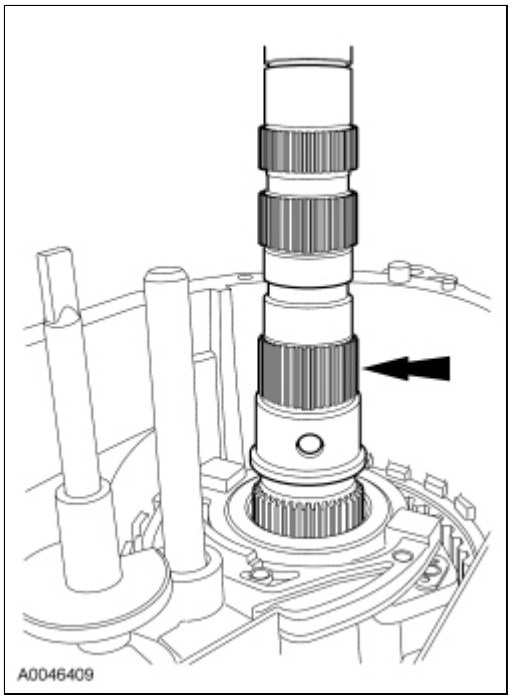


12. ***NOTICE:*** **If removed, using a press and the Input Shaft Bearing Installer, install the needle bearing into the front planet. Be careful not to damage the bearing cage.**

    Install the front planet.

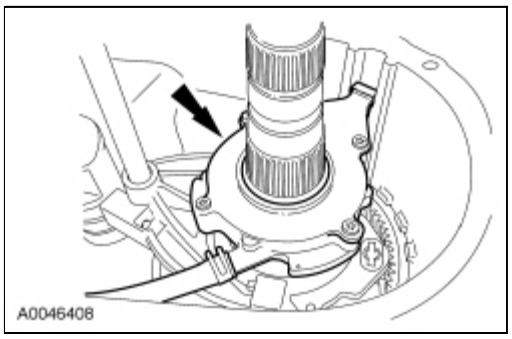


13. Install the shift fork shaft.

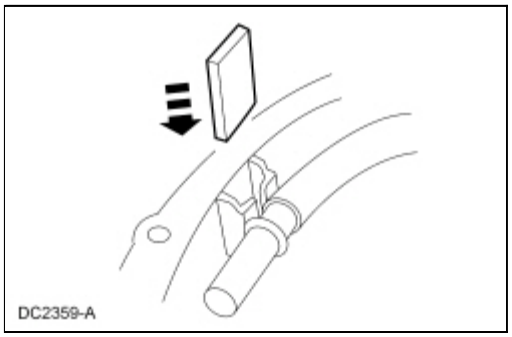


repair4less

14. Assemble the reduction hub and the reduction shift fork. Install the reduction shift fork, the reduction hub and the shift cam as an assembly.

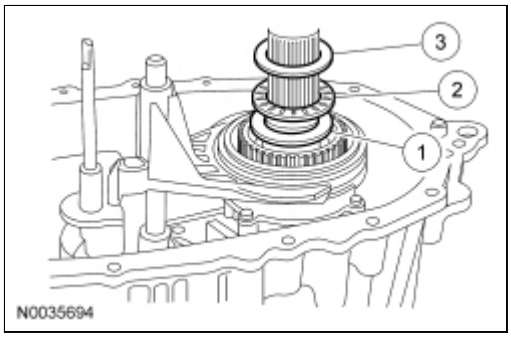


15. Install the output shaft.

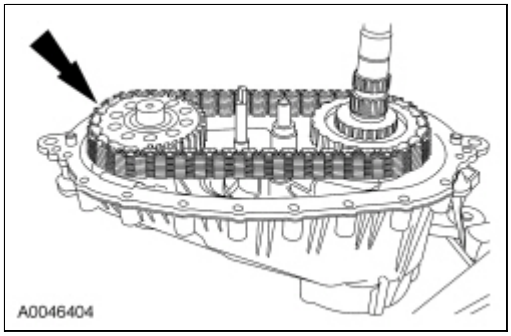


16. **NOTE:** Make sure the oil pump finger is in the slot in the case.

    Install the oil pump assembly.

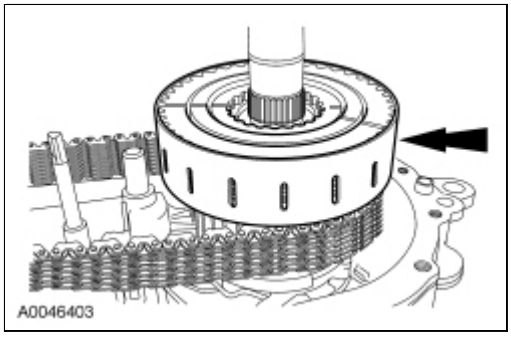


17. Install the oil pan magnet into the slot in the case.

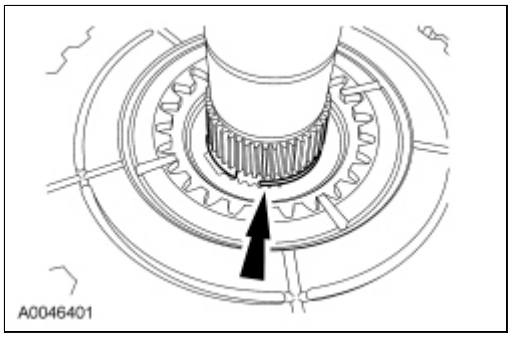


18. Install the 3-piece thrust bearing assembly.
    1. Install the thrust washer.
    2. Install the thrust bearing.
    3. Install the thrust washer.

repair4less



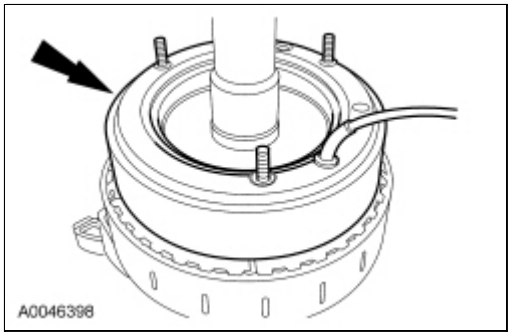
19. Install the drive chain and the sprockets as an assembly.



20. ***NOTICE:*** **When installing the clutch assembly, do not separate the clutch pack assembly. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem will occur.**

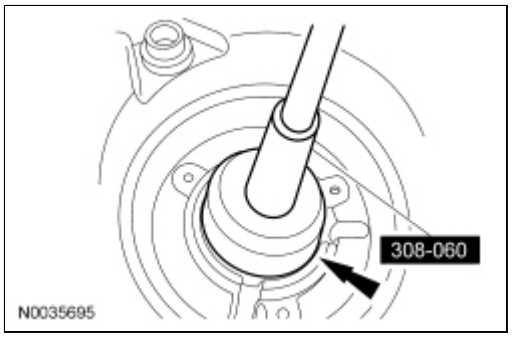
    NOTICE: **If the clutch pack is disassembled, a new clutch pack must be installed and the armature transferred. Failure to install a new clutch pack can result in component failure.**

    Install the clutch pack assembly with the armature.

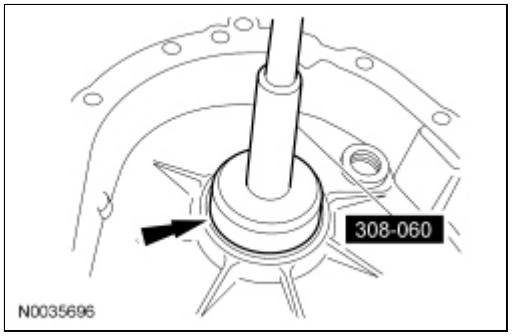


21. Install a new snap ring.

22. Install the wave spring.
23. Install the cam and the steel balls.

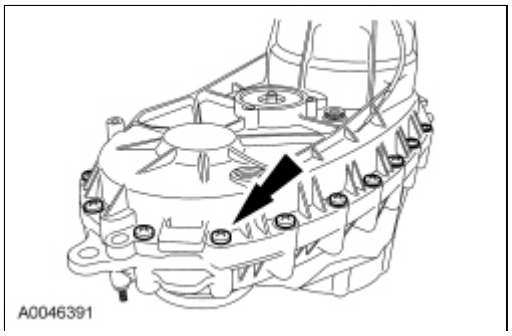


24. Install the cam/coil housing.

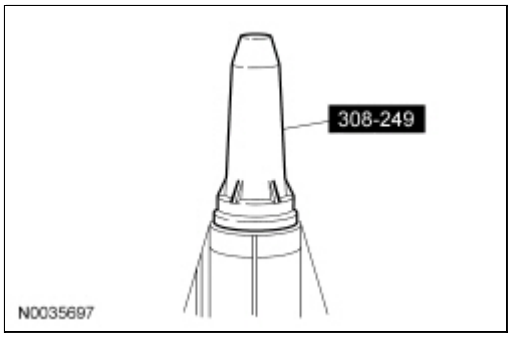


25. Install the thrust bearing assembly.
26. Install the snap ring.
27. Using a press and the Mainshaft Bearing Installer, install the rear output shaft support bearing.

repair4less



28. Using a press and the Mainshaft Bearing Installer, install the front output shaft rear bearing.



29. **NOTE:** Only apply enough silicone sealant to seal the transfer case halves together.

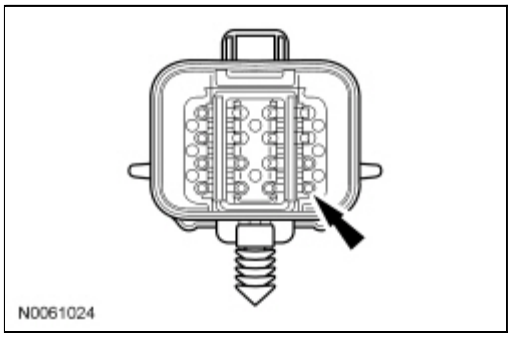
    Apply a bead of silicone sealant to the transfer case mating surface, then position the 2 transfer case halves together. Tighten the 20 transfer case bolts evenly in a star pattern.
    - Position the coil studs through the case holes, making sure the shift cam shaft is aligned with its case bore and the lockup shift fork spring is in position.
    - Tighten to 29 Nm (21 lb-ft).

30. Install the 3 coil washers and nuts.
    - Tighten to 10 Nm (89 lb-in).

31. Using the Input Shaft Oil Seal Installer, install the rear output shaft seal.

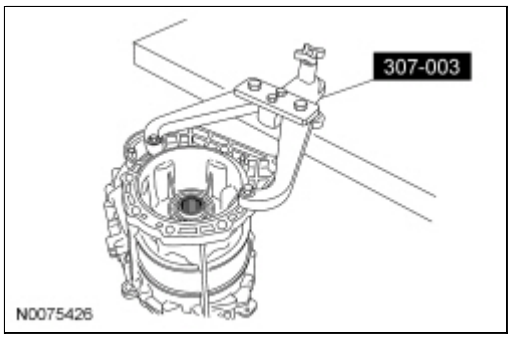
32. Apply a small bead of silicone sealant to the transfer case shift motor mating surface.

NOTICE: **When installing the shift motor, tighten the bracket nuts last. Failure to follow the steps in the correct order may result in damage to the component.**



33. Install the transfer case shift motor and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

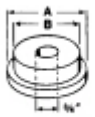
34. Install the transfer case shift motor bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

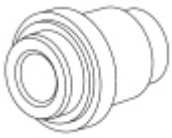


35. Secure the transfer case shift motor bracket nuts.

36. **NOTE:** After the wire is inserted into the connector, gently pull the wire back to verify the pin is locked inside the connector.

    Insert the coil wire pin in the electrical connector and install the inner connector retainer.





37. Secure the transfer case to a transmission jack and remove the transfer case from the Transmission Holding Fixture.

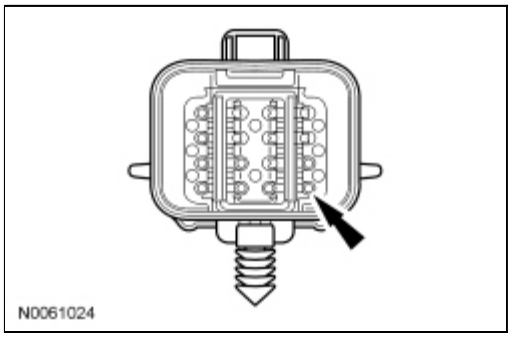
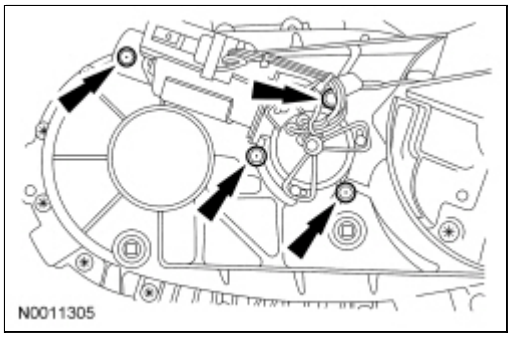
Disassembly

NOTE: Discard all seals after removing them.

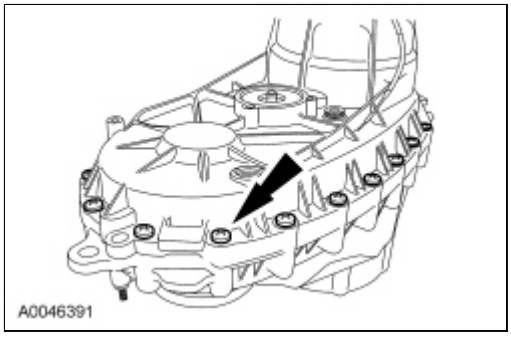


1. Clean the transfer case with solvent and dry with compressed air.
2. Using the Transmission Holding Fixture, secure the transfer case to the bench.

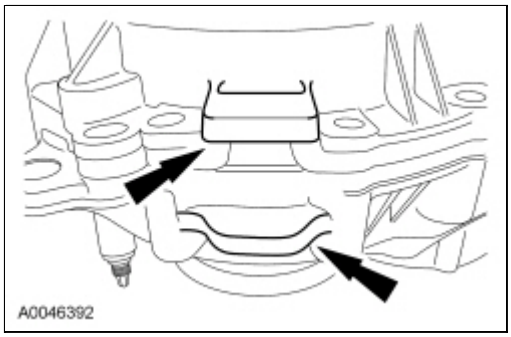


3. Remove the rear output shaft seal.

4. Remove the inner connector retainer. Press the release tab and remove the coil wire from the electric shift motor electrical connector.

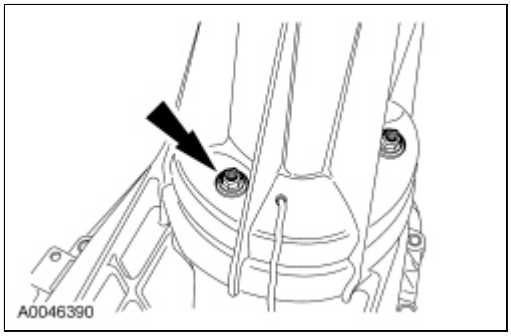


5. Remove the 3 transfer case shift motor bolts, bracket bolt and loosen the 2 bracket nuts.

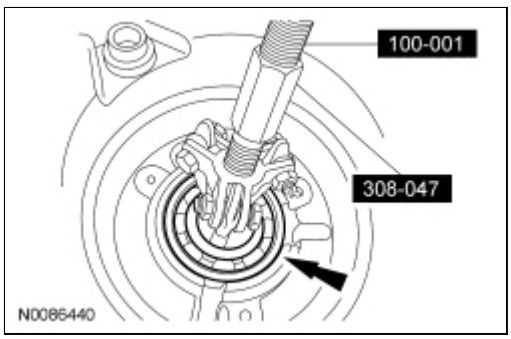


6. **NOTE:** The transfer case bolts are self tapping, and it is normal to find metal shavings while removing the cover.

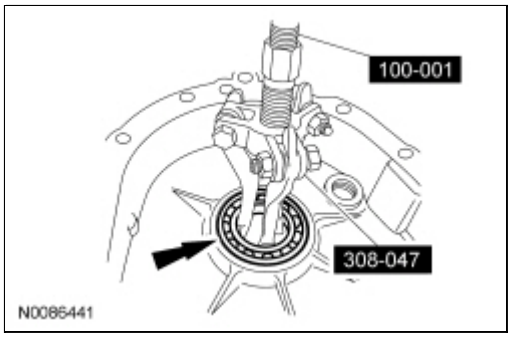
repair4less



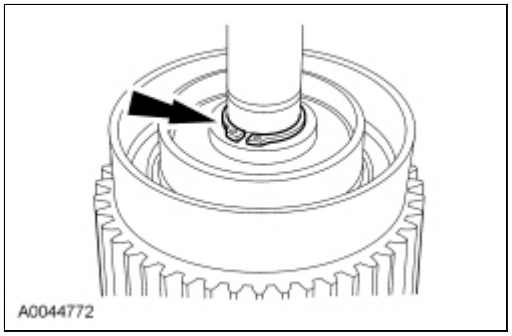
Remove the 20 transfer case bolts.



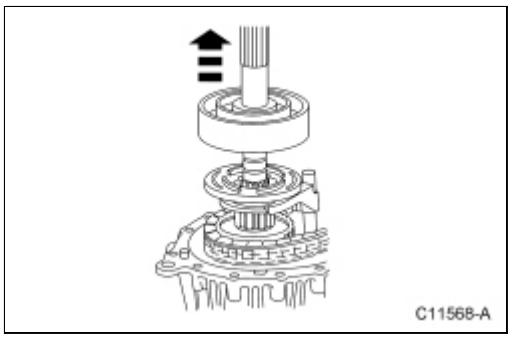
7. Using the pry bosses, separate the transfer case covers.



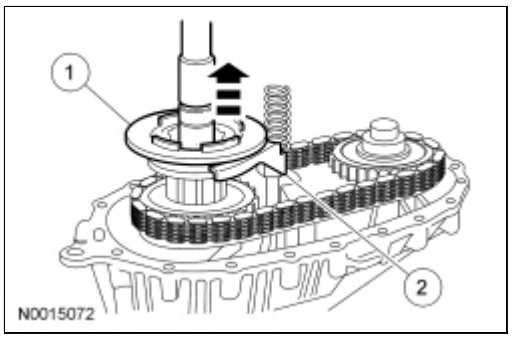
8. Remove the 3 transfer case field coil nuts, washers and transfer case field coil.



9. Using the Bearing Cup Remover with the Slide Hammer, remove the rear output shaft bearing.



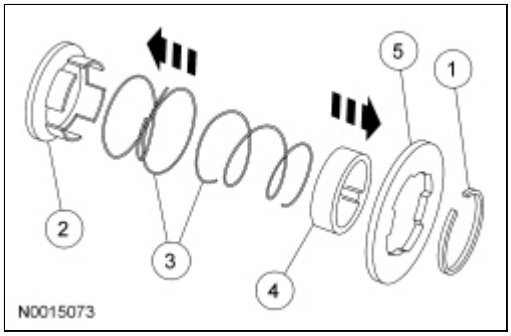
10. Using the Bearing Cup Remover with the Slide Hammer, remove the front output shaft bearing.



11. Remove the shift collar hub snap ring.

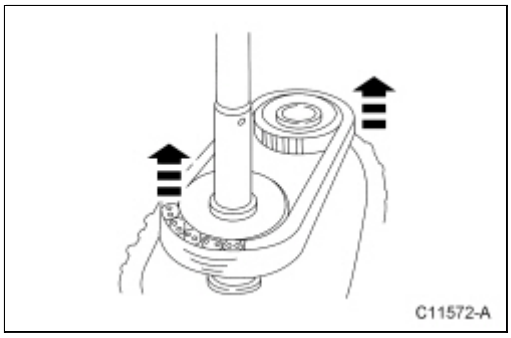
12. Remove the coil housing.

13. Remove the shift fork.
    1. Remove the lockup hub.
    2. Remove the shift fork and spring.



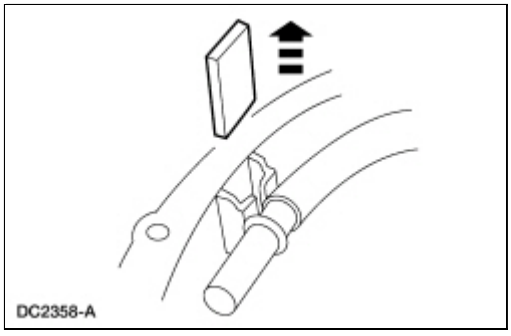
14. **NOTE:** Remove the lockup hub assembly as a single unit. If disassembly is required, proceed with the following.

repair4less



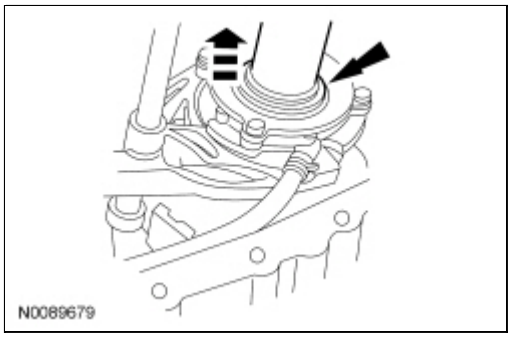
Disassemble the lockup hub assembly.

1. Remove the lockup hub snap ring.
2. Separate the lockup collar.
3. Separate the 2 lockup springs.
4. Separate the lockup hub.
5. Remove the armature.

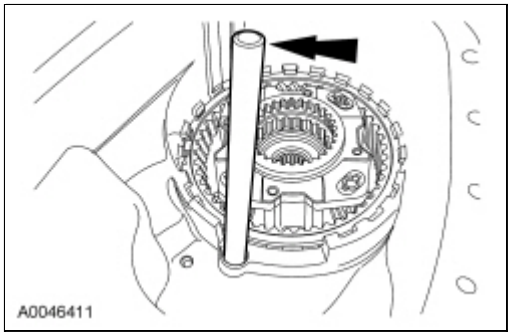


15. **NOTE:** Remove the drive chain and sprockets as an assembly.

    Remove the drive chain, sprockets and the thrust washer.



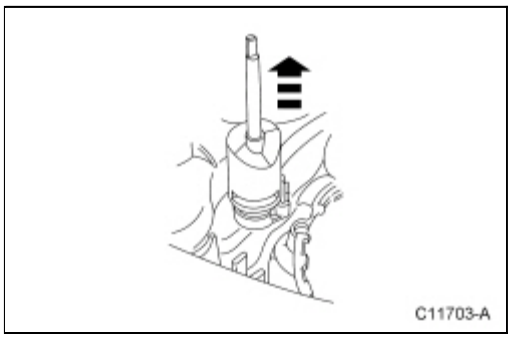
16. Remove the magnet from its slot in the case.



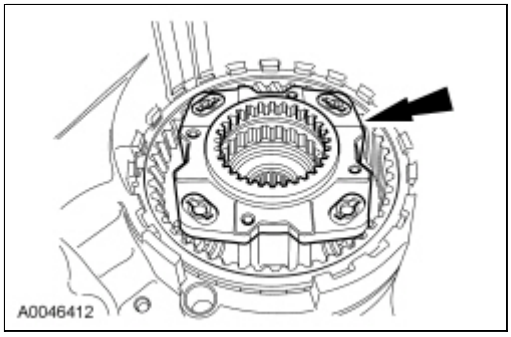
17. **NOTE:** The pump assembly is not repairable.

    Remove the oil pump and the output shaft as an assembly. Remove the oil pump from the output shaft.

18. Remove the shift rail.

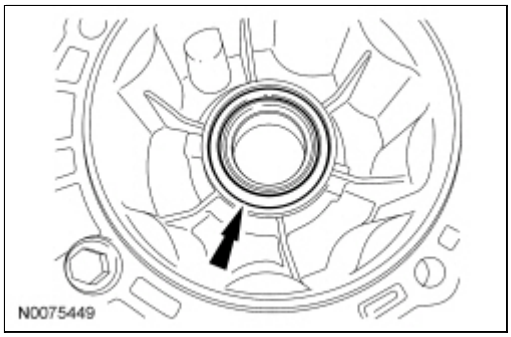


19. Remove the shift fork and the reduction hub.
    1. Remove the shift fork.
    2. Remove the reduction hub.

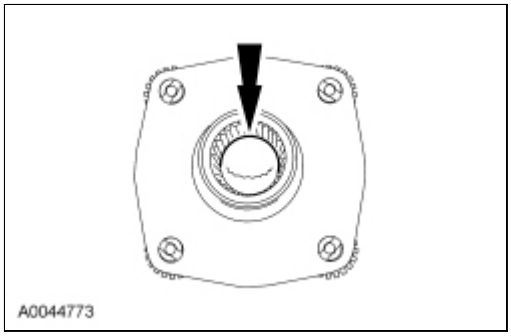


20. **NOTE:** The electric shift cam is serviced as an assembly. Do not disassemble the shift cam assembly.

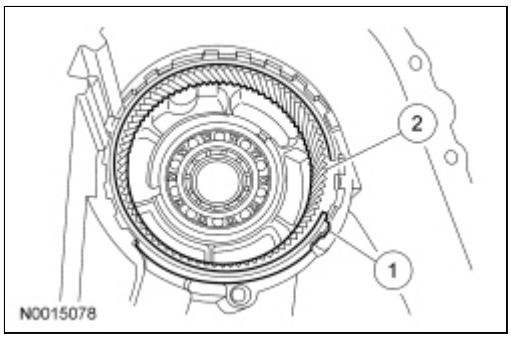
    Remove the electric shift cam assembly.



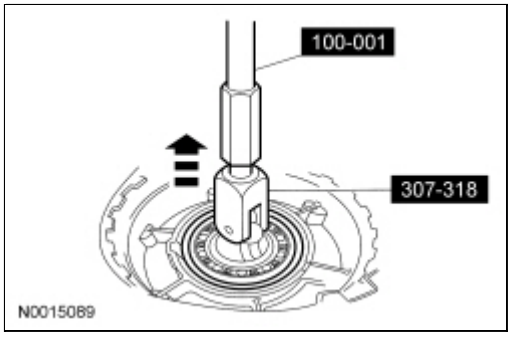
repair4less



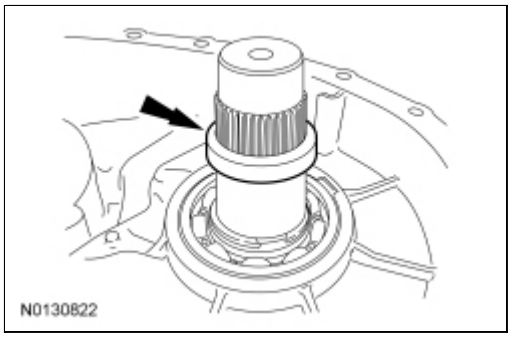
21. Remove the front planet carrier.



22. Remove and discard the front input shaft seal.

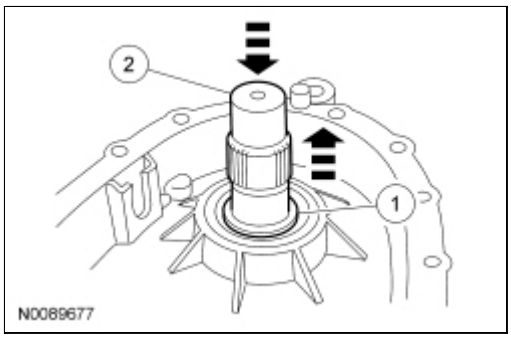


23. Remove the thrust bearing.
    - Remove the needle bearing, if necessary.

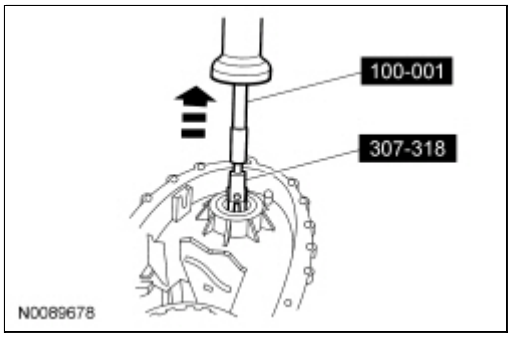


24. Remove the ring gear.
    1. Remove the ring gear snap ring.
    2. Remove the ring gear.

25. Using the Stator Bearing Remover with the Slide Hammer, remove the front planet carrier bearing.

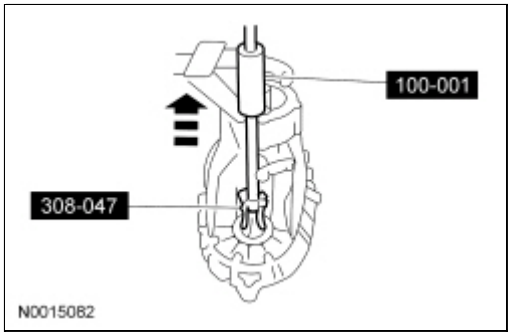


26. Remove the driven sprocket spacer.



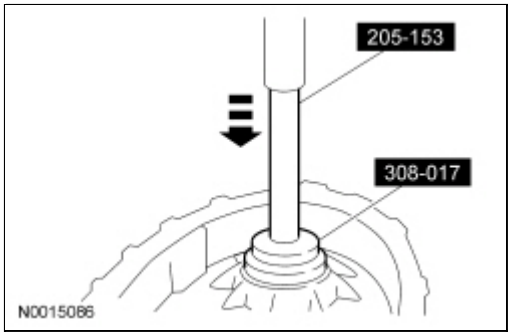
27. ***NOTICE:*** **Do not let the front output shaft fall while removing the snap ring or damage to the component may occur.**

    Remove the front output shaft.
    1. Remove the front output shaft snap ring.
    2. Remove the front output shaft.

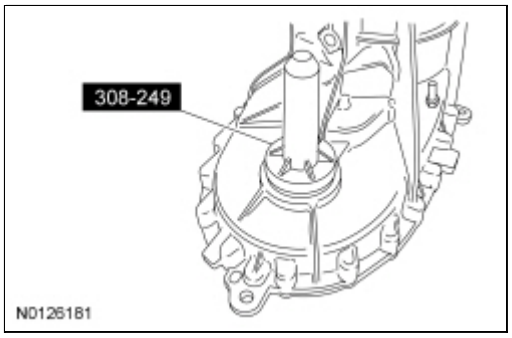


28. Using the Stator Bearing Remover with the Slide Hammer, remove the front output shaft bearing.

repair4less

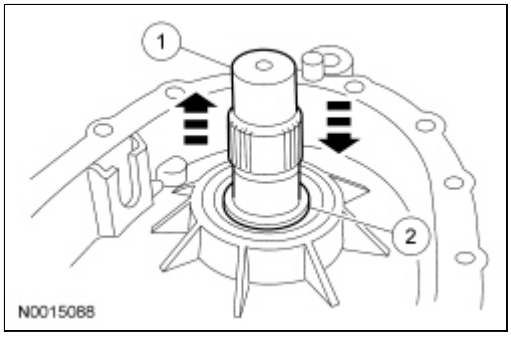


29. Using the Bearing Cup Remover with the Slide Hammer, remove the front output shaft seal.

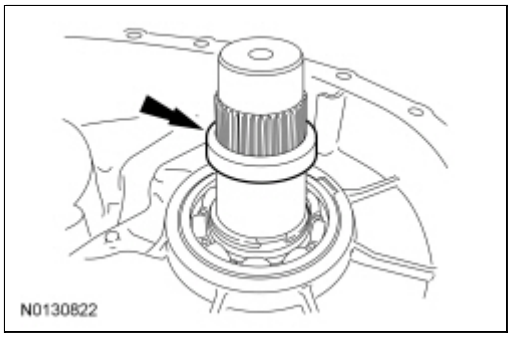


Assembly

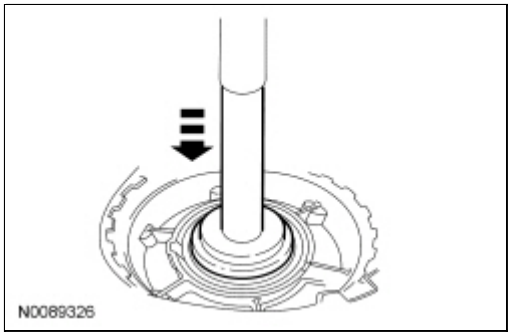
1. Using a press and the Bearing Cup Installer with the Handle, install the front output shaft bearing.



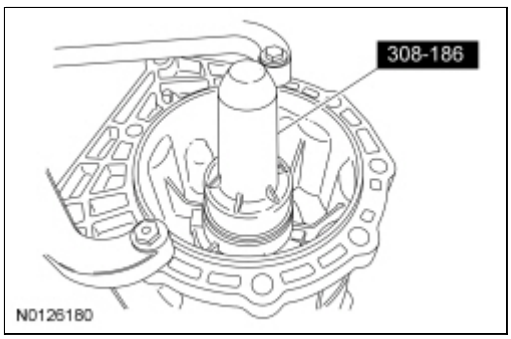
2. Using the Input Shaft Oil Seal Installer, install the front output shaft seal.



3. Install the front output shaft.
    1. Position the front output shaft.

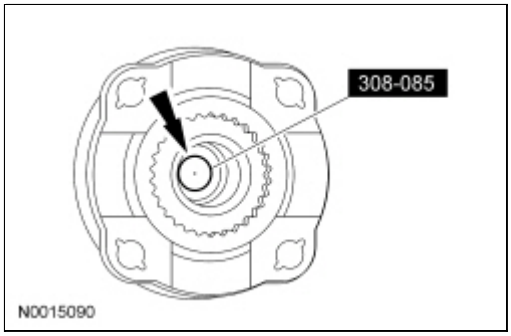


2. Install the front output shaft snap ring.

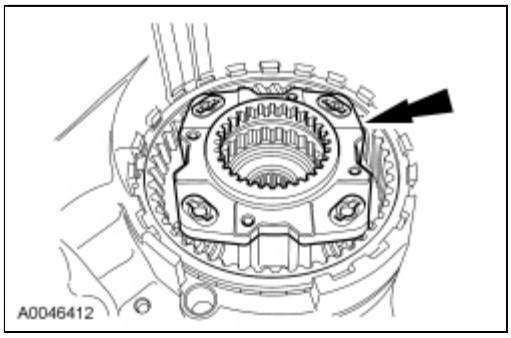


4. Install the driven sprocket spacer.

5. Install the front planet carrier bearing.

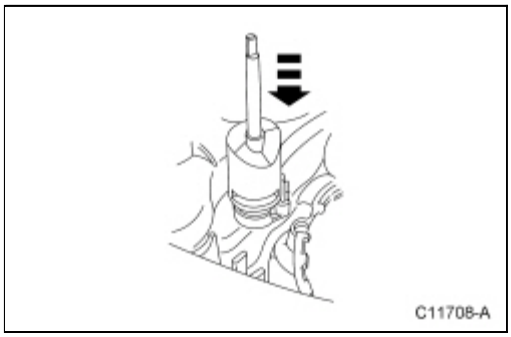


6. Using the Input Shaft Oil Seal Installer, install the front input seal.

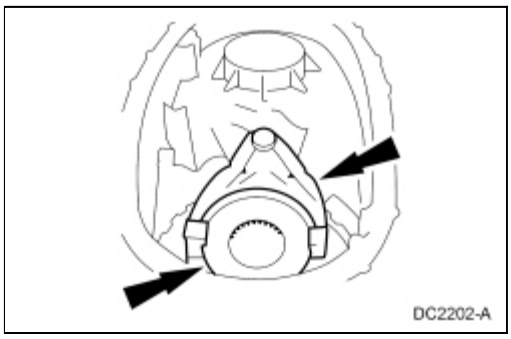


7. Position the ring gear in the case. Install the ring gear snap ring.

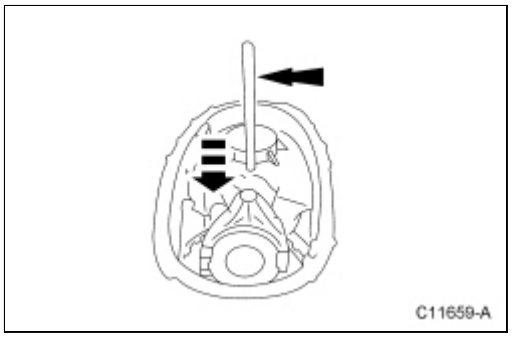
repair4less



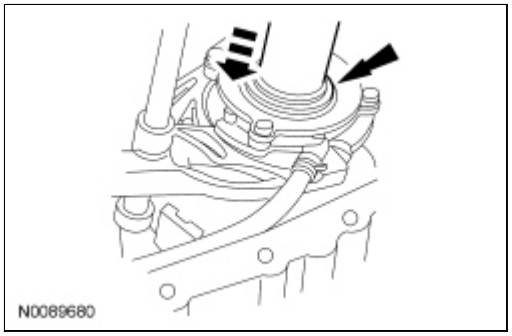
8. If removed, using a press and the Input Shaft Bearing Installer, install the needle bearing into the front planet carrier.



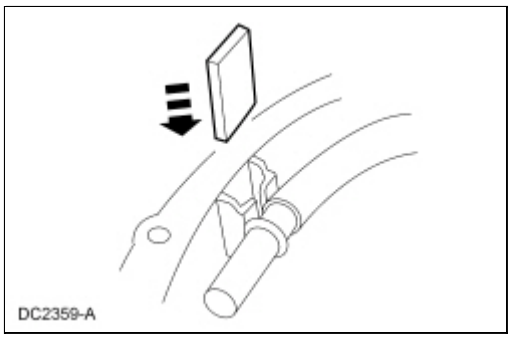
9. Install the front planet carrier and the thrust bearing.



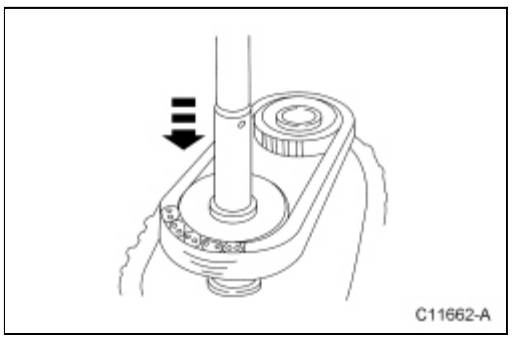
10. Install the electric shift cam assembly.



11. Install the shift fork and the reduction hub.

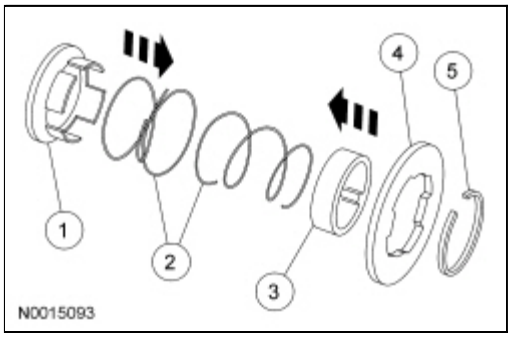


12. Install the shift rail.

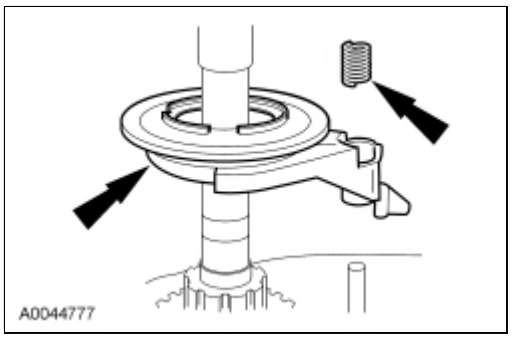


13. Install the oil pump, output shaft and the thrust washer.

14. Install the magnet into its slot in the case.

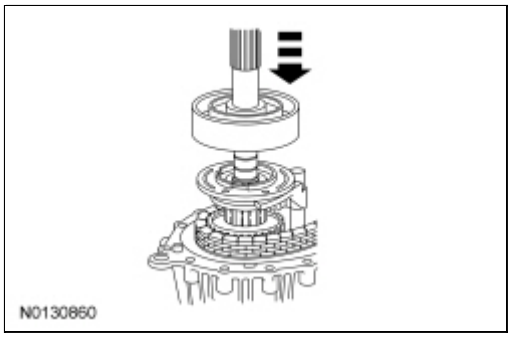


15. Install the drive chain and the sprockets as an assembly.

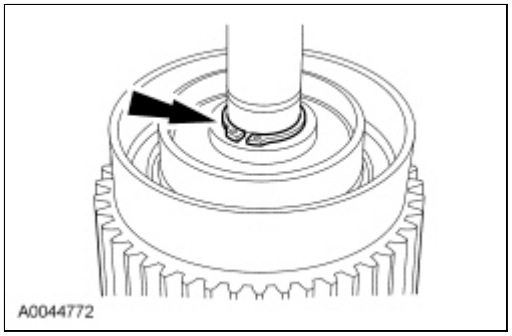


16. Install the lockup hub assembly. If the lockup hub assembly was disassembled, carry out the following steps.
    1. Position the lockup collar.
    2. Install the lockup collar springs.

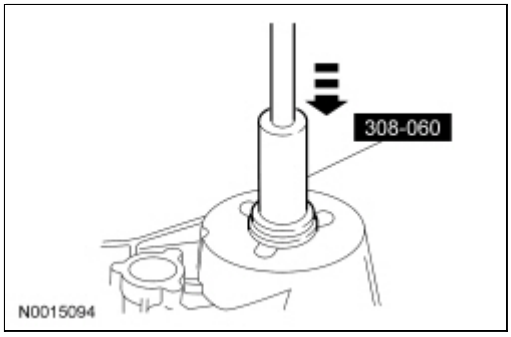
repair4less



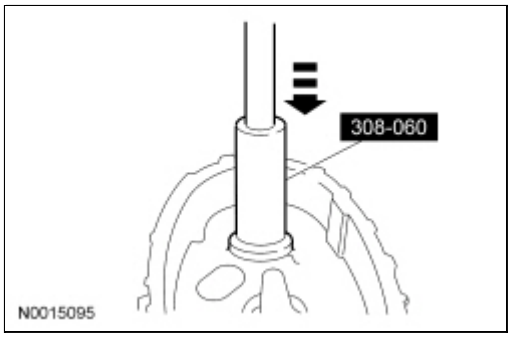
3. Install the lockup hub.
4. Install the armature.
5. Install the lockup hub snap ring.



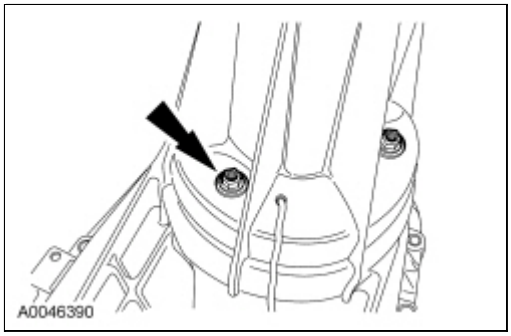
17. Install the lockup hub and the shift fork and spring.



18. Install the coil housing.



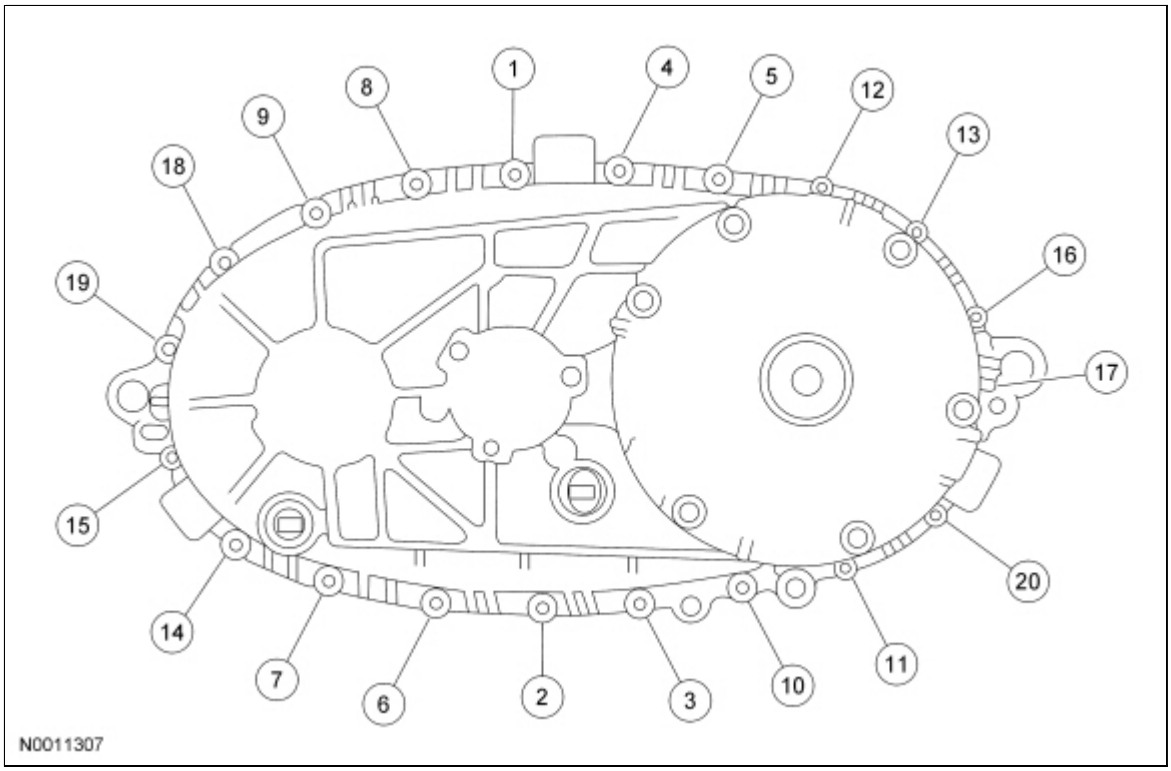
19. Install the snap ring.



20. Using the Mainshaft Bearing Installer, install the rear output shaft bearing.

21. Using the Mainshaft Bearing Installer, install the front output shaft bearing.

22. Install the transfer case field coil, washers and the 3 nuts.
    - Tighten to 10 Nm (89 lb-in).

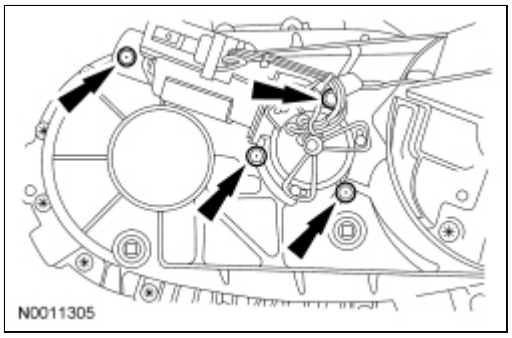


23. **NOTE:** Only apply enough silicone sealant to seal the transfer case halves together.

    Apply a small bead of silicone sealant to the mating surface of the case and cover.

24. Position the 2 transfer case halves and tighten the 20 bolts in the sequence shown.
    - Tighten to 24 Nm (18 lb-ft).

repair4less

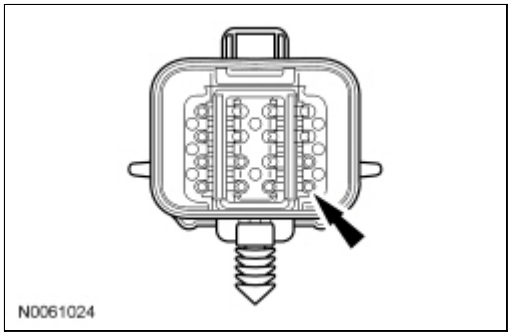


25. Using the Input Shaft Oil Seal Installer, install the rear output shaft seal.

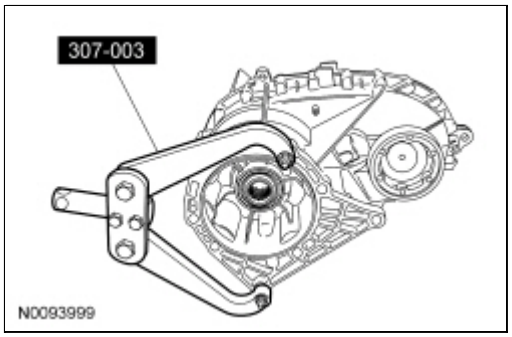
26. Apply a small bead of silicone sealant to the transfer case shift motor mating surface.

NOTICE: **The following steps need to be performed in the correct order when installing the transfer case shift motor. Failure to follow the steps in the correct order may result in damage to the component.**

27. Install the transfer case shift motor and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



28. Install the transfer case shift motor bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



29. Secure the 2 transfer case shift motor bracket nuts.
    - Tighten to 3 Nm (27 lb-in).

30. **NOTE:** After the coil wire is inserted into the connector, gently pull the wire back to verify the pin is locked inside the connector.

    Insert the coil wire pin in the electrical connector and install the inner connector retainer.

31. Remove the transfer case from the Transmission Holding Fixture.

repair4less

repair4less

Exhaust System

NOTICE: **When repairing exhaust system or removing exhaust components, disconnect all Heated Oxygen Sensor (HO2S) and all Catalyst Monitor Sensor (CMS) at the wiring connectors to prevent damage to the HO2S and CMS wiring harnesses. Refer to Section 303-14 for location of the HO2S and CMS .**

NOTICE: **Oil or grease-based lubricants on the isolators may cause the exhaust hanger isolator to separate from the exhaust hanger bracket during vehicle operation.**

NOTE: Exhaust fasteners are of a torque-prevailing design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

The exhaust system:

- has an exhaust Y-pipe dual catalytic converter that is a 2-piece assembly. The RH and LH converters can be serviced separately as needed.
- has 2 upstream Heated Oxygen Sensor (HO2S) mounted before the catalytic converters.
- has 2 Catalyst Monitor Sensor (CMS) mounted on catalytic converters.
- has an intermediate pipe.
- has muffler brackets with isolators at the front and rear of the muffler, bolted to the body.
- production muffler and tail pipe assembly is a one-piece design.

repair4less

Exhaust System

Inspection and Verification

1. Verify the concern by running the engine (with the vehicle on the ground) or road testing the vehicle to duplicate the condition.

2. Visually inspect the components of the exhaust system and related controls that may affect exhaust gas quality or loss of power.

3. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Exhaust pipe pinched or crushed • Damaged muffler and tail pipe assembly • Broken or damaged exhaust hanger brackets • Damaged catalytic converter • Cracked exhaust manifold • Loose or damaged heat shields

4. Verify that the exhaust system is installed correctly, with Torca® clamps correctly located and tightened to specification.

5. If the fault is not visually evident, determine the symptom. GO to Symptom Chart - Exhaust System or GO to Symptom Chart - NVH .

Symptom Chart — Exhaust System

Symptom Chart — Exhaust System

Condition	Possible Sources	Action
• Vehicle has low or no power — vehicle performance complaint	• Exhaust pipe pinched or crushed • Damaged catalytic converter • Loose obstruction in exhaust	• INSPECT the exhaust components for damage. REPAIR or INSTALL new components as necessary. TEST the system for normal operation. If the concern is still present, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for restricted exhaust.
	• Restricted exhaust	• CHECK drain holes for foreign

	(possible frozen condensate in muffler)	material. PARK the vehicle inside to thaw. TEST vehicle for normal operation. If concern is still present, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Burning smell — usually occurs at idle with possible traces of smoke	• Foreign material caught in exhaust system • Missing heat shields • Fluid leak on exhaust	• INSPECT the exhaust system for foreign material or missing heat shields. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Odor — described as a sulfur or rotten egg smell	• Catalytic converter	• At times, a slight sulfur smell is normal for catalytic converters. The cause is the sulfur content in the gasoline being used. ADVISE customer, no repair required.
	• Rich fuel conditions • Misfire conditions • Excessive sulfur content in fuel	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Visible rust on surface of exhaust pipes	• Catalytic converter/exhaust system	• Surface rust is a characteristic of materials used on exhaust systems. Exposure to heat or road salt may result in surface rust. INSPECT for perforations. If there are no perforations, condition is normal.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Rattle, squeaks or buzz-type noise — from the bottom of vehicle	• Loose or damaged heat shield	• INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and tighten to 7 Nm (62 lb-in). If the heat shields are missing, INSTALL new heat shields or exhaust system components as necessary. If a rattle, noise or buzz condition persists, INSTALL a new heat

repair4less

		shield or component as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged exhaust isolators	• CHECK that the exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Damaged exhaust isolator hanger bracket	• INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets or fasteners. TIGHTEN bolts to specification or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Catalytic converter • Muffler	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, lightly TAP on the exhaust components one at a time to duplicate the noise concern. DETERMINE if there are any loose or broken baffles or element. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Drone or clunk type noise — from bottom of vehicle	• Loose or damaged exhaust isolators	• INSPECT exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Whistles, boom, hum or ticking-type noise — noise tends to change as engine warms. Noises are often	• Exhaust system leak	• INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged Torca® clamps/fasteners, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which would indicate

accompanied by exhaust fumes		exhaust leakage at that point. To magnify a small leak, have an assistant hold a shop towel over the tail pipe outlet, while listening for a leak. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Catalytic converter • Muffler	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, lightly TAP on the exhaust components one at a time to duplicate the noise concern. DETERMINE if there are any loose or broken baffles or element. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust muffler drain hole enlarged due to corrosion	• **NOTE:** Check with vehicle on the ground, not on a hoist. CONFIRM drain holes are the noise source. INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Thermal expansion of exhaust versus heat shields	• This is a normal condition.
• Hissing or rushing noise — high frequency sound. Vehicle performance is unaffected	• Exhaust system. Exhaust flow through pipes	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, lightly TAP on the exhaust components one at a time to duplicate the noise concern. DETERMINE if there are any loose or broken baffles or element. CHECK for missing or leaking Torca® clamps or couplings. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Pinging noise — occurs when exhaust system is hot, engine turned off	• Catalytic converter/exhaust system • Thermal expansion of exhaust system	• Cool down pinging is the exhaust system expanding and contracting during heating and cooling. This is a normal condition.
• Vibration — occurs at idle	• Loose or damaged exhaust isolators	• INSPECT the exhaust isolators for wear or damage. INSTALL new

repair4less

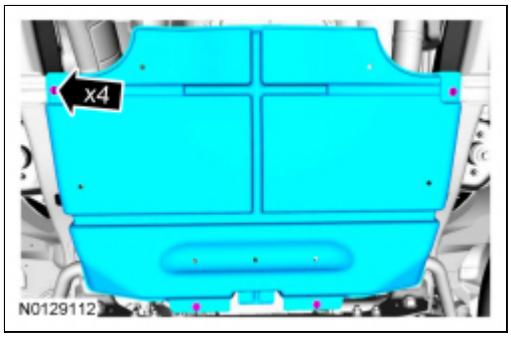
and at low speeds. Also accompanied by clunk or buzz type noise		isolators as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged exhaust isolator hanger brackets	• INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary. TEST the system for normal operation after the repair.
	• Damper missing or damaged, if equipped	• INSPECT for missing or damaged damper. INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust system grounded to chassis	• CARRY OUT the Exhaust System Alignment in this section.
• Engine drumming noise — normally accompanied by vibration	• Damaged or misaligned exhaust system	• INSPECT the exhaust system for loose or damaged fasteners, Torca® clamps, couplings or isolators. CARRY OUT the Exhaust System Alignment in this section. TEST the system for normal operation after the repair.
• Sputter type noise — noise worse when cold, lessens or disappears when the vehicle is at operating temperature	• Damaged or worn exhaust system	• INSPECT the exhaust system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
• Thumping noise — from the bottom of the vehicle, worse at acceleration	• Misaligned exhaust system	• CHECK the exhaust system-to-chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary. TEST the system for normal operation after the repair.
• Engine vibration — is felt with increases and decreases in engine rpm	• Strain on exhaust system isolators	• CARRY OUT the Exhaust System Alignment in this section. REPAIR as necessary. TEST the system for normal operation after the repair.
• Drumming noise — occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	• Exhaust system vibration excites the body resonances inducing interior noise	• GO to Pinpoint Test A .

Pinpoint Test

Pinpoint Test A: Drumming Noise

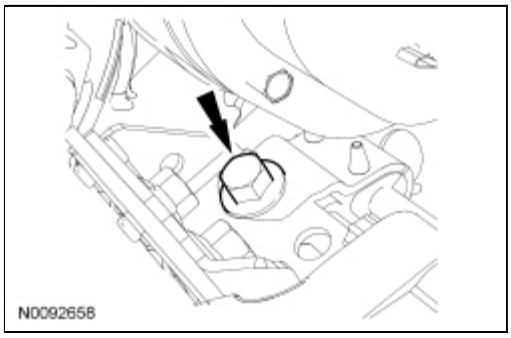
This pinpoint test is intended to diagnose the following:

- Exhaust system



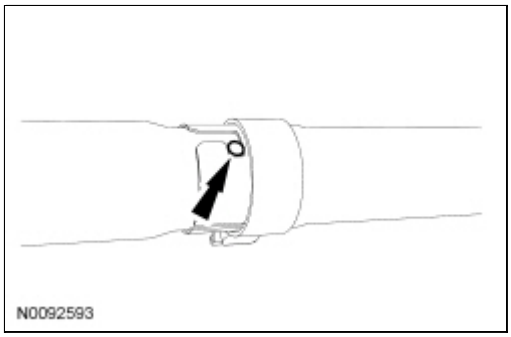
PINPOINT TEST A: DRUMMING NOISE

Test Step	Result / Action to Take
A1 CHECK THE EXHAUST SYSTEM • Start the engine. • Increase the engine rpm until the noise is the loudest. Note the engine rpm. • Ignition OFF. • Add approximately 9 kg (20 lb) of weight to the exhaust system. First place the weight at the tail pipe and test, then at the front pipe. • Start the engine. • Increase the engine rpm and listen for the drumming noise. Note the engine rpm if the noise occurs. • Ignition OFF. • Determine the amount of vibration that occurs with the drumming noise. • **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different rpm?**	**Yes** REFER to Exhaust System Alignment in this section. TEST the system for normal operation. **No** CONDUCT a diagnosis on other suspect systems. REFER to Section 100-04 .

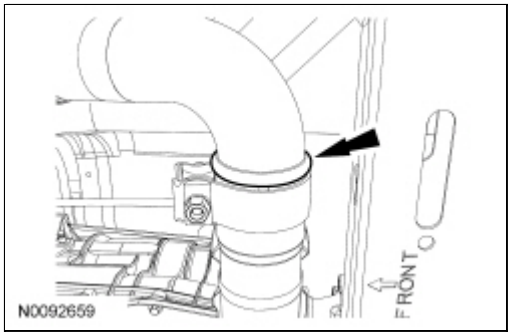


repair4less

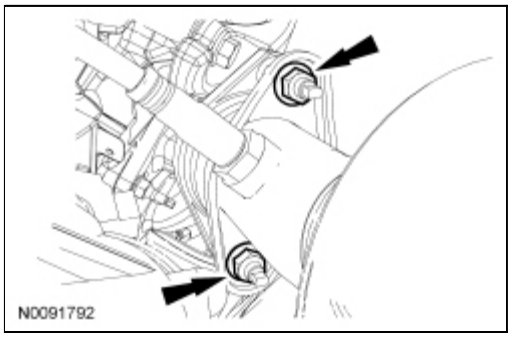
Exhaust System Alignment



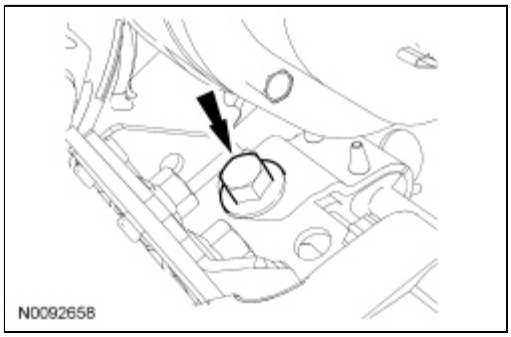
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If equipped, release the 4 fasteners and remove the splash shield.



3. Loosen all exhaust system component fasteners adjoining the exhaust system.
4. Loosen the 2 front muffler isolator and bracket assembly bolts.
5. Loosen the LH isolator cap bolt.

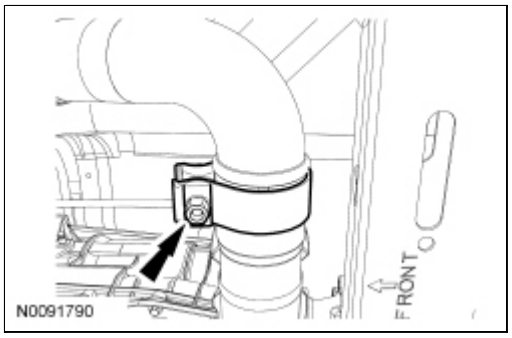


6. Make sure the button on the exhaust intermediate pipe is fully inserted into the L-notch on the muffler and tail pipe assembly inlet pipe.

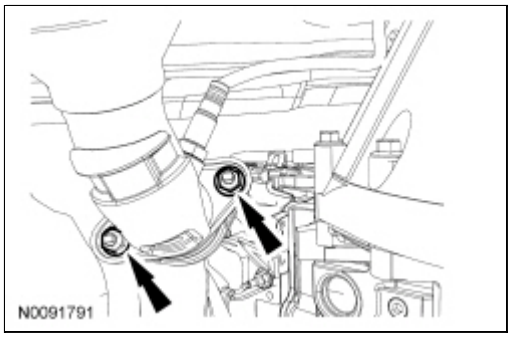


7. Make sure the LH catalytic converter is fully seated into the RH catalytic converter up to the stop on the LH catalytic converter.

8. Tighten the RH catalytic converter-to-exhaust manifold or turbocharger nuts in the following sequence.
    1. Tighten the RH lower catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).
    2. Tighten the RH upper catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).



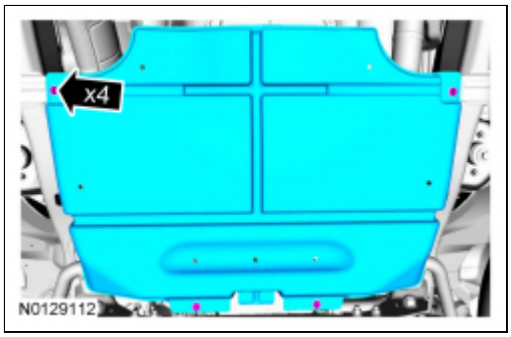
9. Tighten the LH isolator cap bolt.
    - Tighten to 55 Nm (41 lb-ft).



10. Tighten the RH catalytic converter-to-LH catalytic converter Torca® clamp.
    - Tighten to 55 Nm (41 lb-ft).

repair4less

11. Tighten the LH catalytic converter-to-exhaust manifold or turbocharger nuts in the following sequence.
    1. Snug the LH inner catalytic converter-to-exhaust manifold or turbocharger nut.
    2. Tighten the LH outer catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).
    3. Tighten the LH inner catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).

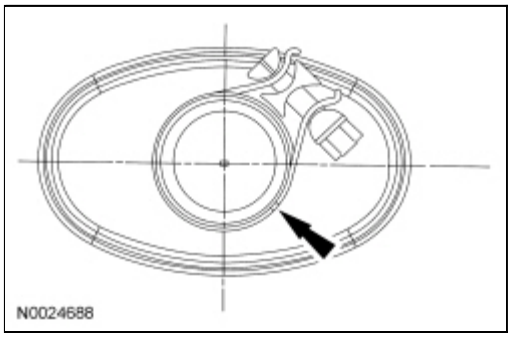


12. Tighten the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts in the following sequence.
    1. Snug the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt.
    2. Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    3. Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

13. Tighten the exhaust intermediate pipe-to-muffler and tail pipe assembly exhaust Torca® clamp.
    - Tighten to 47 Nm (35 lb-ft).

14. Tighten the 2 front muffler isolator and bracket assembly bolts.
    - Tighten to 30 Nm (22 lb-ft).

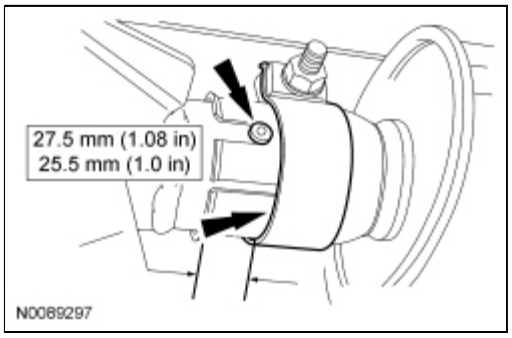
15. If equipped, install the splash shield and the 4 fasteners.



16. Start the engine and check the exhaust system for leaks.

---

repair4less



Torca® Clamp

1. Remove the nut from the Torca® clamp.
2. Grind the spot weld and the tac weld from the Torca® clamp and remove the clamp.
3. Clean the uneven surface area and position the Torca® clamp.

4. **NOTE:** Make sure the clamp position is no more than 27.5 mm (1.08 in) or less than 25.5 mm (1 in) from the inlet of the resonator pipe.

   Make sure the back of the slot is covered by the clamp and the button is fully seated inside the notch.

5. **NOTE:** Do not tighten the clamp until the exhaust system has been aligned.

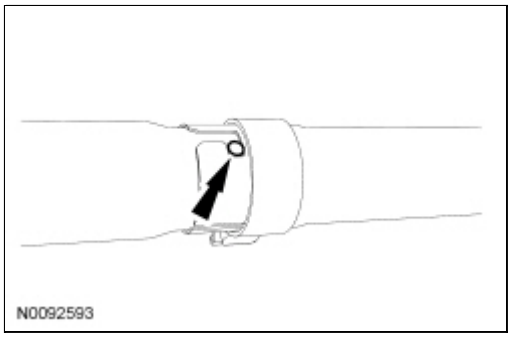
   Tighten the Torca® clamp.
   - Tighten to 55 Nm (41 lb-ft).

repair4less

Exhaust Intermediate Pipe

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the muffler and tail pipe. For additional information, refer to Muffler and Tailpipe in this section.

3. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and remove the exhaust intermediate pipe from the vehicle.

Installation

1. **NOTE:** Make sure the exhaust intermediate pipe is installed so the rear L-notch nub is at the 1 o'clock position.

   Position the exhaust intermediate pipe into the vehicle and install the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and tighten in the following sequence.
   1. Snug the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt.
   2. Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
   3. Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

2. Install the muffler and tail pipe. For additional information, refer to Muffler and Tailpipe in this section.

Exhaust Y-Pipe — Dual Catalytic Converter

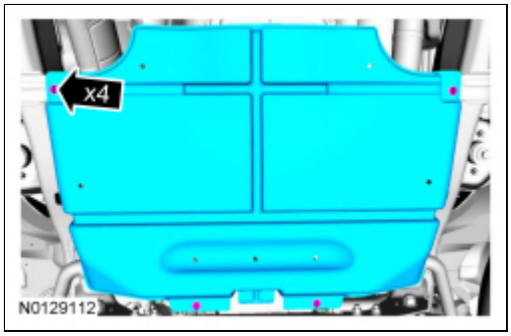
Removal

All vehicles

NOTICE: **Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.**

NOTE: The exhaust Y-pipe dual catalytic converter is a 2-piece assembly. The RH and LH converters can be serviced separately as needed.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



3.5L Gasoline Turbocharged Direct Injection (GTDI)

2. Disconnect the LH Heated Oxygen Sensor (HO2S) pushpin and electrical connector.

All vehicles

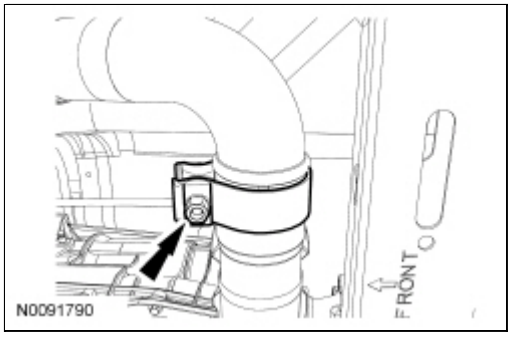
3. **NOTE:** Inspect and replace this splash shield if it is damaged or will not re-secure properly to the vehicle.

   If equipped, release the 4 fasteners and remove the splash shield.

3.5L GTDI

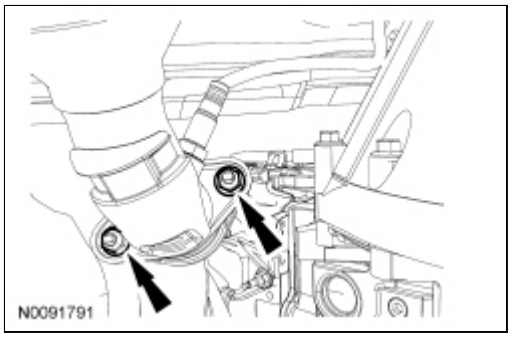
4. Disconnect the RH HO2S pushpin and electrical connector.

3.7L, 5.0L and 6.2L



5. Disconnect the 2 HO2S pushpins and electrical connectors.

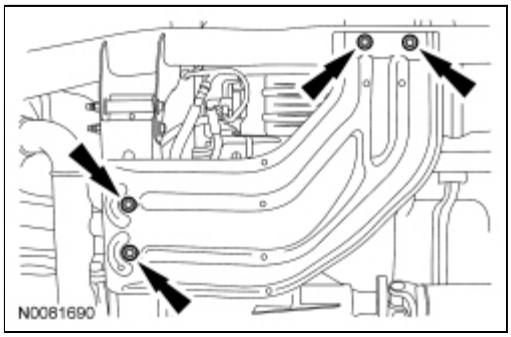
All vehicles



6. Disconnect the 2 Catalyst Monitor Sensor (CMS) electrical connectors.

repair4less

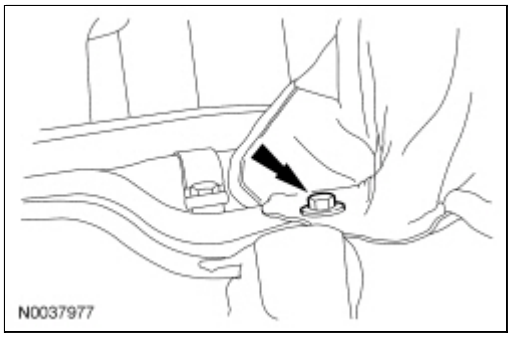
7. Loosen the RH catalytic converter-to-LH catalytic converter Torca® clamp.



8. Remove and discard the 2 LH catalytic converter-to-exhaust manifold or turbocharger nuts.

9. Remove the LH catalytic converter from the vehicle.

Four-Wheel Drive (4WD) vehicles



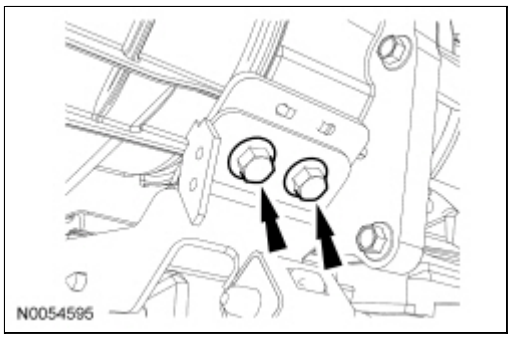
10. If equipped, remove the 4 bolts and the transfer case skid plate.

All vehicles

11. Using an appropriate tool, support the transmission.
12. **NOTE:** LH side shown, RH similar.

    Remove the 2 heat shield bolts from the transmission crossmember.

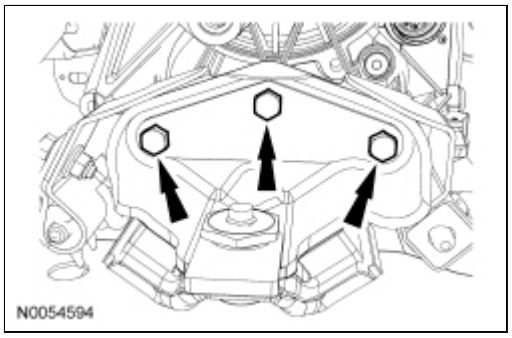
13. Remove the 2 transmission insulator and retainer/exhaust support bracket assembly nuts.



14. Remove the 4 transmission crossmember nuts, the 4 bolts and remove the transmission crossmember from the vehicle.

15. Remove the LH isolator cap from the transmission insulator and retainer/exhaust support bracket assembly.

4WD vehicles



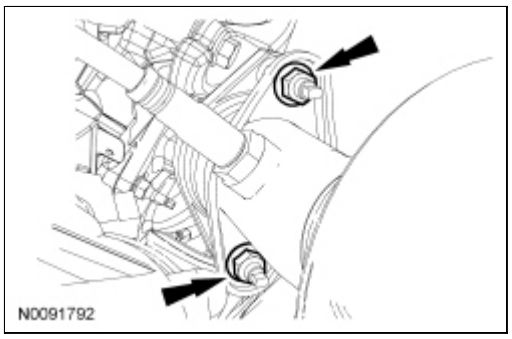
16. Remove the 4 transmission insulator and retainer/exhaust support bracket assembly bolts and remove the transmission insulator and retainer/exhaust support bracket assembly from the vehicle.

2-Wheel Drive (2WD) vehicles

17. Remove the 3 transmission insulator and retainer/exhaust support bracket assembly bolts and remove the transmission insulator and retainer/exhaust support bracket assembly from the vehicle.

repair4less

3.5L GTDI and 3.7L vehicles



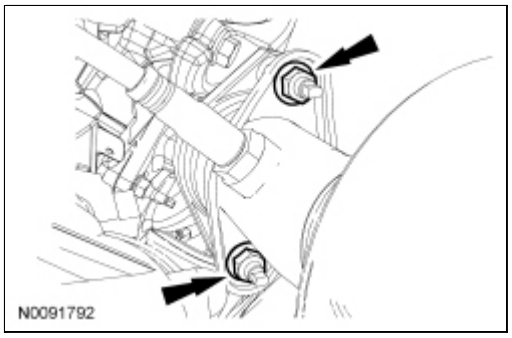
18. ***NOTICE:*** **Do not excessively bend, twist or allow the exhaust intermediate pipe to hang from the flexible pipe or damage to the muffler and tailpipe may occur.**

    Support the exhaust intermediate pipe with a jackstand.

All vehicles

19. Remove the 2 RH catalytic converter-to-exhaust intermediate pipe bolts.

20. With help of an assistant, remove the 2 nuts on the RH catalytic converter-to-exhaust manifold or turbocharger joint and remove the RH catalytic converter from the vehicle.
    - Discard the nuts.

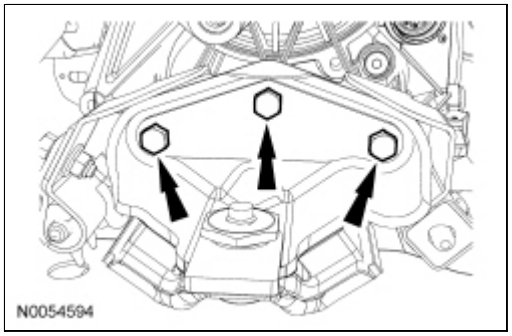


Installation

NOTE: Clean the mating surfaces of the exhaust manifold outlet or turbocharger flares and the catalytic converter inlet flares.

All vehicles

1. With the help of an assistant, position the RH catalytic converter into the vehicle and loosely install 2 new RH catalytic converter-to-exhaust manifold or turbocharger nuts.

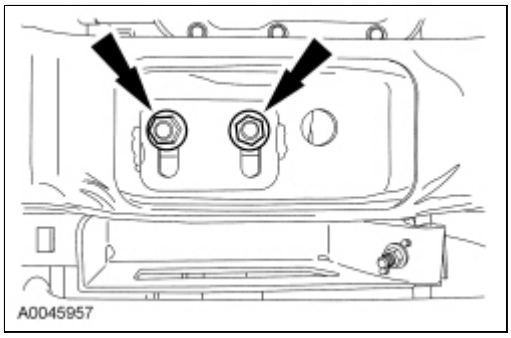


2. ***NOTICE:*** **If equipped, do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the muffler and tailpipe may occur.**

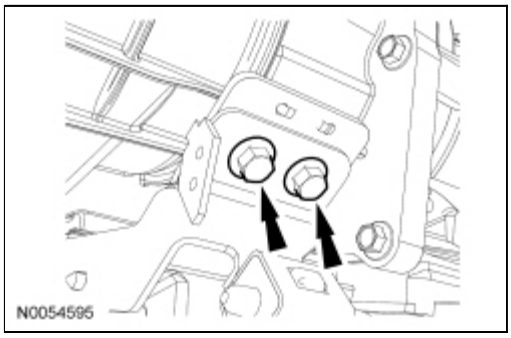
   Loosely install the 2 RH catalytic converter-to-intermediate pipe bolts.

2WD vehicles

3. Install the transmission insulator and retainer/exhaust bracket assembly and 3 bolts.
   - Tighten to 90 Nm (66 lb-ft).

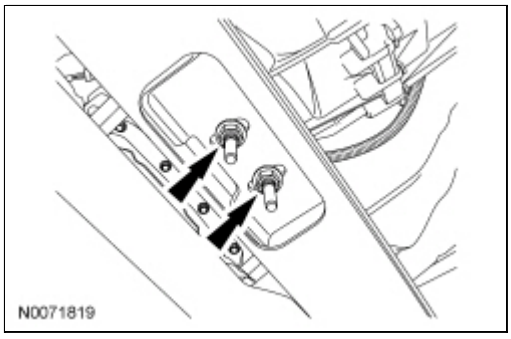


4. Install the transmission crossmember, 4 bolts and 4 nuts.
   - Tighten to 90 Nm (66 lb-ft).

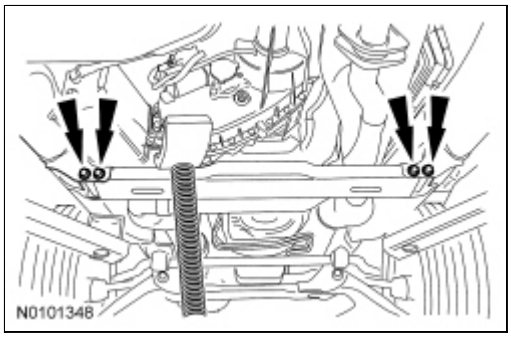


5. Lower the transmission onto the transmission crossmember and install the 2 transmission insulator and retainer/exhaust support bracket assembly nuts.
   - Tighten to 103 Nm (76 lb-ft).

repair4less

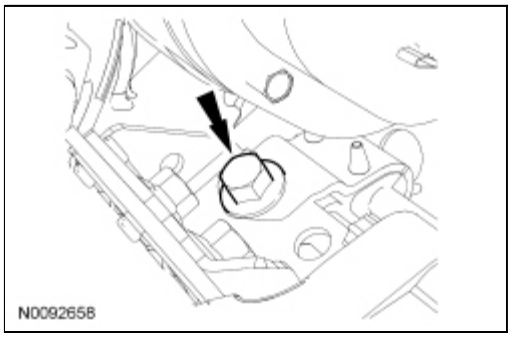


4WD vehicles

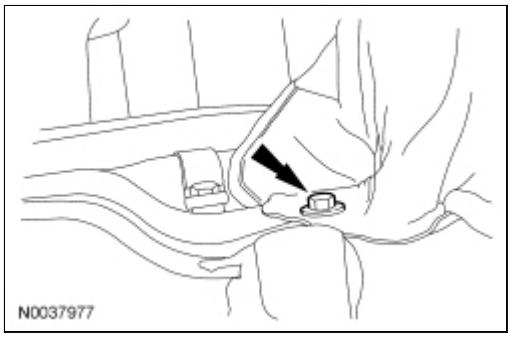


6. Loosely install the transmission insulator and retainer/exhaust support bracket assembly and the 4 bolts.

7. Position the transmission crossmember and loosely install the 2 transmission insulator and retainer/exhaust support bracket assembly nuts.



8. Install the 4 transmission crossmember bolts and nuts.
    - Tighten the transmission insulator and retainer/exhaust support bracket assembly and 4 bolts to 90 Nm (66 lb-ft).
    - Tighten the transmission crossmember bolts and nuts to 90 Nm (66 lb-ft).
    - Tighten the 2 transmission insulator and retainer/exhaust support bracket assembly nuts to 103 Nm (75 lb-ft).



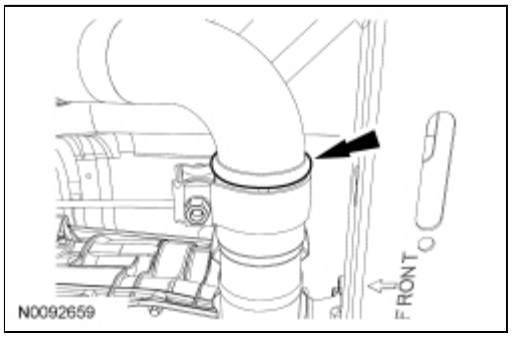
All vehicles

9. Loosely install the LH isolator cap and bolt onto the transmission insulator and retainer/exhaust support bracket assembly.

10. **NOTE:** LH side shown, RH similar.

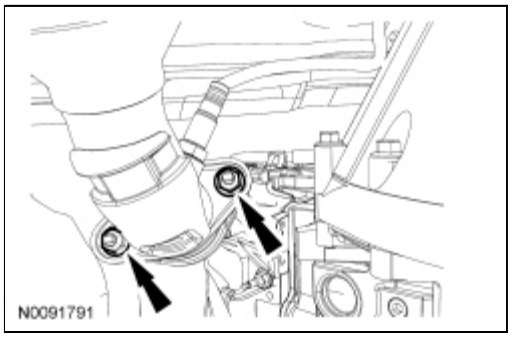
    Install the 2 heat shield bolts into the transmission crossmember.
    - Tighten to 15 Nm (133 lb-in).

4WD vehicles

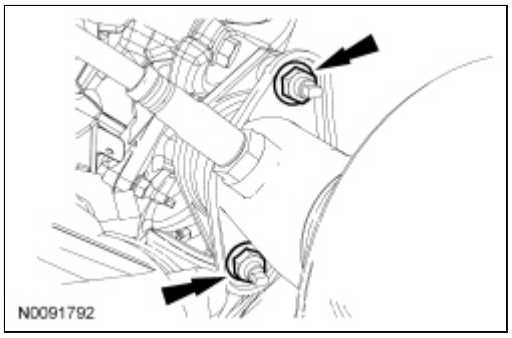


11. If equipped, install the transfer case skid plate and 4 bolts.
    - Tighten to 24 Nm (18 lb-ft).

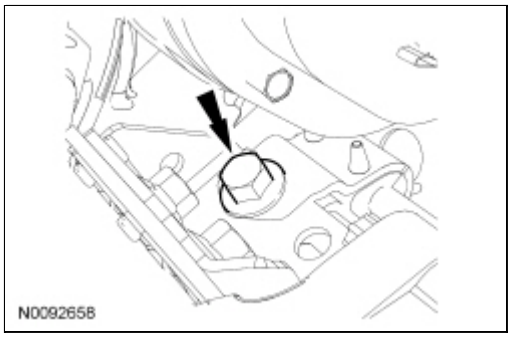
repair4less



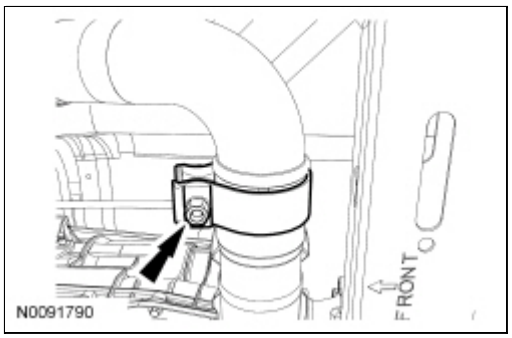
All vehicles



12. Slide the LH catalytic converter into the RH catalytic converter up to the stop on the LH catalytic converter and position the LH catalytic converter into place.

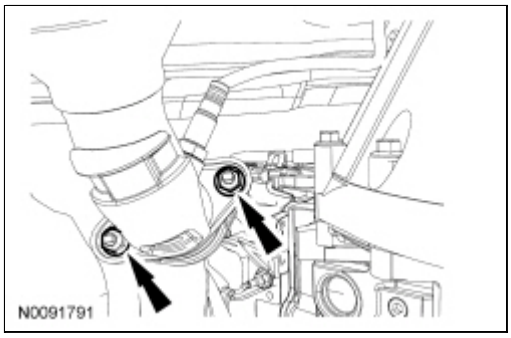


13. Loosely install the 2 new LH catalytic converter-to-exhaust manifold or turbocharger nuts.



14. Tighten the 2 new RH catalytic converter-to-exhaust manifold or turbocharger nuts in the following sequence.
    1. Tighten the RH lower catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).
    2. Tighten the RH upper catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).

15. Tighten the LH isolator cap bolt.
    - Tighten to 55 Nm (41 lb-ft).



16. Tighten the RH catalytic converter-to-LH catalytic converter Torca® clamp.
    - Tighten to 55 Nm (41 lb-ft).

17. Tighten the 2 new LH catalytic converter-to-exhaust manifold or turbocharger nuts in the following sequence.
    1. Snug the LH inner catalytic converter-to-exhaust manifold or turbocharger nut.
    2. Tighten the LH outer catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).
    3. Tighten the LH inner catalytic converter-to-exhaust manifold or turbocharger nut to 40 Nm (30 lb-ft).

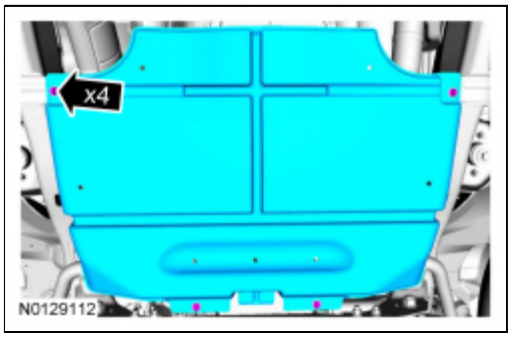
repair4less

18. ***NOTICE:*** **If equipped, do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the muffler and tailpipe may occur.**

    Tighten the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts in the following sequence.
    1. Snug the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt.
    2. Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    3. Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

19. Connect the 2 CMS electrical connectors.

3.7L, 5.0L and 6.2L



20. Connect the 2 HO2S pushpins and electrical connectors.

3.5L GTDI

21. Connect the RH HO2S pushpin and electrical connector.

All vehicles

22. If equipped, install the splash shield and the 4 fasteners.

3.5L GTDI

23. Connect the LH HO2S pushpin and electrical connector.

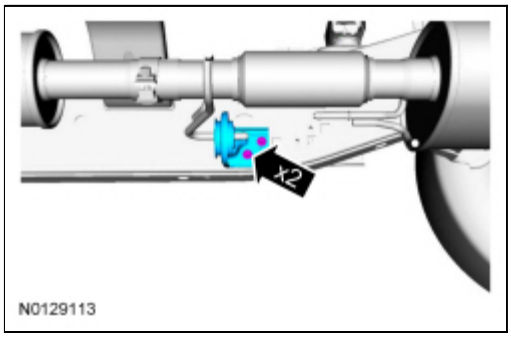
All vehicles

24. Start engine and check for exhaust leaks.

repair4less

Muffler and Tailpipe

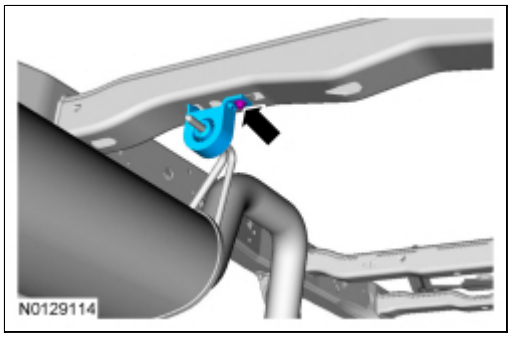
Removal



All vehicles

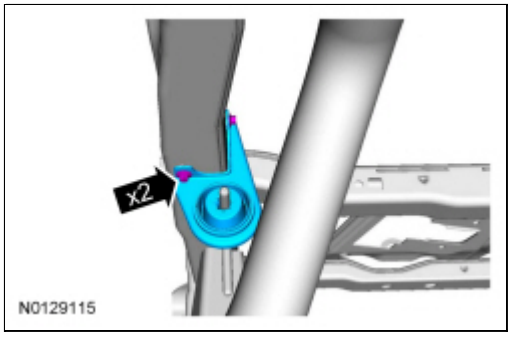
NOTICE: **Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Support the muffler and tailpipe with a jackstand.
3. Loosen the exhaust intermediate pipe-to-muffler and tail pipe assembly Torca® clamp.
4. Remove the 2 bolts and the front muffler isolator and bracket assembly from the frame.



3.5L Gasoline Turbocharged Direct Injection (GTDI) and 3.7L vehicles

5. Remove the 2 bolts and the muffler inlet pipe bracket support isolator from the frame.



All vehicles

6. Remove the bolt and the rear muffler isolator and bracket assembly from the frame.

7. Remove the 2 bolts and the rear tailpipe hanger isolator from the frame.

8. ***NOTICE:*** **If equipped, do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the muffler and tailpipe may occur.**

   Release the exhaust intermediate pipe alignment nub from the muffler and tailpipe.
   - Remove the muffler and tail pipe assembly from the vehicle.

Installation

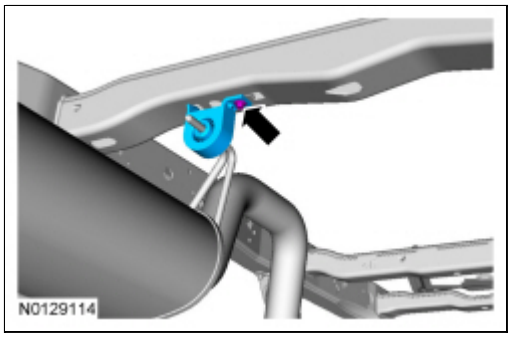
All vehicles

1. **NOTE:** Using an abrasive pad, clean the exhaust Torca® clamp surface area of any surface rust.

   Position the muffler and tail pipe assembly.

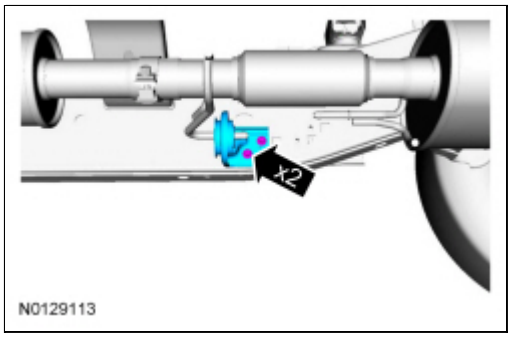
2. ***NOTICE:*** **If equipped, do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the muffler and tailpipe may occur.**

   Slide the muffler and tail pipe assembly into the exhaust intermediate pipe until the alignment nub on the exhaust intermediate pipe is properly positioned into the L-notch on the muffler and tail pipe.



3. Support the muffler and tailpipe with a jackstand.

4. Position the rear tailpipe hanger isolator on the frame and install the 2 bolts.
   - Tighten to 30 Nm (22 lb-ft).



5. Position the rear muffler isolator and bracket assembly on the frame and install the bolt.
   - Tighten to 30 Nm (22 lb-ft).

repair4less

3.5L Gasoline Turbocharged Direct Injection (GTDI) and 3.7L vehicles

6. Position the muffler inlet pipe bracket support isolator on the frame and install the 2 bolts.
    - Tighten to 30 Nm (22 lb-ft).

All vehicles

7. Position the front muffler isolator and bracket assembly and install the 2 bolts.
    - Tighten to 30 Nm (22 lb-ft).

8. Tighten the exhaust intermediate pipe-to-muffler and tail pipe assembly Torca® clamp.
    - Tighten to 47 Nm (35 lb-ft).

repair4less

General Specifications

Item	Specification
Fuel Pressure	
Engine running - 3.5L Gasoline Turbocharged Direct Injection (GTDI)	430-500 kPa (62-73 psi)
Engine running - 3.7L	350-430 kPa (51-62 psi)
Engine running - 5.0L (4V)	350-430 kPa (51-62 psi)
Engine running - 6.2L (2V)	350-430 kPa (51-62 psi)
Fuel Tank Capacity	
Standard fuel tank	98.4L (26 gal)
Optional long wheelbase fuel tank	136.3L (36 gal)

Torque Specifications

Description	Nm	lb-ft	lb-in
Fuel tank filler pipe hose clamp	4	—	44
High pressure fuel tube-to-fuel injection pump	30	22	—

Fuel System

3.5L Gasoline Turbocharged Direct Injection (GTDI)

The fuel system consists of the following:

- Fuel supply tubes
- Fuel vapor tubes
- Fuel Pump (FP) module (located in the fuel tank)
- High pressure Fuel Pump (FP) (located in the left valve cover)
- Lifetime fuel filter (serviced as part of the FP module)
- Fuel tank filler pipe assembly
- Fuel tank
- Fuel rail
- Fuel injectors
- Fresh air tube (located on top of the transmission)
- Easy Fuel ^{TM} (capless) fuel tank filler pipe assembly (which cannot be modified in any way)
- Supplement refueling adapter (located with the vehicle jack)
- Two-speed Mechanical Returnless Fuel System (MRFS)

The vehicle is equipped with a Gasoline Turbocharged Direct Injection (GTDI) system.

Fuel delivery is accomplished through a MRFS .

- The FP module supplies pressurized fuel to the high pressure FP .
- The high pressure FP supplies high pressure low volume fuel pressure to the fuel rails.
- The fuel injectors are separately controlled and mounted to the intake manifold for each cylinder.
- The fuel tubes route the fuel from the FP to the fuel rail.
- The fuel filter cleans the fuel delivered from the FP to the fuel rail.

3.7L, 5.0L (4V), 6.2L (2V)

The fuel system consists of the following:

- Fuel supply tubes
- Fuel vapor tubes
- Fuel Pump (FP) module (located in the fuel tank)
- Lifetime fuel filter (serviced as part of the FP module)
- Fuel tank filler pipe assembly
- Fuel tank
- Fuel rail
- Fuel injectors

repair4less

- Fresh air tube (located on top of the transmission)
- Easy Fuel TM (capless) fuel tank filler pipe assembly (which cannot be modified in any way)
- Supplement refueling adapter (located with the vehicle jack)
- Two-speed Mechanical Returnless Fuel System (MRFS)

The vehicle is equipped with a Multi-Port Fuel Injection (MFI) system.

Fuel delivery is accomplished through a MRFS .

- The FP supplies the fuel injectors with pressurized fuel through the fuel rail.
- The fuel injectors are separately controlled and mounted to the intake manifold for each cylinder.
- The fuel tubes route the fuel from the FP to the fuel rail.
- The fuel filter cleans the fuel delivered from the FP to the fuel rail.

Fuel Pump (FP) Shut-off Feature

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump (FP) shut-off feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the Restraints Control Module (RCM) to the FP control module. Signal communication between the RCM and the FP control module allows the PCM to shut-off the FP .

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition switch to the OFF position and then turn the ignition switch to the ON position. In some instances the vehicle may not start the first time and may take one additional key cycle.

For exploded view information of the fuel system, refer to Fuel Tank and Filter Pipe — Exploded View or Fuel Lines and Fuel Filter — Exploded View in Section 310-01 .

repair4less

Fuel System

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The following procedure diagnoses a slow-to-fill concern only. For all other concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

The fuel tank filler pipe assembly is used to refuel the vehicle. The fuel tank inlet check valve prevents spitback of fuel during and after refueling. The fuel tank stores the fuel. The fuel tank contains a Fuel Pump (FP) module. The FP module consists of a fuel level sender and a FP . The fuel level sender sends a signal to the fuel gauge informing the driver of how much fuel is in the fuel tank. The FP provides fuel to the fuel tubes which supply the fuel rail.

During refueling, the fuel tank vents to the atmosphere through the vent and filler pipes, on vehicles without On-Board Refueling Vapor Recovery (ORVR) systems. In vehicles equipped with ORVR , the fuel tank and filler pipe are designed so that when the vehicle is being refueled, fuel vapors in the fuel tank travel to the Evaporative Emission (EVAP) canister, which absorbs the fuel vapors and vents the pressure from the fuel tank during refueling.

Inspection and Verification

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Do not use incandescent lights when inspecting the fuel system. Use only flourescent or LED lighting.

1. Verify the customer concern by refueling the vehicle and observe the fuel fill rate.

2. Inspect to determine if any of the following mechanical concerns apply.

Visual Inspection Chart

Mechanical
• Bent, kinked or damaged fuel tank filler pipe • Bent, kinked or damaged fuel tank filler pipe vent tube (if equipped) • Incorrect routing of the fuel tank filler pipe • Incorrect routing of the fuel tank filler pipe vent tube (if equipped) • Incorrect position of fuel tank filler pipe clamps • Incorrect position of fuel tank filler pipe vent tube clamps (if equipped) • Fuel tank mounted vapor tubes bent or damaged • Evaporative Emission (EVAP) system tubes or hoses bent or damaged • Accident damage to the fuel tank • Accident damage to the vehicle affecting the fuel tank filler pipe-to-body connection • Unauthorized modifications and/or alterations to the vehicle • EVAP system fresh air hose plugged (dirt, spider webbing)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.

repair4less

- If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the EVAP system using the scan tool.

9. If the DTCs retrieved are related to the concern, go to Evaporative Emission (EVAP) System DTC Chart. For PCM-related DTCs, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Evaporative Emission (EVAP) System DTC Chart

DTC	Description	Action
P0446	Evaporative Emission System Vent Control Circuit	GO to Pinpoint Test A .
P0451	Evaporative Emission System Pressure Sensor/Switch Range/Performance	GO to Pinpoint Test A .
P0452	Evaporative Emission System Pressure Sensor/Switch Low	GO to Pinpoint Test A .
P0453	Evaporative Emission System Pressure Sensor/Switch High	GO to Pinpoint Test A .
P0454	Evaporative Emission System Pressure Sensor/Switch Intermittent	GO to Pinpoint Test A .
P1450	Unable to Bleed up Fuel Tank Vacuum	GO to Pinpoint Test A .
P1451	Evaporative Emission System Vent Control Circuit	GO to Pinpoint Test A .
P260F	Emission System Monitoring Processor Performance	GO to Pinpoint Test A .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Slow to fill	• Fuel tank filler pipe • Fuel tank filler pipe vent tube, if equipped • Evaporative Emission (EVAP) system • Fuel tank inlet check valve (part of the fuel tank) • Fuel level vent valve, if	• GO to Pinpoint Test A .

	equipped (part of the Fuel Pump (FP) module)	
• All other fuel system concerns	• Fuel system components	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Pinpoint Test

Pinpoint Test A: Slow to Fill

Normal Operation

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank, air is vented through the filler pipe or the On-Board Refueling Vapor Recovery (ORVR) system.

This pinpoint test is intended to diagnose the following:

- Fuel tank filler pipe vent tube, if equipped
- Fuel tank filler pipe
- Evaporative Emission (EVAP) system
- Fuel tank inlet check valve (part of the fuel tank)
- Fuel level vent valve, if equipped

PINPOINT TEST A: SLOW TO FILL

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out Inspection and Verification. • **Was the cause of the concern found?**	**Yes** REPAIR or INSTALL new components to correct the concern. **No** GO to A2.
A2 CHECK THE SYSTEM FOR ANY EVAP DTCs	
• Connect the scan tool. • Check the system for any of the following EVAP DTCs: P0446, P0451, P0452, P0453, P0454, P1450, P1451 and P260F. • **Are any of these DTCs present?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnosis the EVAP system. **No** GO to A3.
A3 MONITOR THE FTP WHILE FILLING THE FUEL TANK	
• Monitor the Fuel Tank Pressure (FTP) reference value while filling the fuel tank.	**Yes** GO to A5.

repair4less

Refer to the Reference Values in the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is FTP within specification?**	**No** GO to A4.
A4 MONITOR THE FTP WHILE FILLING THE FUEL TANK WITH THE EVAP SYSTEM DISCONNECTED	
• Disconnect the fuel tank-to- EVAP canister quick connect coupling at the EVAP canister. • Monitor the FTP reference value while filling the fuel tank. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is FTP within specification?**	**Yes** INSPECT the EVAP system for blockage or restrictions. REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL new EVAP system components. **No** GO to A5.
A5 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION	
• Remove the fuel tank filler pipe assembly. Refer to Section 310-01. • Inspect the fuel tank filler pipe and fuel tank filler pipe vent tube (if equipped) for a blockage or restriction. • **Is the fuel tank filler pipe or fuel tank filler pipe vent tube (if equipped) blocked or restricted?**	**Yes** If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe or fuel tank filler pipe vent tube. **No** GO to A6.
A6 CHECK THE FUEL TANK INLET CHECK VALVE	
• Inspect the fuel tank inlet check valve for restriction or sticking. • **Is the fuel tank inlet check valve restricted or sticking?**	**Yes** If possible, REPAIR the restrictions. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to Section 310-01. **No** GO to A7.
A7 CHECK TO MAKE SURE THAT THE FUEL LEVEL VENT VALVE IS FUNCTIONING CORRECTLY	
• **NOTE:** The fuel level vent valve, if equipped, is part of the FP module. • Remove the FP module. Refer to Section 310-01. • Inspect the fuel level vent valve for foreign material at the bottom drain hole. • Invert the FP. Watch for a movement and a click noise. • **Was a movement/click noise witnessed?**	**Yes** Fuel level vent valve is OK. RETEST the system for normal operation. **No** INSTALL a new FP module. REFER to Section 310-01.

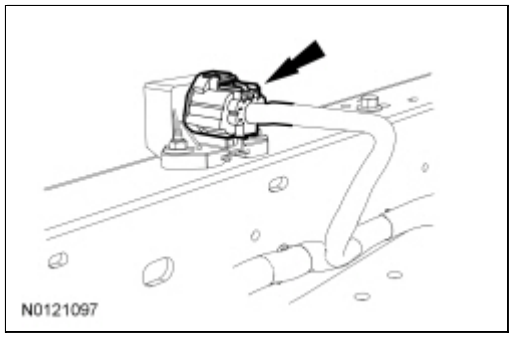
repair4less

Fuel System Pressure Release

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.



WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** The Fuel Pump Control Module (FPCM) is located on the frame rail above the spare tire.

   Disconnect the Fuel Pump Control Module (FPCM) electrical connector.

3. Start the engine and allow it to idle until it stalls.

4. After the engine stalls, crank the engine for approximately 5 seconds to make sure the fuel rail pressure has been released.

5. Turn the ignition switch to the OFF position.

6. Disconnect battery ground cable.

Gasoline Turbocharged Direct Injection (GTDI) equipped vehicles

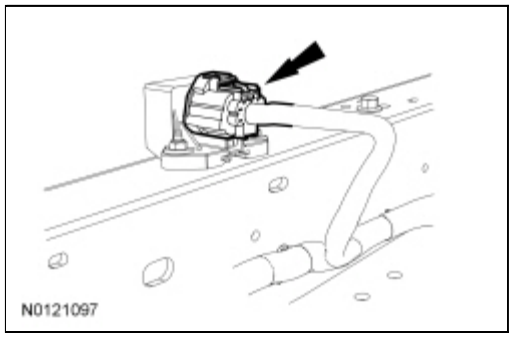
7. Remove and discard the nut for the high pressure fuel tube bracket.

8. **NOTE:** On vehicles equipped with Gasoline Turbocharged Direct Injection (GTDI), it is necessary to release the high pressure fuel system prior to disconnecting a low pressure fuel tube quick connect coupling.

   NOTE: To release the fuel pressure in the high pressure fuel tube, wrap the flare nut with a shop towel to absorb any residual fuel pressure during the loosening of the flare nut.

   Disconnect the high pressure fuel tube-to-fuel injection pump flare nut to release the fuel pressure.

9. Connect the high pressure fuel tube-to-fuel injection pump flare nut.
   1. Tighten to 15 Nm (133 lb-in).
   2. Tighten an additional 30 degrees.
   3. Tighten to 32 Nm (24 lb-ft).



All vehicles

10. Install new nut for the high pressure fuel tube bracket.
    - Tighten to 8 Nm (71 lb-in).

11. Reconnect battery ground cable.

12. When fuel system service is complete, reconnect the FPCM electrical connector.

13. **NOTE:** It may take more than one key cycle to pressurize the fuel system.

    Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before

repair4less

starting the engine.

14. Start the vehicle and check the fuel system for leaks.

Fuel System Pressure Test

Special Tool(s)

 ST3038-A	Fuel Pressure Test Kit 310-D009 (D95L-7211-A) or equivalent
 ST3284-A	Fuel Pressure T-Adapter 3/8" 310-D252 or equivalent

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

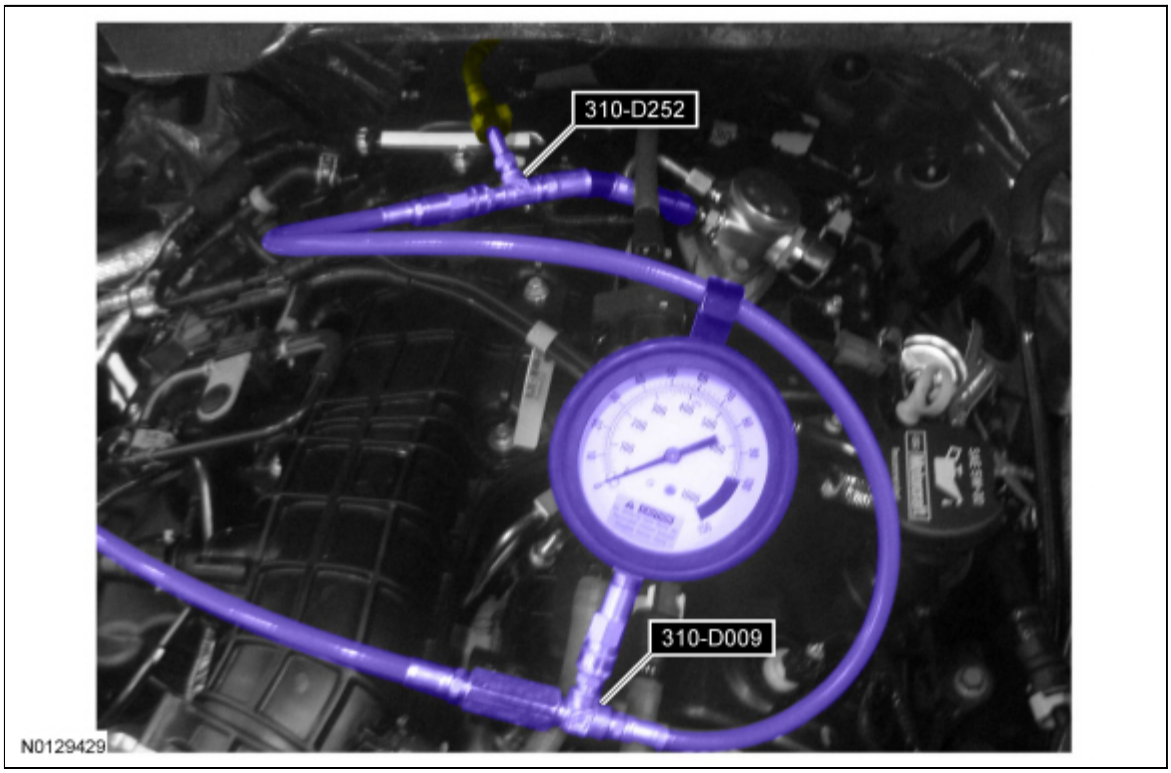
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

All vehicles

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



3.5L Gasoline Turbocharged Direct Injection (GTDI)

3. Remove the fuel injection pump noise insulator shield.

repair4less

4. Disconnect the front fuel supply tube-to-fuel injection pump quick connect coupling. For additional information, refer to Quick Connect Coupling in this section.

5. Install the Fuel Pressure T-Adapter 3/8" and Fuel Pressure Test Kit between the fuel tube and the fuel injection pump.

3.7L, 5.0L (4V), 6.2L (2V) engines

6. Disconnect the front fuel supply tube-to-fuel rail quick connect coupling. For additional information, refer to Quick Connect Coupling in this section.

7. Install the Fuel Pressure T-Adapter 3/8" and Fuel Pressure Test Kit in line between the fuel supply line and fuel rail.

All vehicles

8. **NOTE:** The Fuel Pump (FP) control module electrical connector was previously disconnected to release the fuel system pressure and must be reconnected to test the fuel system pressure.

   Connect the FP control module electrical connector.

9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

10. **NOTE:** It may take more than one key cycle to pressurize the fuel system.

    Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

11. **NOTE:** After completing the fuel system pressure test, open the drain valve on the Fuel Pressure Test Kit and release any residual fuel into a suitable container prior to removing the tool.

Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to Specifications in this section.

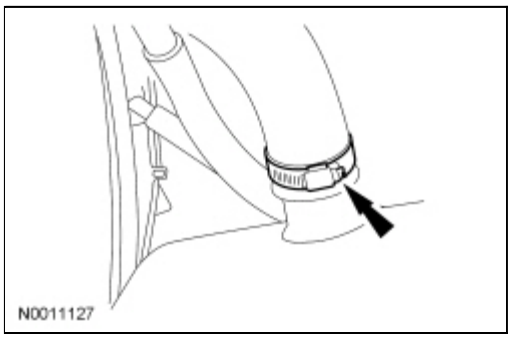
Fuel Tank Draining

Special Tool(s)

 ST1134A	100 Gallon Gasoline Hand Pump Storage Tanker 292-00007 or equivalent

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

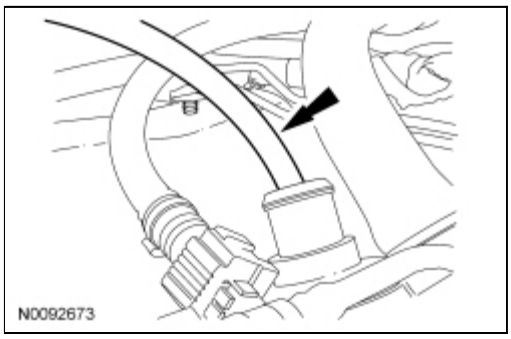
WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.



WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Relieve the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Remove the driveshaft. For additional information, refer to Section 205-01 .
5. Disconnect the fuel tank filler pipe from the fuel tank.

- To install, tighten to 4 Nm (35 lb-in).

6. **NOTE:** Follow the operating instructions supplied by the equipment manufacturer.

   Insert the hose from the 100 Gallon Manual Fuel Tanker and siphon the fuel through the fuel tank inlet spout.

repair4less

Quick Connect Coupling

Disconnect — Type I

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

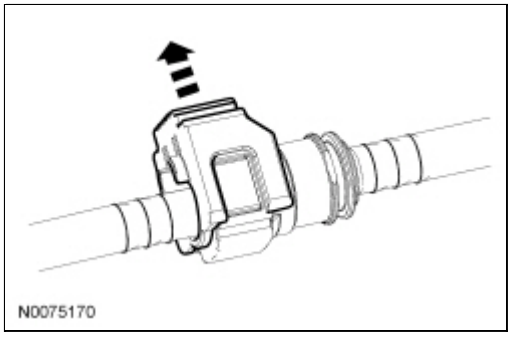
WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

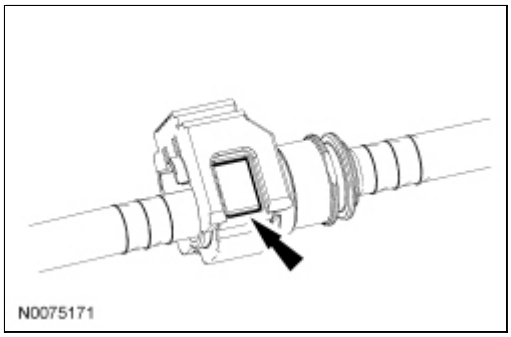
***NOTICE:* Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install plugs to any open orifices or tubes.**

***NOTICE:* When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur.**



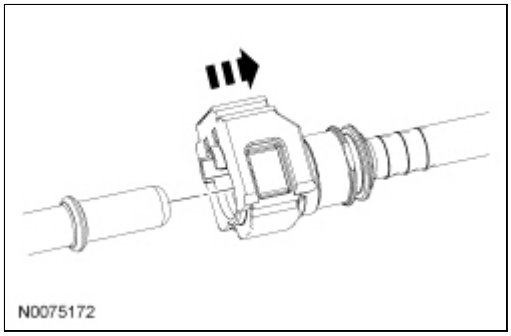
NOTE: During the repair or replacement of fuel-related components, all fuel liquid and fuel vapor openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.



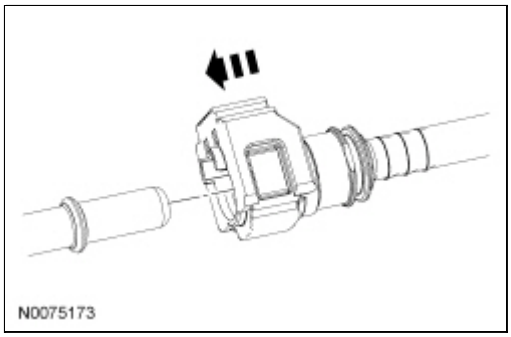
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. ***NOTICE:* Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**



Position the secondary latch outward.

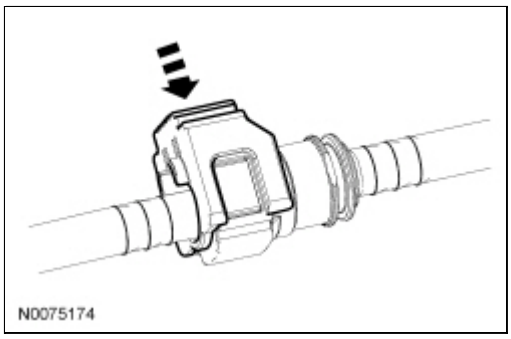
4. Squeeze both of the release tabs.



5. Remove the quick connect coupling from the tube.

Connect — Type I

1. Install the quick connect coupling onto the tube until completely seated.



repair4less

2. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   NOTE: Make sure the coupling is completely seated and locked onto the tube by pulling on the quick connect coupling.

   Apply the secondary latch into the locked position.

3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect — Type II

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

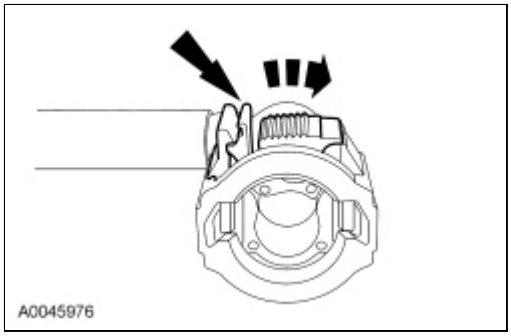
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install plugs to any open orifices or tubes.**

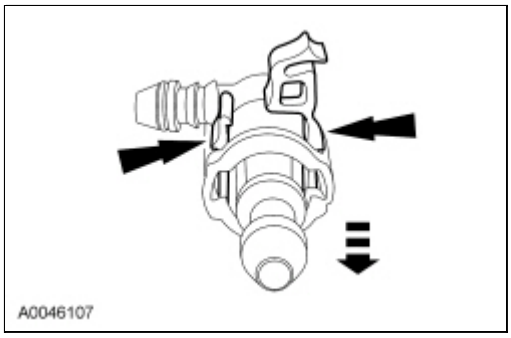
NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove**

any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur.



NOTE: During the repair or replacement of fuel-related components, all fuel liquid and fuel vapor openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.



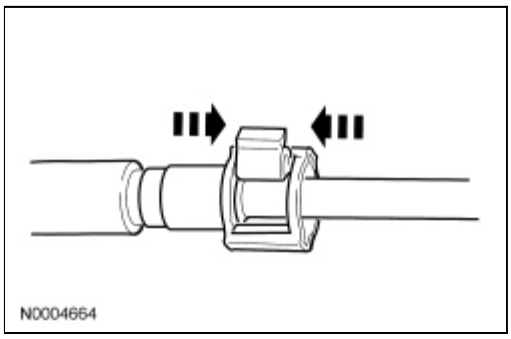
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   Unclip the locking tab.

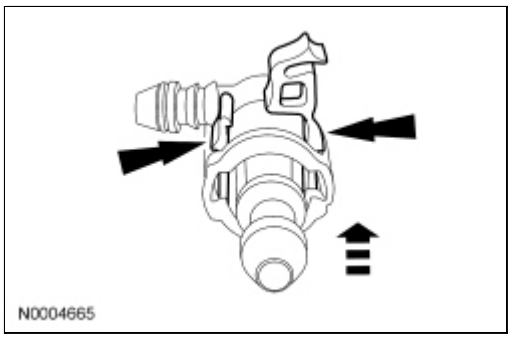
4. Depress the tabs and press the clip downward.

5. Separate the quick connect coupling.



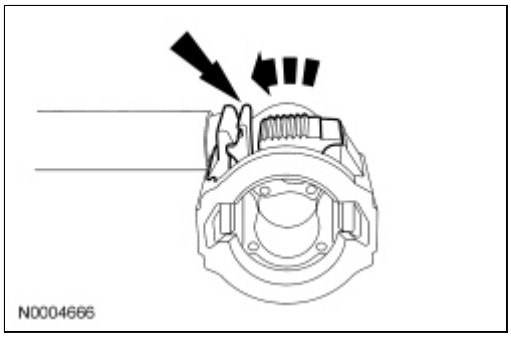
repair4less

Connect — Type II



1. Inspect and clean both quick connect coupling ends.
2. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

   Connect the tube into the quick connect coupling.



3. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   Push the clip up into the quick connect coupling. Pull on the tube to make sure it is seated correctly.

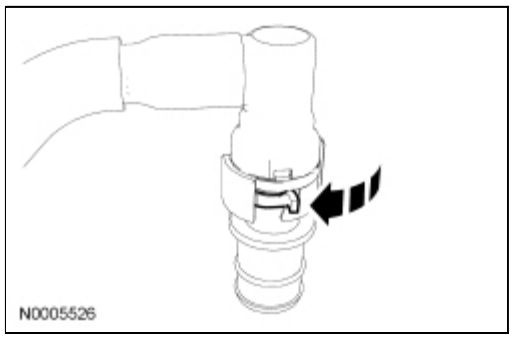
4. Clip the locking tab into place.

5. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect — Type III

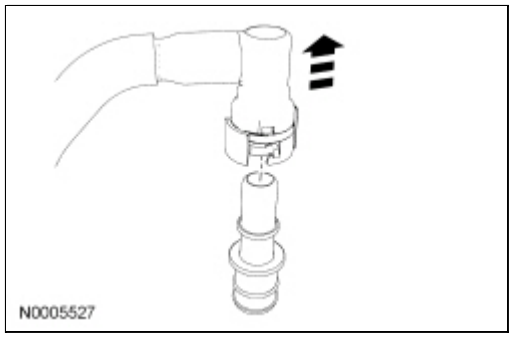
WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

***NOTICE:* When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur.**

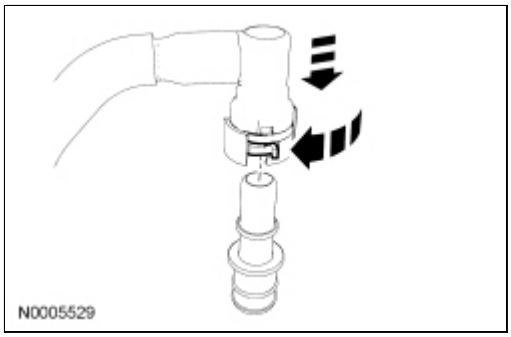


NOTE: During the repair or replacement of fuel-related components, all fuel liquid and fuel vapor openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. ***NOTICE:* Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   Release the locking tab on the quick connect coupling.

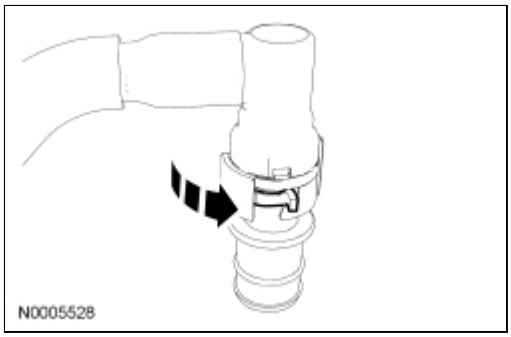
2. Separate the quick connect coupling from the fitting.



Connect — Type III

repair4less

1. Inspect the quick connect coupling and the tube for damage. Remove any dirt or obstructions.



2. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   Release the locking tab and install the quick connect coupling onto the fitting.

3. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

   Position the locking tab into the latched position.

Disconnect — Type IV

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

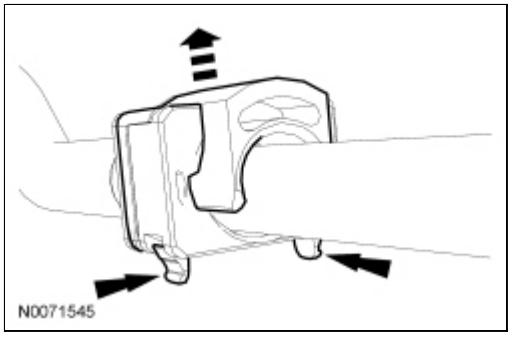
WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in

the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

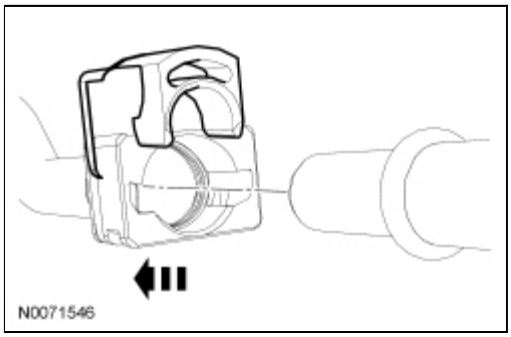
WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

***NOTICE:* When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur.**



***NOTICE:* Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install blanking plugs to any open orifices or tubes.**

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information refer to Fuel System Pressure Release in this section.

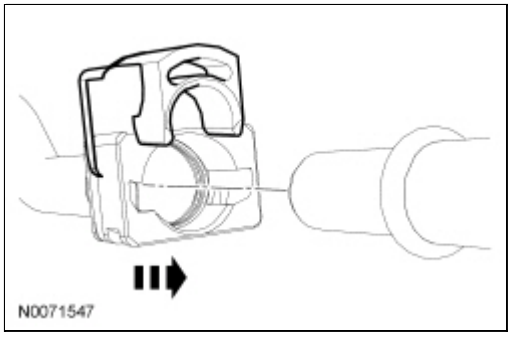


2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. ***NOTICE:* Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   Depress the legs of the retainer clip and position the clip to the outward position.

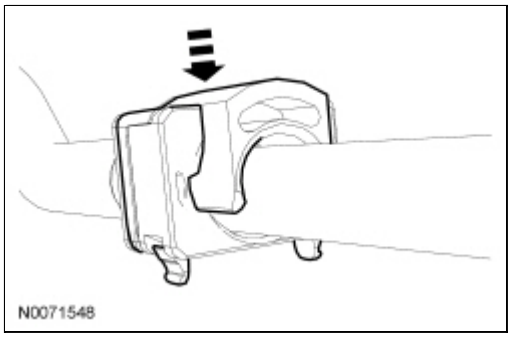
4. Disconnect the quick connect coupling from the fuel tube.



Connect — Type IV

1. Inspect and clean both quick connect coupling ends.

repair4less



2. Install the quick connect coupling onto the fuel tube until fully seated.

3. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   NOTE: Make sure the retainer clip is fully seated and locked onto the fuel tube by pulling on the quick connect coupling.

   Press the retainer clip into the quick connect coupling body until flush and the legs are locked in place.

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

repair4less

Fuel Tank and Lines

3.5L Gasoline Turbocharged Direct Injection (GTDI)

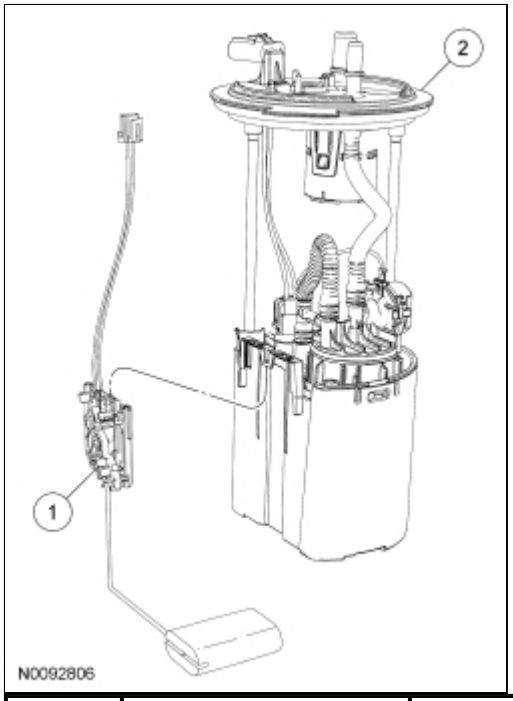
The fuel system contains the following:

- Fuel tank assembly
- Easy Fill ™ (capless) fuel tank filler pipe assembly (which cannot be modified in any way)
- Lifetime fuel filter (serviced as part of the Fuel Pump (FP) module)
- Fuel tube(s)
- Fuel vapor tubes
- Fresh air tube (located on top of the transmission)
- FP module containing:
  - the electric FP , which provides pressurized fuel to the high pressure FP .
  - the fuel level sensor.
  - an inlet filter.
  - a check valve which maintains system pressure after the pump is shut off.
  - a pressure regulator.

The FP is controlled by the PCM which energizes the FP control module. Electrical power to the pump is provided through the FP control module.

3.7L, 5.0L (4V), 6.2L (2V)

The fuel system contains the following:



- Fuel tank assembly
- Easy Fill ™ (capless) fuel tank filler pipe assembly (which cannot be modified in any way)
- Lifetime fuel filter (serviced as part of the Fuel Pump (FP) module)
- Fuel tube(s)
- Fuel vapor tubes
- Fresh air tube (located on top of the transmission)
- FP module containing:
  - the electric FP , which provides pressurized fuel to the engine.
  - the fuel level sensor.

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

All vehicles

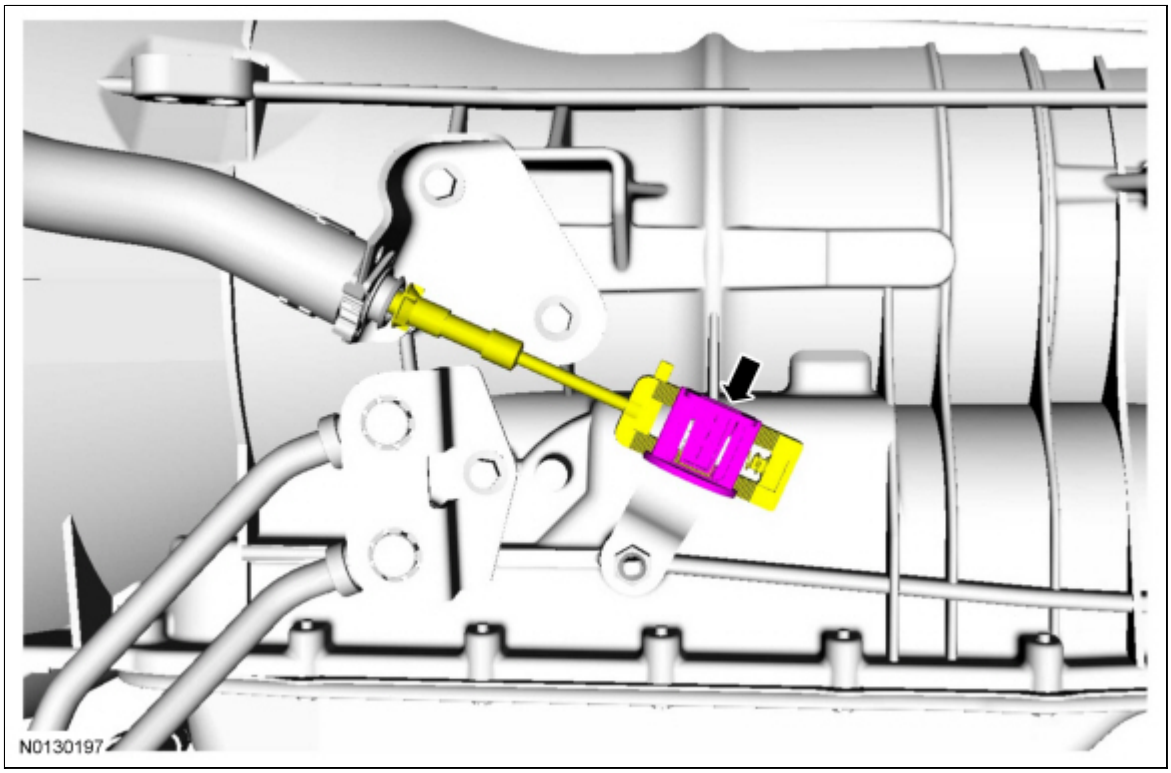
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3.5L Gasoline Turbocharged Direct Injection (GTDI)

4. Remove the fuel injection pump noise insulator shield.

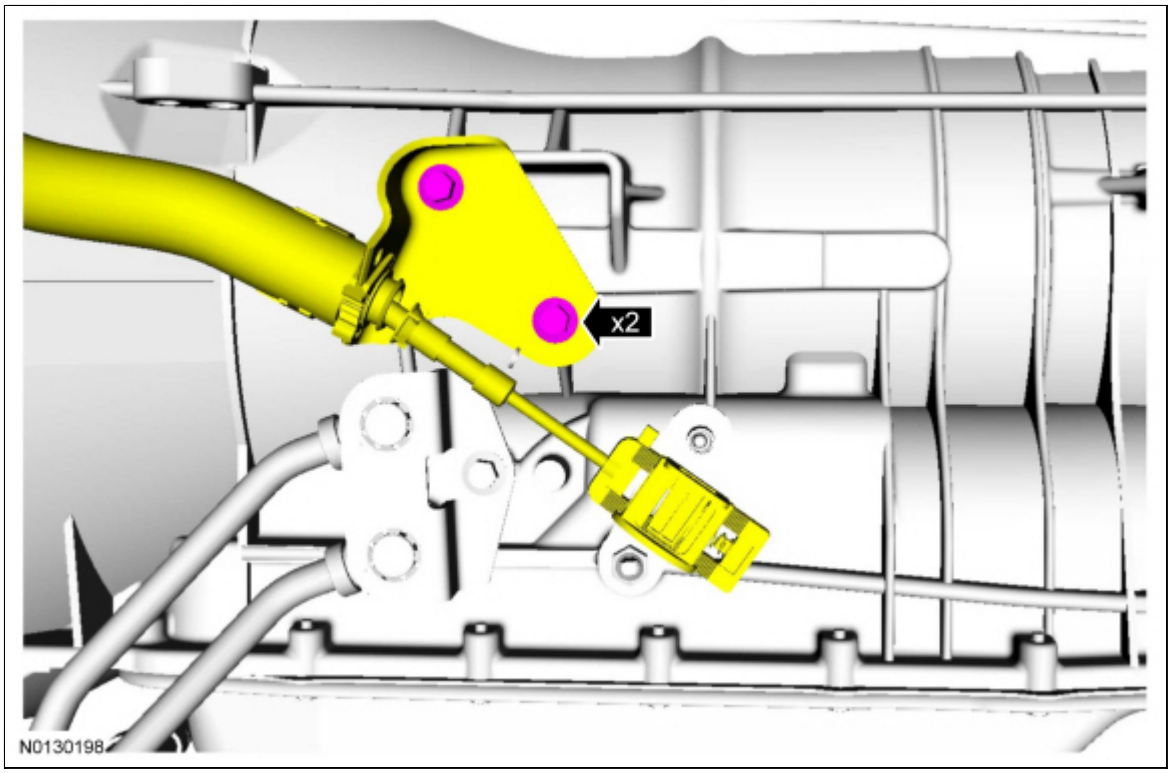
repair4less

5. Disconnect the front fuel supply tube-to-fuel injection pump quick connect coupling. For additional information, refer to Section 310-00 .



3.7L, 5.0L (4V), 6.2L (2V) engines

6. Disconnect the front fuel supply tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .



All vehicles

7. Disconnect the fuel vapor tube-to-Evaporative Emission (EVAP) canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .

8. Move the locking tab up and disconnect the selector lever cable from the manual lever ball stud.

9. Remove the selector lever cable bracket and 2 bolts.
    - To install, tighten to 48 Nm (35 lb-ft).

10. If equipped, remove the transfer case shift lever. For additional information, refer to Section 308-07B .

11. Disconnect the vapor tube-to- EVAP canister quick connect coupling. For additional information, refer to Section 310-00 .

12. Disconnect the fresh air tube from the EVAP canister vent solenoid and dust separator assembly.

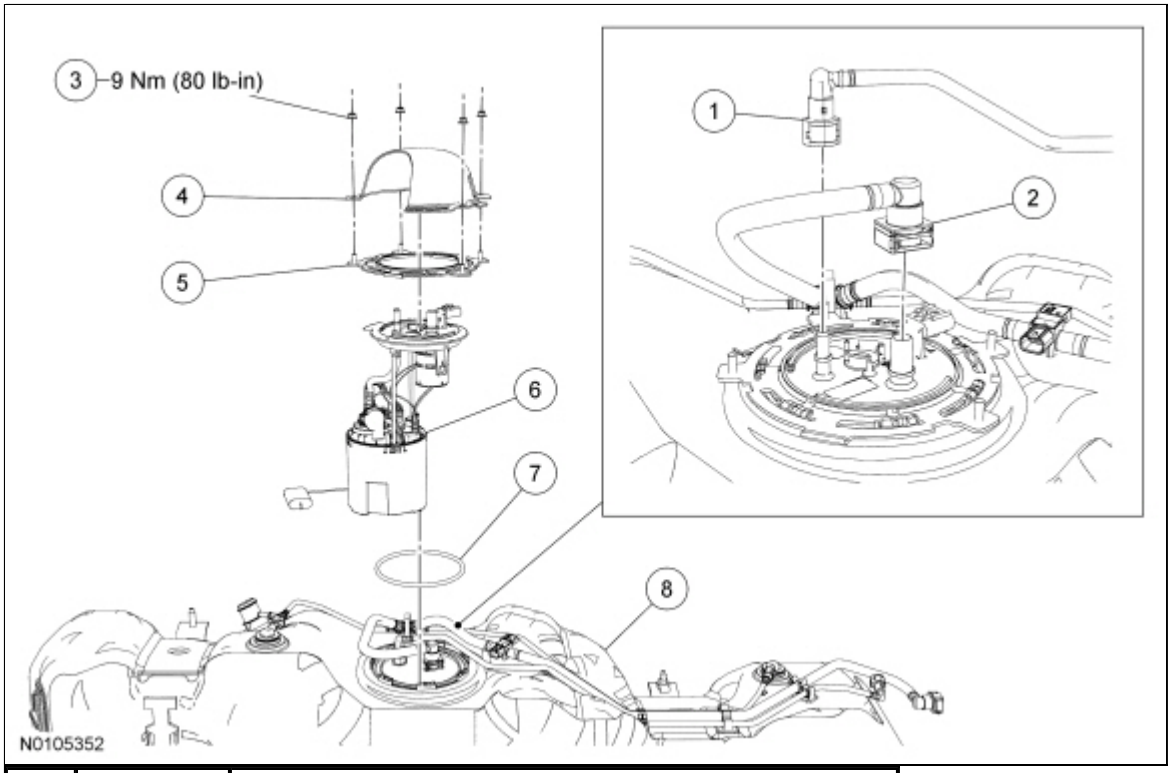
13. Disconnect the front fuel supply tube-to-center fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .

14. If necessary, remove the front fuel supply tube, vapor tube and fresh air tube bracket bolt at the rear of the transmission.
    - To install, tighten to 35 Nm (26 lb-ft).

15. Unclip the front fuel supply tube, vapor tube and fresh air tube from the bracket at the rear of the transmission.

16. Unclip the front fuel supply tube and vapor tube from the bracket at the transmission bellhousing.

17. Remove the front fuel supply tube from the vehicle.



18. Remove the vapor tube from the vehicle.

19. Unclip the fresh air tube retainer from the bracket at the transmission bellhousing and remove from the vehicle.

20. To install, reverse the removal procedure.

Fuel Pump Module

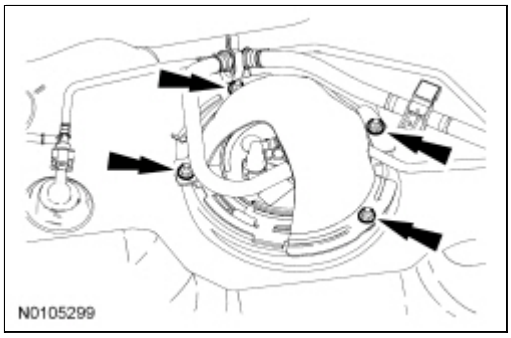
Special Tool(s)

 ST2803-A	Wrench, Fuel Tank Sending Unit 310-123

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

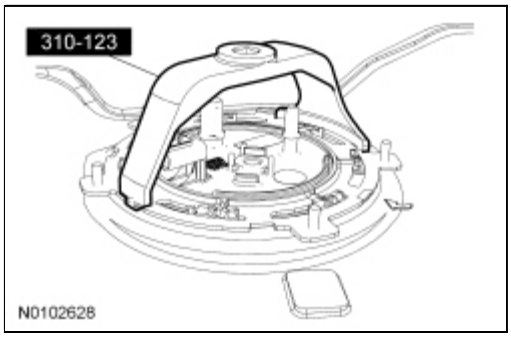
Removal and Installation



WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

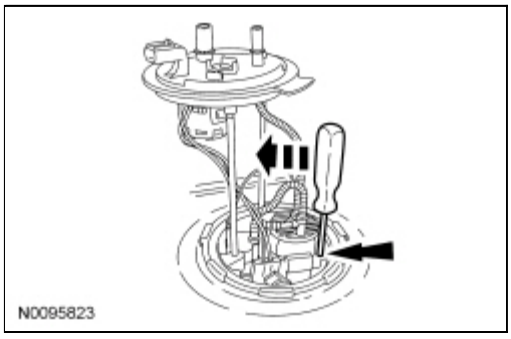
WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the fuel tank. For additional information, refer to Fuel Tank in this section.
3. Using soapy water, clean a minimum of 76 mm (3 in) surface area around the Fuel Pump (FP) module.
4. If equipped, remove the 4 fuel pump module cover nuts and remove the fuel pump module cover.
   - To install, tighten to 9 Nm (80 lb-in).

repair4less

5. Disconnect the fuel supply tube and Fuel Tank Pressure (FTP) sensor and vapor tube assembly quick connect couplings at the FP module. For additional information, refer to Section 310-00 .

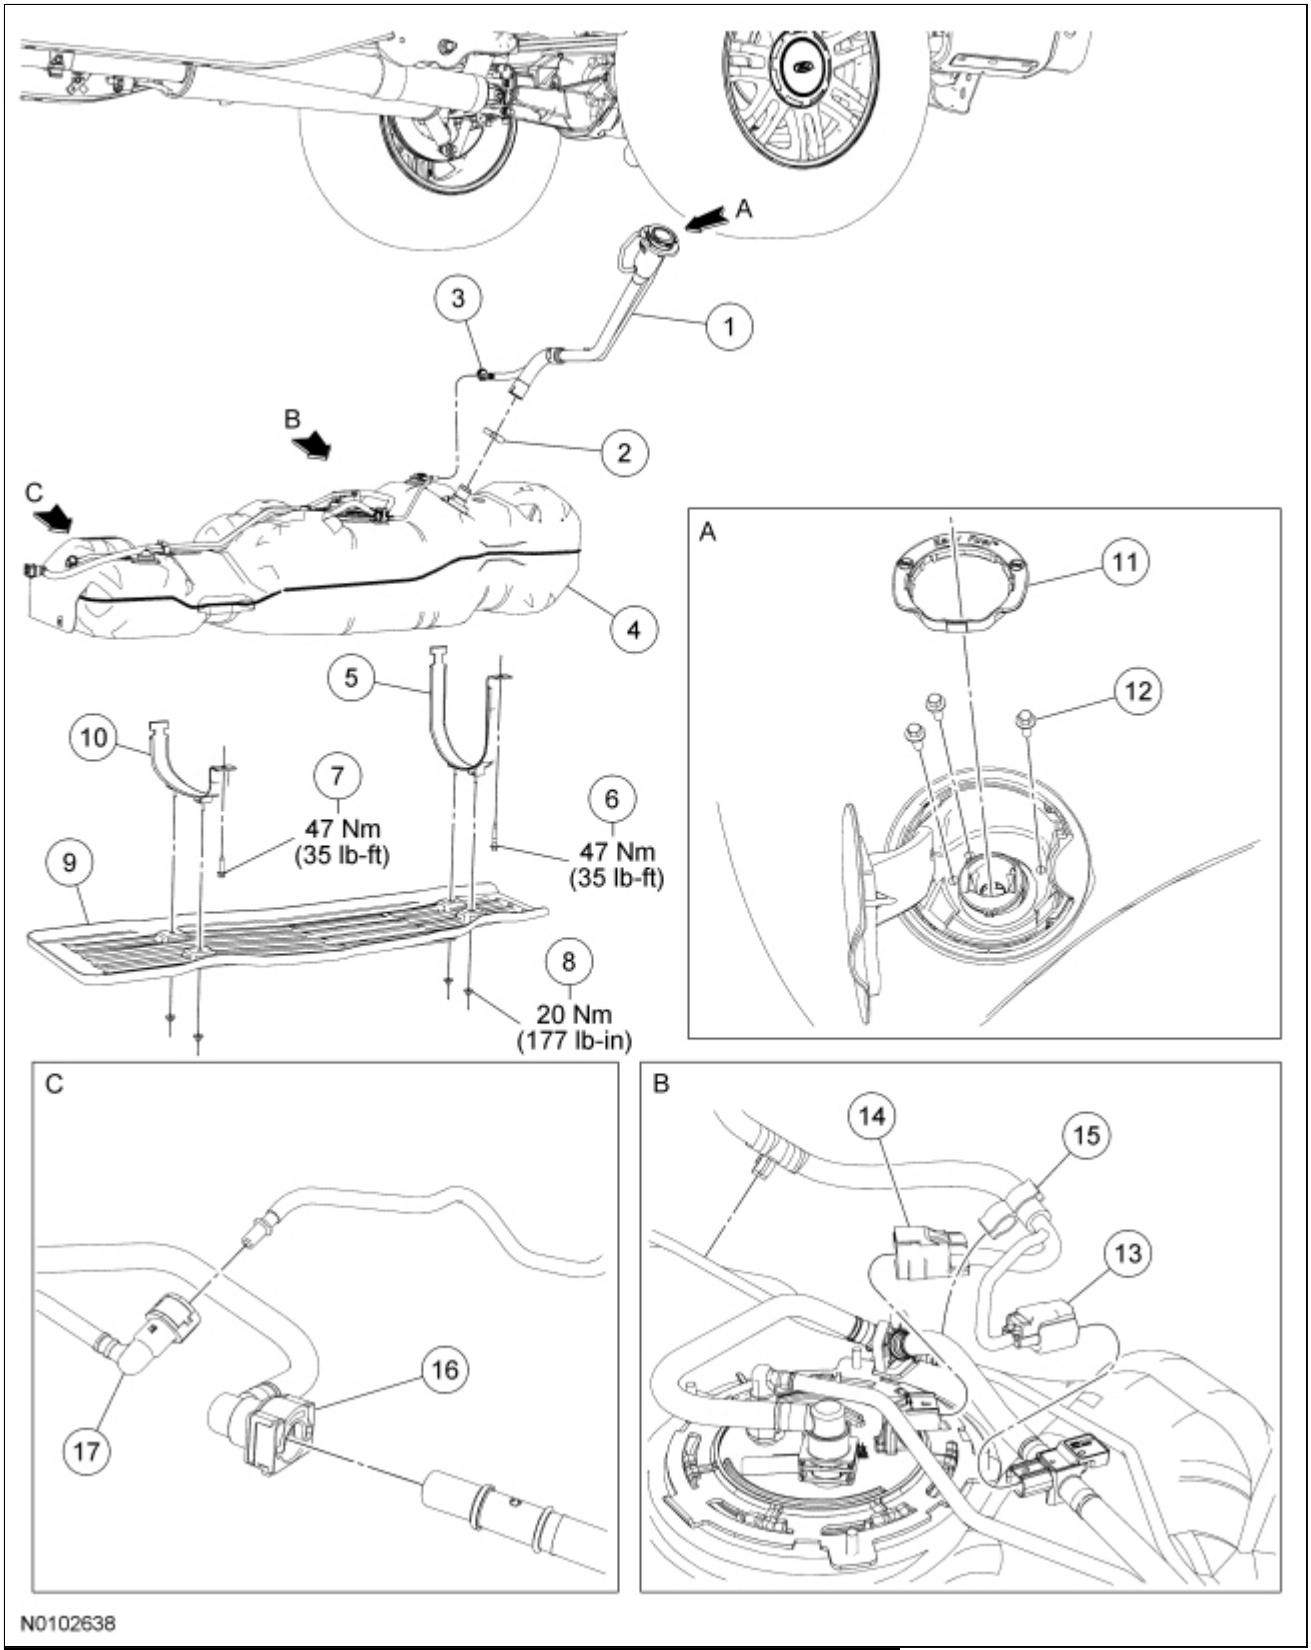


6. Using the Fuel Tank Sending Unit Wrench, remove the FP module locking ring.

7. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm and the filter.**

   NOTE: If the FP does not clear the FP mounting flange on the fuel tank, the use of a screwdriver may be necessary.

   Remove the FP module.
   - If necessary, insert a screwdriver into the empty FP rod hole and slightly pull the screwdriver inboard until the base of the FP clears the FP mounting flange.



8. Remove and discard the FP module O-ring seal.

9. To install, reverse the removal procedure.
   - Install a new FP module O-ring seal and lubricate with clean engine oil.

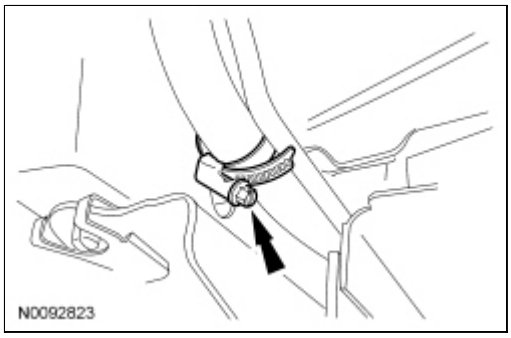
1. For additional information, refer to the procedures in this section.

Fuel Tank Filler Pipe

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the driveshaft. For additional information, refer to Section 205-01 .
4. Loosen the worm gear clamp and disconnect the fuel tank filler pipe from the fuel tank.
    - To install, tighten to 4 Nm (35 lb-in).
5. Disconnect the fuel tank filler pipe-to-Fuel Tank Pressure (FTP) sensor and vapor tube assembly quick connect coupling. For additional information, refer to Section 310-00 .
6. Loosen the fuel tank filler pipe-to-body worm gear clamp.
    - To install, tighten to 5 Nm (44 lb-in).

repair4less

7. Remove the fuel tank filler pipe information bezel.

8. Remove the 3 screws from the fuel tank filler pipe and remove the fuel tank filler pipe.
    - To install, tighten to 3 Nm (27 lb-in).

9. To install, reverse the removal procedure.

Fuel Tank

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. Drain the fuel tank. For additional information, refer to Section 310-00 .
2. Disconnect the fuel tank fuel supply tube-to-center fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .
3. Disconnect the Fuel Tank Pressure (FTP) sensor and vapor tube assembly-to-Evaporative Emission (EVAP) canister assembly vapor tube quick connect coupling. For additional information, refer to Section 310-00 .
4. Disconnect the FTP sensor and Fuel Pump (FP) module electrical connectors, and if equipped, retainer(s).
5. Disconnect the fuel tank filler pipe-to- FTP sensor and vapor tube assembly quick connect coupling. For additional information, refer to Section 310-00 .
6. If equipped, remove the 4 fuel tank skid plate nuts and the skid plate.
   - To install, tighten to 20 Nm (177 lb-in).
7. Use a suitable jack to support the fuel tank.
8. Remove the 2 fuel tank support strap-to-frame bolts and remove the fuel tank support straps.
   - To install, tighten to 47 Nm (35 lb-ft).
9. Lower the fuel tank out of the vehicle.
10. To install, reverse the removal procedure.

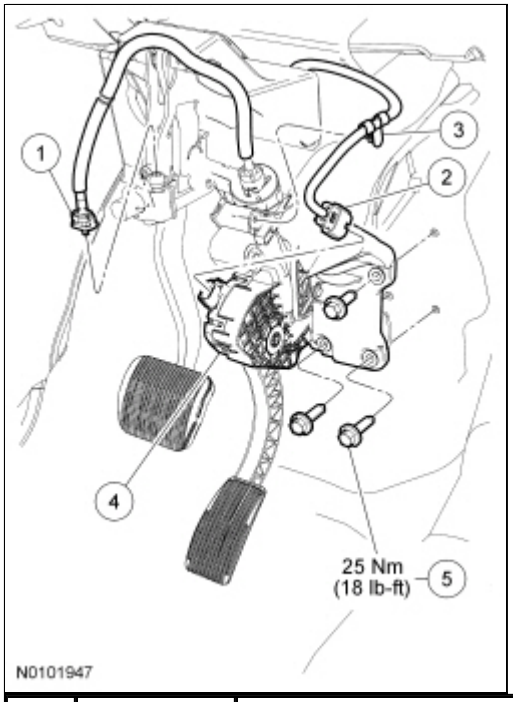
repair4less

Torque Specifications

Description	Nm	lb-ft
Adjustable accelerator pedal bolts	25	18
Fixed accelerator pedal bolts	25	18

repair4less

Acceleration Control



The acceleration control consists of one of the following:

- A fixed accelerator pedal and position sensor assembly
- An adjustable accelerator pedal and position sensor assembly

The throttle is controlled by an Accelerator Pedal Position (APP) sensor on the accelerator pedal assembly. The APP sensor sends a signal to the PCM in response to throttle pedal movements initiated by the driver. The PCM sends a signal to the electronic throttle control which increases and decreases throttle position.

Some vehicles are equipped with adjustable pedals. This allows both the accelerator and brake pedals to be adjusted simultaneously forward or rearward. A rocker switch on the instrument panel provides adjustment on the pedal assembly when it is activated. On vehicles with the memory seat option, the pedal position can be controlled by the memory selection, as well as the rocker switch. The components in the acceleration control system cannot be repaired, new components must be installed if damaged or worn. When servicing the adjustable accelerator pedal, always disconnect the cable at the brake pedal.

Accelerator Pedal — Adjustable

Item	Part Number	Description
1	—	Accelerator pedal-to-brake pedal cable (part of 9F836)
2	—	Accelerator Pedal Position (APP) sensor electrical connector (part of 12A581)
3	—	APP sensor electrical connector wiring harness retainer (part of 12A581)
4	9F836	Accelerator pedal assembly
5	W713384	Accelerator pedal assembly bolts (3 required)

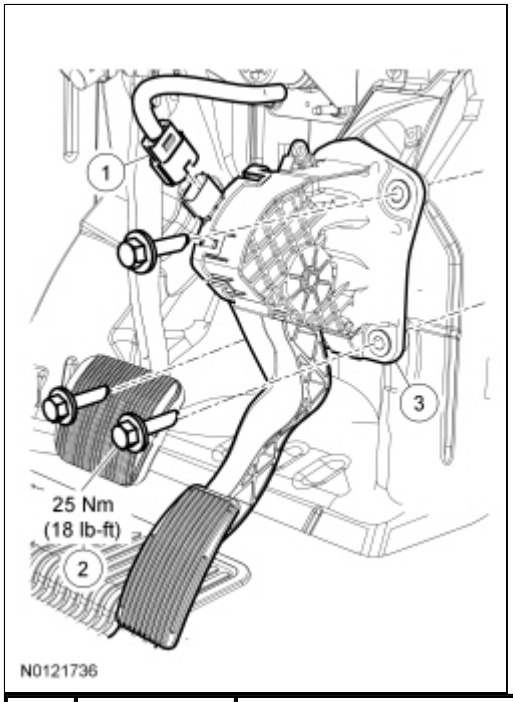
Removal

1. If possible, adjust the pedals to the full forward (away from driver) position.
2. **NOTE:** To prevent setting DTCs, make sure the ignition switch is in the OFF position prior to disconnecting the accelerator pedal electrical connector.

   Disconnect the Accelerator Pedal Position (APP) sensor electrical connector.
3. Disconnect the accelerator pedal-to-brake pedal cable from the brake pedal.
4. Remove the 3 bolts and the accelerator pedal assembly.

Installation

repair4less



1. Install the accelerator pedal assembly and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

2. Connect the accelerator pedal-to-brake pedal cable to the brake pedal.

3. Connect the APP sensor electrical connector.

4. Carry out the adjustable pedal indexing procedure. For additional information, refer to Section 206-06 .

Accelerator Pedal — Fixed

Item	Part Number	Description
1	—	Accelerator Pedal Position (APP) sensor electrical connector (part of 12A581)
2	W713384	Accelerator pedal assembly bolts (3 required)
3	9F836	Accelerator pedal assembly

Removal and Installation

1. **NOTE:** To prevent setting DTCs, make sure the ignition switch is in the OFF position prior to disconnecting the accelerator pedal electrical connector.

   Disconnect the Accelerator Pedal Position (APP) sensor electrical connector.

2. Remove the 3 bolts and the accelerator pedal assembly.
   - To install, tighten to 25 Nm (18 lb-ft).

3. To install, reverse the removal procedure.

Climate Control System

WARNING: Air conditioning R-134a liquid refrigerant is capable of harming eyes or freezing skin. Always wear safety goggles and avoid contact with liquid refrigerant. Failure to follow these instructions may result in serious personal injury.

WARNING: Air conditioning R-134a refrigerant gas is capable of displacing the air necessary for breathing in a confined space and can produce toxic gasses if burned at high temperatures. Do not release a large quantity of R-134a gas within a confined space or allow it to be exposed to a high temperature flame (such as a torch). Consult the Material Safety Data Sheet for further information. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **To avoid damaging the vehicle or A/C components, the following precautions must be observed.**

- **The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.**
- **Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These 2 types of refrigerant must never be mixed. Doing so can damage the A/C system.**
- **Charge the A/C system with R-134a refrigerant gas while the engine is running only at the low-pressure side to prevent refrigerant slugging from damaging the A/C compressor.**
- **Use only R-134a refrigerant. Due to environmental concerns, when the A/C system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. Federal, State/Provincial and/or local laws REQUIRE that R-134a be recovered into appropriate recovery equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as ASE or MACS . Use of a recovery machine dedicated to R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the A/C system.**
- **Refrigerant R-134a must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.**
- **A number of manufacturers are producing refrigerant products that are described as direct substitutes for refrigerant R-134a. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled refrigerant R-134a.**

NOTICE: **To avoid contamination of the A/C system, the following precautions must be observed.**

- **Never open or loosen a connection before recovering the refrigerant.**
- **When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.**
- **Evacuate a system that has been opened to install a new component or one that has discharged through leakage before charging.**
- **Seal open fittings with a cap or plug immediately after disconnecting a component from the system.**
- **Clean the outside of the fittings thoroughly before disconnecting a component from the system.**

repair4less

- **Do not remove the sealing caps from a new component until ready to install.**
- **Refrigerant oil absorbs moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use and install the cap immediately after using. Store the oil in a clean, moisture-free container.**
- **Install a new O-ring seal before connecting an open fitting. Coat the fitting and O-ring seal with PAG oil before connecting.**
- **When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.**
- **Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system does not tolerate overtightening.**
- **When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.**
- **Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This prevents condensation from forming inside a component that is cooler than the surrounding air.**

The system consists of the following components:

- A/C compressor
- A/C compressor clutch assembly
- A/C condenser core
- A/C evaporator core
- Receiver/drier
- Connecting refrigerant lines
- TXV
- A/C pressure transducer
- Heater core and evaporator core housing
- HVAC module
- FCIM
- FCDIM (non touchscreen only)
- FDIM (touchscreen only)
- Air inlet mode door actuator
- Defrost/panel/floor mode door actuator
- Temperature blend door actuator(s)
- Blower motor resistor (EMTC base systems only)
- Blower motor speed control (remote HVAC control module systems only)
- Blower motor
- In-vehicle temperature and humidity sensor (remote HVAC control module systems only)
- Sunload sensor (EATC dual zone systems only)
- Evaporator temperature sensor (serviced only with the heater core and evaporator core housing)

External Temperature Display

The ambient air temperature sensor is monitored by the PCM. The PCM sends the raw value through the HS-CAN to the BCM . The BCM sends the data through the MS-CAN to the HVAC module. The HVAC module filters and stabilizes the value and sends it back to the BCM . The BCM sends the filtered ambient temperature data to the IPC over the I-CAN . The IPC sends the data over the I-CAN to the FDIM to display the temperature.

While the actual external temperature can vary continuously, the value that is displayed updates at a specific

rate depending on whether or not the engine is "hot" and whether or not the vehicle is moving.

When the external temperature is rising, the display updates slowly.

Updates (when the actual external temperature is higher than currently displayed value) is limited to 0.6°C (1°F) every 20 seconds while the vehicle is moving at greater than 32 km/h (20 mph) for more than 60 seconds or 0.6°C (1°F) every 20 minutes if the vehicle is not moving at this speed. This is to prevent the heat from the engine compartment from affecting the accuracy of the display.

When the external temperature is dropping, the display updates quickly.

Updates (when the actual external temperature is lower than currently displayed value) are limited to 0.6°C (1°F) every 2 seconds (regardless of vehicle speed). Consequently the display essentially follows the drop experienced by the external temperature thermistor.

EMTC — Base System

System Operation

The EMTC base system heats or cools the vehicle depending on the HVAC module control panel selection. The EMTC base system has 4 blower motor speed positions.

- The control panel selection determines heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the outlet air temperature.
- The blower motor switch varies the blower motor speed (4 speed positions).
- During A/C operation, the system reduces the relative humidity of the air inside the vehicle.

Remote Start System Behavior — Message Center Set to Auto

Remote start is an available feature on this vehicle. In addition to being able to start the vehicle remotely, the remote start feature also utilizes other vehicle systems to increase the level of comfort to the vehicle occupants upon entering the vehicle. For additional information on the remote start feature and the other vehicle systems it utilizes, refer to Section 303-06 .

When the remote start feature is used, the climate control system automatically sets certain parameters in an attempt to achieve a comfortable cabin temperature. These parameters are set based on outside air temperature. During remote start, the outside air temperature is continually evaluated and HVAC system behavior can change if the outside air changes between cold, moderate and warm temperatures.

For cold ambient air temperatures (below 4.4°C (40°F)):

- the airflow mode is set to FLOOR/DEFROST if Front Defrost is set to Off in the message center.
- the airflow mode is set to DEFROST if Front Defrost is set to Auto in the message center.
- the temperature is set to full HOT.
- the blower speed is set to HIGH.
- the air inlet mode is set to fresh air.
- A/C is set to OFF.

repair4less

For moderate ambient air temperatures (between 4.4°C (40°F) and 23.9°C (75°F)):

- the airflow mode is set to the last user setting.
- the temperature is set to the last user setting.
- the blower speed is set to the last user setting.
- the air inlet mode is set to the last user setting.
- A/C is set to the last user setting.

For warm ambient air temperatures (above 23.9°C (75°F)):

- the airflow mode is set to MAX A/C.
- the temperature is set to full COOL.
- the blower speed is set to HIGH.
- the air inlet mode is set to RECIRC.
- A/C is set to ON.

Remote Start System Behavior — Message Center Set to Last User Settings

Remote start is an available feature on this vehicle. In addition to being able to start the vehicle remotely, the remote start feature also utilizes other vehicle systems to increase the level of comfort to the vehicle occupants upon entering the vehicle. For additional information on the remote start feature and the other vehicle systems it utilizes, refer to Section 303-06.

When the remote start feature is used, the climate control system automatically sets certain parameters in an attempt to achieve a comfortable cabin temperature. These parameters are set based on outside air temperature. During remote start, the outside air temperature is continually evaluated and HVAC system behavior can change if the outside air changes between cold, moderate and warm temperatures.

For additional information regarding the message center, refer to Section 413-01.

When Heater — A/C is set to Last User Settings in the message center, the remote start sets the climate control system to the following settings.

- For cold ambient air temperatures as determined by the HVAC module:
  - the airflow mode is set to the last user setting if Front Defrost is set to Off in the message center.
  - the airflow mode is set to DEFROST if Front Defrost is set to Auto in the message center.
  - the temperature is set to the last user setting.
  - the blower speed is set to the last user setting.
  - the air inlet mode is set to the last user setting.
  - A/C is set to the last user setting.
- For moderate and warm ambient air temperatures as determined by the HVAC module:
  - the airflow mode is set to the last user setting.
  - the temperature is set to the last user setting.
  - the blower speed is set to the last user setting.
  - the air inlet mode is set to the last user setting.
  - A/C is set to the last user setting.

System Airflow and Mode Description

Max A/C

When MAX A/C is selected:

- the air inlet door closes, preventing outside air and admits only recirculated air.
- the RECIRC indicator is illuminated (RECIRC forced on).
- the mode doors direct airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is illuminated.
- the A/C compressor operates if the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

PANEL

When PANEL is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the mode doors direct airflow to the instrument panel A/C registers.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the mode doors direct airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters and defrost duct is present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

OFF

When OFF is selected:

- the air inlet door closes, preventing outside air and allowing only recirculated air.
- the blower motor is off.

repair4less

FLOOR

When FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment. In this mode, the RECIRC request times-out after 5 minutes and return to fresh air mode. RECIRC mode can be selected again after the time-out.
- the mode doors direct airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters is present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

FLOOR/DEFROST

When FLOOR/DEFROST is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment. In this mode, the RECIRC request times-out after 5 minutes and return to fresh air mode. RECIRC mode can be selected again after the time-out.
- the mode doors direct airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button toggles the indicator on and off. To reduce fogging, the A/C compressor operates automatically, regardless of indicator status, if the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

DEFROST

When DEFROST is selected:

- the RECIRC request button is disabled. The air inlet door opens, allowing only outside air into the passenger compartment.
- the mode doors direct airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct is present.
- blended air temperature is available.
- the A/C request button toggles the indicator on and off. To reduce fogging, the A/C compressor operates automatically, regardless of indicator status, if the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

HVAC Module — Remote Mount

The EATC dual zone and the EMTC 4.2 inch display systems use a remote HVAC module that is separate from the control interface. The EMTC with 4.2 inch display system has 7 blower motor speed positions.

System Operation

The system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation, the system reduces the relative humidity of the air inside the vehicle.
- The driver may override the automatic mode of operation.
- The temperature control setting is the desired cabin air temperature.
- The blower motor control override buttons vary the blower motor speed.
- The driver side and passenger side temperature settings can be individually controlled (dual zone systems only).

When the system is set to AUTO the air distribution direction, blower motor speed and A/C compressor operation and air inlet door mode are automatically controlled based on the temperature(s) selected.

The system manual override settings:

- allow the air distribution direction to be manually selected.
- allow the blower motor speed to be manually selected.
- allow recirculation mode to be manually selected in all modes except DEFROST. The A/C request can be manually selected by pressing the A/C request switch.
- allow A/C compressor operation to be manually selected except in DEFROST and FLOOR/DEFROST.

Load Shed Behavior

Under certain circumstances, the vehicle can enter an engine running load shed mode. When this condition occurs, the blower motor in the EATC system behaves in the following manor:

- If the blower motor speed setting is greater than 50%, the speed automatically is reduced to 50% of the maximum setting.
- If the blower motor speed setting is equal to or less than 50%, the speed automatically is reduced to the next lowest level.
- If the blower motor speed setting is set to it's lowest setting, it remains in the lowest setting.

For information on when the vehicle can enter an engine running load shed mode, refer to Section 414-00 .

Remote Start System Behavior — Message Center Set to Auto

Remote start is an available feature on this vehicle. In addition to being able to start the vehicle remotely, the remote start feature also utilizes other vehicle systems to increase the level of comfort to the vehicle occupants upon entering the vehicle. For additional information on the remote start feature and the other vehicle systems it utilizes, refer to Section 303-06 .

When the remote start feature is used, the climate control system automatically sets certain parameters in an attempt to achieve a comfortable cabin temperature. These parameters are set based on outside air temperature. During remote start, the outside air temperature is continually evaluated and HVAC system behavior can change if the outside air changes between cold, moderate and warm temperatures.

repair4less

For additional information regarding the message center, refer to Section 413-01 .

When Heater — A/C is set to Auto in the message center, the remote start sets the climate control system to the following settings:

- For cold ambient air temperatures as determined by the HVAC module AUTO mode to request heat:
  - the airflow mode is set to AUTO if Front Defrost is set to Off in the message center. (if the HVAC module requests FLOOR in AUTO mode, FLOOR/DEFROST is used in remote start mode).
  - the airflow mode is set to DEFROST if Front Defrost is set to Auto in the message center.
  - the temperature is set to 22°C (72°F).
  - the blower speed is set to AUTO.
  - the air inlet mode is set to AUTO.
  - A/C is set to AUTO.
- For moderate and warm ambient air temperatures as determined by the HVAC module AUTO mode to request heat or cooling:
  - the airflow mode is set to AUTO.
  - the temperature is set to 22°C (72°F).
  - the blower speed is set to AUTO.
  - the air inlet mode is set to AUTO.
  - A/C is set to AUTO.

Remote Start System Behavior — Message Center Set to Last User Settings

Remote start is an available feature on this vehicle. In addition to being able to start the vehicle remotely, the remote start feature also utilizes other vehicle systems to increase the level of comfort to the vehicle occupants upon entering the vehicle. For additional information on the remote start feature and the other vehicle systems it utilizes, refer to Section 303-06 .

When the remote start feature is used, the climate control system automatically sets certain parameters in an attempt to achieve a comfortable cabin temperature. These parameters are set based on outside air temperature. During remote start, the outside air temperature is continually evaluated and HVAC system behavior can change if the outside air changes between cold, moderate and warm temperatures.

For additional information regarding the message center, refer to Section 413-01 .

When Heater — A/C is set to Last User Settings in the message center, the remote start sets the climate control system to the following settings:

- For cold ambient air temperatures as determined by the HVAC module:
  - the airflow mode is set to the last user setting if Front Defrost is set to Off in the message center.
  - the airflow mode is set to DEFROST if Front Defrost is set to Auto in the message center.
  - the temperature is set to the last user setting.
  - the blower speed is set to the last user setting.
  - the air inlet mode is set to the last user setting.
  - A/C is set to the last user setting.
- For moderate and warm ambient air temperatures as determined by the HVAC module AUTO mode to request heating or cooling:
  - the airflow mode is set to the last user setting.
  - the temperature is set to the last user setting.

- the blower speed is set to the last user setting.
- the air inlet mode is set to the last user setting.
- A/C is set to the last user setting.

System Airflow and Mode Description

AUTO

When AUTO is selected:

- the temperature control setting is manually set to the desired setting.
- the air inlet door is automatically controlled by the HVAC module based on the temperature setting.
- the mode door is automatically controlled by the HVAC module based on the temperature setting.
- the temperature blend doors are automatically controlled by the HVAC module, based on the temperature setting.
- the A/C compressor is automatically controlled by the HVAC module, based on the temperature setting. The A/C compressor cannot operate if the outside temperature is below approximately 0°C (32°F).
- the blower motor is on. The blower motor speed is automatically controlled by the HVAC module based on the temperature setting, but can be manually overridden.

OFF

When OFF is selected:

- the air inlet door closes, preventing outside air and allowing only recirculated air.
- the blower motor is off.

Max A/C

When MAX A/C is selected:

- the air inlet door closes, preventing outside air and allows only recirculated air.
- the RECIRC button is disabled and the indicator is illuminated (RECIRC forced on).
- the mode doors direct airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is illuminated and is disabled.
- the A/C compressor operates if the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

PANEL

When PANEL is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the mode doors direct airflow to the instrument panel A/C registers.
- blended air temperature is available. Only when A/C compressor operation has been selected by

repair4less

pressing the A/C request button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the mode doors direct airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters and defrost duct is present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

FLOOR

When FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment. In this mode, the RECIRC request times-out after 5 minutes and return to fresh air mode. RECIRC mode can be selected again after the time-out.
- the mode doors direct airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters is present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

FLOOR/DEFROST

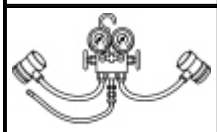
When FLOOR/DEFROST is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment. In this mode, the RECIRC request times-out after 5 minutes and return to fresh air mode. RECIRC mode can be selected again after the time-out.
- the mode doors direct airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor operates automatically and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately

0°C (32°F).
- the blower motor is on.

DEFROST

When DEFROST is selected:



- the RECIRC request button and indicator is disabled. Regardless of button and indicator status, the air inlet door opens, allowing only outside air into the passenger compartment.
- the mode doors direct airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct is present.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor operates automatically and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

 ST3094-A	

Principles of Operation

For additional refrigerant system and component information, refer to Section 412-01 .

The Refrigerant Cycle

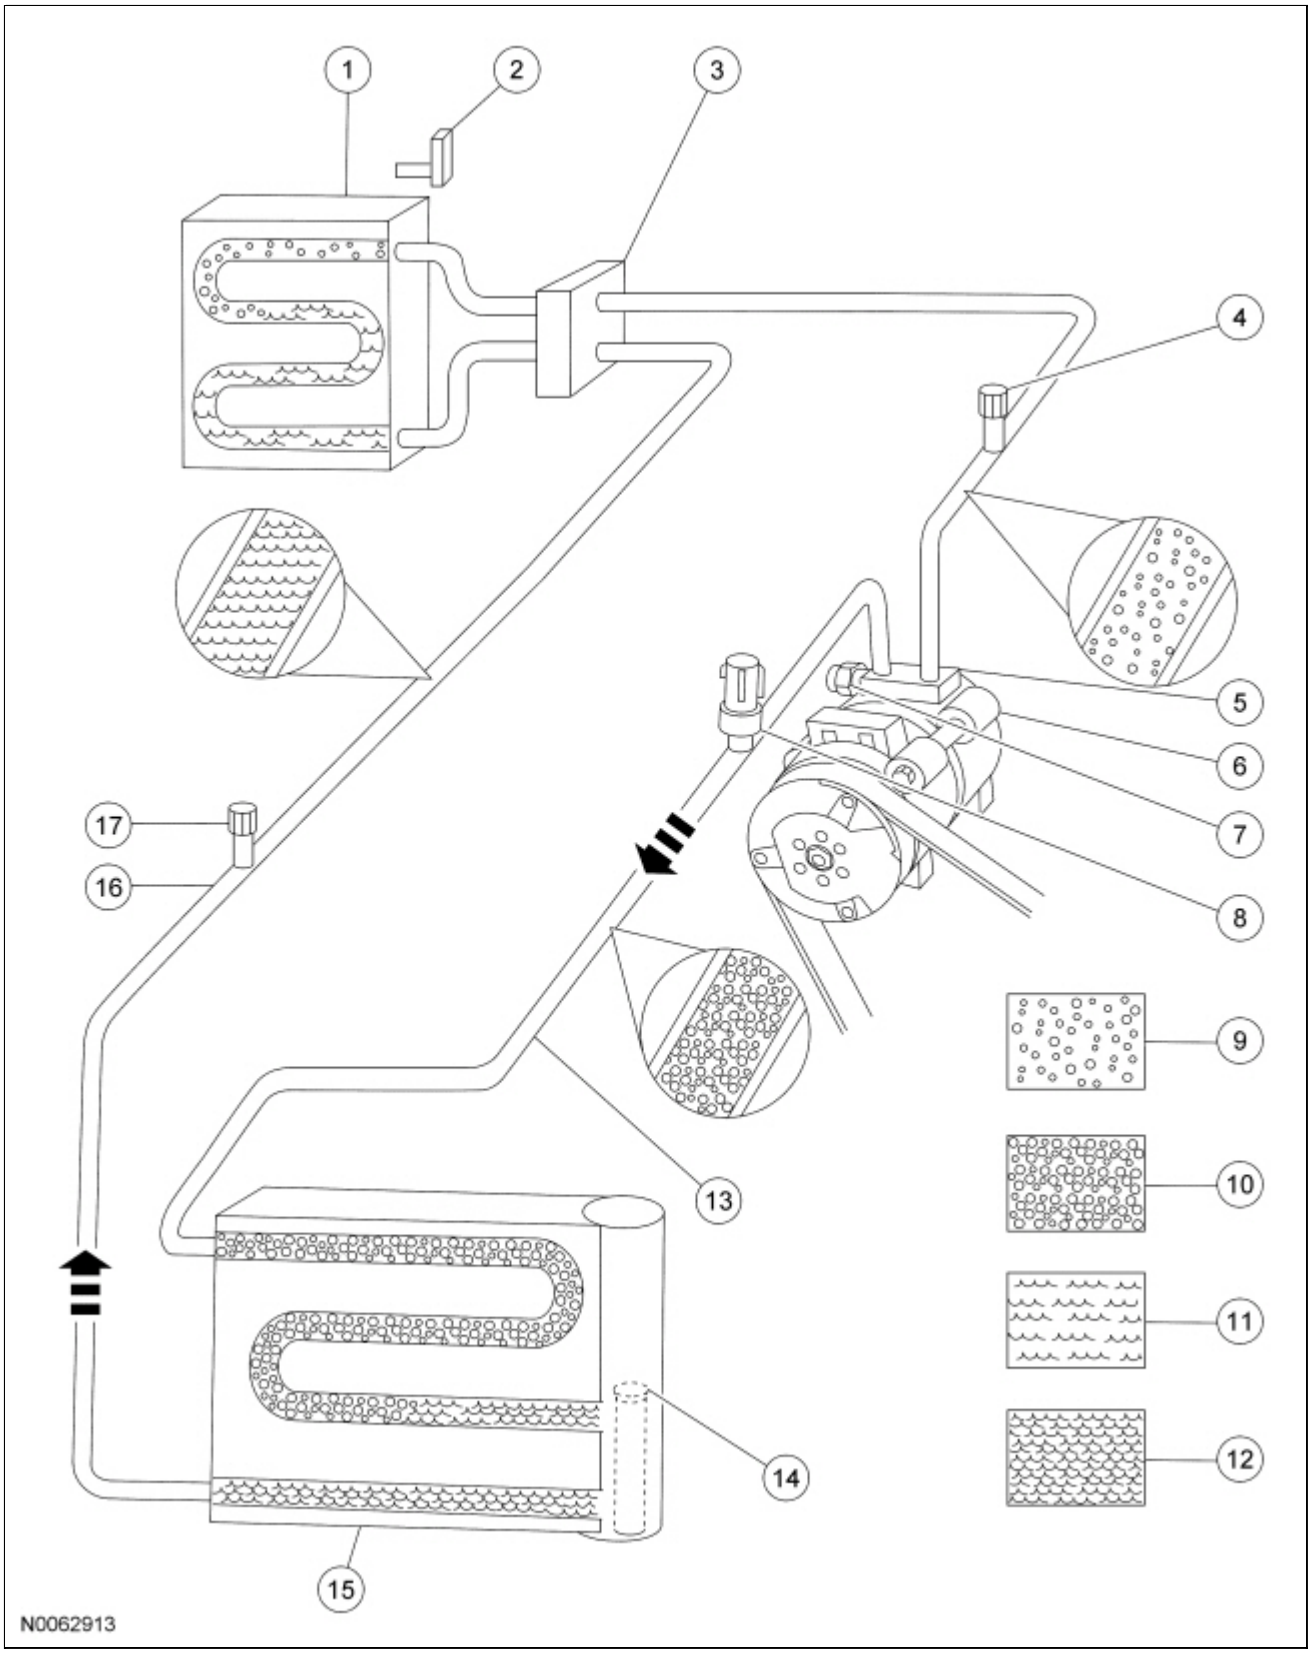
During stabilized conditions (A/C system shutdown), the refrigerant pressures are equal throughout the system. When the A/C compressor is in operation, it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the A/C condenser core.

The A/C condenser, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser and enters the inlet side of the A/C receiver/drier. The receiver/drier is designed to remove moisture from the refrigerant.

The outlet of the receiver/drier is connected to the TXV . The TXV provides the orifice which is the restriction in the refrigerant system and separates the high and low pressure sides of the A/C system. As the liquid refrigerant passes across this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator, it absorbs heat from the airflow passing over the plate/fin sections of the A/C evaporator. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.



The PCM controls the A/C clutch relay. The evaporator temperature sensor monitors the temperature of the air that has passed through the evaporator core and sends a signal to the PCM. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the PCM.

The line pressure is monitored so that A/C compressor operation is interrupted if the system pressure becomes too high or too low.

The A/C compressor relief valve opens and vents refrigerant to relieve unusually high system pressure.

TXV Type Refrigerant System

Item	Description
1	A/C evaporator core

2	A/C evaporator core outlet temperature thermistor
3	TXV
4	A/C charge valve port (low side)
5	A/C suction line
6	A/C compressor
7	A/C pressure relief valve
8	A/C pressure transducer
9	Low-pressure vapor
10	High-pressure vapor
11	Low-pressure liquid
12	High-pressure liquid
13	Compressor discharge line
14	A/C desiccant cartridge
15	A/C condenser core with A/C receiver/drier
16	Condenser-to-evaporator line
17	A/C charge valve port (high side)

Inspection and Verification

1. Verify the customer's concern by operating the climate control system to duplicate the condition.
2. Inspect to determine if one of the following mechanical or electrical concerns apply:

   Visual Inspection Chart

Mechanical	Electrical

• Loose, missing or damaged A/C compressor drive belt
• Loose or disconnected A/C clutch
• Broken or binding door/actuator
• Broken or leaking refrigerant lines
• Obstructed in-vehicle temperature and humidity sensor
• Disconnected in-vehicle temperature aspirator hose
	• BJB fuses:
	  ▪ 30 (10A)
	  ▪ 51 (40A)
	  ▪ 52 (5A)
	  ▪ 77 (10A)
	• BCM fuse 46 (10A)
	• Blower motor inoperative
	• A/C compressor inoperative
	• Circuitry open/shorted
	• Disconnected electrical connectors
	• Cooling fan inoperative

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the DLC .
5. **NOTE:** The VCM LED prove-out confirms power and ground from the DLC are provided to the VCM .

repair4less

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the VCM .

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM, HVAC module.

7. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the CMDTCs .

8. Clear the continuous DTCs and carry out the self-test diagnostics from the PCM or HVAC module.

9. **NOTE:** Some PCM DTCs can inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

   If the HVAC DTCs retrieved are related to the concern, go to the HVAC Module DTC Chart. If the PCM DTCs retrieved are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Climate Control Systems or GO to Symptom Chart - NVH .

DTC Charts

PCM DTC Chart

DTC	Description	Action to Take
P0532	A/C Refrigerant Pressure Sensor A Circuit Low	GO to Pinpoint Test A .
P0533	A/C Refrigerant Pressure Sensor A Circuit High	GO to Pinpoint Test A .
P0645	A/C Clutch Relay Control Circuit	GO to Pinpoint Test B .
P1464	A/C Demand Out Of Self Test Range	If the HVAC selector was not powered off, POWER the HVAC off, CLEAR the DTCs and REPEAT the self-test. If the DTC does not return, IGNORE the DTC and continue diagnosing other DTCs or symptoms. If the DTC returns, GO to Pinpoint Test Q .
All Other DTCs	—	REFER to Section 303-14 .

HVAC Module DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. CMDTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

NOTE: Network DTCs (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle repair procedures such as module reprogramming often set network DTCs. Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery, refer to Section 414-01 .

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

U0401:09	Invalid Data Received From ECM/PCM A: Component Failure	This DTC can set due to a fault in the PCM. CARRY OUT a self-test of the PCM and DIAGNOSE any PCM DTCs present, REFER to Section 303-14 .
U0401:68	Invalid Data Received From ECM/PCM A: Event Information	This DTC can set due to a fault in the PCM. CARRY OUT a self-test of the PCM and DIAGNOSE any PCM DTCs present, REFER to Section 303-14 .
U0401:81	Invalid Data Received From ECM/PCM A: Invalid Serial Data Received	This DTC can set due to a fault in the PCM. CARRY OUT a self-test of the PCM and DIAGNOSE any PCM DTCs present, REFER to Section 303-14 .
U0401:82	Invalid Data Received From ECM/PCM A: Alive/Sequence Counter Incorrect/Not Updated	This DTC can set due to a fault in the PCM. CARRY OUT a self-test of the PCM and DIAGNOSE any PCM DTCs present, REFER to Section 303-14 .
U0422:68	Invalid Data Received From Body Control Module: Event Information	This DTC can set due to a fault in the BCM . CARRY OUT a self-test of the BCM and DIAGNOSE any BCM DTCs present, REFER to Section 419-10 .
U0422:81	Invalid Data Received From Body Control Module: Invalid Serial Data Received	This DTC can set due to a fault in the BCM . CARRY OUT a self-test of the BCM and DIAGNOSE any BCM DTCs present, REFER to Section 419-10 .
U0423:82	Invalid Data Received from Instrument Panel Cluster Control Module: Alive/Sequence Counter Incorrect/Not Updated	This DTC can set due to a fault in the IPC . CARRY OUT a self-test of the IPC and DIAGNOSE any IPC DTCs present, REFER to Section 413-01 .
U0554:82	Invalid Data Received From Accessory Protocol Interface Module: Alive / Sequence Counter Incorrect / Not Updated	This DTC can set due to a fault in the APIM . CARRY OUT a self-test of the APIM and DIAGNOSE any APIM DTCs present, Refer to the appropriate section in Group 415 for the procedure.
U1000:00	Solid State Driver Protection Actived - Driver Disabled:	The HVAC module has temporarily disabled an output because an excessive current draw exists (such as a short to ground). The HVAC module cannot enable the output until the cause of the short is corrected. ADDRESS all other Diagnostic Trouble Codes (DTCs) first. After the cause of the concern is corrected, CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test.
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CARRY OUT PMI on the HVAC module. REFER to Section 418-01 . REPEAT the self-test. If PMI is successful, the DTC will not be present. If the DTC returns, INSTALL a new HVAC module. REFER to Section 412-01 .
U3000:49	Control Module: Internal	ADDRESS all other DTCs first. CLEAR the DTCs. REPEAT the

repair4less

	Electronic Failure	self-test. If DTC U3000:49 is retrieved again, INSTALL a new HVAC module. REFER to Section 412-01 .
U3002:62	Vehicle Identification Number: Signal Compare Failure	CARRY OUT PMI on the HVAC module. REFER to Section 418-01 . REPEAT the self-test. If PMI is successful, the DTC will not be present. If the DTC returns, INSTALL a new HVAC module. REFER to Section 412-01 .
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test H .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test H .
All other DTCs	—	REFER to the Master DTC Chart in Section 419-10 .

Symptom Chart — Climate Control Systems

Symptom Chart — Climate Control Systems

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

Condition	Possible Sources	Action
• No communication with the HVAC module	• HVAC module • Communication network	• REFER to Section 418-00 .
• Unable to duplicate the customer concern and no DTCs present	• HVAC system and/or related components	• GO to Pinpoint Test I .
• Reduced outlet airflow	• Wiring, terminals or connectors • A/C compressor clutch air gap • A/C evaporator temperature sensor • A/C clutch relay • Blower motor control • Blower motor resistor • PCM • HVAC module • FCIM	• If the A/C compressor does not cycle, GO to Pinpoint Test P . • For EMTC base with 4 blower motor speed positions, if the A/C compressor cycles normally, GO to Pinpoint Test X . • For other systems, if the A/C compressor cycles normally, GO to Pinpoint Test Z .
• The air inlet door is inoperative	• Wiring, terminals or connectors • Air inlet mode door actuator • Stuck or bound linkage or door • HVAC module • FCIM	• For EMTC base with 4 blower motor speed positions, GO to Pinpoint Test J . • For other systems, GO to Pinpoint Test K .
• Incorrect/erratic	• Wiring, terminals or	• For EMTC base with 4

direction of airflow from outlets	connectors • Defrost/panel/floor mode door actuator • Stuck or bound linkage or door • HVAC module • FCIM	blower motor speed positions, GO to Pinpoint Test L . • For other systems, GO to Pinpoint Test M .
• Insufficient, erratic or no heat	• Low engine coolant level • Plugged or partially plugged heater core • Temperature blend door(s) binding or stuck • Temperature blend door actuator(s)	• GO to Pinpoint Test n .
• Insufficient A/C cooling	• Improper refrigerant level • Temperature blend door(s) binding or stuck • Temperature blend door actuator(s)	• CARRY OUT the refrigerant system tests. Refrigerant System Tests If OK, DIAGNOSE for a temperature blend door actuator not operating correctly. • For inadequate temperature out of the EMTC base with 4 blower motor speed positions, GO to Pinpoint Test R . • For inadequate temperature out of the EMTC with 4.2 inch display with 7 blower motor speed positions, GO to Pinpoint Test S . • For inadequate temperature out of the EATC , dual zone driver side, GO to Pinpoint Test U . • For inadequate temperature out of the EATC , dual zone passenger side, GO to Pinpoint Test V .
• The air conditioning (A/C) is inoperative	• Fuse(s) • Wiring, terminals or connectors • A/C system discharged/low charge • PCM • HVAC module • FCIM • A/C clutch relay • A/C compressor clutch air gap • A/C pressure transducer • Evaporator temperature sensor	• GO to Pinpoint Test O .

repair4less

	• A/C compressor clutch field coil	
• The air conditioning (A/C) is always on — A/C compressor does not cycle	• Wiring, terminals or connectors • PCM • Evaporator temperature sensor • A/C clutch relay • A/C compressor clutch air gap	• GO to Pinpoint Test P .
• The air conditioning (A/C) is always on — A/C mode always commanded ON	• Wiring, terminals or connectors • PCM • FCIM • HVAC module	• GO to Pinpoint Test Q .
• Temperature control is inoperative/does not operate correctly — EMTC base with 4 blower motor speed positions	• Wiring, terminals or connectors • HVAC module • Stuck or bound linkage or door • Temperature blend door actuator	• GO to Pinpoint Test R .
• Temperature control is inoperative/does not operate correctly — EMTC with 4.2 inch display with 7 blower motor speed positions	• Wiring, terminals or connectors • HVAC module • Stuck or bound linkage or door • Temperature blend door actuator	• GO to Pinpoint Test S .
• Temperature control is inoperative/does not operate correctly — EATC , dual zone driver side	• Wiring, terminals or connectors • HVAC module • Stuck or bound linkage or door • Temperature blend door actuator • FCIM	• GO to Pinpoint Test U .
• Temperature control is inoperative/does not operate correctly — EATC , dual zone passenger side	• Wiring, terminals or connectors • HVAC module • Stuck or bound linkage or door • Temperature blend door actuator • FCIM	• GO to Pinpoint Test V .
• The blower motor is inoperative — EMTC base with 4 blower motor speed positions	• Fuse(s) • Wiring, terminals or connectors • Blower motor relay • Blower motor • HVAC module	• GO to Pinpoint Test W .
• The blower motor does not operate correctly — EMTC base with 4 blower motor speed	• Wiring, terminals or connectors • Blower motor resistor	• GO to Pinpoint Test X .

positions	• HVAC module	
• The blower motor is inoperative — EATC dual zone and EMTC with 4.2 inch display with 7 blower motor speed positions	• Fuse(s) • Wiring, terminals or connectors • Blower motor relay • Blower motor • HVAC module • Blower motor speed control	• GO to Pinpoint Test Y .
• The blower motor does not operate correctly — EATC dual zone and EMTC with 4.2 inch display with 7 blower motor speed positions	• Wiring, terminals or connectors • Blower motor speed control • HVAC module • FCIM	• GO to Pinpoint Test Z .
• A/C pressure relief valve discharging	• High system pressure • A/C pressure relief valve	• CHECK the high side system pressure. If the pressure is below the A/C pressure relief valve open pressure, REPLACE the A/C pressure relief valve. If the system pressure is above the A/C pressure relief valve open pressure, REPAIR the system for a restriction.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms will be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Noisy A/C compressor	• A/C compressor clutch air gap out of specification	• CHECK and ADJUST the A/C compressor clutch gap if necessary. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. • If the A/C compressor clutch gap is OK, INSTALL an A/C compressor clutch. REFER to Section 412-01 . TEST the system for normal operation.
	• A/C compressor pulley bearing worn	• INSPECT the A/C compressor pulley bearing for roughness. If bearing roughness is found, INSTALL an A/C compressor pulley. REFER to Section 412-01 . TEST the system for normal operation.

repair4less

	• A/C compressor bearing worn	• INSPECT the A/C compressor bearing for roughness. If bearing roughness is found, INSTALL an A/C compressor. REFER to Section 412-01 . TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: DTC P0532 or P0533

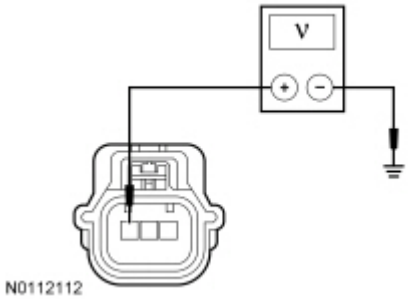
Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

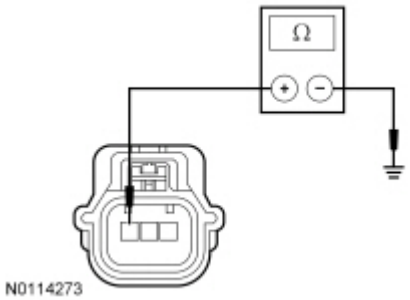
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

The A/C pressure transducer receives a ground from the PCM. A 5-volt reference voltage is supplied to the A/C pressure transducer from the PCM. The A/C pressure transducer then sends a voltage to the PCM to indicate the A/C pressure.

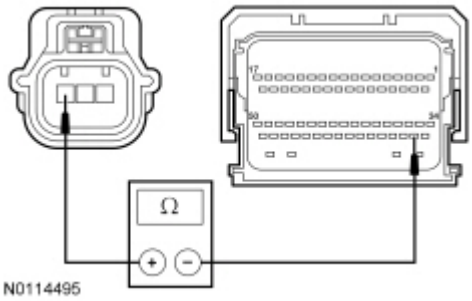
DTC Fault Trigger Conditions





DTC	Description	Fault Trigger Conditions
P0532	A/C Refrigerant Pressure Sensor A Circuit Low: No Sub Type Information	The A/C pressure transducer inputs a feedback voltage to the PCM. This DTC sets if the feedback voltage is less than 0.26 volts for at least 2 seconds and the ambient air temperature is greater than 0°C (32°F).
P0533	A/C Refrigerant Pressure Sensor A Circuit High: No Sub Type Information	The A/C pressure transducer inputs a feedback voltage to the PCM. This DTC sets if the feedback voltage is greater than 4.95 volts for at least 2 seconds and the ambient air temperature is greater than 0°C (32°F).

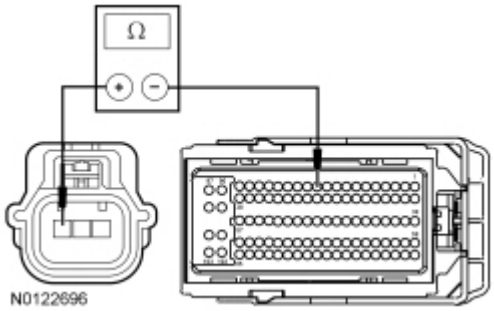
This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- A/C pressure transducer
- PCM

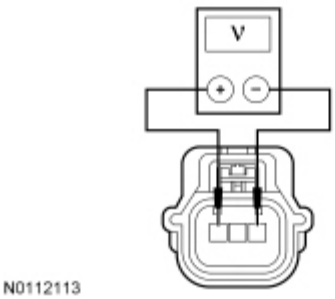
PINPOINT TEST A: DTC P0532 OR P0533

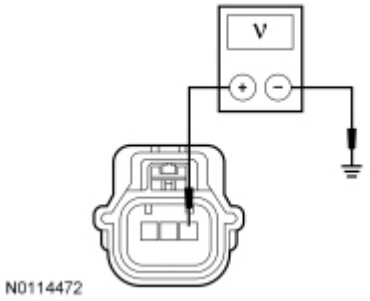
Test Step	Result / Action to Take
A1 COMPARE THE A/C PRESSURE SENSOR (ACP_PRESS) PCM PARAMETER IDENTIFICATION (PID) WITH THE MANIFOLD GAUGE SET READINGS	
• Allow the A/C system to stabilize to the outside ambient	**Yes**

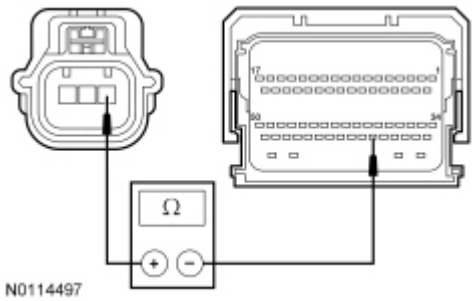


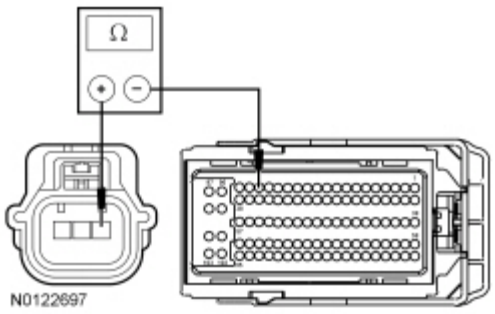
temperature. • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger . • With the R-134a manifold gauge set connected, compare the pressure readings of the manifold gauge set and the ACP_PRESS PCM PID. • **Are the pressure values of the manifold gauge set and the Parameter Identification (PID) within +/-15 psi?**	IGNORE the Diagnostic Trouble Codes (DTCs). REFER to the Symptom Chart in this section. **No** GO to A2 .
A2 CHECK THE PCM REFERENCE VOLTAGE CIRCUIT	
• Ignition OFF. • Disconnect: A/C Pressure Transducer C1260 . • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1260-3, circuit LE424 (YE/GN), harness side.  • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to A5 . **No** If the voltage is below 4.7 volts, GO to A3 . If the voltage is greater than 5.1 volts, REPAIR the circuit for a short to voltage.
A3 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C1381B (5.0L, 6.2L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1551B (3.5L) . • Measure the resistance between ground and A/C pressure transducer C1260-3, circuit LE424 (YE/GN), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A4 . **No** REPAIR the circuit.
A4 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN	
For 3.7L, 5.0L and 6.2L	**Yes** GO to A14 . **No** REPAIR the circuit.

repair4less



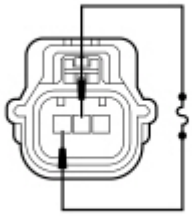


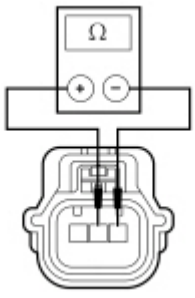


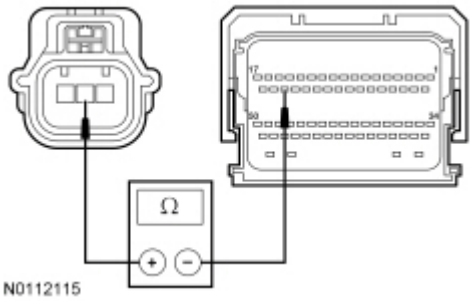


- Measure the resistance between A/C pressure transducer C1260-3, circuit LE424 (YE/GN), harness side and:
  - For 3.7L, PCM C175B-52, circuit LE424 (YE/GN), harness side.
  - For 5.0L and 6.2L, PCM C1381B-52, circuit LE424 (YE/GN), harness side.

For 3.5L



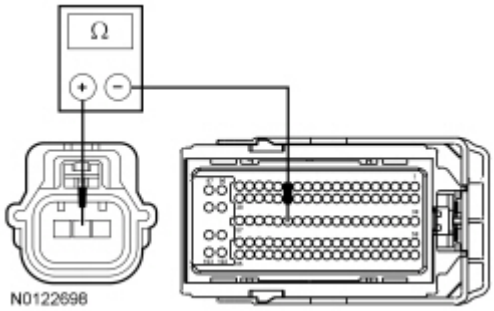




- For 3.5L, measure the resistance between A/C pressure transducer C1260-3, circuit LE424 (YE/GN), harness side and PCM C1551B-11, circuit LE424 (YE/GN), harness side.
- **Is the resistance less than 3 ohms?**

A5 CHECK THE PCM SENSOR GROUND	
• Measure the voltage between A/C pressure transducer C1260-1, circuit RE407 (YE/VT), harness side and A/C pressure transducer C1260-3, circuit LE424 (YE/GN), harness side.  • **Is the voltage greater than 4.7 volts?**	**Yes** If diagnosing DTC P0532, GO to A8 . If diagnosing DTC P0533, GO to A11 . **No** GO to A6 .
A6 CHECK THE SIGNAL RETURN CIRCUIT FOR VOLTAGE	
• Measure the voltage between ground and A/C pressure	**Yes**

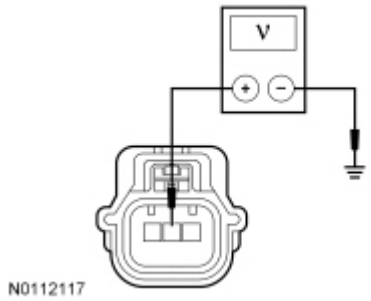
transducer C1260-1, circuit RE407 (YE/VT), harness side.  • **Is any voltage present?**	If the voltage is 5.1 volts or less, REPAIR circuit RE407 (YE/VT) for a short to circuit LE424 (YE/GN). If the voltage is greater than 5.1 volts, REPAIR circuit RE407 (YE/VT) for a short to voltage. **No** GO to A7 .
A7 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: PCM C1381B (5.0L, 6.2L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1551B (3.5L) . **For 3.7L, 5.0L and 6.2L**  • Measure the resistance between A/C pressure transducer C1260-1, circuit RE407 (YE/VT), harness side and: ▪ For 3.7L, PCM C175B-56, circuit RE407 (YE/VT), harness side. ▪ For 5.0L and 6.2L, PCM C1381B-56, circuit RE407 (YE/VT), harness side. **For 3.5L**  • For 3.5L, measure the resistance between A/C pressure transducer C1260-1, circuit RE407 (YE/VT), harness side and PCM C1551B-17, circuit RE407 (YE/VT), harness side. • **Is the resistance less than 3 ohms?**	**Yes** GO to A14 . **No** REPAIR the circuit.

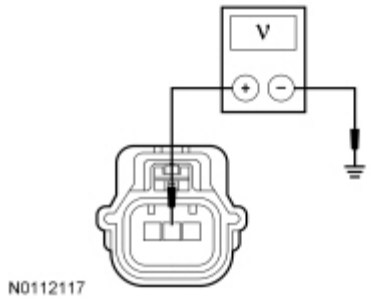


repair4less

A8 CHECK THE A/C PRESSURE SENSOR (ACP_V) PCM PID WITH THE A/C PRESSURE TRANSDUCER SHORTED	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger . • While observing the ACP_V PCM PID, connect a fused jumper between A/C pressure transducer C1260-3, circuit LE424 (YE/GN), harness side and A/C pressure transducer C1260-2, circuit VH433 (VT/OG), harness side.  N0114498 • **Does the ACP_V PCM PID voltage read between 4.7 and 5.1 volts?**	**Yes** INSTALL a new A/C pressure transducer. **No** GO to A9 .
A9 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN CIRCUIT	
• Ignition OFF. • Disconnect: PCM C1381B (5.0L, 6.2L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1551B (3.5L) . • Measure the resistance between A/C pressure transducer C1260-2, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1260-1, circuit RE407 (YE/VT), harness side.  N0112118 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A10 . **No** REPAIR circuit VH433 (VT/OG) for a short to circuit RE407 (YE/VT).
A10 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR AN OPEN	
For 3.7L, 5.0L and 6.2L	**Yes** GO to A14 . **No** REPAIR the circuit.

- Measure the resistance between A/C pressure transducer C1260-2, circuit VH433 (VT/OG), harness side and:
  - For 3.7L, PCM C175B-31, circuit VH433 (VT/OG), harness side.
  - For 5.0L and 6.2L, PCM C1381B-31, circuit VH433 (VT/OG), harness side.





For 3.5L

- For 3.5L, measure the resistance between A/C pressure transducer C1260-2, circuit VH433 (VT/OG), harness side and PCM C1551B-52, circuit VH433 (VT/OG), harness side.
- **Is the resistance less than 3 ohms?**

A11 CHECK THE A/C PRESSURE SENSOR (ACP_V) PCM PID WITH THE A/C PRESSURE TRANSDUCER DISCONNECTED	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Observe the ACP_V PCM PID voltage. • **Does the ACP_V PCM PID voltage read 0 volts?**	**Yes** INSTALL a new A/C pressure transducer. **No** GO to A12 .
A12 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR VOLTAGE	
• Measure the voltage between ground and A/C pressure transducer C1260-2, circuit VH433 (VT/OG), harness side.	**Yes** GO to A13 . **No** GO to A14 .

repair4less

 • **Is any voltage present?**	
A13 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C1381B (5.0L, 6.2L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1551B (3.5L) . • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1260-2, circuit VH433 (VT/OG), harness side.  • **Is any voltage present?**	**Yes** REPAIR the circuit. **No** REPAIR circuit VH433 (VT/OG) for a short to circuit LE424 (YE/GN).
A14 CHECK FOR CORRECT PCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all PCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all PCM connectors. Make sure they seat and latch correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test B: DTC P0645

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

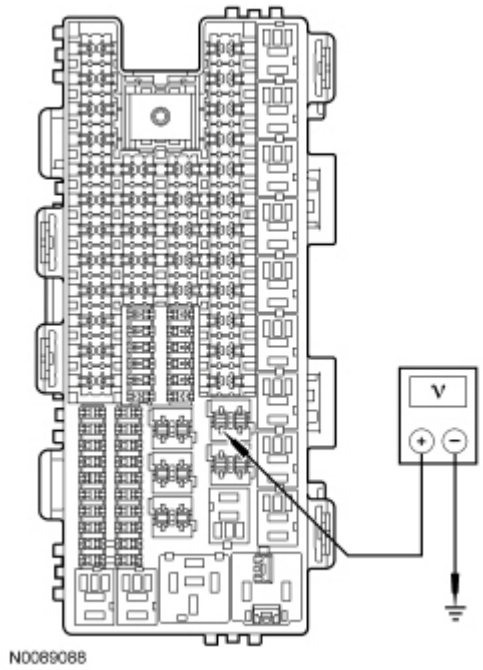
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Voltage is provided to the A/C clutch relay coil from Battery Junction Box (BJB) fuse 77 (10A). When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0645	A/C Clutch Relay Control Circuit: No Sub Type Information	The DTC sets when the PCM grounds the relay circuit and more voltage than expected is detected on the relay circuit. The DTC also sets when the relay circuit is off and no voltage is detected on the relay circuit.

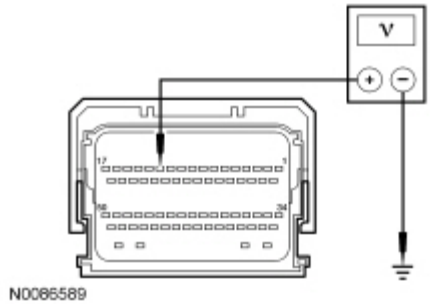


This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- A/C clutch relay
- PCM

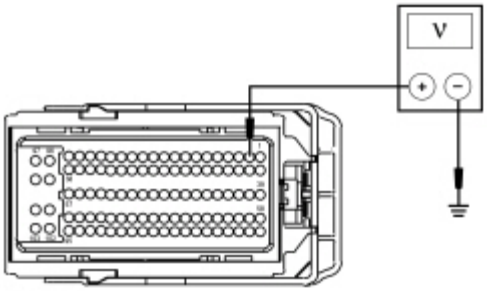
PINPOINT TEST B: DTC P0645

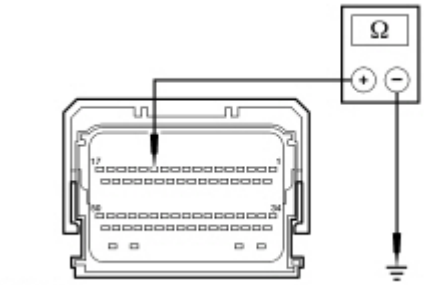
Test Step	Result / Action to Take
B1 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY	
• Ignition OFF. • Disconnect: A/C Clutch Relay . • Ignition ON. • Measure the voltage between ground and the A/C clutch relay socket, circuit CBB77 (WH).	**Yes** GO to B2 . **No** VERIFY BJB fuse 77 (10A) is OK. If OK, REPAIR circuit CBB77 (WH) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

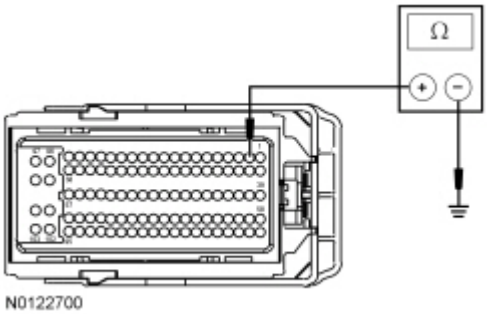


repair4less

N0089088

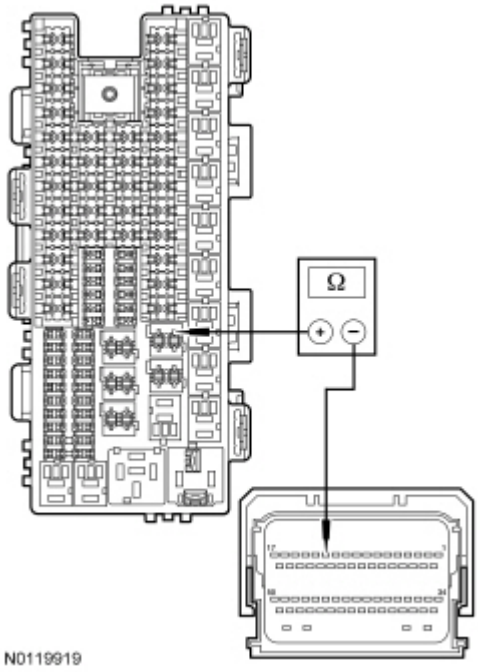


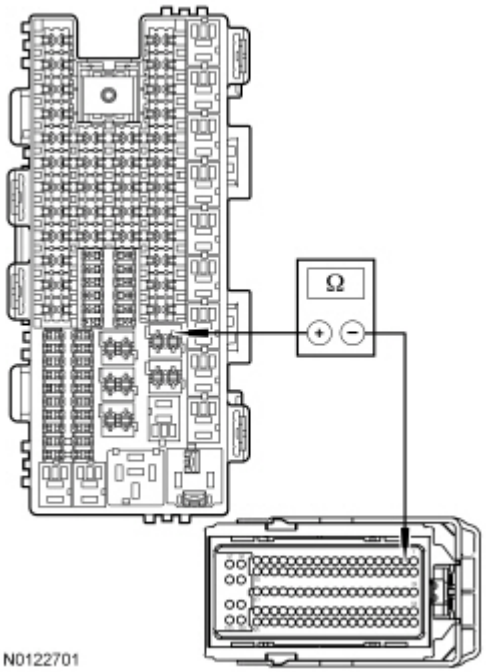




- **Is the voltage greater than 11 volts?**

B2 CHECK THE A/C CLUTCH RELAY	
• Carry out the A/C clutch relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the relay pass the component test?**	**Yes** GO to B3 . **No** INSTALL a new A/C clutch relay. TEST the system for normal operation.
B3 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C1381B (5.0L, 6.2L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1551B (3.5L) . • Ignition ON. **For 3.7L, 5.0L and 6.2L**	**Yes** REPAIR the circuit. **No** GO to B4 .





N0086589

- Measure the voltage between ground and:
  - For 3.7L, PCM C175B-12, circuit CH302 (WH/BN), harness side.
  - For 5.0L and 6.2L, PCM C1381B-12, circuit

CH302 (WH/BN), harness side. **For 3.5L**  N0122699 • For 3.5L, measure the voltage between ground and PCM C1551B-2, circuit CH302 (WH/BN), harness side. • **Is any voltage present?**	
B4 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. **For 3.7L, 5.0L and 6.2L**  N0086590 • Measure the resistance between ground and: ▪ For 3.7L, PCM C175B-12, circuit CH302 (WH/BN), harness side. ▪ For 5.0L and 6.2L, PCM C1381B-12, circuit CH302 (WH/BN), harness side. **For 3.5L**  N0122700 • For 3.5L, measure the resistance between ground and	**Yes** GO to B5 . **No** REPAIR the circuit.

repair4less

PCM C1551B-2, circuit CH302 (WH/BN), harness side. • **Is the resistance greater than 10,000 ohms?**	
B5 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR AN OPEN	
For 3.7L, 5.0L and 6.2L  N0119919 • Measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and: ▪ For 3.7L, PCM C175B-12, circuit CH302 (WH/BN), harness side. ▪ For 5.0L and 6.2L, PCM C1381B-12, circuit CH302 (WH/BN), harness side. **For 3.5L**	**Yes** GO to B6 . **No** REPAIR the circuit.

 • For 3.5L, measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and PCM C1551B-2, circuit CH302 (WH/BN), harness side. • **Is the resistance less than 3 ohms?**	
B6 CHECK FOR CORRECT PCM OPERATION	

• Ignition OFF.
• Disconnect and inspect all PCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all PCM connectors. Make sure they seat and latch correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test C: DTC C1B14:11 or C1B14:12

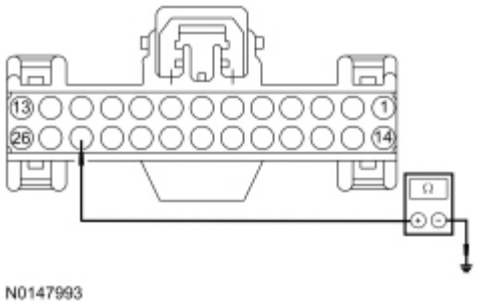
Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

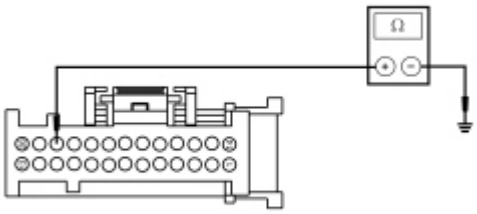
A 5-volt reference voltage is supplied to the sensors and actuators from the HVAC module.

repair4less



DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C1B14:11	Sensor Supply Voltage A: Circuit Short to Ground	The HVAC module senses less than 5 volts on the sensor reference voltage circuit, indicating a short to ground.
C1B14:12	Sensor Supply Voltage A: Circuit Short to Battery	The HVAC module senses greater than 5 volts on the sensor reference voltage circuit, indicating a short to voltage.

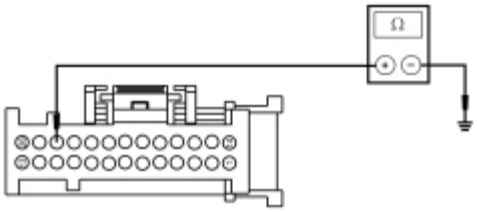


This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module

PINPOINT TEST C: DTC C1B14:11 OR C1B14:12

Test Step	Result / Action to Take
C1 CHECK THE SENSOR RESISTANCE	
• Check for HVAC DTCs. • **Is DTC C1B14:11 present?**	**Yes** GO to C2 . **No** GO to C5 .
C2 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . **For vehicles with Base EMTC**  N0147993 • Measure the resistance between ground and HVAC module — Base EMTC C294A-24, circuit LH111 (BN/WH), harness side.	**Yes** GO to C3 . **No** REPAIR the circuit.

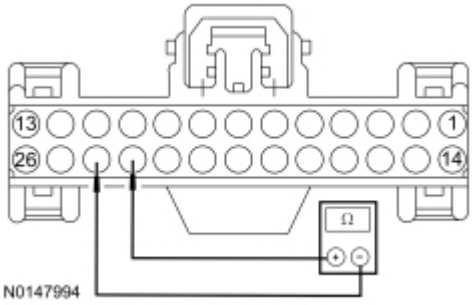


For vehicles with Remote Mount EMTC

N0114401

- Measure the resistance between ground and HVAC module — Remote Mount EMTC C2357A-24, circuit LH111 (BN/WH), harness side.

For vehicles with EATC



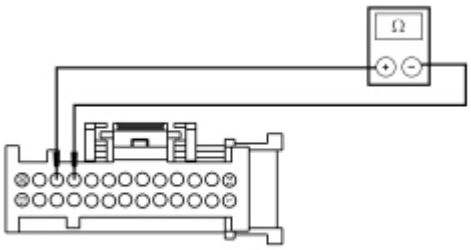
N0114401

- Measure the resistance between ground and HVAC module — EATC C228A-24, circuit LH111 (BN/WH), harness side.
- **Is the resistance greater than 10,000 ohms?**

C3 CHECK THE REFERENCE VOLTAGE CIRCUIT AND THE SIGNAL RETURN CIRCUIT FOR A SHORT TOGETHER

For vehicles with Base EMTC

N0147994

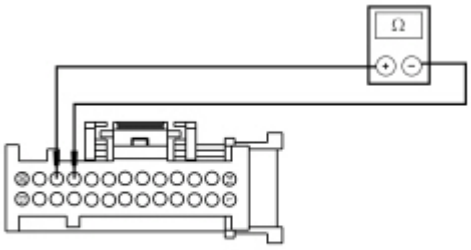


- Measure the resistance between HVAC module — Base EMTC C294A-24, circuit LH111 (BN/WH), harness side and HVAC module — EMTC C294A-23, circuit RH111 (GY/BU), harness side.

For vehicles with Remote Mount EMTC

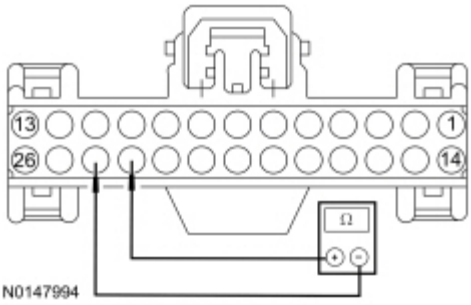
Yes
GO to C6 .

No
GO to C4 .

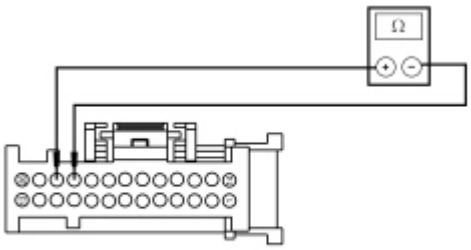


repair4less

N0114402



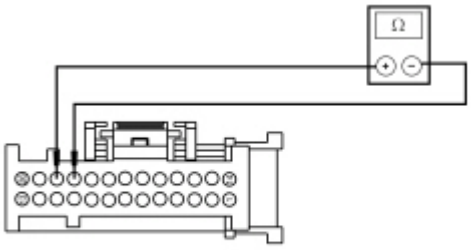
- Measure the resistance between HVAC module — Remote Mount EMTC C2357A-24, circuit LH111 (BN/WH), harness side and HVAC module — Remote Mount EMTC C2357A-23, circuit RH111 (GY/BU), harness side.



For vehicles with EATC

N0114402

- Measure the resistance between HVAC module — EATC C228A-24, circuit LH111 (BN/WH), harness side and HVAC module — EATC C228A-23, circuit RH111 (GY/BU), harness side.
- **Is the resistance greater than 200 ohms?**



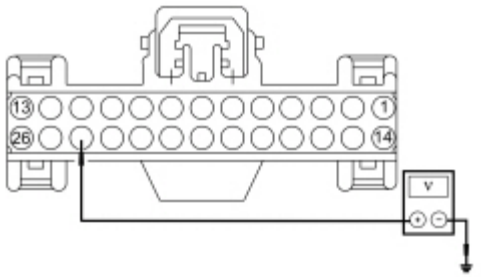
C4 CHECK THE ACTUATORS	
For vehicles with Base EMTC  N0147994 • Measure the resistance between HVAC module — Base EMTC C294A-24, circuit LH111 (BN/WH), harness side and HVAC module — Base EMTC C294A-23, circuit RH111 (GY/BU), harness side. **For vehicles with Remote Mount EMTC**	**Yes** INSTALL a new actuator or sensor (the last one to be disconnected). REFER to Section 412-01 . When installing an actuator, CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected. TEST the system for normal operation. **No** REPAIR the circuits.

N0114402

- Measure the resistance between HVAC module — Remote Mount EMTC C2357A-24, circuit LH111 (BN/WH), harness side and HVAC module Remote Mount EMTC C2357A-23, circuit RH111 (GY/BU), harness side.

  For vehicles with EATC

N0114402

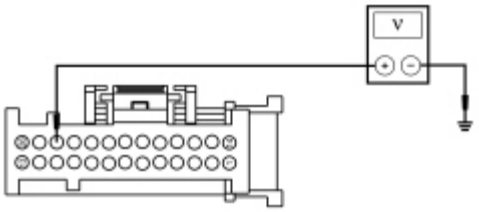


- Measure the resistance between HVAC module — EATC C228A-24, circuit LH111 (BN/WH), harness side and HVAC module C228A-23, circuit RH111 (GY/BU), harness side.
- While measuring the resistance, disconnect the following components one at a time, in order. Stop disconnecting components if the measured resistance rises above 200 ohms.
  - In-vehicle temperature and humidity sensor C2247
  - Air inlet mode door actuator C289
  - Defrost/panel/floor mode door actuator C236
  - Temperature blend door actuator C2381 (EMTC only)
  - Driver side temperature blend door actuator C2091 (EATC only)
  - Passenger side temperature blend door actuator C2092 (EATC only)
- **Did the resistance rise above 200 ohms?**

C5 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC	**Yes** REPAIR the circuit. **No** GO to C6 .

repair4less

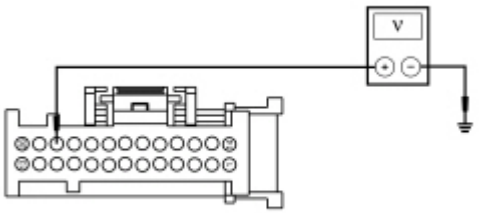
C2357B .
- Disconnect: HVAC Module — EATC C228A .
- Disconnect: HVAC Module — EATC C228B .



For vehicles with Base EMTC

N0147995

- Measure the voltage between ground and HVAC module — EMTC C294A-24, circuit LH111 (BN/WH), harness side.



For vehicles with Remote Mount EMTC

N0114403

- Measure the voltage between ground and HVAC module — Remote Mount EMTC C2357A-24, circuit LH111 (BN/WH), harness side.

For vehicles with EATC

N0114403

- Measure the voltage between ground and HVAC module — EATC C228A-24, circuit LH111 (BN/WH), harness side.
- **Is any voltage present?**

C6 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs. If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test D: DTC B1A61:11 or B1A61:15

Refer to Wiring Diagrams Cell 54, Manual Climate Control System for schematic and connector information.

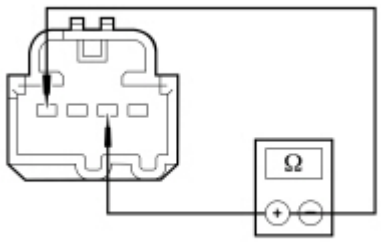
Refer to Wiring Diagrams Cell 55, Automatic Climate Control System for schematic and connector information.

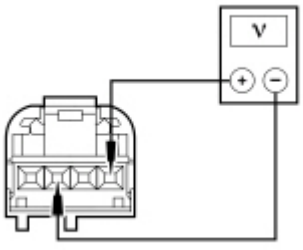
Normal Operation

The in-vehicle temperature and humidity sensor receives a ground from the HVAC module. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls the resistance rises. The HVAC module measures this resistance to determine the temperature at the sensor.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1A61:11	Cabin Temperature Sensor: Circuit Short to Ground	This CMDTC and on demand DTC sets when the HVAC module senses lower than expected voltage on the sensor feedback circuit, indicating a short to ground.
B1A61:15	Cabin Temperature Sensor: Circuit Short to Battery or Open	This CMDTC and on demand DTC sets when the HVAC module senses greater than expected voltage on the sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.



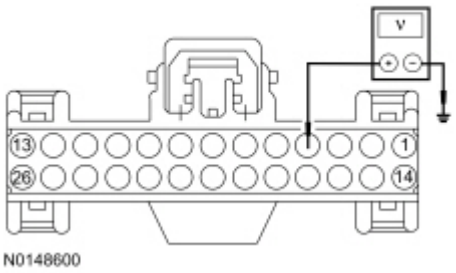


This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- In-vehicle temperature and humidity sensor
- HVAC module

PINPOINT TEST D: DTC B1A61:11 OR B1A61:15

Test Step	Result / Action to Take
D1 CHECK THE IN-VEHICLE TEMPERATURE SENSOR	

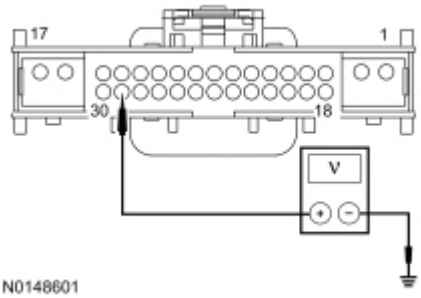


repair4less

RESISTANCE • Ignition OFF. • Disconnect: In-Vehicle Temperature and Humidity Sensor C2247 . • Measure the resistance between the in-vehicle temperature and humidity sensor C2247-1, component side and C2247-3, component side and compare to the table below. **Ambient Temperature** / **Resistance (Ohms)** 0-10°C (32-50°F) / 57,950-97,640 10-20°C (50-68°F) / 36,880-59,920 20-25°C (68-77°F) / 29,700-37,790 25-30°C (77-86°F) / 23,960-30,300 30-35°C (86-95°F) / 19,440-24,550 35-40°C (95-104°F) / 15,860-20,000 40-50°C (104-122°F) / 10,740-16,390  N0119920 • **Is the resistance within the specified values for the temperatures?**	**Yes** GO to D2 . **No** INSTALL a new in-vehicle temperature and humidity sensor. REFER to Section 412-01 .
D2 CHECK THE HVAC MODULE OUTPUT VOLTAGE • Ignition ON. • Measure the voltage between in-vehicle temperature and humidity sensor C2247-1, circuit VH414 (GN/BU), harness side and C2247-3, circuit RH111 (GY/BU), harness side.  N0119921 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new in-vehicle temperature and humidity sensor. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. If the DTC returns, GO to D8 . **No** For DTC B1A61:15, GO to D3 . For DTC B1A61:11, GO to D6 .
D3 CHECK THE IN-VEHICLE TEMPERATURE SENSOR	

FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: HVAC Module — Base EMTC C294A .
- Disconnect: HVAC Module — Base EMTC C294B .
- Disconnect: HVAC Module — Remote Mount EMTC C2357A .
- Disconnect: HVAC Module — Remote Mount EMTC C2357B .
- Disconnect: HVAC Module — EATC C228A .
- Disconnect: HVAC Module — EATC C228B .
- Ignition ON.



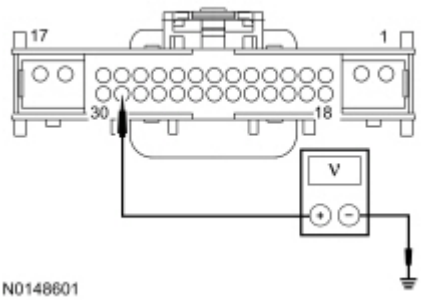
For Base EMTC vehicles

N0148600

- Measure the voltage between ground and HVAC module — Base EMTC C294A-4, circuit VH414 (GN/BU), harness side.

For Remote Mount EMTC vehicles

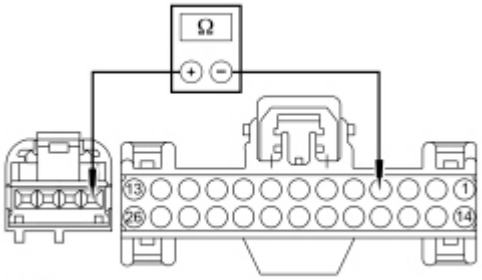
N0148601

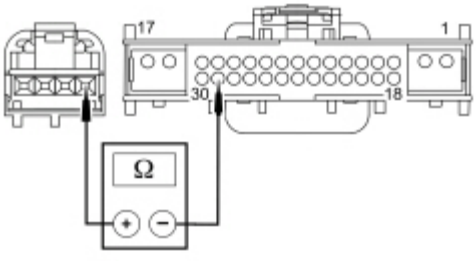


- Measure the voltage between ground and HVAC module — Remote Mount EMTC C2357A-29, circuit VH414 (GN/BU), harness side.

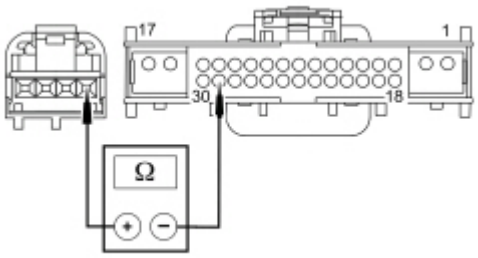
For EATC vehicles

Yes
REPAIR the circuit.



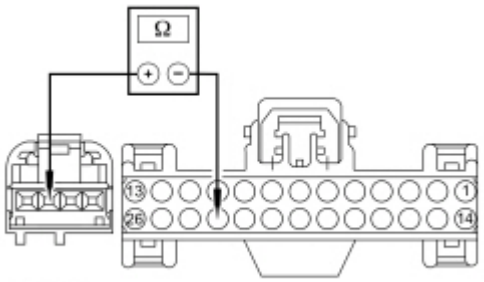


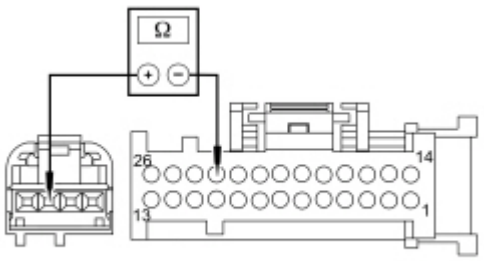
No
GO to D4 .



repair4less

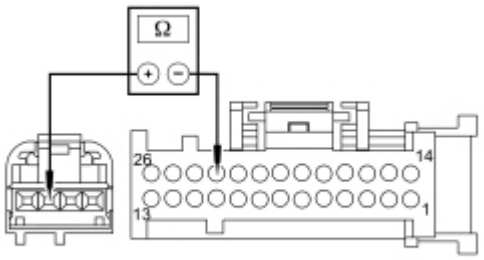
N0148601





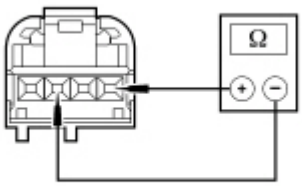
- Measure the voltage between ground and HVAC module — EATC C228B-29, circuit VH414 (GN/BU), harness side.
- **Is any voltage present?**

D4 CHECK THE IN-VEHICLE TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR AN OPEN	
• Ignition OFF. **For Base EMTC vehicles**  N0148602 • Measure the resistance between HVAC module — Base EMTC C294A-4, circuit VH414 (GN/BU), harness side and in-vehicle temperature and humidity sensor C2247-1, circuit VH414 (GN/BU), harness side. **For Remote Mount EMTC vehicles**  N0148603 • Measure the resistance between HVAC module — Remote Mount EMTC C2357A-29, circuit VH414 (GN/BU), harness side and in-vehicle temperature and humidity sensor C2247-1, circuit VH414 (GN/BU), harness side. **For EATC vehicles**	**Yes** GO to D5 . **No** REPAIR the circuit.

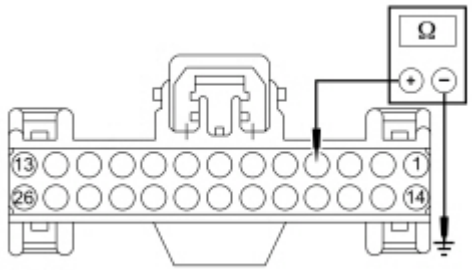


N0148603

- Measure the resistance between HVAC module — EATC C228B-29, circuit VH414 (GN/BU), harness side and in-vehicle temperature and humidity sensor C2247-1, circuit VH414 (GN/BU), harness side.
- **Is the resistance less than 3 ohms?**



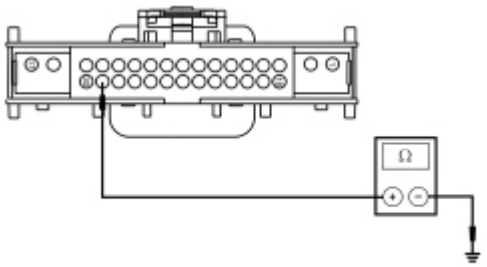
D5 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	
For Base EMTC vehicles  N0148604 • Measure the resistance between HVAC module — Base EMTC C294A-23, circuit RH111 (GY/BU), harness side and in-vehicle temperature and humidity sensor C2247-3, circuit RH111 (GY/BU), harness side. **For Remote Mount EMTC vehicles**  N0148608 • Measure the resistance between HVAC module — Remote Mount EMTC C2357A-23, circuit RH111 (GY/BU), harness side and in-vehicle temperature and humidity sensor C2247-3, circuit RH111 (GY/BU), harness side. **For EATC vehicles**	**Yes** GO to D8 . **No** REPAIR the circuit.



repair4less

N0148608

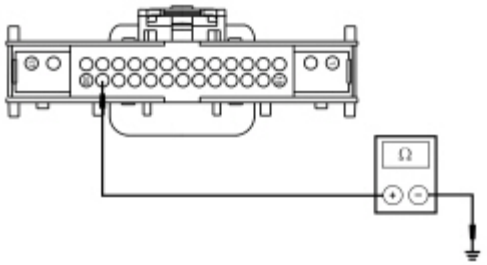
- Measure the resistance between HVAC module — EATC C228A-23, circuit RH111 (GY/BU), harness side and in-vehicle temperature and humidity sensor C2247-3, circuit RH111 (GY/BU), harness side.
- **Is the resistance less than 3 ohms?**



D6 CHECK THE IN-VEHICLE TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN CIRCUIT	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . • Measure the resistance between in-vehicle temperature and humidity sensor C2247-1, circuit VH414 (GN/BU), harness side and C2247-3, circuit RH111 (GY/BU), harness side.  N0098162 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D7 . **No** REPAIR the circuits.
D7 CHECK THE IN-VEHICLE TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
For Base EMTC vehicles	**Yes** GO to D8 . **No** REPAIR the circuit.

N0148612

- Measure the resistance between HVAC module — Base EMTC C294A-4, circuit VH414 (GN/BU), harness side and ground.



For Remote Mount EMTC vehicles

N0114407

- Measure the resistance between HVAC module — Remote Mount EMTC C2357A-29, circuit VH414 (GN/BU), harness side and ground.

For EATC vehicles

N0114407

- Measure the resistance between HVAC module — EATC C228B-29, circuit VH414 (GN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

D8 CHECK FOR CORRECT HVAC MODULE OPERATION
• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module.

repair4less

• Connect all HVAC module connectors. Make sure they seat and latch correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	REFER to Section 412-01 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test E: DTC B1A69:11 or B1A69:15

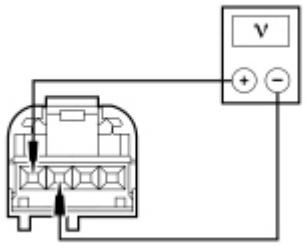
Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

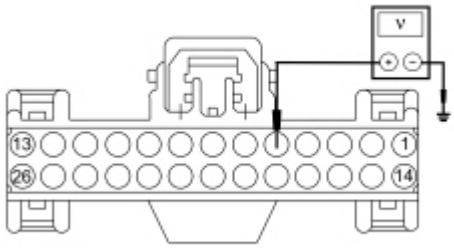
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

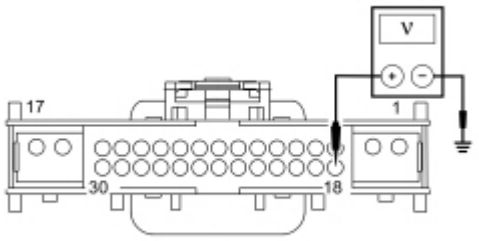
Normal Operation

The in-vehicle temperature and humidity sensor receives a ground from the HVAC module. The sensor varies its resistance with the humidity inside the vehicle. As the humidity rises, the resistance falls. As the humidity falls the resistance rises. The HVAC module measures this resistance to determine the humidity at the sensor.

DTC Fault Trigger Conditions

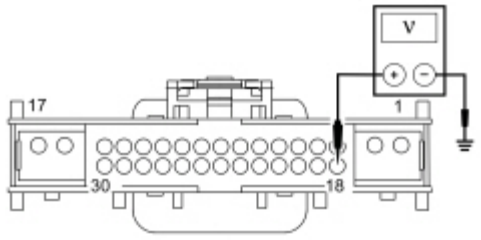


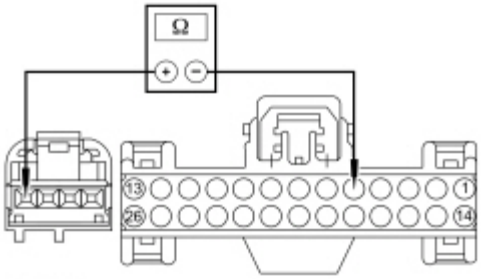


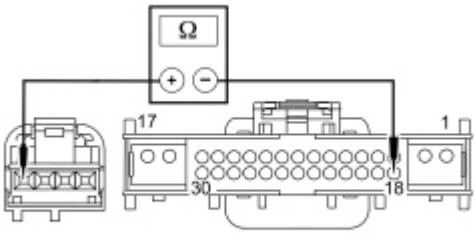


DTC	Description	Fault Trigger Conditions
B1A69:11	Humidity Sensor: Circuit Short to Ground	This DTC sets when the HVAC module senses lower than expected voltage on the sensor feedback circuit, indicating a short to ground.
B1A69:15	Humidity Sensor: Circuit Short to Battery or Open	This DTC sets when the HVAC module senses greater than expected voltage on the sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.

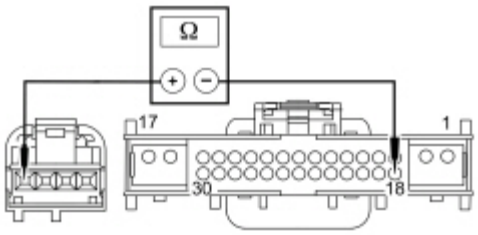
This pinpoint test is intended to diagnose the following:

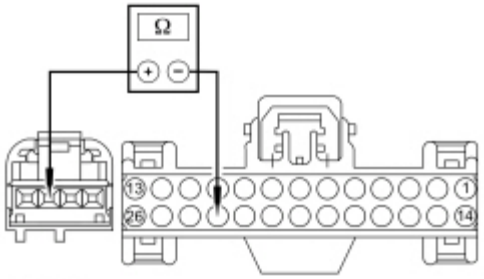


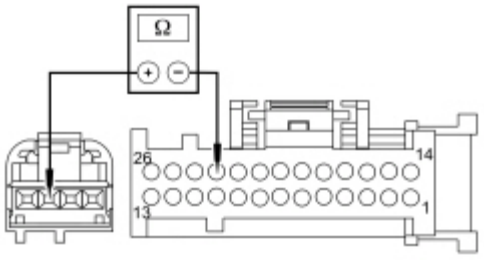




- Wiring, terminals or connectors
- In-vehicle temperature and humidity sensor
- HVAC module

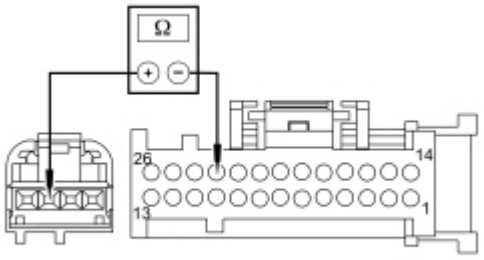


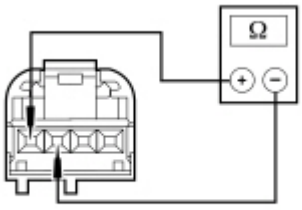




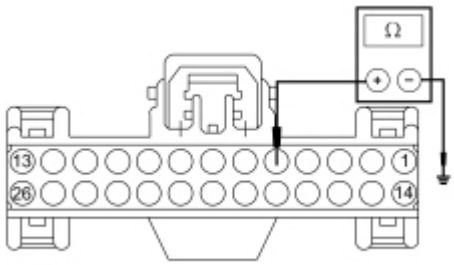
PINPOINT TEST E: DTC B1A69:11 OR B1A69:15

Test Step	Result / Action to Take
E1 CHECK THE HVAC MODULE OUTPUT VOLTAGE	
• Ignition OFF. • Disconnect: In-Vehicle Temperature and Humidity Sensor C2247 . • Ignition ON. • Measure the voltage between in-vehicle temperature and humidity sensor C2247-4, circuit VH413 (WH/BU), harness	**Yes** INSTALL a new in-vehicle temperature and humidity sensor. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. If the DTC returns, GO to





side and C2247-3, circuit RH111 (GY/BU), harness side.  N0119929 • **Is the voltage between 4.7 and 5.1 volts?**	E7 . **No** For DTC B1A69:15, GO to E2 . For DTC B1A69:11, GO to E5 .
E2 CHECK THE HUMIDITY SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . • Ignition ON. **For Base EMTC vehicles**  N0148613 • Measure the voltage between ground and HVAC module — Base EMTC C294A-5, circuit VH413 (WH/BU), harness side. **For Remote Mount EMTC vehicles**  N0148614	**Yes** REPAIR the circuit. **No** GO to E3 .



repair4less

• Measure the voltage between ground and HVAC module — Remote Mount EMTC C2357A-18, circuit VH413 (WH/BU), harness side. **For EATC vehicles**  N0148614 • Measure the voltage between ground and HVAC module — EATC C228B-18, circuit VH413 (WH/BU), harness side. • **Is any voltage present?**	
E3 CHECK THE HUMIDITY SENSOR FEEDBACK CIRCUIT FOR AN OPEN	
• Ignition OFF. **For Base EMTC vehicles**  N0148615 • Measure the resistance between HVAC module — Base EMTC C294A-5, circuit VH413 (WH/BU), harness side and in-vehicle temperature and humidity sensor C2247-4, circuit VH413 (WH/BU), harness side. **For Remote Mount EMTC vehicles**  N0148616 • Measure the resistance between HVAC module — Remote	**Yes** GO to E4 . **No** REPAIR the circuit.

Mount EMTC C2357A-18, circuit VH413 (WH/BU), harness side and in-vehicle temperature and humidity sensor C2247-4, circuit VH413 (WH/BU), harness side. **For EATC vehicles**  N0148616 • Measure the resistance between HVAC module — EATC C228B-18, circuit VH413 (WH/BU), harness side and in-vehicle temperature and humidity sensor C2247-4, circuit VH413 (WH/BU), harness side. • **Is the resistance less than 3 ohms?**

Make sure they seat and latch correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	REFER to Section 412-01 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

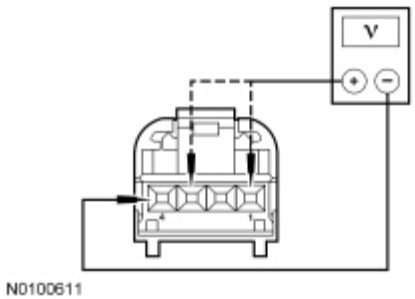
Pinpoint Test F: DTC B1A63:11, B1A63:15, B1A64:11 or DTC B1A64:15

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

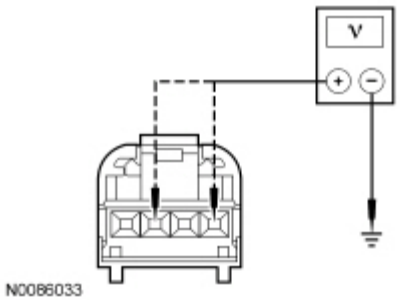
The autolamp/autolamp/sunload sensor is grounded. As the light applied to the sensor changes, the HVAC module detects the change through the passenger side and driver side feedback circuits.

DTC Fault Trigger Conditions



DTC	Description	Fault Trigger Conditions
B1A63:11	Right Solar Sensor: Circuit Short to Ground	This DTC sets when the HVAC module senses lower than expected voltage on the passenger side sensor feedback circuit, indicating a short to ground.
B1A63:15	Right Solar Sensor: Circuit Short to Battery or Open	This DTC sets when the HVAC module senses greater than expected voltage on the passenger side sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.
B1A64:11	Left Solar Sensor: Circuit Short to Ground	This DTC sets when the HVAC module senses lower than expected voltage on the driver side sensor feedback circuit, indicating a short to ground.
B1A64:15	Left Solar Sensor: Circuit Short to Battery or Open	This DTC sets when the HVAC module senses greater than expected voltage on the driver side sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.

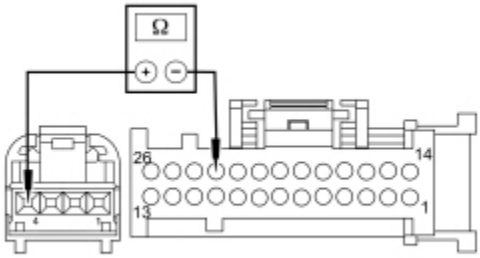
This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Autolamp/autolamp/sunload sensor
- HVAC module

PINPOINT TEST F: DTC B1A63:11, B1A63:15, B1A64:11 OR DTC B1A64:15

Test Step	Result / Action to Take
F1 CHECK THE AUTOLAMP/SUNLOAD SENSOR REFERENCE VOLTAGE	
• Ignition OFF.	**Yes**



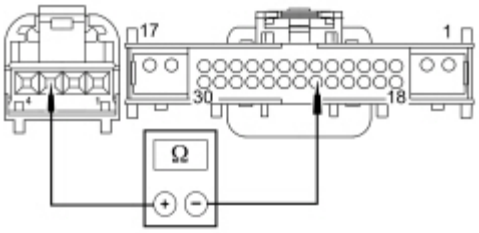
• Disconnect: Autolamp/Sunload Sensor C286 .
• Ignition ON.
• Press the AUTO button.
• Measure the voltage between autolamp/sunload sensor C286-4, circuit RH111 (GY/BU), harness side and autolamp/sunload sensor:
  ▪ For DTC B1A63:11 or B1A63:15, C286-1, circuit VH417 (YE/OG), harness side.
  ▪ For DTC B1A64:11 or B1A64:15, C286-3, circuit VH416 (VT), harness side.

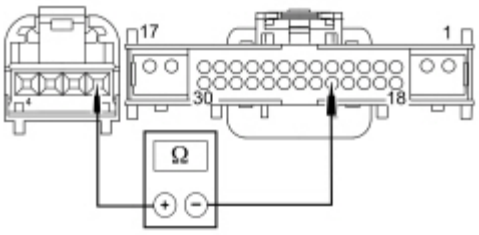
 	
N0100611
• **Is the voltage between 4.7 and 5.1 volts?**
	INSTALL a new autolamp/sunload sensor. REFER to Section 417-01 . CLEAR the DTCs. REPEAT the self-test. If the code returns, GO to F7 .
	
	No
	If diagnosing DTC B1A63:15 or DTC B1A64:15, GO to F2 .
	
	If diagnosing DTC B1A63:11 or DTC B1A64:11, GO to F5 .

F2 CHECK THE AUTOLAMP/SUNLOAD SENSOR FEEDBACK CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF.
• Disconnect: HVAC Module — EATC C228A .
• Disconnect: HVAC Module — EATC C228B .
• Ignition ON.
• Measure the voltage between ground and autolamp/sunload sensor:
  ▪ For DTC B1A64:15, C286-3, circuit VH416 (VT), harness side.
  ▪ For DTC B1A63:15, C286-1, circuit VH417 (YE/OG), harness side.

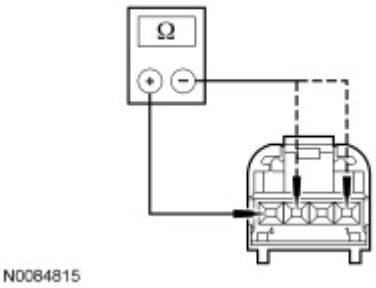
 	
N0086033
• **Is any voltage present?**
	Yes
	REPAIR the circuit in question.
	
	No
	GO to F3 .



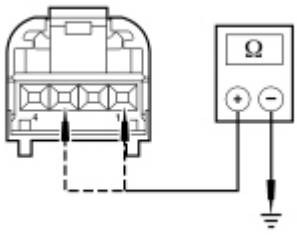


F3 CHECK THE AUTOLAMP/SUNLOAD SENSOR GROUND CIRCUIT FOR AN OPEN	
	Yes GO to F4 . **No** REPAIR the circuit.

repair4less



N0148637



- Ignition OFF.
- Measure the resistance between autolamp/sunload sensor C286-4, circuit RH111 (GY/BU), harness side and HVAC module — EATC C228A-23, circuit RH111 (GY/BU), harness side.
- **Is the resistance less than 3 ohms?**

F4 CHECK THE AUTOLAMP/SUNLOAD SENSOR FEEDBACK CIRCUITS FOR AN OPEN	
For DTC B1A64:15  N0148638 • Measure the resistance between HVAC module — EATC C228B-23, circuit VH416 (VT), harness side and autolamp/sunload sensor C286-3, circuit VH416 (VT), harness side. **For DTC B1A63:15**  N0148639 • Measure the resistance between HVAC module — EATC C228B-22, circuit VH417 (YE/OG), harness side and autolamp/sunload sensor C286-1, circuit VH417 (YE/OG), harness side. • **Is the resistance less than 3 ohms?**	**Yes** GO to F7 . **No** REPAIR the circuit.
F5 CHECK THE AUTOLAMP/SUNLOAD SENSOR FEEDBACK CIRCUITS FOR A SHORT TO THE	

AUTOLAMP/SUNLOAD SENSOR GROUND CIRCUIT	

• Ignition OFF.
• Disconnect: HVAC Module — EATC C228A .
• Disconnect: HVAC Module — EATC C228B .
• Measure the resistance between autolamp/sunload sensor C286-4, circuit RH111 (GY/BU), harness side and autolamp/sunload sensor:
  ▪ For DTC B1A64:11, C286-3, circuit VH416 (VT), harness side.
  ▪ For DTC B1A63:11, C286-1, circuit VH417 (YE/OG), harness side.

 	
N0084815
• **Is the resistance greater than 10,000 ohms?**
	Yes
	GO to F6 .
	
	No
	REPAIR the circuit in question.

F6 CHECK THE AUTOLAMP/SUNLOAD SENSOR FEEDBACK CIRCUITS FOR A SHORT TO GROUND	

• Measure the resistance between ground and autolamp/sunload sensor:
  ▪ For DTC B1A64:11, C286-3, circuit VH416 (VT), harness side.
  ▪ For DTC B1A63:11, C286-1, circuit VH417 (YE/OG), harness side.

 	
N0083696
• **Is the resistance greater than 10,000 ohms?**
	Yes
	GO to F7 .
	
	No
	REPAIR the circuit in question.

F7 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .

repair4less

seat and latch correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test G: DTC B1B71:11 or B1B71:15

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

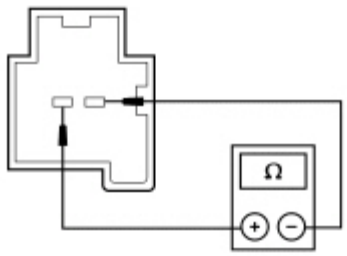
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

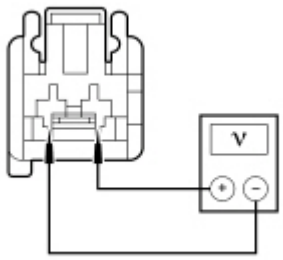
Normal Operation

The evaporator temperature sensor receives a ground from the HVAC module. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls the resistance rises. The HVAC module measures this resistance to determine the temperature at the sensor.

An accurate evaporator temperature is critical to prevent evaporator icing. The HVAC module uses the temperature measurement to turn off the A/C compressor before the evaporator temperatures are cold enough to freeze the condensation. This prevents ice blockage of airflow over the evaporator core.

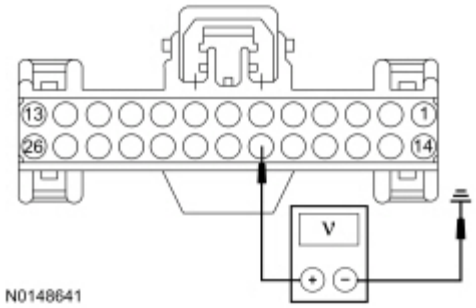
DTC Fault Trigger Conditions

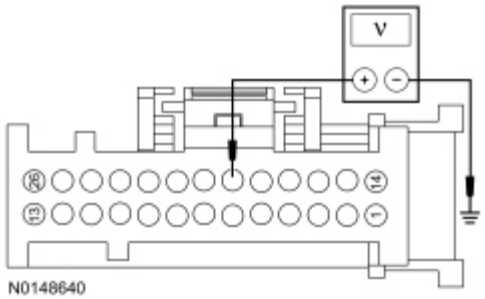




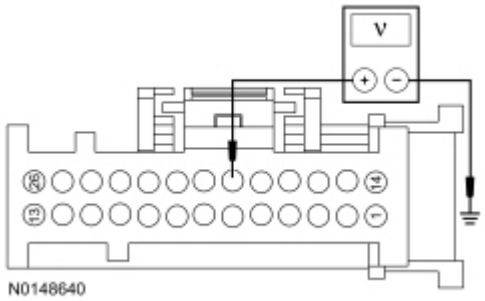
DTC	Description	Fault Trigger Conditions
B1B71:11	Evaporator Temperature Sensor: Circuit Short to Ground	This CMDTC and on demand DTC sets when the HVAC module senses lower than expected voltage on the sensor feedback circuit, indicating a short to ground.
B1B71:15	Evaporator Temperature Sensor: Circuit Short to Battery or Open	This CMDTC and on demand DTC sets when the HVAC module senses greater than expected voltage on the sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.

This pinpoint test is intended to diagnose the following:





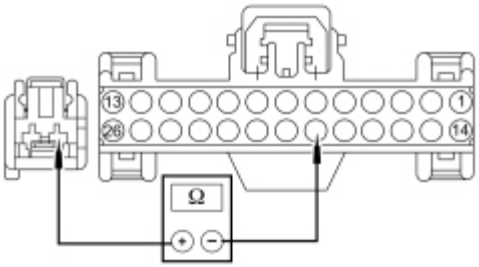
- Wiring, terminals or connectors
- Evaporator temperature sensor
- HVAC module

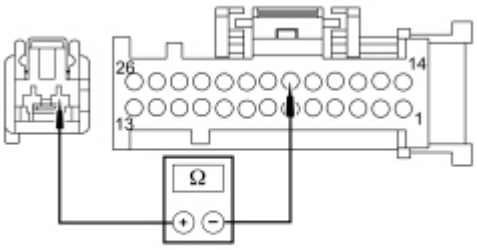


PINPOINT TEST G: DTC B1B71:11 OR B1B71:15

Test Step	Result / Action to Take
G1 CHECK THE EVAPORATOR TEMPERATURE SENSOR RESISTANCE	
• Ignition OFF. • Disconnect: Evaporator Temperature Sensor C296 .	**Yes** GO to G2 .

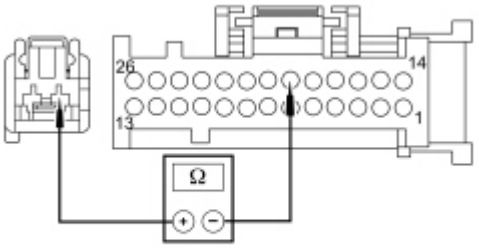
• Measure the resistance between the evaporator temperature sensor C296-1, component side and evaporator temperature sensor C296-2, component side and compare to the table below. **Ambient Temperature / Resistance (Ohms)** -40°C (-40°F) 1,005,00-1,104,000 -20°C (-4°F) 287,811-307,800 0°C (32°F) 96,890-101,300 20°C (68°F) 37,080-38,000 25°C (77°F) 29,700-30,300 30°C (86°F) 23,840-24,430 35°C (95°F) 19,260-19,820 40°C (104°F) 15,660-16,180 60°C (140°F) 7,239-7,594 100°C (212°F) 1,943-2,091  A0004761 • **Is the resistance within the specified values for the temperatures?**	**No** INSTALL a new heater core and evaporator core housing. REFER to Section 412-01 .
G2 CHECK THE HVAC MODULE OUTPUT VOLTAGE	
• Ignition ON. • Select PANEL on the HVAC controls. • Measure the voltage between evaporator temperature sensor C296-1, circuit VH406 (VT/BN), harness side and C296-2, circuit RH111 (GY/BU), harness side.  N0054664 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to G8 . **No** For DTC B1B71:11, GO to G6 . For DTC B1B71:15, GO to G3 .





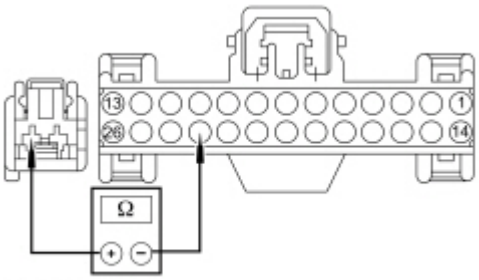
repair4less

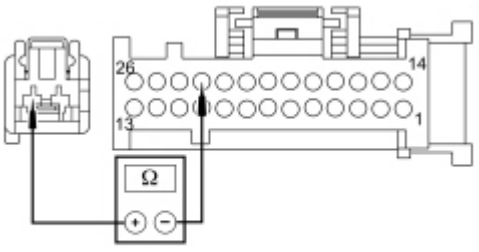
G3 CHECK THE EVAPORATOR TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . • Ignition ON. **For Base EMTC vehicles**  N0148641 • Measure the voltage between ground and HVAC module — Base EMTC C294A-19, circuit VH406 (VT), harness side and ground. **For Remote Mount EMTC vehicles**  N0148640 • Measure the voltage between ground and HVAC module — Remote Mount EMTC C2357A-19, circuit VH406 (VT/BN), harness side and ground. **For EATC vehicles**	**Yes** REPAIR the circuit. **No** GO to G4 .



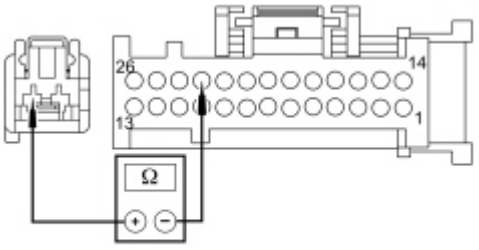
N0148640

- Measure the voltage between ground and HVAC module — EATC C228A-19, circuit VH406 (VT/BN), harness side and ground.
- **Is any voltage present?**



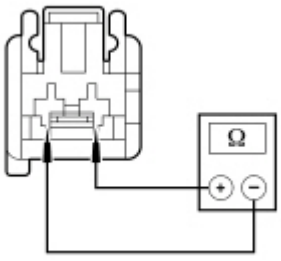


G4 CHECK THE EVAPORATOR TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR AN OPEN	
• Ignition OFF. **For Base EMTC vehicles**  N0148642 • Measure the resistance between HVAC module — Base EMTC C294A-19, circuit VH406 (VT), harness side and evaporator temperature sensor C296-1, circuit VH406 (VT/BN), harness side. **For Remote Mount EMTC vehicles**  N0148649 • Measure the resistance between HVAC module — Remote Mount EMTC C2357A-19, circuit VH406 (VT/BN), harness side and evaporator temperature sensor C296-1, circuit VH406 (VT/BN), harness side. **For EATC vehicles**	**Yes** GO to G5 . **No** REPAIR the circuit.



repair4less

N0148649



- Measure the resistance between HVAC module — EATC C228A-19, circuit VH406 (VT/BN), harness side and evaporator temperature sensor C296-1, circuit VH406 (VT/BN), harness side.
- **Is the resistance less than 3 ohms?**

G5 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	
For Base EMTC vehicles  N0148644 • Measure the resistance between HVAC module — Base EMTC C294A-23, circuit RH111 (GY/BU), harness side and evaporator temperature sensor C296-2, circuit RH111 (GY/BU), harness side. **For Remote Mount EMTC vehicles**  N0148645 • Measure the resistance between HVAC module — Remote Mount EMTC C2357A-23, circuit RH111 (GY/BU), harness side and evaporator temperature sensor C296-2, circuit RH111 (GY/BU), harness side. **For EATC vehicles**	**Yes** GO to G8 . **No** REPAIR the circuit.

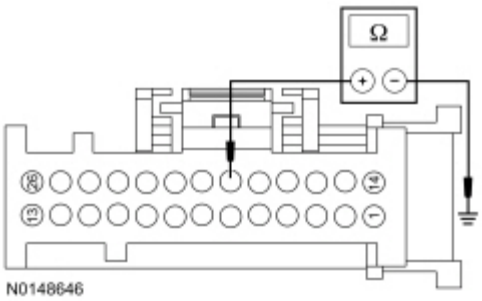
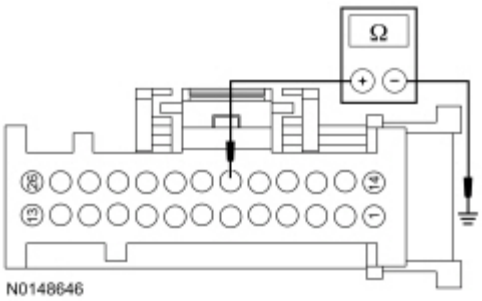
- **Is the resistance less than 3 ohms?**



G6 CHECK THE EVAPORATOR TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN CIRCUIT	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . • Measure the resistance between evaporator temperature sensor C296-1, circuit VH406 (VT/BN), harness side and C296-2, circuit RH111 (GY/BU), harness side.  N0089503 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G7 . **No** REPAIR the circuits.
G7 CHECK THE EVAPORATOR TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
For Base EMTC vehicles	**Yes** GO to G8 . **No** REPAIR the circuit.

repair4less



- Measure the resistance between HVAC module — EMTC C294A-19, circuit VH406 (VT), harness side and ground.

For Remote Mount EMTC vehicles

- Measure the resistance between HVAC module — Remote Mount EMTC C2357A-19, circuit VH406 (VT/BN), harness side and ground.

For EATC vehicles

- Measure the resistance between HVAC module — EATC C228A-19, circuit VH406 (VT/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

G8 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they
	Yes
	CHECK OASIS for any applicable TSBs. If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01.

seat and latch correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test H: DTC U3003:16 or U3003:17

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

NOTE: DTC U3003 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

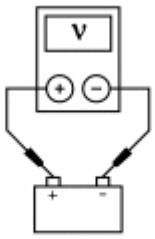
NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Normal Operation

The HVAC module is supplied constant battery voltage and ground.

DTC Fault Trigger Conditions

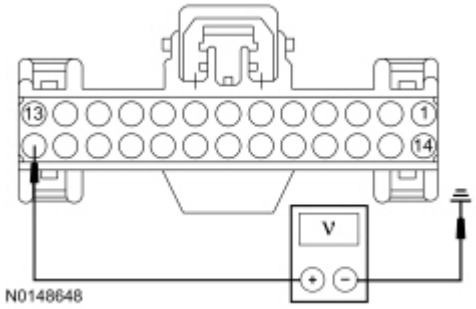
DTC	Description	Fault Trigger Conditions
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	This CMDTC sets when the HVAC module senses battery voltage is less than 8 volts for more than 10 seconds.
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	This CMDTC sets when the HVAC module senses battery voltage is greater than 16 volts for more than 10 seconds.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module

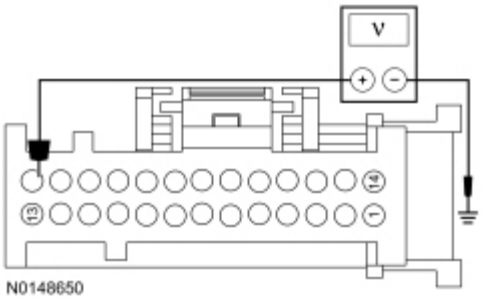
PINPOINT TEST H: U3003:16 OR U3003:17



Test Step	Result / Action to Take
H1 RETRIEVE PCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — PCM .	**Yes** REFER to Section 414-00 for diagnosis of the battery and

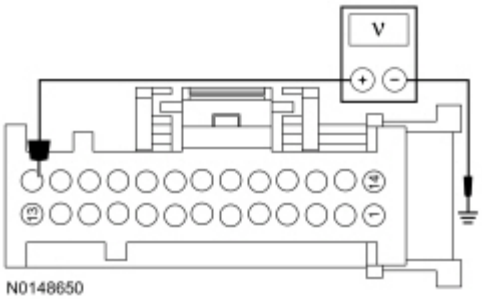
repair4less

• **Are any charging system DTCs present in the PCM?**	charging system. **No** GO to H2 .
H2 CHECK BATTERY CONDITION • Ignition OFF. • Refer to Section 414-01 and carry out the Battery — Condition Test • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to H3 . **No** INSTALL a new battery. REFER to Section 414-01 .
H3 CHECK THE CHARGING SYSTEM VOLTAGE **NOTE:** Do not allow the engine rpm to exceed 2,000 rpm while performing this step or the generator may self-excite, resulting in default charging system output voltage. If engine rpm has exceeded 2,000 rpm, shut the vehicle off and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery: ▪ For DTC U3003:17, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes. ▪ For DTC U3003:16, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes.  AJ0210-A • **Is the battery voltage between 13-15.2 volts?**	**Yes** For DTC U3003:16, GO to H4 . For DTC U3003:17, GO to H6 . **No** REFER to Section 414-00 to diagnose the charging system.
H4 CHECK THE HVAC MODULE VOLTAGE SUPPLY CIRCUIT FOR HIGH RESISTANCE • Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC	**Yes** GO to H5 . **No**



C2357A .
- Disconnect: HVAC Module — Remote Mount EMTC C2357B .
- Disconnect: HVAC Module — EATC C228A .
- Disconnect: HVAC Module — EATC C228B .
- Ignition ON.

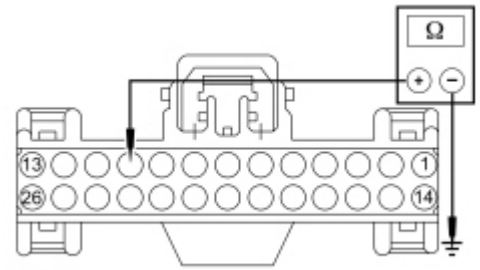
For Base EMTC vehicles

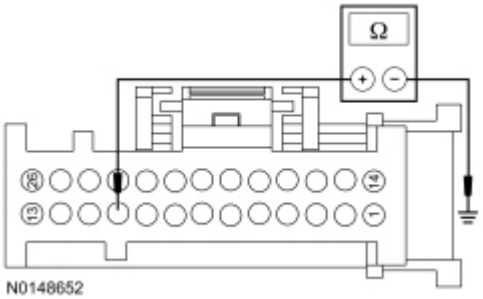


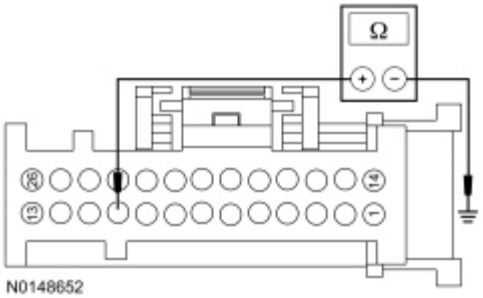
- Measure the voltage between ground and HVAC module — EMTC C294A-19, circuit VH406 (VT), harness side and ground.

For Remote Mount EMTC vehicles

- Measure the voltage between ground and HVAC module — Remote Mount EMTC C2357A-19, circuit VH406 (VT/BN), harness side and ground.







For EATC vehicles

- Measure the voltage between ground and HVAC module — EATC C228A-19, circuit VH406 (VT/BN), harness side and ground.

REPAIR the circuit.

repair4less

• **Is the voltage greater than 11 volts?**	
H5 CHECK THE HVAC MODULE GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. **For Base EMTC vehicles**  N0148651 • Measure the resistance between HVAC module — Base EMTC C294A-10, circuit GD133 (BK), harness side and ground. ▪ Repeat this measurement while wiggling the harness. **For For Remote Mount EMTC vehicles**  N0148652 • Measure the resistance between HVAC module — For Remote Mount EMTC C2357A-10, circuit GD133 (BK), harness side and ground. ▪ Repeat this measurement while wiggling the harness. **For EATC vehicles**  N0148652 • Measure the resistance between HVAC module — EATC C228A-10, circuit GD133 (BK), harness side and ground.	**Yes** GO to H6 . **No** REPAIR the circuit.

▪ Repeat this measurement while wiggling the harness. • **Is the resistance less than 3 ohms?**	
H6 CHECK FOR CORRECT HVAC MODULE OPERATION	
• Ignition OFF. • Disconnect and inspect all HVAC module connectors. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new terminals/pins ▪ pushed-out pins - install new pins as necessary • Connect all HVAC module connectors. Make sure they seat and latch correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test I: Unable to Duplicate the Customer Concern and No DTCs Present

Normal Operation

This pinpoint test tests the functions of the HVAC system and identifies the correct HVAC symptom pinpoint test.

This pinpoint test is intended to diagnose the following:

- HVAC system and/or related components

PINPOINT TEST I: UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DTCs PRESENT

NOTE: Before carrying out the following test, diagnose any HVAC or PCM DTCs.

Test Step	Result / Action to Take
I1 CHECK THE BLOWER MOTOR OPERATION	
• Ignition ON. • Select PANEL mode. • Observe blower motor operation and select each blower motor speed. • **Does the blower motor operate in all selections and change speed in each?**	**Yes** GO to I2 . **No** For EMTC base with 4 blower motor speed positions, if the blower motor does not operate in any setting, GO to Pinpoint Test W . For EATC dual zone or EMTC with 4.2 inch display with 7 blower motor speed positions, if the blower motor does not operate in any setting, GO to Pinpoint Test Y .

repair4less

	For EMTC base with 4 blower motor speed positions, if the blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test X. For EATC dual zone or EMTC with 4.2 inch display with 7 blower motor speed positions, if the blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test Z.
I2 CHECK AIRFLOW OPERATION • Select the highest blower motor setting. • **NOTE:** Refer to Description and Operation in this section for proper airflow descriptions. • While observing the airflow, select each of the airflow positions (PANEL, PANEL/FLOOR, FLOOR, FLOOR/DEFROST, DEFROST). • **Is the airflow directed to the proper outlets?**	**Yes** GO to I3. **No** EMTC base, GO to Pinpoint Test L. For other systems, GO to Pinpoint Test M.
I3 VERIFY TEMPERATURE CONTROL OPERATION • Start the vehicle and allow it to reach normal operating temperature. • With the A/C OFF, select PANEL mode. • Change the temperature setting from the coldest to the warmest and back to the coldest. • **Does the temperature change between very warm to cool?**	**Yes** GO to I4. **No** If the temperature does not get very warm, GO to Pinpoint Test N. For EMTC base with 4 blower motor speed positions, if the temperature does not change at all, GO to Pinpoint Test R. For EMTC with 4.2 inch display with 7 blower motor speed positions, if the temperature does not change at all, GO to Pinpoint Test S. For EATC dual zone, if the driver side temperature does not change at all, GO to Pinpoint Test U. For EATC dual zone, if the passenger side temperature does not change at all, GO to Pinpoint Test V.
I4 VERIFY THE A/C CLUTCH DOES NOT ENGAGE WITH A/C OFF • With the engine running and the A/C off, select PANEL mode. • Select the coldest temperature setting. • **Is the outlet temperature close to ambient temperature?**	**Yes** GO to I5. **No** For EMTC base with 4 blower motor speed positions, if the temperature is warmer than ambient temperature, GO to Pinpoint Test R and diagnose for inoperative blend door.

	For EMTC with 4.2 inch display with 7 blower motor speed positions, if the temperature is warmer than ambient temperature, GO to Pinpoint Test S and diagnose for inoperative blend door. For EATC dual zone, if the driver side temperature is warmer than ambient temperature, GO to Pinpoint Test U and diagnose for an inoperative blend door. For EATC dual zone, if the passenger side temperature is warmer than ambient temperature, GO to Pinpoint Test V and diagnose for an inoperative blend door. If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch cycles normally, GO to Pinpoint Test Q . If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch does not cycle, GO to Pinpoint Test P .
I5 VERIFY A/C CLUTCH ENGAGEMENT IN THE A/C MODE • Make sure the ambient air temperature is above 2°C (35°F). • With the engine running, select PANEL mode. • Press the A/C button (indicator ON). • **Does the A/C clutch engage when the PANEL and A/C button (indicator ON) is pressed?**	**Yes** GO to I6 . **No** GO to Pinpoint Test O .
I6 CHECK THE RECIRC OPERATION • Press the RECIRC button (indicator OFF). • Select PANEL mode. • Select the highest blower motor setting. • Observe airflow noise. • Press the RECIRC button (indicator ON). • **Does the airflow noise increase when the RECIRC mode is selected (indicator ON)?**	**Yes** The system is operating normally. **No** EMTC base with 4 blower motor speed positions, GO to Pinpoint Test J . For other systems, GO to Pinpoint Test K .

Pinpoint Test J: The Air Inlet Door Is Inoperative — EMTC Base With 4 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

To rotate the air inlet door actuator, the HVAC module supplies voltage and ground to the air inlet door actuator through the door actuator motor circuits. To reverse the air inlet door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The air inlet door actuator feedback resistors are supplied a ground from the HVAC module by the air inlet door actuator return circuits and a 5-volt reference voltage on the air inlet door actuator reference circuits. The HVAC module reads the voltage on the air inlet door actuator feedback circuits to determine the air inlet

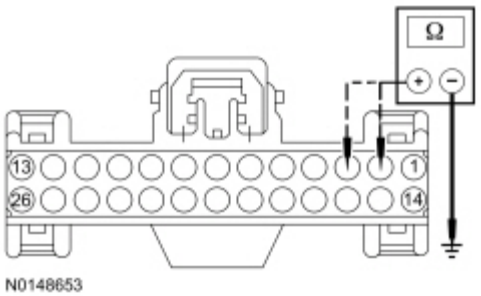
repair4less

door actuator position by the position of the actuator feedback resistor wiper arm.

During an actuator calibration cycle, the HVAC module drives the air inlet door until the door reaches both internal stops in the HVAC case. If the air inlet door is temporarily obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to its end of travel, the air intake may not be from the expected source.

In FLOOR and FLOOR/DEFROST modes, the RECIRC request will time-out after 5 minutes and return to fresh air mode. RECIRC mode can be selected again after the time-out.

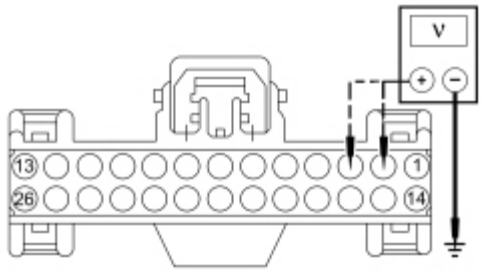
DTC Fault Trigger Conditions



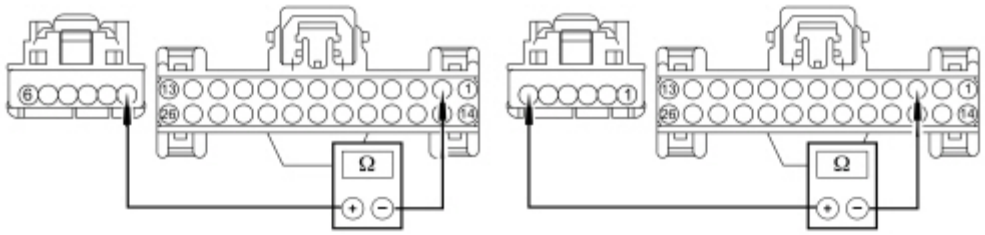
DTC	Description	Fault Trigger Conditions
B1083:00	Recirculation Damper Motor: No Sub Type Information	The HVAC module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates either an open in an actuator motor circuit, an actuator internal failure or a binding or stuck linkage or door.
B1083:11	Recirculation Damper Motor: Circuit Short to Ground	The HVAC module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
B1083:12	Recirculation Damper Motor: Circuit Short to Battery	The HVAC module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
B1083:13	Recirculation Damper Motor: Circuit Open	The HVAC module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit.
B11F0:11	Air Intake Damper Position Sensor: Circuit Short to Ground	The HVAC module senses less than 1 volt on the actuator feedback circuit, indicating a short to ground.
B11F0:15	Air Intake Damper Position Sensor: Circuit Short to Battery or Open	The HVAC module senses greater than 4 volts on the actuator feedback circuit, indicating an open circuit or a short to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Air inlet mode door actuator
- HVAC module
- Stuck or bound linkage or door



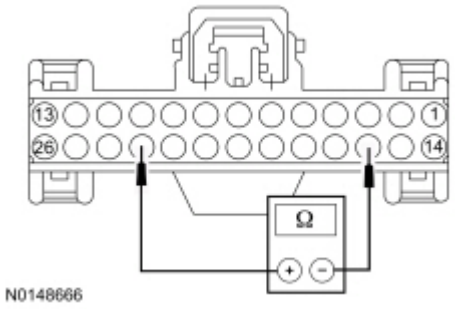
PINPOINT TEST J: THE AIR INLET DOOR IS INOPERATIVE — EMTC BASE WITH 4 BLOWER MOTOR SPEED POSITIONS



Test Step	Result / Action to Take
J1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B1083:00,

	INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, GO to J4 . For DTC B1083:11, GO to J2 . For DTC B1083:12, GO to J3 . For DTC B1083:13, GO to J4 . For DTC B11F0:11, GO to J6 . For DTC B11F0:15, GO to J9 . **No** INSPECT for broken linkage or door. REPAIR as necessary. If no condition is found, GO to J13 .
J2 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Measure the resistance between ground and: ▪ HVAC module — EMTC C294A-2, circuit CH207 (BU), harness side. ▪ HVAC module — EMTC C294A-3, circuit CH208 (GN), harness side.  N0148653	**Yes** GO to J5 . **No** REPAIR the circuit in question.

repair4less



• **Are the resistances greater than 10,000 ohms?**	
J3 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	

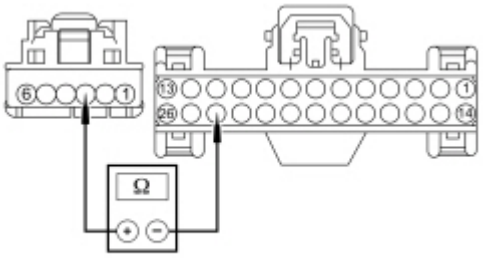
• Ignition OFF.
• Disconnect: HVAC Module — Base EMTC C294A .
• Disconnect: HVAC Module — Base EMTC C294B .
• Ignition ON.
• Measure the voltage between ground and:
  ▪ HVAC module — EMTC C294A-2, circuit CH207 (BU), harness side.
  ▪ HVAC module — EMTC C294A-3, circuit CH208 (GN), harness side.

 	
N0148654
• **Is any voltage present?**
	Yes
	REPAIR the circuit in question.
	
	No
	GO to J5 .

J4 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR AN OPEN	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: Air Inlet Mode Door Actuator C289 . • Measure the resistance between HVAC module — EMTC C294A-2, circuit CH207 (BU), harness side and air inlet mode door actuator C289-1, circuit CH207 (BU/GY), harness side.  N0148655 N0148663 • Measure the resistance between HVAC module — EMTC C294A-3, circuit CH208 (GN), harness side and air inlet mode door actuator C289-6, circuit CH208 (GN/OG), harness side. • **Are the resistances less than 3 ohms?**	**Yes** GO to J13 . **No** REPAIR the circuit in question.
J5 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TOGETHER	
NOTE: Access to the connector in the following step is difficult. Before performing	**Yes**

this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF. • Disconnect: Air Inlet Mode Door Actuator C289 . • Measure the resistance between HVAC module — EMTC C294A-2, circuit CH207 (BU), harness side and HVAC module — EMTC C294A-3 , circuit CH208 (GN), harness side.  N0148664 • **Is the resistance greater than 10,000 ohms?**	GO to J13 . **No** REPAIR the circuits.
J6 CHECK THE AIR INLET MODE DOOR ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Measure the resistance between ground and HVAC Module — EMTC C294A-16, circuit VH438 (GN), harness side.  N0148665 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J7 . **No** REPAIR the circuit.
J7 CHECK THE SIGNAL RETURN CIRCUIT FOR A SHORT TO THE AIR INLET MODE DOOR ACTUATOR FEEDBACK CIRCUIT	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Disconnect: Air Inlet Mode Door Actuator C289 . • Measure the resistance between HVAC Module — EMTC C294A-16, circuit VH438 (GN), harness side and HVAC module — EMTC C294A-23, circuit RH111 (GY/BU), harness side.	**Yes** GO to J8 . **No** REPAIR the circuits.

repair4less



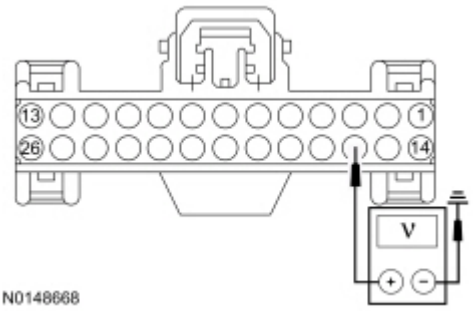
N0148666

- **Is the resistance greater than 10,000 ohms?**

J8 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

- Measure the resistance between HVAC Module — EMTC C294A-24, circuit LH111 (BN/WH), harness side and air inlet door actuator C289-3, circuit LH111 (BN/WH), harness side.

N0148667



- **Is the resistance less than 3 ohms?**

Yes
GO to J13 .

No
REPAIR the circuit.

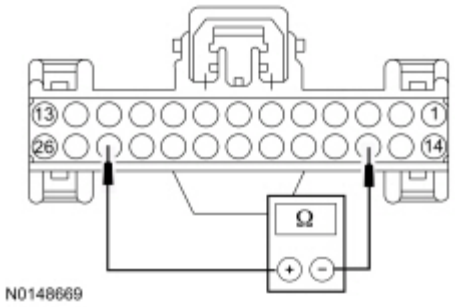
J9 CHECK THE AIR INLET MODE DOOR ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

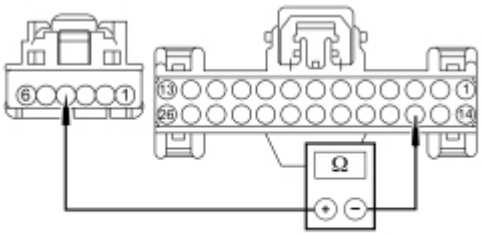
- Ignition OFF.
- Disconnect: HVAC Module — Base EMTC C294A .
- Disconnect: HVAC Module — Base EMTC C294B .
- Ignition ON.
- Measure the voltage between ground and HVAC Module — EMTC C294A-16, circuit VH438 (GN), harness side.

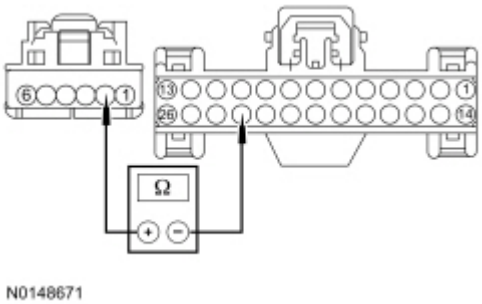
N0148668

- **Is any voltage present?**

Yes
REPAIR the circuit.







No
GO to J10 .

J10 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO THE AIR INLET MODE DOOR ACTUATOR FEEDBACK CIRCUIT

NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test.

Yes
GO to J11 .

No

• Ignition OFF. • Disconnect: Air Inlet Mode Door Actuator C289 . • Measure the resistance between HVAC Module — EMTC C294A-16, circuit VH438 (GN), harness side and HVAC module — EMTC C294A-24, circuit LH111 (BN/WH), harness side.  N0148669 • **Is the resistance greater than 10,000 ohms?**	REPAIR the circuits.
J11 CHECK THE AIR INLET MODE DOOR ACTUATOR FEEDBACK CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC Module — EMTC C294A-16, circuit VH438 (GN), harness side and air inlet door actuator C289-4, circuit VH438 (GN/VT), harness side.  N0148670 • **Is the resistance less than 3 ohms?**	**Yes** GO to J12 . **No** REPAIR the circuit.
J12 CHECK THE AIR INLET MODE DOOR ACTUATOR RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC Module — EMTC C294A-23, circuit RH111 (GY/BU), harness side and air inlet door actuator C289-2, circuit RH111 (GY/BU), harness side.  N0148671 • **Is the resistance less than 3 ohms?**	**Yes** GO to J13 . **No** REPAIR the circuit.
J13 CHECK THE AIR INLET MODE DOOR ACTUATOR CONNECTION	
• Ignition OFF.	**Yes**

repair4less

• Disconnect and inspect the air inlet mode door actuator connector.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Reconnect the air inlet mode door actuator connector. Make sure it seats and latches correctly.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	CARRY OUT the Air Inlet Mode Door Actuator component test in this section. If the actuator tests OK, GO to J14 . When installing an actuator, CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

J14 MODULE ACTUATOR POSITION CALIBRATION
 	
NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below.
• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Ignition ON.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Select any position except OFF.
• **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators takes approximately 30 seconds.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No

	The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

Pinpoint Test K: The Air Inlet Door Is Inoperative — EATC Dual Zone And EMTC With 4.2 Inch Display System With 7 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Automatic Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

To rotate the air inlet door actuator, the HVAC module supplies voltage and ground to the air inlet door actuator through the door actuator motor circuits. To reverse the air inlet door actuator rotation, the HVAC module reverses the voltage and ground circuits.

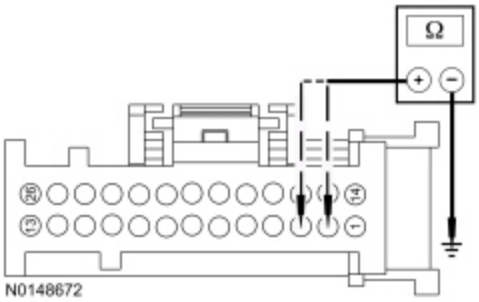
The air inlet door actuator feedback resistors are supplied a ground from the HVAC module by the air inlet door actuator return circuits and a 5-volt reference voltage on the air inlet door actuator reference circuits. The HVAC module reads the voltage on the air inlet door actuator feedback circuits to determine the air inlet door actuator position by the position of the actuator feedback resistor wiper arm.

During an actuator calibration cycle, the HVAC module drives the air inlet door until the door reaches both internal stops in the HVAC case. If the air inlet door is temporarily obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to its end of travel, the air intake may not be from the expected source.

In FLOOR and FLOOR/DEFROST modes, the RECIRC request will time-out after 5 minutes and return to fresh air mode. RECIRC mode can be selected again after the time-out.

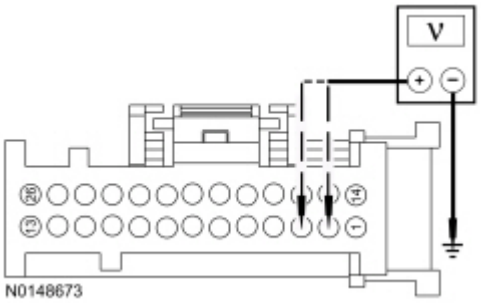
repair4less

DTC Fault Trigger Conditions



DTC	Description	Fault Trigger Conditions
B1083:00	Recirculation Damper Motor: No Sub Type Information	The HVAC module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates either an open in an actuator motor circuit, an actuator internal failure or a binding or stuck linkage or door.
B1083:11	Recirculation Damper Motor: Circuit Short to Ground	The HVAC module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
B1083:12	Recirculation Damper Motor: Circuit Short to Battery	The HVAC module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
B1083:13	Recirculation Damper Motor: Circuit Open	The HVAC module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit.
B11F0:11	Air Intake Damper Position Sensor: Circuit Short to Ground	The HVAC module senses less than 1 volt on the actuator feedback circuit, indicating a short to ground.
B11F0:15	Air Intake Damper Position Sensor: Circuit Short to Battery or Open	The HVAC module senses greater than 4 volts on the actuator feedback circuit, indicating an open circuit or a short to voltage.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Air inlet mode door actuator
- HVAC module
- FCIM
- Stuck or bound linkage or door

PINPOINT TEST K: THE AIR INLET DOOR IS INOPERATIVE — EATC DUAL ZONE AND EMTC WITH 4.2 INCH DISPLAY SYSTEM WITH 7 BLOWER MOTOR SPEED POSITIONS

Test Step	Result / Action to Take
K1 CHECK THE HVAC MODULE FOR DTCs • Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B1083:00, INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, GO to K5. For DTC B1083:11, GO to K3. For DTC B1083:12, GO to K4. For DTC B1083:13, GO to K5. For DTC B11F0:11, GO to K7. For DTC B11F0:15, GO to K10.

	No INSPECT for broken/binding linkage or door. REPAIR as necessary. If no condition is found, GO to K2 .
K2 CHECK THE AIR INLET MODE DOOR ACTUATOR OPERATION USING THE HVAC A/C RECIRCULATING SERVO POSITION (RECIRC_DPOS) ACTIVE COMMAND	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: HVAC Module DataLogger . • Select PANEL mode on the HVAC controls. • Select the highest blower motor setting. • Observe airflow noise while using the scan tool to operate the HVAC module active command RECIRC_DPOS between Fresh Air and RECIRC. • **Does the airflow noise change when the active command is changed?**	**Yes** INSTALL a new FCIM . Refer to the appropriate section in Group 415 for the procedure.. **No** INSPECT for broken/binding linkage or door. REPAIR as necessary. If no condition is found, GO to K14 .
K3 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . • Disconnect: HVAC Module Remote Mount EMTC C2357A . • Disconnect: HVAC Module Remote Mount EMTC C2357B .  • Measure the resistance between ground and: ▪ HVAC module EATC C228A-3, circuit CH208 (GN), harness side. ▪ HVAC module EATC C228A-2, circuit CH207 (BU), harness side. ▪ HVAC module EMTC C2357A-3, circuit CH208 (GN), harness side. ▪ HVAC module EMTC C2357A-2, circuit CH207 (BU), harness side. • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to K6 . **No** REPAIR the circuit in question.
K4 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO VOLTAGE

K13 CHECK THE AIR INLET MODE DOOR ACTUATOR RETURN CIRCUIT FOR AN OPEN	
	Yes GO to K14 . **No** REPAIR the circuit.

 N0148692 • Measure the resistance between: ▪ HVAC module EATC C228A-23, circuit RH111 (GY/BU), harness side and inlet door mode door actuator C289-2, circuit RH111 (GY/BU), harness side. ▪ HVAC module EMTC C2357A-23, circuit RH111 (GY/BU), harness side and inlet door mode door actuator C289-2, circuit RH111 (GY/BU), harness side. • **Is the resistance less than 3 ohms?**	
K14 CHECK THE AIR INLET MODE DOOR ACTUATOR CONNECTION	
• Disconnect and inspect the air inlet mode door actuator connector. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new terminals/pins ▪ pushed-out pins - install new pins as necessary • Connect the air inlet mode door actuator connector. Make sure they seat and latch correctly. • Clear the DTCs. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module . • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** CARRY OUT the Air Inlet Mode Door Actuator component test in this section. If the actuator tests OK, GO to K15 . When installing an actuator, CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected. **No** The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects. ADDRESS the root cause of any connector or pin issues.
K15 MODULE ACTUATOR POSITION CALIBRATION	
NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below. • Ignition OFF. • Disconnect and inspect all HVAC module connectors. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new	**Yes** CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded

repair4less

terminals/pins ▪ pushed-out pins - install new pins as necessary • Connect all HVAC module connectors. Make sure they seat and latch correctly. • Ignition ON. • Clear the DTCs. • Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module . • Select any position except OFF. • **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators takes approximately 30 seconds. • Operate the system and verify the concern is still present. • **Is the concern still present?**	connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test L: Incorrect/Erratic Direction of Airflow From Outlets — EMTC Base

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

To rotate the defrost/panel/floor mode door actuator, the HVAC module supplies voltage and ground to the defrost/panel/floor mode door actuator motor through the actuator motor circuits. To reverse the defrost/panel/floor mode door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The defrost/panel/floor mode door actuator feedback resistor is supplied a 5-volt reference voltage and ground from the HVAC module. The HVAC module measures the resistance on the defrost/panel/floor mode door actuator feedback circuit to determine the defrost/panel/floor mode door actuator position by the position of the actuator feedback resistor wiper arm.

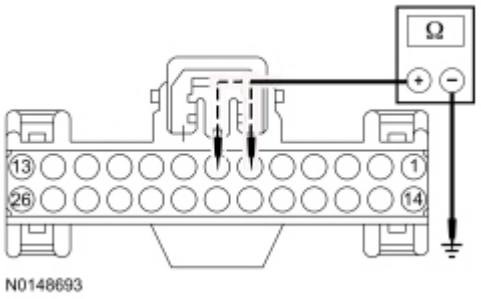
During an actuator calibration cycle, the HVAC module drives the defrost/panel/floor mode door until the door reaches both internal stops in the HVAC case. If the defrost/panel/floor mode door is temporally obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to it's end of travel, the airflow may not be from the expected outlets.

DTC Fault Trigger Conditions

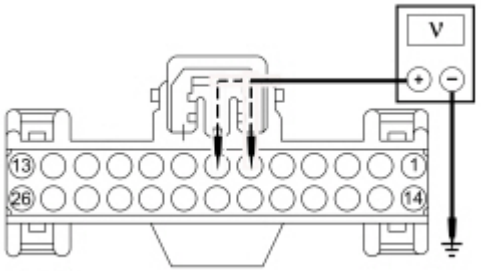
DTC	Description	Fault Trigger Conditions
B1086:00	Air Distribution Damper Motor: No Sub Type Information	The HVAC module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates either an open in an actuator motor circuit, an actuator internal failure or a binding or stuck linkage or door.
B1086:11	Air Distribution Damper Motor: Circuit Short to Ground	The HVAC module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
B1086:12	Air Distribution Damper Motor: Circuit Short to Battery	The HVAC module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
B1086:13	Air Distribution Damper	The HVAC module senses no voltage on the actuator motor circuit

	Motor: Circuit Open	when ground is applied to drive the motor, indicating an open circuit.
B11E7:11	Air Distribution Damper Position Sensor: Circuit Short to Ground	The HVAC module senses less than 1 volt on the actuator feedback circuit, indicating a short to ground.
B11E7:15	Air Distribution Damper Position Sensor: Circuit Short to Battery or Open	The HVAC module senses greater than 4.88 volts on the actuator feedback circuit, indicating an open circuit or a short to voltage.

This pinpoint test is intended to diagnose the following:

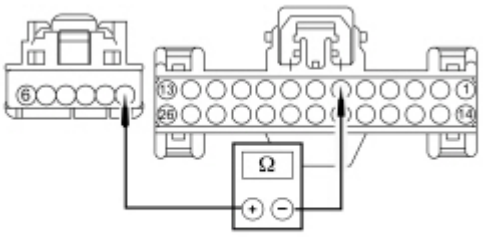


- Wiring, terminals or connectors
- Defrost/panel/floor mode door actuator
- HVAC module
- Stuck or bound linkage or door



PINPOINT TEST L: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS — EMTC BASE

Test Step	Result / Action to Take
L1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B1086:00, INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, GO to L4 . For DTC B1086:11, GO to L2 . For DTC B1086:12, GO to L3 . For DTC B1086:13, GO to L4 . For DTC B11E7:11, GO to L6 . For DTC B11E7:15, GO to L9 . **No** INSPECT for broken linkage or door. REPAIR as necessary. If no condition is found, GO to L13 .
L2 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO GROUND	



• Ignition OFF.
• Disconnect: HVAC Module — Base EMTC C294A .
• Disconnect: HVAC Module — Base EMTC C294B .

If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 . **No** The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

Pinpoint Test M: Incorrect/Erratic Direction of Airflow From Outlets — EATC Dual Zone and EMTC With 4.2 Inch Display System With 7 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Automatic Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

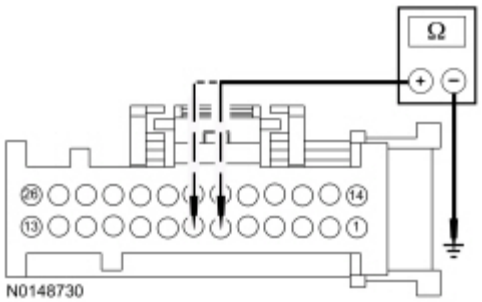
repair4less

To rotate the defrost/panel/floor mode door actuator, the HVAC module supplies voltage and ground to the defrost/panel/floor mode door actuator motor through the actuator motor circuits. To reverse the defrost/panel/floor mode door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The defrost/panel/floor mode door actuator feedback resistor is supplied a 5-volt reference voltage and ground from the HVAC module. The HVAC module measures the resistance on the defrost/panel/floor mode door actuator feedback circuit to determine the defrost/panel/floor mode door actuator position by the position of the actuator feedback resistor wiper arm.

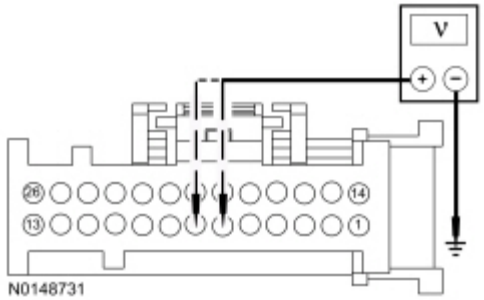
During an actuator calibration cycle, the HVAC module drives the defrost/panel/floor mode door until the door reaches both internal stops in the HVAC case. If the defrost/panel/floor mode door is temporally obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to it's end of travel, the airflow may not be from the expected outlets.

DTC Fault Trigger Conditions

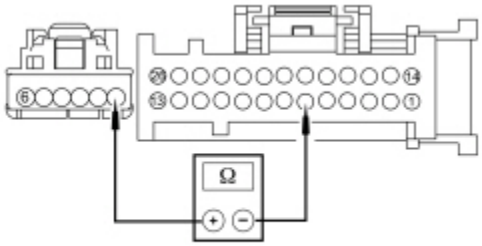


DTC	Description	Fault Trigger Conditions
B1086:00	Air Distribution Damper Motor: No Sub Type Information	The HVAC module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates either an open in an actuator motor circuit, an actuator internal failure or a binding or stuck linkage or door.
B1086:11	Air Distribution Damper Motor: Circuit Short to Ground	The HVAC module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
B1086:12	Air Distribution Damper Motor: Circuit Short to Battery	The HVAC module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
B1086:13	Air Distribution Damper Motor: Circuit Open	The HVAC module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit.
B11E7:11	Air Distribution Damper Position Sensor: Circuit Short to Ground	The HVAC module senses less than 1 volt on the actuator feedback circuit, indicating a short to ground.
B11E7:15	Air Distribution Damper Position Sensor: Circuit Short to Battery or Open	The HVAC module senses greater than 4.88 volts on the actuator feedback circuit, indicating an open circuit or a short to voltage.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Defrost/panel/floor mode door actuator
- HVAC module
- Front Controls Interface Module (FCIM)
- Stuck or bound linkage or door



PINPOINT TEST M: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS — EATC DUAL ZONE AND EMTC WITH 4.2 INCH DISPLAY SYSTEM WITH 7 BLOWER MOTOR SPEED POSITIONS

Test Step	Result / Action to Take

M1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B1086:00, INSPECT for binding/damaged linkage or door. REPAIR as necessary. M8 CHECK THE SIGNAL RETURN CIRCUIT FOR A SHORT TO THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR FEEDBACK CIRCUIT	
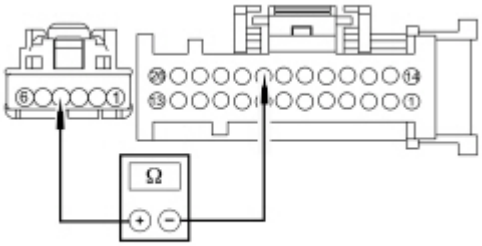
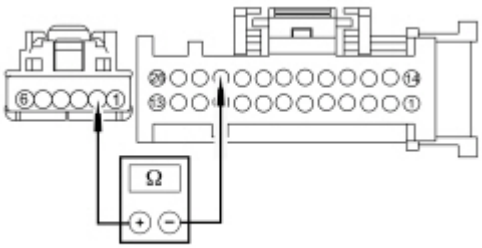
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Disconnect: Defrost/Panel/Floor Mode Door Actuator	**Yes** GO to M9 . **No** REPAIR the circuits.

 N0148738 C236 . • Measure the resistance between: ▪ HVAC module EATC C228A-23, circuit RH111 (GY/BU), harness side and HVAC module C228A-21, circuit VH436 (YE/VT), harness side. ▪ HVAC module EMTC C2357A-23, circuit RH111 (GY/BU), harness side and HVAC module C2357A-21, circuit VH436 (YE/VT), harness side. • **Is the resistance greater than 10,000 ohms?**	
M9 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN	
 N0148686 • Measure the resistance between: ▪ HVAC module EATC C228A-24, circuit LH111 (BN/WH), harness side and defrost/panel/floor mode door actuator C236-3, circuit LH111 (BN/WH), harness side. ▪ HVAC module EMTC C2357A-24, circuit LH111 (BN/WH), harness side and defrost/panel/floor mode door actuator C236-3, circuit LH111 (BN/WH), harness side. • **Is the resistance less than 3 ohms?**	**Yes** GO to M14 . **No** REPAIR the circuit.
M10 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Ignition ON.	**Yes** REPAIR the circuit. **No** GO to M11 .





repair4less

 	
• Measure the voltage between ground and:
  ▪ HVAC module EATC C228A-21, circuit VH436 (YE/VT), harness side.
  ▪ HVAC module EMTC C2357A-21, circuit VH436 (YE/VT), harness side.
• **Is any voltage present?**	

M11 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR FEEDBACK CIRCUIT	

NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test.
• Ignition OFF.
• Disconnect: Defrost/Panel/Floor Mode Door Actuator C236 .

 	
• Measure the resistance between:
  ▪ HVAC module EATC C228A-24, circuit LH111 (BN/WH), harness side and HVAC module C228A-21, circuit VH436 (YE/VT), harness side.
  ▪ HVAC module EMTC C2357A-21, circuit LH111 (BN/WH), harness side and HVAC module C2357A-21, circuit VH436 (YE/VT), harness side.
• **Is the resistance greater than 10,000 ohms?**
	Yes
	GO to M12 .
	
	No
	REPAIR the circuits.

M12 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR FEEDBACK CIRCUIT FOR AN OPEN	
	Yes GO to M13 . **No** REPAIR the circuit.

 N0148737 • Measure the resistance between: ▪ HVAC module EATC C228A-21, circuit VH436 (YE/VT), harness side and defrost/panel/floor mode door actuator C236-4, circuit VH436 (YE/VT), harness side. ▪ HVAC module EMTC C2357A-21, circuit VH436 (YE/VT), harness side and defrost/panel/floor mode door actuator C236-4, circuit VH436 (YE/VT), harness side. • **Is the resistance less than 3 ohms?**	
M13 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR RETURN CIRCUIT FOR AN OPEN	**Yes** GO to M14 . **No** REPAIR the circuit.
 N0148692 • Measure the resistance between: ▪ HVAC module EATC C228A-23, circuit RH111 (GY/BU), harness side and defrost/panel/floor mode door actuator C236-2, circuit RH111 (GY/BU), harness side. ▪ HVAC module EMTC C2357A-23, circuit RH111 (GY/BU), harness side and defrost/panel/floor mode door actuator C236-2, circuit RH111 (GY/BU), harness side. • **Is the resistance less than 3 ohms?**	
M14 CHECK FOR CORRECT DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR OPERATION	**Yes** CARRY OUT the Defrost/Panel/Floor Mode Door Actuator component test in this section. If the actuator tests OK, GO to M15 . When installing an actuator, CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected.
• Disconnect and inspect the defrost/panel/floor mode door actuator connector. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new terminals/pins ▪ pushed-out pins - install new pins as necessary • Reconnect the defrost/panel/floor mode door actuator connector. Make sure it seats and latches	

repair4less

correctly. • Connect all HVAC module connectors. Make sure they seat and latch correctly. • Clear the DTCs. • Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module . • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

M15 MODULE ACTUATOR POSITION CALIBRATION
 	
NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below.
• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Ignition ON.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Select any position except OFF.
• **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators takes approximately 30 seconds.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

Pinpoint Test N: Insufficient, Erratic or No Heat

Normal Operation

Warm coolant flows from the engine through the heater core and back to the engine. Proper coolant temperatures are critical for good heater performance.

This pinpoint test is intended to diagnose the following:

- Plugged or partially plugged heater core
- Low engine coolant level
- Temperature blend door actuator(s)
- Temperature blend door(s) binding or stuck

PINPOINT TEST N: INSUFFICIENT, ERRATIC OR NO HEAT

Test Step	Result / Action to Take
N1 CHECK FOR CORRECT ENGINE COOLANT LEVEL • Ignition OFF. • Check the engine coolant level when hot and cold. • **Is the engine coolant at the correct level (hot/cold) as indicated on the engine coolant recovery reservoir?**	**Yes** GO to N3. **No** GO to N2.
N2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS • Pressure test the cooling system for leaks. Refer to Section 303-03. • **Does the engine cooling system leak?**	**Yes** REPAIR the engine coolant leak. TEST the system for normal operation. **No** FILL and BLEED the cooling system. REFER to Section 303-03. After filling and bleeding the cooling system, GO to N3.
N3 CHECK FOR COOLANT FLOW TO THE HEATER CORE • Run the engine until it reaches normal operation temperature. Select the FLOOR position on the control assembly. Set the temperature control to full warm and the blower to the lowest setting. • Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot. • **Is the heater core inlet hose temperature above 65.5°C (150°F)?**	**Yes** GO to N4. **No** REFER to Section 303-03 to check cooling system function.
N4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE • Using a suitable temperature measuring device, measure the heater core outlet hose temperature. • **Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17°C [10-30°F])?**	**Yes** For EMTC base with 4 blower motor speed positions, GO to Pinpoint Test R. For EMTC with 4.2 inch display with 7 blower motor speed positions, GO to Pinpoint Test S. For EATC dual zone, if the driver side temperature is not hot, GO to Pinpoint Test U. For EATC dual zone, if the passenger side temperature is not hot, GO to Pinpoint Test V. **No** INSTALL a new heater core. REFER to Section 412-01. TEST the system for normal operation.

Pinpoint Test O: The Air Conditioning (A/C) is Inoperative

repair4less

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

For vehicles equipped with EMTC base system with 4 blower motor speed positions, when A/C button is pressed, a message is sent from the HVAC module over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

For vehicles equipped with EMTC with non touch 4.2" display (FCDIM) system with 7 blower motor speed positions, when A/C is requested, the A/C request message is sent over I-CAN to the FCIM . The FCIM sends a message over the MS-CAN bus to the HVAC module that A/C has been selected. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

For vehicles equipped with 8" touchscreen, when A/C is requested by touching the FDIM , a message is sent from the APIM over the MS-CAN bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

Voltage is provided to the A/C clutch relay coil from BJB fuse 77 (10A) and switch contacts from BJB fuse 30 (10A). When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay. When the PCM energizes the relay, voltage is supplied to the A/C compressor clutch field coil from the relay. Ground is supplied for the A/C compressor clutch field coil.

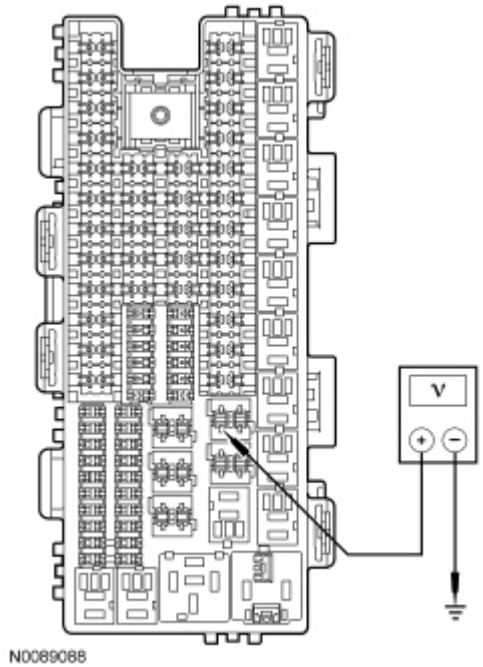
An accurate evaporator temperature is critical for compressor engagement. The PCM uses the temperature measurement to turn the A/C compressor off before the evaporator temperatures are cold enough to freeze the condensation on the evaporator core.

When an A/C request is received by the PCM, the A/C compressor clutch will only be engaged through the A/C clutch relay if all of the following conditions are met:

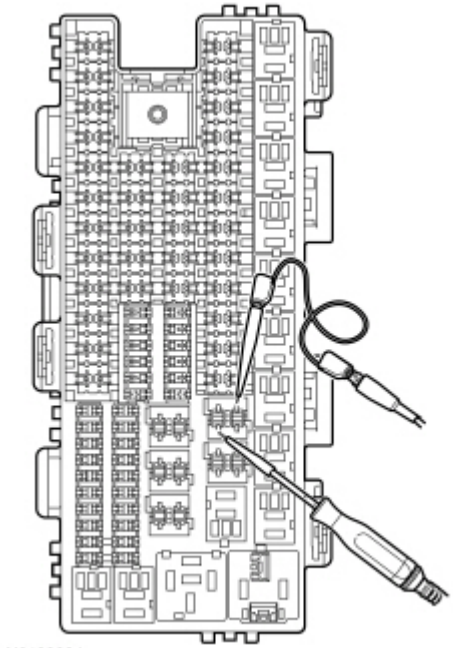
- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below -1°C (30°F).
- The PCM has not detected a WOT condition.
- The HVAC module does not detect an evaporator discharge air temperature below 2°C (36°F).

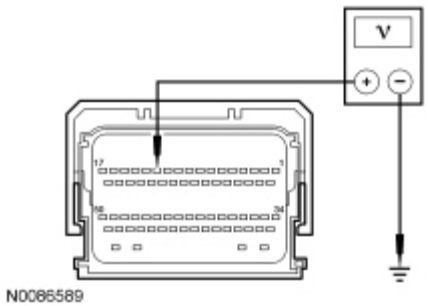
This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- A/C system discharged/low charge
- PCM
- HVAC module
- FCIM
- Evaporator temperature sensor
- A/C pressure transducer
- A/C compressor clutch field coil
- A/C clutch relay
- A/C compressor clutch air gap



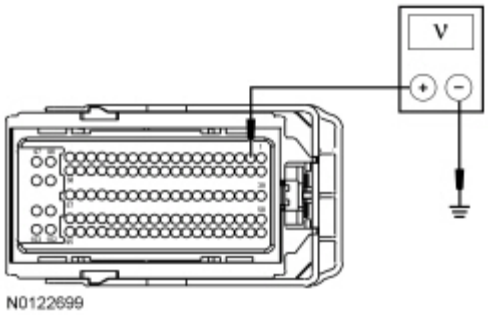
PINPOINT TEST O: THE AIR CONDITIONING (A/C) IS INOPERATIVE

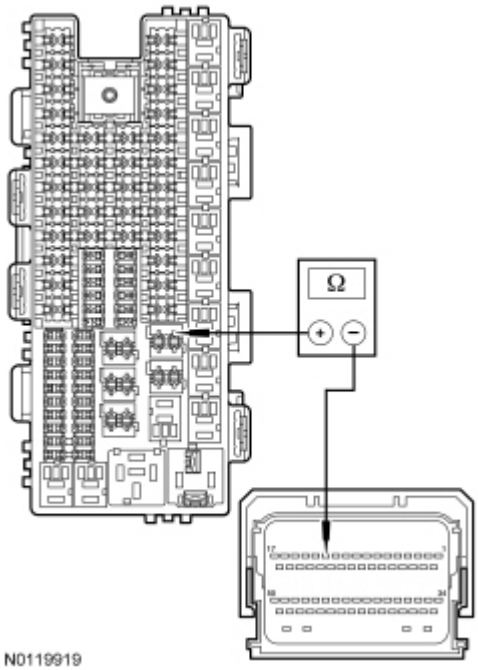




NOTE: Before carrying out the following test, diagnose any HVAC or PCM DTCs.

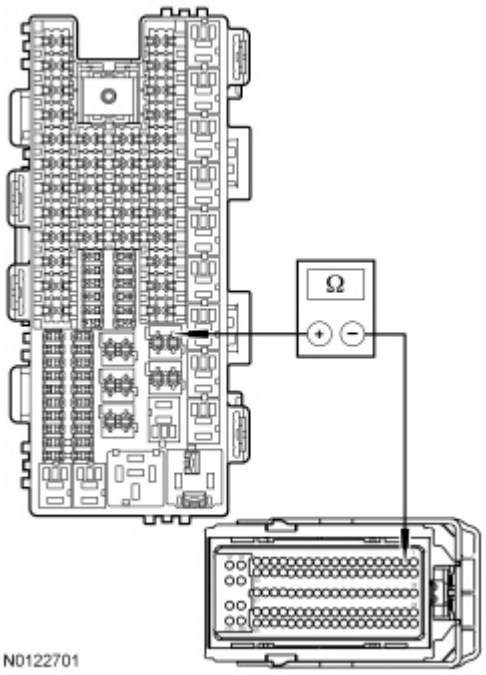
NOTE: Before carrying out the following test, check that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), refer to Fluorescent Dye Leak Detection in this section.





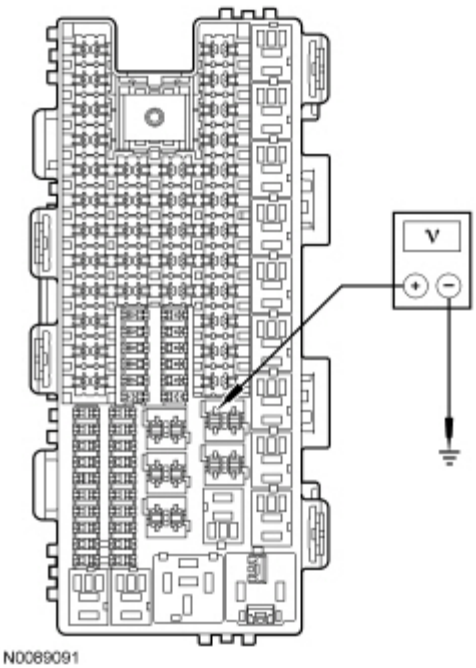
Test Step	Result / Action to Take
O1 CHECK THE A/C SYSTEM PRESSURE • Ignition OFF. • With the R-134a manifold gauge set connected, check the A/C system pressure. • **Is the A/C system pressure above 290 kPa (42 psi) ?**	**Yes** GO to O2 . **No** CHECK the A/C system for leaks. REFER to Fluorescent Dye Leak Detection or Electronic Leak Detection in this section. RECHARGE the A/C system. REFER to Air Conditioning (A/C) System Recovery, Evacuation and Charging . TEST the system for normal operation.
O2 CHECK THE A/C PRESSURE SENSOR (ACP_PRESS) PCM PID • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger . • With the R-134a manifold gauge set connected, compare the pressure readings of the manifold gauge set and the ACP_PRESS PCM PID. • **Are the pressure values of the manifold gauge set and the ACP_PRESS PID similar?**	**Yes** GO to O3 . **No** INSTALL a new A/C pressure transducer. TEST the system for normal operation.
O3 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID • Allow the vehicle exterior and interior to stabilize to the ambient temperature. • Enter the following diagnostic mode on the scan tool: HVAC DataLogger . • Monitor the EVAP_TEMP HVAC PID • **Does the EVAP_TEMP HVAC PID read similar to the ambient temperature?**	**Yes** GO to O4 . **No** GO to Pinpoint Test g .
O4 CHECK THE AC_DEMAND HVAC PID WITH THE A/C ON • Enter the following diagnostic mode on the scan tool: HVAC DataLogger . • Select PANEL press the A/C button (indicator on) on the HVAC controls and monitor the AC_DEMAND HVAC PID. • **Does the AC_DEMAND HVAC PID read Active?**	**Yes** GO to O5 . **No** GO to O17 .
O5 CHECK THE (A/C) SWITCH (CC_SW_AC) FCIM PID WITH THE A/C ON • Enter the following diagnostic mode on the scan tool:	**Yes**

repair4less



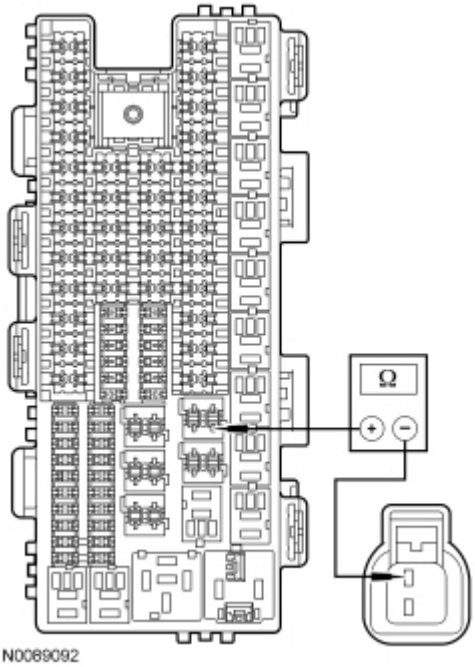
FCIM DataLogger . • Select PANEL press the A/C button (indicator on) on the HVAC controls and monitor the CC_SW_AC FCIM PID. • **Does the CC_SW_AC FCIM PID read Active?**	GO to O6 . **No** INSTALL a new Front Controls Interface Module (FCIM). Refer to the appropriate section in Group 415 for the procedure.. TEST the system for normal operation.
O6 CHECK THE AIR CONDITIONING REQUEST SIGNAL (AC_REQ) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Select PANEL press the A/C button (indicator on) on the HVAC controls and monitor the AC_REQ PCM PID. • **Does the AC_REQ PCM PID read YES?**	**Yes** GO to O7 . **No** GO to O17 .
O7 CHECK THE AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Select PANEL press the A/C button (indicator on) on the HVAC controls and monitor the ACC_CMD PCM PID. • **Does the ACC_CMD PCM PID read ON?**	**Yes** GO to O8 . **No** GO to O18 .
O8 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY COIL	
• Ignition OFF. • Disconnect: A/C Clutch Relay . • Ignition ON. • Measure the voltage between ground and the A/C clutch relay socket, circuit CBB77 (WH).  N0089088	**Yes** GO to O9 . **No** VERIFY Battery Junction Box (BJB) fuse 77 (10A) is OK. If OK, REPAIR circuit CBB77 (WH) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

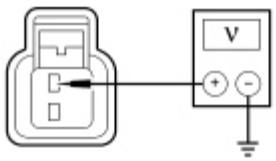
• **Is the voltage greater than 11 volts?**	
O9 CHECK THE A/C CLUTCH RELAY • Start the engine. • Select PANEL and press the A/C button (indicator on) on the HVAC controls. • With the engine running, connect a 12-volt test light between A/C clutch relay socket, circuit CBB77 (WH) and A/C clutch relay socket, circuit CH302 (WH/BN).  N0122684 • **Does the test light illuminate?**	**Yes** GO to O12 . **No** GO to O10 .
O10 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: PCM C1381B (5.0L, 6.2L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1551B (3.5L) . • Ignition ON. **For 3.7L, 5.0L and 6.2L**  N0086589 • Measure the voltage between ground and: ▪ For 3.7L, PCM C175B-12, circuit CH302	**Yes** REPAIR the circuit. **No** GO to O11 .



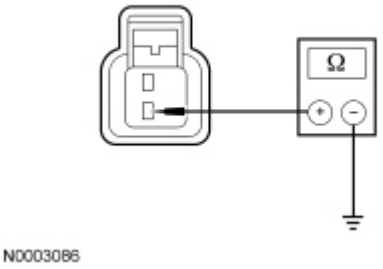
repair4less

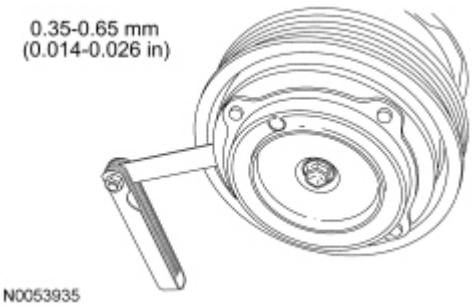
(WH/BN), harness side. ■ For 5.0L and 6.2L, PCM C1381B-12, circuit CH302 (WH/BN), harness side. **For 3.5L**  N0122699 ● For 3.5L, measure the voltage between ground and PCM C1551B-2, circuit CH302 (WH/BN), harness side. ● **Is any voltage present?**	
O11 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR AN OPEN	
● Ignition OFF. **For 3.7L, 5.0L and 6.2L**  N0119919 ● Measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and: ■ For 3.7L, PCM C175B-12, circuit CH302 (WH/BN), harness side. ■ For 5.0L and 6.2L, PCM C1381B-12, circuit CH302 (WH/BN), harness side.	**Yes** GO to O18 . **No** REPAIR the circuit.





For 3.5L





- For 3.5L, measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and PCM C1551B-2, circuit CH302 (WH/BN), harness side.
- **Is the resistance less than 3 ohms?**

O12 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY SWITCH CONTACTS	
• Measure the voltage between the A/C clutch relay socket, circuit SBB30 (BN/RD) and ground.  	**Yes** GO to O13 . **No** VERIFY Battery Junction Box (BJB) fuse 30 (10A) is OK. If OK, REPAIR circuit SBB30 (BN/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

repair4less

• **Is the voltage greater than 11 volts?**	
O13 CHECK THE A/C COMPRESSOR CLUTCH FIELD COIL VOLTAGE CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: A/C Compressor Clutch Field Coil C100 . • Measure the resistance between the A/C clutch relay socket, circuit CH401 (VT/WH) and A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH), harness side.  N0089092 • **Is the resistance less than 3 ohms?**	**Yes** GO to O14 . **No** REPAIR the circuit.
O14 CHECK THE VOLTAGE AT THE A/C COMPRESSOR CLUTCH FIELD COIL • Connect: A/C Clutch Relay . • Ignition ON. • Select PANEL and press the A/C button (indicator on) on the HVAC controls. • Measure the voltage between A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH), harness side and ground.  A0048576 • **Is the voltage greater than 11 volts?**	**Yes** GO to O15 . **No** INSTALL a new A/C clutch relay. TEST the system for normal operation.

O15 CHECK THE GROUND AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Measure the resistance between A/C compressor clutch field coil C100-2, circuit GD123 (BK/GY), harness side and ground.  N0003086 • **Is the resistance less than 3 ohms?**	**Yes** GO to O16 . **No** REPAIR the circuit.
O16 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP	
• Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley.  N0053935 • **Is the A/C compressor clutch air gap average greater than 0.65 mm (0.026 in)?**	**Yes** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. REFER to Section 412-01 . TEST the system for normal operation.
O17 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

O18 CHECK FOR CORRECT PCM OPERATION	

repair4less

• Ignition OFF.
• Disconnect and inspect all the PCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all PCM connectors. Make sure they seat and latch correctly.
• Operate the system and verify the concern is still present.
• Connect and correctly seat all the PCM connectors.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — PCM .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test P: The Air Conditioning (A/C) is Always On — A/C Compressor Does Not Cycle

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

For vehicles equipped with EMTC base system with 4 blower motor speed positions, when A/C button is pressed, a message is sent from the HVAC module over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

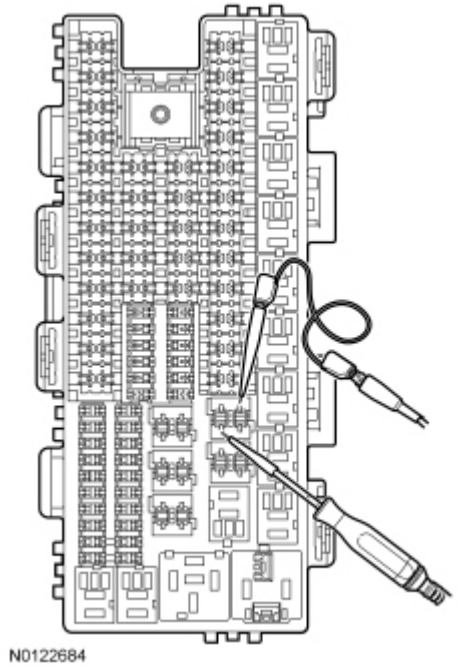
For vehicles equipped with EMTC with non touch 4.2" display (FCDIM) system with 7 blower motor speed positions, when A/C is requested, the A/C request message is sent over I-CAN to the FCIM . The FCIM sends a message over the MS-CAN bus to the HVAC module that A/C has been selected. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

For vehicles equipped with 8" touchscreen, when A/C is requested by touching the FDIM , a message is sent from the APIM over the MS-CAN bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

Voltage is provided to the A/C clutch relay coil from Battery Junction Box (BJB) fuse 77 (10A) and switch contacts from Battery Junction Box (BJB) fuse 30 (10A). When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay. When the PCM energizes the relay, voltage is supplied to the A/C compressor clutch field coil from the relay. Ground is supplied for the A/C compressor clutch field coil.

The evaporator temperature sensor is used for A/C compressor cycling. An accurate evaporator temperature is critical for compressor engagement. The PCM uses the temperature measurement to turn the A/C compressor off before the evaporator temperatures are cold enough to freeze the condensation on the evaporator core.

This pinpoint test is intended to diagnose the following:

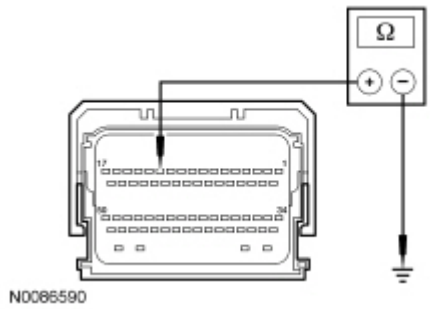


- Wiring, terminals or connectors
- PCM
- Evaporator temperature sensor
- A/C clutch relay
- A/C compressor clutch air gap

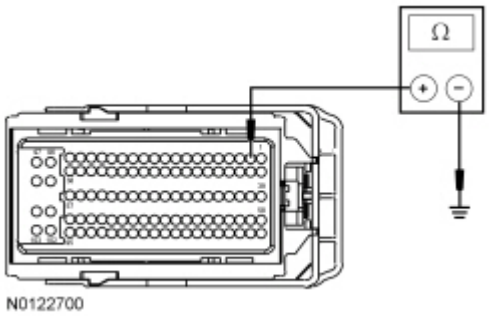
PINPOINT TEST P: THE AIR CONDITIONING (A/C) IS ALWAYS ON — A/C COMPRESSOR DOES NOT CYCLE

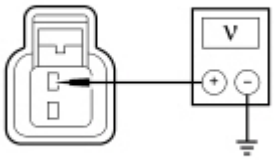
NOTE: Before carrying out the following test, diagnose any HVAC or PCM or DTCs.

Test Step	Result / Action to Take
P1 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID	
• Ignition ON. • Allow the vehicle exterior and interior to stabilize to the ambient temperature. • Enter the following diagnostic mode on the scan tool: HVAC DataLogger . • Monitor the EVAP_TEMP HVAC PID • **Does the EVAP_TEMP HVAC PID read similar to the ambient temperature?**	**Yes** GO to P2 . **No** GO to Pinpoint Test g .
P2 CHECK THE AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Monitor the ACC_CMD PCM PID • Select PANEL press the A/C button (indicator off) on the HVAC controls. • **Does the ACC_CMD PCM PID read OFF?**	**Yes** GO to P3 . **No** GO to P7 .
P3 CHECK THE A/C COMPRESSOR CLUTCH ENGAGEMENT WITH RELAY DISCONNECTED	
• Ignition OFF. • Disconnect: A/C Clutch Relay . • Start the engine. • With the engine running, observe the A/C compressor clutch. • **Is the compressor clutch disengaged?**	**Yes** GO to P4 . **No** GO to P6 .
P4 CHECK THE A/C CLUTCH RELAY	
• Select PANEL and press the A/C button (indicator off) on the HVAC controls. • With the engine running, connect a 12-volt test light between A/C clutch relay socket, circuit CBB77 (WH) and A/C clutch relay socket, circuit CH302 (WH/BN).	**Yes** GO to P5 . **No** INSTALL a new A/C clutch relay. TEST the system for normal operation.



repair4less





N0122684

- **Does the test light illuminate?**

P5 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO GROUND	

• Ignition OFF.
• Disconnect: PCM C1381B (5.0L, 6.2L) .
• Disconnect: PCM C175B (3.7L) .
• Disconnect: PCM C1551B (3.5L) .
 	
For 3.7L, 5.0L and 6.2L
 	

 	
N0086590
 	
• Measure the resistance between ground and:
  ▪ For 3.7L, PCM C175B-12, circuit CH302 (WH/BN), harness side.
  ▪ For 5.0L and 6.2L, PCM C1381B-12, circuit CH302 (WH/BN), harness side.
 	
For 3.5L
	Yes
	GO to P7 .
	
	No
	REPAIR the circuit.

 N0122700 • For 3.5L, measure the resistance between ground and PCM C1551B-2, circuit CH302 (WH/BN), harness side. • **Is the resistance greater than 10,000 ohms?**	
P6 CHECK FOR VOLTAGE TO THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Disconnect: A/C Compressor Clutch Field Coil C100 . • Ignition ON. • Select the OFF position on the HVAC module. • Measure the voltage between A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH), harness side and ground.  A0048576 • **Is any voltage present?**	**Yes** REPAIR the circuit. **No** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation.
P7 CHECK FOR CORRECT PCM OPERATION	
• Disconnect and inspect all PCM connectors. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new terminals/pins ▪ pushed-out pins - install new pins as necessary • Connect all PCM connectors. Make sure they seat and latch correctly. • Clear the DTCs. • Enter the following diagnostic mode on the scan tool: Self-Test — PCM . • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new PCM. REFER to Section 303-14 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test Q: The Air Conditioning (A/C) is Always On — A/C Mode Always Commanded ON

repair4less

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

For vehicles equipped with EMTC base system with 4 blower motor speed positions, when A/C button is pressed, a message is sent from the HVAC module over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

For vehicles equipped with EMTC with non touch 4.2" display (FCDIM) system with 7 blower motor speed positions, when A/C is requested, the A/C request message is sent over I-CAN to the FCIM . The FCIM sends a message over the MS-CAN bus to the HVAC module that A/C has been selected. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

For vehicles equipped with 8" touchscreen, when A/C is requested by touching the FDIM , a message is sent from the APIM over the MS-CAN bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Front Controls Interface Module (FCIM)
- PCM
- HVAC module

PINPOINT TEST Q: THE AIR CONDITIONING (A/C) IS ALWAYS ON — A/C MODE ALWAYS COMMANDED ON

NOTE: Before carrying out the following test, diagnose any HVAC or PCM DTCs.

Test Step	Result / Action to Take
Q1 CHECK THE AIR CONDITIONING REQUEST SIGNAL (AC_REQ) PCM PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Select PANEL press the A/C button (indicator off) on the HVAC controls and monitor the AC_REQ PCM PID. • **Does the AC_REQ PCM PID read NO?**	**Yes** GO to Q6 . **No** GO to Q2 .
Q2 CHECK THE AIR CONDITIONING SWITCH STATUS (CC_SW_AC) HVAC PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: HVAC DataLogger . • Select PANEL on the HVAC controls and monitor the CC_SW_AC HVAC PID.	**Yes** GO to Q3 . **No** GO to Q5 .

• **Does the CC_SW_AC HVAC PID read Inactive?**	
Q3 CHECK THE AIR CONDITIONING SWITCH STATUS (CC_SW_AC) FCIM PID WITH THE A/C OFF	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Front Controls Interface Module (FCIM) DataLogger . • Monitor the CC_SW_AC FCIM PID • Select PANEL on the HVAC controls and monitor the CC_SW_AC FCIM PID. • **Does the CC_SW_AC FCIM PID read Inactive?**	**Yes** GO to Q4 . **No** INSTALL a new FCIM . REFER to Refer to the appropriate section in Group 415 for the procedure.. TEST the system for normal operation.
Q4 CHECK THE AIR CONDITIONING REQUEST SIGNAL (AC_REQ) PCM PID WITH HVAC MODULE DISCONNECTED	
• Disconnect: HVAC Module — Base EMTC C294A . • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — EATC C228B . • Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Monitor the AC_REQ PCM PID • **Does the AC_REQ PCM PID read NO?**	**Yes** GO to Q5 . **No** GO to Q6 .
Q5 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Ignition ON.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

repair4less

• Operate the system and verify the concern is still present. • **Is the concern still present?**	

Q6 CHECK FOR CORRECT PCM OPERATION
• Disconnect and inspect all PCM connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all PCM connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — PCM .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test R: Temperature Control Is Inoperative/Does Not Operate Correctly — EMTC Base With 4 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

To rotate the temperature blend door actuator, the HVAC module supplies voltage and ground to the temperature blend door actuators through the door actuator motor circuits. To reverse the temperature blend door actuator rotation, the HVAC module reverses the voltage and ground circuits.

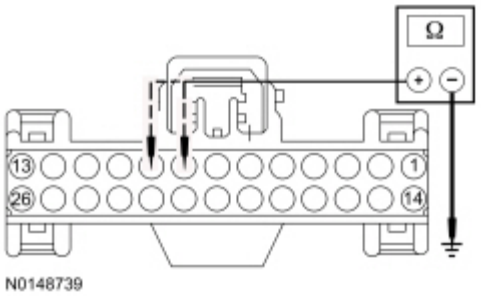
The temperature blend door actuator feedback resistor is supplied a ground from the HVAC module and a 5-volt reference voltage on the temperature blend door actuator reference circuits. The HVAC module reads the voltage on the temperature blend door actuator feedback circuits to determine the temperature blend door actuator position by the position of the actuator feedback resistor wiper arm.

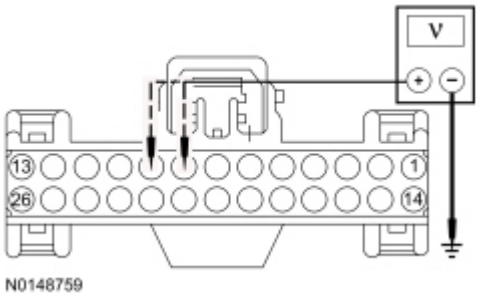
During an actuator calibration cycle, the HVAC module drives the temperature blend door until the door reaches both internal stops in the HVAC case. If the temperature blend door is temporally obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to it's end of travel, the airflow temperature may not be as warm or cold as expected.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1081:00	Left Temperature Damper Motor: No Sub Type Information	The HVAC module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates either an open in an actuator motor circuit,

		an actuator internal failure or a binding or stuck linkage or door.
B1081:11	Left Temperature Damper Motor: Circuit Short to Ground	The HVAC module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
B1081:12	Left Temperature Damper Motor: Circuit Short to Battery	The HVAC module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
B1081:13	Left Temperature Damper Motor: Circuit Open	The HVAC module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit.
B11E5:11	Left Temperature Damper Position Sensor: Circuit Short to Ground	The HVAC module senses less than 1 volt on the actuator feedback circuit, indicating a short to ground.
B11E5:15	Left Temperature Damper Position Sensor: Circuit Short to Battery or Open	The HVAC module senses greater than 4.88 volts on the actuator feedback circuit, indicating an open circuit or a short to voltage.

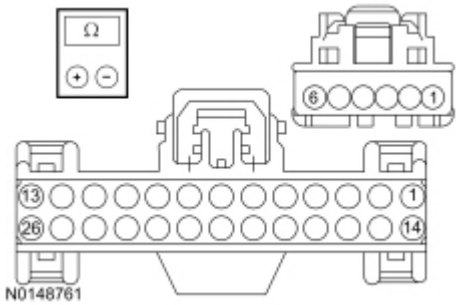




This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Temperature blend door actuator
- HVAC module
- Stuck or bound linkage or door

PINPOINT TEST R: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — EMTC BASE WITH 4 BLOWER MOTOR SPEED POSITIONS



Test Step	Result / Action to Take
R1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B1081:00, INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, GO to R4. For DTC B1081:11, GO to R2. For DTC B1081:12, GO to R3. For DTC B1081:13, GO to R4. For DTC B11E5:11, GO to R6. For DTC B11E5:15, GO to R9. **No** INSPECT for broken linkage or door. REPAIR as necessary. If no condition is found, GO to R13.
R2 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO	

repair4less

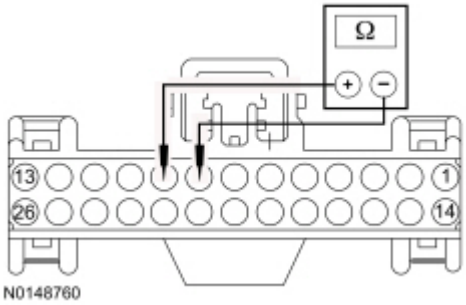
GROUND • Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Measure the resistance between ground and: ▪ HVAC module — EMTC C294A-9, circuit CH238 (YE/OG), harness side. ▪ HVAC module — EMTC C294A-8, circuit CH239 (BU), harness side.  N0148739 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to R5 . **No** REPAIR the circuit in question.
R3 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Ignition ON. • Measure the voltage between ground and: ▪ HVAC module — EMTC C294A-8, circuit CH239 (BU), harness side. ▪ HVAC module — EMTC C294A-9, circuit CH238 (YE/OG), harness side.  N0148759 • **Are any voltages present?**	**Yes** REPAIR the circuit in question. **No** GO to R5 .
R4 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR AN OPEN **NOTE:** Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF.	**Yes** GO to R13 . **No** REPAIR the circuit in question.

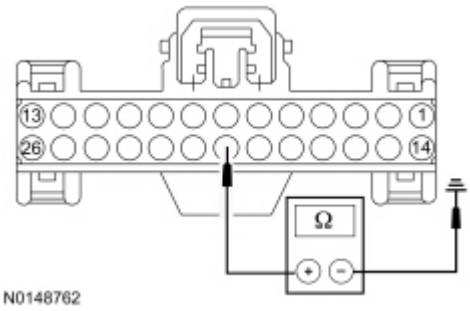
- Disconnect: HVAC Module — Base EMTC C294A .
- Disconnect: Temperature Blend Door Actuator C2381 .
- Measure the resistance between HVAC module — EMTC C294A, harness side and temperature blend door actuator C2381, harness side using the following chart:

HVAC Module — EMTC	Circuit	Temperature Blend Door Actuator
C294A-9	CH238 (YE/OG)	C2381-6
C294A-8	CH239 (BU) (BU/WH)	C2381-5

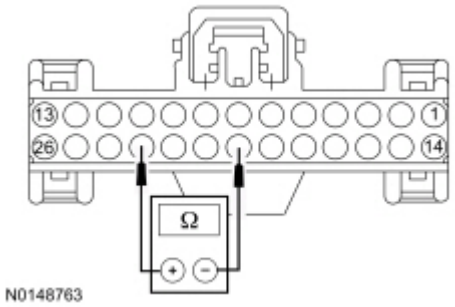
- **Are the resistances less than 3 ohms?**

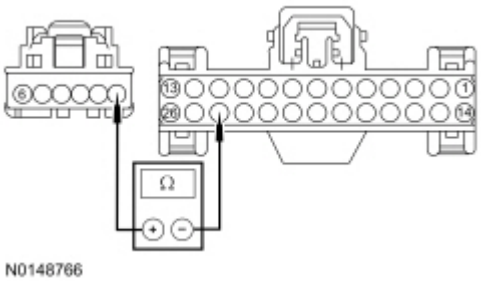
R5 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TOGETHER

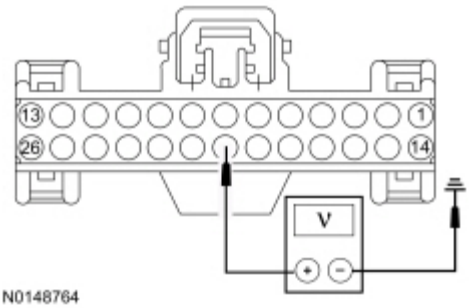




NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test.

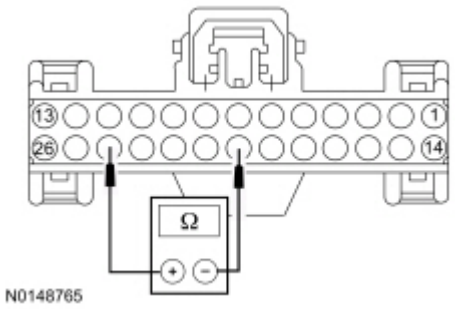


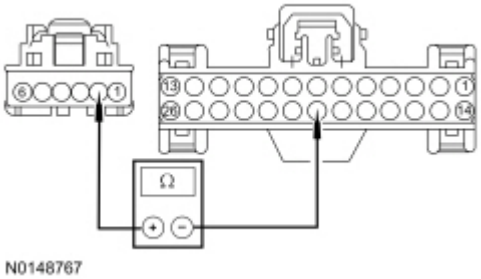




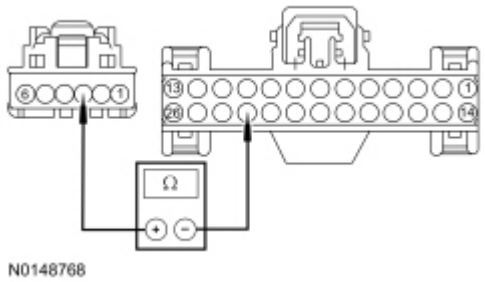
- Ignition OFF.
- Disconnect: Temperature Blend Door Actuator C2381 .
- Measure the resistance between HVAC module — EMTC C294A-8, circuit CH239 (BU), harness side and HVAC module — EMTC C294A-9, circuit CH238 (YE/OG), harness side.

Yes
GO to R13 .





No
REPAIR the circuits.



repair4less

 N0148760 • **Is the resistance greater than 10,000 ohms?**	
R6 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Measure the resistance between ground and HVAC module — EMTC C294A-20, circuit VH440 (BU), harness side.  N0148762 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R7 . **No** REPAIR the circuit.
R7 CHECK THE SIGNAL RETURN CIRCUIT FOR A SHORT TO THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Disconnect: Temperature Blend Door Actuator C2381 . • Measure the resistance between HVAC module — EMTC C294A-23, circuit RH111 (GY/BU) and HVAC module — EMTC C294A-20, circuit VH440 (BU), harness side.	**Yes** GO to R8 . **No** REPAIR the circuits.

 N0148763 • **Is the resistance greater than 10,000 ohms?**	
R8 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module — EMTC C294A-24, circuit LH111 (BN/WH) and temperature blend door actuator C2381-1, circuit LH111 (BN/WH), harness side.  N0148766 • **Is the resistance less than 3 ohms?**	**Yes** GO to R13 . **No** REPAIR the circuit.
R9 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Ignition ON. • Measure the voltage between ground and HVAC module — EMTC C294A-20, circuit VH440 (BU), harness side.  N0148764 • **Is any voltage present?**	**Yes** REPAIR the circuit. **No** GO to R10 .
R10 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT	

repair4less

NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF. • Disconnect: Temperature Blend Door Actuator C2381 . • Measure the resistance between HVAC module — EMTC C294A-24, circuit LH111 (BN/WH) and HVAC module — EMTC C294A-20, circuit VH440 (BU), harness side.  N0148765 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R11 . **No** REPAIR the circuits.
R11 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module — EMTC C294A-20, circuit VH440 (BU), harness side and driver side blend door actuator C2381-2, circuit VH440 (BU/BN), harness side.  N0148767 • **Is the resistance less than 3 ohms?**	**Yes** GO to R12 . **No** REPAIR the circuit.
R12 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module — EMTC C294A-23, circuit RH111 (GY/BU) and temperature blend door actuator C2381-3, circuit RH111 (GY/BU), harness side.	**Yes** GO to R13 . **No** REPAIR the circuit.

 N0148768 • **Is the resistance less than 3 ohms?**	
R13 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR CONNECTION	

• Disconnect and inspect the temperature blend door actuator connector.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Reconnect the temperature blend door actuator connector. Make sure it seats and latches correctly.
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CARRY OUT the Temperature Blend Door Actuator component test in this section. If the actuator tests OK, GO to R14 . When installing an actuator, CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

R14 MODULE ACTUATOR POSITION CALIBRATION	

NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below.
• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Ignition ON.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Select any position except OFF.
• **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

repair4less

takes approximately 30 seconds. • Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test S: Temperature Control Is Inoperative/Does Not Operate Correctly — EMTC With 4.2 Inch Display With 7 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Automatic Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

To rotate the temperature blend door actuator, the HVAC module supplies voltage and ground to the temperature blend door actuators through the door actuator motor circuits. To reverse the temperature blend door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The temperature blend door actuator feedback resistor is supplied a ground from the HVAC module and a 5-volt reference voltage on the temperature blend door actuator reference circuits. The HVAC module reads the voltage on the temperature blend door actuator feedback circuits to determine the temperature blend door actuator position by the position of the actuator feedback resistor wiper arm.

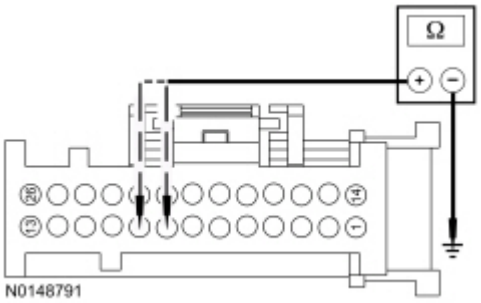
During an actuator calibration cycle, the HVAC module drives the temperature blend door until the door reaches both internal stops in the HVAC case. If the temperature blend door is temporally obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to it's end of travel, the airflow temperature may not be as warm or cold as expected.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1081:00	Left Temperature Damper Motor: No Sub Type Information	The HVAC module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates either an open in an actuator motor circuit, an actuator internal failure or a binding or stuck linkage or door.
B1081:11	Left Temperature Damper Motor: Circuit Short to Ground	The HVAC module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
B1081:12	Left Temperature Damper Motor: Circuit Short to Battery	The HVAC module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
B1081:13	Left Temperature Damper Motor: Circuit Open	The HVAC module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit.
B11E5:11	Left Temperature Damper Position Sensor: Circuit Short to Ground	The HVAC module senses less than 1 volt on the actuator feedback circuit, indicating a short to ground.

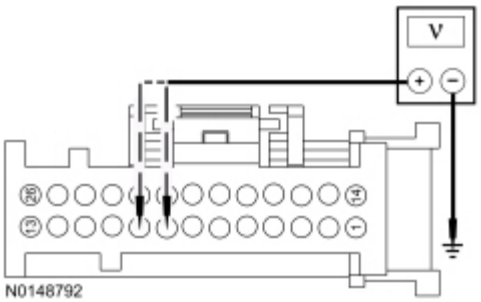
B11E5:15	Left Temperature Damper Position Sensor: Circuit Short to Battery or Open	The HVAC module senses greater than 4.88 volts on the actuator feedback circuit, indicating an open circuit or a short to voltage.

This pinpoint test is intended to diagnose the following:

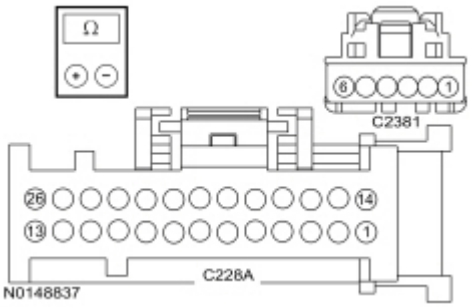


- Wiring, terminals or connectors
- Temperature blend door actuator
- HVAC module
- Front Controls Interface Module (FCIM)
- Stuck or bound linkage or door

PINPOINT TEST S: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — EMTC WITH 4.2 INCH DISPLAY WITH 7 BLOWER MOTOR SPEED POSITIONS

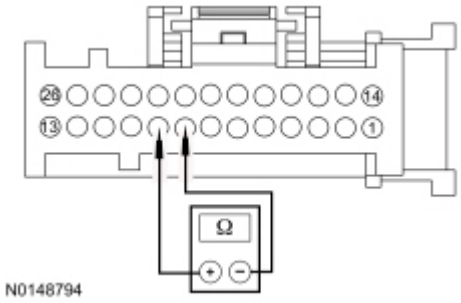


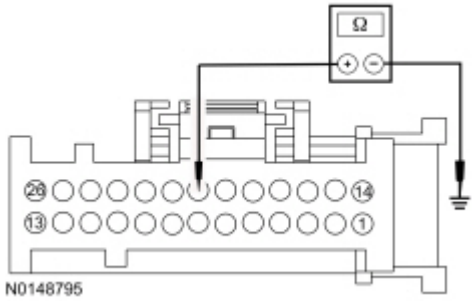
Test Step	Result / Action to Take
S1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B1081:00, INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, GO to S5 . For DTC B1081:11, GO to S3 . For DTC B1081:12, GO to S4 . For DTC B1081:13, GO to S5 . For DTC B11E5:11, GO to S7 . For DTC B11E5:15, GO to S10 . **No** GO to S2 .
S2 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR OPERATION USING THE HVAC LEFT BLEND DOOR POSITION (LEFT_BLEND) ACTIVE COMMAND	
• Start the engine. • Run the engine until it reaches normal operating temperature. • Enter the following diagnostic mode on the scan tool: HVAC Module DataLogger . • Select PANEL mode on the HVAC controls. • Select the highest blower motor setting. • Observe airflow while using the scan tool to operate the HVAC module active command LEFT_BLEND, increasing and decreasing the percentage value. • **Does the airflow temperature change between warm and cold when the active command is changed?**	**Yes** INSTALL a new FCIM . REFER to Refer to the appropriate section in Group 415 for the procedure.. TEST the system for normal operation. **No** INSPECT for broken linkage or door. REPAIR as necessary. If no condition is found, GO to S14 .
S3 CHECK THE TEMPERATURE BLEND DOOR	



repair4less

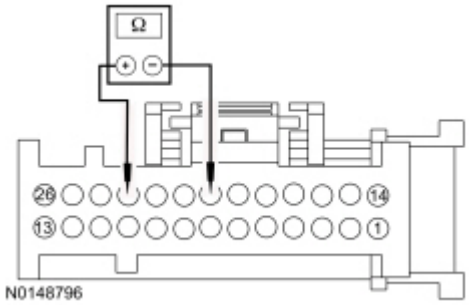
ACTUATOR MOTOR CIRCUITS FOR A SHORT TO GROUND	

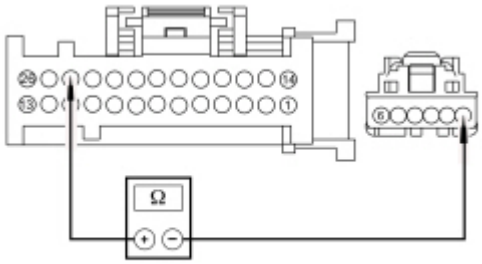


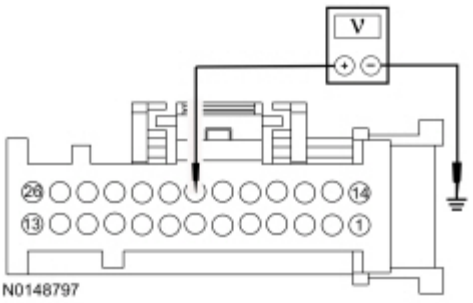


• Ignition OFF.
• Disconnect: HVAC Module — Remote Mount EMTC C2357A .
• Disconnect: HVAC Module — Remote Mount EMTC C2357B .
• Disconnect: Temperature Blend Door Actuator C2381 .
• Measure the resistance between ground and:
  ▪ HVAC module C2357A-8, circuit CH239 (BU), harness side.
  ▪ HVAC module C2357A-9, circuit CH238 (YE/OG), harness side.

 	
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to S6 .
	
	No
	REPAIR the circuit in question.



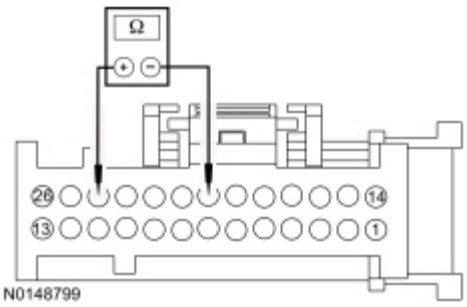


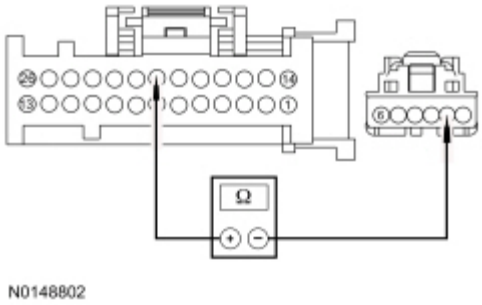


S4 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	

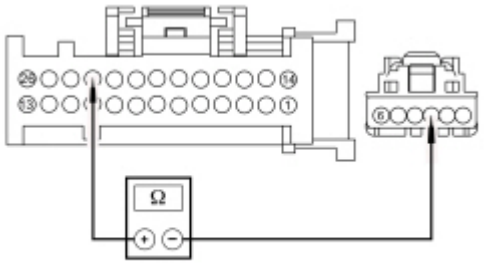
• Disconnect: HVAC Module — Remote Mount EMTC C2357A .
• Disconnect: HVAC Module — Remote Mount EMTC C2357B .
• Disconnect: Temperature Blend Door Actuator C2381 .
• Ignition ON.
• Measure the voltage between ground and:
  ▪ HVAC module C2357A-8, circuit CH239 (BU), harness side.
  ▪ HVAC module C2357A-9, circuit CH238 (YE/OG), harness side.

 	
• **Are any voltages present?**
	Yes
	REPAIR the circuit in question.
	
	No
	GO to S6 .





S5 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR AN OPEN	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF. • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: Temperature Blend Door Actuator C2381 . • Measure the resistance between HVAC module C228A, harness side and driver side temperature blend door actuator C2381, harness side using the following chart: **HVAC Module** / **Circuit** / **Temperature Blend Door Actuator** C2357A-9 / CH238 (YE) (YE/OG) / C2381-6 C2357A-8 / CH239 (BU) (BU/WH) / C2381-5  • **Are the resistances less than 3 ohms?**	**Yes** GO to S14 . **No** REPAIR the circuit in question.
S6 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TOGETHER	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF. • Disconnect: Temperature Blend Door Actuator C2381 . • Measure the resistance between HVAC module C2357A-8, circuit CH239 (BU), harness side and HVAC module C2357A-9, circuit CH238 (YE),	**Yes** GO to S14 . **No** REPAIR the circuits.



repair4less

harness side.  • **Is the resistance greater than 10,000 ohms?**	
S7 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Disconnect: Temperature Blend Door Actuator C2381 . • Measure the resistance between ground and HVAC module C2357A-20, circuit VH440 (BU), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S8 . **No** REPAIR the circuit.
S8 CHECK THE SIGNAL RETURN CIRCUIT FOR A SHORT TO THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Disconnect: Temperature Blend Door Actuator C2381 . • Measure the resistance between HVAC module C2357A-23, circuit RH111 (GY/BU) and HVAC module C2357A-20, circuit VH440 (BU), harness side.	**Yes** GO to S9 . **No** REPAIR the circuits.

 N0148796 • **Is the resistance greater than 10,000 ohms?**	
S9 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module C2357A-24, circuit LH111 (BN/WH) and temperature blend door actuator C2381-1, circuit LH111 (BN/WH), harness side.  N0148798 • **Is the resistance less than 3 ohms?**	**Yes** GO to S14 . **No** REPAIR the circuit.
S10 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Disconnect: HVAC Module — Remote Mount EMTC C2357B . • Ignition ON. • Measure the voltage between ground and HVAC module C2357A-20, circuit VH440 (BU), harness side.  N0148797 • **Is any voltage present?**	**Yes** REPAIR the circuit. **No** GO to S11 .

repair4less

S11 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF. • Disconnect: Temperature Blend Door Actuator C2381 . • Measure the resistance between HVAC module C2357A-24, circuit LH111 (BN/WH) and HVAC module C2357A-20, circuit VH440 (BU), harness side.  N0148799 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S12 . **No** REPAIR the circuits.
S12 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module C2357A-20, circuit VH440 (BU), harness side and temperature blend door actuator C2381-2, circuit VH440 (BU/BN), harness side.  N0148802 • **Is the resistance less than 3 ohms?**	**Yes** GO to S13 . **No** REPAIR the circuit.
S13 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module C2357A-23, circuit RH111 (GY/BU) and temperature blend door actuator C2381-3, circuit RH111 (GY/BU), harness side.	**Yes** GO to S14 . **No** REPAIR the circuit.

 N0148801 • **Is the resistance less than 3 ohms?**	

S14 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR CONNECTION
• Disconnect and inspect the temperature blend door actuator connector.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Reconnect the temperature blend door actuator connector. Make sure it seats and latches correctly.
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CARRY OUT the Temperature Blend Door Actuator component test in this section. If the actuator tests OK, GO to S15 . When installing an actuator, CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

S15 MODULE ACTUATOR POSITION CALIBRATION
NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below.
• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Ignition ON.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Select any position except OFF.
• **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

repair4less

takes approximately 30 seconds. • Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test U: Temperature Control Is Inoperative/Does Not Operate Correctly — EATC , Dual Zone Driver Side

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

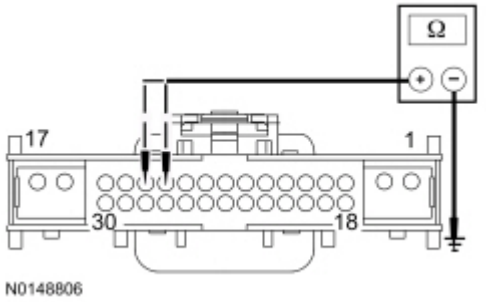
To rotate the temperature blend door actuator, the HVAC module supplies voltage and ground to the temperature blend door actuators through the door actuator motor circuits. To reverse the temperature blend door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The temperature blend door actuator feedback resistor is supplied a ground from the HVAC module and a 5-volt reference voltage on the temperature blend door actuator reference circuits. The HVAC module reads the voltage on the temperature blend door actuator feedback circuits to determine the temperature blend door actuator position by the position of the actuator feedback resistor wiper arm.

During an actuator calibration cycle, the HVAC module drives the temperature blend door until the door reaches both internal stops in the HVAC case. If the temperature blend door is temporally obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to it's end of travel, the airflow temperature may not be as warm or cold as expected.

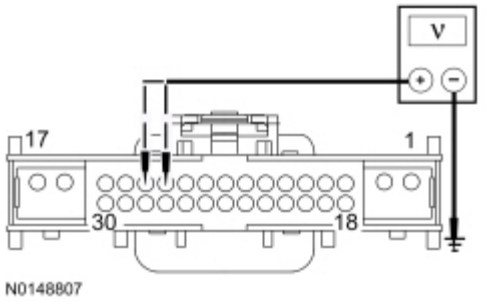
DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1081:00	Left Temperature Damper Motor: No Sub Type Information	The HVAC module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates either an open in an actuator motor circuit, an actuator internal failure or a binding or stuck linkage or door.
B1081:11	Left Temperature Damper Motor: Circuit Short to Ground	The HVAC module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
B1081:12	Left Temperature Damper Motor: Circuit Short to Battery	The HVAC module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
B1081:13	Left Temperature Damper Motor: Circuit Open	The HVAC module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit.
B11E5:11	Left Temperature Damper Position Sensor: Circuit Short to Ground	The HVAC module senses less than 1 volt on the actuator feedback circuit, indicating a short to ground.
B11E5:15	Left Temperature Damper Position Sensor: Circuit Short to Battery or Open	The HVAC module senses greater than 4.88 volts on the actuator feedback circuit, indicating an open circuit or a short to voltage.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Temperature blend door actuator
- HVAC module
- Front Controls Interface Module (FCIM)
- Stuck or bound linkage or door



PINPOINT TEST U: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — EATC , DUAL ZONE DRIVER SIDE

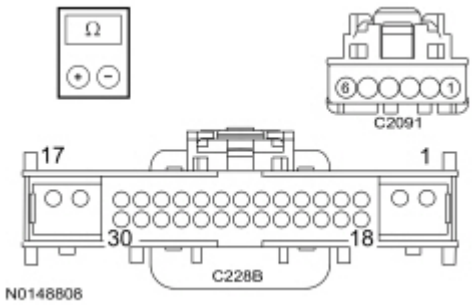
Test Step	Result / Action to Take
U1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B1081:00, INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, GO to U5 . For DTC B1081:11, GO to U3 . For DTC B1081:12, GO to U4 . For DTC B1081:13, GO to U5 . For DTC B11E5:11, GO to U7 . For DTC B11E5:15, GO to U10 . **No** GO to U2 .
U2 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR OPERATION USING THE HVAC LEFT BLEND DOOR POSITION (LEFT_BLEND) ACTIVE COMMAND	
• Start the engine. • Run the engine until it reaches normal operating temperature. • Enter the following diagnostic mode on the scan tool: HVAC Module DataLogger . • Select PANEL mode on the HVAC controls. • Select the highest blower motor setting. • Observe airflow while using the scan tool to operate the HVAC module active command LEFT_BLEND, increasing and decreasing the percentage value. • **Does the airflow temperature change between warm and cold when the active command is changed?**	**Yes** INSTALL a new FCIM . REFER to Refer to the appropriate section in Group 415 for the procedure.. TEST the system for normal operation. **No** INSPECT for broken linkage or door. REPAIR as necessary. If no condition is found, GO to U14 .
U3 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF.	**Yes**

repair4less

• Disconnect: HVAC Module — EATC C228A .
• Disconnect: HVAC Module — EATC C228B .
• Disconnect: Driver Side Temperature Blend Door Actuator C2091 .
• Measure the resistance between ground and:
  ▪ HVAC module — EATC C228B-12, circuit CH239 (BU), harness side.
  ▪ HVAC module — EATC C228B-13, circuit CH238 (YE), harness side.

 	
N0148806
• **Are the resistances greater than 10,000 ohms?**
	GO to U6 .
	
	No
	REPAIR the circuit in question.

U4 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	



• Disconnect: HVAC Module — EATC C228A .
• Disconnect: HVAC Module — EATC C228B .
• Disconnect: Driver Side Temperature Blend Door Actuator C2091 .
• Ignition ON.
• Measure the voltage between ground and:
  ▪ HVAC module — EATC C228B-12, circuit CH239 (BU), harness side.
  ▪ HVAC module — EATC C228B-13, circuit CH238 (YE), harness side.

 	
N0148807
• **Are any voltages present?**
	Yes
	REPAIR the circuit in question.
	
	No
	GO to U6 .

U5 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR AN OPEN	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the	**Yes** GO to U14 . **No** REPAIR the circuit in question.

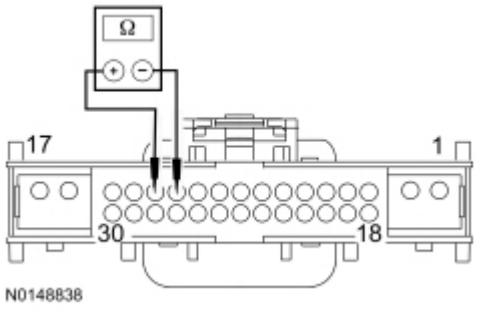
test.

- Ignition OFF.
- Disconnect: HVAC Module — EATC C228A .
- Disconnect: HVAC Module — EATC C228B .
- Disconnect: Driver Side Temperature Blend Door Actuator C2091 .
- Measure the resistance between HVAC module — EATC C228B, harness side and driver side temperature blend door actuator C2091, harness side using the following chart:

HVAC Module — EATC	Circuit	Driver side Temperature Blend Door Actuator
C228B-13	CH238 (YE) (YE/OG)	C2091-6
C228B-12	CH239 (BU) (BU/WH)	C2091-5

- **Are the resistances less than 3 ohms?**

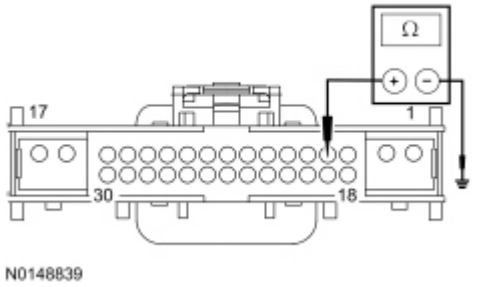
U6 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TOGETHER



NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test.

- Ignition OFF.
- Disconnect: Driver side Temperature Blend Door Actuator C2091 .
- Measure the resistance between HVAC module — EATC C228B-12, circuit CH239 (BU), harness side and HVAC module — EATC C228B-13, circuit CH238 (YE), harness side.

Yes
GO to U14 .



No
REPAIR the circuits.

ACTUATOR FEEDBACK CIRCUIT	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Ignition OFF. • Disconnect: Passenger side Temperature Blend Door Actuator C2092 . • Measure the resistance between HVAC module — C228A-24, circuit LH111 (BN/WH) and HVAC module — EATC C228A-20, circuit VH441 (WH), harness side.  N0148799 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to V12 . **No** REPAIR the circuits.
V12 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR FEEDBACK CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module — EATC C228A-20, circuit VH441 (WH), harness side and passenger side temperature blend door actuator C2092-2, circuit VH441 (WH), harness side.  N0148802 • **Is the resistance less than 3 ohms?**	**Yes** GO to V13 . **No** REPAIR the circuit.
V13 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module — EATC C228A-23, circuit RH111 (GY/BU) and passenger side temperature blend door actuator C2092-3, circuit RH111 (GY/BU), harness side.	**Yes** GO to V14 . **No** REPAIR the circuit.

N0148801

- **Is the resistance less than 3 ohms?**

V14 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR CONNECTION	

• Disconnect and inspect the temperature blend door actuator connector.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Reconnect the temperature blend door actuator connector. Make sure it seats and latches correctly.
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CARRY OUT the Temperature Blend Door Actuator component test in this section. If the actuator tests OK, GO to V15 . When installing an actuator, CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

V15 MODULE ACTUATOR POSITION CALIBRATION	

NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below.
• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Ignition ON.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Select any position except OFF.
• **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

repair4less

takes approximately 30 seconds. • Operate the system and verify the concern is still present. • **Is the concern still present?**	

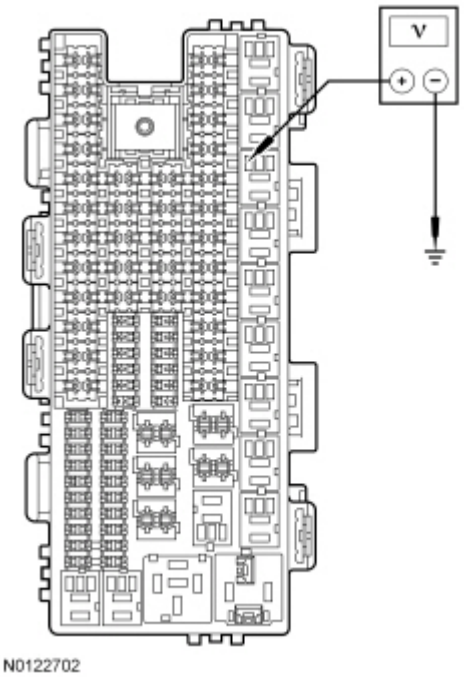
Pinpoint Test W: The Blower Motor Is Inoperative — EMTC Base With 4 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

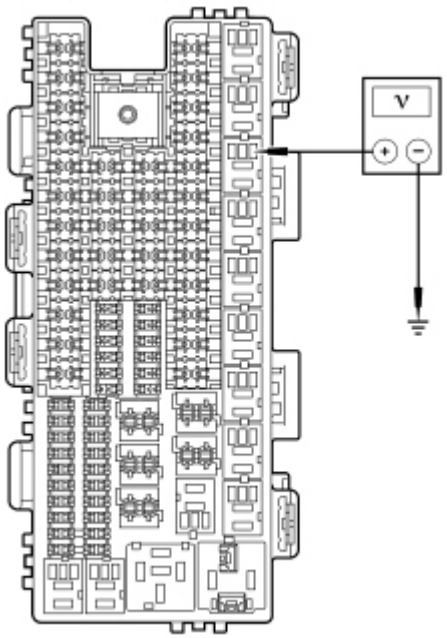
Voltage is supplied to the relay coil and relay switch contacts from BJB . The coil receives ground from the HVAC module if any function selector position but OFF is selected. When the relay coil is grounded by the HVAC module, the relay is energized and voltage is delivered to the blower motor. Ground for the blower motor is provided from the blower resistor or the blower switch (in HI only). The blower resistor and blower switch are grounded.

DTC Fault Trigger Conditions



DTC	Description	Fault Trigger Conditions
B10AF:12	Blower Fan Relay: Circuit Short to Battery	This DTC sets when the HVAC module senses voltage on the relay coil ground circuit when the relay is grounded by the HVAC module, indicating a short directly to voltage.
B10AF:13	Blower Fan Relay: Circuit Open	This CMDTC sets when the HVAC module senses no voltage on the relay coil ground circuit when the relay is not grounded by the HVAC module, indicating an open.

This pinpoint test is intended to diagnose the following:

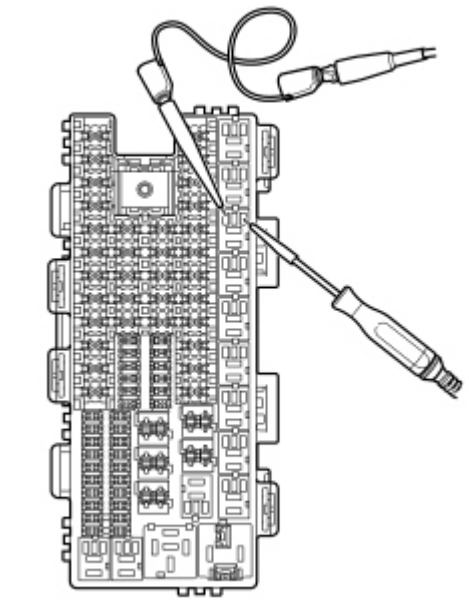


- Battery Junction Box (BJB) fuse 51 (40A) and fuse 52 (5A)
- Wiring, terminals or connectors
- Blower motor
- Blower motor relay
- HVAC module

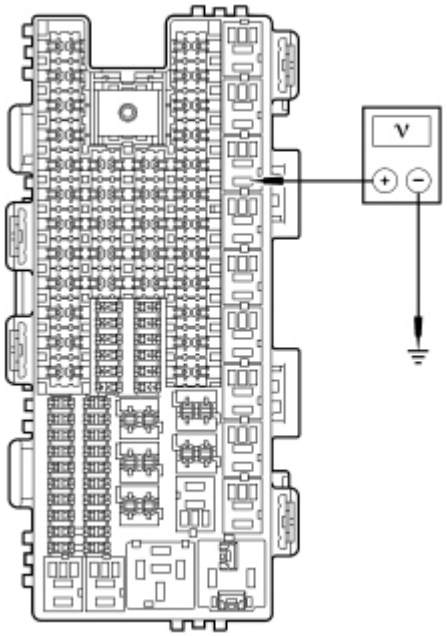
PINPOINT TEST W: THE BLOWER MOTOR IS INOPERATIVE — EMTC BASE WITH 4 BLOWER MOTOR SPEED POSITIONS

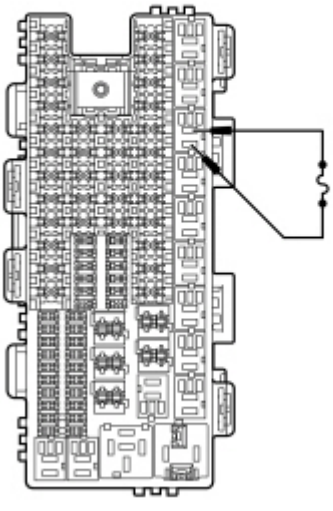
Test Step	Result / Action to Take
W1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For B10AF:12, GO to W2 . For B10AF:13, CARRY OUT the blower motor relay component test.

	Refer to Wiring Diagrams Cell 149 for component testing. If the relay tests OK, GO to W3 . **No** GO to W5 .
W2 CHECK THE BLOWER MOTOR RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: Blower Motor Relay . • Disconnect: HVAC Module — Base EMTC C294A . • Ignition ON. • Measure the voltage between blower motor relay socket pin 2, circuit CH123 (VT/GN) and ground.  N0122702 • **Is any voltage present?**	**Yes** REPAIR the circuit. **No** GO to W11 .
W3 CHECK THE BLOWER MOTOR RELAY COIL SUPPLY VOLTAGE • Ignition OFF. • Disconnect: Blower Motor Relay . • Ignition ON. • Measure the voltage between blower motor relay socket pin 1, circuit CBB52 (GN/WH) and ground.	**Yes** GO to W4 . **No** VERIFY Battery Junction Box (BJB) fuse 52 (5A) is OK. If OK, REPAIR circuit CBB52 (GN/WH) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

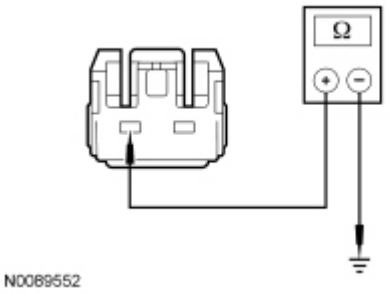


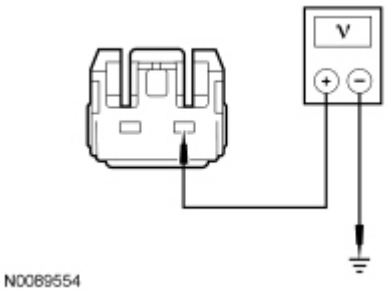
repair4less

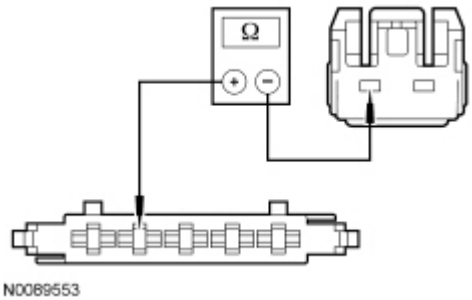




N0096368







- **Is the voltage greater than 11 volts?**

W4 CHECK THE BLOWER MOTOR RELAY COIL SWITCHED GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294A . • Measure the resistance between blower motor relay socket pin 2, circuit CH123 (VT/GN) and HVAC module — EMTC C294A-11, circuit CH123 (VT), harness side.  N0148803 • **Is the resistance less than 3 ohms?**	**Yes** GO to W11 . **No** REPAIR the circuit.
W5 CHECK THE HVAC MODULE BLOWER MOTOR RELAY	

OUTPUT	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Blower Motor Relay . • Ignition ON. • Connect the 12-volt test light between blower motor relay socket pin 1, circuit CBB52 (GN/WH) and socket pin 2, circuit CH123 (VT/GN).  N0095371 • Select PANEL on the HVAC controls. • **Does the test light illuminate?**	**Yes** GO to W6 . **No** GO to W11 .
W6 CHECK THE BLOWER MOTOR RELAY SWITCH CONTACT VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the voltage between blower motor relay socket pin 3, circuit SBB51 (BU/RD) and ground.	**Yes** GO to W7 . **No** VERIFY Battery Junction Box (BJB) fuse 51 (40A) is OK. If OK, REPAIR circuit SBB51 (BU/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

repair4less

 N0096369 • **Is the voltage greater than 11 volts?**	
W7 CHECK THE BLOWER MOTOR RELAY	
• Connect fused jumper lead between blower motor relay socket pin 3, circuit SBB51 (BU/RD) and socket pin 5, circuit CH402 (YE/GN).  N0122704 • **Does the blower motor operate?**	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to W8 .
W8 CHECK FOR GROUND TO THE BLOWER MOTOR	
• Ignition OFF. • Disconnect: Blower Motor C2004 .	**Yes** GO to W9 .

• Turn the blower motor switch to the HI position. • Measure the resistance between blower motor connector C2004-2, circuit CH426 (YE/OG), harness side and ground.  N0089552 • **Is the resistance less than 3 ohms?**	**No** GO to W10 .
W9 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	
• Connect: Blower Motor Relay . • Ignition ON. • Select PANEL on the HVAC controls. • Measure the voltage between blower motor C2004-1, circuit CH402 (YE/GN), harness side and ground.  N0089554 • **Is the voltage greater than 11 volts?**	**Yes** INSTALL a new blower motor. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR the circuit.
W10 CHECK THE BLOWER MOTOR GROUND CIRCUIT FOR AN OPEN	
• Disconnect: HVAC Module — Base EMTC C294B . • Measure the resistance between HVAC module — EMTC C294B-2, circuit CH426 (YE/OG), harness side and blower motor C2004-2, circuit CH426 (YE/OG), harness side.  N0089553 • **Is the resistance less than 3 ohms?**	**Yes** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation. **No** REPAIR circuit CH426 (YE/OG) for an open. TEST the system for normal operation.
W11 CHECK FOR CORRECT HVAC MODULE OPERATION	
• Ignition OFF.	**Yes**

repair4less

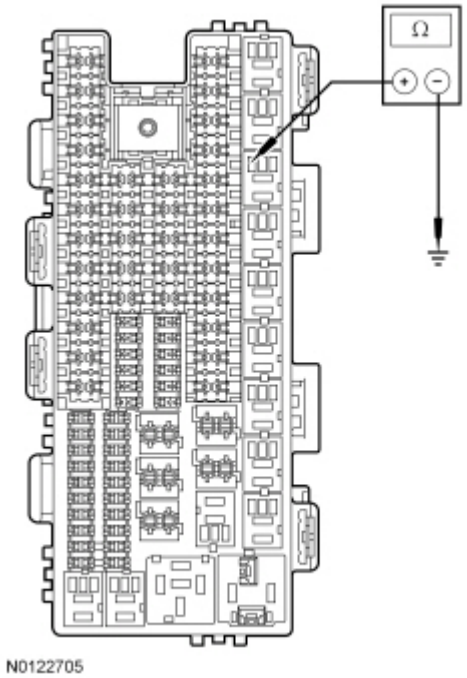
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test X: The Blower Motor Does Not Operate Correctly — EMTC Base With 4 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

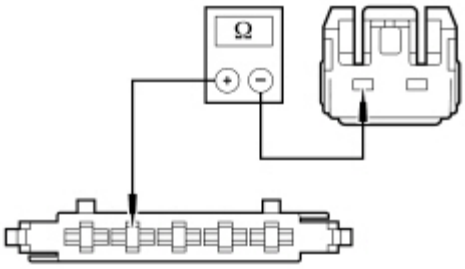
Normal Operation

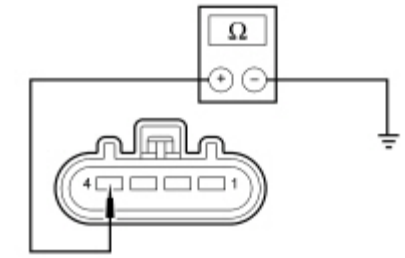
The blower motor is provided a ground through the entire blower resistor in the lowest blower setting. In MED-LO and MED-HI the resistor gets a ground from the blower motor switch. In HI, the blower motor is grounded directly through the blower motor switch. The blower switch is provided a ground.



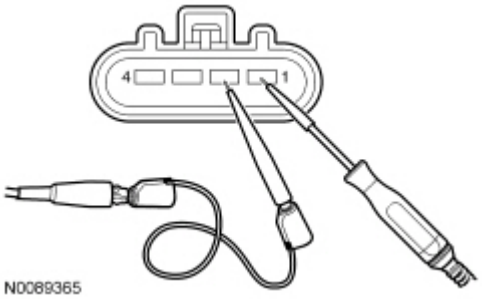
- DTC B10AF:11 (Blower Fan Relay: Circuit Short to Ground) — the module senses no voltage on the relay coil ground circuit when the module is not grounding the circuit for more than 2 seconds.

This pinpoint test is intended to diagnose the following:





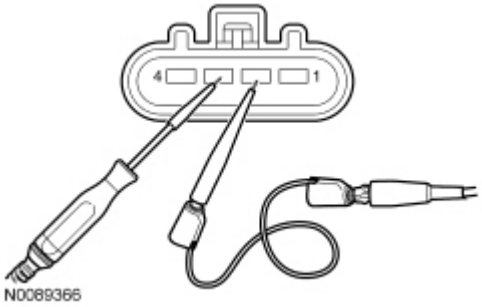
- Wiring, terminals or connectors
- Blower motor resistor
- HVAC module



PINPOINT TEST X: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY — EMTC BASE WITH 4 BLOWER MOTOR SPEED POSITIONS

Test Step	Result / Action to Take
X1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Is DTC B10AF:11 present?**	**Yes** GO to X2 . **No** GO to X3 .
X2 CHECK THE BLOWER MOTOR RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO GROUND	

• Ignition OFF. • Disconnect: Blower Motor Relay . • Disconnect: HVAC Module — Base EMTC C294B . • Measure the resistance between blower motor relay socket pin 2, circuit CH123 (VT/GN) and ground.  N0122705 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X12 . **No** REPAIR the circuit.
X3 CHECK THE BLOWER MOTOR OPERATION	
• Ignition ON. • Select PANEL on the HVAC controls. • Select all blower speed positions. • **Does the blower motor operate in any position?**	**Yes** If the blower motor does not operate in HI setting only, GO to X4 . If the blower motor does not operate in LO setting only, GO to X5 . If the blower motor does not operate in MED-LO or MED-HI setting only, GO to X6 . If the blower motor operates in HI setting only, GO to X8 . If the blower motor operates in LO setting only, GO to X9 . For all other symptoms, GO to X10 . **No** GO to Pinpoint Test W .
X4 CHECK THE BLOWER MOTOR GROUND CIRCUIT FOR AN	

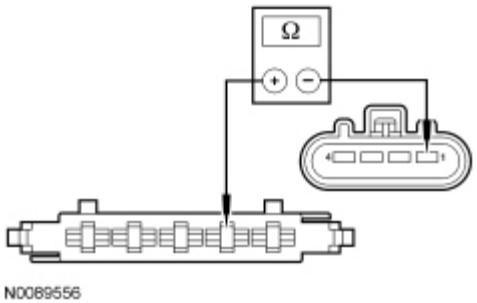


repair4less

OPEN • Ignition OFF. • Disconnect: HVAC Module — Base EMTC C294B . • Disconnect: Blower Motor C2004 . • Measure the resistance between HVAC module — EMTC C294B-2, circuit CH426 (YE/OG), harness side and blower motor C2004-2, circuit CH426 (YE/OG), harness side.  N0089553 • **Is the resistance less than 3 ohms?**	**Yes** GO to X12 . **No** REPAIR the circuit.
X5 CHECK BLOWER MOTOR RESISTOR GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: Blower Motor Resistor C2185 . • Measure the resistance between blower motor resistor C2185-4, circuit GD138 (BK/WH), harness side and ground.  A0035320 • **Is the resistance less than 3 ohms?**	**Yes** INSTALL a new blower motor resistor. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR the circuit.
X6 CHECK THE BLOWER MOTOR SWITCH ***NOTICE:*** **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Blower Motor Resistor C2185 . • Ignition ON. **For MED-LO inoperative**	**Yes** INSTALL a new blower motor resistor. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to X7 .

- For MED-LO inoperative: With the blower motor switch in the MED-LO speed position, connect the 12-volt test light between blower motor resistor C2185-2, circuit CH426 (YE/OG), harness side and blower motor resistor C2185-1, circuit CH428 (GN/WH), harness side.

For MED-HI inoperative

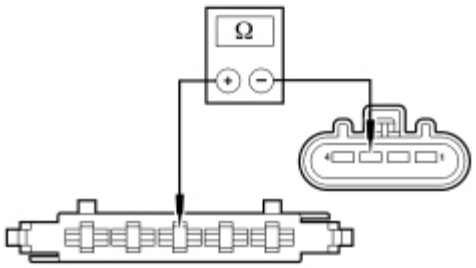


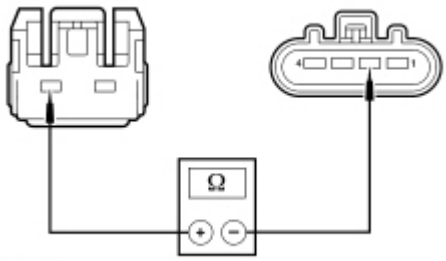
- For MED-HI inoperative: With the blower motor switch in the MED-HI speed position, connect the 12-volt test light between blower motor resistor C2185-2, circuit CH426 (YE/OG), harness side and blower motor resistor C2185-3, circuit CH429 (GY/BN), harness side.
- **Does the test light illuminate?**

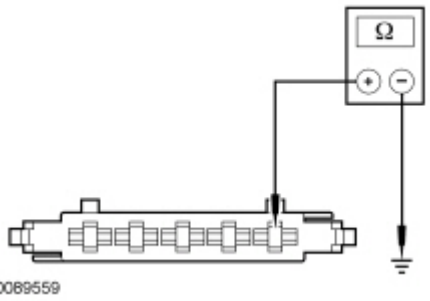
X7 CHECK THE BLOWER MOTOR SWITCH TO BLOWER MOTOR RESISTOR CIRCUITS FOR AN OPEN

- Ignition OFF.
- Disconnect: HVAC Module — Base EMTC C294B .

For MED-LO inoperative



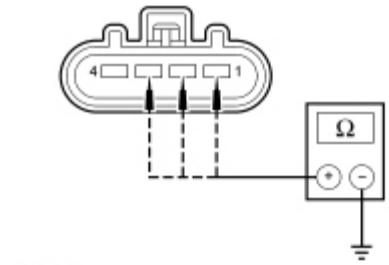




- For MED-LO inoperative, measure the resistance between HVAC module — EMTC C294B-4, circuit CH428 (GN/WH), harness side and blower motor resistor C2185-1, circuit CH428

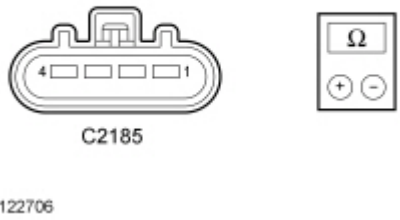
Yes
GO to X12 .

No
REPAIR the circuit in question.



repair4less

(GN/WH), harness side. **For MED-HI inoperative**  N0089557 • For MED-HI inoperative, measure the resistance between HVAC module — EMTC C294B-3, circuit CH429 (GY/BN), harness side and blower motor resistor C2185-3, circuit CH429 (GY/BN), harness side. • **Is the resistance less than 3 ohms?**	
X8 CHECK THE BLOWER MOTOR GROUND CIRCUIT TO THE BLOWER MOTOR RESISTOR FOR AN OPEN • Ignition OFF. • Disconnect: Blower Motor Resistor C2185 . • Disconnect: Blower Motor C2004 . • Measure the resistance between blower motor resister C2185-2, circuit CH426 (YE/OG), harness side and blower motor C2004-2, circuit CH426 (YE/OG), harness side.  N0089558 • **Is the resistance less than 3 ohms?**	**Yes** INSTALL a new blower motor resistor. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR the circuit.
X9 CHECK THE BLOWER MOTOR SWITCH GROUND CIRCUIT FOR AN OPEN • Disconnect: HVAC Module — Base EMTC C294B . • Measure the resistance between HVAC module — EMTC C294B-5, circuit GD138 (BK/WH), harness side and ground.	**Yes** GO to X12 . **No** REPAIR the circuit.



- **Is the resistance less than 3 ohms?**

X10 CHECK THE BLOWER MOTOR RESISTOR CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Disconnect: Blower Motor C2004 .
• Disconnect: Blower Motor Resistor C2185 .
• Disconnect: HVAC Module — Base EMTC C294B .
• Measure the resistance between ground and blower motor resistor:
  ▪ C2185-1, circuit CH428 (GN/WH), harness side.
  ▪ C2185-2, circuit CH426 (YE/OG), harness side.
  ▪ C2185-3, circuit CH429 (GY/BN), harness side.

 	
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to X11 .
	
	No
	REPAIR the circuit in question.

X11 CHECK THE BLOWER MOTOR RESISTOR CIRCUITS FOR SHORTS TOGETHER	
• Measure the resistance between blower motor resistor C2185, harness side using the following chart: **Blower Motor Resistor** / **Circuit** / **Blower Motor Resistor** / **Circuit** C2185-1 / CH428 (GN/WH) / C2185-2 / CH426 (YE/OG) C2185-1 / CH428 (GN/WH) / C2185-3 / CH429 (GY/BN) C2185-2 / CH426 (YE/OG) / C2185-3 / CH429 (GY/BN)	**Yes** CARRY OUT the Blower Motor Resistor component test in this section. If the resistor tests OK, GO to X12 . **No** REPAIR the circuit in question.

repair4less

 • **Are the resistances greater than 10,000 ohms?**	
X12 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test Y: The Blower Motor is Inoperative — EATC Dual Zone and EMTC With 4.2 Inch Display System With 7 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Automatic Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

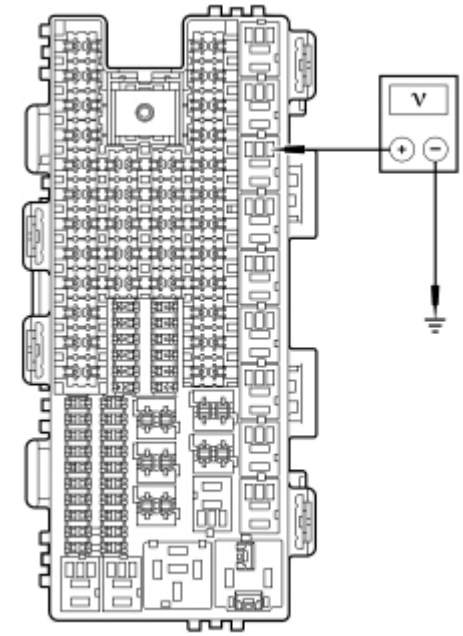
Normal Operation

Voltage is supplied to the relay coil and relay switch contacts from BJB . When the blower motor relay coil receives a ground from the HVAC module, the relay coil is energized and voltage is delivered to the blower motor and the blower motor speed control from the relay. Ground for the motor is provided from the blower motor speed control. Ground is provided for the blower control module. The HVAC module sends a Pulse Width Modulated (PWM) signal to the blower motor speed control to control the blower speed.

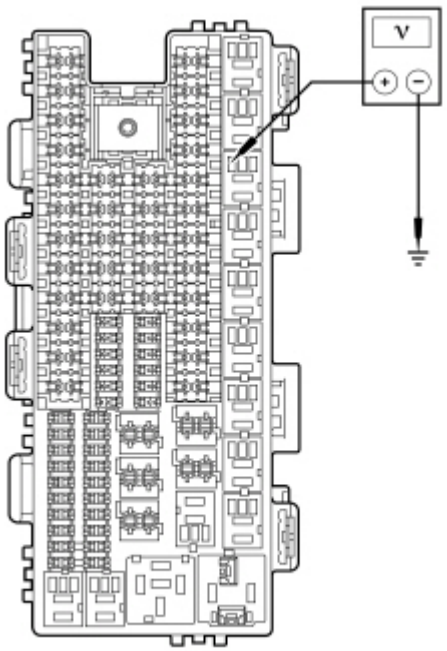
DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions

B10AF:12	Blower Fan Relay: Circuit Short to Battery	This DTC sets when the HVAC module senses voltage on the relay coil ground circuit when the relay is grounded by the HVAC module, indicating a short directly to voltage.
B10AF:13	Blower Fan Relay: Circuit Open	This DTC sets when the HVAC module senses no voltage on the relay coil ground circuit when the relay is not grounded by the HVAC module, indicating an open.
B10B9:14	Blower Control: Circuit Short to Ground or Open	This DTC sets when the HVAC module senses no voltage on the blower motor control target speed signal circuit, indicating an open or a short directly to ground.



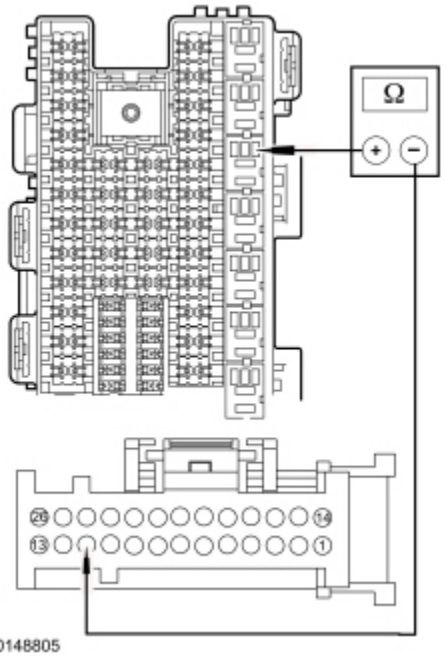
This pinpoint test is intended to diagnose the following:



- Battery Junction Box (BJB) fuse 51 (40A) and fuse 52 (5A)
- Wiring, terminals or connectors
- Blower motor relay
- Blower motor speed control
- HVAC module
- Blower motor

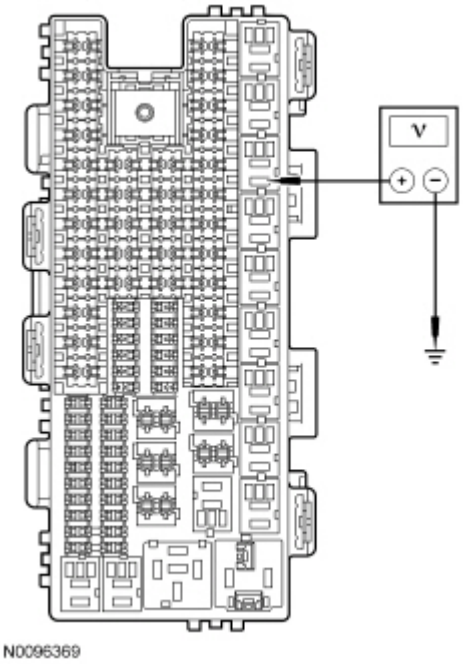
PINPOINT TEST Y: THE BLOWER MOTOR IS INOPERATIVE — EATC DUAL ZONE AND EMTC WITH 4.2 INCH DISPLAY SYSTEM WITH 7 BLOWER MOTOR SPEED POSITIONS

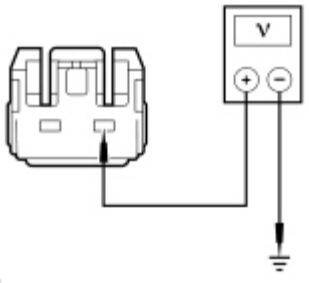
Test Step	Result / Action to Take
Y1 CHECK THE BLOWER MOTOR RELAY FUNCTIONALITY	
• Ignition OFF. • Install a known good blower motor relay. • Ignition ON. • Operate the system and verify the concern is still present. • **Does the blower motor function correctly?**	**Yes** INSTALL a new blower motor relay. **No** GO to Y2.
Y2 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B10AF:12 and B10AF:13, GO to Y3. For DTC B10B9:14, GO to Y6. **No** GO to Y6.
Y3 CHECK THE BLOWER MOTOR RELAY COIL SUPPLY VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay . • Ignition ON. • Measure the voltage between ground and BJB blower motor relay socket, pin 1, circuit CBB52 (GN/WH).	**Yes** GO to Y4. **No** VERIFY Battery Junction Box (BJB) fuse 52 (5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit

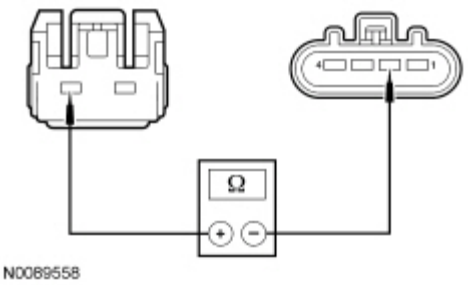


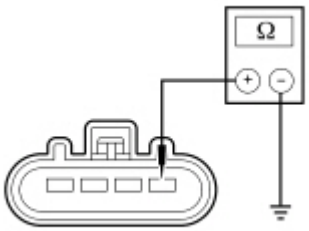
repair4less

 N0096368 • **Is the voltage greater than 11 volts?**	short.
Y4 CHECK THE BLOWER MOTOR RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Ignition ON. • Measure the voltage between ground and BJB blower motor relay socket, pin 2, circuit CH123 (VY/GN).	**Yes** REPAIR the circuit. CLEAR the DTCs. RETEST the system. If the blower motor is still inoperative, GO to Y6 . **No** GO to Y5 .



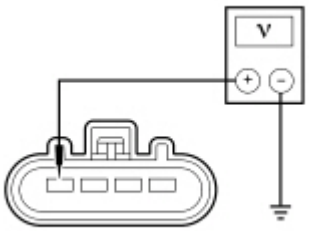


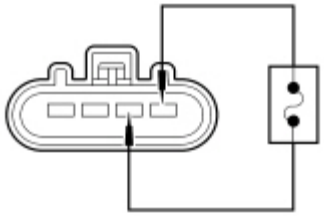


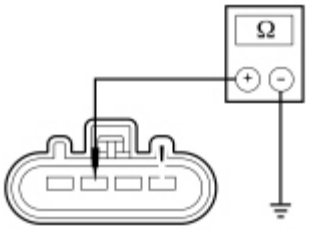


N0122702

- **Is any voltage present?**







Y5 CHECK THE BLOWER MOTOR RELAY COIL SWITCHED GROUND CIRCUIT FOR AN OPEN	
 N0148805 • Ignition OFF. • Measure resistance between BJB blower motor relay socket pin 2, circuit CH123 (VT/GN) and: ▪ HVAC module — EATC C228A-11, circuit CH123 (VT/GN), harness side. ▪ HVAC module — EMTC C2357A-11, circuit CH123 (VT/GN), harness side. • **Is the resistance less than 3 ohms?**	**Yes** GO to Y14 . **No** REPAIR the circuit. CLEAR the DTCs. RETEST the system. If the blower motor is still inoperative, GO to Y6 .
Y6 CHECK THE BLOWER MOTOR RELAY SWITCH	

repair4less

SUPPLY VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay . • Ignition ON. • Measure the voltage between ground and BJB blower motor relay socket, pin 3, circuit SBB51 (/BU/RD).  N0096369 • **Is the voltage greater than 11 volts?**	**Yes** GO to Y7 . **No** VERIFY BJB fuse 51 (40A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
Y7 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	
• Ignition OFF. • Connect: Blower Motor Relay . • Disconnect: Blower Motor C2004 . • Ignition ON. • Select PANEL on the HVAC controls. • Measure the voltage between blower motor C2004-1, circuit CH402 (YE/GN), harness side and ground.  N0089554 • **Is the voltage greater than 11 volts?**	**Yes** GO to Y8 . **No** REPAIR the circuit.
Y8 CHECK THE GROUND CIRCUIT BETWEEN THE BLOWER MOTOR AND BLOWER MOTOR SPEED CONTROL FOR AN OPEN	
• Ignition OFF.	**Yes**

• Disconnect: Blower Motor Speed Control C271 . • Measure the resistance between blower motor C2004-2, circuit VH301 (YE/BU), harness side and blower motor speed control C271-2, circuit VH301 (YE/BU), harness side.  N0089558 • **Is the resistance less than 3 ohms?**	GO to Y9 . **No** REPAIR the circuit.
Y9 CHECK THE BLOWER MOTOR SPEED CONTROL GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between blower motor speed control C271-1, circuit GD138 (BK/WH), harness side and ground.  N0001799 • **Is the resistance less than 3 ohms?**	**Yes** GO to Y10 . **No** REPAIR the circuit.
Y10 CHECK FOR VOLTAGE TO THE BLOWER MOTOR SPEED CONTROL	
• Connect: HVAC Module — EATC C228A . • Connect: HVAC Module — Remote Mount EMTC C2357A . • Ignition ON. • Select PANEL on the HVAC controls. • Measure the voltage between blower motor speed control C271-4, circuit CH402 (YE/GN), harness side and ground.	**Yes** GO to Y11 . **No** REPAIR the circuit.

repair4less

 N0001798 • **Is the voltage greater than 11 volts?**	
Y11 CHECK THE BLOWER MOTOR	**Yes** GO to Y12 . **No** INSTALL a new blower motor. REFER to Section 412-01 . TEST the system for normal operation.
• Ignition OFF. • Connect: Blower Motor C2004 . • Connect a fused jumper lead between blower motor speed control C271-2, circuit VH301 (YE/BU), harness side and C271-1, circuit GD138 (BK/WH), harness side.  N0001800 • Ignition ON. • Select PANEL on the HVAC controls. • **Does the blower motor operate?**	
Y12 CHECK THE BLOWER MOTOR SPEED CONTROL PULSE WIDTH CIRCUIT FOR A SHORT TO GROUND	**Yes** GO to Y13 . **No** REPAIR the circuit.
• Ignition OFF. • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Measure the resistance between blower motor speed control C271-3, circuit VH101 (WH/VT), harness side and ground.  N0148253 • **Is the resistance greater than 10,000 ohms?**	

Y13 CHECK THE BLOWER MOTOR SPEED CONTROL CONNECTION	

• Disconnect and inspect the blower motor speed control connector.
  ▪ Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect the blower motor speed control connector. Make sure it seats and latches correctly.
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new blower motor speed control. REFER to Section 412-01 .
	
	RETEST the system. If concern Is still present, GO to Y14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Y14 CHECK THE HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Clear the DTCs.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test Z: The Blower Motor Does Not Operate Correctly — EATC Dual Zone and EMTC With 4.2 Inch Display System With 7 Blower Motor Speed Positions

Refer to Wiring Diagrams Cell 54 , Automatic Climate Control System for schematic and connector information.

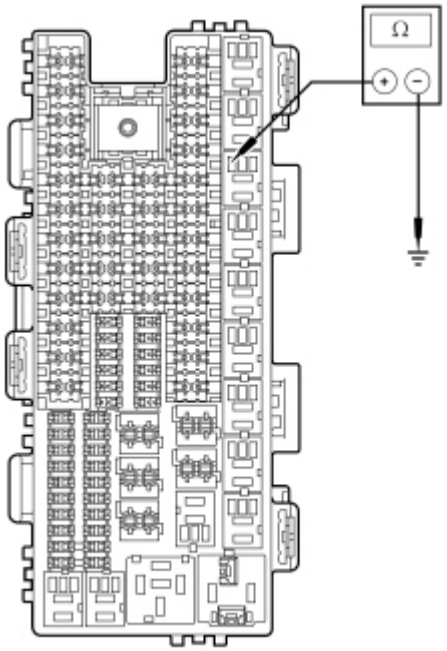
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

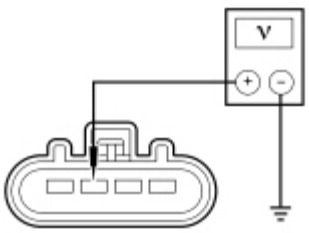
Normal Operation

Voltage is supplied to the relay coil from Battery Junction Box (BJB) fuse 52 (5A) and relay switch contacts from BJB fuse 51 (40A). When the blower motor relay coil receives a ground from the HVAC module, the relay coil is energized and voltage is delivered to the blower motor and the blower motor speed control from the relay. Ground for the motor is provided from the blower motor speed control. Ground is provided for the blower control module. The HVAC module sends a Pulse Width Modulated (PWM) signal to the blower motor speed control to control the blower speed.

repair4less

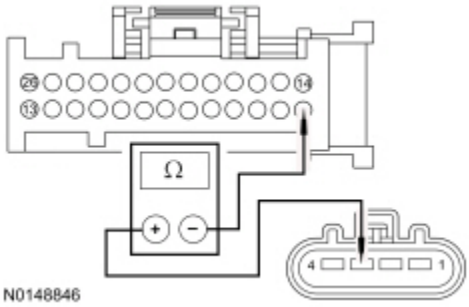
DTC Fault Trigger Conditions



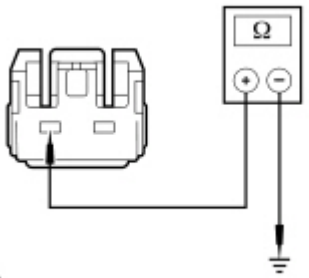


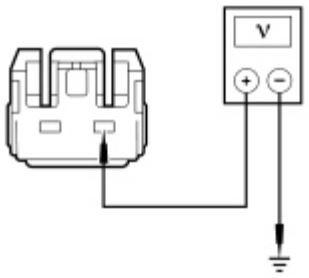
DTC	Description	Fault Trigger Conditions
B10AF:11	Blower Fan Relay: Circuit Short to Battery	This DTC sets when the HVAC module senses no voltage on the relay coil ground circuit when the HVAC module is not grounding the circuit, indicating a short directly to voltage.
B10B9:12	Blower Control: Circuit Short to Battery	This DTC sets when the HVAC module senses excessive voltage on the blower motor control PWM circuit for more than 1 second, indicating a short to voltage.
B10B9:14	Blower Control: Circuit Short to Ground or Open	This DTC sets when the HVAC module senses no voltage on the blower motor control blower motor control PWM circuit for more than 1 second, indicating an open or a short directly to ground.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Blower motor speed control
- HVAC module
- Front Controls Interface Module (FCIM)





PINPOINT TEST Z: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY — EATC DUAL ZONE AND EMTC WITH 4.2 INCH DISPLAY SYSTEM WITH 7 BLOWER MOTOR SPEED POSITIONS

Test Step	Result / Action to Take
Z1 CHECK THE HVAC MODULE FOR DTCs • Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** For DTC B10AF:11, GO to Z2 . For DTC B10B9:12, GO to Z3 . For DTC B10B9:14, GO to Z4 . **No** GO to Z5 .
Z2 CHECK THE BLOWER MOTOR RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: Blower Motor Relay . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Ignition ON. • Measure the voltage between blower motor relay socket pin 2, circuit CH123 (VT/GN) and ground.	**Yes** GO to Z11 . **No** REPAIR the circuit.

 N0122705 • **Is the resistance greater than 10,000 ohms?**	
Z3 CHECK THE BLOWER MOTOR CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Speed Control C271 . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — Remote Mount EMTC C2357A . • Ignition ON. • Measure the voltage between blower motor speed control C271-3, circuit VH101 (WH/VT), harness side and ground.  N0001804 • **Is any voltage present?**	**Yes** REPAIR the circuit. **No** GO to Z10 .
Z4 CHECK THE BLOWER MOTOR CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor Speed Control C271 . • Disconnect: HVAC Module — EATC C228A . • Disconnect: HVAC Module — Remote Mount EMTC	**Yes** GO to Z10 . **No** REPAIR the circuit.

repair4less

 C2357A . • Measure the resistance between HVAC module — EATC C228A-1, circuit VH101 (WH/VT), harness side and blower motor speed control C271-3, circuit VH101 (WH/VT), harness side. • **Is the resistance less than 3 ohms?**	
Z5 CHECK THE BLOWER MOTOR OPERATION USING THE BLOWER MOTOR SPEED (BLOWRSPD) ACTIVE COMMAND	
• Enter the following diagnostic mode on the scan tool: HVAC Module DataLogger . • Select PANEL mode on the HVAC controls. • Select the lowest blower motor setting. • Observe blower motor speed while using the scan tool to operate the HVAC module active command BLOWRSPD, increasing and decreasing the percentage value. • **Does the blower motor speed change between low and high when the active command is changed?**	**Yes** INSTALL a new FCIM . REFER to Refer to the appropriate section in Group 415 for the procedure.. TEST the system for normal operation. **No** GO to Z6 .
Z6 VERIFY THE BLOWER MOTOR OPERATION	
• Select PANEL on the HVAC controls. Adjust the blower motor setting to LO and then to HI then press the POWER button on the HVAC module (OFF). • **Does the blower motor operate at any setting and/or turn OFF?**	**Yes** If the blower motor operates always in HI, GO to Z7 . If the blower motor is always ON, GO to Z8 . All other symptoms, INSTALL a new blower motor speed control. REFER to Section 412-01 . TEST the system for normal operation. If the blower motor still does not operate correctly, GO to Z11 . **No** GO to Pinpoint Test Y .
Z7 CHECK THE BLOWER MOTOR PWM GROUND CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Blower Motor Speed Control C271 . • Disconnect: Blower Motor C2004 . • Measure the resistance between blower motor connector C2004-2, circuit VH301 (YE/BU), harness side and ground.	**Yes** GO to Z10 . **No** REPAIR the circuit.

 N0089552 • **Is the resistance greater than 10,000 ohms?**	
Z8 CHECK THE BLOWER MOTOR RELAY • Ignition OFF. • Disconnect: Blower Motor Relay . • Turn OFF the HVAC system. • **Does the blower motor operate?**	**Yes** GO to Z9 . **No** INSTALL a new blower motor relay. TEST the system for normal operation.
Z9 CHECK THE BLOWER MOTOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: Blower Motor C2004 . • Disconnect: Blower Motor Speed Control C271 . • Ignition ON. • Measure the voltage between blower motor C2004-1, circuit CH402 (YE/GN), harness side and ground.  N0089554 • **Is any voltage present?**	**Yes** REPAIR the circuit. **No** GO to Z10 .
Z10 CHECK THE BLOWER MOTOR SPEED CONTROL CONNECTION • Disconnect and inspect the blower motor speed control connector. • Repair: ▪ corrosion (install new connector or terminals - clean module pins) ▪ damaged or bent pins - install new terminals/pins ▪ pushed-out pins - install new pins as necessary • Connect the blower motor speed control connector. Make sure it seats and latches correctly. • Clear the DTCs. • Enter the following diagnostic mode on the scan tool: Self-Test — HVAC Module . • Operate the system and verify the concern is still	**Yes** INSTALL a new blower motor speed control. REFER to Section 412-01 . TEST the system for normal operation. If the blower motor is still inoperative, GO to Z11 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

repair4less

present. • **Is the concern still present?**	
Z11 CHECK FOR CORRECT HVAC MODULE OPERATION	

• Ignition OFF.
• Disconnect and inspect all HVAC module connectors.
• Repair:
  ▪ corrosion (install new connector or terminals - clean module pins)
  ▪ damaged or bent pins - install new terminals/pins
  ▪ pushed-out pins - install new pins as necessary
• Connect all HVAC module connectors. Make sure they seat and latch correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs . If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSB addresses this concern, INSTALL a new HVAC module. REFER to Section 412-01 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test AA: DTC U0140:00

Normal Operation

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub-Type Information) — sets in continuous memory in the HVAC module if data messages received from the Body Control Module (BCM) over the Medium Speed Controller Area Network (MS-CAN) are missing for 3 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- BCM
- HVAC module

PINPOINT TEST AA: DTC U0140:00

Test Step	Result / Action to Take
AA1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AA2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AA2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the BCM pass the network test?**	**Yes** GO to AA3 . **No** REFER to Section 418-00 .

AA3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded DTCs from the BCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** Section 419-10 . **No** GO to AA4 .
AA4 RETRIEVE THE RECORDED DTCs FROM THE HVAC MODULE SELF-TEST	
• Check for recorded DTCs from the HVAC module self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test H . **No** GO to AA5 .
AA5 RECHECK THE HVAC MODULE DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the HVAC module self-test. • **Is DTC U0140:00 still present?**	**Yes** GO to AA6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AA6 CHECK FOR DTC U0140:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140:00 set in the Driver Seat Module (DSM)?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.

Pinpoint Test AB: DTC U0163:00

Normal Operation

- DTC U0163:00 (Lost Communication With navigation Control Module: No Sub-Type Information) — sets in continuous memory in the HVAC module if data messages received from the Accessory Protocol Interface Module (APIM) over the Medium Speed Controller Area Network (MS-CAN) are missing for 3 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- APIM
- HVAC module

PINPOINT TEST AB: DTC U0163:00

repair4less

Test Step	Result / Action to Take
AB1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AB2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AB2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the APIM pass the network test?**	**Yes** GO to AB3 . **No** REFER to Section 418-00 .
AB3 RETRIEVE THE RECORDED DTCs FROM THE APIM SELF-TEST • Check for recorded DTCs from the APIM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** Refer to the appropriate section in Group 415 for the procedure.. **No** GO to AB4 .
AB4 RETRIEVE THE RECORDED DTCs FROM THE HVAC MODULE SELF-TEST • Check for recorded DTCs from the HVAC module self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test H . **No** GO to AB5 .
AB5 RECHECK THE HVAC MODULE DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the HVAC module self-test. • **Is DTC U0163:00 still present?**	**Yes** INSTALL a new APIM . Refer to the appropriate section in Group 415 for the procedure.. CLEAR the DTCs. REPEAT the HVAC module self-test. If HVAC DTC U0163:00 returns, INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AC: DTC U0256:00

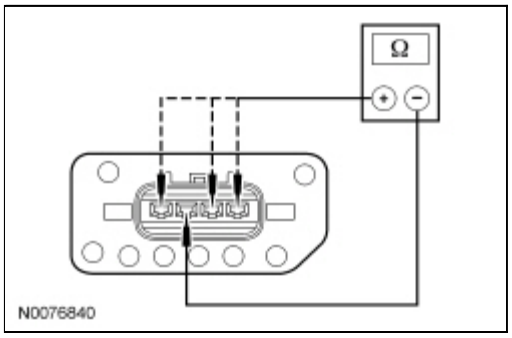
Normal Operation

- DTC U0256:00 (Lost Communication With FCIM "A") — sets in continuous memory in the HVAC module if data messages received from the FCIM over the MS-CAN are missing for 3 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- FCIM
- HVAC module

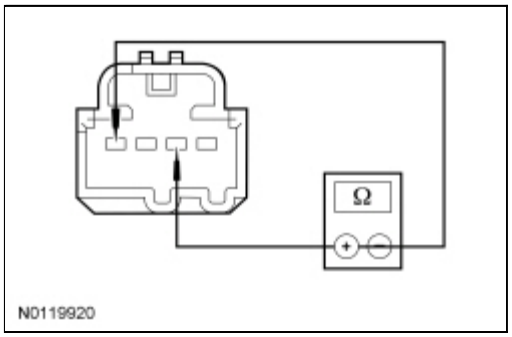
PINPOINT TEST AC: DTC U0256:00



Test Step	Result / Action to Take
AC1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AC2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AC2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the FCIM pass the network test?**	**Yes** GO to AC3 . **No** REFER to Section 418-00 .
AC3 RETRIEVE THE RECORDED DTCs FROM THE FCIM SELF-TEST • Check for recorded DTCs from the FCIM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** Refer to the appropriate section in Group 415 for the procedure.. **No** GO to AC4 .
AC4 RETRIEVE THE RECORDED DTCs FROM THE HVAC MODULE SELF-TEST • Check for recorded DTCs from the HVAC module self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test H . **No** GO to AC5 .
AC5 RECHECK THE HVAC MODULE DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the PMI or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the HVAC module self-test. • **Is DTC U0256:00 still present?**	**Yes** GO to AC6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AC6 CHECK FOR DTC U0256:00 SET IN OTHER MODULES	

repair4less

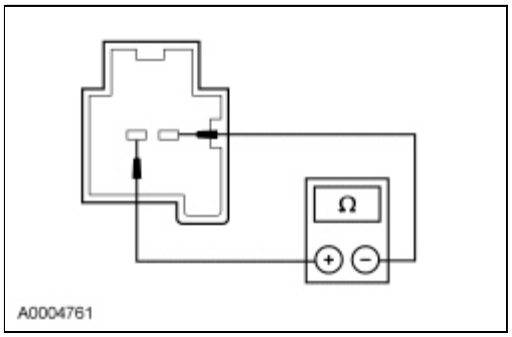
• Clear all DTCs. • Ignition OFF. • Wait 10 seconds. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0256:00 set in the APIM ?**	**Yes** INSTALL a new FCIM . Refer to the appropriate section in Group 415 for the procedure.. **No** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.



Component Tests

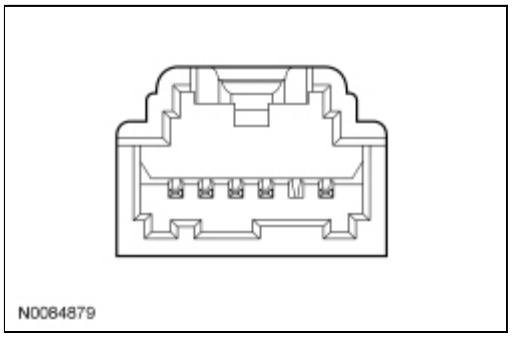
Blower Motor Resistor

Blower Motor Resistor Pins	Resistance (Ohms)
4 and 2	2.0-2.6
2 and 3	0.2-0.4
2 and 1	0.8-1.1



Temperature Sensor — In-Vehicle

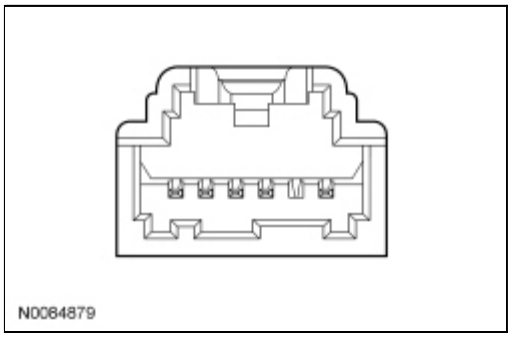
Ambient Temperature	Resistance (Ohms)
0-10°C (32-50°F)	57,950-97,640
10-20°C (50-68°F)	36,880-59,920
20-25°C (68-77°F)	29,700-37,790



25-30°C (77-86°F)	23,960-30,300
30-35°C (86-95°F)	19,440-24,550
35-40°C (95-104°F)	15,860-20,000
40-50°C (104-122°F)	10,740-16,390

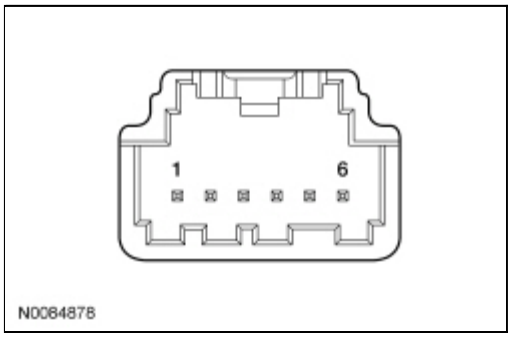
Temperature Sensor — Evaporator Discharge

Ambient Temperature	Resistance (Ohms)
-40°C (-40°F)	1,005,00-1,104,000
-20°C (-4°F)	287,811-307,800
0°C (32°F)	96,890-101,300
20°C (68°F)	37,080-38,000
25°C (77°F)	29,700-30,300
30°C (86°F)	23,840-24,430
35°C (95°F)	19,260-19,820
40°C (104°F)	15,660-16,180
60°C (140°F)	7,239-7,594
100°C (212°F)	1,943-2,091



Air Inlet Mode Door Actuator

repair4less



Actuator Pins	Approx. Resistance (Ohms)
2 and 3	2,775-4,625
2 and 4	187-4,313
3 and 4	187-4,313
1 and 6	43-53

Defrost/Panel/Floor Door Actuator

Actuator Pins	Approx. Resistance (Ohms)
2 and 3	2,775-4,625
2 and 4	187-4,313
3 and 4	187-4,313
1 and 6	43-53

Temperature Blend Door Actuator

Actuator Pins	Approx. Resistance (Ohms)
1 and 3	2,850-4,750
1 and 2	113-4,563
2 and 3	113-4,563
5 and 6	32-44

Heater Core

1. **NOTE:** If a heater core leak is suspected, the heater core must be tested by following the Plugged Heater Core Component Test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

   Inspect for evidence of coolant leakage at the heater hose to heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

2. **NOTE:** Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the heater hose connection and damage the heater core.

   Check the integrity of the heater hose clamps.

Heater Core — Plugged

1. Check to see that the engine coolant is at the correct level.

2. Start the engine and turn on the heater.

3. When the engine coolant reaches operating temperature, using a suitable temperature measuring device, check the core inlet and outlet hoses to see if they are hot.

4. If the outlet only is not hot:
   - the heater core may have an air pocket.
   - the heater core may be plugged.

5. If the inlet only is not hot:
   - the thermostat may not be working correctly.

Heater Core — Pressure Test

 **WARNING: Before disconnecting any heater water hoses, shut OFF the engine and wait until engine is fully cool. Failure to comply with this warning may result in serious injury or burns from hot liquid escaping from the engine cooling system.**

Use the Pressure Test Kit to carry out the pressure test.

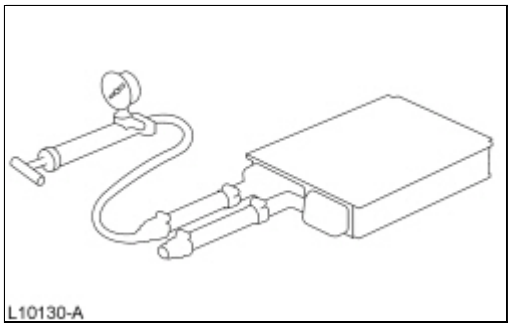
1. **NOTE:** Due to space limitations, a bench test may be necessary for pressure testing.

   Drain the coolant from the cooling system.

2. Disconnect the heater hoses from the heater core.

3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube.

repair4less



4. Fill the heater core and heater hoses with water and install the plug BT-7422-B and the adapter BT-7422-A from the Pressure Test Kit. Secure the heater hoses, plug and adapter with hose clamps.

5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter.
6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core.
7. Observe the pressure gauge for a minimum of 3 minutes.
8. If the pressure drops, check the heater hose connections to the core tubes for leaks. If the heater hoses do not leak, remove the heater core from the vehicle and carry out the bench test.

Heater Core — Bench Test

1. Remove the heater core from the vehicle.
2. Drain all of the coolant from the heater core.
3. Connect the 101 mm (4 in) test heater hoses with plug and adapter to the core tubes. Then connect the Pressure Test Kit to the adapter.
4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water.
5. If a leak is observed, install a new heater core.

Evaporator/Condenser Core — On-Vehicle Leak Test

1. Discharge and recover the refrigerant. Refer to Air Conditioning (A/C) System Recovery, Evacuation

and Charging in this section.

2. Disconnect the suspect evaporator core or condenser core from the A/C system.

3. Clean the manifold fittings.

4. Connect the appropriate test fittings from the A/C Flush Adapter Kit to the condenser or evaporator core tube connections.

5. **NOTE:** The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter that will activate the valve. The test is not valid if the shut-off valve does not open.

   Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the evaporator core or condenser core. Connect the yellow hose to a known good vacuum pump.

6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low-pressure gauge indicates 101 kPa (30 in-Hg). The 45-minute evacuation is necessary to remove any refrigerant from oil left in the evaporator core or condenser core. If the refrigerant is not completely removed from the oil, outgassing will degrade the vacuum and appear as a refrigerant leak.

7. If the low-pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before installing a new evaporator core or condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low-pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
   - If the low-pressure gauge reading rises 34 or more kPa (10 or more in-Hg) of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
   - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
   - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the evaporator core or condenser core. Then recheck for loss of vacuum.
   - If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check for vacuum loss.

9. If the evaporator core or condenser core does leak, as verified by the above procedure, install a new evaporator core or condenser core.

A/C Compressor — External Leak Test

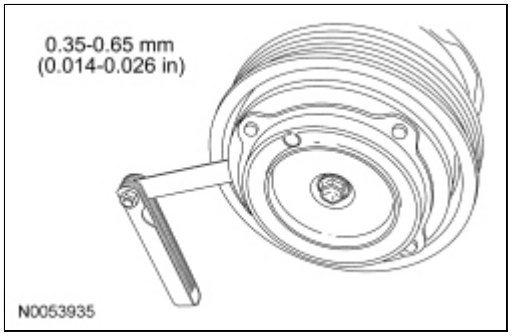
1. Install the appropriate adapter from the A/C Flush Adapter Kit on the port of the A/C compressor, using the existing manifold retaining bolt.

2. Connect the high- and low-pressure lines of a manifold gauge set or a refrigerant recovery/recycling station to the corresponding fittings on the adapter.

3. Attach the center hose of a manifold gauge set to a refrigerant container standing in an upright position.

repair4less

4. Open the low-pressure gauge valve, the high-pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.



5. Using the Refrigerant Leak Detector, check for leaks at the compressor shaft.

6. If a shaft seal leak is found, install a new compressor shaft seal. If an external leak is found, install a new A/C compressor.

7. When the leak test is complete, recover the refrigerant from the compressor.

Air Conditioning (A/C) Clutch Air Gap Adjustment

1. Check the A/C clutch air gap at 3 equally spaced places between the clutch plate and the A/C clutch pulley.

2. Remove the clutch plate. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification.

repair4less

Air Conditioning (A/C) Odor Treatment

Special Tool(s)

 ST2940-A	Flexible Applicator Tool 258-62644

Material

Item	Specification
Motorcraft® A/C Cooling Coil Coating YN-29	—

WARNING: Carry out this procedure in a well-ventilated area with all vehicle windows and doors opened. Carefully read cautionary information on product label. For emergency medical information, seek medical advice. On Ford/Motorcraft products in the USA or Canada call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS), if available. Failure to follow these instructions may result in serious personal injury.

NOTE: There are typically 4 types of objectionable odors found in a vehicle:

- Chemical odors
- Environmental odors
- Human and other interior-generated odors
- Microbiological odors

Before determining that A/C odor treatment is required, the source and the circumstances under which the odor occurs must be determined.

NOTE: Chemical odors are usually constant regardless of the climate control system setting although they may be enhanced by A/C operation. Most chemical odors are caused by fluid leaks or incorrectly cured adhesives. Chemical odors can be eliminated by repairing the leaking component and removing any residue.

NOTE: Environmental odors usually occur for a short time and diminish after the vehicle passes through the affected area. These odors are typically only detected when the vehicle windows are open, or when the climate control system is operating in a mode that allows for fresh air. Environmental odors cannot be eliminated because they are external in source, but they may be minimized by switching to a climate control setting that uses recirculated air.

NOTE: Human and other interior-generated odors occur while the source is present and may linger for a short time after. These odors may be more noticeable during A/C operation. Human odors may be

eliminated by removing the source and cleaning the affected area.

NOTE: Microbiological odors, if in the A/C system, usually last for about 30 seconds after the system is turned on. They will be detected while the A/C is turned on and using either outside or recirculated air. Microbiological odors that occur in areas other than the A/C system (for example, water in doors or wet carpeting) may last indefinitely and will be more intense when recirculated air is used. Microbiological odors will not be present at temperatures at or below 10°C (50°F).

Microbiological odors can be eliminated by removing the source and treating the affected area. Standing water must be allowed to drain and dry out. A/C systems may be treated by using Motorcraft® A/C Cooling Coil Coating as described in the service procedure below.

Microbiological odors result from microbial growth supported by warm temperatures and moisture. Microbiological odors are described as musty/mildew type smells and may occur on/in:

- foam seals
- rubber seals
- adhesives
- standing water
- water soaked carpet/trim

1. Identify the type of odor present in the vehicle. Do not proceed with A/C odor treatment if the odor source is found to be outside of the A/C system. Refer to the following chart for examples.

Odor Source	Odor Description
Chemical Odors	
Coolant	Sweet smell
Fuel	Gasoline or diesel fuel smell
Oil	Oil type or burning smell
Power Steering Fluid	Oil type or burning smell
Transmission Fluid	Oil type or burning smell
Washer Fluid	Alcohol type smell
Gear Lube	Garlic/sulfur smell
Refrigerant Oil	Ether type smell
Carpet/trim Adhesives	Fishy, urine or sweet smell
Evaporator Core Coating	Wet cement type smell
Environmental Odors	
Exhaust	Exhaust, fuel or burning type smell
Industrial Pollutants	Various smells
Dust	Musty, mildew or wet cement type smell
Pollen	Sweet smell
Tobacco	Burning, tar smell
Human and Other Interior Generated Odors	
Body Secretions	Body odor
Perfuming Agents	Sweet or fragrance smell

repair4less

Clothing	Musty, mildew or body odors
Food/Beverage	Sweet, musty, mildew or fishy smell
Microbiological Odors	
Microbiological Odors Occurring Inside of A/C System	Musty, mildew smell lasting about 30 seconds after A/C is turned on
Microbiological Odors Occurring Outside of A/C System	Musty, mildew smell lasting indefinitely and possibly more pronounced when using recirculated air

2. Identify the source of the odor.
   - Check the evaporator core drain tube for restriction.
   - Check the passenger and driver side carpet for moisture. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
   - Check the blower motor and blower motor cover (if equipped) for moisture resulting from water bypassing the cowl baffling system. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
   - Check the cowl top panel and air inlet screen for standing water or foreign material. If possible, remove any standing water and clean the air inlet screen using a wet/dry vacuum.

3. Open all vehicle windows and doors.

4. Make sure that the A/C is off.

5. Set the following.
   - Select PANEL mode (A/C off).
   - Adjust the temperature setting to full warm.
   - Adjust the blower motor speed to HI.

6. Run the engine for 25 minutes to dry out the A/C system.

7. Turn the ignition OFF.

8. Remove the blower motor.

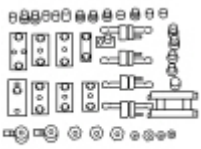
9. **NOTE:** Blower motor speed controls that are mounted outside of the evaporator core housing and not exposed to the blower motor airflow do not need to be removed.

   Remove the blower motor resistor (if equipped) or blower motor speed control (if equipped and exposed to the inside of the evaporator core housing).

10. ***NOTICE:*** **To avoid damage to the vehicle interior, do not spill or spray this product on any interior surface.**

    Add one full bottle of Motorcraft® A/C Cooling Coil Coating to the Flexible Applicator Tool.

11. Insert the nozzle into the evaporator housing and direct the spray toward the evaporator core face. Spray the entire evaporator core face until empty.



12. Install the blower motor and blower motor resistor (if equipped) or blower motor speed control (if equipped).

13. Repeat Steps 4 through 6 to cure the evaporator core coating.

repair4less

Air Conditioning (A/C) System Flushing

Special Tool(s)

 ST2985-A	A/C Flush Adapter Kit 219-CL-00732 or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00082 or equivalent
 ST3313-A	A/C Flush and Purge Machine 357-405 80001 00 or equivalent

Material

Item	Specification
Motorcraft® A/C System Flushing Solvent YN-23	—
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

WARNING: Take the following precautions when repairing an air conditioning system containing R-134a:

- **Always wear safety goggles.**
- **Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and will freeze skin tissue.**
- **Never allow refrigerant R-134a gas to escape in quantity in an occupied space. It will displace the oxygen needed to support life.**
- **Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but it decomposes when exposed to high temperatures such as a torch flame. During decomposition it releases irritating and toxic gasses (as described in the Material Safety Data Sheet from the manufacturer). Decomposition products are hydrofluoric acid,**

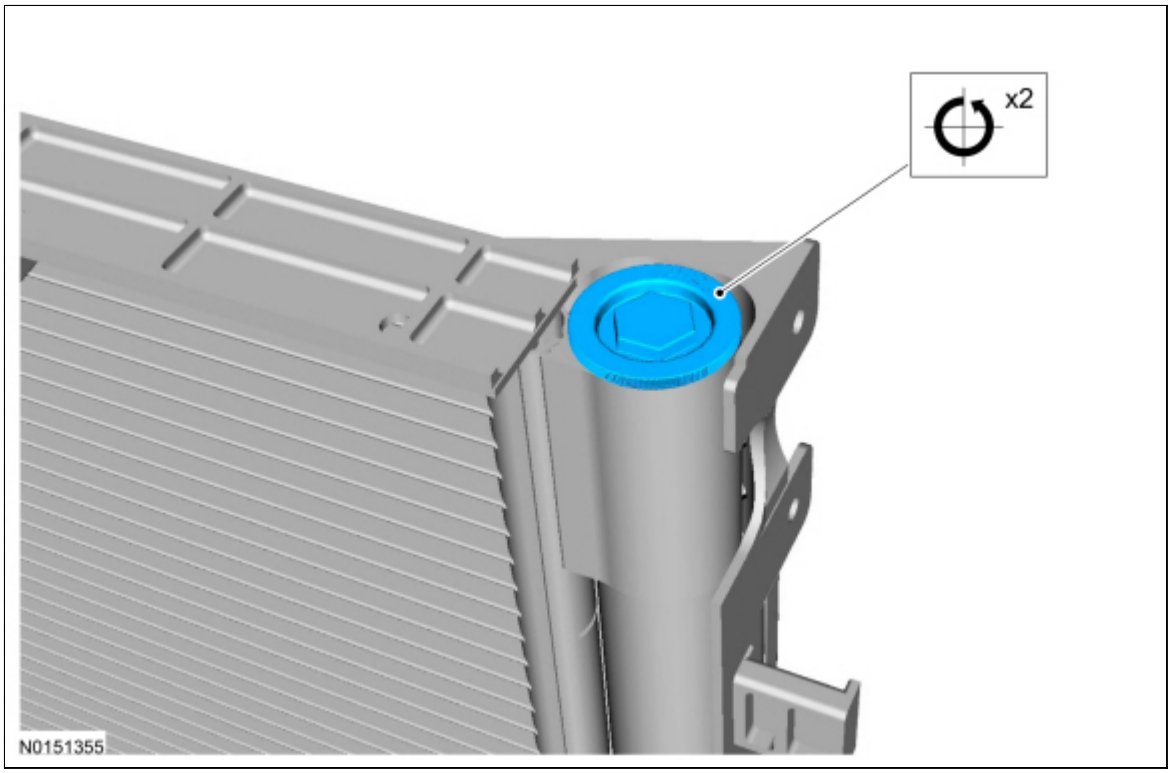
carbon dioxide and water.

Failure to follow these instructions may result in serious personal injury.

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

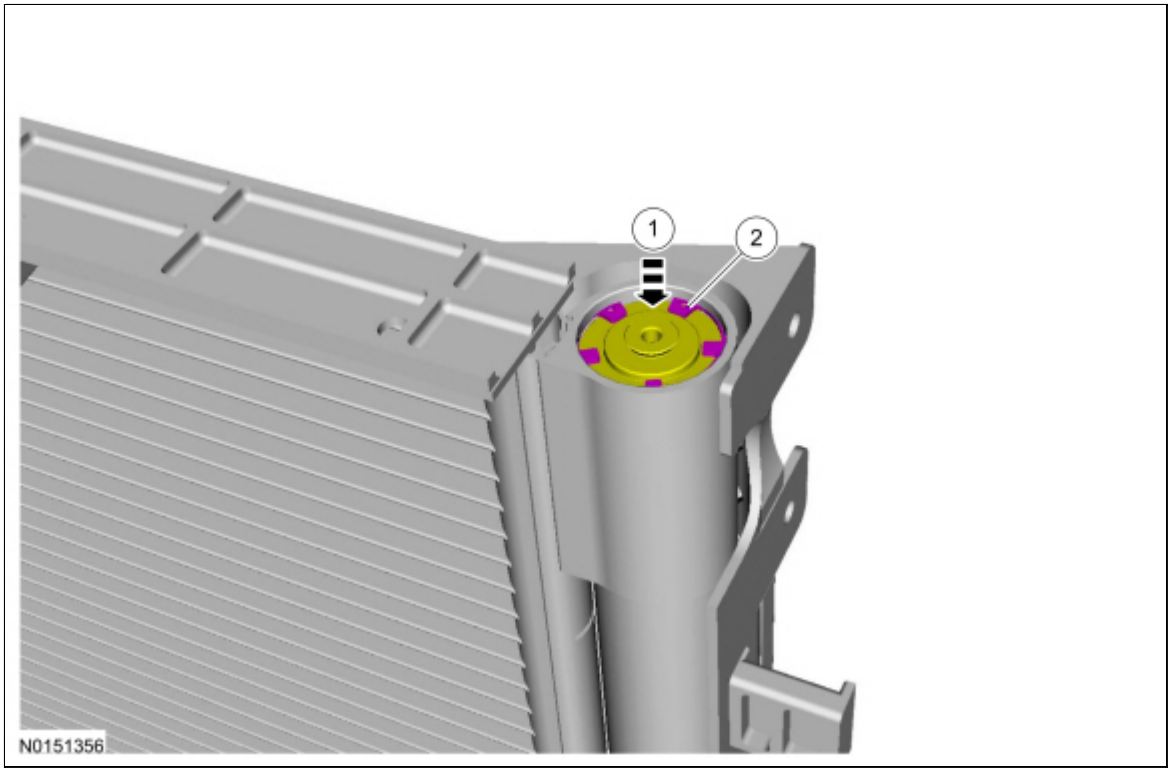
NOTICE: **Receiver/drier cartridge, front Thermostatic Expansion Valve (TXV), rear TXV (if equipped) and hoses with mufflers should be removed when flushing the Air Conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The 3.78L (1 gal) of Motorcraft® A/C System Flushing Solvent YN-23 and FL1-A filter used in A/C Flush and Purge Machine 357-405 80001 00 are intended for use on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.**

NOTICE: **Only the A/C Flush and Purge Machine 357-405 80001 00 and Motorcraft® A/C System Flushing Solvent is approved for use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers (Air Conditioning (A/C) condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.**



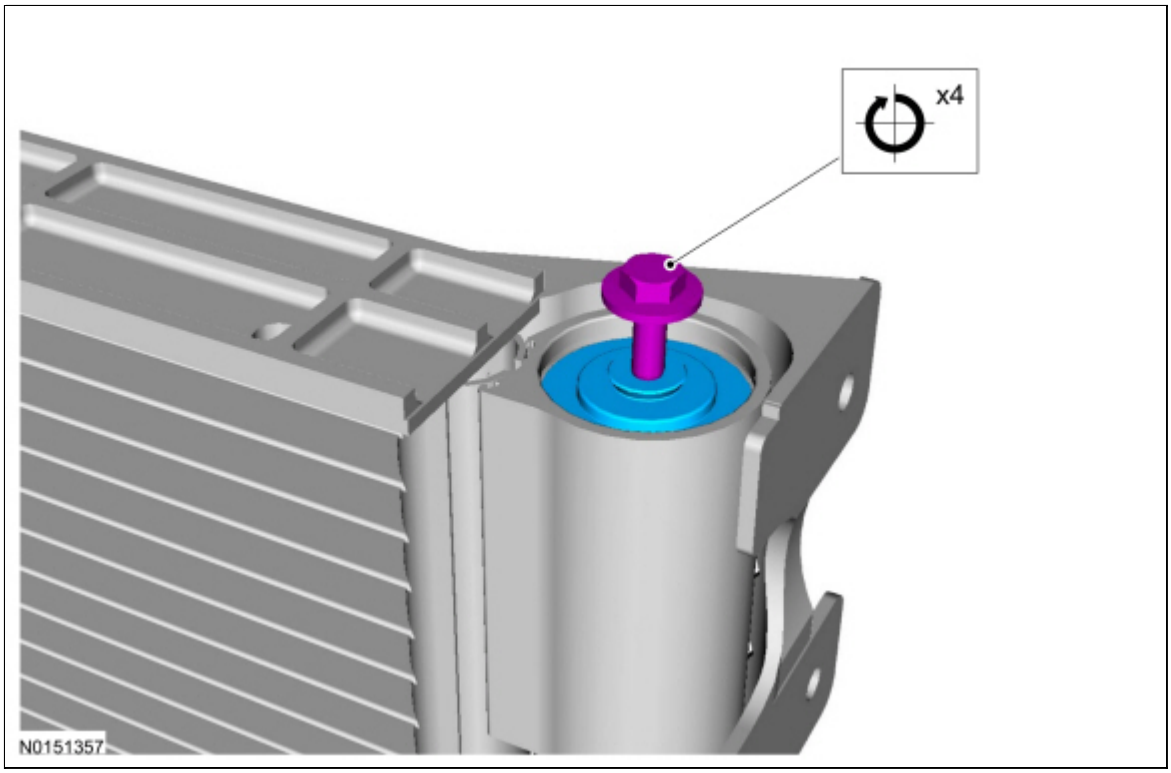
NOTE: Prior to using the A/C Flush and Purge Machine 357-405 80001 00 for the first time, review the operating instructions.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a 2-step procedure that involves the use of an A/C Flush and Purge Machine 357-405 80001 00 to:

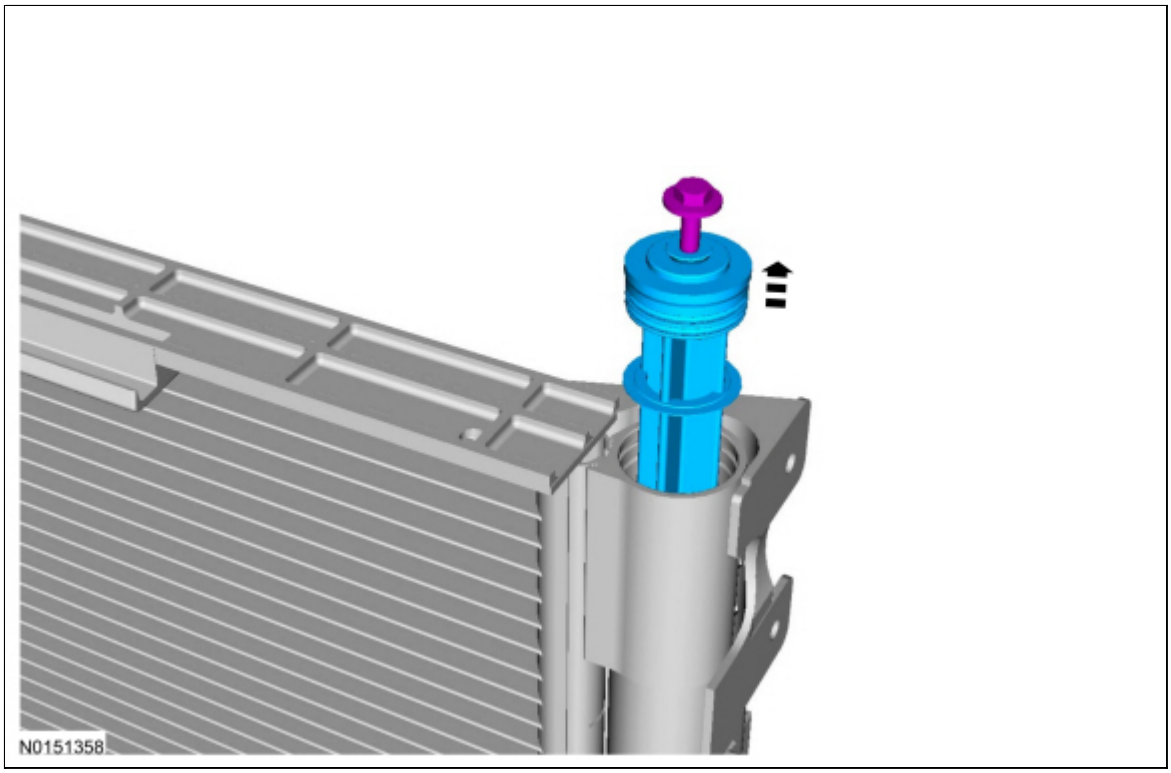


- circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
- remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and evaporate any remaining flush solvent from the heat exchanger.

1. Remove the condenser core. For additional information, refer to Section 412-01 .
2. Remove the plastic receiver/drier cap.



repair4less



3. Remove the receiver/drier plug.
    1. Push the receiver/drier plug towards the top of the condenser.
    2. Remove the receiver/drier plug snap ring.

4. Install a M5 bolt in the center of the receiver/drier plug.

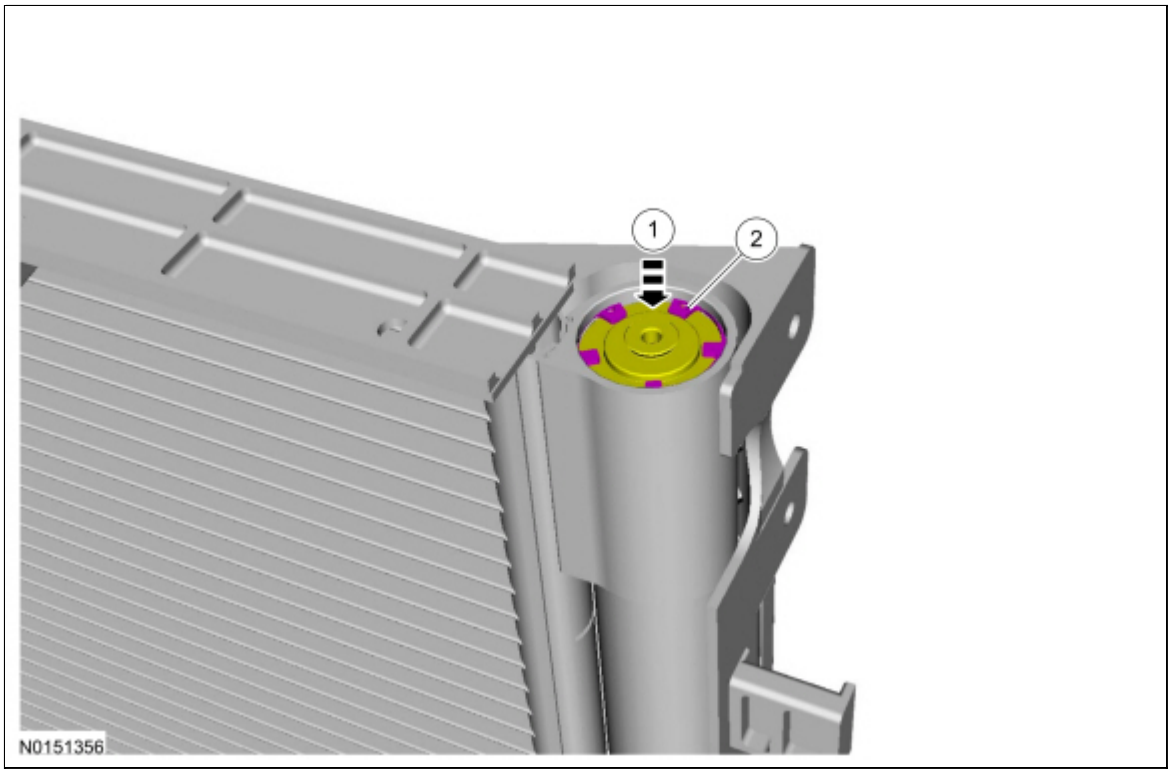
5. Remove the receiver/drier plug and the desiccant bag.

6. **NOTE:** Do not install a new receiver/drier at this time.

   With the receiver/drier removed, reinstall the receiver/drier plug and snap ring into the condenser

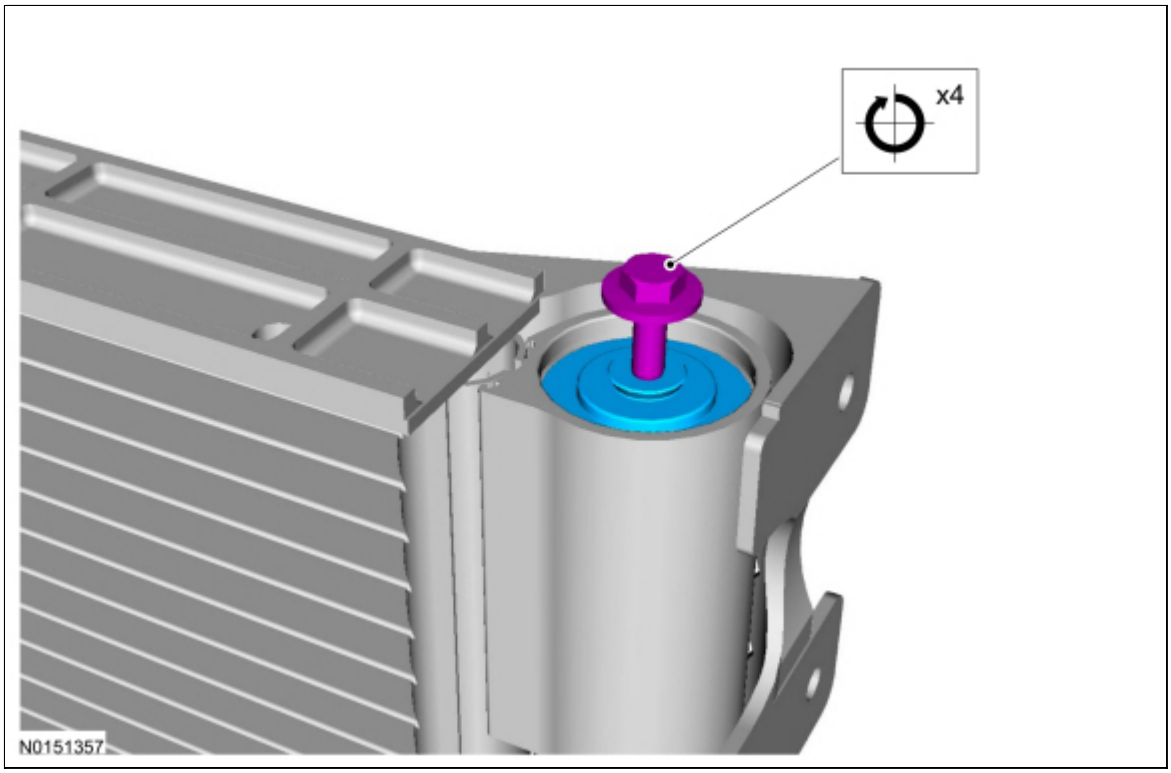
repair4less

core.



7. Connect the A/C Flush and Purge Machine to the condenser inlet and outlet fittings using the correct adapters from the A/C Flush Adapter Kit.

8. Flush the condenser core for a minimum of 15 minutes.



9. Turn the A/C Flush and Purge machine to the PURGE mode and run for a minimum of 30 minutes.

10. Disconnect the A/C Flush and Purge machine and adapters from the condenser core.

11. Remove the receiver/drier plug.
    1. Push the receiver/drier plug towards the top of the condenser.
    2. Remove the receiver/drier plug snap ring.

12. Install a M5 bolt in the center of the receiver/drier plug.

13. Install a new receiver/drier desiccant bag.

14. Install the new receiver/drier plug, snap ring and cap included in the receiver/drier cartridge service kit.

15. **NOTE:** Do not charge the refrigerant system after the condenser core is installed.

    Install the condenser core. For additional information, refer to Section 412-01 .

16. Remove the Thermostatic Expansion Valve (TXV). For additional information, refer to Section 412-01 .

17. Disconnect the evaporator inlet and outlet fittings.
    - Discard the O-ring seals.

18. Connect the A/C Flush and Purge Machine to the evaporator inlet and outlet fittings using the correct adapters from the A/C Flush and Purge Fitting Kit.

19. Flush the evaporator core for a minimum of 15 minutes.

20. Turn the A/C Flush and Purge Machine to the PURGE mode and run for a minimum of 30 minutes.

21. Disconnect the A/C Flush and Purge Machine and adapters from the evaporator core.

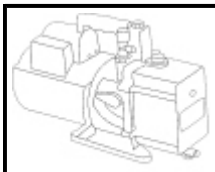
22. Install new O-ring seals and connect the front evaporator inlet and outlet fittings.

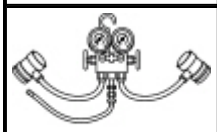
23. Install a new front TXV and new TXV gaskets. For additional information, refer to Section 412-01 .

24. **NOTE:** It is necessary to evacuate the refrigerant system for a minimum of one hour to evaporate any traces of flush solvent that may remain in the system.

repair4less

Evacuate the refrigerant system for one hour. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.





25. If a new A/C compressor is to be installed, install the new A/C compressor. For additional information, refer to Section 412-01 .

26. If a new A/C compressor is not to be installed, add the correct amount of refrigerant oil to the A/C compressor in the following sequence.
    1. Remove the A/C compressor. For additional information, refer to Section 412-01 .
    2. Drain the PAG oil and refill following the Refrigerant Oil Adding in this section.
    3. Reinstall the A/C compressor. For additional information, refer to Section 412-01 .

27. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant System Recovery

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTE: Ford Motor Company recommends the use of R-134a refrigerant management equipment that meets the requirements of the SAE J2788 standard.

1. Prior to recovering, the purity of the refrigerant must be verified. For additional information, refer to Refrigerant Identification Testing in this section.
2. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.
3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer. Note the amount of oil removed during the refrigerant recovery (if any). Add that same amount back into the system once repairs are complete.
4. Once the R-134a Refrigerant Management Machine has recovered the refrigerant, switch OFF the power supply.
5. Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.
6. If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.
7. Carry out the required repairs.

Refrigerant System Evacuation Using a R-134a Refrigerant Management Machine

1. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.
2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.
3. Turn OFF the Vacuum Pump. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held.

Refrigerant System Evacuation Using a R-134a Manifold Gauge Set and Vacuum Pump

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

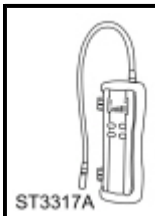
1. Connect the R-134a Manifold Gauge Set to the low-side and high-side service gauge port valves.
2. Connect the center (yellow) hose from the R-134a Manifold Gauge Set to the suction port on the Vacuum Pump.
3. Open all valves on the R-134a Manifold Gauge Set and both service gauge port valves.
4. Turn on the Vacuum Pump and evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.
5. Close the high-side and low-side valves on the R-134a Manifold Gauge Set (not the service gauge port valves) and turn OFF the Vacuum Pump.
6. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Charging Using a R-134a Refrigerant Management Machine

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.
2. Connect a R-134a Refrigerant Management Machine to the low-side and high-side service gauge port valves following the operating instructions provided by the equipment manufacturer.
3. Set the refrigerant charge amount, and charge the refrigerant system following the instructions provided by the equipment manufacturer.

Refrigerant System Charging Using a R-134a Manifold Gauge Set and Automatic Refrigerant Charging Meter

NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out charging of the refrigerant system. If a R-134a Refrigerant Management Machine is not available, refrigerant system charging may be accomplished using a separate Automatic Refrigerant Charging Meter and R-134a Manifold Gauge Set.



1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.
2. Assemble the R-134a Manifold Gauge Set, Automatic Refrigerant Charging Meter and R-134a supply tank following the Automatic Refrigerant Charging Meter operating instructions.
3. Charge the refrigerant system following the Automatic Refrigerant Charging Meter operating instructions.

repair4less

4. If the refrigerant flow stops before the refrigerant charge is complete, start the engine, select MAX A/C operation and allow the refrigerant charge to complete.

Electronic Leak Detection

Special Tool(s)

 ST3317A	Infrared Refrigerant Leak Detector (SAE J-2791 Compliant) 023-22791 or equivalent
 ST3316A	Dual Mode Refrigerant Gas and UV Dye Leak Detector (SAE J-2791 Compliant) 339-D440A-UV or equivalent

NOTE: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the Heated Pentode Halogen Leak Detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

NOTE: R-134a is heavier than air, and will tend to move downward from the source of the leak if present. It is possible that a leak may not be detected if the leak detector tip is held above the leaking fitting, line or component. Always be sure to thoroughly leak test below the fitting, line or component for the presence of R-134a as well as leak testing above and around.

1. **NOTE:** The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off and cool. The pressure reading may be higher if the engine is hot.

   Leak test the refrigerant system using the Heated Pentode Halogen Leak Detector. Follow the instructions included with the Heated Pentode Halogen Leak Detector for handling and operation techniques.

repair4less

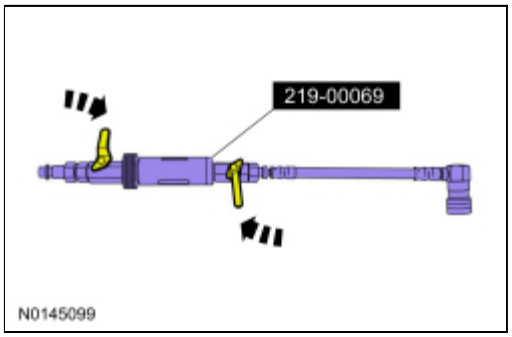
Dye 164-R6060 (Rotunda)	

Fluorescent Dye Injection Using a R-134a Refrigerant Management Machine and Dye Injector — Vehicles Requiring R-134a Addition

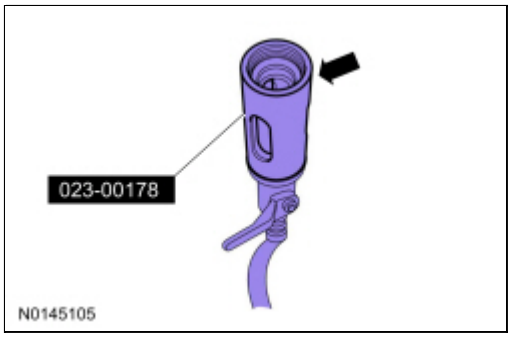
NOTE: This method of fluorescent dye injection requires the addition of R-134a from a R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set hooked to an external tank to charge the dye into the refrigerant system. If adding fluorescent dye to a refrigerant system that is already fully charged, the R-134a Loop/Add On Injector Kit-Set method should be used.

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.



NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the manufacturer's instructions on evacuation of any non-condensable gases from the hoses.

NOTE: Only connect the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set when fluorescent dye is to be injected. The dye/lubricant injector has a one-way check valve that will prevent refrigerant system recovery and evacuation.



1. **NOTE:** If no R-134a pressure is present in the refrigerant system, the system should be evacuated before carrying out the injection procedure. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

   Connect a R-134a Refrigerant Management Machine or a R-134a Manifold Gauge Set to the refrigerant system service port valves.

2. Verify that the valves on the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set are closed.

3. Fill the R-134a fluorescent dye injector reservoir with 7.4 ml (0.25 fl. oz.) of fluorescent dye.

4. Install the dye/lubricant injector between the low-pressure service gauge port valve and the R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set.

5. **NOTE:** Following fluorescent dye injection, the refrigerant system should be fully charged to make sure of correct movement of the dye.

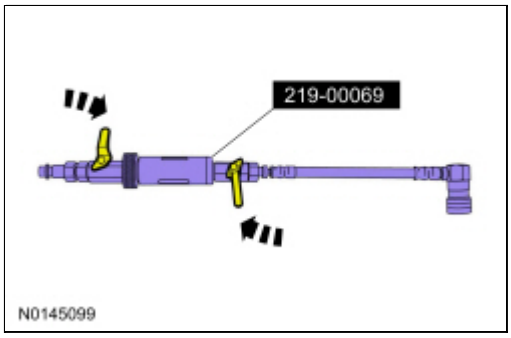
   Open all valves and inject the fluorescent dye into the refrigerant system by charging the refrigerant system with the required amount of R-134a.

6. When fluorescent dye injection is complete, close all valves.

7. Recover the refrigerant from the dye/lubricant injector.

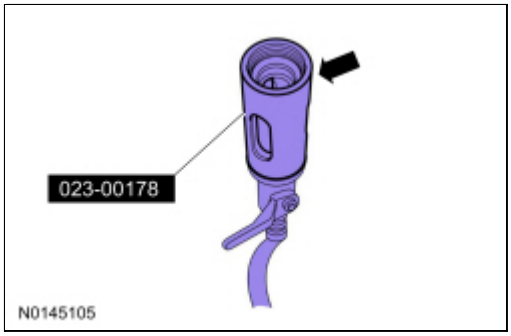
8. Remove the dye/lubricant injector from the low-pressure service gauge port valve and the R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set.

Fluorescent Dye Injection Using a R-134a Loop/Add On Injector Kit-Set — Vehicles Not Requiring R-134a Addition



NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.

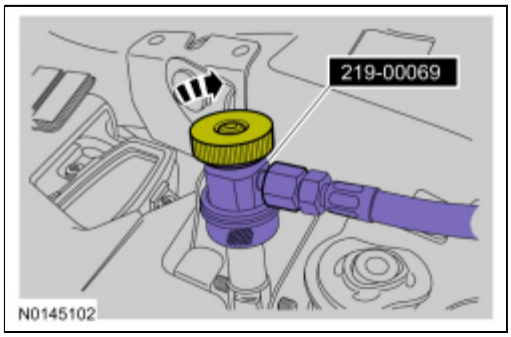


NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off and cool.

1. Verify that the valves on the R-134a Loop/Add On Injector Kit-Set are closed.

repair4less

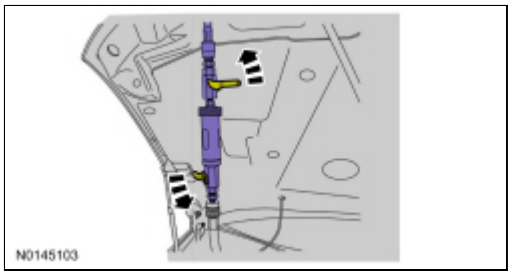
2. Fill the R-134a Loop/Add On Injector Kit-Set reservoir with 7.4 ml (0.25 fl. oz.) of fluorescent dye.



3. Install the R-134a Loop/Add On Injector Kit-Set between the high-pressure and low-pressure service gauge port valves.

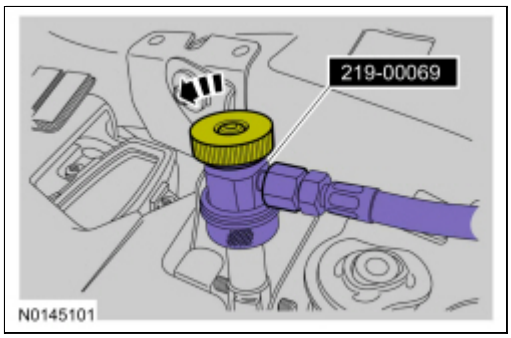
4. ***NOTICE:*** **Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine. Failure to keep tools and hoses clear from the engine cooling fan and drive belt will result in damage to the tools and/or vehicle.**

   With the A/C off, start the engine. Allow engine speed to stabilize below 1,000 rpm.



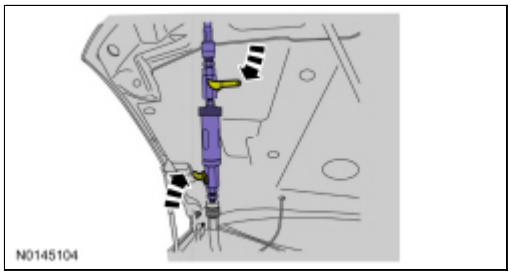
5. Set the A/C to the ON position.

6. Open the high-pressure service valve.



7. **NOTE:** To prevent pressure spike/liquid slug, crack the R-134a Loop/Add On Injector Kit-Set valves and slowly open to inject the fluorescent dye into the refrigerant system.

   Open the R-134a Loop/Add On Injector Kit-Set valves and inject the fluorescent dye into the refrigerant system.



8. Close the high-pressure service valve to allow the pressure inside the R-134a Loop/Add On Injector Kit-Set to equalize with the suction side of the refrigerant system.

9. **NOTE:** Close the valves on the R-134a Loop/Add On Injector Kit-Set while the A/C compressor is operating.

   Close the valves on the R-134a Loop/Add On Injector Kit-Set.

10. **NOTE:** Leave all valves on the R-134a Loop/Add On Injector Kit-Set closed when not in use.

    Disconnect the high-pressure and low-pressure service valves and remove the R-134a Loop/Add On Injector Kit-Set from the vehicle.

Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line and fitting in the refrigerant system for a leak.

NOTE: Use of dye-enhancing glasses or goggles greatly improves the detection of the dye under the UV lamp.

repair4less

NOTE: Not all UV lamps will fluoresce the dye used in Ford vehicles. All Rotunda UV lamps are optimized to fluoresce the dye.

1. Check for leaks using a Rotunda-approved UV lamp and dye enhancing glasses.
    - Inspect all components, lines and fittings of the refrigerant system.

2. After the leak(s) is repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

3. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp.

Refrigerant Identification Testing

Special Tool(s)

 ST3090-A	Refrigerant Blend Identifier with Printer 023-16910 or equivalent

Refrigerant Identification

1. **NOTE:** A Refrigerant Blend Identifier with Printer must be used to identify gas samples taken directly from the refrigeration system or storage containers prior to recovering or charging the refrigerant system.

   Follow the instructions included with the Refrigerant Blend Identifier with Printer to obtain the sample for testing.

2. The Refrigerant Blend Identifier with Printer will display one of the following:
   - If the purity level of R-134a is 98% or greater by weight, the green PASS LED will light. The weight concentrations of R-134a, R-12, R-22, hydrocarbons and air will be displayed on the digital display.
   - If refrigerant R-134a does not meet the 98% purity level, the red FAIL LED will light and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will be displayed on the digital display.
   - If hydrocarbon concentrations are 2% or greater by weight, the red FAIL LED will light, "Hydrocarbon High" will be displayed on the digital display, and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will also be displayed on the digital display.

3. The percentage of air contained in the sample will be displayed if the R-134a content is 98% or greater. The Refrigerant Blend Identifier with Printer eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the Refrigerant Blend Identifier with Printer has determined that a refrigerant source is pure (R-134a is 98% or greater by weight) and air concentration levels are 2% or greater by weight, it will prompt the user if an air purge is desired.

4. If contaminated refrigerant is detected, repeat the refrigerant identification test to verify that the refrigerant is indeed contaminated.

Contaminated Refrigerant Handling

NOTICE: **If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a**

repair4less

recovery/recycling equipment. Recovery of contaminated refrigerant will contaminate the recovered refrigerant supply and may damage the recovery/recycling equipment.

NOTE: A new suction accumulator or receiver/drier must be installed as directed by the A/C system flushing procedure.

1. Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant only.
    - If this equipment is not available, contact an A/C service facility in the area with the correct equipment to carry out this service.

2. Determine and correct the cause of the customer's initial concern.

3. Flush the A/C system.

4. Dispose of the contaminated refrigerant in accordance with all federal, state and local regulations.

Refrigerant Oil Adding

Special Tool(s)

 ST3057-A	R-134a Loop/Add On Injector Kit-Set 219-703710 or equivalent

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Refrigerant Oil Adding

NOTICE: **During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.**

1. Refer to the chart below for refrigerant oil adding amounts when new components are installed.

Component	PAG (polyalkylene glycol) Refrigerant Compressor Oil (YN-12-D) Oil Amount (fl oz (ml))	Method of Adding
After installing the A/C Compressor.	Service compressor contains full system charge of oil. Oil matching required plus amount collected during recovery.	Add directly to A/C compressor before installation
After installing the receiver/drier.	2 fl oz (60 ml) plus the amount collected during refrigerant recovery.	Inject to low-side service port during system charging.
After installing the receiver/drier element.	1 fl oz (30 ml) plus the amount collected during refrigerant recovery.	Inject to low-side service port during system charging.
After installing the condenser core.	1.5 fl oz (45 ml) plus the amount collected during refrigerant recovery.	Add directly to inlet port or inject to low-side service port during system charging.
After installing the condenser	2 fl oz (60 ml) plus the amount	Add directly to inlet port or

repair4less

core, and the receiver/drier element	collected during refrigerant recovery.	inject to low-side service port during system charging.
After installing the evaporator core.	1.5 fl oz (45 ml) plus the amount collected during refrigerant recovery.	Add directly to inlet port or inject to low-side service port during system charging.
After installing/reassembling the thermostatic expansion valve.	Amount collected during refrigerant recovery.	Inject to low-side service port during system charging.
After installing a refrigerant Hose/Line.	2 fl oz (60 ml) plus the amount collected during refrigerant recovery [a]	Inject to low-side service port during system charging.
After an O-ring Leak Repair.	1 fl oz (30 ml) plus the amount collected during refrigerant recovery [b]	Inject to low-side service port during system charging.
After a service port leak repair.	Amount collected during refrigerant recovery.	Inject to low-side service port during system charging.

[a] If an excessive amount of PAG (polyalkylene glycol) Refrigerant Compressor Oil YN-12-D is lost due to a hose rupture/separation or other damage, the total system PAG (polyalkylene glycol) Refrigerant Compressor Oil YN-12-D capacity must be added. Also, it is necessary to replace the receiver/drier.

[b] The amount specified may be used for one or multiple O-ring leak repairs. Do not multiply the PAG (polyalkylene glycol) Refrigerant Compressor Oil YN-12-D amount by the number of O-ring leaks being repaired.

Compressor Type(s)

NOTICE: **An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. Dispose of all contaminated A/C refrigerant as hazardous waste. For all equipment, follow the manufacturer's instructions.**

NOTICE: **Motorcraft® PAG A/C Compressor Oil YN-12-D only must be used as a refrigerant system lubricant. Addition of any oil other than Motorcraft® PAG A/C Compressor Oil YN-12-D to the refrigerant system will damage the A/C compressor and contaminate the refrigerant system.**

NOTICE: **During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.**

NOTICE: **Oil balance must be performed when replacing a compressor where system flush will not be performed.**

NOTE: The purpose of oil balance is to ensure that the amount of oil in the system is not increased or decreased as a result of the replacement component(s).

NOTE: New compressors come fully charged with Motorcraft® PAG A/C Compressor Oil YN-12-D. The old

compressor is only partially charged because some of the oil is elsewhere in the A/C system.

1. Verify location of the drain plug by compressor type. Once compressor type has been identified, procedure to appropriate compressor type below for compressor oil matching steps.

2. ***NOTICE:*** **Make sure the equipment is clean and free of foreign material.**

   NOTE: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the PAG (polyalkylene glycol) oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

   Fill the system with the calculated quantity of new refrigerant oil in accordance with the A/C service unit manufacturer instructions.

Type 1: (IVDC) Internal Variable Displacement Air Conditioning (A/C) Compressor

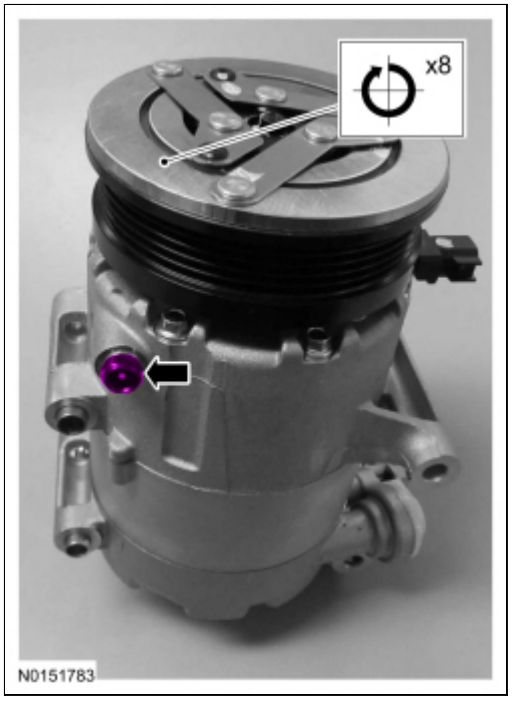
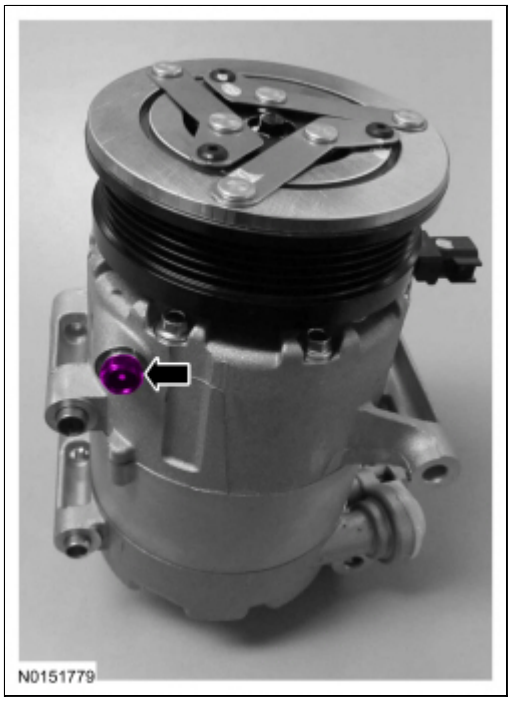
Type 4: Fixed Air Conditioning (A/C) Compressor



1.

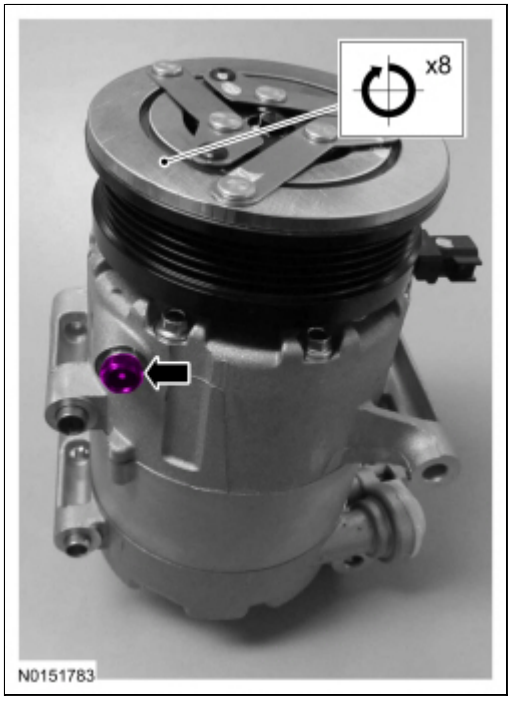
Type 1



NOTICE: **Make sure the old A/C compressor shaft is rotating and not just the A/C pulley.**

1. Remove the oil drain bolt and rotate the old A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

2. Install the oil drain bolt in the old A/C compressor.
    - To install, tighten to 20 Nm (177 lb-in).



repair4less

3. Remove the suction and discharge port seal cap from the new A/C compressor.

4. ***NOTICE:*** **Make sure the new A/C compressor shaft is rotating and not just the A/C pulley.**

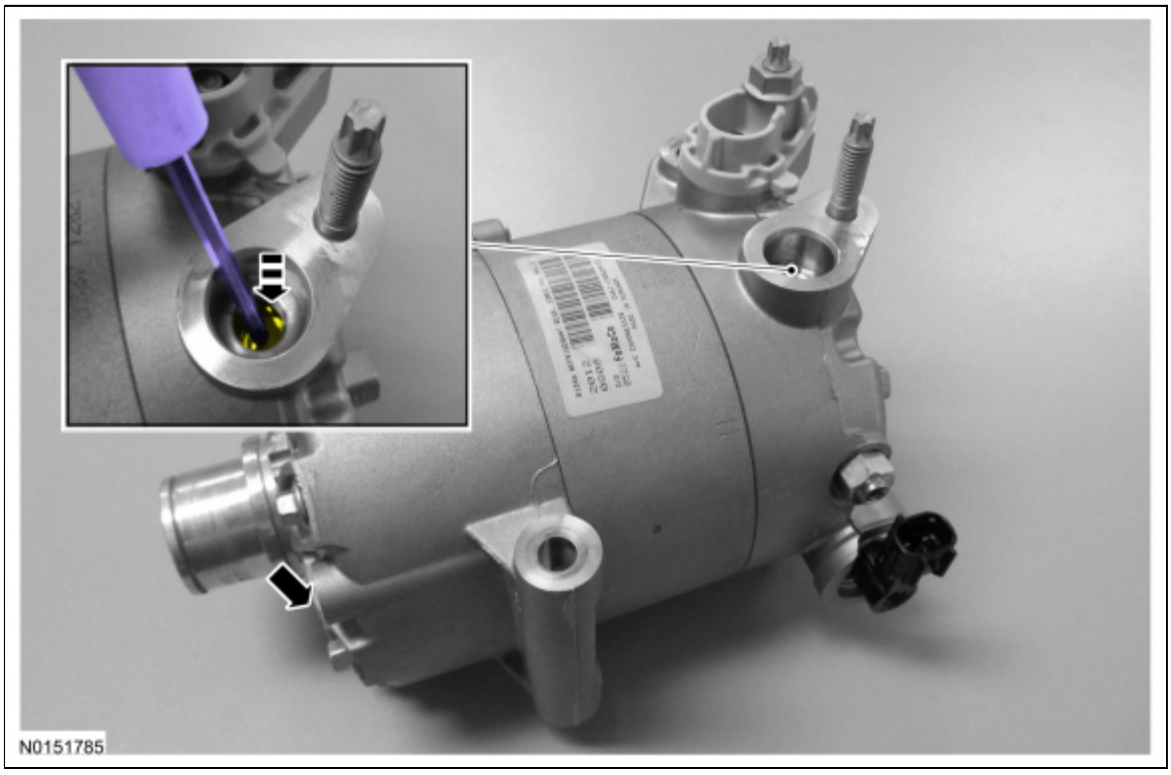
   Remove the drain bolt and rotate the new A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

5. Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

6. Install the oil drain bolt in the new A/C compressor.
    - To install, tighten to 20 Nm (177 lb-in).

7. Install the suction and discharge port seal cap from the new A/C compressor.

Type 2



1. Remove the A/C Clutch and A/C Clutch Field Coil from the old A/C compressor. For additional Information, refer to Section 412-01 .

2. Remove the oil drain bolt from the old A/C compressor.

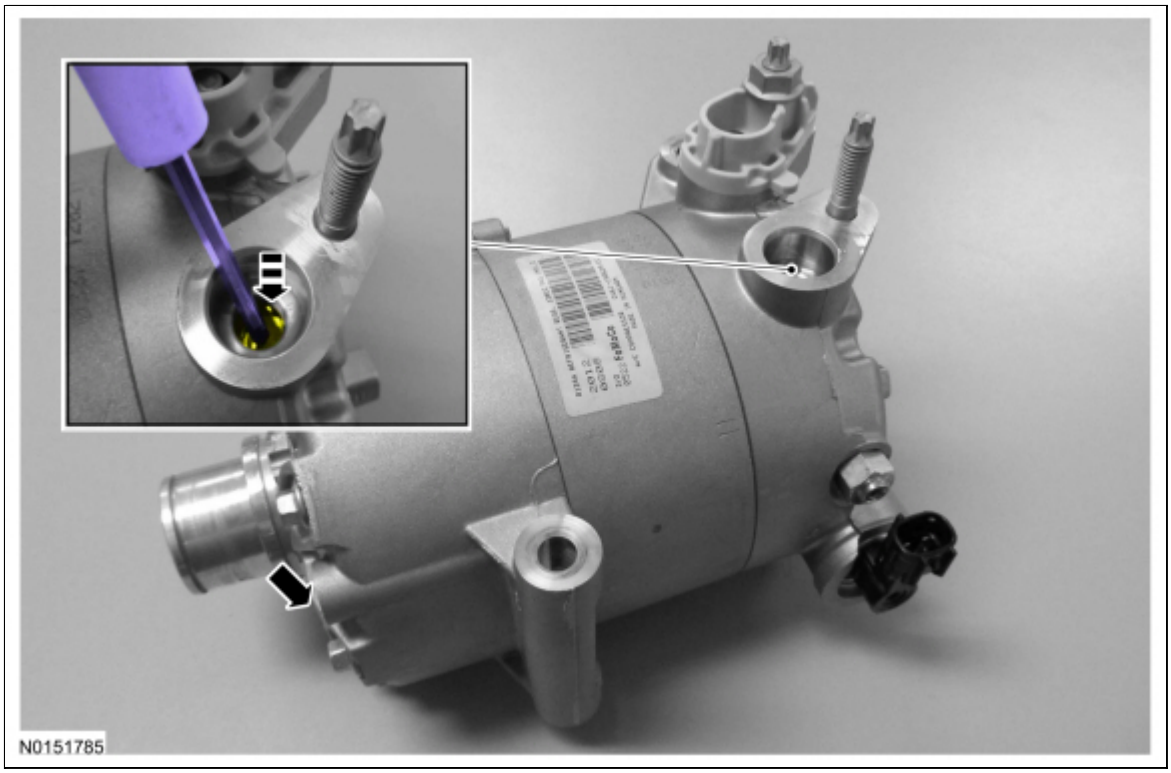
repair4less

3. Depress the suction damper to allow proper ventilation while draining oil from the old A/C compressor.

4. Drain as much oil from the old A/C compressor.

5. Install the oil drain bolt in the old A/C compressor.
    - To install, tighten to 9 Nm (80 lb-in).

6. Remove the A/C Clutch and A/C Clutch Field Coil from the new A/C compressor. For additional information, refer to Section 412-01 .



7. Remove the oil drain bolt from the new A/C compressor.

8. Remove the suction port seal cap.

9. Depress the suction damper to allow proper ventilation while draining oil from the old A/C compressor.

repair4less

10. Drain as much oil from the new A/C compressor.

11. Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

12. Install the oil drain bolt in the new A/C compressor.
    - To install, tighten to 9 Nm (80 lb-in).

13. Install the suction port seal cap.

14. Install the A/C Clutch and A/C Clutch Field Coil on the new A/C compressor. For additional information, refer to Section 412-01 .

Type 3

NOTICE: **Make sure the old A/C compressor shaft is rotating and not just the A/C pulley.**

1. Remove the oil drain bolt and rotate the old A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

2. Install the oil drain bolt in the old A/C compressor.
    - To install, tighten to 30 Nm (22 lb-ft).

repair4less

3. Remove the suction and discharge port seal cap from the new A/C compressor.

4. ***NOTICE:*** **Make sure the new A/C compressor shaft is rotating and not just the A/C pulley.**

   Remove the drain bolt and rotate the new A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

5. Install the oil drain bolt in the old A/C compressor.
   - To install, tighten to 30 Nm (22 lb-ft).

6. Remove the suction and discharge port seal cap from the new A/C compressor

7. ***NOTICE:*** **Make sure the new A/C compressor shaft is rotating and not just the A/C pulley.**

   Remove the drain bolt and rotate the new A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device

8. Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

repair4less

9. Install the oil drain bolt in the new A/C compressor.
    - To install, tighten to 30 Nm (22 lb-ft).

10. Install the suction and discharge port seal cap on the new A/C compressor.

Type 4

NOTICE: **Make sure the old A/C compressor shaft is rotating and not just the A/C pulley.**

1. Rotate the old A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device from the A/C compressor discharge port.

2. Remove the suction and discharge port seal cap from the new A/C compressor.

3. ***NOTICE:*** **Make sure the new A/C compressor shaft is rotating and not just the A/C pulley.**

   Rotate the new A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device from the A/C compressor discharge port.

4. Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

repair4less

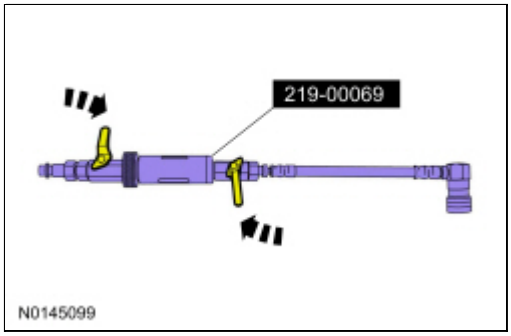
5. Install the suction and discharge port seal cap on the new A/C compressor.

Oil Injection Using a Dye/Lubricant Injector

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV black light. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye wafer included in the desiccant bag which dissolves after approximately 30 minutes of continuous A/C operation. It is not necessary to add dye after flushing the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing procedure. Replace hose/accumulator, receiver/drier or receiver/drier element.

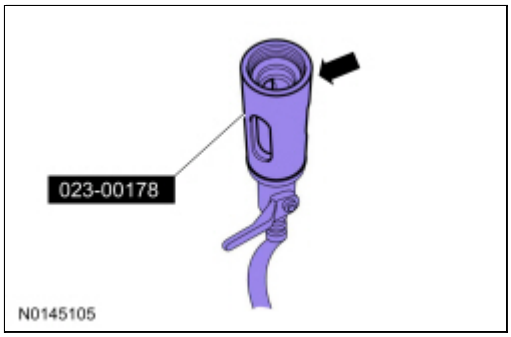
NOTE: The dye/lubricant injector is included as part of the 219-00069 R-134a Loop/Add On Injector Kit-Set.

NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.



NOTE: If fluorescent leak detection dye is also to be added during A/C charging, the dye may be added to the dye/lubricant injector along with the refrigerant oil.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24° C (75° F) with the engine off and cool.



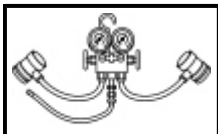
1. Evacuate the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Assemble the dye/lubricant injector using the correct adapters to match the amount of refrigerant compressor oil to be injected.

3. Verify that all the valves on the dye/lubricant injector are closed.

4. Fill the dye/lubricant injector with the correct amount of clean, new PAG (polyalkylene glycol) oil.

5. Install the dye/lubricant injector between the low-side service gauge port valve and the refrigerant service station or manifold gauge set.



6. **NOTE:** Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine. Failure to keep tools and hoses clear from the engine cooling fan and drive belt results in damage to the tools and/or vehicle.

   Open all valves and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant System Tests

Special Tool(s)

 ST1928-A	R-134a Manifold Gauge Set 265-41339 or equivalent
 ST3079A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 023-34788-H or equivalent
 ST3081-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 199-CCST388 or equivalent
 ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 265-37830 or equivalent

Procedure 1 — Ambient Temperature at or Below 38°C (100°F)

NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

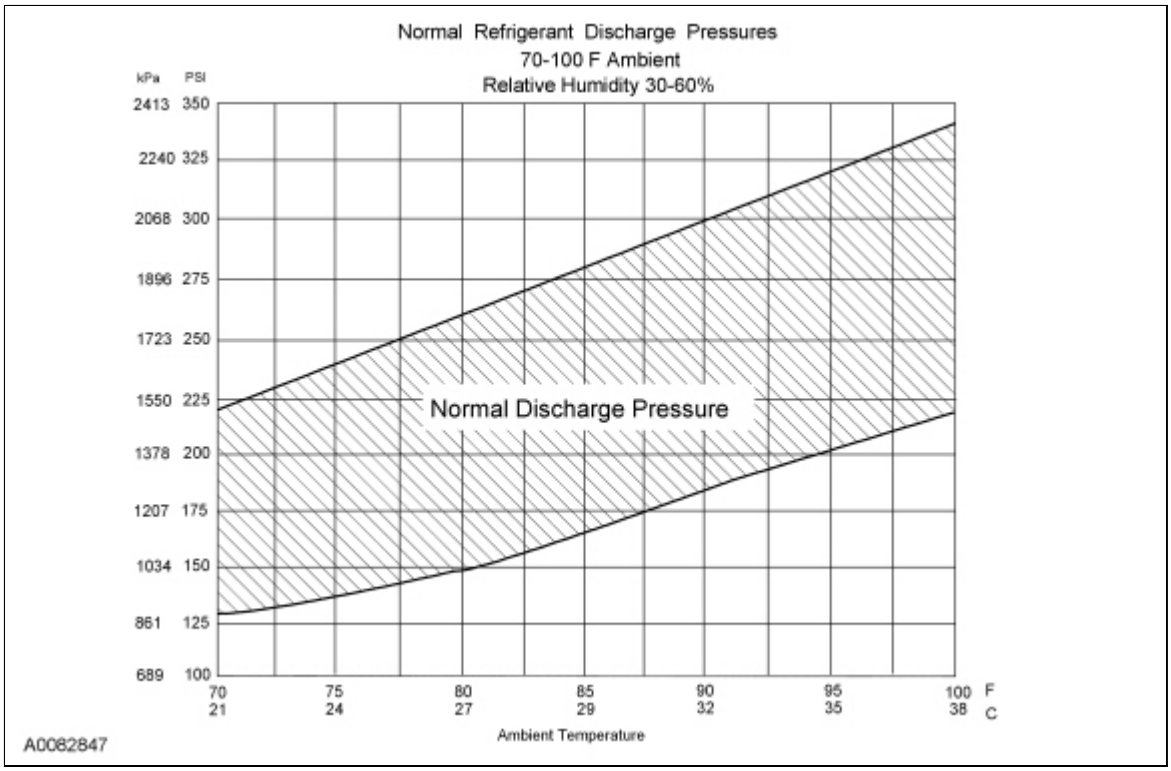
NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

NOTE: If the A/C compressor cycles at any time during this test, refer to the diagnostic table.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a R-134a Manifold Gauge Set or R-134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.

3. Set the climate controls.
    - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, HI blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
    - If equipped with Electronic Automatic Temperature Control (EATC), set temperature to 15°C (60°F) (lowest possible temperature setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
    - If the vehicle is equipped with auxiliary climate control, set the auxiliary controls to full COOL in the PANEL mode at HI blower speed.

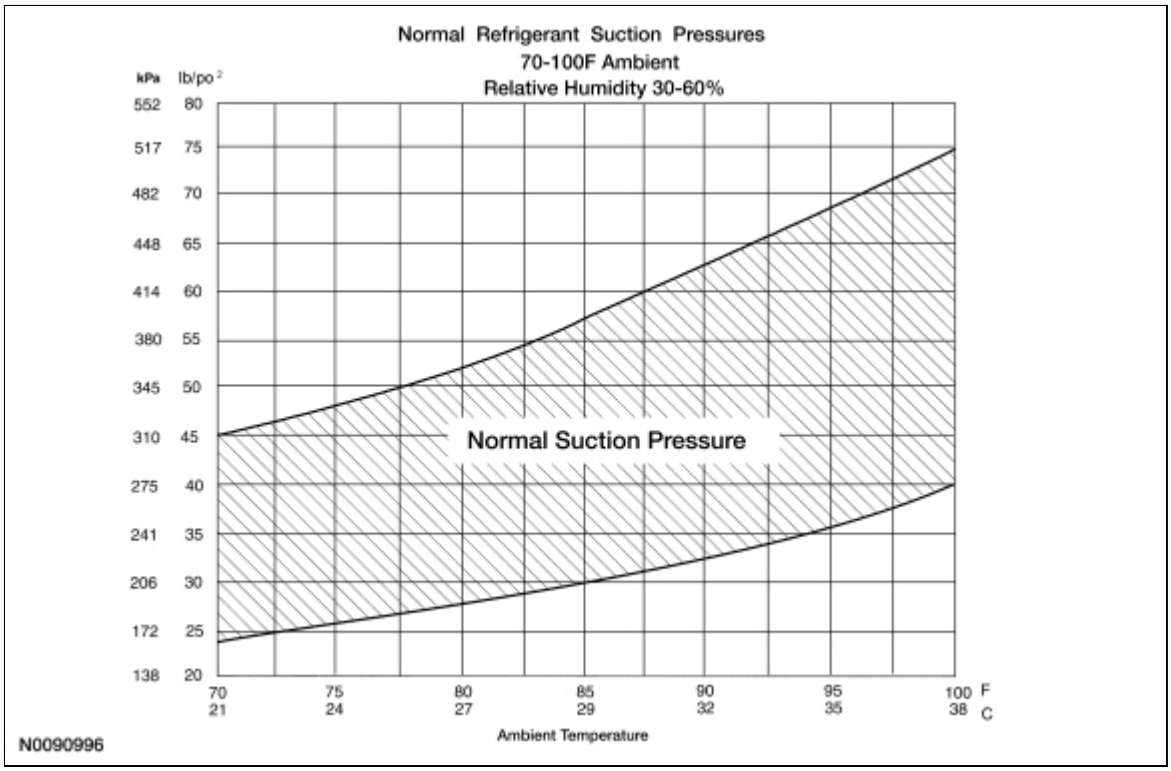


4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.

7. Record the discharge pressure. If the pressure is fluctuating, record the average value.



8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

repair4less

11. Proceed to the Diagnostic Table.

Procedure 2 — Ambient Temperature Above 38°C (100°F)

NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

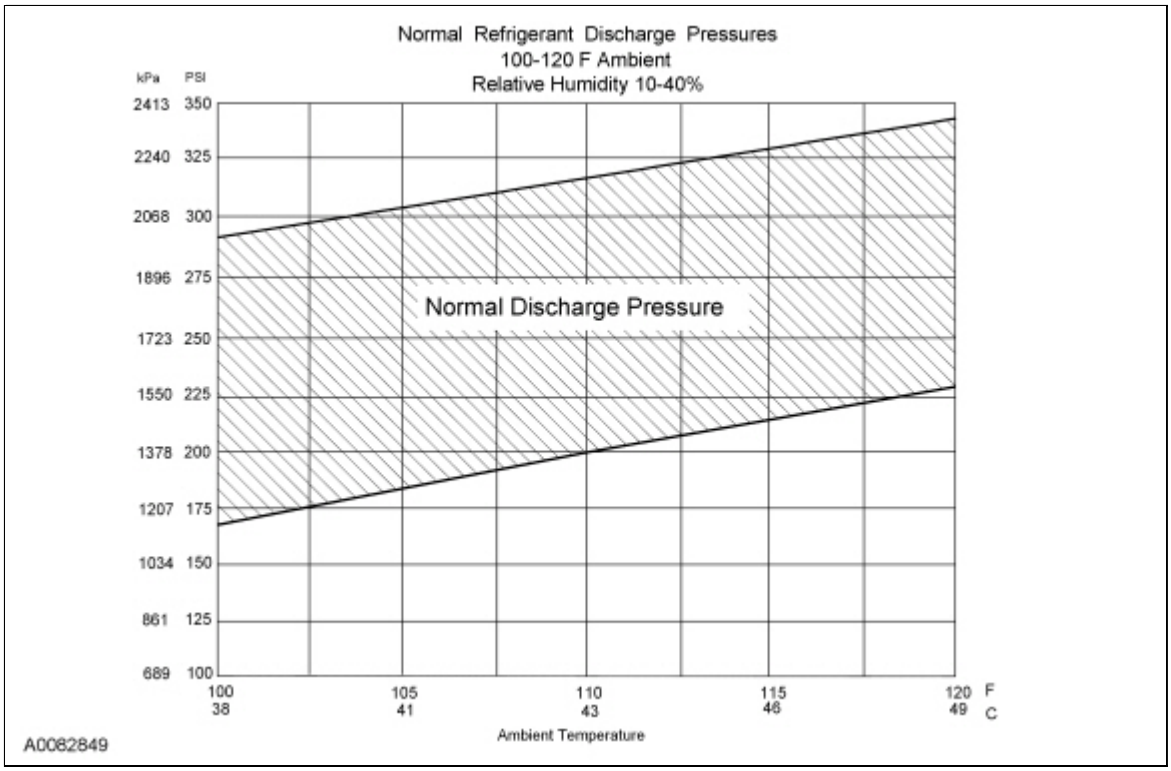
NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a R-134a Manifold Gauge Set or R-134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.

3. Set the climate controls.
   - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, MED-LO blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If equipped with EATC , set temperature to 15°C (60°F) (lowest possible temperature setting). Manually set blower to MED-LO (3 to 4 bars). If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If the vehicle is equipped with auxiliary climate control, set the auxiliary controls to full COOL in the PANEL mode at MED-LO blower speed.

4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors

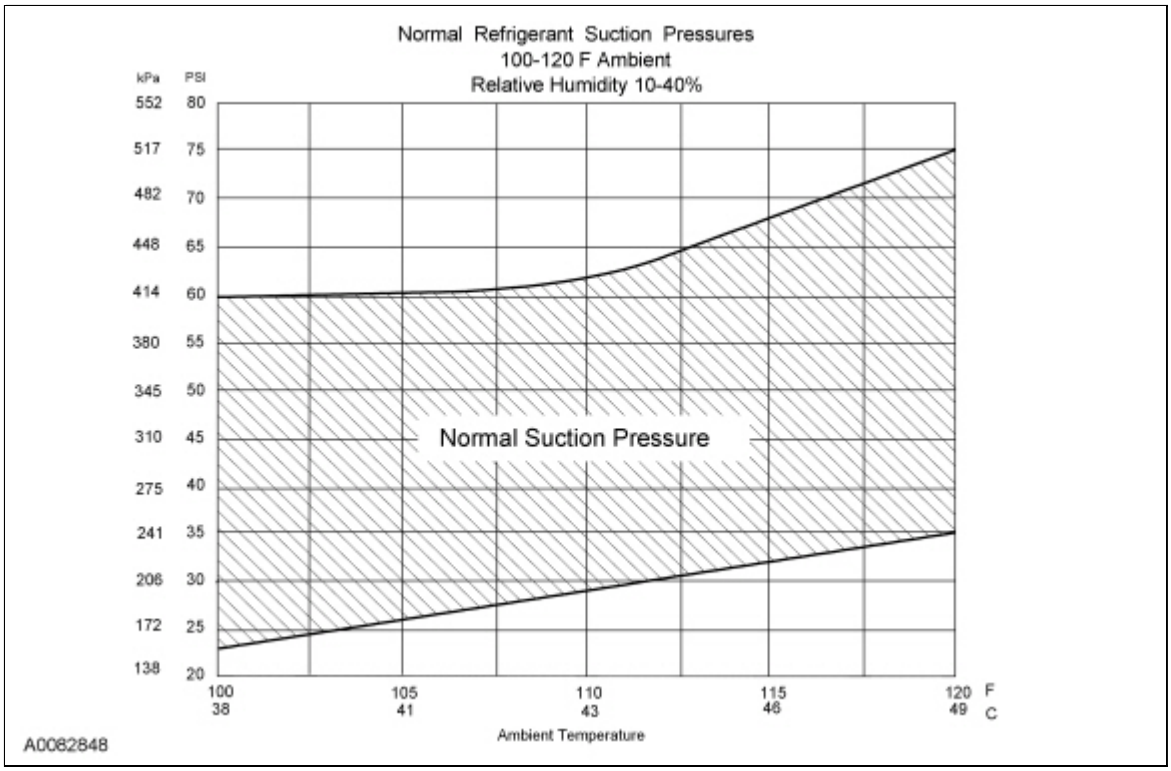


(if equipped).

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.

7. Record the discharge pressure. If the pressure is fluctuating, record the average value.



8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

repair4less

11. Proceed to the diagnostic table.

Diagnostic Table

1. **NOTE:** The following table is used to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

   Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component — Causes
High or Clutch Cycling	High	Condenser — inadequate airflow.
High	Normal to High	Engine — overheating.
Normal to High	Normal	Refrigerant overcharge — air in refrigerant.
Normal to Low	High	TXV not operating correctly.
Normal to Low	Normal to High	A/C suction line — partially restricted or plugged. [a]
Normal to Low	Low or Clutch Cycling	Low refrigerant charge, A/C suction line — partially restricted or plugged A/C cycling switch — sticking closed (if equipped). [b]
Erratic Operation or Compressor Not Running		A/C cycling switch — poor connection at A/C clutch connector or clutch cycling switch connector. A/C electrical circuit erratic — see A/C Electrical Circuit Wiring Diagram.
Normal to Low	High	Compressor — low performance.

Additional Possible Cause Components Associated With Inadequate Compressor Operation
• Compressor Drive Belt — loose • Compressor Clutch — slipping • Clutch Coil Open — shorted, or loose mounting • Control Assembly Switch — dirty contacts or sticking open • Clutch Wiring Circuit — high resistance, open or blown fuse • Compressor Operation Interrupted by Engine Computer
Additional Possible Cause Components Associated With a Damaged Compressor
• Incorrect Clutch Air-gap • Suction Accumulator — refrigerant oil bleed hose plugged • Refrigerant Leaks

[a] Low pressure reading will be normal to high if pressure is taken at accumulator and if restriction is downstream of service access valve.

[b] Low pressure reading will be low if pressure is taken near the compressor and restriction is upstream of service access valve.

Air Conditioning

The A/C refrigerant system is a clutch cycling TXV type. The system components are the following:

- A/C compressor
- A/C condenser core
- A/C evaporator core
- Connecting refrigerant lines

The refrigeration system operation is controlled by the following:

- TXV
- Evaporator temperature sensor
- A/C compressor pressure relief valve
- A/C pressure transducer

The refrigerant system incorporates an A/C compressor controlled by the PCM through an A/C clutch relay. The HVAC module sends an A/C request signal over the MS-CAN to the BCM which relays the request over the HS-CAN to the PCM . An evaporator temperature sensor is used to disengage the A/C compressor clutch when the evaporator core temperature is slightly above the freezing point of water.

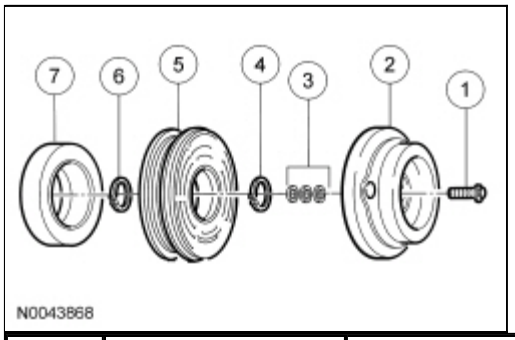
The PCM commands the A/C clutch relay to turn on the A/C compressor clutch if all of the following conditions are met:

- The HVAC module is set to a mode which provides an A/C request to the PCM via the IPC .
- The evaporator temperature sensor is reading an acceptable temperature.
- The A/C pressure transducer is not reading a pressure above 2,841 kPa (412 psi) in the high side of the refrigerant system.
- The A/C pressure transducer is not reading a pressure that is too low (indicating a low charge condition) in the high-pressure side of the refrigerant system.
- The engine coolant temperature is not excessively high.
- The PCM has not detected a WOT condition.

An A/C compressor pressure relief valve is installed in the A/C compressor to protect the refrigerant system against excessively high refrigerant pressures as a redundant backup to the A/C pressure transducer.

A/C Compressor and Clutch Assembly

NOTE: Internal A/C compressor components are not serviced separately. The A/C compressor is serviced only as an assembly. The clutch disc and hub, A/C compressor pulley and bearing and the clutch field coil are serviceable.



The A/C compressor uses the following:

- A non-serviceable shaft seal
- A pressure relief valve installed in the rear of the compressor to protect the refrigerant system against

excessively high refrigerant pressures as a redundant backup to the A/C pressure transducer
- PAG oil or equivalent. This oil contains special additives required for the A/C compressor

Use the refrigerant oil adding procedure specified for this vehicle when installing a new A/C compressor. Refer to Section 412-00 .

A/C Compressor Clutch Assembly

Item	Part Number	Description
1	W711887	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19N689	A/C clutch disc and hub spacer
4	N805338	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W711883	A/C clutch field coil snap ring
7	19D798	A/C clutch field coil

The magnetic A/C clutch has the following characteristics:

- The A/C clutch drives the compressor shaft
- When battery positive voltage (B+) is applied to the A/C clutch field coil, the clutch disc and hub assembly is drawn toward the A/C clutch pulley
- The magnetic force locks the clutch disc and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate
- When B+ is removed from the A/C clutch field coil, springs in the clutch disc and hub assembly move the clutch disc away from the A/C clutch pulley

A/C Pressure Relief Valve

NOTE: If the A/C compressor is operating within limits and the A/C pressure relief valve is venting, or if the A/C pressure relief valve is leaking around the threads, replace the A/C pressure relief valve and O-ring seal. If the A/C pressure relief valve still vents after it is replaced, diagnose the refrigerant system for a restriction between the A/C compressor and A/C pressure transducer.

An A/C pressure relief valve is incorporated in the A/C compressor, as a redundant backup to the A/C pressure transducer, to prevent damage to the A/C compressor and other system components by relieving unusually high system discharge pressure buildups. Under normal conditions the A/C pressure relief valve will never vent. Only a failure of the A/C pressure transducer, a failure of the A/C clutch control system (clutch stuck on), overheating of the refrigerant system, or a restriction in the refrigerant system between the

repair4less

A/C compressor and A/C pressure transducer will cause the A/C pressure relief valve to vent.

The A/C pressure relief valve is a separate component and can be replaced separately from the A/C compressor. It is necessary to recover the refrigerant before removing the A/C pressure relief valve.

A/C Condenser/Power Steering Combo Cooler

The A/C condenser/power steering combo cooler is an aluminum fin-and-tube design heat exchanger located in front of the vehicle radiator. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat and by condensing gas to liquid refrigerant as it is cooled.

The receiver/drier is incorporated onto the LH side of the condenser core. The receiver/drier cartridge is a separate component and can be removed and installed separately from the condenser core.

The top portion of the condenser/power steering combo cooler is partitioned from the refrigerant system and is used for power steering fluid cooling.

Evaporator Core

The evaporator core is an aluminum plate/fin type and is located in the heater core and evaporator core housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and continues out of the evaporator core through the evaporator core outlet tube as a vapor. During A/C operation, all airflow from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

TXV

The TXV is located between the evaporator core and the TXV manifold and tube assembly at the rear of the engine compartment. The TXV provides a restriction to the flow of refrigerant from the high-pressure side of the refrigerant system and separates the low-pressure and high-pressure sides of the refrigerant system. Refrigerant entering and exiting the evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Desiccant Bag

NOTE: Installation of a new desiccant bag is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier desiccant bag. Damage to the receiver/drier desiccant bag includes physical damage to the receiver/drier desiccant bag or moisture contamination. Moisture contamination results only from a complete loss of refrigerant and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the system before repairs are carried out, the receiver/drier desiccant bag should not be replaced.

The desiccant bag is integral to the A/C condenser/power steering combo cooler. It stores high-pressure liquid after it leaves the condenser core. The desiccant bag removes any moisture from the refrigerant. The

desiccant bag is a separate component and can be removed and installed separately from the A/C condenser/power steering combo cooler.

Evaporator Temperature Sensor

The evaporator temperature sensor contains a thermistor. The resistance of this thermistor varies by a specific amount based on the evaporator temperature. The HVAC module measures a voltage ratio between the reference voltage it supplies to the sensor and the sensor voltage to determine this resistance and the associated evaporator temperature.

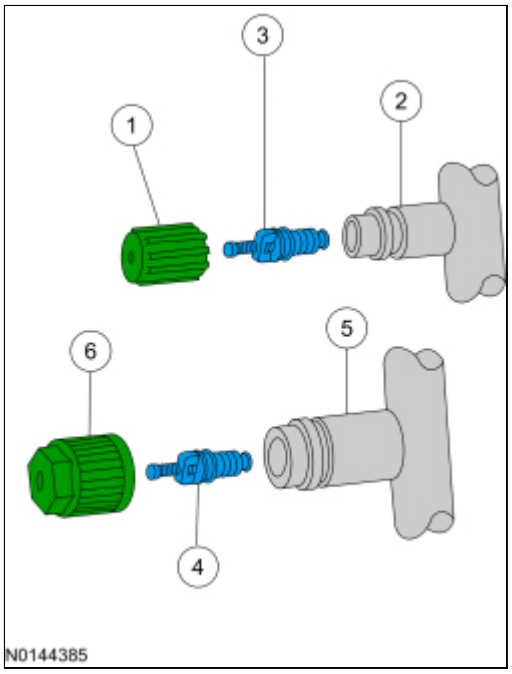
The HVAC module maintains evaporator core temperature and prevents the evaporator core from icing. This is accomplished by switching the A/C request signal off when the evaporator temperature sensor reading falls below acceptable levels (slightly above the freezing point of water), and by switching the A/C request signal on when the evaporator temperature rises above acceptable levels.

The evaporator temperature sensor electrical connector is located outside of the heater core and evaporator core housing behind the glove compartment, with the sensor pigtail leading into the housing to the sensor probe which is inserted between the evaporator core fins.

The evaporator temperature sensor is not available as a separate component. To install a new evaporator temperature sensor, a new heater core and evaporator core housing must be installed.

A/C Pressure Transducer

The A/C pressure transducer monitors the compressor discharge pressure and sends a variable voltage signal representing the pressure to the PCM . The PCM will interrupt A/C compressor operation in the event that the A/C pressure transducer indicates high system discharge pressures. It is also used to sense low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the PCM will not allow the clutch to engage.



The A/C pressure transducer is located on the compressor-to-condenser discharge line near the condenser inlet fitting. It is not necessary to recover the refrigerant before removing the A/C pressure transducer.

Service Gauge Port Valves

The high-pressure service gauge port valve is located on the condenser-to-evaporator line.

The low-pressure service gauge port valve is located on the evaporator outlet portion of the TXV manifold and tube assembly.

repair4less

Item	Torque	Description
1	0.8 Nm (7 lb-in)	Low-pressure service gauge port valve cap
2	—	Low-pressure service gauge port valve
3	2.26 Nm (20 lb-in)	Low-pressure Schrader-type valve
4	3.4 Nm (30 lb-in)	High-pressure Schrader-type valve
5	—	High-pressure service gauge port valve
6	0.8 Nm (7 lb-in)	High-pressure service gauge port valve cap

The fitting is an integral part of the refrigeration line or component.

- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage around the Schrader-type valve with the service gauge port valve cap removed is considered normal. Install a new Schrader-type valve core if the seal leaks excessively.
- The A/C service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.

Refrigerant System Dye

A fluorescent refrigerant system dye wafer is added to the receiver/drier desiccant bag to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. This fluorescent dye wafer dissolves after about 30 minutes of continuous A/C operation. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system.

repair4less

Air Distribution and Filtering

NOTE: The air distribution system of this vehicle cannot be equipped with a cabin air filter.

There are 2 sources of air available to the air distribution system:

- Outside air
- Recirculated air

Air enters the passenger compartment from the:

- instrument panel registers.
- floor duct.
- windshield defroster.
- side window demisters.
- rear footwell duct (if equipped).

Passenger compartment air is exhausted from the vehicle through open windows or body air vents on the back panel of the cab.

EMTC

Recirculated air is always used when the HVAC module is set to the MAX A/C mode and can be selected in any mode except DEFROST.

Air distribution within the vehicle is determined by the airflow mode selected. Airflow mode doors are used to direct airflow within the heater core and evaporator core housing. Electric mode door actuators are used to position these airflow mode doors.

Dual-Zone EATC

Vehicles equipped with dual-zone EATC use recirculated air only when the RECIRC mode is selected in any airflow mode other than DEFROST, or when required by the HVAC module in the AUTOMATIC mode during maximum cooling demands. The HVAC module will drive the air inlet mode door to the full RECIRC position, the full fresh air inlet position, or may stop at a mid-position based on the HVAC module cooling/heating requirements.

Air distribution within the vehicle is determined by the airflow mode selected, or by the EATC system in the AUTOMATIC mode. The air distribution mode on vehicles equipped with EATC can be overridden by the driver if desired. Airflow mode doors are used to direct airflow within the heater core and evaporator core housing. Electric mode door actuators are used to position these airflow mode doors.

Vehicles equipped with dual-zone EATC use 2 separate temperature blend doors. This allows individual temperature settings to be selected for the RH and LH air outlets. The airflow mode doors are not partitioned for separate RH and LH airflow positions. Therefore, the airflow mode will always remain similar for the RH

and LH sides of the vehicle regardless of the temperatures selected.

---

repair4less

Control Components

Control System Logic

A/C Request

For vehicles equipped with EMTC base system with 4 blower motor speed positions, when A/C button is pressed, a message is sent from the HVAC module over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

For vehicles equipped with EMTC non touch 4.2" display (FCDIM) system (with 7 blower motor speed positions), when A/C is requested by pressing the A/C button on the FCIM , the A/C request message is sent over the MS-CAN bus to the HVAC module that A/C has been selected. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

For vehicles equipped with 8" touchscreen, when A/C is requested by touching the FDIM , a message is sent from the APIM over the MS-CAN bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the BCM , then from the BCM through the HS-CAN bus to the PCM.

Voltage is provided to the A/C clutch relay coil and switch contacts from BJB . When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay. When the PCM energizes the relay, voltage is supplied to the A/C compressor clutch field coil from the relay. Ground is supplied for the A/C compressor clutch field coil.

An accurate evaporator temperature is critical for compressor engagement. The PCM uses the temperature measurement to turn the A/C compressor off before the evaporator temperatures are cold enough to freeze the condensation on the evaporator core.

When an A/C request is received by the PCM, the A/C compressor clutch will only be engaged through the A/C clutch relay if all of the following conditions are met:

- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below -1°C (30°F).
- The PCM has not detected a WOT condition.
- The HVAC module does not detect an evaporator discharge air temperature below 2°C (36°F).

EMTC — Base

All customer commands for the EMTC base climate control system come through the HVAC control head. The EMTC base system heats or cools the vehicle depending on the HVAC control panel selection. The EMTC base system has 4 blower motor speed positions.

- During A/C operation, the system reduces the relative humidity of the air inside the vehicle.
- The control panel selection determines heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the outlet air temperature.
- The blower motor switch varies the blower motor speed.
- A/C compressor operation.

The HVAC module is mounted to the center instrument panel finish panel below the ACM .

Control System Inputs

The temperature control selector setting determines air temperature. Movement of the temperature display from COOL (blue) to WARM (red) causes a corresponding movement of the temperature blend door and determines the discharge air temperature that the air distribution system will maintain. The temperature control selector is an integral part of the HVAC module and cannot be installed separately.

The airflow mode setting determines air discharge location. Pressing each airflow mode selector button causes a corresponding movement of the airflow mode doors and determines the air discharge location. The airflow mode selector buttons are an integral part of the HVAC module and cannot be installed separately.

The A/C request button determines A/C compressor operation, except when the airflow mode selector is in the OFF, MAX A/C or DEFROST mode. The A/C request button is an integral part of the HVAC module and cannot be installed separately.

The recirculated air request button can select recirculated air in any mode except DEFROST, and fresh air in any mode except MAX A/C or OFF. The recirculated air request button is an integral part of the HVAC module and cannot be installed separately.

The rear defog button signals activation of the heated backlight. The rear defog button is an integral part of the HVAC module and cannot be installed separately.

The blower motor speed setting controls blower motor speed by adding or bypassing resistors in the blower motor resistor in all modes except OFF. The blower motor speed selector is an integral part of the HVAC module and cannot be installed separately.

Control System Outputs

The EMTC base system has 4 control system outputs.

Blower Motor Speed

The HVAC module blower motor speed selector varies the blower motor ground circuit resistance by adding or bypassing series resistance in the blower motor resistor. Increased resistance lowers the blower motor speed, and lowered resistance increases blower motor speed. When the blower motor is in the HI (4) position, the blower motor resistor is bypassed.

The blower motor resistor is located on the heater core and evaporator core housing behind the glove compartment.

Temperature Blend Door Position

The temperature blend door actuator moves the temperature blend door on command from the HVAC module.

The temperature blend door actuator contains a reversible electric motor and a potentiometer. The

repair4less

potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the temperature blend door. The HVAC module powers the actuator motor to move the temperature blend door to the desired position. The vehicle occupants use the temperature selector knob to set the desired position.

On the EMTC system, the temperature blend door actuator is located on the top of the heater core and evaporator core housing.

Airflow Mode Door Position

The airflow mode door actuator uses a cam and lever assembly to position the defrost/panel/floor airflow mode doors on command from the HVAC module. The airflow mode door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the HVAC module to monitor the position of the airflow mode doors. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the airflow mode doors. The HVAC module powers the actuator motor to move the airflow mode doors to the desired position. The vehicle occupants use the mode selector buttons to set the desired position.

The airflow mode door actuator is located on the heater core and evaporator core housing to the right of the steering column. The HVAC module powers the actuator motor to move the airflow mode doors to the desired position. The desired position is set by the vehicle occupants using the mode selector buttons.

Air Inlet Mode Door Position

The air inlet mode door actuator moves the air inlet door between the fresh and RECIRC positions on command from the HVAC module. The air inlet mode door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the HVAC module to monitor the position of the air inlet door. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the air inlet door.

The air inlet mode door actuator is located on the air inlet duct behind the glove compartment. The HVAC module powers the actuator motor to move the air inlet door to the desired position. Under certain conditions, the air inlet door may stop at intermediate positions to provide a mix of fresh and recirculated air to meet cooling/heating requirements. The air inlet mode door actuator will automatically engage when ambient temperature is above 75°F, once per ignition cycle when in Panel or Panel/Floor modes.

HVAC Module — Remote Mount

The EATC dual zone and the EMTC 4.2 inch display systems use a remote HVAC module that is separate from the control interface. For details on the HVAC module communication, REFER to Control System Logic. The HVAC module also controls the outputs for the rear window defrost and heated seats. The HVAC module utilizes Field-Effect Transistor (FET) protective circuit strategy for its actuator outputs. Output load (current level) is monitored for excessive current (typically short circuits) and is shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A short circuit DTC is stored at the fault event and a cumulative counter is started. When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit is still shorted, the FET protection shuts off the circuit again and the cumulative counter advances. When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out.

The FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET. If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events. When each tolerance level is reached, the short circuit DTC that was stored on the first failure cannot be cleared by a command to clear the DTCs. The module does not allow the DTC to be cleared or the circuit to be restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), DTC U1000:00 and the associated DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns. When each level is reached, the DTC associated with the short circuit sets along with DTC U1000:00. These DTCs can be cleared using the module self-test, then the Clear DTC operation on the scan tool. The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur. If the number of short circuit fault events reach the third level, then DTCs U1000:00 and U3000:49 set along with the associated short circuit DTC. DTC U3000:49 cannot be cleared and a new module must be installed after the repair. The HVAC requires PMI when it is replaced.

The EATC dual zone and the EMTC 4.2 inch display systems use a remote HVAC module that is separate from the control interface. The EMTC with 4.2 inch display system has 7 blower motor speed positions.

The HVAC module analyzes input from the following sources:

- Temperature, airflow direction, blower, A/C and RECIRC selection (made by the vehicle occupants)
- In-vehicle temperature and humidity sensor
- AAT sensor
- Autolamp/Sunload sensor (solar radiation sensor, only on dual zone system)
- Vehicle speed
- Engine coolant temperature

Using these inputs, the HVAC module determines the correct conditions for the following outputs:

- A/C compressor operation
- Blower speed
- Driver side and passenger side (if equipped) temperature blend door positions
- Defrost/panel/floor airflow mode door position
- Air inlet door position

Control System Inputs

Both EATC dual zone system and the EMTC 4.2 inch display without touchscreen system have remote mounted HVAC modules.

HVAC Module — Without Touchscreen System

Vehicles equipped with the non touchscreen 4.2 inch display use a remote HVAC module that is separate from the control interface. This EMTC system has 7 blower motor speed positions. The FCIM provides the interface for the vehicle occupants to control the climate control system. When selections are made, the FCIM communicates the selections to the HVAC module through the MS-CAN . The remote HVAC module controls the climate control system based on the FCIM selections.

HVAC Module — With Touchscreen System

Vehicles equipped with the touchscreen EATC dual zone system use a remote HVAC module that is separate from the control interface. The FDIM provides the touchscreen interface for the vehicle occupants to control the climate control system. When selections are made, the FCIM communicates the selections to the HVAC module over the MS-CAN . The remote HVAC module controls the climate control system based

repair4less

on the FDIM selections, or automatically controls the climate control system in the AUTO mode.

The remote HVAC module is located at the top center of the instrument panel and can be accessed through the upper instrument panel storage tray opening with the tray removed.

In-Vehicle Temperature and Humidity Sensor

The in-vehicle temperature and humidity sensor contains 2 thermistors, which separately measure the in-vehicle air temperature and humidity and send those readings to the HVAC module. An aspirator hose and elbow is connected between the heater core and evaporator core housing and the in-vehicle temperature and humidity sensor. The aspirator hose uses airflow from the heater core and evaporator core housing air stream to create a venturi-type suction to draw in-vehicle air through the in-vehicle temperature and humidity sensor and across the thermistors.

The in-vehicle temperature and humidity sensor is mounted to the instrument panel to the right of the steering column.

Autolamp/Sunload Sensor (Solar Radiation Sensor)

The autolamp/sunload sensor supplies information to the dual-zone HVAC module indicating sunload. When sunload is detected, the information from the sensor is used to lower the A/C temperature output to compensate for radiant heat warming the vehicle interior and occupants.

The sunload sensor is located on the center of the instrument panel at the base of the windshield.

AAT Sensor

The AAT sensor signal is hard wired to the PCM and is sent over the vehicle communication network. The AAT sensor is located in front of the radiator to the right of the hood latch. For information regarding the external air temperature display, Section 412-00 .

Control System Outputs

NOTE: Each of the 4 control system outputs may be overridden by the passenger if desired.

When operating in AUTO mode (if equipped), the control system outputs will be automatically adjusted by the HVAC module.

Blower Motor Speed

The blower motor speed control controls the blower motor speed by converting low power signals from the HVAC module to a high-current, variable ground feed for the blower motor. The HVAC module adjusts blower motor speed based on the difference between the in-vehicle temperature sensor signal and set temperature. A delay function is used to provide a gradual increase or decrease in blower motor speed under all conditions.

The blower motor speed control is located on the heater core and evaporator core housing near the blower motor.

Single Zone Temperature Blend Door Position

The single zone temperature blend door actuator moves the temperature blend door on command from the HVAC module.

The single zone temperature blend door actuator contains a reversible electric motor and a potentiometer.

The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the temperature blend door. The HVAC module powers the actuator motor to move the temperature blend door to the desired position. The desired temperature blend door positions are calculated by the HVAC module based on the set temperature, in-vehicle temperature and humidity, and ambient air temperature.

On the single zone system, the temperature blend door actuator is located on the top of the heater core and evaporator core housing.

Dual Zone Temperature Blend Door Position

The dual-zone EATC system uses 2 temperature blend door actuators to control 2 separate temperature blend doors. The temperature blend doors independently vary the driver side and passenger side temperature settings, as desired. The temperature blend door actuators each contain a reversible electric motor and a potentiometer. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the temperature blend door. The HVAC module powers the actuator motors to move the temperature blend doors to the desired positions. The desired temperature blend door positions are calculated by the HVAC module based on the set temperature, in-vehicle temperature and humidity, ambient air temperature and sunload.

On the dual-zone EATC system, the temperature blend door-driver side actuator is located on the bottom of the heater core and evaporator core housing. The temperature blend door-passenger side actuator is located on the top of the heater core and evaporator core housing.

Airflow Mode Door Position

The airflow mode door actuator uses a cam and lever assembly to position the defrost/panel/floor airflow mode doors on command from the HVAC module. The airflow mode door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the HVAC module to monitor the position of the airflow mode doors. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the airflow mode doors. The HVAC module powers the actuator motor to move the airflow mode doors to the desired position. The HVAC module determines the desired airflow mode door position based on the calculated outlet temperature.

The airflow mode door actuator is located on the heater core and evaporator core housing to the right of the steering column.

Air Inlet Mode Door Position

The air inlet mode door actuator moves the air inlet door between the fresh and RECIRC positions on command from the HVAC module. The air inlet mode door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the HVAC module to monitor the position of the air inlet door. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the air inlet door.

The air inlet mode door actuator is located on the air inlet duct behind the glove compartment. The HVAC module powers the actuator motor to move the air inlet door to the desired position. Under certain conditions, the air inlet door may stop at intermediate positions to provide a mix of fresh and recirculated air to meet cooling/heating requirements. The air inlet mode door actuator will automatically engage when

repair4less

ambient temperature is above 75°F, once per ignition cycle when in Panel or Panel/Floor modes.

Heating and Ventilation

The heating and ventilation system:

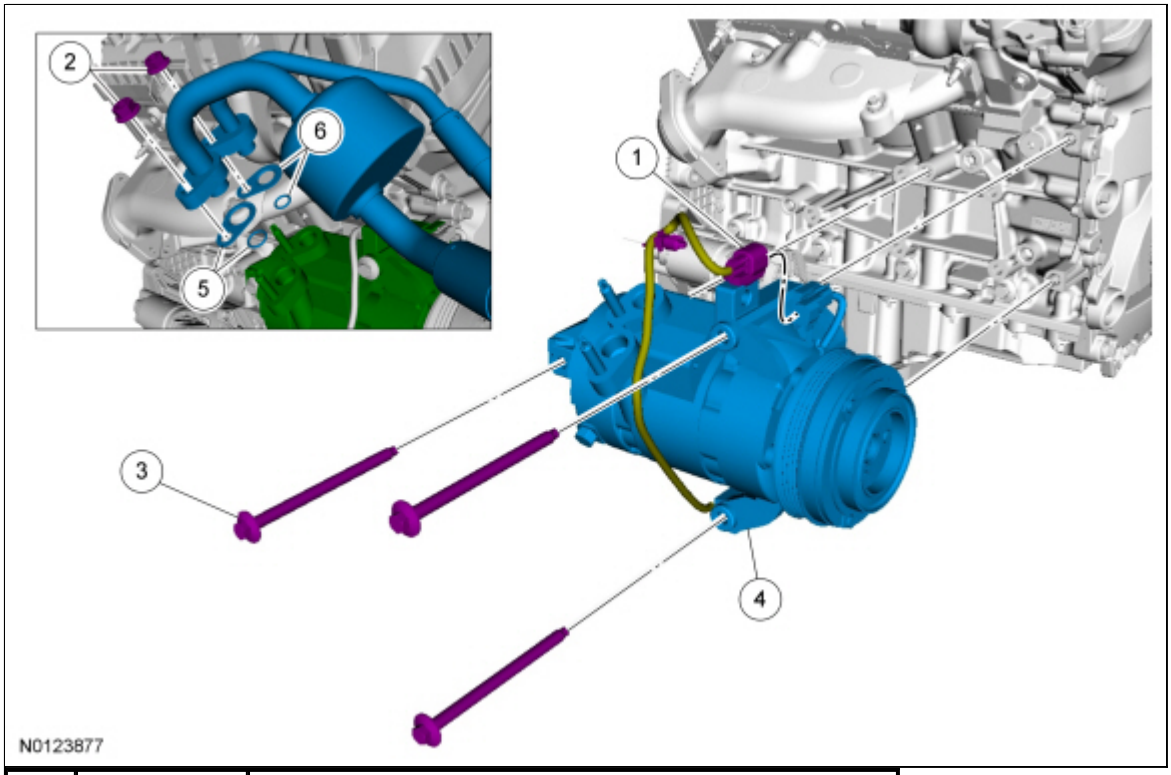
- controls the temperature and, during A/C operation, reduces the relative humidity of the air inside the vehicle.
- delivers heated or cooled air to maintain the vehicle interior temperature and comfort level.

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer it to air passing through the heater core.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the heater core and evaporator core housing and the plenum chamber where it is mixed and distributed.



Heater Core and Evaporator Core Housing

The heater core and evaporator core housing directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. The airflow is then directed through or around the heater core by the temperature blend door. After passing through the heater core, the airflow is distributed to the selected outlet by the airflow mode doors.

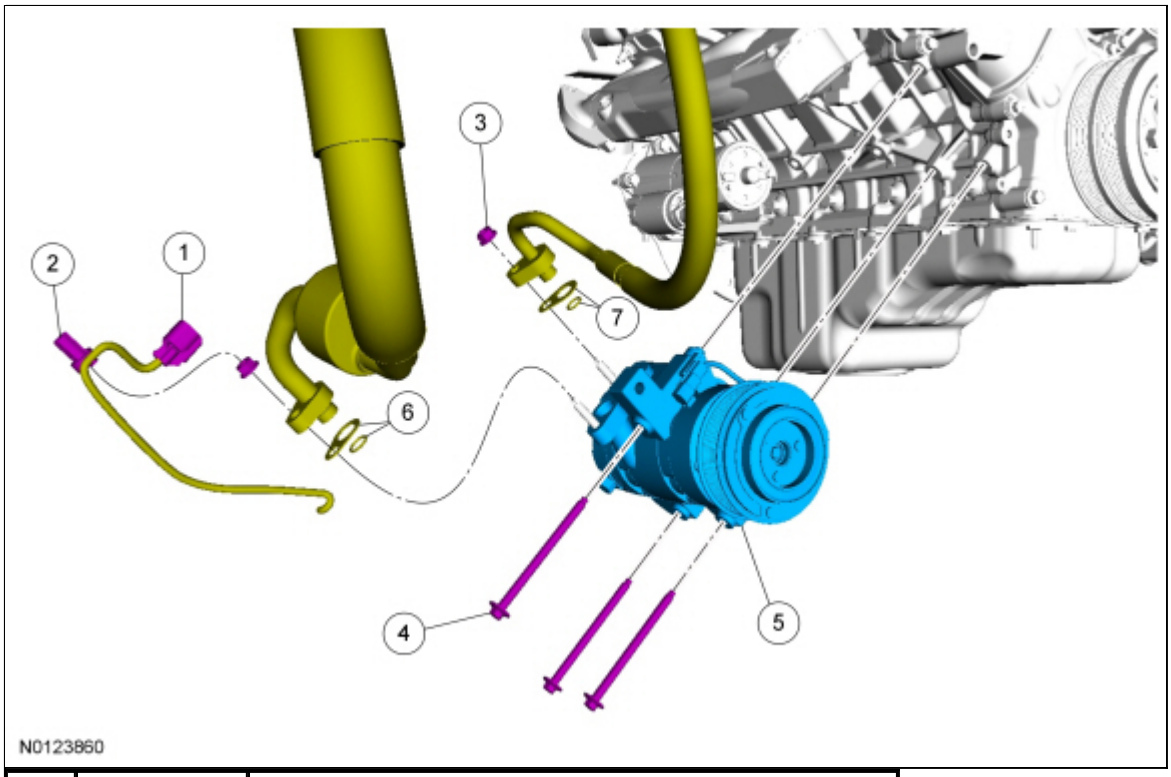
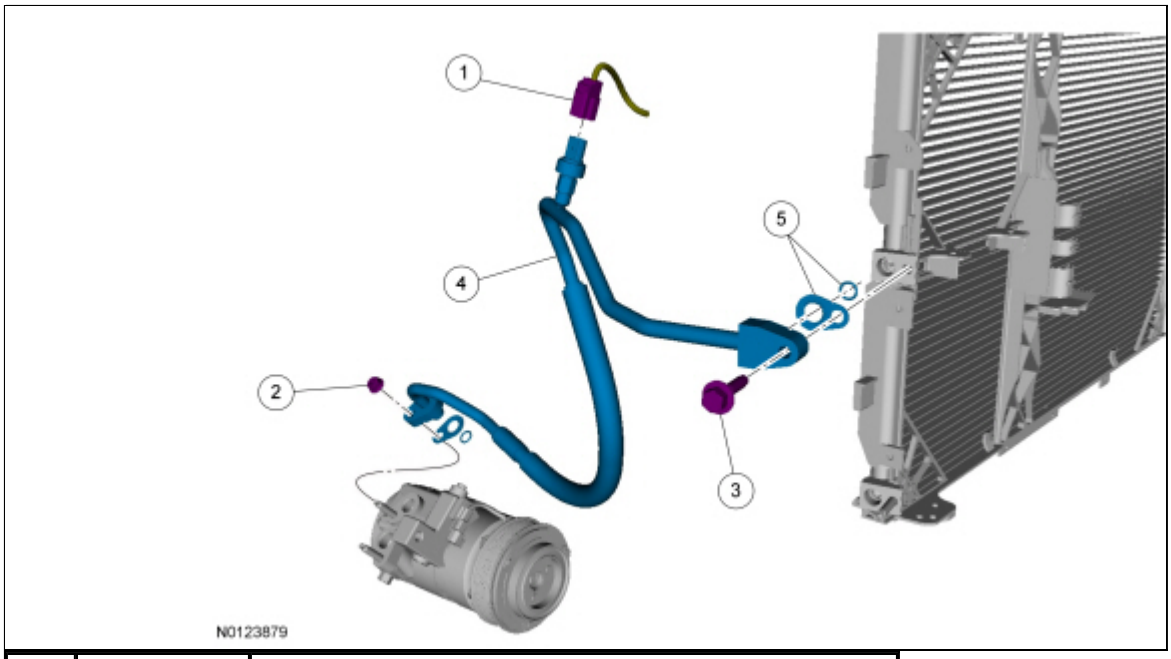
Air Conditioning — Exploded View

A/C Compressor — 3.5L GTDI, 3.7L



Item	Part Number	Description
1	—	A/C compressor electrical connector (part of 14300)
2	W520413	A/C compressor fitting nut (2 required) - 15 Nm (133 lb-in)
3	W704750	A/C compressor bolt (3 required) - 25 Nm (18 lb-ft)
4	19703	A/C compressor
5	19B596	O-ring seal and gasket seal kit
6	19B596	O-ring seal and gasket seal kit

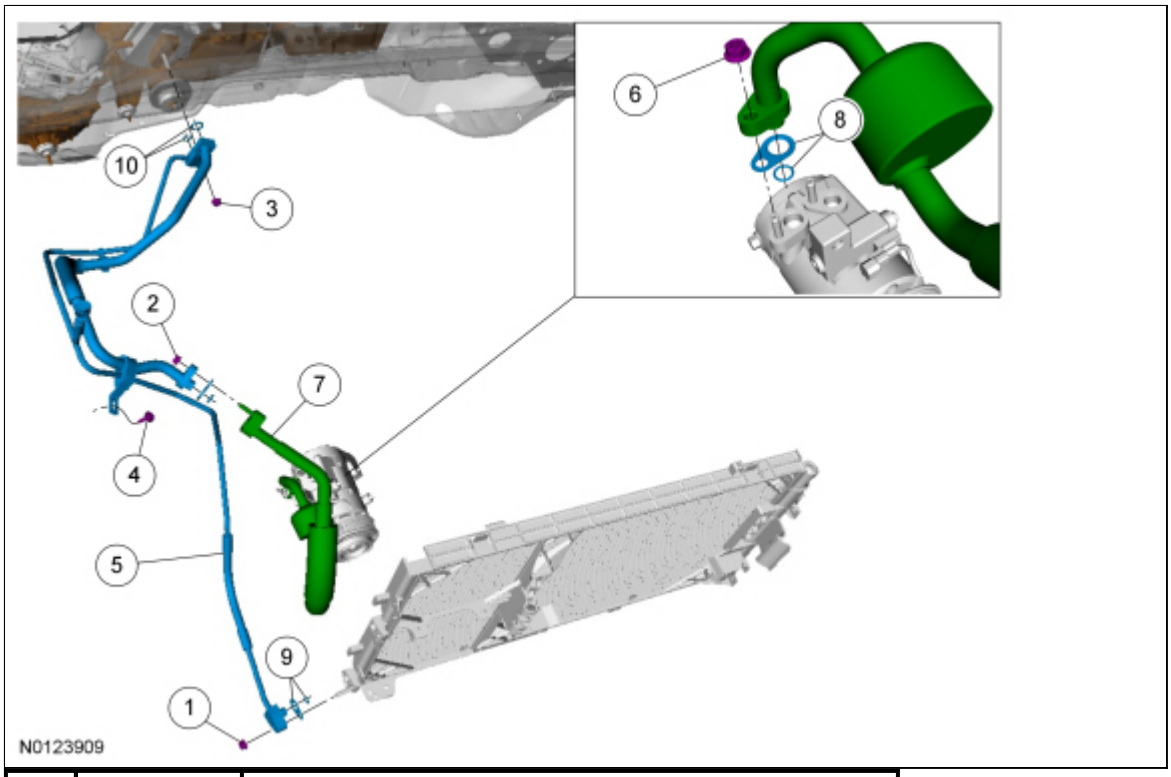
A/C Compressor 5.0L (4V), 6.2L (2V)



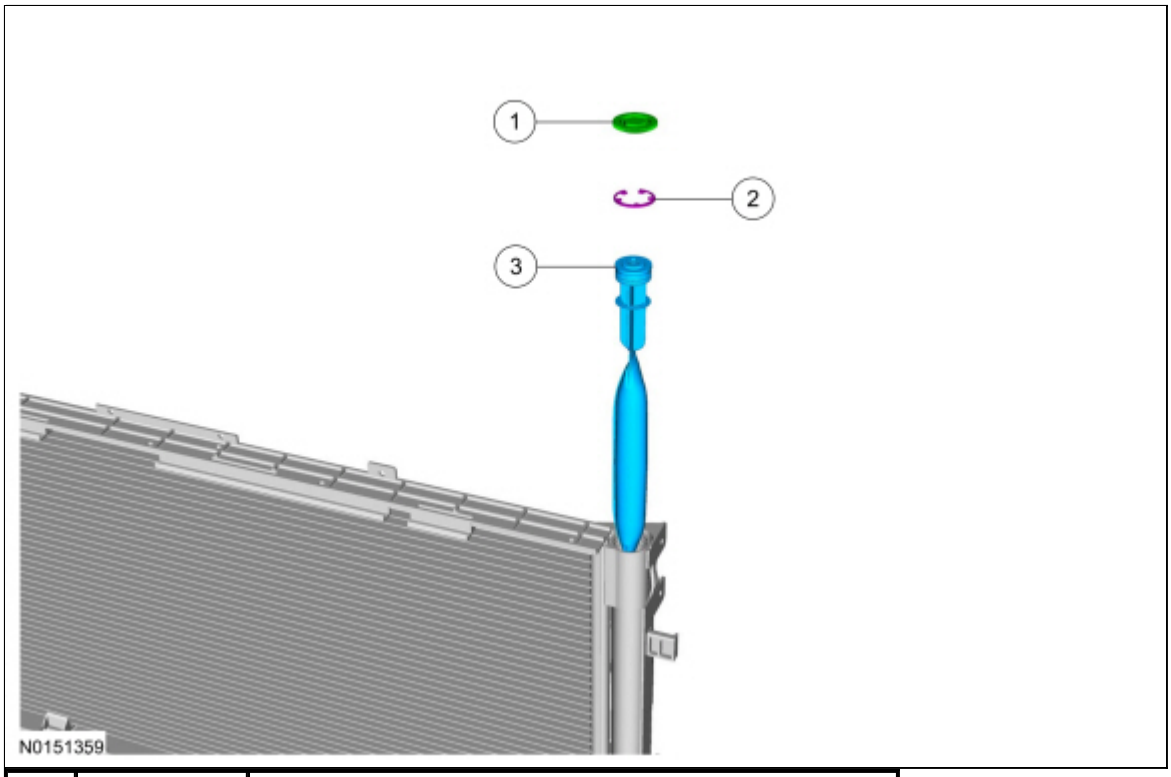
NOTE: 5.0L (4V) shown, 6.2L (2V) similar.

repair4less

Item	Part Number	Description
1	—	A/C compressor electrical connector (part of 14300)
2	—	Wire harness retainer (part of 14300)
3	W520413	A/C compressor fitting nut (2 required) - 15 Nm (133 lb-in)
4	W704750	A/C compressor bolt (3 required) - 25 Nm (18 lb-ft)
5	19703	A/C compressor
6	19B596	O-ring seal and gasket seal kit
7	19B596	O-ring seal and gasket seal kit



Compressor-to-Condenser Discharge Line



Item	Part Number	Description
1	—	A/C pressure transducer electrical connector
2	W520413	A/C compressor discharge fitting nut - 15 Nm (133 lb-in)
3	W715219	A/C condenser inlet fitting bolt - 20 Nm (177 lb-in)
4	19972	Compressor-to-condenser discharge line
5	19B596	O-ring seal and gasket seal kit (2 required)

Thermostatic Expansion Valve (TXV) Manifold-and-Tube and Evaporator-to-Compressor Suction Line

repair4less

Item	Part Number	Description
1	W520413	A/C condenser outlet fitting nut - 15 Nm (133 lb-in)
2	W520413	Evaporator-to-compressor suction line fitting nut - 15 Nm (133 lb-in)
3	W520413	Thermostatic Expansion Valve (TXV) fitting nut 15 Nm (133 lb-in)
4	W505424	TXV manifold and tube assembly bracket bolt
5	19A834	TXV manifold and tube assembly
6	W520413	A/C compressor suction fitting nut - 15 Nm (133 lb-in)
7	19972	Evaporator-to-compressor suction line
8	19B596	O-ring seal and gasket seal kit (2 required)
9	19B596	O-ring seal and gasket seal kit
10	19B596	Gasket seals (2 pieces from kit required)

Item	Part Number	Description

Air Conditioning (A/C) Compressor

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

NOTICE: **If installing a new Air Conditioning (A/C) compressor due to an internal failure of the old unit, the following procedures must be carried out to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.**

- **Carry out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to Section 412-00 .**
- **Install a new Thermostatic Expansion Valve (TXV), as directed by the A/C flushing procedure.**
- **Install a new receiver/drier as directed by the A/C flushing procedure.**

NOTE: Installation of a new receiver/drier is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier. Damage to the receiver/drier includes leaks in the receiver/drier, physical damage to the receiver/drier shell or desiccant, or moisture contamination. Moisture contamination results only from a complete loss of refrigerant and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the system before repairs are carried out, the receiver/drier should not be replaced.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If flushing of the A/C system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00 .

3.5L GTDI vehicles

3. Remove the Air Cleaner (ACL) outlet pipe, RH ACL pipe to-turbocharger pipe, RH turbocharger bypass hose and the RH turbocharger-to-Charge Air Cooler (CAC) pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .

All vehicles

4. Disconnect the clutch field coil electrical connector.

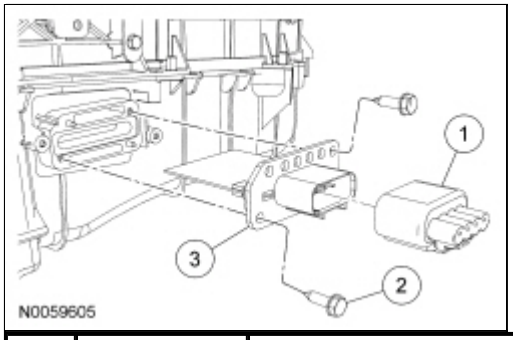
5. Detach the wire harness retainer from the A/C compressor and position the wire harness aside.

repair4less

6. Remove the 2 A/C compressor fitting nuts and disconnect the fittings.
    - Discard the O-ring seals and gasket seals.
    - To install, tighten to 15 Nm (133 lb-in).

7. If equipped, remove the front skid-plate.

8. Remove the drive belt from the A/C compressor pulley. For additional information, refer to Section 303-05 .



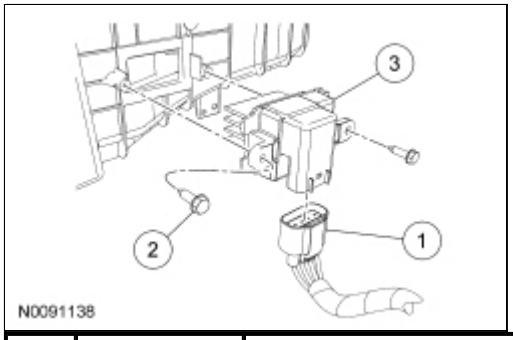
9. Remove the 3 A/C compressor bolts.
    - To install, tighten to 25 Nm (18 lb-ft).

10. Remove the A/C compressor.

11. To install, reverse the removal procedure.
    - If a new A/C compressor is to be installed, the clutch assembly may need to be transferred from the old unit to the new unit. For additional information, refer to Clutch and Clutch Field Coil in this section.
    - Install new gasket seals and O-ring seals.
    - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Blower Motor Resistor



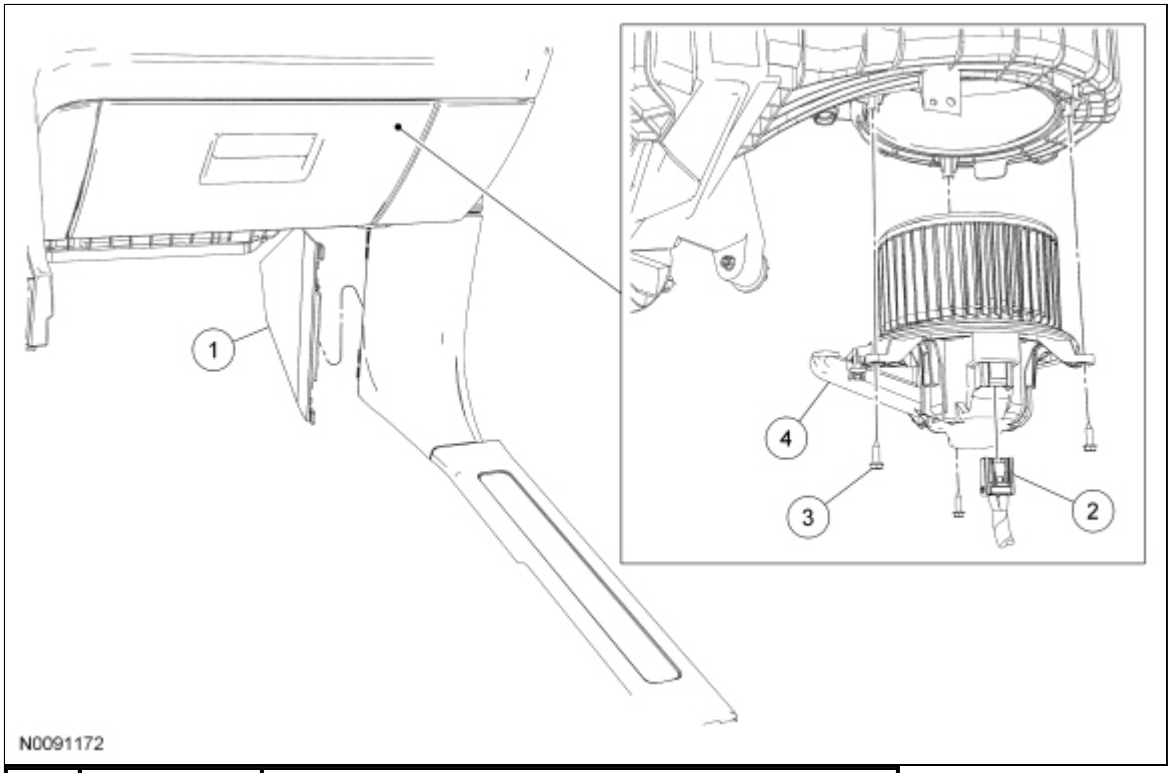
Item	Part Number	Description
1	—	Blower motor resistor electrical connector (part of 18B518)
2	W701696	Blower motor resistor screw (2 required)
3	18591	Blower motor resistor

Removal and Installation

1. Disconnect the blower motor resistor electrical connector.
2. Remove the 2 blower motor resistor screws.
3. Remove the blower motor resistor.
4. To install, reverse the removal procedure.

repair4less

Blower Motor Speed Control



Item	Part Number	Description
1	—	Blower motor speed control electrical connector (part of 18B518)
2	W701696	Blower motor speed control screw (2 required)
3	19E624	Blower motor speed control

Removal and Installation

1. Disconnect the blower motor speed control electrical connector.
2. Remove the 2 blower motor speed control screws.
3. Remove the blower motor speed control.
4. To install, reverse the removal procedure.

repair4less

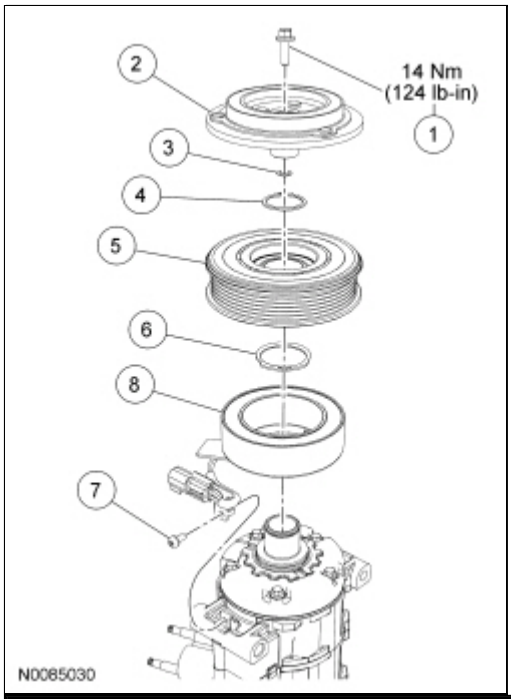
Blower Motor

Item	Part Number	Description
1	02348	Junction box cover
2	—	Blower motor electrical connector (part of 18B574)
3	W701696	Blower motor screw (3 required)
4	19805	Blower motor and wheel assembly

Removal and Installation

NOTICE: **The blower motors for vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) and vehicles equipped with Electronic Manual Temperature Control (EMTC) are not interchangeable. If the wrong blower motor is installed for the specific vehicle application, the blower motor circuit components will be damaged. Use only the correct blower motor listed for the specific vehicle application in the Ford Catalog Advantage™ or equivalent.**

1. Remove the junction box cover.
2. Remove the 2 push pins and the lower access panel.
3. Disconnect the blower motor electrical connector.
4. Remove the 3 blower motor screws.



repair4less

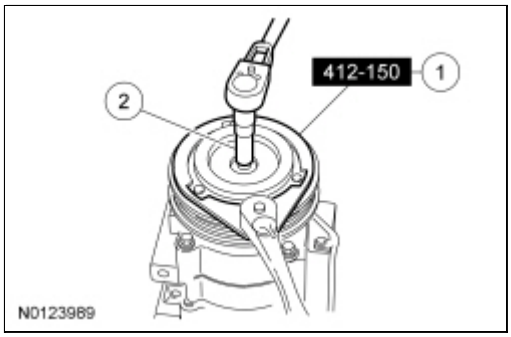
5. Remove the blower motor.
6. To install, reverse the removal procedure.

Clutch and Clutch Field Coil

Special Tool(s)

 ST2946-A	Holding Tool, A/C Clutch 412-150
 ST2382-A	Remover, Compressor Pulley 412-001 (T71P-19703-B)

Item	Part Number	Description
1	W711887	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19N689	A/C clutch hub disc and hub spacer
4	N805338	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W711883	A/C clutch field coil snap ring



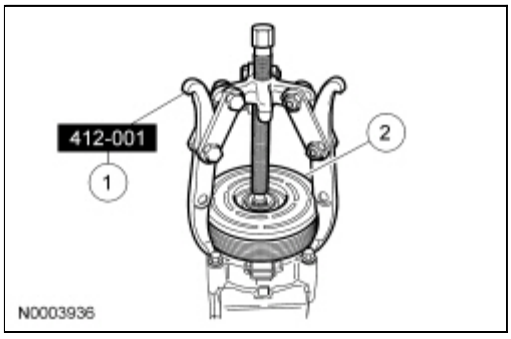
repair4less

7	W710797	A/C clutch field coil electrical connector screw
8	19D798	A/C clutch field coil

Removal

1. Remove the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

2. Remove the A/C clutch disc and hub bolt.
   1. Using the A/C Clutch Holding Tool, hold the A/C clutch disc and hub.
   2. Remove the A/C clutch disc and hub bolt.



3. Remove the A/C clutch disc and hub.

4. Remove the A/C compressor pulley snap ring.

5. ***NOTICE:*** **Do not use air tools. Damage to the Air Conditioning (A/C) clutch pulley or A/C compressor may result.**

   Using the Compressor Pulley Remover, remove the A/C compressor pulley.
   1. Install the Compressor Pulley Remover.
   2. Remove the A/C compressor pulley.

6. Remove the A/C clutch field coil snap ring.

7. Remove the A/C clutch field coil electrical connector screw.

8. Remove the A/C clutch field coil.

Installation

NOTE: A new A/C compressor may come equipped with a clutch and pulley. If not, the A/C clutch components should be reused unless obvious signs of damage are found. If excessive grooving is found on the friction surface, a new A/C clutch disc and hub and a new A/C compressor pulley must be installed together. Otherwise, each component can be installed individually where needed.

1. Visually inspect the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil for damage.
    - Inspect for physical damage, including cracked or melted components or discoloration due to excessive heat.
    - Inspect for excessive wear, including grooving in the A/C clutch disc and hub or A/C compressor pulley that is more than fingernail depth.
    - Inspect for roughness in the A/C compressor pulley bearing.

2. Clean the A/C clutch field coil and pulley mounting surfaces.

3. Install the A/C clutch field coil.

4. Install the A/C clutch field coil electrical connector screw.

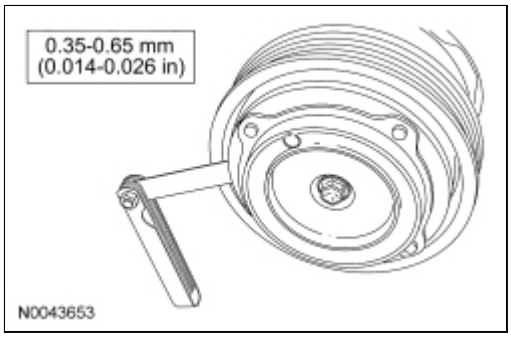
5. Install the A/C clutch field coil snap ring.

6. **NOTE:** The A/C compressor pulley is a tight fit on the A/C compressor. It must be correctly aligned during installation.

   Install the A/C compressor pulley.

7. Install the A/C compressor pulley snap ring with the bevel side out.

8. Place one nominal thickness A/C clutch disc and hub spacer inside the clutch hub spline opening.



9. Install the A/C clutch disc and hub.

10. Using the A/C Clutch Holding Tool, install the A/C compressor clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the A/C Clutch Holding Tool.
    2. Tighten the bolt to 14 Nm (124 lb-in).

11. Measure and adjust the clutch air gap at 3 spaces by removing or adding A/C clutch disc and hub spacers.

repair4less

12. Install the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

Compressor to Condenser Discharge Line

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

All vehicles

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

3.5L GTDI vehicles

2. Remove the Air Cleaner (ACL) outlet pipe, RH ACL pipe to-turbocharger pipe, RH turbocharger bypass hose and the RH turbocharger-to-Charge Air Cooler (CAC) pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .

All vehicles

3. Remove the A/C compressor discharge fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

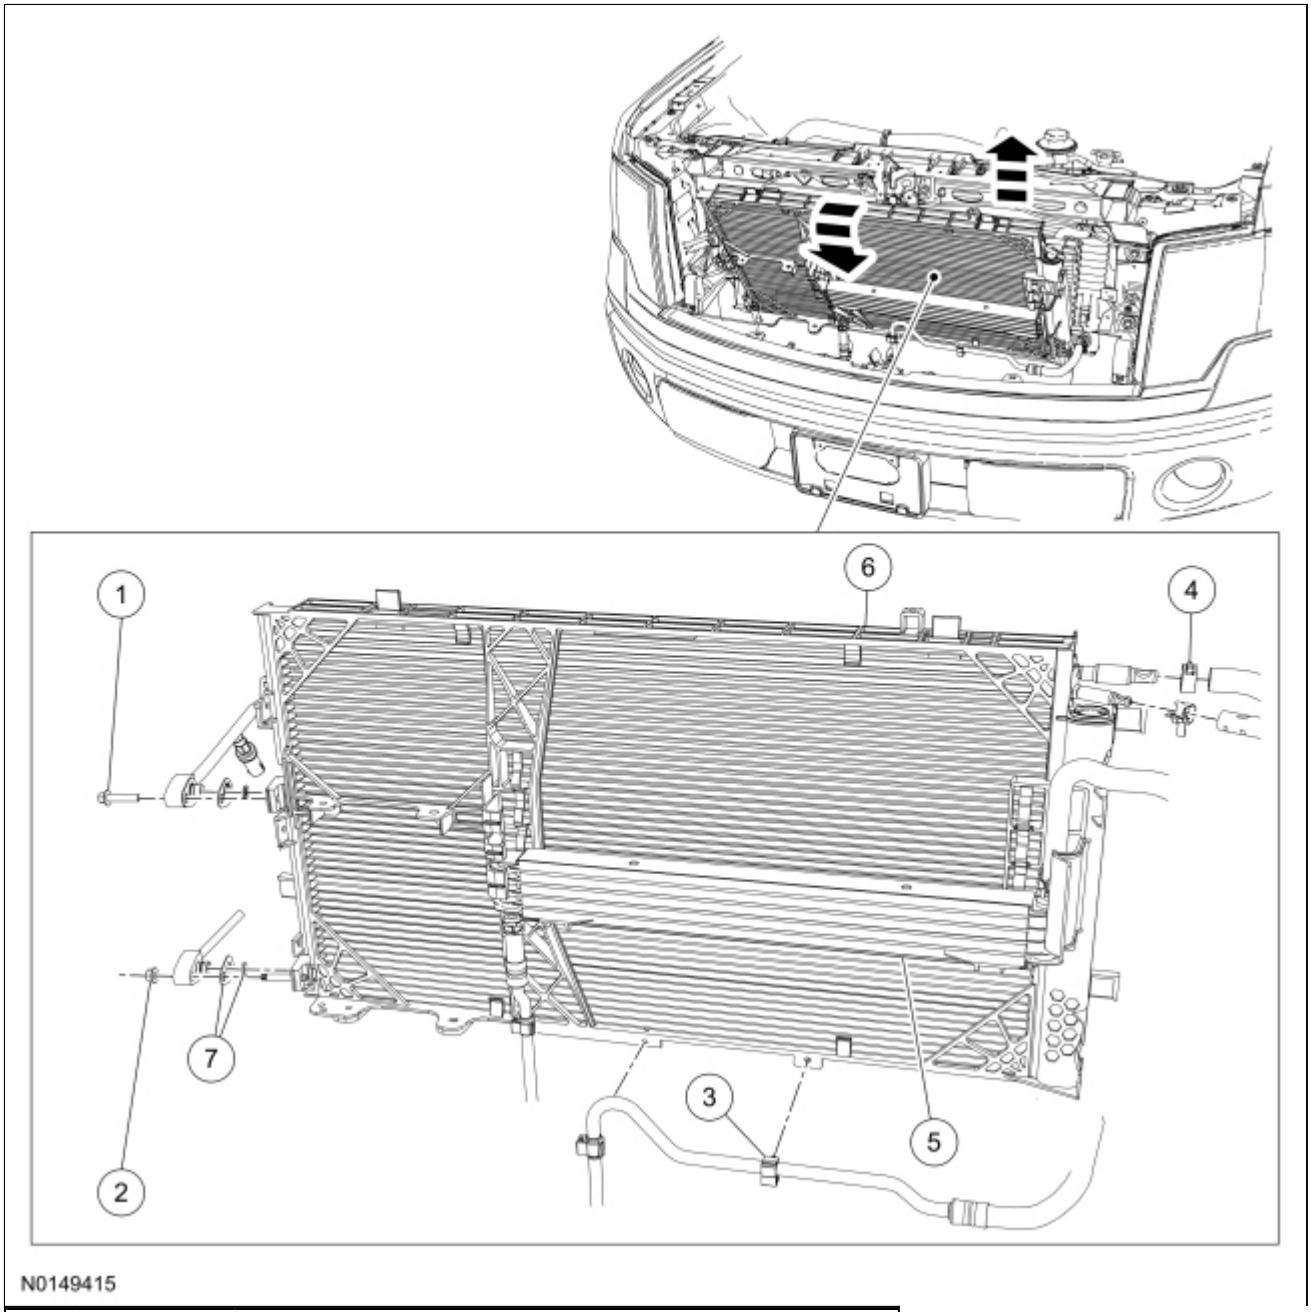
4. Remove the RH radiator air deflector upper pin-type retainer and position the air deflector aside.

5. Disconnect the A/C pressure transducer electrical connector.

6. Remove the condenser inlet fitting bolt and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 20 Nm (177 lb-in).

7. Remove the compressor-to-condenser discharge line.

8. To install, reverse the removal procedure.
   - Install new gasket seals and O-ring seals.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .



9. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

repair4less

Condenser Core

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

repair4less

Item	Part Number	Description
1	W715219	Condenser inlet fitting bolt - 20Nm (177 lb-in)
2	W520413	Condenser outlet fitting nut - 15Nm (133 lb-in)
3	7N291	Transmission cooler line pin-type retainer (3 required)
4	—	Power steering fluid cooler hose clamp (6.2L [2V] only) (part of 3A713) (2 required)
5	7A095	Auxiliary transmission fluid cooler
6	19712	Condenser core
7	19B596	O-ring seal and gasket seal kit (2 required)

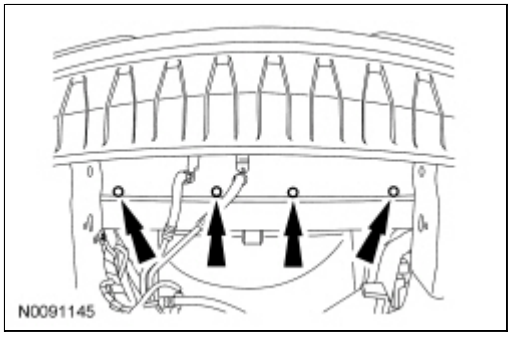
Removal and Installation

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the 6 upper radiator sight shield pin-type retainers and remove the upper radiator sight shield.

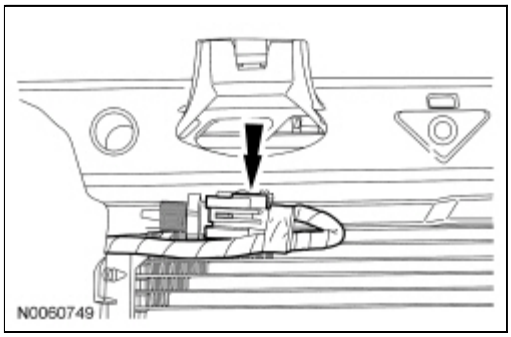


4. Remove the RH and LH radiator side air deflector-to-headlamp pin-type retainers.

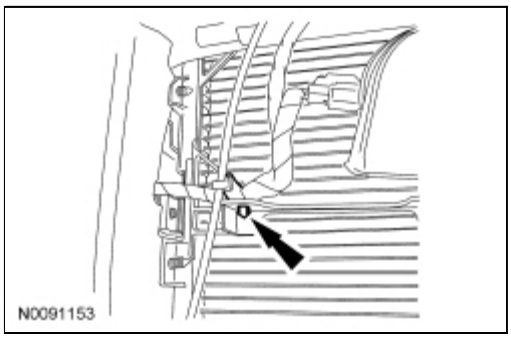
5. Remove the 5 radiator side air deflector pin-type retainers from the condenser bracket and position the side air deflectors aside.

6. Remove the horn assembly bolt and position the horn assembly aside.
   - To install, tighten to 10 Nm (89 lb-in).

7. Remove the 4 junction box bracket bolts and position the junction box aside.
   - To install, tighten to 10 Nm (89 lb-in).



8. Remove the 4 lower radiator air deflector pin-type retainers from the condenser bracket.

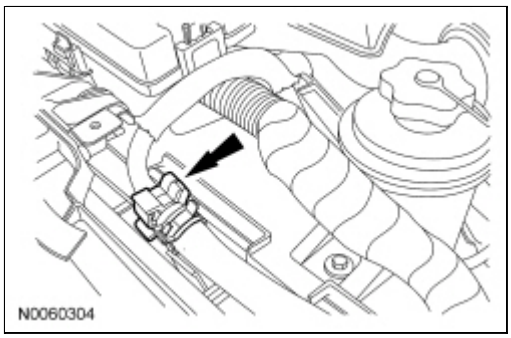


9. Remove the condenser inlet fitting bolt and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 20 Nm (177 lb-in).

10. Remove the condenser outlet fitting nut and disconnect the fitting.
    - Discard the O-ring seal and gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

11. Detach the ambient temperature sensor pin-type retainer from the core support.

12. Detach the hood latch cable pin-type retainer from the condenser core bracket.



3.5L Gasoline Turbocharged Direct Injection (GTDI)

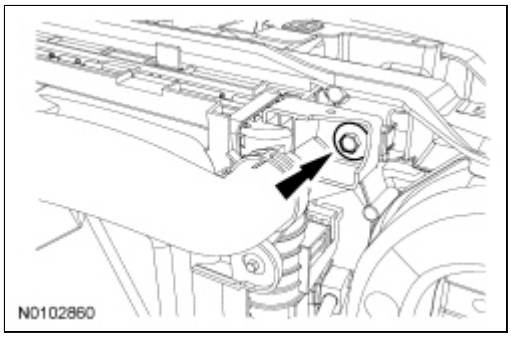
13. Remove the charge air cooler. For additional information, refer to Section 303-12 .

6.2L (2V) vehicles

14. Detach the power steering cooler line clip from the top of the condenser core bracket.

15. Detach the 3 transmission cooler line pin-type retainers from the condenser bracket.

Vehicles with auxiliary transmission fluid cooler



repair4less

16. Release the auxiliary transmission fluid cooler from the condenser core bracket and position aside.

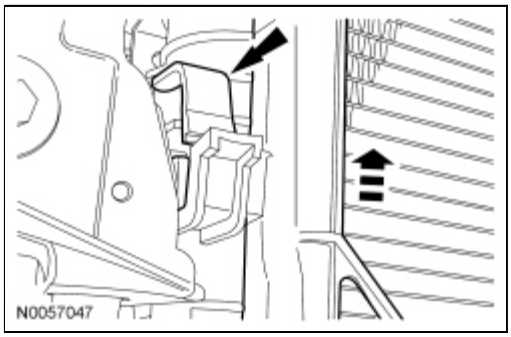
All vehicles

17. **NOTE:** RH bolt shown, LH similar.

    Remove the 2 radiator bolts.
    - To install, tighten to 15 Nm (133 lb-in).

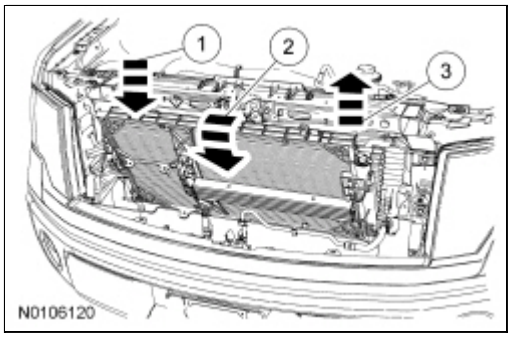
6.2L (2V) vehicles

18. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.



19. Release the 2 power steering fluid cooler hose clamps and disconnect the power steering cooler hoses from the condenser core.

All vehicles



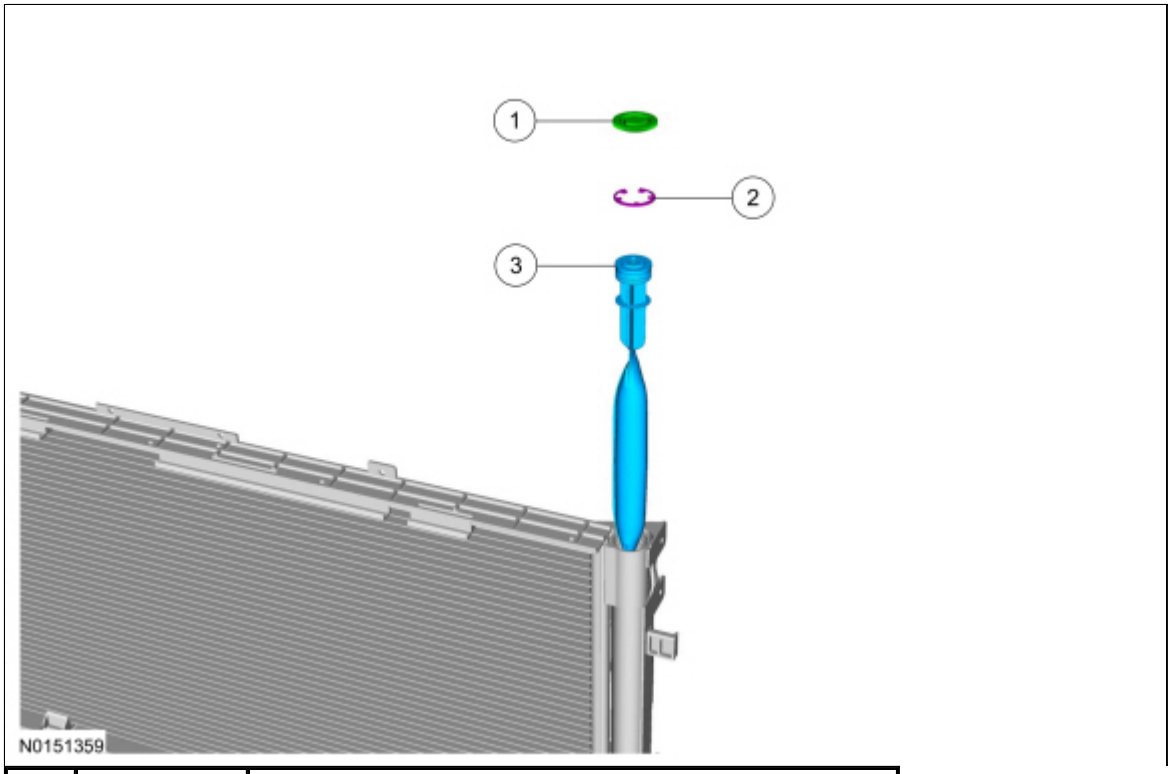
20. **NOTE:** The cooling module must be positioned rearward to detach the condenser from the radiator.

    NOTE: RH condenser retaining clip shown, LH similar.

    Release the 2 condenser core retaining clips, lift the condenser core upward and detach it from the radiator.

21. Remove the condenser core and bracket assembly.
    1. Lower the condenser core and bracket assembly to allow the top of the assembly to be tilted forward.
    2. Tilt the top of the condenser core and bracket assembly forward to allow it to clear the upper radiator support.
    3. Lift the condenser core and bracket assembly out of the vehicle.

22. To install, reverse the removal procedure.
    - Install new gasket seals and O-ring seals.
    - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .



23. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

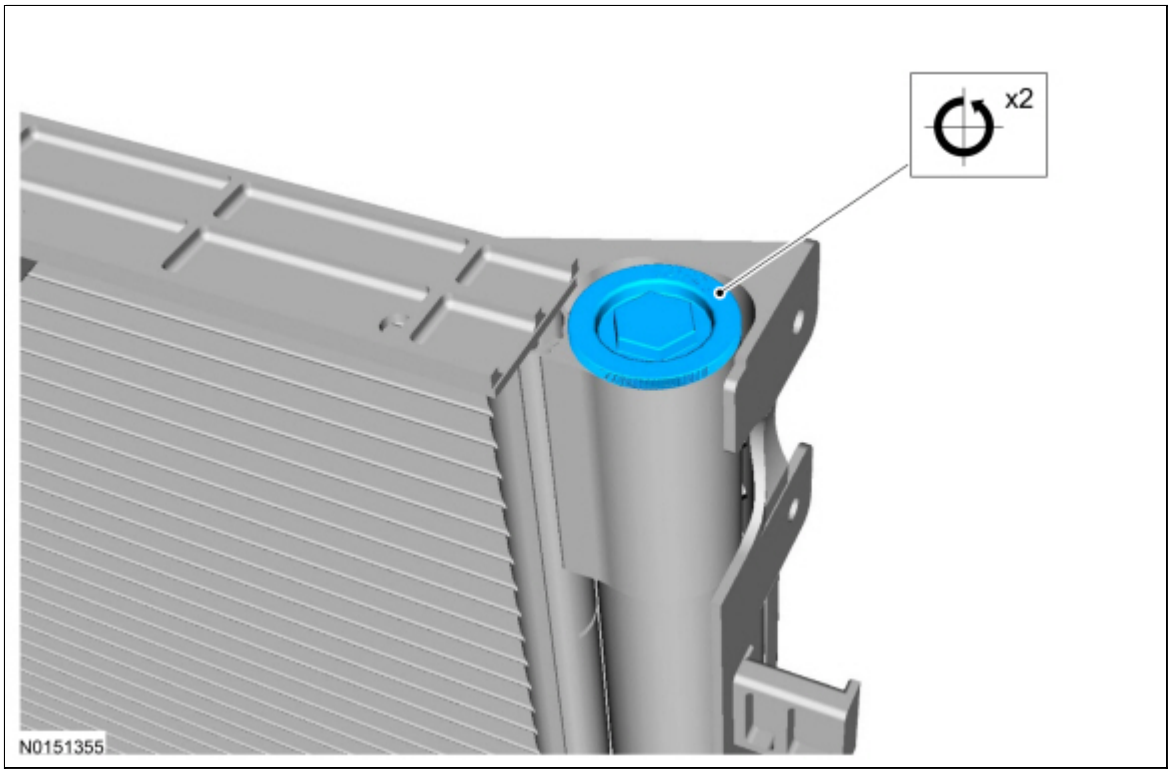
repair4less

Desiccant Bag

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

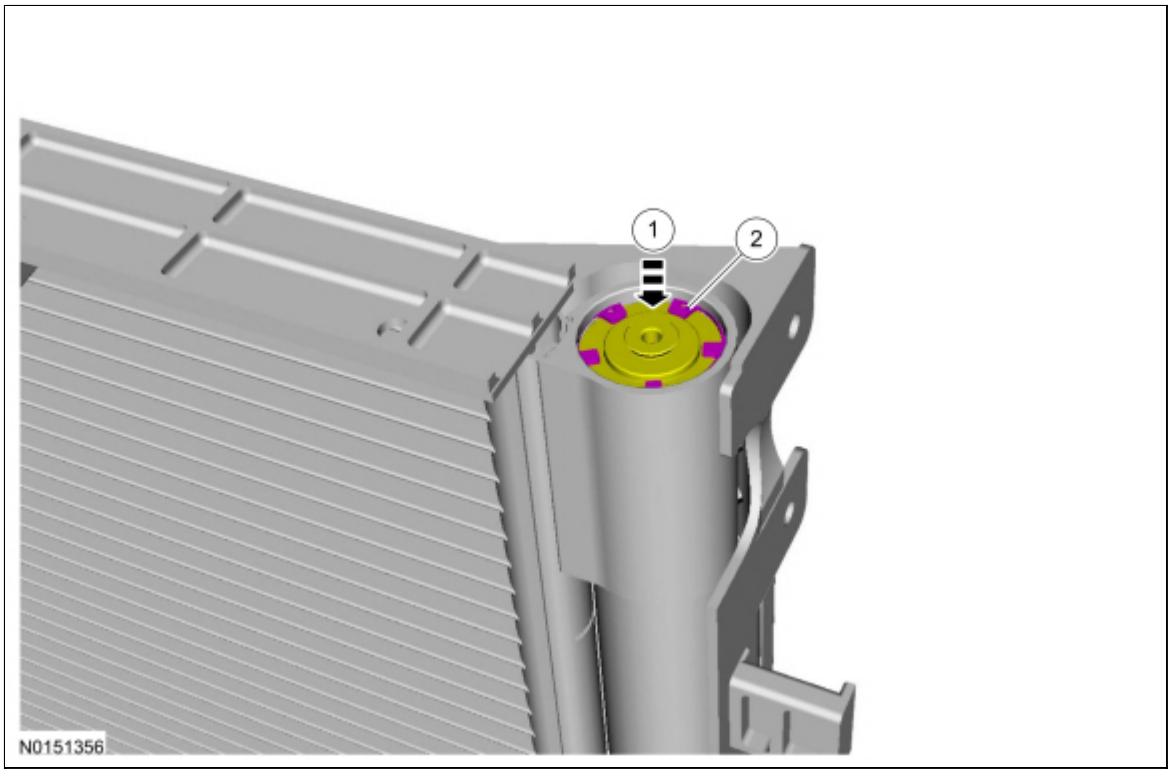
Item	Part Number	Description
1	—	Plastic receiver/drier cap (part of 19C836 kit)
2	—	Snap ring (part of 19C836 kit)
3	—	Receiver/drier plug and desiccant bag (part of 19C836 kit)



Removal and Installation

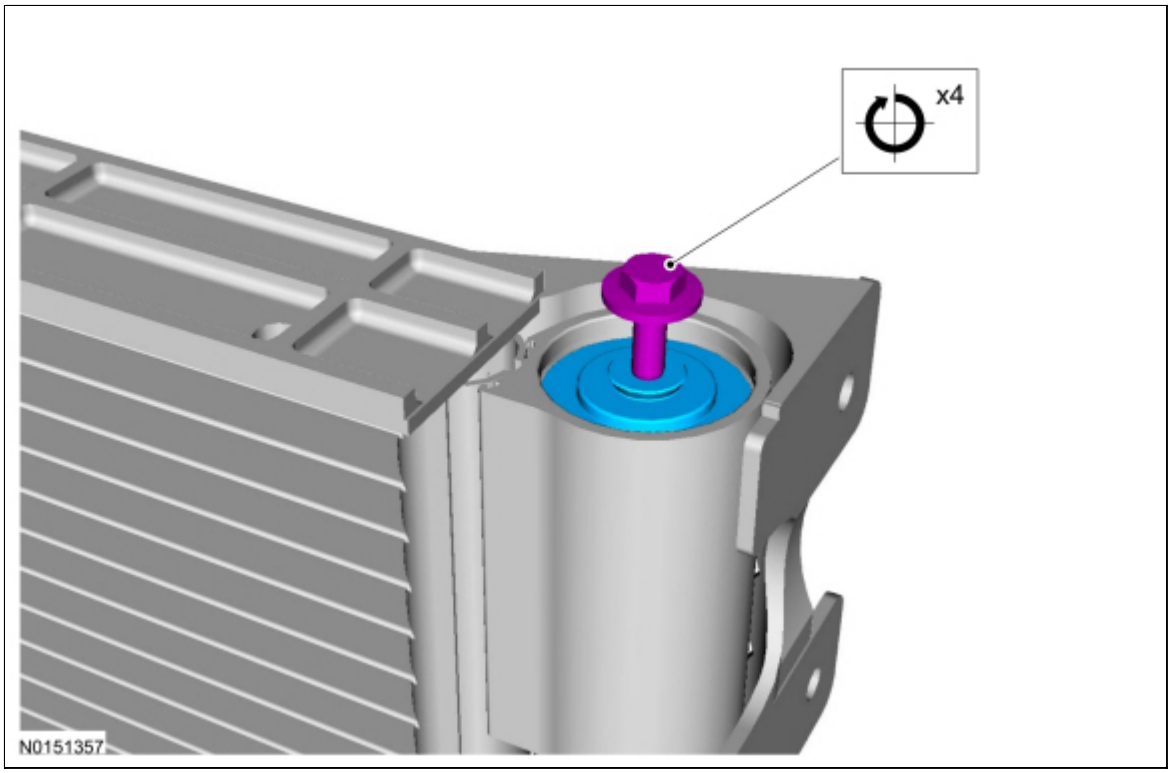
NOTE: Installation of a new desiccant bag is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier desiccant bag. It is not necessary to add additional dye to the refrigerant system, the new receiver/drier desiccant bag comes with a new dye pellet. Damage to the receiver/drier desiccant bag includes physical damage to the receiver/drier desiccant bag or moisture contamination. Moisture contamination results only from a complete loss of refrigerant and equalization of the refrigerant system pressure with atmospheric

pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the system before repairs are carried out, the receiver/drier desiccant bag should not be replaced.

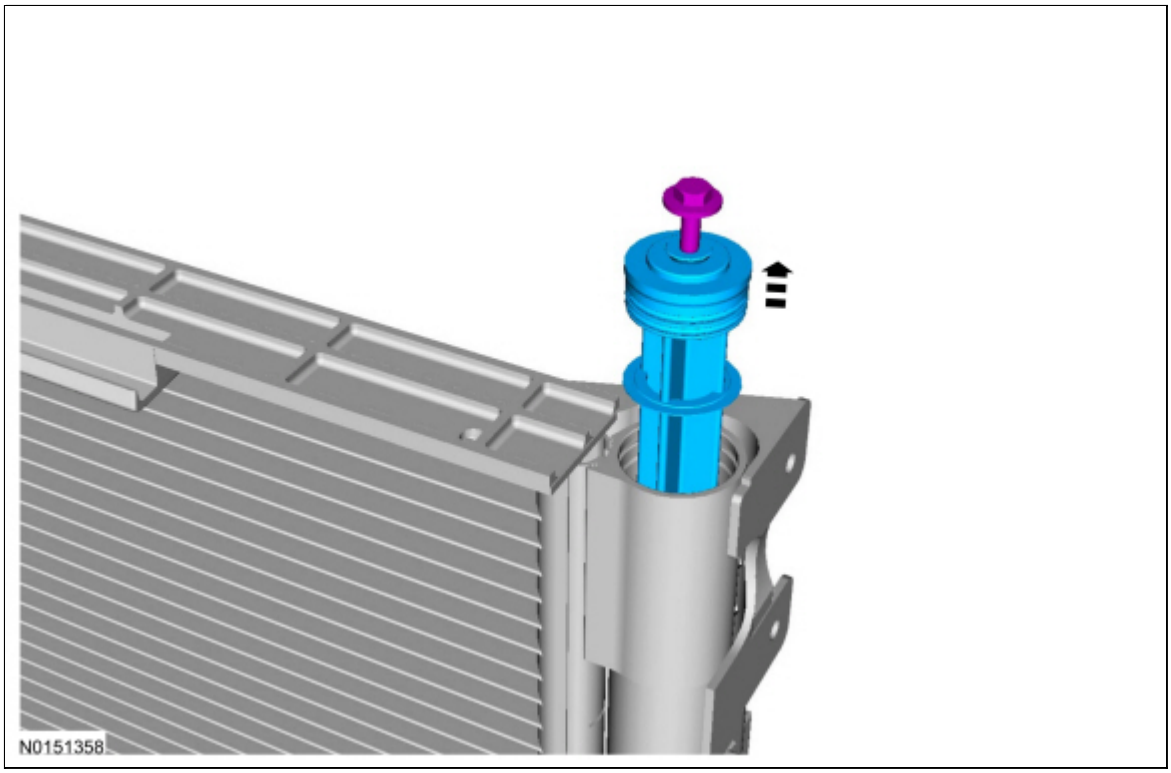


1. Remove the condenser core. For additional information, refer to Condenser Core .

2. Remove the receiver/drier cap.



3. Remove the receiver/drier plug snap ring.
    1. Push the receiver/drier plug towards the top of the condenser.
    2. Remove the receiver/drier plug snap ring.



repair4less

4. Install an M5 bolt in the center of the receiver/drier plug.

5. Remove the receiver/drier plug and the desiccant bag.

6. To install, reverse the removal procedure.
    - Lubricate the receiver/drier plug O-ring seals using residual refrigerant oil from inside the receiver/drier.

repair4less

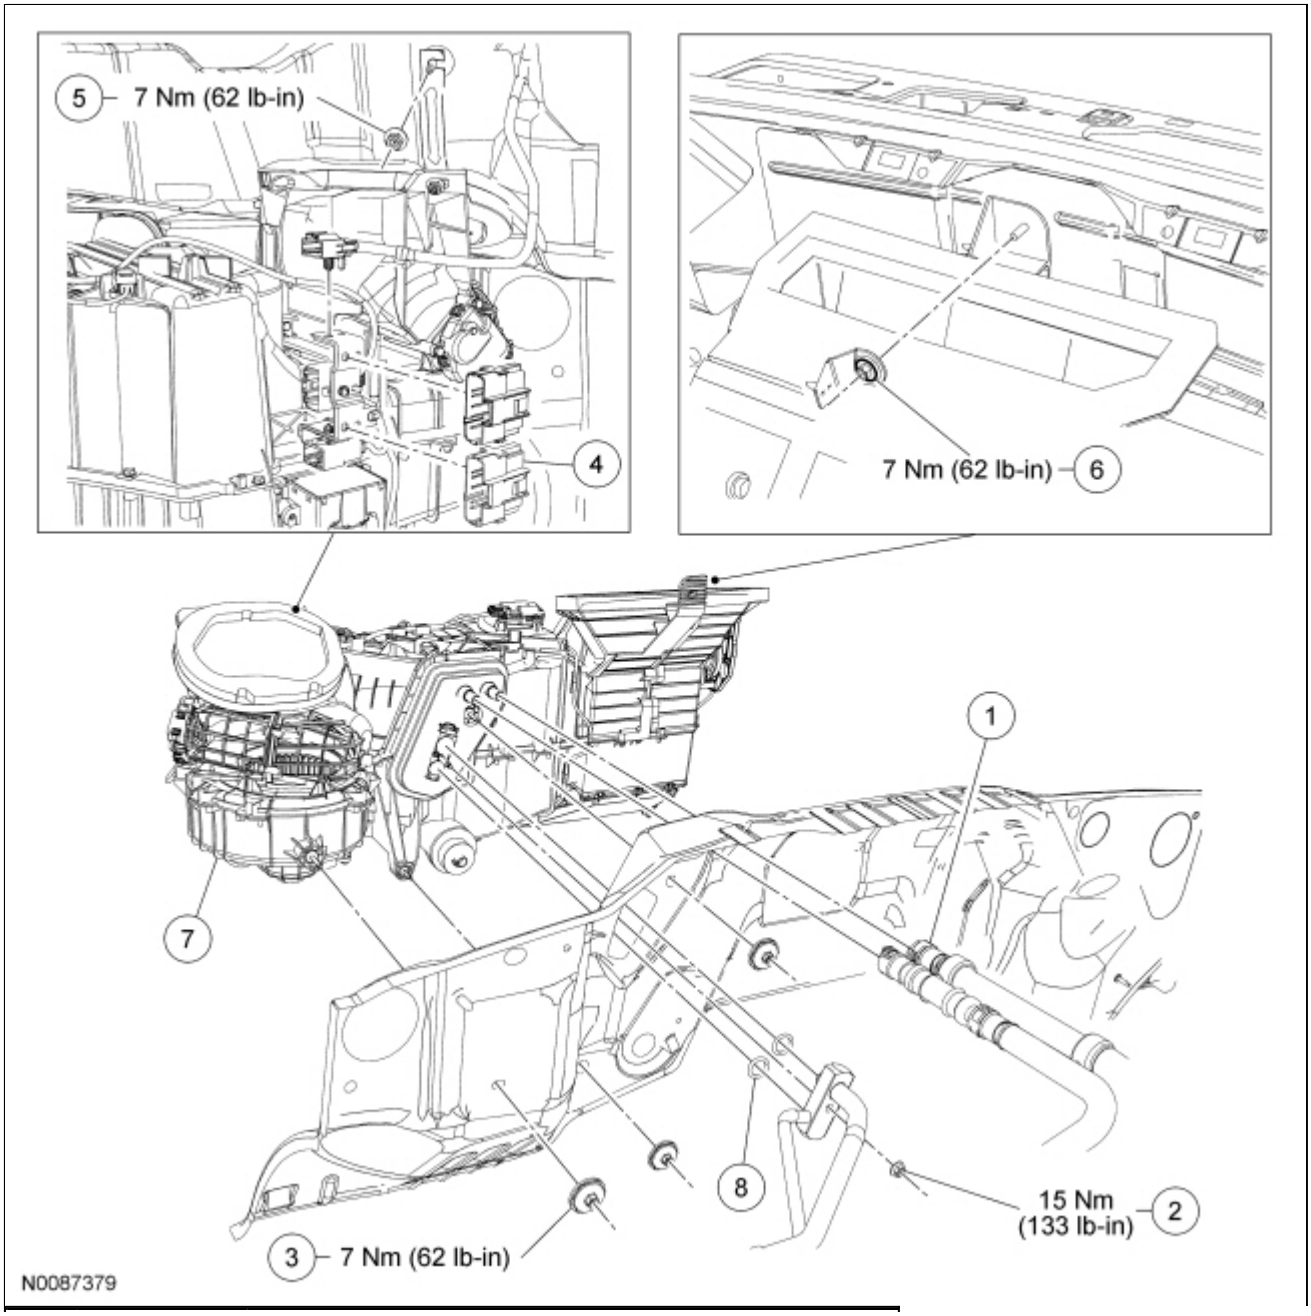
Evaporator Core

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

NOTE: The evaporator core is available only as part of the heater core and evaporator core housing assembly.



NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Transfer the components from the old housing to the new housing as needed.
3. Install the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.

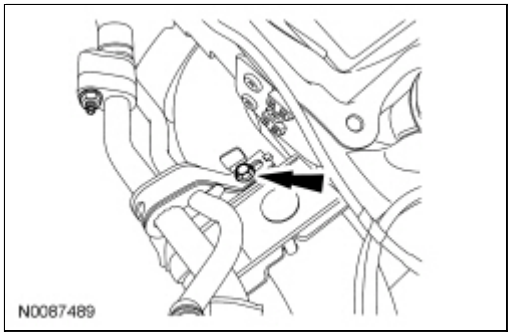
Heater Core And Evaporator Core Housing

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

repair4less

Item	Part Number	Description
1	18472	Heater hose quick disconnect fitting (2 required)
2	W520413	Thermostatic Expansion Valve (TXV) fitting nut
3	W708206	Heater core and evaporator core housing nut (3 required)
4	—	Body harness electrical connector (part of 14401) (3 required)
5	N806543	Air inlet duct bracket nut
6	—	Plenum chamber nut (part of 18471)
7	19B555	Heater core and evaporator core housing
8	19B596	Gasket seal (2 pieces from kit required)



Removal and Installation

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.

NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle.

NOTE: Failure to correctly install the evaporator core seal when installing the evaporator core will result in decreased A/C cooling efficiency due to airflow bypassing the evaporator core.

1. Drain the engine coolant. For additional information, refer to Section 303-03 .
2. Recover the refrigerant. For additional information, refer to Section 412-00 .
3. Remove the instrument panel. For additional information, refer to Section 501-12 .
4. Disconnect the 2 heater core quick disconnect fittings at the heater core.
5. Remove the Thermostatic Expansion Valve (TXV) manifold and tube bracket bolt.
   - To install, tighten to 8 Nm (71 lb-in).

6. Remove the TXV fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

7. Remove the 3 heater core and evaporator core housing nuts.
    - To install, tighten to 7 Nm (62 lb-in).

8. Detach the 3 harness electrical connectors from the heater core and evaporator core housing bracket.

9. If equipped, detach the 2 antenna cable retainers from the heater core and evaporator core housing.

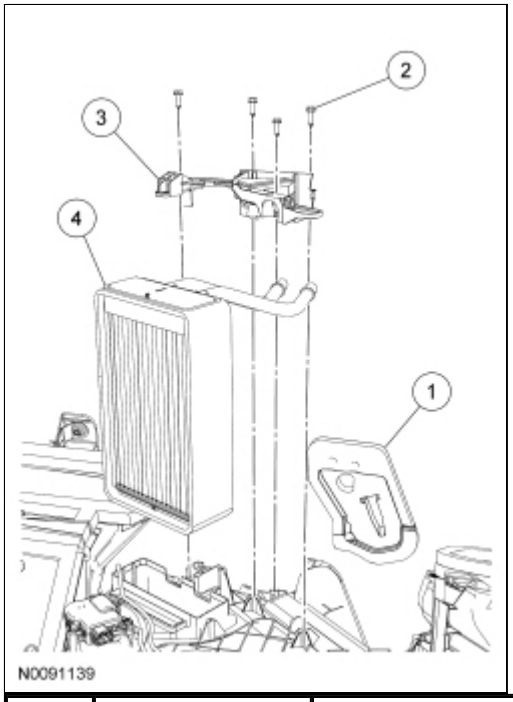
10. Remove the air inlet duct bracket nut.
    - To install, tighten to 7 Nm (62 lb-in).

11. Completely loosen the plenum chamber nut.
    - To install, tighten to 7 Nm (62 lb-in).

12. If equipped, detach the floor console duct from the heater core and evaporator core housing.

13. **NOTE:** For vehicles equipped with a rear footwell duct, the heater core and evaporator core housing must be carefully detached from the dash panel and then tilted toward the rear of the vehicle to detach it from the rear footwell duct connection.

    Remove the heater core and evaporator core housing.



14. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

15. Fill the engine cooling system. For additional information, refer to Section 303-03 .

---

Heater Core

Item	Part Number	Description
1	19C593	Heater tube dash panel seal
2	W701696	Heater core bracket screw (4 required)
3	18B689	Heater core bracket
4	18476	Heater core

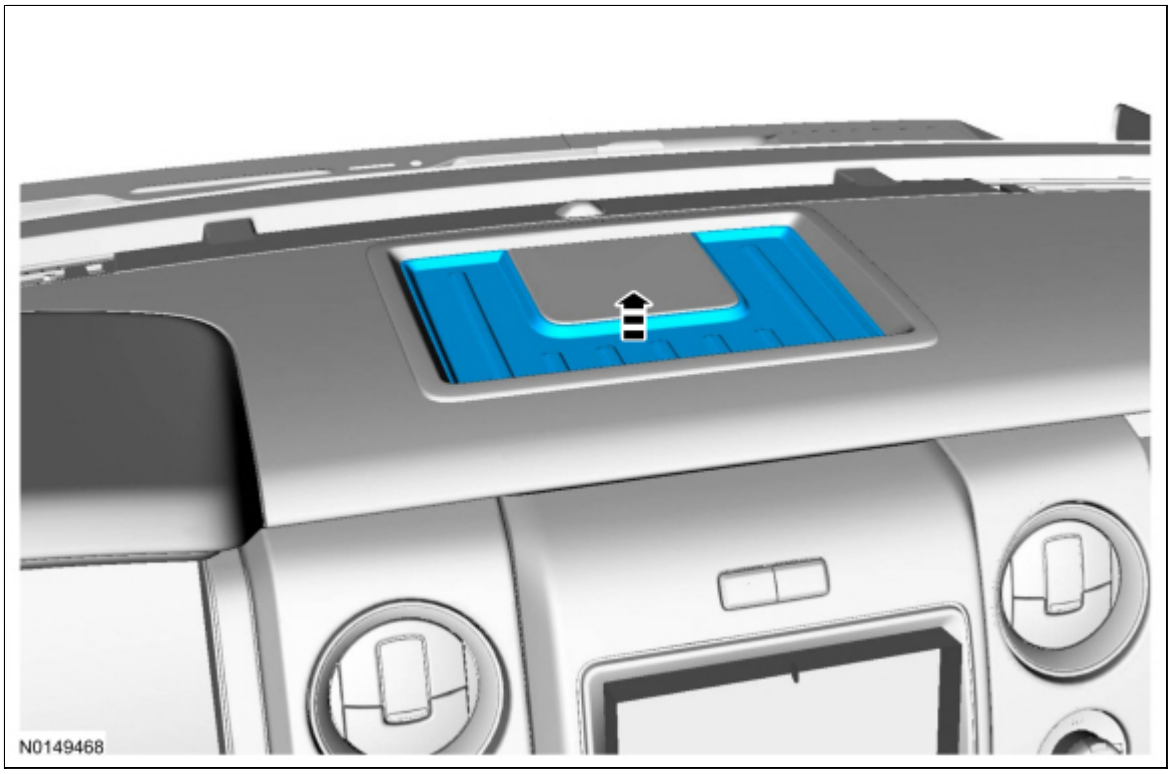
Removal and Installation

NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle.

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Remove the heater hose quick disconnect clips from the heater core.
3. Remove the heater tube dash panel seal.
4. Remove the 4 heater core bracket screws and the bracket.
5. Remove the heater core.
6. **NOTE:** The heater core seal must be correctly installed to prevent airflow from bypassing the heater core.

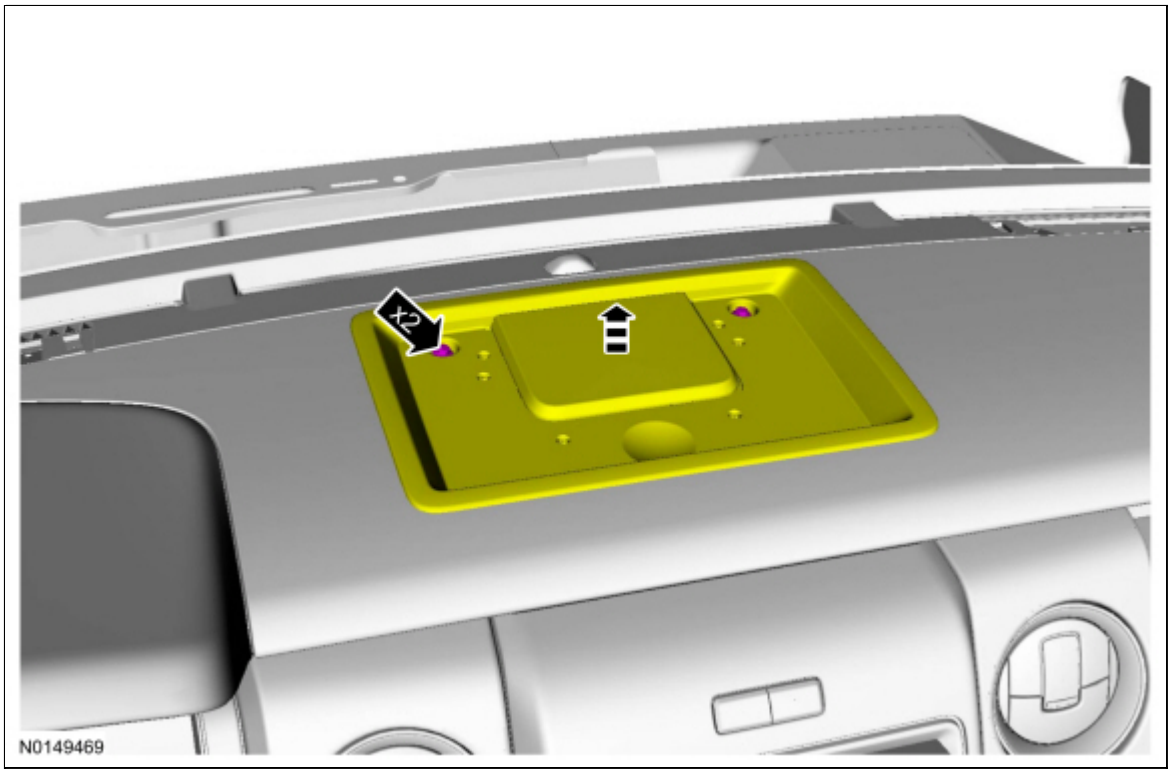
To install, reverse the removal procedure.

repair4less



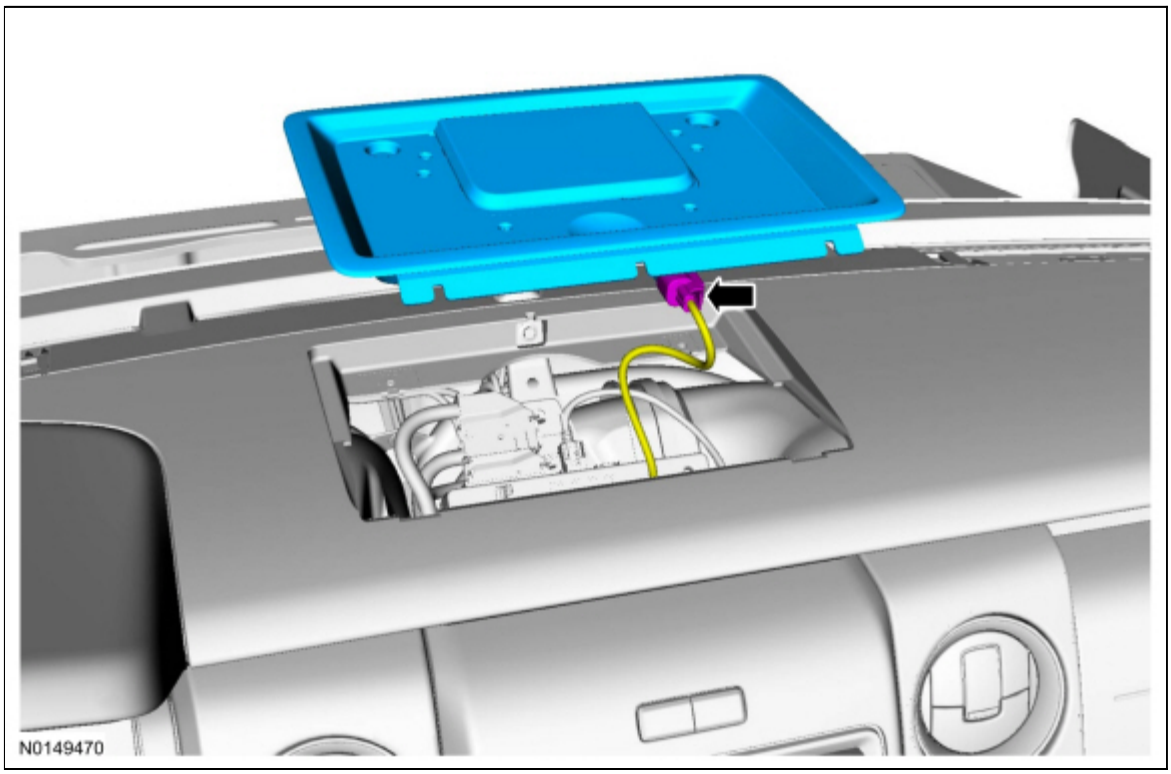
Heating Ventilation Air Conditioning (HVAC) Module

Removal and Installation



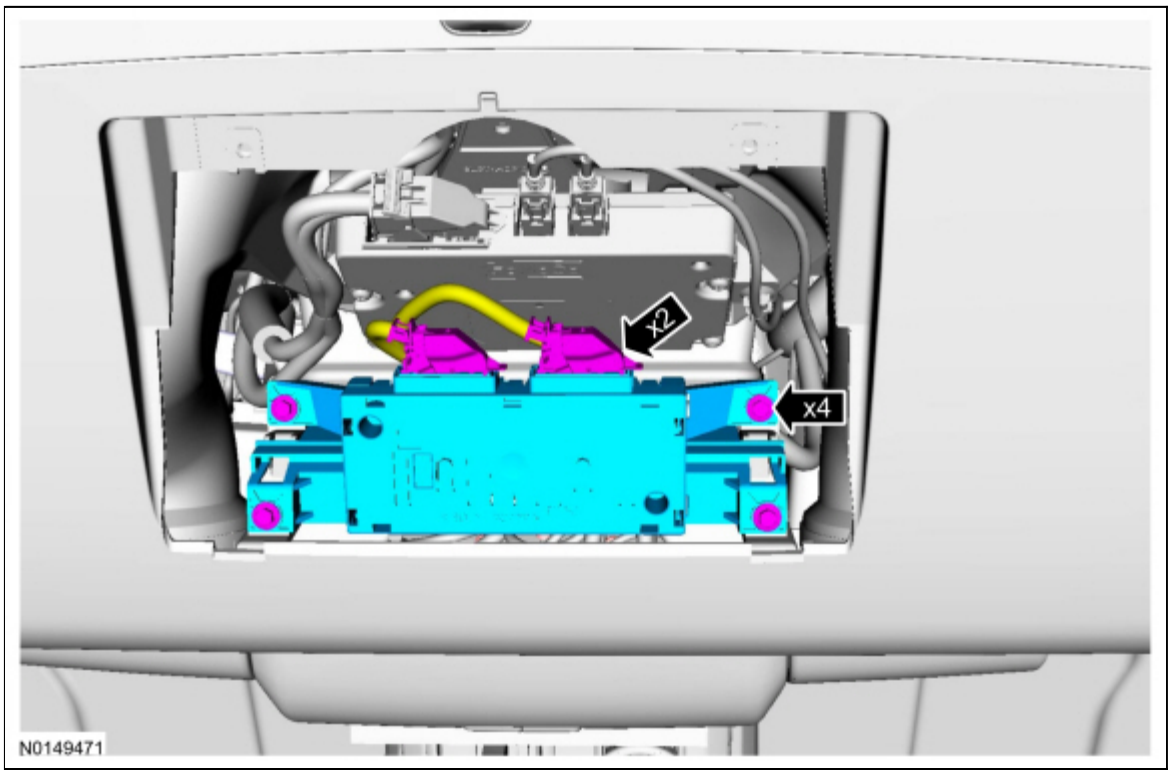
NOTE: If installing a new HVAC module, the new module must be configured for the vehicle. For additional information, refer to Section 418-01 .

With Electronic Automatic Temperature Control or Electronic Manual Temperature Control Remote Mount



1. Remove the upper instrument panel storage tray mat.

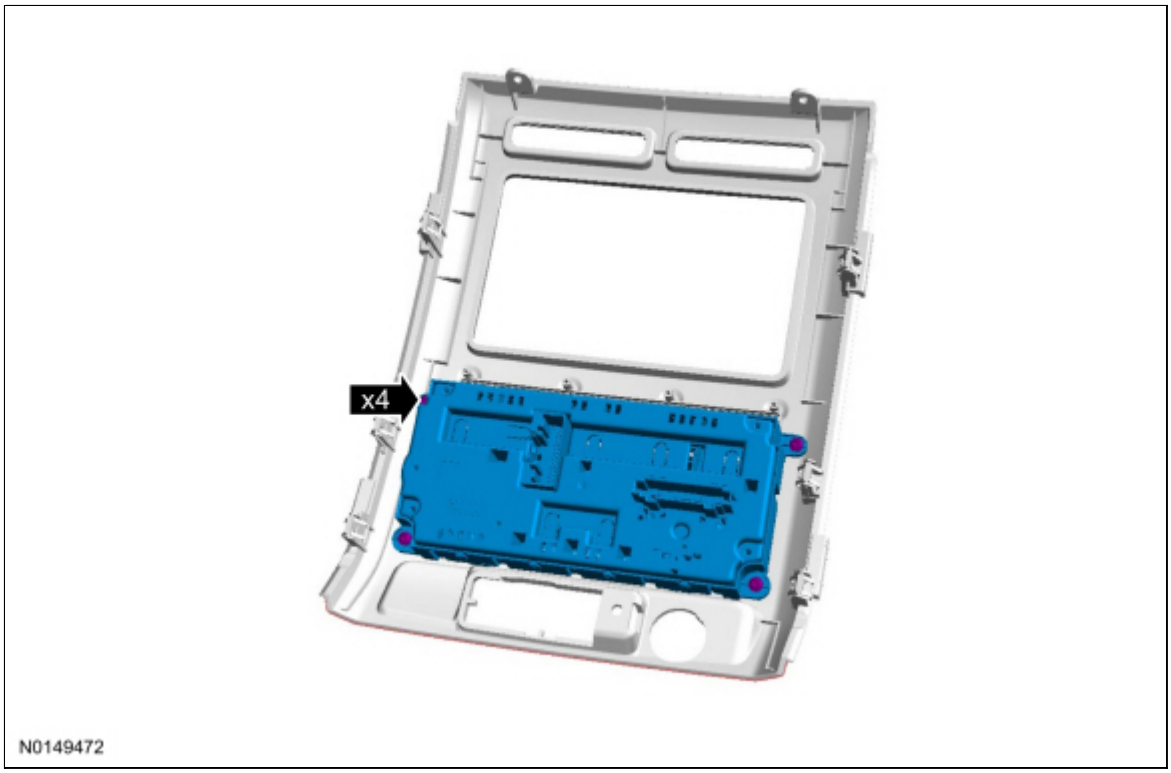
2. Remove the 2 upper instrument panel storage tray screws.



3. Disconnect the speaker electrical connector (if equipped), and remove the upper instrument panel storage tray.

4. Remove the HVAC module.
    - Disconnect the HVAC module electrical connectors.

repair4less

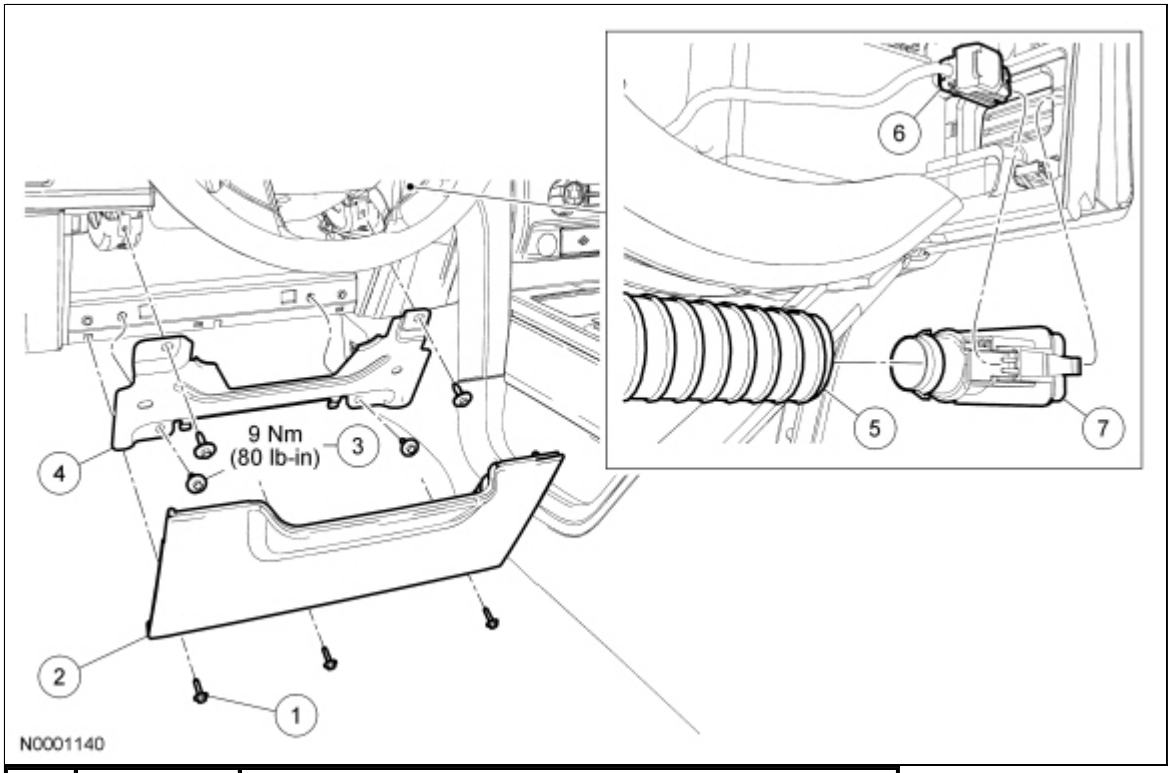


- Remove the 4 HVAC module screws.

Vehicles with Electronic Manual Temperature Control Base

5. Remove the instrument panel finish panel – center, lower. For additional information, refer to Section 501-12 .

6. Remove the HVAC module.
   - Remove the 4 HVAC module screws.



All vehicles

7. To install, reverse the removal procedure.

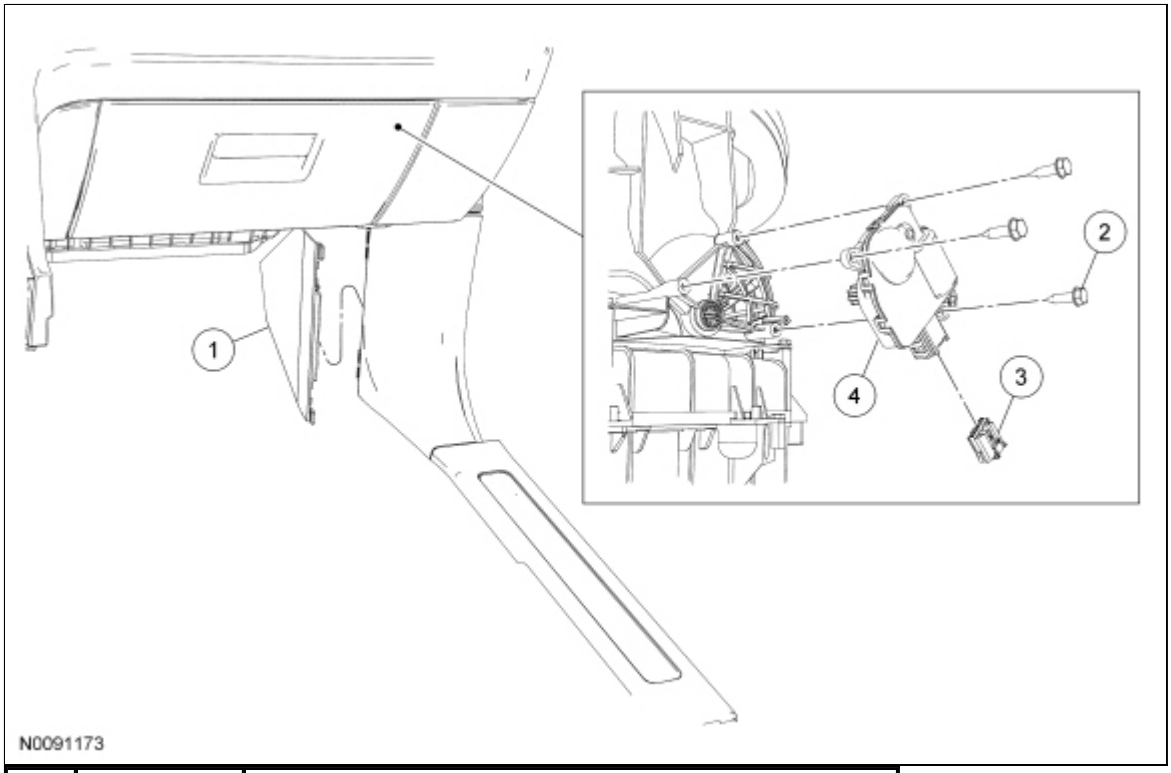
In-Vehicle Temperature and Humidity Sensor

Item	Part Number	Description
1	W707628	Steering column cover screw (3 required)
2	1504459	Steering column cover
3	N706599	Steering column cover reinforcement bolt (4 required)
4	15017A26	Steering column cover reinforcement
5	—	In-vehicle temperature and humidity sensor aspirator hose (part of 19C734)
6	14401	In-vehicle temperature and humidity sensor electrical connector
7	19C734	In-vehicle temperature and humidity sensor

Removal and Installation



1. Remove the 3 steering column cover screws and the steering column cover.
2. Remove the 4 steering column cover reinforcement bolts.
3. Detach the in-vehicle temperature and humidity sensor aspirator hose.
4. Disconnect the in-vehicle temperature and humidity sensor electrical connector.

5. Remove the in-vehicle temperature and humidity sensor.
6. To install, reverse the removal procedure.

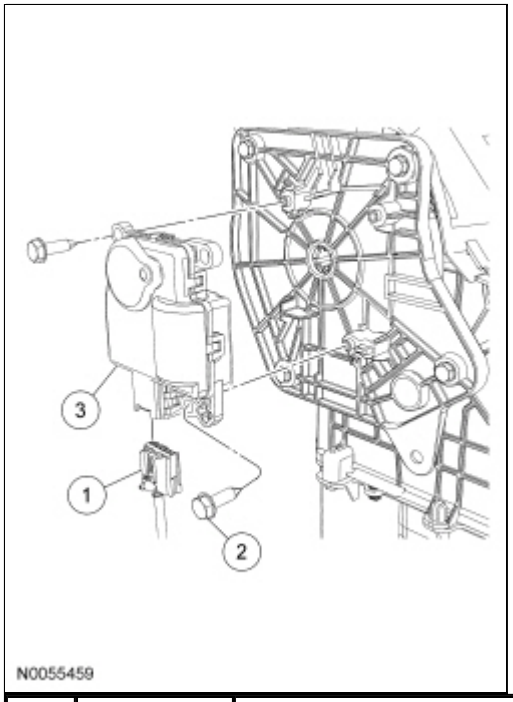
Mode Door Actuator — Air Inlet Door



Item	Part Number	Description
1	023A98	Junction box cover
2	W701696	Air inlet mode door actuator screw (3 required)
3	—	Air inlet mode door actuator electrical connector (part of 18B574)
4	19E616	Air inlet mode door actuator

Removal and Installation

1. Remove the junction box cover.
2. Disconnect the air inlet mode door actuator electrical connector.
3. Remove the 3 air inlet mode door actuator screws.
4. Remove the air inlet door mode door actuator.
5. To install, reverse the removal procedure.

repair4less

Mode Door Actuator — Defrost/Panel/Floor Door

Item	Part Number	Description
1	—	Defrost/panel/floor door mode door actuator electrical connector (part of 18B518)
2	W701696	Defrost/panel/floor door mode door actuator screw (2 required)
3	19E616	Defrost/panel/floor door mode door actuator

Removal and Installation

NOTE: The defrost/panel/floor mode door actuator can be accessed from underneath the LH side of the instrument panel.

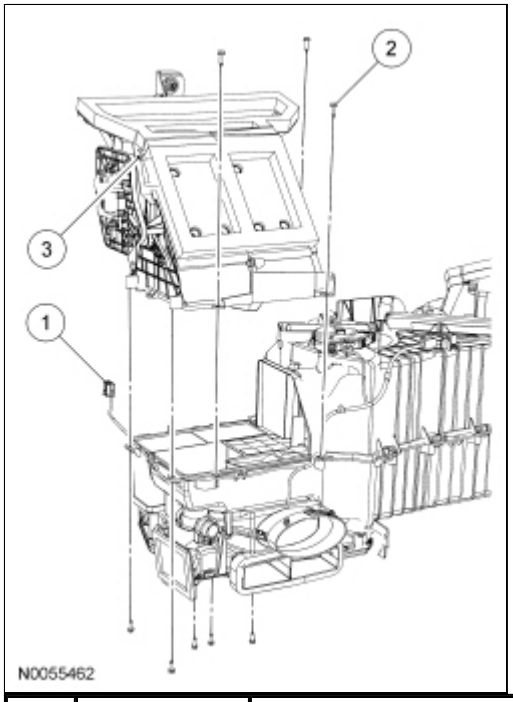
1. Disconnect the defrost/panel/floor door mode door actuator electrical connector.
2. Remove the 2 defrost/panel/floor door mode door actuator screws.
3. Remove the defrost/panel/floor door mode door actuator.
4. ***NOTICE:*** **The ignition key must be off when replacing the actuator. Energizing the actuator before installation will cause the part to become positioned incorrectly and proper orientation will be lost. Incorrect actuator operation will result.**

   To install, reverse the removal procedure.

5. Remove the passenger side cowl trim panel. For additional information, refer to Section 501-12 .

6. **NOTE:** The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out calibration, carry out the following steps.

   Remove Body Control Module BCM fuse 46 for at least one minute.



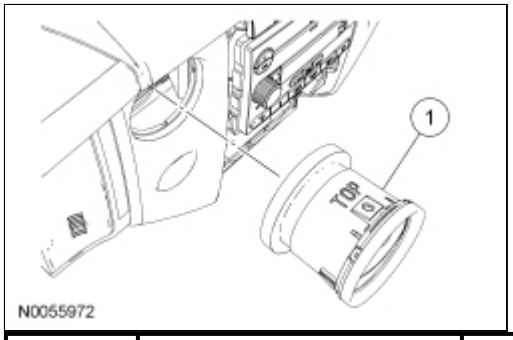
7. **NOTE:** When the ignition switch is switched to the ON position, the HVAC module will initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds.

   Reinstall BCM fuse 46. Turn the ignition switch to the ON position and wait 30 seconds before verifying correct mode door actuator operation.

---

repair4less

Plenum Chamber

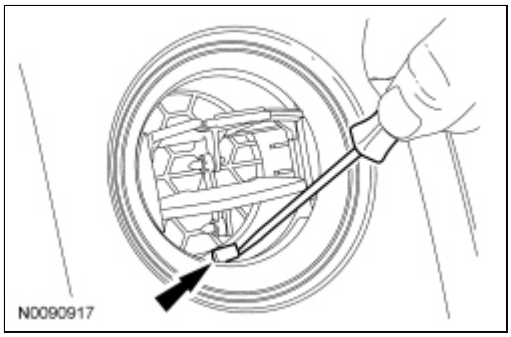


Item	Part Number	Description
1	18B518	Mode door actuator electrical connector (part of 18B518)
2	W701696	Plenum chamber screw (8 required)
3	18471	Plenum chamber

Removal and Installation

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Disconnect the mode door actuator electrical connector and position the wire harness aside.
3. Remove the 8 plenum chamber screws and remove the plenum chamber.
4. To install, reverse the removal procedure.

repair4less



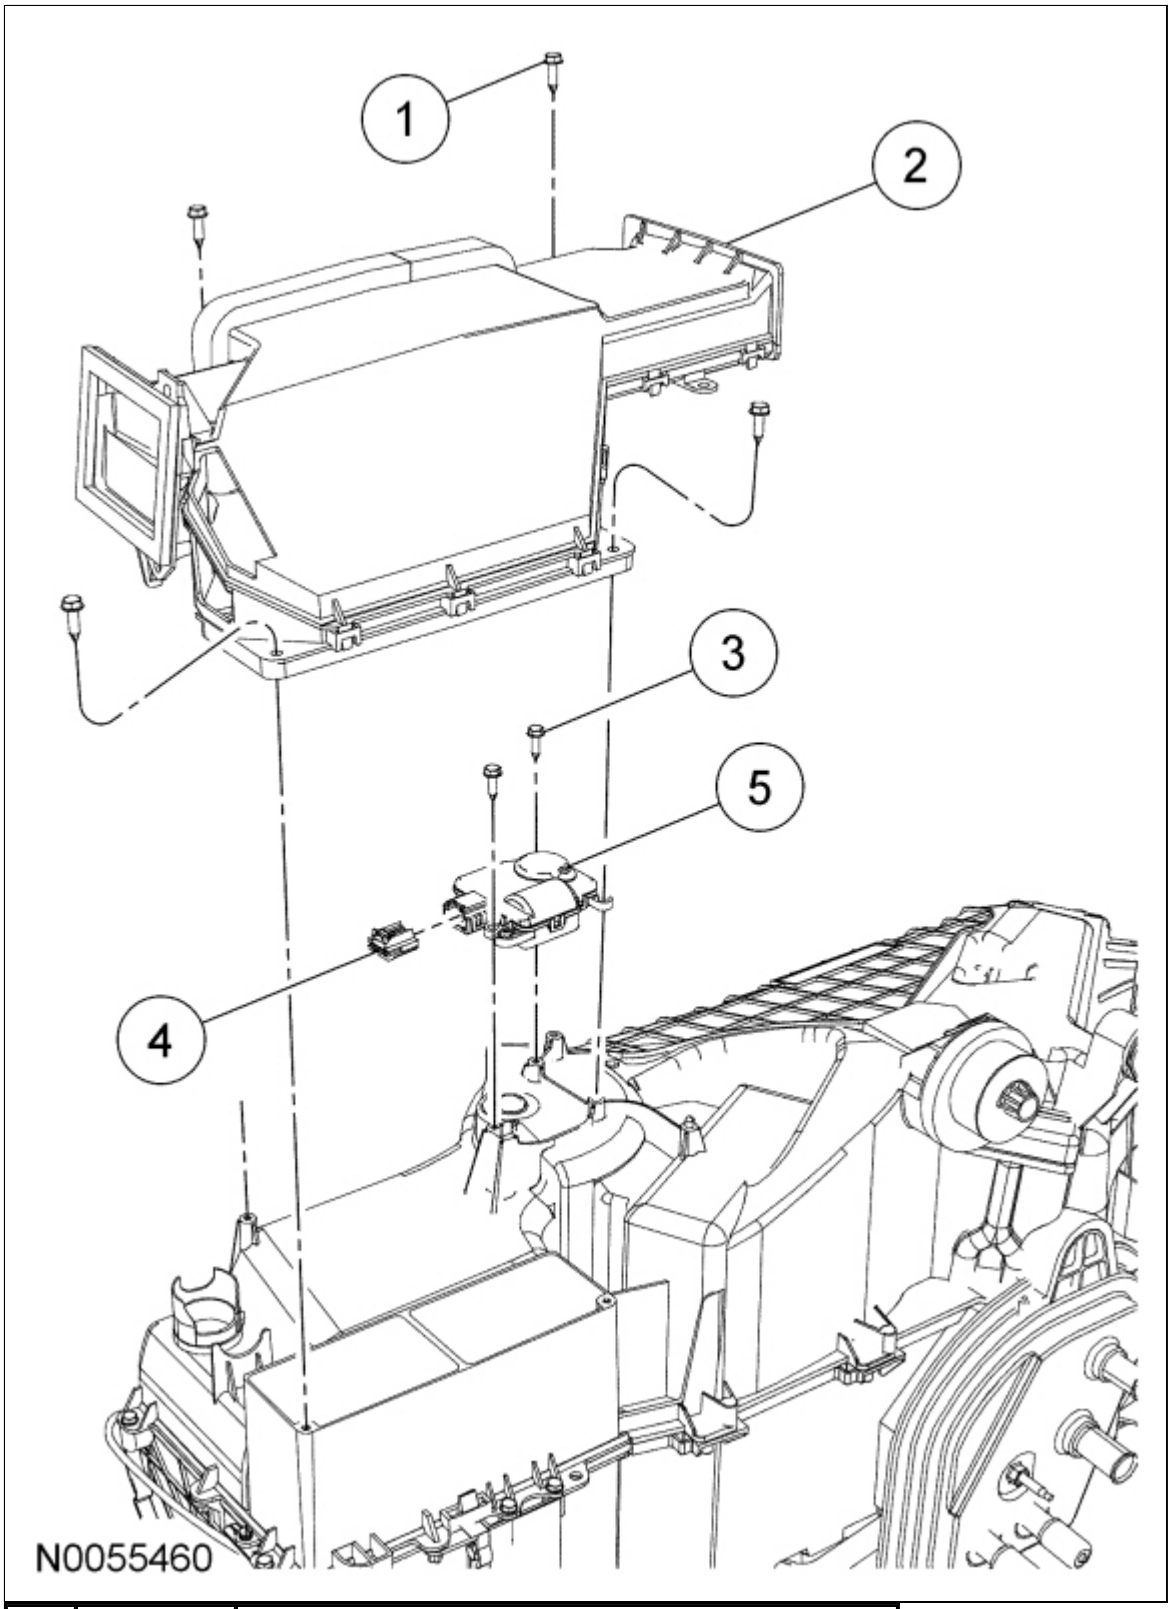
Register

Item	Part Number	Description
1	19893	Register assembly

Removal

1. Using a suitable 90 degree pick-type tool, individually release the 4 clips while gently pulling the register outward to keep the clips from reengaging.

2. Remove the register.



Installation

1. Install the register by aligning it with the opening in the instrument panel and carefully pushing it into the opening until the retaining clips engage.

repair4less

Temperature Blend Door Actuator — Driver Side

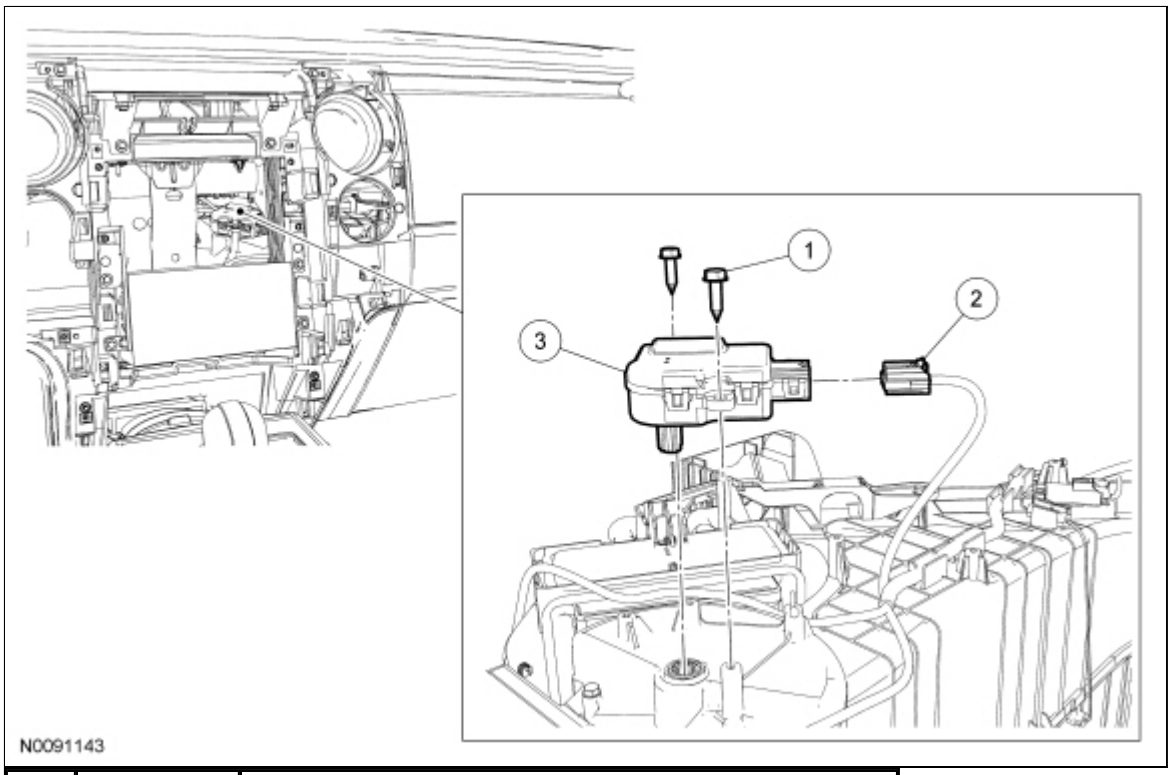
NOTE: The heater box is shown upside down in the illustration for clarity purposes.

Item	Part Number	Description
1	W701696	Floor duct screw (4 required)
2	18C433	Floor duct

repair4less

3	W701696	Driver side temperature blend door actuator screw (2 required)
4	—	Driver side temperature blend door actuator electrical connector (part of 18B574)
5	19E616	Driver side temperature blend door actuator

Removal and Installation



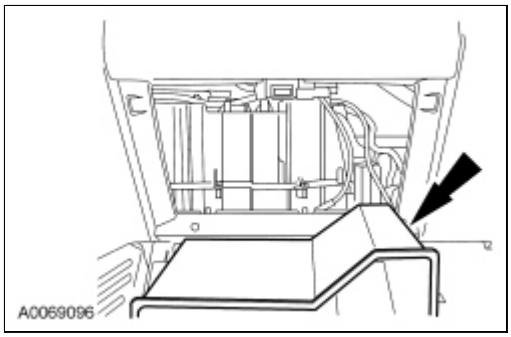
NOTE: The driver side temperature blend door actuator is present on dual-zone Electronic Automatic Temperature Control (EATC) vehicles to control the driver side temperature blend door only. Vehicles equipped with Electronic Manual Temperature Control (EMTC) are not equipped with this actuator. For EMTC vehicles, refer to Temperature Blend Door Actuator — Passenger Side in this section.

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Remove the 4 floor duct screws and remove the floor duct.
3. Disconnect the driver side temperature blend door actuator electrical connector.
4. Remove the 2 driver side temperature blend door actuator screws.
5. Remove the driver side temperature blend door actuator.
6. To install, reverse the removal procedure.
7. **NOTE:** Because the battery has been disconnected as part of the removal procedure, the HVAC module will initialize and calibrate the actuators when the ignition switch is switched to the ON position. The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. Calibration of the actuators will take approximately 30 seconds.

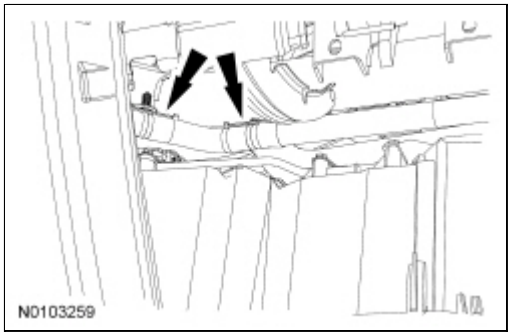
   Turn the ignition switch to the ON position and wait 30 seconds before verifying correct temperature blend door actuator operation.

repair4less

Temperature Blend Door Actuator — Passenger Side



Item	Part Number	Description
1	W701696	Temperature blend door actuator screw (2 required)
2	—	Temperature blend door actuator electrical connector (part of 18B574)
3	19E616	Temperature blend door actuator



Removal and Installation

1. Remove the Audio Front Control Module (ACM). For additional information, Refer to the appropriate section in Group 415 for the procedure.

2. While pushing the glove compartment door tab, position the glove compartment downward.

3. Detach the 2 wire harness pin-type retainers and position the wire harness aside.

4. **NOTE:** The forward temperature blend door actuator screw can be removed with a combination wrench. With one hand working through the ACM opening, hold the top end of the combination wrench. With the other end of the combination wrench pointing away (toward the right front corner of the vehicle), and with the other hand working through the glove compartment opening, the combination wrench can be manipulated.

   Remove the 2 temperature blend door actuator screws.

5. Detach the temperature blend door actuator.

6. Disconnect the temperature blend door actuator electrical connector.

7. Remove the temperature blend door actuator.

8. ***NOTICE:*** **The ignition key must be off when replacing the actuator. Energizing the actuator before installation will cause the part to become positioned incorrectly and proper orientation will be lost. Incorrect actuator operation will result.**

   To install, reverse the removal procedure.

9. **NOTE:** The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out calibration, carry out the following steps.

   Remove BCM fuse 46 for at least one minute.

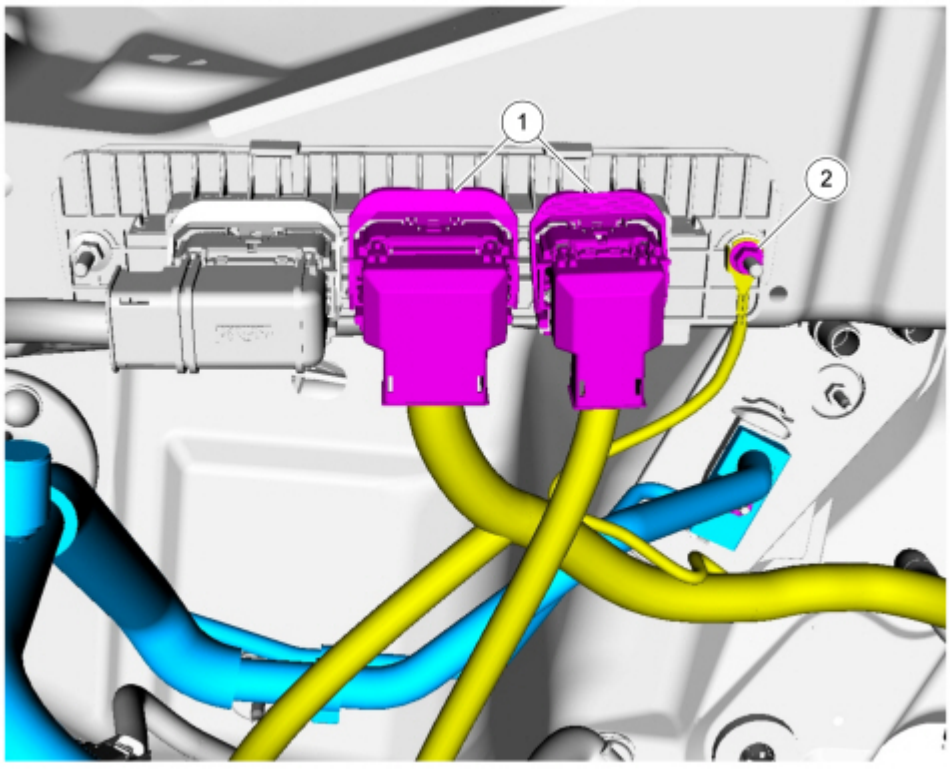
10. **NOTE:** When the ignition switch is switched to the ON position, the HVAC module will initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds.

    Reinstall BCM fuse 46. Turn the ignition switch to the ON position and wait 30 seconds before

repair4less

verifying correct mode door actuator operation.

Thermostatic Expansion Valve Manifold and Tube Assembly



Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Disconnect the 2 PCM electrical connectors and the ground cable.
    1. Disconnect the 2 PCM electrical connectors.
    2. If equipped with a 5.0L engine, remove the nut and disconnect the ground cable.
    - To install, tighten to 9 Nm (80 lb-in).

3. Remove the condenser outlet fitting nut and disconnect the fitting.
    - Discard the O-ring seal and gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

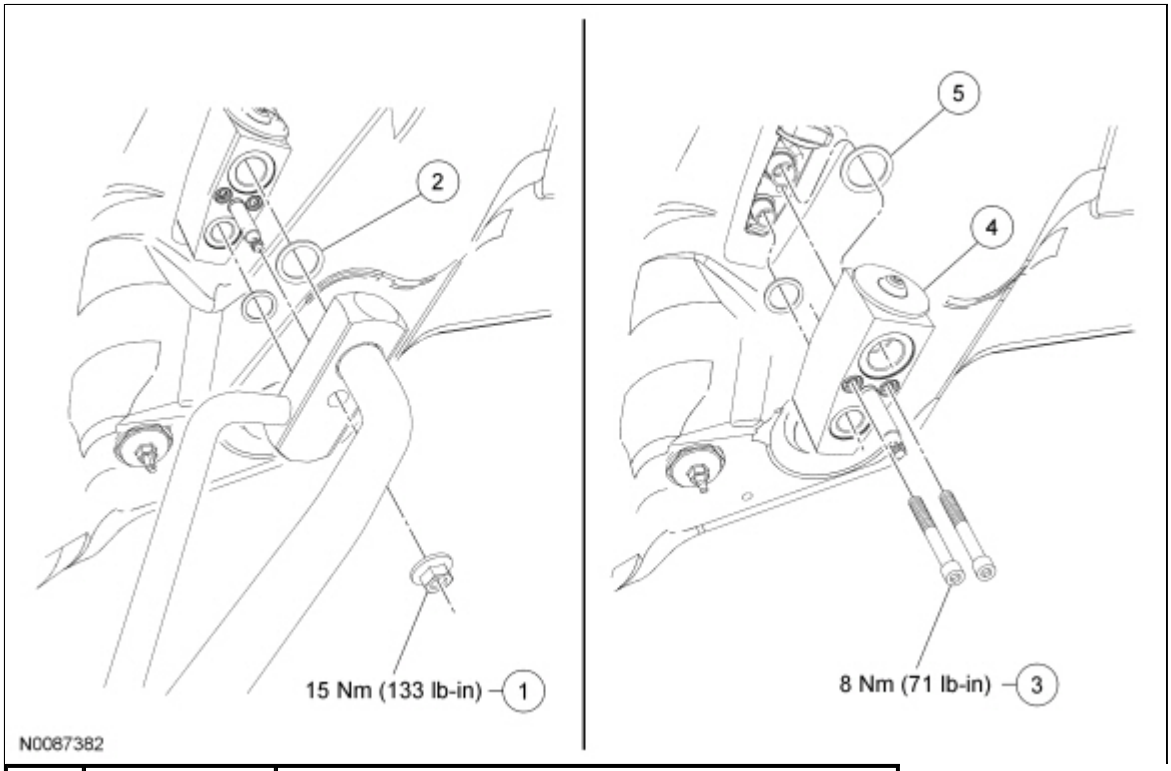
4. Remove the Thermostatic Expansion Valve (TXV) manifold and tube bracket bolt.

repair4less

- To install, tighten to 8 Nm (71 lb-in).

5. Remove the evaporator-to-compressor suction line fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

6. Remove the TXV fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).



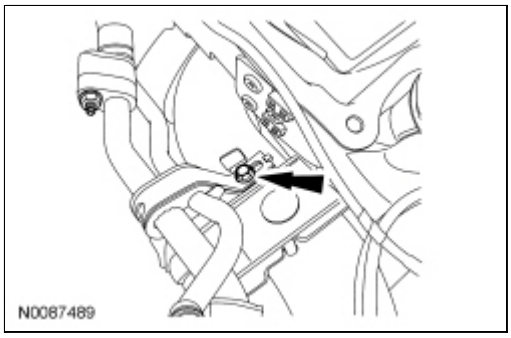
7. To install, reverse the removal procedure.
   - Install new gasket seals and O-ring seals.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

8. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Thermostatic Expansion Valve

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W505424	Thermostatic Expansion Valve (TXV) fitting nut
2	19B596	Gasket seal kit (2 pieces from kit required)
3	—	TXV bolt (part of 19849 kit) (2 required)
4	19849	TXV
5	19B596	Gasket seal kit (2 pieces from kit required)

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the Thermostatic Expansion Valve (TXV) manifold and tube bracket bolt.
   - To install, tighten to 8 Nm (71 lb-in).

repair4less

3. Remove the TXV fitting nut and disconnect the fitting.
    - Discard the gasket seals.
    - To install, tighten to 15 Nm (133 lb-in).

4. Remove the 2 TXV bolts.
    - To install, tighten to 8 Nm (71 lb-in).

5. Remove the TXV .
    - Discard the gasket seals.

6. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Instrument Cluster and Panel Illumination

Dimmable Backlighting

The dimmable backlighting system consists of the following components:

- Floor console lamp
- Floor shifter
- Hazard switch/Passenger Air Bag Deactivation (PAD) indicator/Traction control switch (without 4.2- inch [107mm] or 8- inch [203mm] display)
- Stability/traction control switch (with 4.2- inch [107mm] or 8- inch [203mm] display)
- Headlamp switch
- Hill descent control switch
- Instrument panel dimmer switch
- Mode select switch
- Off-road mode switch (Raptor only)
- Overhead console
- Steering wheel switches
- Upfitter switch (Raptor only)
- Audio Front Control Module (ACM) (base audio only)
- Front Controls Interface Module (FCIM)
- Front Display Interface Module (FDIM) (with 8- inch [203mm] touch screen or non-touch screen)
- FCDIM
- HVAC module (without 4.2- inch [107mm] or 8- inch [203mm] display)
- Instrument Panel Cluster (IPC)
- Trailer Brake Control (TBC) module

The dimmable switches and components are illuminated when the parking lamps are on. The instrument panel dimmer switch is a double detent rocker switch used to control all dimmable interior illuminated components and the courtesy lamps. The first up detent increases dimmable backlighting intensity. The first down detent decreases dimmable backlighting intensity. The second up detent turns the courtesy lamps on. The second down detent turns the courtesy lamps off (allowing other features to control the courtesy lamps).

On vehicles equipped with autolamps, if the exterior lamps are activated during the daytime, the message center illumination remains at full intensity and does not dim from the instrument panel dimmer switch during this condition. If the vehicle travels under a bridge or a tunnel, the low level of ambient light causes the illumination level of the message center to change to the level set by the instrument panel dimmer switch. The message center illumination changes back to full intensity when the intense ambient light is restored.

Non-Dimmable Backlighting

The non-dimmable backlighting system consists of the following components:

- Door lock control switches
- Rear heated seat switches
- Window control switches

Non-dimmable illumination provides backlighting with the ignition on or ignition off while the accessory delay

repair4less

relay is energized.

Instrument Cluster and Panel Illumination

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

Dimmable Backlighting

When the parking lamps are on, the Steering Column Control Module (SCCM) monitors the input from the instrument panel dimmer switch. The SCCM sends a message to the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN) relaying the instrument panel dimmer switch input. Based on the input from the instrument panel dimmer switch, the BCM sends voltage to the dimmable switches. The BCM sends a message to the HVAC module and to the ACM (except base AM/FM) on the MS-CAN and a message to the Trailer Brake Control (TBC) module and Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) to indicate the backlighting intensity level. The IPC sends a message to indicate the backlighting intensity level to the APIM, FCIM, and FCDIM over the Infotainment Controller Area Network (I-CAN).

If the receiving module receives invalid backlighting data from the BCM or from the IPC for 5 seconds or less, the receiving module defaults the backlighting to the last setting. If the receiving module does not receive the backlighting status message from the BCM or from the IPC or if the data received is deemed invalid for more than 5 seconds, the receiving module sets a missing message related DTC in continuous memory and defaults the backlighting to full nighttime intensity.

Non-Dimmable Backlighting

When the accessory delay relay is energized, switched voltage is supplied to the rear heated seat switches, window control and door lock control switches.

repair4less

Field-Effect Transistor (FET) Protection

A Field-Effect Transistor (FET) is a type of transistor that, when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes an FET protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A short circuit DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit is still shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the short circuit DTC that was stored on the first failure cannot be cleared by the clear the continuous DTCs command. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), DTC U1000:00 and the associated DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When each level is reached, the DTC associated with the short circuit sets along with DTC U1000:00. These DTCs are cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs U1000:00 and U3000:49 set along with the associated short circuit DTC. DTC U3000:49 cannot be cleared and the module must be replaced after the repair.

The BCM FET protected output circuit for the instrument cluster and panel illumination system is the dimmable switch output circuit.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical

• Body Control Module (BCM) fuse(s):
  ▪ 12 (15A)
  ▪ 32 (15A)
• Wiring, terminals or connectors
• Illuminated components

- BCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool release software.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.
   If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Steering Column Control Module (SCCM) DTC Chart

DTC	Description	Action
B1124:09	Lamp Fade Control: Component Failure	GO to Pinpoint Test A.
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B1315:11	Backlighting (Non	GO to Pinpoint Test B.

repair4less

	Reflective Controls) Illumination Output: Circuit Short To Ground	
B1315:15	Backlighting (Non Reflective Controls) Illumination Output: Circuit Short To Battery or Open	If the backlighting components are inoperative, GO to Pinpoint Test B . If the backlighting components are always on, GO to Pinpoint Test C .
U1000:00	Solid State Driver Protection Active - Driver Disabled: No Sub Type Information	The module has temporarily disabled an output because an excessive current draw exists (such as a short to ground). The BCM cannot enable the output until the cause of the short is corrected. ADDRESS all other DTCs first. After the cause of the concern is corrected, CLEAR the DTCs. REPEAT the self-test.
U3000:49	Control Module: Internal Electrical Failure	The module has permanently disabled an output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the BCM can withstand. CORRECT the cause of the excessive current draw before installing a new BCM . ADDRESS all other DTCs first. After the cause of the concern is corrected, INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

FCIM DTC Chart

DTC	Description	Action
B113C:11	Hazard Switch Illumination: Circuit Short To Ground	CLEAR the DTC. WAIT at least 10 seconds. REPEAT the self-test. If DTC B113C:11 is retrieved again, INSTALL a new FCIM . Refer to the appropriate section in Group 415 for the procedure. TEST the system for normal operation.
All other DTCs	—	Refer to the appropriate section in Group 415 for the procedure.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• All dimmable illumination does not dim	• Wiring, terminals or connectors • Instrument panel dimmer switch • Steering Column Control Module	• GO to Pinpoint Test A .

	(SCCM)	
• All dimmable non-networked illumination is inoperative	• Fuse • Wiring, terminals or connectors • Body Control Module (BCM)	• GO to Pinpoint Test B .

		with the IPC , INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation.
• The HVAC module illumination is inoperative (without 4.2- inch [107mm] or 8-inch [203mm] display)	• Medium Speed Controller Area Network (MS-CAN) • HVAC module	• CARRY OUT the network test. ▪ If the scan tool responds with no communication with the HVAC module, REFER to Section 418-00 . ▪ If the scan tool communicates with the HVAC module, INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
• The Audio Front Control Module (ACM) illumination is inoperative (base AM/FM radio)	• Wiring, terminals or connectors • ACM	• GO to Pinpoint Test E .
• The Front Controls Interface Module (FCIM) illumination is inoperative/does not dim	• Medium Speed Controller Area Network (MS-CAN) (without 4.2-inch [107mm] display or 8-inch [203mm] touch screen) • Infotainment Controller Area Network (I-CAN) (with 4.2- inch [107mm] display or 8-inch [203mm] touch screen) • FCIM	• CARRY OUT the network test. ▪ If the scan tool responds with no communication with the FCIM , REFER to Section 418-00 . ▪ If the scan tool communicates with the FCIM , INSTALL a new FCIM . Refer to the appropriate section in Group 415 for the procedure.
• The Front Display Interface Module (FDIM) illumination is inoperative/does not dim (non-touchscreen)	• MS-CAN • FDIM	• CARRY OUT the network test. ▪ If the scan tool responds with no communication with the FDIM , REFER to Section 418-00 . ▪ If the scan tool communicates with the FDIM , INSTALL a new FDIM . REFER to Section 415-00B . TEST the system for normal operation.
• The FDIM illumination is inoperative/does not dim (with 8-inch [203mm] touchscreen)	• APIM • FDIM	• VERIFY that the audio system can be operated from the FDIM . ▪ If the audio system operates correctly from the FDIM inputs, For diagnosing and testing please refer to the on-line

		Workshop Manual. If you do not have an on-line subscription, go to www.motorcraftservice.com. If the APIM replacement does not resolve the condition, replace the FDIM. REFER to Section 415-00D or Section 415-00E. TEST the system for normal operation. ■ If the audio system does not operate correctly from the FDIM inputs, REFER to Section 415-00D or Section 415-00E.
• The FCDIM illumination is inoperative/does not dim (with 4.2-inch [107mm] display)	• Infotainment Controller Area Network (I-CAN) • FCDIM	• CARRY OUT the network test. ■ If the scan tool communicates with the FCDIM, INSTALL a new FCDIM. REFFER to: Section 415-00C. TEST the system for normal operation. ■ If the scan tool does not communicate with the FCDIM, REFER to Section 418-00.
• The hazard switch/ PAD indicator illumination is inoperative/does not dim (with 4.2-inch [107mm] and 8- inch [203mm] display only)	• FCIM	• INSTALL a new FCIM. Refer to the appropriate section in Group 415 for the procedure. TEST the system for normal operation.
• The hazard switch/ PAD indicator/traction control switch illumination is inoperative/does not dim (without 4.2- inch [107mm] or 8- inch [203mm] display)	• Wiring, terminals or connectors • Illuminated switch	• GO to Pinpoint Test E.
• Stability/traction control switch illumination is inoperative/does not dim (with 4.2-inch [107mm] or 8- inch [203mm] display)	• Wiring, terminals or connectors • Illuminated switch	• GO to Pinpoint Test E.
• The Trailer Brake Control (TBC) module illumination is inoperative	• HS-CAN • TBC module	• CARRY OUT the network test. ■ If the scan tool responds with no communication with the TBC module, REFER to Section 418-00. ■ If the scan tool communicates with the TBC module, INSTALL a

repair4less

		new TBC module, REFER to Section 206-10 . TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: All Dimmable Illumination Does Not Dim

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

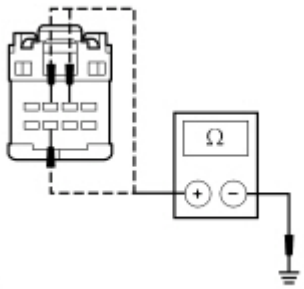
When the parking lamps are on, the dimmable backlighting intensity can be changed by pressing the instrument panel dimmer switch to the first detent up or first detent down. The instrument panel dimmer switch is a momentary contact switch. When the instrument panel dimmer switch is placed in the first detent up or down, the corresponding input signal is routed back to the SCCM to an internal ground indicating a request to turn the dimmable lighting up or down. The SCCM retains the last brightness setting between uses.

Based on the input received from the instrument panel dimmer switch, the SCCM sends a message to the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The BCM sends a network message to the backlit modules indicating the backlighting intensity level and a voltage to the hardwired dimmable illumination sources.

When the instrument panel dimmer switch is pressed to the second detent, the dome lamp request input circuit is routed to ground in addition to the instrument panel dimmer switch input circuit. The SCCM needs both an instrument panel dimmer switch up/down input circuit and the dome lamp request input circuit to turn the courtesy lamps on or off from the instrument panel dimmer switch.

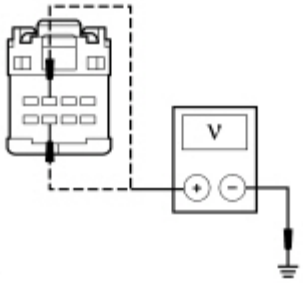
If the SCCM detects a concern with the instrument panel dimmer switch up/down input circuit or the dome lamp request input circuit, the backlighting defaults to full nighttime brightness.

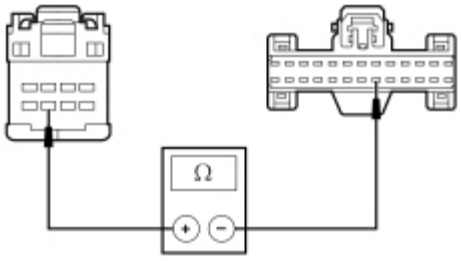
- DTC B1124:09 (Lamp Fade Control: Component Failure) — a continuous and on-demand DTC that sets when the SCCM detects a short to ground from the instrument panel dimmer switch up/down input or dome lamp request input circuits.

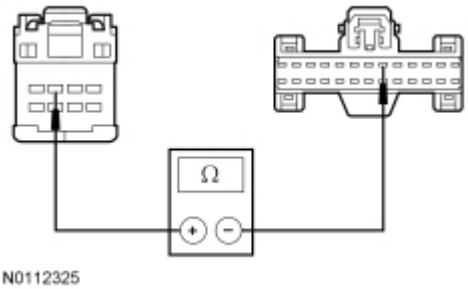


This pinpoint test is intended to diagnose the following:

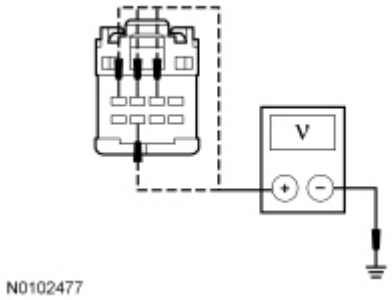
- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SCCM

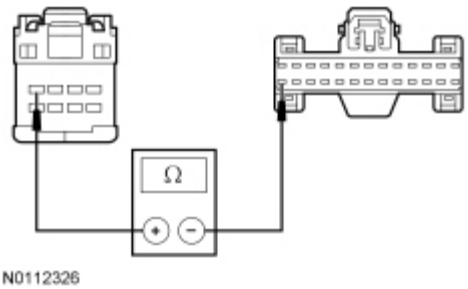






PINPOINT TEST A: ALL DIMMABLE ILLUMINATION DOES NOT DIM





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

A1 CHECK THE RECORDED RESULTS FROM THE SCCM ON-DEMAND SELF-TEST	
• Ignition OFF. • Review the recorded results from the SCCM on-demand self-test. • **Is DTC B1124:09 present?**	**Yes** GO to A2 . **No** GO to A4 .
A2 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Disconnect: Instrument Panel Dimmer Switch C2298 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: SCCM Self-Test . • Clear the DTCs and repeat the SCCM self-test. • **Is DTC B1124:09 still present?**	**Yes** GO to A3 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.
A3 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SCCM C2414A . • Measure the resistance between the instrument panel dimmer switch, harness side and ground as follows: Connector-Pin / Circuit: C2298-2 — VLN36 (GY/OG) C2298-3 — CLN55 (YE/VT) C2298-7 — CLN56 (BN/VT)  N0102475 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-test.
A4 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Disconnect: Instrument Panel Dimmer Switch C2298 . • Carry out the instrument panel dimmer switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the instrument panel dimmer switch OK?**	**Yes** GO to A5 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.

repair4less

A5 CHECK THE INSTRUMENT PANEL DIMMER SWITCH UP AND DOWN INPUT CIRCUITS FOR VOLTAGE	
• Ignition ON. • Measure the voltage between the instrument panel dimmer switch C2298-7, circuit CLN56 (BN/VT), harness side and ground; and between the instrument panel dimmer switch C2298-3, circuit CLN55 (YE/VT), harness side and ground.  N0102476 • **Are the voltages greater than 5 volts?**	**Yes** GO to A7 . **No** GO to A6 .
A6 CHECK THE INSTRUMENT PANEL DIMMER SWITCH UP AND DOWN INPUT CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: SCCM C2414A . • Measure the resistance between the instrument panel dimmer switch C2298-7, circuit CLN56 (BN/VT), harness side and the SCCM C2414A-19, circuit CLN56 (BN/VT), harness side.  N0112324 • Measure the resistance between the instrument panel dimmer switch C2298-3, circuit CLN55 (YE/VT), harness side and the SCCM C2414A-6, circuit CLN55 (YE/VT), harness side.  N0112325 • **Are the resistances less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit in question for an open. TEST the system for normal operation.

A7 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT AND RETURN CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SCCM C2414A . • Ignition ON. • Measure the voltage between the instrument panel dimmer switch, harness side and ground as follows: **Connector-Pin / Circuit** C2298-2 — VLN36 (GY/OG) C2298-3 — CLN55 (YE/VT) C2298-4 — RLN29 (WH/OG) C2298-7 — CLN56 (BN/VT)  N0102477 • **Is any voltage present?**	**Yes** REPAIR the circuit in question for a short to voltage. TEST the system for normal operation. **No** GO to A8 .
A8 CHECK THE INSTRUMENT PANEL DIMMER SWITCH RETURN CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the instrument panel dimmer switch C2298-4, circuit RLN29 (WH/OG), harness side and the SCCM C2414A-26, circuit RLN29 (WH/OG), harness side.  N0112326 • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit for an open. TEST the system for normal operation.
A9 CHECK FOR CORRECT SCCM OPERATION	
• Connect all disconnected connectors. • Disconnect all the SCCM connectors. • Check for: ▪ corrosion	**Yes** INSTALL a new SCCM . REFER to Section 211-05 . TEST the system for normal operation.

repair4less

▪ damaged pins ▪ pushed-out pins • Connect all the SCCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

Pinpoint Test B: All Dimmable Non-Networked Illumination Is Inoperative

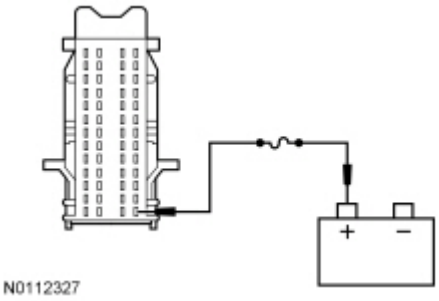
Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the parking lamps are on, the Body Control Module (BCM) provides voltage to the hardwired dimmable illumination sources based on the Steering Column Control Module (SCCM) illumination messages sent to the BCM over the network.

DTC Description	Fault Trigger Conditions
• B1315:11 — Backlighting (Non Reflective Controls) Illumination Output: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the backlighting output circuit. This DTC also sets when fuse 12 (15A) has failed or is removed.
• B1315:15 — Backlighting (Non Reflective Controls) Illumination Output: Circuit Short To Battery or Open	An on-demand DTC that sets when the BCM detects an open from the backlighting output circuit.
• U1000:00 — Solid State Driver Protection Active - Driver Disabled: No Sub Type Information	A continuous DTC that sets when the BCM has temporarily shut down the output driver. The module has temporarily disabled the backlighting output because an excessive current draw exists (such as a short to ground). The BCM cannot enable the backlighting output until the cause of the short is corrected, the DTCs have been cleared and a successful self-test is run.
• U3000:49 — Control Module: Internal Electrical Failure	A continuous DTC that sets when the BCM has permanently shut down the output driver. The module has permanently disabled the backlighting output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the BCM can withstand. Correct the cause of the excessive current draw before installing a new BCM .

This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- BCM

PINPOINT TEST B: ALL DIMMABLE NON-NETWORKED ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK FOR RECORDED BCM DTCs FROM THE ON-DEMAND SELF-TEST	
• Use the recorded results from the BCM self-test. • **Is DTC B1315:11 present?**	**Yes** VERIFY the BCM fuse 12 (15A) is OK. If OK, GO to B2. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC U1000:00 is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the backlighting output driver if DTC U1000:00 is present).** TEST the system for normal operation. If DTC U3000:49 is present, INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation. **No** GO to B2.
B2 BYPASS THE BCM	
• Ignition OFF. • Disconnect: BCM C2280B. • **NOTE:** If the jumper wire fails, refer to the Wiring Diagrams manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, test the system for normal operation. If DTC U1000:00 is present, clear the DTCs **and** repeat the self-test **(required to enable the courtesy lamp output driver if DTC U1000:00 is present).** Test the system for normal operation. If DTC U3000:49 is present, install a new BCM. Refer to Section 419-10. Test the system for normal operation. • Connect a fused jumper wire between the BCM C2280B-	**Yes** REMOVE the jumper wire. GO to B3. **No** REMOVE the jumper wire. REPAIR circuit VLN04 (VT/GY) for an open. TEST the system for normal operation.

repair4less

40, circuit VLN04 (VT/GY) and battery positive.  • **Do the backlighting components illuminate?**	

B3 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: All Dimmable Non-Networked Illumination Is Always On

Refer to Wiring Diagrams Cell 71, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the parking lamps are on, the Body Control Module (BCM) provides voltage to the hardwired dimmable illumination sources based on the Steering Column Control Module (SCCM) illumination messages sent to the BCM over the network.

- B1315:15 (Backlighting (Non Reflective Controls) Illumination Output: Circuit Short To Battery or Open) — an on-demand DTC that sets when the BCM detects a short to voltage from the backlighting output circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- BCM

PINPOINT TEST C: ALL DIMMABLE NON-NETWORKED ILLUMINATION IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

C1 CHECK THE EXTERIOR LIGHTING	
• Place the headlamp switch in the OFF position. • Observe the parking lights. • **Are the parking lights illuminated?**	**Yes** REFER to Section 417-01 . **No** GO to C2 .
C2 CHECK THE BCM BACKLIGHTING OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280B . • Ignition ON. • **Do the dimmable backlighted components continue to illuminate?**	**Yes** REPAIR circuit VLN04 (VT/GY) for a short to voltage. TEST the system for normal operation. **No** GO to C3 .
C3 CHECK FOR CORRECT BCM OPERATION	

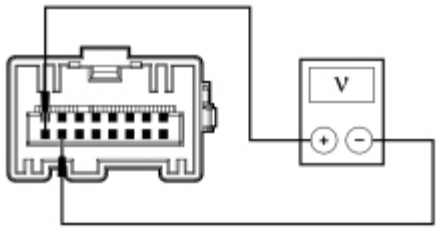
• Ignition OFF.
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The Steering Wheel Switch(es) Illumination Is Inoperative

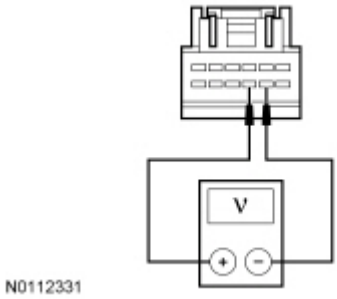
Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

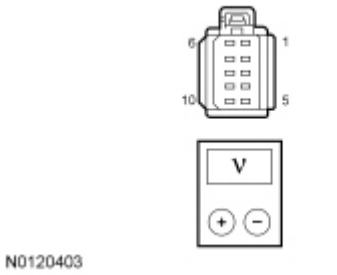
Normal Operation

When the parking lamps are on, the Body Control Module (BCM) sends voltage to the clockspring. The voltage passes through the clockspring to the steering wheel switches.



This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Steering wheel switch(es)
- Steering wheel harness
- Clockspring

PINPOINT TEST D: THE STEERING WHEEL SWITCH(ES) ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

repair4less

Test Step	Result / Action to Take
D1 CHECK THE OTHER DIMMABLE LIGHTING SWITCHES • Ignition ON. • Place the headlamp switch in the PARKING LAMPS ON position. • Press and hold the instrument panel dimmer switch up to the full illumination position and observe other dimmable switches. • **Are all the dimmable steering wheel switches inoperative?**	**Yes** GO to Pinpoint Test A . **No** If all the steering wheel switches illumination is inoperative, GO to D2 . If only one steering wheel switch illumination is inoperative, GO to D5 .
D2 CHECK THE HORN OPERATION • Press the driver air bag module against the steering wheel. • **Does the horn sound?**	**Yes** GO to D3 . **No** REFER to Section 413-06 to diagnose the horn is inoperative.
D3 CHECK FOR VOLTAGE TO THE STEERING WHEEL SWITCHES • Place the headlamp switch in the OFF position. • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Clockspring C218B . • Ignition ON. • Place the headlamp switch in the PARKING LAMPS ON position. • Press and hold the instrument panel dimmer switch up to the full illumination position. • Measure the voltage between the clockspring C218B-9, component side and the clockspring C218B-10, component side.  N0116238 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation. **No** GO to D4 .
D4 CHECK FOR VOLTAGE TO THE CLOCKSPRING • Disconnect: Clockspring C218A . • Measure the voltage between the clockspring C218A-9, circuit VLN04 (VT/GY), harness side and the clockspring C218A-8, circuit GD133 (BK), harness side.	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation. **No**

 • **Is the voltage greater than 10 volts?**	REPAIR circuit VLN04 (VT/GY) for an open. TEST the system for normal operation.
D5 CHECK THE SUSPECT STEERING WHEEL SWITCH FOR VOLTAGE • Disconnect: Suspect Steering Wheel Switch . • Press and hold the instrument panel dimmer switch up to the full illumination position. • Measure the voltage between the inoperative illumination source, harness side as follows: **Component** / **Connector-Pin** / **Connector-Pin** Steering wheel switch — LH / C2998-2 / C2998-4 Steering wheel switch — RH / C2999-1 / C2999-3  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new component for the one in question. TEST the system for normal operation. **No** INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation.

Pinpoint Test E: One Or More Illumination Source Is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage to the dimmable components.

For the base Audio Front Control Module (ACM) (AM/FM only), the BCM supplies voltage to the ACM illumination based on the Steering Column Control Module (SCCM) illumination messages sent to the BCM over the network.

When the accessory delay relay energizes, voltage is provided to the non-dimmable switches.

repair4less

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- ACM
- Door lock control switch
- Illuminated switch
- Illuminated component

PINPOINT TEST E: ONE OR MORE ILLUMINATION SOURCE IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>E1 CHECK THE VOLTAGE TO THE SINGLE ILLUMINATION</td><td rowspan="2">Yes
For a door lock control switch, INSTALL a new door lock control switch. REFER to Section 501-14 . TEST the system for normal operation.

For rear heated seat switch, INSTALL a new rear heated seat switch. REFER to Section 501-10 .

For an instrument panel dimmer switch, INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.

For all other components, GO to E2 .

No
REPAIR circuit VLN04 (VT/GY) or circuit CBP32 (GN/VT) for an open. TEST the system for normal operation.</td></tr>
<tr><td>NOTE: If the instrument panel dimmer switch illumination is the inoperative source, increase the backlighting brightness to the highest setting before unplugging the instrument panel dimmer switch connector.
• Ignition OFF.
• Disconnect: Inoperative Illumination Source .
• Ignition ON.
• NOTE: If the headlamp switch illumination is the inoperative source, unplugging the headlamp switch connector causes the BCM to turn the exterior lights on by default, so there is no need to turn the parking lamps on.
• Place the headlamp switch to the PARKING LAMPS ON position.
• Increase the backlighting brightness to the highest setting.
• Measure the voltage between the inoperative illumination source, harness side and ground as follows:
<table>
<tr><th>Component</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>ACM (base AM/FM radio only)</td><td>C290A-3</td><td>VLN04 (VT/GY)</td></tr>

Instrument Panel Dimmer Switch

Item	Part Number	Description
1	1504481	Instrument panel side finish panel
3	—	Electrical connector (part of 14401)
2	15042D82	Instrument panel dimmer switch bezel
4	11691	Instrument panel dimmer switch

Removal and Installation

1. Remove the instrument panel side finish panel.
2. **NOTE:** The instrument panel dimmer switch is removed by pushing from behind.

   Remove the instrument panel dimmer switch and bezel assembly from the instrument panel.
   - Disconnect the electrical connectors.
3. Release the tabs and separate the instrument panel dimmer switch from the bezel.
4. To install, reverse the removal procedure.

repair4less

Information And Message Center

There are 2 types of message center configurations available. The base message center is a fixed format, 2-line display integrated into the center of the Instrument Panel Cluster (IPC). The optional message center is a 4.2 inch display located in the center of the IPC . The base message center is controlled by a 3-button message center switch located in the LH steering wheel switch assembly. The optional message center is controlled by a 5-button message center switch, also located in the LH steering wheel switch assembly.

Oil Change Minder

The message center provides an oil change minder to inform the driver that an oil change is required. The duration of the interval between oil changes is calculated in the PCM and varies due to driving conditions. The PCM assumes a base mileage of 16,093 km (10,000 miles) or 1 year for normal driving. However, this number will be adjusted down due to high engine temperature, high engine rpms, use of flex fuel and possibly low oil level. The PCM calculates and provides an oil life status message to the IPC . The IPC further converts the remaining oil life using the driver's configured oil life start value and displays the oil life percentage, indicating the remaining oil life. The oil change minder can be reset at any time by the driver. For additional information, refer to Message Center Configuration in this section.

Oil Life and Oil Life Start Value

The oil life is displayed in percentages. The oil life start value is used to increase or decrease the starting point of the oil life. The oil life start value can be lowered in 10% increments down to 10% or adjusted up to the maximum of approximately 16,093 km (10,000 miles) if the value was previously changed. Each 10% reduction lowers the oil life in both mileage and time (days).

For example, if the oil life start value is lowered to 50%, the maximum mileage is 8,047 km (5,000 miles) or 6 months. The oil life remains at the selected setting (50% in this example) until the driver changes the oil life start value. When the oil life (not oil life start value) is reset back to 100% following an oil change, the oil life resets to 8,047 km (5,000 miles). For configuration of the oil life and oil life start value, refer to Message Center Configuration in this section.

Message Center Indicators

The message center displays message center indicators in the RH side of the message center display area (base IPC) or in the lower RH section of the message center (optional IPC). Message center indicators replace indicators that have typically been displayed in the IPC using the same iconic representation (for example; the low oil pressure message center warning indicator is represented by the oil can symbol that has been traditionally used as the low oil pressure warning indicator in other IPC configurations). Message center indicators are generally displayed along with warning messages in the message center display area of the IPC .

Base Message Center

The base IPC message center functions and menus listed below can be selected through the INFO and SETUP buttons. The information items (trip A, trip B and average fuel economy) and setup items (language, system configurable items such as autolamps or autolock) can be reset with the RESET button. Refer to the Owner's Literature for complete operating instructions for both the full function message center and the base IPC message center.

Message Center Configuration

repair4less

On configurable items such as autolock, auto-unlock or parking aid, the message center indicates the appropriate selection (ON/OFF) by bracketing the selection. For example, if the driver selects the autolock feature on, the message displays: AUTOLOCK OFF. If the driver selects the autolock off, the message displays: AUTOLOCK ON .

Message Center Functions

The message center provides the following functions:

- Information displays (INFO)
- Setup displays (SETUP)
- Reset (RESET)
- System check messages
- System warning messages

Information Displays

The information displays are non-timed modes. The selected mode remains on until the driver presses a message center button to change the mode or it is overridden by another mode.

The information display modes (INFO button) are:

- Odometer
- Trip odometer A and B
- MyKey® miles
- Distance To Empty (DTE)
- Average fuel economy
- Drive time (elapsed travel timer)
- Trailer brake gain and output (displays only when the gain is changed)
- Blank display

Setup Displays

The setup displays are timed modes and terminate after a fixed interval. As part of the setup menu, the message center has the capability to configure items such as units (English or metric), autolamp delay or to enable/disable options such as autolock. The message center setup display modes (SETUP button) are:

- System check
- Oil life
- Units English/metric
- Autolamp (delay in seconds)
- Autolock (on/off) (if equipped)
- Auto unlock
- Running boards (if equipped)
- Easy entry/easy exit
- Parking aid
- Trailer sway control
- Create MyKey®
- MyKey® setup
- Clear MyKey®
- Remote start
- Language

System Check Displays

The system check provides a check of all the monitored systems on the vehicle. The system check scrolls through each of the monitored systems and provides a visual indication to report out the status of each system. If the system check does not detect a fault in the system, the message center displays OK for approximately 2 seconds. If a fault is reported in the system, the message center displays a warning message for approximately 2 seconds. To manually scroll through the system check displays, press the RESET button repeatedly.

The system check display modes are:

- Oil life
- Door ajar status
- Brake system status
- Fuel level/ DTE
- Trailer brake control
- MyKey® distance
- MyKey® programmed keys
- Administrator keys programmed

Optional Message Center Features

The optional message center is different in the way the information is presented. The IPC uses a 4.2 inch Liquid Crystal Display (LCD) for all message center displays. The optional message center provides the following main displays/functions:

- Gauge mode
- Trip A/B
- Fuel economy
- Truck applications
- Settings
- Information

Gauge Mode Displays

- Transmission temperature (in text format)
- ControlTrac 4WD
- Blank display

Trip A/B Displays

- Elapsed time
- Trip distance
- Fuel consumed
- Average fuel economy
- Odometer

Fuel Economy Displays

- Instantaneous fuel economy
- Distance To Empty (DTE)
- Fuel economy history

repair4less

- Fuel duration (interval used to calculate the fuel economy history)

Truck Application Displays

- Off road feature settings
  - Electronic Locking Differential (ELD)
  - Four-Wheel Drive (4WD) system
  - Traction control
  - Hill descent control
  - Off road mode (SVT only)
  - AdvanceTrac® (SVT only)
  - Off road camera (SVT only)
- **NOTE:** The trailer naming, trailer connection and trailer mileage displays are only displayed when a trailer is connected.

  Trailer feature settings
  - Active trailer name
  - Accumulated trailer distance
  - Trailer gain/output
  - Trailer disconnected status

Setting Displays

- Driver assist
  - Rear parking aid
  - Rear view camera
  - Trailer brake mode
  - Trailer sway control
- Vehicle
  - Autolamp delay
  - DTE calculation
  - Easy entry/exit
  - Locks
  - Menu control
  - Oil life reset
  - Power running boards
  - Remote start
  - Wiper
- MyKey®
  - Create MyKey®
  - AdvanceTrac®
  - Maximum mph (km/h)
  - Speed warning
  - Volume limiter
  - Clear MyKeys
- Language
  - English
  - Spanish
  - French
- Units

    - English
    - Metric
- System reset

Information Displays

- MyKey®
    - MyKeys programmed
    - Administrator keys
    - MyKey® miles
- System Check
    - Display of any active warnings
    - Oil life
    - Doors
    - Brakes
    - Trailer brake control
    - Fuel level

System Warning Messages

The system warning messages alert the driver to possible problems or malfunctions in the vehicle operating systems. The message center displays the last selected feature if there are no additional warning messages. Once a warning message has been displayed, the message must be acknowledged to allow full functionality of the message center. Press the RESET button (base message center) or the OK button (optional message center) to acknowledge and clear the warning message.

The warning messages are divided into 3 basic categories:

- Cannot be cleared until the condition is corrected.
- Reappears 10 minutes after pressing the select/reset button.
- Reappears if the condition clears then reoccurs within the same ignition on-off cycle.

When the IPC receives a request to display an informational warning message or a fault condition warning message, the message center may display one of the following warning messages:

Body

- COULD NOT PROGRAM INTEGRATED KEY (optional IPC)
- DRIVER DOOR AJAR
- INTKEY COULD NOT PROGRAM (base IPC)
- KEY COULD NOT PROGRAM
- PASSENGER DOOR AJAR
- REAR LEFT DOOR AJAR
- REAR RIGHT DOOR AJAR
- STARTING SYSTEM FAULT
- TO STOP ALARM START VEHICLE

Chassis

- FUEL LEVEL LOW
- ADVANCETRAC SPORT MODE (SVT only)

repair4less

- BRAKE FLUID LEVEL LOW
- CHECK BRAKE SYSTEM
- CHECK REAR PARK AID
- LOW TIRE PRESSURE
- PARK BRAKE ENGAGED
- POWER STEERING ASSIST FAULT
- REDUCE ACCELERATOR TO PREVENT WHEEL SLIP (optional IPC)
- REAR PARK AID ON/OFF
- SERVICE ADVANCETRAC
- SERVICE POWER STEERING
- SERVICE POWER STEERING NOW
- TRACTION CONTROL ON/OFF
- TIRE PRESSURE SENSOR FAULT
- TIRE PRESSURE MONITOR FAULT

Electronic Locking Differential (ELD)

- SLOW VEHICLE TO XX MPH or XX KM/H FOR ELD
- CHECK LOCKING DIFFERENTIAL

MyKey®

- ADVANCE TRAC ALWAYS ON/SELECTABLE — MYKEY SETTING
- BUCKLE UP TO UNMUTE AUDIO
- CHECK SPEED DRIVE SAFELY
- ESC ALWAYS ON - MYKEY SETTING
- MYKEY ACTIVE DRIVE SAFELY
- SPEED LIMITED TO 130 KM/H (80 MPH)
- TOP SPEED MYKEY SETTING
- VEHICLE NEAR TOP SPEED
- VEHICLE AT TOP SPEED - MYKEY SETTING

Powertrain

- CHECK CHARGING SYSTEM (late build)
- CHECK FUEL FILL INLET
- ENGINE OIL CHANGE SOON
- LOW BATTERY FEATURES TURNED OFF
- OIL CHANGE REQUIRED
- POWER REDUCED TO LOWER TEMP
- TURN POWER OFF TO SAVE BATT

Electronic Locking Differential (ELD)

- CHECK LOCKING DIFFERENTIAL
- ELD DISENGAGED
- ELD ENGAGED
- TO ENGAGE ELD RELEASE PEDAL
- TO ENGAGE ELD SLOW TO 20 MPH/30KM/H
- TO ENGAGE ELD SLOW TO 55 MPH/90KM/H

Neutral Tow Feature

- NEUTRAL TOW DISABLED
- NEUTRAL TOW ENABLED
- NEUTRAL TOW LEAVE IN N

Trailer

- TRAILER BRAKE GAIN = XX.X
- TRAILER BRAKE MODULE FAULT
- TRAILER CONNECTED/DISCONNECTED
- TBC GAIN = XX.X NO TRAILER
- TBC GAIN = XX.X OUTPUT = (bar display)
- TRAILER SWAY REDUCE SPEED
- WIRING FAULT ON TRAILER

Four-Wheel Drive (4WD) Mode

- 4X4 SHIFT IN PROGRESS
- CHECK 4X4
- FOR 4X4 LOW APPLY BRAKE
- FOR 4X4 LOW SHIFT TO N
- FOR 4X4 LOW SLOW TO 3 MPH
- SHIFT DELAYED PULL FORWARD
- TO EXIT 4X4 LOW APPLY BRAKE
- TO EXIT 4X4 LOW SHIFT TO N
- TO EXIT 4X4 LOW SLOW TO 3 MPH

Hill Descent Mode

- FOR HILL DESCENT REDUCE SPEED
- FOR HILL DESCENT SELECT GEAR
- HILL DESCENT CONTROL FAULT
- HILL DESCENT CONTROL OFF
- HILL DESCENT CONTROL OFF SYSTEM COOLING
- HILL DESCENT CONTROL READY
- HILL DESCENT - DRIVER RESUME CONTROL

Off Road Mode (SVT Only)

- FOR OFF ROAD SLOW TO 5 MPH
- OFF ROAD MODE ENABLED
- EXITING OFF ROAD MODE

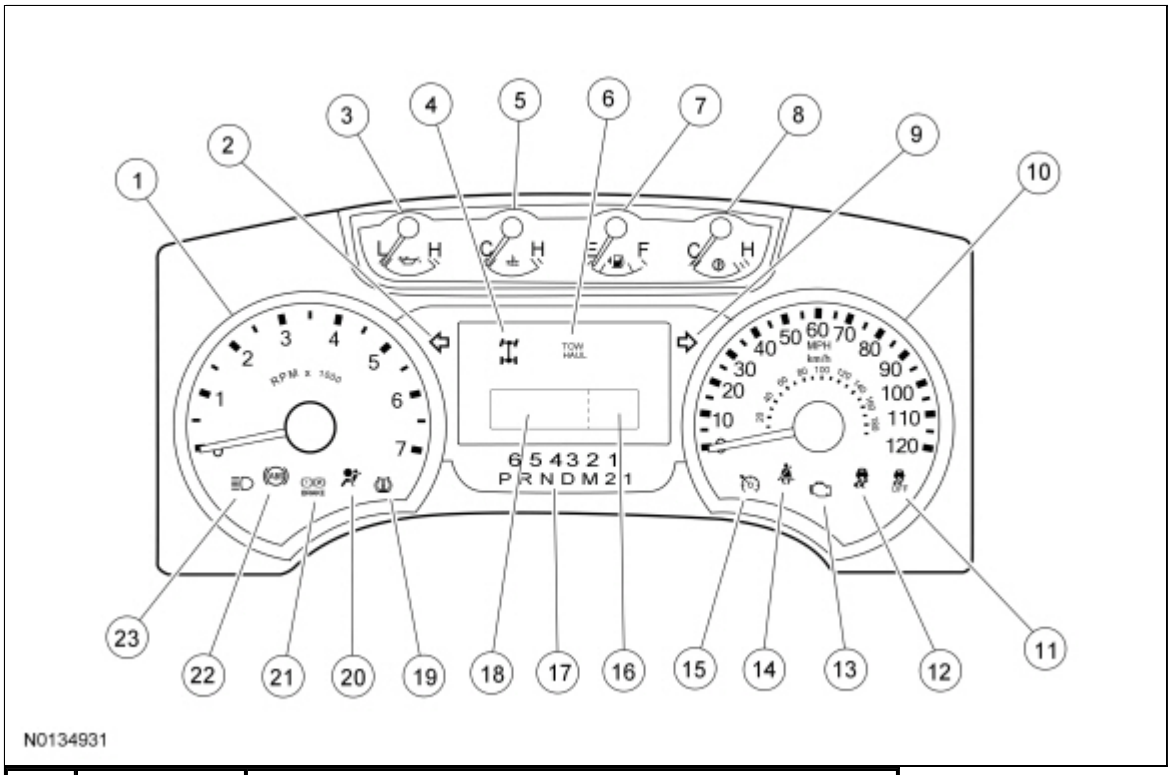
Off Road Camera (SVT Only)

- CAMERA MALFUNCTION

Service Procedure Displays

repair4less

In addition to the warning messages, the message center provides messages that are displayed during repair procedures to indicate certain states of a procedure. The following are the service repair procedures displayed in the message center:



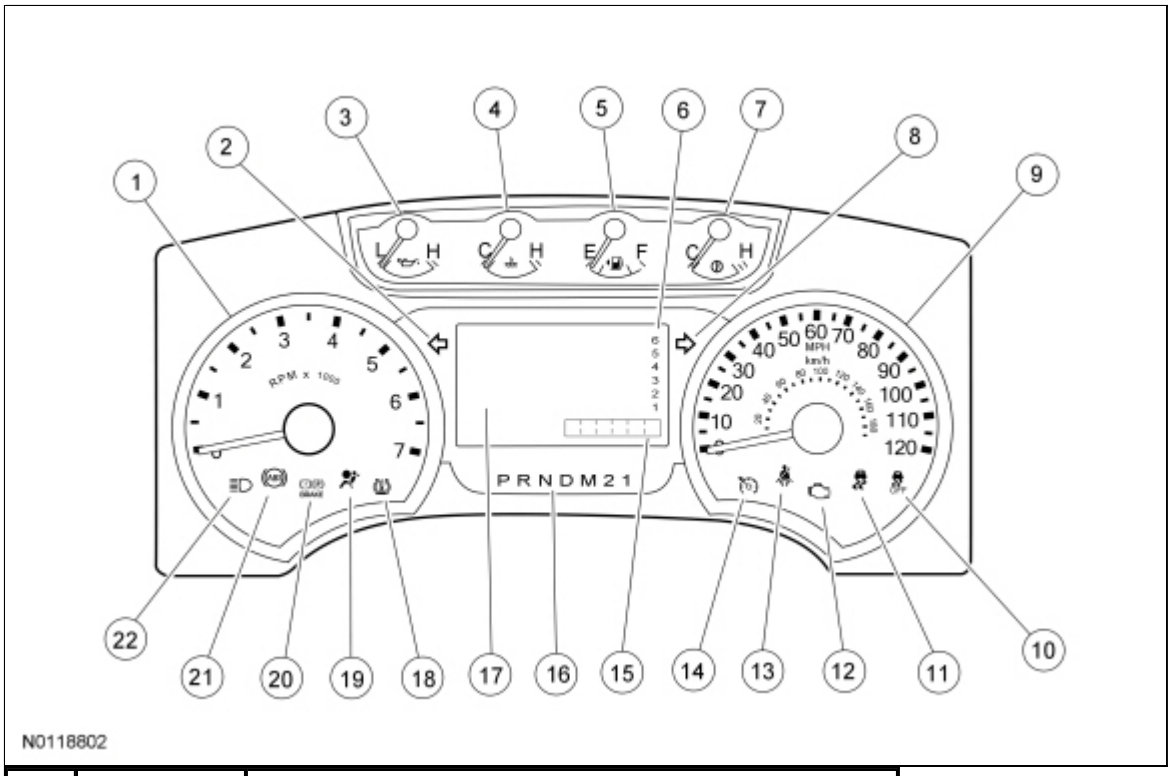
Tire Pressure Monitoring System (TPMS) Tire Training

- TRAINING COMPLETE
- TRAIN LEFT FRONT TIRE
- TRAIN RIGHT FRONT TIRE
- TRAIN RIGHT REAR TIRE
- TRAIN LEFT REAR TIRE
- TIRES NOT TRAINED-REPEAT

Instrument Panel Cluster (IPC)

Base Instrument Panel Cluster (IPC)

NOTE: Additional warning indicators, which are displayed in the message center, are listed below under " IPC Message Center Indicators".



Item	Part Number	Description
1	—	Tachometer
2	—	LH turn indicator
3	—	Oil pressure gauge
4	—	Electronic locking differential indicator
5	—	Engine temperature gauge
6	—	Tow haul indicator
7	—	Fuel gauge
8	—	Transmission temperature gauge
9	—	RH turn indicator
10	—	Speedometer
11	—	Stability/traction control disabled indicator
12	—	Stability/traction control indicator

repair4less

13	—	Malfunction Indicator Lamp (MIL)
14	—	Safety belt warning indicator
15	—	Cruise control indicator
16	—	Message center indicator display area
17	—	PRNDL with select shift display (if equipped)
18	—	Message center display area
19	—	Tire Pressure Monitoring System (TPMS) warning indicator
20	—	Air bag warning indicator
21	—	Brake warning indicator
22	—	ABS warning indicator
23	—	High beam indicator

Optional IPC

NOTE: Base F-150 Instrument Panel Cluster (IPC) shown, SVT Raptor IPC similar. Additional warning indicators, which are displayed in the message center, are listed below under " IPC Message Center Indicators".

Item	Part Number	Description
1	—	Tachometer
2	—	LH turn indicator
3	—	Oil pressure gauge

4	—	Engine temperature gauge
5	—	Fuel gauge
6	—	Select shift display
7	—	Transmission temperature gauge
8	—	RH turn indicator
9	—	Speedometer
10	—	Stability/traction control disabled indicator
11	—	Stability/traction control indicator
12	—	Malfunction Indicator Lamp (MIL)
13	—	Safety belt warning indicator
14	—	Cruise control indicator
15	—	Message center indicator display area
16	—	PRNDL display
17	—	Message center display area
18	—	Tire Pressure Monitoring System (TPMS) warning indicator
19	—	Air bag warning indicator
20	—	Brake warning indicator
21	—	ABS warning indicator
22	—	High beam indicator

Instrument Panel Cluster (IPC)

The Instrument Panel Cluster (IPC) is available either with a base message center (identified by the 3-button message center switch) or with the optional message center (identified by the 5-button message center switch). The IPC contains gauges, informational indicators, warning indicators and message center indicators that are designed to provide the driver with system status and to alert the driver that certain conditions exist in the vehicle.

The IPC uses part of the message center as a display area for basic informational items such as the odometer and trip odometer and for the message center display information.

All indicator lamps and warning indicator lamps are LEDs, which are not replaceable.

Compass Display

The electronic compass system consists of:

- Compass module (without navigation)
- Global Positioning System (GPS) antenna (with navigation)
- Front Display Interface Module (FDIM)

Vehicles Without Navigation

The compass signal originates with the compass module and is displayed in the FDIM . The vehicle heading is displayed as a 1 or 2-character display and indicates the current direction of the vehicle (N, NE, E, SE, S,

repair4less

SW, W, or NW).

Compass Accuracy

Driving near power lines, or driving in the area of large iron or steel structures on vehicles without navigation can temporarily alter the compass heading. If the compass remains inaccurate after driving near such objects, calibrate the compass. For additional information, refer to Compass Calibration in this section. Most geographic areas (zones) have a magnetic north compass point that varies slightly from the northerly direction on maps. This variation is 4 degrees between the adjacent zones and becomes noticeable as the vehicle crosses multiple zones. A correct zone setting eliminates the error. For additional information, refer to Compass Zone Adjustment in this section.

Vehicles With Navigation

The compass signal originates with the GPS antenna. No calibration or zone adjustment is available, as the compass heading is based on the GPS signal. Refer to the appropriate section in Group 415 for the procedure.

Transport Mode

The vehicle is placed in a transport mode at the completion of production to reduce the drain on the battery. Various systems may be altered in how they operate or are disabled when in the transport mode. The vehicle automatically reverts to normal operation after 201 km (125 miles). To disable or turn off the transport mode, carry out the following within 10 seconds:

- Verify the battery is fully charged.
- With ignition in RUN, press brake pedal 5 times.
- Press hazard switch 4 times (on, off, on, off).

Factory Mode

During vehicle assembly, the vehicle defaults to factory mode. Factory mode sets the function timers such as PRNDL display to further reduce the drain on the battery during assembly. The vehicle is placed into transport mode at the end of vehicle assembly. The vehicle remains in factory mode for 60 ignition cycles or until it is manually changed to transport mode.

Informational Indicators/Warning Indicators

Informational indicators provide information to the driver of conditions that exist in the vehicle. Warning indicators provide information to the driver of conditions that could potentially cause personal injury or alter vehicle performance.

Instrument Panel Cluster (IPC) Message Center Indicators

Message center indicators illuminate in the message center and replace the typical informational or warning indicator using the same iconic representation. When multiple warnings exist, the message center indicators cycle through each display until the condition has been corrected. The message center indicators include:

- 4X4 auto
- Charging system
- Door ajar
- Electronic Locking Differential (ELD)
- Engine oil pressure
- Engine over-temperature

- Low fuel
- 4X2
- 4X4 low
- 4X4 high
- Powertrain malfunction (wrench)
- Tow haul

Hardwired Inputs

The hardwired inputs are provided from the following systems or components:

- Fuel level
- Hill descent control
- Message center switch
- Park detect
- Traction control switch

Messaged Inputs

Module messaging is the standard for sending and receiving information required to operate the IPC . All messages required for the IPC to operate are received over the High Speed Controller Area Network (HS-CAN). For a list of module messages with the message origination sources, refer to Section 418-00 .

Listed below is a partial list of status and information messages that the IPC requires from other vehicle inputs:

- ABS
  - ABS braking
  - Roll Stability Control (RSC®)
  - Traction control
- Base brake system
  - Brake fluid level status
  - Parking brake status
- Body
  - Door ajar
  - Supplemental Restraint System (SRS)
  - Tire Pressure Monitoring System (TPMS)
- Lighting system
  - LH/RH turn
  - High beam
- Powertrain
  - Charging system
  - ELD
  - Engine emission system
  - Engine oil pressure
  - Engine rpm
  - Engine temperature
  - Four-Wheel Drive (4WD)
  - Tow haul status
  - Transmission range
  - Vehicle speed

repair4less

Welcome/Farewell Mode

The IPC provides a startup/shutdown mode also known as a welcome/farewell mode. When the vehicle receives a Remote Keyless Entry (RKE) request or a door ajar (open) message, the IPC gradually increases illumination of the gauge trim rings and powers up the message center (the optional IPC provides a welcome graphic). When the key is inserted into the ignition switch (key off), the IPC illuminates the gauge points. When the ignition is placed into the RUN or START position, the IPC begins a prove-out stage. During the prove-out stage, the IPC provides message center information (replaces the welcome screen with vehicle specific information on the optional IPC) while illuminating all LED indicators for a predetermined time. For the shutdown, the IPC reverses the startup process.

MyKey®

NOTE: All MyKey® displayed messages listed below are base IPC (3-button message center switch) displays. The optional IPC (5-button message center switch) message displays are similar.

The MyKey® feature allows the customer to program a restricted driving mode that is tied to one or more keys known as a MyKey®. When MyKey® is in use, the IPC provides the following functions:

- At the beginning of vehicle start up, as part of the welcome strategy, the message center greets the MyKey® driver with MYKEY ACTIVE DRIVE SAFELY displayed in the message center. If the MyKey® speed limiter feature is turned on, the message center also displays SPEED LIMITED TO 80 MPH (or 130 km/h).
- The IPC continuously provides a periodic Belt-Minder® warning chime until the driver and passenger safety belts are buckled. When the Belt-Minder® is issued, the Audio Front Control Module (ACM) is muted and the message center displays BUCKLE UP TO UNMUTE AUDIO.
- If the MyKey® speed limiter feature is turned on and the vehicle speed approaches 120 km/h (75 mph), the message center displays VEHICLE NEAR TOP SPEED along with a chime.
- If the MyKey® speed limiter feature is turned on and the vehicle speed reaches 130 km/h (80 mph), the message center displays VEHICLE AT TOP SPEED DRIVE SAFELY along with a chime.
- If the speed warning is selected at one of the preset values (75, 90, 105 km/h [45, 55, 65 mph]) and the vehicle approaches the preset speed, the message center displays CHECK SPEED DRIVE SAFELY along with a chime.
- If the traction control always on feature is turned on and the MyKey® driver presses the traction control switch to disable traction control, the message center displays ADVTRAC ON MYKEY SETTING.
- At 1/8 tank of remaining fuel, the IPC turns on the low fuel warning with the appropriate Distance To Empty (DTE) message along with a chime.
- MyKey® miles driven by the MyKey® user can be found in the information display and in the system check function of the message center on the base IPC and in the information display only on the optional IPC .
- The number of MyKey® programmed and administrator keys can be found in the system check function of the message center (base IPC) or information function (optional IPC).
- The parking aid warning menu is disabled in the message center to force these features always on.

When an administrator key is in use, the IPC provides the following functions:

- The message center provides a menu guiding the user to create a MyKey®. When the maximum MyKey® limit is reached, the MyKey® creation menu is no longer available.
- The message center provides menus for setting 4 optional MyKey® features:
    - MyKey® 80 MPH speed limiter
    - MyKey® pre-selected speed warning
    - MyKey® radio volume limiter
    - AdvanceTrac® on/off

- The message center provides a menu to clear all MyKey® programmed keys at once.
- MyKey® miles driven by the MyKey® user can be found in the information display and in the system check function of the message center on the base IPC and in the information display only on the optional IPC .
- The number of MyKey® programmed and administrator keys can be found in the system check function of the message center (base IPC) or information function (optional IPC).

For additional information on the MyKey® features, refer to Section 419-01B .

Neutral Tow Feature

The neutral tow feature provides informational messages to inform the driver that neutral tow is enabled or disabled and powers down or turns off IPC functions such as welcome/farewell (starrtup-shut down) and PRNDL indication. The neutral tow feature allows the vehicle to be towed in NEUTRAL (N) without excessive battery drain.

---

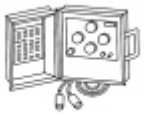
repair4less

Warning Chimes

The warning chimes provide the driver with an audible warning that acts as a supplemental alert. The only deviation from this strategy is the air bag chime which alerts the driver that the primary alerting system (air bag warning indicator) does not operate. The Instrument Panel Cluster (IPC) controls all warning chimes based on messages received from external modules.

The warning device system consists of the following:

- IPC
- Key-in-ignition warning switch (part of the ignition switch)
- Parking brake warning indicator switch
- ABS module
- Body Control Module (BCM)
- PCM
- Restraints Control Module (RCM)



The following chimes are controlled by the IPC :

- Air bag warning
- Belt-Minder®
- Door ajar
- Headlamps on
- Key-in-ignition
- Memory feedback
- Message center
- Parking brake applied
- Perimeter alarm
- Safety belt warning
- Service AdvanceTrac®
- Turn signal left on
- Turn signal/hazard on

repair4less

Instrumentation, Message Center and Warning Chimes

Special Tool(s)

 ST3093-A	Fluke 77-1V Digital Multimeter FLU77-4 or equivalent
 ST1473-A	Instrument Gauge System Tester 014-R1063 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Instrument Panel Cluster (IPC) utilizes a microprocessor to control the gauge, indicator, message center and warning chime functions. Data is sent to the IPC over the High Speed Controller Area Network (HS-CAN) and through hardwired circuitry from individual components. The IPC uses each input to output an action to the gauges, indicators, message center or chime arbitrator.

When diagnosing an IPC concern, it is very important to understand:

- where the input originates.
- all of the information necessary for a feature to operate.
- which module(s) receive(s) the input or command message.
- which module controls the output of the feature.
- whether the module that receives the input controls the output of the feature, or whether it outputs a message over the communication network to another module.

Instrument Panel Cluster (IPC)

IPC Network Messages

The IPC uses input messages from other modules to control the gauges, informational indicators, warning indicators and message center indicators over the HS-CAN . Messages that originate within or are sent to other modules on the Medium Speed Controller Area Network (MS-CAN) are sent to the Body Control Module (BCM) and converted to an HS-CAN message. For additional information on the communication networks or the BCM gateway function, refer to Section 418-00 . If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last message received. For example, if the brake status message is missing for less than 5 seconds and the brake warning indicator was illuminated, the indicator remains in the ON state until the next message is received. If the message remains missing or invalid for greater than 5 seconds, the IPC sets a network U-code DTC and the IPC output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer to the normal operation descriptions located in the individual pinpoint test for further description of the default action specific to each indicator or gauge. If the missing messaged input to the cluster returns at any time, the normal function of the gauge or indicator resumes.

NOTE: Whenever a message is suspected as missing and confirmed by a missing message DTC, it is important to look for other symptoms that may also be present in the IPC and throughout the vehicle. Once a DTC sets in the IPC , it may be helpful to review the complete message list available in Section 418-00 to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.

IPC Configuration

The IPC contains items that are configurable. Configurable items include customer preference items, which can also be set with a scan tool. The remaining configurable items can only be set by the Programmable Module Installation (PMI) procedure or by using As-Built data. Refer to Section 418-01 .

The configurable IPC items are as follows:

IPC Configuration Parameters

As-Built Parameter	State Description
ABS	ABS No ABS
Traction control/interactive vehicle dynamics/Roll Stability Control (RSC®)	No traction control/interactive vehicle dynamics/ RSC® Traction control Interactive vehicle dynamics RSC®
Tire Pressure Monitoring System (TPMS)	Off On
Oil pressure input	Hardwired

repair4less

	High Speed Controller Area Network (HS-CAN)
Belt-Minder®	Off On
Oil life	Off On
RSC® warning chime	Enabled Disabled
Compass	Enabled Disabled
Rear park aid	Rear park aid No rear park aid
Front park aid	Front park aid No front park aid
MyKey®	Enabled Disabled
Autolamp	Enabled Disabled
Auto lock	Enabled Disabled
Auto unlock	Enabled Disabled
Easy entry/easy exit	Enabled Disabled
Rain sensing wipers	Yes No
Trailer Brake Control (TBC) gain	TBC and gain warnings No TBC and gain warnings
Trailer sway	Enabled Disabled
Default language	English French Spanish

Speedometer bias	European and gulf coast countries North American
Number of fuel senders	One sender Two sender
Number of fuel tanks	One fuel tank Two fuel tanks
Overspeed warning chime	Gulf coast countries Non-gulf coast countries
Reverse warning chime	Japan Non-Japan
Key-in-ignition chime	Enabled Disabled
Electronic Power Assist Steering (EPAS)	Enabled Disabled
Two-wheel drive/Four-Wheel Drive (4WD)/All-Wheel Drive (AWD)	Two-wheel drive 4WD AWD Undefined
Power Running Board (PRB)	PRB No PRB
Electronic Locking Differential (ELD)	ELD No ELD
Welcome	Yes No
Tank configuration	Single tank Dual tanks Saddle tank
Tank selection	Tank 1 (26 gallon) Tank 2 (36 gallon)
Fuel capacity	Fuel tank capacity in tenths of a liter (0-409.5)
Flex-fuel	Flex fuel vehicle Not a flex-fuel vehicle
Fuel economy metric display	L/100km

repair4less

	km/L

Mexico	Mexico a IPC Not a Mexico IPC
Rear camera auto zoom	Yes No
Front camera	Yes No
Neutral tow	Yes No
Steering gear ratio	Low 17 to 1 High 20 to 1
ControlTrac 4WD display	Yes No

IPC Prove-Out

The IPC and other vehicle modules carry out a display prove-out to verify all module controlled warning/indicator lamps and monitored systems are functioning correctly within the IPC . When the ignition is cycled to ON with the engine off, the indicators illuminate to prove-out according to the following table:

Indicator	Indicator Type	Prove-Out Duration
ABS	Warning	3 seconds
Air bag	Warning	6 seconds
Brake	Warning	3 seconds
Cruise control	Informational	No prove-out
High beam	Informational	No prove-out
Malfunction Indicator Lamp (MIL)	Warning	Engine startup
RH/LH turn signals	Informational	No prove-out
Safety belt	Warning	65 seconds if the safety belt is unbuckled, turns off when the safety belt is buckled
Tire Pressure Monitoring System (TPMS)	Warning	3 seconds
Stability/traction control	Informational	3 seconds
Stability/traction control disabled	Informational	3 seconds

Information And Message Center

repair4less

The message center is an integral part of the IPC that receives and acts upon much of the same information that is input and used to operate the IPC gauges, indicators, warning indicators and message center indicators.

Whenever conditions are present that require a warning message, the message center replaces the last selected display with the new warning display. Once the message is reset or cleared, the message center returns to the last selected display. If multiple warnings are present, the message center displays each warning for approximately 4 seconds. Warning messages are also generally associated with other observable IPC indications. For example, when the LH front door is opened, the message center displays the message DRIVER DOOR AJAR along with the door ajar message center warning indicator. This allows the message center to be a more informative supplement to the IPC gauges and indicators.

Another function of the message center is to display message center warning indicators. The message center often displays a warning message and the message center warning indictor at the same time. For example, if the PCM detects low engine oil pressure, the PCM sends a request to the IPC to illuminate the low oil pressure message center indicator and to display LOW OIL PRESSURE in the message center. If multiple warnings are present requiring multiple message center warning indicator displays, the message center cycles or rotates through the displays in the same manner the message center cycles the text messages.

Warning Chimes

Each warning chime has unique characteristics. The warning chimes use volume, chime frequency, length of time the chime sounds and the number of chime tones to identify which chime is sounding. The IPC prioritizes the chimes according to a preset hierarchy programmed into the IPC software. When more than one chime request is received by the IPC , the highest priority chime sounds. If a lower priority chime is currently sounding, the higher priority request takes over and replaces the lower priority chime.

There are 3 different chimes as listed below:

- Repetitive
- Single tone
- Tick-tock

The following table provides a summary of the chimes:

IPC Chime Characteristics

Chime Name	Chime Type	Condition Description
Air bag	Repetitive	Five sequences of 1 second on and 1 second off (10 seconds total)
Belt-Minder® A and B	Repetitive	The chime sounds 6 chime tones/safety belt warning indicator flash sequences for as long as the IPC receives the Belt-Minder® chime request.
Door ajar	Single tone	The chime sounds a single 1.6 second chime tone when any door changes from the closed to the open state.
Headlamps on	Repetitive	On for as long as the headlamps are on and the IPC receives the chime on command. Shuts off when battery saver has expired (approximately 30 minutes).
Key-in-ignition	Repetitive	On for as long as the key is in the ignition with the driver door ajar and the IPC receives the chime on command. Shuts off when battery saver has

		expired (approximately 30 minutes).
Memory feedback	Single tone	The chime sounds for 0.1 second when the IPC receives a memory state change message.
Message center	Single tone	The chime is a single 0.1 second tone chime that sounds once per ignition cycle whenever the IPC receives a new message commanding on one of the message center warnings.
Parking brake on	Repetitive	On for as long as the parking brake is applied and the IPC receives the chime on command.
Perimeter alarm	Repetitive	On for 12 seconds when the driver door is opened using a key and the alarm is armed. The chime sounds 2 chime tones for the first 6 seconds followed by 3 chime tones for the next 4 seconds and finally 4 chime tones for the last 3 seconds.
Safety belt	Repetitive	Six cycles of 0.5 second on/0.5 second off for as long as the safety belt is unbuckled and the IPC receives the chime on command.
Service AdvanceTrac®	Repetitive	The chime sounds three 1.0 second chime tones for as long as the IPC receives the chime request on command.
Turn signal/hazard on	Tick-tock	On for as long as the RH or LH turn signal or hazards are on and the IPC receives the chime on command.
Turn signal left on	Repetitive	On for as long as the RH or LH turn signal is on and the IPC receives the chime on command (approximately 3.2 km [2 miles]).

Air Bag Secondary Warning Chime

The air bag secondary warning chime warns that the air bag warning indicator light does not work correctly. The IPC monitors the air bag warning indicator status internally and provides an air bag indication status report to the RCM . When a fault is present in the Supplemental Restraint System (SRS) with the RCM sending the IPC an air bag warning indicator on request and a fault is detected in the air bag warning indicator, the RCM sends the IPC a secondary request to sound the air bag warning chime.

The air bag secondary warning chime inputs are:

- Ignition state
- Air bag warning indicator request communicated by the RCM to the IPC
- Air bag warning indicator chime request communicated by the RCM to the IPC

Message Center Warning Chime

The message center warning chime feature draws the driver's attention to the message center display to view each new warning message. The IPC provides a single one second tone whenever a new warning message is displayed in the message center. If multiple warning messages are present, the IPC sounds a chime for each of the warning messages that are present.

Perimeter Alarm Warning Chime

The perimeter alarm warning chime alerts the driver that the perimeter alarm is armed when the driver door is unlocked with a key. The warning chime is only functional when a key is used to unlock the driver door. If the key fob or keypad (if equipped) is used to unlock the door, the perimeter alarm is disarmed and the warning chime does not sound. The warning chime sounds for 12 seconds when the driver door is opened and turns off when the perimeter alarm is disarmed (either by using the key fob, keypad or turning the key on). After the 12 second warning chime duration, the warning chime stops sounding and the perimeter alarm activates, sounding the horn and flashing the turn signal lamps.

repair4less

Turn/Hazard On Chime

The turn/hazard on chime provides an audible sound to indicate the RH/LH turn or hazard lamps are on. When the LH turn lamps, RH turn lamps or hazard lamps are on, the IPC provides a tick-tock tone along with the visual turn signal indicators.

The turn/hazard on tone inputs are:

- Left and right turn indicator signal from the BCM to the IPC through the HS-CAN
- Hazard signal from the BCM to the IPC through the HS-CAN

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Accessory drive belt
• Brake fluid level
• Correct tire size
• Courtesy lamps
• Engine coolant level
• Engine oil level
• Fuel tank
• Fuel evaporative system
• Tire pressure
	• Body Control Module (BCM) fuse(s):
	  ▪ 11 (10A)
	  ▪ 32 (15A)
	• Wiring, terminals or connectors
	• Auto-dimming interior mirror
	• Message center switch (part of the LH steering wheel switch)
	• Instrument Panel Cluster (IPC)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the IPC , PCM, Restraints Control Module (RCM), ABS module, Trailer Brake Control (TBC) module, Parking Aid Module (PAM) and the BCM .

9. If the DTCs retrieved are related to the concern, go to DTC Charts in this section.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Instrument Panel Cluster (IPC) , GO to Symptom Chart - Information And Message Center or GO to Symptom Chart - Warning Chimes .

Instrument Panel Cluster (IPC) Dealer Test Mode — Base IPC

To enter the IPC dealer test mode, press and hold the message center RESET button. Place the ignition in RUN and continue to hold the RESET button until the display indicates ENGINEERING TEST MODE, usually within 3 to 5 seconds. Press the RESET button once to advance through each stage of the self-test.

To exit the IPC dealer test mode, press and hold the RESET button for more than 3 seconds or simply turn the ignition off.

NOTE: The displays listed in the table below use xxx's to represent a numeric or alpha-numeric value or a text display. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display. For example, VEHICLE SPEED xxx.x mph may display VEHICLE SPEED 45 mph.

First Line Display	Second Line Display	Description
ENGINEERING	TEST MODE	Initial entry display into dealer test mode.
GAUGE	TEST	Carries out a gauge sweep of all the gauges, then displays the present gauge values.
All segments illuminated	—	Illuminates all odometer segments.
TELLTALE	TEST	Illuminates all the micro-controlled lamps and LEDs.
PART NUMBER	xxxx-xxx	Displays the alpha-numeric part number prefix and suffix.
ROM LEVEL	$xxxx	Returns all IPC controlled lamps/LEDs to the normal operation and displays the Read-Only Memory (ROM) level stored in hexadecimal format.
EEPROM LEVEL	$xx	Displays the EE level in hexadecimal format.
MANUFACTURE	DATE $xxxx	Displays final manufacturing test date in hexadecimal format.
AUTOCONFIG	BYTE 1 $xx	Displays all bytes of the IPC configuration settings in hexadecimal format.
B&A CONFIG	BYTE 1-2 $xx	Displays all bytes of the IPC configuration settings in hexadecimal format.
MANU CONFIG	BYTE 1 $xx	Displays the Non-Volatile Memory (NVM) As-Built configuration in

repair4less

		hexadecimal format.
CONTINUOUS	DTC $xxxx	Displays a 16-bit DTC in hexadecimal format. DTCs displayed are those detected in continuous operation not during self-test.
VEHICLE SPEED	xxx.x mph	Displays the messaged English speed value received. The speedometer indicates the present speed. If the vehicle speed message is missing, MISSING DATA is displayed.
VEHICLE SPEED	xxx.x km/h	Displays the messaged metric speed value received. The speedometer indicates the present speed.
TACHOMETER	xxxx rpm	Displays the messaged engine speed signal value received. The tachometer indicates present rpm.
FUEL LEVEL	xxx INSTANT	Displays the present instantaneous unfiltered fuel level. The fuel gauge indicates the filtered level.
FUEL LEVEL%	STATUS xxx	Displays the present fuel level percent status in decimal input from the secondary fuel level sensor in decimal. The fuel gauge indicates the present level.
INSTANT DTE	xxx MILES	Provides the current Distance To Empty (DTE).
RAFE DTE	xx.x MPG	Displays the running average fuel economy in decimal.
FUEL ON/OFF/SZ	xxx xxx xxx	Displays the key on initialization (left xxx), key off reference (middle xxx), and zero speed reference (right xxx) fuel level values in fuel level percent status.
F#S ON/OFF/SZ	xxx xxx xxx	Displays the number of valid fuel samples taken at key on initialization (left xxx), key off convergence (middle xxx), and zero speed convergence (right xxx) in decimal counts, no leading zeros.
COOLANT TEMP	xxx DEG C	Displays the last messaged engine coolant temperature value message received. The temperature gauge indicates the present temperature.
ODOMETER	xxx COUNTS	Displays the messaged odometer rolling count input received in decimal.
TRIP ODOMETER	xxx.x mi	Displays the trip odometer value stored in Random Access Memory (RAM) in miles.
BATTERY	xx.x VOLTS	Displays the present battery voltage in 10th of volts.
DIMMING CMD	xxx	Displays the messaged dimming value input from the Body Control Module (BCM).
DIMMING STEP	xx	Displays the messaged dimming level step (0 thru 21) received in decimal from the BCM .
MC SWITCH	xxx A/D COUNTS	Displays the present message center switch input analog/digital counts in decimal.
LWF OPS OAT	x x xxx	Displays the low washer fluid switch input (left x), oil pressure switch input (middle x) and the outside air temperature sensor input (right xxx).
COMPASS	xxx	Displays the present compass input in decimal.
LAST CHIME	SOUNDED xx	Displays the last chime that sounded.
GAUGE	TEST	Repeats the sweep of all gauges and then displays present gauge values.

Instrument Panel Cluster (IPC) Dealer Test Mode — Optional IPC

To enter the IPC dealer test mode, press and hold the message center OK button. Place the ignition in RUN and continue to hold the OK button until the display indicates ENGINEERING TEST MODE, usually within 3 to 5 seconds. Press the OK button once to advance through each stage of the self-test.

To exit the IPC dealer test mode, press and hold the OK button for more than 3 seconds or simply turn the ignition off.

NOTE: The displays listed in the table below use xxx's to represent a numeric or alpha-numeric value or a text display. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display. For example, VEHICLE SPEED xxx.x mph may display VEHICLE SPEED 45 mph.

First Line Display	Second Line Display	Description
ENGINEERING	TEST MODE	Initial entry display into dealer test mode.
GAUGE	TEST	Carries out a gauge sweep of all the gauges, then displays the present gauge values.
All segments illuminated	—	Illuminates all message center LEDs in the different colors.
ALL MICRO CONT	BULBS ON	Illuminates all the micro-controlled lamps and LEDs.
PART NUMBER	xxxx-xxx	Displays the alpha-numeric part number prefix and suffix.
ROM LEVEL	$xxxx	Returns all IPC controlled lamps/LEDs to normal operation and displays the Read-Only Memory (ROM) level in hexadecimal format.
NVM ROM LEVEL	$xxxx	Displays the Non-Volatile Memory (NVM) level in hexadecimal format.
EEPROM LEVEL	$xx	Displays the EE level in hexadecimal format.
MANUFACTURE	DATE $xxxx	Displays final manufacturing test date in hexadecimal format.
MANU CONFIG	BYTE 1-2 $xx	Displays the Non-Volatile Memory (NVM) As-Built configuration in hexadecimal format.
VOPS CONFIG	BYTE 1-5 $xx	Displays all bytes of the IPC configuration settings in hexadecimal format.
VOPS CONFIG	TANK CAP xx.x	Displays all bytes of the IPC configuration settings in hexadecimal format.
VOPS CONFIG	BYTE 7-8 LN $xx	Displays all bytes of the IPC configuration settings in hexadecimal format.
CONTINUOUS	DTC $xxxx	Displays a 16-bit DTC in hexadecimal format. DTCs displayed are those detected in continuous operation not during self-test.
VEHICLE SPEED	xxx.x mph	Displays the messaged English speed value received. The speedometer indicates the present speed. If the vehicle speed message is missing, MISSING DATA is displayed.
VEHICLE SPEED	xxx.x km/h	Displays the messaged metric speed value received. The speedometer indicates the present speed.
SPEEDOMETER	DC xxxx	Displays corresponding gauge driver counts output for present

repair4less

		vehicle speed value.
TACHOMETER	xxxx rpm	Displays the messaged engine speed signal value received. The tachometer indicates present rpm.
TACHOMETER	DC xxxx	Displays corresponding gauge driver counts output for present rpm value.
FUEL LEVEL	A/D INPUT xxxx	Displays the present ratio'd analog/digital fuel level input in decimal.
FUEL LEVEL	FLPS IN xxxx	Displays the present input for fuel level percent status in decimal.
FUEL LVL FILT	FLPS IN xxxx	Displays the present filtered fuel level percent status in decimal (used by gauge).
FUEL FILT	% STATUS xxxx	Displays the present fuel filter percent status in decimal.
FUEL FILT HYST	% STATUS xxxx	Displays the present fuel filter delay percent status in decimal.
FUEL GAUGE	DC xxxx	Displays the corresponding fuel gauge driver counts output for filtered fuel level percent status value.
FUEL LEVEL	INIT REF $xxxx	Displays the fuel initial reference type used at key on initiation in hexadecimal followed by the fuel level percent status value of the initial reference in hexadecimal.
FUEL RAFE	xx.x MPG	Displays the running average fuel economy in decimal in miles.
FUEL RAFE	xx.x L/100km	Displays the running average fuel economy in decimal in kilometers.
INSTANT DTE	xxx MILES	Displays the instantaneous Distance To Empty (DTE) in miles.
INSTANT DTE	xxx km	Displays the instantaneous Distance To Empty (DTE) in kilometers.
FUEL ON/OFF/SZ	xxx xxx xxx	Displays the key on initialization (left xxx), key off reference (middle xxx), and zero speed reference (right xxx) fuel level values in fuel level percent status.
F#S ON/OFF/SZ	xxx xxx xxx	Displays the number of valid fuel samples taken at key on initialization (left xxx), key off convergence (middle xxx), and zero speed convergence (right xxx) in decimal counts, no leading zeros.
COOLANT TEMP	xxx C	Displays the last messaged engine coolant temperature value message received. The temperature gauge indicates the present temperature.
TEMP GAUGE	DC xxxx	Displays corresponding gauge driver counts output for present engine temperature value.
FAIL SAFE	COOL MODE xx	Displays the fail safe mode in hexadecimal.
OIL PRESSURE	LAMP xxx	Displays the low oil pressure indicator status.
OIL PRS GAUGE	DC xxxx	Displays corresponding gauge driver counts output for present oil pressure gauge value.
TRANS TEMP	xxx C	Displays the transmission temperature input in degrees Celsius.
TRANS TEMP	DC xxxx	Displays corresponding gauge driver counts output for present transmission temperature gauge value.
BATTERY	xx.x VOLTS	Displays the present battery voltage in 10th of volts.
BATTERY A/D	COUNTS xxxx	Displays the present battery analog/digital counts in decimal.
ODOMETER	xxx COUNTS	Displays the messaged odometer rolling count input received in decimal.

TRIP ODOMETER	A xxx.x mi	Displays the trip odometer value stored in Random Access Memory (RAM) in miles.
TRIP ODOMETER	B xxx.x mi	Displays the trip odometer value stored in Random Access Memory (RAM) in miles.
PDS IN	SENSE x	Displays the current state of the park detect switch input.
MC SW IN	SENSE x	Displays the current state of the message center switch input.
HDC SW IN	SENSE x	Displays the current state of the hill descent switch input.
HDC LED OUT	CMD xx	Displays the current state of the hill descent indicator.
DIMMING CMD	xxxx	Displays the messaged dimming value input from the Body Control Module (BCM).
DIMMING STEP	D xx	Displays the messaged dimming level step (0 thru 21) received in decimal from the BCM .
MCSW IN	xxxx A/D COUNTS	Displays the present message center switch analog/digital counts in decimal.
MC SWITCH	xxx A/D COUNTS	Displays the present message center switch input analog/digital counts in decimal.
LAST CHIME	SOUNDED xx	Displays the last chime that sounded.
A/D PORT 2-9	$ xxxx	Displays 10 bit hexadecimal value of the analog port readings.
DIGITAL INPUTS	PORT A, C, A/D $xx	Displays 8 bit hexadecimal value of the digital port readings.
DIGITAL INPUTS	PORT A/D $xxxx	Displays 8 bit hexadecimal value of the digital port readings.
DIGITAL INPUTS	HET1 $xxxxxxxx	Displays 8 bit hexadecimal value of the digital port readings.
GAUGE	TEST	Repeats the sweep of all gauges and then displays present gauge values.

DTC Charts

Instrument Panel Cluster (IPC) DTC Chart

DTC	Description	Action
B1A82:11	External Trip Switch: Circuit Short To Ground	GO to Pinpoint Test AF .
B1A82:13	External Trip Switch: Circuit Open	GO to Pinpoint Test AF .
B1A82:23	External Trip Switch: Signal Stuck Low	INSTALL a new LH steering wheel switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
P0460:11	Fuel Level Sensor A Circuit: Circuit Short to Ground	GO to Pinpoint Test B .
P0460:13	Fuel Level Sensor A Circuit: Circuit Open	GO to Pinpoint Test B .
P062F:46	Internal Control Module EEPROM Error: Calibration/Parameter Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC P062F:46 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal

repair4less

		operation.
P1534:01	Restraint Deployment Indicator Circuit: General Electrical Failure	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
P1706:00	High Vehicle Speed Observed in Park: No Sub Type Information	GO to Pinpoint Test X .
U0100:00	Lost Communication With ECM /PCM "A": No Sub-Type Information	GO to Pinpoint Test AT .
U0102:00	Lost Communication With Transfer Case Control Module: No Sub-Type Information	GO to Pinpoint Test AU .
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub-Type Information	GO to Pinpoint Test AV .
U0131:00	Lost Communication With Power Steering Control Module: No Sub-Type Information	GO to Pinpoint Test AW .
U0137:00	Lost Communication With Trailer Brake Control Module: No Sub-Type Information	GO to Pinpoint Test AX .
U0140:00	Lost Communication With Body Control Module: No Sub-Type Information	GO to Pinpoint Test AY .
U0151:00	Lost Communication With Restraints Control Module: No Sub-Type Information	GO to Pinpoint Test AZ .
U0154:00	Lost Communication With Restraints Occupant Classification System Module: No Sub-Type Information	GO to Pinpoint Test BA .
U0159:00	Lost Communication With Parking Assist Control Module "A": No Sub-Type Information	GO to Pinpoint Test BB .
U0212:00	Lost Communication With Steering Column Control Module: No Sub-Type Information	GO to Pinpoint Test BC .
U0401:00	Invalid Data Received from ECM /PCM A: No Sub-Type Information	This DTC sets when the IPC receives invalid network data from the PCM for the vehicle speed input. RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to Section 419-10 for the correct navigation of all DTCs. TEST the system for normal operation.
U0401:55	Invalid Data Received from ECM /PCM A: Not Configured	This DTC sets when the IPC receives invalid network data from the PCM for Trailer Brake Control (TBC) when the IPC is not configured for TBC . CARRY OUT the Programmable Module Installation (PMI) (when the original module is not available) for the IPC . REFER to Section 418-01 . TEST the system for normal operation.
U0401:81	Invalid Data Received from ECM /PCM A: Invalid Serial Data	This DTC sets when the IPC receives invalid network data from the PCM for the engine temperature data. RETRIEVE

	Received	and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to Section 419-10 for the correct navigation of all DTCs. TEST the system for normal operation.
U0401:86	Invalid Data Received from ECM /PCM A: Signal Invalid	This DTC sets when the IPC receives invalid network data from the PCM for the odometer data. RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to Section 419-10 for the correct navigation of all DTCs. TEST the system for normal operation.
U0415:56	Invalid Data Received from Anti-Lock Brake System (ABS) Control Module: Invalid/Incompatible Configuration	This DTC sets when the IPC receives invalid data from the ABS module. DETERMINE which module (IPC or ABS module) has been replaced. CARRY OUT the Programmable Module Installation (PMI) (when the original module is not available) for the module in question. REFER to Section 418-01 . TEST the system for normal operation.
U0422:00	Invalid Data Received from Body Control Module: No Sub-Type Information	This DTC sets when the IPC receives invalid Body Control Module (BCM) data for the Tire Pressure Monitoring System (TPMS) function. RETRIEVE and REPAIR all non-network DTCs in the BCM . REFER to Section 419-10 for the correct navigation of all DTCs. TEST the system for normal operation.
U0422:56	Invalid Data Received from Body Control Module: Invalid/Incompatible Configuration	This DTC sets when the IPC receives BCM data for the autolamp function and the IPC is not configured for autolamps. DETERMINE which module (IPC or BCM) has been replaced. CARRY OUT the Programmable Module Installation (PMI) (when the original module is not available) for the module in question. REFER to Section 418-01 . TEST the system for normal operation.
U045A:55	Invalid Data Received From Parking Assist Control Module "A": Not Configured	This DTC sets when the IPC receives rear parking aid data when the IPC is not configured for parking aid. CARRY OUT the PMI (when the original module is not available) for the IPC . REFER to Section 418-01 . TEST the system for normal operation.
U045A:68	Invalid Data Received From Parking Assist Control Module "A": Event Information	This DTC sets when the IPC receives invalid rear parking aid data. RETRIEVE and REPAIR all non-network DTCs in the Parking Aid Module (PAM). REFER to Section 413-13 for a list of all DTCs. If there are no DTCs present, INSTALL a new PAM . REFER to Section 413-13 . TEST the system for normal operation.
U0462:82	Invalid Data Received from Compass Module: Alive/Sequence Counter Incorrect/Not Updated	If equipped with a 4.2" message center and a 4.2" FCDIM , GO to Pinpoint Test AG . For all other configurations, Refer to the appropriate section in Group 415 for the procedure.

repair4less

U0545:56	Invalid Data Received From Running Board Control Module: Invalid/Incompatible Configuration	This DTC sets when the IPC receives Power Running Board (PRB) data when the IPC is not configured for PRB s. CARRY OUT the PMI (when the original module is not available) for the IPC . REFER to Section 418-01 . TEST the system for normal operation.
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CARRY OUT the PMI (when the original module is not available) for the IPC . REFER to Section 418-01 . TEST the system for normal operation. After the PMI , CLEAR the DTC. REPEAT the self-test.
U3000:04	Control Module: System Internal Failure	CLEAR the DTCs. REPEAT the self-test. If the DTC returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test BD .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test BE .
U300A:64	Ignition Switch: Signal Plausibility Failure	This DTC sets on-demand and in continuous memory when the IPC detects a messaged START input for 15 seconds or longer. Once the fault condition is detected, the IPC operates with limited functionality for 15 seconds then returns to full functionality. REFER to Section 211-05 to diagnose the ignition start circuit to the BCM .

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B1048:7B	Brake Fluid Level Switch: Low Fluid Level	GO to Pinpoint Test N .
B10F1:14	Key In Switch: Circuit Short To Ground or Open	If the chime sounds with the door ajar and no key in the ignition, GO to Pinpoint Test AM . If the key-in-ignition chime is inoperative, GO to Pinpoint Test AO .
C1D00:11	Park Brake Apply Switch: Circuit Short to Ground	GO to Pinpoint Test N .
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

P0462	Fuel Level Sensor A Circuit Low	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
P0463	Fuel Level Sensor A Circuit High	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
All other DTCs	—	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Charts

Symptom Chart — Instrument Panel Cluster (IPC)

Condition	Possible Sources	Action
• No communication with the Instrument Panel Cluster (IPC)	• Fuse • Wiring, terminals or connectors • IPC	• REFER to Section 418-00 .
• The Instrument Panel Cluster (IPC) is inoperative	• Communication concern • IPC	• GO to Pinpoint Test A .
• Incorrect fuel gauge indication	• Wiring, terminals or connectors • Fuel tank • Fuel level sender (float and resistance card) • Fuel pump module • IPC	• GO to Pinpoint Test B .
• Incorrect oil pressure gauge indication	• Communication network concern • Wiring, terminals or connectors	• GO to Pinpoint Test C .

repair4less

	• Engine oil pressure switch • Base engine oil pressure concern • PCM • IPC	
• The temperature gauge is inoperative	• PCM • IPC	• GO to Pinpoint Test D .
• Incorrect temperature gauge indication	• PCM concern • IPC	• GO to Pinpoint Test E .
• The speedometer is inoperative	• PCM • IPC	• GO to Pinpoint Test F .
• Incorrect speedometer indication	• Tire size configuration • Axle ratio configuration • PCM concern • IPC	• GO to Pinpoint Test G .
• The odometer is inoperative	• PCM • IPC	• GO to Pinpoint Test H .
• The tachometer is inoperative	• PCM • IPC	• GO to Pinpoint Test I .
• Incorrect tachometer indication	• PCM concern • IPC	• GO to Pinpoint Test J .
• The transmission temperature gauge is inoperative	• PCM • IPC	• GO to Pinpoint Test K .
• Incorrect transmission temperature gauge indication	• Transmission concern • IPC	• GO to Pinpoint Test L .
• The ControlTrac 4WD gauge is inoperative	• 4WD concern • IPC	• GO to Pinpoint Test BG .
• The brake warning indicator is never on	• Wiring, terminals or connectors • Brake fluid level switch • Parking brake warning indicator switch • Body Control Module (BCM) • IPC	• GO to Pinpoint Test M .
• The brake warning indicator is always on	• Wiring, terminals or connectors • Parking brake warning indicator switch • Brake fluid level switch • ABS concern • BCM	• GO to Pinpoint Test N .

	• IPC	
• The ABS warning indicator is never/always on	• ABS module • IPC	• GO to Pinpoint Test O .
• The stability/traction control indicator is never/always on	• Stability/traction control concern • ABS module • IPC	• GO to Pinpoint Test P .
• The stability/traction control disabled indicator is never/always on	• A MyKey® programmed key is in use • Stability/traction control cannot be disabled • ABS module • IPC	• GO to Pinpoint Test Q .
• The LH/RH turn or high beam indicator is never/always on	• Turn signal concern • High beam concern • BCM • IPC	• GO to Pinpoint Test R .
• The Tire Pressure Monitoring System (TPMS) warning indicator is never/always on	• Tire pressure • TPMS concern • BCM • IPC	• GO to Pinpoint Test S .
• The air bag warning indicator is never/always on	• SRS concern • Restraints Control Module (RCM) • IPC	• GO to Pinpoint Test T .
• The safety belt warning indicator is never/always on	• Safety belt buckle concern • RCM • IPC	• GO to Pinpoint Test U .
• The Malfunction Indicator Lamp (MIL) is never/always on	• PCM • IPC	• GO to Pinpoint Test V .
• The cruise control indicator is never/always on	• PCM • IPC	• GO to Pinpoint Test W .
• The PRNDL indicator is never on/always displays P	• Wiring, terminals or connectors • Brake shift interlock actuator • PCM concern • IPC	• GO to Pinpoint Test X .
• The powertrain malfunction (wrench) message center indicator is always on	• Message center concern • Electronic Throttle Control (ETC) concern • 4WD concern (if	• GO to Pinpoint Test Y .

repair4less

	equipped) • Transmission concern	
• The engine over-temperature message center warning indicator is never/always on	• PCM concern • IPC	• OPEN then CLOSE the driver door and VERIFY the door ajar message center warning indicator functions correctly. ▪ If the door ajar message center warning indicator does not function correctly, INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. ▪ If the door ajar message center warning indicator functions correctly, GO to Pinpoint Test D to diagnose the temperature gauge.
• The charging system message center warning indicator is never/always on	• Message center concern • Charging system concern • PCM	• GO to Pinpoint Test Z.
• The low oil pressure message center warning indicator is never/always on	• Wiring, terminals or connectors • Message center concern • Communication concern • Tachometer concern • Engine oil pressure switch • Base engine oil pressure concern • PCM	• GO to Pinpoint Test AA.
• The 4X4 auto, 4X4 low, 4X4 high or 4X2 message center indicator is never/always on (if equipped)	• Message center concern • Four-Wheel Drive (4WD) concern • Transfer Case Control Module (TCCM)	• GO to Pinpoint Test AB.
• The tow haul message center indicator is never/always on	• Message center concern • PCM	• GO to Pinpoint Test AC.
• The Electronic Locking Differential (ELD) message center indicator is	• Message center concern • ELD concern • TCCM	• GO to Pinpoint Test AD.

never/always on		
• The door ajar message center warning indicator is never/always on	• Message center concern • Interior lighting concern • BCM	• GO to Pinpoint Test AE .
• The low fuel message center indicator is never/always on	• Fuel gauge indication concern • IPC	• GO to Pinpoint Test BF .

Symptom Chart — Information And Message Center

Condition	Possible Sources	Action
• The message center display is blank	• Message center set to blank display mode • IPC	• On the base IPC , PRESS the INFO button to make sure the message center is not set to a blank display mode. On the optional IPC , PRESS the message center button left several times to navigate from the blank message center display. ▪ If the message center display turns on, the system is operating normally at this time. The message center display was set to a blank display mode. ▪ If the message center display is still blank, GO to Pinpoint Test A .
• Not all segments of the display illuminate — base IPC only	• IPC	• INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• Not all display pixels illuminate — optional IPC only	• IPC	• **NOTE:** In order to condemn the IPC , the display failure must meet all of the following criteria: • There must be 3 or more pixels inoperative. • The inoperative pixels must be within 5 mm (0.196 in) or less from each other. • The inoperative pixels must be inside of the area that is 19 mm (0.748 in) from each outside border. VERIFY the number of pixels

repair4less

		are inoperative and the location of the inoperative pixels in the display screen. ■ If the does not meet the above criteria, the display is operating within design specifications. ■ If display meets the above criteria, INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The message center is not operating correctly	• Wiring, terminals or connectors • Message center switch (part of the LH steering wheel switch) • Clockspring • IPC	• GO to Pinpoint Test AF.
• The compass is inoperative (with 4.2" message center and 4.2" FCDIM)	• Communication concern • GPSM	• GO to Pinpoint Test AG.
• The compass is inoperative (without 4.2" message center and 4.2" FCDIM)	• Fuse • Wiring, terminals or connectors • Communication concern • GPSM	• Refer to the appropriate section in Group 415 for the procedure.
• The compass is inaccurate	• Zone setting • Calibration • Compass module • Auto-dimming interior mirror	• Refer to the appropriate section in Group 415 for the procedure.
• The factory mode message is always on	• Vehicle still in factory mode	• **NOTE:** This vehicle automatically defaults to normal operation mode after 60 ignition cycles. CARRY OUT the procedure to place the vehicle in normal operation mode. REFER to Disable Transport or Factory Mode in Section 419-10.
• The transport mode message is always on	• Vehicle still in transport mode	• **NOTE:** The vehicle automatically defaults to normal operation mode when the mileage reaches 125

		miles (200 km). CARRY OUT the procedure to place the vehicle in normal operation mode. REFER to Disable Transport or Factory Mode in Section 419-10 .
• The ENGINE OIL CHANGE SOON, OIL CHANGE REQUIRED message is inoperative	• Odometer • IPC	• Using the system check in the message center, VERIFY the oil life is between 1% and 5% for the ENGINE OIL CHANGE SOON message or at 0% for the OIL CHANGE REQUIRED message. ▪ If the oil life is between 1% and 5%, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. ▪ If the oil life is above 5%, the message center is operating correctly. INFORM the customer how the message center functions and how the oil life messages are set.
• The Distance To Empty (DTE)/average fuel economy display is inoperative	• IPC	• CHECK the operation of the fuel gauge, the speedometer and the odometer. ▪ If the speedometer, the fuel gauge or the odometer do not operate correctly, GO to Pinpoint Test B (fuel gauge), GO to Pinpoint Test F (speedometer) or GO to Pinpoint Test H (odometer). ▪ If the speedometer, the fuel gauge and the odometer operate correctly, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The outside air temperature display is inoperative/incorrect	• Communication concern • PCM concern	• GO to Pinpoint Test AI .

repair4less

• A hill descent message is inoperative/always on	• Message center concern • ABS module	• GO to Pinpoint Test AJ .
• The CHECK FUEL FILL INLET message is inoperative/always on	• Evaporative fuel system concern • PCM • IPC	• GO to Pinpoint Test AK .
• The CHECK BRAKE SYSTEM, PARK BRAKE ENGAGED or BRAKE FLUID LEVEL LOW warning is inoperative/always on	• Brake warning indication concern • IPC	• OPEN then CLOSE the driver door and VERIFY the DRIVER DOOR AJAR warning functions correctly. ▪ If the DRIVER DOOR AJAR warning does not function correctly, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. ▪ If the DRIVER DOOR AJAR warning functions correctly, GO to Pinpoint Test M (never on) or GO to Pinpoint Test N (always on) to diagnose the brake warning indicator.
• The DRIVER, PASSENGER, REAR LEFT or REAR RIGHT DOOR AJAR warning is inoperative/always on	• Interior lighting concern • IPC	• DISCONNECT the brake fluid level switch and VERIFY the message center displays CHECK BRAKE SYSTEM. ▪ If the CHECK BRAKE SYSTEM warning turns on, GO to Pinpoint Test AE to diagnose the door ajar message center warning indicator. ▪ If the CHECK BRAKE SYSTEM warning does not turn on, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The TIRE PRESSURE SENSOR FAULT, LOW TIRE PRESSURE or TIRE PRESSURE MONITOR FAULT warning is inoperative/always on	• BCM • IPC	• OPEN then CLOSE the driver door and VERIFY the DRIVER DOOR AJAR warning functions correctly. ▪ If the DRIVER DOOR AJAR warning does not function correctly,

		INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. ■ If the DRIVER DOOR AJAR warning functions correctly, GO to Pinpoint Test S to diagnose the TPMS warning indicator.
• The TRAIN LEFT FRONT, RIGHT FRONT, RIGHT REAR or LEFT REAR message is inoperative/always on	• TPMS warning indicator concern • TPMS sensor training	• **NOTE:** These messages only appear during the TPMS sensor training procedure. REFER to Section 204-04 . VERIFY the TPMS warning indicator functions. ■ If the TPMS warning indicator does not operate, GO to Pinpoint Test S . ■ If the TPMS warning indicator operates, CARRY OUT the TPMS sensor training. REFER to Section 204-04 .
• The TIRES NOT TRAINED-REPEAT message is always on	• TPMS sensor training	• CARRY OUT the TPMS sensor training. REFER to Section 204-04 .
• The TRAINING COMPLETE message is inoperative	• TPMS sensor training	• CARRY OUT the TPMS sensor training. REFER to Section 204-04 .
• A MyKey® menu is not available or incorrect	• MyKey® programmed key in use • Number of keys set to unlimited mode • Non-Ford approved remote start system installed	• REFER to Section 419-01B to diagnose the MyKey® system.
• The WIRING FAULT ON TRAILER, TRAILER BRAKE MODULE FAULT or TRAILER DISCONNECTED warning is inoperative/always on	• IPC configuration • Trailer brake control system	• VERIFY the vehicle is equipped with the trailer brake control system. ■ If the trailer brake warning is inoperative, VERIFY the IPC is correctly configured for trailer brake using the PMI (when the original

repair4less

		module is not available). REFER to Section 418-01 . ■ If the trailer brake warning is always on, REFER to Section 206-10 .
• A 4X4 system message is inoperative/always on	• Message center concern • 4WD system concern • TCCM	• OPEN then CLOSE the driver door and VERIFY the DRIVER DOOR AJAR warning functions correctly. ■ If the DRIVER DOOR AJAR warning does not function correctly, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. ■ If the DRIVER DOOR AJAR warning functions correctly, GO to Pinpoint Test AB to diagnose the 4X4 auto, 4X4 low, 4X4 high or 4X2 message center warning indicator.
• An off road mode message is inoperative/always on (Raptor only)	• Message center concern • 4WD concern • TCCM	• GO to Pinpoint Test AL .

Symptom Chart — Warning Chimes

Condition	Possible Sources	Action
• All the chimes are inoperative	• Instrument Panel Cluster (IPC)	• VERIFY the IPC gauges and indicators are functioning correctly. ■ If the IPC gauges and indicators do not function correctly, GO to Pinpoint Test A . ■ If the IPC gauges and indicators function correctly, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The air bag secondary warning chime is inoperative	• IPC	• RETRIEVE the recorded IPC DTCs from the self-test. ■ If the IPC DTC P1534:01 is not present, the system is operating correctly. The air bag secondary warning chime sounds only when a fault in the air bag warning indicator is present and DTC P1534:01 is

		recorded. ■ If the IPC DTC P1534:01 is present, INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The air bag secondary warning chime has activated	• IPC	• INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The Belt-Minder® feature does not operate correctly	• Safety belt warning indication concern • Belt-Minder® deactivated • Speedometer concern • RCM • IPC	• GO to Pinpoint Test AR.
• The chime always sounds	• Exterior lighting concern • Interior lighting concern • Wiring, terminals or connectors • Key-in-ignition warning switch (part of the ignition switch) • Ignition lock cylinder • Body Control Module (BCM)	• GO to Pinpoint Test AM.
• The door ajar warning chime is inoperative	• Interior lighting concern • BCM • IPC	• VERIFY the key-in-ignition warning chime functions correctly. ■ If the key-in-ignition warning chime does not function correctly, GO to Pinpoint Test AO. ■ If the key-in-ignition warning chimes functions correctly, GO to Pinpoint Test AE to diagnose the door ajar message center warning indicator.
• The headlamps on warning chime is inoperative	• Interior lighting concern • BCM • IPC	• GO to Pinpoint Test AN.
• The key-in-ignition warning chime is inoperative	• Interior lighting concern • Wiring, terminals or	• GO to Pinpoint Test AO.

repair4less

	connectors • Key-in-ignition warning switch (part of the ignition switch) • Ignition lock cylinder • BCM • IPC	
• The message center warning chime is inoperative	• IPC	• DISCONNECT the brake fluid level switch and VERIFY the message center warning chime sounds when the message center displays CHECK BRAKE SYSTEM. ▪ If the message center warning chime sounds when the CHECK BRAKE SYSTEM warning appears, the system is operating correctly at this time. The message center warning chime only sounds when the message center displays a new warning message. ▪ If the message center warning chime does not sound when the CHECK BRAKE SYSTEM warning appears, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The memory feedback warning chime is inoperative	• Driver Seat Module (DSM) • IPC	• GO to Pinpoint Test AP .
• The parking brake warning chime is inoperative	• Brake warning indication concern • BCM • IPC	• GO to Pinpoint Test AQ .
• The perimeter alarm warning chime is inoperative	• Perimeter alarm concern • IPC	• VERIFY the key-in-ignition warning chime functions correctly. ▪ If the key-in-ignition warning chime does not function correctly, GO to Pinpoint Test AO . ▪ If the key-in-ignition warning chimes functions correctly, REFER to Section 419-01A to diagnose the perimeter alarm.
• The safety belt warning chime is inoperative	• Safety belt warning indication concern • IPC	• GO to Pinpoint Test AR .

• The service AdvanceTrac® warning chime is inoperative	• Message center traction control warning concern • IPC	• VERIFY the SERVICE ADVANCETRAC message is displayed in the message center and the stability/traction control indicator operates correctly. ▪ If the SERVICE ADVANCETRAC message is not displayed in the message center and the stability/traction control indicator is not illuminated, the system is operating correctly. ▪ If the SERVICE ADVANCETRAC message is displayed and the stability/traction control indicator is illuminated, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The turn/hazard on chime (tick-tock) is inoperative	• RH/LH turn indicator • IPC	• VERIFY the RH/LH turn indicators operate correctly. ▪ If the RH/LH turn indicators do not operate correctly, GO to Pinpoint Test R . ▪ If the RH/LH turn indicators operate correctly, INSTALL a new IPC . TEST the system for normal operation.
• The turn signal on warning chime is inoperative	• Turn signal indication concern • Odometer operation • BCM • IPC	• GO to Pinpoint Test AS .

Pinpoint Tests

Pinpoint Test A: The Instrument Panel Cluster (IPC) Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives a hot at all times voltage from the Body Control Module (BCM) fuse 11 (10A). The IPC uses a run/start input messaged from the BCM over the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Communication concern
- IPC

repair4less

PINPOINT TEST A: THE IPC IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 VERIFY THE IPC PASSES THE NETWORK TEST	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • In the LH pane of theIntegrated Diagnostic System (IDS) network test display screen, verify whether the IPC passed the network test. • **Did the IPC pass the network test?**	**Yes** GO to A2 . **No** REFER to Section 418-00 to diagnose the IPC does not respond to the scan tool.
A2 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to A3 .
A3 CHECK FOR CORRECT IPC OPERATION	

• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: Incorrect Fuel Gauge Indication

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The fuel level sender (part of the fuel pump module) is hardwired to the Instrument Panel Cluster (IPC) between the signal and return circuits. The fuel level sender is a variable resistor that ranges from 10 ohms ± 2 ohms at full (F) and 180 ohms ± 4 ohms at empty (E). The IPC provides a reference voltage to the fuel pump module. As the fuel level changes, a float actuates a variable resistor on the fuel pump sender and raises or lowers the fuel level signal voltage depending on the resistance of the fuel level sender. The IPC monitors the changes in voltage and commands the fuel gauge with a corresponding movement of the pointer.

The IPC uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)

- Key off fueling
- Key on fueling
- Recovery

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

Anti-Slosh Mode

The default fuel gauge mode is called the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sender readings caused by fuel moving around in the tank), the fuel gauge takes approximately 55 minutes to go from empty (E) to full (F).

Key Off Fueling Mode

The key off fueling mode (2 seconds to read empty [E] to full [F]) requires the following conditions be met:

- The ignition must be off when refueling the vehicle.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.
- The IPC must receive a valid key on fuel sender reading within 1 second of the ignition being put into run. The key on sample readings are considered valid if the fuel sender reading is between 10 ohms ± 2 ohms and 180 ohms ± 4 ohms.

If these conditions are not met, the fuel gauge stays in the default anti-slosh mode, which results in a slow to read full (F) event.

Key On Fueling Mode

The key on fueling mode (approximately 60 seconds to read empty [E] to full [F]) requires the following conditions be met:

- Engine speed input greater than 0 rpm.
- The transmission is in park.
- The ignition is in run.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.

In key on fueling mode, a 30 second timer activates after the transmission is put into the PARK position. When the 30 second time has elapsed and at least 15% of the vehicle's fuel capacity has been added, the fuel gauge response time is 60 seconds to read from empty (E) to full (F). When the transmission is shifted out of park, the fuel gauge strategy reverts to the anti-slosh mode. The key on fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the ignition in RUN.

Recovery Mode

Recovery mode is incorporated into the IPC strategy to recover from a missing fuel level input after a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sender or its circuits. Recovery mode (empty [E] to full [F] approximately 20 minutes) is initiated when the following 2 conditions are met:

- The IPC is in the anti-slosh (default) mode.
- The actual fuel level in the tank is greater than what is being displayed by the fuel gauge.

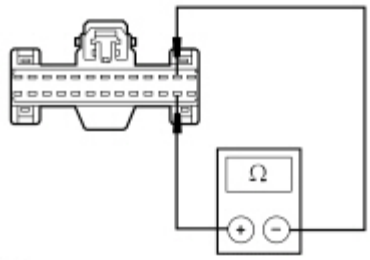
repair4less

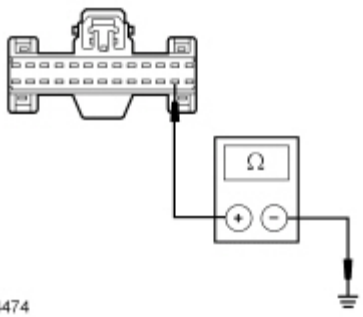
Instrument Panel Cluster (IPC) DTCs

DTC Description	Fault Trigger Conditions
• P0460:11 — Fuel Level Sensor A Circuit: Circuit Short to Ground	A continuous and on-demand DTC that sets in the IPC if the IPC detects the fuel sender is out of range on the fuel level input circuit with a short to ground for more than 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P0460:11.
• P0460:13 — Fuel Level Sensor A Circuit: Circuit Open	A continuous and on-demand DTC that sets in the IPC if the IPC detects the fuel sender is out of range on the fuel level input circuit with an open or short to voltage for more than 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P0460:13.

PCM DTCs

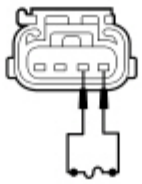
DTC Description	Fault Trigger Condition
• P0460 — Fuel Level Sensor A Circuit	This DTC sets when the PCM determines the value of the fuel level input signal is stuck, the fuel level input signal does not change or does not correspond with the calculated fuel usage.
• P0461 — Fuel Level Sensor A Circuit Range/Performance	This DTC sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
• P0462 — Fuel Level Sensor A Circuit Low	This DTC sets in the PCM when the PCM detects a short to ground on the fuel pump module signal circuit based on the messaged input received from the IPC .
• P0463 — Fuel Level Sensor A Circuit High	This DTC sets in the PCM when the PCM detects an open or a short to voltage on the fuel pump module signal circuit based on the messaged input received from the IPC .

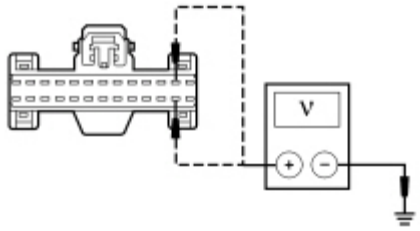




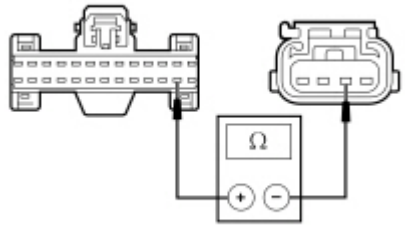
This pinpoint test is intended to diagnose the following:

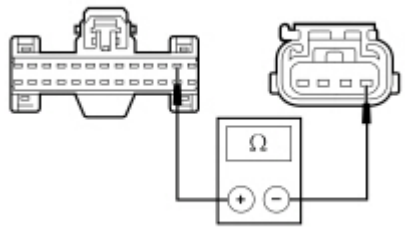
- Wiring, terminals or connectors
- Fuel tank
- Fuel level sender (float and resistance card)
- Fuel pump module
- IPC





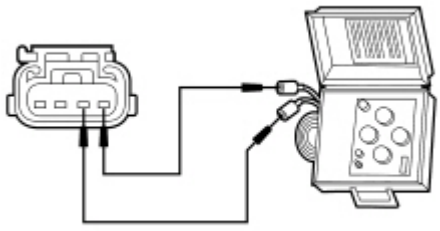
PINPOINT TEST B: INCORRECT FUEL GAUGE INDICATION





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Ignition OFF.	**Yes**

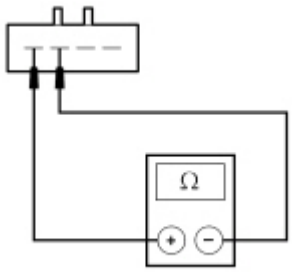


• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	For DTC P0460:11, GO to B2 . For DTC P0460:13, GO to B5 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to B9 .
B2 CHECK THE FUEL PUMP MODULE FOR A SHORT TO GROUND	
• Disconnect: Fuel Pump Module C4330 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • Wait 1 minute. • **NOTE:** DTC P0460:11 may also be present when carrying out this test step and should be ignored. • Clear the IPC DTCs. Repeat the IPC self-test. • **Is DTC P0460:13 retrieved?**	**Yes** GO to B13 . **No** GO to B3 .
B3 CHECK THE FUEL PUMP MODULE SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: IPC C220 . • Measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and the IPC C220-2, circuit RMC32 (GN/BU), harness side.  N0094472 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuits for a short together. CLEAR the DTCs. REPEAT the self-test.
B4 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and ground.  N0094474 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B15 . **No** REPAIR circuit VMC11 (YE/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test.

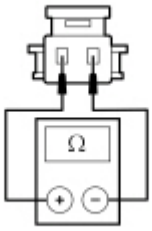
repair4less

B5 CHECK THE FUEL PUMP MODULE FOR AN OPEN	
• Disconnect: Fuel Pump Module C4330 . • Connect a fused jumper wire between the fuel pump module C4330-2, circuit VMC11 (YE/VT), harness side and the fuel pump module C4330-1, circuit RMC32 (GN/BU), harness side.  N0057125 • Ignition ON. • Wait 1 minute. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • **NOTE:** DTC P0460:13 may also be present when carrying out this test step and should be ignored. • Clear the IPC DTCs. Repeat the IPC self-test. • **Is DTC P0460:11 retrieved?**	**Yes** REMOVE the jumper wire. GO to B13 . **No** REMOVE the jumper wire. GO to B6 .
B6 CHECK THE FUEL LEVEL SIGNAL AND RETURN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220 . • Ignition ON. • Measure the voltage between the IPC C220-15, circuit VMC11 (YE/VT), harness side and ground; and between the IPC C220-2, circuit RMC32 (GN/BU), harness side and ground.  N0094467 • **Is any voltage present?**	**Yes** REPAIR the circuit in question for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to B7 .
B7 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and the fuel pump module C4330-2, circuit VMC11 (YE/VT), harness side:	**Yes** GO to B8 . **No** REPAIR circuit VMC11 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test.

 N0120192 • **Is the resistance less than 5 ohms?**	
B8 CHECK THE FUEL LEVEL RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between the IPC C220-2, circuit RMC32 (GN/BU), harness side and the fuel pump module C4330-1, circuit RMC32 (GN/BU), harness side.  N0120193 • **Is the resistance less than 5 ohms?**	**Yes** GO to B15 . **No** REPAIR circuit RMC32 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test.
B9 CARRY OUT THE IPC FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC fuel gauge (FUELLEVEL) active command. Monitor the fuel gauge while scrolling the fuel level at 0%, 50%, and 100%. • **Does the fuel gauge display below E with 0%, half with 50%, and full stop with 100%?**	**Yes** GO to B10 . **No** GO to B15 .
B10 CHECK THE FUEL LEVEL INPUT TO THE IPC	
NOTE: Since the IPC may be in anti-slosh mode, the PID values may not match the fuel gauge readings. Disregard the actual gauge indication during this test step. • Ignition OFF. • Disconnect: Fuel Pump Module C4330 . • Connect one lead of the instrument gauge system tester to the fuel pump module C4330-2, circuit VMC11 (YE/VT), harness side and the other lead to the fuel pump module assembly C4330-1, circuit RMC32 (GN/BU), harness side.	**Yes** DISCONNECT the instrument gauge system tester. GO to B12 . **No** DISCONNECT the instrument gauge system tester. GO to B11 .



repair4less



N0057130

- Ignition ON.
- Enter the following diagnostic mode on the scan tool: IPC DataLogger .
- **NOTE:** It is important to confirm the gauge tester settings with an ohmmeter to make sure the gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results.
- Monitor the IPC fuel level PID (FUELLEVEL) with the instrument gauge system tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms, and 10 ohms.
- **Does the PID begin at approximately 0%, move to 25%, 50%, 75% then 100%?**

B11 CHECK THE FUEL PUMP MODULE SIGNAL AND RETURN CIRCUITS FOR A HIGH RESISTANCE	
- Ignition OFF. - Disconnect: IPC C220 . - Connect a fused jumper wire between the fuel pump module C4330-2, circuit VMC11 (YE/VT), harness side and the fuel pump module C4330-1, circuit RMC32 (GN/BU), harness side.  N0057125 - Measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and the IPC C220-2, circuit RMC32 (GN/BU), harness side.  N0094472 - **Is the resistance less than 5 ohms?**	**Yes** GO to B15 . **No** REPAIR the circuits for high resistance. TEST the system for normal operation.

B12 CHECK THE FUEL TANK	
• Check the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to B13 . **No** VERIFY the fuel level sensor and fuel pump module are OK. INSTALL a new fuel tank. REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test.
B13 CHECK THE FUEL PUMP MODULE	
NOTE: The fuel pump module resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position. • Remove the fuel pump module. Refer to Section 310-01 . • Measure the resistance between the fuel pump module pin 1, component side, and the fuel pump module pin 2, component side, while moving the float arm from the lower stop position to the upper stop position.  N0027636 • **Does the resistance slowly decrease from approximately 180 ohms to 10 ohms?**	**Yes** CHECK the fuel pump module connector for corrosion, damaged or pushed out pins and REPAIR as necessary. **No** GO to B14 .
B14 CHECK THE FUEL LEVEL SENDER	
NOTE: The fuel level sender resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position. • Disconnect the fuel level sender input wire from the fuel pump module. • Measure the resistance between the fuel level sender connector pin 1, harness side and the fuel level sender connector pin 2, harness side while slowly moving the float arm between the lower and upper stop position.	**Yes** INSTALL a new fuel pump module. REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new fuel level sender (float and card). CLEAR the DTCs. REPEAT the self-test.

repair4less

 N0112563 • **Does the resistance slowly decrease from approximately 180 ohms to 10 ohms?**	
B15 CHECK FOR CORRECT IPC OPERATION	

• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: Incorrect Oil Pressure Gauge Indication

Normal Operation

The engine oil pressure switch is hardwired to the PCM. The Instrument Panel Cluster (IPC) receives the engine oil pressure status from the PCM over the High Speed Controller Area Network (HS-CAN).

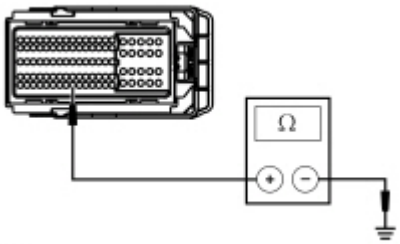
The PCM provides a reference voltage to the engine oil pressure switch when the ignition key is in RUN. When there is low or no oil pressure, the engine oil pressure switch remains open. The PCM detects no change in the reference voltage and provides engine oil pressure status to IPC to keep the oil pressure gauge in the low oil pressure area of the gauge. With the engine running and sufficient oil pressure, the engine oil pressure switch closes, pulling the reference voltage low. The PCM detects the low reference voltage and provides engine oil pressure status to the IPC to command the oil pressure gauge to the normal oil pressure range.

If the IPC fails to receive the oil pressure status from the PCM for 5 seconds or less, the IPC defaults the oil pressure gauge to the last setting, based upon the last known good oil pressure status message. If the IPC fails to receive the oil pressure status from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the oil pressure gauge to low (L).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

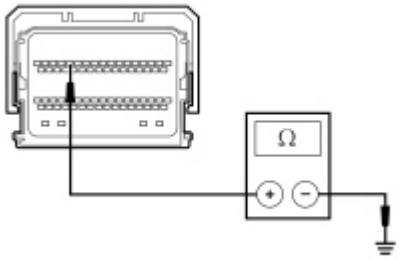
- Communication network concern
- Wiring, terminals or connectors



- Engine oil pressure switch
- Base engine oil pressure concern
- PCM
- IPC

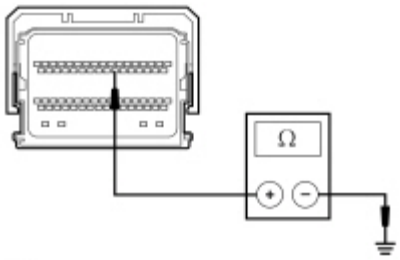
PINPOINT TEST C: INCORRECT OIL PRESSURE GAUGE INDICATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
C1 CARRY OUT THE IPC OIL PRESSURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC oil pressure gauge active command (OIL_PRESS) on and off to sweep the gauge. • **Does the engine oil pressure gauge sweep to the normal range when commanded on and return to low (L) when commanded off?**	**Yes** If the oil pressure gauge always reads in the normal range, GO to C2 . If the oil pressure gauge always reads low (L) (does not register any oil pressure), GO to C4 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
C2 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH • Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Ignition ON. • Observe the engine oil pressure gauge. • **Does the engine oil pressure gauge indicate low (L) oil pressure?**	**Yes** INSTALL a new engine oil pressure switch. Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation. **No** GO to C3 .
C3 CHECK THE OIL PRESSURE INPUT CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: PCM C175E (3.7L), C1381E (5.0L and 6.2L), or C1551E (3.5L) . • For 3.5L, measure the resistance between the PCM C1551E-9, circuit CMC24 (GY), harness side and ground.	**Yes** GO to C8 . **No** REPAIR circuit CMC24 (GY) for a short to ground. TEST the system for normal operation.

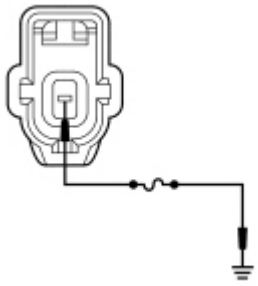
repair4less

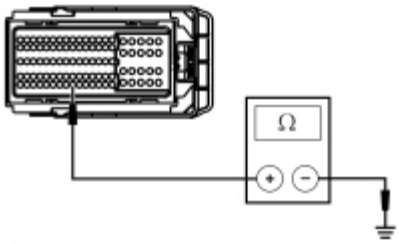


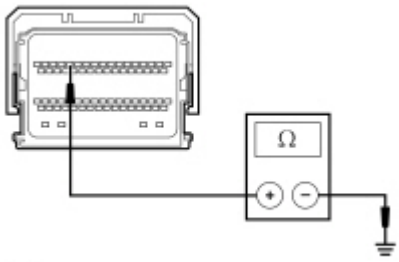
N0122305

- For 3.7L, measure the resistance between the PCM C175E-13, circuit CMC24 (GY), harness side and ground.

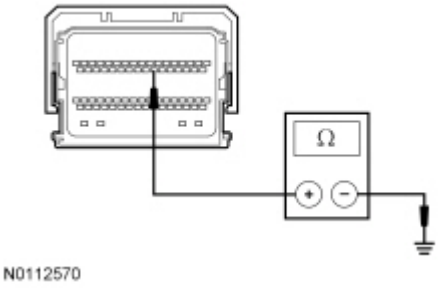
N0120194







- For 5.0L and 6.2L, measure the resistance between the PCM C1381E-24, circuit CMC24 (GY), harness side and ground.



N0112570

- **Is the resistance greater than 10,000 ohms?**

C4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test AT . **No** GO to C5 .
C5 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Connect a fused jumper wire between the engine oil pressure switch C103-1, circuit CMC24 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. GO to C7 . **No** LEAVE the jumper wire connected.

 N0002760 • Ignition ON. • Observe the engine oil pressure gauge. • **Does the engine oil pressure gauge indicate normal oil pressure?**	GO to C6 .
C6 CHECK THE ENGINE OIL PRESSURE INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175E (3.7L), C1381E (5.0L and 6.2L), or C1551E (3.5L) . • For 3.5L, measure the resistance between the PCM C1551E-9, circuit CMC24 (GY), harness side and ground.  N0122305 • For 3.7L, measure the resistance between the PCM C175E-13, circuit CMC24 (GY), harness side and ground.  N0120194 • For 5.0L and 6.2L, measure the resistance between the PCM C1381E-24, circuit CMC24 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. GO to C8 . **No** REMOVE the jumper wire. REPAIR circuit CMC24 (GY) for an open. TEST the system for normal operation.

repair4less

 N0112570 • **Is the resistance less than 5 ohms?**	
C7 CHECK THE ENGINE OIL PRESSURE	
• Carry out the engine oil pressure test. Refer to Section 303-00 . • **Is the engine oil pressure within specification?**	**Yes** INSTALL a new engine oil pressure switch. Refer to the appropriate section in Group 303 for the procedure. TEST the system for normal operation. **No** REFER to Section 303-00 to continue diagnosis of the engine oil pressure.
C8 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Connect: Engine Oil Pressure Switch C103 . • Connect: PCM C175E (3.7L), C1381E (5.0L and 6.2L) or C1551E (3.5L) . • Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to C9 .
C9 CHECK FOR CORRECT PCM OPERATION	

• Disconnect the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The Temperature Gauge Is Inoperative

Normal Operation

The PCM uses the Cylinder Head Temperature (CHT) sensor to measure the engine temperature. The Instrument Panel Cluster (IPC) receives the engine temperature data from the PCM over the High Speed Controller Area Network (HS-CAN). The IPC monitors the engine temperature data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

If the IPC receives invalid engine temperature data from the PCM for 5 seconds or less, the IPC defaults the

temperature gauge to the last setting, based upon the last known good engine temperature status message. If the IPC does not receive the engine temperature status message from the PCM or if the data received is deemed invalid for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the temperature gauge to cold (C). If the engine temperature data is deemed invalid by the IPC , the IPC sets DTC U0401:00 and defaults the temperature gauge to cold (C).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST D: THE TEMPERATURE GAUGE IS INOPERATIVE

Test Step	Result / Action to Take
D1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to D2 .
D2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section. **No** GO to D3 .
D3 CARRY OUT THE TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • **NOTE:** Make sure the temperature gauge is commanded to full cold before beginning this step. • Select the IPC temperature gauge (ENGCOOLNT) active command. Command the temperature gauge on and off while monitoring the gauge. • **Does the temperature gauge start at cold (C), move to full hot (H) and return to cold (C)?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test E: Incorrect Temperature Gauge Indication

Normal Operation

repair4less

The PCM uses the Cylinder Head Temperature (CHT) sensor to measure the engine temperature. The Instrument Panel Cluster (IPC) receives the engine temperature data from the PCM over the High Speed Controller Area Network (HS-CAN). The IPC monitors the engine temperature data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

If the IPC receives invalid engine temperature data from the PCM for 5 seconds or less, the IPC defaults the temperature gauge to the last setting, based upon the last known good engine temperature status message. If the IPC does not receive the engine temperature status message from the PCM or if the data received is deemed invalid for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the temperature gauge to cold (C). If the engine temperature data is deemed invalid by the IPC , the IPC sets DTC U0401:00 and defaults the temperature gauge to cold (C).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM concern
- IPC

PINPOINT TEST E: INCORRECT TEMPERATURE GAUGE INDICATION

Test Step	Result / Action to Take
E1 CHECK FOR CORRECT OPERATION OF THE COOLING SYSTEM	
• Verify the engine cooling system and thermostat are functioning correctly. • **Do the engine cooling system and thermostat operate correctly?**	**Yes** GO to E2 . **No** REFER to Section 303-03 .
E2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the KOEO self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to E3 .
E3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section. **No** GO to E4 .
E4 CARRY OUT THE TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
	Yes

NOTE: The coolant temperature should range between 0-59°C (32-138°F) with the gauge in the cold (C) range, between 60-120°C (140-248°F) with the gauge in the normal or mid-range and above 121°C (250°F) with the gauge in the hot (H) range. • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • **NOTE:** Make sure the temperature gauge is commanded to full cold before beginning this step. • Select the IPC temperature gauge (ENGCOOLNT) active command. Command the temperature gauge according to the following table: **Temperature Command** / **Gauge Position** 20% / Beginning of the normal band 50% / Center of the gauge (mid-range) 90% / End of the normal band • **Does the temperature gauge operate according to the above specifications?**	GO to E5 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
E5 CHECK THE PCM TEMPERATURE PID	
NOTE: The coolant temperature should range between 0-59°C (32-138°F) with the gauge in the cold (C) range, between 60-120°C (140-248°F) with the gauge in the normal or mid-range and above 121°C (250°F) with the gauge in the hot (H) range. • Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Ignition ON. • Select the PCM temperature PID (CHT). With the engine running, monitor the PCM temperature PID. • **Does the PCM PID agree with the position of the temperature gauge indication?**	**Yes** The temperature gauge is operating correctly at this time. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test F: The Speedometer Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the vehicle speed signal from the PCM over the High Speed Controller Area Network (HS-CAN). The PCM receives the vehicle speed signal input from the transmission Output Shaft Speed (OSS) sensor. The IPC monitors the vehicle speed signal input from the PCM and commands the speedometer with a corresponding movement of the pointer.

If the IPC receives invalid vehicle speed data from the PCM for 5 seconds or less, the IPC defaults the speedometer to the last setting, based upon the last known good vehicle speed message. If the IPC does not receive the vehicle speed data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the speedometer to 0 km/h (0 mph). If the vehicle speed data received is deemed invalid by the IPC , the IPC sets DTC U0401:00 and defaults the speedometer to 0 km/h (0 mph).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative tachometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

repair4less

- PCM
- IPC

PINPOINT TEST F: THE SPEEDOMETER IS INOPERATIVE

Test Step	Result / Action to Take
F1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to F2 .
F2 CARRY OUT THE SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC speedometer (SPDOMETER) active command. Command the speedometer on and off while monitoring the speedometer. • **Does the speed begin at 0 km/h (0 mph) move to 193 km/h (120 mph) and return to 0 km/h (0 mph)?**	**Yes** GO to F3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
F3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test G: Incorrect Speedometer Indication

Normal Operation

The Instrument Panel Cluster (IPC) receives the vehicle speed signal from the PCM over the High Speed Controller Area Network (HS-CAN). The PCM receives the vehicle speed signal input from the transmission Output Shaft Speed (OSS) sensor. The IPC monitors the vehicle speed signal input from the PCM and commands the speedometer with a corresponding movement of the pointer.

The IPC provides a tolerance which allows the gauge to display between 3% lower and 7% higher than the actual vehicle speed. This means that with an actual vehicle speed of 96.6 km/h (60 mph), the speedometer may indicate between 93.7-103.3 km/h (58.2-64.1 mph). Factors that could potentially affect the speedometer accuracy are incorrect tire size configuration and axle ratio configuration.

If the IPC receives invalid vehicle speed data from the PCM for 5 seconds or less, the IPC defaults the speedometer to the last setting, based upon the last known good vehicle speed message. If the IPC does not receive the vehicle speed data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the speedometer to 0 km/h (0 mph). If the vehicle speed data received is deemed invalid by the IPC , the IPC sets DTC U0401:00 and defaults the speedometer to 0 km/h (0 mph).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative tachometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- Tire size configuration
- Axle ratio configuration
- PCM concern
- IPC

PINPOINT TEST G: INCORRECT SPEEDOMETER INDICATION

Test Step	Result / Action to Take
G1 CHECK THE TIRE SIZE CONFIGURATION	
• Enter the following diagnostic mode on the scan tool: Module Programming . • **NOTE:** The correct tire size can be found on the Vehicle Certification (VC) label on the LH B-pillar. Refer to Section 100-01 . • Verify the size of the tires installed on the vehicle matches the VC label. • Verify the tire size configuration matches the VC label. • **Is the tire size correct and is tire size correctly configured?**	**Yes** GO to G2 . **No** INSTALL the correct size tires or CONFIGURE the correct tire size as required. TEST the system for normal operation.
G2 CHECK THE AXLE RATIO CONFIGURATION	
• Enter the following diagnostic mode on the scan tool: Module Programming . • **NOTE:** The correct axle ratio can be found on the Vehicle Certification (VC) label on the LH B-pillar. Refer to Section 100-01 . • Verify the axle ratio configuration matches the VC label. • **Is the axle ratio correctly configured?**	**Yes** GO to G3 . **No** CONFIGURE the correct axle ratio. TEST the system for normal operation.
G3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to G4 .
G4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test.	**Yes** For DTC U0100:00, GO to

repair4less

- **Are any DTCs recorded?**

Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section.

No
GO to G5 .

G5 CARRY OUT THE SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL

- Ignition ON.
- Enter the following diagnostic mode on the scan tool: IPC DataLogger .
- Select the IPC speedometer (SPDOMETER) active command. Command the speedometer in 10% increments while monitoring the speedometer. The speed indicated should increase in increments of approximately 19 km/h (12 mph) for each 10% change.

Command	Indication Range
10% (19 km/h [12 mph])	19-21 km/h (12-13 mph)
20% 39 km/h [24 mph])	37-42 km/h (23-26 mph)
30% (58 km/h [36 mph])	56-63 km/h (35-39 mph)
40% (77 km/h [48 mph])	76-82 km/h (47-51 mph)
50% (97 km/h [60 mph])	93-103 km/h (58-64 mph)
60% (116 km/h [72 mph])	113-124 km/h (70-77 mph)
70% (135 km/h [84 mph])	130-145 km/h (81-90 mph)
80% (154 km/h [96 mph])	150-166 km/h (93-103 mph)
90% (174 km/h [108 mph])	169-187 km/h (105-116 mph)
100% (193 km/h [120 mph])	116-206 km/h (116-128 mph)

- **Does the speed indicated increase according to the above specifications?**

Yes
GO to G6 .

No
INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

G6 CHECK THE PCM VSS PIDs

- Enter the following diagnostic mode on the scan tool: PCM DataLogger .
- Select the PCM vehicle speed (VSS) PID and monitor the PID while driving the vehicle at 32 km/h (20 mph), 64 km/h (40 mph) and 97 km/h (60 mph).
- **Does the speedometer indicate between 31-34 km/h (19-21 mph), 63-69 km/h (39-43 mph) and 93-103 km/h (58-64 mph) at the 3 PCM PID values?**

Yes
GO to G7 .

No
INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

G7 OBSERVE THE SPEEDOMETER OPERATION

- Ignition ON.
- Observe the speedometer while driving the vehicle at various speeds and stopping frequently.
- **Does the speedometer begin at 0 km/h (0 mph) and fully return to the 0 km/h (0 mph) position when the vehicle is stopped?**

Yes
The speedometer is operating correctly at this time.

No
INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test H: The Odometer Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the odometer rolling count data from the PCM over the High Speed Controller Area Network (HS-CAN). The IPC monitors the odometer rolling count input from the PCM and commands the odometer with a display in the message center display.

If the IPC does not receive the odometer rolling count data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the odometer display to all dashes (-----). If the odometer rolling count data is deemed invalid by the IPC , the IPC sets DTC U0401:86 and defaults the odometer display to all dashes (-----).

If the Non-Volatile Memory (NVM) becomes corrupted or if any NVM failure occurs, the IPC sets DTC U3000:04 and displays ERROR in the message center display.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer, temperature gauge.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST H: THE ODOMETER IS INOPERATIVE

Test Step	Result / Action to Take
H1 CHECK FOR CORRUPTED NVM	
• Ignition ON. • Observe the message center display area. • **Does the odometer display ERROR?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** GO to H2 .
H2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to H3 .
H3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test.	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For DTC U3000:04,

repair4less

• **Are any DTCs recorded?**	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test I: The Tachometer Is Inoperative

Normal Operation

The PCM uses the Crankshaft Position (CKP) sensor to measure the engine rpm. The PCM sends the rpm data to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) to command the tachometer according to the data.

If the IPC does not receive the engine rpm data from the PCM for 5 seconds or less, the IPC defaults the tachometer to the last setting, based upon the last known good rpm message. If the IPC does not receive the engine rpm data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the tachometer to 0 rpm.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST I: THE TACHOMETER IS INOPERATIVE

Test Step	Result / Action to Take
I1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to I2 .
I2 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC tachometer (TACH_IND) active command. Command the tachometer on and off while monitoring the tachometer. • **Does the tachometer begin at 0 rpm, increase to 7,000 rpm then return to 0 rpm?**	**Yes** GO to I3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

I3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test J: Incorrect Tachometer Indication

Normal Operation

The PCM uses the Crankshaft Position (CKP) sensor to measure the engine rpm. The PCM sends the rpm data to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) to command the tachometer gauge according to the data.

If the IPC does not receive the engine rpm data from the PCM for 5 seconds or less, the IPC defaults the tachometer to the last setting, based upon the last known good rpm message. If the IPC does not receive the engine rpm data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the tachometer to 0 rpm.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- PCM concern
- IPC

PINPOINT TEST J: INCORRECT TACHOMETER INDICATION

Test Step	Result / Action to Take
J1 RETRIEVE THE RECORDED DTCs FROM PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to J2 .
J2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this

repair4less

<table>
<tr><td></td><td>section.

No
GO to J3 .</td></tr>
<tr><td>J3 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL

• Ignition ON.
• Enter the following diagnostic mode on the scan tool: IPC DataLogger .
• Select the IPC tachometer (TACH_IND) active command. Command the tachometer in 10% increments while monitoring the tachometer.
• Does the tachometer indication increase by 700 rpm at each 10% increment?</td><td>Yes
GO to J4 .

No
INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.</td></tr>
<tr><td>J4 CHECK THE PCM RPM PIDs

• Enter the following diagnostic mode on the scan tool: PCM DataLogger .
• Select the PCM engine rpm (RPM) PID and monitor the tachometer while operating the engine at 1,000, 1,500, 2,000 and 2,500 rpm using the PCM PID to set the vehicle speed.

<table><tr><th>Command</th><th>Indication Range</th></tr><tr><td>1,000 rpm</td><td>922-1,078 rpm</td></tr><tr><td>1,500 rpm</td><td>1,422-1,578 rpm</td></tr><tr><td>2,000 rpm</td><td>1,922-2,078 rpm</td></tr><tr><td>2,500 rpm</td><td>2,422-2,578 rpm</td></tr></table>
• Does the tachometer indication increase according to the above specifications?</td><td>Yes
The tachometer is operating correctly at this time.

No
INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.</td></tr>
</table>

Pinpoint Test K: The Transmission Temperature Gauge Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the transmission temperature data from the PCM over the High Speed Controller Area Network (HS-CAN). The PCM filters the transmission temperature input and sends the filtered data to the IPC . The IPC then further dampens the temperature data to eliminate minor fluctuations in the gauge indication.

If the transmission temperature data is missing or invalid from the PCM for 5 seconds or less, the IPC defaults the transmission temperature gauge to the last setting, based upon the last known good message received. If the IPC does not receive the transmission temperature data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the transmission temperature gauge to the cold (C) stop position. If the transmission temperature data is deemed invalid by the IPC for more than 5 seconds, the IPC sets DTC U0401:00 and defaults the transmission temperature gauge to the cold (C) stop position.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be the powertrain malfunction (wrench) warning indicator always on.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST K: THE TRANSMISSION TEMPERATURE GAUGE IS INOPERATIVE

Test Step	Result / Action to Take
K1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the self-test. • **Are any transmission temperature DTCs recorded?**	**Yes** REFER to Section 307-01 . For all other DTCs, REFER to Section 303-14 . TEST the system for normal operation. **No** GO to K2 .
K2 CHECK THE TRANSMISSION TEMPERATURE GAUGE	
• Enter the dealer test mode. Refer to Dealer Test Mode in Inspection and Verification in this section. • Scroll through the displays until GAUGE TEST is displayed while monitoring the transmission temperature gauge. • **Does the transmission temperature gauge sweep from cold (C) to hot (H) then return to cold (C)?**	**Yes** GO to K3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
K3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test L: Incorrect Transmission Temperature Gauge Indication

Normal Operation

The Instrument Panel Cluster (IPC) receives the transmission temperature data from the PCM over the High Speed Controller Area Network (HS-CAN). The PCM filters the transmission temperature input and sends the filtered data to the IPC . The IPC then further dampens the temperature data to eliminate minor fluctuations in the gauge indication.

If the transmission temperature data is missing or invalid from the PCM for 5 seconds or less, the IPC defaults the transmission temperature gauge to the last setting, based upon the last known good message received. If the IPC does not receive the transmission temperature data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the transmission temperature gauge to the cold (C) stop position. If the transmission temperature data is deemed invalid by the IPC for

repair4less

more than 5 seconds, the IPC sets DTC U0401:00 and defaults the transmission temperature gauge to the cold (C) stop position.

This pinpoint test is intended to diagnose the following:

- Transmission concern
- IPC

PINPOINT TEST L: INCORRECT TRANSMISSION TEMPERATURE GAUGE INDICATION

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>

	No GO to L4 .
L4 CHECK THE PCM TEMPERATURE PID **NOTE:** This step may require the use of an assistant to monitor the transmission temperature PID and the transmission temperature gauge indication. • Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Ignition ON. • **NOTE:** The transmission temperature should range below 10°C (50°F) with the gauge in the cold (C) range, between 27 to 107° C (81 to 225°F) with the gauge in the normal or mid-range and above 135°C (275°F) with the gauge in the hot (H) range. • Select the PCM transmission temperature gauge PID (TFT). • Beginning with a cold transmission, drive the vehicle while monitoring the PCM transmission temperature PID. • **Does the PID agree with the position of the transmission temperature gauge indication at different temperature ranges?**	**Yes** The transmission temperature gauge is operating correctly at this time. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. TEST the system for normal operation.

Pinpoint Test M: The Brake Warning Indicator is Never On

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) uses 3 basic messaged inputs to control the brake warning indicator. The first two are the parking brake warning indicator switch and the brake fluid level switch. The third is for the Electronic Brake Distribution (EBD) function controlled by the ABS module. The parking brake warning indicator switch and the brake fluid level switch status are sent from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The EBD message is sent from the ABS module over the HS-CAN .

The parking brake warning indicator switch is hardwired to the BCM through a single signal circuit while using a separate ground to control the input. The brake fluid level switch is hardwired to the BCM through separate signal and return circuits while using a separate ground to control the input.

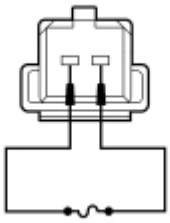
The BCM provides a reference voltage to both the parking brake warning indicator switch and the brake fluid level switch. When the parking brake is applied, the parking brake warning indicator switch closes to ground, pulling the parking brake signal circuit low. When a low brake fluid level condition exists, the brake fluid level switch closes to ground, pulling the signal and return circuits low. If the brake fluid level switch is disconnected, the BCM reference voltage sent to the brake fluid level switch is sent high and the BCM sets DTC B1048:7B. When the BCM detects either the brake fluid level signal or the parking brake signal circuits low, or the brake fluid level signal and return circuit high, the BCM sends the IPC a brake warning indicator on request.

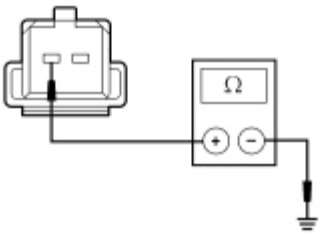
When the ABS module detects a base brake system concern or other ABS related concerns that affect the EBD function, the ABS module sends a brake warning indicator on request to the IPC to illuminate the brake warning indicator and the ABS warning indicator.

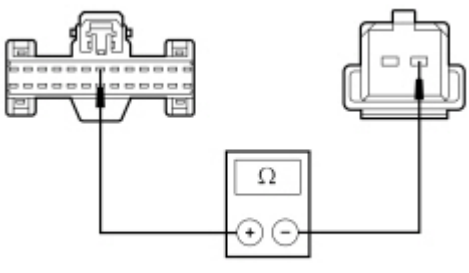
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Brake fluid level switch

repair4less

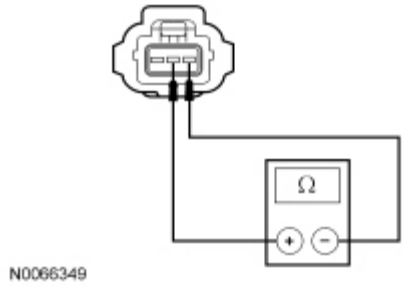


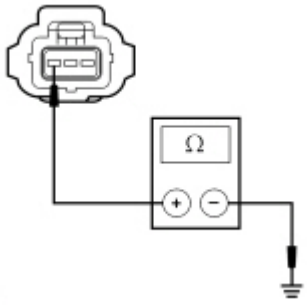




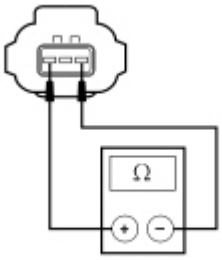
- Parking brake warning indicator switch
- BCM
- IPC

PINPOINT TEST M: THE BRAKE WARNING INDICATOR IS NEVER ON





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Failure to disconnect the battery when instructed, results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
M1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to M2 .
M2 DETERMINE IF THE BRAKE WARNING INDICATOR OPERATES WITH THE PARKING BRAKE	
• Ignition ON. • Apply the parking brake while monitoring the brake warning indicator. • **Does the brake warning indicator illuminate with the parking brake applied?**	**Yes** RELEASE the parking brake. GO to M8 . **No** RELEASE the parking brake. GO to M3 .
M3 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC brake warning indicator (PBA_LMP) active command. Command the brake warning indicator on and observe the brake warning indicator. • **Does the brake warning indicator illuminate when commanded on?**	**Yes** GO to M4 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
M4 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH PID	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Select the BCM parking brake (PARK_BRK_SW) PID. Monitor the parking brake PID while applying the parking brake. • **Does the PID agree with the parking brake position?**	**Yes** GO to M12 . **No** GO to M5 .
M5 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH	
• Disconnect: Parking Brake Warning Indicator Switch C2015 . • Connect a fused jumper wire between the parking brake warning	**Yes** REMOVE the jumper

indicator switch C2015-2, circuit GD120 (BK/GN), harness side and the parking brake warning indicator switch C2015-1, circuit CMC25 (WH/VT), harness side.  N0002774 • **Does the brake warning indicator illuminate?**	wire. INSTALL a new parking brake warning indicator switch. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to M6 .
M6 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the parking brake warning indicator switch C2015-2, circuit GD120 (BK/GN), harness side and ground.  N0057133 • **Is the resistance less than 5 ohms?**	**Yes** GO to M7 . **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
M7 CHECK THE PARKING BRAKE WARNING INDICATOR SIGNAL CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280C . • Measure the resistance between the BCM C2280C-7, circuit CMC25 (WH/VT), harness side and the parking brake warning indicator switch C2015-1, circuit CMC25 (WH/VT), harness side and ground.  N0112572 • **Is the resistance less than 5 ohms?**	**Yes** GO to M12 . **No** REPAIR circuit CMC25 (WH/VT) for an open. TEST the system for normal operation.

repair4less

M8 CHECK THE BRAKE FLUID LEVEL SWITCH OPERATION	
• Ignition OFF. • Disconnect: Brake Fluid Level Switch C124 . • Ignition ON. • **Does the brake warning indicator illuminate?**	**Yes** GO to M10 . **No** GO to M9 .
M9 CHECK THE BRAKE FLUID LEVEL SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: BCM C2280F . • Measure the resistance between the brake fluid level switch C124-2, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-3, circuit RMC19 (YE/GY), harness side.  N0066349 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M12 . **No** REPAIR the circuits. TEST the system for normal operation.
M10 CHECK THE BRAKE FLUID LEVEL SWITCH GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the brake fluid level switch C124-1, circuit GD120 (BK/GN), harness side and ground.  N0027596 • **Is the resistance less than 5 ohms?**	**Yes** GO to M11 . **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
M11 CHECK THE BRAKE FLUID LEVEL SWITCH	
• Ignition ON. • ***NOTICE:*** **Do not spill brake fluid onto painted or plastic surfaces. If spilled, wipe up immediately before damage to the painted or plastic surface occurs.** • Remove the brake fluid from the reservoir to allow the brake fluid level switch to fall to the bottom of the reservoir. • Measure the resistance between the brake fluid level switch pin 3, component side and the brake fluid level switch pin 1, component side.	**Yes** GO to M12 . **No** INSTALL a new brake fluid level switch. TEST the system for normal operation.

 N0057135 • **Is the resistance less than 5 ohms?**	
M12 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Brake Warning Indicator is Always On

Normal Operation

The Instrument Panel Cluster (IPC) uses 3 basic messaged inputs to control the brake warning indicator. The first two are the parking brake warning indicator switch and the brake fluid level switch. The third is for the Electronic Brake Distribution (EBD) function controlled by the ABS module. The parking brake warning indicator switch and the brake fluid level switch status are sent from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The EBD message is sent from the ABS module over the HS-CAN.

The parking brake warning indicator switch is hardwired to the BCM through a single signal circuit while using a separate ground to control the input. The brake fluid level switch is hardwired to the BCM through separate signal and return circuits while using a separate ground to control the input.

The BCM provides a reference voltage to both the parking brake warning indicator switch and the brake fluid level switch. When the parking brake is applied, the parking brake warning indicator switch closes to ground, pulling the parking brake signal circuit low. When a low brake fluid level condition exists, the brake fluid level switch closes to ground, pulling the signal and return circuits low. If the brake fluid level switch is disconnected, the BCM reference voltage sent to the brake fluid level switch is sent high and the BCM sets DTC B1048:7B. When the BCM detects either the brake fluid level signal or the parking brake signal circuits low, or the brake fluid level signal and return circuit high, the BCM sends the IPC a brake warning indicator on request.

When the ABS module detects a base brake system concern or other ABS related concerns that affect the EBD function, the ABS module sends a brake warning indicator on request to the IPC to illuminate the brake warning indicator and the ABS warning indicator.

If the brake fluid level or parking brake status messages are missing for less than 5 seconds, the IPC

repair4less

defaults the brake warning indicator to its last state (on or off) based upon the last known good message received. If the brake fluid level or parking brake status messages are missing for more than 5 seconds, the IPC sets DTC U0140:00 and defaults the brake warning indicator on. If the IPC does not receive the ABS status message or the EBD message from the ABS module for more than 5 seconds, the IPC sets DTC U0121:00 and defaults the ABS warning indicator on.

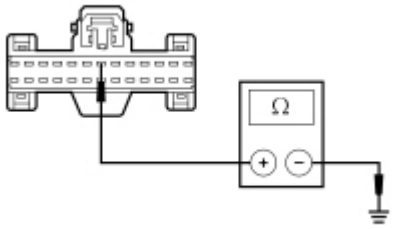
DTC Description	Fault Trigger Conditions
• DTC B1048:7B — Brake Fluid Level Switch: Low Fluid Level	A continuous DTC that sets when the BCM detects an open or short to ground on the brake fluid level switch input.
• DTC C1D00:11 — Park Brake Apply Switch: Circuit Short to Ground	A continuous DTC that sets in the BCM if the BCM detects a short to ground on the parking brake input circuit.

NOTE: If DTC U0140:00 sets in the IPC, other symptoms may also be present such as Tire Pressure Monitoring System (TPMS), instrument panel backlighting, and door ajar indication. If DTC U0121:00 is set, other symptoms may also be present such as ABS warning indicator and stability/traction control or stability/traction control off indicators always on.

NOTE: Both the ABS warning indicator and the brake warning indicator illuminate if the input to illuminate the brake warning indicator is received from the ABS module.

This pinpoint test is intended to diagnose the following:

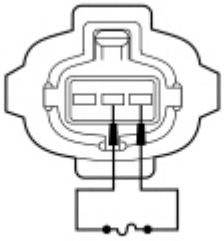
- Wiring, terminals or connectors
- Parking brake warning indicator switch
- Brake fluid level switch
- ABS concern
- BCM
- IPC

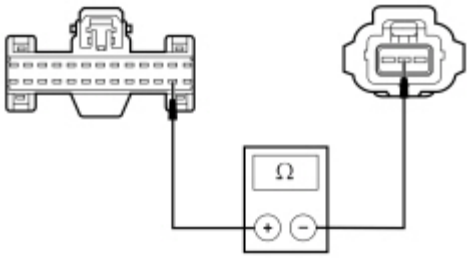


PINPOINT TEST N: THE BRAKE WARNING INDICATOR IS ALWAYS ON

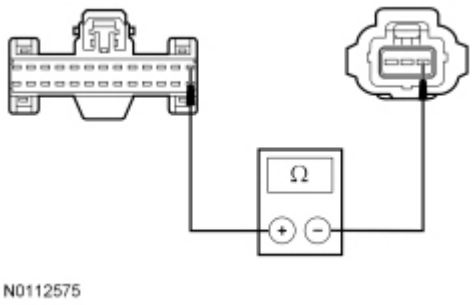
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

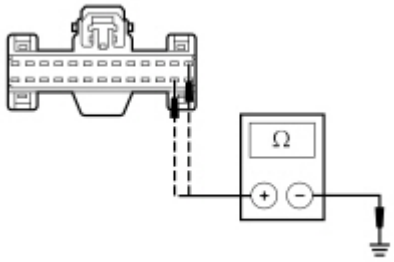
Test Step	Result / Action to Take
N1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC brake warning indicator (PBA_LMP) active command. Command the brake warning indicator on and off. Observe the brake warning indicator. • **Does the brake warning indicator turn off when commanded off?**	**Yes** GO to N2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
N2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	





• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0121:00, GO to Pinpoint Test AV . For DTC U0140:00, GO to Pinpoint Test AY . For all other DTCs, REFER to DTC Charts in this section. **No** GO to N3 .
N3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test. • **Is DTC B1048:7B recorded?**	**Yes** GO to N8 . **No** GO to N4 .
N4 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** GO to N5 .
N5 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH PID	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Select the BCM parking brake (PARK_BRK_SW) PID. • Monitor the parking brake PID while applying and releasing the parking brake. • **Does the PID agree with the parking brake position?**	**Yes** GO to N12 . **No** GO to N6 .
N6 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH	
• Disconnect: Parking Brake Warning Indicator Switch C2015 . • Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Select the BCM parking brake (PARK_BRK_SW) PID. • Monitor the parking brake PID. • **Does the PID indicate the parking brake is released or off?**	**Yes** INSTALL a new parking brake warning indicator switch. CLEAR the DTCs. REPEAT the self-test. **No** GO to N7 .
N7 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280C . • Measure the resistance between the BCM C2280C-7, circuit CMC25 (WH/VT), harness side and ground.	**Yes** GO to N12 . **No** REPAIR circuit CMC25 (WH/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test.





repair4less

N0112573

- **Is the resistance greater than 10,000 ohms?**

N8 CHECK THE BRAKE WARNING INDICATOR USING THE FLUID LEVEL SWITCH	
• Ignition OFF. • Disconnect: Brake Fluid Level Switch C124 . • Connect a fused jumper wire between the brake fluid level switch C124-2, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-3, circuit RMC19 (YE/GY), harness side.  N0002771 • Ignition ON. • **Does the brake warning indicator turn off?**	**Yes** REMOVE the jumper wire. INSTALL a new brake fluid level switch. CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the jumper wire. GO to N9 .
N9 CHECK THE BRAKE FLUID LEVEL SWITCH INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280F . • Measure the resistance between the BCM C2280F-15, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-2, circuit CMC19 (GY/VT), harness side.  N0112574 • **Is the resistance less than 5 ohms?**	**Yes** GO to N10 . **No** REPAIR circuit CMC19 (GY/VT) for an open. TEST the system for normal operation.
N10 CHECK THE BRAKE FLUID LEVEL SWITCH RETURN CIRCUIT FOR AN OPEN	

• Measure the resistance between the BCM C2280F-1, circuit RMC19 (YE/GY), harness side and the brake fluid level switch C124-3, circuit RMC19 (YE/GY), harness side.  N0112575 • **Is the resistance less than 5 ohms?**	**Yes** GO to N11 . **No** REPAIR circuit RMC19 (YE/GY) for an open. TEST the system for normal operation.
N11 CHECK THE BRAKE FLUID LEVEL SWITCH INPUT AND RETURN CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the BCM C2280F-15, circuit CMC19 (GY/VT), harness side and ground; and between the BCM C2280F-1, circuit RMC19 (YE/GY), harness side and ground.  N0112576 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to N12 . **No** REPAIR the circuit in question. TEST the system for normal operation.
N12 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM .
	REFER to Section 419-10 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The ABS Warning Indicator Is Never/Always On

Normal Operation

The ABS module provides the ABS warning indicator request to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN). If a fault condition exists in the ABS, the ABS module sends

repair4less

the IPC a request to illuminate the ABS warning indicator.

If the ABS warning indicator status message is missing for less than 5 seconds, the IPC defaults the ABS warning indicator to its last state (on or off) based upon the last known good message received. If the ABS warning indicator request message is missing for more than 5 seconds, the IPC sets DTC U0121:00 and defaults the ABS warning indicator on.

This pinpoint test is intended to diagnose the following:

- ABS module
- IPC

PINPOINT TEST O: THE ABS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
O1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC ABS warning indicator (ABS_LAMP) active command. Command the ABS warning indicator on then off. Observe the ABS warning indicator. • **Does the ABS warning indicator turn on when commanded on and turn off when commanded off?**	**Yes** GO to O2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
O2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0121:00, GO to Pinpoint Test AV . For all other DTCs, REFER to DTC Charts in this section. **No** GO to O3 .
O3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** If the ABS warning indicator is always on, INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation. If the ABS warning indicator is never on after the bulb prove-out, the system is operating correctly at this time.

Pinpoint Test P: The Stability/Traction Control Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the stability/traction control indicator request from the ABS module over the High Speed Controller Area Network (HS-CAN). The stability/traction control indicator operates according to the following chart:

Indication Mode	Condition
Flashes rapidly	The vehicle stability/traction control is in active mode or is being controlled by the ABS module
Flashes slowly	A configuration conflict or concern is present in the ABS module
On steady	A fault condition exists in the stability/traction control system

The IPC monitors the stability/traction control message from the ABS module and either flashes the stability/traction control indicator or turns it on steady depending on the condition. The stability/traction control indicator is also used to indicate a trailer sway condition (if equipped).

If the stability/traction control indicator status message is missing for less than 5 seconds, the IPC defaults the stability/traction control indicator to its last state (on or off) based upon the last known good message received. If the stability/traction control indicator status message is missing for more than 5 seconds, the IPC sets DTC U0121:00 in continuous memory and defaults the stability/traction control indicator on.

This pinpoint test is intended to diagnose the following:

- Stability/traction control concern
- ABS module
- IPC

PINPOINT TEST P: THE STABILITY/TRACTION CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
P1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC stability/traction control indicator (TC/IVD/RSCLMP) active command. Command the stability/traction control active indicator on and off while observing the stability/traction control indicator. • **Does the stability/traction control indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to P2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
P2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	

repair4less

• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0121:00, GO to Pinpoint Test AV . For all other DTCs, REFER to DTC Charts in this section. **No** GO to P3 .
P3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS module self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** If the stability/traction control indicator is never on after the bulb prove-out, the system is operating correctly at this time. If the stability/traction control indicator is always on, INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.

Pinpoint Test Q: The Stability/Traction Control Disabled Indicator Is Never/Always On

Normal Operation

The traction control switch is hardwired to the Instrument Panel Cluster (IPC). When the traction control switch is pressed, the IPC sends a message to the ABS module over the High Speed Controller Area Network (HS-CAN) indicating the traction control switch has been pressed. The ABS module either disables or enables the stability/traction control system and sends a stability/traction control disabled indicator request back to the IPC to illuminate or turn off the stability/traction control disabled indicator based upon the system state.

When a MyKey® programmed key is in use and the AdvanceTrac® on feature is configured always on, the stability/traction control system cannot be disabled and the stability/traction control indicator does not illuminate when the traction control disable button is pressed. The stability/traction control indicator still functions normally to indicate a stability/traction control system fault and a stability/traction control active event.

If the stability/traction control disabled indicator request message is missing for less than 5 seconds, the stability/traction control disabled indicator remains in the last state (on or off) based upon the last known good message received. If the stability/traction control disabled indicator request message is missing for more than 5 seconds, the IPC sets DTC U0121:00 in continuous memory and defaults the stability/traction control disabled indicator off.

This pinpoint test is intended to diagnose the following:

- A MyKey® programmed key is in use
- Stability/traction control cannot be disabled
- ABS module
- IPC

PINPOINT TEST Q: THE STABILITY/TRACTION CONTROL DISABLED INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Q1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC stability/traction control disabled indicator (STAB_TC_LMP) active command. Command the stability/traction control disabled indicator on and off while observing the stability/traction control disabled indicator. • **Does the stability/traction control disabled indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to Q2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
Q2 CHECK FOR THE KEY TYPE	
• Check if the key is a MyKey® programmed key or an administrator key. Refer to Section 419-01B . • **Is the key an administrator key?**	**Yes** GO to Q3 . **No** If the MyKey® AdvanceTrac® on feature is configured always on, the system is normal. The stability/traction control system cannot be disabled when the AdvanceTrac® on feature is configured always on. If the MyKey® AdvanceTrac® on feature is not configured always on, GO to Q3 .
Q3 CHECK THE TRACTION CONTROL INPUT TO THE IPC	
• Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC traction control switch PID (STAB_CTRL_SW). • Monitor the traction control PID while pressing and releasing the traction control disable switch. • **Does the traction control PID read RELEASED when the button is released and DEPRESSED when the button is pressed?**	**Yes** GO to Q4 . **No** REFER to Section 206-09 to diagnose the stability/traction control system cannot be disabled.
Q4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0121:00, GO to Pinpoint Test AV . For all other DTCs, REFER to DTC Charts in this section. **No** GO to Q5 .
Q5 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS	**Yes**

repair4less

module self-test. • **Are any DTCs recorded?**	REFER to Section 206-09 . **No** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.

Pinpoint Test R: The LH/RH Turn Or High Beam Indicator Is Never/Always On

Normal Operation

When the multifunction switch is in the LH or RH TURN position, a turn signal on/off request is sent to the Instrument Panel Cluster (IPC) from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). Upon receipt of the applicable turn signal on/off request, the IPC flashes the turn signal indicator on and off.

When the high beams are turned on, the BCM sends a high beam indicator on request to the IPC through the HS-CAN to illuminate the high beam indicator.

If the high beam indicator request status message is missing for less than 5 seconds, the IPC defaults the high beam indicator to its last state (on or off) based upon the last known good message received. If the high beam indicator request status message is missing for more than 5 seconds, the IPC sets DTC U0140:00 in continuous memory and defaults the high beam indicator off.

This pinpoint test is intended to diagnose the following:

- Turn signal concern
- High beam concern
- BCM
- IPC

PINPOINT TEST R: THE LH/RH TURN OR HIGH BEAM INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
R1 DETERMINE THE FAULT CONDITION	
• Turn the high beams on then off again. • Ignition ON. • Observe the high beam indicator. • **Does the high beam indicator illuminate when the high beams are on and turn off when the high beams are off?**	**Yes** GO to R4 . **No** LEAVE the headlamp switch in the HIGH BEAM position. GO to R2 .
R2 CHECK THE HIGH BEAM HEADLAMPS OPERATION	
• Observe the high beam headlamps. • **Do the high beam headlamps operate correctly?**	**Yes** GO to R3 . **No** REFER to Section 417-01 .
R3 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON.	**Yes**

• Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC high beam indicator (HIGH_BEAM). • Command the high beam indicator on and off. Observe the high beam indicator. • **Does the high beam indicator illuminate when commanded on and turn off when commanded off?**	GO to R6 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
R4 CHECK THE LH OR RH TURN SIGNAL LAMPS OPERATION	
• Ignition ON. • Operate the LH or RH turn signal. Observe the exterior LH or RH turn signal lamps. • **Do the exterior turn signal lamps operate correctly?**	**Yes** GO to R5 . **No** REFER to Section 417-01 .
R5 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC RH or LH turn signal indicator (RH_TURN_L) or (LH_TURN_L) active command. Command the RH or LH turn signal indicator on and off. Observe the LH or RH turn signal indicator. • **Does the LH or RH turn signal indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to R6 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
R6 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0140:00 recorded?**	**Yes** GO to Pinpoint Test AY . **No** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test S: The Tire Pressure Monitoring System (TPMS) Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Tire Pressure Monitoring System (TPMS) warning indicator request from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). If the BCM determines the tire pressure has exceeded the low tire pressure limits, a request is sent to the IPC to illuminate the TPMS warning indicator. If a TPMS fault condition exists, the BCM sends a request to the IPC to flash the TPMS warning indicator.

If the TPMS status message is missing for more than 5 seconds, the IPC sets DTC U0140:00 and flashes the TPMS indicator for approximately 75 seconds then turns the TPMS indicator on.

NOTE: If DTC U0140:00 sets in the BCM , other symptoms may also be present such as high beam indicator, RH/LH turn indicators, instrument panel backlighting, and door ajar indication inoperative.

This pinpoint test is intended to diagnose the following:

repair4less

- Tire pressure
- TPMS concern
- BCM
- IPC

PINPOINT TEST S: THE TPMS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
S1 CHECK THE TIRE PRESSURE • Verify the tire pressure in all tires meets the recommended tire pressures on the Vehicle Certification (VC) label. Refer to Section 100-01 . • **Do all the tires meet the recommended tire pressures?**	**Yes** GO to S2 . **No** CORRECT the tire pressures. TEST the system for normal operation.
S2 RETRIEVE THE RECORDED DTCs FROM IPC SELF-TEST • Check for recorded IPC DTC from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140:00, GO to Pinpoint Test AY . For all other DTCs, REFER to DTC Charts in this section. **No** GO to S3 .
S3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST • Check for recorded BCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Body Control Module (BCM) DTC Chart in Section 419-10 . **No** GO to S4 .
S4 RETRIEVE THE RECORDED DTCs FROM THE TPM MODULE SELF-TEST • Check for recorded Tire Pressure Monitor (TPM) module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 204-04 . **No** GO to S5 .
S5 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC TPMS warning indicator (TPMWARN_LMP) active command. Command the TPMS warning indicator on and off. Observe the TPMS warning indicator.	**Yes** If the TPMS warning indicator is never on after the bulb prove-out, the system is operating correctly at this time. If the TPMS warning indicator is always on, INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No**

• **Does the TPMS warning indicator illuminate when commanded on and turn off when commanded off?**	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test T: The Air Bag Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Supplemental Restraint System (SRS) warning indicator request from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN). If an SRS concern is detected, the RCM sets a DTC and sends a request to the IPC to illuminate the air bag warning indicator.

If the SRS status message is missing for less than 5 seconds, the IPC defaults the air bag warning indicator to its last state (on or off) based upon the last known good message received. If the SRS status message is missing or is deemed invalid for more than 5 seconds, the IPC sets DTC U0151:00 in continuous memory and defaults the air bag warning indicator on.

This pinpoint test is intended to diagnose the following:

- SRS concern
- RCM
- IPC

PINPOINT TEST T: THE AIR BAG WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
T1 CARRY OUT THE IPC RESTRAINTS OUTPUT CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC air bag warning indicator (AIRBAG_LMP) active command. Command the air bag warning indicator on and off. Observe the air bag warning indicator. • **Does the air bag warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to T2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
T2 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	
• Check for recorded RCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to T3 .
T3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	

repair4less

• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0151:00, GO to Pinpoint Test AZ . For all other DTCs, REFER to DTC Charts in this section. **No** If the air bag warning indicator is never on after the bulb prove-out, the system is operating correctly at this time. If the air bag warning indicator is always on, INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test U: The Safety Belt Warning Indicator Is Never/Always On

Normal Operation

The Restraints Control Module (RCM) monitors the safety belt position through the safety belt buckle switch. The RCM provides the safety belt buckle status to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN).

If the safety belt buckle status message is missing or invalid for less than 5 seconds, the IPC defaults the safety belt warning indicator to its last state (on or off) based upon the last known good message received. If the IPC does not receive the safety belt buckle switch status message from the RCM or the message is deemed invalid by the IPC for greater than 5 seconds, the IPC sets DTC U0151:00 and defaults the safety belt warning indicator off.

This pinpoint test is intended to diagnose the following:

- Safety belt buckle concern
- RCM
- IPC

PINPOINT TEST U: THE SAFETY BELT WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
U1 RETRIEVE THE RECORDED RCM DTCs FROM THE SELF-TEST	
• Check for recorded RCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to U2 .
U2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0151:00, GO to Pinpoint Test AZ . For all other DTCs, REFER to DTC Charts in this section. **No** GO to U3 .
U3 CARRY OUT THE IPC INDICATOR	

LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC all warning indicators (SBLT_LAMP) active command. Command all the warning indicators on and off. Observe the safety belt warning indicator. • **Does the safety belt warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** If the safety belt warning indicator is never on after the bulb prove-out, the system is operating correctly at this time. If the safety belt warning indicator is always on, INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test V: The Malfunction Indicator Lamp (MIL) Is Never/Always On

Normal Operation

The Malfunction Indicator Lamp (MIL) is controlled by the Instrument Panel Cluster (IPC) using data sent from the PCM over the High Speed Controller Area Network (HS-CAN).

If the MIL status message is missing or invalid for less than 5 seconds, the IPC defaults the MIL to its last state (on or off) based upon the last known good message received. If the MIL status message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the MIL on.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST V: THE MIL IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
V1 CARRY OUT THE IPC MIL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC MIL active command (MIL). Command the MIL on and off. Observe the MIL . • **Does the MIL illuminate when selected on and turn off when selected off?**	**Yes** GO to V2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

repair4less

V2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the KOEO self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to V3 .
V3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test AT . **No** If the MIL is never on with the KOEO , the system is operating correctly at this time. If the MIL is always on, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test W: The Cruise Control Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the cruise control indicator on request from the PCM over the High Speed Controller Area Network (HS-CAN). When the cruise control switch is placed in the ON position, the PCM sends the IPC a standby mode request and the IPC illuminates the cruise control indicator to amber. When the cruise control is engaged, the PCM sends a cruise control on request message to the IPC and the IPC changes the cruise control indicator illumination from amber to green.

If the cruise control message is missing or if the data is deemed invalid by the IPC for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the cruise control off.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST W: THE CRUISE CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
W1 CHECK THE CRUISE CONTROL OPERATION	
• Operate the cruise control. • **Does the cruise control operate correctly?**	**Yes** GO to W2 . **No** REFER to Section 419-03 .

W2 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC cruise control indicator (CRUISE) active command. Command the cruise control indicator on and off. Observe the cruise control indicator. • **Does the cruise control indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to W3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
W3 RETRIEVE AND RECORD THE DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to W4 .
W4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test X: The PRNDL Indicator is Never On/Always Displays P

Normal Operation

The Instrument Panel Cluster (IPC) receives the transmission range status and the select shift status from the PCM over the High Speed Controller Area Network (HS-CAN). The IPC also uses a park detect switch (part of the brake shift interlock actuator) to signal the IPC the shift lever is fully seated in the PARK (P) position. The IPC compares the park detect switch input with the transmission range status sent from the PCM and looks for vehicle speed above 16 km/h (10 mph). The IPC provides a reference voltage to the brake shift interlock. When the selector lever is in PARK (P), the brake shift indicator routes the reference voltage to ground pulling the circuit low to the IPC . When the selector lever is moved out of PARK (P), the brake shift interlock opens the ground, sending the reference voltage high.

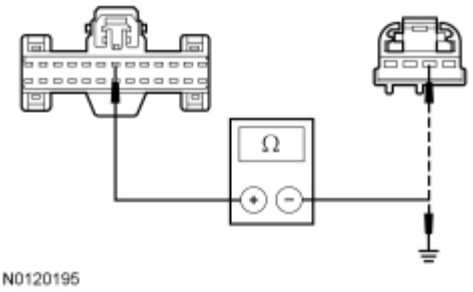
When in select shift mode, the select shift indication is illuminated along with the PRNDM21 display. For example, when M is selected and select shift is selected, the PRNM21 illuminates the M and the select shift display illuminates 1-6 (base IPC) or M1-M6 (optional IPC) simultaneously.

If the transmission range information is missing from the PCM, the IPC sets DTC U0100:00.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer, temperature gauge or odometer. If DTC U0101:00 sets in the IPC , other observable symptoms may be the powertrain malfunction (wrench) warning indicator always on.

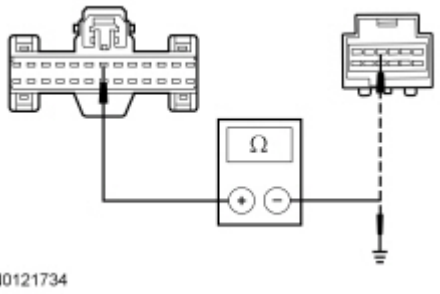
repair4less

- DTC P1706:00 (High Vehicle Speed Observed In Park: No Sub Type Information) — a continuous memory DTC that sets if the IPC receives a short to ground on the park detect switch input circuit, pulling the circuit low with a Vehicle Speed Sensor (VSS) input over 16 km/h (10 mph) for greater than 5 seconds (indicating the vehicle is in park and in motion).



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Brake shift interlock actuator
- PCM concern
- IPC



PINPOINT TEST X: THE PRNDL INDICATOR IS NEVER ON/ALWAYS DISPLAYS P

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
X1 CHECK THE PRNDL DISPLAY PARK OPERATION	
• Ignition ON. • Shift the selector lever through the different gear positions while observing the PRNDL display. • Place the selector lever in the PARK (P) position. • Ignition OFF. • Observe the PRNDL display immediately after turning the key off. • **Does the PRNDL display the different ranges according to the selector lever position then display P for approximately 5 seconds when the key is turned off?**	**Yes** The system is functioning correctly at this time. **No** GO to X2.
X2 RETRIEVE AND RECORD THE IPC DTCs FROM THE SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC P1706:00, GO to X3. For DTC U0100:00, GO to Pinpoint Test AT. For all other DTCs, REFER to DTC Charts in this section. **No** GO to X4.
X3 CONFIRM DTC P1706:00 IS STILL PRESENT	
• CLEAR the DTCs. DRIVE the vehicle above 16 km/h (10 mph) for more than 5 seconds. REPEAT the self-test. • **Is DTC P1706:00 present?**	**Yes** GO to X5. **No** The PRNDL is operating correctly at this time. The fault may be caused by an intermittent concern with the park detect input to the IPC.
X4 RETRIEVE AND RECORD THE DTCs FROM THE PCM KOEO	

SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
X5 CHECK THE BRAKE SHIFT INTERLOCK OPERATION	
• Apply the park brake and shift the transmission into NEUTRAL (N). • Ignition OFF. • Disconnect: Brake Shift Interlock C2008 (Column Shift) . • Disconnect: Brake Shift Interlock C3245 (Floor Shift) . • Clear the DTCs. • Disengage the park brake and drive the vehicle above 16 km/h (10 mph) for more than 5 seconds. • Retrieve the IPC continuous memory DTCs. • **Is DTC P1706:00 still present?**	**Yes** GO to X6 . **No** INSTALL a new brake shift interlock actuator. REFER to Section 307-05 . TEST the system for normal operation.
X6 CHECK THE PARK DETECT INPUT CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220 . • For column shift, measure the resistance between the IPC C220-7, circuit CET52 (GN), harness side and the brake shift interlock C2008-2, circuit CET52 (GN), harness side; and between the IPC C220-7, circuit CET52 (GN), harness side and ground.  N0120195 • For floor shift, measure the resistance between the IPC C220-7, circuit CET52 (GN), harness side and the selector lever C3245-3, circuit CET52 (GN), harness side; and between the IPC C220-7, circuit CET52 (GN), harness side and ground.	**Yes** GO to X7 . **No** REPAIR circuit CET52 (GN) for an open or short to ground. REPEAT the self-test. CLEAR the DTCs.

repair4less

 N0121734 • **Is the resistance less than 5 ohms between the IPC and the brake shift interlock or selector lever, and greater than 10,000 ohms between the IPC and ground?**	

X7 CHECK FOR CORRECT IPC OPERATION
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Y: The Powertrain Malfunction (Wrench) Message Center Indicator Is Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives requests from the PCM and Transfer Case Control Module (TCCM) to control the powertrain malfunction (wrench) message center indicator. The PCM provides an indicator request for Electronic Throttle Control (ETC) faults and transmission faults over the High Speed Controller Area Network (HS-CAN). The TCCM provides an indicator request for Four-Wheel Drive (4WD) faults over the HS-CAN.

If the indicator request message for ETC or transmission faults is missing or if the data is deemed invalid for less than 5 seconds, the powertrain malfunction (wrench) message center indicator remains in the last state (on or off) based upon the last known good message received. If the indicator request message for ETC or transmission faults is missing or if the data is deemed invalid by the IPC for greater than 5 seconds, the IPC sets DTC U0100:00 and defaults the powertrain malfunction (wrench) message center warning indicator active (on).

If the indicator request message for the 4WD faults is missing or deemed invalid for less than 5 seconds, the powertrain malfunction (wrench) message center indicator remains in the last state (on or off) based upon the last known good message received. If the indicator request message is missing or if the data is deemed invalid by the IPC for greater than 5 seconds, the IPC sets DTC U0102:00 and defaults the powertrain malfunction (wrench) message center warning indicator active (on).

NOTE: If DTC U0100:00 sets in the IPC, other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge. If DTC U0102:00 sets in the IPC, other symptoms may also be present such as an inoperative 4X4 high or 4X4 low indicator when equipped with Electronic Shift-

On-The-Fly (ESOF).

This pinpoint test is intended to diagnose the following:

- Message center concern
- ETC concern
- 4WD concern (if equipped)
- Transmission concern

PINPOINT TEST Y: THE POWERTRAIN MALFUNCTION (WRENCH) MESSAGE CENTER INDICATOR IS ALWAYS ON

Test Step	Result / Action to Take
Y1 VERIFY THE OPERATION OF THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR	
• Close all doors then open the LH front door. • Ignition ON. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warning indicators. Allow the displays to cycle through each display while determining whether the door ajar message center warning indicator is active. • Observe the message center. • **Is the door ajar message center warning indicator active?**	**Yes** GO to Y2. **No** GO to Pinpoint Test AF.
Y2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 or DTC U0102:00 recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT. For DTC U0102:00, GO to Pinpoint Test AU. **No** GO to Y3.
Y3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14. TEST the system for normal operation. **No** REFER to Section 308-07A to diagnose TCCM DTCs.

Pinpoint Test Z: The Charging System Message Center Warning Indicator Is Never/Always On

Normal Operation

The charging system indicator is controlled by the Instrument Panel Cluster (IPC) based upon data received from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The BCM receives the charging system status from the PCM over the HS-CAN. When a fault is detected in the

repair4less

charging system, the BCM sends the IPC a request to illuminate the charging system warning indicator.

If the charging system warning indicator request message is missing for less than 5 seconds, the charging system indicator remains in the last state (on or off). If the charging system message is missing for more than 5 seconds, the IPC sets DTC U0140:00 in continuous memory and defaults the charging system indicator on.

NOTE: If DTC U0140:00 sets in the IPC, other observable symptoms may be an inoperative key-in-ignition chime, door ajar message center indicator or RH/LH turn indicators.

This pinpoint test is intended to diagnose the following:

- Message center concern
- Charging system concern
- PCM

PINPOINT TEST Z: THE CHARGING SYSTEM MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Z1 VERIFY THE OPERATION OF THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR	
• Close all doors then open the LH front door. • Ignition ON. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warning indicators. Allow the displays to cycle through each display while determining whether the door ajar message center warning indicator is active. • Observe the message center. • **Is the door ajar message center warning indicator active?**	**Yes** GO to Z2. **No** GO to Pinpoint Test AF.
Z2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any charging system DTCs recorded?**	**Yes** REFER to Section 303-14. TEST the system for normal operation. **No** GO to Z3.
Z3 CHECK THE CHARGING SYSTEM OPERATION	
• Check the charging system operation. Refer to Section 414-00. • **Does the charging system operate correctly?**	**Yes** GO to Z4. **No** REFER to Section 414-00.
Z4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
	Yes

• Check for recorded IPC DTCs from the self-test. • **Is DTC U0140:00 recorded?**	GO to Pinpoint Test AY . **No** If the charging system warning indicator is never on with the KOEO , the system is operating correctly at this time. If the charging system warning indicator is always on, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test AA: The Low Oil Pressure Message Center Warning Indicator Is Never/Always On

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The engine oil pressure switch is hardwired to the PCM. The Instrument Panel Cluster (IPC) receives the engine oil pressure status from the PCM over the High Speed Controller Area Network (HS-CAN). The IPC uses both the messaged oil pressure status and engine rpm to control the low oil pressure message center warning indicator. The PCM provides a reference voltage to the engine oil pressure switch when the ignition key is in RUN. With the engine running and low or no oil pressure, the engine oil pressure switch remains open. The PCM detects no change in the reference voltage and provides the IPC a request to illuminate the low oil pressure warning indicator. With the engine running and sufficient oil pressure, the engine oil pressure switch closes, pulling the reference voltage low. The PCM detects the low reference voltage and provides the IPC a request to turn off the low oil pressure warning indicator.

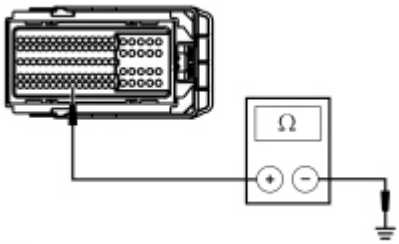
If the IPC fails to receive the oil pressure status from the PCM for 5 seconds or less, the IPC defaults the low oil pressure warning indicator to the last state (on or off), based upon the last known good oil pressure status message. If the IPC fails to receive the oil pressure status from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the low oil pressure warning indicator active (on).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Message center concern
- Communication concern
- Tachometer concern
- Engine oil pressure switch
- Base engine oil pressure concern
- PCM

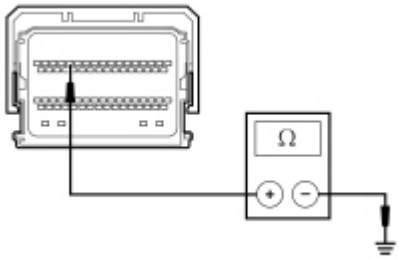
PINPOINT TEST AA: THE LOW OIL PRESSURE MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

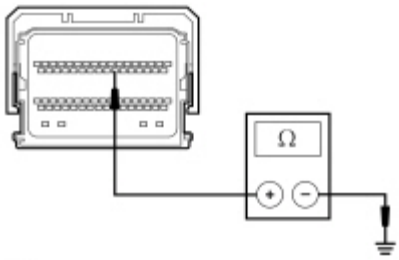
NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to

repair4less



Section 414-01 .

Test Step	Result / Action to Take
AA1 VERIFY THE OPERATION OF THE TACHOMETER	
• Ignition ON. • With the engine running, verify the tachometer is operating correctly. • **Does the tachometer operate correctly?**	**Yes** GO to AA2 . **No** For an inoperative tachometer, GO to Pinpoint Test I . For an inaccurate tachometer, GO to Pinpoint Test J .
AA2 VERIFY THE OPERATION OF THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR	
• Close all doors then open the LH front door. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warnings. Allow the displays to cycle through each display while determining whether the door ajar message center warning indicator is active. • Observe the message center. • **Is the door ajar message center warning indicator active?**	**Yes** If the low oil pressure message center warning indicator is never on, GO to AA3 . If the low oil pressure message center warning indicator is always on, GO to AA5 . **No** GO to Pinpoint Test AF .
AA3 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Start the engine. • Observe the low oil pressure warning indicator. • **Does the low oil pressure warning indicator illuminate?**	**Yes** INSTALL a new engine oil pressure switch. Refer to the appropriate section in Group 303 for the procedure. TEST the system for normal operation. **No** GO to AA4 .
AA4 CHECK THE OIL PRESSURE INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175E (3.7L), C1381E (5.0L and 6.2L), or C1551E (3.5L) . • For 3.5L, measure the resistance between the PCM C1551E-9, circuit CMC24 (GY), harness side and ground.	**Yes** GO to AA9 . **No** REPAIR circuit CMC24 (GY) for a short to ground. TEST the system for normal operation.

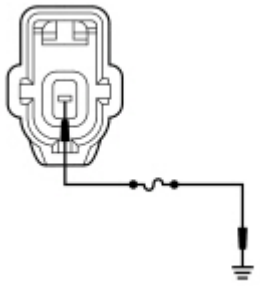


N0122305

- For 3.7L, measure the resistance between the PCM C175E-13, circuit CMC24 (GY), harness side and ground.

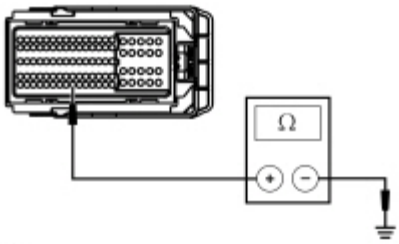
N0120194

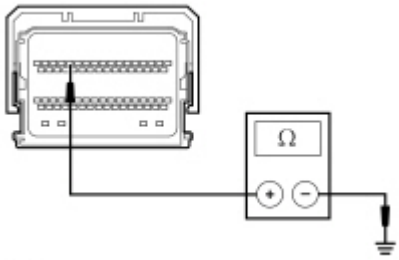
- For 5.0L and 6.2L, measure the resistance between the PCM C1381E-24, circuit CMC24 (GY), harness side and ground.



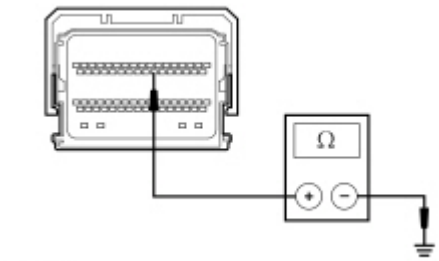
N0112570

- **Is the resistance greater than 10,000 ohms?**





AA5 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test AT . **No** GO to AA6 .
AA6 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Connect a fused jumper wire between the engine oil pressure switch C103-1, circuit CMC24 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. GO to AA8 . **No** LEAVE the jumper wire connected. GO to AA7 .



repair4less

N0002760

- Start the engine.
- Observe the low oil pressure warning indicator.
- **Does the low oil pressure indicator turn off?**

AA7 CHECK THE ENGINE OIL PRESSURE INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Disconnect: PCM C175E (3.7L), C1381E (5.0L and 6.2L), or C1551E (3.5L) . • For 3.5L, measure the resistance between the PCM C1551E-9, circuit CMC24 (GY), harness side and ground.  N0122305 • For 3.7L, measure the resistance between the PCM C175E-13, circuit CMC24 (GY), harness side and ground.  N0120194 • For 5.0L and 6.2L, measure the resistance between the PCM C1381E-24, circuit CMC24 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. GO to AA9 . **No** REMOVE the jumper wire. REPAIR circuit CMC24 (GY) for an open. TEST the system for normal operation.

 N0112570 • **Is the resistance less than 5 ohms?**	
AA8 CHECK THE OIL PRESSURE	
• Carry out the engine oil pressure test. Refer to Section 303-00 . • **Is the oil pressure within specification?**	**Yes** INSTALL a new engine oil pressure switch. Refer to the appropriate section in Group 303 for the procedure. TEST the system for normal operation. **No** REFER to Section 303-00 to continue diagnosis of the engine oil pressure.
AA9 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Connect: Engine Oil Pressure Switch C103 . • Connect: PCM C175E (3.7L), C1381E (5.0L and 6.2L) or C1551E (3.5L) . • Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to AA10 .
AA10 CHECK FOR CORRECT PCM OPERATION	

• Disconnect the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AB: The 4X4 Auto, 4X4 Low, 4X4 High Or 4X2 Message Center Indicator Is Never/Always On (If Equipped)

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

repair4less

The Instrument Panel Cluster (IPC) receives the Four-Wheel Drive (4WD) status from the Transfer Case Control Module (TCCM) over the High Speed Controller Area Network (HS-CAN). If the vehicle is shifted into 4X4 auto, 4WD low or high, the TCCM sends the IPC a message to illuminate the 4X4 auto, 4X4 low or 4X4 high message center indicator. If the vehicle is shifted out of either 4X4 auto, 4X4 low or 4X4 high into 4X2 mode, the TCCM sends the IPC a message to illuminate the 4X2 message center indicator, informing the driver the vehicle has shifted into 4X2 mode.

If the 4X4 status message is missing for less than 5 seconds, the IPC defaults the applicable 4X4 message center indicator to the last on/off state, based upon the last known good ABS status message received.

If the 4X4 status message is missing for greater than 5 seconds, the IPC sets DTC U0102:00 and defaults the applicable 4X4 message center indicator off.

This pinpoint test is intended to diagnose the following:

- Message center concern
- 4WD concern
- TCCM

PINPOINT TEST AB: THE 4X4 AUTO, 4X4 LOW, 4X4 HIGH OR 4X2 MESSAGE CENTER INDICATOR IS NEVER/ALWAYS ON (IF EQUIPPED)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AB1 VERIFY THE OPERATION OF THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR	
• Close all doors then open the LH front door. • Ignition ON. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warning indicators. Allow the displays to cycle through each display while determining whether the door ajar message center warning indicator is active. • Observe the message center. • **Is the door ajar message center warning indicator active?**	**Yes** GO to AB2. **No** GO to Pinpoint Test AF.
AB2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0102:00 recorded?**	**Yes** GO to Pinpoint Test AU. **No** GO to AB3.
AB3 RETRIEVE THE RECORDED DTCs FROM THE TCCM SELF-TEST	
• Check for recorded DTCs from the TCCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 308-07A. **No** GO to AB4.
AB4 CHECK THE 4WD SYSTEM OPERATION	

• Test drive the vehicle and operate the 4WD system. • **Does the 4WD system operate correctly?**	**Yes** INSTALL a new TCCM. REFER to Section 308-07A. TEST the system for normal operation. **No** REFER to Section 308-07A.

Pinpoint Test AC: The Tow Haul Message Center Indicator Is Never/Always On

Normal Operation

The tow haul indicator illuminates when the tow haul system has been engaged and is actively providing tow haul control for the vehicle. The Instrument Panel Cluster (IPC) receives the O/D off and tow haul indicator request from the PCM over the High Speed Controller Area Network (HS-CAN).

If the tow haul indicator request message is missing or invalid for less than 5 seconds, the tow haul indicator remains in the last state (on or off), based upon the last known good message received. If the or tow haul indicator request message is missing for more than 5 seconds, the IPC sets DTC U0101:00 in continuous memory and defaults the tow haul indicator off.

This pinpoint test is intended to diagnose the following:

- Message center concern
- PCM

PINPOINT TEST AC: THE TOW HAUL MESSAGE CENTER INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AC1 VERIFY THE OPERATION OF THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR	
• Close all doors then open the LH front door. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warnings. Allow the displays to cycle through each display while determining whether the door ajar message center warning indicator is active. • Observe the message center. • **Is the door ajar message center warning indicator active?**	**Yes** GO to AC2. **No** GO to Pinpoint Test AF.
AC2 RETRIEVE AND RECORD THE IPC DTCs FROM THE SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT. For all other DTCs, REFER to DTC Charts in this section. **No** GO to AC3.
AC3 RETRIEVE AND RECORD THE DTCs FROM THE PCM	

repair4less

KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . TEST the system for normal operation. **No** GO to AC4 .
AC4 VERIFY THE OPERATION OF THE TOW HAUL SYSTEM	
• Verify the tow haul system turns off when turned off and turns on when turned on. • **Does the tow haul system function correctly?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** REFER to Section 307-05 .

Pinpoint Test AD: The Electronic Locking Differential (ELD) Message Center Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Electronic Locking Differential (ELD) status from the Transfer Case Control Module (TCCM) over the High Speed Controller Area Network (HS-CAN). If the vehicle is shifted into ELD mode, the TCCM sends the IPC a message to illuminate the ELD message center indicator. If the vehicle is shifted out of ELD mode, the TCCM sends the IPC a message to turn off the ELD message center indicator, informing the driver the vehicle has shifted out of ELD mode.

If the ELD status message is missing or invalid for less than 5 seconds, the ELD warning indicator remains in the last state (on or off), based upon the last known good ELD status message received. If the ELD status message is missing for more than 5 seconds, the IPC sets DTC U0102:00 in continuous memory and defaults the ELD warning indicator off.

This pinpoint test is intended to diagnose the following:

- Message center concern
- ELD concern
- TCCM

PINPOINT TEST AD: THE ELD MESSAGE CENTER INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AD1 VERIFY THE OPERATION OF THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR	
• Close all doors then open the LH front door. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warnings. Allow the displays to cycle through each display while determining whether the door ajar message center warning indicator is active.	**Yes** GO to AD2 . **No** GO to Pinpoint Test

• Observe the message center. • **Is the door ajar message center warning indicator active?**	AF .
AD2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0102:00 recorded?**	**Yes** GO to Pinpoint Test AU . **No** GO to AD3 .
AD3 RETRIEVE THE RECORDED DTCs FROM THE TCCM SELF-TEST	
• Check for recorded TCCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 308-07A . **No** GO to AD4 .
AD4 CHECK THE 4X4 OPERATION	
• Start the engine. • Shift the transfer case into 4WD mode. • **Does the transfer case shift into 4WD mode?**	**Yes** INSTALL a new TCCM . REFER to Section 308-07A . **No** REFER to Section 308-07A to diagnose 4WD concerns.

Pinpoint Test AE: The Door Ajar Message Center Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the door ajar status for the LH front, RH front, LH rear and RH rear door ajar switch from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). When the IPC receives a door ajar indication request from the BCM that one or more doors are open or ajar, the IPC turns on the appropriate door ajar message center warning indicator.

If the door ajar indication request message is missing for less than 5 seconds, the door ajar indication remains in its last state (on or off) based upon the last known good message received. If the door ajar status message is missing for more than 5 seconds, the IPC sets DTC U0140:00 and defaults the door ajar message center warning indicator active (on).

NOTE: If DTC U0140:00 sets in the IPC , other symptoms may also be present such as high beam indicator, RH/LH turn indicators, instrument panel backlighting and Tire Pressure Monitoring System (TPMS).

This pinpoint test is intended to diagnose the following:

- Message center concern
- Interior lighting concern
- BCM

repair4less

PINPOINT TEST AE: THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AE1 VERIFY THE OPERATION OF THE WRENCH AND ENGINE OVER-TEMPERATURE MESSAGE CENTER WARNING INDICATORS	
• Ignition OFF. • Disconnect: PCM C175E (3.7L), C1381E (5.0L and 6.2L) or C1551E (3.5L) . • Ignition ON. • **NOTE:** If multiple warnings are present, the message center indicators rotate through each of the warnings. Allow the displays to rotate through each display while determining whether the powertrain malfunction (wrench) and over-temperature message center warning indicator is active. • Observe the message center or integrated display area of the IPC with the PCM connected and disconnected. • **Do the powertrain malfunction (wrench) and engine over-temperature warning message center indicators remain off when the PCM is connected and become active with the PCM disconnected?**	**Yes** GO to AE2 . **No** GO to Pinpoint Test AF .
AE2 CHECK THE INTERIOR LIGHTING OPERATION	
• Open and close each door while monitoring the interior lamps. • **Do the interior lamps operate correctly with each door?**	**Yes** GO to AE3 . **No** REFER to Section 417-02 .
AE3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Is DTC U0140:00 recorded?**	**Yes** GO to Pinpoint Test AY . **No** GO to AE4 .
AE4 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Body Control Module (BCM) DTC Chart in Section 419-10 for correct navigation of the DTC. **No** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test AF: The Message Center Is Not Operating Correctly

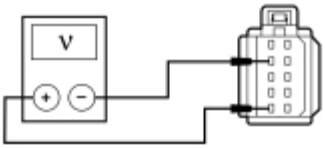
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

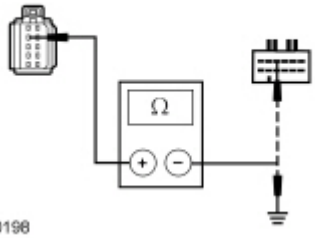
Normal Operation

The message center functionality is controlled through the message center switch (part of the LH steering wheel switch), which is hardwired to the Instrument Panel Cluster (IPC) through input and return circuits. There are 3 message center switch buttons (base IPC) or 5 message center switch buttons (optional IPC). Each button operates a unique switch within the message center switch portion of the LH steering wheel switch assembly using a different resistance value associated with each specific button. The IPC sends out a reference voltage to the message center switch on the input circuit and monitors the voltage drop when a message center switch button is pressed. The voltage drop varies depending upon the resistance of the specific button pressed, providing indication to the IPC , which switch is pressed.

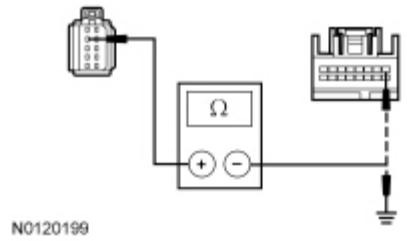
DTC Description	Fault Trigger Conditions
• B1A82:11 — External Trip Switch: Circuit Short To Ground	**NOTE:** This DTC only sets when equipped with the base message center IPC and does not apply to the Raptor or optional message center IPC s. A continuous and on-demand DTC that sets in the IPC when the IPC detects a short to ground on the message center switch input circuit.
• B1A82:13 — External Trip Switch: Circuit Open	A continuous and on-demand DTC that sets in the IPC when the IPC detects an open on the message center switch input circuit.
• B1A82:23 — External Trip Switch: Signal Stuck Low	A continuous memory DTC that sets in the IPC when the IPC detects the message center switch input pulled low (message center switch button stuck) but not shorted to ground.

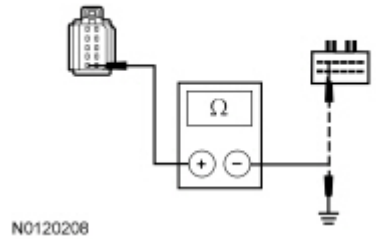
This pinpoint test is intended to diagnose the following:





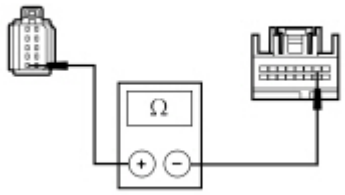
- Wiring, terminals or connectors
- Message center switch (part of the LH steering wheel switch)
- Clockspring
- IPC

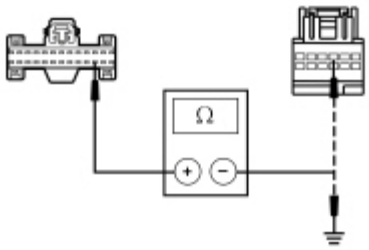


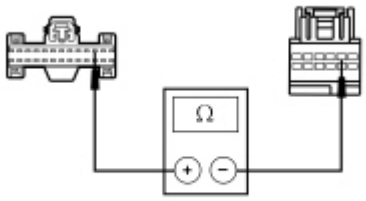


PINPOINT TEST AF: THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

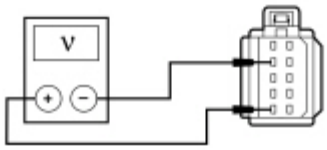
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**







Test Step	Result / Action to Take
AF1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Retrieve the recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC B1A82:23, INSTALL a new LH steering wheel. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test. For DTC B1A82:11 or DTC B1A82:13, GO to AF2 . For all other DTCs, REFER to DTC Charts in this section. **No**



repair4less

	For the base message center, GO to AF9 . For the Raptor or optional message center, GO to AF2 .
AF2 CHECK THE IPC OUTPUT AT THE LH STEERING WHEEL SWITCH	
• Ignition OFF. • Disconnect: LH Steering Wheel Switch C2998 . • Ignition ON. • Measure the voltage between the LH steering wheel switch C2998-10, harness side and the LH steering wheel switch C2998-7, harness side.  N0120197 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new LH steering wheel. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test. **No** GO to AF3 .
AF3 CHECK THE MESSAGE CENTER SIGNAL CIRCUIT BETWEEN THE LH STEERING WHEEL SWITCH AND THE LOWER CLOCKSPRING FOR AN OPEN AND A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Lower Clockspring C218A . • Measure the resistance between the LH steering wheel switch C2998-7, harness side and the lower clockspring pin 3, component side; and between the LH steering wheel switch C2998-7, harness side and ground.  N0120198 • **Is the resistance less than 5 ohms between the LH steering wheel switch and the clockspring, and greater than 10,000 ohms between the LH steering wheel switch and ground?**	**Yes** GO to AF5 . **No** GO to AF4 .
AF4 CHECK THE MESSAGE CENTER SIGNAL CIRCUIT BETWEEN THE LH STEERING WHEEL SWITCH AND THE UPPER CLOCKSPRING FOR AN OPEN AND A SHORT TO GROUND	
• Remove the driver air bag. Refer to Section 501-20B .	**Yes**

• Disconnect: Upper Clockspring C218B . • Measure the resistance between the LH steering wheel switch C2998-7, harness side and the upper clockspring C218B-1, harness side; and between the LH steering wheel switch C2998-7, harness side and ground.  N0120199 • **Is the resistance less than 5 ohms between the LH steering wheel switch and the clockspring, and greater than 10,000 ohms between the LH steering wheel switch and ground?**	INSTALL a new clockspring. REFER to Section 501-20B . CLEAR the DTC. REPEAT the self-test **No** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTC. REPEAT the self-test.
AF5 CHECK THE MESSAGE CENTER RETURN CIRCUIT BETWEEN THE LH STEERING WHEEL SWITCH AND THE LOWER CLOCKSPRING FOR AN OPEN	
• Ignition OFF. • Disconnect: Lower Clockspring C218A . • Measure the resistance between the LH steering wheel switch C2998-10, harness side and the lower clockspring pin 2, component side.  N0120208 • **Is the resistance less than 5 ohms?**	**Yes** GO to AF7 . **No** GO to AF6 .
AF6 CHECK THE MESSAGE CENTER RETURN CIRCUIT BETWEEN THE LH STEERING WHEEL SWITCH AND THE UPPER CLOCKSPRING FOR AN OPEN	
• Remove the driver air bag. Refer to Section 501-20B . • Disconnect: Lower Clockspring C218B . • Measure the resistance between the LH steering wheel switch C2998-10, harness side and the upper clockspring C218B-2, harness side.	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR the DTC. REPEAT the self-test **No** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTC. REPEAT the self-test.

repair4less

 N0120201 • **Is the resistance less than 5 ohms?**	
AF7 CHECK THE MESSAGE CENTER SIGNAL CIRCUIT BETWEEN THE IPC AND THE LOWER CLOCKSPRING FOR AN OPEN AND A SHORT TO GROUND	
• Disconnect: IPC C220 . • Measure the resistance between the IPC C220-16, circuit CMC29 (GN/VT), harness side and the lower clockspring C218A-3, circuit CMC29 (GN/VT), harness side; and between the IPC C220-16, circuit CMC29 (GN/VT), harness side and ground.  N0120209 • **Is the resistance less than 5 ohms between the IPC and the clockspring, and greater than 10,000 ohms between the IPC and ground?**	**Yes** GO to AF8 . **No** REPAIR circuit CMC29 (GN/VT) for an open or short to ground. CLEAR the DTC. REPEAT the self-test.
AF8 CHECK THE MESSAGE CENTER RETURN CIRCUIT BETWEEN THE IPC AND THE LOWER CLOCKSPRING FOR AN OPEN	
• Measure the resistance between the IPC C220-3, circuit RMC27 (WH/VT), harness side and the lower clockspring C218A-2, circuit RMC27 (WH/VT), harness side.  N0120210 • **Is the resistance less than 5 ohms?**	**Yes** GO to AF10 . **No** REPAIR circuit RMC27 (WH/VT) for an open or short to ground. CLEAR the DTC. REPEAT the self-test.
AF9 CHECK FOR VOLTAGE FROM THE IPC	

• Disconnect: LH Steering Wheel Switch C2998 . • Ignition ON. • Measure the voltage between the LH steering wheel switch C2998-10, harness side and the LH steering wheel switch C2998-7, harness side.  N0120197 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new LH steering wheel switch. REFER to Section 211-05 . TEST the system for normal operation. **No** GO to AF10 .

AF10 CHECK FOR CORRECT IPC OPERATION
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AG: The Compass Is Inoperative (With 4.2" Message Center and 4.2" FCDIM))

Normal Operation

The compass is displayed in IPC and FCDIM when equipped with the 4.2" FCDIM , and in the Front Display Interface Module (FDIM) when equipped with the base Front Display Interface Module (FDIM) and the 8" Front Display Interface Module (FDIM).

The IPC receives the compass display message from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The BCM receives the compass display message from the GPSM over the MS-CAN .

If the compass display message is missing or invalid for 5 seconds or less, the compass displays the last vehicle direction based upon the last known good compass display message received. If the compass display message is invalid or missing for 5 seconds or more, the IPC defaults the compass display to all dashes (---).

- DTC U0462:82 (Invalid Data Received from Compass Module: Alive/Sequence Counter Incorrect/Not Updated) — sets in the Instrument Panel Cluster (IPC) in continuous memory if the IPC does not receive updated compass data from the BCM for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

repair4less

- Communication concern
- GPSM

PINPOINT TEST AG: THE COMPASS IS INOPERATIVE (WITH 4.2" MESSAGE CENTER AND 4.2" FCDIM))

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AG1 CHECK THE COMPASS ZONE AND CALIBRATION SETTINGS THROUGH THE MESSAGE CENTER	
• Ignition ON. • Enter the vehicle settings in the message center and verify whether the compass zone and calibration setting menu is present. • **Is the compass zone and calibration setting menu present?**	**Yes** DIAGNOSE the compass display in the 4.2" FCDIM . Refer to the appropriate section in Group 415 for the procedure. **No** GO to AG2 .
AG2 RETRIEVE THE RECORD DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE GLOBAL POSITIONING SYSTEM MODULE (GPSM) SELF-TEST	
• Carry out the GPSM self-test. • **Are any DTCs recorded?**	**Yes** Refer to the appropriate section in Group 415 for the procedure.. **No** GO to AG3 .
AG3 RETRIEVE THE RECORD DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE BODY CONTROL MODULE (BCM) SELF-TEST	
• Carry out the BCM self-test. • **Are any DTCs recorded?**	**Yes** Section 419-10 . **No** GO to AG4 .
AG4 RETRIEVE THE RECORD DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE INSTRUMENT PANEL CLUSTER (IPC) SELF-TEST	
• Carry out the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Chart: IPC in this section. **No** INSTALL a new GPSM . Refer to the appropriate section in Group 415 for the procedure..

Pinpoint Test AI: The Outside Air Temperature Display Is Inoperative/Incorrect

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The outside air temperature is displayed in the Front Display Interface Module (FDIM). The Ambient Air Temperature (AAT) sensor is hardwired to the PCM through separate input and return circuits. The PCM provides a reference voltage to the AAT sensor and monitors the change in voltage resulting from changes in resistance as determined by outside air temperature. The PCM then messages the ambient air temperature data to the HVAC module through the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The BCM then filters the temperature data and sends the updated temperature status to the FDIM over the Medium Speed Controller Area Network (MS-CAN).

The HVAC module is programmed to update the messaged outside temperature data at different rates depending on several criteria to prevent false temperature displays due to a condition known as heat soaking. Heat soaking is where the outside air temperature is hotter in the location of the AAT sensor than the actual outside air temperature.

When the sensed outside temperature rises, the display updates slowly at varying rates based on vehicle speed. When the sensed outside temperature drops, the display updates more quickly following the drop experienced by the AAT sensor.

This pinpoint test is intended to diagnose the following:

- Communication concern
- PCM concern

PINPOINT TEST AI: THE OUTSIDE AIR TEMPERATURE DISPLAY IS INOPERATIVE/INCORRECT

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AI1 RETRIEVE THE RECORDED DTCs FROM THE FDIM SELF-TEST	
• Check for recorded FDIM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0164, REFER to Refer to the appropriate section in Group 415 for the procedure.. **No** GO to AI2 .
AI2 RETRIEVE THE RECORDED DTCs FROM THE HVAC MODULE SELF-TEST	
• Check for recorded HVAC module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 412-00 . **No** GO to AI3 .
AI3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test.	**Yes** REFER to Section 303-14 . TEST the system for

repair4less

• **Are any ambient temperature sensor DTCs recorded?**	normal operation. **No** The system is operating correctly at this time. The condition may have been caused by a heat soak concern.

Pinpoint Test AJ: A Hill Descent Control Message Is Inoperative/Always On

Normal Operation

The hill descent control system maintains vehicle speed on a downhill grade at operating speeds between 3 km/h (2 mph) and 32 km/h (20 mph). The system goes into standby mode on a flat or uphill terrain. The system deactivates at speeds above 64 km/h (40 mph). During periods of sustained use, the hill descent control system may automatically deactivate in order to cool the braking system.

When the hill descent control switch is pressed, a ground signal is sent to the PCM. The PCM then sends a message to the ABS module along the High Speed Controller Area Network (HS-CAN) requesting system activation. The ABS module uses inputs from the Restraints Control Module (RCM) and wheel speed sensors to determine the mode of operation.

The Instrument Panel Cluster (IPC) receives the hill descent control status from the ABS module over the HS-CAN . The message center also displays hill descent control messages to inform the driver they have entered or exited various states of the hill descent control function.

If the hill descent message is missing for less than 5 seconds, the hill descent active message center indicator remains in the last state (on or off) based on the last status message received. If the hill descent status message is missing for more than 5 seconds, the IPC sets DTC U0121:00 and defaults the hill descent active message center indicator off.

This pinpoint test is intended to diagnose the following:

- Message center concern
- ABS module

PINPOINT TEST AJ: A HILL DESCENT CONTROL MESSAGE IS INOPERATIVE/ALWAYS ON

Test Step	Result / Action to Take
AJ1 VERIFY THE OPERATION OF THE DOOR AJAR MESSAGE CENTER WARNING INDICATOR	
• Close all doors then open the LH front door. • Ignition ON. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warning indicators. Allow the displays to cycle through each display while determining whether the door ajar message center warning indicator is active. • Observe the message center. • **Does the message center display DRIVER DOOR AJAR?**	**Yes** GO to AJ2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AJ2 CHECK AND ENSURE THE HILL DESCENT CONTROL MODE FUNCTIONS	

• Start the engine. • Drive the vehicle between 3 km/h (2 mph) and 32 km/h (20 mph) on a downhill grade and activate the hill descent control system mode. • **Are the brakes applying on a downhill grade?**	**Yes** GO to AJ3 . **No** REFER to Section 206-09 .
AJ3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0121:00 recorded?**	**Yes** GO to Pinpoint Test AV . **No** GO to AJ4 .
AJ4 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** INSTALL a new ABS module. REFER to Section 206-09 .

Pinpoint Test AK: The CHECK FUEL FILL INLET Message Is Inoperative/Always On

Normal Operation

The PCM monitors the fuel tank evaporative emission system for significant leaks that occur following refueling of the vehicle. Once the PCM detects a fuel vapor leak, the PCM sends the Instrument Panel Cluster (IPC) a message over the communication network to turn on the CHECK FUEL FILL INLET message. The PCM only sets DTC P0457 following a successful cruise test, which is initiated when the vehicle is driven at a steady speed above 64 km/h (40 mph) for a duration of approximately 4-5 minutes. If the PCM is unable to successfully run the cruise test, the IPC does not receive the fuel inlet status and the CHECK FUEL FILL INLET message remains off.

If the IPC does not receive the fuel inlet status from the PCM for 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the CHECK FUEL FILL INLET message off.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, temperature gauge or odometer.

- DTC P0457 (Evaporative Emission System Leak Detected) (Fuel Cap Loose/Off) — sets in the PCM if the PCM detects a significant fuel tank pressure change after refueling occurs.

This pinpoint test is intended to diagnose the following:

- Evaporative fuel system concern
- PCM
- IPC

PINPOINT TEST AK: THE CHECK FUEL FILL INLET MESSAGE IS INOPERATIVE/ALWAYS ON

repair4less

Test Step	Result / Action to Take
AK1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display DRIVER DOOR AJAR?**	**Yes** GO to AK2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AK2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Is DTC P0457 recorded?**	**Yes** If the CHECK FUEL FILL INLET message is illuminated, REFER to Section 303-14 . TEST the system for normal operation. If the CHECK FUEL FILL INLET message is not illuminated, GO to AK3 . **No** If the CHECK FUEL FILL INLET message is always on, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. If the check fuel cap indicator is not illuminated, the system is operating normally at this time. If the fuel cap was left off and the CHECK FUEL FILL INLET message did not turn on, driving conditions may not have allowed for the PCM to run the cruise test and message the IPC to turn the CHECK FUEL FILL INLET message on.
AK3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AT . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test AL: An Off-Road Mode Message Is Inoperative/Always On (Raptor Only)

Normal Operation

The message center displays off-road mode messages to inform the driver they have entered or exited various states of the off-road mode function. When the off-road mode is active, the standard vehicle speed thresholds for the Instrument Panel Cluster (IPC) are lifted and the AdvanceTrac® settings are altered for optimized off-road driving. The IPC receives the off-road mode signal from the Transfer Case Control

Module (TCCM) over the High Speed Controller Area Network (HS-CAN).

If the off-road mode message is missing for less than 5 seconds, the IPC defaults the applicable off-road mode message center indicator to the last on/off state, based upon the last off-road mode status message received.

If the off-road mode status message is missing for greater than 5 seconds, the IPC sets DTC U0102:00 and defaults the applicable off-road mode message center indicator off.

This pinpoint test is intended to diagnose the following:

- Message center concern
- Four-Wheel Drive (4WD) concern
- TCCM

PINPOINT TEST AL: AN OFF-ROAD MODE MESSAGE IS INOPERATIVE/ALWAYS ON (RAPTOR ONLY)

Test Step	Result / Action to Take
AL1 CHECK THE MESSAGE CENTER OPERATION • Close all doors. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display DRIVER DOOR AJAR?**	**Yes** GO to AL2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AL2 CHECK THE 4X4 OPERATION IN OFF-ROAD MODE • Start the engine. • Drive the vehicle in Four-Wheel Drive (4WD) and activate the off-road mode. • **Has the vehicle entered off-road mode?**	**Yes** GO to AL3. **No** REFER to Section 308-07A to diagnose 4X4 system concerns.
AL3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded DTCs from the IPC self-test. • **Is DTC U0102:00 recorded?**	**Yes** GO to Pinpoint Test AU. **No** GO to AL4.
AL4 RETRIEVE THE RECORDED DTCs FROM THE TCCM SELF-TEST • Check for recorded DTCs from the TCCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 308-07A. **No** INSTALL a new TCCM. REFER to Section 308-07A.

repair4less

Pinpoint Test AM: The Chime Always Sounds

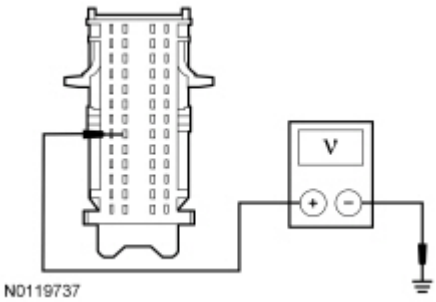
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) receives the key-in-ignition warning status from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The key-in-ignition warning switch (part of the ignition switch) is hardwired to the BCM . When the key is inserted into the ignition lock cylinder, the key-in-ignition switch closes and supplies voltage to the BCM . The BCM monitors the door ajar input from the LH front door and the key-in-ignition switch status. When the key is inserted into the ignition lock cylinder and the LH front door is open or ajar, the BCM sends the IPC a chime request message to sound the key-in-ignition warning chime. The headlamps on warning chime sounds when the driver door is opened with the ignition off, and the headlamp switch is in the PARK or HEADLAMP ON position.

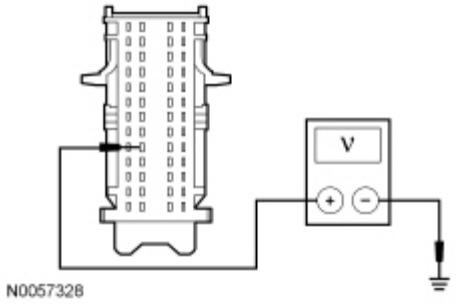
The BCM receives the headlamp switch status from the headlamp switch and the LH front door ajar status from the LH front door ajar switch through hardwired circuitry. The BCM communicates the headlamp on chime request to the IPC when the headlamps or parking lamps are on and the driver door is opened. The autolamps feature must not be selected for the headlamps on warning chime to operate.

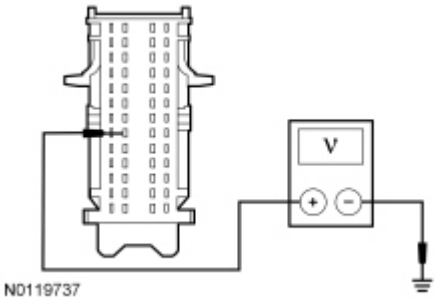
- DTC B10F1:14 (Key In Switch: Circuit Short To Ground or Open) — a continuous and on-demand DTC that sets if the BCM detects an open on the key-in-ignition switch input circuit or if the BCM detects ignition START, RUN/START OR RUN/ACC inputs without the key-in-ignition input.



This pinpoint test is intended to diagnose the following:

- Exterior lighting concern
- Interior lighting concern
- Wiring, terminals or connectors
- Key-in-ignition warning switch (part of the ignition switch)
- Ignition lock cylinder
- BCM





PINPOINT TEST AM: THE CHIME ALWAYS SOUNDS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AM1 CHECK THE EXTERIOR LIGHTING OPERATION	
• Turn the headlamp switch to the OFF position. • Close all doors and wait one minute. • Wait one minute. • Observe the exterior lights. • **Are the headlamps and parking lamps off?**	**Yes** GO to AM2 . **No** REFER to Section 417-01 .
AM2 CHECK THE INTERIOR LAMPS OPERATION	
• Open and close the drivers door. • Observe the interior lamps. • **Do the interior lamps operate correctly from the driver door?**	**Yes** GO to AM3 . **No** REFER to Section 417-02 .

AM3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check the recorded DTCs from the BCM self-tests. • **Are any DTCs present?**	**Yes** For DTC B10F1:14, GO to AM4. For all other DTCs, REFER to Section 419-10. **No** GO to AM5.
AM4 CHECK THE BCM INPUT PIDs FROM THE IGNITION SWITCH	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Select and monitor the BCM ignition switch state (IGN_SW_STATE) while switching through the ignition states. • **Do the BCM PIDs match the ignition switch position?**	**Yes** GO to AM9. **No** REFER to Section 211-05 to diagnose the ignition switch outputs to the BCM.
AM5 CHECK THE BCM KEY-IN-IGNITION SWITCH INPUT	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Select and monitor the BCM key-in-ignition switch state (KEY_IN_SW) while wiggling the igntion key in the lock cylinder. • **Does the PID indicate the key is in at all times?**	**Yes** GO to AM6. **No** INSTALL a new igntion lock cylinder. REFER to Section 501-14. TEST the system for normal operation.
AM6 CHECK THE KEY-IN-IGNITION INPUT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Remove the key from the ignition cylinder. • Disconnect: BCM C2280B. • Measure the voltage between the BCM C2280B-34, circuit CDC30 (BU/GY), harness side and ground.  • **Is any voltage present?**	**Yes** GO to AM7. **No** GO to AM9.
AM7 CHECK THE IGNITION LOCK CYLINDER	
NOTE: Make sure there is no mechanical damage between the igntion lock cylinder and the ignition switch causing the key-in-ignition switch to remain engaged. • Remove the igntion lock cylinder. Refer to Section 501-14. • Measure the voltage between the BCM C2280b-35, circuit CDC30 (BU/GY), harness side and ground.	**Yes** GO to AM8 **No** INSTALL a new ignition lock cylinder. REFER to Section

repair4less

 N0057328 • **Is any voltage present?**	501-14 . TEST the system for normal operation.
AM8 CHECK KEY-IN-IGNITION INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Ignition Switch C250 . • Measure the voltage between the BCM C2280B-34, circuit CDC30 (BU/GY), harness side and ground.  N0119737 • **Is any voltage present?**	**Yes** REPAIR circuit CDC30 (BU/GY) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation.
AM9 CHECK FOR CORRECT BCM OPERATION	
• Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AN: The Headlamps On Warning Chime Is Inoperative

Normal Operation

The Body Control Module (BCM) receives the headlamp switch status from the headlamp switch and the LH front door ajar status from the LH front door ajar switch through hardwired circuitry. The headlamps on warning chime sounds when the LH front door is opened with the ignition off, and the headlamp switch is in the PARK or HEADLAMP ON position. The BCM communicates the headlamp on chime request to the IPC over the High Speed Controller Area Network (HS-CAN) when the headlamps or parking lamps are on with the ignition off and the driver door is opened.

This pinpoint test is intended to diagnose the following:

- Interior lighting concern
- BCM
- IPC

PINPOINT TEST AN: THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AN1 CHECK THE SAFETY BELT WARNING CHIME OPERATION • Ignition OFF. • Ignition ON. • While monitoring the safety belt warning chime, transition the ignition switch from OFF to RUN. • **Does the safety belt warning chime operate for approximately 6 seconds?**	**Yes** GO to AN2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AN2 CHECK THE INTERIOR LAMPS OPERATION • Open and close the driver door. • Observe the interior lamps. • **Do the interior lamps operate correctly from the driver door?**	**Yes** GO to AN3. **No** REFER to Section 417-02.
AN3 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION • Ignition OFF. • Insert the key into the ignition lock cylinder. • Open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime sound?**	**Yes** GO to AN4. **No** GO to Pinpoint Test AO.
AN4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140:00, GO to Pinpoint Test AY. For all other DTCs, REFER to DTC Chart in this section. **No** GO to AN5.
AN5 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST • Check for recorded BCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 for correct navigation of the DTC. **No** INSTALL a new BCM. REFER to Section 419-

repair4less

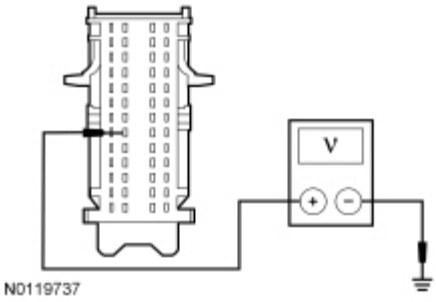
	10 . TEST the system for normal operation.

Pinpoint Test AO: The Key-In-Ignition Warning Chime Is Inoperative

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) receives the key-in-ignition warning status from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The key-in-ignition warning switch (part of the ignition switch) is hardwired to the BCM . When the key is inserted into the ignition lock cylinder, the key-in-ignition switch closes and supplies voltage to the BCM . The BCM monitors the door ajar input from the LH front door and the key-in-ignition switch status. When the key is inserted into the ignition lock cylinder and the driver door is open or ajar, the BCM sends the IPC a chime request message to sound the key-in-ignition warning chime.



- DTC B10F1:14 (Key In Switch: Circuit Short To Ground or Open) — a continuous and on-demand DTC that sets if the BCM detects an open on the key-in-ignition switch input circuit or if the BCM detects ignition START, RUN/START OR RUN/ACC inputs without the key-in-ignition input.

This pinpoint test is intended to diagnose the following:

- Interior lighting concern
- Wiring, terminals or connectors
- Key-in-ignition warning switch (part of the ignition switch)
- Ignition lock cylinder
- BCM
- IPC

PINPOINT TEST AO: THE KEY-IN-IGNITION WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AO1 CHECK THE SAFETY BELT WARNING CHIME OPERATION	
• Ignition OFF. • Unbuckle the driver safety belt. • Ignition ON. • Monitor the safety belt warning chime when the ignition switch is transitioned from OFF to RUN for 6 seconds. • **Does the safety belt warning chime operate for approximately 6 seconds?**	**Yes** GO to AO2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AO2 CHECK THE INTERIOR LAMPS OPERATION	
• Open and close the driver door. • Observe the interior lamps. • **Do the interior lamps operate correctly from the driver door?**	**Yes** GO to AO3 . **No** REFER to Section 417-02 .
AO3 RETRIEVE THE RECORDED DTCs FROM THE BCM	

SELF-TEST	
• Check the recorded DTCs from the BCM self-test. • **Is DTC B10F1:14 present?**	**Yes** GO to AO4 . **No** GO to AO7 .
AO4 CHECK THE BCM KEY-IN-IGNITION SWITCH INPUT	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Select and monitor the BCM key-in-ignition switch state (KEY_IN_SW) while wiggling the igntion key in the lock cylinder. • **Does the PID indicate the key is in at all times?**	**Yes** GO to AO5 . **No** INSTALL a new igntion lock cylinder. REFER to Section 501-14 . TEST the system for normal operation.
AO5 CHECK THE KEY-IN-IGNITION INPUT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Insert the key into the ignition cylinder. • Disconnect: BCM C2280B . • Measure the voltage between the BCM C2280B-34, circuit CDC30 (BU/GY), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to AO7 . **No** GO to AO6 .
AO6 CHECK THE IGNITION SWITCH	
• Ignition OFF. • Disconnect: Ignition Switch C250 . • Carry out the ignition switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the ignition switch OK?**	**Yes** REPAIR circuit CDC30 (BU/GY) for an open. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ignition switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
AO7 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly

repair4less

• Operate the system and verify the concern is still present. • **Is the concern still present?**	at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AP: The Memory Feedback Warning Chime Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the memory feedback chime request from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). When a successful memory set procedure is carried out, the Driver Seat Module (DSM) sends a chime request over the Medium Speed Controller Area Network (MS-CAN) to the BCM , which gateways the chime request to the IPC to sound the memory feedback chime.

This pinpoint test is intended to diagnose the following:

- DSM
- IPC

PINPOINT TEST AP: THE MEMORY FEEDBACK WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AP1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION	
• Ignition OFF. • Insert the key into the ignition lock cylinder. • Open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to AP2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AP2 CHECK THE MEMORY SET FEATURE	
• Verify the memory set procedure can successfully change the memory preferences. • **Does the memory set procedure successfully change the memory preferences?**	**Yes** GO to AP3 . **No** REFER to Section 501-10 .
AP3 RETRIEVE THE RECORDED DTCs FROM THE DSM SELF-TEST	
• Check for recorded DTCs from the DSM self-test. • **Is DTC U0140:00 recorded?**	**Yes** REFER to Section 501-10 . **No** INSTALL a new DSM . REFER to Section 501-10 . TEST the system for normal operation.

Pinpoint Test AQ: The Parking Brake Warning Chime Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the parking brake warning chime request from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The parking brake warning chime sounds when the ignition switch is on, the parking brake is engaged and the vehicle speed is greater than 5 km/h (3 mph). The parking brake warning chime stops sounding and resets if the parking brake is released, the ignition switch is not on, if the vehicle speed is below 5 km/h (3 mph), or after 90 seconds from the time the chime is activated.

NOTE: Make sure the parking brake warning chime operation is verified with the vehicle moving at least 5 km/h (3 mph) with the parking brake slightly applied (just enough to turn the brake warning indicator on) without damaging the rear brakes.

This pinpoint test is intended to diagnose the following:

- Brake warning indication concern
- BCM
- IPC

PINPOINT TEST AQ: THE PARKING BRAKE WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AQ1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION	
• Ignition OFF. • With the ignition switch in the OFF position and the key in the ignition lock cylinder, open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to AQ2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AQ2 CHECK THE BRAKE WARNING INDICATOR OPERATION	
• Apply the parking brake. • Ignition ON. • Observe the brake warning indicator. • **Does the brake warning indicator illuminate?**	**Yes** GO to AQ3 . **No** GO to Pinpoint Test M .
AQ3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140:00, GO to Pinpoint Test AY . For all other DTCs, REFER to DTC Chart in this section. **No** GO to AQ4 .
AQ4 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test.	**Yes**

repair4less

• **Are any DTCs recorded?**	REFER to Section 419-10 for correct navigation of the DTC. **No** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test AR: The Safety Belt Warning Chime Is Inoperative/The Belt-Minder® Feature Does Not Operate Correctly

Normal Operation

The Instrument Panel Cluster (IPC) receives the safety belt and Belt-Minder® requests from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN). The safety belt warning chime sounds for approximately 6 seconds when the driver safety belt is not fastened and the ignition lock cylinder is turned from the OFF/LOCK or ACC to the ON or START position.

The Belt-Minder® feature supplements the safety belt warning function and is enabled after the safety belt warning is complete. The Belt-Minder® simultaneously sounds the chime and illuminates the safety belt warning lamp in the IPC once the vehicle speed has exceeded 5 km/h (3 mph), and remains active for 5 minutes from the time it is started.

There are 2 Belt-Minder® strategies used and implemented by the IPC as commanded by the RCM . The 2 strategies are designed to provide an increased intensity level of the chime. Belt-Minder® A provides 6 one-second sequences of 0.5 second on/0.5 second off for the first minute of the Belt-Minder® warning. Belt-Minder® B provides 6 one-second sequences of 0.2 second on/0.2 second off then 0.3 second on/0.3 second off for the remainder of the Belt-Minder® warning.

NOTE: Whenever the vehicle is operated using MyKey®, the RCM enables the Belt-Minder®.

If the Belt-Minder® is deactivated using an administrator key and driven using a MyKey® key, the MyKey® system overrides the deactivation of Belt-Minder®. When MyKey® is in use, the driver cannot configure the Belt-Minder® off. Once the Belt-Minder® is activated, the Belt-Minder® continues to chime periodically (does not time out after 5 minutes) and the audio system is muted until the driver safety belt is fastened. Refer to Section 419-01B for more information on the MyKey® feature.

NOTE: Make sure the Belt-Minder® chime operation is verified with the vehicle moving at least 5 km/h (3 mph).

This pinpoint test is intended to diagnose the following:

- Safety belt warning indication concern
- Belt-Minder® deactivated
- Speedometer concern
- RCM
- IPC

PINPOINT TEST AR: THE SAFETY BELT WARNING CHIME IS INOPERATIVE/THE BELT-MINDER® FEATURE DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AR1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION • Ignition OFF. • Open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to AR2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AR2 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH • Ignition ON. • Enter the following diagnostic mode on the scan tool: RCM PIDs. • Monitor the RCM driver safety belt buckle PID (SBELT_D_ST) while buckling and unbuckling the driver safety belt. • **Does the PID display BUCKLED with the safety belt buckled and UNBUCKLED with the safety belt unbuckled?**	**Yes** GO to AR3. **No** REFER to Section 501-20B.
AR3 CHECK THE SAFETY BELT WARNING INDICATOR FOR CORRECT OPERATION • Ignition ON. • Within one minute, buckle then unbuckle the LH front safety belt. • With the engine running, verify the safety belt warning indicator illuminates with the safety belt unbuckled and turns off when buckled. • **Does the safety belt warning indicator operate correctly?**	**Yes** GO to AR4. **No** GO to Pinpoint Test U.
AR4 CHECK THE SPEEDOMETER OPERATION • Verify the speedometer is operating correctly. • **Does the speedometer operate correctly?**	**Yes** GO to AR5. **No** GO to Pinpoint Test F.
AR5 CHECK THE BELT-MINDER® CONFIGURATION **NOTE:** Verify an administrator key is used for this test and **not** a MyKey® programmed key. When a MyKey® programmed key is used, the Belt-Minder® automatically turns on and cannot be disabled (if previously disabled by an administrator, the Belt-Minder® remains disabled when an administrator key is used). • Verify the Belt-Minder® is activated or configured on for the seating position in question. Refer to Belt-Minder® Deactivating/Activating in this section to configure without a scan tool. • **Is the Belt-Minder® activated for the seating position in question?**	**Yes** If the Belt-Minder® is always on above 5 km/h (3 mph) with the safety belt unfastened, the system is operating normally. If the Belt-Minder® is always on with the safety belt fastened or never on with the safety belt unfastened above 5 km/h (3 mph), INSTALL a new RCM. REFER to Section 501-20B. TEST the system for normal operation. **No** ACTIVATE the Belt-Minder® for the

repair4less

	seating position in question. REFER to Belt-Minder® Deactivating/Activating in this section. TEST the system for normal operation.

Pinpoint Test AS: The Turn Signal On Warning Chime Is Inoperative

Normal Operation

The turn signal on warning chime sounds when the vehicle travels more than 3.2 km (2.0 miles) with the turn signal on. The Body Control Module (BCM) communicates the turn signal switch status to the IPC over the High Speed Controller Area Network (HS-CAN). The PCM communicates the odometer count data to the IPC over the HS-CAN.

This pinpoint test is intended to diagnose the following:

- Odometer operation
- Turn signal indication concern
- BCM
- IPC

PINPOINT TEST AS: THE TURN SIGNAL ON WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AS1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION	
• Ignition OFF. • With the ignition switch off and the key in the ignition lock cylinder, open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to AS2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AS2 CHECK THE TURN SIGNAL INDICATORS OPERATION	
• Ignition ON. • Verify the turn signal indicators operation. • **Do the turn signal indicators operate correctly?**	**Yes** GO to AS3. **No** GO to Pinpoint Test R.
AS3 CHECK THE ODOMETER FOR CORRECT OPERATION	
• Drive the vehicle and observe the odometer for correct operation. • **Does the odometer operate correctly?**	**Yes** INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation. **No** GO to Pinpoint Test H.

Pinpoint Test AT: DTC U0100:00

Normal Operation

- DTC U0100:00 (Lost Communication With ECM /PCM "A": No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the PCM over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

NOTE: Once the IPC sets DTC U0100:00, multiple gauges or indicators are likely to be inoperative in the IPC . Other modules that require data from the IPC all set communication DTCs and may also exhibit system function concerns.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST AT: DTC U0100:00

Test Step	Result / Action to Take
AT1 VERIFY THE SCAN TOOL CAN COMMUNICATE WITH THE PCM	
• Connect the scan tool. • Make sure a vehicle session can be established using the scan tool. • **Can a vehicle session be established?**	**Yes** GO to AT2 . **No** REFER to Section 418-00 to diagnose no communication with the PCM.
AT2 CHECK THE IPC CONTINUOUS MEMORY DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0100:00 retrieved again?**	**Yes** GO to AT3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AT3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded DTCs from the PCM Key ON Engine OFF (KOEO) self-test. • **Is DTC P0562 or P0563 recorded?**	**Yes** REFER to Section 303-14 . **No** GO to AT4 .
AT4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test.	**Yes**

repair4less

• **Is DTC U3003:16 or DTC U3003:17 recorded?**	For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to AT5 .
AT5 CHECK FOR DTC U0100:00 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0100:87 set in the Remote Function Actuator (RFA) module (if equipped) or DTC U0100:00 in the Restraints Control Module (RCM)?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AU: DTC U0102:00

Normal Operation

- DTC U0102:00 (Lost Communication With Transfer Case Control Module: No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Transfer Case Control Module (TCCM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- TCCM
- IPC

PINPOINT TEST AU: DTC U0102:00

Test Step	Result / Action to Take
AU1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AU2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AU2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the TCCM pass the network test?**	**Yes** GO to AU3 . **No** REFER to Section 418-00 .

AU3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to AU4 .
AU4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0102:00 still present?**	**Yes** GO to AU5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AU5 CHECK FOR DTC U0102:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0102:00 set in the ABS module?**	**Yes** INSTALL a new TCCM . REFER to Section 308-07A . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AV: DTC U0121:00

Normal Operation

- DTC U0121:00 (Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the ABS module over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- ABS module
- IPC

PINPOINT TEST AV: DTC U0121:00

Test Step	Result / Action to Take
AV1 VERIFY THE CUSTOMER CONCERN	

repair4less

• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AV2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AV2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the ABS module pass the network test?**	**Yes** GO to AV3 . **No** REFER to Section 418-00 .
AV3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS module self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 206-09 . **No** GO to AV4 .
AV4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to AV5 .
AV5 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0121:00 still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0121:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AW: DTC U0131:00

Normal Operation

- DTC U0131:00 (Lost Communication With Power Steering Control Module: No Sub-Type Information) — sets in the Instrument Panel Cluster (IPC) if data messages received from the Power Steering Control Module (PSCM) over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- PSCM
- IPC

PINPOINT TEST AW: DTC U0131:00

Test Step	Result / Action to Take
AW1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AW2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AW2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the PSCM pass the network test?**	**Yes** GO to AW3 . **No** REFER to Section 418-00 .
AW3 RETRIEVE THE RECORDED DTCs FROM THE PSCM MODULE SELF-TEST • Check for recorded DTCs from the PSCM module self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 211-00A or Section 211-00B . **No** GO to AW4 .
AW4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to AW5 .
AW5 RECHECK THE IPC DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0131:00 still present?**	**Yes** GO to AW6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AW6 CHECK FOR DTC U0131:00 SET IN OTHER MODULES • Clear all DTCs.	**Yes**

repair4less

• Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0131:00 set in the ABS module?**	INSTALL a new PSCM (part of the steering gear). REFER to Section 211-02 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AX: DTC U0137:00

Normal Operation

- DTC U0137:00 (Lost Communication With Trailer Brake Control Module: No Sub Type Information) — sets in continuous memory if data messages received from the Trailer Brake Control (TBC) module over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- TBC module
- IPC

PINPOINT TEST AX: DTC U0137:00

Test Step	Result / Action to Take
AX1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AX2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AX2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the TBC module pass the network test?**	**Yes** GO to AX3 . **No** REFER to Section 418-00 .
AX3 RETRIEVE THE RECORDED DTCs FROM THE TBC MODULE SELF-TEST • Check for recorded TBC module DTCs from the self-test. • **Is DTC B1317 or DTC B1318 recorded?**	**Yes** REFER to Section 206-10 . **No** GO to AX4 .

AX4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to AX5 .
AX5 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Are any DTCs present?**	**Yes** For DTC U0137:00, INSTALL a new TBC module. REFER to Section 206-10 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0137:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AY: DTC U0140:00

Normal Operation

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- BCM
- IPC

PINPOINT TEST AY: DTC U0140:00

Test Step	Result / Action to Take
AY1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AY2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AY2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON.	**Yes**

repair4less

• Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the BCM pass the network test?**	GO to AY3 . **No** REFER to Section 418-00 .
AY3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded DTCs from the BCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 419-10 . **No** GO to AY4 .
AY4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to AY5 .
AY5 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0140:00 still present?**	**Yes** GO to AY6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AY6 CHECK FOR DTC U0140 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in the Restraints Control Module (RCM), Driver Seat Module (DSM) or the Driver Door Module (DDM)?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AZ: DTC U0151:00

Normal Operation

- DTC U0151:00 (Lost Communication With Restraints Control Module: No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- RCM
- IPC

PINPOINT TEST AZ: DTC U0151:00

Test Step	Result / Action to Take
AZ1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AZ2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AZ2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the RCM pass the network test?**	**Yes** GO to AZ3 . **No** REFER to Section 418-00 .
AZ3 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST • Check for recorded DTCs from the RCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 501-20B . **No** GO to AZ4 .
AZ4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to AZ5 .
AZ5 RECHECK THE IPC DTCs • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0151:00 still present?**	**Yes** GO to AZ6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AZ6 CHECK FOR DTC U0151:00 SET IN OTHER MODULES • Clear all DTCs. • Ignition OFF. • Ignition ON.	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

repair4less

• Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0151:00 set in the Occupant Classification System Module (OCSM)?**	**No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BA: DTC U0154:00

Normal Operation

- DTC U0154:00 (Lost Communication With Occupant Classification Sensor [OCS]: No Sub-Type Information) — sets in the Instrument Panel Cluster (IPC) if data messages received from the Occupant Classification System Module (OCSM) over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- OCSM
- IPC

PINPOINT TEST BA: DTC U0154:00

Test Step	Result / Action to Take
BA1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BA2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BA2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the OCSM pass the network test?**	**Yes** GO to BA3 . **No** REFER to Section 418-00 .
BA3 RETRIEVE THE RECORDED DTCs FROM THE OCSM SELF-TEST	
• Check for recorded DTCs from the OCSM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 501-20B . **No** GO to BA4 .

BA4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to BA5 .
BA5 RECHECK THE IPC DTCs	
• Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0154:00 still present?**	**Yes** GO to BA6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BA6 CHECK FOR DTC U0154:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0154:00 set in the Restraints Control Module (RCM) module?**	**Yes** INSTALL a new OCSM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BB: DTC U0159:00

Normal Operation

- DTC U0159:00 (Lost Communication With Parking Assist Control Module "A": No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Parking Aid Module (PAM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- PAM
- IPC

PINPOINT TEST BB: DTC U0159:00

Test Step	Result / Action to Take
BB1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON.	**Yes**

repair4less

• Verify there is an observable symptom present. • **Is an observable symptom present?**	GO to BB2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BB2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the PAM pass the network test?**	**Yes** GO to BB3 . **No** REFER to Section 418-00 .
BB3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to BB4 .
BB4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0159:00 still present?**	**Yes** INSTALL a new PAM . REFER to Section 413-13 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0159:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BC: DTC U0212:00

Normal Operation

- DTC U0212:00 (Lost Communication With Steering Column Control Module: No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Steering Column Control Module (SCCM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- SCCM
- IPC

PINPOINT TEST BC: DTC U0212:00

Test Step	Result / Action to Take
BC1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BC2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BC2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the SCCM pass the network test?**	**Yes** GO to BC3 . **No** REFER to Section 418-00 .
BC3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test BD . For DTC U3003:17, GO to Pinpoint Test BE . **No** GO to BC4 .
BC4 RECHECK THE IPC DTCs • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0212:00 still present?**	**Yes** GO to BC5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BC5 CHECK FOR DTC U0212:87 SET IN OTHER MODULES • Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0212:87 set in the Body Control Module (BCM)?**	**Yes** INSTALL a new SCCM . REFER to Section 211-04 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BD: DTC U3003:16

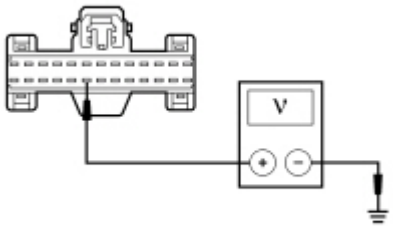
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

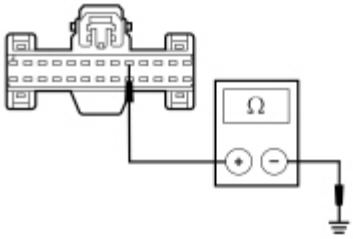
repair4less

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — sets in the Instrument Panel Cluster (IPC) in continuous memory if the IPC detects battery voltage below 9 volts on the voltage supply circuit for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- High circuit resistance
- IPC

PINPOINT TEST BD: DTC U3003:16

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
BD1 RECHECK THE IPC DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to BD2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
BD2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM • Enter the following diagnostic mode on the scan tool: PCM Self-Test . • Carry out the PCM Key ON Engine OFF (KOEO) self-test. • Retrieve the continuous memory DTCs from all modules. • **Are any charging system related DTCs set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to BD3 .
BD3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to BD4 . **No** REFER to Section 414-01 .
BD4 CHECK THE IPC VOLTAGE PID • Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool:	**Yes** GO to BD7 .

IPC DataLogger . • Monitor the IPC voltage PID (MODULE_VOLT). • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**No** GO to BD5 .
BD5 CHECK THE IPC VOLTAGE SUPPLY • Ignition OFF. • Disconnect: IPC C220 . • Ignition ON. • Measure the voltage between the IPC C220-21, circuit SBP11 (BU/RD), harness side and ground.  N0094461 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to BD6 . **No** REPAIR circuit SBP11 (BU/RD) for high resistance. CLEAR the DTC. REPEAT the self-test.
BD6 CHECK THE IPC GROUND CIRCUIT • Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the IPC C220-5, circuit GD133 (BK), harness side and ground.  N0115953 • **Is the resistance less than 5 ohms?**	**Yes** GO to BD7 . **No** REPAIR circuit GD133 (BK) for high resistance. CLEAR the DTCs. REPEAT the self-test.

BD7 CHECK FOR CORRECT IPC OPERATION
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

repair4less

Pinpoint Test BE: DTC U3003:17

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — sets in the Instrument Panel Cluster (IPC) in continuous memory if the IPC detects battery voltage above 16 volts on the voltage supply circuit for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- IPC

PINPOINT TEST BE: DTC U3003:17

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
BE1 CHECK FOR LOW VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is a low voltage DTC set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to BE2 .
BE2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to BE3 .
BE3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test . • Clear the continuous memory DTCs. • Carry out the IPC self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test BF: The Low Fuel Message Center Indicator Is Never/Always On

Normal Operation

The low fuel message center indicator illuminates when the remaining fuel level is 1/16 tank (with an administrator key) or 1/8 tank (with a MyKey® programmed key) or less.

This pinpoint test is intended to diagnose the following:

- Fuel gauge indication concern
- IPC

PINPOINT TEST BF: THE LOW FUEL MESSAGE CENTER INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
BF1 CHECK THE MESSAGE CENTER WARNING INDICATOR FUNCTION • Close all doors, hood and liftgate. • Ignition ON. • **NOTE:** If multiple warnings are present, the message center cycles through each of the warning indicators. Allow the message center to cycle through each display while determining whether the door ajar message center warning indicator is active. • Open the driver door while monitoring the door ajar message center warning indicator. • **Does the driver door ajar message center warning indicator turn off with the driver door closed and illuminate with the driver door open?**	**Yes** GO to BF2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
BF2 CHECK THE FUEL GAUGE OPERATION • Verify the fuel gauge is operating correctly and is not registering empty (E) or full (F) all the time. • **Does the fuel gauge operate correctly?**	**Yes** GO to BF3 **No** GO to Pinpoint Test B .
BF3 CHECK THE DTE REMAINING MILEAGE DISPLAYED • Enter the dealer test mode. Refer to Dealer Test Mode in Inspection and Verification in this section. • **NOTE:** The display below uses xxxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxxx's	**Yes** If the low fuel message center indicator is never on, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. If the low fuel message center warning indicator is always on, the system is operating correctly at this time.

repair4less

or there may be more/less depending on the input value. • Scroll through the displays until FUEL LEVEL% STATUS xxx (base IPC) or FUEL LVL FILT FLPS IN xxxx (optional IPC) is displayed • **Does the fuel level value indicate 41 (with a MyKey®) or 26 (with an administrator programmed key) or less?**	**No** If the low fuel message center warning indicator is always on, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. If the low fuel message center warning indicator is never on, the system is operating correctly at this time. The low fuel message center indicator illuminates when the fuel level is at or below 1/16 tank (with an administrator key) or 1/8 tank (with MyKey® programmed key).

Pinpoint Test BG: The ControlTrac 4WD Gauge Is Inoperative

Normal Operation

The ControlTrac 4WD gauge indicates the level of power applied to each wheel in a continuous display over the vehicle. The Instrument Panel Cluster (IPC) uses multiple inputs to determine the ControlTrac 4WD gauge display. The first is an engine torque message sent to the IPC from the PCM over the High Speed Controller Area Network (HS-CAN). The second is an AWD torque message sent from the Transfer Case Control Module (TCCM) to the IPC over the HS-CAN . The third is wheel speed data sent from the PCM to the IPC over the HS-CAN .

As power is applied to the wheels, the display area around the wheels begin to light up and fill in. The lowest power is displayed closest to the wheel. As the amount of power increases, the display begins to fill rearward and/or forward of the vehicle.

If the engine torque data, wheel speed data or AWD torque message is missing for 5 seconds or less or if the IPC receives invalid engine torque data, wheel speed data or AWD torque for 5 seconds or less, the IPC defaults the display area fill around the wheels off.

If the IPC does not receive the engine torque data or wheel speed data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the display area fill around the wheels off.

If the IPC does not receive the AWD torque message from the TCCM for 5 seconds, the IPC sets DTC U0401:00 in continuous memory and defaults the display area fill around the wheels off.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative tachometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- 4WD concern
- IPC

PINPOINT TEST BG: THE CONTROLTRAC 4WD GAUGE IS INOPERATIVE

Test Step	Result / Action to Take
BG1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from	**Yes**

the self-test. • **Are any DTCs recorded?**	REFER to DTC Charts in this section. **No** GO to BG2 .
BG2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST • Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** For all 4WD related DTCs, REFER to Section 308-07A . For all other DTCs, REFER to Section 303-14 . TEST the system for normal operation. **No** GO to BG3 .
BG3 RETRIEVE THE RECORDED DTCs FROM THE TCCM SELF-TEST • Check for recorded PCM DTCs from the TCCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 308-07A . **No** GO to BG4 .
BG4 CHECK THE DISPLAY MODE MENU SETTING • In the gauge display mode, check the ControlTrac 4WD gauge. • **Does the ControlTrac 4WD gauge display?**	**Yes** The ControlTrac 4WD gauge is operating correctly at this time. The display mode was not set to correct display mode. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

repair4less

Belt-Minder® Deactivating/Activating

Preparation

1. **NOTE:** The driver and the front passenger Belt-Minder® are deactivated/activated independently. When deactivating/activating one seating position, do not buckle the other position as this terminates the process.

   Set the parking brake.

2. Place the transmission in PARK (P).

3. Place the ignition switch in the OFF position.

4. Unbuckle the driver and passenger safety belts.

Deactivating/Activating

NOTE: The Belt-Minder® cannot be deactivated using a MyKey® programmed key. The Belt-Minder® can only be deactivated using an administrator key.

If the Belt-Minder® is already disabled, driving the vehicle with a MyKey® programmed key overrides the deactivation, however, when the vehicle is subsequently operated using an administrator key, the Belt-Minder® once again reverts to the disabled state.

1. Turn the ignition switch to the RUN position. (do not start the engine.)

2. Wait until the safety belt warning indicator turns off (approximately 1 minute).

3. **NOTE:** Steps 3 and 4 must be completed within 30 seconds after the safety belt warning indicator turns off or the procedure must be repeated.

   Buckle then unbuckle the safety belt 3 times, ending with the safety belt unbuckled. The safety belt warning indicator then illuminates for 3 seconds.

4. Within 10 seconds of the safety belt warning indicator illuminating, buckle then unbuckle the safety belt. This enables the Belt-Minder® if disabled, or disables the Belt-Minder® if enabled.

5. The safety belt warning indicator flashing 4 times per second for 3 seconds provides confirmation that the Belt-Minder® is disabled.

6. The following sequence of events confirms the Belt-Minder® is enabled:
   - flashing of the safety belt warning indicator 4 times per second for 3 seconds
   - 3 seconds with the safety belt warning indicator off
   - flashing of the safety belt warning indicator 4 times per second for 3 seconds again

7. After confirmation, the deactivation/activation procedure is complete.

repair4less

Compass Calibration

NOTE: This procedure is only applicable to vehicles without navigation. For vehicles with navigation, there is no compass calibration.

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures such as bridges, steel buildings, etc. Switch off all non-essential electrical accessories (heated rear window, heater fan, A/C, map lamps, and wipers) and make sure all doors are closed.

   Start the vehicle.

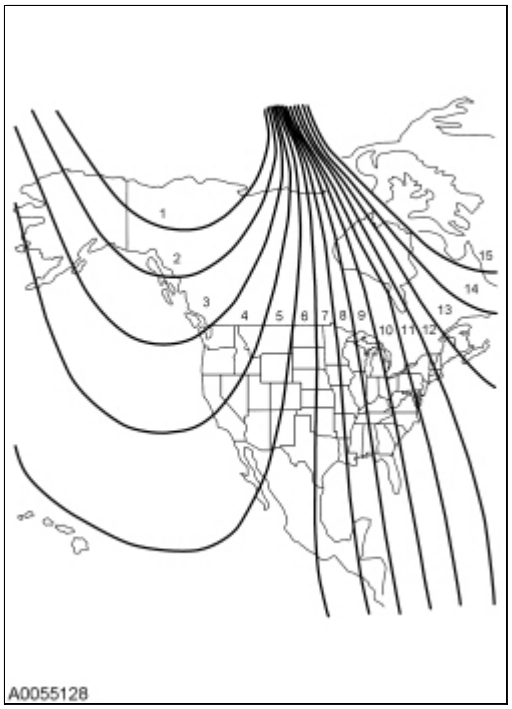
2. **NOTE:** The vehicle remains in the CAL mode until the compass has been successfully calibrated.

   NOTE: While holding the Front Controls Interface Module (FCIM) 7 and 9 buttons down, the compass display first enters the ZONE setting mode (after 5 seconds) and then after another 5 seconds (approximately 10 seconds total), the compass display enters the CAL mode.

   Press and hold (for approximately 10 seconds) the 7 and 9 buttons until the CAL indicator appears in the display, then release the buttons.

3. **NOTE:** If the CAL indicator does not turn off after the vehicle is driven in a circle at least 5 times, repeat the procedure.

   Drive the vehicle slowly at less than 5 km/h (3 mph) in a continuous circle until the CAL indicator disappears from the display and the compass heading is shown.



4. If the CAL indicator does not turn off after driving in a circle at least 5 times (and the procedure has been repeated at least once), install a new compass.
   For vehicles equipped an auto-dimming interior rear view mirror, install a new mirror. Refer to Section 501-09 .
   For vehicles without an auto-dimming interior rear view mirror, install a new compass module. Refer to Refer to the appropriate section in Group 415 for the procedure.

repair4less

Compass Zone Adjustment

Compass Calibration Zone Map

NOTE: This procedure is only applicable to vehicles without navigation. For vehicles with navigation, there is no compass zone adjustment.

1. Refer to the compass calibration zone map to select the correct compass zone setting for the geographic location of the vehicle.

2. With the ignition in the ON position, press and hold the Front Controls Interface Module (FCIM) 7 and 9 buttons (for approximately 5 seconds) until the compass display shows the current zone setting (ZONE XX). Release the 7 and 9 buttons.

3. Before the zone setting mode turns off (within 5 seconds), momentarily press and release the 7 and 9 buttons to increase the zone increment by one. Set the zone display number to match the vehicle geographical location on the compass calibration zone map.

4. Release the 7 and 9 buttons for 5 seconds to exit the zone setting mode.

repair4less

Message Center Configuration

Oil Life Reset — Message Center Instrument Cluster (IC)

1. Press and release the SETUP button until the message center displays OIL LIFE XXX% HOLD RESET = NEW OIL.
2. Press and hold the RESET button for 2 seconds and release when the message center displays OIL LIFE SET TO XXX%.
3. Press and release the SETUP button to exit the procedure.

Oil Life Reset — Base Instrument Cluster (IC)

NOTE: All message center functions are carried out using the single stem SELECT/RESET button in the Instrument Cluster (IC).

1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET FOR SETUP MENU.
2. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE XXX% HOLD RESET = NEW.
3. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE SET TO XXX%.
4. Release the SELECT/RESET button and allow the setup timer to expire to exit the procedure.

Oil Life Start Value — Message Center Instrument Cluster (IC)

1. Press and release the SETUP button until the message center displays OIL LIFE XXX% HOLD RESET = NEW OIL.
2. Press and hold the RESET button for 2 seconds and release when the message center displays OIL LIFE SET TO XXX%.
3. Press and release the RESET button to decrease the oil life start value (from 100% to 10%) for each 10% reduction until the desired oil life start value is displayed.
4. Press and release the SETUP button to exit the procedure.

Oil Life Start Value — Base Instrument Cluster (IC)

NOTE: All message center functions are carried out using the single stem SELECT/RESET button in the IC .

1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET FOR SETUP MENU.

2. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE XXX% HOLD RESET = NEW.

3. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE SET TO XXX%.

4. **NOTE:** The oil life start value reduces by 10% for each second that the SELECT/RESET button is held once the oil life start value begins decreasing.

   Continue to hold the SELECT/RESET button until the oil life begins to decrease in value (from 100% down to 10%), continuing to hold until the desired start value is displayed.

5. Release the SELECT/RESET button and allow the setup timer to expire to exit the procedure.

Instrument Panel Cluster (IPC) Lens

Item	Part Number	Description
1	N805589	Instrument Cluster (IC) screws (2 required)
2	10890	IC lens
3	10849	IC

Removal and Installation

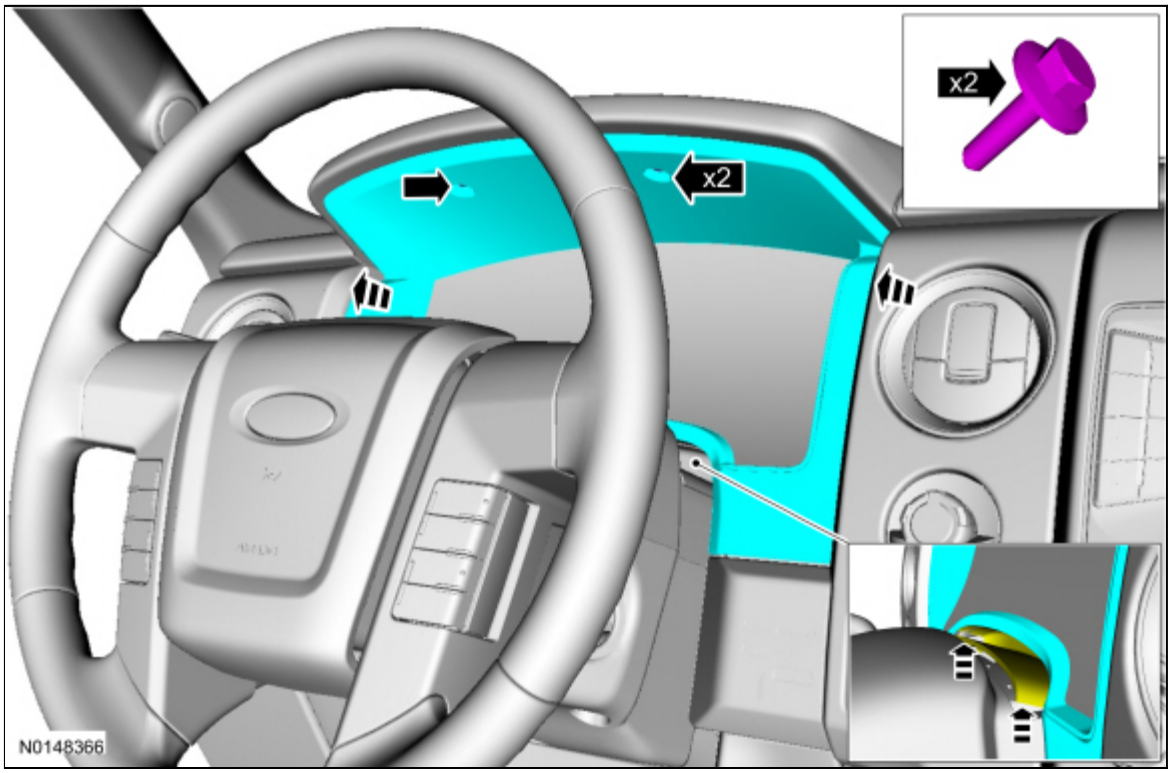
1. Remove the Instrument Cluster (IC). For additional information, refer to Instrument Panel Cluster (IPC) in this section.
2. Remove the 2 screws.
3. Release the 7 tabs and remove the IC lens.

4. To install, reverse the removal procedure.

repair4less

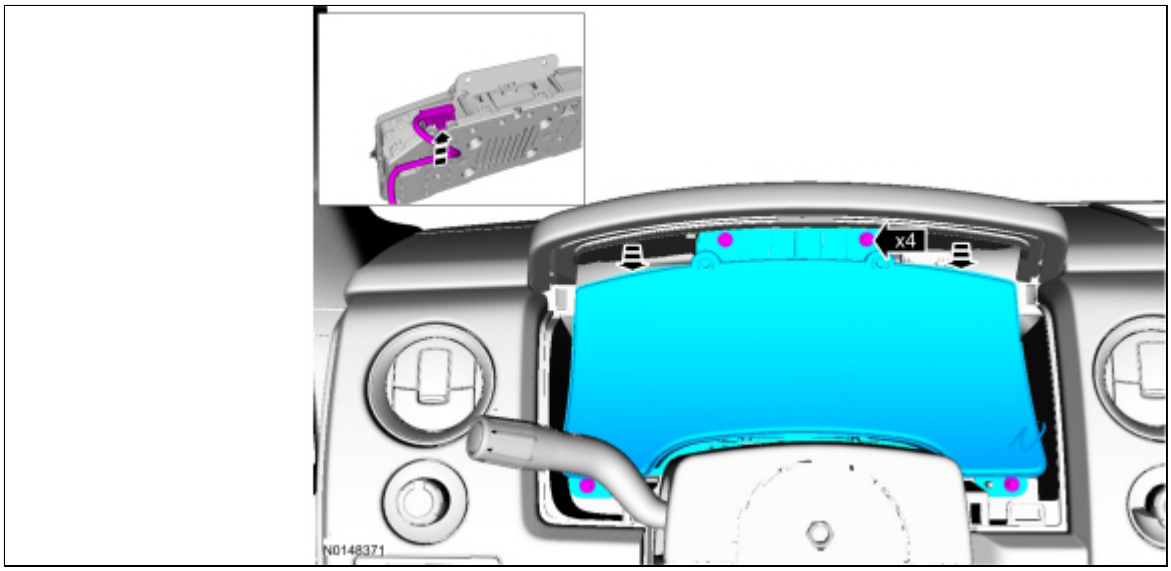
Instrument Panel Cluster (IPC)

Removal



NOTE: If installing a new Instrument Panel Cluster (IPC), all vehicle keys are erased during the parameter reset procedure. Verify at least 2 of the vehicle keys are available prior to carrying out this procedure.

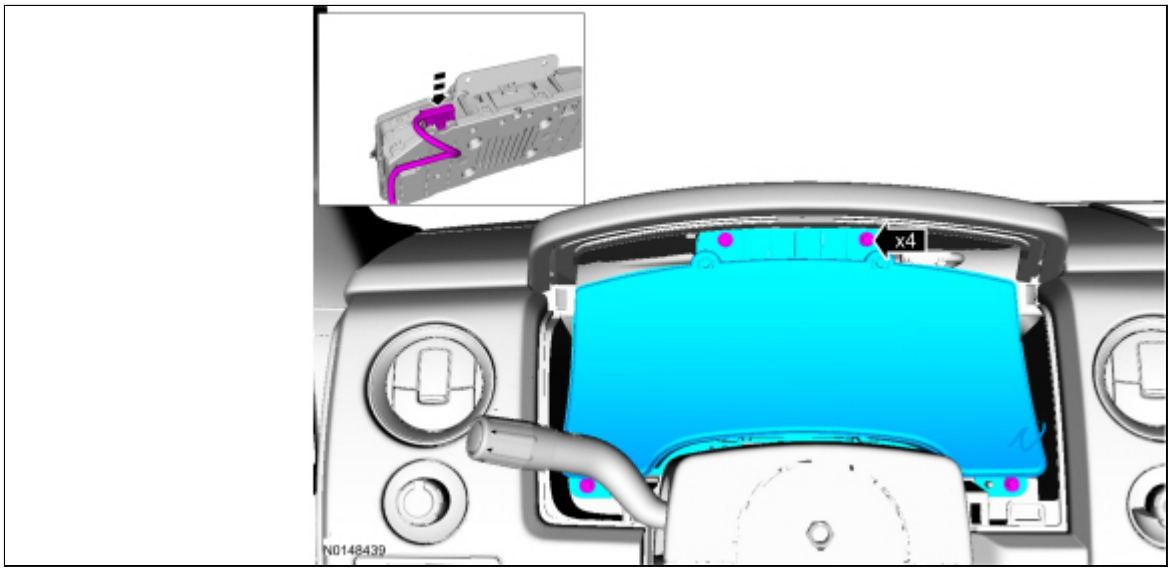
1. If installing a new IPC, upload the IPC configuration information to the scan tool. For additional information, refer to Section 418-01.



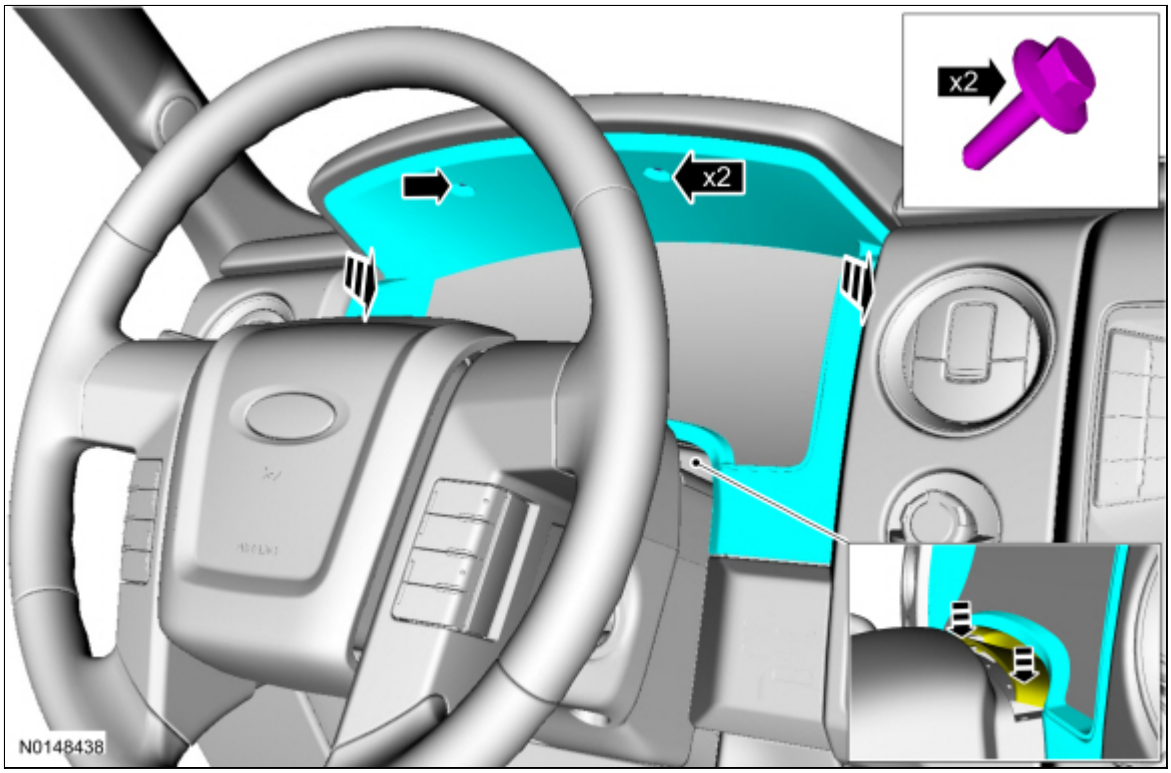
2. Tilt and telescope the steering column to the full downward and rearward position.

3. If equipped with a column shift, apply the parking brake and lower the gear shift to the lowest gear.

4. Remove the 2 screws and the IPC center finish panel.
   - Release the gap hider retainers.



5. Remove the 4 screws and the IPC.
   - Disconnect the electrical connector.



Installation

1. Position the IPC , connect the electrical connector and install the 4 screws.

2. Install the IPC finish panel and the 2 screws.
    - Attach the gap hider retainers.

repair4less

3. If installing a new IPC , download the IPC configuration information from the scan tool into the new IPC . For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .

4. **NOTE:** If a new IPC is installed, the IPC and the PCM require a parameter reset to allow the IPC and the PCM to recognize each other. Failure to carry out the parameter reset to the IC and the PCM may result in a no start condition.

   NOTE: If equipped, the vehicles Passive Anti-Theft System (PATS) keys must be programmed to the new IPC .

   If installing a new IPC , carry out the parameter reset and key programming procedure. For additional information, refer to Section 419-01B .

Torque Specifications

Description	Nm	lb-ft
Horn bolt	35	26

Horn

The horn system consists of the following components:

- Body Control Module (BCM)
- Clockspring
- Horn switch (part of the steering wheel)
- Horn (mounted on the RH side of the upper radiator core support)
- Steering Column Control Module (SCCM)

repair4less

Horn

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Body Control Module (BCM) supplies the switched and control voltage to the horn relay (integrated into the BCM).

The horn switch consists of 2 sets of contacts separated by springs. The lower set is connected to ground and the upper set is connected to the horn signal circuit. When the driver air bag module is pressed, it pushes down on the upper set of contacts, collapsing the springs and allowing the contacts to touch. When the contacts touch, it completes the circuit and provides the ground signal which is routed through the clockspring and Steering Column Control Module (SCCM). The horn relay (integral to the BCM) is energized and the horn sounds.

The BCM provides a momentary ground to the horn relay when the anti-theft system is armed, and an alternating on/off ground when the panic button is pressed on the Remote Keyless Entry (RKE) transmitter.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Horn	• Body Control Module (BCM) fuse 22 (20A) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, verify the symptom. GO to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The horn is inoperative	• Fuse • Wiring, terminals or connectors • Horn • Steering wheel harness • Clockspring • Horn switch (part of the steering wheel) • Body Control Module (BCM) • Steering Column Control Module (SCCM)	• GO to Pinpoint Test A.
• The horn is always on	• Wiring, terminals or connectors • Clockspring • Steering wheel harness	• GO to Pinpoint Test B.

repair4less

	• Horn switch (part of the steering wheel) • BCM • SCCM	

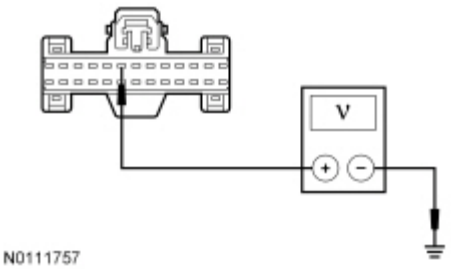
Pinpoint Tests

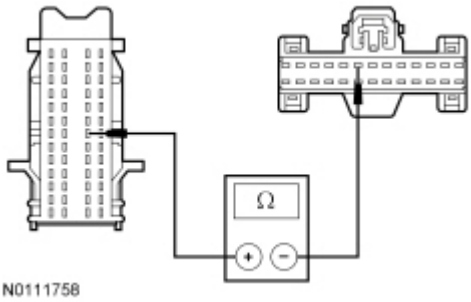
Pinpoint Test A: The Horn Is Inoperative

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

Normal Operation

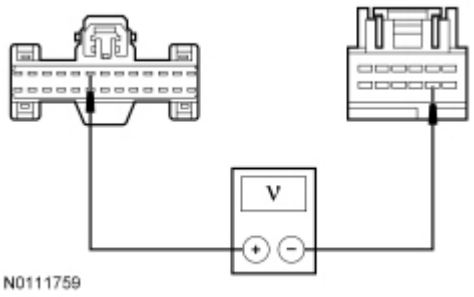
When the driver air bag module is pressed, the normally open horn switch (part of the steering wheel) is closed and a path to ground is routed through the clockspring and the Steering Column Control Module (SCCM), energizing the horn relay. The Body Control Module (BCM) supplies the switched and control voltage to the horn relay, which is integrated into the BCM . The horn relay then provides voltage to the horn, enabling the horn to sound.

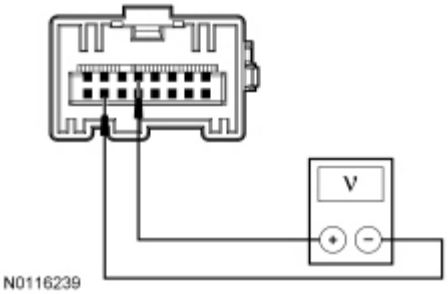


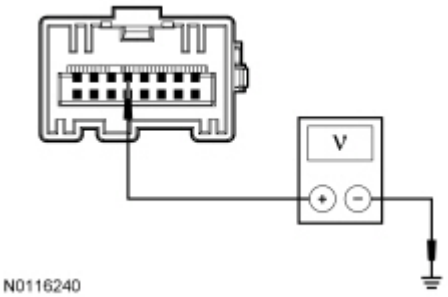


This pinpoint test is intended to diagnose the following:

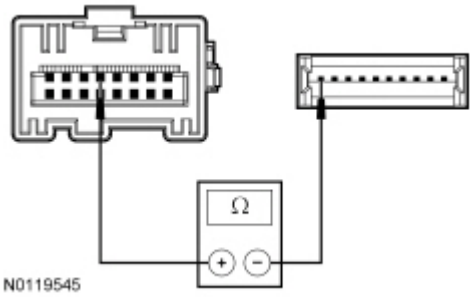
- Fuse
- Wiring, terminals or connectors
- Steering wheel harness
- Horn
- Clockspring
- Horn switch (part of the steering wheel)
- BCM
- SCCM

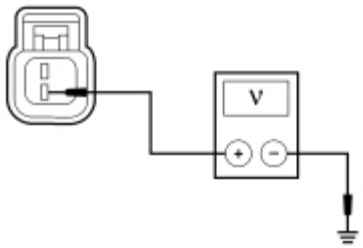


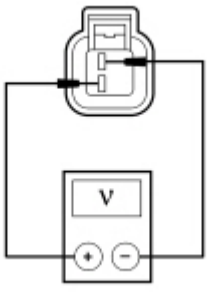




PINPOINT TEST A: THE HORN IS INOPERATIVE

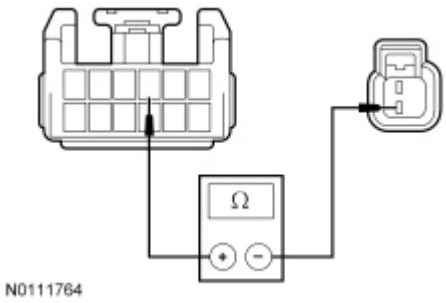






NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE BCM OUTPUT	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Select the active command BCM HORN PID. Command the horn on and then off. • **Does the horn sound when commanded on?**	**Yes** GO to A2 . **No** VERIFY the BCM fuse 22 (20A) is OK. If OK, GO to A8 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
A2 CHECK FOR VOLTAGE TO THE SCCM	



• Ignition OFF. • Disconnect: SCCM C2414A. • Ignition ON. • Measure the voltage between the SCCM C2414A-8, circuit CRH04 (VT), harness side and ground.  N0111757 • **Is the voltage greater than 10 volts?**	**Yes** GO to A4 . **No** GO to A3 .
A3 CHECK THE HORN RELAY COIL GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280B. • Measure the resistance between the BCM C2280B-33, circuit CRH04 (VT), harness side and the SCCM C2414A-8, circuit CRH04 (VT), harness side.  N0111758 • **Is the resistance less than 5 ohms?**	**Yes** GO to A11 . **No** REPAIR circuit CRH04 (VT) for an open. TEST the system for normal operation.
A4 CHECK THE CLOCKSPRING GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Clockspring C218A. • Ignition ON. • Measure the voltage between the SCCM C2414A-8, circuit CRH04 (VT), harness side and the clockspring C218A-8, circuit GD133 (BK), harness side.	**Yes** GO to A5 . **No** REPAIR circuit GD133 (BK) for an open. TEST the system for normal operation.

repair4less

 N0111759 • **Is the voltage greater than 10 volts?**	
A5 CHECK FOR VOLTAGE TO THE CLOCKSPRING	
• Ignition OFF. • Disconnect: Clockspring C218B. • Ignition ON. • Measure the voltage between the clockspring connector C218B pin 4, component side and the clockspring C218B pin 10, component side.  N0116239 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation. **No** GO to A6 .
A6 CHECK THE CLOCKSPRING FOR AN OPEN	
• Measure the voltage between the clockspring connector C218B pin 4, component side and ground.  N0116240 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation. **No** GO to A7 .
A7 CHECK FOR AN OPEN IN THE CLOCKSPRING	
• Remove the clockspring. • Measure the resistance between the clockspring connector C218B pin 4, component side and the clockspring connector C218C pin 1, component side	**Yes** GO to A12 . **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.

 N0119545 • **Is the resistance less than 5 ohms?**	
A8 CHECK FOR VOLTAGE TO THE HORN	
• Ignition OFF. • Disconnect: Horn C131. • While pressing the driver air bag module against the steering wheel, measure the voltage between the horn C131-2, circuit SRH01 (YE/RD), harness side and ground.  N0090544 • **Is the voltage greater than 10 volts?**	**Yes** GO to A9 . **No** GO to A10 .
A9 CHECK THE HORN GROUND CIRCUIT FOR CONTINUITY	
• While pressing the driver air bag module against the steering wheel, measure the voltage between the horn C131-2, circuit SRH01 (YE/RD), harness side, and the horn C131-1, circuit GD123 (BK/GY), harness side.  N0013171 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new horn. REFER to Horn in this section. TEST the system for normal operation. **No** REPAIR circuit GD123 (BK/GY) for an open. TEST the system for normal operation.
A10 CHECK THE BCM HORN OUTPUT CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280E. • Measure the resistance between the BCM C2280E-3, circuit SRH01 (YE/RD), harness side, and the horn C131-	**Yes** GO to A11 .

repair4less

2, circuit SRH01 (YE/RD), harness side.  • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit SRH01 (YE/RD) for an open. TEST the system for normal operation.
A11 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

A12 CHECK FOR CORRECT SCCM OPERATION	

• Disconnect all the SCCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SCCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SCCM. REFER to Section 211-05. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

Pinpoint Test B: The Horn Is Always On

Refer to Wiring Diagrams Cell 44, Horn/Cigar Lighter for schematic and connector information.

Normal Operation

When the driver air bag module is pressed, the normally open horn switch (part of the steering wheel) is closed and ground is routed through the clockspring and the Steering Column Control Module (SCCM) to the horn relay, energizing the horn relay. The Body Control Module (BCM) supplies the switched and control voltage to the horn relay, which is integrated into the BCM. The horn relay then provides voltage to the horn, enabling the horn to sound.

This pinpoint test is intended to diagnose the following:

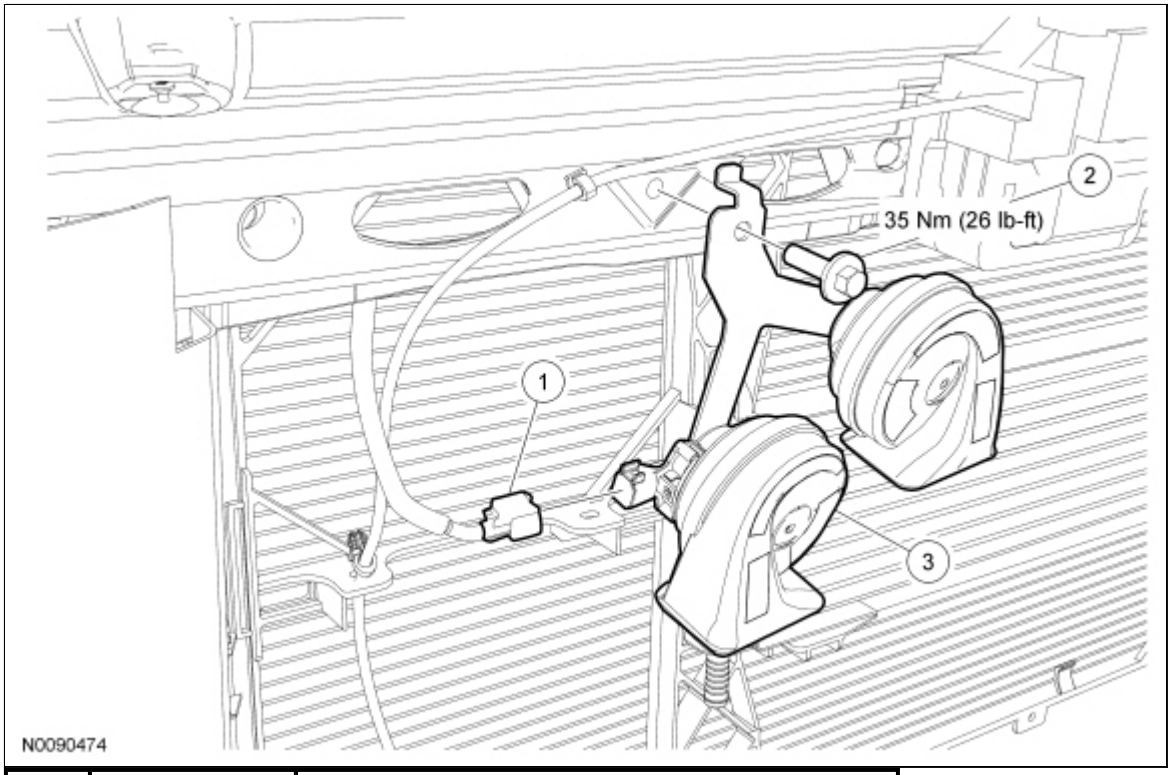
- Wiring, terminals or connectors
- Steering wheel harness
- Clockspring
- Horn switches (part of the steering wheel)
- BCM
- SCCM

PINPOINT TEST B: THE HORN IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE BCM HORN OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280E. • **Does the horn continue to sound?**	**Yes** REPAIR circuit SRH01 (YE/RD) for a short to voltage. TEST the system for normal operation. **No** GO to B2.
B2 CHECK THE HORN SWITCH INPUT TO THE BCM	
• Connect: BCM C2280E. • Disconnect: BCM C2280B. • **Does the horn continue to sound?**	**Yes** GO to B7. **No** GO to B3.
B3 CHECK THE HORN SWITCH INPUT FOR A SHORT TO GROUND	
• Connect: BCM C2280B. • Disconnect: SCCM C2414A. • **Does the horn continue to sound?**	**Yes** REPAIR circuit CRH04 (VT) for a short to ground. TEST the system for normal operation. **No** GO to B4.
B4 CHECK THE HORN SWITCH	
• Connect: SCCM C2414A. • Remove the driver air bag module. Refer to Section 501-20B. • Disconnect: Horn Switch C217A. • **Does the horn continue to sound?**	**Yes** GO to B5. **No** INSTALL a new steering wheel. REFER to Section 211-04. TEST the system for normal operation.
B5 CHECK THE STEERING	

repair4less



WHEEL HARNESS • Disconnect: Clockspring C218B. • **Does the horn continue to sound?**	**Yes** GO to B6. **No** The steering wheel harness has a short circuit. INSTALL a new steering wheel. REFER to Section 211-04. TEST the system for normal operation.
B6 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND • Remove the clockspring. Refer to Section 501-20B. • **Does the horn continue to sound?**	**Yes** GO to B8. **No** INSTALL a new clockspring. REFER to Section 501-20B. TEST the system for normal operation.

B7 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

B8 CHECK FOR CORRECT SCCM OPERATION
• Disconnect all the SCCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SCCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SCCM. REFER to Section 211-05. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

repair4less

Horn

Item	Part Number	Description
1	—	Horn electrical connector (part of 12A581)
2	W709435	Horn bolt
3	13832	Horn

Removal and Installation

1. Remove the bolt and the horn assembly.
    - Disconnect the electrical connector.
    - To install, tighten to 35 Nm (26 lb-ft).

2. To install, reverse the removal procedure.

repair4less

General Specifications

Item	Specification
Azimuth system check object position 1 (P1) and position 5 (P5) distance from sensor	30 cm (12 in)
Azimuth system check object position 2 (P2) and position 4 (P4) distance from sensor	91 cm (36 in)
Azimuth system check object position 3 (P3) distance from sensor	152 cm (60 in)

Parking Aid

The parking aid system consists of the following:

- Parking aid sensors (located in the rear bumper)
- Parking Aid Module (PAM) (located on the cowl above and next to the brake pedal)
- Parking aid speaker (integral to the PAM)
- **NOTE:** Parking aid disable feature is not available when a MyKey® is in use.

  Parking aid disable feature (integral to the Instrument Panel Cluster (IPC) message center)

The parking aid system uses of 4 ultrasonic sensors to calculate the distance to an object around the rear of the vehicle. The parking aid system sounds a warning to alert the driver of stationary objects near the rear bumper when REVERSE (R) is selected.

Rear Video

The rear video camera system consists of the following:

- Rear video camera (located in the blue oval Ford emblem housing in the tailgate)
- Auto-dimming interior mirror (without navigation)
- Front Display Interface Module (FDIM) (with navigation)
- IPC
- Body Control Module (BCM)
- Camera switching module (if equipped with the front video camera)

The rear video camera system visually aids the driver while reversing or reverse parking the vehicle.

For vehicles without navigation, the image from the rear video camera is displayed in the left portion of the auto-dimming interior mirror. For vehicles with navigation, the image from the rear video camera is displayed in the FDIM .

The rear video camera system features are as follows:

- Fixed guidelines — assists the driver with backing into a parking space or aligning the vehicle with an object.
- Visual park aid alert — assists the driver to visually see the object causing the parking aid system to sound.
- Manual zoom — assists the driver with connecting or towing a trailer and allowing the driver to manually zoom closer to an object behind the vehicle.
- Video camera delay — allows the driver to see the image behind the vehicle after the vehicle is shifted out of REVERSE (R). The image is not displayed if the vehicle is shifted into PARK (P).

Rear Video Camera System With Base IPC

For vehicles equipped with a base IPC (2 rows, 14 character display), only fixed guidelines are displayed in the auto-dimming interior mirror and cannot be disabled.

repair4less

Rear Video Camera System With Optional IPC

For vehicles equipped with an optional IPC (4.2 LCD message center) include all the rear video camera system features and the features are enabled and disabled within the message center.

Rear Video Camera System With Navigation

For vehicles equipped with navigation include all the rear video camera system features. These features are enabled and disabled within the FDIM .

Refer to the Owner's Literature for information on rear video camera system operation.

Front Video — F-150 Raptor Only

The front video camera system consists of the following:

- Front video camera (located in the front grille).
- FDIM
- IPC
- BCM
- Camera switching module (under dash left of the steering column)

The front video camera system visually aids the driver during off-road driving at vehicle speeds less than 24 km/h (15 mph).

The image from the front video camera is displayed in the FDIM .

The front video camera system features are as follows:

- Fixed guidelines — assists the driver to align with an object in front of the vehicle.
- Active guidelines — assists the driver with show the path of intended forward motion of the vehicle while in D (Drive).
- Manual zoom — assists drivers as an off road aid. It allows the driver to manually zoom closer to an object in front of the vehicle. The zoomed image keeps the bumper in the image to provide a reference.

Refer to the Owner's Literature for information on the video camera system operation.

repair4less

Parking Aid — Video

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The tailgate must be closed for correct operation of the rear video camera system.

Rear Video Camera

The rear video camera system is active with the ignition in run and the transmission selector in the REVERSE (R). The rear video camera receives commands and sends status to the Body Control Module (BCM) over a dedicated Local Interconnect Network (LIN). For vehicles with a 203.2 mm (8 in) touchscreen, the rear video camera sends a video signal to the APIM on a pair of shielded video circuits. The APIM then displays the rear video camera image on the FDIM . For vehicles without a 203.2 mm (8 in) touchscreen, the signal from the rear video camera is sent to the auto-dimming interior mirror on a pair of shielded video circuits, which displays the video image on the LH side of the auto-dimming interior mirror glass.

If the vehicle is equipped with a front video camera, the rear video camera sends the rear video signal to the camera switching module on a pair of shielded video circuits. The camera switching module determines which video image should be displayed based on vehicle operating conditions, and then sends the front or rear video camera signal to the APIM on a pair of shielded video circuits.

The rear video camera system has 4 video features (only the fixed guidelines are available on vehicles equipped with the base Instrument Panel Cluster (IPC)). The features are:

- Fixed guidelines
- Visual park aid alert

- Manual zoom
- Video camera delay

Vehicles equipped with a base IPC (2 rows, 14 character display), display only fixed guidelines in the auto-dimming interior mirror. The guidelines cannot be disabled.

Vehicles equipped with an optional IPC (4.2 LCD message center) include all the rear video camera system features. The features are enabled and disabled within the message center.

For vehicles with a 203.2 mm (8 in) touchscreen, the rear video camera features are controlled within the FDIM menu screen. When the driver changes any of the rear video camera system features, the APIM sends a message to the BCM via the Medium Speed Controller Area Network (MS-CAN). The BCM sends the message to the rear video camera over the LIN . The LIN is a dedicated single wire communication line that sends and receives network messages from the BCM to the rear video camera.

The messages sent from the BCM to the rear video camera are:

- transmission selector (PRNDL) status
- camera configuration data
- display manual zoom request
- parking aid audible warning status
- parking aid sensor distance to object data

The messages sent from the rear video camera to the BCM are:

- camera status
- display zoom status
- camera part number data
- visual park aid alert status
- fixed guideline status

The rear video system has a delay feature and is available on vehicles with optional Instrument Panel Cluster (IPC) or a 203.2 mm (8 in) touchscreen. For vehicles equipped with a 203.2 mm (8 in) touchscreen, the image is displayed in the FDIM for 5 minutes or until the vehicle reaches 8 km/h (5 mph), when the vehicle is shifted out of REVERSE (R), or if any button on the FDIM is pressed. The image is not displayed if the vehicle is shifted into PARK (P). For vehicles without a 203.2 mm (8 in) touchscreen, the image is displayed in the auto-dimming interior mirror and remains on for a few seconds once the vehicle is shifted out of REVERSE (R).

The fixed guidelines feature displays guidelines on top of the video image to assist the driver with alignment of the vehicle. A dashed line on the displayed image represents the center of the vehicle and 3 color-coded lines (red, yellow, green) identify different zones between the rear of the vehicle and objects.

NOTE: The color-coded lines cannot indicate accurate or consistent distances between objects located behind the vehicle and at the rear of the vehicle. This normal condition is due to variances in vehicle ride height, including, but not limited to, vehicle loading.

The visual park aid alert feature utilizes the 4 parking aid sensor inputs from the Parking Aid Module (PAM) and the rear video camera image. When the transmission selector is in REVERSE (R) and an object is detected in the path of the parking aid sensor, a network message of the distance from the parking aid sensor to the object is sent from the PAM to the BCM over the HS-CAN . The BCM networks the parking aid sensor message to the rear video camera over the LIN . The visual alerts are red, yellow or green and appear as highlights on top of the displayed image to indicate in which zone the object is detected. The highlighted visual alerts are still operational if the parking aid system is disabled within the IPC and the

repair4less

visual alert feature is enabled.

The manual zoom feature is controlled by the rear video camera. The manual zoom feature has 3 zoom levels that are only active when the vehicle is in reverse. If the manual zoom feature is enabled and the vehicle is shifted out of reverse the manual zoom feature is disabled. The manual zoom feature must be re-enabled the next time the vehicle is shifted into reverse. For vehicles with a 203.2 mm (8 in) touchscreen, when the driver inputs to the FDIM request the video image to be zoomed in or out, the APIM sends a zoom request network message to the BCM . For vehicles without a 203.2 mm (8 in) touchscreen, when the message center requests the video image to be zoomed in or out, the IPC sends a zoom request network message to the BCM . The BCM sends the zoom request message to the rear video camera over the LIN . The video image sent by the rear video camera is then digitally zoomed in or out.

Front Video Camera — F-150 Raptor Only

The front video camera system is active with the ignition in run, the transmission selector in the drive position, the vehicle is in off road mode and the Electronic Locking Differential (ELD) or 4L (4X4 LOW) is activated.

The front video camera receives commands and sends status to the Body Control Module (BCM) over a dedicated Local Interconnect Network (LIN). The front video camera sends a video signal to the camera switching module on a pair of shielded video circuits. The camera switching module determines which video image should be displayed based on vehicle operating conditions, and then sends the front or rear video camera signal to the APIM on a pair of shielded video circuits.

To help distinguish the front video display from the rear video display, there is an icon displayed in the upper left corner of the screen for the front camera. It is an image of a camera with the letter "F".

The front video camera system has 3 video features (only the fixed guidelines are available with the base Instrument Panel Cluster (IPC)). The features are:

- Fixed guidelines
- Visual park aid alert
- Manual zoom

The front video camera features are controlled within the FDIM menu screen. For each one of these system features the Audio Front Control Module (ACM) sends a network message requesting the system feature to the BCM via the Medium Speed Controller Area Network (MS-CAN). The BCM sends the message to the front video camera over the LIN . The LIN is a dedicated single wire communication line that sends and receives network messages from the BCM to the front video camera.

The messages sent from the BCM to the front video camera are:

- transmission selector (PRNDL) status
- camera configuration data
- display manual zoom request
- 4L active
- Electronic Locking Differential (ELD) active

The fixed guidelines feature displays guidelines on top of the video image to assist the driver with alignment of the vehicle. A dashed line on the displayed image represents the center of the vehicle and 3 color-coded lines (red, yellow, green) identify different zones between the front of the vehicle and objects.

NOTE: The color-coded lines cannot indicate accurate or consistent distances between objects located in front of the vehicle and at the front of the vehicle. This normal condition is due to variances in vehicle ride height, including, but not limited to, vehicle loading.

The manual zoom feature is controlled by the front video camera. The manual zoom feature has 3 zoom levels that are only active when the vehicle is in a forward gear, and either the 4L or ELD are active. The manual zoom feature must be re-enabled the next time the vehicle is shifted into a forward gear. When the FDIM requests the video image to be zoomed in or out, the ACM sends a zoom request network message to the BCM. The BCM sends the zoom request message to the front video camera over the LIN. The video image is then digitally zoomed in or out.

Camera Switching Module

The rear video camera always sends a video signal to the camera switching module. The front video camera only sends a video signal to the camera switching module when the vehicle is in a forward gear and the vehicle is in 4L or ELD modes. When the camera switching module receives only a rear video signal, the rear video signal is sent to the APIM. When the camera switching module receives both front and rear signals, the front video signal is sent to the APIM. An icon of a camera with the letter "F" is displayed while the front video signal is active.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

   Visual Inspection Chart

Mechanical	Electrical

• Tailgate and rear video camera
• Grille and front video camera
	• Body Control Module (BCM) fuse(s):
	  ▪ 32 (15A) (vehicles without a 203.2 mm (8 in) touchscreen)
	  ▪ 34 (10A)
	• Wiring, terminals and connectors
	• Rear video camera
	• Front video camera
	• Auto-dimming interior mirror (without a 203.2 mm (8 in) touchscreen)
	• Front Display Interface Module (FDIM) (with a 203.2 mm (8 in) touchscreen)
	• Accessory Protocol Interface Module (APIM) (with a 203.2 mm (8 in) touchscreen)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool still does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

repair4less

6. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the RUN position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 , The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM and Audio Front Control Module (ACM) (vehicles with navigation).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

APIM DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
C1001:01	Vision System Camera: General Electrical Failure	For F-150 Raptor equipped with front video camera, GO to Pinpoint Test I . For all other vehicles, GO to Pinpoint Test E .
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Charts in Section 415-00E or Section 415-00F .

Body Control Module (BCM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B115E:01	Camera Module: General Electrical Failure	DTC B115E:01 sets in the BCM when the rear video camera status indicates corrupted data with in the rear video camera. CLEAR the DTCs. REPEAT the self-test. If DTC B115E:01 is retrieved again, INSTALL a new rear video camera. REFER to Video Camera — Rear in this section. TEST the system for normal operation.
B115E:08	Camera Module: Bus	GO to Pinpoint Test E .

	Signal/Message Failure	For F-150 Raptor equipped with front video camera, GO to Pinpoint Test I .
B115E:49	Camera Module: Internal Electronic Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B115E:49 is retrieved again, INSTALL a new rear video camera. REFER to Video Camera — Rear in this section. TEST the system for normal operation.
B115E:55	Camera Module: Not Configured	DTC B115E:55 sets in the BCM when the rear video camera is not configured. The rear video camera needs to be configured through the BCM . CARRY OUT the rear video camera configuration using the scan tool under Body > RVC configuration. TEST the system for normal operation.
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Charts in Section 419-10 .

	guidelines feature is disabled	camera, GO to Pinpoint Test I . • For all other vehicles, GO to Pinpoint Test E .
• Rear video camera delay feature is inoperative	• Rear video camera delay feature is disabled	• ENABLE the rear video camera delay feature within the FDIM (with a 203.2 mm (8 in) touchscreen) or message center (without a 203.2 mm (8 in) touchscreen and optional cluster).
• The rear video display is always on (vehicles without a 203.2 mm (8 in) touchscreen)	• Wiring, terminals or connectors • Auto-dimming interior mirror	• GO to Pinpoint Test G .
• The rear video display is always on (vehicles with a 203.2 mm (8 in) touchscreen)	• Reverse lamp input always on	• For F-150 Raptor equipped with front video camera, GO to Pinpoint Test I . • For all other vehicles, GO to Pinpoint Test E .
• All other image concerns	• Rear video camera • Front video camera	• For F-150 Raptor equipped with front video camera, GO to Pinpoint Test I . • For all other vehicles, GO to Pinpoint Test E .
• Front camera displayed when in reverse	• Rear video camera not configured after replacement (DTC B115E:55 may be present)	• CARRY OUT the rear video camera configuration using the scan tool under Body > RVC Configuration..

Pinpoint Tests

Pinpoint Test E: The Rear Video Does Not Operate Correctly

Normal Operation

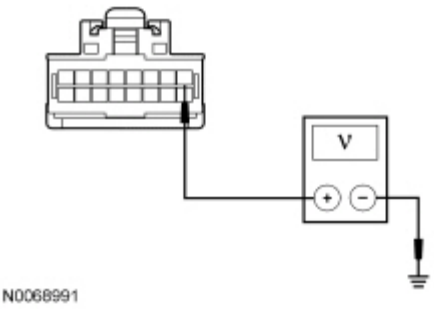
When the ignition switch is in the RUN position, the rear video camera receives voltage. For vehicles without a 203.2 mm (8 in) touchscreen, with the transmission selector in REVERSE (R), a reverse signal message from the Body Control Module (BCM) is sent over a dedicated Local Interconnect Network (LIN) to the auto-dimming interior mirror, enabling the system. For vehicles with a 203.2 mm (8 in) touchscreen, with the transmission selector in REVERSE (R), the BCM sends a reverse signal message to the APIM over the Medium Speed Controller Area Network (MS-CAN), enabling the system. The video signal from the rear video camera displays an image on the left portion of the auto-dimming interior mirror for vehicles without a 203.2 mm (8 in) touchscreen, or displays an image on the Front Display Interface Module (FDIM) for vehicles with a 203.2 mm (8 in) touchscreen.

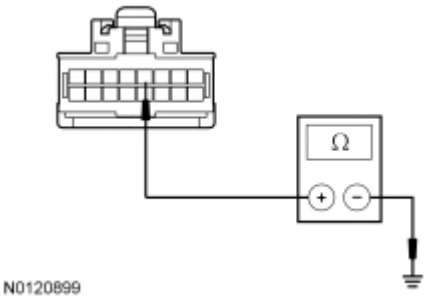
- DTC B115E:08 (Camera Module: Bus Signal/Message Failure) — an on-demand DTC that sets in the BCM when there is a LIN communication fault from the rear video camera.
- DTC C1001:01 (Vision System Camera: General Electrical Failure) — a continuous DTC that sets in the APIM when no video signal is detected from the rear video camera when the vehicle is in reverse (vehicles with a 203.2 mm (8 in) touchscreen only).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Rear video camera
- Camera switching module (with front camera)
- Auto-dimming interior mirror (without a 203.2 mm (8 in) touchscreen)
- Accessory Protocol Interface Module (APIM) (with a 203.2 mm (8 in) touchscreen)
- BCM

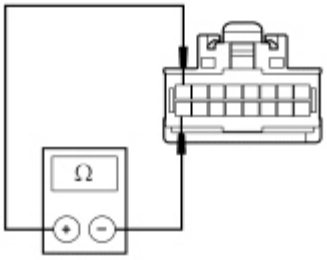
PINPOINT TEST E: THE REAR VIDEO DOES NOT OPERATE CORRECTLY

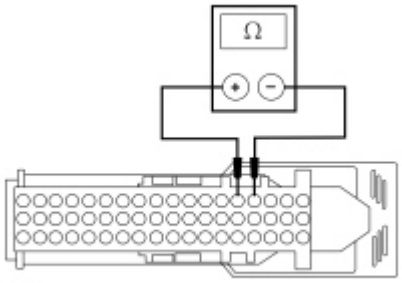


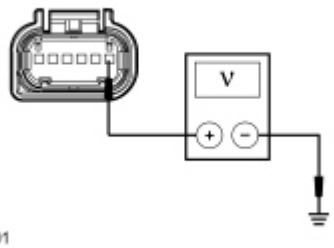


NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

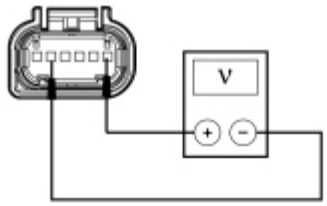
NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

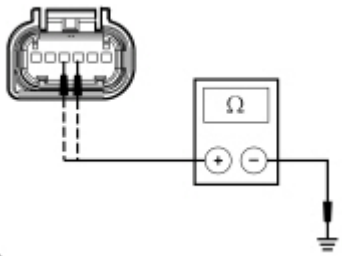


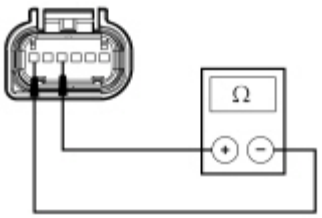




Test Step	Result / Action to Take
E1 CHECK AND CLEAN THE REAR VIDEO CAMERA LENS	
• Clean and make sure the rear video camera lens is clear of any debris. • Test the rear video camera system and verify the rear video camera image. • **Is the rear video camera concern still present?**	**Yes** GO to E2 . **No** The system is operating correctly at this time. The concern was caused by a dirty rear video camera lens.
E2 CHECK THE REVERSING LAMPS OPERATION	
• Ignition OFF. • Apply the parking brake. • Ignition ON. • Select REVERSE.	**Yes** GO to E3 . **No**



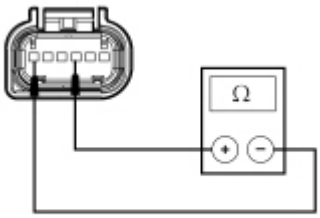




repair4less

• Check the operation of the reversing lamps. • **Do the reversing lamps operate correctly?**	REFER to Section 417-01 .
E3 CHECK THE DTCs FROM THE BCM SELF-TEST • Check the BCM DTCs from the self-test. • **Are any BCM DTCs retrieved?**	**Yes** For BCM DTC B115E:08, GO to E19 . For all other DTCs, REFER to DTC Charts in this section. **No** For an inoperative rear video camera feature concern, GO to E4 . Otherwise, GO to E5 .
E4 VERIFY AND ENABLE THE INOPERATIVE REAR VIDEO CAMERA FEATURE • Verify and enable the inoperative rear video camera feature. Refer to the Owner's Literature. • **Does the rear video camera feature operate correctly?**	**Yes** The rear video camera system is operating correctly at this time. The rear video camera feature concern was caused by the feature being disabled. INSTRUCT the customer on how to enable the rear video camera features, REFER to the Owner's Literature. **No** GO to E5 .
E5 VERIFY VEHICLE EQUIPMENT — 203.2 mm (8 in) TOUCHSCREEN • Check the vehicle for a 203.2 mm (8 in) touchscreen. • **Is the vehicle equipped with a 203.2 mm (8 in) touchscreen?**	**Yes** GO to E10 . **No** GO to E6 .
E6 CHECK THE AUTO-DIMMING INTERIOR MIRROR • Observe the auto-dimming interior mirror. • Select PARK. • Select REVERSE. • **Does the auto-dimming interior mirror momentarily display a blue screen then turn off?**	**Yes** The auto-dimming interior mirror is functional. There is no signal from the rear video camera. GO to E11 . **No** GO to E7 .
E7 CHECK THE COMPASS FOR CORRECT OPERATION • **NOTE:** The auto-dimming interior mirror uses the LIN for compass messaging along with messaging for the rear video camera operation. • Verify the compass operates correctly. • **Does the compass operate correctly?**	**Yes** GO to E8 . **No** REFER to Section 413-01 to diagnose the compass.
E8 CHECK THE AUTO-DIMMING INTERIOR MIRROR	

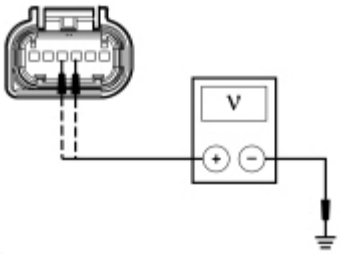
VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror C9039. • Ignition ON. • Measure the voltage between the auto-dimming interior mirror C9039-1, circuit CBP32 (GN/VT), harness side and ground.  N0068991 • **Is the voltage greater than 10 volts?**	**Yes** GO to E9 . **No** VERIFY the BCM fuse 32 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
E9 CHECK THE AUTO-DIMMING INTERIOR MIRROR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the auto-dimming interior mirror C9039-4, circuit GD133 (BK), harness side and ground.  N0120899 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new auto-dimming interior mirror. REFER to Section 501-09 . CONNECT the negative battery cable. TEST the system for normal operation. **No** REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.
E10 CHECK THE FDIM DISPLAY	
• Observe the FDIM while placing the vehicle in reverse. • **While selecting reverse and waiting up to 30 seconds, does the FDIM screen switch to rear video camera mode and display "Please Contact Your Dealership"?**	**Yes** The FDIM display is functional. There is no signal from the rear video camera. GO to E11 . **No** RETRIEVE and FOLLOW audio system DTCs. REFER to Section 415-00E or Section 415-00F .
E11 CHECK THE VIDEO SIGNAL CIRCUITS INTEGRITY	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror (Without Navigation) C9039.	**Yes** GO to E12 .

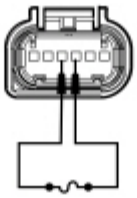


repair4less

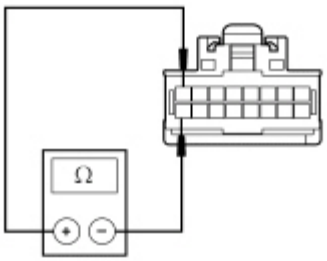
• Disconnect: APIM (With a 203.2 mm (8 in) touchscreen) C2383. • For vehicles without a 203.2 mm (8 in) touchscreen, measure the resistance between the auto-dimming interior mirror C9039-8, circuit VMP19 (WH/GN), harness side and the auto-dimming interior mirror C9039-16, circuit RMP19 (BN/VT), harness side.  N0069002 • For vehicles with a 203.2 mm (8 in) touchscreen, measure the resistance between the APIM C2383-14, circuit VMP19 (WH/GN), harness side and the APIM C2383-15, circuit RMP19 (BN/VT), harness side.  N0149434 • **Is the resistance between 74 and 106 ohms?**	**No** GO to E14 .
E12 CHECK THE REAR VIDEO CAMERA VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: Rear Video Camera C4357. • Ignition ON. • Measure the voltage between the rear video camera C4357-1, circuit CBP34 (VT/BN), harness side and ground.  N0120901 • **Is the voltage greater than 10 volts?**	**Yes** GO to E13 . **No** VERIFY the BCM fuse 34 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
E13 CHECK THE REAR VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF. • Measure the voltage between the rear video camera C4357-1, circuit CBP34 (VT/BN), harness side and the rear video camera C4357-5, circuit GD120 (BK/GN), harness side and ground.  N0120902 • **Is the voltage greater than 10 volts?**	**Yes** GO to E14 . **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
E14 CHECK THE REAR VIDEO CAMERA SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Disconnect: Rear Video Camera C4357. • Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and ground; and between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and ground.  N0121053 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to E15 . **No** REPAIR the circuit in question. TEST the system for normal operation.
E15 CHECK THE REAR VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-6, circuit DMP19 (BK), harness side.  N0120904 • Measure the resistance between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and the rear	**Yes** GO to E16 . **No** REPAIR the circuit in question. TEST the system for normal operation.



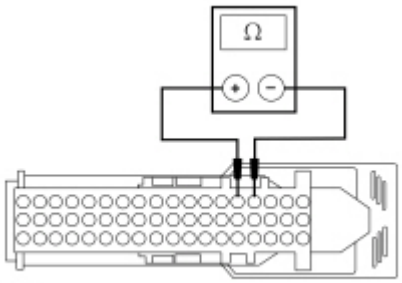


repair4less



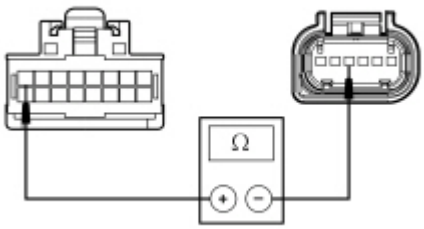
video camera C4357-6, circuit DMP19 (BK), harness side.

N0120905



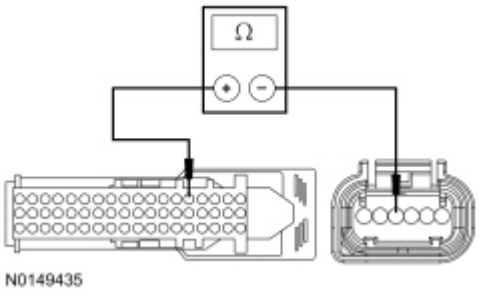
- **Are the resistances greater than 10,000 ohms?**

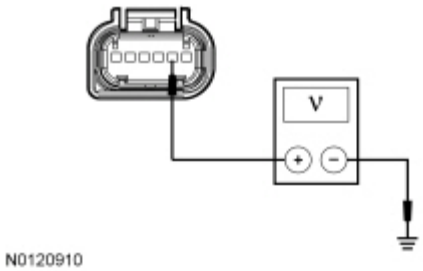
E16 CHECK THE REAR VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and ground; and between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and ground.  N0120909 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to E17 .
E17 CHECK VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Ignition OFF. • Connect a fused jumper wire between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side.  N0120906 • For vehicles without a 203.2 mm (8 in) touchscreen, measure the resistance between the auto-dimming interior mirror C9039-8, circuit VMP19 (WH/GN), harness side and the auto-dimming interior mirror C9039-16, circuit RMP19 (BN/VT), harness side.	**Yes** REMOVE the jumper wire. GO to E19 . **No** REMOVE the jumper wire. GO to E18 .

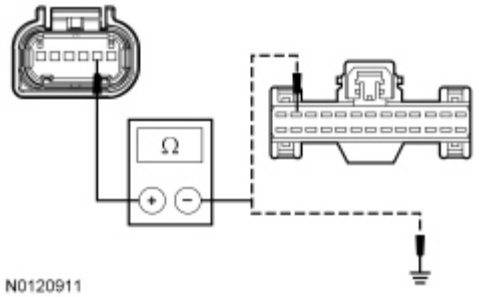


N0069002

- For vehicles with a 203.2 mm (8 in) touchscreen, measure the resistance between the APIM C2383-14, circuit VMP19 (WH/GN), harness side and the APIM C2383-15, circuit RMP19 (BN/VT), harness side.







N0149434

- **Is the resistance less than 5 ohms?**

E18 CHECK VIDEO (+) SIGNAL CIRCUIT FOR AN OPEN	
- For vehicles without a 203.2 mm (8 in) touchscreen, measure the resistance between the auto-dimming interior mirror C9039-8, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side.  N0120907 - For vehicles with a 203.2 mm (8 in) touchscreen, measure the resistance between the APIM C2383-14, circuit VMP19 (WH/GN), harness side and the video camera C4357-4, circuit VMP19 (WH/GN), harness side.	**Yes** REPAIR circuit RMP19 (BN/VT). TEST the system for normal operation. **No** REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation.

repair4less

 N0149435 • **Is the resistance less than 5 ohms?**	
E19 CHECK THE LIN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Rear Video Camera C4357. • Disconnect: BCM C2280C. • Ignition ON. • Measure the voltage between the rear video camera C4357-2, circuit VDN03 (GY/VT), harness side and ground.  N0120910 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E20 .
E20 CHECK THE LIN CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the rear video camera C4357-2, circuit VDN03 (GY/VT), harness side and the BCM C2280C-12, circuit VDN03 (GY/VT), harness side; and between the rear video camera C4357-2, circuit VDN03 (GY/VT), harness side and ground.  N0120911 • **Is resistance less than 5 ohms between the rear video camera and BCM ; and greater than 10,000 ohms between the rear video camera and ground?**	**Yes** GO to E21 . **No** REPAIR the circuit. TEST the system for normal operation.
E21 CHECK FOR CORRECT REAR VIDEO CAMERA	

OPERATION	

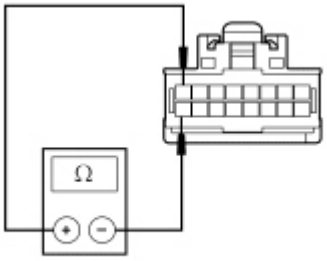
• Connect: All Disconnected Connectors.
• Disconnect the rear video camera connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the rear video camera connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new rear video camera. REFER to Video Camera — Rear in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

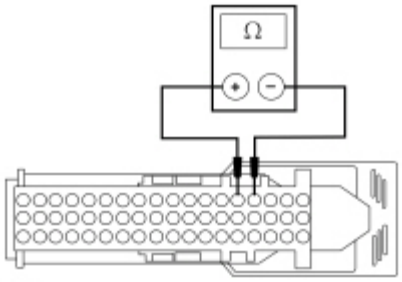
Pinpoint Test F: Poor Image Quality — Rear Video Camera

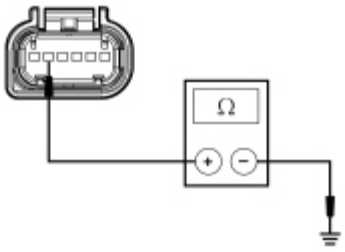
Normal Operation

A pair of shielded wires carries the video signal from the rear video camera to the Front Display Interface Module (FDIM) for vehicles with navigation, and the auto-dimming interior mirror for vehicles without navigation. The rear video system provides a clear image of objects to the rear of the vehicle.

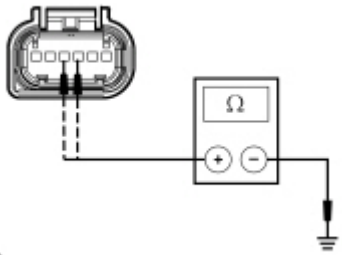
This pinpoint test is intended to diagnose the following:

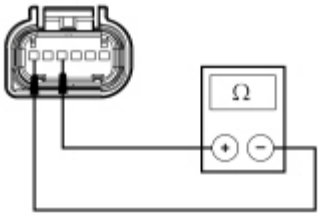


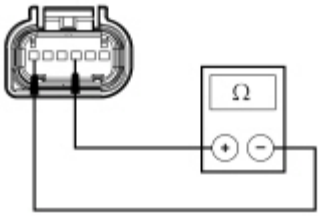




- Wiring, terminals or connectors
- Rear video camera

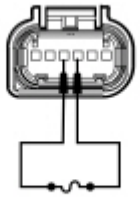






PINPOINT TEST F: POOR IMAGE QUALITY

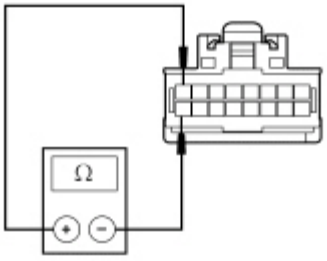
NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .



Test Step	Result / Action to Take
F1 CHECK AND CLEAN THE REAR VIDEO CAMERA LENS	
• Clean and make sure the rear video camera lens is clear of any debris. • Test the rear video camera system and verify the rear video camera image. • **Is the rear video camera concern still present?**	**Yes** GO to F2 . **No** The system is operating correctly at this time. The concern was caused by a dirty rear video camera lens.
F2 CHECK THE REAR VIDEO SIGNAL CIRCUITS INTEGRITY	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror (Without a 203.2 mm (8 in) touchscreen) C9039. • Disconnect: APIM (With a 203.2 mm (8 in) touchscreen) C2123. • For vehicles without a 203.2 mm (8 in) touchscreen, measure the	**Yes** GO to F3 . **No** GO to F4 .

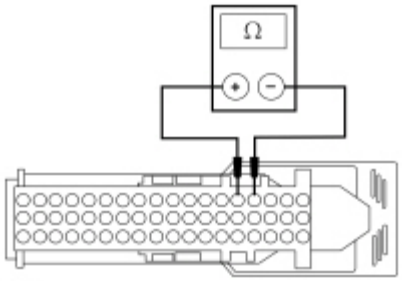
repair4less

resistance between the auto-dimming interior mirror C9039-8, circuit VMP19 (WH/GN), harness side and the auto-dimming interior mirror C9039-16, circuit RMP19 (BN/VT), harness side.  N0069002 • For vehicles with a 203.2 mm (8 in) touchscreen, measure the resistance between the APIM C2383-14, circuit VMP19 (WH/GN), harness side and the APIM C2383-15, circuit RMP19 (BN/VT), harness side.  N0149434 • **Is the resistance between 74 and 106 ohms?**	
F3 CHECK THE REAR VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Disconnect: Rear Video Camera C4357. • Measure the resistance between the rear video camera C4357-5, circuit GD120 (BK/GN), harness side and ground.  N0120912 • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to F4 . **No** REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.
F4 CHECK THE REAR VIDEO CAMERA SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Disconnect: Rear Video Camera C4357. • Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and ground; and between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side	**Yes** GO to F5 . **No**



and ground.  N0121053 • **Are the resistances greater than 10,000 ohms?**	REPAIR the circuit in question. TEST the system for normal operation.
F5 CHECK THE REAR VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-6, circuit DMP19 (BK), harness side.  N0120904 • Measure the resistance between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and the rear video camera C4357-6, circuit DMP19 (BK), harness side.  N0120905 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F6 . **No** REPAIR the circuit in question. TEST the system for normal operation.
F6 CHECK REAR VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Connect a fused jumper wire between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side.	**Yes** REMOVE the jumper wire. GO to F8 . **No** REMOVE the jumper wire. GO to F7 .

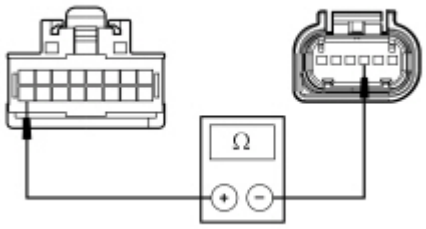
repair4less



N0120906

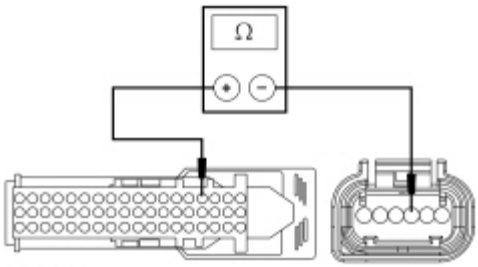
- For vehicles without a 203.2 mm (8 in) touchscreen, measure the resistance between the auto-dimming interior mirror C9039-8, circuit VMP19 (WH/GN), harness side and the auto-dimming interior mirror C9039-16, circuit RMP19 (BN/VT), harness side.

N0069002



- For vehicles with a 203.2 mm (8 in) touchscreen, measure the resistance between the APIM C2383-14, circuit VMP19 (WH/GN), harness side and the APIM C2383-15, circuit RMP19 (BN/VT), harness side.

N0149434



- **Is the resistance less than 5 ohms?**

F7 CHECK REAR VIDEO (-) SIGNAL CIRCUIT FOR AN OPEN	
• For vehicles without a 203.2 mm (8 in) touchscreen, measure the resistance between the auto-dimming interior mirror C9039-16, circuit RMP19 (BN/VT), harness side and the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side.	**Yes** REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation. **No** REPAIR circuit RMP19 (BN/VT). TEST the system for normal operation.

N0120914

- For vehicles with a 203.2 mm (8 in) touchscreen, measure the resistance between the APIM C2383-15, circuit RMP19 (BN/VT), harness side and the video camera C4357-3, circuit RMP19 (BN/VT), harness side.

N0149436

- **Is the resistance less than 5 ohms?**

F8 CHECK FOR CORRECT REAR VIDEO CAMERA OPERATION	

• Connect all disconnected connectors.
• Disconnect the rear video camera connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the rear video camera connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new rear video camera. REFER to Video Camera — Rear in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Rear Video Mirror Display Is Always On

Normal Operation

With the transmission selector in REVERSE (R), a reverse signal message from the Body Control Module (BCM) is sent over a dedicated Local Interconnect Network (LIN) to the auto-dimming interior mirror, enabling the system. The video signal from the rear video camera displays an image on the left portion of the auto-dimming interior mirror display.

This pinpoint test is intended to diagnose the following:

repair4less

- Wiring, terminals or connectors
- Auto-dimming interior mirror

PINPOINT TEST G: THE REAR VIDEO MIRROR DISPLAY IS ALWAYS ON

Test Step	Result / Action to Take
G1 CHECK THE REVERSING LAMPS OPERATION	
• Check the operation of the reversing lamps. • **Do the reversing lamps operate correctly?**	**Yes** DISCONNECT any aftermarket trailer lighting equipment. GO to G2 . **No** REFER to Section 417-01 .
G2 CHECK THE COMPASS FOR CORRECT OPERATION	
• **NOTE:** The auto-dimming interior mirror uses the LIN for compass messaging along with messaging for the rear video camera operation. • Verify the compass operates correctly. • **Does the compass operate correctly?**	**Yes** GO to G3 . **No** REFER to Section 413-01 to diagnose the compass.
G3 CHECK FOR CORRECT AUTO-DIMMING INTERIOR MIRROR DISPLAY OPERATION	

• Disconnect the auto-dimming interior mirror display connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the auto-dimming interior mirror display connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new auto-dimming interior mirror. REFER to Section 501-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: Visual Park Aid Is Inoperative

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

When the transmission selector is in REVERSE (R) and an object is detected in the path of the parking aid sensor, a network message of the distance from the parking aid sensor to the object is sent from the Parking Aid Module (PAM) to the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The BCM networks the parking aid sensor message to the rear video camera over the Local Interconnect Network (LIN). The visual alerts are red, yellow or green and appear as highlights on top of the displayed image to indicate in which zone the object is detected. The visual park aid feature can be enabled and disabled within the Front Display Interface Module (FDIM).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Rear video camera
- PAM
- BCM

PINPOINT TEST H: VISUAL PARK AID IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 VERIFY THE VISUAL PARK AID IS ENABLED	
• For vehicles with a 203.2 mm (8 in) touchscreen, verify that the visual park aid is enabled in the FDIM . • For vehicles without a 203.2 mm (8 in) touchscreen, verify that the visual park aid is enabled in the message display. • **Is the visual park aid enabled in the FDIM or message center display?**	**Yes** GO to H2 . **No** ENABLE the visual park aid. TEST the system for normal operation.
H2 CHECK THE DTCs FROM THE PAM SELF-TEST	
• Check the PAM DTCs from the self-test. • **Are any PAM DTCs recorded?**	**Yes** REPAIR all PAM DTCs first. REFER to Parking Aid in this section. TEST the system for normal operation. **No** GO to H3 .
H3 CHECK THE DTCs FROM THE BCM SELF-TEST	
• Check the BCM DTCs from the self-test. • **Are any BCM DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to H4 .
H4 CHECK FOR CORRECT REAR VIDEO CAMERA OPERATION	

• Connect: All Disconnected Connectors.
• Disconnect the rear video camera connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the rear video camera connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new rear video camera. REFER to Video Camera — Rear in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

repair4less

Pinpoint Test I: The Front or Rear Video Does Not Operate Correctly — Raptor

Normal Operation — Front Video Camera

The front video camera system is active with the ignition on, the transmission selector in the drive position, the vehicle is in off road mode and the Electronic Locking Differential (ELD) or 4L activated. The front video camera receives commands from the Body Control Module (BCM) over a dedicated Local Interconnect Network (LIN). The front video camera sends a video signal to the camera switching module on a pair of shielded video circuits. The Front Display Interface Module (FDIM) receives the signal from the camera switching module, the FDIM displays the video image of the area in front of the vehicle.

Normal Operation — Rear Video Camera

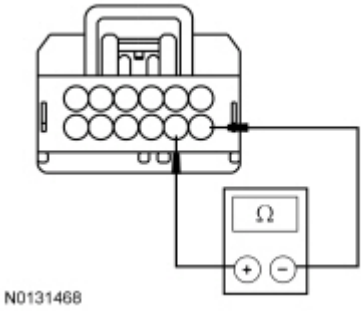
The rear video camera system is active with the ignition on and the transmission selector in the reverse position. The rear video camera receives commands from the BCM over a dedicated LIN . The rear video camera sends a video signal to the camera switching module on a pair of shielded video circuits. The FDIM receives the signal from the camera switching module, the FDIM displays the video image of the area behind the vehicle.

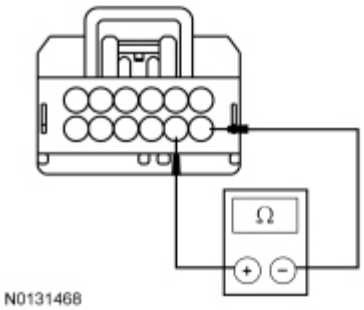
- DTC B115E:08 (Camera Module: Bus Signal/Message Failure) — a continuous and a on-demand DTC that sets in the BCM when there is a LIN communication fault from the rear video camera.
- DTC C1001:01 (Vision System Camera: General Electrical Failure) — a continuous DTC that sets in the ACM when no video signal is detected from the rear video camera when the vehicle is in reverse.

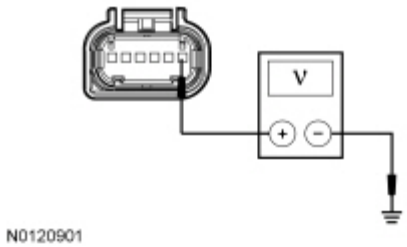
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Front video camera
- Rear video camera
- Camera switching module
- FDIM
- BCM

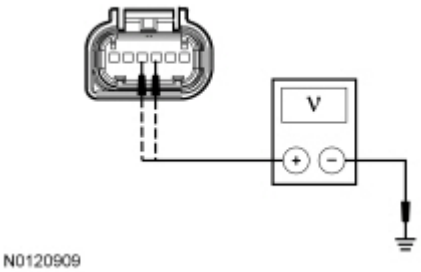
PINPOINT TEST I: THE FRONT OR REAR VIDEO DOES NOT OPERATE CORRECTLY — RAPTOR

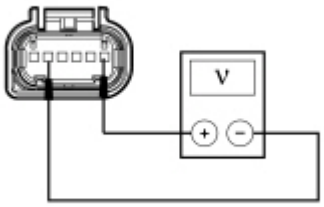






NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**





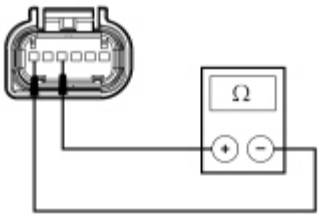
NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

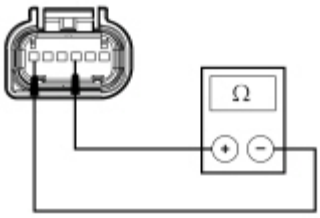
Test Step	Result / Action to Take
I1 CHECK THE OPERATION OF THE FRONT AND REAR VIDEO CAMERAS	
• Check the operation of the front video camera system and verify the front video camera image. • Check the operation of the rear video camera system and verify the rear video camera image. • **Are both cameras inoperative?**	**Yes** GO to I35 . **No** For the front video camera, GO to I19 . For the rear video

	camera, GO to I2.
I2 CHECK AND CLEAN THE REAR VIDEO CAMERA LENS • Clean and make sure the rear video camera lens is clear of any debris. • Test the rear video camera system and verify the rear video camera image. • **Is the rear video camera concern still present?**	**Yes** GO to I3. **No** The system is operating correctly at this time. The concern was caused by a dirty rear video camera lens.
I3 CHECK THE REVERSING LAMPS OPERATION • Apply the parking brake. • Ignition ON. • Select REVERSE. • Check the operation of the reversing lamps. • **Do the reversing lamps operate correctly?**	**Yes** GO to I4. **No** REFER to Section 417-01.
I4 CHECK THE DTCs FROM THE BCM SELF-TEST • Check the BCM DTCs from the self-test. • **Are any BCM DTCs retrieved?**	**Yes** For BCM DTC B115E:08, GO to I16. For all other DTCs, REFER to DTC Charts in this section. **No** For an inoperative rear video camera feature concern, GO to I5. Otherwise, GO to I6.
I5 VERIFY AND ENABLE THE INOPERATIVE REAR VIDEO CAMERA FEATURE • Verify and enable the inoperative rear video camera feature within the FDIM (with a 203.2 mm (8 in) touchscreen) or message center (without a 203.2 mm (8 in) touchscreen). • **Does the rear video camera feature operate correctly?**	**Yes** The rear video camera system is operating correctly at this time. The rear video camera feature concern was caused by the feature being disabled. INSTRUCT the customer on how to enable the rear video camera features. REFER to the Owner's Literature. **No** GO to I6.
I6 CHECK THE FDIM DISPLAY • Observe the FDIM while placing the vehicle in reverse. • **While selecting reverse and waiting up to 30 seconds, does the FDIM screen switch to rear video camera mode and display "Please Contact Your Dealership"?**	**Yes** The FDIM display is functional. There is no signal from the rear video camera. GO to I7. **No** REFER to Section 415-00E or Section 415-00F.
I7 CHECK THE REAR VIDEO SIGNAL CIRCUITS INTEGRITY	

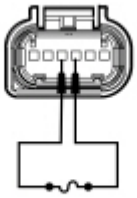
repair4less

• Ignition OFF. • Disconnect: Camera Switching Module C1664. • Measure the resistance between the camera switching module C1664-7, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-8, circuit RMP19 (BN/VT), harness side.  N0131468 • **Is the resistance between 74 and 106 ohms?**	**Yes** GO to I9 . **No** If the resistance is less than 74 ohms, GO to I8 . If the resistance is greater than 106 ohms, GO to I14 .
I8 CHECK THE REAR VIDEO SIGNAL CIRCUITS FOR A SHORT TOGETHER	
• Disconnect: Rear Video Camera C4357. • Measure the resistance between the camera switching module C1664-7, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-8, circuit RMP19 (BN/VT), harness side.  N0131468 • **Is the resistance less than 10,000 ohms?**	**Yes** GO to I18 . **No** REPAIR the circuits.
I9 CHECK THE REAR VIDEO CAMERA VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: Rear Video Camera C4357. • Ignition ON. • Measure the voltage between the rear video camera C4357-1, circuit CBP34 (VT/BN), harness side and ground.  N0120901	**Yes** GO to I10 . **No** REPAIR the circuit.



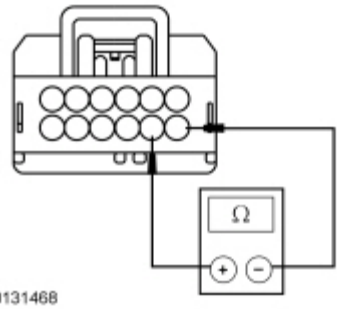


• **Is the voltage greater than 10 volts?**	
I10 CHECK THE REAR VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VOLTAGE • Ignition ON. • Measure the voltage between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and ground; and between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and ground.  N0120909 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to I11 .
I11 CHECK THE REAR VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN • Measure the voltage between the rear video camera C4357-1, circuit CBP34 (VT/BN), harness side and the rear video camera C4357-5, circuit GD120 (BK/GN), harness side and ground.  N0120902 • **Is the voltage greater than 10 volts?**	**Yes** GO to I12 . **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
I12 CHECK THE REAR VIDEO CAMERA SIGNAL CIRCUITS FOR A SHORT TO GROUND • Ignition OFF. • Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and ground; and between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and ground.	**Yes** GO to I13 . **No** REPAIR the circuit in question. TEST the system for normal operation.



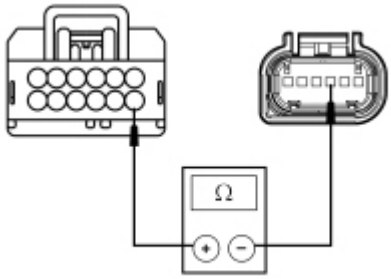
repair4less

N0121053



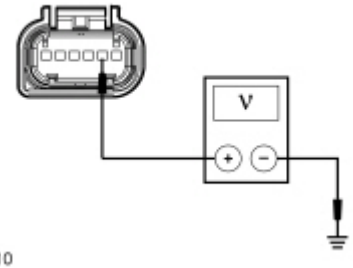
- **Are the resistances greater than 10,000 ohms?**

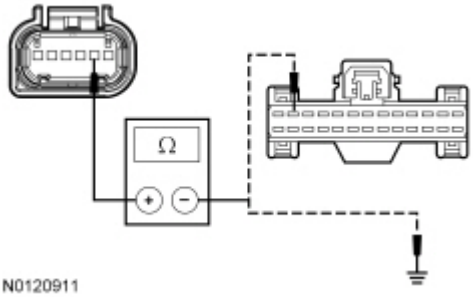
I13 CHECK THE REAR VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-6, circuit DMP19 (BK), harness side.  N0120904 • Measure the resistance between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and the rear video camera C4357-6, circuit DMP19 (BK), harness side.  N0120905 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I14 . **No** REPAIR the circuit in question. TEST the system for normal operation.
I14 CHECK REAR VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Ignition OFF. • Connect a fused jumper wire between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side.	**Yes** REMOVE the jumper wire. GO to I18 . **No** REMOVE the jumper wire. GO to I15 .

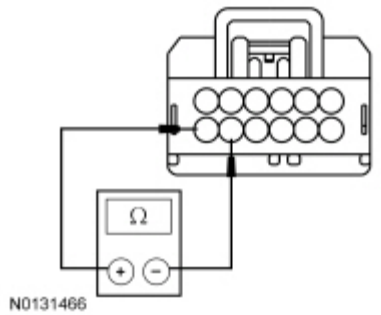


N0120906

- Measure the resistance between the camera switching module C1664-7, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-8, circuit RMP19 (BN/VT), harness side.

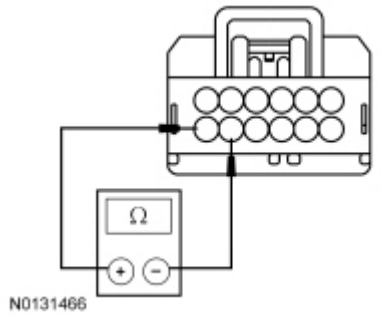


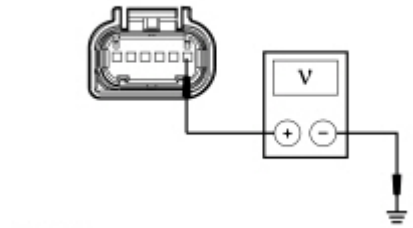




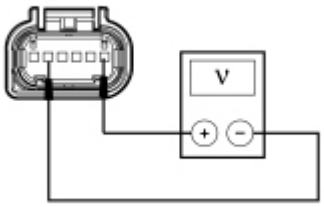
N0131468

- **Is the resistance less than 5 ohms?**





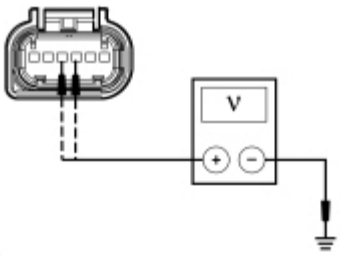
I15 CHECK REAR VIDEO (+) SIGNAL CIRCUIT FOR AN OPEN	
• Measure the resistance between the camera switching module C1664-7, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side.  N0131469 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit RMP19 (BN/VT). TEST the system for normal operation. **No** REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation.
I16 CHECK THE LIN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Front Video Camera C1663. • Disconnect: Rear Video Camera C4357. • Disconnect: BCM C2280C. • Ignition ON. • Measure the voltage between the rear video camera C4357-2, circuit VDN03 (GY/VT), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to I17 .

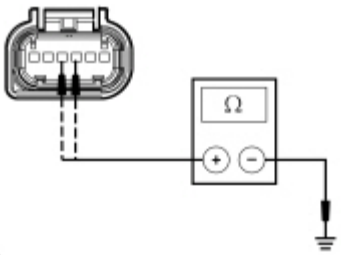


repair4less

 N0120910 • **Is any voltage present?**	
I17 CHECK THE LIN CIRCUIT FOR AN OPEN OR SHORT TO GROUND • Ignition OFF. • Measure the resistance between the rear video camera C4357-2, circuit VDN03 (GY/VT), harness side and the BCM C2280C-12, circuit VDN03 (GY/VT), harness side; and between the rear video camera C4357-2, circuit VDN03 (GY/VT), harness side and ground.  N0120911 • **Is resistance less than 5 ohms between the rear video camera and BCM ; and greater than 10,000 ohms between the rear video camera and ground?**	**Yes** GO to I18 . **No** REPAIR the circuit. TEST the system for normal operation.
I18 CHECK FOR CORRECT REAR VIDEO CAMERA OPERATION • Connect: All Disconnected Connectors. • Disconnect the rear video camera connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the rear video camera connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new rear video camera. REFER to Video Camera — Rear in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
I19 CHECK AND CLEAN THE FRONT VIDEO CAMERA LENS • Clean and make sure the front video camera lens is clear of any debris. • Test the front video camera system and verify the front video camera image. • **Is the front video camera concern still present?**	**Yes** GO to I20 . **No** The system is operating

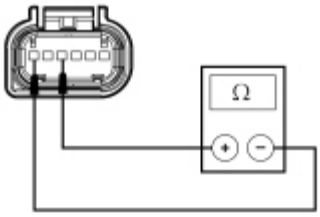
	correctly at this time. The concern was caused by a dirty front video camera lens.
I20 CHECK THE 4X4 LOW OPERATION • Ignition ON. • Shift the transfer case to 4L (4X4 LOW). • Select DRIVE. • **Does the 4L engage correctly?**	**Yes** GO to I21. **No** REFER to Section 308-07A.
I21 VERIFY AND ENABLE THE INOPERATIVE FRONT VIDEO CAMERA FEATURE • Verify and enable the inoperative front video camera feature within the FDIM. • **Does the front video camera feature operate correctly?**	**Yes** The front video camera system is operating correctly at this time. The front video camera feature concern was caused by the feature being disabled. INSTRUCT the customer on how to enable the front video camera features, REFER to the Owner's Literature. **No** GO to I22.
I22 CHECK THE FDIM DISPLAY • Observe the FDIM while placing the vehicle in off road mode. • **While selecting 4L and waiting up to 30 seconds, does the FDIM screen switch to front video camera mode and display "Please Contact Your Dealership"?**	**Yes** The FDIM display is functional. There is no signal from the front video camera. GO to I23. **No** REFER to Section 415-00E or Section 415-00F.
I23 CHECK THE FRONT VIDEO SIGNAL CIRCUITS INTEGRITY • Ignition OFF. • Disconnect: Camera Switching Module C1664. • Measure the resistance between the camera switching module C1664-12, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-11, circuit RMP19 (BN/VT), harness side.  • **Is the resistance between 74 and 106 ohms?**	**Yes** GO to I25. **No** If less than 74 ohms, GO to I24. If greater than 106 ohms, GO to I28.
I24 CHECK THE FRONT VIDEO SIGNAL CIRCUITS FOR A	





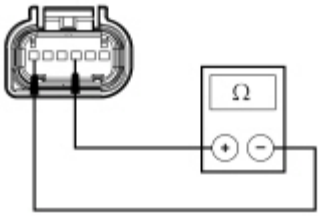
repair4less

SHORT TOGETHER	
• Disconnect: Front Video Camera C1663. • Measure the resistance between the camera switching module C1664-12, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-11, circuit RMP19 (BN/VT), harness side.  N0131466 • **Is the resistance the greater than 10,000 ohms?**	**Yes** GO to I34 . **No** REPAIR the circuits.
I25 CHECK THE FRONT VIDEO CAMERA VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: Front Video Camera C1663. • Ignition ON. • Measure the voltage between the front video camera C1663-1, circuit CBP34 (VT/BN), harness side and ground.  N0120901 • **Is the voltage greater than 10 volts?**	**Yes** GO to I26 . **No** REPAIR the circuit.
I26 CHECK THE FRONT VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the voltage between the front video camera C1663-1, circuit CBP34 (VT/BN), harness side and the front video camera C1663-5, circuit GD120 (BK/GN), harness side and ground.	**Yes** GO to I27 . **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.



N0120902

- **Is the voltage greater than 10 volts?**



I27 CHECK THE FRONT VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between the front video camera C1663-4, circuit VMP19 (WH/GN), harness side and ground; and between the front video camera C1663-3, circuit RMP19 (BN/VT), harness side and ground.  N0120909 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to I28 .
I28 CHECK THE FRONT VIDEO CAMERA SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the front video camera C1663-4, circuit VMP19 (WH/GN), harness side and ground; and between the front video camera C1663-3, circuit RMP19 (BN/VT), harness side and ground.  N0121053 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I29 . **No** REPAIR the circuit in question. TEST the system for normal operation.
I29 CHECK THE FRONT VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the front video camera C1663-4, circuit VMP19 (WH/GN), harness side and the front video camera C1663-6, circuit DMP19 (BK), harness side.	**Yes** GO to I30 .

repair4less

N0120904

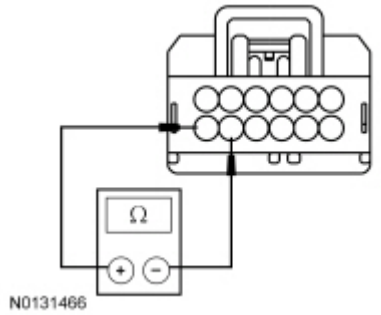
N0120905

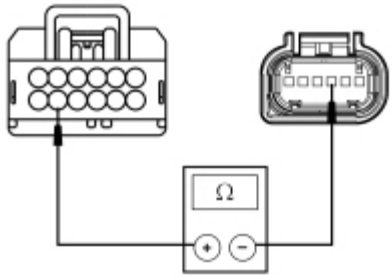
- **Are the resistances greater than 10,000 ohms?**

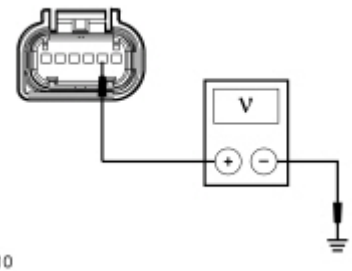
No
REPAIR the circuit in question. TEST the system for normal operation.

I30 CHECK FRONT VIDEO SIGNAL CIRCUITS FOR AN OPEN

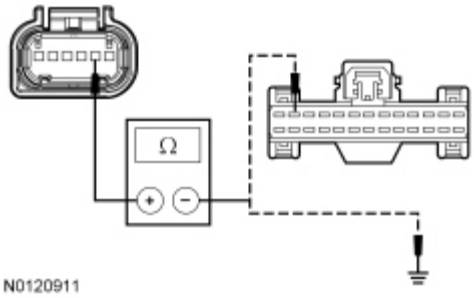
- Ignition OFF.
- Connect a fused jumper wire between the front video camera C1663-4, circuit VMP19 (WH/GN), harness side and the front video camera C1663-3, circuit RMP19 (BN/VT), harness side.





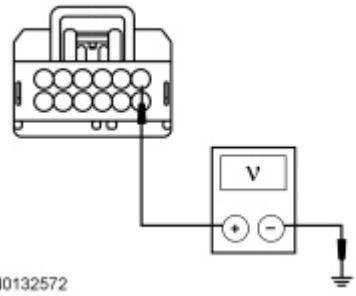


N0120906



- Measure the resistance between the camera switching module C1664-12, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-11, circuit RMP19 (BN/VT), harness side.

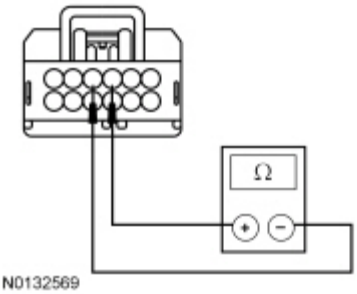
Yes
REMOVE the jumper wire. GO to I32 .



No
REMOVE the jumper wire. GO to I31 .

 N0131466 • **Is the resistance less than 5 ohms?**	
I31 CHECK FRONT VIDEO (+) SIGNAL CIRCUIT FOR AN OPEN	
• Measure the resistance between the camera switching module C1664-11, circuit RMP19 (BN/VT), harness side and the front video camera C1663-3, circuit RMP19 (BN/VT), harness side.  N0131467 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation. **No** REPAIR circuit RMP19 (BN/VT). TEST the system for normal operation.
I32 CHECK THE LIN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Front Video Camera C1663. • Disconnect: BCM C2280C. • Ignition ON. • Measure the voltage between the front video camera C1663-2, circuit VDN03 (GY/VT), harness side and ground.  N0120910 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to I33 .
I33 CHECK THE LIN CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the front video camera C1663-2, circuit VDN03 (GY/VT), harness side and the BCM C2280C-12, circuit VDN03 (GY/VT), harness side; and	**Yes** GO to I34 . **No**

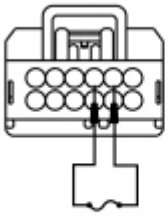
repair4less

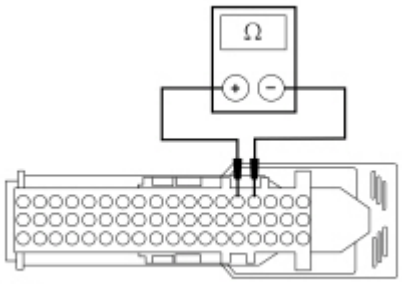


between the front video camera C1663-2, circuit VDN03 (GY/VT), harness side and ground.  N0120911 • **Is resistance less than 5 ohms between the front video camera and BCM ; and greater than 10,000 ohms between the front video camera and ground?**	REPAIR the circuit. TEST the system for normal operation.

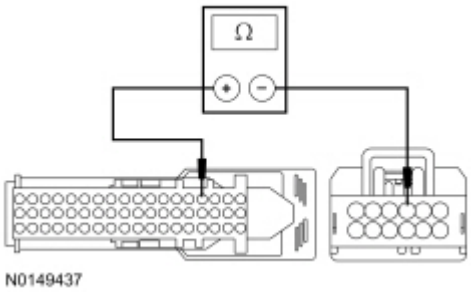
I34 CHECK FOR CORRECT FRONT VIDEO CAMERA OPERATION
• Connect: All Disconnected Connectors.
• Disconnect the front video camera connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the front video camera connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new front video camera. REFER to Video Camera — Front in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

I35 CHECK THE CAMERA SWITCHING MODULE POWER CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: Camera Switching Module C1664. • Ignition ON. • Measure the voltage between the camera switching module C1664-1, circuit CBP34 (VT/BN), harness side and ground.  N0132572 • **Is the voltage greater than 10 volts?**	**Yes** GO to I36 . **No** REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.
I36 CHECK THE CAMERA SWITCHING MODULE GROUND CIRCUIT FOR AN OPEN • Disconnect: Negative Battery Cable. • Measure the resistance between the camera switching	**Yes** CONNECT the negative battery





module C1664-6, circuit GD120 (BK/GN), harness side and ground.  • **Is the resistance less than 5 ohms?**	cable. GO to I37 . **No** REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.
I37 CHECK THE VIDEO SIGNAL CIRCUITS FOR A SHORT TO GROUND • Disconnect: APIM C2383. • Measure the resistance between the camera switching module C1664-2, circuit VMP19 (WH/GN), harness side and ground; and between the camera switching module C1664-3, circuit RMP19 (BN/VT), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I38 . **No** REPAIR the circuit in question. TEST the system for normal operation.
I38 CHECK THE VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD • Measure the resistance between the camera switching module C1664-2, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-4, circuit DMP19 (BK), harness side.  • Measure the resistance between the camera switching module C1664-3, circuit RMP19 (BN/VT), harness side and the camera switching module C1664-4, circuit DMP19 (BK), harness side.	**Yes** GO to I39 . **No** REPAIR the circuit in question. TEST the system for normal operation.



repair4less

N0132569

- **Are the resistances greater than 10,000 ohms?**

I39 CHECK VIDEO SIGNAL CIRCUITS FOR AN OPEN • Connect a fused jumper wire between the camera switching module C1664-2, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-3, circuit RMP19 (BN/VT), harness side.  N0132571 • Measure the resistance between the APIM C2383-14, circuit VMP19 (WH/GN), harness side and the APIM C2383-15, circuit RMP19 (BN/VT), harness side.  N0149434 • **Is the resistance less than 5 ohms?**	**Yes** REMOVE the jumper wire. GO to I41 . **No** REMOVE the jumper wire. GO to I40 .
I40 CHECK VIDEO (-) SIGNAL CIRCUIT FOR AN OPEN • Measure the resistance between the camera switching module C1664-3, circuit RMP19 (BN/VT), harness side and the APIM C2383-15, circuit RMP19 (BN/VT), harness side.	**Yes** REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation. **No** REPAIR circuit RMP19 (BN/VT). TEST the system for normal operation.

 N0149437 • **Is the resistance less than 5 ohms?**	
I41 CHECK FOR CORRECT CAMERA SWITCHING MODULE OPERATION	

• Connect all disconnected connectors.
• Disconnect the camera switching module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the camera switching module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new camera switching module. REFER to Camera Switching Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

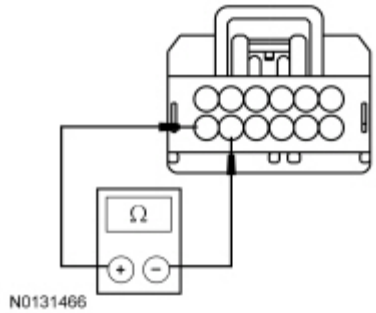
Pinpoint Test J: Poor Image Quality — Raptor

Normal Operation — Front Video Camera

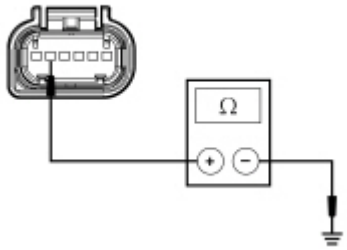
The front video camera system is active with the ignition on, the transmission selector in the drive position, the vehicle is in off road mode and the Electronic Locking Differential (ELD) or 4L activated. The front video camera receives commands from the Body Control Module (BCM) over a dedicated Local Interconnect Network (LIN). The front video camera sends a video signal to the camera switching module on a pair of shielded video circuits. The Front Display Interface Module (FDIM) receives the signal from the camera switching module and displays the video image of the area in front of the vehicle.

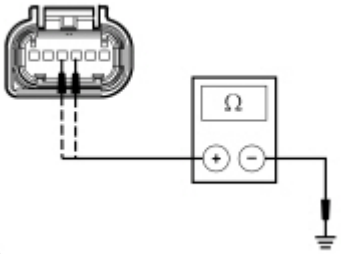
Normal Operation — Rear Video Camera

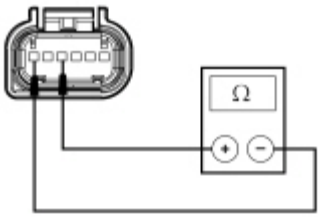
The rear video camera system is active with the ignition on and the transmission selector in the reverse position. The rear video camera receives commands from the BCM over a dedicated LIN . The rear video camera sends a video signal to the camera switching module on a pair of shielded video circuits. The FDIM receives the signal from the camera switching module and displays the video image of the area behind the vehicle.



This pinpoint test is intended to diagnose the following:

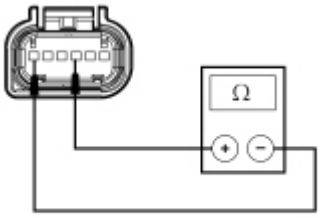


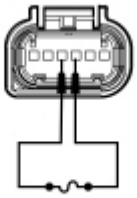


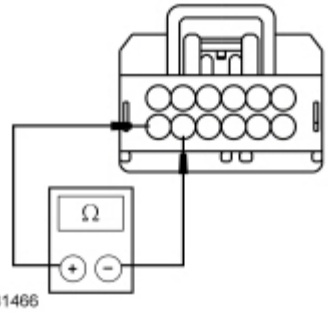


- Wiring, terminals or connectors
- Front video camera
- Rear video camera
- Camera switching module

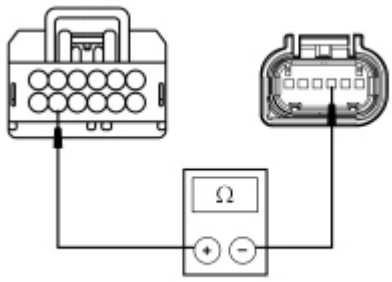
repair4less







PINPOINT TEST J: POOR IMAGE QUALITY — RAPTOR



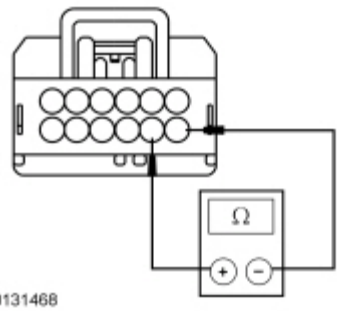
NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
J1 CHECK THE OPERATION OF THE FRONT AND REAR VIDEO CAMERAS	
• Check the operation of the front video camera system and verify the front video camera image. • Check the operation of the rear video camera system and verify the rear video camera image. • **Do both cameras have poor image quality?**	**Yes** GO to J18 . **No** For the front video camera, GO to J2 . For the rear video camera, GO to J10 .
J2 CHECK AND CLEAN THE FRONT VIDEO CAMERA LENS	
• Clean and make sure the front video camera lens is clear of any debris. • Test the front video camera system and verify the front video camera image. • **Is the front video camera concern still present?**	**Yes** GO to J3 . **No** The system is operating correctly at this time. The concern was caused by a dirty front video camera lens.
J3 CHECK THE FRONT VIDEO SIGNAL CIRCUITS INTEGRITY	
• Ignition OFF. • Disconnect: Camera Switching Module C1664. • Measure the resistance between the camera switching module C1664-12, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-11, circuit RMP19 (BN/VT), harness side.  • **Is the resistance between 74 and 106 ohms?**	**Yes** GO to J4 . **No** GO to J5 .
J4 CHECK THE FRONT VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Disconnect: Front Video Camera C1663. • Measure the resistance between the front video camera C1663-5, circuit GD120 (BK/GN), harness side and ground.	**Yes** CONNECT the negative battery cable. GO to J5 . **No**

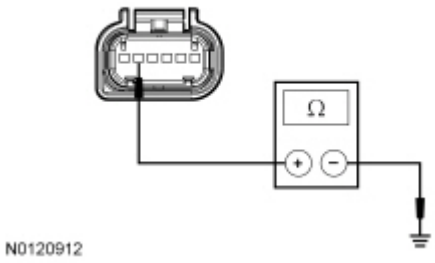
 N0120912 • **Is the resistance less than 5 ohms?**	REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.
J5 CHECK THE FRONT VIDEO CAMERA SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the front video camera C1663-4, circuit VMP19 (WH/GN), harness side and ground; and between the front video camera C1663-3, circuit RMP19 (BN/VT), harness side and ground.  N0121053 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J6 . **No** REPAIR the circuit in question. TEST the system for normal operation.
J6 CHECK THE FRONT VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the front video camera C1663-4, circuit VMP19 (WH/GN), harness side and the front video camera C1663-6, circuit DMP19 (BK), harness side.  N0120904 • Measure the resistance between the front video camera C1663-3, circuit RMP19 (BN/VT), harness side and the front video camera C1663-6, circuit DMP19 (BK), harness side.	**Yes** GO to J7 . **No** REPAIR the circuit in question. TEST the system for normal operation.

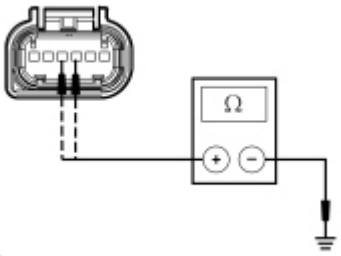
repair4less

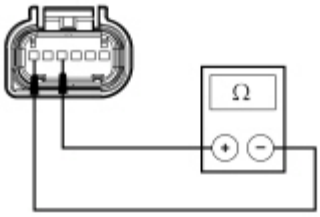
 N0120905 • **Are the resistances greater than 10,000 ohms?**	
J7 CHECK FRONT VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Connect a fused jumper wire between the front video camera C1663-4, circuit VMP19 (WH/GN), harness side and the front video camera C1663-3, circuit RMP19 (BN/VT), harness side.  N0120906 • Measure the resistance between the camera switching module C1664-12, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-11, circuit RMP19 (BN/VT), harness side.  N0131466 • **Is the resistance less than 5 ohms?**	**Yes** REMOVE the jumper wire. GO to J9 . **No** REMOVE the jumper wire. GO to J8 .
J8 CHECK FRONT VIDEO (-) SIGNAL CIRCUIT FOR AN OPEN	
• Measure the resistance between the camera switching module C1664-11, circuit RMP19 (BN/VT), harness side and the front video camera C1663-3, circuit RMP19 (BN/VT), harness side.	**Yes** REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation. **No** REPAIR circuit RMP19 (BN/VT). TEST the system for normal operation.



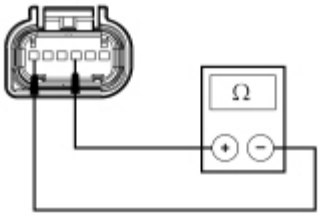
N0131467

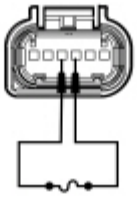


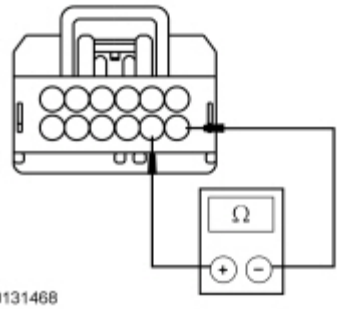




- **Is the resistance less than 5 ohms?**

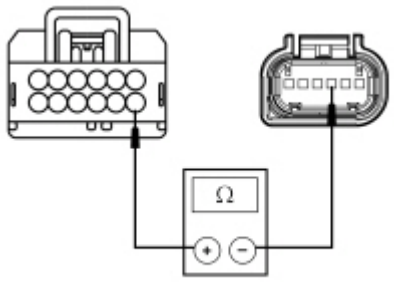






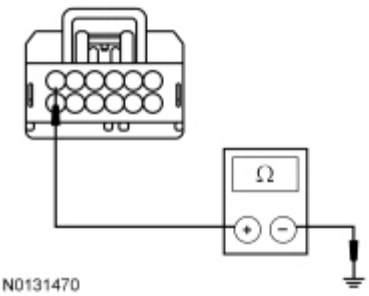
J9 CHECK FOR CORRECT FRONT VIDEO CAMERA OPERATION	

• Connect all disconnected connectors.
• Disconnect the front video camera connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the front video camera connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new front video camera. REFER to Video Camera — Front in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

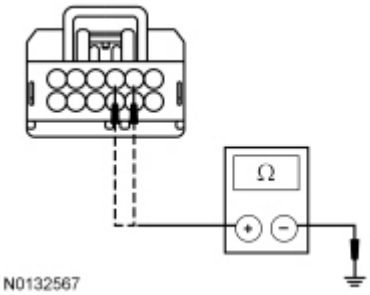


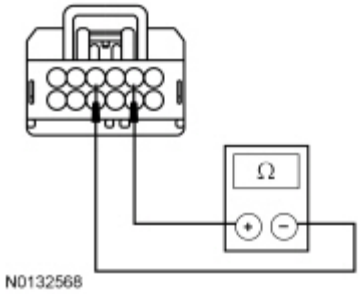
J10 CHECK AND CLEAN THE REAR VIDEO CAMERA LENS	
• Clean and make sure the rear video camera lens is clear of any debris. • Test the rear video camera system and verify the rear video camera image. • **Is the rear video camera concern still present?**	**Yes** GO to J11 . **No** The system is operating correctly at this time. The concern was caused by a dirty rear video camera lens.
J11 CHECK THE REAR VIDEO SIGNAL CIRCUITS INTEGRITY	
• Ignition OFF. • Disconnect: Camera Switching Module C1664. • Measure the resistance between the camera switching module C1664-7, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-8, circuit RMP19 (BN/VT), harness side.  N0131468 • **Is the resistance between 74 and 106 ohms?**	**Yes** GO to J12 . **No** GO to J13 .

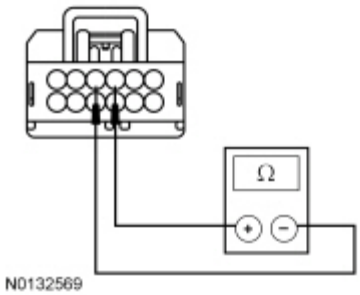
repair4less



J12 CHECK THE REAR VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Disconnect: Rear Video Camera C4357. • Measure the resistance between the rear video camera C4357-5, circuit GD120 (BK/GN), harness side and ground.  N0120912 • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to J13 . **No** REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.
J13 CHECK THE REAR VIDEO CAMERA SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and ground; and between the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side and ground.  N0121053 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J14 . **No** REPAIR the circuit in question. TEST the system for normal operation.
J14 CHECK THE REAR VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-6, circuit DMP19 (BK), harness side.  N0120904 • Measure the resistance between the rear video camera C4357-3,	**Yes** GO to J15 . **No** REPAIR the circuit in question. TEST the system for normal operation.







circuit RMP19 (BN/VT), harness side and the rear video camera C4357-6, circuit DMP19 (BK), harness side.  N0120905 • **Are the resistances greater than 10,000 ohms?**	
J15 CHECK REAR VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Connect a fused jumper wire between the rear video camera C4357-4, circuit VMP19 (WH/GN), harness side and the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side.  N0120906 • Measure the resistance between the camera switching module C1664-7, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-8, circuit RMP19 (BN/VT), harness side.  N0131468 • **Is the resistance less than 5 ohms?**	**Yes** REMOVE the jumper wire. GO to J17 . **No** REMOVE the jumper wire. GO to J16 .
J16 CHECK REAR VIDEO (-) SIGNAL CIRCUIT FOR AN OPEN	
• Measure the resistance between the camera switching module C1664-8, circuit RMP19 (BN/VT), harness side and the rear video camera C4357-3, circuit RMP19 (BN/VT), harness side.	**Yes** REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation. **No** REPAIR circuit RMP19 (BN/VT). TEST the system

repair4less

 N0131469 • **Is the resistance less than 5 ohms?**	for normal operation.
J17 CHECK FOR CORRECT REAR VIDEO CAMERA OPERATION	

• Connect all disconnected connectors.
• Disconnect the rear video camera connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the rear video camera connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new rear video camera. REFER to Video Camera — Rear in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

J18 CHECK THE CAMERA SWITCHING MODULE GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Disconnect: Camera Switching Module C1664. • Measure the resistance between the camera switching module C1664-6, circuit GD120 (BK/GN), harness side and ground.  N0131470 • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to J19 . **No** REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.
J19 CHECK THE VIDEO SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Disconnect: APIM C2383. • Measure the resistance between the camera switching module C1664-2, circuit VMP19 (WH/GN), harness side and ground; and between the camera switching module C1664-3, circuit RMP19 (BN/VT), harness side and ground.	**Yes** GO to J20 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 N0132567 • **Are the resistances greater than 10,000 ohms?**	
J20 CHECK THE VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the camera switching module C1664-2, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-4, circuit DMP19 (BK), harness side.  N0132568 • Measure the resistance between the camera switching module C1664-3, circuit RMP19 (BN/VT), harness side and the camera switching module C1664-4, circuit DMP19 (BK), harness side.  N0132569 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J21 . **No** REPAIR the circuit in question. TEST the system for normal operation.
J21 CHECK VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Connect a fused jumper wire between the camera switching module C1664-2, circuit VMP19 (WH/GN), harness side and the camera switching module C1664-3, circuit RMP19 (BN/VT), harness side.	**Yes** REMOVE the jumper wire. GO to J23 . **No** REMOVE the jumper wire. GO to J22 .

Parking Aid

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The parking aid sensors detect objects approximately 152 cm (60 in) from the rear of the vehicle, 50 cm (20 in) from the rear side of the vehicle, and 30 cm (12 in) above the ground. The Parking Aid Module (PAM) calculates the distance to an object within the 170 degree semicircular area around the rear of the vehicle.

A variable-rate warning tone is generated from a speaker attached to the PAM. The speaker increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 30 cm (12 in) of the sensors, the warning tone becomes continuous. When the PAM sounds the parking aid tone, it sends a volume cutback enabled message to the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN). The BCM sends a message to the Audio Front Control Module (ACM) over the Medium Speed Controller Area Network (MS-CAN). When the ACM receives the message, it reduces the speaker output so the parking aid tone can be heard.

For vehicles that have a base audio system that is not on the Medium Speed Controller Area Network (MS-CAN), the audio speaker output does not reduce when the parking aid tone sounds.

The parking aid system is enabled when the ignition switch is in the RUN position and the transmission in reverse. The parking aid system is disabled if a fault is detected in 1 of the 4 sensors, the parking aid speaker, or the PAM. This is indicated by a parking aid disabled warning message in the message center.

The parking aid system is enabled and disabled through the message center, located in the Instrument Panel Cluster (IPC).

If a MyKey® restricted key is in the ignition cylinder, the parking aid menu is not available in the message center and cannot be deactivated.

If the vehicle is equipped with an integrated electronic Trailer Brake Control (TBC) module and a trailer with electric trailer brakes is connected to the vehicle, the parking aid system is disabled.

The PAM communicates on the HS-CAN and can be diagnosed with a scan tool. The PAM communicates with the scan tool, the BCM, the PCM and the IPC.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

   Visual Inspection Chart

Electrical
• Body Control Module (BCM) fuse 34 (10A) • Wiring, terminals or connectors • Parking Aid Module (PAM) • Parking aid sensors • Parking aid speaker (integral to the PAM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PAM.

repair4less

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

PID Chart

PID	Description
LRI_DIST	Left rear inner sensor distance to object
LRO_DIST	Left rear outer sensor distance to object
RRI_DIST	Right rear inner sensor distance to object
RRO_DIST	Right rear outer sensor distance to object
TRANSGR	Transmission gearshift (PRNDL) position

DTC Charts

Parking Aid Module (PAM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous Memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B1B44:01	Right Rear Outer Sensor: General Electrical Failure	GO to Pinpoint Test B .
B1B44:96	Right Rear Outer Sensor: Component Internal Failure	GO to Pinpoint Test B .
B1B46:01	Right Rear Inner Sensor: General Electrical Failure	GO to Pinpoint Test B .
B1B46:96	Right Rear Inner Sensor: Component Internal Failure	GO to Pinpoint Test B .
B1B48:01	Left Rear Outer Sensor: General Electrical Failure	GO to Pinpoint Test B .
B1B48:96	Left Rear Outer Sensor: Component Internal Failure	GO to Pinpoint Test B .
B1B50:01	Left Rear Inner Sensor: General Electrical Failure	GO to Pinpoint Test B .
B1B50:96	Left Rear Inner Sensor: Component Internal Failure	GO to Pinpoint Test B .
B1B52:12	Rear Sounder-Park Aid: Circuit Short to Battery	CLEAR the DTCs. REPEAT the self-test. If DTC B1B52:12 is recorded again, INSTALL a new Parking Aid Module (PAM). REFER to Parking Aid Module (PAM) in this section. REPEAT the self-test.
B1B52:14	Rear Sounder-Park Aid: Circuit Short to Ground or Open	CLEAR the DTCs. REPEAT the self-test. If DTC B1B52:14 is recorded again, INSTALL a new PAM .

		REFER to Parking Aid Module (PAM) in this section. REPEAT the self-test.
U0155:87	Lost Communication With Instrument Panel Cluster (IPC) Control Module: Missing Message	GO to Pinpoint Test C.
U0294:87	Lost Communication With Powertrain Control Monitor Module: Missing Message	GO to Pinpoint Test D.
U3000:41	Control Module: General Check Sum Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:41 is recorded again. INSTALL a new PAM. REFER to Parking Aid Module (PAM) in this section. CLEAR all DTCs. REPEAT the self-test.
U3000:46	Control Module: Calibration/Parameter Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:46 is recorded again, INSTALL a new PAM. REFER to Parking Aid Module (PAM) in this section. REPEAT the self-test.
U3000:54	Control Module: Missing Calibration	The PAM needs to be configured. CARRY OUT Programmable Module Installation (PMI) for the PAM. REFER to Section 418-01. CLEAR all DTCs. REPEAT the self-test.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the Parking Aid Module (PAM)	• Fuse • Wiring, terminals or connectors • PAM	• REFER to Section 418-00.
• The parking aid is inoperative/does not operate correctly	• Parking aid sensor alignment • PAM • Rear bumper	• GO to Pinpoint Test A.
• Continuous or intermittent tone when no obstacles or fault codes are present (certain obstacles may not be detected or recognized due to their shape, size or material)	• Dirty or iced over parking aid sensor(s)	• CLEAN the rear bumper and sensors with high-pressure water.
	• Parking aid sensor bezel(s) or parking aid sensor(s) locked into the rear bumper incorrectly • Incorrectly mounted sensor and/or grommet • Parking aid sensors are not aligned correctly	• REMOVE and correctly INSTALL the parking aid sensor(s) and or bezel(s) as necessary. REFER to Parking Aid Sensor in this section.

repair4less

	• Parking aid sensor(s) • PAM	• CARRY OUT the azimuth system check and elevation system check. REFER to Azimuth System Check and Elevation System Check in this section.
• The audio does not reduce when the parking aid tone sounds	• Communication network concern • Instrument Panel Cluster (IPC) • Audio Front Control Module (ACM)	• RETRIEVE and REPAIR all related IPC and ACM DTCs. For IPC DTCs, REFER to Section 413-01. For ACM DTCs, Refer to the appropriate section in Group 415 for the procedure.
• The reverse parking aid menu is not available in the message center and cannot be deactivated	• A MyKey® restricted key is in use	• The parking aid disable feature is not available when a MyKey® restricted key is in use. This is normal operation.
• The message center displays the "Rear Parking Aid Off" selection message and cannot be selected ON	• The vehicle is equipped with a Trailer Brake Control (TBC) module and a trailer with electric trailer brakes is connected to the vehicle.	• This is normal operation. The parking aid is selected OFF when a Trailer Brake Control (TBC) module and a trailer with electric trailer brakes is connected.

Pinpoint Tests

Pinpoint Test A: The Parking Aid Is Inoperative/Does Not Operate Correctly

Normal Operation

The parking aid system is enabled when the ignition switch is in the RUN position and the reverse gear is selected. The Parking Aid Module (PAM) receives a reverse gear input message from the PCM over the High Speed Controller Area Network (HS-CAN). The PAM supplies reference voltage and signal return to the parking aid sensors. The PAM receives an input signal from each individual parking aid sensor. The system can be disabled through the message center which is part of the Instrument Panel Cluster (IPC).

This pinpoint test is intended to diagnose the following:

- Parking aid sensor alignment
- PAM
- Rear bumper

PINPOINT TEST A: THE PARKING AID IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS	
• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are any PAM DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to A2.
A2 CHECK THE MESSAGE CENTER FOR CORRECT OPERATION	
• While observing the message center, disable and enable the parking aid system. • **Does the message center display REAR PARK AID OFF when the parking aid system is disabled, and display REAR PARK AID ON when the parking aid system is enabled?**	**Yes** GO to A3. **No** REFER to Section 413-01.
A3 CHECK FOR CORRECT REVERSE GEAR INPUT	
• Apply the parking brake. • Ignition ON. • Select REVERSE. • Enter the following diagnostic mode on the scan tool: PAM DataLogger. • Monitor the PAM TRANSGR PID. • **Does the PID read REVERSE (transmission in reverse)?**	**Yes** GO to A4. **No** GO to A5.
A4 CHECK THE PARKING AID SENSORS FOR CORRECT ALIGNMENT	
NOTE: If the vehicle was in a rear end collision, the parking aid sensors may not be aligned correctly. • Check the bumper for correct alignment. • Carry out the azimuth system check. Refer to Azimuth System Check in this section. • Carry out the elevation system check. Refer to Elevation System Check in this section. • **Does the parking aid system pass both system checks?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. **No** REALIGN or INSTALL a new bumper cover. REFER to Section 501-19. If the vehicle was in a rear end collision, additional body work may be required to bring the parking aid sensors into correct alignment.
A5 CHECK FOR CORRECT PAM OPERATION	

• Disconnect the PAM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PAM connector and make sure it
	Yes
	INSTALL a new PAM. REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation.
	
	No

repair4less

seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTCs B1B44:01, 96; B1B46:01, 96; B1B48:01, 96; B1B50:01, 96

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

The Parking Aid Module (PAM) supplies a reference voltage and signal return to the parking aid sensors. When an object is present behind the vehicle, the reference voltage to the PAM changes based on how close the object is from the rear of the vehicle. The input signal from the sensors determines the distance of the object to the vehicle. A fault condition occurs when the PAM detects an open in the parking aid sensor circuits or the parking aid sensor input signal is shorted to ground.

DTC Description	Fault Trigger Conditions
• B1B44:01 — Right Rear Outer Sensor: General Electrical Failure	A continuous and on-demand DTC that sets when the right rear outer parking aid sensor circuits are shorted to battery voltage, open or the sensor signal line is shorted to ground.
• B1B44:96 — Right Rear Outer Sensor: Component Internal Failure	A continuous and on-demand DTC that sets when the PAM detects an internal failure to the right rear outer parking aid sensor.
• B1B46:01 — Right Rear Inner Sensor: General Electrical Failure	A continuous and on-demand DTC that sets when the right rear inner parking aid sensor circuits are shorted to battery voltage, open or the sensor signal line is shorted to ground.
• B1B46:96 — Right Rear Inner Sensor: Component Internal Failure	A continuous and on-demand DTC that sets when the PAM detects an internal failure to the right rear inner parking aid sensor.
• B1B48:01 — Left Rear Outer Sensor: General Electrical Failure	A continuous and on-demand DTC that sets when the left rear outer parking aid sensor circuits are shorted to battery voltage, open or the sensor signal line is shorted to ground.
• B1B48:96 — Left Rear Outer Sensor: Component Internal Failure	A continuous and on-demand DTC that sets when the PAM detects an internal failure to the left rear outer parking aid sensor.
• B1B50:01 — Left Rear Inner Sensor: General Electrical Failure	A continuous and on-demand DTC that sets when the left rear inner parking aid sensor circuits are shorted to battery voltage, open or the sensor signal line is shorted to ground.
• B1B50:96 — Left Rear Inner Sensor: Component Internal Failure	A continuous and on-demand DTC that sets when the PAM detects an internal failure to the left rear inner parking aid sensor.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM
- Parking aid sensor(s)

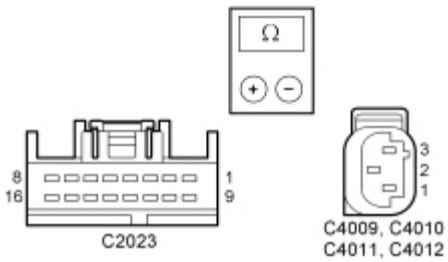
- Parking aid bumper harness

PINPOINT TEST B: DTCs B1B44:01, 96; B1B46:01, 96; B1B48:01, 96; B1B50:01, 96

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS</td><td></td></tr>
<tr><td>• Check the PAM DTCs from the continuous and on-demand self-tests.
• Are multiple DTCs recorded?</td><td>Yes
GO to B2 .

No
For DTC B1B44:01, B1B44:96, B1B46:01, B1B46:96, B1B48:01, B1B48:96, B1B50:01 or B1B50:96, GO to B3 .



For all other DTCs, REFER to DTC Charts in this section.</td></tr>
<tr><td>B2 CHECK THE BUMPER WIRING HARNESS</td><td></td></tr>
<tr><td>• Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion.
• Is the bumper wiring harness OK?</td><td>Yes
GO to B3 .

No
REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.</td></tr>
<tr><td>B3 CHECK THE SENSOR CIRCUITRY FOR OPENS</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Suspect Parking Aid Sensor C4009, C4010, C4011 or C4012.
• Disconnect: PAM C2023.
• Measure the resistance between the PAM C2023, harness side and the suspect parking aid sensor, harness side as follows:
<table>
<tr><th>DTC</th><th>Rear Sensor</th><th>PAM Connector-Pin</th><th>Sensor Connector-Pin</th><th>Circuit</th></tr>
<tr><td rowspan="2">B1B44:01, 96</td><td rowspan="2">RH outer</td><td>C2023-9</td><td>C4011-1</td><td>VMP17 (YE/OG)</td></tr>

B1B50:01, 96	LH inner	C4010-1 VMP14 (WH/OG)	C4010-3 RMP07 (GN/WH)

N0120897

- **Is the resistance greater than 10,000 ohms?**

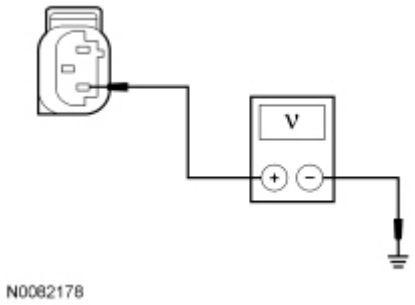
Yes
GO to B6.

No
REPAIR the circuits in question. CLEAR the DTCs. TEST the system for normal operation.

B6 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO VOLTAGE

- Ignition ON.
- Measure the voltage between the suspect parking aid sensor, harness side and ground as follows:

DTC	Rear Sensor	Connector-Pin	Circuit
B1B44:01, 96	RH outer	C4011-1	VMP17 (YE/OG)
B1B46:01, 96	RH inner	C4012-1	VMP16 (YE/GY)
B1B48:01, 96	LH outer	C4009-1	VMP15 (YE/GN)



Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
If all of the parking aid sensors recorded DTCs, GO to B7.

If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question.

repair4less

B1B50:01, 96	LH inner	C4010-1	VMP14 (WH/OG)

- **Is any voltage present?**

REFER to Parking Aid Sensor in this section. CLEAR the DTCs. REPEAT the self-test.

B7 CHECK FOR CORRECT PAM OPERATION	

• Disconnect the PAM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PAM connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PAM. REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTC U0155:87

Normal Operation

- DTC U0155:87 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: Missing Message) — the Parking Aid Module (PAM) set this DTC if data messages received from the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds.

This pinpoint test is intended to diagnose the following:

- Module communication
- IPC
- PAM

PINPOINT TEST C: DTC U0155:87

Test Step	Result / Action to Take

C1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to C2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
C2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IPC pass the network test?**	**Yes** GO to C3 . **No** REFER to Section 418-00 , The IPC Does Not Respond To The Scan Tool.
C3 CHECK THE IPC FOR DTCs	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 413-01 . **No** GO to C4 .
C4 RECHECK THE PAM DTCs	
• Clear the DTCs. • Wait 10 seconds. • Repeat the PAM self-test. • **Is DTC U0155:87 still present?**	**Yes** GO to C5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
C5 CHECK FOR DTC U0155 OR U0155:00 SET IN OTHER MODULES	
• Ignition ON. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155 or U0155:00 set in the ACM or the ABS module?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation.

Pinpoint Test D: DTC U0294:87

Normal Operation

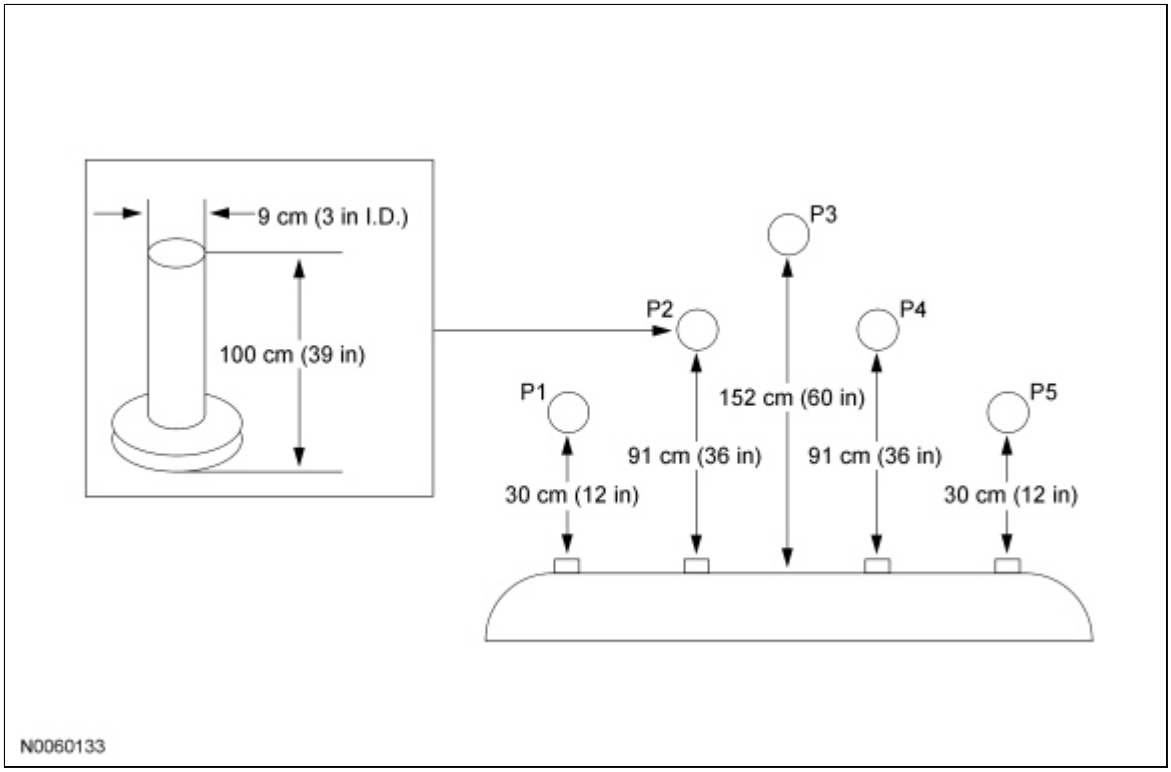
- DTC U0294:87 (Lost Communication With Powertrain Control Monitor Module: Missing Message) — the Parking Aid Module (PAM) sets this DTC if data messages received from the PCM over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds.

This pinpoint test is intended to diagnose the following:

- Module communication

repair4less

- PAM
- PCM



PINPOINT TEST D: DTC U0294:87

Test Step	Result / Action to Take
D1 VERIFY CUSTOMER CONCERN • Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to D2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
D2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the PCM pass the network test?**	**Yes** GO to D3 . **No** REFER to Section 418-00 , The PCM Does Not Respond To The Scan Tool.
D3 CHECK THE PCM FOR DTCs • Check for recorded PCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 303-14 . **No** GO to D4 .
D4 RECHECK THE PAM DTCs • Clear the DTCs. • Wait 10 seconds. • Repeat the PAM self-test. • **Is DTC U0294:87 still present?**	**Yes** GO to D5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
D5 CHECK FOR DTC U0100 OR U0100:00 SET IN OTHER MODULES • Ignition ON. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0100 or U0100:00 set in the ABS module or the IPC ?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation.

Azimuth System Check

Maximum Detectable Object Locations

1. **NOTE:** The object used in this system check can be fabricated using a 9 cm O.D. (3 in I.D.) plastic pipe 100 cm (39 in) in length (available as Polyvinyl Chloride (PVC) pipe, or similar from a hardware or plumbing supply).

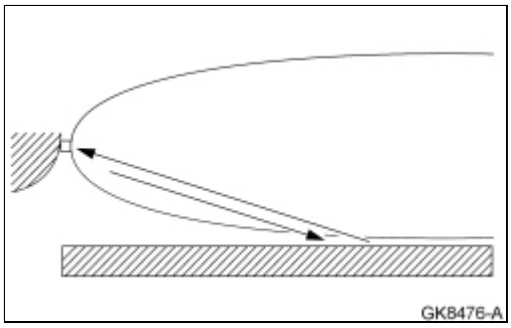
   NOTE: The following system check should be carried out with the vehicle on a level surface.

   NOTE: The parking aid system will default to on when the ignition key is cycled from off to on.

   NOTE: The scan tool may be used to monitor distance PIDs. The distance PIDs read between 0 and 255 cm (0 and 8 ft) on a correctly functioning system.

   Turn the ignition switch to the ON position, engine off.

2. Set the parking brake on.



3. Place the transmission in REVERSE (R).

4. Verify that the parking aid system detects the specified object when placed in the five specified locations (P1, P2, P3, P4 and P5).
   - If the PAM does not detect the object above, refer to Parking Aid in the Diagnosis and Testing portion of this section.

repair4less

Elevation System Check

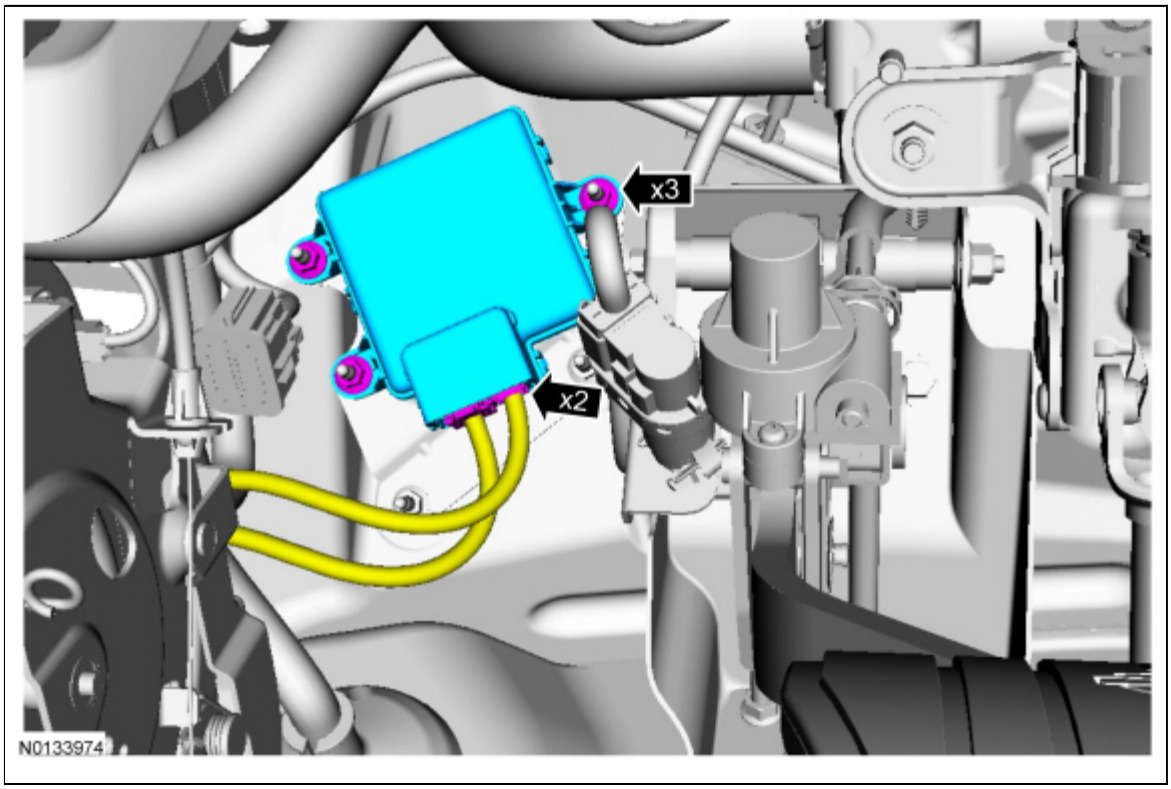
1. Check the parking aid system to make sure that the system does not see signals caused by ground reflections.

2. The following system check should be carried out with the vehicle on a 3.0 m wide by 4.5 m deep (10 ft wide by 15 ft deep) smooth concrete surface, free of all obstacles and noise from fans and pneumatic tools.

3. Turn the ignition switch to the ON position, engine off.

4. Set the parking brake on.

5. Place the transmission in REVERSE (R).



6. Verify that no audible alerts are heard. If audible alerts are heard, check to make sure the bumper is correctly installed and is not tilted downward so that the sensor is pointing toward the ground.
    - If the audible warning tone is heard, refer to Parking Aid in the Diagnosis and Testing portion of this section.

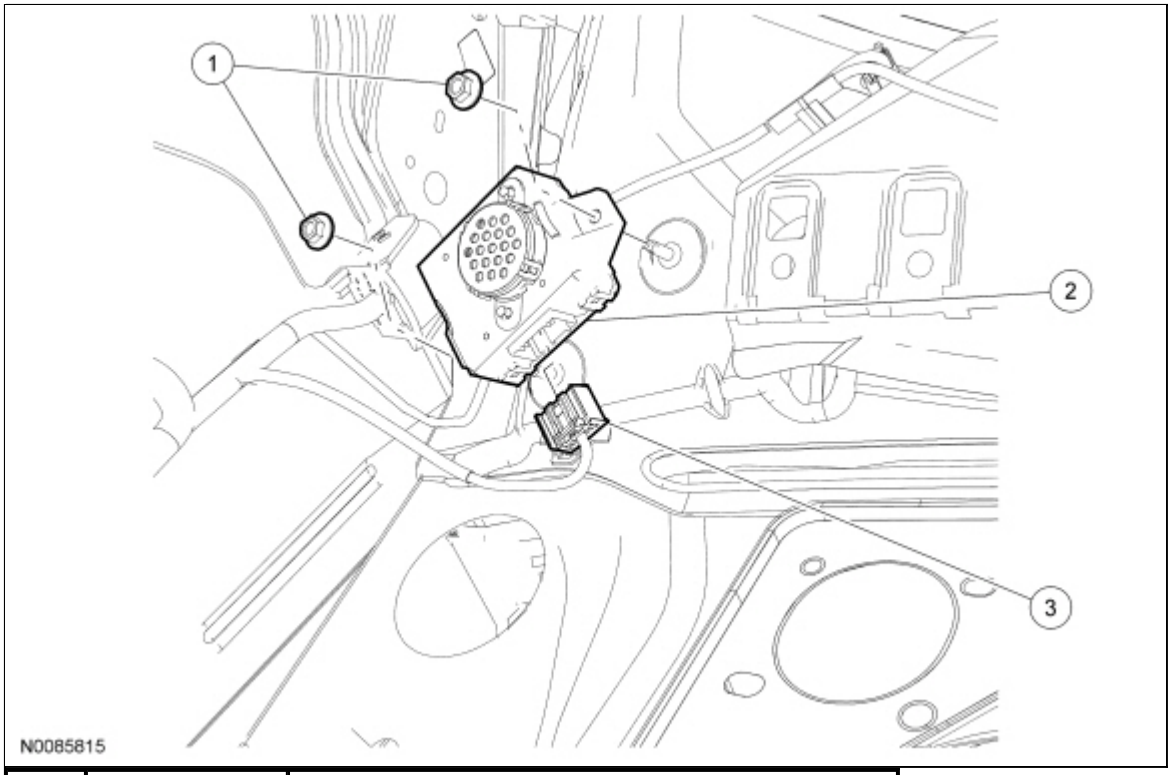
Camera Switching Module

Removal

1.

2. If required, remove the camera switching module bracket.



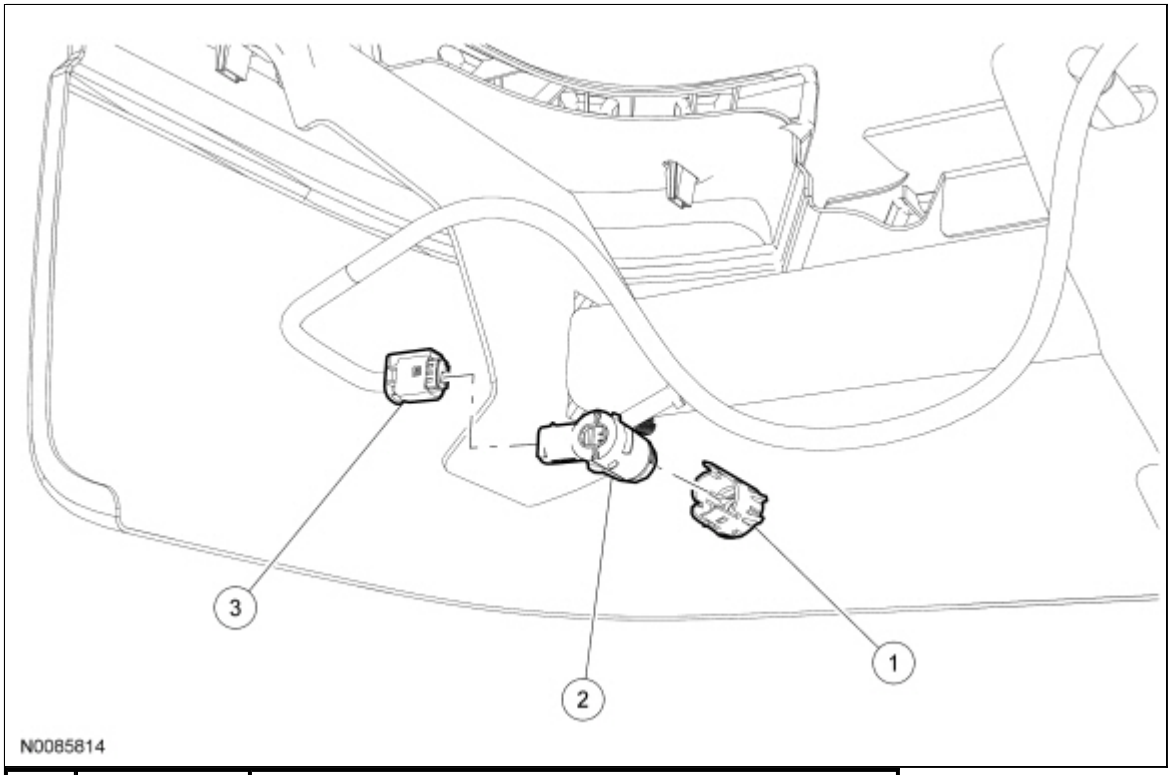
Installation

1. To install, reverse the removal procedure.

---

repair4less

Parking Aid Module (PAM)



Item	Part Number	Description
1	—	Parking Aid Module (PAM) nuts (2 required)
2	157850	PAM and parking aid speaker assembly
3	—	PAM electrical connector (part of 14A005)

Removal and Installation

1. Disconnect the PAM electrical connector.
2. Remove the 2 PAM nuts.
3. Remove the PAM .
4. To install, reverse the removal procedure.

repair4less

Parking Aid Sensor

Item	Part Number	Description
1	—	Parking aid sensor bezel
2	15K859	Parking aid sensor
3	—	Parking aid sensor electrical connector (part of 13A576)

Removal

1. Disconnect the parking aid sensor electrical connector.

2. Using a suitable tool (such as a flat-bladed screwdriver), carefully pry away the retaining tabs to remove the parking aid sensor from the sensor bezel.
   - Remove the parking aid sensor from the rear bumper.

Installation

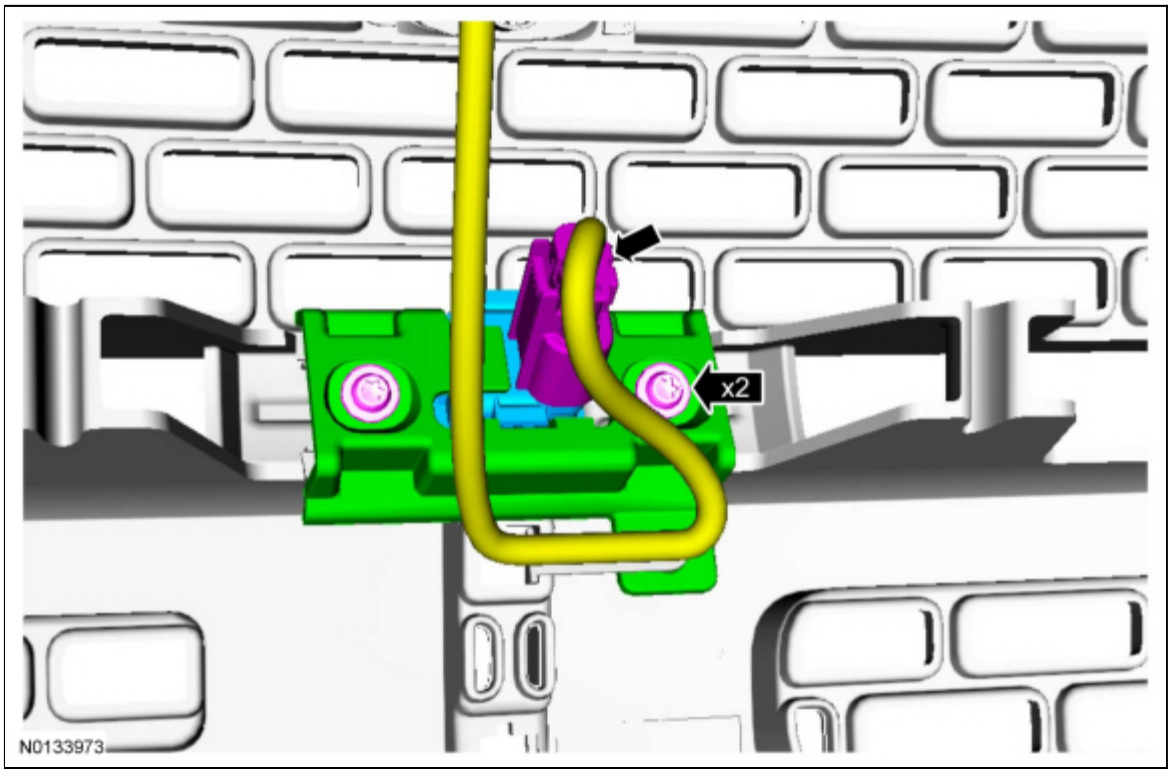
1. To install the parking aid sensor in the rear bumper, insert the sensor in the sensor bezel opening until the retaining tabs lock in position.

2. Connect the parking aid sensor electrical connector.

3. After installing the sensor(s), use the scan tool to verify that the parking aid sensor PIDs read no

object present.

4. Carry out the azimuth and elevation test. For additional information, refer to Azimuth System Check and Elevation System Check in this section



---

repair4less

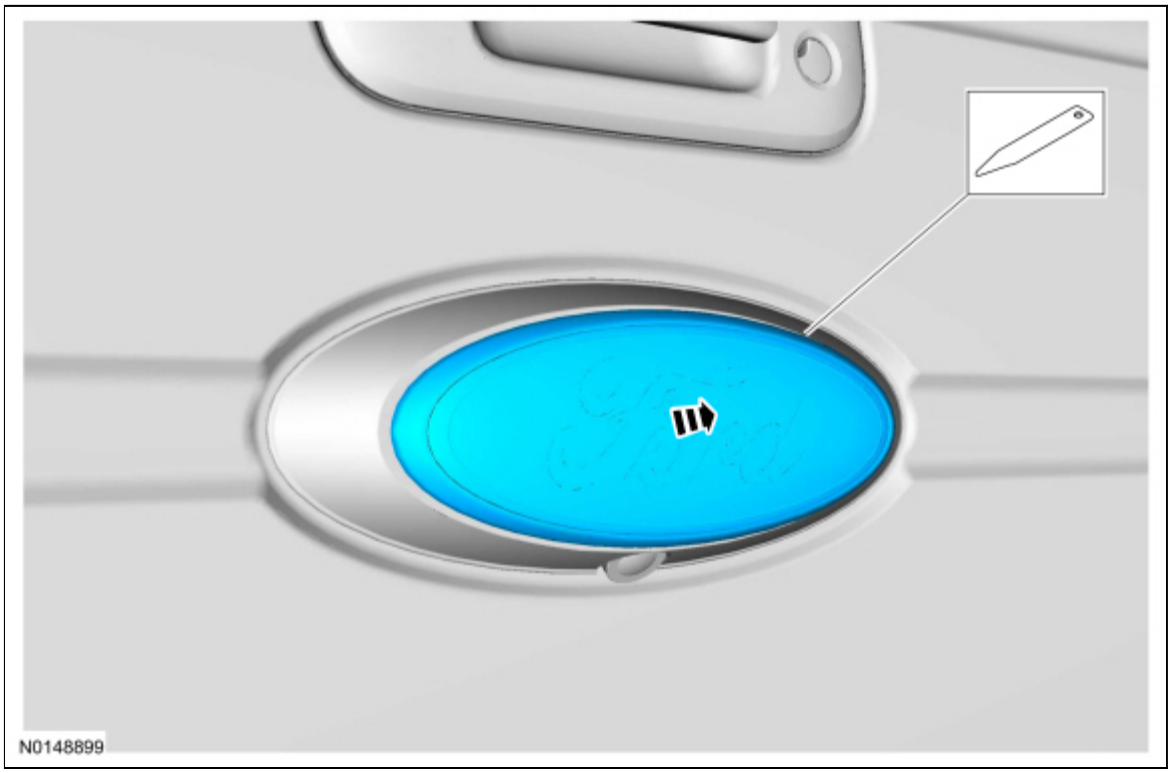
Video Camera — Front

Removal

1.

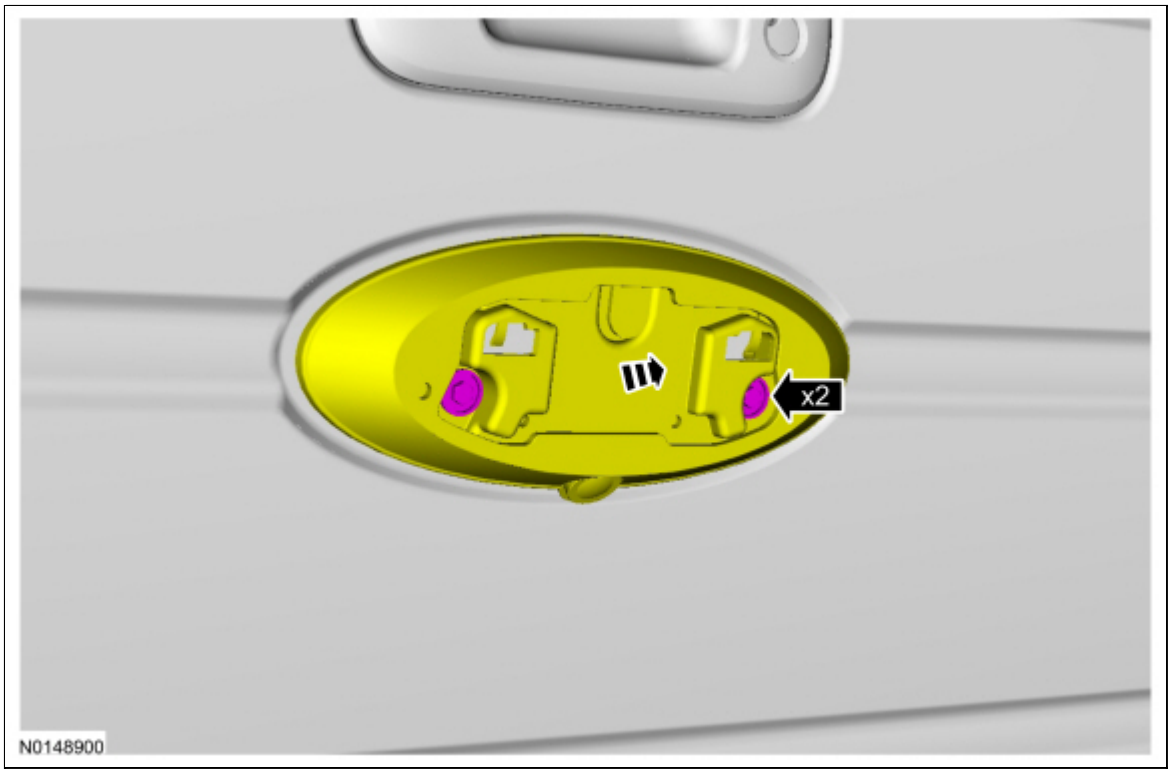
Installation

1. To install, reverse the removal procedure.



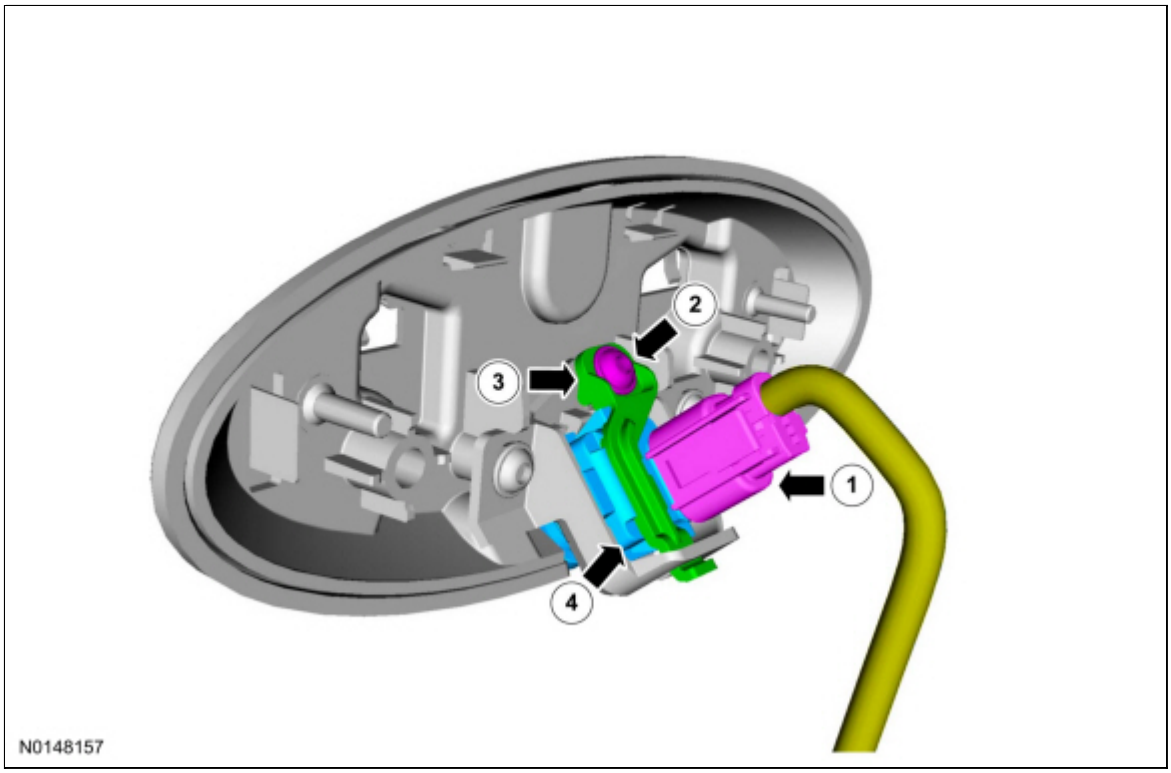
repair4less

Video Camera — Rear



Removal and Installation

NOTE: The Ford oval emblem must be replaced, as the tabs break during removal.



1.

2.

3.

4. To install, reverse the removal procedure.
    - Configure the rear video camera following the instructions on the scan tool.

General Specifications

Item	Specification
Generator (3.5L, with AC powerpoint or climate control seats)	
Generator pulley ratio	2.67:1
Rating	220 amps
Output	92 amps @ 580 rpm (min) to 217 amps @ 2,000 rpm (max)
Generator (3.5L, without AC powerpoint or climate control seats)	
Generator pulley ratio	2.67:1
Rating	200 amps
Output	90 amps @ 580 rpm (min) to 209 amps @ 2,000 rpm (max)
Generator (3.7L, with AC powerpoint or climate control seats)	
Generator pulley ratio	2.67:1
Rating	220 amps
Output	74 amps @ 550 rpm (min) to 217 amps @ 2,000 rpm (max)
Generator (3.7L, without AC powerpoint or climate control seats)	
Generator pulley ratio	2.67:1
Rating	200 amps
Output	72 amps @ 550 rpm (min) to 209 amps @ 2,000 rpm (max)
Generator (5.0L, with AC powerpoint or climate control seats)	
Generator pulley ratio	2.95:1
Rating	220 amps
Output	92 amps @ 525 rpm (min) to 220 amps @ 2,000 rpm (max)
Generator (5.0L, without AC powerpoint or climate control seats)	
Generator pulley ratio	2.95:1
Rating	200 amps
Output	90 amps @ 525 rpm (min) to 211 amps @ 2,000 rpm (max)
Generator (6.2L, Base)	
Generator pulley ratio	2.95:1
Rating	155 amps
Output	66 amps @ 525 rpm (min) to 160 amps @ 2,000 rpm (max)
Generator (6.2L, Optional)	
Generator pulley ratio	2.95:1
Rating	200 amps
Output	90 amps @ 525 rpm (min) to 211 amps @ 2,000 rpm (max)

Generator B+ terminal nut	17	—	150
Generator bolts	48	35	—
Generator stud (3.5L)	8	—	71
Generator stud nut (3.5L and 3.7L)	48	35	—

Charging System

The charging system is a negative ground system consisting of:

- a generator with an internal voltage regulator
- a charging system warning indicator
- a battery
- circuitry and cables
- a PCM
- a radial arm adapter (serviced separately from the generator)
- a battery current sensor
- a generator current sensor

The generator is driven by the accessory drive belt. When the engine is started, the generator begins to generate AC voltage which is internally converted to DC voltage. The DC voltage is controlled by the voltage regulator (located on the rear of the generator) and supplied to the battery. The PCM controls the voltage regulation set point, working with the generator internal voltage regulator over 2 control and communication circuits.

This vehicle is equipped with load shed strategy. The Body Control Module (BCM) monitors the battery state of charge using the battery current sensor attached to the negative battery cable and the battery open circuit voltage as measured by the BCM during 8 continuous hours of vehicle sleep time (ignition off with doors closed).

With the engine off and the ignition in the ACC, RUN or delayed accessory position, when the BCM determines the battery state of charge is low, a message is sent to shut down the audio/navigation system in order to save the remaining battery charge. Under this condition:

- the Front Display Interface Module (FDIM) displays SYS OFF TO SAVE BATT (without navigation) or BATTERY SAVER — SYSTEM OFF PLEASE START THE ENGINE (with navigation).
- the Instrument Panel Cluster (IPC) message center may also display TURN POWER OFF TO SAVE BATT (base message center) or TURN POWER OFF TO SAVE BATTERY (optional message center) to notify the driver that battery protection actions are active.
- the battery indicator may also illuminate.

If the vehicle battery has been charged or battery replaced , it takes approximately 8 hours for the BCM to learn the new battery state of charge. During this 8 hour period, the vehicle must be undisturbed, with no doors opened or keyless entry buttons pressed. If the vehicle is used before the BCM is allowed to learn the new battery state of charge, engine off load shedding may occur earlier than normal and a message may be displayed.

If the vehicle has been jump started , engine off load shedding can still occur and a message may be displayed until the BCM determines the battery state of charge is above 40%.

With the engine running, when the BCM and Power Steering Control Module (PSCM) voltage is low, a message is sent from the BCM to either minimize or shut down the climate controlled seats, rear defrost, heated mirrors and Dual Automatic Temperature Control (DATC) blower motor to improve system voltage. Under this condition, the IPC message center displays either LOW BATTERY LESS FEATURES (base message center) or LOW BATTERY FEATURES TEMPORARILY TURNED OFF (optional message center) to notify the driver that battery protection actions are active.

repair4less

The PCM monitors the generator current using the generator current sensor attached to the generator B+ battery cable. This is used for engine idle stability and torque control.

Diagnostic Trouble Code (DTC) Chart

NOTE: The Body Control Module (BCM) utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Source	Action
P0562	System Voltage Low	PCM	GO to Pinpoint Test B.
P0563	System Voltage High	Various Modules	GO to Pinpoint Test A.
P0620	Generator Control Circuit	PCM	GO to Pinpoint Test C.
P0625	Generator Field Terminal Circuit Low	PCM	GO to Pinpoint Test D.
P0626	Generator Field Terminal Circuit High	PCM	GO to Pinpoint Test D.
P065B	Generator Control Circuit Range/Performance	PCM	GO to Pinpoint Test E.
P0A5A	Generator Current Sensor Circuit Range/Performance	PCM	GO to Pinpoint Test H.
P0A5B	Generator Current Sensor Circuit Low	PCM	GO to Pinpoint Test H.
P0A5C	Generator Current Sensor Circuit High	PCM	GO to Pinpoint Test H.
P1397	System Voltage Out Of Self-Test Range	PCM	If combined with P0562, GO to Pinpoint Test B. If combined with P0563, GO to Pinpoint Test A.
B1317	Battery Voltage High	Various Modules	GO to Pinpoint Test A.
B1318	Battery Voltage Low	Various Modules	GO to Pinpoint Test B.
B1676	Battery Pack Voltage Out of Range	Various Modules	If combined with B1317, GO to Pinpoint Test A. If combined with B1318, GO to Pinpoint Test B.
U1007:31	Lost Communication With Battery Monitoring Sensor "A": No Signal	BCM	GO to Pinpoint Test I.

DTCs		Modules	Chart in Section 303-14 . If directed to this section from another section, GO to Symptom Chart in this section.

Inspection And Verification

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

***NOTICE:* Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals or fuses.**

***NOTICE:* Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.**

NOTE: While carrying out any pinpoint test, disregard any DTCs set while following a specific pinpoint test. After the completion of a test, be sure to clear all DTCs in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Front End Accessory Drive (FEAD) belt • Generator pulley	• Wiring, terminals or connectors • Cables • Battery • Generator • Fuses

repair4less

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the battery condition. Refer to Section 414-01 .

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out (other indicators may NOT prove ignition is on) confirms ignition on. If ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - refer to Section 418-00 , Inspection and Verification, to establish a scan tool session (without the ignition on).
   - verify the scan tool operation with a known good vehicle.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .

NOTE: Use the Integrated Diagnostic System (IDS) feature that retrieves all Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules at one time.

9. Retrieve CMDTCs from all modules.

10. **NOTE:** If no charging system DTCs are present, the charging system is operating correctly. If the charging system has a concern, it usually sets a charging system DTC.

    If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Master DTC Chart in Section 419-10 or Powertrain Control/Emissions Diagnosis (PC/ED) manual.

11. If no DTCs related to the concern are retrieved, go to the Symptom Chart in this section.

repair4less

Pinpoint Test

Special Tool(s)

 ST3104-A	Backprobe Pins POM6411 or equivalent
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3285-A	GR 1 190 V3.0 Intelligent Diagnostic Charger 162-00036 or equivalent
 ST3094-A	Test Light SGT27000 or equivalent 250-350 mA incandescent bulb test lamp SGT27000
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Pinpoint Test A: System Voltage High

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

NOTE: DTC P1397 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

Normal Operation

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The voltage that is supplied to the vehicle electrical system is used for the operation of the various vehicle systems and modules. Many modules monitor this voltage and if it rises above or below their calibrated setpoints, a DTC sets.

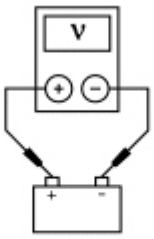
DTC Description	Fault Trigger Condition
• P0563 — System Voltage High	If the module detects a voltage from the charging system higher than 15.2 volts, this DTC sets. This DTC does not set in the PCM unless the vehicle speed is above 8 km/h (5 mph).
• P1397 — System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

This pinpoint test is intended to diagnose the following:

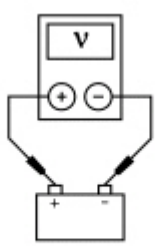
- Fuse
- Wiring, terminals or connectors
- Engine, generator and battery grounds
- Battery
- Generator
- PCM

PINPOINT TEST A: SYSTEM VOLTAGE HIGH

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.



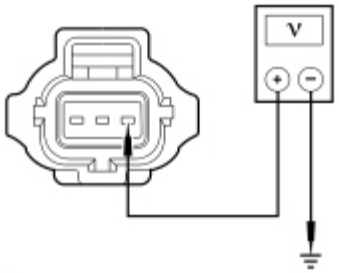
NOTE: Do not have a battery charger attached during vehicle testing.



Test Step	Result / Action to Take
A1 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to A2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 RETRIEVE PCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self-	**Yes**

repair4less

Test — PCM . • **Is DTC P0620, P0625, P0626 or P065B present?**	For **DTC P0620** , GO to Pinpoint Test C . For **DTCs P0625 and P0626** , GO to Pinpoint Test D . For **DTC P065B** , GO to Pinpoint Test E . **No** GO to A3 .



A3 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD)
 	
• Start the engine.
• **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test.
• Select and monitor the following PCM PIDs:
  ▪ Generator Monitor (GENMON)
  ▪ Generator Command (GENCMD)
  ▪ Generator Voltage Desired (GENVDSD)
  ▪ Module Supply Voltage (VPWR)
• Monitor the GENVDSD PID.
• **Does the GENVDSD PID indicate 15.1 volts or less?**
	Yes
	GO to A4 .
	
	No
	GO to A12 .

A4 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD) • With the engine still running at idle, measure battery voltage and record.  AJ0210-A • Monitor the GENVDSD PID. • **Is battery voltage within ±0.5 volt of the PID GENVDSD?**	**Yes** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A5 .
A5 MEASURE THE "A" SENSE VOLTAGE • Ignition OFF. • Disconnect: Generator C102A . • Ignition ON. • Measure battery voltage and record.	**Yes** GO to A6 . **No** **For 3.5L, 3.7L and 5.0L engines** , VERIFY Battery Junction Box (BJB) fuse 45 (10A) is OK. If OK, REPAIR circuit SBB45 (GY/RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs.

AJ0210-A

- Measure the voltage between:
  - **For 3.5L, 3.7L and 5.0L engines** , generator C102A-3, circuit SBB45 (GY/RD), harness side and ground.
  - **For 6.2L engines** , generator C102A-3, circuit SDC14 (RD), harness side and ground.

N0105264

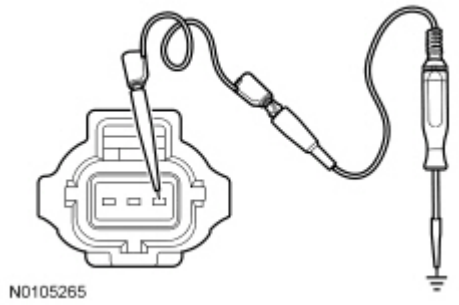
- **Is the "A" sense voltage equal to battery voltage?**

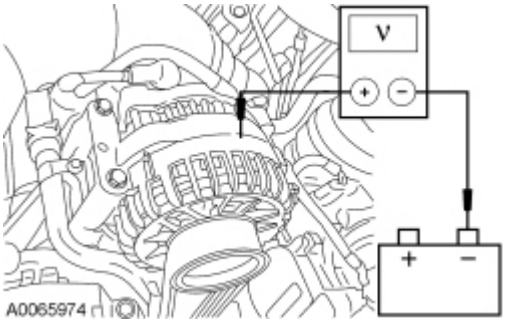
REPEAT the self-test. TEST the system for normal operation.

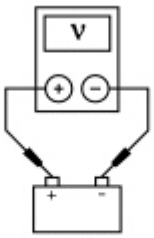
For 6.2L engines , VERIFY fusible links are OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A6 "A" SENSE CIRCUIT LOAD TEST

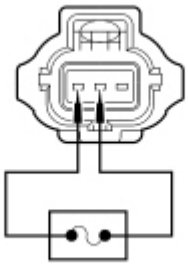
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.**

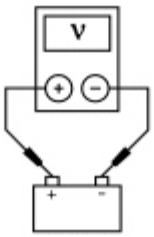






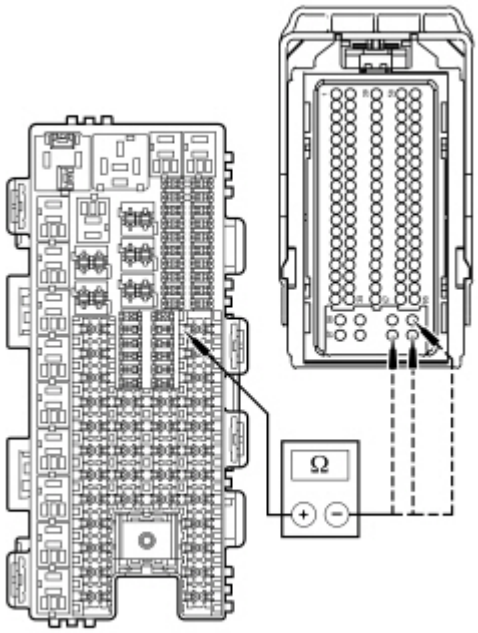
NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.





- Using a 12-volt test lamp connected to ground, while performing a wiggle test on the generator harness, check for voltage at:
  - **For 3.5L, 3.7L and 5.0L engines** , generator C102A-3, circuit SBB45 (GY/RD), harness side.
  - **For 6.2L engines** , generator C102A-3, circuit SDC14 (RD), harness side.

Yes
GO to A7 .

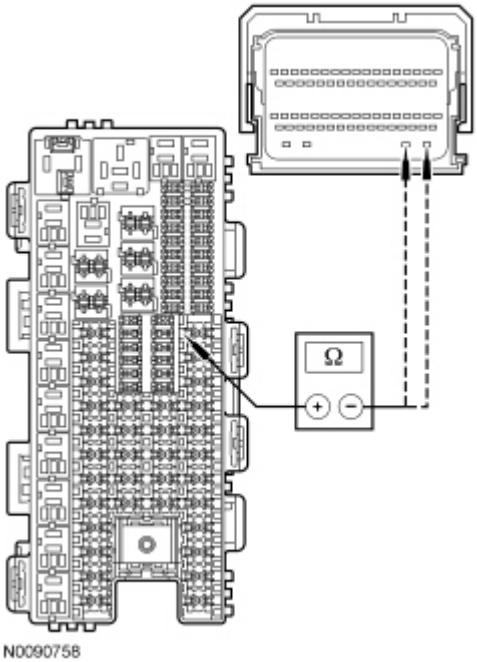


No
REPAIR corroded or loose connection on circuit SDC14 (RD). INSPECT generator C102A-3, circuit SDC14 (RD) or SBB45 (GY/RD) for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less

 N0105265 • **Does the test lamp illuminate?**	
A7 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS	
• Connect: Generator C102A . • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator case, and the negative battery terminal.  A0065974 • **Is the voltage drop less than 0.25 volt (250mV)?**	**Yes** GO to A8 . **No** INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion as required. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A8 CHECK THE GENERATOR OUTPUT	
• With the engine still running at idle, increase engine rpm until generator starts to generate output. • With the engine running, measure battery voltage and record.  AJ0210-A • **Is the voltage above 15.2 volts?**	**Yes** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A9 .
A9 MONITOR PCM PIDs GENERATOR COMMAND (GENCMD), GENERATOR MONITOR (GENMON) AND GENERATOR VOLTAGE DESIRED (GENVDSD)	
• Ignition OFF. • Disconnect: Generator C102A . • Connect a fused jumper wire between generator C102A-1, CDC15 (VT), harness side and generator C102A-2, circuit	**Yes** GO to A10 . **No**

CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • Monitor the GENVDSD, GENMON and GENCMD PIDs. • Using the active command, set GENVDSD PID to 14 volts. • **Does the GENCMD PID read within 5% of GENMON PID?**	GO to A12 .
A10 COMPARE PCM SUPPLY VOLTAGE (VPWR) PID TO BATTERY VOLTAGE • With the engine still running at idle, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does PCM VPWR PID accurately display battery voltage within ±0.5 volt?**	**Yes** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A11 .
A11 CHECK PCM SUPPLY VOLTAGE CIRCUITS • Ignition OFF. • Disconnect: Fused Jumper Wire . • Disconnect: BJB fuse 75 . • Disconnect: PCM C1551B (3.5L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1381B (5.0L and 6.2L) . • **For 3.5L equipped vehicles** , measure resistance between BJB and PCM, harness side as follows: **PCM Connector-Pin** / **BJB Fuse** / **Circuit** C1551B-101 / 75 (25A) / CBB75 (YE/GY) C1551B-102 / 75 (25A) / CBB75 (YE/GY) C1551B-103 / 75 (25A) / CBB75 (YE/GY)	**Yes** GO to A12 . **No** REPAIR high resistance or loose connections in the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

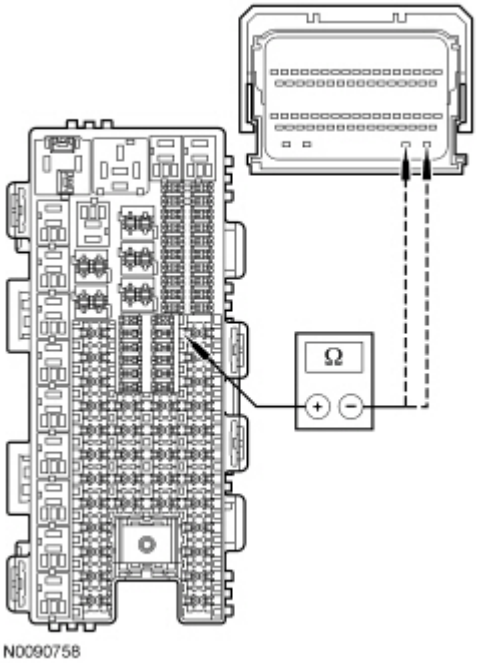


repair4less

N0122686

- **For 3.7L equipped vehicles** , measure the resistance between the BJB and the PCM, harness side as follows:

PCM Connector-Pin	BJB Fuse	Circuit
C175B-67	75 (15A)	CBB75 (YE/GY)
C175B-68	75 (15A)	CBB75 (YE/GY)



N0090758

- **For 5.0L and 6.2L equipped vehicles** , measure the resistance between the BJB and the PCM, harness side as

follows:

PCM Connector-Pin	BJB Fuse	Circuit
C1381B-67	75 (15A)	CBB75 (YE/GY)
C1381B-68	75 (15A)	CBB75 (YE/GY)

- **Are the resistances less than 0.5 ohm?**

A12 CHECK FOR CORRECT PCM OPERATION
• Ignition OFF.
• Reinstall BJB fuse 75.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PCM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: System Voltage Low or Battery is Discharged

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

NOTE: DTC P0562 or P1397 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive

repair4less

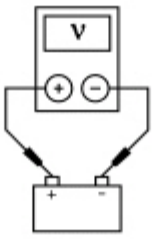
load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

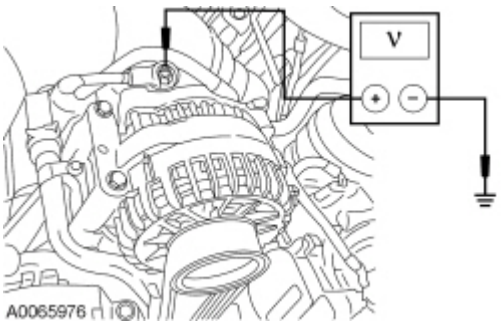
Normal Operation

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The PCM monitors this voltage through the battery positive post through the Battery Junction Box (BJB). If voltage drops 1.5 volts or more below the generator voltage desired, this DTC sets after 30 seconds.

DTC Description	Fault Trigger Condition
• P0562 — System Voltage Low	If the PCM detects voltage from the charging system that is 1.5 volts lower than the generator voltage desired, this DTC sets.
• P1397 — System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

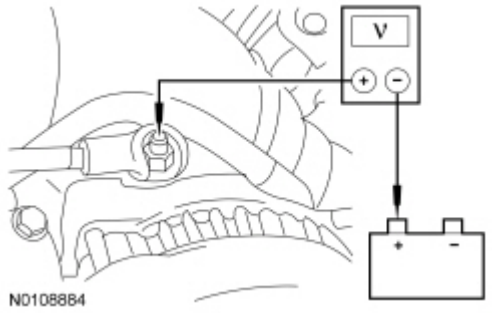
This pinpoint test is intended to diagnose the following:

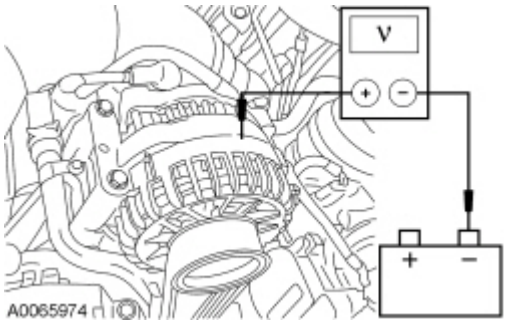


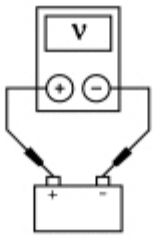


- Fuse
- Fusible link
- Wiring, terminals or connectors
- Engine, generator and battery grounds
- Abnormal ignition-off current drain(s)
- Radial arm adapter
- Battery
- Generator
- PCM

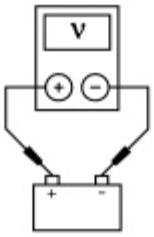
PINPOINT TEST B: SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

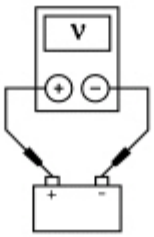


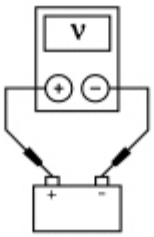




NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.







NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
B1 RETRIEVE PCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self-Test — PCM . • **Is DTC P0620, P0625, P0626 or P065B present?**	**Yes** For **DTC P0620** , GO to Pinpoint Test C . For **DTCs P0625 and P0626** , GO to Pinpoint Test D . For **DTC P065B** , GO to Pinpoint Test E . **No** GO to B2 .
B2 CHECK BATTERY CONDITION	

• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to B3 . **No** INSTALL a new battery. REFER to Section 414-01 . TEST the system for normal operation.
B3 CHECK THE GENERATOR CONNECTIONS • Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Disconnect: Generator C102A . • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SDC14 (RD). Connection should be tight. • Measure the battery voltage.  AJ0210-A • **NOTE:** 6.2L shown, others similar. • Measure the voltage between generator C102B, B+ circuit SDC14 (RD) and ground.  A0065976 • **Is generator C102B connection tight and does the generator B+ measure battery voltage?**	**Yes** GO to B4 . **No** **For 3.5L, 3.7L and 5.0L engines** , TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B4 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT • Connect: Generator C102A . • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C102B, circuit SDC14 (RD) and the positive battery terminal.	**Yes** GO to B5 . **No** INSPECT circuit SDC14 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as required. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less

 • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	
B5 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS	
• Connect: Generator C102A . • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator case, and the negative battery terminal.  • **Is the voltage drop less than 0.25 (250mV) volt?**	**Yes** GO to B6 . **No** INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion as required. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B6 COMPARE PCM MODULE SUPPLY VOLTAGE (VPWR) PID	
• With the engine still running at idle, headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.  • **Does PCM VPWR PID display battery voltage within ±0.5 volt?**	**Yes** GO to B7 . **No** REPAIR high resistance or loose connections in the affected PCM power circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B7 CHECK PCM GROUND FOR HIGH RESISTANCE	
• Monitor PCM VPWR PID. • With the engine still running at idle, turn off all	**Yes** GO to B8 .

accessory loads, measure the battery voltage at the battery and note the PCM VPWR PID.  AJ0210-A • With the engine still running at idle, turn headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does the VPWR PID read within ±0.5 volt with accessory loads on as compared to accessory loads off?**	**No** REPAIR the affected PCM ground circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B8 MONITOR PID VPWR AT WOT	
• With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • Monitor the VPWR PID and momentarily accelerate the engine to Wide Open Throttle (WOT) and release. Repeat this step 4-5 times while continuing to monitor the VPWR PID. • **Does the VPWR PID stay within 1.5 volt of battery voltage when the engine rpms are increased?**	**Yes** GO to B9 . **No** GO to B10 .
B9 CHECK FOR CURRENT DRAINS	
• With the engine still running at idle, measure the	**Yes**

repair4less

battery voltage at the battery. • Monitor PCM PIDs generator voltage desired (GENVDSD) and generator monitor (GENMON). • **Does GENMON PID frequently rise above 90% and battery voltage drop below GENVDSD PID by 0.5 volt or more?**	CARRY OUT the Component Test, Battery — Drain Test. REFER to Section 414-01 . **No** **For 3.5L, 3.7L and 5.0L engines** , VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , VERIFY fusible links are OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B10 CHECK FOR CORRECT PCM OPERATION • Ignition OFF. • Disconnect all the PCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the PCM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTC P0620

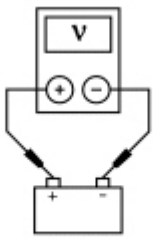
Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The PCM monitors the generator output via the generator monitor (GENMON) circuit. The PCM uses the generator command (GENCOM) circuit to command the generator to either increase or decrease output. If the GENCOM circuit (generator control circuit) or the "A" sense circuit are open or shorted to ground, the PCM will not be able to control the generator output. When the engine speed is greater than approximately 2,000 rpm, the generator defaults to a steady voltage output of approximately 13.5 volts and the PCM sends a request to the Instrument Panel Cluster (IPC) to illuminate the charging system warning indicator. A GENCOM circuit fault can be confirmed by viewing the PCM PID generator command line fault (GENCMD_LF) (YES status indicator fault).

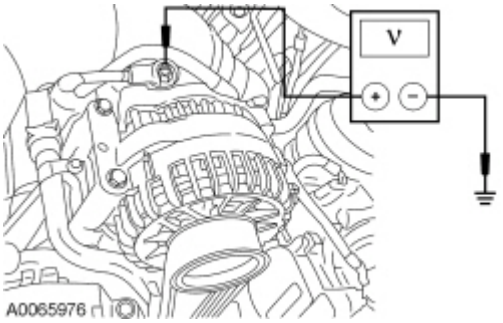
- DTC P0620 (Generator Control Circuit) — The PCM sets this DTC if the GENCOM circuit or "A" sense circuit are open or shorted to ground.

This pinpoint test is intended to diagnose the following:



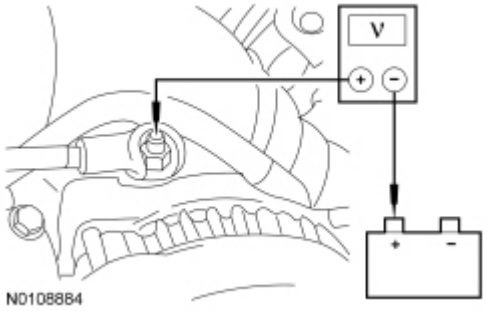
- Fuse
- Wiring, terminals or connectors

- Radial arm adapter
- Generator
- PCM

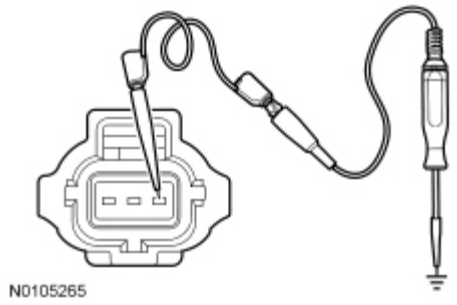


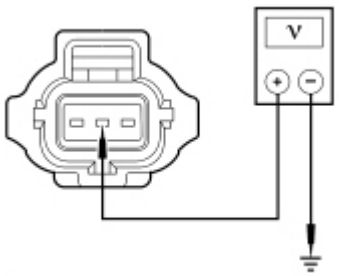
PINPOINT TEST C: DTC P0620

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.



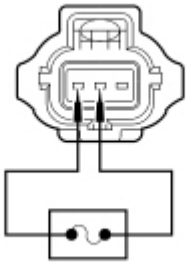
NOTE: Do not have a battery charger attached during vehicle testing.

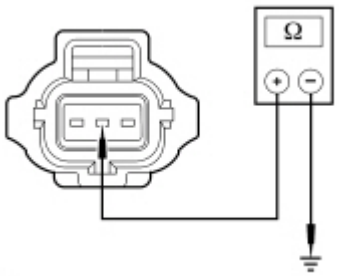




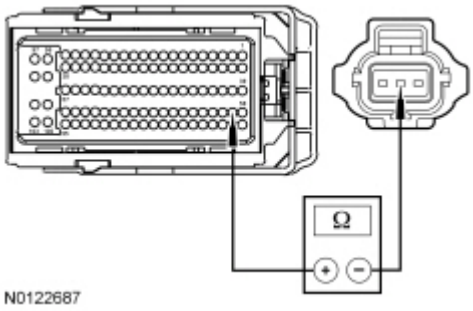
Test Step	Result / Action to Take
C1 CHECK THE BATTERY CONDITION • Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to C2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C2 CHECK THE GENERATOR CONNECTIONS • Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Disconnect: Generator C102A . • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SDC14 (RD). Connection should be tight. • Measure the battery voltage.  AJ0210-A • **NOTE:** 6.2L shown, others similar. • Measure the voltage between generator C102B, B+ circuit SDC14 (RD) and ground.	**Yes** GO to C3 . **No** **For 3.5L, 3.7L and 5.0L engines** , VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , VERIFY fusible links are OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less



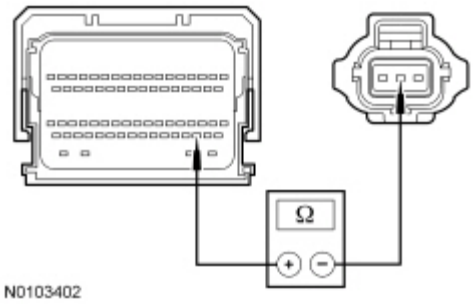


- **Is generator C102B connection tight and does the generator B+ measure battery voltage?**



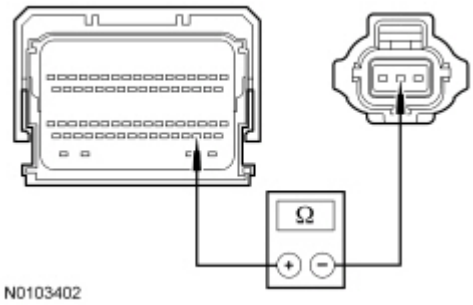
C3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Connect: Generator C102A . • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C102B, circuit SDC14 (RD) and the positive battery terminal.  • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	**Yes** GO to C4 . **No** INSPECT circuit SDC14 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C4 "A" SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition OFF. • Disconnect: Generator C102A . • Ignition ON. • Using a 12-volt test lamp connected to ground, while performing a wiggle test on the generator harness, check for voltage at: ▪ **For 3.5L, 3.7L and 5.0L engines** , generator C102A-3, circuit SBB45 (GY/RD), harness side. ▪ **For 6.2L engines** , generator C102A-3, circuit SDC14	**Yes** GO to C5 . **No** **For 3.5L, 3.7L and 5.0L engines** , VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , VERIFY fusible links are OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs.

(RD), harness side.  N0105265 • **Does the test lamp illuminate?**	REPEAT the self-test. TEST the system for normal operation.
C5 CHECK THE GENERATOR COMMAND LINE FAULT (GENCMD_LF) PID • Ignition OFF. • Connect: Generator C102A . • Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ▪ Generator Monitor (GENMON) ▪ Generator Command (GENCMD) ▪ Generator Command Line Fault (GENCMD_LF) • With the engine running at idle, monitor the GENCMD_LF PID. • **Does the GENMON_LF PID indicate FAULT?**	**Yes** GO to C6 . **No** GO to C9 .
C6 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO POWER • Ignition OFF. • Disconnect: Generator C102A . • Ignition ON. • Measure the voltage between generator C102A-2, circuit CDC10 (BU/OG), harness side and ground.  N0087307 • **Does voltage read 1 volt or less?**	**Yes** GO to C7 . **No** GO to C11 .
C7 COMPARE THE PCM PIDs GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD) • Ignition OFF. • Connect a fused jumper wire between generator C102A-1, circuit CDC15 (VT), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.	**Yes** GO to C12 . **No** GO to C8 .



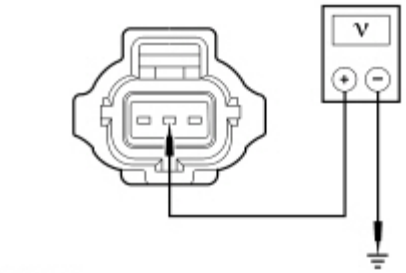
repair4less

 N0074142 • Start the engine. • Monitor the GENMON and GENCMD PIDs while performing a wiggle test on the generator harness. • **Does the GENMON PID read within 5% of the GENCMD PID?**	
C8 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO GROUND	**Yes** GO to C9 . **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
• Ignition OFF. • Disconnect: Generator C102A (if not previously disconnected) . • Disconnect: PCM C1551B (3.5L) (if not previously disconnected) . • Disconnect: PCM C175B (3.7L) (if not previously disconnected) . • Disconnect: PCM C1381B (5.0L and 6.2L) (if not previously disconnected) . • Measure the resistance between the generator C102A-2, circuit CDC10 (BU/OG), harness side and ground.  N0105266 • **Is the resistance greater than 10,000 ohms?**	
C9 CHECK THE GENERATOR COMMAND CIRCUIT FOR DAMAGE OR AN OPEN	**Yes** GO to C10 . **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
• Ignition OFF. • Disconnect: Fused Jumper Wire . • Disconnect: PCM C1551B (3.5L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1381B (5.0L and 6.2L) . • Inspect the following harness connectors for damaged or pushed-out pins: ▪ PCM C1551B-59, circuit CDC10 (BU/OG) (3.5L) ▪ PCM C175B-53, circuit CDC10 (BU/OG) (3.7L) ▪ PCM C1381B-53, circuit CDC10 (BU/OG) (5.0L and 6.2L) ▪ Generator C102A-2, circuit CDC10 (BU/OG) • **For 3.5L equipped vehicles** , measure the resistance	



between PCM C1551B-59, circuit CDC10 (BU/OG), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.

- **For 3.7L equipped vehicles** , measure the resistance between PCM C175B-53, circuit CDC10 (BU/OG), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.



- **For 5.0L and 6.2L equipped vehicles** , measure the resistance between PCM C1381B-53, circuit CDC10 (BU/OG), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.

- **Are the connectors and pins free of damage and is the resistance less than 5 ohms?**

C10 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS	
• Connect: Generator C102A . • Connect: PCM C1551B (3.5L) . • Connect: PCM C175B (3.7L) . • Connect: PCM C1381B (5.0L and 6.2L) . • Ignition ON. • Clear all DTCs. • Start the engine and let the engine run for 5 minutes.	**Yes** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test.

repair4less

• Retrieve Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules. • **Did any charging system DTC get stored into memory?**	TEST the system for normal operation. **No** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C11 CHECK GENERATOR COMMAND CIRCUIT FOR SHORT TO VOLTAGE • Ignition OFF. • Disconnect: Generator C102A . • Disconnect: PCM C1551B (3.5L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1381B (5.0L and 6.2L) . • Ignition ON. • Measure the voltage between generator C102A-2, circuit CDC10 (BU/OG), harness side and ground.  N0087307 • **Is any voltage present?**	**Yes** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to C12 .
C12 INSPECT GENERATOR CONNECTORS AND CIRCUITS • Ignition OFF. • Disconnect: PCM C1551B (3.5L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1381B (5.0L and 6.2L) . • Inspect the following connector pins for damage and/or corrosion: ▪ PCM C1551B-96, circuit GD113 (BK/YE) (3.5L) ▪ PCM C1551B-97, circuit GD113 (BK/YE) (3.5L) ▪ PCM C1551B-98, circuit GD113 (BK/YE) (3.5L) ▪ PCM C1551B-99, circuit GD113 (BK/YE) (3.5L) ▪ PCM C175B-50, circuit GD113 (BK/YE) (3.7L) ▪ PCM C175B-69, circuit GD113 (BK/YE) (3.7L) ▪ PCM C175B-70, circuit GD113 (BK/YE) (3.7L) ▪ PCM C1381B-50, circuit GD113 (BK/YE) (5.0L and 6.2L) ▪ PCM C1381B-69, circuit GD113 (BK/YE) (5.0L and 6.2L)	**Yes** GO to C13 . **No** REPAIR high resistance or loose connections in the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

▪ PCM C1381B-70, circuit GD113 (BK/YE) (5.0L and 6.2L) ▪ Generator C102A-1, circuit CDC15 (VT) ▪ Generator C102A-2, circuit CDC10 (BU/OG) • **Are the connectors and circuits OK?**	
C13 CHECK FOR CORRECT PCM OPERATION	
• Ignition OFF. • Disconnect all the PCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the PCM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTC P0625 or P0626

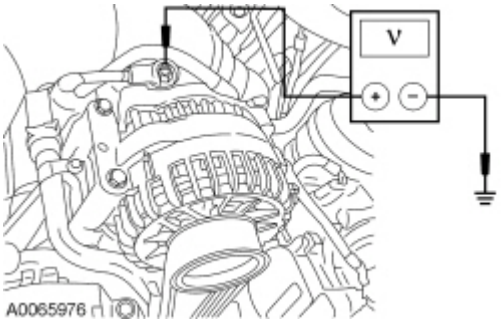
Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

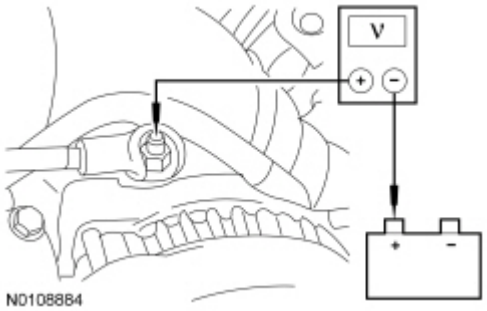
The PCM monitors the generator output via the generator monitor (GENMON) circuit (generator field terminal circuit). If the PCM cannot read the GENMON circuit due to an open or short to ground, when the engine speed is greater than approximately 2,000 rpm, the generator defaults to a steady voltage of approximately 13.5 volts and the PCM sends a request to the Instrument Panel Cluster (IPC) to illuminate the charging system warning indicator. A GENMON duty cycle of 3% or less indicates a short to ground fault is present and results in DTC P0625 setting in the PCM. A GENMON duty cycle of 98% or more indicates an open or short to voltage fault is present and results in DTC P0626 setting in the PCM.

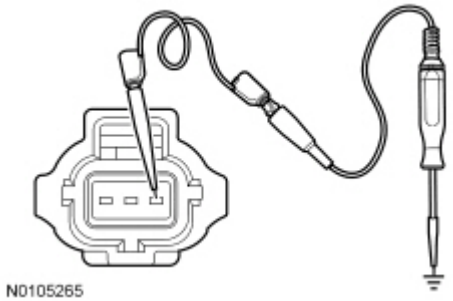
- DTC P0625 (Generator Field Terminal Circuit Low) — The PCM sets this DTC if the GENMON circuit is shorted to ground, the "A" sense circuit is open or the B+ circuit is open. This DTC also sets by a faulted PCM or generator.
- DTC P0626 (Generator Field Terminal Circuit High) — The PCM sets this DTC if the GENMON circuit is open or shorted to power. This DTC can also be set by a faulted PCM or generator.

This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Radial arm adapter
- Engine, generator and battery grounds
- Battery
- Generator
- PCM

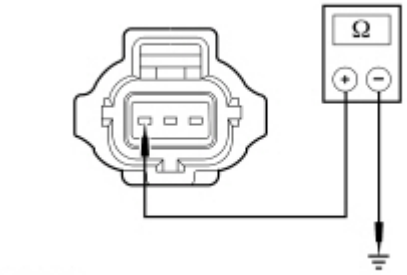




PINPOINT TEST D: DTC P0625 OR P0626

repair4less

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.



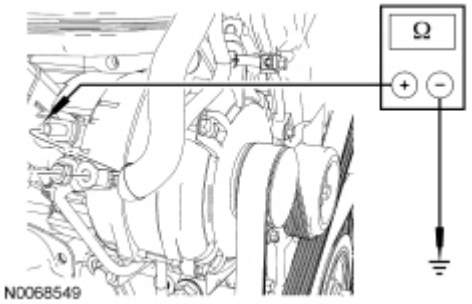
NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
D1 CHECK THE BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to D2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D2 CHECK THE GENERATOR B+ CONNECTION	
• Ignition OFF. • Inspect generator C102B, circuit SDC14 (RD), harness side. Connection should be tight. • Inspect generator radial adaptor connection on rear of generator. Connection should be tight. • Measure the voltage between generator C102B, circuit SDC14 (RD) and ground.  • **Are the generator C102B connections tight and does the generator B+ measure battery voltage?**	**Yes** GO to D3 . **No** **For 3.5L, 3.7L and 5.0L engines** , TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C102B, circuit SDC14 (RD) and the positive battery terminal.	**Yes** **For DTC P0625** , GO to D4 . **For DTC P0626** , GO to D6 . **No** INSPECT circuit SDC14 (RD),

 N0108884 • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D4 "A" SENSE CIRCUIT LOAD TEST ***NOTICE:*** **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition OFF. • Disconnect: Generator C102A . • Ignition ON. • Using a 12-volt test lamp connected to ground, while performing a wiggle test on the generator harness, check for voltage at: ▪ **For 3.5L, 3.7L and 5.0L engines** , generator C102A-3, circuit SBB45 (GY/RD), harness side. ▪ **For 6.2L engines** , generator C102A-3, circuit SDC14 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	**Yes** GO to D5 . **No** **For 3.5L, 3.7L and 5.0L engines** , VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SBB45 (GY/RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , VERIFY fusible links are OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D5 CHECK GENMON CIRCUIT FOR DAMAGE OR A SHORT TO GROUND • Ignition OFF. • Disconnect: PCM C1551B (3.5L) . • Disconnect: PCM C175B (3.7L) .	**Yes** GO to D10 .

repair4less

- Disconnect: PCM C1381B (5.0L and 6.2L) .
- Inspect the following harness connectors for damaged or pushed-out pins:
  - PCM C1551B-26, circuit CDC15 (VT) (3.5L)
  - PCM C175B-14, circuit CDC15 (VT) (3.7L)
  - PCM C1381B-14, circuit CDC15 (VT) (5.0L and 6.2L)
  - Generator C102A-1, circuit CDC15 (VT)
- Measure the resistance between generator C102A-1, circuit CDC15 (VT), harness side and ground.



N0105271

- **Are the connectors and pins free of damage and is the resistance greater than 10,000 ohms?**

No
REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D6 CHECK THE GENERATOR B+ RESISTANCE

- Ignition OFF.
- **NOTE:** Failure to disconnect the battery will result in false resistance readings.
- Disconnect the battery. Refer to Section 414-01 .
- Disconnect: Generator C102B .
- Measure the resistance between generator C102B, component side and the generator housing.

N0068549

- **Is the resistance greater than 25K ohms?**

Yes
GO to D7 .

No
INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

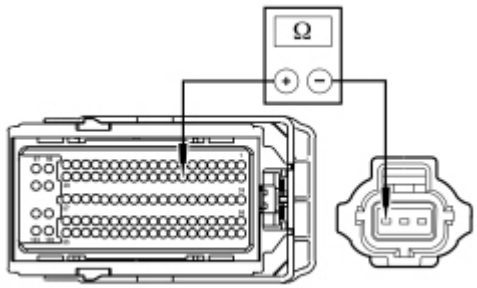
D7 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS TO GROUND

- Disconnect: Generator C102A .
- Measure the resistance between generator C102A, component side and ground. Refer to the following table.

Pin	Expected Resistance
1	Greater than 10K ohms
2	Greater than 10K ohms

Yes
GO to D8 .

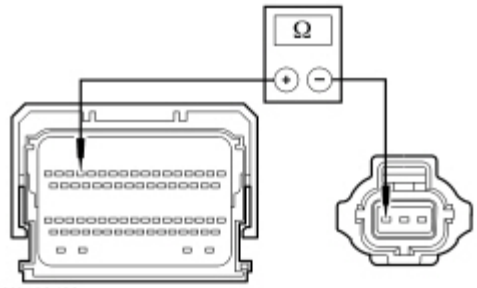
No
INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the



3	Greater than 10K ohms

- **Are the resistance values as indicated?**

system for normal operation.

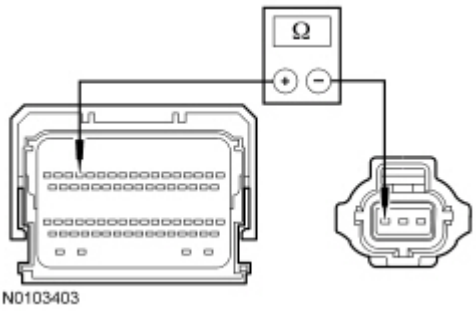


D8 CHECK THE GENMON CIRCUIT FOR DAMAGE OR AN OPEN

- Disconnect: PCM C1551B (3.5L) .
- Disconnect: PCM C175B (3.7L) .
- Disconnect: PCM C1381B (5.0L and 6.2L) .
- Inspect the following harness connectors for damaged or pushed-out pins:
  - PCM C1551B-26, circuit CDC15 (VT) (3.5L)
  - PCM C175B-14, circuit CDC15 (VT) (3.7L)
  - PCM C1381B-14, circuit CDC15 (VT) (5.0L and 6.2L)
  - Generator C102A-1, circuit CDC15 (VT)
- **For 3.5L equipped vehicles** , measure the resistance between PCM C1551B-26, circuit CDC15 (VT), harness side and generator C102A-1, circuit CDC15 (VT), harness side.

N0122688

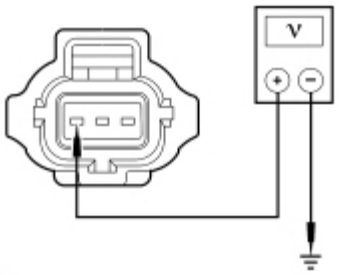
- **For 3.7L equipped vehicles** , measure the resistance between PCM C175B-14, circuit CDC15 (VT), harness side and generator C102A-1, circuit CDC15 (VT), harness side.

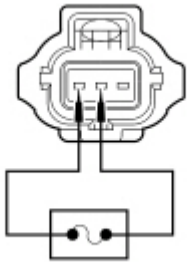


N0103403

- **For 5.0L an 6.2L equipped vehicles** , measure the resistance between PCM C1381B-14, circuit CDC15 (VT), harness side and generator C102A-1, circuit CDC15 (VT), harness side.

Yes
GO to D9 .





No
REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less

N0103403

- **Are the connectors and pins free of damage and is the resistance less than 5 ohms?**

D9 CHECK THE GENMON CIRCUIT FOR A SHORT TO POWER	
• Connect the battery. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between generator C102A-1, circuit CDC15 (VT), harness side and ground.  N0105272 • **Is there any voltage present?**	**Yes** REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D10 .
D10 COMPARE THE PCM PIDs GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD)	
• Ignition OFF. • Connect: PCM C1551B (3.5L) . • Connect: PCM C175B (3.7L) . • Connect: PCM C1381B (5.0L and 6.2L) . • Connect a fused jumper wire between generator C102A-1, circuit CDC15 (VT), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • Using the active command, set the GENVDSD PID to 14.0 volts. • Monitor the GENMON and GENCMD PIDs while carrying	**Yes** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D11 .

out a wiggle test on the generator wiring harness. • **Does the GENMON PID read within 2% of the GENCMD PID?**	
D11 CHECK FOR CORRECT PCM OPERATION	

• Ignition OFF.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PCM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTC P065B

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

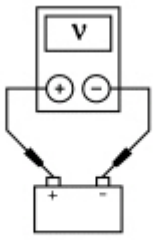
Normal Operation

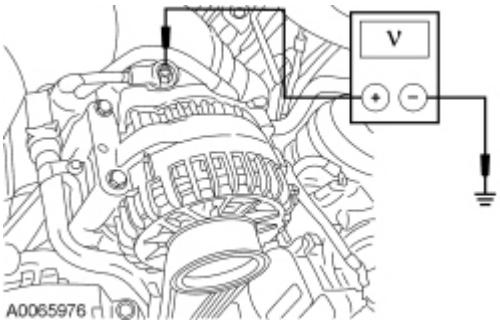
With the engine running, the PCM monitors and expects to receive a valid generator monitor (GENMON) signal with a duty cycle greater than 5% and less than 98%. The PCM also monitors the state of the generator command (GENCMD) signal line to make sure it is not stuck high or stuck low. A DTC sets if the GENMON or GENCMD signal fluctuates between out-of-valid range, stuck high, stuck low, or some combination and normal. When the engine speed is greater than approximately 2,000 rpm, the generator defaults to a steady voltage of approximately 13.5 volts and the PCM sends a request to the Instrument Panel Cluster (IPC) to illuminate the charging system warning indicator lamp.

- DTC P065B (Generator Control Circuit Range/Performance) — The PCM sets this DTC if the input frequency was continuously less than 80 Hz or more than 200 Hz. Additionally, if the signal shows a faulted condition that is happening in a fluctuating manner, the PCM tracks the fluctuations between faulted and normal conditions. This DTC can also set if the fluctuations occur frequently within a short amount of time.

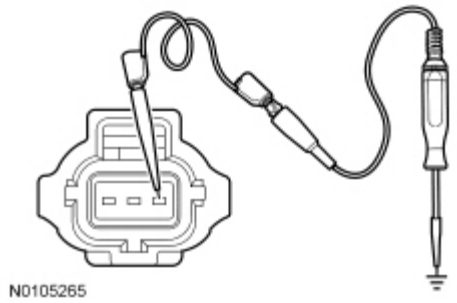
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Radial arm adapter
- Generator
- PCM



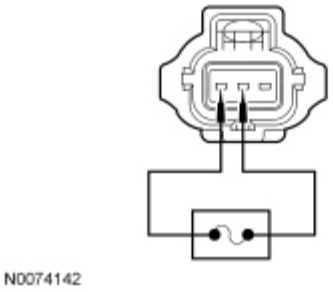


PINPOINT TEST E: DTC P065B



NOTE: Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.



Test Step	Result / Action to Take
E1 CHECK THE BATTERY CONDITION	

repair4less

• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to E2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E2 CHECK THE GENERATOR CONNECTIONS	
• Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Disconnect: Generator C102A . • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SDC14 (RD). Connection should be tight. • Measure the battery voltage.  AJ0210-A • **NOTE:** 6.2L shown, others similar. • Measure the voltage between generator C102B, B+ circuit SDC14 (RD) and ground.  • **Is generator C102B connection tight and does the generator B+ measure battery voltage?**	**Yes** GO to E3 . **No** **For 3.5L, 3.7L and 5.0L engines** , TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E3 "A" SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help	**Yes** GO to E4 . **No** **For 3.5L, 3.7L and 5.0L engines** , VERIFY high current BJB 250A fuse is OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring

show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition ON. • Using a 12-volt test lamp connected to ground, while performing a wiggle test on the generator harness, check for voltage at: ▪ **For 3.5L, 3.7L and 5.0L engines** , generator C102A-3, circuit SBB45 (GY/RD), harness side. ▪ **For 6.2L engines** , generator C102A-3, circuit SDC14 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For 6.2L engines** , VERIFY fusible links are OK. If OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E4 CHECK THE PCM GENERATOR MONITOR FREQUENCY (GENMON_HZ) PID	
• Ignition OFF. • Connect: Generator C102A . • Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ▪ Generator Voltage Desired (GENVDSD) ▪ Generator Monitor Frequency (GENMON_HZ) • Monitor the GENMON_HZ PID. • **Does the PID read between 80-200 Hz?**	**Yes** GO to E8 . **No** GO to E5 .
E5 CHECK THE PCM GENERATOR MONITOR FREQUENCY (GENMON_HZ) PID WITH GENERATOR C102A DISCONNECTED	
• Ignition OFF. • Disconnect: Generator C102A . • Start the engine. • Monitor the GENMON_HZ PID. • **Does the PID read between 0-2 Hz?**	**Yes** GO to E7 . **No** GO to E6 .
E6 CHECK GENERATOR CIRCUITRY	
***NOTICE:* This pinpoint test step directs testing circuits using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while making sure that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** • Ignition OFF.	**Yes** INSPECT the harness for wire to wire shorts or insulation chaffing, mis-pinned connectors and correct wire colors and REPAIR generator circuit CDC15 (VT) as needed. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less

• **For 3.5L equipped vehicles** , with PCM C175B connected, connect a fused jumper wire between PCM C1551B-26, circuit CDC15 (VT) and ground by carefully back probing the connector. • **For 3.7L equipped vehicles** , with PCM C175B connected, connect a fused jumper wire between PCM C175B-14, circuit CDC15 (VT) and ground by carefully back probing the connector. • **For 5.0L and 6.2L equipped vehicles** , with PCM C1381B connected, connect a fused jumper wire between PCM C1381B-14, circuit CDC15 (VT) and ground by carefully back probing the connector. • Start the engine. • Monitor the GENMON_HZ PID. • **Does the PID read 0 Hz?**	**No** GO to E9 .
E7 MONITOR THE PCM PID GENERATOR MONITOR FREQUENCY (GENMON_HZ) WHILE ACTIVATING THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID	
• Ignition OFF. • Connect a fused jumper wire between generator C102A-1, circuit CDC15 (VT), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • With the engine running at idle, set the active command GENVDSD PID to 14 volts. • Monitor the GENMON_HZ PID while performing a wiggle test on the generator harness. • **Does the GENMON_HZ PID read between 120-130 Hz?**	**Yes** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to E9 .
E8 CHECK THE PCM GENERATOR COMMAND LINE FAULT (GENCMD_LF) PID	
• With the engine running and all selectable loads OFF, monitor the PCM PID GENCMD_LF. • **Does the PCM PID GENCMD_LF fluctuate from YES FAULT to NO FAULT?**	**Yes** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT

	a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E9 CHECK FOR CORRECT PCM OPERATION
• Ignition OFF.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PCM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Generator is Noisy

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system. There are several sources of generator noise which include bearing noise, electrical fault noise, generator or belt pulley misalignment. A generator with certain types of diode or stator failures may also produce an audible noise.

This pinpoint test is intended to diagnose the following:

- Front End Accessory Drive (FEAD) belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST F: THE GENERATOR IS NOISY

Test Step	Result / Action to Take
F1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS • Ignition OFF. • Check the accessory drive belt and tensioner for damage and correct installation. Refer to Section 303-05 . • Check the accessory mounting brackets and generator pulley for looseness or misalignment.	**Yes** GO to F2 . **No** REPAIR as necessary. REFER to Section 303-05 for diagnosis and testing of the

repair4less

• **Is the accessory drive OK?**	accessory drive system. TEST the system for normal operation.
F2 CHECK THE GENERATOR MOUNTING • Check the generator mounting for loose bolts or misalignment. • **Is the generator mounted correctly?**	**Yes** GO to F3 . **No** REPAIR as necessary. TEST the system for normal operation.
F3 CHECK THE GENERATOR FOR NOISE • With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise. • **Is the generator the noise source?**	**Yes** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. **No** REFER to Section 303-00 to diagnose the source of the engine noise.

Pinpoint Test G: Radio Interference

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Wiring, terminals or connectors
- In-vehicle entertainment system

PINPOINT TEST G: RADIO INTERFERENCE

NOTE: If the OEM ACM has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before following this pinpoint test.

NOTE: If the engine is operated at greater than 2,000 rpm momentarily, the generator self-excites. Make sure when the generator is disconnected the engine rpm stays below 2,000 rpm. If it does rise above 2,000 rpm, turn the ignition to the OFF position and start the test over again.

NOTE: Inspect for any aftermarket accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.

Test Step	Result / Action to Take
G1 VERIFY THE GENERATOR IS	

THE SOURCE OF THE RADIO INTERFERENCE	
• Start the engine and allow the engine to idle. • Tune the ACM to a station where the interference is present. • Ignition OFF. • Disconnect: Generator C102B . • Start the engine and allow the engine to idle. • **Is the interference present with the generator disconnected?**	**Yes** Refer to the appropriate section in Group 415 for the procedure.. Refer to Diagnosis and Testing of the In-Vehicle Entertainment System. **No** INSTALL a new generator. REFER to Generator — 3.5L GTDI , Generator — 3.7L , Generator — 5.0L or Generator — 6.2L in this section. TEST the system for normal operation.

Pinpoint Test H: DTC P0A5A, P0A5B, P0A5C

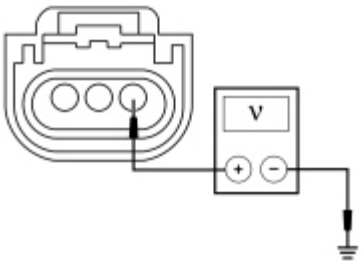
Refer to Wiring Diagrams Cell 13 , Power Distribution/BCM for schematic and connector information.

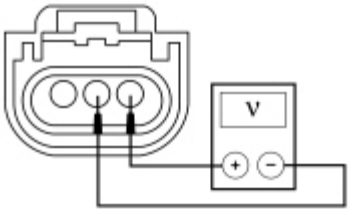
Normal Operation

The generator current sensor is a Hall-effect sensor attached to the generator B+ cable. It is supplied a 5 volt reference and ground from the PCM. The PCM reads the generator current sensor feedback voltage to determine how much current is flowing through the generator B+ cable.

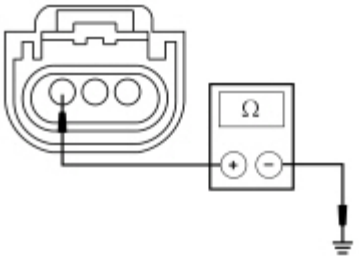
- DTC P0A5A (Generator Current Sensor Circuit Range/Performance) — The PCM does not detect current through the generator current sensor and there are no generator current sensor circuit DTCs are set.
- DTC P0A5B (Generator Current Sensor Circuit Low) — The PCM senses lower than expected voltage on the generator current sensor feedback circuit, indicating an open or a short directly to ground.
- DTC P0A5C (Generator Current Sensor Circuit High) — The PCM senses higher than expected voltage on the generator current sensor feedback circuit, indicating a short directly to voltage.

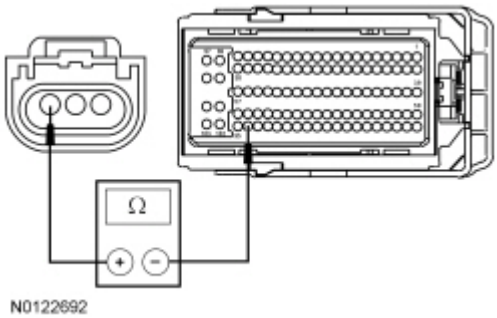
This pinpoint test is intended to diagnose the following:

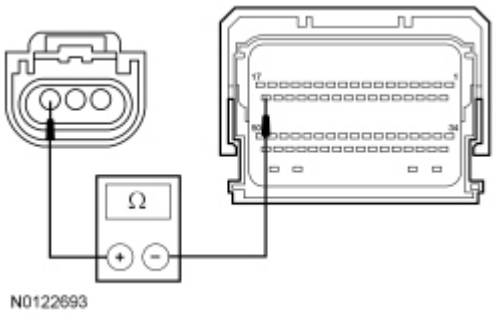




- Wiring, terminals or connectors
- Battery current sensor
- BCM

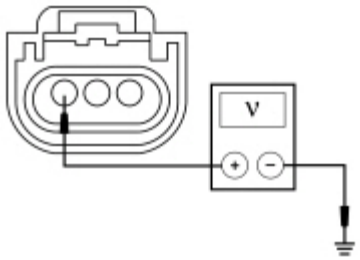


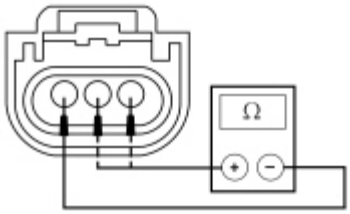




PINPOINT TEST H: DTC P0A5A, P0A5B, P0A5C

Test Step	Result / Action to Take
H1 CHECK THE PCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — PCM . • Check the PCM DTCs. • **Is DTC P0A5A present?**	**Yes** GO to H2 . **No** **For DTC P0A5B** , GO to H3 . **For DTC P0A5C** , GO to H7 .
H2 CHECK THE GENERATOR CURRENT SENSOR	





repair4less

• Inspect the generator current sensor for the following:
  ■ Physical damage
  ■ Corrosion
  ■ Disconnected electrical connector
  ■ Disconnected from generator B+ cable
  ■ Debris between the generator current sensor and the generator B+ cable
• **Are any of these conditions found during inspection?**
	Yes
	REPAIR as necessary or INSTALL a new generator current sensor. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	GO to H9 .

H3 CHECK THE PCM OUTPUT VOLTAGE	
• Ignition OFF. • Disconnect: Generator Current Sensor C1645 . • Ignition ON. • Measure the voltage between ground and generator current sensor C1645-1, circuit LE424 (YE/GN), harness side.  N0122689 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to H4 . **No** If the voltage is less than 4.7 volts, REPAIR circuit LE424 (YE/GN) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the voltage is greater than 5.1 volts, REPAIR circuit LE424 (YE/GN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H4 CHECK THE GENERATOR CURRENT SENSOR GROUND CIRCUIT	
• Measure the voltage between generator current sensor C1645-2, circuit RE407 (YE/VT), harness side and generator current sensor C1645-1, circuit LE424 (YE/GN), harness side.  N0122690 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to H5 . **No** REPAIR circuit RE407 (YE/VT) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H5 CHECK THE FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C1551B (3.5L) . • Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1381B (5.0L) . • Measure the resistance between ground and generator	**Yes** GO to H6 . **No** REPAIR circuit VDC61 (VT/GN)

current sensor C1645-3, circuit VDC61 (VT/GN), harness side.  N0122691 • **Is the resistance greater than 10,000 ohms?**	for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H6 CHECK THE FEEDBACK CIRCUIT FOR AN OPEN	
• **For 3.5L engines** , measure the resistance between generator current sensor C1645-3, circuit VDC61 (VT/GN), harness side and PCM C1551B-94, circuit VDC61 (VT/GN), harness side.  N0122692 • Measure the resistance between generator current sensor C1645-3, circuit VDC61 (VT/GN), harness side and: ▪ **For 3.7L engines** , PCM C175B-33, circuit VDC61 (VT/GN), harness side. ▪ **For 5.0L engines** , PCM C1381B-33, circuit VDC61 (VT/GN), harness side.  N0122693 • **Is the resistance less than 5 ohms?**	**Yes** GO to H7 . **No** REPAIR circuit VDC61 (VT/GN) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H7 CHECK THE FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Generator Current Sensor C1645 . • Disconnect: PCM C1551B (3.5L) .	**Yes** REPAIR circuit VDC61 (VT/GN) for a short to voltage. CLEAR the

repair4less

• Disconnect: PCM C175B (3.7L) . • Disconnect: PCM C1381B (5.0L) . • Ignition ON. • Measure the voltage between ground and generator current sensor C1645-3, circuit VDC61 (VT/GN), harness side.  N0122694 • **Is any voltage present?**	DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to H8 .
H8 CHECK THE FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR REFERENCE CIRCUIT	
• Ignition OFF. • Measure the resistance between generator current sensor C1645-3, circuit VDC61 (VT/GN), harness side and: ▪ generator current sensor C1645-1, circuit LE424 (YE/GN), harness side. ▪ generator current sensor C1645-2, circuit RE407 (YE/VT), harness side.  N0122695 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H9 . **No** REPAIR circuit VDC61 (VT/GN) for a short to circuit LE424 (YE/GN) or RE407 (YE/VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H9 CHECK THE GENERATOR CURRENT SENSOR CONNECTION	
• Ignition OFF. • Disconnect the generator current sensor connector. • Inspect the generator current sensor connector for: ▪ corrosion ▪ pushed-out terminals ▪ damaged terminals • Connect and correctly seat the generator current sensor connector. • Ignition ON. • Clear the DTCs. • Enter the following diagnostic mode on the scan tool: Self-Test — PCM . • **Did the DTC return?**	**Yes** REPAIR as necessary or INSTALL new generator current sensor. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. If the DTC returns, GO to H10 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

H10 CHECK FOR CORRECT PCM OPERATION	

• Ignition OFF.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PCM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: DTC U1007:31

Refer to Wiring Diagrams Cell 13 , Power Distribution/BCM for schematic and connector information.

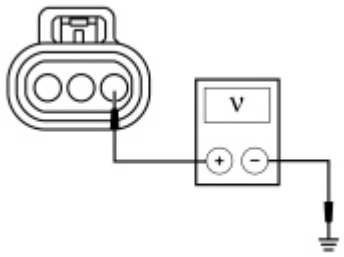
Normal Operation

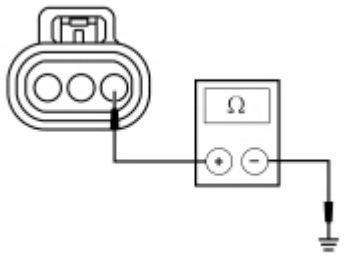
The battery current sensor is a Hall-effect sensor attached to the battery ground cable. It is supplied a 5 volt reference and ground from the Body Control Module (BCM). The BCM reads the battery current sensor feedback voltage to determine how much current is flowing through the battery ground cable.

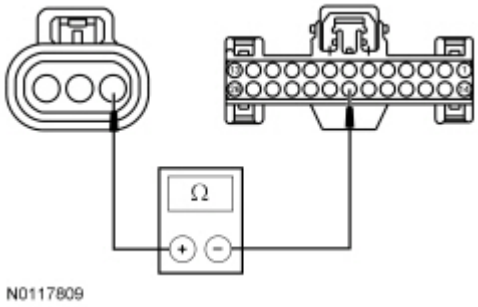
- DTC U1007:31 (Lost Communication With Battery Monitoring Sensor "A": No Signal) — The BCM does not indicate current from the battery current sensor.

This pinpoint test is intended to diagnose the following:

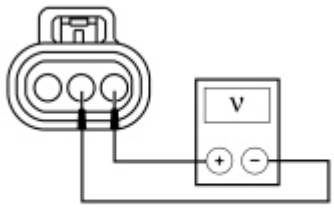
- Wiring, terminals or connectors
- Battery current sensor
- BCM







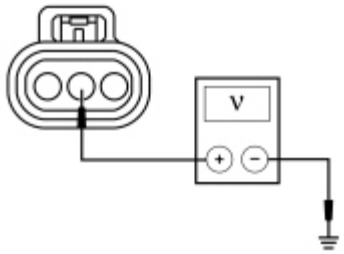
PINPOINT TEST I: DTC U1007:31

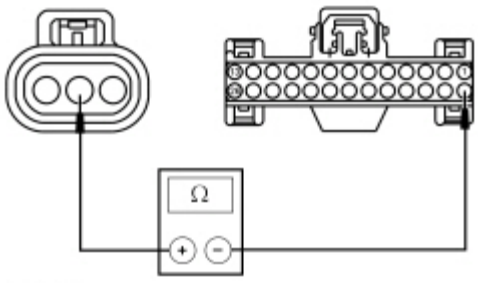


Test Step	Result / Action to Take
I1 CHECK THE BATTERY CURRENT SENSOR	

• Inspect the battery current sensor for the following:
  ▪ Physical damage
  ▪ Corrosion
  ▪ Disconnected electrical connector
  ▪ Disconnected from battery ground cable
  ▪ Debris between the battery current sensor and the battery ground cable
• **Are any of these conditions found during inspection?**
	Yes
	GO to I12 .
	
	No
	GO to I2 .

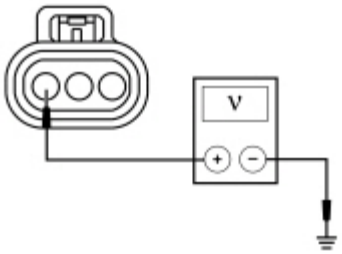
I2 CHECK THE BCM OUTPUT VOLTAGE	
• Ignition OFF. • Disconnect: Battery Current Sensor C1646 . • Ignition ON. • Measure the voltage between ground and battery current sensor C1646-1, circuit SDC57 (BU/OG), harness side.	**Yes** GO to I5 . **No** If the voltage is less than 4.7 volts, GO to I3 .

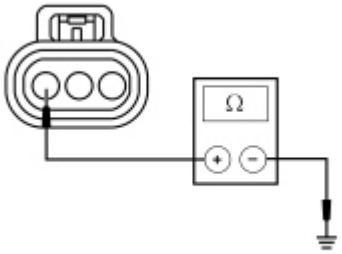


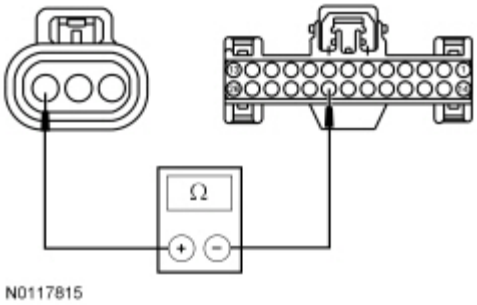


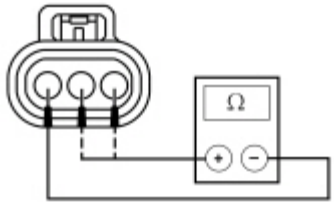
repair4less

 N0117807 • **Is the voltage between 4.7 and 5.1 volts?**	If the voltage is greater than 5.1 volts, REPAIR circuit SDC57 (BU/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I3 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Body Control Module (BCM) C2280F . • Measure the resistance between ground and battery current sensor C1646-1, circuit SDC57 (BU/OG), harness side.  N0117808 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I4 . **No** REPAIR circuit SDC57 (BU/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I4 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the resistance between battery current sensor C1646-1, circuit SDC57 (BU/OG), harness side and Body Control Module (BCM) C2280F-20, circuit SDC57 (BU/OG), harness side.  N0117809 • **Is the resistance less than 5 ohms?**	**Yes** GO to I12 . **No** REPAIR circuit SDC57 (BU/OG) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I5 CHECK THE BCM SENSOR GROUND	
• Measure the voltage between battery current sensor C1646-2, circuit RDC59 (GY/BN), harness side and battery current sensor C1646-1, circuit SDC57 (BU/OG), harness side.	**Yes** GO to I8 . **No** GO to I6 .









N0117810

- **Is the voltage greater than 4.7 volts?**

I6 CHECK THE SIGNAL RETURN CIRCUIT FOR VOLTAGE	
• Measure the voltage between ground and battery current sensor C1646-2, circuit RDC59 (GY/BN), harness side.  N0117811 • **Is any voltage present?**	**Yes** If the voltage is 5.1 volts or less, REPAIR circuit RDC59 (GY/BN) for a short to circuit SDC57 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the voltage is greater than 5.1 volts REPAIR circuit RDC59 (GY/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to I7 .
I7 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Body Control Module (BCM) C2280F . • Measure the resistance between battery current sensor C1646-2, circuit RDC59 (GY/BN), harness side and BCM C2280F-14, circuit RDC59 (GY/BN), harness side.  N0117812 • **Is the resistance less than 5 ohms?**	**Yes** GO to I12 . **No** REPAIR circuit RDC59 (GY/BN) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I8 CHECK THE FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Body Control Module (BCM) C2280F . • Ignition ON. • Measure the voltage between ground and battery current sensor C1646-3, circuit LDC59 (BU/WH), harness side.	**Yes** REPAIR circuit LDC59 (BU/WH) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

repair4less

 N0117813 • **Is the voltage greater then 11 volts?**	operation. **No** GO to I9 .
I9 CHECK THE FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and battery current sensor C1646-3, circuit LDC59 (BU/WH), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I10 . **No** REPAIR circuit LDC59 (BU/WH) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I10 CHECK THE FEEDBACK CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280F . • Measure the resistance between battery current sensor C1646-3, circuit LDC59 (BU/WH), harness side and BCM C2280F-21, circuit LDC59 (BU/WH), harness side.  N0117815 • **Is the resistance less than 5 ohms?**	**Yes** GO to I11 . **No** REPAIR circuit LDC59 (BU/WH) for an open or high resistance. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I11 CHECK THE FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR REFERENCE CIRCUIT	
• Measure the resistance between battery current sensor C1646-3, circuit LDC59 (BU/WH), harness side and: ▪ battery current sensor C1646-2, circuit RDC59 (GY/BN), harness side. ▪ battery current sensor C1646-1, circuit SDC57	**Yes** GO to I12 . **No** REPAIR circuit LDC59 (BU/WH)

(BU/OG), harness side.  N0117816 • **Is the resistance greater than 10,000 ohms?**	for a short to circuit RDC59 (GY/BN) or SDC57 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I12 CHECK THE BATTERY CURRENT SENSOR CONNECTION
• Ignition OFF.
• Disconnect the battery current sensor connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect and correctly seat the battery current sensor connector.
• Connect and correctly seat the BCM (if previously disconnected).
• Ignition ON.
• Clear the DTCs.
• Enter the following diagnostic mode on the scan tool: Self-Test — BCM.
• **Did the DTC return?**
	Yes
	REPAIR as necessary or INSTALL a new battery cable assembly. REFER to Section 414-01. CLEAR the DTCs. REPEAT the self-test. If the DTC returns, GO to I13.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

I13 CHECK FOR CORRECT BCM OPERATION
• Ignition OFF.
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the BCM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 418-01. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

repair4less

Principles of Operation

Charging System

The PCM-controlled, or Smart Charge charging system determines the optimal voltage setpoint for the charging system and communicates this information to the voltage regulator. The Smart Charge charging system is designed to set 1 of 6 DTCs any time a charging system fault is present. All of the DTCs can set continuous faults, but not all DTCs set as on-demand faults.

DTC	KOEO	KOER	Continuous
P0562	X	X	X
P0563		X [a]	X [a]
P0620			X
P0625		X	X
P0626		X	X
P065B			X

[a] Requires vehicle speed above 5 mph.

This system uses 2 communication lines between the PCM and the generator/voltage regulator. Both of these communication lines use Pulse-Width Modulation (PWM). The generator communication (GENCOM) line communicates the desired setpoint from the PCM to the voltage regulator. The generator monitor (GENMON) line communicates the generator load and error conditions to the PCM. The GENCOM command is only sent by the PCM when it is necessary to adjust the voltage setpoint. If the setpoint does not need to be changed, several seconds may elapse between PCM GENCOM commands. This normal operation appears in the PID as occasional bursts of pulse-width commands. The third pin on the voltage regulator, the "A" pin, is a circuit dedicated to monitor or sense battery voltage.

The PCM simultaneously controls and monitors the output of the generator. When the current consumption is high or the battery is discharged, the PCM raises engine speed as needed to increase generator output. The generator charges the battery and at the same time supplies power for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM is able to adjust the charging voltage according to the battery temperature, calculated by using a signal from the Intake Air Temperature (IAT) sensor. The PCM also uses other inputs to control charging system voltage such as the Vehicle Speed Sensor (VSS) and Engine Coolant Temperature (ECT). The voltage setpoint is calculated by the PCM and communicated to the voltage regulator by the GENCOM circuit based on the needs of the vehicle and the conditions.

The PCM turns off the generator during cranking to reduce the generator load and improve cranking speed. Once the engine starts, the PCM slowly increases generator output to the desired voltage.

The PCM reports any charging system faults and sends a message through High Speed Controller Area Network (HS-CAN) to the Body Control Module (BCM). The BCM controls the charging system warning indicator by sending a message over the Medium Speed Controller Area Network (MS-CAN) to the Instrument Panel Cluster (IPC). The IPC then controls charging system warning indication based on the

repair4less

message from the PCM through the BCM. The status of the PCM charging system warning indicator and/or message can be confirmed by viewing PCM PID generator fault indicator lamp (GENFIL). Any charging system fault detected by the PCM results in 1 or more DTCs being set and the PID GENFIL having a status of On. If equipped with a charging system warning indicator, the IPC turns the indicator on or off. If equipped with a message center, the IPC displays a CHECK CHARGING SYSTEM message. When the ignition is ON and the engine is off on vehicles equipped with a message center, the CHECK CHARGING SYSTEM message may not be displayed. For information regarding the IPC and message center, refer to Section 413-01.

Under certain circumstances, the charging system may have a concern, but still keeps the battery charged and the vehicle running. GENCOM is normally used to initiate charging, but the generator may charge with a fault in this circuit. If the engine operates at more than 2,000 rpm momentarily, the generator may self-excite or start charging on its own. The charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off. When the engine is restarted and the engine operates at more than 2,000 rpm momentarily, the generator may again self-excite and again the charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed.

The PIDs and their associated descriptions used in the charging system diagnosis are listed below:

PID Chart

PID	Description	Normal Display	Associated Circuit Name	Connector, Circuit
GENMON	Generator Monitor	Constant fluctuating percentage 3%-98%	Generator monitor (GENMON)	C102A-1, CDC15 (VT)
GENCMD	Generator Command	Fluctuating percentage or small intermittent bursts 3%-98%	Generator communication (GENCOM)	C102A-2, CDC10 (BU/OG)
GENVDSD	Generator Voltage Desired	Voltage varies by vehicle needs - May be controlled by an output state control	—	—
GENFIL	Generator Fault Indicator Lamp	OFF if charging system is OK	—	—
GENCMD_LF	Generator Command Line Fault	NO FAULT if GENCOM circuit (GENCMD PID) is OK	—	—
GENMON_HZ	Generator Monitor Frequency	Frequency value	—	—
VPWR	Module Supply Voltage	Within 0.5 volt of battery voltage	—	—
RPM	Engine Revolutions Per Minute	Engine rpm — May be controlled by an output state control	—	—

Load Shed Operation

NOTICE: **When the Body Control Module (BCM) is being programmed, connect an external battery charger to make sure that the module programming is completed without the interruption due to the**

load shedding feature becoming active. The external battery charger must maintain a system voltage above 13 volts. This may require a charger setting higher than the lowest charge setting. The external battery charger negative connection must be made to an engine or vehicle chassis ground and not the negative battery terminal. If the connection is to the negative battery terminal, load shedding cannot be prevented from being invoked and module programming may be corrupted. After charging has begun, start the engine to clear any load shed states and then turn the engine off and proceed with programming.

NOTE: To maintain correct operation of the load shed system, any electrical devices or equipment must be grounded to the engine or chassis ground and not the negative battery terminal. A connection to the negative battery terminal may cause an inaccurate measurement of the battery state of charge and may cause incorrect load shed system operation.

This vehicle is equipped with load shed strategy. The Body Control Module (BCM) monitors system voltage to the BCM and the Power Steering Control Module (PSCM) as well as the battery state of charge using the battery current sensor attached to the negative battery cable.

Engine Off Load Shed

The BCM uses the battery current sensor to keep track of the battery state of charge. The battery current sensor is a Hall-effect sensor attached to the battery ground cable. When the engine is off, and the BCM determines the battery state of charge is below 40% or 10% of the charge has been drained or 45 minutes have elapsed, a load shed message is sent over the Controller Area Network (CAN). This message turns off the audio/navigation system to save the remaining battery charge. Under this condition, the Front Display Interface Module (FDIM) displays SYS OFF TO SAVE BATT (without navigation) or BATTERY SAVER — SYSTEM OFF PLEASE START THE ENGINE (with navigation) to notify the driver that battery protection actions are active.

Engine off load shed occurs when the engine is not running, and the ignition is in the ACC or RUN position. To clear the load shed state, restart the engine.

NOTE: To maintain correct operation of the load shed system, any electrical devices or equipment must be grounded to the engine or chassis ground and not the negative battery terminal. A connection to the negative battery terminal may cause an inaccurate measurement of the battery state of charge and may cause incorrect load shed system operation.

When charging the vehicle battery by connecting the charger to the negative battery terminal is necessary , such as when using a combination battery charger and battery tester/analyzer, like the GR 1 190 V3.0 Intelligent Diagnostic Charger, the BCM will not immediately update the battery state of charge. In this instance, after charging, you must carry out the Battery Monitoring System (BMS) Reset using the scan tool. This reset is needed for proper engine off load shedding and to prevent invoking of engine off load shedding earlier than normal.

NOTE: If the reset is not carried out, when the battery is charged by connecting the charger to the negative battery terminal, it takes approximately 8 hours for the BCM to learn the new battery state of charge. During this 8 hour period, the vehicle must be undisturbed, with no doors opened or keyless entry button presses. If the vehicle is used before the BCM is allowed to learn the new battery state of charge, engine off load shedding can still occur and a message may be displayed.

When charging the vehicle battery by connecting the charger to engine or chassis ground , the negative charger clamp must be connected to an unpainted chassis surface or a solid engine component such as a generator mount or engine lifting eye. In this instance, after charging, the BMS Reset **is not required** . Through this method of charging the BCM will update the battery state of charge during the charging process.

When the ignition is in the RUN position and load shed occurs, the IPC message center displays either TURN POWER OFF TO SAVE BATT (base message center) or TURN POWER OFF TO SAVE BATTERY

repair4less

(optional message center). The audio/navigation system will shut down after the message center displays it's warning.

If a fault occurs with the battery current sensor or circuit(s), the only engine off load shed strategy is a 45 minute timer. After 45 minutes have elapsed, the audio/navigation system turns off. To clear the load shed state, restart the engine.

Engine Running Load Shed

When the BCM and/or PSCM voltage is low, with the engine running, a message is sent by the BCM to either minimize or shut down the climate controlled seats, rear defrost, heated mirrors and Dual Automatic Temperature Control (DATC) blower motor to improve system voltage. Under this condition, the IPC message center displays either LOW BATTERY LESS FEATURES (base message center) or LOW BATTERY FEATURES TEMPORARILY TURNED OFF (optional message center) to notify the driver that battery protection actions are active.

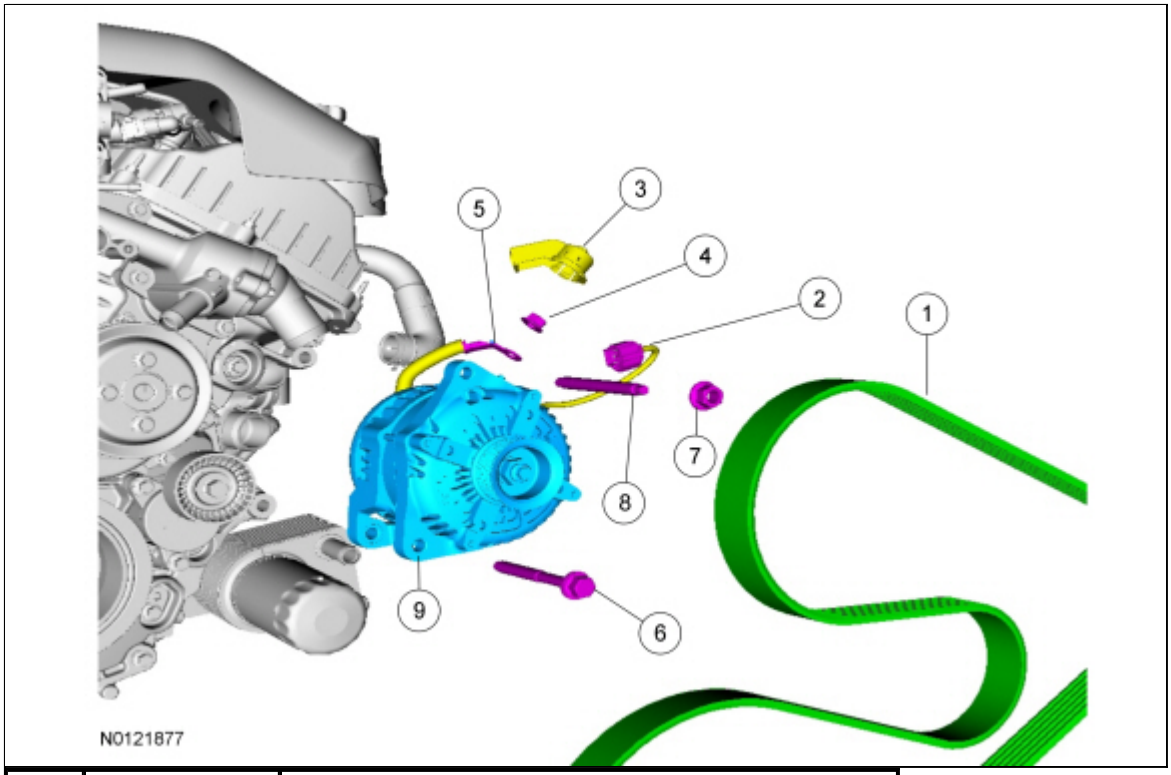
There are 3 states of engine running load shed:

- Load shed 1
- Load shed 2 transient
- Load shed 2 continuous

Load Shed State	Entry Conditions	Impact to Features	Clear Conditions
Load shed 1	**If vehicle speed is below 16 km/h (10 mph):** ● Voltage to the PSCM is less than 11.5 volts. ● PSCM measures current draw greater than 0 amps. **If vehicle speed is above 16 kp/h (10 mph):** ● Voltage to the BCM is less than 11.6 volts.	Climate controlled seats switch from HIGH to MED. If the are already at MED, the state does not change.	Voltage to the BCM is greater than 12.7 volts **or** the generator field duty cycle is less than 88%.
Load shed 2 transient	● Voltage to the PSCM is less than 11.0 volts. ● PSCM measures current draw greater than 20 amps.	● If equipped, climate controlled seats are disabled, but the indicators remain illuminated. ● If equipped, rear defrost and heated mirrors are disabled, but the indicator remain illuminated.	Voltage to the BCM is greater than 12.4 volts.
Load shed 2 continuous	Vehicle was in load shed 2 transient state for greater than 20 seconds.	● If equipped, climate controlled seats are disabled and the indicators are off. ● If equipped, rear defrost and heated mirrors are disabled	Voltage to the BCM is greater than 12.4 volts for more than 60 seconds.

		and the indicator is off. ● If equipped with DATC , the blower motor is reduced to 50% speed. ● If equipped, DC/AC inverter (AC powerpoint) is disabled. ● The base IPC message center displays LOW BATTERY LESS FEATURES. ● The optional IPC message center displays LOW BATTERY FEATURES TEMPORARILY TURNED OFF.	

repair4less



Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• System voltage high	• Fuse • Wiring, terminals or connectors • Engine, generator and battery grounds • Battery • Generator • PCM	• GO to Pinpoint Test A .
• System voltage low or battery is discharged	• Fuse • Fusible link • Wiring, terminals or connectors • Engine, generator and battery grounds • Abnormal ignition-off current drain(s) • Radial arm adapter • Battery • Generator • PCM	• GO to Pinpoint Test B .
• The generator is noisy	• Front End Accessory Drive (FEAD) belt • Loose bolts/brackets • Generator/pulleys	• GO to Pinpoint Test F .
• Radio interference	• Generator • Wiring, terminals or connectors • In-vehicle entertainment system	• GO to Pinpoint Test G .
• Charging system warning indicator is never/always on	• Wiring, terminals or connectors • Instrument Panel Cluster (IPC) • Generator • PCM	• RETRIEVE Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules. If any charging system DTCs are found, REFER to the Diagnostic Trouble Code (DTC) Chart in this section. If no charging system DTCs are found, REFER to Section 413-01 .

Generator — 3.5L GTDI

Item	Part Number	Description
1	8620	Accessory drive belt
2	—	Generator electrical connector (part of 14300)
3	—	Generator B+ protective boot (part of 14300)
4	W711953	Generator B+ terminal nut - 17 Nm (150 lb-in)
5	—	Generator B+ terminal (part of 14300)
6	W715092	Generator bolt (lower) - 47 Nm (35 lb-ft)
7	W520414	Generator stud nut - 47 Nm (35 lb-ft)
8	W715087	Generator stud - 8 Nm (71 lb-in)
9	10346	Generator

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery. For additional information, refer to Section 414-01 .

3. Remove the Air Cleaner (ACL) outlet pipe, LH ACL pipe-to-turbocharger pipe and the LH turbocharger-to-Charge Air Cooler (CAC) pipe. For additional information, refer to Intake Air System

Components - Exploded View in Section 303-12 .

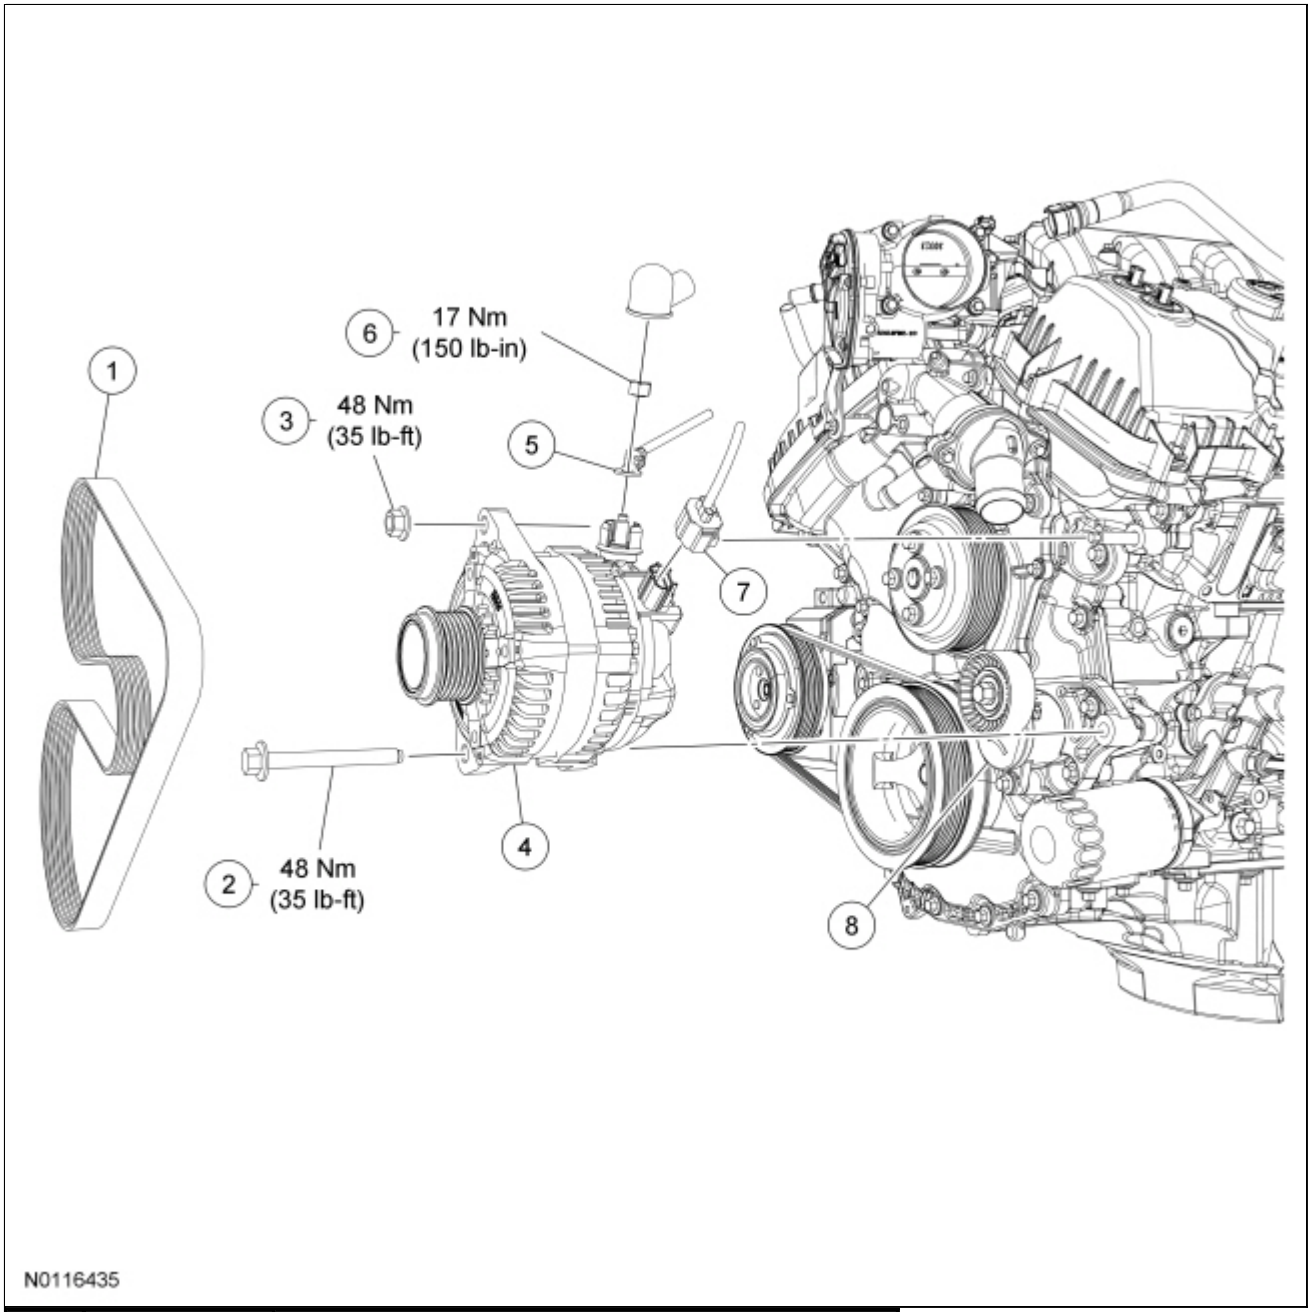
4. Rotate the accessory drive belt tensioner and remove the accessory drive belt from the generator.

5. Remove the LH ACL and CAC pipe bracket. For additional information, refer to Intake Air System Components - Exploded View in Section 303-12 .

6. Position the generator B+ protective boot aside, remove the B+ terminal nut and position the B+ terminal aside.
   - To install, tighten to 17 Nm (150 lb-in).

7. Disconnect the generator electrical connector and position the harness aside.

8. Remove the lower generator bolt.
   - To install, tighten to 47 Nm (35 lb-ft).



9. Remove the generator stud and the generator.
   - To install, tighten to 8 Nm (71 lb-in).

10. To install, reverse the removal procedure.

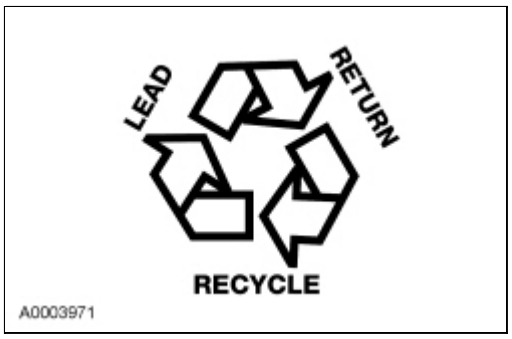
Transmission fluid cooler tube bracket nut	12	—	106

repair4less

Battery and Cables

Vehicles are equipped with a 12-volt, maintenance-free battery.

The battery and cable system consists of the following components:



- Battery
- Battery cable assembly
- Battery tray
- Battery current sensor
- Generator current sensor

For additional information about the the battery and generator current sensors, refer to Section 414-00 .

The battery is a 12V DC source connected in a negative ground system. The battery case is sealed with 2 vent holes to release gases. The battery has 3 major functions:

- Engine cranking power source
- Voltage stabilizer for the electrical system
- Temporary power source when electrical loads exceed the generator output current

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.

repair4less

Battery Drain Test

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Typically, a drain of approximately 1 amp is attributed to an engine compartment lamp, glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it may be due to the generator. Disconnect the generator and retest.

NOTE: To accurately test the drain on a battery, an in-line ammeter must be used between the negative battery post and its respective cable. Use of a test lamp or voltmeter is not an accurate method.

1. Make sure the junction box(es)/fuse panel(s) is accessible without turning on the interior lights or the underhood lights.

2. Drive the vehicle at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.

3. Allow the vehicle to sit with the key out of the ignition for at least 40 minutes to allow the modules to time out/power down.

4. Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent modules from resetting.

5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.

6. ***NOTICE:*** **To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.**

   NOTE: It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire 40-minute procedure must be repeated.

   Connect the battery tester between the negative battery cable and the post. The meter must be capable of reading milliamps and should have a 10-amp capability.

7. **NOTE:** If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

repair4less

Remove the jumper wire.

8. Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

NOTE: If the vehicle sits for an extended period of time and the battery drains, there is the possibility of a control module staying alive and not going into sleep mode. If a module does stay alive, it can also result in battery drain. If a module is suspect, isolate individual modules by disconnecting each module one at a time and note if the excessive draw goes away.

NOTE: For vehicles equipped with aftermarket bodies or boxes which contain electrical connections, disconnect the aftermarket to factory connections to isolate the body from the chassis.

9. If the current draw is excessive, remove the fuses from the Battery Junction Box (BJB) one at a time and note the current drop. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located. The excessive draw can be isolated by continuing to pull sub system fuses. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.
    - Once the main circuit is identified, continue to remove the fuses from the Smart Junction Box (SJB) one at a time and note the current reading. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.

10. Check the wiring diagrams for any circuits that run from the battery without passing through the BJB or the SJB . If the current draw is still excessive, disconnect these circuits until the draw is found. Also, disconnect the generator electrical connections and retest if the draw cannot be located. The generator may be internally shorted, causing the current drain.

Inspection And Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, GO to Pinpoint Test A in the Pinpoint Test procedure.

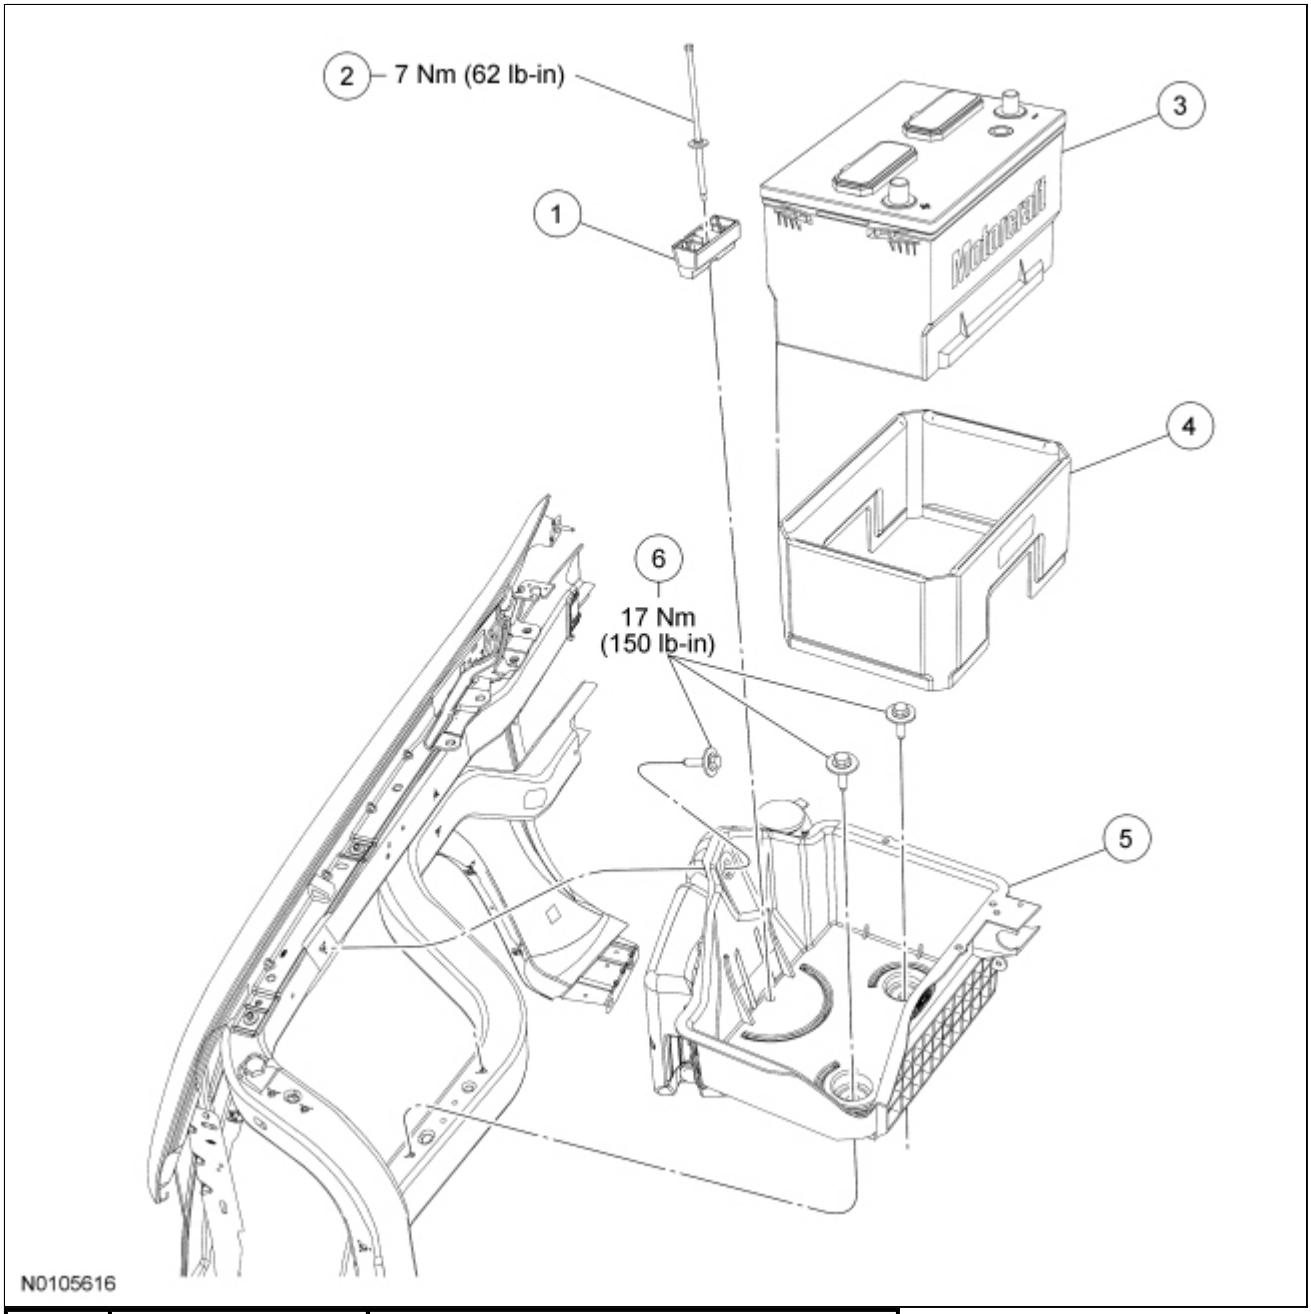
repair4less

Principles of Operation

Battery Eye Operation

The battery eye indicates the state-of-charge of the battery by responding to the specific gravity of a single battery cell electrolyte. The battery eye has a viewing plate, 2 colored balls of different specific gravity and a small passage. As the state-of-charge and specific gravity changes, the balls change their position in the passageway and subsequently display a different color in the viewing eye. The primary purpose of the battery is to be a quick indicator of state-of-charge for assembly plants and dealership pre-delivery processes.

The color of the battery eye indicates the approximate state-of-charge.



- Red — indicates low state-of-charge.
- Yellow/Black — indicates between high and low state-of-charge.
- Green — indicates high state-of-charge.
- No color can occur after the battery has been in service for several years and some of the plate material has coated the balls.
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates.

NOTE: The battery eye may remain red for a period of time (up to several days), even after the battery is fully charged, because the acid is not yet fully mixed.

Do not install a new battery based solely on the indication of the battery eye. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow/black battery eye usually indicates the battery is discharged, not damaged. If the battery eye indicates the battery may be discharged, it is necessary to recharge the battery before testing its condition.

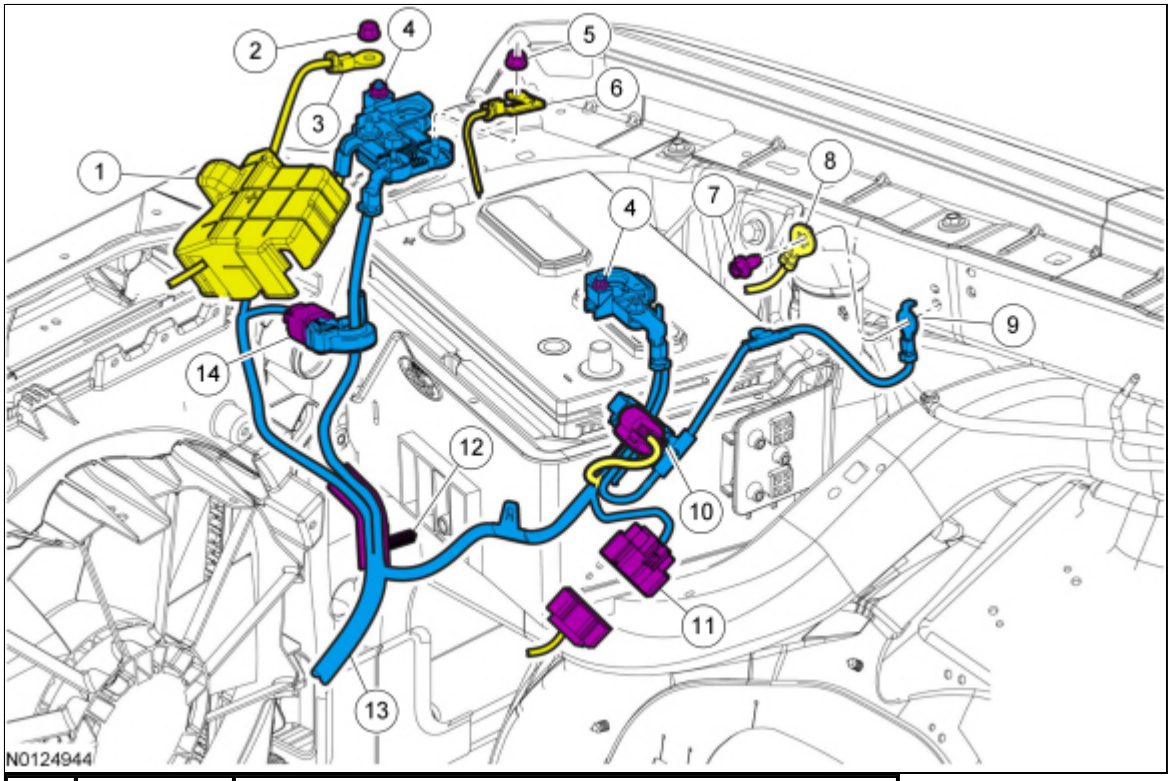
Battery and Battery Tray — Exploded View

Item	Part Number	Description
1	—	Battery hold-down clamp
2	N808480	Battery hold-down clamp bolt
3	10655	Battery
4	10A687	Battery cover



5	10732	Battery tray
6	N811479	Battery tray bolts (3 required)

1. Carry out the Battery Monitoring System (BMS) Reset using the scan tool after the battery is connected, if the battery has been replaced. If the BMS Reset is not carried out, it takes approximately 8 hours for the Body Control Module (BCM) to learn the new battery state of charge. During this 8 hour period, the vehicle must be undisturbed, with no doors opened or keyless entry button presses. If the vehicle is used before the BCM is allowed to learn the new battery state of charge, engine off load shedding can still occur and a message may be displayed.

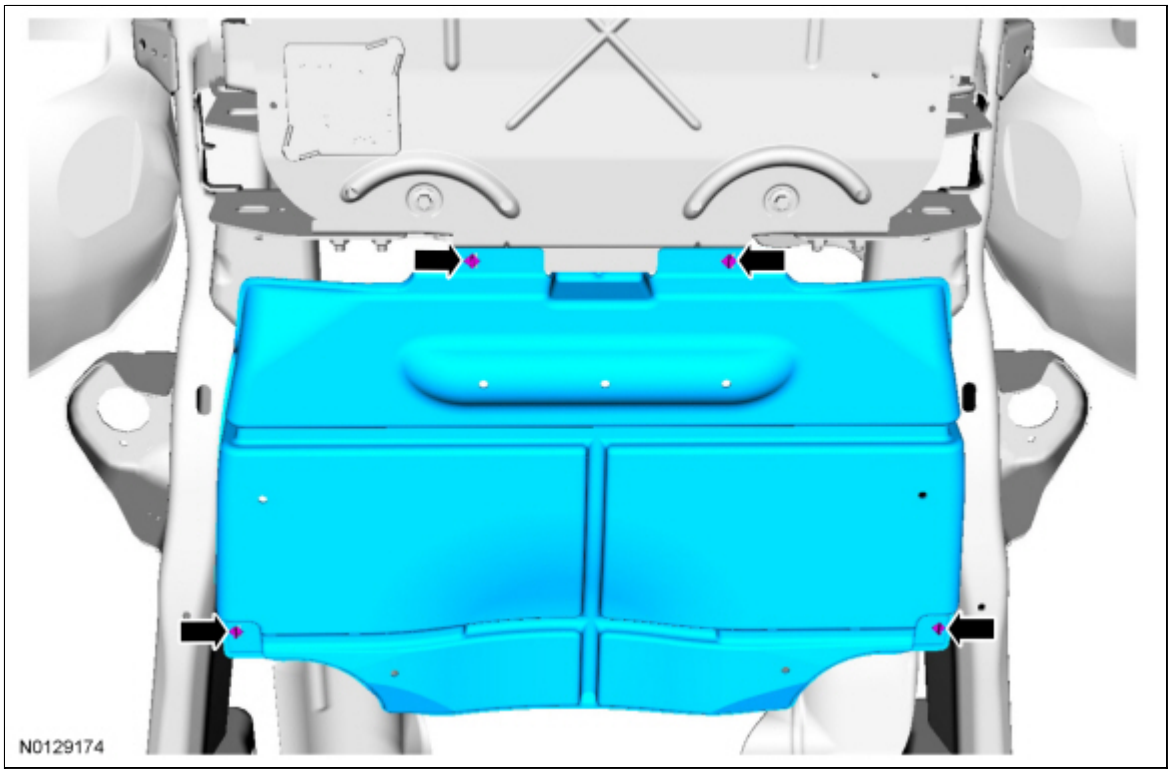
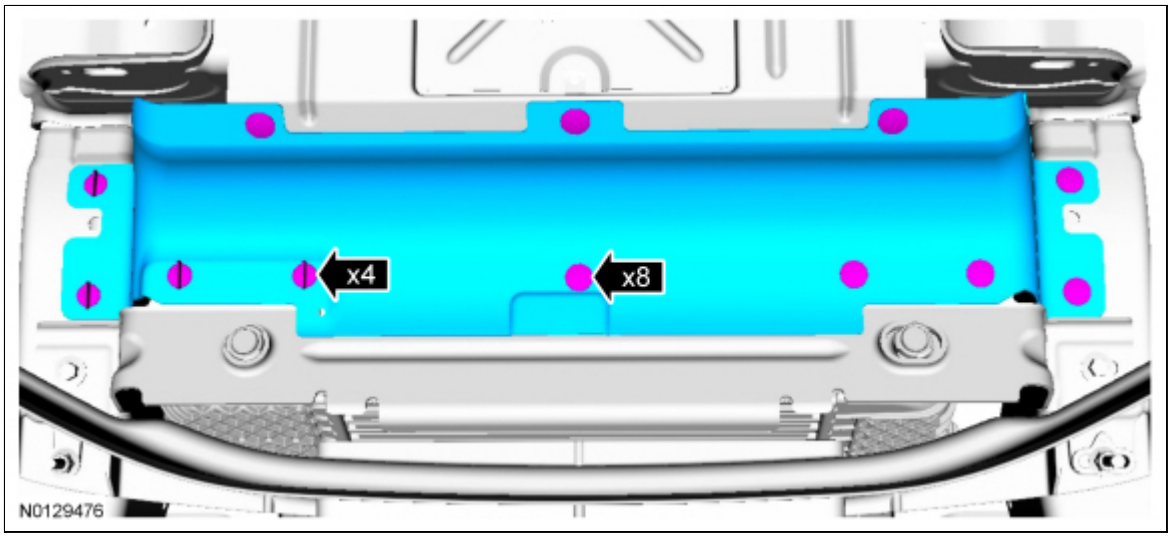
Removal and Installation

All vehicles



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.
3. Remove the battery cable body ground terminal bolt and position the cable aside.
   - To install, tighten to 13 Nm (115 lb-in).
4. Disconnect the 2 battery cable harness retainers from the battery tray.
5. Disconnect the battery current sensor electrical connector.
6. Remove the Power Steering Control Module (PSCM) harness positive terminal nut and position the cable aside.
   - To install, tighten to 9 Nm (80 lb-in).
7. Remove the Battery Junction Box (BJB) harness positive terminal nut and position the cable aside.
   - To install, tighten to 9 Nm (80 lb-in).
8. Loosen the positive battery cable terminal nut and position the cable aside.
   - To install, tighten to 5 Nm (44 lb-in).
9. Disconnect the battery cable in-line electrical connector.
10. Remove the battery tray. For additional information, refer to Battery Tray in this section.

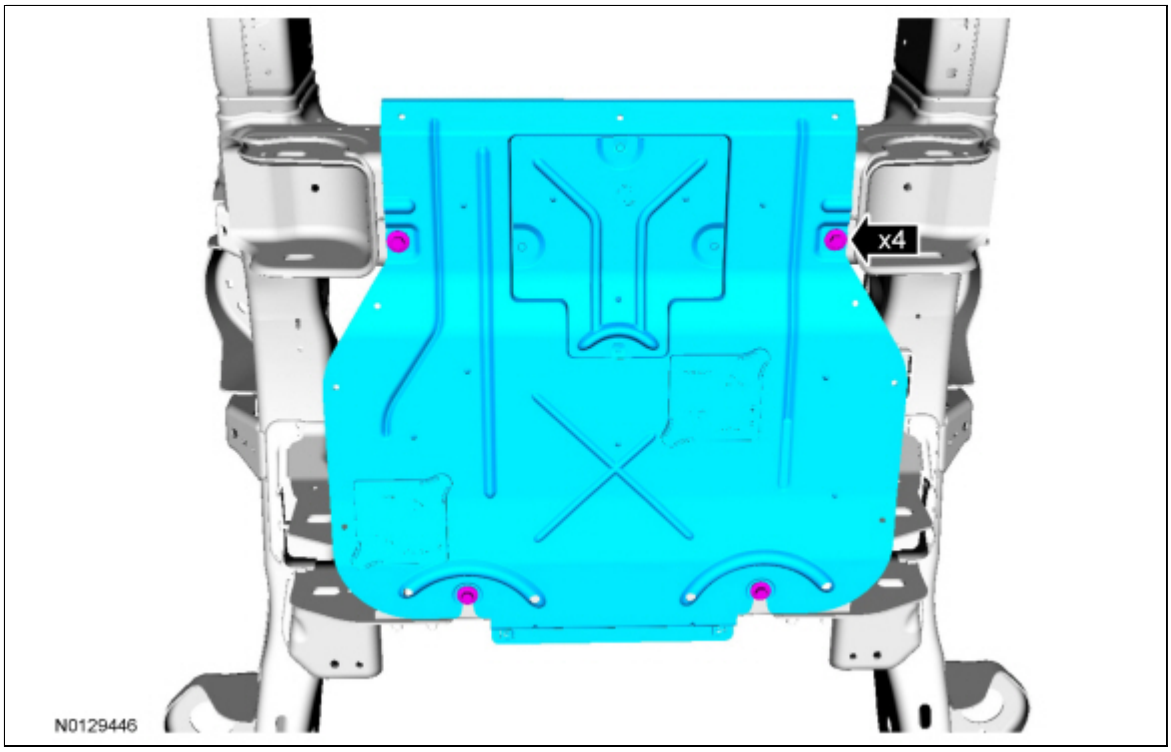
Vehicles with 3.5L GTDI



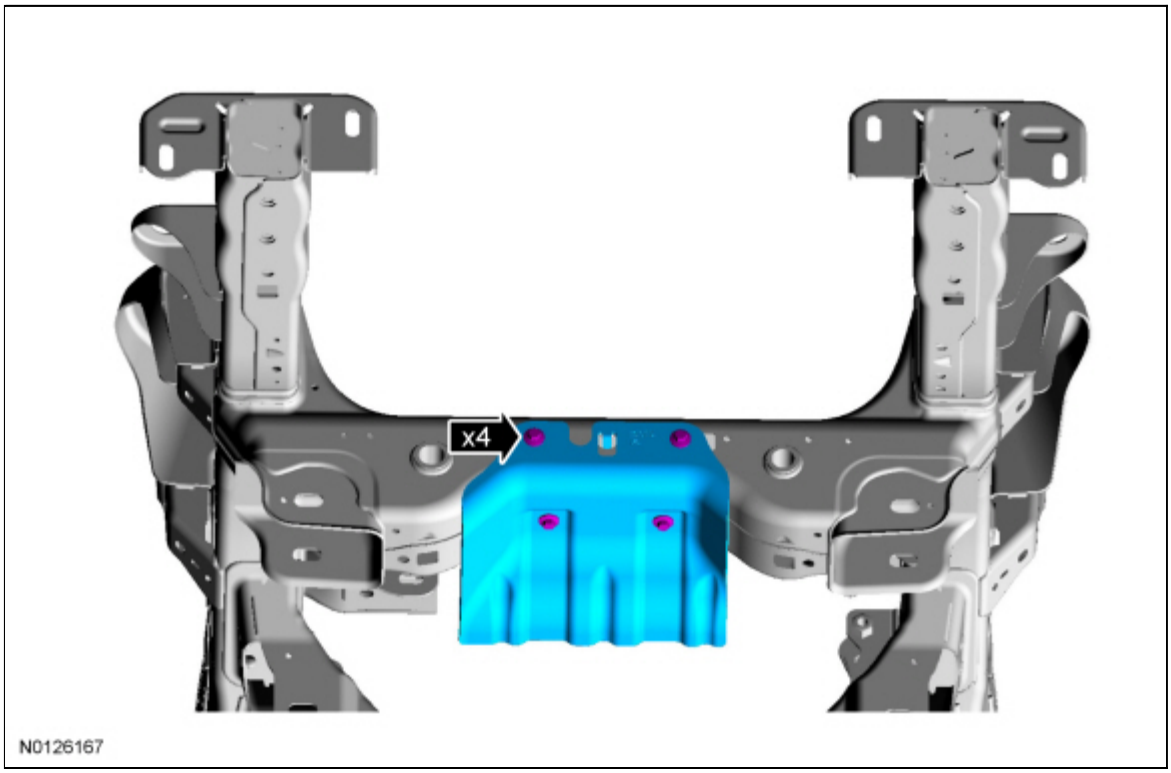
11. Remove the LH ACL pipe-to-turbocharger pipe and the LH turbocharger-to-Charge Air Cooler (CAC) pipe. For additional information, refer to Intake Air System Components - Exploded View in Section 303-12 .

All vehicles

12. Remove the generator B+ cable end cover.
13. Remove the generator B+ cable end nut and position the cable aside.
    - To install, tighten to 17 Nm (150 lb-in).
14. Disconnect the generator electrical connector.
15. If equipped, turn the 4 quarter-turn retainers and remove the rear splash shield.

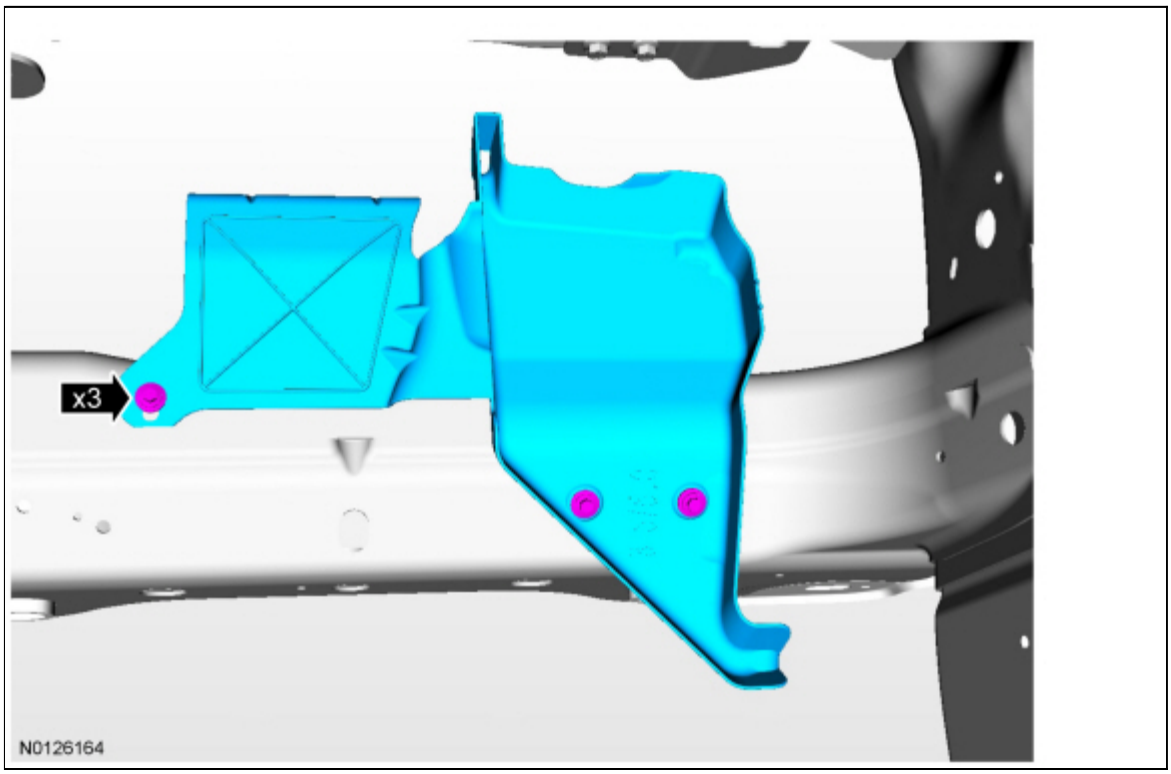


16. Turn the 4 quarter-turn retainers, detach the 8 pushpins and remove the lower air deflector.



17. If equipped, remove the 4 bolts and the skid plate.
    - To install, tighten to 48 Nm (35 lb-ft).

repair4less



18. If equipped, remove the 4 bolts and the Power Steering Control Module (PSCM) skid plate.
    - To install, tighten to 40 Nm (30 lb-ft).

19. **NOTE:** 3.5L GTDI oil filter drip shield shown, 3.7L similar.

    Remove the 3 bolts and the oil filter drip shield.

- To install, tighten to 7 Nm (62 lb-in).

20. Remove the battery cable harness bracket bolt from the RF frame.
    - To install, tighten to 20 Nm (177 lb-in).

21. Remove the battery cable chassis ground terminal bolt.
    - To install, tighten to 20 Nm (177 lb-in).

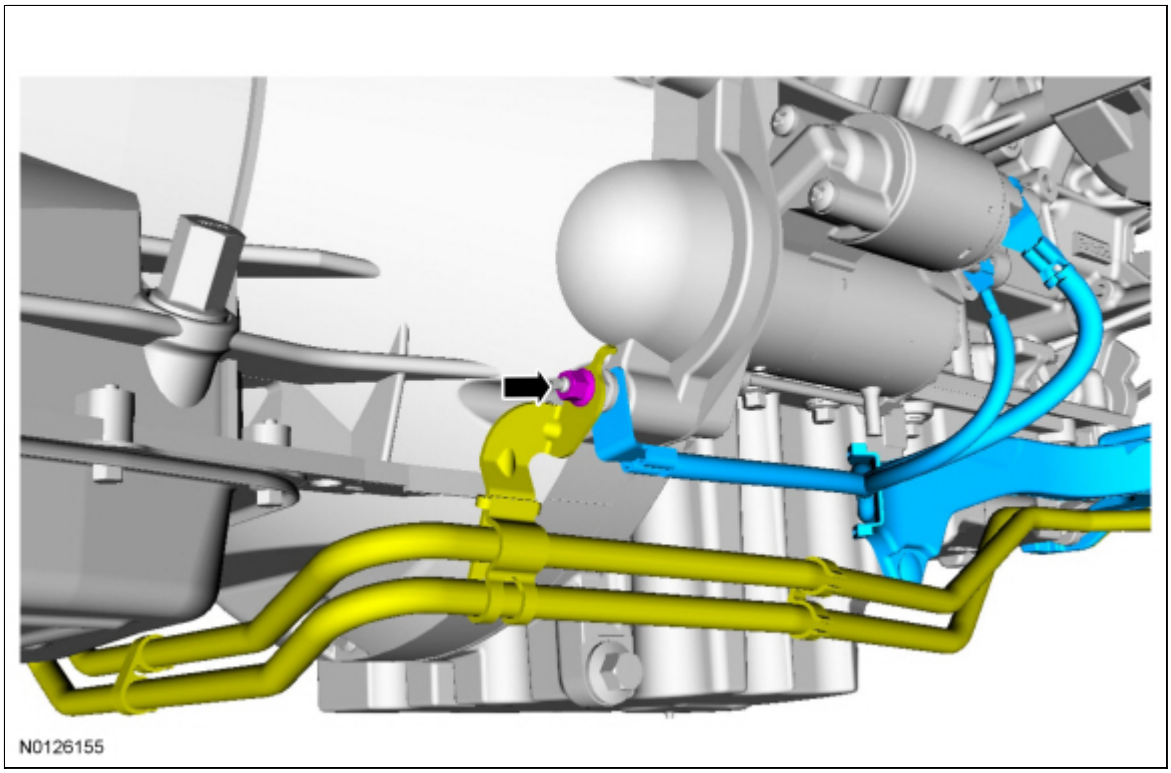
22. Disconnect the A/C compressor electrical connector.

23. Disconnect the wire harness retainer from the A/C compressor.

24. Remove the battery cable shield nut.
    - To install, tighten to 12 Nm (106 lb-in).

25. Position the transmission fluid cooler tube bracket and wire harness aside.

26. Remove the wire harness retainer from the battery cable shield.



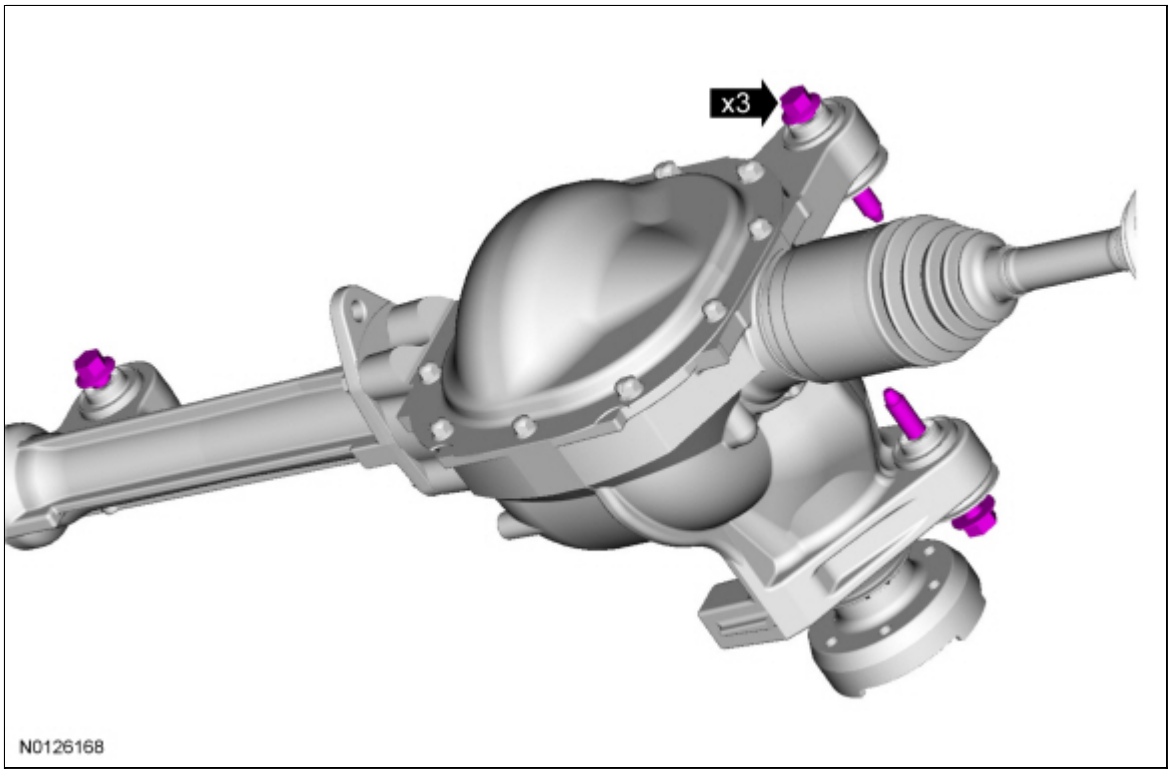
27. Remove the starter solenoid terminal cover.

28. Remove the starter solenoid wire terminal nut and position the cable aside.
    - To install, tighten to 5 Nm (44 lb-in).

29. Remove the starter solenoid positive cable terminal nut and position the cable aside.
    - To install, tighten to 12 Nm (106 lb-in).

30. Remove the nut and position the transmission fluid cooler tube bracket aside.
    - To install, tighten to 12 Nm (106 lb-in).

repair4less



31. Remove the battery cable engine ground terminal stud bolt.
    - To install, tighten to 47 Nm (35 lb-ft).

Vehicles with Four Wheel Drive (4WD)

32. Position a suitable hydraulic jack under the front axle. Securely strap the axle to the jack.

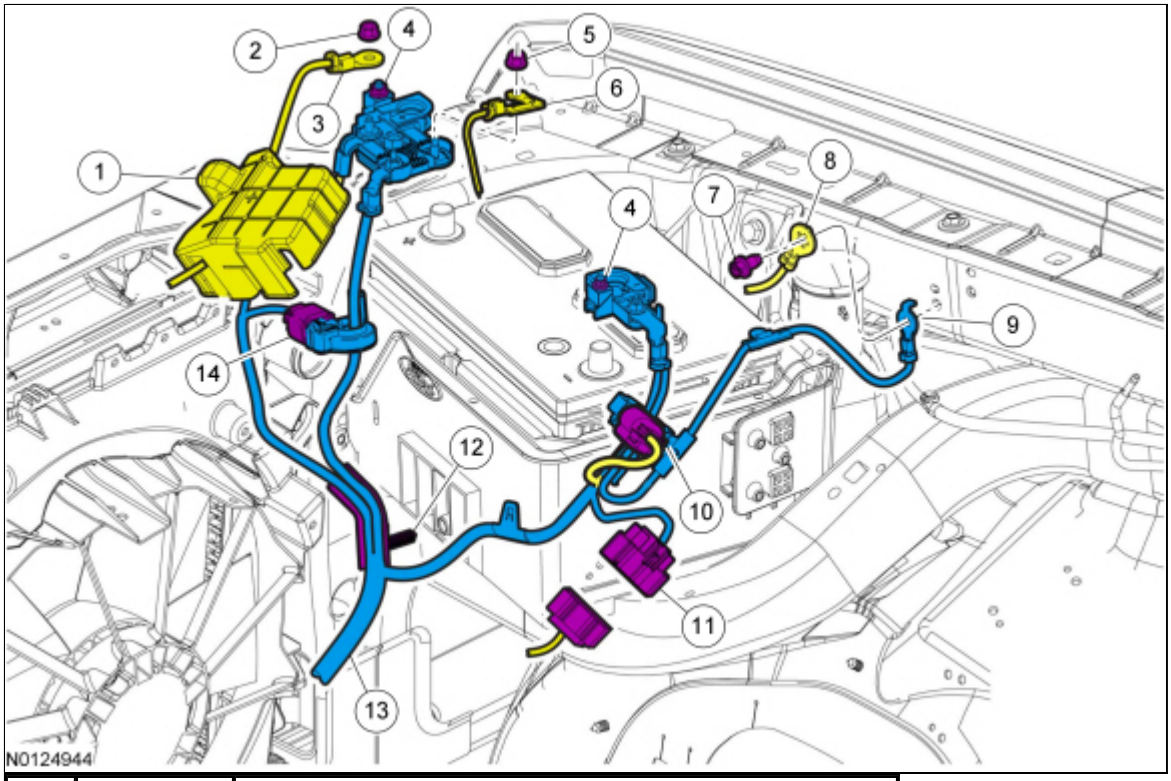
33. Remove the 3 front axle mounting bolts.
    - To install, tighten to 115 Nm (85 lb-ft).

34. Lower the front axle to allow clearance to the 2 wire harness retainers at the engine front cover and the engine block.

All vehicles

35. Disconnect the wire harness retainers from the engine front cover, engine block and the oil filter adaptor.

36. Remove the battery cable.



37. To install, reverse the removal procedure.

Removal and Installation

1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.

2. Remove the battery cable chassis ground terminal bolt and position the cable aside.
   - To install, tighten to 20 Nm (177 lb-in).

3. Remove the battery cable body ground terminal bolt and position the cable aside.
   - To install, tighten to 13 Nm (115 lb-in).

4. Remove the bolt and position the battery cable harness bracket aside.
   - To install, tighten to 20 Nm (177 lb-in).

5. Remove the wire harness retainer from the battery cable shield.

6. Remove the stud bolt and position the battery cable shield aside.
   - To install, tighten to 12 Nm (106 lb-in).

7. Remove the battery cable engine ground terminal nut and position the cable aside.
   - To install, tighten to 25 Nm (18 lb-ft).

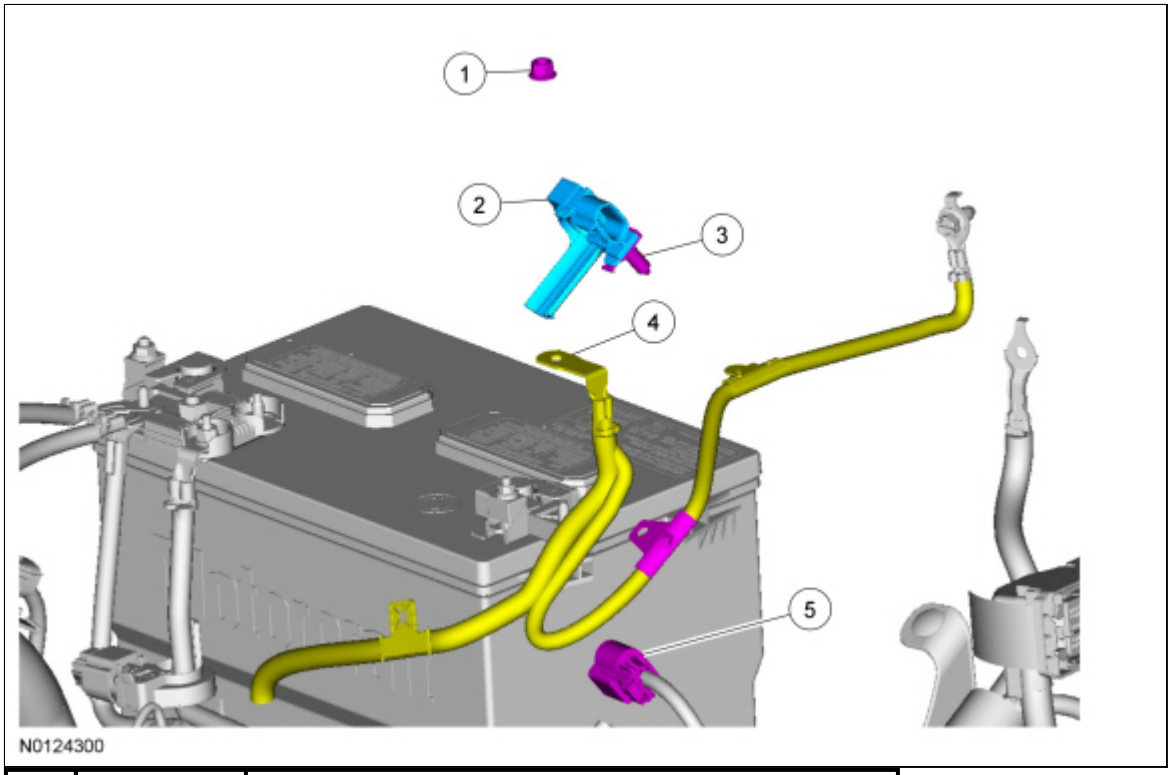
8. Remove the starter solenoid terminal cover.

9. Remove the nut and position the starter solenoid wire terminal aside.
   - To install, tighten to 5 Nm (44 lb-in).

repair4less

10. Remove the nut and position the starter solenoid positive cable terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).

11. Remove the nut and position the generator B+ cable terminal and the Power Distribution Box (PDB) cable terminal aside.
    - To install, tighten to 9 Nm (80 lb-in).



12. Disconnect the 2 battery cable harness retainers from the battery tray.

13. Disconnect the battery cable in-line electrical connector.

14. Remove the battery cable assembly.

15. To install, reverse the removal procedure.

Battery Current Sensor

Item	Part Number	Description
1	—	Battery terminal nut (part of 14300) - 9 Nm (80 lb-in)
2	14B357	Battery current sensor
3	—	Battery current sensor retainer (part of 14B357)
4	—	Negative battery cable terminal (part of 14300)
5	—	Battery current sensor electrical connector (part of 12A581)

Removal

1. Remove the nut and position the negative battery cable terminal aside.
2. Disconnect the battery current sensor electrical connector.
3. Disconnect the battery current sensor retainer from the battery cable.
4. **NOTE:** Note the orientation and position of the battery current sensor tape tab.

   Index-mark the battery cable at the battery current sensor. Remove and discard the tape securing the battery current sensor to the battery cable and remove the battery current sensor.

repair4less

Installation

1. **NOTE:** The battery current sensor must be installed in the proper position and orientation to function correctly.

   With the battery current sensor tape tab pointing downward, position the battery current sensor to the index-mark on the battery cable and secure with electrical tape.

2. Connect the battery current sensor retainer to the battery cable.

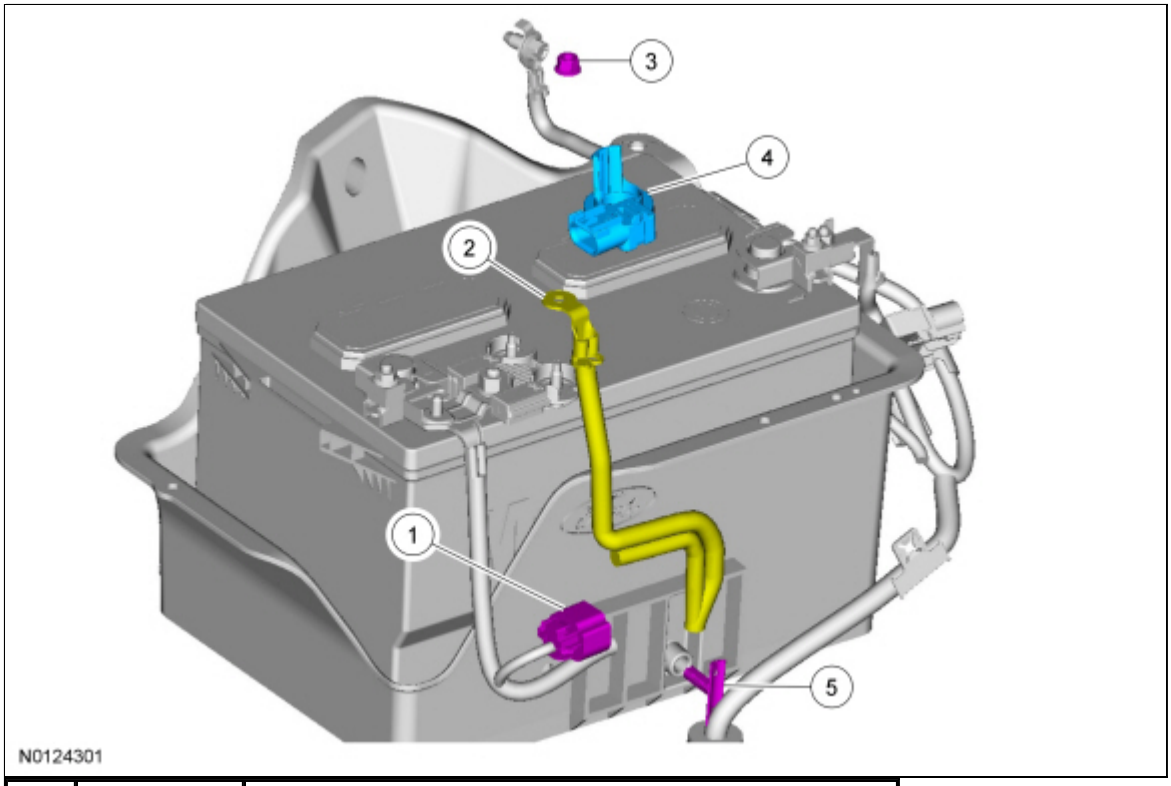
3. Connect the battery current sensor electrical connector.

4. Connect the negative battery cable terminal to the battery terminal and install the battery terminal nut.
   - Tighten to 9 Nm (80 lb-in).

Battery Tray

1. Remove the battery. For additional information, refer to Battery and Battery Tray — Exploded View in this section.

2. Disconnect the wire harness retainers from the battery tray and position the wire harness aside.



3. Remove the 3 bolts from the battery tray and carefully position the battery tray aside to gain access to the washer reservoir electrical connector.
   - To install, tighten to 17 Nm (150 lb-in).

4. Disconnect the wire connector and washer hose from the washer bottle and remove the battery tray assembly.

5. To install, reverse the removal procedure.

repair4less

Generator Current Sensor

Item	Part Number	Description
1	—	Generator current sensor electrical connector (part of 14290)
2	—	Positive battery cable terminal (part of 14300)
3	—	Battery terminal nut (part of 14300) - 9 Nm (80 lb-in)
4	14B357	Generator current sensor
5	—	Battery cable retainer (part of 14300)

Removal

1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.
2. Remove the nut and position the positive battery cable terminal aside.
3. Disconnect the generator current sensor electrical connector.
4. Disconnect the battery cable retainer from the battery tray.
5. **NOTE:** Note the orientation and position of the generator current sensor tape tab.

Index-mark the battery cable at the generator current sensor. Remove and discard the tape securing the generator current sensor to the battery cable and remove the generator current sensor.

Installation

1. **NOTE:** The generator current sensor must be installed in the proper position and orientation to function correctly.

   With the generator current sensor tape tab pointing upward, position the generator current sensor to the index-mark on the battery cable and secure with electrical tape.

2. Connect the battery cable retainer to the battery tray.

3. Connect the generator current sensor electrical connector.

4. Connect the positive battery cable terminal to the battery terminal and install the battery terminal nut.
   - Tighten to 9 Nm (80 lb-in).

5. Connect the battery. For additional information, refer to Battery Disconnect in this section.

Torque Specifications

Description	Nm	lb-ft	lb-in
Center instrument panel support bracket bolts	9	—	80

High-Voltage Converter/Inverter

DC/AC Inverter and AC Power Point

The high-voltage converter/inverter system consists of the following components:

- AC power point
- DC/AC inverter

The DC/AC inverter converts low voltage (12 volts) DC to 110 volts AC to power a device that uses AC power with a rating of less than 150 watts. The DC/AC inverter is located behind the instrument panel, and is a serviceable part. The 110-volt AC power point is located in the rear of the front floor console and can be serviced separately from the front floor console.

repair4less

High-Voltage Converter/Inverter

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

Principles of Operation

The 110 volts AC created by the inverter measures differently than a conventional AC outlet (utility-generated) with some multi-meters. The power point automatically shuts off if the load exceeds 150 watts to prevent damage to the inverter or load. The inverter supplies 110 volts AC power only when the ignition is ON. If the ignition is ON, but the engine is not running, the DC/AC inverter automatically shuts off after 13 minutes. The inverter can be powered back on and the timer reset by cycling the ignition from RUN to OFF and back to RUN, but only for another 13 minutes. This feature is intended to prevent the 12-volt battery from being fully discharged. If the engine is running, the inverter operation is not time-limited.

The DC/AC inverter time-out is controlled by a Local Interconnect Network (LIN) circuit. The BCM transmits the engine running status over the network to the DC/AC inverter. Once the DC/AC inverter stops receiving information that indicates the engine is running, it begins counting the amount of time the engine has not been running. If, after 13 minutes, the DC/AC inverter still has not received information that indicates the engine is running, the DC/AC inverter times out and stops supplying voltage to the AC power point. The LIN is also used by the electrochromatic mirror, but the mirror is receiving compass information, not engine running status.

The AC power point is equipped with a green LED that indicates the system status. The green LED is illuminated continuously when the ignition is ON and the system is operating normally. When the inverter shuts off after 13 minutes, the LED flashes until the ignition is cycled. Additionally, the green LED flashes constantly if the ignition is ON and a fault is detected.

The DC/AC inverter has a self-protection feature for the following conditions:

- Short circuits on the inverter output circuits — If the inverter detects a short on the output circuit(s), it shuts down. After 6 seconds, it restarts and checks for a short condition. If the condition still exists, the inverter shuts down again. The inverter restarts 5 times and, if on the 5th restart, the short still exists, the inverter disables AC output and flashes the green LED indicator.
- Low voltage input — the inverter does not operate when the input voltage is less than 11 volts.
- High voltage input — the inverter does not operate when the input voltage is greater than 16 volts.

- Overload
- High temperature — the inverter does not operate if it has overheated or if ambient temperatures exceed 75°C (167°F)

If the self-protection feature is activated, the green LED indicator flashes and the DC/AC inverter does not provide power output to the AC power point. If the LED is flashing, the problem must be corrected before DC/AC inverter operation will resume.

Refer to the Owner's Literature for a list of appropriate electrical loads/devices that can be used.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• AC power point • Battery Junction Box (BJB) fuse 33 (40A) • Body Control Module (BCM) fuse 38 (10A) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The DC/AC inverter does not operate correctly — no power at the AC power point	• Fuse(s) • Wiring, terminals or connectors • DC/AC inverter • AC power point	• GO to Pinpoint Test A .
• The DC/AC inverter does not operate correctly — the AC power point LED	• Overloaded DC/AC inverter • Inverter timed-out with	• DISCONNECT all electrical accessories from the AC power outlet and VERIFY that cabin temperature is below 75°C (167°F). TEST the system for normal operation. If the system is operating

repair4less

indicator flashes with the ignition in the ON position	engine not running • Overheated DC/AC inverter • Fuse(s) • Wiring, terminals or connectors • DC/AC inverter • AC power point	normally, RETURN the vehicle to the customer. If the AC power point LED indicator is still flashing, GO to Pinpoint Test A .
• The DC/AC inverter does not operate correctly — the AC power point LED indicator is never on	• Fuse(s) • Wiring, terminals or connectors • DC/AC inverter • AC power point	• GO to Pinpoint Test B .
• The DC/AC inverter does not operate correctly — the AC power point turns off after 13 minutes	• Inverter timing out with engine not running • Body Control Module (BCM) • DC/AC inverter • Wiring, terminals or connectors	• VERIFY the concern by monitoring the AC power point LED for 13 minutes with the engine running. If the AC power point LED begins to flash after 13 minutes with the engine running, GO to Pinpoint Test C .

Pinpoint Tests

Pinpoint Test A: The DC/AC Inverter Does Not Operate Correctly — No Power at the AC Power Point/The AC Power Point LED Indicator Flashes with the Ignition in the ON Position

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Normal Operation

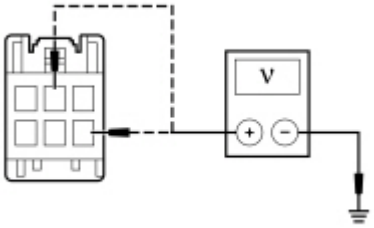
The DC/AC inverter receives 12 volts DC from the Battery Junction Box (BJB) and the Body Control Module (BCM) and is wired to chassis ground. Power from the BJB is available at all times, regardless of ignition status. Power from the BCM is only available when the ignition is ON. The incoming DC power is internally converted to 60 Hz 110 volts AC power that is output to the AC power point.

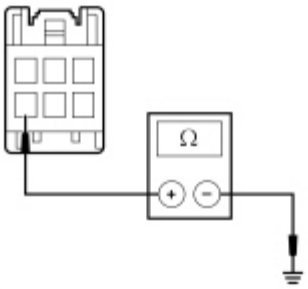
NOTE: The electrical device powered by the AC power point must not exceed 150 watts.

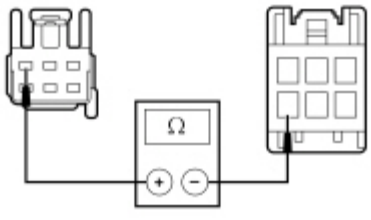
NOTE: If the green LED is flashing, the AC power point may be overloaded, overheated or shorted. Unplug the electrical device from the AC power point and cycle the ignition. Refer to the Owner's Literature to determine if the electrical device is appropriate for the AC power point.

NOTE: The DC/AC inverter turns off after 13 minutes if the engine is not running. If the inverter times out, the green LED flashes. Cycle the ignition to resume normal operation.

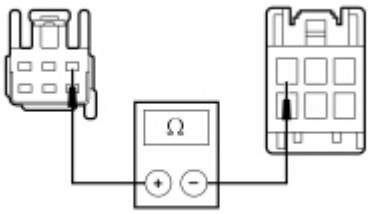
This pinpoint test is intended to diagnose the following:







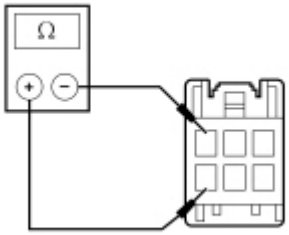
- Overloaded DC/AC inverter
- Overheated DC/AC inverter
- Inverter timed-out with engine not running
- Fuse(s)
- Wiring, terminals or connectors
- DC/AC inverter
- AC power point

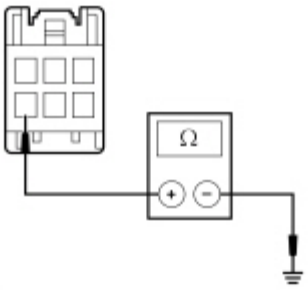


PINPOINT TEST A: THE DC/AC INVERTER DOES NOT OPERATE CORRECTLY — NO POWER AT THE AC POWER POINT/THE AC POWER POINT LED INDICATOR FLASHES WITH THE KEY IN THE ON POSITION

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

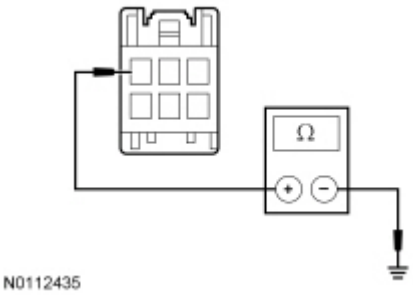
Test Step	Result / Action to Take
A1 CHECK THE POWER OUTLET LED STATUS • Start the engine. • Check the green LED on the AC power outlet. • **Is the green LED flashing?**	**Yes** GO to A2. **No** If the green LED is NOT illuminated, VERIFY BJB fuse 33 (40A) and BCM fuse 38 (10A) are OK. If OK, GO to Pinpoint Test B. If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. TEST the system for normal operation. If the green LED is illuminated continuously, the DC/AC inverter may have timed-out after 13 minutes of operation without the engine running. VERIFY correct system operation with a device rated at less than 150 watts. If there is still no power at the power outlet, GO to A2. If the system is operating correctly, RETURN the vehicle to the customer.
A2 CHECK THE POWER SUPPLY CIRCUITS • Ignition OFF. • Disconnect: DC/AC Inverter C2293A. • Ignition ON. • Measure the voltage between DC/AC inverter C2293A-2, circuit CBP38 (GY/BU), harness side and ground and between DC/AC inverter C2293A-4, circuit SBB33 (RD), harness side and ground.	**Yes** GO to A3. **No** For voltage less than 11 volts, VERIFY Battery Junction Box (BJB) fuse 33 (40A) and BCM fuse 38 (10A) are OK. If OK, REPAIR the open circuit or high resistance on the affected circuit(s). If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. TEST the system for normal operation.

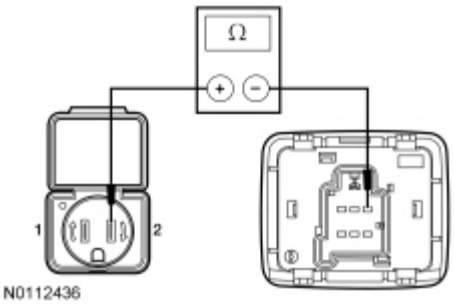


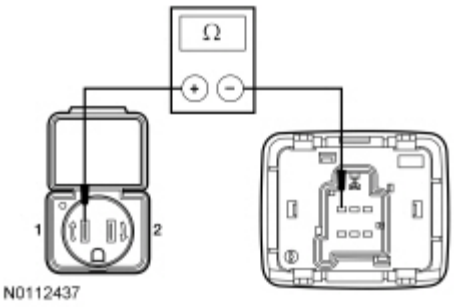


repair4less

 N0112203 • **Is the voltage greater than 11 volts?**	For voltage greater than 16 volts, REFER to System Voltage High in the Symptom Chart in Section 414-00 .
A3 CHECK THE GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Measure the resistance between DC/AC inverter C2293A-6, circuit GD138 (BK/WH), harness side and ground.  N0112204 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR circuit GD138 (BK/WH). TEST the system for normal operation.
A4 CHECK THE AC POWER OUTPUT CIRCUITS FOR AN OPEN • Disconnect: BJB Fuse 33 (40A). • Disconnect: BCM Fuse 38 (10A). • Disconnect: AC Power Point C301. • Disconnect: DC/AC Inverter C2293B. • Measure the resistance between AC power point C301-3, circuit HYA01 (OG/GN), harness side and DC/AC inverter C2293B-6, circuit HYA01 (OG/GN), harness side.  N0112205 • Measure the resistance between AC power point C301-1, circuit HYA02 (OG/WH), harness side and DC/AC inverter C2293B-3, circuit HYA02 (OG/WH), harness side.	**Yes** GO to A5 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.







N0112206

- **Are the resistances less than 5 ohms?**

A5 CHECK THE AC POWER OUTPUT CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between DC/AC inverter C2293B-6, circuit HYA01 (OG/GN), harness side and DC/AC inverter C2293B-3, circuit HYA02 (OG/WH), harness side.  N0112434 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuits. TEST the system for normal operation.
A6 CHECK THE AC POWER OUTPUT CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between DC/AC inverter C2293B-6, circuit HYA01 (OG/GN), harness side and ground.  N0112204 • Measure the resistance between DC/AC inverter C2293B-3, circuit HYA02 (OG/WH), harness side and ground.	**Yes** GO to A7 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.

repair4less

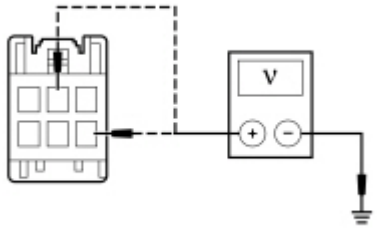
 N0112435 • **Are the resistances greater than 10,000 ohms?**	
A7 CHECK THE AC POWER POINT FOR AN OPEN • Measure the resistance between AC power point C301 pin 3, component side and AC power point face side pin 2.  N0112436 • Measure the resistance between AC power point C301 pin 1, component side and AC power point face side pin 1.  N0112437 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DC/AC inverter. REFER to Direct Current/Alternating Current (DC/AC) Inverter in this section. TEST the system for normal operation. **No** INSTALL a new AC power point. REFER to Alternating Current (AC) Power Point in this section. TEST the system for normal operation.

Pinpoint Test B: The DC/AC Inverter Does Not Operate Correctly — The AC Power Point LED Indicator is Never On

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

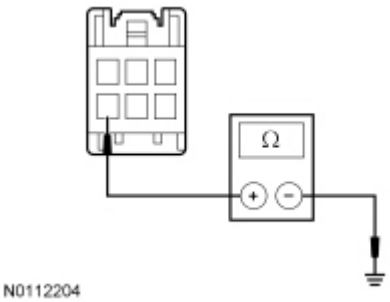
Normal Operation

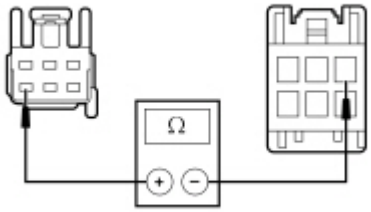
The DC/AC inverter receives 12 volts DC from the Battery Junction Box (BJB) and the Body Control Module (BCM) and is wired to chassis ground. The incoming DC power is internally converted to 60 Hz 110 volts AC power that is output to the AC power point. If a fault in the system is detected, the LED flashes when the

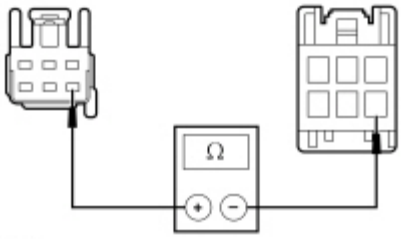


ignition is ON. The LED is continuously illuminated if the system is operating correctly when the ignition is ON. The DC/AC inverter supplies 12V DC and ground to the LED along two circuits.

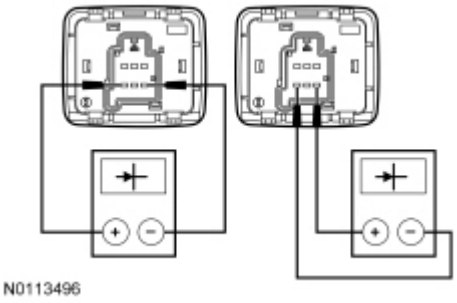
This pinpoint test is intended to diagnose the following:







- Fuse(s)
- Wiring, terminals or connectors
- DC/AC inverter
- AC power point



PINPOINT TEST B: THE DC/AC INVERTER DOES NOT OPERATE CORRECTLY — THE AC POWER POINT LED INDICATOR IS NEVER ON

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
B1 CHECK THE POWER SUPPLY CIRCUITS FOR VOLTAGE	
• Ignition OFF. • Disconnect: DC/AC Inverter C2293A. • Ignition ON. • Measure the voltage between DC/AC inverter C2293A-2, circuit CBP38 (GY/BU), harness side and ground and between DC/AC inverter C2293A-4, circuit SBB33 (RD), harness side and ground.  N0112203 • **Are the voltages greater than 10 volts?**	**Yes** GO to B2 . **No** VERIFY Body Control Module (BCM) fuse 38 (10A) and the Battery Junction Box (BJB) fuse 33 (40A) are OK. If OK, REPAIR the open or high resistance on the affected circuit(s). If not OK, REFER to the Wiring Diagrams manual to locate the possible cause of the circuit short. TEST the system for normal operation.
B2 CHECK THE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between DC/AC inverter C2293A-6, circuit GD138 (BK/WH), harness side and ground.	**Yes** GO to B3 . **No** REPAIR circuit GD138 (BK/WH). TEST the system for normal operation.

repair4less

 N0112204 • **Is the resistance less than 5 ohms?**	
B3 CHECK THE LED CONTROL CIRCUITS FOR AN OPEN	
• Disconnect: BJB Fuse 33 (40A). • Disconnect: BCM Fuse 38 (10A). • Disconnect: DC/AC Inverter C2293B. • Disconnect: AC Power Point C301. • Measure the resistance between AC power point C301-6, circuit LYA03 (YE/VT), harness side and DC/AC inverter C2293B-1, circuit LYA03 (YE/VT), harness side.  N0112438 • Measure the resistance between AC power point C301-4, circuit RYA03 (BU/BN), harness side and DC/AC inverter C2293B-4, circuit RYA03 (BU/BN), harness side.  N0112439 • **Are the resistances less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
B4 CHECK THE AC POWER POINT LED	
• Test the diode between AC power point C301 pin 4, component side and AC power point C301 pin 6, component side in both directions.	**Yes** INSTALL a new DC/AC inverter. REFER to Direct Current/Alternating Current (DC/AC) Inverter in this section. TEST the system for normal operation.

 N0113496 • **Is the resistance greater than 10,000 ohms in one direction and between 10-20 ohms in the opposite direction?**	**No** INSTALL a new AC power point. REFER to Alternating Current (AC) Power Point in this section. TEST the system for normal operation.

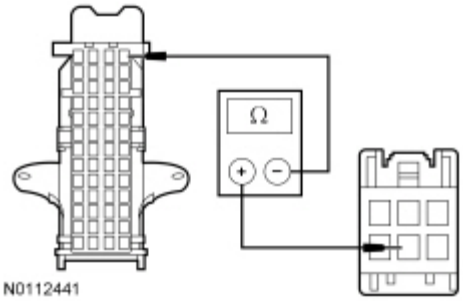
Pinpoint Test C: The DC/AC Inverter Does Not Operate Correctly — The AC Power Point Turns Off After 13 Minutes

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Normal Operation

The DC/AC inverter receives a signal from the Body Control Module (BCM) over the Local Interconnect Network (LIN) whenever the engine is running. If the DC/AC inverter does not receive this message for 13 minutes, the inverter stops supplying 110V to the power outlet and the green LED indicator flashes. The system can be reset by cycling the ignition from ON to OFF and back to ON, however the system only operates for another 13 minutes unless the signal is received from the BCM that the engine is running.

This pinpoint test is intended to diagnose the following:

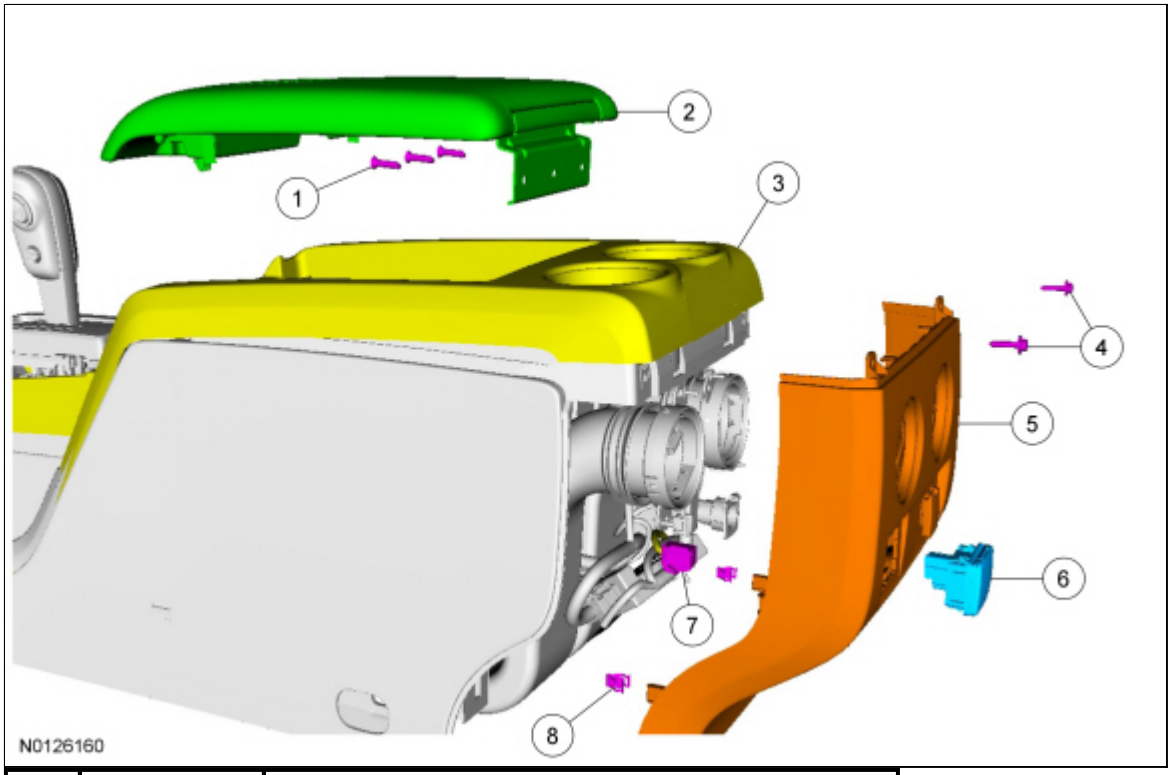


- Wiring, terminals or connectors
- DC/AC inverter
- BCM

PINPOINT TEST C: THE DC/AC INVERTER DOES NOT OPERATE CORRECTLY — THE AC POWER POINT TURNS OFF AFTER 13 MINUTES

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
C1 CHECK FOR BCM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — BCM . • Record any BCM DTCs retrieved. • **Are U0100:87 or U0401:00 present in the BCM ?**	**Yes** REFER to Section 419-10 to diagnose the BCM . **No** GO to C2 .
C2 VERIFY THE COMPASS FUNCTION	
• Verify the compass functions correctly. • **Does the compass function correctly?**	**Yes** GO to C3 .



repair4less

	No REFER to Section 413-01 to diagnose the compass.
C3 CHECK THE LIN COMMUNICATION CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280B. • Disconnect: DC/AC Inverter C2293A. • Measure the resistance between BCM C2280B-52, circuit VDN01 (BU/WH), harness side and DC/AC inverter C2293A-5, circuit VDN01 (BU/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DC/AC inverter. REFER to Direct Current/Alternating Current (DC/AC) Inverter in this section. TEST the system for normal operation. If the AC power point still turns off after 13 minutes when the engine is running, GO to C4 . **No** REPAIR circuit VDN01 (BU/WH). TEST the system for normal operation.
C4 CHECK THE BCM FOR CORRECT OPERATION	

• Check BCM C2280B for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: BCM C2280B.
• Connect: DC/AC Inverter C2293A.
• Make sure the connectors seat correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

repair4less

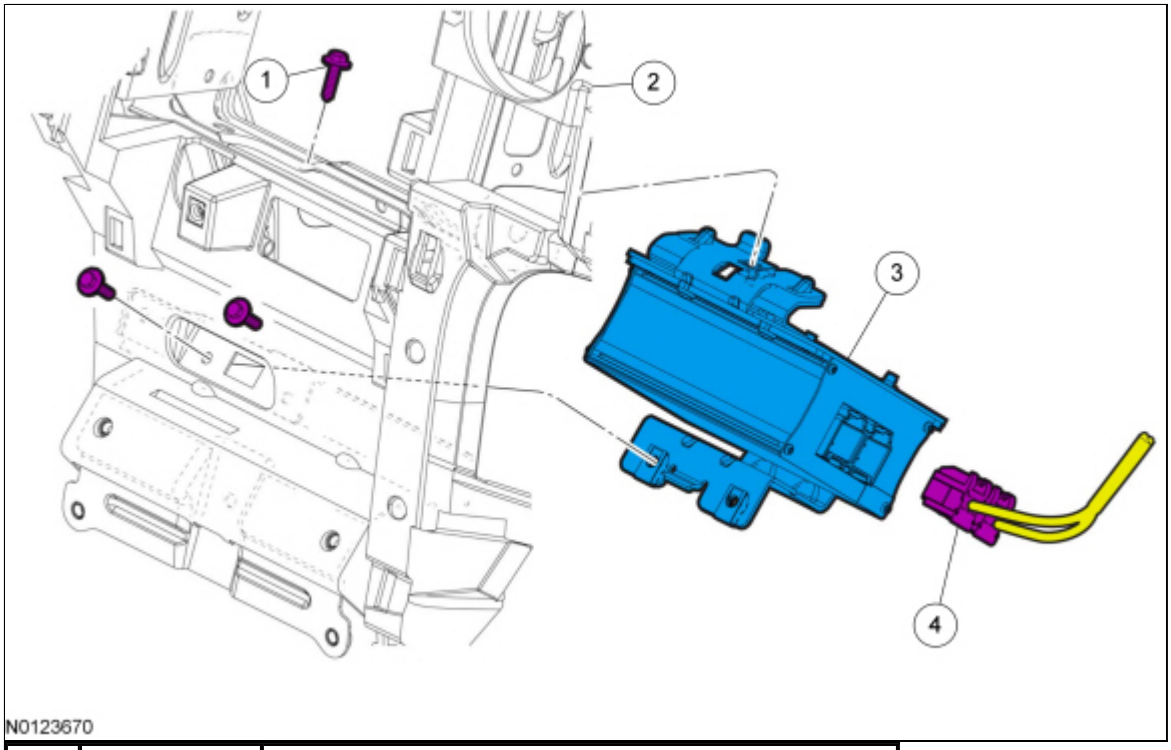
Alternating Current (AC) Power Point

Item	Part Number	Description
1	N808641	Storage compartment door screw (3 required)
2	06024	Storage compartment door
3	04567A	Selector lever trim panel
4	W707628	Floor console rear panel screws (2 required)
5	045E24	Floor console rear panel
6	19N236	AC powerpoint
7	14A318	AC powerpoint electrical connector
8	W705289	Floor console rear panel retaining clip (2 required)

WARNING: Disconnect the 12 volt battery before servicing the direct current to alternating current (DC-AC) inverter or alternating current (AC) powerpoint to prevent the risk of high voltage shock. Failure to follow this instruction may result in serious personal injury.

1. Remove the 3 screws and the storage compartment door.

2. ***NOTICE:*** **Raise the selector lever trim panel only enough to access the floor console rear panel screws. If the selector lever trim panel is raised excessively, component damage may occur.**



Lift the rear portion of the selector lever trim panel to release the retaining clips.

3. Remove the 2 floor console rear panel screws.
4. Using a non-marring tool, gently pry the lower portion of the floor console rear panel to release the 2 retaining clips.
5. Disconnect the AC powerpoint electrical connector.
6. Press the AC powerpoint retainers inward and remove the AC powerpoint.
7. To install, reverse the removal procedure.

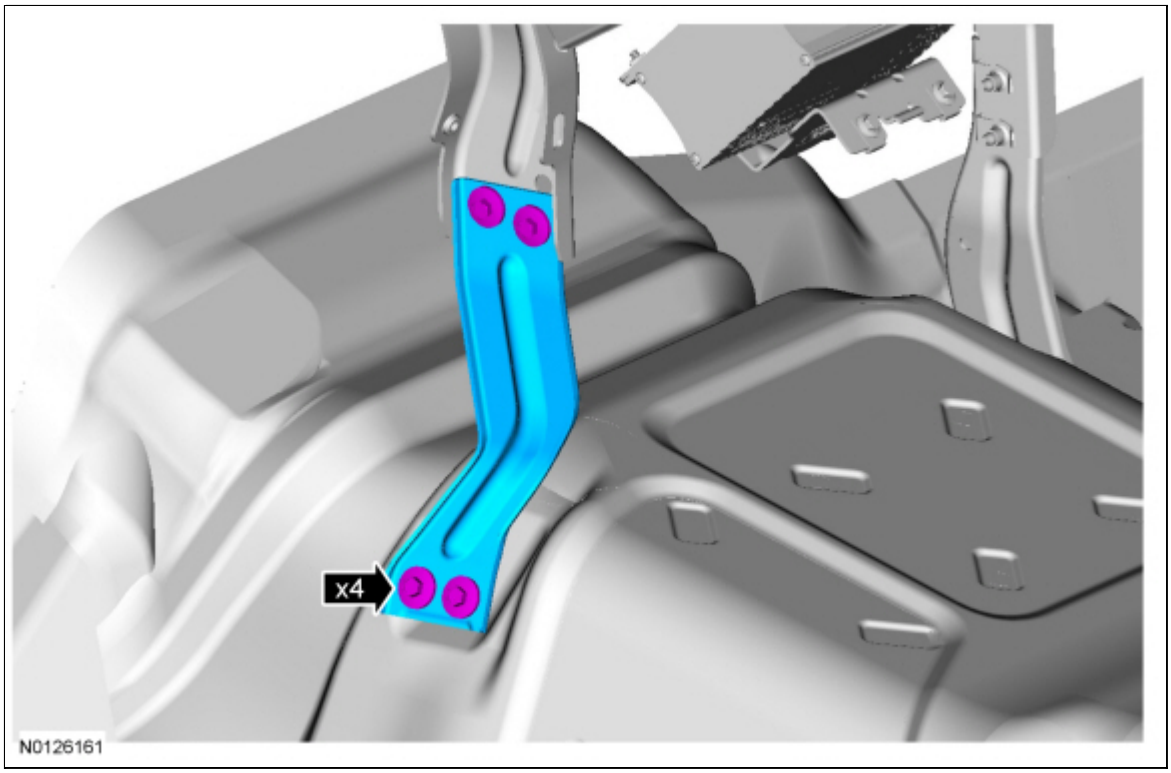
Direct Current/Alternating Current (DC/AC) Inverter



Item	Part Number	Description
1	W707628	DC/AC inverter screw (3 required)
2	04304	Instrument panel
3	19G317	DC/AC inverter
4	—	DC/AC inverter electrical connector (part of 14401)

WARNING: Disconnect the 12 volt battery before servicing the direct current to alternating current (DC-AC) inverter or alternating current (AC) powerpoint to prevent the risk of high voltage shock. Failure to follow this instruction may result in serious personal injury.

1. Remove the center instrument panel lower finish panel. For additional information, refer to Section 501-12 .

2. Remove the 4 bolts and the LH center instrument panel support bracket.
   - To install, tighten to 9 Nm (80 lb-in).

3. Disconnect the DC/AC inverter electrical connectors.
4. Remove the 3 screws and the DC/AC inverter.
5. To install, reverse the removal procedure.

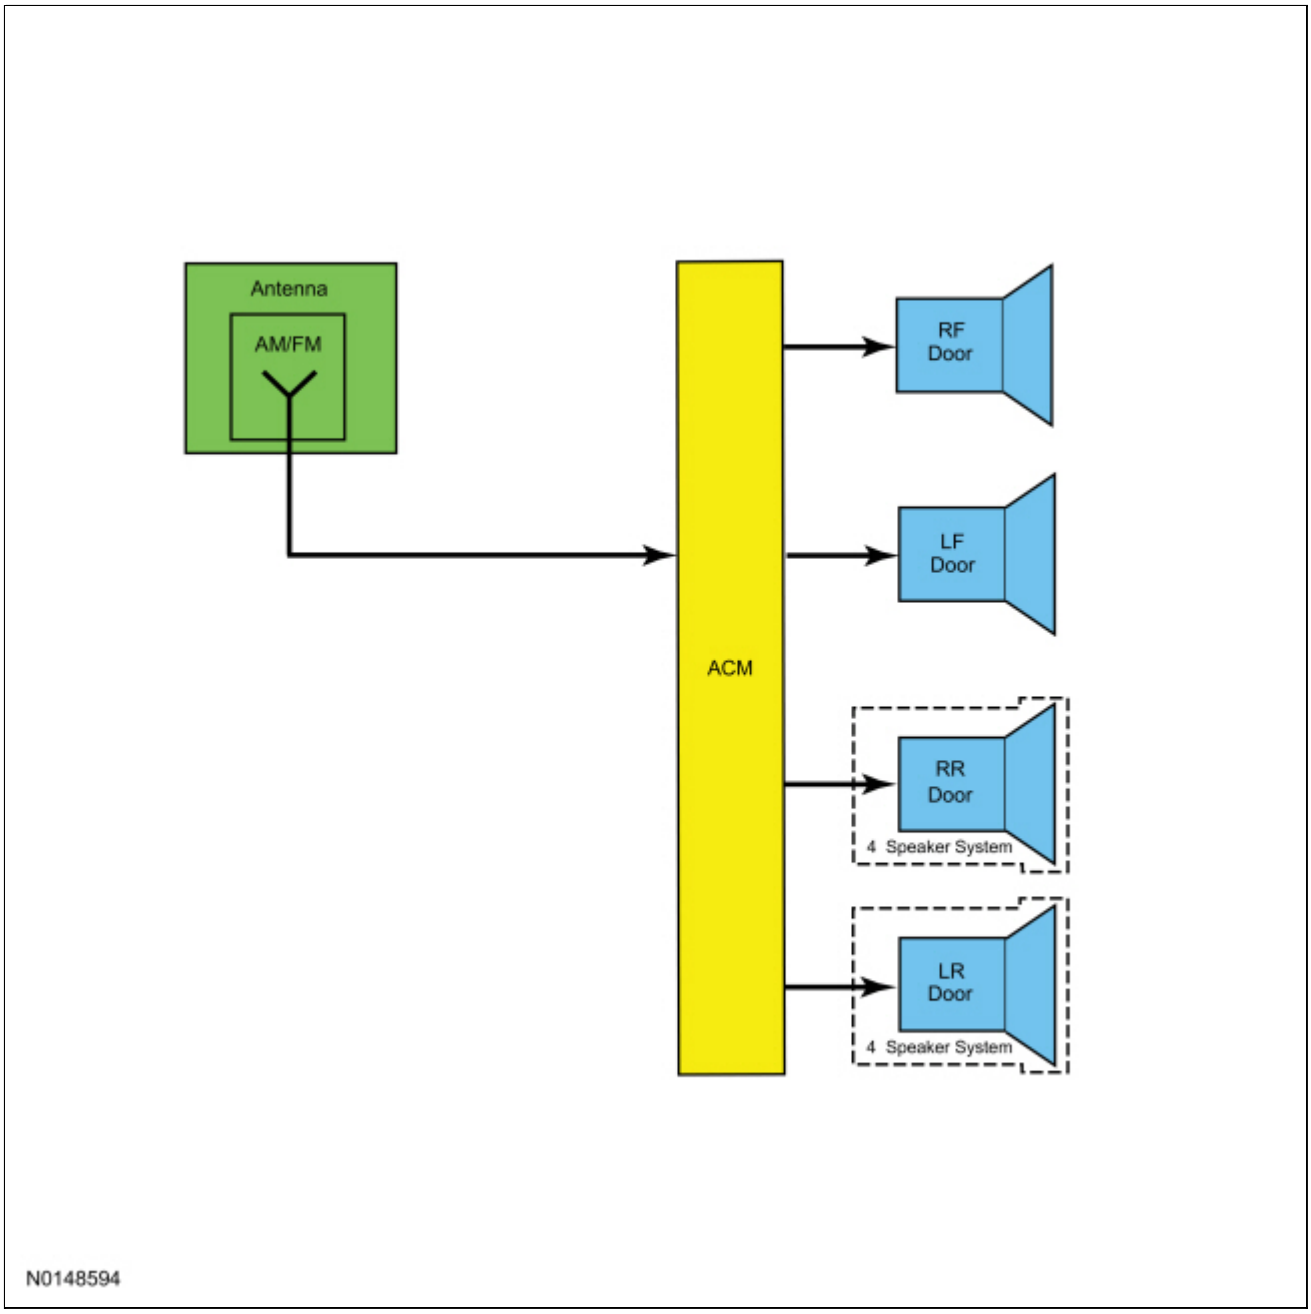
Overview



The audio system consists of the following:

Main Components

- 2 or 4 speakers
- AM/FM ACM

System Operation

System Diagram

Accessory Delay Feature

The accessory delay feature allows the audio system to be operated for a preset period of time after the ignition is turned off and a front door has not been opened.

AM/FM Radio

The AM/FM fender-mounted antenna receives radio waves and sends them through the AM/FM antenna coaxial cable to the ACM . The radio waves are converted into fluctuating AC voltage and sent as left and right analog audio signals to the speakers.

Battery Load Shed

repair4less

The BCM uses the battery current sensor to monitor the battery state of charge. The battery current sensor is attached to the battery ground cable. With the vehicle OFF and the ignition in ACC or ON, a load shed message is sent over the CAN when the BCM determines that the battery state of charge is below 40%, 45 minutes have elapsed, or 10% of the charge has been drained. This message turns off the audio system to save the remaining battery charge. Under this condition, SYS OFF TO SAVE BATT is displayed on the centerstack infotainment display to notify the driver that battery protection actions are active. To clear the load shed state, start the vehicle.

Component Description

ACM

The ACM can be operated with the ignition in RUN, ACC, or OFF.

The ACM receives radio waves containing audio from the antenna coaxial cable and converts them into fluctuating AC voltage. The ACM processes these inputs and sends left and right analog audio signals to the speakers as fluctuating AC voltage.

Antenna

The AM/FM fender-mounted antenna receives radio waves containing audio and sends them through the AM/FM antenna coaxial cable to the ACM . The antenna mast is used to amplify the AM/FM radio waves to improve reception.

Diagnostic Overview

Diagnostics in this manual assume a certain skill level and knowledge of Ford-specific diagnostic practices. Refer to Diagnostic Methods in Section 100-00 for information about these practices.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation and Fault Conditions

Refer to ACM in Information and Entertainment System .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B2924	Stuck Button	Set by the ACM when buttons are held for more than 100 milliseconds during the self-test.

Possible Sources

- Debris
- ACM

PINPOINT TEST A: ONE OR MORE ACM BUTTONS ARE INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK BUTTON OPERATION	
• Operate all of the ACM buttons and check for proper operation. • **Do all buttons work properly?**	**Yes** The system is operating correctly at this time. **No** GO to A2 .
A2 CHECK FOR DEBRIS	
• CHECK the ACM buttons for dust collection and/or debris. • **Was any dust collection and/or debris found?**	**Yes** Clean as necessary **No** GO to A3 .
A3 RECHECK FOR DTC B2924	
• Ignition ON.	**Yes**

repair4less

• Clear the ACM DTCs. REFER to Audio Control Module (ACM) Self-Diagnostic Mode . • Ignition OFF. • Ignition ON. • Wait at least 2 minutes. • Retrieve all DTCs. • **Is DTC B2924 set?**	GO to A4 . **No** The system is operating correctly at this time.
A4 CHECK FOR CORRECT ACM OPERATION	

• Ignition OFF.
• Disconnect and inspect all the ACM connectors.
• Repair:
  ▪ Corrosion (clean module pins or install new connectors or terminals)
  ▪ Damaged or bent pins (install new terminals or pins)
  ▪ Pushed-out pins (install new pins as necessary)
• Reconnect the ACM connectors. Make sure they seat and latch correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	CHECK OASIS for any applicable TSBs. If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no TSBs address this concern, INSTALL a new ACM . REFER to Audio Control Module (ACM) .
	
	No
	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

Pinpoint Test B: Poor Reception Or Continuous Seek Or Scan — AM/FM

Diagnostic Overview

Diagnostics in this manual assume a certain skill level and knowledge of Ford-specific diagnostic practices. Refer to Diagnostic Methods in Section 100-00 for information about these practices.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation and Fault Conditions

Refer to AM/FM Radio, ACM , and Antenna in Information and Entertainment System .

Possible Sources

- AM/FM antenna
- AM/FM antenna coaxial cable
- Charging system
- Ignition system
- Noise suppression equipment
- Wiring, terminals, or connectors
- ACM

PINPOINT TEST B: POOR RECEPTION OR CONTINUOUS SEEK OR SCAN — AM/FM

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK THE AUDIO SYSTEM RECEPTION
• Operate the audio system in radio tuner AM/FM mode.
• Check the reception with the engine running, and with the engine off.
• Does the poor reception only occur with the engine running?</td><td>Yes
GO to B2 .

No
GO to B4 .</td></tr>
<tr><td>B2 CHECK THE GENERATOR
• Ignition OFF.
• Disconnect: Wiring harness to the generator voltage regulator.
• Start the engine.
• Operate the audio system in radio tuner AM/FM mode.
• Is the reception OK?</td><td>Yes
INSTALL a new generator. REFER to Section 414-00 .

No
GO to B3 .</td></tr>
<tr><td>B3 CHECK THE IGNITION CIRCUITS
• Ignition OFF.
• Connect: Wiring harness to the generator voltage regulator.
• Visually inspect the engine compartment and make sure all ignition coils are correctly and securely connected, and that there are no visible cracks in the coil housings.
• Inspect all the wiring harnesses and connectors for damaged insulation and loose or broken conditions.
• Are the ignition components OK?</td><td>Yes
USE a jumper cable to ground various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, air cleaner, and body sheet metal). When the noise is eliminated, PROVIDE a permanent ground where necessary.

No
REPAIR the ignition system as necessary.</td></tr>
<tr><td>B4 CHECK THE LOWER AM/FM ANTENNA COAXIAL CABLE FOR A SHORT TO VOLTAGE
• Ignition OFF.
• Disconnect: AM/FM antenna coaxial cable at the ACM . Refer to Audio Control Module (ACM) .
• Disconnect: AM/FM antenna inline coaxial cable connection behind the glove compartment. Refer to Antenna Cable — AM/FM .
• Ignition ON.
• Measure the voltage between:
<table><tr><th colspan="2">Positive Lead</th><th colspan="2">Negative Lead</th></tr><tr><th>Pin</th><th>Circuit</th><th>Pin</th><th>Circuit</th></tr><tr><td>AM/FM antenna coaxial cable core at the ACM</td><td>—</td><td>—</td><td>Ground</td></tr><tr><td>AM/FM antenna coaxial cable shield at the ACM</td><td>—</td><td>—</td><td>Ground</td></tr></table>• Is any voltage present?</td><td>Yes
REPAIR or INSTALL a new lower AM/FM antenna coaxial cable. REFER to Antenna Cable — AM/FM .

No
GO to B5 .</td></tr>
<tr><td>B5 CHECK THE LOWER AM/FM ANTENNA COAXIAL</td><td></td></tr>

repair4less

CABLE CORE FOR A SHORT TO GROUND

- Ignition OFF.
- Measure the **resistance** between:

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit
AM/FM antenna coaxial cable core at the ACM	—	—	Ground

- **Is the resistance greater than 10,000 ohms?**

Yes
GO to B6 .

No
REPAIR or INSTALL a new lower AM/FM antenna coaxial cable. REFER to Antenna Cable — AM/FM .

B6 CHECK THE LOWER AM/FM ANTENNA COAXIAL CABLE FOR AN OPEN

- Measure the **resistance** between:

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit
AM/FM coaxial cable core at the ACM	—	Lower AM/FM antenna coaxial cable core at the inline connection	—
AM/FM antenna coaxial cable shield at the ACM	—	Lower AM/FM antenna coaxial cable shield at the inline connection	—

- **Is the resistance less than 1 ohm?**

Yes
GO to B7 .

No
REPAIR or INSTALL a new lower AM/FM antenna coaxial cable. REFER to Antenna Cable — AM/FM .

B7 CHECK THE LOWER AM/FM ANTENNA COAXIAL CABLE CORE AND SHIELD FOR A SHORT TOGETHER

- Measure the **resistance** between:

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit
AM/FM antenna coaxial cable core at the ACM	—	AM/FM antenna coaxial cable shield at the ACM	—

- **Is the resistance greater than 10,000 ohms?**

Yes
GO to B8 .

No
REPAIR or INSTALL a new lower AM/FM antenna coaxial cable. REFER to Antenna Cable — AM/FM .

B8 CHECK THE UPPER AM/FM ANTENNA COAXIAL CABLE FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Connect: AM/FM antenna inline coaxial cable connection behind the glove compartment.
- Disconnect: AM/FM antenna coaxial cable at the antenna unit. Refer to Antenna — AM/FM .
- Ignition ON.
- Measure the **voltage** between:

Yes
REPAIR or INSTALL a new upper AM/FM antenna coaxial cable. REFER to Antenna Cable — AM/FM .

No
GO to B9 .

Positive Lead		Negative Lead	
Pin	Circuit	Pin	Circuit
AM/FM antenna coaxial cable core at the ACM	—	—	Ground
AM/FM antenna coaxial cable shield at the ACM	—	—	Ground

- **Is any voltage present?**

B9 CHECK THE UPPER AM/FM ANTENNA COAXIAL CABLE CORE FOR A SHORT TO GROUND

- Ignition OFF.
