AV2 CHECK THE BATTERY VOLTAGE • Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AV3 .
AV3 RECHECK FOR DTC U3006:17 • Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Clear the continuous memory DTCs. • Carry out the IPC self-test. • **Is DTC U3006:17 present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test AW: DTC U3010:01

Normal Operation

- DTC U3010:01 (Ignition Input Start: General Electrical Failure) — sets on-demand in the Instrument Panel Cluster (IPC) if the IPC detects voltage on the START input circuit during the self-test.

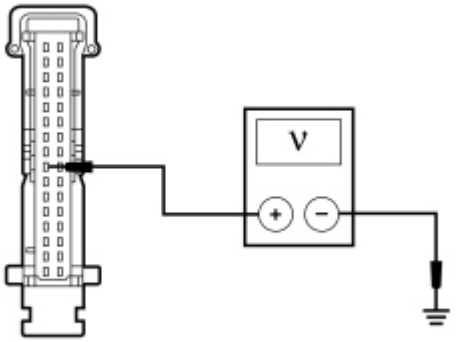
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- IPC

PINPOINT TEST AW: DTC U3010:01

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AW1 CHECK FOR VEHICLE OPTION CONTENT	
• Check if the vehicle is equipped with Intelligent Access (IA). • **Is the vehicle equipped with IA ?**	**Yes** GO to AW2 . **No** GO to AW3 .
AW2 CHECK THE RFA MODULE	
• Ignition OFF. • Disconnect: RFA Module C3503C. • Ignition ON. • Clear the IPC DTCs. • Enter the following diagnostic mode on the scan tool: Self-Test. • Repeat the IPC self-test. • **Is DTC U3010:01 recorded?**	**Yes** GO to AW4 . **No** REFER to Section 303-06 to diagnose the PCM starter inhibit function.
AW3 CHECK THE PCM	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Clear the IPC DTCs. • Enter the following diagnostic mode on the scan tool: Self-Test. • Repeat the IPC self-test. • **Is DTC U3010:01 recorded?**	**Yes** GO to AW4 . **No** REFER to Section 303-06 to diagnose the PCM starter inhibit function.
AW4 CHECK THE START INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the IPC C220-9, circuit CDC54 (WH/GN), harness side and ground.	**Yes** REPAIR circuit CDC54 (WH/GN) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.



N0115643

- **Is any voltage present?**

Belt-Minder® Deactivating/Activating

Preparation

NOTE: The driver and front passenger Belt-Minder® are deactivated/activated independently. When deactivating/activating one seating position, do not buckle the other position, as this terminates the procedure.

NOTE: The Belt-Minder® can also be deactivated/activated using the scan tool.

1. Before deactivating/activating the Belt-Minder®, set the parking brake (manual transaxle).

2. Place the transmission selector lever in PARK (automatic transaxle).

3. Turn the ignition switch to the OFF position.
   - For vehicles with push-button start, push the start/stop switch to turn the vehicle off completely.

4. Unbuckle the driver and front passenger safety belts.

Deactivating/Activating

1. Turn the ignition switch to the RUN position (do not start the engine).
   - For vehicles with push-button start, push the start/stop switch and release quickly, do not attempt to start the engine.

2. Wait approximately 1 minute until the safety belt warning indicator turns off.

3. **NOTE:** Complete Step 3 within 50 seconds after the safety belt warning indicator turns off.

   NOTE: Buckle and unbuckle the safety belt at a moderate rate. If the safety belt buckle/unbuckle/buckle sequence is carried out too quickly, the Restraints Control Module (RCM) can fail to recognize one of the sequences and the procedure must be repeated.

   To disable the seating position, buckle then unbuckle the safety belt 3 times, ending in the unbuckled state.
   - After Step 3, the safety belt warning indicator illuminates for 3 seconds then turns off.

4. Within 7 seconds of the indicator turning off, buckle then unbuckle the safety belt.
   - If currently enabled this disables the Belt-Minder® feature for that seating position. As confirmation, the safety belt warning indicator flashes 1 time per second for 3 seconds.
   - If currently disabled this enables the Belt-Minder® feature for that seating position. As confirmation, the safety belt warning indicator flashes 4 times per second for 3 seconds, followed by 3 seconds with the indicator ff, then followed by the safety belt warning indicator flashing 1 times per second for 3 seconds again.

Message Center Configuration

Oil Life Reset

NOTE: This procedure resets the oil life telltale in the Instrument Panel Cluster (IPC), and the oil change reminder message in the message center display.

1. Press the brake and accelerator pedals at the same time.

2. Turn the ignition switch to the RUN position (do not start the engine).
   - For vehicles with push-button start, push the start/stop switch and release quickly, do not attempt to start the engine.

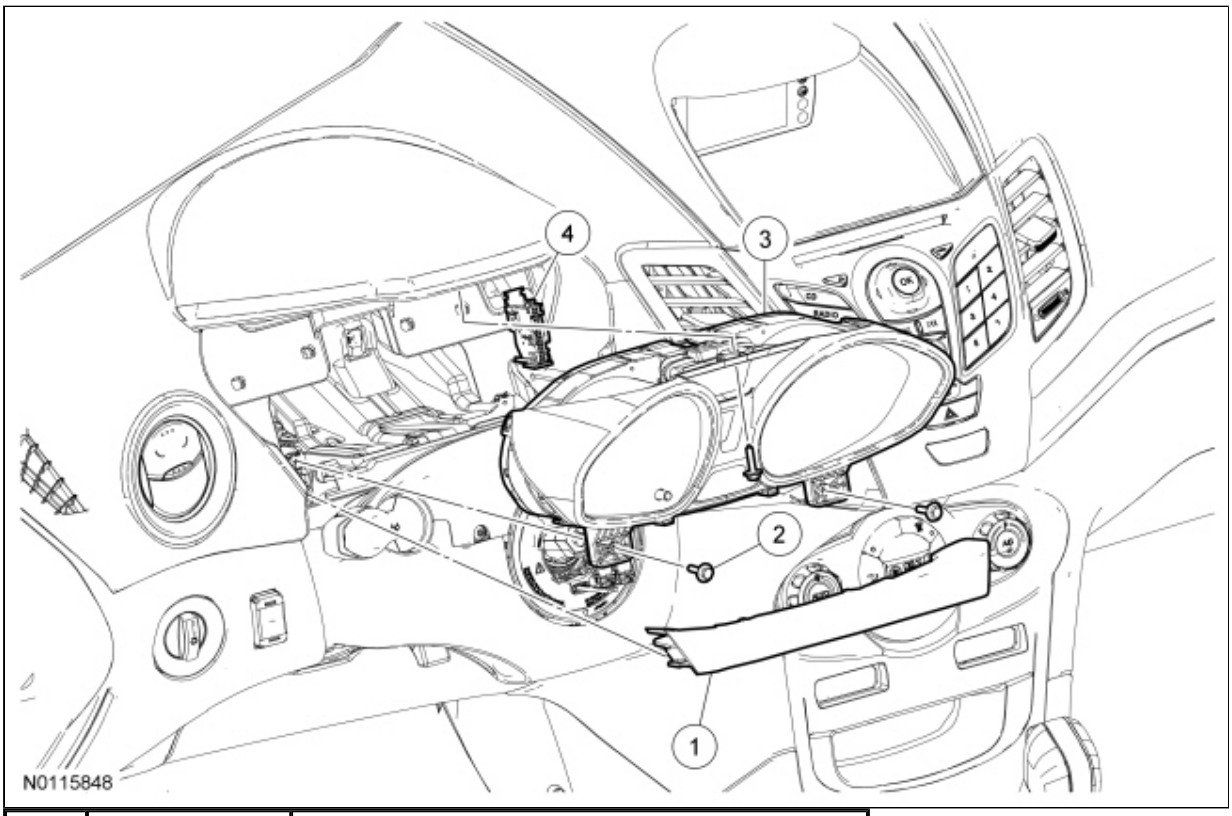
3. Keep the pedals fully depressed for a minimum of 20 seconds.

4. Rotate the key to the OFF position.
   - For vehicles with push-button start, push the start/stop switch to turn the vehicle off completely.

5. Start the vehicle. Make sure that the oil life telltale is not illuminated in the IPC , and the oil change reminder message is no longer displayed in the message center.

Instrument Panel Cluster (IPC)

NOTE: Steering wheel removed for clarity.



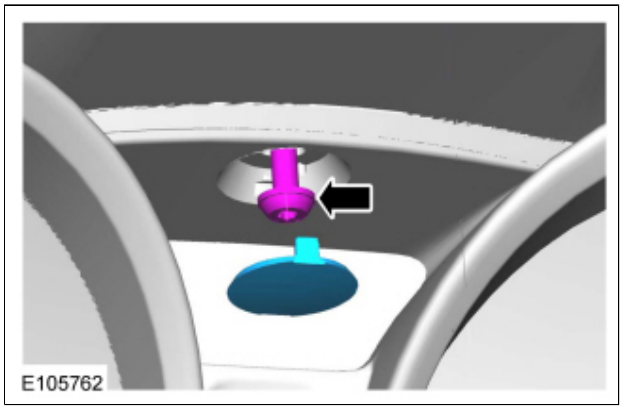
Item	Part Number	Description
1	—	IPC finish panel
2	W707628	IPC screws (3 required)
3	10849	IPC
4	—	IPC electrical connector (part of 14K024)

Removal

NOTE: If installing a new Instrument Panel Cluster (IPC), all vehicle keys are erased during the parameter reset procedure. Verify at least 2 of the vehicle keys are available prior to carrying out this procedure.

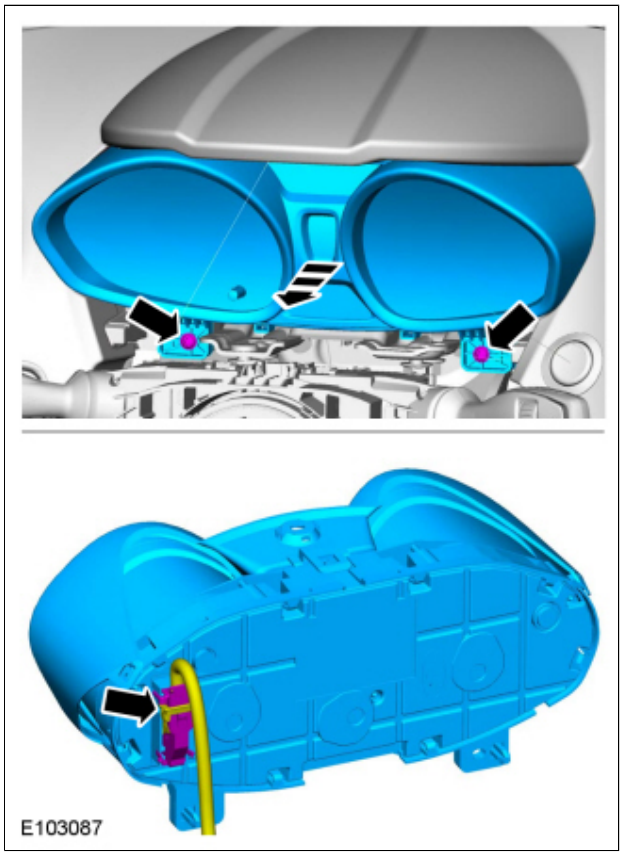
NOTE: If a new non-Intelligent Access (IA) IPC is installed, the IPC and the PCM require a parameter reset to allow the IPC and the PCM to recognize each other. Failure to carry out the parameter reset to the IPC and the PCM may result in a no start condition.

1. If installing a new IPC , upload the IPC configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .
2. Lower the tilt steering column to the lowest setting.
3. Remove the IPC center bolt cover and bolt.



4. Position back the instrument cluster finish panel.

5. Remove the two lower IPC bolts and the IPC .
    - Disconnect the electrical connector.

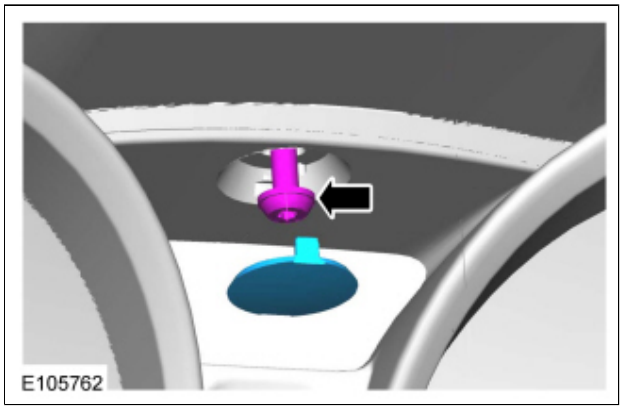


Installation

1. Position the IPC in the instrument panel, connect the electrical connector and install the 2 lower IPC screws.

2. Reposition the instrument cluster finish panel.

3. Install the IPC center bolt cover and bolt.



4. If installing a new IA IPC remove relay R7 from the Central Junction Box (CJB) and jumper pins 3 and 5 together. Download the IPC configuration information from the scan tool into the new IPC . For additional information, refer to PMI in Section 418-01 .
    - After configuration, remove the jumper and reinstall relay R7.

5. If installing a new non- IA IPC , carry out the parameter reset procedure. For additional information, refer to Section 418-01 .

6. If installing a new non- IA IPC , carry out the key programming procedure. For additional information, refer to Section 419-01B .

Torque Specifications

Description	Nm	lb-in
Horn bracket bolt	9	80

Horn

The horn system consists of the following components:

- Body Control Module (BCM)
- Clockspring
- Driver air bag module
- Horn relay (integral to the BCM)
- Horn (located below the RH headlamp and behind the RH fender)

Horn

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Battery Junction Box (BJB) supplies the switched and control voltage to the horn relay (part of the Body Control Module (BCM)). When the driver air bag module is pressed, the horn switch (which is integrated into the driver air bag module) is closed and ground is supplied to the BCM which is routed through the clockspring. The horn relay then energizes, sending voltage to the horn, enabling the horn to sound.

The horn switch is not a single component, but consists of contact points located on the steering wheel and driver air bag module. The contact points are separated by springs. One set of contacts is part of the steering wheel itself and the other set is part of a metal plate mounted to the rear of the driver air bag module. Springs mounted to the metal plate are isolated by plastic seats on the steering wheel. When the driver air bag module is pressed against the steering wheel, the contacts on the driver air bag module and the steering wheel touch to complete the circuit.

Anti-Theft Horn

On vehicles equipped with perimeter alarm, the vehicle has a separate anti-theft horn. Refer to Section 419-01A , for information on the perimeter alarm and anti-theft horn.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Horn	• Battery Junction Box (BJB) fuse 32 (20A) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The horn is inoperative	• Fuse • Wiring, terminals or connectors • Steering wheel harness • Horn • Clockspring • Driver air bag module • Body Control Module (BCM)	• GO to Pinpoint Test A .
• The horn is always on	• Wiring, terminals or connectors • Steering wheel harness • Clockspring • Driver air bag module • BCM • Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM)	• GO to Pinpoint Test B .

Pinpoint Tests

Pinpoint Test A: The Horn Is Inoperative

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

Normal Operation

When the driver air bag module is pressed, the normally open horn switch (which is part of the driver air bag module) is closed and ground is routed through the clockspring to the horn relay, energizing the horn relay. The Battery Junction Box (BJB) supplies the switched and control voltage to the horn relay, which is integrated into the Body Control Module (BCM). The horn relay then provides voltage to the horn, enabling the horn to sound.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Steering wheel harness

- Horn
- Clockspring
- Driver air bag module
- BCM

PINPOINT TEST A: THE HORN IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK FOR VOLTAGE TO THE HORN	
• Ignition OFF. • Disconnect: Horn C131. • While pressing the horn switch, measure the voltage between the horn C131-2, circuit CRH04 (VT/GN), harness side and ground.  N0090544 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** GO to A3 .
A2 CHECK FOR VOLTAGE TO THE HORN USING THE CONNECTOR GROUND	
• While pressing the horn switch, measure the voltage between the horn C131-2, circuit CRH04 (VT/GN), harness side and the horn C131-1, circuit GD123 (BK/GY), harness side.  N0013171 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new horn. REFER to Horn in this section. TEST the system for normal operation. **No** REPAIR circuit GD123 (BK/GY) for an open. TEST the system for normal operation.
A3 CHECK FOR VOLTAGE TO THE BCM	
• Connect: Horn C131.	**Yes** GO to A4 .

• Disconnect: BCM C2280A. • Measure the voltage between the BCM C2280A-2, circuit SBB32 (VT/RD), harness side and ground.  N0115570 • **Is the voltage greater than 10 volts?**	**No** VERIFY the BJB fuse 32 (20A) is OK. If OK, REPAIR circuit SBB32 (VT/RD) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
A4 BYPASS THE BCM	
• Connect a fused jumper wire between the BCM C2280A-2, circuit SBB32 (VT/RD), harness side and the BCM C2280A-3, circuit CRH04 (VT/GN), harness side.  N0115571 • **Does the horn sound?**	**Yes** REMOVE the jumper wire. GO to A5 . **No** REMOVE the jumper wire. REPAIR circuit CRH04 (VT/GN) for an open. TEST the system for normal operation.
A5 CHECK FOR VOLTAGE TO THE CLOCKSPRING	
• Connect: BCM C2280A. • Disconnect: Clockspring C218B . • Measure the voltage between the clockspring C218B-11, circuit CRH03 (BN), harness side and ground.  N0115572 • **Is the voltage greater than 10 volts?**	**Yes** GO to A7 . **No** GO to A6 .

A6 CHECK HORN RELAY COIL GROUND CONTROL CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280E. • Measure the resistance between the clockspring C218B-11, circuit CRH03 (BN), harness side and the BCM C2280E-21, circuit CRH03 (BN), harness side.  N0115573 • **Is the resistance less than 5 ohms?**	**Yes** GO to A10 . **No** REPAIR circuit CRH03 (BN) for an open. TEST the system for normal operation.
A7 CHECK FOR VOLTAGE TO THE CLOCKSPRING USING THE CONNECTOR GROUND	
• Measure the voltage between the clockspring C218B-11, circuit CRH03 (BN), harness side and the clockspring C218B-15, circuit GD115 (BK/GY), harness side.  N0115574 • **Is the voltage greater than 10 volts?**	**Yes** GO to A8 . **No** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
A8 CHECK FOR VOLTAGE TO THE HORN SWITCH CONNECTOR	
• Connect: BCM C2280E. • Connect: Clockspring C218B. • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Horn Switch C217A. • Disconnect: Horn Switch C217B. • Measure the voltage between the horn switch C217A-1, circuit (RD), harness side and the horn switch C217B-1, circuit (VT), harness side.	**Yes** INSTALL a new driver air bag module. REFER to Section 501-20B . TEST the system for normal operation. **No** GO to A9 .

 N0115575 • **Is the voltage greater than 10 volts?**	
A9 CHECK FOR VOLTAGE TO THE CLOCKSPRING • Disconnect: Clockspring C218C. • Measure the voltage between the clockspring connector C218C pin 4, component side and the clockspring C218C pin 8 component side.  N0115576 • **Is the voltage greater than 10 volts?**	**Yes** The steering wheel harness has an open circuit. INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation. **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
A10 CHECK FOR CORRECT BCM OPERATION • Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Horn Is Always On

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

Normal Operation

When the driver air bag module is pressed, the normally open horn switch (which is part of the driver air bag module) is closed and ground is routed through the clockspring to the horn relay, energizing the horn relay. The Battery Junction Box (BJB) supplies the switched and control voltage to the horn relay,

which is integrated into the Body Control Module (BCM). The horn relay then provides voltage to the horn, enabling the horn to sound. If incorrectly installed, the horn pad can cause the horn switch to be closed at all times.

The Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) is also wired to the horn relay coil controlled circuit. The TPM / VSM sounds the horn during TPMS sensor training.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Steering wheel harness
- Clockspring
- Driver air bag module
- BCM
- TPM / VSM

PINPOINT TEST B: THE HORN IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

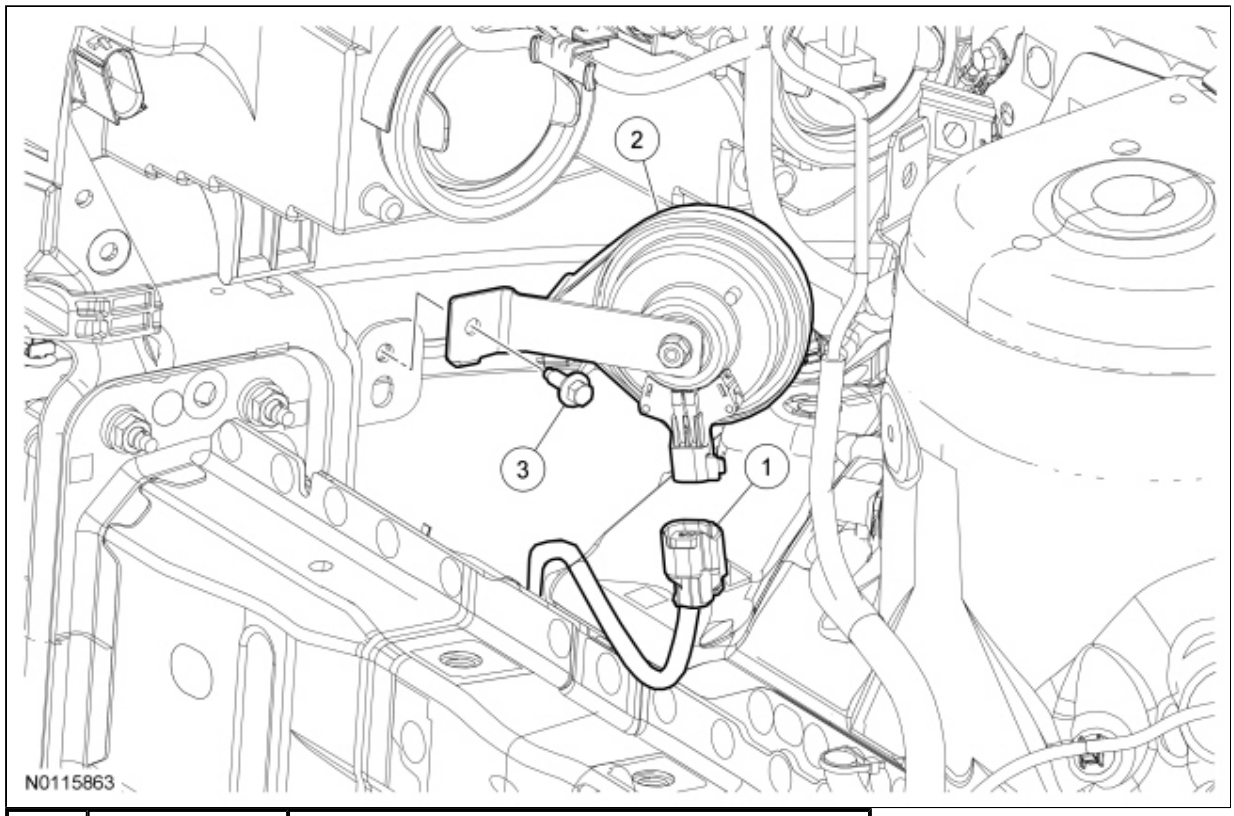
Test Step	Result / Action to Take
B1 CHECK THE HORN SWITCH INPUT TO THE BCM • Ignition OFF. • Disconnect: BCM C2280E. • Disconnect: BCM C2280D. • Ignition ON. • **Does the horn continue to sound?**	**Yes** GO to B2. **No** GO to B3.
B2 CHECK THE HORN CIRCUIT FOR SHORT TO VOLTAGE • Ignition OFF. • Disconnect: BCM C2280A. • Ignition ON. • **Does the horn continue to sound?**	**Yes** REPAIR circuit CHR04 (VT/GN) for a short to voltage. TEST the system for normal operation. **No** GO to B7.
B3 CHECK THE TPM / VSM • Ignition OFF. • Connect: BCM C2280E. • Connect: BCM C2280D. • Disconnect: TPM / VSM C4321B. • **Does the horn continue to sound?**	**Yes** GO to B4. **No** GO to B8.
B4 CHECK THE HORN SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND • Disconnect: Clockspring C218B. • **Does the horn continue to sound?**	**Yes** REPAIR circuit CRH03 (BN) for a short to ground. TEST the system for normal operation. **No** GO to B5.

B5 CHECK HORN SWITCH • Connect: Clockspring C218B. • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Horn Switch C217A. • **Does the horn continue to sound?**	**Yes** GO to B6 . **No** INSTALL a new driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.
B6 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND • Disconnect: Clockspring C218C. • **Does the horn continue to sound?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation. **No** The steering wheel harness has a short circuit. INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation.

B7 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

B8 CHECK FOR CORRECT TPM / VSM OPERATION
• Disconnect all the TPM / VSM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the TPM / VSM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TPM module. REFER to Section 204-04 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Horn



Item	Part Number	Description
1	—	Horn electrical connector (part of 14K012)
2	13832	Horn
2	W702498	Horn bracket bolt

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the electrical connector.
3. Remove the horn bracket bolt and the horn.
   - To install, tighten to 10 Nm (89 lb-in).
4. To install, reverse the removal procedure.

General Specifications

Item	Specification
Generator	
Generator pulley ratio	2.62:1
Rating	81 amps @ 750 rpm (min) - 124 amps @ 2,300 rpm (max)
Voltage regulator type	Electronic internal with generator

Torque Specifications

Description	Nm	lb-ft	lb-in
Generator B+ terminal nut	15	—	133
Generator nut	48	35	—
Generator stud bolt	10	—	89
Lower generator bolt	48	35	—
Upper generator bolt	48	35	—

Charging System

The charging system is a negative ground system consisting of:

- a generator with an internal voltage regulator.
- a charging system warning indicator.
- a battery.
- circuitry and cables.
- a PCM.

The generator is driven by the accessory drive belt. When the engine is started, the generator begins to generate AC voltage which is internally converted to DC voltage. The DC voltage is controlled by the voltage regulator (located on the rear of the generator) and supplied to the battery. The PCM controls the voltage regulator set point, communicating with the generator internal voltage regulator over a dedicated Local Interconnect Network (LIN) communication circuit.

Principles of Operation

The PCM-controlled charging system, or Smart Charge charging system, determines the optimal voltage setpoint for the charging system and communicates this information to the voltage regulator. The Smart Charge charging system is designed to set 1 of 9 DTCs any time a charging system fault is present. All of the DTCs can set continuous faults, but not all DTCs set as on-demand faults.

DTC	Key ON Engine OFF (KOEO)	Key ON Engine Running (KOER)	Continuous
P065B:09		X	X
P065C:09		X	X
P0A3B:09		X	X
P1794:16	X	X	X
P1794:17	X	X	X
U0120:13	X	X	X
U0469:09		X	X
U3003:16	X	X	X
U3003:17	X	X	X

This system uses a dedicated Local Interconnect Network (LIN) communication circuit. The generator uses this LIN circuit to communicate the desired setpoint from the PCM to the voltage regulator. The generator also uses this LIN circuit to communicate the generator load and error conditions to the PCM.

The PCM simultaneously controls and monitors the output of the generator. When the usage of current is high or the battery is discharged, the PCM raises engine speed as needed to increase generator output. The generator charges the battery and at the same time supplies power for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM uses the measurement from the Intake Air Temperature (IAT) sensor to adjust the charging voltage according to the battery temperature. The PCM also uses other inputs to control charging system voltage such as the Vehicle Speed Sensor (VSS) and Engine Coolant Temperature (ECT) sensor. The voltage setpoint is calculated by the PCM and communicated to the voltage regulator by the LIN circuit based on the needs of the vehicle and the operating conditions.

The PCM turns off the generator during cranking to reduce the generator load and improve cranking speed. Once the engine starts, the PCM slowly increases generator output to desired voltage.

The PCM controls the charging system warning indicator by sending a message over the High Speed Controller Area Network (HS-CAN) to the Instrument Panel Cluster (IPC) module. The IPC module controls the charging system warning indication based on the message from the PCM. The IPC module controls the charging system indication based on the message from the PCM, turning it on or off. If equipped with a Front Control/Display Interface Module (FCDIM) (message center), the IPC module displays a CHECK CHARGING SYSTEM message. When the ignition is on and the engine is off on vehicles equipped with a message center, the CHECK CHARGING SYSTEM message may not be displayed. For additional information regarding the IPC module, refer to Section 413-01 . For additional information regarding the FCDIM , refer to Section 415-00 .

Under certain circumstances the charging system may have a concern but still keep the battery charged and the vehicle running. The LIN normally initiates charging from the PCM, but the generator may continue charging when a fault is present on this circuit. If the engine is operated at greater than 2,000

rpm momentarily, the generator may self-excite or start charging on its own. The charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off. When the engine is restarted and the engine is operated at greater than 2,000 rpm momentarily, the generator may again self-excite and again the charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed.

The PIDs and their associated descriptions used in the charging system diagnosis are listed below:

PID Chart

PID	Description	Normal Display	Associated Circuit Name	Connector, Circuit
GENVDSD	Generator Voltage Desired	Voltage varies by vehicle needs - May be controlled by an output state control	—	—
VPWR	Module Supply Voltage	Within 0.5 volt of battery voltage	—	—

Inspection And Verification

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

NOTICE: **Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals or fuses.**

NOTICE: **Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.**

NOTE: While carrying out any pinpoint test, disregard any DTCs set while following a specific pinpoint test. After the completion of a test, be sure to clear all DTCs in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Front End Accessory Drive (FEAD) belt • Generator pulley	• Wiring, terminals or connectors • Cables • Battery • Generator • Fuses

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the battery condition. Refer to Section 414-01 .

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out (other indicators may NOT prove ignition is on) confirms ignition on. If ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - refer to Section 418-00 , Inspection and Verification, to establish a scan tool session (without the ignition on).
   - verify the scan tool operation with a known good vehicle.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .

NOTE: Use the Integrated Diagnostic System (IDS) feature that retrieves all Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules at one time.

9. Retrieve CMDTCs from all modules.

10. **NOTE:** If no charging system DTCs are present, the charging system is operating correctly. If the charging system has a concern, it usually sets a charging system DTC.

    If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Master DTC Chart in Section 419-10 or Powertrain Control/Emissions Diagnosis (PC/ED) manual.

11. If no DTCs related to the concern are retrieved, go to the Symptom Chart in this section.

Diagnostic Trouble Code (DTC) Chart

DTCs	Description	Source	Action
P065B:09	Generator Control Circuit Range/Performance: Component Failure	PCM	INSTALL a new generator. Refer to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P065C:09	Generator Mechanical Performance: Component Failure	PCM	GO to Pinpoint Test D .
P0A3B:09	Generator Over Temperature: Component Failure	PCM	INSTALL a new generator. Refer to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P1794:16	Battery Voltage Circuit: Circuit Voltage Below Threshold	PCM	GO to Pinpoint Test B .
P1794:17	Battery Voltage Circuit: Circuit Voltage Above Threshold	PCM	GO to Pinpoint Test A .
U0120:13	Lost Communication with Starter/Generator Control Module: Circuit Open	PCM	GO to Pinpoint Test C .
U0469:09	Invalid Data Received From Starter/Generator Control Module: Component Failure	PCM	INSTALL a new generator. Refer to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	PCM	GO to Pinpoint Test B .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	PCM	GO to Pinpoint Test A .
All other DTCs	—	Various Modules	REFER to the Section 303-14 or the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If directed to this section from another section, GO to Symptom Chart in this section.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• System voltage high	• Engine, generator and battery grounds • Wiring, terminals or connectors • Battery • Generator • PCM	• GO to Pinpoint Test A .
• System voltage low or battery is discharged	• High-current fuse assembly • Abnormal ignition-off current drain(s) • Engine, generator and battery grounds • Positive battery cable • Wiring, terminals or connectors • Battery • Generator • PCM	• GO to Pinpoint Test B .
• The generator is noisy	• Front End Accessory Drive (FEAD) belt • Loose bolts/brackets • Generator/pulleys	• GO to Pinpoint Test D .
• Radio interference	• Generator • Wiring, terminals or connectors • In-vehicle entertainment system	• GO to Pinpoint Test E .
• Charging system warning indicator is never/always on	• Wiring, terminals or connectors • IPC • Generator • PCM	• RETRIEVE Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules. If any charging system DTCs are found, REFER to the Diagnostic Trouble Code (DTC) Chart in this section. If no charging system DTCs are found, REFER to Section 413-01 .

Pinpoint Test

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Pinpoint Test A: System Voltage High

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

NOTE: DTC P1794:17 or U3003:17 can set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

Normal Operation

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The voltage that is supplied to the vehicle electrical system operates of the various vehicle systems and modules. Many modules monitor this voltage and set a DTC if the voltage exceeds their calibrated setpoint.

- DTC P1794:17 (Battery Voltage Circuit: Circuit Voltage Above Threshold) — Sets when the module senses battery voltage is greater than 16 volts.
- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — Sets when the module senses battery voltage is greater than 16 volts.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Engine, generator and battery grounds
- Battery
- Generator
- PCM

PINPOINT TEST A: SYSTEM VOLTAGE HIGH

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
A1 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to A2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD)	
• Start the engine. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the GENVDSD PID. • **Does the GENVDSD PID indicate 15.9 volts or less?**	**Yes** GO to A3 . **No** GO to A8 .
A3 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD)	
• With the engine still running at idle, measure battery voltage and record.  AJ0210-A • Monitor the GENVDSD PID. • **Is battery voltage within ±0.6 volt of the PID GENVDSD?**	**Yes** The fault is not present at this time. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A4 .
A4 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD) WHILE COMMANDED	
• Monitor the GENVDSD PID. • Using the active command, set GENVDSD PID to 14 volts. • With the engine still running at idle, measure battery voltage and record.	**Yes** GO to A5 . **No** INSTALL a new generator. REFER to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 AJ0210-A • **Is battery voltage within ±0.6 volt of the PID GENVDSD?**	
A5 CHECK THE GENERATOR OUTPUT	
• Increase engine rpm until generator starts to generate output. • With the engine running, measure battery voltage and record.  AJ0210-A • **Is the voltage greater than 14.5 volts?**	**Yes** INSTALL a new generator. REFER to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A6.
A6 COMPARE PCM SUPPLY VOLTAGE (VPWR) PID TO BATTERY VOLTAGE	
• With the engine still running at idle, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does PCM VPWR PID accurately display battery voltage within ±0.5 volt?**	**Yes** INSTALL a new generator. REFER to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A7.
A7 CHECK PCM SUPPLY VOLTAGE CIRCUITS	
• Ignition OFF. • Disconnect: PCM C175B. • Inspect the connector pins for damage. Measure resistance	**Yes** GO to A8.

between Battery Junction Box (BJB) fuse 16 (15A), output side and: ■ PCM C175B-11, circuit CBB16 (BU/GN), harness side. ■ PCM C175B-12, circuit CBB16 (BU/GN), harness side.  • **Are the resistances less than 0.5 ohm?**	**No** REPAIR high resistance or loose connections in the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A8 CHECK FOR CORRECT PCM OPERATION	
• Ignition OFF. • Check the PCM harness and component side connectors for: ■ corrosion. ■ pushed-out/bent pins. • Connect the PCM and generator, make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: System Voltage Low or Battery is Discharged

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The voltage that is supplied to the vehicle electrical system operates the various vehicle systems and modules. Many modules monitor this voltage and set a DTC if the voltage drops below their calibrated setpoint.

- DTC P1794:16 (Battery Voltage Circuit: Circuit Voltage Below Threshold) — Sets when the module senses battery voltage is less than 9 volts.
- DTC P065B:09 (Generator Control Circuit Range/Performance: Component Failure) — Sets when the generator reports an internal regulator failure.
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — Sets when the module senses battery voltage is less than 9 volts.

This pinpoint test is intended to diagnose the following:

- High-current fuse assembly
- Abnormal ignition-off current drain(s)
- Engine, generator and battery grounds
- Positive battery cable
- Wiring, terminals or connectors
- Battery
- Generator
- PCM

PINPOINT TEST B: SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

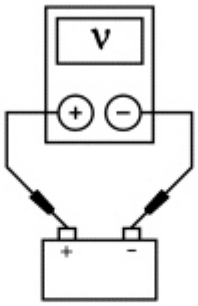
NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
B1 CHECK THE PCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test — PCM. • Check the PCM for DTCs. • **Is DTC P065B:09 present?**	**Yes** INSTALL a new generator. REFER to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B2.
B2 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to B3. **No** INSTALL a new battery. REFER to Section 414-01. TEST the system for normal operation.
B3 CHECK THE GENERATOR CONNECTIONS	
• Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Inspect generator C102A for bent and/or pushed-out pins.	**Yes** GO to B4. **No**

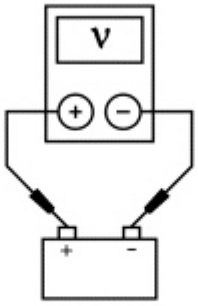
• Inspect generator C102B, B+ circuit SBF01 (RD) connection. The connection should be tight. • Measure the battery voltage.  AJ0210-A • Measure the voltage between generator C102B, B+ circuit SBF01 (RD) and ground.  N0115310 • **Is the generator C102B connection tight and does the generator B+ measure battery voltage within ±0.5 volt?**	TIGHTEN or INSTALL a new C102B (B+ nut) or REPAIR connection as needed. REFER to Specifications in this section. VERIFY the high current fuse assembly is OK. If the fuse assembly is OK, REPAIR circuit SBF01 (RD). If the fuse assembly is not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B4 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C102B, circuit SBF01 (RD) and the positive battery terminal.  N0115311 • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	**Yes** GO to B5 . **No** INSPECT and REPAIR any corrosion in the B+ circuit SBF01 (RD) or positive battery cable connections. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B5 CHECK THE VEHICLE GROUNDS	
• Start the engine. • With the engine running at idle, headlamps on and heater blower on high, measure the voltage drop between the generator housing and the negative battery terminal.  N0117821 • **Is the voltage drop less than 0.5 volt?**	**Yes** GO to B6 . **No** INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B6 COMPARE PCM SUPPLY VOLTAGE (VPWR) PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor PCM VPWR PID. • With the engine still running at idle, headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does PCM VPWR PID display battery voltage within ±0.5 volt?**	**Yes** GO to B7 . **No** REPAIR high resistance or loose connections in the affected PCM power circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B7 CHECK PCM GROUND FOR HIGH RESISTANCE	
• Monitor PCM VPWR PID. • With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and note the PCM VPWR PID.	**Yes** GO to B8 . **No** REPAIR the affected PCM ground circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



AJ0210-A

- With the engine still running at idle, turn headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.



AJ0210-A

- **Does the VPWR PID read within ±0.5 volt with accessory loads on as compared to accessory loads off?**

B8 MONITOR PID VPWR AT WOT	
• With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • Monitor the VPWR PID and momentarily accelerate the engine to WOT and release. Repeat this step 4-5 times while continuing to monitor the VPWR PID. • **Does the VPWR PID stay within 0.5 volt of battery voltage when the engine rpms are increased?**	**Yes** CARRY OUT the Component Test, Battery — Drain Test. REFER to Section 414-01 . **No** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: DTC U0120:13

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The PCM monitors the generator output through a dedicated Local Interconnect Network (LIN) communication circuit. The generator uses this LIN circuit to communicate the desired voltage setpoint from the PCM to the voltage regulator. The generator also uses this LIN circuit to communicate the generator load and error conditions to the PCM.

- DTC U0120:13 (Lost Communication with Starter/Generator Control Module: Circuit Open) — Sets when the PCM does not detect communication through the LIN circuit. This can be a result of an open or short in the LIN circuit. This DTC also sets if the B+ circuit is open.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Generator
- PCM

PINPOINT TEST C: DTC U0120:13

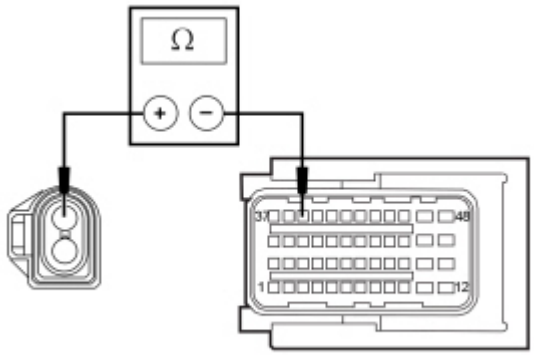
NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
C1 CHECK THE GENERATOR CONNECTIONS • Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SBF01 (RD) connection. The connection should be tight. • Measure the battery voltage.  AJ0210-A • Measure the voltage between generator C102B, B+ circuit SBF01 (RD) and ground.	**Yes** GO to C2 . **No** TIGHTEN or INSTALL a new C102B (B+ nut) or REPAIR connection as needed. REFER to Specifications in this section. VERIFY the high current fuse assembly is OK. If the fuse assembly is OK, REPAIR circuit SBF01 (RD). If the fuse assembly is not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0115310 • **Is the generator C102B connection tight and does the generator B+ measure battery voltage within ±0.5 volt?**	
C2 CHECK THE GENERATOR LIN CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: Generator C102A. • Disconnect: PCM C175E. • Ignition ON. • Measure the voltage between generator C102A-1, circuit CDC15 (VT), harness side and ground.  N0116048 • **Is any voltage present?**	**Yes** REPAIR circuit CDC15 (VT) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to C3 .
C3 CHECK THE GENERATOR LIN CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Measure the resistance between the generator C102A-1, circuit CDC15 (VT), harness side and ground.  N0116049 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit CDC15 (VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C4 CHECK THE GENERATOR LIN CIRCUIT FOR AN OPEN	

• Inspect the following harness connectors for damaged or pushed-out pins:
  ▪ PCM C175E-39, circuit CDC15 (VT)
  ▪ Generator C102A-1, circuit CDC15 (VT)
• Measure the resistance between PCM C175E-39, circuit CDC15 (VT), harness side and generator C102A-1, circuit CDC15 (VT), harness side.
  	


N0117793
• **Are the connectors and pins free of damage and is the resistance less than 5 ohms?**
	Yes
	INSTALL a new generator. Refer to Generator in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	If DTC U0120:13 returns, INSTALL a new PCM. Refer to Section 303-14. TEST the system for normal operation.
	
	No
	REPAIR circuit CDC15 (VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: The Generator is Noisy

Refer to Wiring Diagrams Cell 12, Charging System for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system. Sources of generator noise include bearing noise, electrical fault noise and generator or belt pulley misalignment. A generator with certain types of diode or stator failures may also produce an audible noise.

- DTC P065C:09 (Generator Mechanical Performance: Component Failure) — Sets when the generator reports an internal mechanical failure. This DTC also sets if the generator has a bad bearing, pulley, axle or belt.

This pinpoint test is intended to diagnose the following:

- Front End Accessory Drive (FEAD) drive belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST D: THE GENERATOR IS NOISY

Test Step	Result / Action to Take
D1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS	
• Ignition OFF. • Check the accessory drive belt and tensioner for damage and correct installation. Refer to Section 303-05. • Check the accessory mounting brackets and	**Yes** GO to D2. **No** REPAIR as necessary. REFER to Section

generator pulley for looseness or misalignment. • **Is the accessory drive OK?**	303-05 for diagnosis and testing of the accessory drive system. TEST the system for normal operation.
D2 CHECK THE GENERATOR MOUNTING	
• Check the generator mounting for loose bolts or misalignment. • **Is the generator mounted correctly?**	**Yes** GO to D3. **No** REPAIR as necessary. TEST the system for normal operation.
D3 CHECK THE GENERATOR FOR NOISE	
• With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise. • **Is the generator the noise source?**	**Yes** INSTALL a new generator. REFER to the Generator in this section. **No** REFER to Section 303-00 to diagnose the source of the engine noise.

Pinpoint Test E: Radio Interference

Refer to Wiring Diagrams Cell 12, Charging System for schematic and connector information.

Normal Operation

The generator radio suppression equipment reduces interference transmitted through the audio system speakers by the vehicle electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Wiring, terminals or connectors
- In-vehicle entertainment system

PINPOINT TEST E: RADIO INTERFERENCE

NOTE: If the OEM audio unit has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before carrying out this pinpoint test.

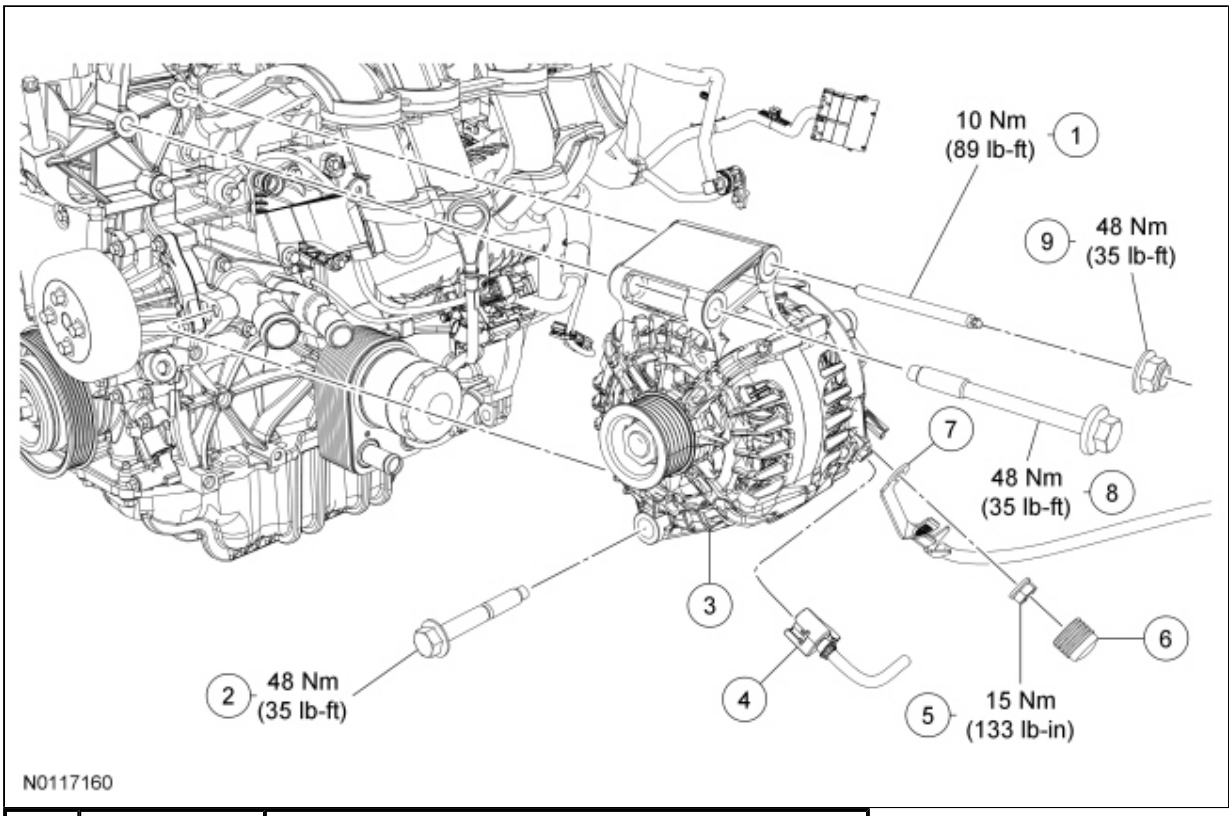
NOTE: If the engine is operated at greater than 2,000 rpm momentarily, the generator self-excites. Make sure the engine rpm remains below 2,000 rpm when the generator is disconnected. If it rises above 2,000 rpm, turn the ignition to the OFF position and restart the test.

NOTE: Inspect for any aftermarket accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.

Test Step	Result / Action to Take
E1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE	
• Start the engine and allow the engine to idle. • Tune the audio unit to a station where the interference is present.	**Yes** REFER to Section 415-00 for diagnosis and testing of the in-vehicle entertainment system.

• Ignition OFF. • Disconnect: Generator C102B. • Start the engine and allow the engine to idle, determine if the interference is still present. • **Is the interference present with the generator disconnected?**	**No** INSTALL a new generator. REFER to Generator in this section. TEST the system for normal operation.

Generator



Item	Part Number	Description
1	W703175	Generator stud bolt
2	W715065	Lower generator bolt
3	10346	Generator
4	—	Generator electrical connector (part of 12A522)
5	W707759	Generator B+ terminal nut (part of 10346)
6	10A375	Generator B+ terminal protective cover
7	—	Generator B+ terminal (part of 12A522)
8	W703957	Upper generator bolt
9	W520103	Generator nut

Removal

1. Disconnect the battery. For additional information, refer to Section 414-01 .
2. Remove the accessory drive belt. For additional information, refer to Section 303-05 .
3. Remove the generator B+ terminal protective cover and nut. Position the generator B+ terminal aside.
4. Disconnect the generator electrical connector.
5. Detach the upper degas bottle hose from the fuel rail and position aside.
6. Remove the generator nut and the stud bolt.

7. Remove the upper and lower generator bolts.

8. Remove the generator.

Installation

1. Install the generator and generator upper and lower bolts. Hand-tighten the bolts. Do not torque the bolt at this time.

2. Install the generator stud bolt.
   - Tighten to 10 Nm (89 lb-in).

3. Install the generator nut.
   - Tighten to 48 Nm (35 lb-ft).

4. Tighten the generator upper and lower bolts.
   - Tighten to 48 Nm (35 lb-ft).

5. Attach the upper degas bottle hose to the fuel rail.

6. Connect the generator electrical connector.

7. Position the generator B+ terminal on the generator and install the nut.
   - Tighten the nut to 15 Nm (133 lb-in).
   - Install the generator B+ terminal protective cover.

8. Install the accessory drive belt. For additional information, refer to Section 303-05 .

9. Connect the battery. For additional information, refer to Section 414-01 .

General Specifications

Item	Specification
Battery	
Cold Cranking Amps (CCA) measured at -18°C (0°F)	500 CCA

Torque Specifications

Description	Nm	lb-ft	lb-in
Battery ground cable body terminal bolt	13	—	115
Battery hold-down bracket nuts	5	—	44
Battery terminal nuts	5	—	44
Battery tray bolts	10	—	89
High current battery junction box side terminal nuts	5	—	44
High current battery junction box upper terminal nuts	10	—	89

Battery and Cables

Vehicles are equipped with a 12-volt, maintenance-free battery.

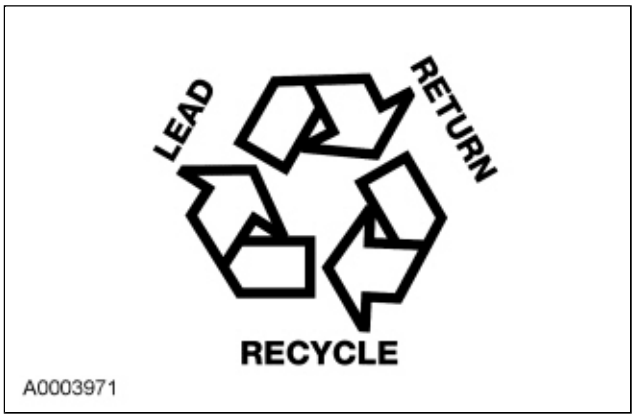
The battery and cable system consists of the following components:

- Battery
- Battery cable assembly
- Battery tray

The battery is a 12V DC source connected in a negative ground system. The battery case is sealed with 2 vent holes to release gases. The battery has 3 major functions:

- Engine cranking power source
- Voltage stabilizer for the electrical system
- Temporary power source when electrical loads exceed the generator output current

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.



Principles of Operation

Battery Eye Operation

The battery eye indicates the state-of-charge of the battery by responding to the specific gravity of a single battery cell electrolyte. The battery eye has a viewing plate, 2 colored balls of different specific gravity and a small passage. As the state-of-charge and specific gravity changes, the balls change their position in the passageway and subsequently display a different color in the viewing eye. The primary purpose of the battery is to be a quick indicator of state-of-charge for assembly plants and dealership pre-delivery processes.

The color of the battery eye indicates the approximate state-of-charge.

- Red — indicates low state-of-charge.
- Yellow/Black — indicates between high and low state-of-charge.
- Green — indicates high state-of-charge.
- No color can occur after the battery has been in service for several years and some of the plate material has coated the balls.
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates.

NOTE: The battery eye may remain red for a period of time (up to several days), even after the battery is fully charged, because the acid is not yet fully mixed.

Do not install a new battery based solely on the indication of the battery eye. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow/black battery eye usually indicates the battery is discharged, not defective. If the battery eye indicates the battery may be discharged, it is necessary to recharge the battery before testing its condition.

Charging a Battery

Batteries discharge while the vehicle is on the dealer lot or parked by the customer for an extended period of time due to normal parasitic key-off loads. Also, vehicles still in dealer inventory or in long-term storage may be driven short distances with heavy electrical loads. Over a period of time (30 days or more), this could result in vehicles having shallow or deeply discharged batteries.

- Deeply discharged — A battery that is drained over a prolonged period of time, such as an unsold vehicle or a vehicle in storage, to the point the battery is dead.
- Shallow discharge — A battery that is drained by leaving an accessory on for several hours or a few days and has a very low charge.

The vehicle charging system is designed to supply the electrical power needed to maintain the battery near full charge during normal vehicle use. The charging system is not capable of bringing a deeply discharged battery back to near full charge in a short amount of time such as allowing the vehicle to idle for 15 minutes to "recharge the battery". Discharged batteries should be charged using an external charger.

NOTE: Battery chargers have improved greatly with the addition of the new generation pulse chargers. These chargers pulse current into the battery, breaking down the sulfation layer on the battery plates and generally reduce charging times to less than an hour.

NOTE: Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm to approximately 5°C (41°F) before charging. This may require 4 to 8 hours at room temperature.

The following chart summarizes 2 recommended methods of charging.

Type of Battery Discharge	Pulse Charger	Standard Charger
Deeply discharged	Follow directions supplied with the pulse charger	2 to 8 hours and may take up to an hour to accept initial charge
Shallow discharge	45 minutes to an hour charge	2 hours below (40A) on manual setting or medium automatic setting

Inspection And Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, GO to Pinpoint Test A in the Pinpoint Test procedure.

Pinpoint Test

Special Tool(s)

ST2442-A	Micro 490 Digital Battery Analyzer 162-00004 or equivalent

Pinpoint Test A: Battery Condition Test

Normal Operation

Battery condition is determined by measuring battery terminal voltage after a specific discharge current is applied for a specified time period.

This pinpoint test is intended to diagnose the following:

- Battery charge
- Battery

PINPOINT TEST A: BATTERY CONDITION TEST

Test Step	Result / Action to Take
A1 TEST THE BATTERY CONDITION **NOTE:** A red test-eye indicates the battery is discharged, not necessarily defective. **NOTE:** Failure to fully charge the battery before retesting may cause false readings. • Verify the battery condition using the Micro 490 Digital Battery Analyzer. • **Is the battery OK?**	**Yes** If the meter reads GOOD BATTERY, RETURN the battery to service. If the meter reads GOOD-RECHARGE, CHARGE the battery and RETURN it to service. If the meter reads CHARGE & RETEST, fully CHARGE and RETEST the battery. **No** If the meter reads REPLACE BATTERY, INSTALL a new battery. If the meter reads BAD CELL-REPLACE, INSTALL a new battery.

Component Test

Battery — Drain Tests

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

NOTICE: **To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.**

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

Check for current drains on the battery in excess of 50 mA (0.050 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Typically, a drain of approximately 1 amp is attributed to an engine compartment lamp, glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it may be due to the generator. Disconnect the generator and retest.

NOTE: To accurately test the drain on a battery, an in-line ammeter must be used between the negative battery post and its respective cable. Use of a test lamp or voltmeter is not an accurate method.

1. Make sure the junction box(es)/fuse panel(s) is accessible without turning on the interior lights or the underhood lights.

2. Drive the vehicle at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.

3. Allow the vehicle to sit with the key out of the ignition for at least 40 minutes to allow the modules to time out/power down.

4. Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent modules from resetting.

5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.

6. **NOTE:** It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire 40-minute procedure must be repeated.

   Connect the battery tester between the negative battery cable and the post. The meter must be

capable of reading milliamps and should have a 10-amp capability.

7. **NOTE:** If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

   Remove the jumper wire.

8. Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

NOTE: If the vehicle sits for an extended period of time and the battery drains, there is the possibility of a control module staying alive and not going into sleep mode. If a module does stay alive, it can also result in battery drain. If a module is suspect, isolate individual modules by disconnecting each module one at a time and note if the excessive draw goes away.

NOTE: For vehicles equipped with aftermarket bodies or boxes which contain electrical connections, disconnect the aftermarket to factory connections to isolate the body from the chassis.

9. If the current draw is excessive, remove the fuses from the Battery Junction Box (BJB) one at a time and note the current drop. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located. The excessive draw can be isolated by continuing to pull sub system fuses. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.
   - Once the main circuit is identified, continue to remove the fuses from the Smart Junction Box (SJB) one at a time and note the current reading. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.

10. Check the wiring diagrams for any circuits that run from the battery without passing through the BJB or the SJB. If the current draw is still excessive, disconnect these circuits until the draw is found. Also, disconnect the generator electrical connections and retest if the draw cannot be located. The generator may be internally shorted, causing the current drain.

Battery Disconnect

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

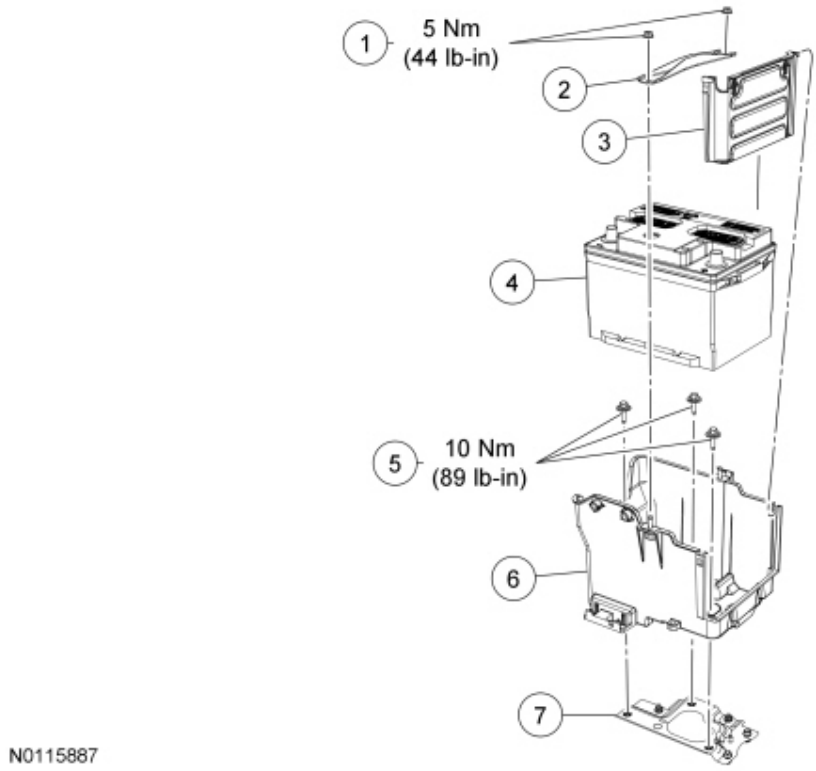
NOTE: When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.

NOTE: When disconnecting the battery ground cable to interrupt power to the vehicle electrical system, disconnect the battery ground cable only. It is not necessary to disconnect the positive battery cable.

NOTE: Wait one minute between ignition OFF and disconnecting the negative battery cable or the ABS module sets DTC U3000:41.

1. Disconnect the battery ground terminal.
   - To connect, tighten to 5 Nm (44 lb-in).
2. Disconnect the positive battery terminal.
   - To connect, tighten to 5 Nm (44 lb-in).
3. To connect, reverse the disconnect procedure.

Battery and Battery Tray — Exploded View



Item	Part Number	Description
1	W520412	Battery hold-down bracket nut (2 required)

Torque Specifications

Description	Nm	lb-in
Antenna cable bolt (part of the antenna cable)	9	80
Door subwoofer bolts	3	27

Information and Entertainment System

Functional Components

The functional components of the audio system (and their locations) are as follows:

- Audio Control Module (ACM)
- Front Controls Interface Module (FCIM)
- Front Control/Display Interface Module (FCDIM)
- Accessory Protocol Interface Module (APIM) (if equipped), located under the RH side of the instrument panel
- Global Positioning System Module (GPSM) (if equipped), located in the top center area of the instrument panel
- Speakers (see Audio Line-Up for locations)
- Antenna (either AM/FM, or combination AM/FM/satellite)
- Antenna cables
- Clockspring
- Audio input jack
- Steering wheel controls (if equipped)
- Universal Serial Bus (USB) port and cable (if equipped)
- Microphone (if equipped)

Audio Line-Up

The vehicle is equipped with one of the following audio systems:

- Base
  - AM/FM stereo (CD with MP3 optional)
  - Four speakers (2 front door woofers, 2 front door tweeters)
- High
  - AM/FM/Single CD with MP3
  - Six speakers (2 front door woofers, 2 front door tweeters, 2 rear door full-range speakers)

All audio systems include the following features:

- Audio input jack

The following options are also available:

- Steering wheel controls
- Satellite radio system
  - Provides satellite broadcast audio channels
- SYNC system
  - Provides mobile phone and media device functionality with the vehicle audio system

Antenna

All vehicles utilize a fixed-mast antenna for AM/FM reception. If the vehicle is equipped with satellite radio, a combination AM/FM/satellite radio antenna is utilized.

Satellite Radio

The satellite radio system is comprised of the following:

- Satellite radio receiver (built-in to the ACM)
- Antenna
- Antenna cables

SYNC System

The SYNC system is comprised of the following:

- APIM
- SYNC-specific steering wheel controls
- Microphone
- USB port and cable
- Audio input jack
- GPSM

SYNC is a hands-free communications and entertainment system that allows the following interactions:

- Send and receive phone calls via a Bluetooth-enabled phone
- Send and receive text messages via a Bluetooth-enabled phone
- Connect media devices (such as an iPod® or USB flash device) in order to play audio files
- Play media files via a Bluetooth-enabled media audio device
- Produce vehicle health reports
- Initiate an emergency call (eCall) when the air bags deploy
- Provide turn-by-turn traffic directions through the use of the signal received by the GPSM

Not all features are available with every phone.

For additional information on audio system operation, including the SYNC system, refer to the Owner's Literature.

Information and Entertainment System

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
ST3104-A	Backprobe Pins POM6411 or equivalent
ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10 or equivalent
ST3086-A	Multi-Media Interface Tester 105-00120

Principles of Operation

Audio Control Module (ACM)

The Audio Control Module (ACM) can be operated while the key is in RUN or ACC. Additionally, the one hour mode feature allows the audio system to be operated for 1 hour when the ignition is transitioned to OFF and the ON/OFF button is pressed.

The ACM can produce its own DTCs, which can be communicated to the scan tool. The ACM communicates on the Infotainment Controller Area Network (I-CAN), with the Front Control/Display Interface Module (FCDIM) acting as the gateway to the Medium Speed Controller Area Network (MS-CAN).

Front Controls Interface Module (FCIM)

The Front Controls Interface Module (FCIM) is the customer interface to the audio system. It is separate from the ACM , and utilizes a dedicated Local Interconnect Network (LIN) with the FCDIM to transmit button press information.

Front Control/Display Interface Module (FCDIM)

The FCDIM is a stand-alone module. It receives messages for all of its displays, which include:

- Audio information
- Warning and information messages

The FCDIM acts as the gateway between the MS-CAN and the I-CAN .

Satellite Audio

The satellite audio system consists of the ACM , the AM/FM/satellite radio combination antenna, and the antenna cables. The antenna receives digital audio signals and sends them to the ACM .

Antenna

The fixed-mast antenna receives AM/FM radio waves and sends them to the ACM via the antenna co-axial cable. If the vehicle is equipped with satellite audio, a combination AM/FM/satellite radio antenna is utilized.

The antenna receives voltage from the ACM in order to amplify the audio signals.

SYNC® System

The SYNC® system allows interaction with several types of customer devices, including mobile phones and media devices. The system is comprised of the Accessory Protocol Interface Module (APIM), a microphone, the Universal Serial Bus (USB) cable and port, and the audio input jack. The APIM contains an on-board Bluetooth® chipset, which enables certain wireless devices to interact with the system.

The APIM consists of 2 internal modules: the Consumer Interface Processor (CIP) and the Vehicle Interface Processor (VIP). The modules are not replaceable individually, but can be flashed independently, if required.

The CIP interfaces with all of the customer inputs to the APIM . The CIP contains an analog-to-digital-to-analog converter, as well as the Bluetooth® chipset. Any consumer-available application upgrades that are available are loaded directly to the CIP through the USB port.

The VIP provides an interface between the CIP and the vehicle. The main functions of the VIP are controlling the APIM power management and translating both inbound and outbound signals over the CAN .

The APIM can receive inputs from the following sources:

- USB port
- Audio input jack
- Bluetooth®

The USB port can be used for connecting a media device (such as an iPod®) with the device's available cable, or for directly plugging in a portable mass storage device (such as a "thumb drive"). When playing media files stored on a mass storage device, the SYNC® system only plays files that do not have Digital Rights Management (DRM) protection. The USB port can also be used for uploading vehicle application upgrades.

The USB port is powered by the APIM , so no external power source is needed to power a device plugged into the USB port.

The audio input jack can be used for connecting a media device (such as an iPod®) utilizing a 1/8-inch audio jack. When a device is connected through the audio input jack, only the speaker volume can be controlled by the ACM . All other functions (such as seek, fast forward, pause, etc.) must be carried out on the device itself.

The Bluetooth® interface can accommodate both Bluetooth®-enabled mobile phones and Bluetooth®-enabled media devices. Any Bluetooth® device used with the SYNC® system must first be paired with the system before it is operational.

Bluetooth® is a secure, short-range radio frequency that allows devices to communicate wirelessly through radio waves. The operating range of a Bluetooth® signal is a maximum of 32 feet.

Only one Bluetooth® phone and one Bluetooth® media device can be connected to the system at any one time. If an additional device of either type is paired with the system and made active, the APIM disconnects any active connections and establishes a connection with the new device.

It is important to understand that not all mobile phones have the same level of features when interacting with the SYNC® system. For a list of compatible phones, refer to the SyncMyRide website .

In addition to audio information, metadata may also be sent to the APIM from a device plugged into the USB port. Metadata consists of such information as artist, album title, song title, and genre. The metadata is used by the APIM to create indexes that can be used to sort for particular music, based on customer preference. Not all USB devices send metadata to the APIM ; also, no metadata is transferred when a device is connected through the audio input jack. When a new media device is connected to the SYNC® system, the APIM automatically indexes the information. This can take up to several minutes (depending on the amount of data on the device), and is considered normal operation. When a device that was previously connected to the SYNC® system is reconnected, the APIM updates the index (rather than creating a new one), which reduces the amount of time needed to create the index.

The APIM receives both stereo and mono sound inputs, and can also transmit both stereo and mono sound. The mono function is used to receive the microphone input, and to send sound to the ACM for voice prompts, the Text-To-Speech (TTS) feature, ringtones, and any audio received through a connected mobile phone. The TTS feature speaks information so that it does not have to be read from the display.

The Global Positioning System Module (GPSM) provides vehicle location for real-time traffic reports and re-routing, and for identifying vehicle location in the event of a collision (part of the e911 feature). The vehicle location information is broadcast to the APIM over the CAN .

The APIM communicates via the I-CAN and High Speed Controller Area Network (HS-CAN). Communication with the scan tool is established through the HS-CAN .

Steering Wheel Controls

The steering wheel controls consist of a series of resistors. Each steering wheel controls switch function corresponds with a specific resistance value within the switch. When a switch is pressed, the FCDIM (or the APIM) monitors the change in reference voltage to determine the requested function.

On vehicles equipped with the SYNC® system, the PUSH-TO-TALK (an icon of a person speaking) switch interfaces directly with the APIM , while the other audio steering wheel controls interface with the FCDIM .

Audio Input Jack

The audio input jack allows for a portable MP3 audio device to be connected to the vehicle audio system. When a portable MP3 player is connected, audio from the MP3 audio device can be played through the vehicle speakers. The audio stream from the audio input jack routes to the APIM if the vehicle is equipped with the SYNC® system, or directly to the ACM if the vehicle is not equipped with the SYNC® system.

Audio Signals

Stereo signals contain left and right channel information, and are used for most audio signals.

A mono signal is used for the microphone input to the APIM. A mono signal is also used for the voice prompts, the TTS feature, ringtones, and any audio received through a connected mobile phone. These audio signals are output from the APIM to the ACM. The mono and stereo outputs from the APIM utilize separate circuits.

A digital signal is used to transmit data from a media device connected through the USB port to the APIM. The APIM then converts the signal to analog and relays the signal to the ACM.

A wireless signal is used to broadcast audio signals from a Bluetooth® device to the APIM. As with a digital signal sent through the USB port, the APIM converts the wireless audio signal to analog and relays it to the ACM.

Network Communication

There are numerous messages internal to the audio system. The functions of these message include (but are not limited to):

- Changing the audio source
- Updating the FCDIM display

In addition, the numerous messages are utilized by the audio system in conjunction with systems outside of the audio system. Refer to Section 418-00 for a complete list of network messages.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Front Control/Display Interface Module (FCDIM) • Front Controls Interface Module (FCIM) • Antenna • Universal Serial Bus (USB) port • Audio input jack • Steering wheel controls • Speaker mounting/speaker cones • Trim panels	• Body Control Module (BCM) fuse(s): ▪ 7 (7.5A) ▪ 10 (15A) ▪ 16 (15A) ▪ 19 (7.5A) • Wiring, terminals or connectors

3. If the fault is visually evident, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. **NOTE:** Do not press any buttons on the FCIM while the ACM is carrying out the self-test.

   Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

9. If no DTCs related to the concern are retrieved, refer to the Symptom Charts.

DTC Charts

Audio Control Module (ACM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B1A01:01	Speaker #1: General Electrical Failure	GO to Pinpoint Test F.
B1A01:11	Speaker #1: Circuit Short to Ground	GO to Pinpoint Test F.
B1A01:12	Speaker #1: Circuit Short to Battery	GO to Pinpoint Test F.
B1A01:13	Speaker #1: Circuit Open	GO to Pinpoint Test F.
B1A02:01	Speaker #2: General Electrical Failure	GO to Pinpoint Test F.
B1A02:11	Speaker #2: Circuit Short to Ground	GO to Pinpoint Test F.

B1A02:12	Speaker #2: Circuit Short to Battery	GO to Pinpoint Test F .
B1A02:13	Speaker #2: Circuit Open	GO to Pinpoint Test F .
B1A03:01	Speaker #3: General Electrical Failure	GO to Pinpoint Test F .
B1A03:11	Speaker #3: Circuit Short to Ground	GO to Pinpoint Test F .
B1A03:12	Speaker #3: Circuit Short to Battery	GO to Pinpoint Test F .
B1A03:13	Speaker #3: Circuit Open	GO to Pinpoint Test F .
B1A04:01	Speaker #4: General Electrical Failure	GO to Pinpoint Test F .
B1A04:11	Speaker #4: Circuit Short to Ground	GO to Pinpoint Test F .
B1A04:12	Speaker #4: Circuit Short to Battery	GO to Pinpoint Test F .
B1A04:13	Speaker #4: Circuit Open	GO to Pinpoint Test F .
B1A56:1D	Antenna: Circuit Current Out of Range	GO to Pinpoint Test A .
B1A56:21	Antenna: Signal Amplitude ⟨ Minimum	GO to Pinpoint Test A .
B1A89:11	Satellite Antenna: Circuit Short to Ground	GO to Pinpoint Test B .
B1A89:13	Satellite Antenna: Circuit Open	GO to Pinpoint Test B .
B1D19:4B	Compact Disc Unit: Over Temperature	The ACM was over-temperature. This may occur during extended use. Audio operation can resume after the ACM cools. CLEAR the DTCs. This is normal operation.
U0074:00	Control Module Communication Bus "B" Off: No Sub Type Information	REFER to Section 418-00 .
U0140:00	Lost Communication With Body Control Module: No Sub Type Information	GO to Pinpoint Test P .
U0253:00	Lost Communication With Accessory Protocol Interface Module: No Sub Type Information	GO to Pinpoint Test Q .
U0257:00	Lost Communication With Front Controls/Display Interface Module: No Sub Type Information	GO to Pinpoint Test R .
U2100:00	Initial Configuration Not Complete: No Sub Type Information	REPROGRAM the Audio Control Module (ACM). REFER to the Programmable Module Installation (PMI) procedure in Section 418-01 . TEST the system for normal operation.
U2101:00	Control Module Configuration Incompatible: No Sub Type Information	REPROGRAM the ACM . REFER to the PMI procedure in Section 418-01 . TEST the system for normal operation.
U3000:41	Control Module: General Checksum Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:41 is retrieved again, INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
U3000:42	Control Module: General Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:41 is retrieved again, INSTALL a new ACM .

		REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
U3000:49	Control Module: Internal Electronic Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:49 is retrieved again, INSTALL a new ACM. REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
U3000:96	Control Module: Component Internal Failure	GO to Pinpoint Test C.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test S.
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test T.

Front Control/Display Interface Module (FCDIM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B10BD:11	Multifunctional Switch: Circuit Short to Ground	GO to Pinpoint Test D.
B10BD:13	Multifunctional Switch: Circuit Open	GO to Pinpoint Test D.
B10BD:23	Multifunctional Switch: Signal Stuck Low	GO to Pinpoint Test D.
U0010:88	Medium Speed CAN Communication Bus: Bus Off	REFER to Section 418-00.
U0074:88	Control Module Communication Bus "B" Off: Bus Off	REFER to Section 418-00.

U3000:42	Control Module: General Memory Failure	INSTALL a new GPSM. REFER to Global Positioning System Module (GPSM) in this section. TEST the system for normal operation.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test AG.
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test AH.

Symptom Chart — General Audio System

General Audio System

Condition	Possible Sources	Action
• The Audio Control Module (ACM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • Front Control/Display Interface Module (FCDIM) • ACM	• REFER to Section 418-00.
• The Front Control/Display Interface Module (FCDIM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • FCDIM	• REFER to Section 418-00.
• The Accessory Protocol Interface Module (APIM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • APIM	• REFER to Section 418-00.
• The Global Positioning System Module (GPSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • FCDIM • GPSM	• REFER to Section 418-00.
• The entire audio system is inoperative	• Communication network concern • FCIM • FCDIM • ACM	• GO to Pinpoint Test K.
• The steering wheel controls are inoperative/do not operate correctly	• Wiring, terminals or connectors • Steering wheel controls • Steering column multifunction switch (vehicles with SYNC®) • FCDIM • ACM • APIM (if equipped)	• For the VOICE switch, GO to Pinpoint Test I. • For all other switches, GO to Pinpoint Test D.
• The speed sensitive	• Speed sensitive	• GO to Pinpoint Test W.

volume does not operate correctly	volume setting • Vehicle Speed Sensor (VSS) signal concern • ACM	
• The audio input jack is inoperative/does not operate correctly	• Wiring, terminals or connectors • Audio input jack • ACM • APIM (if equipped)	• GO to Pinpoint Test E.
• An individual Front Controls Interface Module (FCIM) button is inoperative/does not operate correctly	• FCIM	• INSTALL a new FCIM. REFER to Front Controls Interface Module (FCIM) in this section. TEST the system for normal operation.
• The audio system does not operate correctly from the Front Controls Interface Module (FCIM)	• Wiring, terminals or connectors • FCIM • FCDIM	• GO to Pinpoint Test Y.
• The Front Controls Interface Module (FCIM) illumination does not operate correctly	• Backlighting system concern • FCIM	• CHECK the operation of the audio system from the FCIM by turning the system on, adjusting the volume, and selecting several different presets. ▪ If the audio system does not operate correctly from the FCIM, GO to Pinpoint Test Y. ▪ If the illumination is the only concern, REFER to Section 413-00.
• One or more Front Control/Display Interface Module (FCDIM) displays is inoperative/does not operate correctly	• FCDIM • ACM • Instrument Panel Cluster (IPC) concern • APIM (if equipped)	• GO to Pinpoint Test V.
• The Front Control/Display Interface Module (FCDIM) screen is completely inoperative	• Fuse • Wiring, terminals or connectors • FCDIM	• CARRY OUT the FCDIM self-test. ▪ If the scan tool cannot communicate with the FCDIM, REFER to Section 418-00. ▪ If the scan tool does communicate with the FCDIM, INSTALL a new FCDIM. REFER to Front Controls/Display Interface Module (FCDIM) in this section. TEST the system for normal operation.

• The Front Control/Display Interface Module (FCDIM) illumination does not operate correctly	• Backlighting system concern • FCDIM	• GO to Pinpoint Test L .

Symptom Chart — Sound Quality

Sound Quality

Condition	Possible Sources	Action
• Poor reception — AM/FM	• Antenna • Antenna cable • Charging system • Ignition system • Audio Control Module (ACM)	• GO to Pinpoint Test A .
• Continuous seek/scan in AM/FM	• Antenna • Antenna cable • ACM	• GO to Pinpoint Test A .
• Poor quality/distorted/no sound from one or more speakers (not all speakers)	• Wiring, terminals or connectors • Speaker • ACM	• GO to Pinpoint Test F .
• Poor quality/distorted/no sound from all speakers	• Wiring, terminals or connectors • ACM	• GO to Pinpoint Test G .
• Poor reception — satellite radio	• Obstructions to the antenna line of sight • Antenna • Antenna cable • ACM	• GO to Pinpoint Test B .
• Continuous seek/scan — satellite radio	• Obstructions to the antenna line of sight • No channel found in the selected category • Antenna • Antenna cable • ACM	• GO to Pinpoint Test B .
• Poor sound quality/no sound while in satellite radio mode — all other functions operate correctly	• Antenna • Antenna cable • ACM	• GO to Pinpoint Test B .
• Poor quality/distorted/no sound while in SYNC® mode	• Wiring, terminals or connectors • Accessory Protocol Interface Module (APIM) • ACM	• GO to Pinpoint Test J .

Symptom Chart — Satellite Radio

Satellite Radio

Condition	Possible Sources	Action
• Poor reception	• Obstructions to the antenna line of sight • Antenna • Antenna cable • Audio Control Module (ACM)	• GO to Pinpoint Test B .
• Continuous seek/scan	• No channel found in the selected category • Obstructions to the antenna line of sight • Antenna • Antenna cable • ACM	• GO to Pinpoint Test B .
• Poor sound quality/no sound while in satellite radio mode — all other functions operate correctly	• Antenna • Antenna cable • ACM	• GO to Pinpoint Test B .
• The satellite radio is inoperative/does not operate correctly	• Subscription status • Satellite radio system concern • ACM	• GO to Pinpoint Test C .

Symptom Chart — SYNC® System

SYNC® System

Condition	Possible Sources	Action
• The SYNC® system is completely inoperative	• Audio system concern • Communication network concern • Customer error • Customer device • Accessory Protocol Interface Module (APIM)	• GO to Pinpoint Test M .
• Poor quality/distorted/no sound while in SYNC® mode	• Wiring, terminals or connectors • APIM • ACM	• GO to Pinpoint Test J .
• Unable to pair Bluetooth® device	• Incompatible Bluetooth® device • Customer error • Customer Bluetooth® device • APIM	• GO to Pinpoint Test N .
• An individual Bluetooth® device feature is inoperative	• Customer device compatibility	• **NOTE:** If a Bluetooth® device is able to pair with the SYNC® system, there are no concerns with the APIM . INSTRUCT the customer

		to review the device compatibility list on the SyncMyRide website . Not all phone features are available through SYNC®. This is normal operation.
• The Universal Serial Bus (USB) port is inoperative/does not operate correctly	• Customer USB device • USB cable and port • APIM	• GO to Pinpoint Test H .
• The steering wheel controls are inoperative/do not operate correctly	• Wiring, terminals or connectors • Steering wheel controls • Multifunction switch • FCDIM • ACM • APIM	• For the VOICE switch, GO to Pinpoint Test I . • For all other switches, GO to Pinpoint Test D .
• The audio input jack is inoperative/does not operate correctly	• Wiring, terminals or connectors • Audio input jack • APIM	• GO to Pinpoint Test E .
• The SYNC® system audible prompts are inoperative/do not operate correctly	• Customer setting • Wiring, terminals or connectors • ACM • APIM	• **NOTE:** The audible prompts include the Text-To-Speech (TTS) feature, voice prompts, and ringtones. GO to Pinpoint Test O .
• During a phone call, no incoming audio is heard in the vehicle	• Customer setting • Wiring, terminals or connectors • ACM • APIM	• GO to Pinpoint Test O .
• Voice recognition is inoperative/does not operate correctly	• Wiring, terminals or connectors • Microphone • Steering column multifunction switch • APIM	• GO to Pinpoint Test I .
• During a phone call, no outgoing audio is heard on the outside device	• Wiring, terminals or connectors • Microphone • APIM	• GO to Pinpoint Test I .

Pinpoint Tests

Pinpoint Test A: Poor Reception — AM/FM

Normal Operation

The antenna receives AM and FM radio waves and sends them to the Audio Control Module (ACM)

through the antenna cable. The ACM powers the antenna in order to amplify the AM signal.

- DTC B1A56:1D (Antenna: Circuit Current Out of Range) — sets continuously when the antenna enable circuit current is outside of limits. The current is checked once every 5 seconds.
- DTC B1A56:21 (Antenna: Signal Amplitude ⟨ Minimum) — sets on-demand when no signal is detected from the antenna.

This pinpoint test is intended to diagnose the following:

- Antenna
- Antenna cable
- Charging system
- Ignition system
- ACM

PINPOINT TEST A: POOR RECEPTION — AM/FM

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE AUDIO SYSTEM RECEPTION	
• Operate the audio system in radio tuner (AM/FM) mode. • Check the reception with the engine running, and with the engine off. • **Does the poor reception only occur with the engine running?**	**Yes** GO to A2. **No** GO to A4.
A2 CHECK THE GENERATOR	
• Ignition OFF. • Disconnect the wiring harness from the generator voltage regulator. • Start the engine. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** INSTALL a new generator. REFER to Section 414-00. TEST the system for normal operation. **No** GO to A3.
A3 CHECK THE IGNITION CIRCUITS	
• Ignition OFF. • Connect the wiring harness to the voltage regulator. • Visually inspect the engine compartment and make sure all ignition coils are correctly and securely connected, and that there are no visible cracks in the coil housings. • Inspect all the wiring harnesses and connectors for damaged insulation and loose or broken conditions. • **Are the ignition components OK?**	**Yes** USE a jumper cable to ground various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal). When the noise is eliminated, PROVIDE a permanent ground where necessary. TEST the system for normal operation. **No** REPAIR the ignition system as necessary. TEST the system for normal

	operation.
A4 CHECK THE ANTENNA ENABLE CIRCUIT	
• Ignition OFF. • Disconnect: Antenna C9021. • Operate the audio system in radio tuner (AM/FM) mode. • Measure the voltage between the antenna C9021-1, circuit CME44 (BU), harness side and ground.  N0115423 • **Is the voltage greater than 10 volts?**	**Yes** GO to A6 . **No** GO to A5 .
A5 CHECK THE ANTENNA ENABLE CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: ACM C240A. • Measure the resistance between the ACM C240A-2, circuit CME44 (BU), harness side and the antenna C9021-1, circuit CME44 (BU); and between the ACM C240A-2, circuit CME44 (BU), harness side and ground.  N0115425 • **Is the resistance less than 5 ohms between the ACM and the antenna, and greater than 10,000 ohms between the ACM and ground?**	**Yes** GO to A9 . **No** REPAIR the circuit. TEST the system for normal operation.
A6 CHECK THE AM/FM ANTENNA CABLE	
• Ignition OFF. • Disconnect: AM/FM Antenna In-Line Connection At RH Kick Panel. • Disconnect: AM/FM Antenna Cable At ACM . • Measure the resistance of the rear AM/FM antenna cable core between the antenna and the front AM/FM antenna cable in-line connection; and between the rear AM/FM antenna cable core and shield. • Measure the resistance of the front AM/FM antenna cable core between the ACM and the rear AM/FM antenna cable in-	**Yes** GO to A7 . **No** INSTALL a new front or rear AM/FM antenna cable. REFER to Antenna Cable — AM/FM/Satellite Radio in this section. TEST the system for normal

line connection; and between the front AM/FM antenna cable core and shield. • **Is the resistance of each AM/FM antenna cable core less than 2 ohms, and the resistance between the core and shield of each AM/FM antenna cable greater than 10,000 ohms?**	operation.
A7 ISOLATE THE ANTENNA	
• Connect: AM/FM Antenna In-Line Connection At RH Kick Panel. • Connect: AM/FM Antenna Cable At ACM. • Install a new antenna. Refer to Antenna in this section. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** The concern was caused by an inoperative AM/FM antenna. The system is now operating correctly. **No** GO to A8.
A8 ISOLATE THE ANTENNA CABLE	
• Ignition OFF. • Substitute each antenna cable by routing a new component. Do not remove the original antenna cable at this time. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** INSTALL a new antenna cable for the inoperative cable. REFER to Antenna Cable — AM/FM/Satellite Radio in this section. TEST the system for normal operation. **No** REMOVE the substitute antenna cable. GO to A9.
A9 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM. REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: Poor Reception/Poor Sound Quality/No Sound — Satellite Radio

Normal Operation

Digital signals are received by the satellite radio antenna and sent to the Audio Control Module (ACM) through the satellite radio antenna cable.

A short to ground in the satellite radio antenna typically has no effect on the antenna signal. However, an open in the antenna circuit results in no sound from the satellite radio system. A short to voltage in the antenna circuit can have varying effects on the system.

Obstructions to the antenna line of sight can affect reception, but this is considered normal operation. Possible obstructions include hills, tall buildings, tunnels, and being parked inside a garage. Make sure the vehicle is in a clear area, free of obstructions, before testing satellite radio reception.

- DTC B1A89:11 (Satellite Antenna: Circuit Short to Ground) — sets when the satellite radio antenna circuit is shorted to voltage or ground for greater than 250 ms. This DTC can be either continuous or on-demand.
- DTC B1A89:13 (Satellite Antenna: Circuit Open) — sets when an open is detected in the satellite radio antenna circuit for greater than 250 ms. This DTC can be either continuous or on-demand.

This pinpoint test is intended to diagnose the following:

- Obstructions to the antenna line of sight
- No channel found in the selected category
- Antenna
- Antenna cable
- ACM

PINPOINT TEST B: POOR RECEPTION/POOR SOUND QUALITY/NO SOUND — SATELLITE RADIO

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE RECEPTION AND CATEGORY FILTER SETTING	
• Turn the category filter function off. For additional information, refer to the Owner's Literature. • Drive the vehicle to an open location, free of obstacles. • Scan for a good channel. • **Does the satellite audio system find a good channel with normal reception?**	**Yes** The system is operating correctly at this time. The concern was a result of no channel being found in the selected category or obstructions to the antenna line of sight. **No** GO to B2.
B2 CHECK THE SATELLITE SIGNAL PID (SAT_SIG_STR)	
• Enter the following diagnostic mode on the scan tool: ACM DataLogger. • Monitor the ACM satellite signal strength PID (SAT_SIG_STR). • **Does the PID indicate "No Signal"?**	**Yes** GO to B3. **No** GO to Pinpoint Test C.
B3 CHECK THE SATELLITE RADIO ANTENNA CABLE RESISTANCE	
• Ignition OFF. • Disconnect: Satellite Radio Antenna Connection At ACM. • Disconnect: Satellite Radio Antenna Cable In-Line Connection At RH Kick Panel. • Disconnect: Antenna C9021. • Measure the resistance of the front satellite radio antenna cable core between the ACM and the satellite radio antenna in-line connection; and between the front satellite radio antenna cable core and shield. • Measure the resistance of the rear satellite radio antenna cable core between the antenna C9021, harness side and the satellite radio antenna cable in-line connection; and between the rear satellite	**Yes** GO to B4. **No** INSTALL a new antenna cable. REFER to Antenna Cable — AM/FM/Satellite Radio in this section. CLEAR any DTCs present. TEST the system for normal operation.

radio antenna cable core and shield. • **Is the resistance of each satellite radio antenna cable core less than 2 ohms, and the resistance between the core and shield of each satellite radio antenna cable greater than 10,000 ohms?**	
B4 ISOLATE THE ANTENNA	
• Connect: Satellite Radio Antenna Connection At ACM . • Connect: Satellite Radio Antenna Cable In-Line Connection At RH Kick Panel. • Install a new antenna. Refer to Antenna in this section. • Operate the audio system in satellite radio mode. • **Is the reception OK?**	**Yes** The concern was caused by an inoperative antenna. The system is now operating correctly. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to B5 .
B5 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Satellite Radio Is Inoperative/Does Not Operate Correctly

Normal Operation

Digital signals are received by the antenna and sent to the Audio Control Module (ACM) through the satellite radio antenna. The satellite radio receiver is internal to the ACM .

When a satellite radio subscription is activated, the Electronic Serial Number (ESN) of the built-in satellite radio receiver is associated with the Vehicle Identification Number (VIN). As a result, the ACM cannot be swapped from one vehicle to another.

- DTC U3000:96 (Control Module: Component Internal Failure) — sets when the ACM detects an internal failure with the built-in satellite radio receiver.

This pinpoint test is intended to diagnose the following:

- Subscription status
- Satellite radio system concern
- ACM

PINPOINT TEST C: THE SATELLITE RADIO IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

C1 VERIFY AN ACTIVE SUBSCRIPTION	
• Operate the audio system in satellite radio mode and observe the display. • **Does the display indicate the subscription has expired?**	**Yes** The subscription has expired. INFORM the customer to contact Sirius to re-activate the subscription. **No** GO to C2.
C2 CHECK THE SATELLITE SIGNAL PID (SAT_SIG_STR)	
• Enter the following diagnostic mode on the scan tool: ACM DataLogger. • Monitor the ACM satellite signal strength PID (SAT_SIG_STR). • **Does the PID indicate "No Signal"?**	**Yes** GO to Pinpoint Test B. **No** GO to C3.
C3 CHECK FOR CORRECT ACM OPERATION	

• Ignition OFF.
• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM. REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The Steering Wheel Controls Are Inoperative/Do Not Operate Correctly

Refer to Wiring Diagrams Cell 130, Audio System for schematic and connector information.

Normal Operation

A reference voltage is sent from the appropriate module to the steering wheel controls. When a switch is pressed, the voltage is routed through a specific resistor value for each function, then to ground through the module. The module uses this voltage signal to determine which control input function has been selected.

All switches are wired to the Front Control/Display Interface Module (FCDIM) except for the VOICE switch, which is wired directly to the Accessory Protocol Interface Module (APIM) for vehicles with the SYNC® system. If the VOICE switch is inoperative, the entire voice recognition system is inoperative. To diagnose this concern, GO to Pinpoint Test I.

- B10BD:11 (Multifunctional Switch: Circuit Short to Ground) — sets when a short to ground is detected in the steering wheel controls circuit.
- B10BD:13 (Multifunctional Switch: Circuit Open) — sets when an open is detected in the steering wheel controls circuit.
- B10BD:23 (Multifunctional Switch: Signal Stuck Low) — sets in continuous memory when the FCDIM detects a steering wheel controls switch stuck for more than 2 minutes during normal operation.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Steering wheel controls

- Clockspring
- ACM

PINPOINT TEST D: THE STEERING WHEEL CONTROLS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>D1 CHECK THE DTCs</td><td rowspan="2">Yes
INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR the DTCs. TEST the system for normal operation.

No
GO to D2 .</td></tr>
<tr><td>• Carry out the FCDIM self-test.
• Is DTC B10BD:23 retrieved?</td></tr>
<tr><td>D2 MONITOR THE STEERING WHEEL CONTROLS PIDs (FCDIM - CONTROLLED SWITCHES)</td><td rowspan="2">Yes
GO to D13 .

No
If only one PID value is incorrect or the PID value always reads one particular switch position, INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR any DTCs present. TEST the system for normal operation.

Otherwise, GO to D3 .</td></tr>
<tr><td>• Enter the following diagnostic mode on the scan tool: FCDIM DataLogger.
• Monitor the steering wheel controls PIDs while pressing each steering wheel controls switch as follows:

<table><tr><th>Steering Wheel Controls Switch</th><th>PID</th></tr><tr><td>VOL-</td><td>SCS_VOLDOWN</td></tr><tr><td>VOL+</td><td>SCS_VOLUP</td></tr><tr><td>SEEK-</td><td>SCS_SEEKMINUS</td></tr><tr><td>SEEK+</td><td>SCS_SEEKPLUS</td></tr><tr><td>MODE</td><td>SCS_MODE</td></tr></table>
• Do the PID values agree with the switch positions?</td></tr>

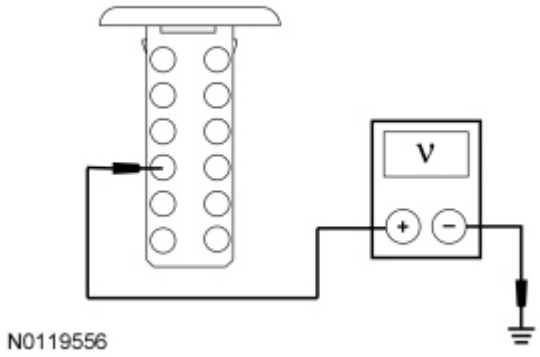
• Measure the voltage between the FCDIM C2123-10, circuit VME14 (GY/YE), harness side and ground.</td></tr>
</table>

 N0119556 • **Is any voltage present?**	
D4 CHECK THE STEERING WHEEL CONTROLS REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE WITH THE CLOCKSPRING DISCONNECTED	
• Ignition OFF. • Disconnect: Clockspring C218B . • Ignition ON. • Turn the parking lamps on. • Measure the voltage between the FCDIM C2123-10, circuit VME14 (GY/YE), harness side and ground.  N0119556 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation. **No** TURN the parking lamps off. GO to D5 .
D5 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Connect: Clockspring C218B . • **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Clockspring C218C . • Connect the battery. • Ignition ON. • Turn the parking lamps on. • Measure the voltage between the FCDIM C2123-10, circuit VME14 (GY/YE), harness side and ground.	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR any DTCs present. TEST the system for normal operation. **No** GO to D6 .



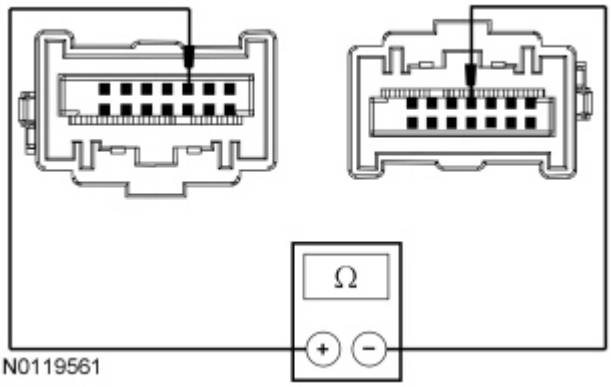
N0119556

- **Is any voltage present?**

D6 CHECK THE STEERING WHEEL CONTROLS CIRCUITRY FOR A SHORT TO THE ILLUMINATION CIRCUIT	
• Ignition OFF. • Disconnect: Steering Wheel Controls C2998 . • Measure the resistance between the steering wheel controls C2998-2, harness side and the steering wheel controls C2998-3, harness side; and between the steering wheel controls C2998-4, harness side and the steering wheel controls C2998-3, harness side.  N0117590 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** REPAIR the steering wheel harness or INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation.
D7 CHECK THE STEERING WHEEL CONTROLS CIRCUITRY FOR A SHORT TO GROUND	
• Ignition OFF. • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Steering Wheel Controls C2998 . • Measure the resistance between the FCDIM C2123-10, circuit VME14 (GY/YE), harness side and ground; and between the FCDIM C2123-9, circuit RME24 (BU/WH), harness side and ground	**Yes** GO to D10 . **No** GO to D8 .

 • **Are the resistances greater than 10,000 ohms?**	
D8 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND • Disconnect: Clockspring C218B . • Measure the resistance between the FCDIM C2123-10, circuit VME14 (GY/YE), harness side and ground; and between the FCDIM C2123-9, circuit RME24 (BU/WH), harness side and ground  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D9 . **No** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.
D9 CHECK THE STEERING WHEEL HARNESS FOR A SHORT TO GROUND • Connect: Clockspring C218B . • Disconnect: Clockspring C218C . • Measure the resistance between the FCDIM C2123-10, circuit VME14 (GY/YE), harness side and ground; and between the FCDIM C2123-9, circuit RME24 (BU/WH), harness side and ground  • **Are the resistances greater than 10,000 ohms?**	**Yes** REPAIR the steering wheel harness or INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation. **No** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR any DTCs present. TEST the system for normal operation.

D10 CHECK THE STEERING WHEEL CONTROLS CIRCUITRY FOR AN OPEN	
• Disconnect: Clockspring C218B . • Measure the resistance between the FCDIM C2123-10, circuit VME14 (GY/YE), harness side and the clockspring C218B-12, circuit VME14 (GY/YE), harness side.  N0119558 • Measure the resistance between the FCDIM C2123-9, circuit RME24 (BU/WH), harness side and the clockspring C218B-14, circuit RME24 (BU/WH), harness side.  N0119559 • **Are the resistances less than 5 ohms?**	**Yes** GO to D11 . **No** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.
D11 CHECK THE CLOCKSPRING FOR AN OPEN	
• Disconnect: Clockspring C218C . • Measure the resistance between the clockspring C218B-12, component side and the clockspring C218C-7, component side.  N0119560 • Measure the resistance between the clockspring C218B-14, component side and the C218C-5, component side.	**Yes** GO to D12 . **No** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR any DTCs present. TEST the system for normal operation.



N0119561

- **Are the resistances less than 5 ohms?**

D12 CHECK THE STEERING WHEEL HARNESS FOR AN OPEN	
• Disconnect: Clockspring C218C . • Measure the resistance between the clockspring C218C-7, harness side and the steering wheel controls C2998-2, harness side.  N0119562 • Measure the resistance between the clockspring C218C-5, harness side and the steering wheel controls C2998-4, harness side.  N0119563 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** REPAIR the steering wheel harness or INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation.
D13 CHECK FOR CORRECT FCDIM OPERATION	

• Connect: All Disconnected Connectors.
• Disconnect the FCDIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
	Yes
	INSTALL a new FCDIM . REFER to Front Controls/Display Interface Module (FCDIM) in this

▪ pushed-out pins • Connect the FCDIM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present. TEST the system for normal operation.

Pinpoint Test E: The Audio Input Jack Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System for schematic and connector information.

Normal Operation — Vehicles Without the SYNC® System

Audio signals are sent from the audio input jack to the Audio Control Module (ACM). There are no external power or ground circuits to the audio input jack.

Vehicles With the SYNC® System

Audio signals are sent from the audio input jack to the Accessory Protocol Interface Module (APIM). The signals are then sent to the ACM . There are no external power or ground circuits to the audio input jack.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Audio input jack
- ACM
- APIM (if equipped)

PINPOINT TEST E: THE AUDIO INPUT JACK IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

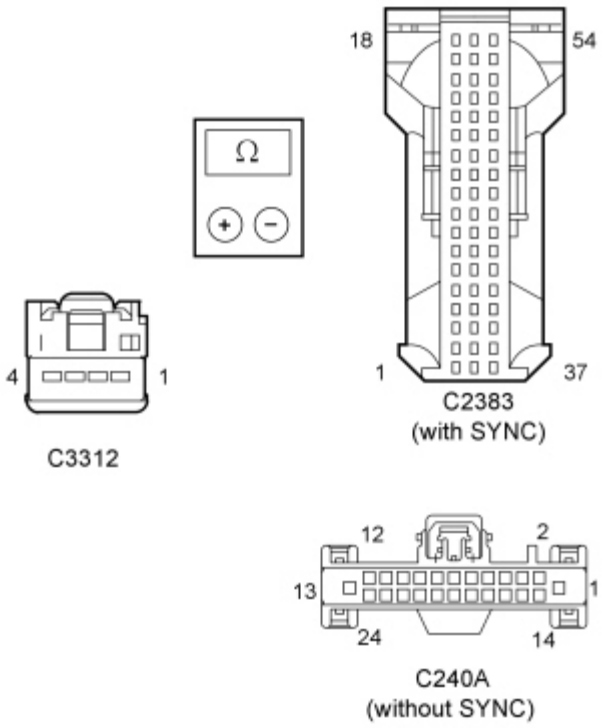
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before carrying out this pinpoint test, make sure the MP3 device is operating correctly.

Test Step	Result / Action to Take
E1 CHECK THE AUDIO INPUT JACK AUDIO	
• Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play an audio file using the audio input jack. • **Does the file play correctly?**	**Yes** The system is operating correctly at this time. The concern may be with the customer device. **No** GO to E2 .

E2 DETERMINE THE VEHICLE CONTENT	
• Determine if the vehicle is equipped with the SYNC® system. • **Is the vehicle equipped with the SYNC® system?**	**Yes** GO to E3 . **No** GO to E4 .
E3 CHECK THE APIM AUDIO OUTPUT	
• Using the Multi-Media Interface Tester, attempt to play an audio file using either the Universal Serial Bus (USB) port or Bluetooth®. • **Is the audio output OK for the USB port or Bluetooth®?**	**Yes** GO to E4 . **No** GO to Pinpoint Test M .
E4 CHECK THE AUDIO INPUT JACK CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Audio Input Jack C3312. • Disconnect: ACM C240B or APIM C2383 (If Equipped). • Ignition ON. • Measure the voltage between the audio input jack, harness side and ground as follows: **Positive Meter Lead** / **Negative Meter Lead** C3312-1 VME46 (BU/GN) — Ground C3312-2 RME46 (WH/GN) — Ground C3312-4 RME45 (YE/GN) — Ground  N0119548 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to E5 .
E5 CHECK THE AUDIO INPUT JACK CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the audio input jack, harness side and the ACM (or APIM , if equipped), harness side; and between the audio input jack, harness side and ground follows:	**Yes** GO to E6 . **No** REPAIR the circuit in

Positive Meter Lead	Negative Meter Lead	Circuit
C3312-1	C240A-18 or C2383-47, then ground	VME46 (BU/GN)
C3312-2	C240A-6 or C2383-48, then ground	RME45 (YE/GN)
C3312-4	C240A-17 or C2383-45, then ground	VME45 (BU)



N0119549

- **Is the resistance less than 5 ohms between the audio input jack and the ACM (or APIM), and greater than 10,000 ohms between the audio input jack and ground?**

question. TEST the system for normal operation.

E6 ISOLATE THE AUDIO INPUT JACK

- Disconnect: ACM C240A or APIM C2383 (If Equipped).
- Install a new audio input jack. Refer to Audio Input Jack in this section.
- Connect: Multi-Media Interface Tester.
- Using the Multi-Media Interface Tester, attempt to play an audio file using the audio input jack.
- **Does the file play correctly?**

Yes
The concern was caused by an inoperative audio input jack. The system is now operating correctly.

No
For vehicles without the SYNC® system, GO to E7 .

For vehicles with the SYNC® system, GO

	to E8 .
E7 CHECK FOR CORRECT ACM OPERATION	

• Ignition OFF.
• Connect: Audio Input Jack C2401.
• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

E8 CHECK FOR CORRECT APIM OPERATION	

• Ignition OFF.
• Connect: Audio Input Jack C2401.
• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the APIM connector and make sure it seats correctly.
• Turn the radio on and press the PUSH-TO-TALK button.
• Wait 2 minutes for the APIM to re-initalize.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers)

Refer to Wiring Diagrams Cell 130 , Audio System for schematic and connector information.

Normal Operation

The Audio Control Module (ACM) directs audio signals to the speakers in the form of a fluctuating AC voltage. The ACM has an overload protection function that protects the ACM if an over-current condition is present. As a result, if there is a short to ground on the circuitry to any of the interior speakers, the ACM can mute the sound to all of the interior speakers.

Root DTC Description	Failure Types	Fault Trigger Conditions
B1A01 — Speaker #1	01, 11, 12, 13	Sets when an open, short to ground, or short to voltage is detected in the LF speaker circuits. The test period is typically 100 ms.
B1A02 — Speaker #2	01, 11, 12, 13	Sets when an open, short to ground, or short to voltage is detected in the RF speaker circuits. The test period is typically 100 ms.
B1A03 — Speaker #3	01, 11, 12, 13	Sets when an open, short to ground, or short to voltage is detected in the LR speaker circuits. The test period is typically 100 ms.

B1A04 — Speaker #4	01, 11, 12, 13	Sets when an open, short to ground, or short to voltage is detected in the LR speaker circuits. The test period is typically 100 ms.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Speaker
- ACM

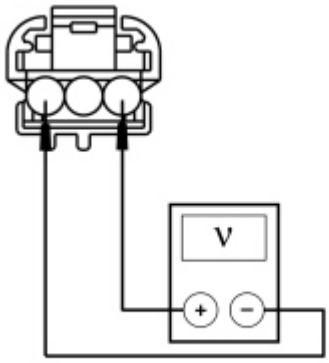
PINPOINT TEST F: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>F1 DETERMINE THE INOPERATIVE SPEAKER</td><td rowspan="2">Yes
GO to F2 .

No
GO to F5 .</td></tr>
<tr><td>NOTE: For vehicles with a 4-speaker system, proceed directly to Step F5.
• Manually adjust the fade/balance to test for sound at each individual speaker.
• Is there a concern with a front door tweeter speaker?</td></tr>
<tr><td>F2 CHECK THE AUDIO SIGNAL TO THE TWEETER SPEAKER</td><td rowspan="2">Yes
INSTALL a new tweeter speaker. REFER to Speaker — Tweeter in this section. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to F3 .</td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Suspect Speaker.
• Operate the audio system in radio tuner (AM/FM) mode.
• Measure the AC voltage between the suspect tweeter speaker pins, harness side as follows:
<table>
<tr><th>Suspect Tweeter Speaker</th><th>Positive Meter Lead</th><th>Negative Meter Lead</th></tr>
<tr><td>LH</td><td>C513-1
VME08 (GN/OG)</td><td>C513-3
RME08 (GY/OG)</td></tr>
<tr><td>RH</td><td>C613-1
VME11 (VT/OG)</td><td>C613-3
RME11 (YE/OG)</td></tr>
</table></td></tr>
</table>



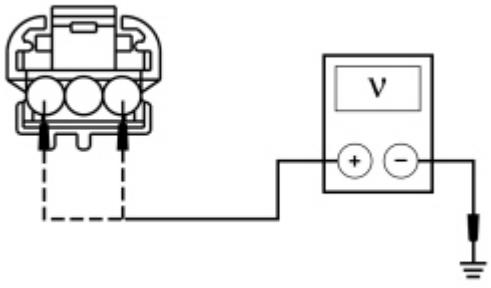
N0119550

- **Is a fluctuating AC voltage present?**

F3 CHECK THE AUDIO CIRCUITS TO THE TWEETER FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: LF Door Speaker C536 (LH Speaker Concern) or RF Door Speaker C628 (RH Speaker Concern).
- Ignition ON.
- Measure the voltage between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Positive Meter Lead	Negative Meter Lead
LH	C513-1 VME08 (GN/OG) C513-3 RME08 (GY/OG)	Ground Ground
RH	C613-1 VME11 (VT/OG) C613-3 RME11 (YE/OG)	Ground Ground



N0119551

- **Is any voltage present?**

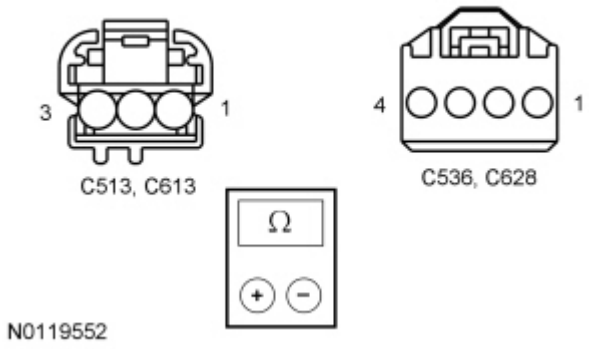
Yes
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to F4 .

F4 CHECK THE AUDIO CIRCUITS TO THE TWEETER FOR AN OPEN OR SHORT TO GROUND

- Measure the resistance between the suspect tweeter speaker, harness side and the corresponding door speaker, harness side; and between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LH	C513-1	C536-2, then ground	VME08 (GN/OG)
	C513-3	C536-3, then ground	RME08 (GY/OG)
RH	C613-1	C628-2, then ground	VME11 (VT/OG)
	C613-3	C628-3, then ground	RME11 (YE/OG)



- **Are the resistances less than 5 ohms between the suspect tweeter speaker and the corresponding door speaker, and greater than 10,000 ohms between the suspect tweeter speaker and ground?**

Yes
GO to F8 .

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

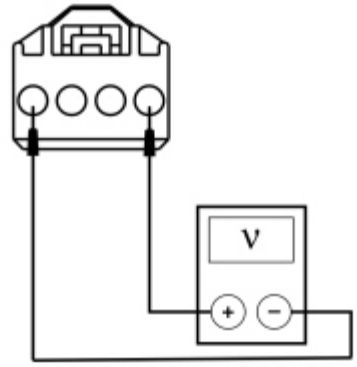
F5 CHECK THE AUDIO SIGNAL TO THE SUSPECT SPEAKER

- Ignition OFF.
- Disconnect: Suspect Speaker.
- Operate the audio system in radio tuner (AM/FM) mode.
- Measure the AC voltage between the suspect speaker pins, harness side as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LF door	C536-1 VME07 (WH)	C536-4 RME07 (WH/BN)
RF door	C628-1 VME10 (WH/VT)	C628-4 RME10 (WH/OG)
LR door	C702-1 VME09 (WH/GN)	C702-4 RME09 (BN/YE)
RR door	C802-1 VME12 (BN/WH)	C802-4 RME12 (BN/BU)

Yes
INSTALL a new door speaker. REFER to Speaker — Front Door or Speaker — Rear Door in this section. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to F6 .



- **Is a fluctuating AC voltage present?**

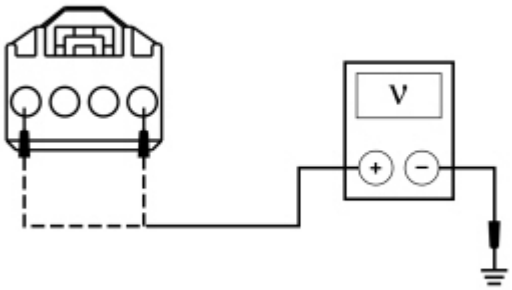
F6 CHECK THE AUDIO CIRCUITS TO THE SUSPECT SPEAKER FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: ACM C240A.
- Ignition ON.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LF door	C536-1 VME07 (WH) C536-4 RME07 (WH/BN)	Ground Ground
RF door	C628-1 VME10 (WH/VT) C628-4 RME10 (WH/OG)	Ground Ground
LR door	C702-1 VME09 (WH/GN) C702-4 RME09 (BN/YE)	Ground Ground
RR door	C802-1 VME12 (BN/WH) C802-4 RME12 (BN/BU)	Ground Ground

Yes
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to F7 .



N0119554

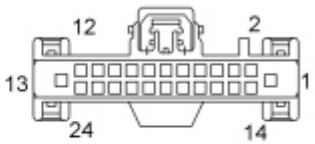
- **Is any voltage present?**

F7 CHECK THE AUDIO CIRCUITS TO THE SUSPECT SPEAKER FOR AN OPEN OR SHORT TO GROUND

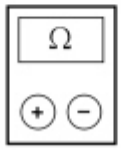
- Measure the resistance between the suspect speaker, harness side and the ACM, harness side; and between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LF door	C536-1	C240A-22, then ground	VME07 (WH)
	C536-4	C240A-10, then ground	RME07 (WH/BN)
RF door	C628-1	C240A-23, then ground	VME10 (WH/VT)
	C628-4	C240A-11, then ground	RME10 (WH/OG)
LR door	C702-1	C240A-21, then ground	VME09 (WH/GN)
	C702-4	C240A-9, then ground	RME09 (BN/YE)
RR door	C802-1	C240A-24, then ground	VME12 (BN/WH)
	C802-4	C240A-12, then ground	RME12 (BN/BU)

C536, C628, C702, C802



C240A



N0119555

- **Are the resistances less than 5 ohms between the suspect speaker and the ACM, and greater than 10,000 ohms between**

Yes
GO to F8.

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

the suspect speaker and ground?	

F8 CHECK FOR CORRECT ACM OPERATION
• Connect: All Disconnected Connectors.
• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM. REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: Poor Quality/Distorted/No Sound From All Speakers

Refer to Wiring Diagrams Cell 130, Audio System for schematic and connector information.

Normal Operation

The Audio Control Module (ACM) receives the START signal through the Controller Area Network (CAN). When it receives this signal, it mutes the audio output to prevent voltage spikes from producing a popping noise through the speakers during engine cranking.

If the ACM loses power or ground, the scan tool cannot communicate with it. Refer to Section 418-00 to continue diagnosis.

If a speaker fault DTC is set in the ACM, the cause of the concern is likely a short to ground or short to voltage in the circuitry to an individual speaker, which has caused the ACM overload protection to activate.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- ACM

PINPOINT TEST G: POOR QUALITY/DISTORTED/NO SOUND FROM ALL SPEAKERS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK FOR SPEAKER DTCs • Ignition ON. • Carry out the ACM self-test. • **Are any speaker fault DTCs present?**	**Yes** GO to Pinpoint Test F. **No** GO to G2.
G2 CHECK FOR CORRECT ACM OPERATION	

• Ignition OFF.
• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Universal Serial Bus (USB) Port Is Inoperative/Does Not Operate Correctly

Normal Operation

The Universal Serial Bus (USB) port is connected to the Accessory Protocol Interface Module (APIM) through the USB cable. The USB port can be used to play audio files or upload software from mass storage devices, or for connecting a media device.

If supported by the user device, the USB can provide charging. Because of this feature, when a USB device is plugged into the USB port, the SYNC® system does not automatically switch to the device.

If a USB mass storage device is used to play an audio file, the SYNC® system only plays audio files that do not have Digital Rights Management (DRM) protection.

The USB cable and port are not serviceable separately.

- DTC B1252:04 (USB Port: System Internal Failure) — sets when the APIM detects an over-temperature condition in the USB circuit. This can be caused by a fault in the USB cable and port, or by the customer USB device.
- DTC B1252:11 (USB Port: Circuit Short to Ground) — sets when the APIM detects an over-current condition in the USB circuit. This can be caused by a fault in the USB cable and port, or by the customer USB device.

This pinpoint test is intended to diagnose the following:

- Customer USB device
- USB cable and port
- APIM

PINPOINT TEST H: THE USB PORT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
H1 CHECK THE USB CONNECTION	
• Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The SYNC® system is operating correctly. REVIEW the operation of the USB port with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to H2 .

H2 INSPECT THE USB CABLE • Ignition OFF. • Disconnect: USB Cable At APIM . • Inspect the USB cable for damage. • Connect: USB Cable At APIM . • Ignition ON. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The concern was caused by the USB connection not being seated correctly. The system is now operating correctly. **No** GO to H3 .
H3 RESET THE APIM AND RECHECK SYNC® SYSTEM OPERATION **NOTE:** Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNC® system. • Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNC® inputs function correctly?**	**Yes** The SYNC® system is operating correctly at this time. CARRY OUT a SYNC® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** If only the USB port is inoperative, GO to H4 . If additional inputs are inoperative, GO to Symptom Chart to diagnose the observed symptom. If all inputs are inoperative, INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section.
H4 ISOLATE THE USB CABLE AND PORT • Install a new USB cable and port. Refer to Universal Serial Bus (USB) Cable and Port in this section. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The concern was caused by an inoperative USB cable. The system is now operating correctly. **No** GO to H5 .

H5 CHECK FOR CORRECT APIM OPERATION
• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the APIM connector and make sure it seats correctly.
• Wait 2 minutes for the APIM to re-initalize.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test I: Voice Recognition Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System for schematic and connector information.

Normal Operation

When the VOICE switch is pressed, it changes a reference voltage signal and the audio system enters voice recognition mode. The VOICE switch is wired to the Accessory Protocol Interface Module (APIM). The microphone receives the voice command and sends a signal to the APIM . The microphone is also used to detect outgoing audio during a phone call.

- DTC B1201:1C (Steering Wheel Audio Switch Pack 2: Circuit Voltage Out of Range) — sets when the APIM detects the VOICE switch circuit out-of-range for greater than 250 ms.
- DTC B1201:63 (Steering Wheel Audio Switch Pack 2: Circuit / Component Protection Time-Out) — sets when the APIM detects the VOICE switch stuck within range for greater than 120 seconds during normal operation, or for greater than 3 seconds during the on-demand self-test.
- DTC B1D79:01 (Microphone Input: General Electrical Failure) — sets during the on-demand self-test if the APIM does not detect the microphone.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Steering column multifunction switch
- Microphone
- APIM

PINPOINT TEST I: VOICE RECOGNITION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

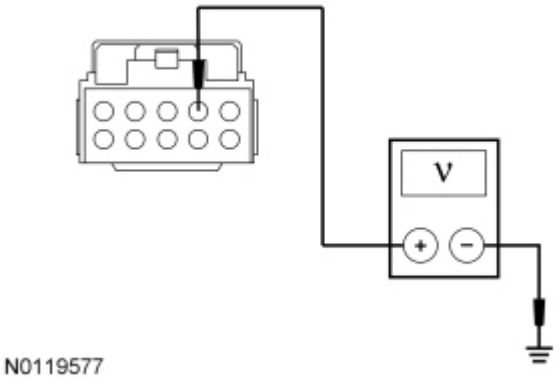
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
I1 CHECK THE OPERATION OF THE VOICE SWITCH • Operate the audio system in radio tuner (AM/FM) mode. • Adjust the audible prompt volume to an acceptable range. Refer to the Owner's Literature. • Press the VOICE switch. • **Does the audio system enter voice recognition mode?**	**Yes** GO to I6 . **No** GO to I2 .
I2 MONITOR THE VOICE SWITCH PID • Enter the following diagnostic mode on the scan tool: APIM DataLogger. • Monitor the VOICE switch PID (SCS_VOICE) while pressing and releasing the VOICE switch. • **Does the PID value agree with the switch position?**	**Yes** GO to I11 . **No** If the switch always reads active, INSTALL a new steering column multifunction switch. REFER to Section 211-05 . CLEAR any DTCs present. TEST the system for normal operation. For all other PID values, GO to I3 .
I3 CHECK THE REFERENCE VOLTAGE CIRCUIT TO THE VOICE	

SWITCH FOR A SHORT TO VOLTAGE

- Disconnect: Steering Column Multifunction Switch C202A.
- Disconnect: APIM C2383 .
- Ignition ON.
- Measure the voltage between the steering column multifunction switchC202A-2, circuit VME14 (GY/YE), harness side and ground.



- **Is any voltage present?**

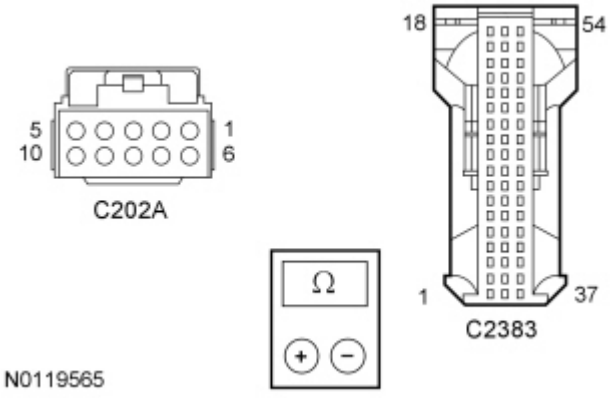
Yes
REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to I4 .

I4 CHECK THE CIRCUITS TO THE VOICE SWITCH FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the steering column multifunction switch, harness side and the APIM , harness side; and between the steering column multifunction switch, harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C202A-2	C2383-15, then ground	VME14 (GY/YE)
C202A-7	C2383-14, then ground	RME24 (BU/WH)



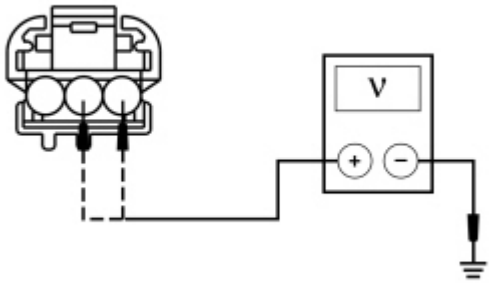
- **Is the resistance less than 5 ohms between the steering column multifunction switch and the APIM , and greater than 10,000 ohms between the steering column multifunction switch and ground?**

Yes
GO to I5 .

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

I5 ISOLATE THE VOICE SWITCH

• Connect: APIM C2383. • Install a new steering column multifunction switch. Refer to Section 211-05 . • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** GO to I11 . **No** The system is operating correctly at this time. The concern was caused by an inoperative steering column multifunction switch. CLEAR any DTCs present.
I6 CHECK THE OPERATION OF THE VOICE RECOGNITION	
• Press the VOICE switch. • Wait for the SYNC® system to acknowledge the VOICE switch being pressed. • While still in voice recognition mode, speak the command "PHONE", and observe the audio system. • **Does the SYNC® system acknowledge the command "PHONE"?**	**Yes** The system is operating correctly at this time. ADVISE the customer on the correct operation of the voice recognition system. **No** GO to I7 .
I7 CHECK THE MICROPHONE SHIELD CIRCUIT FOR CONTINUITY TO GROUND	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect: Microphone C9221. • Measure the resistance between the microphone C9221-3, circuit GD111, harness side and ground.  N0119566 • **Is the resistance less than 5 ohms?**	**Yes** GO to I8 . **No** REPAIR the circuit. TEST the system for normal operation.
I8 CHECK THE MICROPHONE CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable. • Disconnect: APIM 2383. • Ignition ON. • Measure the voltage between the microphone C9221-1, circuit VMT02 (GN/OG), harness side and ground; and between the microphone C9221-2, circuit VMM13 (YE/GN), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to I9 .



N0119567

- **Is any voltage present?**

I9 CHECK THE MICROPHONE CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the microphone, harness side and the APIM , harness side as follows: **Positive Meter Lead** / **Negative Meter Lead** / **Circuit** C9221-1 / C2383-18, then ground / VMT02 (GN/OG) C9221-2 / C2383-5, then ground / VMM13 (YE/GN)  N0119568 • **Are the resistances less than 5 ohms between the microphone and the APIM , and greater than 10,000 ohms between the microphone and ground?**	**Yes** GO to I10 . **No** REPAIR the circuit in question. TEST the system for normal operation.
I10 ISOLATE THE MICROPHONE	
• Connect: APIM C2383. • Install a new microphone. Refer to Microphone in this section. • Operate the audio system in radio tuner (AM/FM) mode. • Press the VOICE switch and attempt several voice commands. • **Does the voice recognition operate correctly?**	**Yes** The fault was caused by an inoperative microphone. The system is now operating correctly. **No** GO to I11 .
I11 RESET THE APIM AND RECHECK SYNC® SYSTEM OPERATION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call	**Yes** The SYNC® system is

histories, and deletes any devices paired with the SYNC® system. • Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNC® inputs function correctly?**	operating correctly at this time. CARRY OUT a SYNC® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to I12.
I12 CHECK FOR CORRECT APIM OPERATION • Disconnect the APIM connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Turn the radio on and press the PUSH-TO-TALK button. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: Poor Quality/Distorted/No Sound While In SYNC® Mode

Refer to Wiring Diagrams Cell 130, Audio System/Navigation for schematic and connector information.

Normal Operation

The Accessory Protocol Interface Module (APIM) transmits left and right channel analog audio signals to the Audio Control Module (ACM). These signals include inputs from the Universal Serial Bus (USB) port, the audio input jack, and a Bluetooth® media device.

If a USB mass storage device is used to play an audio file, the SYNC® system only plays audio files that do not have Digital Rights Management (DRM) protection.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- ACM
- APIM

PINPOINT TEST J: POOR QUALITY/DISTORTED/NO SOUND WHILE IN SYNC® MODE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>J1 VERIFY THE OPERATION OF THE SYNC® SYSTEM AUDIO SOURCES</td><td></td></tr>
<tr><td>

Connect: Multi-Media Interface Tester.
Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port and Bluetooth®.
Is there poor quality/distorted/no sound from each SYNC® audio source?

</td><td>Yes
GO to J2.

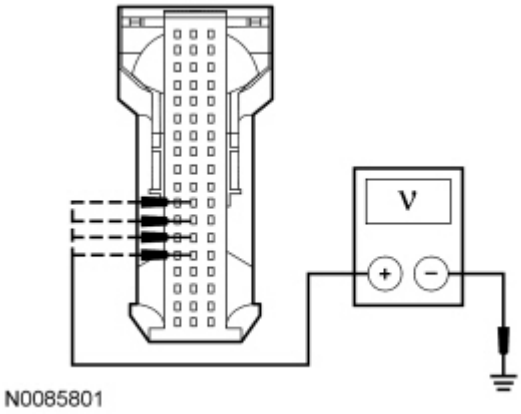
No
If the concern is only with some of the audio sources, GO to Symptom Chart - SYNC® System to diagnose the observed symptom.

If all audio sources operate correctly, the concern is with the customer device.</td></tr>
<tr><td>J2 CHECK THE AUDIO CIRCUITS FROM THE APIM FOR A SHORT TO VOLTAGE</td><td></td></tr>
<tr><td>

Ignition OFF.
Disconnect: ACM C240B.
Disconnect: APIM C2383.
Ignition ON.
Measure the voltage between the APIM, harness side and ground as follows:

<table>
<tr><th>Positive Meter Lead</th><th>Negative Meter Lead</th></tr>
<tr><td>C2383-23
VME53 (VT/GN)</td><td>Ground</td></tr>
<tr><td>C2383-24
RME53 (BN/WH)</td><td>Ground</td></tr>
<tr><td>C2383-25
VME52 (BU)</td><td>Ground</td></tr>
<tr><td>C2383-26
RME52 (GY/OG)</td><td>Ground</td></tr>
</table>
</td><td>Yes
REPAIR the circuit in question. TEST the system for normal operation.

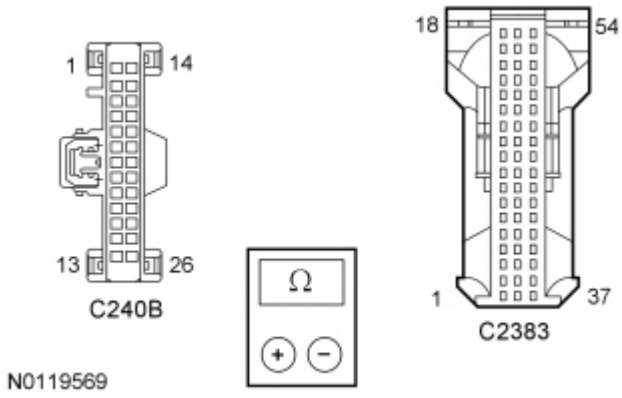
No
GO to J3.</td></tr>
</table>



- **Is any voltage present?**

J3 CHECK THE CIRCUITS FROM THE APIM FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the ACM, harness side, and the APIM, harness side; and between the ACM, harness side and ground as follows:	**Yes** GO to J4. **No** REPAIR the circuit in question. TEST the system for normal operation.

Positive Meter Lead	**Negative Meter Lead**	**Circuit**
C240B-13	C2383-23, then ground	VME53 (VT/GN)
C240B-26	C2298-24, then ground	RME53 (BN/WH)
C240B-12	C2298-25, then ground	VME52 (BU)
C240B-25	C2298-26, then ground	RME52 (GY/OG)



- **Are the resistances less than 5 ohms between the ACM and the APIM, and greater than 10,000 ohms between the ACM and ground?**

J4 CHECK FOR CORRECT APIM OPERATION	

• Connect: All Disconnected Connectors.
• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
	Yes
	INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section.

▪ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Turn the radio on and press the PUSH-TO-TALK button. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	TEST the system for normal operation. If the concern is still present, GO to J5 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
J5 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: The Entire Audio System is Inoperative

Normal Operation

With the ignition in RUN or ACC, the audio system can be powered on. When the ON button is pressed on the Front Controls Interface Module (FCIM) (or the ignition is turned to RUN or ACC and the audio system was on when the ignition was turned off), a wake-up signal is provided to the Front Control/Display Interface Module (FCDIM) via the dedicated Local Interconnect Network (LIN) line. The FCDIM then broadcasts a message over the Infotainment Controller Area Network (I-CAN) to the other modules in the audio system.

When a button is pressed on the FCIM , there is a corresponding display on the FCDIM . The FCDIM displays base audio system information, warning message and icons, SYNC® information (if equipped), and satellite radio information (if equipped). The information is sent to the FCDIM via the MS-CAN .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- FCIM
- FCDIM
- ACM

PINPOINT TEST K: THE ENTIRE AUDIO SYSTEM IS INOPERATIVE

Test Step	Result / Action to Take
K1 CHECK FOR SCAN TOOL COMMUNICATION	
• Carry out the network test with the scan tool.	**Yes** REFER to Section 418-00 to diagnose The

• **Do either the ACM or the FCDIM fail to communicate with the scan tool?**	ACM Does Not Respond To The Scan Tool or The FCDIM Does Not Respond To The Scan Tool. **No** GO to K2.
K2 CHECK THE POWER SWITCH INPUT TO THE FCDIM	
• Enter the following diagnostic mode on the scan tool: FCDIM DataLogger. • Monitor the FCDIM power switch PID (BTN_POWER) while pressing and releasing the power switch on the FCIM. • **Does the PID display the correct the power switch positions?**	**Yes** GO to K3. **No** GO to Pinpoint Test Y.
K3 CHECK FOR LOST COMMUNICATION DTCs	
• Using the scan tool, clear the ACM and FCDIM continuous DTCs. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Repeat the ACM and FCDIM self-tests. • **Is DTC U0140:00, U0193:00, or U0257:00 present in either module?**	**Yes** REFER to DTC Charts in this section. **No** GO to K4.
K4 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM. REFER to Audio Control Module (ACM) in this section. CLEAR any DTCs present. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test L: The Front Control/Display Interface Module (FCDIM) Illumination Does Not Operate Correctly

Normal Operation

The Front Control/Display Interface Module (FCDIM) receives the illumination signal from the Body Control Module (BCM) and dims the illumination based on the position of the dimmer switch. In the event this signal is lost, the FCDIM defaults to full nighttime brightness, resulting in a symptom of the FCDIM being unable to dim.

This pinpoint test is intended to diagnose the following:

- Backlighting system concern
- FCDIM

PINPOINT TEST L: THE FDIM ILLUMINATION DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
L1 CHECK FOR DTC U0140:00	**Yes** GO to Pinpoint Test P . **No** GO to L2 .
• Carry out the FCDIM self-test. • **Is DTC U0140:00 present?**	
L2 CHECK FOR CORRECT FCDIM OPERATION	**Yes** INSTALL a new FCDIM . REFER to Front Controls/Display Interface Module (FCDIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Disconnect the FCDIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the FCDIM connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**	

Pinpoint Test M: The SYNC® System Is Completely Inoperative

Normal Operation

The Accessory Protocol Interface Module (APIM) takes action based on network message it receives from other audio system modules, and from the VOICE switch (part of the multifunction switch). The APIM sends display data to the Front Control/Display Interface Module (FCDIM) in order to update the display screen.

- DTC U3000:04 (Control Module: System Internal Failure) — sets when the APIM detects a fault due to a device conflict or an internal failure.

This pinpoint test is intended to diagnose the following:

- Audio system concern
- Communication network concern
- Customer error
- Customer device
- APIM

PINPOINT TEST M: THE SYNC® SYSTEM IS COMPLETELY INOPERATIVE

Test Step	Result / Action to Take
M1 CHECK FOR SCAN TOOL COMMUNICATION WITH THE APIM	**Yes** GO to M2 . **No** REFER to Section 418-00 .
• Carry out the network test using the scan tool. • **Does the APIM pass the network test?**	

M2 CHECK THE SYNC® SYSTEM OPERATION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNC® system. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNC® inputs function correctly?**	**Yes** The SYNC® system is operating correctly at this time. CARRY OUT a SYNC® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to M3.
M3 RESET THE APIM AND RECHECK SYNC® SYSTEM OPERATION	
• Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNC® inputs function correctly?**	**Yes** The SYNC® system is operating correctly at this time. CARRY OUT a SYNC® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** If only some (but not all) of the inputs are inoperative, GO to Symptom Chart to diagnose the observed symptom. If all inputs are inoperative and/or DTC U3000:04 is present, INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section.

Pinpoint Test N: Unable To Pair Bluetooth® Device

Normal Operation

When a new Bluetooth® device is added, the Accessory Protocol Interface Module (APIM) and the Bluetooth® device must be paired together. Most Bluetooth® devices can pair with the SYNC® system, although functionality varies. To determine if a Bluetooth® device is supported, retrieve the Consumer Interface Processor (CIP) software level using the Accessory Protocol Interface Module (APIM) Software Level Check in this section, and verify the customer device is on the compatibility list for the current CIP software level.

Pairing a Bluetooth® device is accomplished through the "Add Device" selection of the phone menu. When pairing a device, the SYNC® system generates a unique Personal Identification Number (PIN) that must be entered on the Bluetooth® device in order for the pairing process to be successful. There are also some device-specific actions that must take place. For additional information on the pairing process, refer to the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Incompatible Bluetooth® device
- Customer error
- Customer Bluetooth® device

- APIM

PINPOINT TEST N: UNABLE TO PAIR Bluetooth® DEVICE

Test Step	Result / Action to Take
N1 CHECK THE BLUETOOTH® CONNECTION **NOTE:** Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories and deletes any devices paired with the SYNC® system. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, connect to the SYNC® system using Bluetooth®. Follow the tool instructions. • Enter the following diagnostic mode on the scan tool: APIM DataLogger. • Monitor the Bluetooth® device paired PID (BT_PAIR) and the Bluetooth® device connected PID (BT_CONN). • **Do the PIDs both read "Yes"?**	**Yes** The SYNC® system is operating correctly at this time. CARRY OUT a SYNC® system Master Reset. REFER to the Owner's Literature. REVIEW the pairing process with the customer. If the customer device still does not pair, the fault is with the customer device. **No** GO to N2.

N2 CHECK FOR CORRECT APIM OPERATION
 	
• Ignition OFF.
• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pints
• Connect the APIM connector and make sure it seats correctly.
• Turn the radio on and press the PUSH-TO-TALK button.
• Wait 2 minutes for the APIM to re-initalize.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The SYNC® System Audible Prompts Are Inoperative/Do Not Operate Correctly

Refer to Wiring Diagrams Cell 130, Audio System for schematic and connector information.

Normal Operation

The Text-To-Speech (TTS) and voice prompt features speak certain text information and interaction requests in order to minimize driver distraction while driving. The ringtone alerts the driver to an incoming call.

Audible prompts can range from a simple tone to more elaborate spoken text, based on the customer setting. When interaction mode is set to standard, detailed guidance is provided. When interaction mode is set to advanced, most prompts are tones only and minimal audible guidance is provided. Refer to the Owner's Literature for further information on voice interaction.

The audio signals for the TTS and voice prompt features, the ringtones, and audio from an outside device during a phone call, are sent from the Accessory Protocol Interface Module (APIM) to the Audio Control Module (ACM).

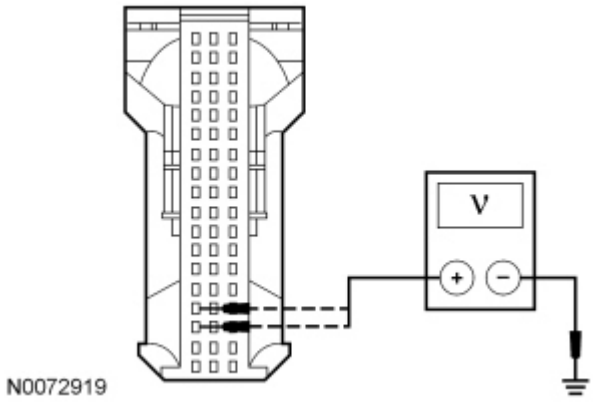
This pinpoint test is intended to diagnose the following:

- Customer setting
- Wiring, terminals or connectors
- ACM
- APIM

PINPOINT TEST O: THE SYNC® SYSTEM AUDIBLE PROMPTS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
O1 CHECK THE AUDIBLE PROMPT SETTING • Operate the audio system in SYNC® mode. • Verify the audible prompts are enabled. Refer to "SYNC® Voice Recognition Feature" in the Owner's Literature. • Press the VOICE button on the steering wheel controls and observe the SYNC® audible prompt. • **Does the SYNC® system produce an audible prompt correctly?**	**Yes** The system is operating correctly at this time. The concern was caused by a customer setting. INSTRUCT the customer in the correct operation of the audible prompt feature. **No** GO to O2.
O2 CHECK FOR A VOLTAGE SIGNAL FROM THE APIM ***NOTICE:*** **This pinpoint test step directs testing circuits using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** • Operate the audio system in SYNC® mode. • While pressing the VOICE button repeatedly, measure the AC voltage by backprobing between the ACM C240B-8, circuit VMN14 (WH/VT), harness side and the ACM C240B-21, circuit RMN14 (GY/BN), harness side. • **Is an AC voltage produced each time the VOICE switch is pressed?**	**Yes** GO to O6. **No** GO to O3.
O3 CHECK THE AUDIBLE PROMPT CIRCUITS FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: ACM C240B. • Disconnect: APIM C2383. • Ignition ON. • Measure the voltage between the APIM C2383-3, circuit VMN14 (WH/VT), harness side and ground; and between the APIM C2383-4, circuit RMN14 (GY/BN), harness side and ground.	**Yes** REPAIR the circuit in question. TEST the system for normal operation.



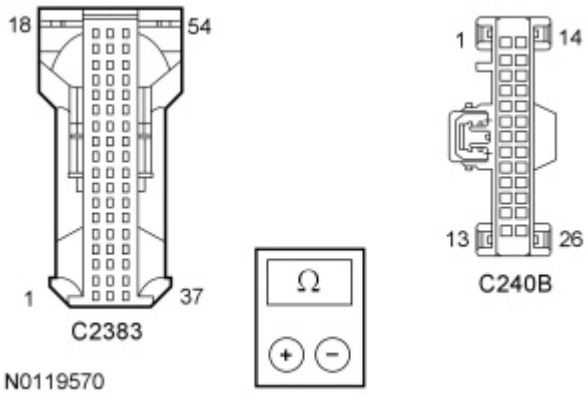
- **Is any voltage present?**

No
GO to O4 .

O4 CHECK THE AUDIBLE PROMPT CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the APIM , harness side and the ACM , harness side; and between the APIM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C2383-3	C240B-8, then ground	VMN14 (WH/VT)
C2383-4	C240B-21, then ground	RMN14 (GY/BN)



- **Are the resistances less than 5 ohms between the APIM and the ACM , and greater than 10,000 ohms between the APIM and ground?**

Yes
GO to O5 .

No
REPAIR the circuit in question. TEST the system for normal operation.

O5 CHECK FOR CORRECT APIM OPERATION

- Ignition OFF.
- Connect: ACM C240B.
- Disconnect the APIM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Turn the radio on and press the PUSH-TO-TALK button.
- Wait 2 minutes for the APIM to re-initalize.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.

	No The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

O6 CHECK FOR CORRECT ACM OPERATION
• Ignition OFF.
• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: DTC U0140:00

Normal Operation

Several audio system modules receive network messages from the Body Control Module (BCM) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- Light and chime request
- Illumination dimmer control

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub Type Information) — set by the Audio Control Module (ACM), the Front Control/Display Interface Module (FCDIM), the Accessory Protocol Interface Module (APIM), or the Global Positioning System Module (GPSM) when network messages are missing from the BCM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- BCM

PINPOINT TEST P: DTC U0140:00

Test Step	Result / Action to Take
P1 CHECK FOR LOST COMMUNICATION DTCs • Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0140:00 set in any audio system module?**	**Yes** GO to P2 . **No** The system is operating correctly at this time. The DTC may been set due to an intermittent fault in the network wiring.
P2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs • Carry out the self-test for the following modules: ▪ ACM ▪ FCDIM ▪ APIM ▪ GPSM ▪ BCM • **Is DTC U3003:16 or DTC U3003:17 recorded in any module?**	**Yes** For an audio system module, REFER to DTC Charts in this section. For the BCM , REFER to Section 419-10 . **No** GO to P3 .
P3 CHECK FOR DTC U0140:00 SET IN MULTIPLE MODULES • Review the recorded results from the self-test. • **Is DTC U0140:00 set in more than one audio system module?**	**Yes** If all audio system modules except the FCDIM set DTC U0140:00, INSTALL a new FCDIM . REFER to Front Controls/Display Interface Module (FCDIM) in this section. TEST the system for normal operation. Otherwise, GO to P4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, the system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
P4 CHECK FOR CORRECT BCM OPERATION • Ignition OFF. • Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pints • Connect all the BCM connectors and make sure	**Yes** INSTALL a new BCM . REFER to Section 419-10 . CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0140:00.

they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test Q: DTC U0253:00

- DTC U0253:00 (Lost Communication With Accessory Protocol Interface Module: No Sub Type Information) — set by the Audio Control Module (ACM) when network messages are missing from the Accessory Protocol Interface Module (APIM) over the Medium Speed Controller Area Network (MS-CAN) for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- APIM

PINPOINT TEST Q: DTC U0253:00

Test Step	Result / Action to Take
Q1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0253:00 or DTC U0197:00 set in any module?**	**Yes** GO to Q2 . **No** The system is operating correctly at this time. The DTC may been set due to an intermittent fault in the network wiring.
Q2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	

• Carry out the self-test for the following modules:
  ▪ ACM
  ▪ APIM
• **Is DTC U3003:16 or DTC U3003:17 recorded in any module?**
	Yes
	REFER to DTC Charts in this section.
	
	No
	GO to Q3 .

Q3 CHECK FOR DTC U0253:00 OR DTC U0197:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Are DTC U0253:00 or DTC U0197:00 set in more than one module?**	**Yes** GO to Q4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom.

	If there is no observable symptom, the system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Q4 CHECK FOR CORRECT APIM OPERATION
• Ignition OFF.
• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pints
• Connect the APIM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. CLEAR all continuous DTCs. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0197:00 or DTC U0253:00.

Pinpoint Test R: DTC U0255:00 Or DTC U0257:00

- DTC U0255:00 (Lost Communication With Front Display Interface Module: No Sub Type Information) — set by the Accessory Protocol Interface Module (APIM) when network messages are missing from the Front Control/Display Interface Module (FCDIM) for greater than 5 seconds with the ignition in RUN.
- DTC U0257:00 (Lost Communication With Front Controls/Display Interface Module: No Sub Type Information) — set by the Audio Control Module (ACM) when network messages are missing from the FCDIM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ACM
- APIM
- FCDIM

PINPOINT TEST R: DTC U0255:00 OR DTC U0257:00

NOTE: Disregard the pinpoint test steps for the APIM if the concern is on a vehicle without the SYNC® system.

Test Step	Result / Action to Take
R1 CHECK FOR LOST COMMUNICATION DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Ignition ON. • Clear the ACM and APIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds.	**Yes** GO to R2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.

• Repeat the ACM and APIM self-test. • **Is DTC U0255:00 or DTC U0257:00 still present?**	
R2 VERIFY THE CUSTOMER CONCERN • Operate the audio system in various modes (radio tuner, SYNC®, etc.). • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to R3. **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring. CHECK the network wiring between the FCDIM and the module in question for an intermittent fault.
R3 CHECK THE COMMUNICATION NETWORK • Carry out the network test using the scan tool. • **Does the FCDIM pass the network test?**	**Yes** GO to R4. **No** REFER to The FCDIM Does Not Respond To The Scan Tool in Section 418-00.
R4 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs • Carry out the self-test for the following modules: ▪ ACM ▪ APIM ▪ FCDIM • **Are any low or high voltage DTCs recorded in any module?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new FCDIM. REFER to Front Controls Interface Module (FCIM) in this section. CLEAR the ACM and APIM DTCs. REPEAT the ACM and APIM self-tests. If DTC U0257:00 is still present in the ACM, INSTALL a new ACM. REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. If DTC U0255:00 is still present in the APIM, INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.

Pinpoint Test S: DTC U3003:16 (Audio Control Module (ACM))

Refer to Wiring Diagrams Cell 130, Audio System for schematic and connector information.

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — set by the Audio Control Module (ACM) as a continuous or on-demand DTC when the supply voltage falls below 10 volts for at least 10 seconds during normal operation, or for greater than 250 milliseconds during the self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance

- ACM

PINPOINT TEST S: DTC U3003:16 (ACM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
S1 RECHECK THE ACM DTCs • Clear the ACM DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Repeat the ACM self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to S2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
S2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM • Retrieve the continuous memory DTCs from all modules. • **Are any voltage-related DTCs set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to S3 .
S3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE • Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to S4 . **No** REFER to Section 414-01 .
S4 CHECK THE ACM VOLTAGE SUPPLY • Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: ACM C240A. • Ignition ON. • Measure the voltage between the ACM C240A-1, circuit SBP10 (YE/RD), harness side and ground.  N0119571	**Yes** GO to S5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.

• **Is the voltage within 0.2 volt of the recorded battery voltage?**	
S5 CHECK THE ACM GROUND CIRCUIT FOR CONTINUITY • Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the ACM C240A-13, circuit GD111 (BK/BU), harness side and ground.  N0119572 • **Is the resistance less than 5 ohms?**	**Yes** GO to S6. **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.

S6 CHECK FOR CORRECT ACM OPERATION
• Connect: Negative Battery Cable.
• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM. REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test T: DTC U3003:17 (Audio Control Module (ACM))

Refer to Wiring Diagrams Cell 130, Audio System for schematic and connector information.

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — set by the Audio Control Module (ACM) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- ACM

PINPOINT TEST T: DTC U3003:17 (ACM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
T1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES • Ignition ON. • Retrieve all continuous DTCs from all modules. • **Are high voltage DTCs (e.g., B1317, U3003:17, P0563) set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to T2 .
T2 CHECK THE BATTERY VOLTAGE • Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to T3 .
T3 RECHECK FOR DTC U3003:17 • Ignition OFF. • Ignition ON. • Clear the ACM DTCs. • Repeat the ACM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test U: DTC U0155:00

Normal Operation

Several audio system modules receive network messages from the Instrument Panel Cluster (IPC) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- Date/time data
- Ignition switch position
- Vehicle speed data
- Warning indicator status

As more than one module receives these messages, all modules receiving a particular message can exhibit a symptom if the message is missing.

- DTC U0155:00 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information) — set by the Front Control/Display Interface Module (FCDIM), the Accessory Protocol Interface Module (APIM), or the Global Positioning System Module (GPSM) when network messages are missing from the IPC for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- IPC

PINPOINT TEST U: DTC U0155:00

Test Step	Result / Action to Take
U1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0155:00 set in any audio system module?**	**Yes** GO to U2. **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
U2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	

• Carry out the self-test for the following modules:
  ▪ FCDIM
  ▪ APIM (if equipped)
  ▪ GPSM (if equipped)
  ▪ IPC
• **Are any low or high voltage DTCs recorded in any module?**
	Yes
	For an audio system module, REFER to DTC Charts in this section.
	
	For the IPC, REFER to Section 413-01.
	
	No
	GO to U3.

U3 CHECK FOR DTC U0155:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0155:00 set in more than one audio system module?**	**Yes** GO to U4. **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, the system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
U4 CHECK FOR CORRECT IPC OPERATION	

• Ignition OFF.
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Section 413-01. CLEAR all continuous DTCs. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0155:00.

Pinpoint Test V: One Or More Front Control/Display Interface Module (FCDIM) Displays Is Inoperative/Does Not Operate Correctly

Normal Operation

All of the displays on the Front Control/Display Interface Module (FCDIM) screen are controlled through network messages. The modules sending display data to the FCDIM are:

- Audio Control Module (ACM): audio system information (including satellite radio information)
- Instrument Panel Cluster (IPC): warning messages and indicators
- Accessory Protocol Interface Module (APIM): SYNC® system information

If the FCDIM loses the signal from any of these modules, only those specific displays are inoperative.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ACM
- IPC
- APIM (if equipped)
- FCDIM

PINPOINT TEST V: ONE OR MORE FCDIM DISPLAYS IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
V1 CHECK FOR SCAN TOOL COMMUNICATION WITH THE FCDIM	
• Carry out the network test using the scan tool. • **Does the scan tool communicate with the FCDIM ?**	**Yes** GO to V2 . **No** REFER to The FCDIM Does Not Respond To The Scan Tool in Section 418-00 .
V2 CHECK FOR LOST COMMUNICATION DTCs SET IN THE FCDIM	
• Using the scan tool, retrieve all continuous DTCs. • **Is DTC U0155:00 or U0193:00 present in the FCDIM ?**	**Yes** REFER to DTC Charts in this section. **No** GO to V3 .
V3 CHECK THE FCDIM DISPLAY SEGMENTS	
• Enter the following diagnostic mode on the scan tool: FCDIM DataLogger. • Command all of the LCD segments on using the FCDIM active command LCD_SEG (All LCD Segments). • **Do all of the FDIM segments illuminate?**	**Yes** GO to V4 . **No** GO to V5 .
V4 OBSERVE THE SPECIFIC INOPERATIVE DISPLAY	
• Observe the inoperative FCDIM display while carrying out the indicated diagnostic method as follows: | | | |	**Yes** The system is operating correctly at this time. INFORM

Inoperative Display	Diagnostic Method	Expected Results
Audio system	Turn the audio system on, press the AM/FM button, and tune to several channels.	The FCDIM display updates to show the change in audio setting.
SYNC® system (if equipped)	Turn the audio system on, press the phone button, and observe the display.	The FCDIM display shows information relating to the phone.

- **Does the suspect display operate correctly based on the expected results?**

the customer on the operation of the FCDIM display.

No
For a warning message or indicator concern, REFER to Section 413-01 .

For all other display concerns, GO to V5 .

V5 CHECK FOR CORRECT FCDIM OPERATION	

• Ignition OFF.
• Disconnect the FCDIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the FCDIM connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FCDIM .
	REFER to Front Controls/Display Interface Module (FCDIM) in this section.
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test W: The Speed Sensitive Volume Does Not Operate Correctly

Normal Operation

The speed sensitive volume function adjusts the volume based on the Vehicle Speed Sensor (VSS) signal, which is received over the Controller Area Network (CAN) Other modules also receive this signal and should exhibit symptoms if the signal is lost.

This pinpoint test is intended to diagnose the following:

- Speed sensitive volume setting
- VSS signal concern
- Communication network concern
- ACM

PINPOINT TEST W: THE SPEED SENSITIVE VOLUME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
W1 CHECK THE SPEEDOMETER OPERATION	
• Drive the vehicle and observe the speedometer. • **Does the speedometer operate correctly?**	**Yes** GO to W2 .

	No REFER to Section 413-01 .
W2 CHECK THE SPEED SENSITIVE VOLUME SETTING	
• Turn the speed sensitive volume off. Refer to the Owner's Literature. • Operate the audio system in radio tuner (AM/FM) mode. • Drive the vehicle at various speeds and observe the speaker volume. • Set the speed sensitive volume to maximum compensation. Refer to the Owner's Literature. • Operate the audio system in radio tuner (AM/FM) mode. • Drive the vehicle at various speeds and observe the speaker volume. • **Does the volume remain constant with the speed sensitive volume turned off, and increase and decrease with vehicle speed with the speed sensitive volume set to maximum?**	**Yes** The system is operating correctly at this time. INSTRUCT the customer in the correct usage of the speed sensitive volume feature. **No** GO to W3 .
W3 CHECK FOR DTC U0155:00 SET IN THE FCDIM	
• Carry out the FCDIM self-test. • **Is DTC U0155:00 present?**	**Yes** GO to Pinpoint Test U . **No** GO to W4 .
W4 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test X: DTC U0184:00 Or DTC U0193:00

Normal Operation

Several audio system modules receive network messages from the Audio Control Module (ACM). These messages consist mainly of audio setting information.

As more than one module receives each of these messages, all modules receiving a particular message can exhibit a symptom if the message is missing.

- DTC U0184:00 (Lost Communication With Radio: No Sub Type Information) — set by the Accessory Protocol Interface Module (APIM) when network messages are missing from the ACM for greater than 5 seconds with the ignition in RUN.
- DTC U0193:00 (Lost Communication With "Digital Audio Control Module A": No Sub Type Information) — set by the Front Control/Display Interface Module (FCDIM) when network messages are missing from the ACM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- ACM

PINPOINT TEST X: DTC U0184:00 OR DTC U0193:00

Test Step	Result / Action to Take
X1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0184:00 or DTC U0193:00 set in any audio system module?**	**Yes** GO to X2 . **No** The system is operating correctly at this time. The DTC may have been set due an intermittent fault in the network wiring.
X2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	

• Carry out the self-test for the following modules:
  ▪ ACM
  ▪ FCDIM
  ▪ APIM (if equipped)
• **Are any low or high voltage DTCs recorded in any module?**
	Yes
	REFER to DTC Charts in this section.
	
	No
	GO to X3 .

X3 CHECK FOR DTC U0184:00 OR DTC U0193:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0184:00 or DTC U0193:00 set in more than one module?**	**Yes** GO to X4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, the system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
X4 CHECK FOR CORRECT ACM OPERATION	

• Ignition OFF.
• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and
	Yes
	INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. CLEAR all continuous DTCs. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0184 or DTC U0184:00.

determine if the concern is still present. • **Is the concern still present?**	

Pinpoint Test Y: The Audio System Does Not Operate Correctly From The Front Controls Interface Module (FCIM)

Normal Operation

The Front Controls Interface Module (FCIM) exchanges information with the Front Control/Display Interface Module (FCDIM) over the Local Interconnect Network (LIN). This information includes (among others) button press data and display data.

- DTC U1A00:00 (Private Communication Network: No Sub Type Information) — sets when the FCDIM does not receive information from the FCIM over the LIN for greater than 2 seconds. This does not necessarily indicate a fault in the LIN wiring, as a loss of power or ground to the FCIM can also cause a lack of communication.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- FCIM
- FCDIM

PINPOINT TEST Y: THE AUDIO SYSTEM DOES NOT OPERATE CORRECTLY FROM THE FCIM

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
Y1 CHECK THE FCDIM BUTTON PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: FCDIM DataLogger. • **NOTE:** The button PIDs begin with the prefix "BTN_" and end with the indicated button. For example, PID BTN_FM correlates with the FM button on the FCIM . • Monitor several of the FCDIM button PIDs. • **Do the PID states agree with the button presses?**	**Yes** GO to Y6 . **No** GO to Y2 .
Y2 CHECK FOR VOLTAGE TO THE FCIM	
• Ignition OFF. • Disconnect: FCIM C2402. • Ignition ON. • Measure the voltage between the FCIM C2402-8, circuit SBP07 (WH/RD), harness side and ground.	**Yes** GO to Y3 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0119578 • **Is the voltage greater than 10 volts?**	
Y3 CHECK THE FCIM GROUND CIRCUIT FOR CONTINUITY • Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the FCIM C2402-5, circuit GD115 (BK/GY), harness side and ground.  N0119579 • **Is the resistance less than 5 ohms?**	**Yes** GO to Y4 . **No** REPAIR the circuit. TEST the system for normal operation.
Y4 CHECK THE LIN CIRCUIT FOR A SHORT TO VOLTAGE • Disconnect: FCDIM C2123. • Measure the voltage between the FCIM C2402-7, circuit VDB21 (OG), harness side and ground.  N0119580 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to Y5 .
Y5 CHECK THE LIN CIRCUIT FOR AN OPEN OR SHORT TO GROUND • Measure the resistance between the FCIM C2402-7, circuit VDB21 (OG), harness side and the FCDIM C2123-8, circuit	**Yes** INSTALL a new FCIM .

VDB21 (OG), harness side; and between the FCIM C2402-7, circuit VDB21 (OG), harness side and ground.  N0119581 • **Is the resistance less than 5 ohms between the FCIM and the FCDIM, and greater than 10,000 ohms between the FCIM and ground?**	REFER to Front Controls Interface Module (FCIM) in this section . TEST the system for normal operation. GO to Y6 . **No** REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation.

Y6 CHECK FOR CORRECT FCDIM OPERATION
• Connect: All Disconnected Connectors.
• Disconnect the FCDIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the FCDIM connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FCDIM . REFER to Front Controls/Display Interface Module (FCDIM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Z: DTC U0100:00

Normal Operation

The Accessory Protocol Interface Module (APIM) receives network messages from the PCM via the High Speed Controller Area Network (HS-CAN). These messages include the odometer reading and the fuel level.

As other modules outside of the audio system also receive these messages, all modules receiving a particular message can exhibit a symptom if the message is missing.

- DTC U0100:00 (Lost Communication With ECM /PCM "A": No Sub Type Information) — set by the APIM when it is missing messages from the PCM over the HS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- PCM

PINPOINT TEST Z: DTC U0100:00

Test Step	Result / Action to Take
Z1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0100 or DTC U0100:00 set in any modules?**	**Yes** GO to Z2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
Z2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	

• Carry out the self-test for the following modules:
  ▪ APIM
  ▪ PCM
  ▪ Instrument Panel Cluster (IPC)
• **Are any low or high voltage DTCs recorded in any module?**
	Yes
	For the APIM , REFER to DTC Charts in this section.
	
	For all other modules, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
	
	No
	GO to Z3 .

Z3 CHECK FOR DTC U0100 OR DTC U0100:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0100 or DTC U0100:00 set in more than one module?**	**Yes** GO to Z4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, the system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
Z4 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . CLEAR all continuous DTCs. REPEAT the APIM self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the APIM self-test.

Pinpoint Test AA: DTC U0151:00

Normal Operation

The Accessory Protocol Interface Module (APIM) receives the emergency call notification message from the Restraints Control Module (RCM) via the High Speed Controller Area Network (HS-CAN). The APIM uses this message to activate the emergency call system.

As other modules outside of the audio system also receive this message, all modules receiving it can exhibit a symptom if the message is missing.

- DTC U0151:00 (Lost Communication With Restraints Control Module: No Sub Type Information) — set by the APIM when it is missing the air bag deployment notification message from the RCM over the HS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Restraints system concern

PINPOINT TEST AA: DTC U0151:00

Test Step	Result / Action to Take
AA1 CHECK FOR LOST COMMUNICATION DTCs • Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0151 or DTC U0151:00 set in any modules?**	**Yes** GO to AA2. **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.

AA2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs
• Carry out the self-test for the following modules:
  ▪ APIM
  ▪ PCM
  ▪ RCM
  ▪ Instrument Panel Cluster (IPC)
• **Are any low or high voltage DTCs recorded in any module?**
	Yes
	For the APIM, REFER to DTC Charts in this section.
	
	For all other modules, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.
	
	No
	GO to AA3.

AA3 CHECK FOR DTC U0151 OR DTC U0151:00 SET IN MULTIPLE MODULES • Review the recorded results from the self-test. • **Is DTC U0151 or DTC U0151:00 set in more than one module?**	**Yes** GO to AA4. **No** If there is an observable audio system symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is an observable restraints system symptom, REFER to Section 501-20B to diagnose the symptom.

	If there is no observable symptom, the system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AA4 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RCM connectors and make sure they seat correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new RCM. REFER to Section 501-20B. CLEAR all continuous DTCs. REPEAT the APIM self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the APIM self-test.

Pinpoint Test AB: DTC U016A:00

- DTC U016A:00 (Lost Communication With Global Positioning System Module: No Sub Type Information) — set by the Accessory Protocol Interface Module (APIM) when it is missing network messages from the Global Positioning System Module (GPSM) over the Medium Speed Controller Area Network (MS-CAN) for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- GPSM
- APIM

PINPOINT TEST AB: DTC U016A:00

Test Step	Result / Action to Take
AB1 CHECK THE APIM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Ignition ON. • Clear the APIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve the APIM self-test. • **Is DTC U016A:00 still present?**	**Yes** GO to AB2. **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AB2 VERIFY THE CUSTOMER CONCERN	
• Operate the audio system in various modes (radio tuner, SYNC®, etc.). • Observe the compass display for normal operation. • **Is an observable symptom present?**	**Yes** GO to AB3. **No** The system is operating correctly at this

	time. The DTC may have been set due to an intermittent fault in the network wiring. CHECK the MS-CAN wiring between the APIM and the GPSM for an intermittent fault.
AB3 CHECK THE COMMUNICATION NETWORK • Carry out the network test using the scan tool. • **Does the GPSM pass the network test?**	**Yes** GO to AB4. **No** REFER to The GPSM Does Not Respond To The Scan Tool in Section 418-00.

AB4 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs
• Carry out the self-test for the following modules:
  ▪ APIM
  ▪ GPSM
• **Is DTC U3003:16 or DTC U3003:17 recorded in either module?**
	Yes
	REFER to DTC Charts in this section.
	
	No
	INSTALL a new GPSM. REFER to Global Positioning System Module (GPSM) in this section. CLEAR the APIM DTCs. REPEAT the APIM self-test.
	
	If DTC U016A:00 is still present, INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.

Pinpoint Test AC: DTC U3003:16 (Accessory Protocol Interface Module (APIM))

Refer to Wiring Diagrams Cell 130, Audio System for schematic and connector information.

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — set by the Accessory Protocol Interface Module (APIM) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation, or for more than 250 ms during the self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- APIM

PINPOINT TEST AC: DTC U3003:16 (APIM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01.

Test Step	Result / Action to Take
AC1 RECHECK THE APIM DTCs	

• Clear the APIM DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Repeat the APIM self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to AC2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AC2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Are any low voltage DTCs set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AC3 .
AC3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AC4 . **No** REFER to Section 414-01 .
AC4 CHECK THE APIM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: APIM C2383. • Ignition ON. • Measure the voltage between the APIM C2383-1, circuit SBP10 (YE/RD), harness side and ground.  N0077601 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AC5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
AC5 CHECK THE APIM GROUND CIRCUIT FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the APIM C2383-37, circuit GD111 (BK/BU), harness side and ground; and between the APIM C2383-38, circuit GD111 (BK/BU), harness side and ground.	**Yes** GO to AC6 . **No** REPAIR the circuit in question for high resistance. CLEAR the DTCs. REPEAT the self-test.

 N0077602 • **Are the resistances less than 5 ohms?**	
AC6 CHECK FOR CORRECT APIM OPERATION	**Yes** INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Connect: Negative Battery Cable.
• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the APIM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**	

Pinpoint Test AD: DTC U3003:17 (Accessory Protocol Interface Module (APIM))

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — set by the Accessory Protocol Interface Module (APIM) when the supply voltage is greater than 15.8 volts for greater than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- APIM

PINPOINT TEST AD: DTC U3003:17 (APIM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AD1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve the continuous memory DTCs	**Yes** REFER to Section 414-01 to diagnose an

from all modules. • **Are high voltage DTCs (e.g., B1317, U3003:17, P0563) set in more than one module?**	overcharging. **No** GO to AD2.
AD2 CHECK THE BATTERY VOLTAGE • Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00. **No** GO to AD3.
AD3 RECHECK FOR DTC U3003:17 • Ignition OFF. • Ignition ON. • Clear the APIM DTCs. • Repeat the APIM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new APIM. REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test AE: DTC U3003:16 (Front Control/Display Interface Module (FCDIM))

Refer to Wiring Diagrams Cell 130, Audio System for schematic and connector information.

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — set by the Front Control/Display Interface Module (FCDIM) when the supply voltage falls below 9 volts for greater than 1 second during normal operation.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- FDIM

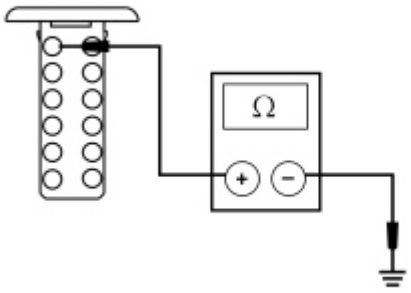
PINPOINT TEST AE: DTC U3003:16 (FCDIM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01.

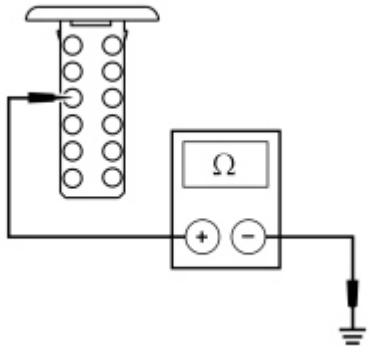
Test Step	Result / Action to Take
AE1 RECHECK THE FCDIM DTCs • Clear the FCDIM DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Repeat the FCDIM self-test.	**Yes** GO to AE2. **No** The system is operating

• **Is DTC U3003:16 still present?**	correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AE2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Are any low voltage DTCs set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AE3 .
AE3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AE4 . **No** REFER to Section 414-01 .
AE4 CHECK THE TCIL VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: FCDIM C2123. • Ignition ON. • Measure the voltage between the FCDIM C2123-1, circuit SBP07 (WH/RD), harness side and ground.  N0115771 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AE5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
AE5 CHECK THE FCDIM GROUND CIRCUIT FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • For vehicles built up to 1/14/2011, measure the resistance between the FCDIM C2123-7, circuit GD115 (BK/GY), harness side and ground.	**Yes** GO to AE6 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.



N0117689

- For vehicles built after 1/14/2011, measure the resistance between the FCDIM C2123-9, circuit GD115 (BK/GY), harness side and ground.



N0133863

- **Is the resistance less than 5 ohms?**

AE6 CHECK FOR CORRECT FCDIM OPERATION	

• Connect: Negative Battery Cable.
• Disconnect the FCDIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the FCDIM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FCDIM . REFER to Front Controls/Display Interface Module (FCDIM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AF: DTC U3003:17 (Front Control/Display Interface Module (FCDIM))

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — set by the Front Control/Display Interface Module (FCDIM) when the supply voltage is greater than 16 volts for greater than 1 second during normal operation.

This pinpoint test is intended to diagnose the following:

- Charging system concern

- FCDIM

PINPOINT TEST AF: DTC U3003:17 (FCDIM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AF1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve the continuous memory DTCs from all modules. • **Are high voltage DTCs (e.g., B1317, U3003:17, P0563) set in more than one module?**	**Yes** REFER to Section 414-01 to diagnose an overcharging. **No** GO to AF2 .
AF2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 . **No** GO to AF3 .
AF3 RECHECK FOR DTC U3003:17	
• Ignition OFF. • Ignition ON. • Clear the FCDIM DTCs. • Repeat the FCDIM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new FCDIM . REFER to Front Controls/Display Interface Module (FCDIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test AG: DTC U3003:16 (Global Positioning System Module (GPSM))

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — set by the Global Positioning System Module (GPSM) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation or for greater than 250 milliseconds during the self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminal or connectors
- High circuit resistance
- GPSM

PINPOINT TEST AG: DTC U3003:16 (GPSM)

NOTICE: **Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AG1 RECHECK THE GPSM DTCs	
• Clear the GPSM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 15 seconds. • Repeat the GPSM self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to AG2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AG2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Are any low voltage DTCs set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AG3 .
AG3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AG4 . **No** REFER to Section 414-01 .
AG4 CHECK THE GPSM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: GPSM C2398. • Measure the voltage between the GPSM C2398-1, circuit SBP16 (VT/RD) for vehicles built up to 1/14/2011, or circuit SBP10 (YE/RD) for vehicles built after 1/14/2011, harness side and ground.  N0094349 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AG5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
AG5 CHECK THE GPSM GROUND CIRCUIT FOR CONTINUITY	

• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the GPSM C2398-6, circuit GD111 (BK/BU), harness side and ground.  N0094350 • **Is the resistance less than 5 ohms?**	**Yes** GO to AG6 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
AG6 CHECK FOR CORRECT GPSM OPERATION	

• Disconnect the GPSM connector.
• Connect: Negative Battery Cable.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the GPSM connector and make sure it seats correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new GPSM . REFER to Global Positioning System Module (GPSM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AH: DTC U3003:17 (Global Positioning System Module (GPSM))

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — set by the Global Positioning System Module (GPSM) when the supply voltage is greater than 15.8 volts for greater than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- GPSM

PINPOINT TEST AH: DTC U3003:17 (GPSM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AH1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve the continuous memory DTCs from all modules. • **Are high voltage DTCs (e.g., B1317, U3003:17, P0563) set in more than one module?**	**Yes** REFER to Section 414-01 to diagnose an overcharging. **No** GO to AH2 .
AH2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 . **No** GO to AH3 .
AH3 RECHECK FOR DTC U3003:17	
• Ignition OFF. • Ignition ON. • Clear the GPSM DTCs. • Repeat the GPSM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new GPSM . REFER to Global Positioning System Module (GPSM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Accessory Protocol Interface Module (APIM) Software Level Check

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10 or equivalent

NOTE: This procedure applies to checking the Accessory Protocol Interface Module (APIM) software level. To program the APIM , refer to Accessory Protocol Interface Module (APIM) Programming in Section 418-01 .

1. Turn the Audio Control Module (ACM) on.

2. Connect the scan tool to the Data Link Connector (DLC).

3. Connect one end of the Universal Serial Bus (USB) male-A to male-A cable to the scan tool.

4. Connect the other end of the USB male-A to male-A cable to the vehicle USB port.

5. From the technician service publication website, run On-Line Automotive Service Information System (OASIS) using Quick Start or by manually entering the Vehicle Identification Number (VIN).

6. From the OASIS tab, select the "Sync/APIM" bullet.

7. Select the "Read APIM" button to verify the current APIM software level.
   - The display shows both the Vehicle Interface Processor (VIP) and Consumer Interface Processor (CIP) software levels.

8. The scan tool displays the following information:
   - Last Recorded State — Hardware
     - VIN : vehicle identification number associated with the current APIM
     - Installed date: date the APIM was installed
     - Radio: currently identified ACM in the vehicle
     - HW Part No.: APIM hardware part number
     - Un-installed date: date (if any) the APIM was uninstalled
     - S/N: APIM serial number
   - Last Recorded State — Software
     - Date/Time: date and time of last recorded software installation
     - VIP : VIP software that was installed at that time

        - CIP : CIP software that was installed at that time
        - Description: a description of the content of the software revision
    - History — Software
        - Date/Time: date and time of any recorded software installation
        - VIP : VIP software that was installed at that time
        - CIP : CIP software that was installed at that time
        - Description: a description of the content of the software revision
    - Available Software for Programming
        - Select: allows the software package to be selected
        - Lineage: the original software release, if the software available is a revision
        - VIP : VIP software level that is available with the selection
        - CIP : CIP software level that is available with the selection
        - Description: a description of the content of the software revision

9. Click a CIP software level to view the device compatibility list associated with the CIP software level, if desired.

10. To exit the APIM software level check, disconnect the scan tool from the DLC and the USB port, or exit the OASIS screen.

Satellite Radio Receiver Electronic Serial Number (ESN) Retrieval

Satellite Radio Electronic Serial Number (ESN) Retrieval

NOTE: If the SDARS is inoperable the Electronic Serial Number (ESN) may be obtained from a label affixed to the chassis.

1. Operate the audio system in satellite radio mode.

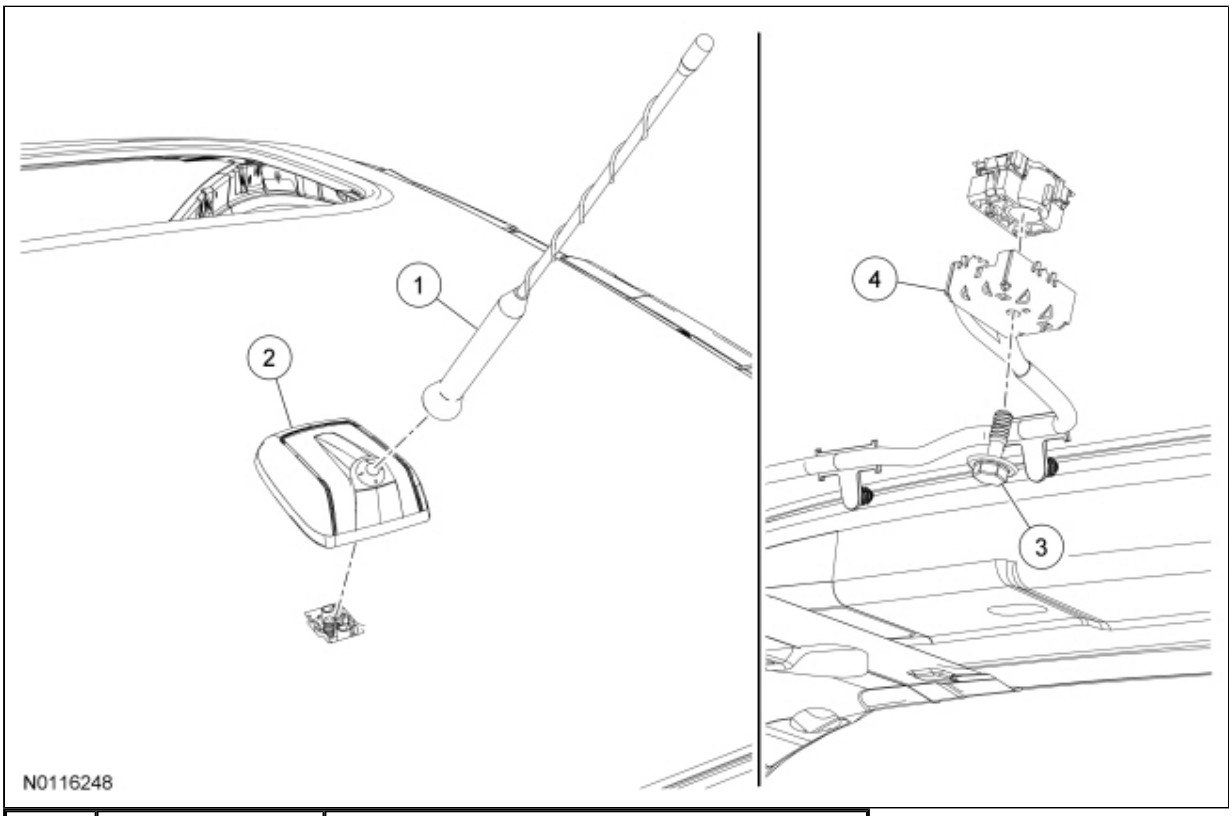
2. Depending on vehicle configuration, press and hold the AUX button and preset button 1 or the SIRIUS button and preset button 1, simultaneously.
   - The Satellite Digital Audio Receiver System (SDARS) module Electronic Serial Number (ESN) displays on the screen.

3. Record the SDARS module ESN .

4. Turn the audio system off.

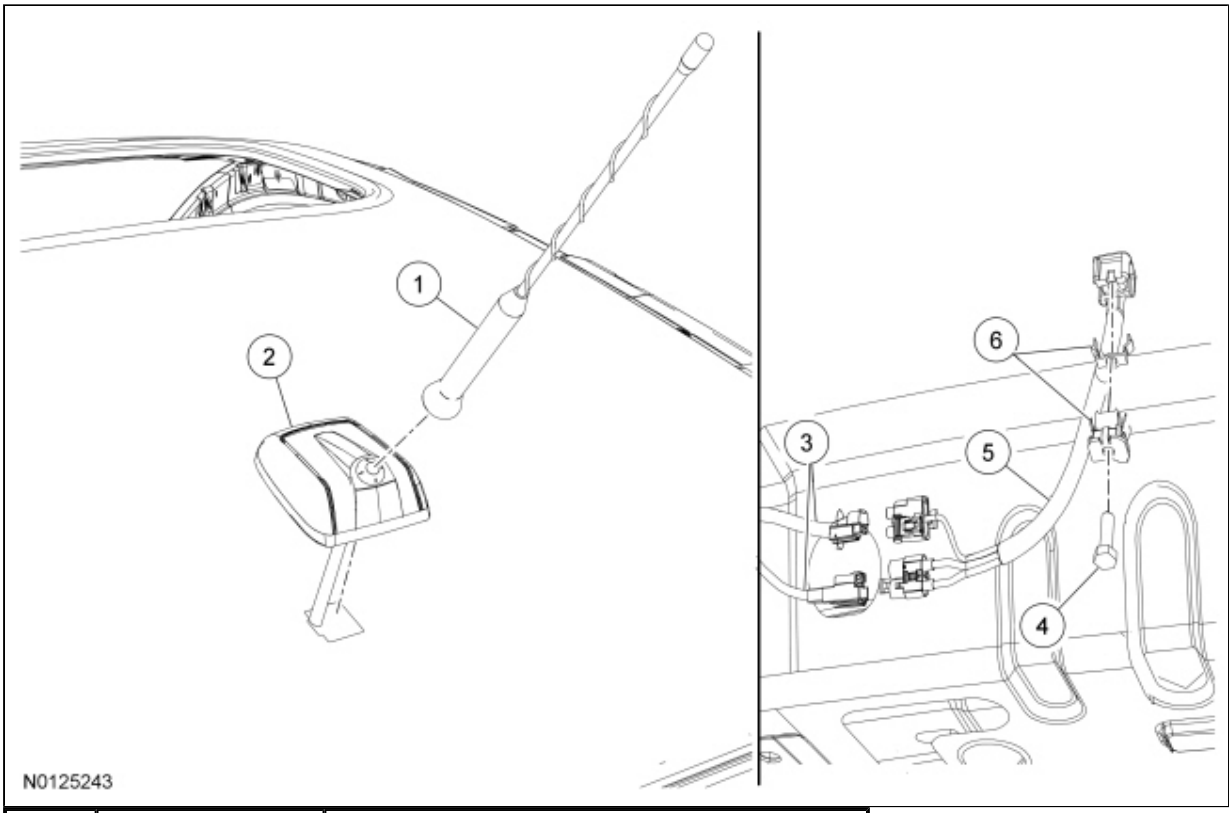
Antenna

Early Build



Item	Part Number	Description
1	18813	Antenna mast
2	18936	Antenna
3	—	Antenna cable bolt (part of 18812)
4	18812	Antenna cable

Late Build



Item	Part Number	Description
1	18813	Antenna mast
2	18936	Antenna
3	18812	Antenna cable
4	—	Antenna cable bolt (part of 18936)
5	—	Antenna pigtail (part of 18936)
6	—	Antenna retainers (part of 18936)

Removal and Installation

All

1. Remove the headliner. For additional information, refer to Section 501-05 .

Early build

2. Remove the bolt from the antenna base and remove the antenna cable connector from the antenna base.
   - To install, tighten to 9Nm (80 lb-in).

Late build

3. Disconnect the antenna cable electrical connectors. Remove the bolt from the antenna base and remove the antenna base retainers.
   - To install, tighten to 9Nm (80 lb-in).

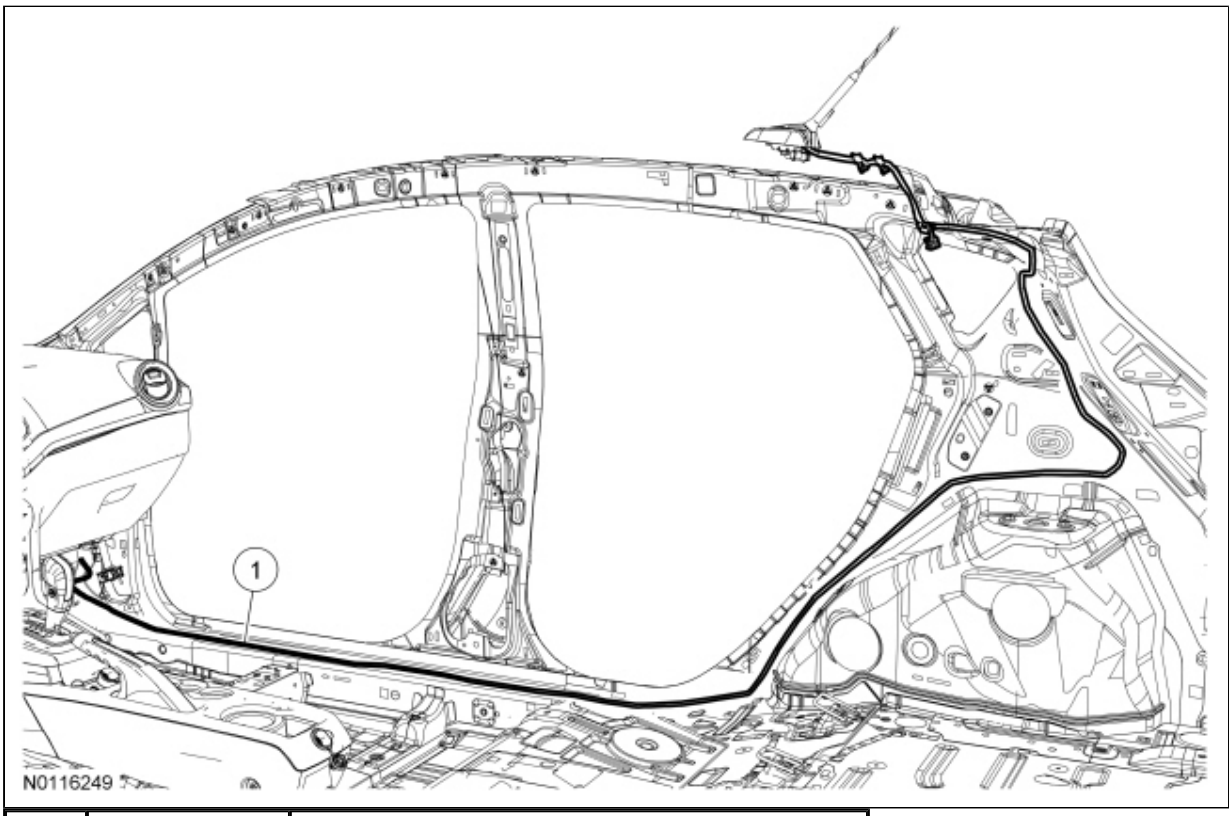
All

4. Remove the satellite radio antenna from the top of the roof.

5. To install, reverse the removal procedure.

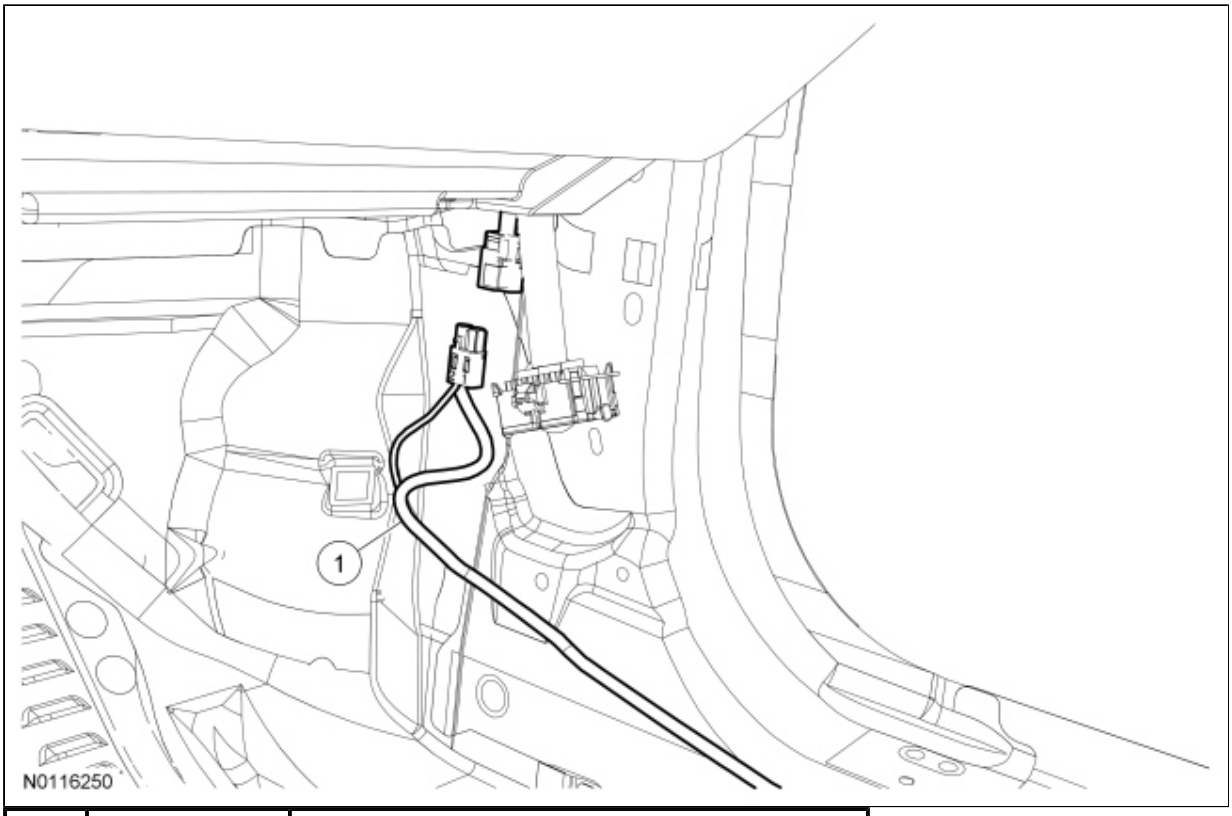
Antenna Cable — AM/FM/Satellite Radio

Cable Routing — Rear



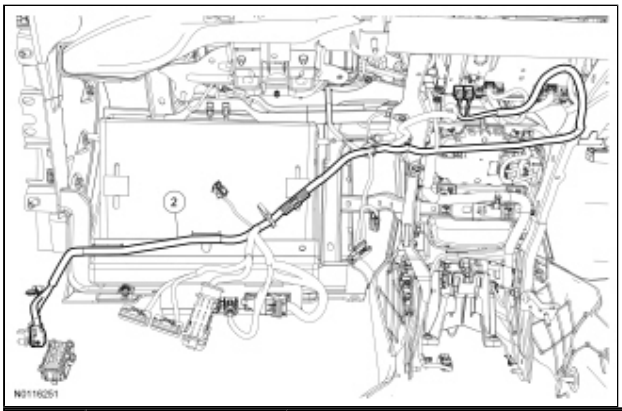
Item	Part Number	Description
1	18812	AM/FM/Satellite radio rear antenna cable

Cable Connection



Item	Part Number	Description
1	18812	AM/FM/Satellite radio rear antenna cable

Cable Routing — Front



Item	Part Number	Description
2	18812	AM/FM/Satellite radio front antenna cable

Removal

NOTE: The AM/FM/Satellite radio antenna cables are part of the vehicle wiring harness. Because the cables cannot be removed from the harness, this procedure applies to replacement of the cables only.

Front cable

1. Remove the Audio Control Module (ACM) and disconnect the AM/FM/Satellite radio antenna cable connection(s). For additional information, refer to Audio Control Module (ACM) in this section.

2. Remove the glove compartment. For additional information, refer to Section 501-12 .

3. Remove the right lower cowl side trim panel. For additional information, refer to Section 501-05 .

4. Disconnect the AM/FM/Satellite radio front antenna cable in-line connection(s) at the lower right side of the cowl.

Rear cable

5. Remove the headliner, C-pillar upper trim panel, C-pillar lower trim panel, rear scuff plate, B-pillar lower trim panel, front scuff plate and the RH side cowl side trim panel. For additional information, refer to Section 501-05 .

6. Remove the AM/FM/Satellite radio antenna cable bolt, and disconnect the AM/FM/Satellite radio rear antenna cable from the antenna base.

7. Disconnect the AM/FM/Satellite radio rear antenna cable in-line connection(s) at the lower right side of the cowl.

Installation

Front cable

1. Overlay the new AM/FM/Satellite radio front antenna cable on the vehicle wiring harness, following the routing of the original cable.

2. Secure the new AM/FM/Satellite radio front antenna cable to the wiring harness with tape or zip ties as necessary.

3. Connect the AM/FM/Satellite radio front antenna cable in-line connection(s) at the lower right side of the cowl.

4. Install the right lower cowl side trim panel. For additional information, refer to Section 501-05 .

5. Install the glove compartment. For additional information, refer to Section 501-12 .

6. Install the Audio Control Module (ACM) and connect the AM/FM/Satellite radio front antenna cable connection(s). For additional information, refer to Audio Control Module (ACM) in this section.

Rear cable

7. Overlay the new AM/FM/Satellite radio rear antenna cable on the vehicle wiring harness, following the routing of the original cable.

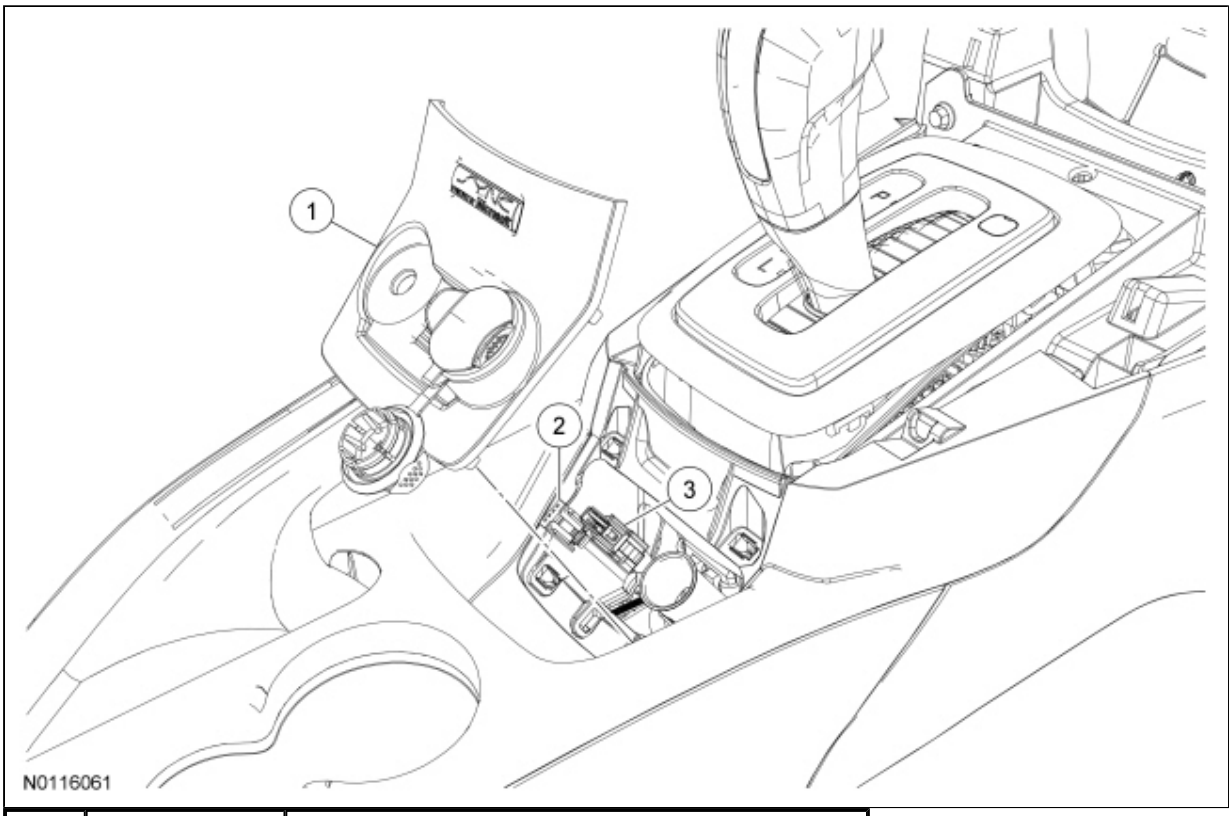
8. Secure the new AM/FM/Satellite radio rear antenna cable to the wiring harness with tape or zip ties as necessary.

9. Connect the AM/FM/Satellite radio rear antenna cable to the AM/FM/Satellite radio antenna cable base and install the antenna cable bolt.
    - Tighten to 6 Nm (53 lb-in).

10. Connect the AM/FM/Satellite radio rear antenna cable in-line connection(s) at the lower right side of the cowl and at the right side quarter trim panel.

11. Install the headliner, C-pillar upper trim panel, C-pillar lower trim panel, rear scuff plate, B-pillar lower trim panel, front scuff plate and the RH side cowl side trim panel. For additional information, refer to Section 501-05 .

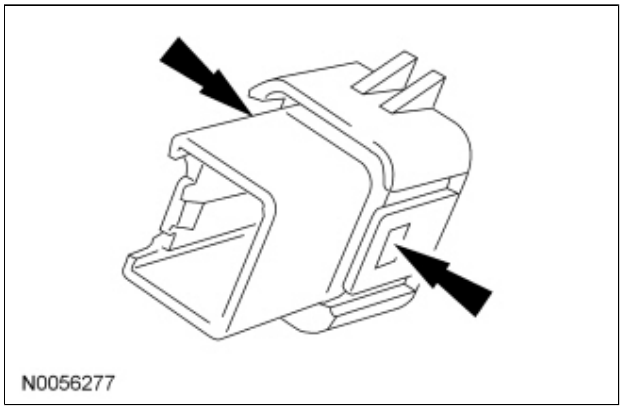
Audio Input Jack



Item	Part Number	Description
1	19C149	Console bezel
2	19A164	Audio input jack
3	14D202	Universal Serial Bus (USB) port and cable

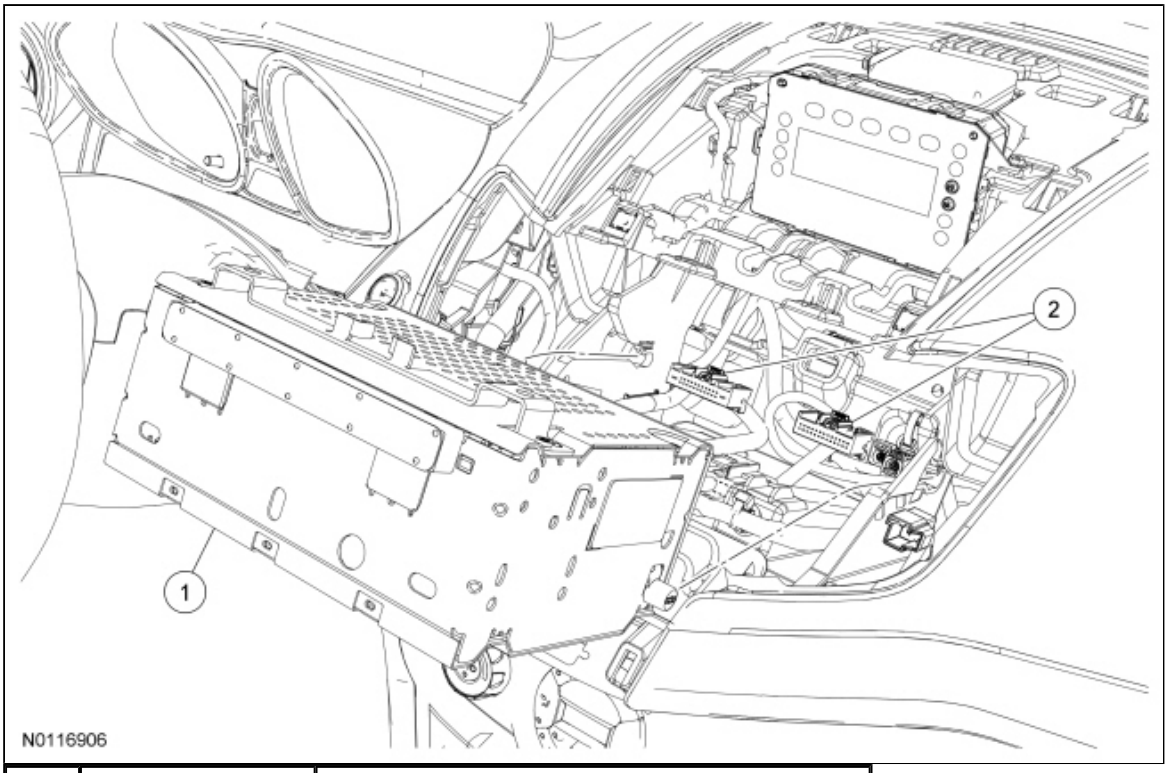
Removal and Installation

1. Remove the instrument panel lower finish panel. For additional information, refer to Section 501-12 .
2. With a non-marring tool, lift the corners of the console bezel upward to release the retaining clips.
3. Disconnect the electrical connector from the audio input jack.
4. Release the tabs and remove the audio input jack from the bezel.



5. To install, reverse the removal procedure.
    - Make sure to align the finish panel retaining clips to the adjacent retaining clip holes.

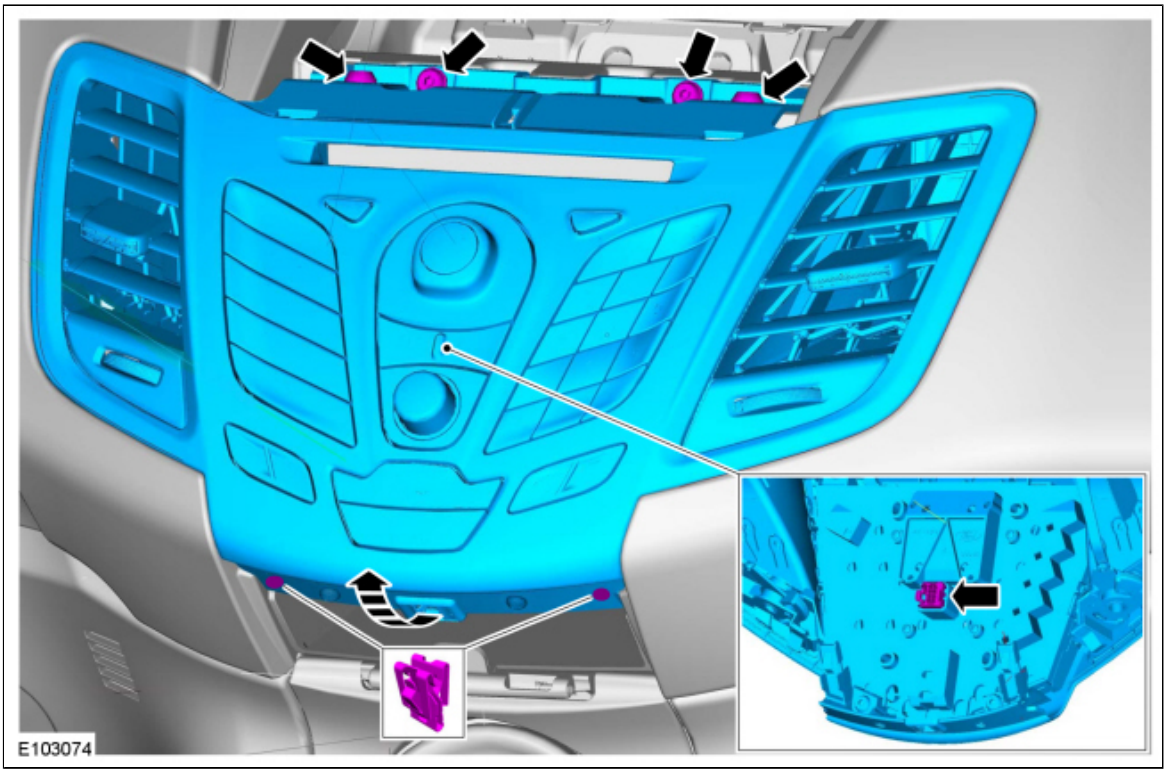
Audio Control Module (ACM)



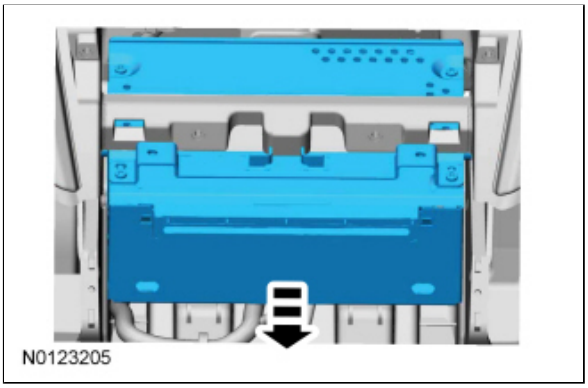
Item	Part Number	Description
1	18K810 / 18C869	ACM
2	—	ACM electrical connectors (part of 14K024)

Removal and Installation

1. Remove the instrument panel upper finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 Front Controls Interface Module (FCIM) finish panel screws and rotate upwards from the bottom to release the 3 clips. Remove the Front Controls Interface Module (FCIM) finish panel.
   - Disconnect the electrical connector.

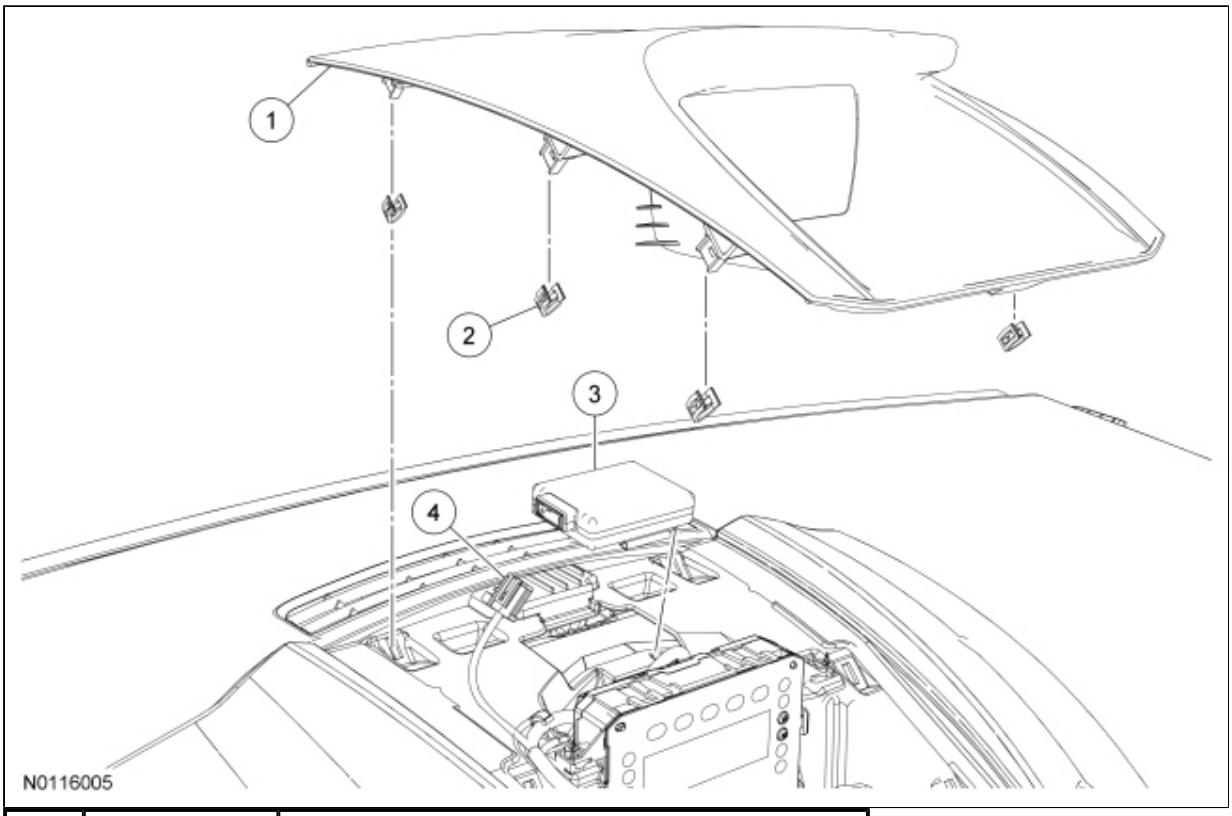


3. Remove the ACM .
   - Disconnect the ACM electrical connectors.



4. To install, reverse the removal procedure.

Global Positioning System Module (GPSM)

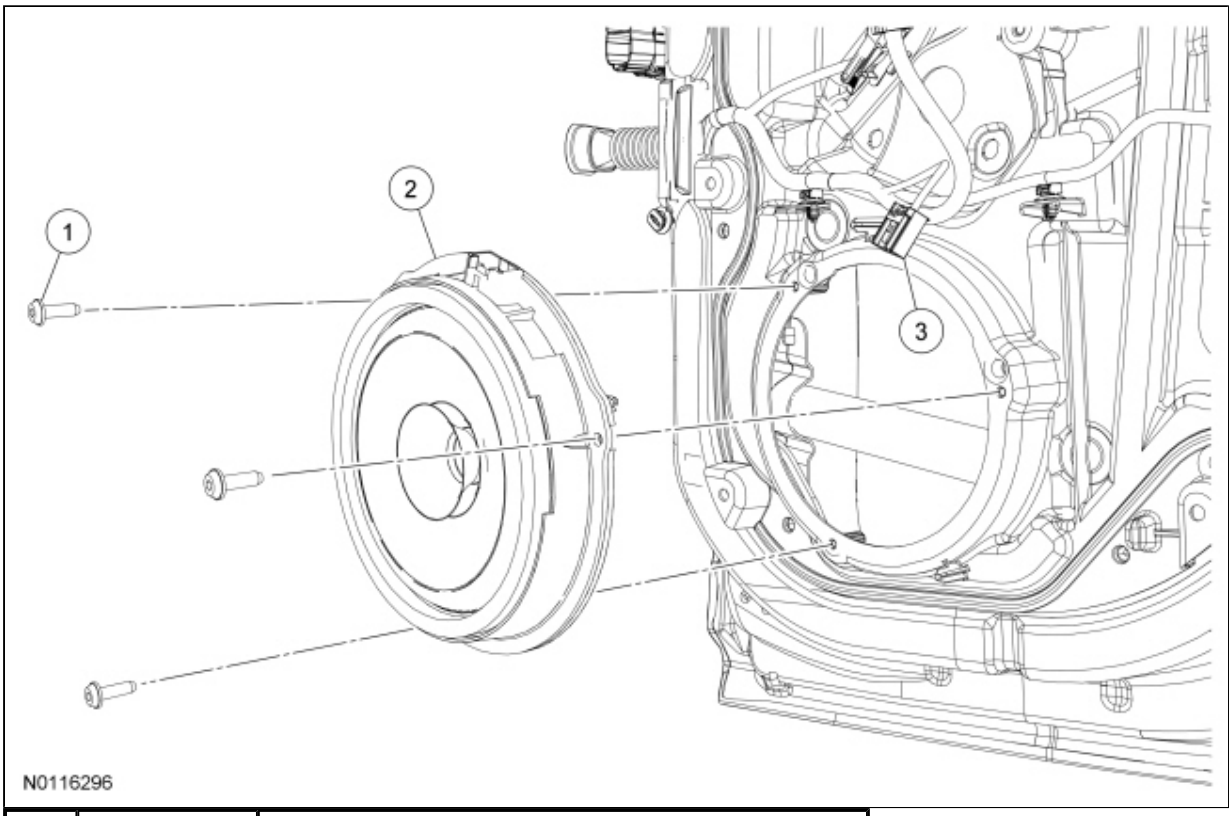


Item	Part Number	Description
1	042A82	Upper finish panel
2	W714972	Upper finish panel clips (6 required)
3	10E893	Global Positioning System Module (GPSM)
4	—	GPSM electrical connector (part of 14K024)

Removal and Installation

1. Remove the instrument panel upper finish panel. For additional information, refer to Section 501-12 .
2. Slide the GPSM and bracket rearward and remove.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

Speaker — Rear Door

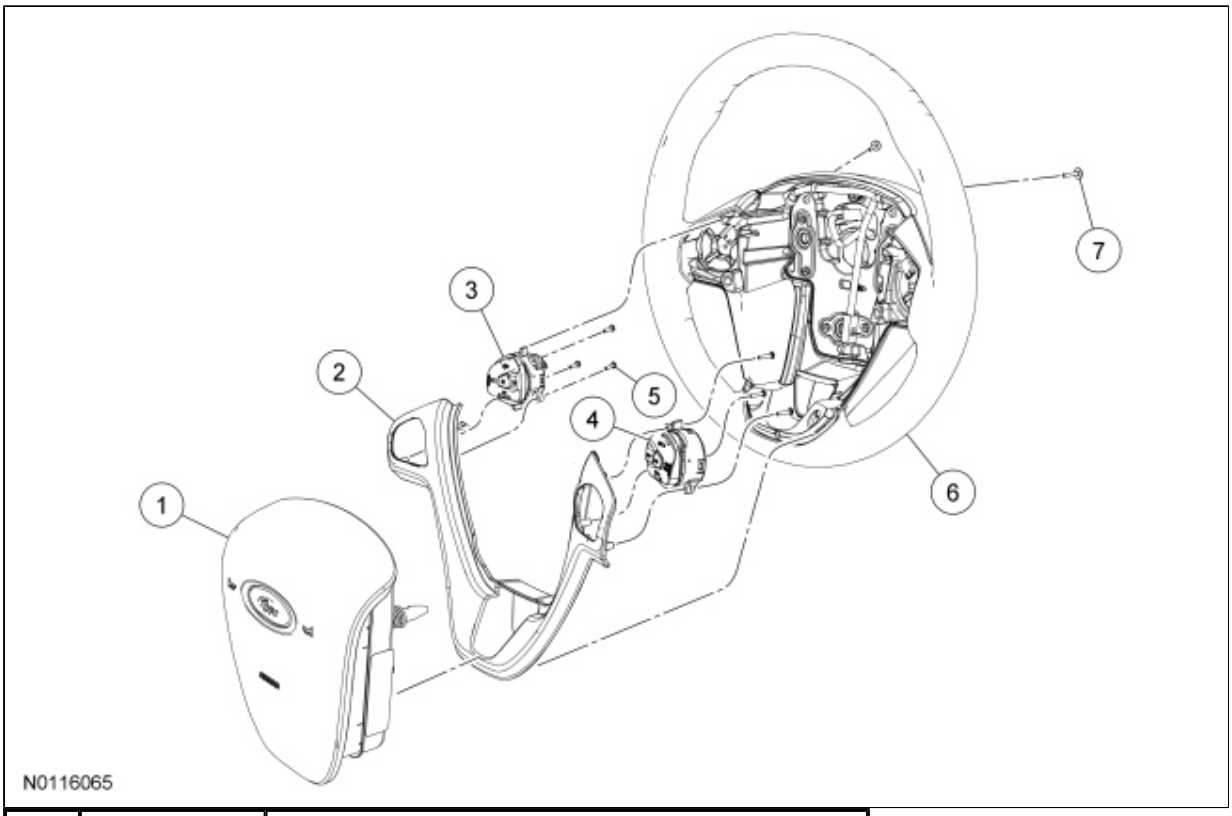


Item	Part Number	Description
1	W506964-S	Speaker screws (3 required)
2	18808C	Door speaker
3	—	Door speaker electrical connector (part of 14631)

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Remove the 3 screws from the rear door speaker and remove the speaker.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

Steering Wheel Controls

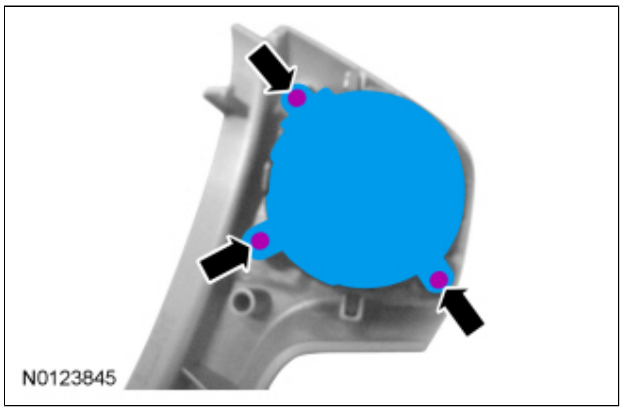


Item	Part Number	Description
1	043B13	Driver air bag module
2	—	Steering wheel finish panel
3	9C888	Audio control switch
4	9C888	Cruise control switch
5	—	Switch screws (3 required)
6	3600	Steering wheel
7	—	Steering wheel finish panel screws (2 required)

Removal and Installation

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .
2. Remove the 2 steering wheel finish panel screws on the back of the steering wheel and remove the steering wheel finish panel.

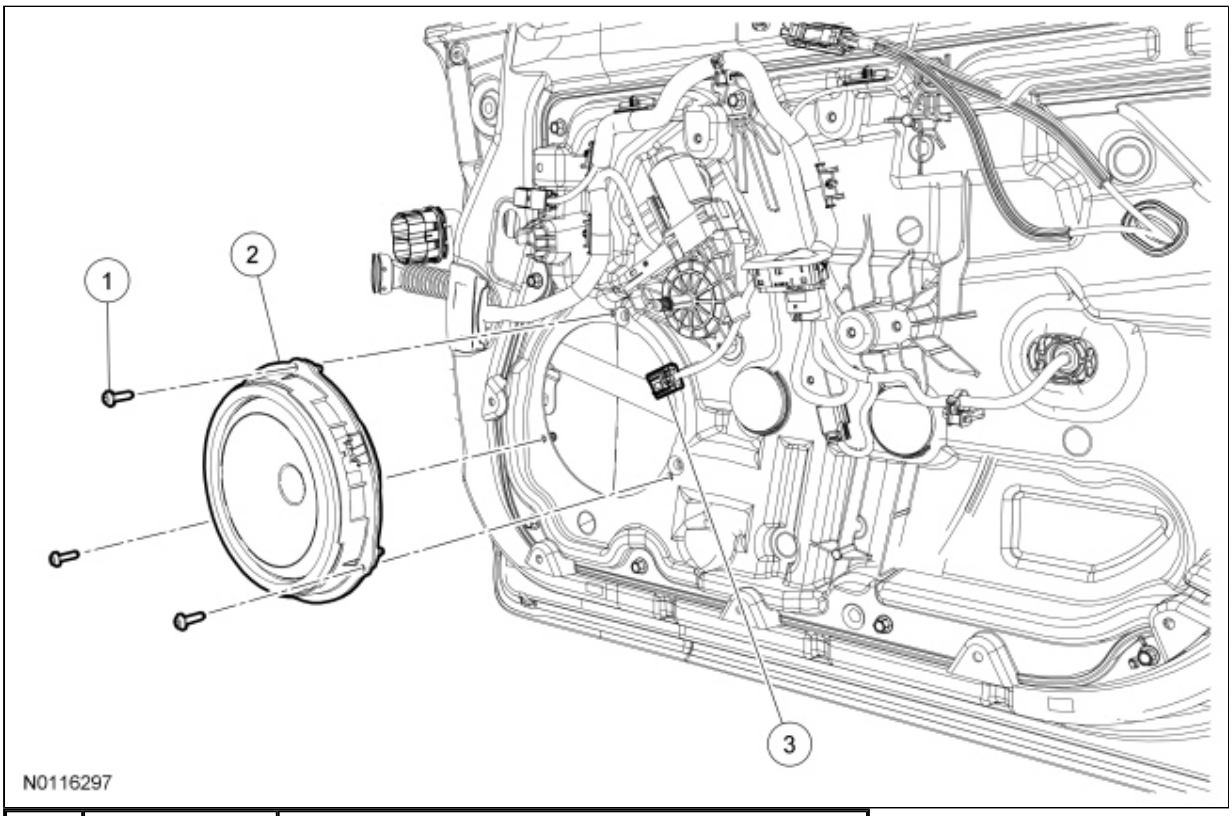
3. Remove the 3 screws on the steering wheel control switch and remove the switch from the steering wheel finish panel.
    - Disconnect the electrical connector.



4. To install, reverse the removal procedure.

Speaker — Front Door

Speaker — subwoofer

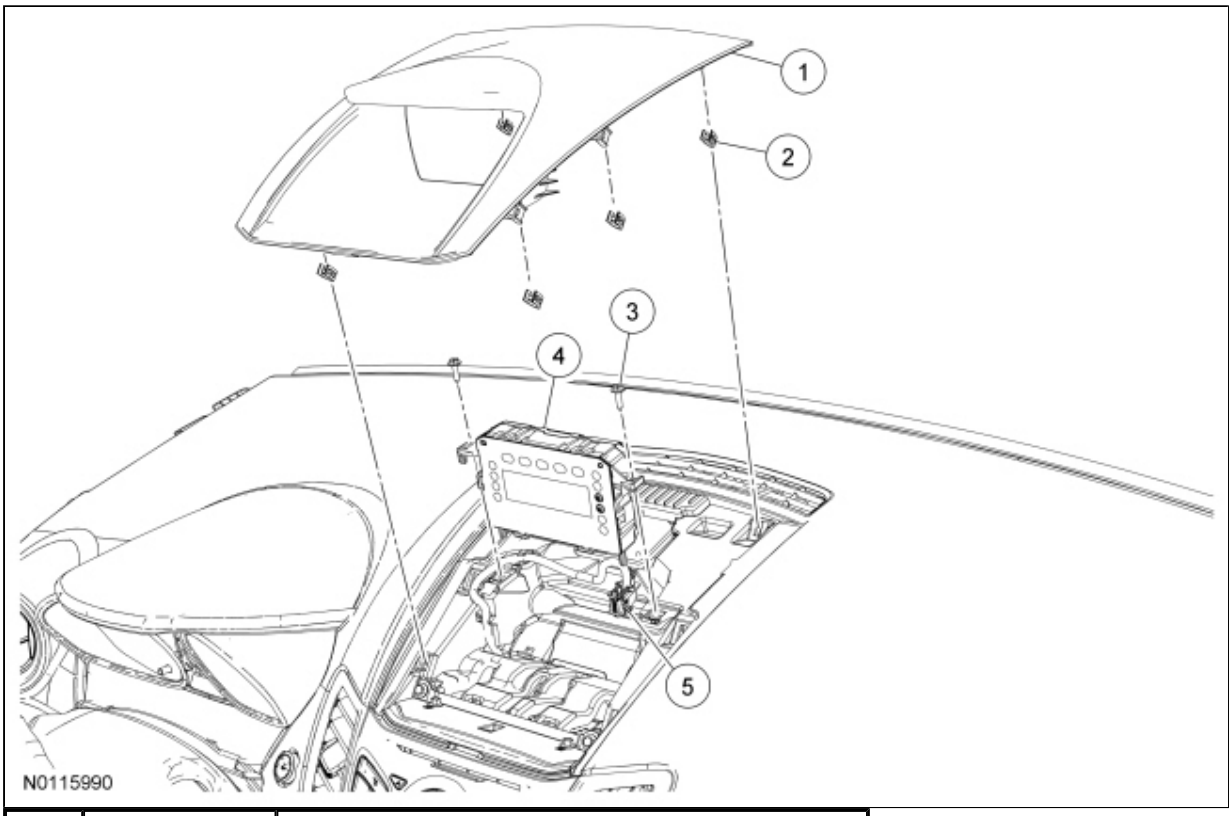


Item	Part Number	Description
1	W506964-S	Speaker screws (3 required)
2	18808A	Speaker
3	—	Speaker electrical connector (part of 14631)

Removal and Installation

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the 3 speakers screws and remove the speaker.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

Front Controls/Display Interface Module (FCDIM)

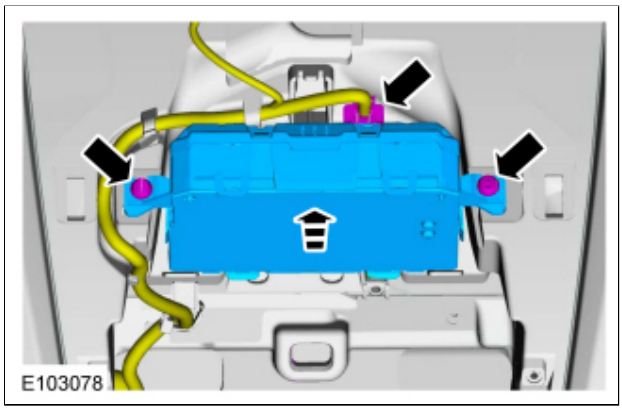


Item	Part Number	Description
1	042A82	Upper finish panel
2	W714972	Upper finish panel clips (6 required)
3	N806272	FCDIM screws (2 required)
4	10D885	FCDIM
5	—	FCDIM electrical connector (part of 14K024)

Removal and Installation

1. Remove the instrument panel upper finish panel. For additional information, refer to Section 501-12 .

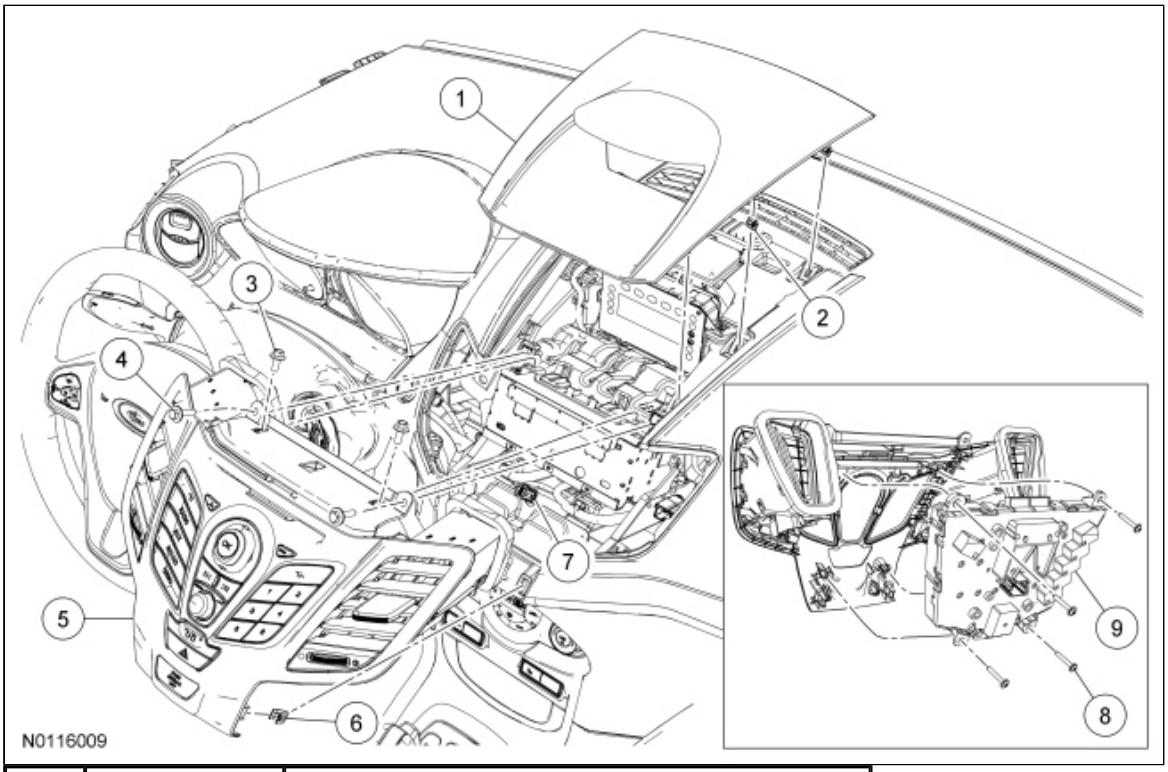
2. Remove the two screws and remove the FCDIM .
   - Disconnect the FCDIM electrical connectors.



3. To install, reverse the removal procedure.

Front Controls Interface Module (FCIM)

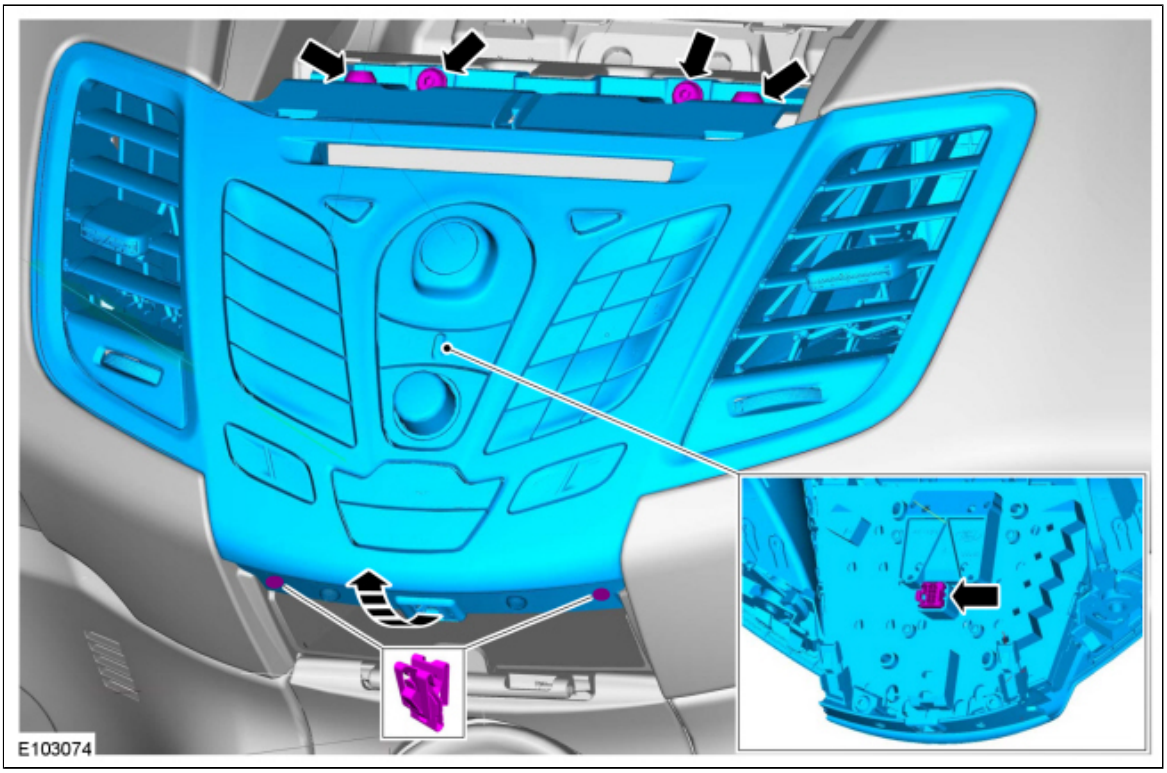
Front Controls Interface Module (FCIM)



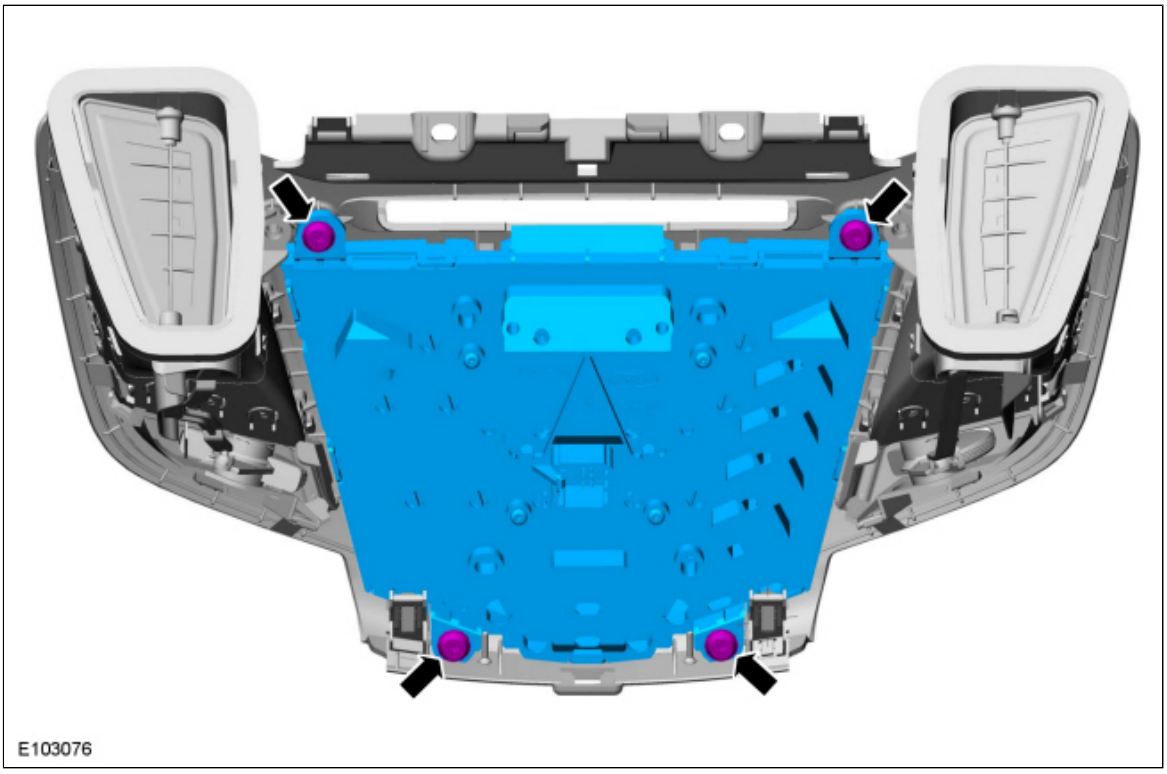
Item	Part Number	Description
1	042A82	Upper finish panel
2	W714972	Upper finish panel clips (6 required)
3	W505142	FCIM finish panel screws (2 required)
4	W707628	FCIM finish panel screws (2 required)
5	18A802	Finish panel
6	—	Finish panel clip (2 required)
7	18812	FCIM electrical connector (part of 14K024)
8	W506962	FCIM screws (4 required)
9	18842	FCIM

Removal and Installation

1. Remove the upper finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 Front Controls Interface Module (FCIM) finish panel screws and rotate upwards from the bottom to release the 3 clips. Remove the FCIM finish panel.
   - Disconnect the electrical connector and release the Passenger Air Bag Deactivation (PAD) indicator from the FCIM finish panel.

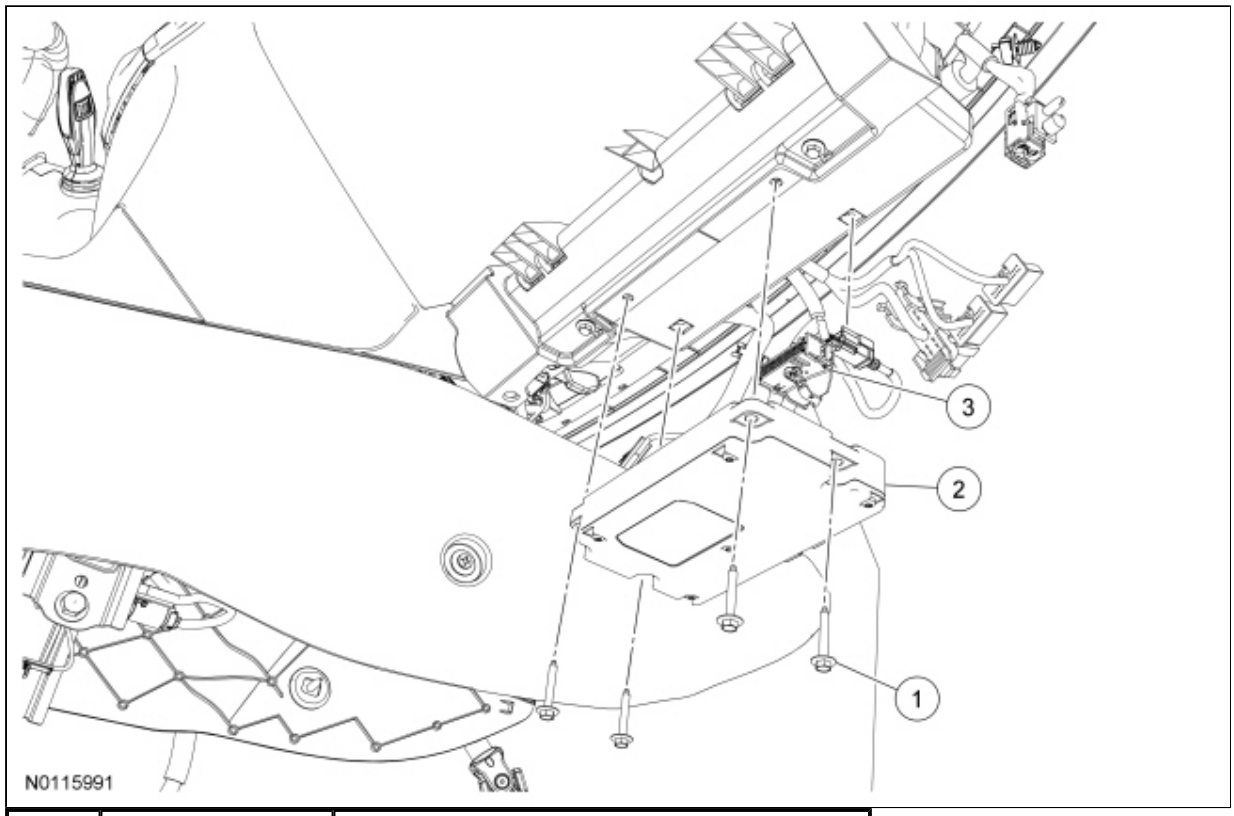


3. Remove the 4 screws from the FCIM and remove the FCIM from the finish panel.



4. To install, reverse the removal procedure.

Accessory Protocol Interface Module (APIM)



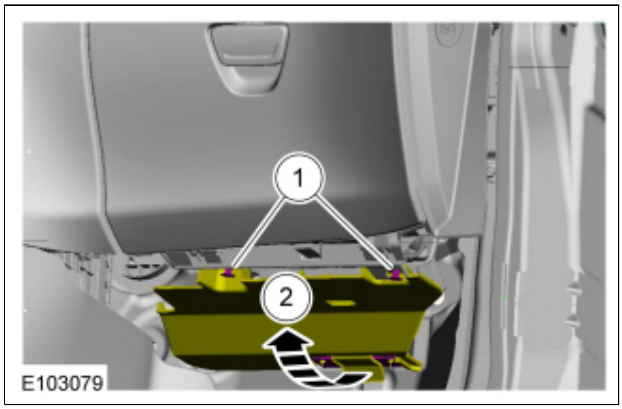
Item	Part Number	Description
1	W505156	APIM screws (4 required)
2	14D212	APIM
3	—	APIM connector (part of 14K024)

Removal and Installation

1. **NOTE:** It is necessary to record the current Accessory Protocol Interface Module (APIM) software and hardware level when a new APIM is being installed to make sure that the new component is the same version as the component being replaced.

   Retrieve and record the current APIM software and hardware level. For additional information, refer to Accessory Protocol Interface Module (APIM) Software Level Check in this section.

2. Disengage the two push pins and remove the hush panel from the lower right side of the instrument panel.

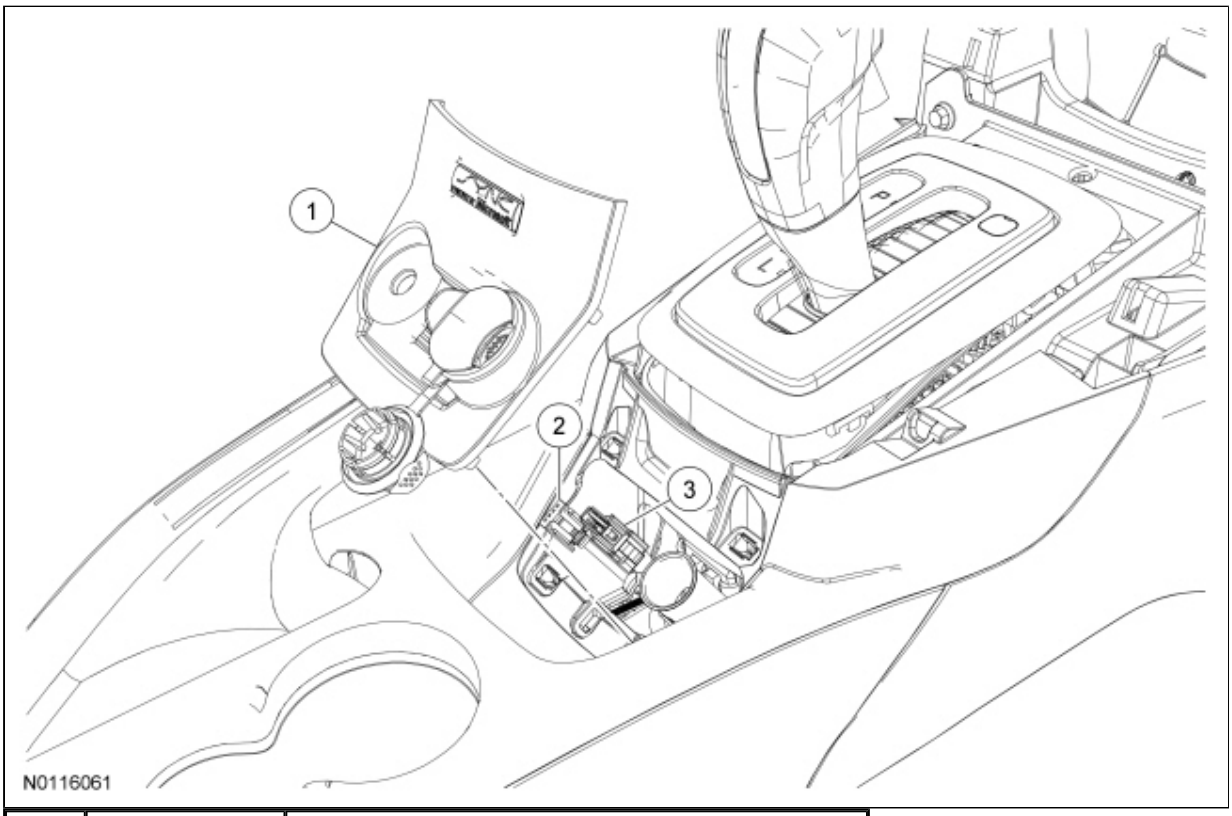


3. Remove the 4 screws and the APIM .
    - Disconnect the electrical connector and the Universal Serial Bus (USB) cable.

4. To install, reverse the removal procedure.
    - If a new APIM is being installed, program the APIM to the correct software level. For additional information, refer to Section 418-01 .

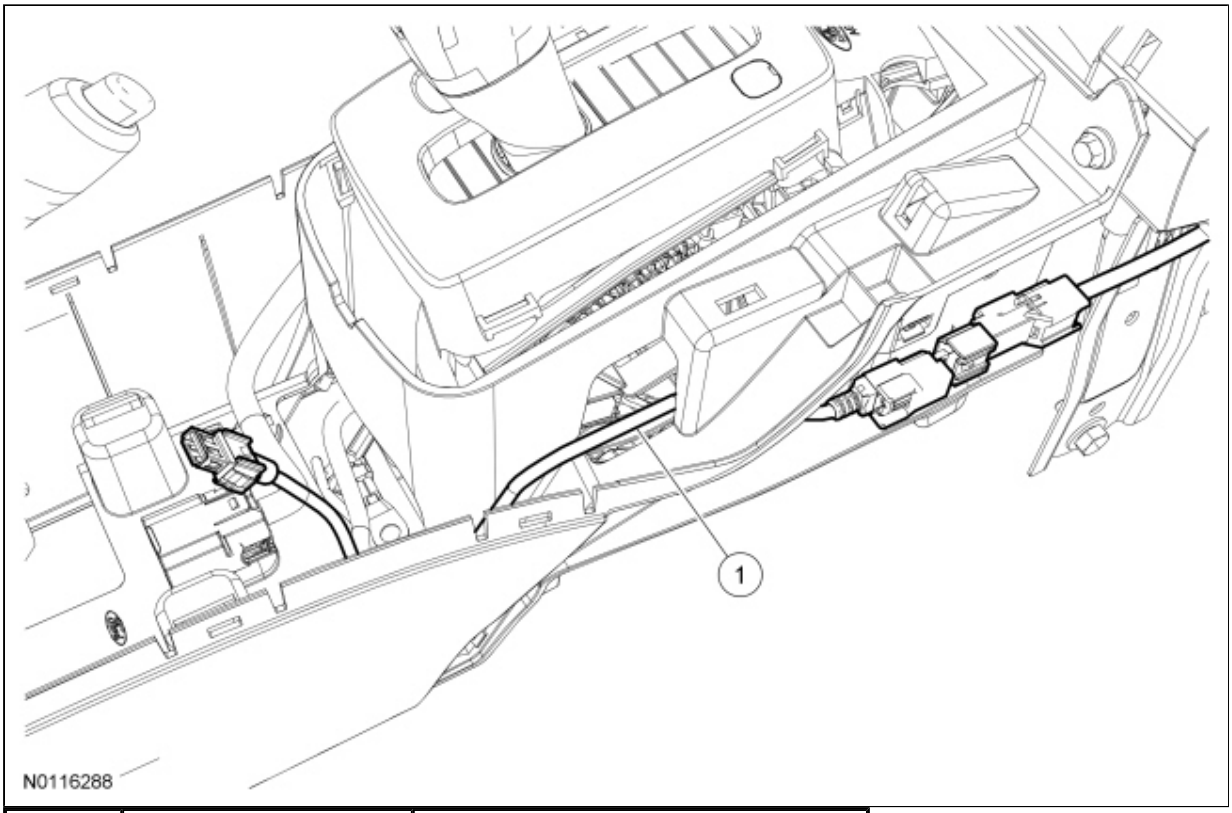
Universal Serial Bus (USB) Cable and Port

USB Port



Item	Part Number	Description
1	19C149	Console bezel
2	19A164	Audio input jack
3	14D202	Universal Serial Bus (USB) port and cable

USB Cable — Console



Item	Part Number	Description
1	14D202	USB cable — console

Removal

NOTE: The Universal Serial Bus (USB) cable is a two piece cable. The USB cable routed through the floor console can be removed and replaced. The USB cable routed through the instrument panel is taped into the wiring harness. Because the instrument panel USB cable cannot be removed from the harness, this procedure applies to replacement of that cable only.

USB Port and Cable — Console

1. Remove the instrument panel lower finish panel and the RH floor console side panel. For additional information, refer to Section 501-12 .

2. Release the push-pins and remove the Universal Serial Bus (USB) port and cable from the floor console bezel.

3. Disconnect the floor console to instrument panel USB cable electrical connector and remove the USB cable.

USB Cable Cable — Instrument panel

4. Remove the instrument panel lower finish panel and the RH floor console side panel. For additional information, refer to Section 501-12 .

5. Disconnect the floor console to instrument panel USB cable electrical connector and push pin.

6. Disconnect the USB cable at the Accessory Protocol Interface Module (APIM). For additional information, refer to Section 415-00 .

Installation

USB Port and Cable — Console

1. Route the USB cable through the floor console. Connect the floor console to instrument panel USB cable electrical connector.

2. Connect the USB port and cable to the floor console bezel.

3. Install the instrument panel lower finish panel and the RH floor console side panel. For additional information, refer to Section 501-12 .

USB Cable Cable — Instrument panel

4. Overlay the new USB cable on the vehicle wiring harness, following the routing of the original cable.

5. Secure the new USB cable to the wiring harness with tape or zip ties as necessary.

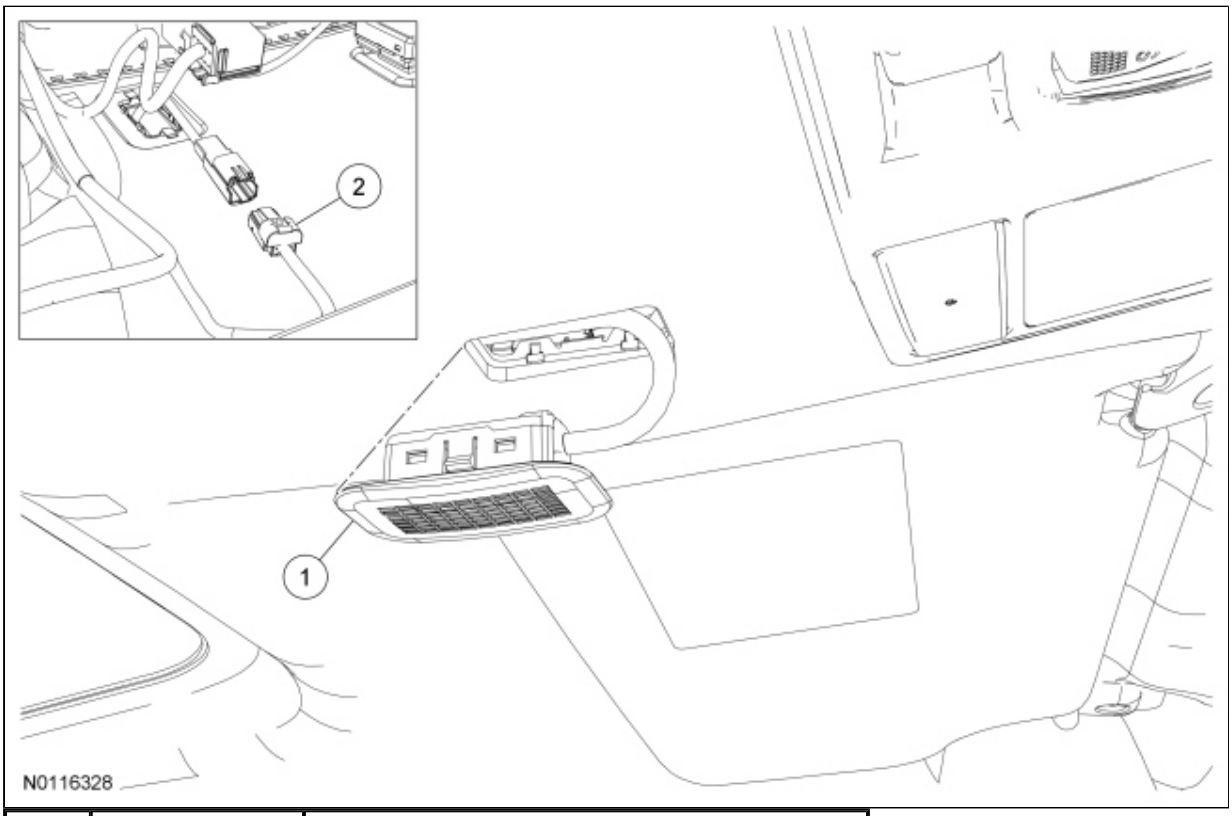
6. Connect the floor console to instrument panel USB cable electrical connector and push pin.

7. Connect the USB cable at the Accessory Protocol Interface Module (APIM). For additional information, refer to Section 415-00 .

8. Install the instrument panel lower finish panel and the RH floor console side panel. For additional information, refer to Section 501-12 .

Microphone

Microphone — SYNC



Item	Part Number	Description
1	19A391	Microphone
2	W713933	Microphone connector (Part of 14335)

Removal

NOTE: If the microphone is removed from the headliner, a new microphone must be installed.

1. Using a suitable tool, (such as a thin small flat head screwdriver) twist and pry the microphone bezel from the headliner metal mounting bracket.

2. Remove the microphone from the headliner by grasping the microphone pigtail.
   - Disconnect the microphone electrical connector.

Installation

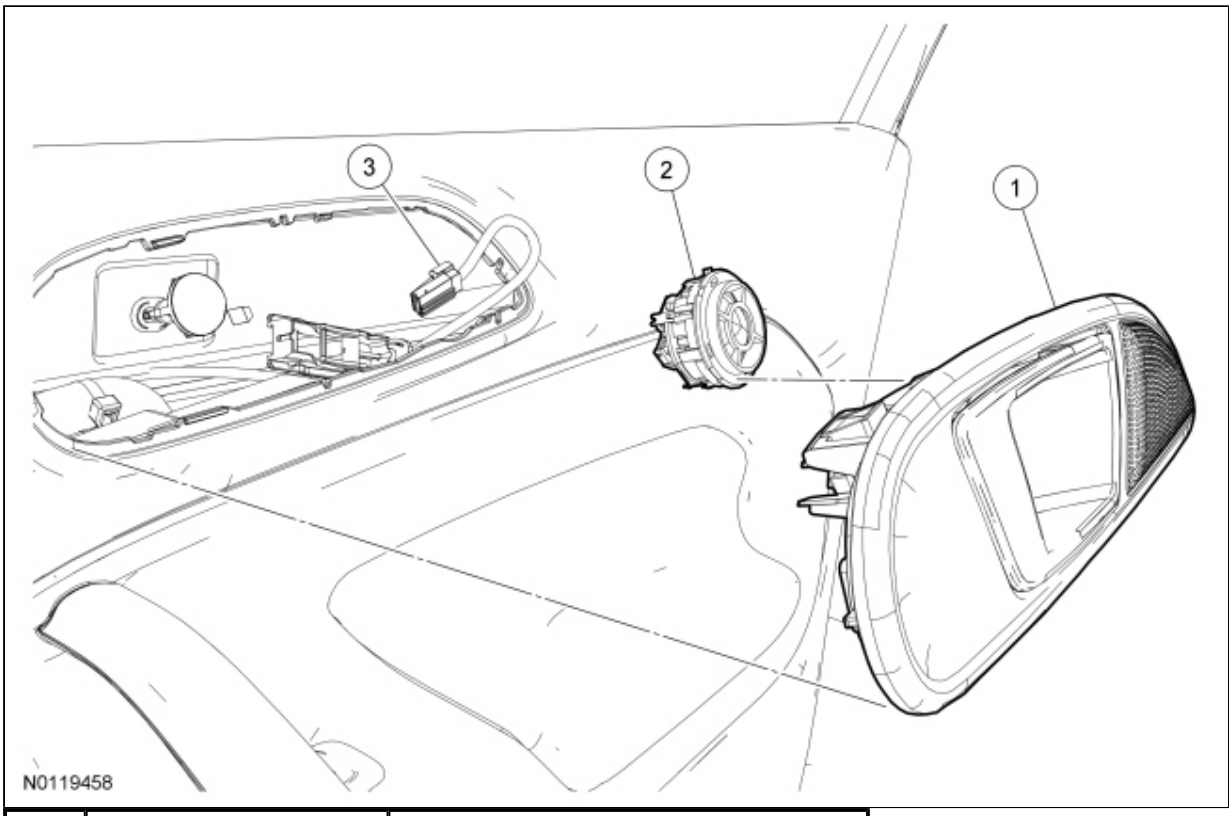
1. Reconnect the microphone electrical connector.

2. Wrap the connection with anti-rattle tape.

3. Feed the microphone pigtail into the headliner through the microphone hole.
   - Verify the microphone pigtail points towards the front of the vehicle.

4. Snap the microphone into the headliner mounting bracket.
   - Verify the mounting bracket and microphone are snug to the headliner.

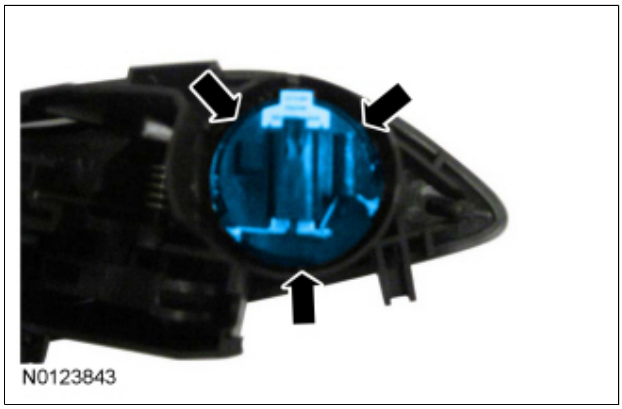
Speaker — Tweeter



Item	Part Number	Description
1	22600 RH/ 22601 LH	Interior door handle
2	18808B	Speaker
3	—	Speaker connector (part of 14631)

Removal and Installation

1. Remove the front interior door handle. For additional information, refer to Section 501-14 .
2. Release the 3 tabs and remove the speaker from the front interior door handle.



3. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Headlamp assembly bolts	5	44
High mounted stoplamp screws (5-door hatchback)	1	9
Reversing lamp switch	14	124

Exterior Lighting

The exterior lighting system consists of the following components:

- Headlamp assemblies
- Body Control Module (BCM) (located under the glove compartment)
- Stoplamp switch
- Low beam relay
- High beam relay
- Reversing lamp relay
- Daytime Running Lamps (DRL) relay (if equipped)
- Headlamp switch
- Multifunction switch
- Reversing lamp switch (manual transaxle)
- Exterior mirror turn lamps
- High mounted stoplamp
- Rear lamp assemblies
- License plate lamps

Lamp Assembly Condensation

Exterior lamps are vented to accommodate normal changes in pressure. Condensation can be a natural by-product of this design. When moist air enters the lamp assembly through the vents, there is a possibility that condensation can occur if the temperature is cold. When normal condensation occurs, a thin mist forms on the interior of the lens. The thin mist eventually clears and exits through the vents during normal operation. The amount of time it takes to clear the lens of acceptable mist varies with ambient humidity and lamp types. Normal condensation clears from any lamp in 48 hours under dry conditions.

Do **not** replace a lamp assembly with acceptable levels of condensation such as:

- presence of thin mist (no streaks, drip marks or droplets are present)
- fine mist covers less than 50% of the lens

Examples of unacceptable moisture (usually caused by a lamp housing leak):

- water puddling inside the lamp
- large water droplets, drip marks or streaks present on the interior of the lens

Headlamps

The headlamp system is a quad-beam pattern system. It consists of replaceable low and high beam bulbs. The headlamp assembly has the park/turn indicator and side marker lamp integrated into the headlamp assembly. The headlamps do not illuminate when the ignition is OFF or in ACC and the headlamp switch is in the HEADLAMPS ON position.

If the headlamps are in the high beam mode when the headlamp switch is turned off, the BCM defaults the headlamps to the low beam mode the next time the headlamp switch is placed in the HEADLAMPS ON position.

Flash-to-Pass and High Beam

When the ignition is in RUN, the high beams are illuminated when the multifunction switch is placed in the FLASH-TO-PASS position and remain illuminated until the multifunction switch is released.

If the low beams are on when the multifunction switch is placed in the HIGH BEAM position, the high beams are illuminated in addition to the low beams (high beam mode). The high beams turn off (low beam mode) when the multifunction switch is placed in the HIGH BEAM position again or the headlamp switch is switched out of the HEADLAMPS ON position.

Headlamp Exit Delay

When the ignition is OFF or in ACC and the multifunction switch is placed in the FLASH-TO-PASS position and released, the parking lamps and low beams are illuminated. They remain illuminated until one of the following occurs:

- 3 minutes have elapsed with a door open
- 30 seconds have elapsed after all doors are closed
- the multifunction switch is placed in the FLASH-TO-PASS position again
- the ignition changes to RUN

With all the doors closed, but within the 30 second delay, opening any door results in the 3 minute timer restarting.

Daytime Running Lamps (DRL)

If the vehicle is equipped with Daytime Running Lamps (DRL), the BCM is configured for this feature. The DRL feature illuminates the low beam headlamps at a reduced intensity when the ignition is in RUN and the headlamp switch is in the OFF position.

The DRL feature is inactive when the flash-to-pass feature is active.

The DRL feature is not a programmable parameter for this vehicle.

Stoplamps

The stoplamp switch is located on the brake pedal assembly. The stoplamps illuminate when the brake pedal is applied. The rear lamps are combination stop/turn lamps on 4-door vehicles.

Turn Signal/Hazard Lamps

The front turn signal lamps are located within the headlamp assemblies. The rear lamps on 4-door vehicles share functionality with the stoplamps (combination stop/turn lamps). If equipped, there are turn signal lamps located within the exterior mirrors.

When the multifunction switch is place in the LH or RH LANE CHANGE position (first detent down or up) and released, the turn signals flash 1 or 3 times. This setting is programmed by the driver from the center display (Front Control/Display Interface Module (FCDIM)) in the instrument panel.

When the multifunction switch is placed in the LH or RH TURN position (second detent down or up), the BCM cycles the voltage on and off approximately 75 times per minute. If a front or rear turn bulb is inoperative, the BCM cycles the voltage on and off approximately 150 times per minute.

The hazard flasher switch is integrated into the Front Controls Interface Module (FCIM). When the hazard flasher switch is pressed, the BCM cycles the voltage on and off to all the turn lamps approximately 75 times per minute.

Parking Lamps

The BCM supplies voltage to the parking lamps when demanded. The parking lamp system includes the following:

- Front parking lamps
- Front side marker lamps
- Rear parking lamps
- License plate lamps

Reversing Lamps

When the transaxle is placed in REVERSE (R) with the ignition in RUN, the reversing lamp relay (automatic transaxle) or the reversing lamp switch (manual transaxle) provides voltage to the reversing lamps. The reversing lamps are located within the rear lamp assemblies.

Diagnostic Trouble Code (DTC) Chart

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B1007:92	High-Beam Headlamp Switch: Performance Or Incorrect Operation	GO to Pinpoint Test D.
B1092:12	Daytime Running Light Relay: Circuit Short To Battery	GO to Pinpoint Test F.
B1092:14	Daytime Running Light Relay: Circuit Short To Ground Or Open	If the Daytime Running Lamps (DRL) are inoperative, GO to Pinpoint Test F. If the DRL are on with the ignition off, GO to Pinpoint Test G.
B1098:11	Left Position Light: Circuit Short To Ground	GO to Pinpoint Test P.
B1098:15	Left Position Light: Circuit Short To Battery Or Open	If the parking lamps are inoperative, GO to Pinpoint Test P. If the parking lamps are always on, GO to Pinpoint Test Q.
B1099:11	Right Position Light: Circuit Short To Ground	GO to Pinpoint Test P.
B1099:15	Right Position Light: Circuit Short To Battery Or Open	If the parking lamps are inoperative, GO to Pinpoint Test P. If the parking lamps are always on, GO to Pinpoint Test Q.
B109A:12	High Beam Relay: Circuit Short To Battery	GO to Pinpoint Test B.
B109A:14	High Beam Relay: Circuit Short To Ground Or Open	If the high beams are inoperative, GO to Pinpoint Test B. If the high beams are always on, GO to Pinpoint Test D.
B10A6:92	Main Light Switch: Performance Or Incorrect Operation	GO to Pinpoint Test C.
B10A8:12	Low Beam Relay: Circuit Short To Battery	GO to Pinpoint Test A.
B10A8:14	Low Beam Relay: Circuit Short To Ground Or Open	If the low beams are inoperative, GO to Pinpoint Test A. If the low beams are always on, GO to Pinpoint Test C.
B1118:11	Left Rear Sidemarker: Circuit Short To Ground	GO to Pinpoint Test P.
B1118:15	Left Rear Sidemarker: Circuit Short To Battery Or Open	If the parking lamps are inoperative, GO to Pinpoint Test P. If the parking lamps are always on, GO to Pinpoint Test Q.

B132B:12	Left Stop/Turn Lamp: Circuit Short To Battery	GO to Pinpoint Test M .
B132B:14	Left Stop/Turn Lamp: Circuit Short To Ground Or Open	If the LH stoplamp is inoperative, GO to Pinpoint Test I . If the LH rear turn lamp function is inoperative, GO to Pinpoint Test M .
B132C:12	Right Stop/Turn Lamp: Circuit Short To Battery	GO to Pinpoint Test M .
B132C:14	Right Stop/Turn Lamp: Circuit Short To Ground Or Open	If the RH stoplamp is inoperative, GO to Pinpoint Test I . If the RH rear turn lamp function is inoperative, GO to Pinpoint Test M .
B1D06:11	Left Turn Indicator: Circuit Short To Ground	For 4-door vehicles, GO to Pinpoint Test M . For 5-door vehicles, GO to Pinpoint Test N .
B1D06:15	Left Turn Indicator: Circuit Short To Battery Or Open	For 4-door vehicles, GO to Pinpoint Test M . For 5-door vehicles, GO to Pinpoint Test N .
B1D07:11	Right Turn Indicator: Circuit Short To Ground	For 4-door vehicles, GO to Pinpoint Test M . For 5-door vehicles, GO to Pinpoint Test N .
B1D07:15	Right Turn Indicator: Circuit Short To Battery Or Open	For 4-door vehicles, GO to Pinpoint Test M . For 5-door vehicles, GO to Pinpoint Test N .
B1D35:23	Hazard Switch: Signal Stuck Low	GO to Pinpoint Test O .
B1D36:92	Turn Indicator Switch: Performance Or Incorrect Operation	GO to Pinpoint Test L .
C1137:24	Reverse Gear Switch: Signal Stuck High	GO to Pinpoint Test T .
All other DTCs	—	REFER to Section 419-10 .

Headlamps

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

Exterior Lighting

The Body Control Module (BCM) monitors the headlamp switch position by sending voltage signals on multiple circuits to the headlamp switch. There is one circuit for each headlamp switch position. At any given time, one of the signal circuits is switched to ground to indicate the headlamp switch position.

If, when the ignition is in RUN, the BCM does not detect any active inputs from the headlamp switch or if the BCM detects multiple headlamp switch input circuits short to ground, the BCM turns the parking lamps and headlamps on and keeps them on until the ignition is transitioned OFF.

If either situation occurs, the BCM **cannot** be ruled immediately as being at fault. This is normal behavior of the BCM design as a fault has been detected with the inputs from the headlamp switch.

Flash-to-Pass and High Beam

The BCM monitors the multifunction switch for a flash-to-pass or high beam request. With the ignition in RUN and the multifunction switch in the FLASH-TO-PASS position, the BCM energizes the high beam relay until the multifunction switch is released.

If the low beams are on when the BCM detects the multifunction switch is in the HIGH BEAM position, the BCM energizes the high beam relay to provide voltage to the high beams (high beam mode). The BCM defaults to low beam mode if the headlamps are turned off using the headlamp switch or the ignition transitions out of RUN.

Field-Effect Transistor (FET) Protection

A Field-Effect Transistor (FET) is a type of transistor that, when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes a FET protective circuit strategy for many of its outputs (such as a turn lamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down when a fault event is detected. A short circuit DTC sets when the fault event occurs.

The circuit remains off until the fault is corrected and the ignition is cycled off and then back on, the module resets the FET protection and allows the circuit to function.

The FET protected circuits for the headlamp system are the low and high beam relay coil ground circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical

• Headlamp switch
• Multifunction switch
	• Battery Junction Box (BJB) fuse(s):
	  ▪ 12 (10A) (LH high beam)
	  ▪ 13 (10A) (RH high beam)
	  ▪ 14 (10A) (LH low beam)
	  ▪ 15 (10A) (RH low beam)
	  ▪ 23 (7.5A) (low beam relay coil)
	  ▪ 31 (20A) (low beam relay)
	• Central Junction Box (CJB) fuse 21 (10A) (ignition ON input)
	• Low beam relay
	• High beam relay
	• Bulb(s)
	• Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.

- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• One or both low beams are inoperative	• Fuse • Wiring, terminals or connectors • Low beam relay • Headlamp assembly • Body Control Module (BCM)	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test A .
• One or both high beams are inoperative	• Fuse • Wiring, terminals or connectors • High beam relay • Multifunction switch • Headlamp assembly • Battery Junction Box (BJB) • BCM	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test B .
• The low beam are always on	• Wiring, terminals or connectors • Low beam relay • Daytime Running Lamps (DRL) system concern • Headlamp switch • BCM	• GO to Pinpoint Test C .
• The high beams are always on	• Wiring, terminals or connectors • High beam relay • Multifunction switch • BCM	• GO to Pinpoint Test D .
• The flash-to-pass feature is inoperative	• Wiring, terminals or connectors • Multifunction switch • BCM	• GO to Pinpoint Test E .

Pinpoint Tests

Pinpoint Test A: One Or Both Low Beams Are Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps for schematic and connector information.

Normal Operation

The low beams do not turn on unless the ignition is in RUN. The Body Control Module (BCM) monitors a circuit that is provided voltage when the ignition is in RUN.

Voltage is provided at all times to the switch and coil sides of the low beam relay. When the BCM detects the headlamp switch in the HEADLAMPS ON position, the BCM provides ground for the low beam relay coil. When the low beam relay energizes, voltage is routed through Battery Junction Box (BJB) fuses 14 (10A) (LH low beam) and 15 (10A) (RH low beam) to the headlamps.

- DTC B10A8:12 (Low Beam Relay: Circuit Short To Battery) — a continuous and on-demand DTC that sets when the BCM detects a short to voltage from the low beam relay coil ground controlled circuit.
- DTC B10A8:14 (Low Beam Relay: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects an open from the low beam relay coil ground controlled circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Low beam relay
- Headlamp assembly
- BCM

PINPOINT TEST A: ONE OR BOTH LOW BEAMS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 DETERMINE IF BOTH HEADLAMPS ARE INOPERATIVE	
• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position and observe the headlamps. • **Are both headlamps inoperative?**	**Yes** VERIFY the BJB fuses 23 (7.5A) and 31 (20A) are OK. If OK, GO to A5 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. **No** VERIFY the BJB fuse 14 (10A) (LH low beam) or fuse 15

	(10A) (RH low beam) is OK. If OK, GO to A2 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
A2 CHECK FOR VOLTAGE TO THE HEADLAMP • Place the headlamp switch in the HEADLAMPS OFF position. • Ignition OFF. • Disconnect: Inoperative Headlamp. • Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • Measure the voltage between the LH headlamp C1021-1, circuit CBB14 (VT/OG), harness side and ground; or between the RH headlamp C1041-1, circuit CBB15 (BN/BU), harness side and ground.  N0114653 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** GO to A4 .
A3 CHECK THE HEADLAMP GROUND CIRCUIT FOR AN OPEN • Measure the voltage between the LH headlamp C1021-1, circuit CBB14 (VT/OG), harness side and the LH headlamp C1021-2, circuit GD123 (BK/GY), harness side; or between the RH headlamp C1041-1, circuit CBB15 (BN/BU), harness side and the RH headlamp C1041-2, circuit GD188 (BK/YE), harness side.  N0114654 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation. **No** REPAIR the circuit GD123 (BK/GY) (LH headlamp) or circuit GD188 (BK/YE) (RH headlamp) for an open. TEST the system for normal operation.
A4 CHECK FOR VOLTAGE TO THE LOW BEAM FUSE • Disconnect: BJB Fuse 14 (10A) (LH low beam) or Fuse 15 (10A) (RH low beam) . • Measure the voltage between the BJB fuse 14 (10A) (LH low beam),	**Yes** REPAIR circuit CBB14 (VT/OG) (LH

circuit CLF09 (BU/GY), input side and ground; or between the BJB fuse 15 (10A) (RH low beam), circuit CLF09 (BU/GY), input side and ground.  N0114655 • **Is the voltage greater than 10 volts?**	headlamp) or circuit CBB15 (BN/BU) (RH headlamp) for an open. TEST the system for normal operation. **No** REPAIR circuit CLF09 (BU/GY) for an open. TEST the system for normal operation.
A5 CHECK THE LOW BEAM RELAY • Place the headlamp switch in the HEADLAMPS OFF position. • Ignition OFF. • Disconnect: Low Beam Relay. • Substitute a known good relay. • Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • **Do the headlamps illuminate?**	**Yes** REMOVE the known good relay. INSTALL a new low beam relay. TEST the system for normal operation. **No** REMOVE the known good relay. GO to A6.
A6 CHECK FOR VOLTAGE TO THE LOW BEAM RELAY • Ignition OFF. • Measure the voltage between the low beam relay pin 5, circuit SBB31 (WH/RD), BJB face side and ground.  N0114656 • **Is the voltage greater than 10 volts?**	**Yes** GO to A7. **No** REPAIR circuit SBB31 (WH/RD) for an open. TEST the system for normal operation.
A7 BYPASS THE LOW BEAM RELAY • Connect a fused jumper wire between the low beam relay pin 5, circuit SBB31 (WH/RD), BJB face side and the low beam relay pin 3, circuit CLF09 (BU/GY), BJB face side.	**Yes** REMOVE the jumper wire. GO to A8. **No** REMOVE the jumper wire. REPAIR circuit

 N0114657 • **Do the headlamps illuminate?**	CLF09 (BU/GY) for an open. TEST the system for normal operation.
A8 CHECK FOR VOLTAGE TO THE LOW BEAM RELAY COIL	
• Measure the voltage between the low beam relay pin 1, circuit SBB23 (WH/RD), BJB face side and ground.  N0114658 • **Is the voltage greater than 10 volts?**	**Yes** GO to A9 . **No** REPAIR circuit SBB23 (WH/RD) for an open. CLEAR the DTCs. TEST the system for normal operation.
A9 CHECK THE LOW BEAM RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280D. • Ignition ON. • Measure the voltage between the BCM C2280D-5, circuit CLF04 (BN/BU), harness side and ground.  N0114659 • **Is any voltage present?**	**Yes** REPAIR circuit CLF04 (BN/BU) for a short to voltage. CYCLE the ignition ON then OFF. CLEAR the DTCs. TEST the system for normal operation. **No** GO to A10 .
A10 CHECK THE LOW BEAM RELAY COIL GROUND CONTROLLED CIRCUIT FOR AN OPEN	
• Ignition OFF.	**Yes**

• Connect: Low Beam Relay. • Ignition ON. • Measure the voltage between the BCM C2280D-5, circuit CLF04 (BN/BU), harness side and ground.  N0114659 • **Is the voltage greater than 10 volts?**	GO to A11 . **No** REPAIR circuit CLF04 (BN/BU) for an open. CLEAR the DTCs. TEST the system for normal operation.
A11 CHECK THE IGNITION RUN INPUT CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280B. • Ignition ON. • Measure the voltage between the BCM C2280B-4, circuit CBP21 (BU/GY), harness side and ground.  N0114660 • **Is the voltage greater than 10 volts?**	**Yes** GO to A12 . **No** REPAIR circuit CBP21 (BU/GY) for an open. CLEAR the DTCs. TEST the system for normal operation.
A12 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: One or Both High Beams are Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps for schematic and connector information.

Normal Operation

Voltage is provided at all times to the switch and coil sides of the high beam relay. The Body Control Module (BCM) sends a voltage signal to the multifunction switch to monitor for a high beam request. The multifunction switch routes the voltage signal to ground when placed in the HIGH BEAM position. When the headlamps are on and the BCM detects a request for the high beams, the BCM provides ground for the high beam relay coil. When the high beam relay energizes, voltage is routed through Battery Junction Box (BJB) fuses 12 (10A) (LH low beam) and 13 (10A) (RH low beam) to the headlamps.

- DTC B109A:12 (High Beam Relay: Circuit Short To Battery) — a continuous and on-demand DTC that sets when the BCM detects a short to voltage from the high beam relay coil ground controlled circuit.
- DTC B109A:14 (High Beam Relay: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects an open from the high beam relay coil ground controlled circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- High beam relay
- Multifunction switch
- Headlamp assembly
- BJB
- BCM

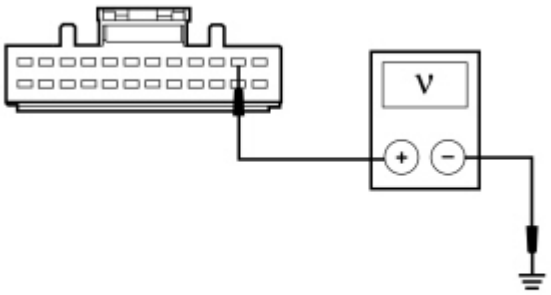
PINPOINT TEST B: ONE OR BOTH HIGH BEAMS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE LOW BEAM OPERATION	
• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • **Do both low beams illuminate?**	**Yes** If an individual high beam is inoperative, VERIFY the BJB fuse 12 (10A) (LH high beam) or fuse 13 (10A) (RH high beam) is OK. If OK, GO to B2 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. If both high beams are inoperative, GO to B4 . **No** GO to Pinpoint Test A .
B2 CHECK FOR VOLTAGE TO THE HEADLAMP	
• Place the headlamp switch in the HEADLAMPS OFF position. • Ignition OFF. • Disconnect: Inoperative Headlamp.	**Yes** REPAIR or INSTALL a new headlamp assembly.

• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position. • Measure the voltage between the LH headlamp C1021-3, circuit CBB12 (GN/WH), harness side and ground; or between the RH headlamp C1041-3, circuit CBB13 (GY/BN), harness side and ground.  N0114661 • **Is the voltage greater than 10 volts?**	REFER to Headlamp Assembly in this section. TEST the system for normal operation. **No** GO to B3.
B3 CHECK FOR VOLTAGE TO THE HIGH BEAM FUSE	
• Ignition OFF. • Disconnect: BJB Fuse 12 (10A) (LH high beam) or Fuse 13 (10A) (RH high beam). • Measure the voltage between the BJB fuse 12 (10A) (LH high beam), circuit CLF08 (YE/VT), input side and ground; or between the BJB fuse 13 (10A) (RH high beam), circuit CLF08 (YE/VT), input side and ground.  N0114662 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CBB12 (GN/WH) (LH headlamp) or circuit CBB13 (GY/BN) (RH headlamp) for an open. TEST the system for normal operation. **No** REPAIR circuit CLF08 (YE/VT) for an open. TEST the system for normal operation.
B4 CHECK THE BCM MULTIFUNCTION SWITCH PID	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM multifunction switch input PID (HIGH_BEAM_SW) while placing the multifunction switch in the HIGH BEAM position. • **Does the PID indicate a request for high beams?**	**Yes** GO to B5. **No** GO to B10.
B5 CHECK THE HIGH BEAM RELAY	
• Place the headlamp switch in the HEADLAMPS OFF position. • Ignition OFF. • Disconnect: High Beam Relay. • Substitute a known good relay. • Ignition ON.	**Yes** REMOVE the known good relay. INSTALL a new high beam relay. TEST the system for normal

• Place the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position. • **Do the high beams illuminate?**	operation. **No** REMOVE the known good relay. GO to B6 .
B6 CHECK FOR VOLTAGE TO THE HIGH BEAM RELAY	
• Ignition OFF. • Measure the voltage between the high beam relay pin 1, BJB face side and ground; and between the high beam relay pin 5, BJB face side and ground.  N0114663 • **Are the voltages greater than 10 volts?**	**Yes** GO to B7 . **No** INSTALL a new BJB . CLEAR the DTCs. TEST the system for normal operation.
B7 BYPASS THE HIGH BEAM RELAY	
• Connect a fused jumper wire between the high beam relay pin 5, BJB face side and the high beam relay pin 3, circuit CLF08 (YE/VT), BJB face side.  N0114664 • **Do the high beams illuminate?**	**Yes** REMOVE the jumper wire. GO to B8 . **No** REMOVE the jumper wire. REPAIR circuit CLF08 (YE/VT) for an open. TEST the system for normal operation.
B8 CHECK THE HIGH BEAM RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: BCM C2280D . • Ignition ON. • Measure the voltage between the BCM C2280D-11, circuit CLF02 (GY/BN), harness side and ground.	**Yes** REPAIR circuit CLF02 (GY/BN) for a short to voltage. CYCLE the ignition ON then OFF. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B9 .



N0114665

- **Is any voltage present?**

B9 CHECK THE HIGH BEAM RELAY COIL GROUND CONTROLLED CIRCUIT FOR AN OPEN	
• Ignition OFF. • Connect: High Beam Relay. • Ignition ON. • Measure the voltage between the BCM C2280D-11, circuit CLF02 (GY/BN), harness side and ground.  N0114665 • **Is the voltage greater than 10 volts?**	**Yes** GO to B13 . **No** REPAIR circuit CLF02 (GY/BN) for an open. CLEAR the DTCs. TEST the system for normal operation.
B10 BYPASS THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202A. • Ignition ON. • Connect a fused jumper wire between the multifunction switch C202A-10, circuit CLF17 (WH/OG), harness side and the multifunction switch C202A-9, circuit GD115 (BK/GY), harness side.  N0114666	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to B11 .

• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM multifunction switch input PID (HIGH_BEAM_SW). • **Does the PID indicate a request for high beams?**	
B11 BYPASS THE MULTIFUNCTION SWITCH GROUND CIRCUIT	
• Connect a fused jumper wire between the multifunction switch C202D-10, circuit CLF17 (WH/OG), harness side and ground.  N0114667 • Enter the following diagnostic mode on the scan tool: BCM DataLogger . • Monitor the BCM multifunction switch input PID (HIGH_BEAM_SW). • **Does the PID indicate a request for high beams?**	**Yes** REMOVE the jumper wire. REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to B12 .
B12 CHECK THE HIGH BEAM REQUEST INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280F . • Measure the resistance between the multifunction switch C202A-10, circuit CLF17 (WH/OG), harness side and the BCM C2280F-10, circuit CLF17 (WH/OG), harness side.  N0114668 • **Is the resistance less than 5 ohms?**	**Yes** GO to B13 . **No** REPAIR circuit CLF17 (WH/OG) for an open. TEST the system for normal operation.
B13 CHECK FOR CORRECT BCM OPERATION	
• Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating

• **Is the concern still present?**	correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Low Beams Are Always On

Refer to Wiring Diagrams Cell 85 , Headlamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage signals to the headlamp switch through the headlamp switch input circuits (off, parking lamps, headlamps). At any given time, the headlamp switch routes one of the input circuits to ground, indicating the headlamp switch position to the BCM . When the BCM detects the headlamp switch in the HEADLAMPS ON position, the BCM provides ground for the low beam relay coil. When the low beam relay energizes, voltage is routed through Battery Junction Box (BJB) fuses 14 (10A) (LH low beam) and 15 (10A) (RH low beam) to the headlamps.

If the BCM detects multiple or no active headlamp switch inputs, the BCM defaults the exterior lamps on.

Vehicles equipped with Daytime Running Lamps (DRL) utilize a separate relay in conjunction with the existing headlamp circuitry to illuminate the low beams at a reduced intensity when the ignition is in RUN.

- DTC B10A6:92 (Main Light Switch: Performance Or Incorrect Operation) — a continuous and on-demand DTC that sets when the BCM detects a no inputs from the headlamp switch are active (circuits open) or more than one headlamp switch input circuits are active (short to ground).
- DTC B10A8:14 (Low Beam Relay: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the low beam relay coil ground controlled circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Low beam relay
- DRL system concern
- Headlamp switch
- BCM

PINPOINT TEST C: THE LOW BEAMS ARE ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE BCM HEADLAMP SWITCH PIDs	
NOTE: Make sure the headlamp switch is aligned in the correct position when monitoring the PIDs. **NOTE:** Only one PID should indicate ON at each headlamp switch position. • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM	**Yes** GO to C7 . **No** GO to C2 .

DataLogger.
- While moving the headlamp switch through all positions (OFF, PARKING LAMPS and HEADLAMPS), monitor the BCM headlamp switch input PIDs (LIGHTNG_MODE, PARK_LMP_SW, LOW_BEAM_SW).
- **Do the headlamp switch positions agree with the PIDs (with only one PID indicating ON in each position?**

C2 CHECK THE HEADLAMP SWITCH

- Ignition OFF.
- Disconnect: Headlamp Switch C205.
- Carry out the headlamp switch component test.

  Refer to Wiring Diagrams Cell 149 for component testing.

- **Does the headlamp switch pass the component test?**

Yes
GO to C3 .

No
INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. TEST the system for normal operation.

C3 DETERMINE IF A HEADLAMP SWITCH INPUT IS SHORT TO GROUND

- Ignition ON.
- Enter the following diagnostic mode on the scan tool: BCM DataLogger.
- Monitor the BCM headlamp switch input PIDs (LIGHTNG_MODE, PARK_LMP_SW, LOW_BEAM_SW).
- **Do any of the headlamp switch PIDs indicate ON?**

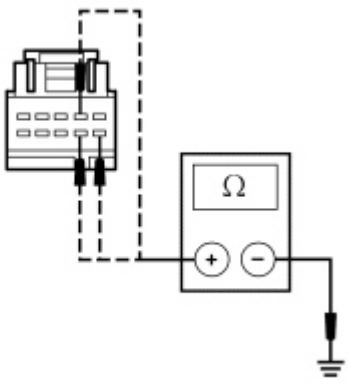
Yes
GO to C4 .

No
GO to C5 .

C4 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND

- Ignition OFF.
- Disconnect: BCM C2280E.
- Measure the resistance between the headlamp switch, harness side and ground as follows:

Headlamp Switch Connector-Pin	Circuit
C205-6	CLF23 (WH/VT)
C205-2	CLF24 (YE/BU)
C205-7	CLF18 (BU/WH)



N0090404

- **Are the resistances greater than 10,000 ohms?**

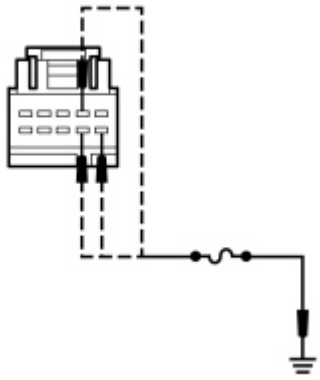
Yes
GO to C12 .

No
REPAIR the circuit in question for a short to ground. CLEAR the DTCs. TEST the system for normal operation.

C5 DETERMINE IF A HEADLAMP SWITCH INPUT IS OPEN

- Enter the following diagnostic mode on the scan tool: BCM DataLogger.
- Monitor the BCM headlamp switch input PIDs while connecting a fused jumper wire between the headlamp switch pins and ground as follows:

PID to Monitor	Headlamp Switch Connector-Pin	Circuit
LIGHTNG_MODE	C205-6	CLF23 (WH/VT)
PARK_LMP_SW	C205-2	CLF24 (YE/BU)
LOW_BEAM_SW	C205-7	CLF18 (BU/WH)



N0117257

- **Do the PIDs indicate ON with each corresponding connection?**

Yes
REPAIR circuit GD115 (BK/GY) for an open. CLEAR the DTCs. TEST the system for normal operation.

No
GO to C6.

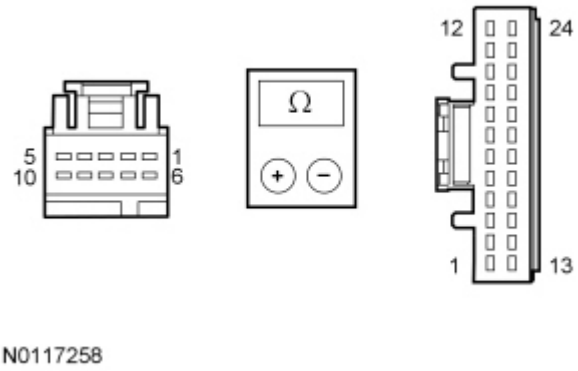
C6 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR AN OPEN

- Ignition OFF.
- Disconnect: BCM C2280E.
- Measure the resistance between the headlamp switch, harness side and the BCM, harness side as follows:

Headlamp Switch Connector-Pin	BCM Connector-Pin	Circuit
C205-6	C2280E-3	CLF23 (WH/VT)
C205-2	C2280E-9	CLF24 (YE/BU)
C205-7	C2280E-13	CLF18 (BU/WH)

Yes
GO to C12.

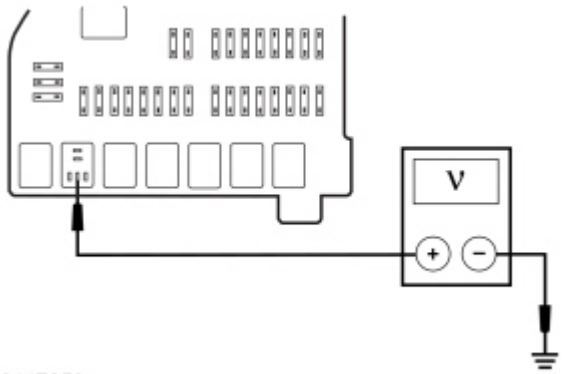
No
REPAIR the circuit in question for an open. CLEAR the DTCs. TEST the system for normal operation.



N0117258

- **Are the resistances less than 5 ohms?**

C7 CHECK THE LOW BEAM RELAY OUTPUT	
• Ignition OFF. • Disconnect: Low Beam Relay. • Ignition ON. • **Do the low beams continue to illuminate?**	**Yes** GO to C8 . **No** If equipped with DRL , GO to C9 . If not equipped with DRL , GO to C10 .
C8 ISOLATE THE SHORT TO VOLTAGE	
• Disconnect: BJB Fuses 14 (10A) and 15 (10A). • **Does either low beam continue to illuminate?**	**Yes** REPAIR circuit CBB14 (VT/OG) (LH headlamp) or circuit CBB15 (BN/BU) (RH headlamp) for a short to voltage as necessary. TEST the system for normal operation. **No** REPAIR circuit CLF09 (BU/GY) for a short to voltage. TEST the system for normal operation.
C9 CHECK THE DRL SYSTEM	
• Ignition OFF. • Measure the voltage between the low beam relay pin 4, circuit CLF13 (YE/BU), BJB face side and ground.	**Yes** GO to Pinpoint Test G . **No** GO to C10 .

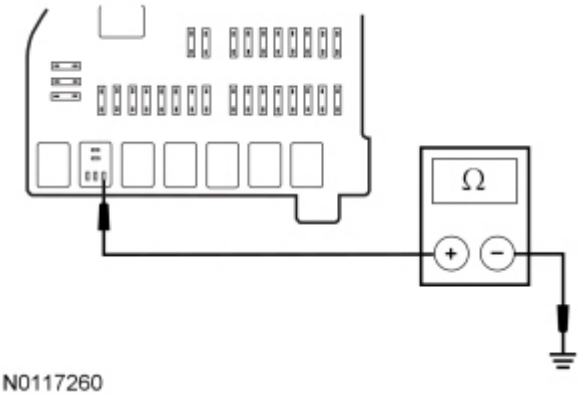


N0117259

- **Is any voltage present?**

C10 CHECK THE LOW BEAM RELAY	
• Ignition OFF. • Substitute a known good relay. • Ignition ON. • **Do the low beams continue to illuminate?**	**Yes** REMOVE the known good relay. GO to C11 . **No** REMOVE the known good relay. INSTALL a new low beam relay. TEST the system for normal operation.
C11 CHECK THE LOW BEAM RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280D. • Measure the resistance between the low beam relay pin 2, circuit CLF04 (BN/BU), BJB face side and ground.	**Yes** GO to C12 . **No** REPAIR circuit CLF04 (BN/BU), for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
C12 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at



N0117260

- **Is the resistance greater than 10,000 ohms?**

	this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The High Beams Are Always On

Refer to Wiring Diagrams Cell 85 , Headlamps for schematic and connector information.

Normal Operation

Voltage is provided at all times to the switch and coil sides of the high beam relay. The Body Control Module (BCM) sends two voltage signals to the multifunction switch. One is to monitor for a high beam request and the other for a flash-to-pass request. The multifunction switch routes the corresponding voltage signal to ground when placed in the HIGH BEAM or FLASH-TO-PASS position. When the headlamps are on and the BCM detects a request for the high beams or flash-to-pass feature, the BCM provides ground for the high beam relay coil. When the high beam relay energizes, voltage is routed through Battery Junction Box (BJB) fuses 12 (10A) (LH high beam) and 13 (10A) (RH high beam) to the headlamps.

- DTC B1007:92 (High-Beam Headlamp Switch: Performance Or Incorrect Operation) — an on-demand DTC that sets when the BCM detects a short to ground from the high beam or flash-to-pass request input circuits.
- DTC B109A:14 (High Beam Relay: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the high beam relay coil ground controlled circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High beam relay
- Multifunction switch
- BCM

PINPOINT TEST D: THE HIGH BEAM(S) ARE ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE MULTIFUNCTION SWITCH INPUT	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM multifunction switch high beam and flash-to-pass PIDs (HIGH_BEAM_SW, FLASH-to-PASS). • **Does either PID indicate a high beam or flash-to-pass request?**	**Yes** GO to D2 . **No** GO to D4 .
D2 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM	**Yes** GO to D3 . **No**

DataLogger. • Monitor the BCM multifunction switch high beam and flash-to-pass PIDs (HIGH_BEAM_SW, FLASH-to-PASS). • **Does either PID indicate a high beam or flash-to-pass request?**	INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation.
D3 CHECK THE HIGH BEAM AND FLASH-TO-PASS INPUT CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280E and C2280F . • Measure the resistance between the multifunction switch C202A-5, circuit CLF27 (GN/BN), harness side and ground; and between the multifunction switch C202A-10, circuit CLF17 (WH/OG), harness side and ground.  N0117261 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D8. **No** REPAIR circuit CLF27 (GN/BN) (flash-to-pass) or circuit CLF17 (WH/OG) (high beam) for a short to ground. TEST the system for normal operation.
D4 CHECK THE HIGH BEAM RELAY OUTPUT	
• Ignition OFF. • Disconnect: High Beam Relay. • Ignition ON. • **Do the high beams continue to illuminate?**	**Yes** GO to D5. **No** GO to D6.
D5 ISOLATE THE SHORT TO VOLTAGE	
• Disconnect: BJB Fuses 12 (10A) and 13 (10A). • **Does either high beam continue to illuminate?**	**Yes** REPAIR circuit CBB12 (GN/WH) (LH headlamp) or circuit CBB13 (GN/BN) (RH headlamp) for a short to voltage as necessary. TEST the system for normal operation. **No** REPAIR circuit CLF08 (YE/VT) for a short to voltage. TEST the system for normal operation.
D6 CHECK THE HIGH BEAM RELAY	
• Ignition OFF. • Substitute a known good relay. • Ignition ON. • **Do the high beams continue to illuminate?**	**Yes** REMOVE the known good relay. GO to D7. **No**

	REMOVE the known good relay. INSTALL a new high beam relay. TEST the system for normal operation.
D7 CHECK THE HIGH BEAM RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280D. • Measure the resistance between the high beam relay pin 2, circuit CLF02 (GY/BN), BJB face side and ground.  N0117262 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D8. **No** REPAIR circuit CLF04 (BN/BU), for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
D8 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Flash-To-Pass Feature Is Inoperative

Normal Operation

The Body Control Module (BCM) sends a voltage signal to the multifunction switch to monitor for a flash-to-pass feature request. The multifunction switch routes the voltage signal to ground when placed in the FLASH-TO-PASS position. When the headlamps are on and the BCM detects a request for the flash-to-pass feature, the BCM activates the high beams.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- BCM

PINPOINT TEST E: THE FLASH-TO-PASS FEATURE IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 VERIFY THE HIGH BEAM HEADLAMP OPERATION	
• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the headlamps. • **Do the high beams illuminate?**	**Yes** GO to E2. **No** GO to Pinpoint Test B.
E2 BYPASS THE MULTIFUNCTION SWITCH	
• Place the headlamp switch in the OFF position. • Ignition OFF. • Disconnect: Multifunction Switch C202A. • Ignition ON. • Connect a fused jumper wire between the multifunction switch C202A-5, circuit CLF27 (GN/BN), harness side and the multifunction switch C202A-9, circuit GD115 (BK/GY), harness side.  N0117263 • **Do the high beams illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to E3.
E3 CHECK THE FLASH-TO-PASS INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280E. • Measure the resistance between the multifunction switch C202A-5, circuit CLF27 (GN/BN), harness side and the BCM C2280E-22, circuit CLF27 (GN/BN), harness side.  N0117264	**Yes** GO to E4. **No** REPAIR circuit CLF27 (GN/BN) for an open. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	

E4 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Daytime Running Lamps (DRL)

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Body Control Module (BCM) controls the Daytime Running Lamps (DRL) by energizing the DRL relay when the ignition is in RUN and the headlamp switch is not in the HEADLAMPS ON position.

When the DRL relay is energized, voltage is routed through a resistor wire to the low beam relay. The voltage passes through the low beam relay to the existing circuitry for the low beams. The voltage passes through a resistor wire to illuminate the low beams at reduced intensity.

The DRL is not a programmable parameter for this vehicle.

Field-Effect Transistor (FET) Protection

A Field-Effect Transistor (FET) is a type of transistor that, when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes a FET protective circuit strategy for many of its outputs (such as a turn lamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down when a fault event is detected. A short circuit DTC sets when the fault event occurs.

The circuit remains off until the fault is corrected and the ignition is cycled off and then back on, the module resets the FET protection and allows the circuit to function.

The FET protected circuit for the DRL system is the DRL relay coil ground circuit.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Electrical
• Battery Junction Box (BJB) fuse 25 (15A) (DRL relay) • Central Junction Box (CJB) fuse 21 (10A) (ignition input) • Daytime Running Lamps (DRL) relay • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM .
9. If the DTCs retrieved are related to the concern, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual or the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action

• The Daytime Running Lamps (DRL) are inoperative	• Fuse • Wiring, terminals or connectors • DRL relay • Body Control Module (BCM)	• GO to Pinpoint Test F .
• The Daytime Running Lamps (DRL) are on with the ignition off	• Wiring, terminals or connectors • DRL relay • Body Control Module (BCM)	• GO to Pinpoint Test G .

Pinpoint Tests

Pinpoint Test F: The Daytime Running Lamps (DRL) Are Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps for schematic and connector information.

Normal Operation

Voltage at all times to the switch and coil sides of the Daytime Running Lamps (DRL) relay. When the ignition is in RUN, voltage the is supplied Body Control Module (BCM) from an ignition switch input circuit.

When the headlamps are not on and the BCM detects the ignition in RUN, the BCM provides ground for the DRL relay coil, energizing the relay. The DRL relay provides voltage to the low beam relay through a resistor wire. The voltage passes through the low beam relay and on to the existing low beam circuitry, illuminating the headlamps at a reduced intensity.

- DTC B1092:12 (Daytime Running Light Relay: Circuit Short To Battery) — a continuous and on-demand DTC that sets when the BCM detects a short to voltage from the DRL relay coil ground controlled circuit.
- DTC B1092:14 (Daytime Running Light Relay: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects an open from the DRL relay coil ground controlled circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DRL relay
- BCM

PINPOINT TEST F: THE DRL ARE INOPERATIVE

Test Step	Result / Action to Take
F1 CHECK THE LOW BEAM OPERATION	
• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • **Do both low beams illuminate?**	**Yes** VERIFY the BJB fuse 25 (15A) is OK. If OK, GO to F2 . If not OK, REFER to the Wiring Diagrams

	manual to identify the possible causes of the circuit short. **No** GO to Pinpoint Test A.
F2 CHECK THE DRL RELAY	
• Place the headlamp switch in the HEADLAMPS OFF position. • Ignition OFF. • Disconnect: DRL Relay. • Substitute a known good relay. • Ignition ON. • **Do the headlamps illuminate?**	**Yes** REMOVE the known good relay. INSTALL a new DRL relay. TEST the system for normal operation. **No** REMOVE the known good relay. GO to F3.
F3 CHECK FOR VOLTAGE TO THE DRL RELAY	
• Ignition OFF. • Measure the voltage between the DRL relay pin 1, circuit SBB25 (RD), BJB face side and ground; and between the DRL relay pin 3, circuit SBB25 (RD), BJB face side and ground.  N0117265 • **Are the voltages greater than 10 volts?**	**Yes** GO to F4. **No** REPAIR circuit SBB25 (RD) for an open. TEST the system for normal operation.
F4 BYPASS THE DRL RELAY	
• Connect a fused jumper wire between the DRL relay pin 3, circuit SBB25 (RD), BJB face side and the DRL relay pin 5, circuit CLF13 (YE/BU), BJB face side.  N0117266 • **Do the headlamps illuminate?**	**Yes** REMOVE the jumper wire. GO to F6. **No** LEAVE the jumper wire connected. GO to F5.
F5 CHECK THE LOW BEAM RELAY	

• Disconnect: Low Beam Relay. • Substitute a known good relay. • **Do the headlamps illuminate?**	**Yes** REMOVE the jumper wire and the known good relay. INSTALL a new low beam relay. TEST the system for normal operation. **No** REMOVE the jumper wire and the known good relay. REPAIR circuit CLF13 (YE/BU) for an open. TEST the system for normal operation.
F6 CHECK THE DRL RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: BCM C2280D. • Ignition ON. • Measure the voltage between the BCM C2280D-8, circuit CLF10 (GN/OG), harness side and ground.  N0117267 • **Is any voltage present?**	**Yes** REPAIR circuit CLF10 (GN/OG) for a short to voltage. CYCLE the ignition ON then OFF. CLEAR the DTCs. TEST the system for normal operation. **No** GO to F7 .
F7 CHECK THE DRL RELAY COIL GROUND CONTROLLED CIRCUIT FOR AN OPEN	
• Ignition OFF. • Connect: DRL Relay. • Ignition ON. • Measure the voltage between the BCM C2280D-8, circuit CLF10 (GN/OG), harness side and ground.  N0117267 • **Is the voltage greater than 10 volts?**	**Yes** GO to F8 . **No** REPAIR circuit CLF10 (GN/OG) for an open. CLEAR the DTCs. TEST the system for normal operation.
F8 CHECK THE IGNITION ON INPUT CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: BCM C2280B. • Ignition ON. • Measure the voltage between the BCM C2280B-4, circuit CBP21 (BU/GY), harness side and ground.  N0114660 • **Is the voltage greater than 10 volts?**	**Yes** GO to F9 . **No** VERIFY the CJB fuse 21 (10A) is OK. If OK, REPAIR circuit CBP21 (BU/GY) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
F9 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Daytime Running Lamps (DRL) Are On With The Ignition Off

Refer to Wiring Diagrams Cell 85 , Headlamps for schematic and connector information.

Normal Operation

Voltage at all times to the switch and coil sides of the Daytime Running Lamps (DRL) relay. Voltage is supplied from an ignition switch input circuit to the Body Control Module (BCM) when the ignition is in RUN.

When the headlamps are not on and the BCM detects the ignition in RUN, the BCM provides ground for the DRL relay coil, energizing the relay. The DRL relay provides voltage to the low beam relay through a resistor wire. The voltage passes through the low beam relay and on to the existing low beam circuitry, illuminating the headlamps at a reduced intensity.

- DTC B1092:14 (Daytime Running Light Relay: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the DRL relay coil ground controlled circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- DRL relay

- BCM

PINPOINT TEST G: THE DRL ARE ON WITH THE IGNITION OFF

Test Step	Result / Action to Take
G1 CHECK THE DRL RELAY OUTPUT	
• Ignition OFF. • Disconnect: DRL Relay. • **Do the headlamps continue to illuminate?**	**Yes** GO to G2. **No** GO to G3.
G2 CHECK THE DRL RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Low Beam Relay. • Measure the voltage between the DRL relay pin 5, circuit CLF13 (YE/BU), BJB face side and ground.  N0117268 • **Is any voltage present?**	**Yes** REPAIR circuit CLF13 (YE/BU) for a short to voltage. TEST the system for normal operation. **No** GO to Pinpoint Test C.
G3 CHECK THE DRL RELAY	
• Substitute a known good relay. • **Do the headlamps continue to illuminate?**	**Yes** REMOVE the known good relay. GO to G4. **No** REMOVE the known good relay. INSTALL a new DRL relay. TEST the system for normal operation.
G4 CHECK THE DRL RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: BCM C2280D. • Measure the resistance between the BCM C2280D-8, circuit CLF10 (GN/OG), harness side and ground.	**Yes** GO to G5. **No** REPAIR circuit CLF10 (GN/OG) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.

 N0117308 • **Is the resistance greater than 10,000 ohms?**	

G5 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Stoplamps

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

4-Door Vehicles

The stoplamp switch is provided voltage at all times. When the brake pedal is applied, voltage is routed to the high mounted stoplamp and to the LH and RH turn relays. The voltage passes through the turn relays, on to the LH and RH stoplamps. The stoplamps are combination rear stop/turn lamps.

5-Door Vehicles

The stoplamp switch is provided voltage at all times. When the brake pedal is applied, voltage is routed to all of the stoplamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Stoplamp switch	• Central Junction Box (CJB) fuse 18 (10A) (stoplamp switch) ▪ • Bulb • Bulb socket

	• Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM.

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• All the stoplamps are inoperative	• Fuse • Wiring, terminals or connectors • Stoplamp switch	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test H.
• One or more stoplamps are inoperative	• Wiring, terminals or connectors • Bulb socket • High mounted stoplamp • Turn relay	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test I.

	• Body Control Module (BCM)	
• The stoplamps are on continuously	• Wiring, terminals or connectors • Stoplamp switch • PCM	• GO to Pinpoint Test J .

Pinpoint Tests

Pinpoint Test H: All The Stoplamps Are Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The stoplamp switch is provided voltage at all times from the Central Junction Box (CJB) fuse 18 (10A). The stoplamps are combination rear stop/turn lamps.

On 4-door vehicles, when the brake pedal is applied, voltage is routed to the high mounted stoplamp and to the LH and RH turn relays. The voltage passes through the turn relays, to the LH and RH stoplamps.

On 5-door vehicles, when the brake pedal is applied, voltage is routed to all of the stoplamps.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Stoplamp switch

PINPOINT TEST H: ALL THE STOPLAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 CHECK FOR VOLTAGE TO THE STOPLAMP SWITCH	
• Ignition OFF. • Disconnect: Stoplamp Switch C2314. • Measure the voltage between the stoplamp switch C2314-1, circuit SBP18 (YE/RD), harness side and ground.	**Yes** GO to H2 . **No** VERIFY the CJB fuse 18 (10A) is OK. If OK, GO to H2 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

 N0037278 • **Is the voltage greater than 10 volts?**	
H2 BYPASS THE STOPLAMP SWITCH	
• Connect a fused jumper wire between the stoplamp switch C2314-1, circuit SBP18 (YE/RD), harness side and the stoplamp switch C2314-2, circuit CCA26 (BU/GY), harness side.  N0047016 • **Are the stoplamps illuminated?**	**Yes** REMOVE the jumper wire. INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR circuit CCA26 (BU/GY) for an open. TEST the system for normal operation.

Pinpoint Test I: One Or More Stoplamps Are Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation — 4-Door

When the brake pedal is applied, voltage is routed to the high mounted stoplamp and to the LH and RH turn relays. The voltage passes through the turn relays, on to the LH and RH stoplamps. When a turn relay is energized (during turn lamp operation), voltage from the stoplamp switch is interrupted. The stoplamps are combination rear stop/turn lamps.

5-Door

On 5-door vehicles, when the brake pedal is applied, voltage is routed to all of the stoplamps.

- DTC B132B:14 (Left Stop/Turn Lamp: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the LH rear turn lamp relay coil ground controlled circuit.
- DTC B132C:14 (Right Stop/Turn Lamp: Circuit Short To Ground Or Open) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the RH rear turn lamp relay coil ground controlled circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Bulb socket
- High mounted stoplamp
- Turn relay
- BCM

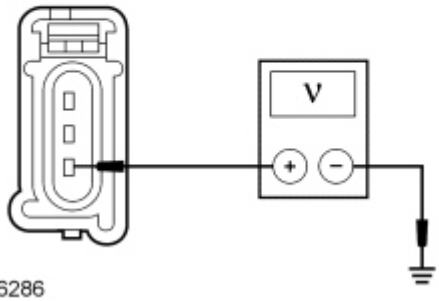
PINPOINT TEST I: ONE OR MORE STOPLAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
I1 DETERMINE THE INOPERATIVE STOPLAMP	
• Ignition OFF. • Apply the brake pedal and observe the stoplamps. • **Are all the stoplamps inoperative?**	**Yes** GO to Pinpoint Test H. **No** For an inoperative high mounted stoplamp, GO to I2. For an inoperative rear lamp on a 5-door vehicle, GO to I4. For an inoperative rear lamp on a 4-door vehicle, GO to I6.
I2 CHECK FOR VOLTAGE TO THE HIGH MOUNTED STOPLAMP	
• Disconnect: High Mounted Stoplamp C904 or C9040. • For 4-door vehicles, while applying the brake pedal, measure the voltage between the high mounted stoplamp C904-1, circuit CCA26 (BU/GY), harness side and ground.  A0025385 • For 5-door vehicles, while applying the brake pedal, measure the voltage between the high mounted stoplamp C9040-1, circuit CCA26	**Yes** GO to I3. **No** REPAIR circuit CCA26 (BU/GY) for an open. TEST the system for normal operation.

(BU/GY), harness side and ground.  N0107644 • **Is the voltage greater than 10 volts?**	
I3 CHECK THE HIGH MOUNTED STOPLAMP GROUND CIRCUIT FOR AN OPEN	
• For 4-door vehicles, while applying the brake pedal, measure the voltage between the high mounted stoplamp C904-1, circuit CCA26 (BU/GY), harness side and the high mounted stoplamp C904-2, circuit GD143 (BK/VT), harness side.  N0090415 • For 5-door vehicles, while applying the brake pedal, measure the voltage between the high mounted stoplamp C9040-1, circuit CCA26 (BU/GY), harness side and the high mounted stoplamp C9040-2, circuit GD143 (BK/VT), harness side.  N0107645 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new high mounted stoplamp. REFER to High Mounted Stoplamp in this section. TEST the system for normal operation. **No** REPAIR circuit GD143 (BK/VT) for an open. TEST the system for normal operation.
I4 CHECK FOR VOLTAGE TO THE REAR LAMP	
• Disconnect: Inoperative Rear Lamp. • While applying the brake pedal, measure the voltage between the LH	**Yes** GO to I5 .

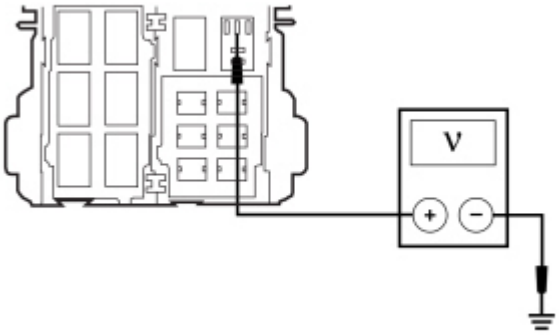
rear lamp C414-3, circuit CCA26 (BU/GY), harness side and ground; or between the RH rear lamp C417-3, circuit CCA26 (BU/GY), harness side and ground.  N0117269 • **Is the voltage greater than 10 volts?**	**No** REPAIR circuit CCA26 (BU/GY) for an open. TEST the system for normal operation.
I5 CHECK THE REAR LAMP GROUND CIRCUIT FOR AN OPEN	
• While applying the brake pedal, measure the voltage between the LH rear lamp C414-3, circuit CCA26 (BU/GY), harness side and the LH rear lamp C414-1, circuit GD143 (BK/VT), harness side; or between the RH rear lamp C417-3, circuit CCA26 (BU/GY), harness side and the RH rear lamp C417-1, circuit GD145 (BK/BU), harness side.  N0117270 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR or INSTALL a new rear lamp harness. TEST the system for normal operation. **No** REPAIR circuit GD143 (BK/VT) (LH rear lamp) or circuit GD145 (BK/BU) (RH rear lamp) for an open. TEST the system for normal operation.
I6 CHECK FOR VOLTAGE TO THE BULB SOCKET	
• Disconnect: Inoperative Rear Lamp. • While applying the brake pedal, measure the voltage between the LH rear lamp C412-3, circuit CLS55 (GN/BU), harness side and ground; or between the RH rear lamp C415-3, circuit CLS54 (BU/OG), harness side and ground.	**Yes** GO to I7 . **No** GO to I8 .



N0066286

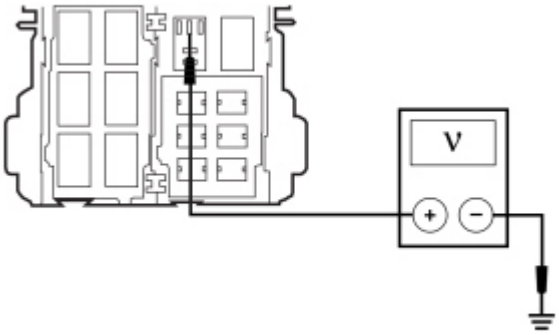
- **Is the voltage greater than 10 volts?**

I7 CHECK THE REAR LAMP GROUND CIRCUIT FOR AN OPEN	
• While applying the brake pedal, measure the voltage between the LH rear lamp C412-3, circuit CLS55 (GN/BU), harness side and the LH rear lamp C412-1, circuit GD143 (BK/VT), harness side; or between the RH rear lamp C415-3, circuit CLS54 (BU/OG), harness side and the RH rear lamp C415-1, circuit GD145 (BK/BU), harness side.  N0088174 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new bulb socket. TEST the system for normal operation. **No** REPAIR circuit GD143 (BK/VT) (LH rear lamp) or circuit GD145 (BK/BU) (RH rear lamp) for an open. TEST the system for normal operation.
I8 CHECK THE TURN RELAY	
• Connect: Inoperative Rear Lamp. • Disconnect: Suspect Turn Relay. • Substitute a known good relay. • Apply the brake pedal and observe the stoplamps. • **Does the stoplamp in question illuminate?**	**Yes** REMOVE the known good relay. INSTALL a new turn relay. TEST the system for normal operation. **No** REMOVE the known good relay. GO to I9 .
I9 CHECK FOR VOLTAGE TO THE TURN RELAY	
• For the LH stoplamp, while applying the brake pedal, measure the voltage between the LH turn relay pin 4, circuit CCA26 (BU/GY), CJB face side and ground.	**Yes** GO to I10 . **No** REPAIR circuit CCA26 (BU/GY) for an open. TEST the system for normal operation.



N0117271

- For the RH stoplamp, while applying the brake pedal, measure the voltage, between the RH turn relay pin 4, circuit CCA26 (BU/GY), CJB face side and ground.

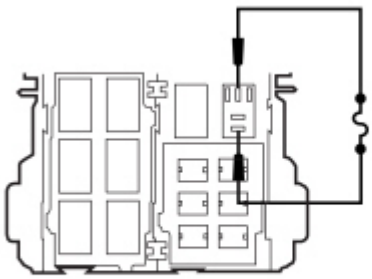


N0117272

- **Is the voltage greater than 10 volts?**

I10 BYPASS THE TURN RELAY

- For the LH stoplamp, connect a fused jumper wire between the LH turn relay pin 4, circuit CCA26 (BU/GY), CJB face side and the LH turn relay pin 3, circuit CLS55 (GN/BU), CJB face side.

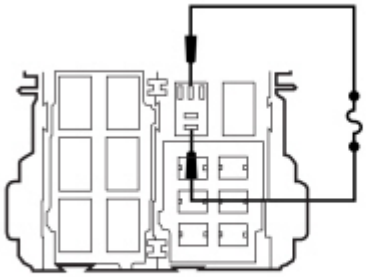


N0117273

- For the RH stoplamp, connect a fused jumper wire between the RH turn relay pin 4, circuit CCA26 (BU/GY), CJB face side and the LH turn relay pin 3, circuit CLS54 (BU/OG), CJB face side.

Yes
REMOVE the jumper wire. GO to I11 .

No
REMOVE the jumper wire. REPAIR circuit CLS55 (GN/BU) (LH rear lamp) or circuit CLS54 (BU/OG) (RH rear lamp) for an open. TEST the system for normal operation.



N0117274

- Apply the brake pedal and observe the stoplamps.
- **Does the stoplamp in question illuminate?**

I11 CHECK THE TURN RELAY COIL GROUND CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: BCM C2280D. • For the LH stoplamp, measure the resistance between the LH turn relay pin 2, circuit CLS51 (WH/GN), harness side and the ground.  N0117275 • For the RH stoplamp, measure the resistance between the RH turn relay pin 2, circuit CLS53 (GY/VT), harness side and the ground.  N0117276 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I12 . **No** REPAIR circuit CLS51 (WH/GN) (LH stoplamp) or circuit CLS53 (GY/VT) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
I12 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal

• Operate the system and verify the concern is still present. • **Is the concern still present?**	operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Stoplamps Are On Continuously

Normal Operation

On 4-door vehicles, when the brake pedal is applied, voltage is routed to the PCM, the high mounted stoplamp and to the LH and RH turn relays. The voltage passes through the turn relays, on to the LH and RH stoplamps.

On 5-door vehicles, when the brake pedal is applied, voltage is routed to the PCM and all of the stoplamps.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stoplamp switch
- PCM

PINPOINT TEST J: THE STOPLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
J1 CHECK THE STOPLAMP SWITCH	
• Disconnect: Stoplamp Switch C2314. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J2 . **No** INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. TEST the system for normal operation.
J2 CHECK THE PCM	
• Disconnect: PCM C175B. • **Do the stoplamps continue to illuminate?**	**Yes** For 4-door vehicles, GO to J3 . For 5-door vehicles, REPAIR circuit CCA26 (BU/GY) for a short to voltage. TEST the system for normal operation. **No** GO to J4 .
J3 ISOLATE THE SHORT TO VOLTAGE	
• Disconnect: LH and RH Turn Relays. • **Does the high mounted**	**Yes** REPAIR circuit CCA26 (BU/GY) for a short to voltage. TEST the system for normal operation.

stoplamp continue to illuminate?	**No** REPAIR circuit CLS55 (GN/BU) (LH stoplamp) or circuit CLS54 (BU/OG) for a short to voltage. TEST the system for normal operation.
J4 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Turn Signal and Hazard Lamps

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Body Control Module (BCM) monitors the multifunction switch position by sending voltage signals to the multifunction switch and the Front Controls Interface Module (FCIM). When the multifunction switch is in the LH or RH TURN position, or the hazard flasher lamp switch is pressed, that input signal is routed to ground.

When the BCM receives a request for a turn signal or hazard lamp function, the BCM supplies on/off voltage to the appropriate turn lamps.

On 4-door vehicles, turn relays interrupt the stoplamp switch output and allow the BCM to control voltage to the combination stop/turn lamps.

The timed on/off cycle for the turn lamps is determined by the BCM and is set to flash approximately 75 times per minute if both the front and rear turn lamps operate correctly. If an individual turn lamp is inoperative, the BCM flashes the remaining turn lamp approximately 150 times per minute.

The timed on/off cycle for the hazard lamp function is set to flash all the turn lamps approximately 75 times per minute.

Field-Effect Transistor (FET) Protection

A Field-Effect Transistor (FET) is a type of transistor that, when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes a FET protective circuit strategy for many of its outputs (such as a turn lamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are

shut down when a fault event is detected. A short circuit DTC sets when the fault event occurs.

The circuit remains off until the fault is corrected and the ignition is cycled off and then back on, the module resets the FET protection and allows the circuit to function.

The FET protected circuits for the turn lamp system are the turn relay coil ground circuits and the front and rear turn lamp voltage supply circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch • Front Controls Interface Module (FCIM)	• Bulb • Bulb socket(s) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Body Control Module (BCM).

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The turn signal function is inoperative	• Wiring, terminals or connectors • Multifunction switch • Body Control Module (BCM)	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test K.
• The turn signal function is always on	• Wiring, terminals or connectors • Multifunction switch • BCM	• GO to Pinpoint Test L.
• **NOTE:** NOTE: LED lamps draw low current compared to an incandescent bulb. The Smart Junction Box (SJB) interprets this as a bulb out and fast flashes (bulb outage mode) the turn lamps. The turn signal lamps fast flash and no bulbs are inoperative	• Bulb(s)	• INSTALL a correct bulbs as necessary. TEST the system for normal operation.
• One turn signal/hazard lamp is inoperative/always on (4-door)	• Wiring, terminals or connectors • Bulb socket • Turn relay • BCM	• VERIFY the bulb is OK. If OK, GO to Pinpoint Test M.
• One turn signal/hazard lamp is inoperative/always on (5-door)	• Wiring, terminals or connectors • Bulb socket • BCM	• VERIFY the bulb is OK. If OK, GO to Pinpoint Test N.
• The hazard lamp function is inoperative/always on	• Wiring, terminals or connectors • Front Controls Interface Module (FCIM) • BCM	• GO to Pinpoint Test O.

Pinpoint Tests

Pinpoint Test K: The Turn Signal Function Is Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage signals to the multifunction switch to monitor the LH and RH turn input circuits. The voltage signal is routed to ground when the multifunction switch is placed in the LH or RH TURN position. When the BCM detects the multifunction switch is in the LH or RH TURN position, the BCM sends voltage to the appropriate turn lamps.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- BCM

PINPOINT TEST K: THE TURN SIGNAL FUNCTION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
K1 CHECK FOR CORRECT HIGH BEAM OPERATION	
• Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the high beam headlamps. • **Do the high beams operate correctly?**	**Yes** GO to K2 . **No** REFER to Headlamps in this section.
K2 BYPASS THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202A. • For an inoperative LH turn signal, connect a fused jumper wire between the multifunction switch C202A-4, circuit CLS39 (VT/WH), harness side and the multifunction switch C202A-9, circuit GD115 (BK/GY), harness side.  N0117277 • For an inoperative RH turn signal, connect a fused jumper wire between the multifunction switch C202A-8, circuit CLS41 (GY/YE),	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to K3 .

harness side and the multifunction switch C202A-9, circuit GD115 (BK/GY), harness side.  N0117278 • Ignition ON. • **Do the turn signals in question flash on and off?**	
K3 CHECK THE TURN LAMP REQUEST INPUT CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280E. • For an inoperative LH turn signal, measure the resistance between the multifunction switch C202A-4, circuit CLS39 (VT/WH), harness side and the BCM C2280E-7, circuit CLS39 (VT/WH), harness side.  N0117279 • For an inoperative RH turn signal, measure the resistance between the multifunction switch C202A-8, circuit CLS41 (GY/YE), harness side and the BCM C2280E-8, circuit CLS41 (GY/YE), harness side.  N0117280 • **Is the resistance less than 5 ohms?**	**Yes** GO to K4 . **No** REPAIR circuit CLS39 (VT/WH) (LH turn) or circuit CLS41 (GY/YE) (RH turn) for an open. TEST the system for normal operation.
K4 CHECK FOR CORRECT BCM OPERATION	
• Disconnect all the BCM connectors.	**Yes**

• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Turn Signal Function Is Always On

Refer to Wiring Diagrams Cell 90, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage signals to the multifunction switch to monitor the LH and RH turn input circuits. The voltage signal is routed to ground when the multifunction switch is placed in the LH or RH TURN position. When the BCM detects the multifunction switch is in the LH or RH TURN position, the BCM sends voltage to the appropriate turn lamps.

- DTC B1D36:92 (Turn Indicator Switch: Performance Or Incorrect Operation) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the LH and/or the RH turn signal switch input.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- BCM

PINPOINT TEST L: THE TURN SIGNAL FUNCTION IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202A. • Ignition ON. • **Do the turn lamps continue to flash on and off?**	**Yes** GO to L2. **No** INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation.
L2 CHECK THE TURN LAMP REQUEST INPUT CIRCUIT FOR A	

SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280E. • Measure the resistance between the multifunction switch C202A-4 (LH turn lamps), circuit CLS39 (VT/WH), harness side and ground; or between the multifunction switch C202A-8 (RH turn lamps), circuit CLS41 (GY/YE), harness side and ground.  N0117281 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L3 . **No** REPAIR circuit CLS39 (VT/WH) (LH turn) or circuit CLS41 (GY/YE) (RH turn) for a short to ground. TEST the system for normal operation.
L3 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: One Turn Signal/Hazard Lamp Is Inoperative/Always On (4-Door)

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

When the Body Control Module (BCM) detects the multifunction switch is in the LH TURN position, the BCM provides ground for the LH turn relay coil to interrupt the stoplamp switch output to the LH rear lamp, and simultaneously provides on/off voltage to the LH front turn lamp on one output circuit, and to the LH turn relay (switch side) and LH exterior mirror turn lamp (if equipped) on another circuit.

When the Body Control Module (BCM) detects the multifunction switch is in the RH TURN position, the BCM provides ground for the RH turn relay coil to interrupt the stoplamp switch output to the RH rear lamp, and simultaneously provides on/off voltage to the RH front turn lamp on one output circuit, and to the RH turn relay (switch side) and RH exterior mirror turn lamp (if equipped) on another circuit.

The rear lamps are combination stop/turn lamps and are controlled through the rear stoplamp circuitry.

DTC Description	Fault Trigger Conditions
• B132B:12 — Left Stop/Turn Lamp: Circuit Short To Battery	A continuous and on-demand DTC that sets when the BCM detects a short to voltage from the LH turn relay coil ground controlled circuit.
• B132B:14 — Left Stop/Turn Lamp: Circuit Short To Ground Or Open	A continuous and on-demand DTC that sets when the BCM detects an open or short to ground from the LH turn relay coil ground controlled circuit.
• B132C:12 — Right Stop/Turn Lamp: Circuit Short To Battery	A continuous and on-demand DTC that sets when the BCM detects a short to voltage from the RH turn relay coil ground controlled circuit.
• B132C:14 — Right Stop/Turn Lamp: Circuit Short To Ground Or Open	A continuous and on-demand DTC that sets when the BCM detects an open or short to ground from the RH turn relay coil ground controlled circuit.
• B1D06:11 — Left Turn Indicator: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the LH front or LH rear turn lamp voltage supply circuits.
• B1D06:15 — Left Turn Indicator: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects an open or short to voltage from the LH front or LH rear turn lamp voltage supply circuits.
• B1D07:11 — Right Turn Indicator: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the RH front or RH rear turn lamp voltage supply circuits.
• B1D07:15 — Right Turn Indicator: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects an open or short to voltage from the RH front or RH rear turn lamp voltage supply circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Bulb socket
- Turn relay
- BCM

PINPOINT TEST M: ONE TURN SIGNAL/HAZARD LAMP IS INOPERATIVE/ALWAYS ON (4-DOOR)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 CHECK THE STOPLAMPS	
• Ignition OFF. • Apply and release the brake pedal while observing the stoplamps. • **Do the stoplamps operate correctly?**	**Yes** GO to M2 . **No** REFER to Stoplamps in this section.
M2 DETERMINE IF A TURN LAMP IS ALWAYS ON	
NOTE: If the turn lamps are flashing, GO to Pinpoint Test L . • Ignition ON.	**Yes** GO to M3 .

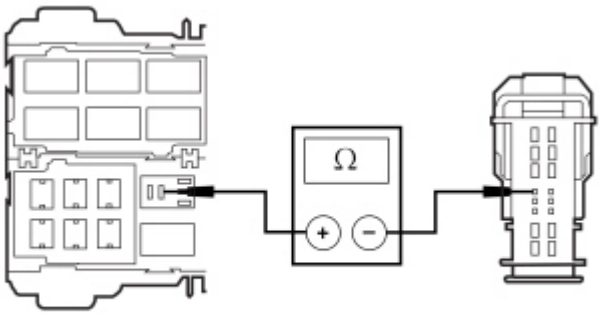
• Activate the hazard lamp function and monitor the turn lamps. • **Is any turn lamp on?**	**No** For a front turn lamp, GO to M4 . For a rear or exterior mirror turn lamp, GO to M9 .
M3 CHECK THE BCM TURN LAMP OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Deactivate the hazard lamp function . • Ignition OFF. • Disconnect: BCM C2280A (Front Turn Lamp). • Disconnect: BCM C2280C (Rear or Exterior Mirror Turn Lamp). • Ignition ON. • Activate the hazard lamp function . • **Does the turn lamp in question continue to illuminate?**	**Yes** For the LH front turn lamp, REPAIR circuit CLS21 (BU/GN) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. For the RH front turn lamp, REPAIR circuit CLS25 (YE/VT) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. For the LH rear or exterior mirror turn lamp, REPAIR circuit CLS23 (GY/OG) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. For the RH rear or exterior mirror turn lamp, REPAIR circuit CLS27 (GN/OG) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. **No** GO to M19 .
M4 CHECK FOR VOLTAGE TO THE FRONT TURN LAMP	
• Ignition OFF. • Disconnect: Inoperative Front Lamp. • Activate the hazard lamp function . • Measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.  N0066286 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	**Yes** GO to M5 . **No** GO to M6 .
M5 CHECK THE FRONT TURN LAMP GROUND CIRCUIT FOR	

AN OPEN	
• Measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and the LH front lamp C1023-1, circuit GD188 (BK/YE), harness side; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and the RH front lamp C1043-1, circuit GD123 (BK/GY), harness side.  N0088174 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	**Yes** INSTALL a new bulb socket. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR circuit GD188 (BK/YE) (LH turn) or circuit GD123 (BK/GY) (RH turn) for an open. CLEAR the DTCs. TEST the system for normal operation.
M6 CHECK THE FRONT TURN LAMP BULB SOCKET FOR A SHORT TO GROUND	
• Deactivate the hazard lamp function . • Cycle the ignition on then off. • Activate the hazard lamp function . • Measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.  N0066286 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	**Yes** INSTALL a new bulb socket. CLEAR the DTCs. TEST the system for normal operation. **No** GO to M7 .
M7 CHECK THE FRONT TURN LAMP VOLTAGE CIRCUIT FOR A SHORT TO GROUND	
• Deactivate the hazard lamp function . • Disconnect: BCM C2280A. • Measure the resistance between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.	**Yes** GO to M8 . **No** REPAIR circuit CLS21 (BU/GN) (LH turn) or CLS25 (YE/VT) (RH turn) for a short to ground.

 N0077657 • **Is the resistance greater than 10,000 ohms?**	CLEAR the DTCs. CYCLE the ignition. TEST the system for normal operation.
M8 CHECK THE FRONT TURN LAMP VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the resistance between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and the BCM C2280A-5, circuit CLS21 (BU/GN), harness side; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and the BCM C2280A-6, circuit CLS25 (YE/VT), harness side.  N0117282 • **Is the resistance less than 5 ohms?**	**Yes** GO to M19 . **No** REPAIR circuit CLS21 (BU/GN) (LH turn) or CLS25 (YE/VT) (RH turn) for an open. CLEAR the DTCs. TEST the system for normal operation.
M9 USE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Deactivate the hazard lamp function. • Check the recorded results from the BCM on-demand self-test. • **Is DTC B1D06:11 or DTC B1D07:11 present?**	**Yes** If equipped with exterior mirror turn lamps, GO to M10 . If not equipped with exterior mirror turn lamps, GO to M11 . **No** GO to M12 .
M10 CHECK THE EXTERIOR MIRROR FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: LH Exterior Mirror C521 (DTC B1D06:11). • Disconnect: RH Exterior Mirror C601 (DTC B1D07:11). • Cycle the ignition on and then off. • Activate the hazard lamp function. • **Does the rear lamp flash on and off?**	**Yes** INSTALL a new exterior mirror. REFER to Section 501-09 . TEST the system for normal operation. **No** GO to M11 .

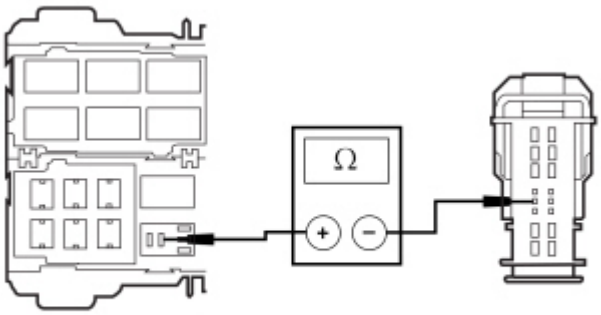
M11 CHECK THE BCM REAR TURN LAMP OUTPUT CIRCUIT FOR A SHORT TO GROUND	
• Deactivate the hazard lamp function. • Disconnect: Corresponding LH or RH Turn Relay. • Disconnect: BCM C2280C. • Measure the resistance between the BCM C2280C-12 (DTC B1D06:11), circuit CLS23 (GY/OG), harness side and ground; or between the BCM C2280C-13 (DTC B1D07:11), circuit CLS27 (GN/OG), harness side and ground.  N0117312 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M19 . **No** REPAIR circuit CLS23 (GY/OG) (LH turn) or circuit CLS27 (GN/OG) (RH turn) for a short to ground. CLEAR the DTCs. CYCLE the ignition. TEST the system for normal operation.
M12 CHECK FOR VOLTAGE TO THE TURN RELAY OR EXTERIOR MIRROR	
NOTE: If both the rear turn and exterior mirror turn lamps are inoperative, follow the diagnostics for the rear turn lamp. • Ignition OFF. • Disconnect: Suspect Turn Relay or Exterior Mirror. • Activate the hazard lamp function. • For an inoperative rear turn lamp, measure the voltage between the LH turn relay pin 5, CJB face side, circuit CLS23 (GY/OG), harness side and ground; or between the RH turn relay pin 5, CJB face side, circuit CLS27 (GN/OG), harness side and ground.  N0117284 • For an inoperative exterior mirror turn lamp, measure the voltage between the LH exterior mirror, C521-8, circuit CLS23 (GY/OG), harness side and ground; or between the RH exterior mirror, C601-8, circuit CLS27 (GN/OG), harness side and ground.	**Yes** For an inoperative exterior mirror turn lamp, GO to M13 . For an inoperative rear turn lamp, GO to M15 . **No** For an inoperative exterior mirror turn lamp, REPAIR circuit CLS23 (GY/OG) (LH turn) or circuit CLS27 (GN/OG) (RH turn) for an open. TEST the system for normal operation. For an inoperative rear turn lamp, GO to M14 .

 N0117285 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	
M13 CHECK THE EXTERIOR MIRROR GROUND CIRCUIT FOR AN OPEN	
• Measure the voltage between the LH exterior mirror C521-8, circuit CLS23 (GY/OG), harness side and the LH exterior mirror C521-2, circuit GD143 (BK/VT), harness side; or between RH exterior mirror, C601-8, circuit CLS27 (GN/OG), harness side and the RH exterior mirror C601-2, circuit GD145 (BK/BU), harness side.  N0117286 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	**Yes** INSTALL a new exterior mirror. REFER to Section 501-09 . TEST the system for normal operation. **No** REPAIR the circuit GD143 (BK/VT) (LH turn) or circuit GD145 (BK/BU) (RH turn) for an open. TEST the system for normal operation.
M14 CHECK THE BCM REAR TURN LAMP OUTPUT CIRCUIT FOR AN OPEN	
• Deactivate the hazard lamp function. • Disconnect: BCM C2280C. • For an inoperative LH rear turn lamp, measure the resistance between the LH turn relay pin 5, circuit CLS23 (GY/OG), CJB face side and the BCM C2280C-12, circuit CLS23 (GY/OG), harness side.	**Yes** GO to M19 . **No** REPAIR circuit CLS23 (GY/OG) (LH turn) or circuit CLS27 (GN/OG) (RH turn) for an open. CLEAR the DTCs. TEST the system for normal operation.



N0117310

- For an inoperative RH rear turn lamp, measure the resistance between the RH turn relay pin 5, circuit CLS27 (GN/OG), CJB face side and the BCM C2280C-13, circuit CLS27 (GN/OG), harness side.



N0117311

- **Is the resistance less than 5 ohms?**

M15 CHECK THE TURN RELAY	
• Deactivate the hazard lamp function. • Substitute a known good relay. • Activate the hazard lamp function. • **Does the suspect rear turn lamp flash on and off?**	**Yes** REMOVE the known good relay. INSTALL a new turn relay. TEST the system for normal operation. **No** REMOVE the known good relay. GO to M16 .
M16 CHECK THE FOR VOLTAGE TO THE TURN RELAY	
• Deactivate the hazard lamp function. • Measure the voltage between the LH turn relay pin 1, circuit SBP18 (YE/RD), CJB face side and ground; or between the RH turn relay pin 1, circuit SBP18 (YE/RD), CJB face side and ground.	**Yes** GO to M17 . **No** REPAIR circuit SBP18 (YE/RD) for an open. TEST the system for normal operation

 N0117289 • **Is the voltage greater than 10 volts?**	
M17 CHECK THE TURN RELAY GROUND CONTROLLED CIRCUIT FOR A SHORT TO VOLTAGE • Disconnect: BCM C2280D. • Ignition ON. • Measure the voltage between the LH turn relay pin 2, circuit CLS51 (WH/GN), CJB face side and ground; or between the RH turn relay pin 2, circuit CLS53 (GY/VT), CJB face side and ground.  N0117290 • **Is any voltage present?**	**Yes** REPAIR circuit CLS51 (WH/GN) (LH turn) or circuit CLS53 (GY/VT) (RH turn) for a short to voltage. CLEAR the DTCs. CYCLE the ignition. TEST the system for normal operation. **No** GO to M18 .
M18 CHECK THE TURN RELAY GROUND CONTROLLED CIRCUIT FOR AN OPEN • Ignition OFF. • Connect: Suspect Turn Relay. • Measure the voltage between the BCM C2280D-6 (LH turn), circuit CLS51 (WH/GN), harness side and ground; or between the BCM C2280D-7 (RH turn), circuit CLS53 (GY/VT), harness side and ground.	**Yes** GO to M19 . **No** REPAIR circuit CLS51 (WH/GN) (LH turn) or circuit CLS53 (GY/VT) (RH turn) for an open. CLEAR the DTCs. TEST the system for normal operation.

 N0117291 • **Is the voltage greater than 10 volts?**	

M19 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: One Turn Signal/Hazard Lamp Is Inoperative/Always On (5-Door)

Refer to Wiring Diagrams Cell 90, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

When the Body Control Module (BCM) detects the multifunction switch is in the LH TURN position, the BCM provides on/off voltage to the LH front turn lamp on one output circuit, and to the LH rear and LH exterior mirror turn lamp (if equipped) on another circuit.

When the BCM detects the multifunction switch is in the RH TURN position, the BCM provides on/off voltage to the RH front turn lamp on one output circuit, and to the RH rear and RH exterior mirror turn lamp (if equipped) on another circuit.

DTC Description	Fault Trigger Conditions
• B1D06:11 — Left Turn Indicator: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the LH front or LH rear turn lamp voltage supply circuits.
• B1D06:15 — Left Turn Indicator: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects an open or short to voltage from the LH front or LH rear turn lamp voltage supply circuits.
• B1D07:11 — Right Turn Indicator: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the RH front or RH rear turn lamp voltage supply circuits.
• B1D07:15 — Right Turn	A continuous and on-demand DTC that sets when the BCM

Indicator: Circuit Short To Battery Or Open	detects an open or short to voltage from the RH front or RH rear turn lamp voltage supply circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Bulb socket
- BCM

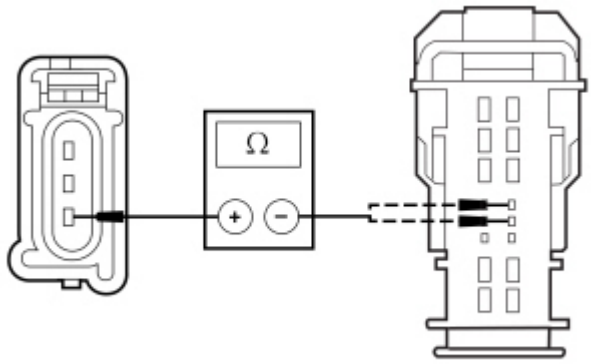
PINPOINT TEST N: ONE TURN SIGNAL/HAZARD LAMP IS INOPERATIVE/ALWAYS ON (5-DOOR)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
N1 CHECK THE STOPLAMPS	
• Ignition OFF. • Apply and release the brake pedal while observing the stoplamps. • **Do the stoplamps operate correctly?**	**Yes** GO to N2. **No** REFER to Stoplamps in this section.
N2 DETERMINE IF A TURN LAMP IS ALWAYS ON	
NOTE: If the turn lamps are flashing, GO to Pinpoint Test L. • Ignition ON. • **Is any turn lamp on?**	**Yes** GO to N3. **No** For a front turn lamp, GO to N4. For a rear or exterior mirror turn lamp, GO to N9.
N3 CHECK THE BCM TURN LAMP OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Deactivate the hazard lamp function. • Ignition OFF. • Disconnect: BCM C2280A (Front Turn Lamp). • Disconnect: BCM C2280C (Rear or Exterior Mirror Turn Lamp). • Ignition ON. • **Does the turn lamp in question continue to illuminate?**	**Yes** For the LH front turn lamp, REPAIR circuit CLS21 (BU/GN) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. For the RH front turn lamp, REPAIR circuit CLS25 (YE/VT) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. For the LH rear or exterior mirror turn lamp, REPAIR circuit CLS23 (GY/OG) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. For the RH rear or exterior mirror turn lamp, REPAIR circuit CLS27 (GN/OG) for a short to voltage. CLEAR the

	DTCs. TEST the system for normal operation. **No** GO to N16 .
N4 CHECK FOR VOLTAGE TO THE FRONT TURN LAMP • Ignition OFF. • Disconnect: Inoperative Front Lamp. • Activate the hazard lamp function. • Measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.  N0066286 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	**Yes** GO to N5 . **No** GO to N6 .
N5 CHECK THE FRONT TURN LAMP GROUND CIRCUIT FOR AN OPEN • Measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and the LH front lamp C1023-1, circuit GD188 (BK/YE), harness side; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and the RH front lamp C1043-1, circuit GD123 (BK/GY), harness side.  N0088174 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	**Yes** INSTALL a new bulb socket. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR circuit GD188 (BK/YE) (LH turn) or circuit GD123 (BK/GY) (RH turn) for an open. CLEAR the DTCs. TEST the system for normal operation.
N6 CHECK THE FRONT TURN LAMP BULB SOCKET FOR A SHORT TO GROUND • Deactivate the hazard lamp function. • Cycle the ignition on then off. • Activate the hazard lamp function.	**Yes** INSTALL a new bulb socket. CLEAR the DTCs.

• Measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.  N0066286 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	TEST the system for normal operation. **No** GO to N7 .
N7 CHECK THE FRONT TURN LAMP VOLTAGE CIRCUIT FOR A SHORT TO GROUND	
• Deactivate the hazard lamp function. • Disconnect: BCM C2280A. • Measure the resistance between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.  N0077657 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N8 . **No** REPAIR circuit CLS21 (BU/GN) (LH turn) or CLS25 (YE/VT) (RH turn) for a short to ground. CLEAR the DTCs. CYCLE the ignition. TEST the system for normal operation.
N8 CHECK THE FRONT TURN LAMP VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the resistance between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and the BCM C2280A-5, circuit CLS21 (BU/GN), harness side; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and the BCM C2280A-6, circuit CLS25 (YE/VT), harness side.	**Yes** GO to N16 . **No** REPAIR circuit CLS21 (BU/GN) (LH turn) or CLS25 (YE/VT) (RH turn) for an open. CLEAR the DTCs. TEST the system for normal operation.

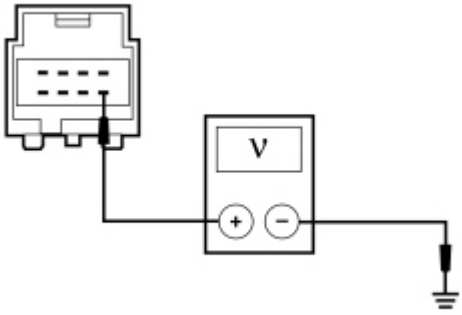


N0117282

- **Is the resistance less than 5 ohms?**

N9 USE THE RECORDED DTCs FROM THE BCM SELF-TEST • Deactivate the hazard lamp function. • Check the recorded results from the BCM on-demand self-test. • **Is DTC B1D06:11 or DTC B1D07:11 present?**	**Yes** If equipped with exterior mirror turn lamps, GO to N10. If not equipped with exterior mirror turn lamps, GO to N11. **No** GO to N13.
N10 CHECK THE EXTERIOR MIRROR FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: LH Exterior Mirror C521 (DTC B1D06:11). • Disconnect: RH Exterior Mirror C601 (DTC B1D07:11). • Cycle the ignition on and then off. • Activate the hazard lamp function. • **Does the rear lamp flash on and off?**	**Yes** INSTALL a new exterior mirror. REFER to Section 501-09. TEST the system for normal operation. **No** GO to N11.
N11 CHECK THE REAR TURN LAMP BULB SOCKET FOR A SHORT TO GROUND • Disconnect: Inoperative Rear Lamp. • Deactivate the hazard lamp function. • Cycle the ignition on then off. • Activate the hazard lamp function. • Measure the voltage between the LH rear turn lamp C414-5, circuit CLS23 (GY/OG), harness side and ground; or between the RH rear turn lamp C417-5, circuit CLS27 (GN/OG), harness side and ground.  N0104366	**Yes** INSTALL a new bulb socket. CLEAR the DTCs. CYCLE the ignition. TEST the system for normal operation. **No** GO to N12.

• **Does the voltage alternate between 0 volts and greater than 10 volts?**	
N12 CHECK THE BCM REAR TURN LAMP OUTPUT CIRCUIT FOR A SHORT TO GROUND	
• Deactivate the hazard lamp function. • Disconnect: BCM C2280C. • Measure the resistance between the BCM C2280C-12 (LH turn), circuit CLS23 (GY/OG), harness side and ground; or between the BCM C2280D-13(RH turn), circuit CLS27 (GN/OG), harness side and ground.  N0117312 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N16 . **No** REPAIR circuit CLS23 (GY/OG) (LH turn) or circuit CLS27 (GN/OG) (RH turn) for a short to ground. CLEAR the DTCs. CYCLE the ignition. TEST the system for normal operation.
N13 CHECK FOR VOLTAGE TO THE REAR TURN LAMP OR EXTERIOR MIRROR	
NOTE: If both the rear turn and exterior mirror turn lamps are inoperative, follow the diagnostics for the rear turn lamp. • Ignition OFF. • Disconnect: Inoperative Rear Lamp or Exterior Mirror. • Activate the hazard lamp function. • For an inoperative rear turn lamp, measure the voltage between the LH rear turn lamp C414-5, circuit CLS23 (GY/OG), harness side and ground; or between the RH rear turn lamp C417-5, circuit CLS27 (GN/OG), harness side and ground.  N0104366 • For an inoperative exterior mirror turn lamp, measure the voltage between the LH exterior mirror, C521-8, circuit CLS23 (GY/OG), harness side and ground; or between the RH exterior mirror, C601-8, circuit CLS27 (GN/OG), harness side and ground.	**Yes** For an inoperative exterior mirror turn lamp, GO to N14 . For an inoperative rear turn lamp, REPAIR or INSTALL a new rear lamp harness. CLEAR the DTCs. TEST the system for normal operation. **No** For an inoperative exterior mirror turn lamp, REPAIR circuit CLS23 (GY/OG) (LH turn) or circuit CLS27 (GN/OG) (RH turn) for an open. TEST the system for normal operation. For an inoperative rear turn lamp, GO to N15 .



N0117285

- **Does the voltage alternate between 0 volts and greater than 10 volts?**

N14 CHECK THE EXTERIOR MIRROR GROUND CIRCUIT FOR AN OPEN	
• Measure the voltage between the LH exterior mirror C521-8, circuit CLS23 (GY/OG), harness side and the LH exterior mirror C521-2, circuit GD143 (BK/VT), harness side; or between RH exterior mirror, C601-8, circuit CLS27 (GN/OG), harness side and the RH exterior mirror C601-2, circuit GD145 (BK/BU), harness side.  N0117286 • **Does the voltage alternate between 0 volts and greater than 10 volts?**	**Yes** INSTALL a new exterior mirror. REFER to Section 501-09 . TEST the system for normal operation. **No** REPAIR the circuit GD143 (BK/VT) (LH turn) or circuit GD145 (BK/BU) (RH turn) for an open. TEST the system for normal operation.
N15 CHECK THE BCM REAR TURN LAMP OUTPUT CIRCUIT FOR AN OPEN	
• Deactivate the hazard lamp function. • Disconnect: BCM C2280C. • Measure the resistance between the LH rear turn lamp C414-5, circuit CLS23 (GY/OG), harness side and the BCM C2280C-12, circuit CLS23 (GY/OG), harness side; or between the RH rear turn lamp C417-5, circuit CLS27 (GN/OG), harness side and the BCM C2280C-13, circuit CLS27 (GN/OG), harness side.	**Yes** GO to N16 . **No** REPAIR circuit CLS23 (GY/OG) (LH turn) or circuit CLS27 (GN/OG) (RH turn) for an open. CLEAR the DTCs. TEST the system for normal operation.

 N0117292 • **Is the resistance less than 5 ohms?**	

N16 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Hazard Lamp Function Is Inoperative/Always On

Refer to Wiring Diagrams Cell 90, Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends a voltage signal to the Front Controls Interface Module (FCIM). The voltage signal is routed to ground when the hazard flasher lamp switch is activated. When the BCM detects a request for the hazard lamps, the BCM provides on/off voltage to all the turn lamps.

- DTC B1D35:23 (Hazard Switch: Signal Stuck Low) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the hazard flasher lamp switch input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- FCIM
- BCM

PINPOINT TEST O: THE HAZARD LAMP FUNCTION IS INOPERATIVE/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to

	Take
O1 CHECK THE RECORDED DTCs FROM THE BCM SELF-TEST • Check the recorded DTCs from the BCM self-test. • **Is DTC B1D35:23 present?**	**Yes** GO to O2. **No** GO to O4.
O2 CHECK THE FCIM • Ignition OFF. • Disconnect: FCIM C2402. • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM Self-Test. • Clear the DTCs and repeat the BCM self-test. • **Is DTC B1D35:23 still present?**	**Yes** GO to O3. **No** GO to O6.
O3 CHECK THE HAZARD LAMP REQUEST INPUT CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: BCM C2280F. • Measure the resistance between the FCIM C2402-1, circuit CLS32 (BN/YE), harness side and ground.  N0117293 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O7. **No** REPAIR circuit CLS32 (BN/YE) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
O4 BYPASS THE FCIM • Ignition OFF. • Disconnect: FCIM C2402. • Connect and remove a fused jumper wire between the FCIM C2402-1, circuit CLS32 (BN/YE), harness side and ground.  N0117294 • **Does the hazard lamp function operate?**	**Yes** GO to O6. **No** GO to O5.

O5 CHECK THE HAZARD LAMP REQUEST INPUT CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280F. • Measure the resistance between the BCM C2280F-4, circuit CLS32 (BN/YE), harness side and the FCIM C2402-1, circuit CLS32 (BN/YE), harness side.  N0117295 • **Is the resistance less than 5 ohms?**	**Yes** GO to O7 . **No** REPAIR circuit CLS32 (BN/YE) for an open. TEST the system for normal operation.
O6 CHECK FOR CORRECT FCIM OPERATION	

• Disconnect all the FCIM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the FCIM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FCIM . REFER to Section 415-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

O7 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Parking, Rear and License Plate Lamps

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Body Control Module (BCM) monitors the headlamp switch position by sending voltage signals on multiple circuits to the headlamp switch. There is one circuit for each headlamp switch position. At any given time, one of the signal circuits is switched to ground to indicate the headlamp switch position.

If, when the ignition is in RUN, the BCM does not detect any active inputs from the headlamp switch or if the BCM detects multiple headlamp switch input circuits short to ground, the BCM turns the parking lamps and headlamps on and keeps them on until the ignition is transitioned OFF.

If either situation occurs, the BCM **cannot** be ruled immediately as being at fault. This is normal behavior of the BCM design as a fault has been detected with the inputs from the headlamp switch.

When the BCM receives an input from the headlamp switch indicating a request for the parking lamps, the supplies voltage to the exterior lamps.

Field-Effect Transistor (FET) Protection

A Field-Effect Transistor (FET) is a type of transistor that, when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes a FET protective circuit strategy for many of its outputs (such as a turn lamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down when a fault event is detected. A short circuit DTC sets when the fault event occurs.

The circuit remains off until the fault is corrected and the ignition is cycled off and then back on, the module resets the FET protection and allows the circuit to function.

The FET protected circuits for the parking lamp system are the LH rear (and license plate lamps), the RH rear, LH front, RH front and front marker lamp voltage supply circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Battery Junction Box (BJB) fuse 22 (15A) • Bulb(s) • Bulb socket(s) • Auxiliary parking lamp(s) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• One or more parking, rear or license plate lamps is inoperative	• Fuse • Wiring, terminals or connectors • Bulb socket • Auxiliary parking lamp • Body Control Module (BCM)	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test P .
• The parking, rear or license plate lamps are on continuously	• Wiring, terminals or connectors • BCM	• GO to Pinpoint Test Q .

Pinpoint Tests

Pinpoint Test P: One Or More Parking, Rear or License Plate Lamps Is Inoperative

Refer to Wiring Diagrams Cell 92 , Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

The Battery Junction Box (BJB) fuse 22 (15A) provides voltage to the Body Control Module (BCM) for the parking lamps. When the headlamp switch is placed in the PARKING LAMPS ON position, the BCM provides voltage on 5 separate circuits to the front and rear parking and license plate lamps.

If a fault exists with the headlamp switch input, the BCM faults the parking lamps and low beam headlamps on.

DTC Description	Fault Trigger Conditions
• B1098:11 — Left Position Light: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the LH front or LH rear parking lamp voltage supply circuits.
• B1098:15 — Left Position Light: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects an open from the LH front or LH rear parking lamp voltage supply circuits.
• B1099:11 — Right Position Light: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the RH front or RH rear parking lamp voltage supply circuits.
• B1099:15 — Right Position Light: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects an open from the RH front or RH rear parking lamp voltage supply circuits.
• B1118:11 — Left Rear Sidemarker: Circuit Short To Ground	A continuous and on-demand DTC that sets when the BCM detects a short to ground from the front side marker lamps voltage supply circuit.

• B1118:15 — Left Rear Sidemarker: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects an open from the front side marker lamps voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Bulb socket
- Auxiliary parking lamp
- BCM

PINPOINT TEST P: ONE OR MORE PARKING, REAR OR LICENSE PLATE LAMPS IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
P1 DETERMINE IF ALL THE PARKING LAMPS ARE INOPERATIVE	
• Ignition OFF. • Place the headlamp switch in the PARKING LAMPS ON position. • **Are all the parking lamps inoperative?**	**Yes** VERIFY the BJB fuse 22 (15A) is OK. If OK, GO to P2. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. **No** GO to P3.
P2 CHECK FOR VOLTAGE TO THE BCM	
• Place the headlamp switch in the OFF position. • Disconnect: BCM C2280A. • Measure the voltage between the BCM C2280A-7, circuit SBB22 (BN/RD), harness side and ground.  N0117296 • **Is the voltage greater than 10 volts?**	**Yes** GO to P6. **No** REPAIR circuit SBB22 (BN/RD) for an open. TEST the system for normal operation.
P3 CHECK FOR VOLTAGE TO THE INOPERATIVE PARKING LAMP	
NOTE: If the LH rear and both license plate lamps are	**Yes**

inoperative, follow the diagnostics for the rear lamp.

- Place the headlamp switch in the OFF position.
- Disconnect: Inoperative Lamp.
- Place the headlamp switch in the PARKING LAMPS ON position.
- Measure the voltage between the inoperative lamp, harness side and ground as follows:

Inoperative Lamp	Connector-Pin	Circuit
LH front	C1023-2	CLS06 (GN/OG)
RH front	C1043-2	CLS07 (BN/YE)
LH front side marker	C1127-2	CLS12 (WH/VT)
RH front side marker	C1126-2	CLS12 (WH/VT)
LH front auxiliary	C1445-1	CLS12 (WH/VT)
RH front auxiliary	C1446-1	CLS12 (WH/VT)
LH rear (4-door)	C412-2	CLS08 (VT/GN)
RH rear (4-door)	C415-2	CLS09 (WH/OG)
LH rear (5-door)	C414-2	CLS08 (VT/GN)
RH rear (5-door)	C417-2	CLS09 (WH/OG)
LH license plate	C452-1	CLS08 (VT/GN)
RH license plate	C462-1	CLS08 (VT/GN)

- **Is the voltage greater than 10 volts?**

For a license plate lamp, REPAIR circuit GD143 (BK/VT) for an open. TEST the system for normal operation. For all other lamps, GO to P4 .

No
For a license plate lamp, REPAIR circuit CLS08 (VT/GN) for an open. TEST the system for normal operation. If an individual front side marker lamp or either front auxiliary parking lamp is inoperative, REPAIR circuit CLS12 (WH/VT) for an open. TEST the system for normal operation. For all other lamp concerns, GO to P5 .

P4 CHECK THE PARKING LAMP GROUND CIRCUIT FOR AN OPEN

- Measure the voltage between the inoperative lamp pins, harness side as follows:

Inoperative Lamp	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH front	C1023-2 CLS06 (GN/OG)	C1023-1 GD188 (BK/YE)
RH front	C1043-2 CLS07 (BN/YE)	C1043-1 GD123 (BK/GY)
LH front side marker	C1127-2 CLS12 (WH/VT)	C1127-1 GD188 (BK/YE)
RH front side marker	C1126-2 CLS12 (WH/VT)	C1126-1 GD123 (BK/GY)
LH front auxiliary	C1445-1 CLS12 (WH/VT)	C1445-2 GD188 (BK/YE)
RH front auxiliary	C1446-1 CLS12 (WH/VT)	C1446-1 GD123 (BK/GY)
LH rear (4-door)	C412-2	C412-1

Yes
For a front parking or side marker lamp, INSTALL a new bulb socket. TEST the system for normal operation. For a front auxiliary parking lamp, INSTALL a new auxiliary parking lamp. REFER to Parking Lamp — Auxiliary in this section. TEST the system for normal operation. For a rear parking lamp (4-door), INSTALL a new bulb socket. TEST the system for normal operation. For a rear parking lamp (5-door), REPAIR or INSTALL a new rear lamp harness . TEST the system for normal operation.

No
REPAIR the ground circuit in question for an open. CLEAR the DTCs. TEST the system for normal operation.

	CLS08 (VT/GN)	GD143 (BK/VT)
RH rear (4-door)	C415-2 CLS09 (WH/OG)	C415-1 GD145 (BK/BU)
LH rear (5-door)	C414-2 CLS08 (VT/GN)	C414-1 GD143 (BK/VT)
RH rear (5-door)	C417-2 CLS09 (WH/OG)	C417-1 GD145 (BK/BU)

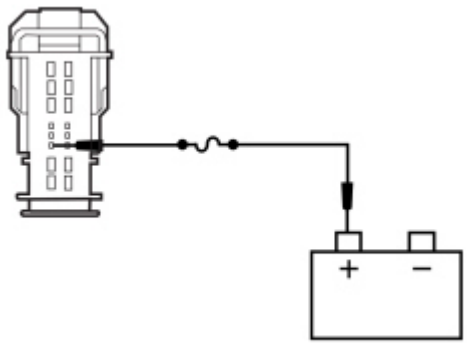
- **Is the voltage greater than 10 volts?**

P5 BYPASS THE BCM

NOTE: If both LH (front and rear) or RH (front and rear) lamps are inoperative, the test must be checked at both lamps to eliminate the circuitry as the cause of the concern.

NOTE: If the fuse in the jumper wire fails, refer to the Wiring Diagrams manual to identify the possible causes of the circuit short. After the repair, cycle the ignition to reset the driver within the BCM . Test the system for normal operation.

- Disconnect: BCM C2280C (Front Side Marker Lamps).
- Disconnect: BCM C2280D (Front Parking Lamps).
- Disconnect: BCM C2280G (Rear Parking Lamps).
- For the front side marker lamps, connect a fused jumper wire between the BCM C2280C-14, circuit CLS12 (WH/VT), harness side and battery positive.



N0117297

- For a front parking lamp, connect a fused jumper wire between the BCM C2280D-24 (LH), circuit CLS06 (GN/OG), harness side and battery positive; or between the BCM C2280D-23 (RH), circuit CLS07 (BN/YE), harness side and battery positive.

Yes
REMOVE the jumper wire.
GO to P6 .

No
REMOVE the jumper wire.
REPAIR the parking lamp voltage supply circuit in question for an open.
CLEAR the DTCs. TEST the system for normal operation.

 N0117298 • For a rear parking lamp, connect a fused jumper wire between the BCM C2280G-13 (LH), circuit CLS08 (VT/GN), harness side and battery positive; or between the BCM C2280G-1 (RH), circuit CLS09 (WH/OG), harness side and battery positive.  N0117300 • **Does the parking lamp(s) in question illuminate?**	
P6 CHECK FOR CORRECT BCM OPERATION	
• Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Q: The Parking, Rear Or License Plate Lamps Are On Continuously

Refer to Wiring Diagrams Cell 92, Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

The Battery Junction Box (BJB) fuse 22 (15A) provides voltage to the Body Control Module (BCM) for the parking lamps. When the headlamp switch is placed in the PARKING LAMPS ON position, the BCM provides voltage on 5 separate circuits to the front and rear parking and license plate lamps.

If a fault exists with the headlamp switch input, the BCM faults the parking lamps and low beam headlamps on.

DTC Description	Fault Trigger Conditions
• B1098:15 — Left Position Light: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects a short to voltage from the LH front or LH rear parking lamp voltage supply circuits.
• B1099:15 — Right Position Light: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects a short to voltage from the RH front or RH rear parking lamp voltage supply circuits.
• B1118:15 — Left Rear Sidemarker: Circuit Short To Battery Or Open	A continuous and on-demand DTC that sets when the BCM detects a short to voltage from the front side marker lamps voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- BCM

PINPOINT TEST Q: THE PARKING, REAR OR LICENSE PLATE LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
Q1 USE THE RECORDED DTCs FROM THE BCM SELF-TEST • Check the recorded results from the BCM self-test. • **Was DTC B10A6:92 recorded?**	**Yes** GO to Pinpoint Test C . **No** GO to Q2 .
Q2 CHECK THE BCM PARKING LAMP OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: BCM C2280C (Front Side Marker and Auxiliary Lamps). • Disconnect: BCM C2280D (Front Parking Lamps). • Disconnect: BCM C2280G (Rear Parking Lamps). • Ignition ON. • **Does the parking lamp(s) in question continue to illuminate?**	**Yes** REPAIR the parking lamp voltage supply circuit in question for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. **No** GO to Q3 .

Q3 CHECK FOR CORRECT BCM OPERATION
• Ignition OFF.
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	

Reversing Lamps

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

Automatic Transaxle

The reversing lamps are provided voltage from the reversing lamps relay. Voltage is supplied to the reversing lamps relay when the ignition is in RUN. The Transmission Control Module (TCM) monitors the transaxle gear status. When the TCM detects the transaxle is in REVERSE (R), the TCM provides a ground for the reversing lamps relay coil. When the relay is energized, voltage is supplied to the reversing lamps.

Manual Transaxle

Voltage is supplied to the reversing lamp switch when the ignition is in RUN. When the transaxle is in REVERSE (R), the reversing lamp switch routes voltage to the reversing lamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical

- Central Junction Box (CJB) fuse 6 (10A)
- Bulb
- Wiring, terminals or connectors
- Reversing lamps relay (automatic transaxle)
- Reversing lamp switch (manual transaxle)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Body Control Module (BCM).

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Both reversing lamps are inoperative	• Fuse • Wiring, terminals or connectors • Reversing lamps relay (automatic transaxle) • Reversing lamp switch	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test R.

	(manual transaxle) • Transmission Control Module (TCM) (automatic transaxle)	
• An individual reversing lamp is inoperative	• Wiring, terminals or connectors • Bulb socket	• VERIFY the bulb is OK. If OK, GO to Pinpoint Test S.
• The reversing lamps are on continuously	• Wiring, terminals or connectors • Reversing lamps relay (automatic transaxle) • Reversing lamp switch (manual transaxle) • Auto-dimming interior rear view mirror • Global Positioning System Module (GPSM) • Body Control Module (BCM) • TCM (automatic transaxle)	• GO to Pinpoint Test T.

Pinpoint Tests

Pinpoint Test R: Both Reversing Lamps Are Inoperative

Refer to Wiring Diagrams Cell 93, Reversing Lamps for schematic and connector information.

Normal Operation — Automatic Transaxle

The reversing lamps are provided voltage from the reversing lamps relay. Voltage is supplied to the reversing lamps relay when the ignition is in RUN. The Transmission Control Module (TCM) monitors the transaxle gear status. When the TCM detects the transaxle is in REVERSE (R), the TCM provides a ground for the reversing lamps relay coil. When the relay is energized, voltage is supplied to the reversing lamps.

Manual Transaxle

Voltage is supplied to the reversing lamp switch when the ignition is in RUN. When the transaxle is in REVERSE (R), the reversing lamp switch routes voltage to the reversing lamps.

NOTE: The reversing lamps on 4-door vehicles share the same ground circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Reversing lamps relay (automatic transaxle)
- Reversing lamp switch (manual transaxle)
- TCM (automatic transaxle)

PINPOINT TEST R: BOTH REVERSING LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
R1 DETERMINE THE TRANSAXLE TYPE	
• Ignition OFF. • Check the vehicle for a manual transaxle. • **Is the vehicle equipped with a manual transaxle?**	**Yes** VERIFY the CJB fuse 6 (10A) is OK. If OK, GO to R2 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. **No** VERIFY the CJB fuse 6 (10A) is OK. If OK, GO to R4 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
R2 CHECK FOR VOLTAGE TO THE REVERSING LAMP SWITCH	
• Disconnect: Reversing Lamp Switch C169. • Ignition ON. • Measure the voltage between the reversing lamp switch C169-1, circuit CBP06 (WH/BU), harness side and ground.  N0117309 • **Is the voltage greater than 10 volts?**	**Yes** GO to R3 . **No** REPAIR circuit CBP06 (WH/BU) for an open. TEST the system for normal operation.
R3 BYPASS THE REVERSING LAMP SWITCH	
• Connect a fused jumper wire between the reversing lamp switch C169-1, circuit CBP06 (WH/BU), harness side and the reversing lamp switch C169-2, circuit CET47 (BU), harness side.	**Yes** REMOVE the jumper wire. INSTALL a new reversing lamp switch. REFER to Reversing Lamp Switch in this section. TEST the system for normal operation. **No** For 4-door vehicles, LEAVE the jumper wire

 N0117301 • **Do the reversing lamps illuminate?**	connected. GO to R7 . For 5-door vehicles, REMOVE the jumper wire. REPAIR circuit CET47 (BU) for an open. TEST the system for normal operation.
R4 CHECK THE REVERSING LAMPS RELAY • Disconnect: Reversing Lamps Relay. • Ignition ON. • Substitute a known good relay and recheck the reversing lamps operation. • **Do the reversing lamps operate correctly?**	**Yes** REMOVE the known good relay. INSTALL a new reversing lamps relay. TEST the system for normal operation. **No** REMOVE the known good relay. GO to R5 .
R5 CHECK FOR VOLTAGE TO THE REVERSING LAMPS RELAY • Ignition ON. • Measure the voltage between the reversing lamps relay pin 1, circuit CBP06 (WH/BU), BJB face side and ground; and between the reversing lamps relay pin 3, circuit CBP06 (WH/BU), BJB face side and ground.  N0117302 • **Are the voltages greater than 10 volts?**	**Yes** GO to R6 . **No** REPAIR circuit CBP06 (WH/BU) for an open. TEST the system for normal operation.
R6 BYPASS THE REVERSING LAMPS RELAY • Connect a fused jumper wire between the reversing lamps relay pin 3, circuit CBP06 (WH/BU), BJB face side and the reversing lamps relay pin 5, circuit CET47 (BU), BJB face side.	**Yes** REMOVE the jumper wire. GO to R8 . **No** For 4-door vehicles, LEAVE the jumper wire connected. GO to R7 . For 5-door vehicles, REMOVE the jumper wire. REPAIR circuit

 N0117303 • **Do the reversing lamps illuminate?**	CET47 (BU) for an open. TEST the system for normal operation.
R7 CHECK FOR VOLTAGE TO THE LH REVERSING LAMP • Ignition OFF. • Disconnect: LH Reverse Lamp C487. • Ignition ON. • Measure the voltage between the LH reversing lamp C487-1, circuit CET47 (BU), harness side and ground.  A0057554 • **Is the voltage greater than 10 volts?**	**Yes** REMOVE the jumper wire. REPAIR circuit GD143 (BK/VT) for an open. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR circuit CET47 (BU) for an open. TEST the system for normal operation.
R8 CHECK THE REVERSING LAMPS RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: TCM C1750A. • Ignition ON. • Measure the voltage between the reversing lamps relay pin 2, circuit CLS28 (BU/WH), BJB face side and ground.  N0117304 • **Is any voltage present?**	**Yes** REPAIR circuit CLS28 (BU/WH) for a short to voltage. TEST the system for normal operation. **No** GO to R9 .
R9 CHECK THE REVERSING LAMPS RELAY COIL GROUND	

CONTROLLED CIRCUIT FOR AN OPEN	
• Ignition OFF. • Connect: Reversing Lamps Relay. • Ignition ON. • Measure the voltage between the TCM C1750A-40, circuit CLS28 (BU/WH), harness side and ground.  N0117305 • **Is the voltage greater than 10 volts?**	**Yes** GO to R10 . **No** REPAIR circuit CLS28 (BU/WH) for an open. TEST the system for normal operation.
R10 CHECK THE TCM GEAR STATUS INPUT PID	
• Ignition OFF. • Connect: TCM C1750A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: TCM DataLogger. • Monitor the TCM gear status PID (GEAR_ENGAGED) while placing the gear selector lever through all its positions. • **Does the PID agree with the gear selections?**	**Yes** GO to R11 . **No** REFER to Section 307-11 to continue diagnosis of the gear input.
R11 CHECK FOR CORRECT TCM OPERATION	

• Ignition OFF.
• Disconnect all the TCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the TCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCM . REFER to Section 307-11 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test S: The Individual Reversing Lamp Is Inoperative

Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

Normal Operation

Voltage is routed to the reversing lamps when the reversing lamps relay is energized.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Bulb socket

PINPOINT TEST S: THE INDIVIDUAL REVERSING LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
S1 CHECK FOR VOLTAGE TO THE INOPERATIVE REVERSING LAMP • Apply the parking brake. • Disconnect: Inoperative Reversing Lamp. • Ignition ON. • Select REVERSE. • For 4-door vehicles, measure the voltage between the LH reversing lamp C487-1, circuit CET47 (BU), harness side and ground; or between the RH reversing lamp C488-1, circuit CET47 (BU), harness side and ground.  A0057554 • For 5-door vehicles, measure the voltage between the LH reversing lamp C414-4, circuit CET47 (BU), harness side and ground; or between the RH reversing lamp C417-4, circuit CET47 (BU), harness side and ground.  N0117306 • **Is the voltage greater than 10 volts?**	**Yes** GO to S2 . **No** REPAIR circuit CET47 (BU) for an open. TEST the system for normal operation.
S2 CHECK THE REVERSING LAMP GROUND CIRCUIT FOR AN OPEN • For 4-door vehicles, measure the voltage between the LH reversing lamp C487-1, circuit CET47 (BU), harness side and the LH reversing lamp C487-2, circuit GD143 (BK/VT), harness side; or between the RH reversing lamp C488-1, circuit CET47 (BU), harness side and the RH reversing lamp C488-2, circuit GD143 (BK/VT), harness side.	**Yes** INSTALL a new bulb socket. TEST the system for normal operation. **No**

 N0088182 • For 5-door vehicles, measure the voltage between the LH reversing lamp C414-4, circuit CET47 (BU), harness side and the LH reversing lamp C414-1, circuit GD143 (BK/VT), harness side; or between the RH reversing lamp C417-4, circuit CET47 (BU), harness side and the RH reversing lamp C417-1, circuit GD143 (BK/BU), harness side.  N0117307 • **Is the voltage greater than 10 volts?**	REPAIR circuit GD143 (BK/VT) or circuit GD143 (BK/VT) for an open. TEST the system for normal operation.

Pinpoint Test T: The Reversing Lamps Are On Continuously

Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

Normal Operation

The reversing lamps are illuminated, voltage is also provided to the Body Control Module (BCM), the auto-dimming interior rear view mirror and the Global Positioning System Module (GPSM) if equipped.

Automatic Transaxle

The reversing lamps are provided voltage from the reversing lamps relay. Voltage is supplied to the reversing lamps relay when the ignition is in RUN. The Transmission Control Module (TCM) monitors the transaxle gear status. When the TCM detects the transaxle is in REVERSE (R), the TCM provides a ground for the reversing lamps relay coil. When the relay is energized, voltage is supplied to the reversing lamps.

Manual Transaxle

Voltage is supplied to the reversing lamp switch when the ignition is in RUN. When the transaxle is in REVERSE (R), the reversing lamp switch routes voltage to the reversing lamps.

- DTC C1137:24 (Reverse Gear Switch: Signal Stuck High) — A continuous and on-demand DTC that sets when the BCM detects a short to voltage from the reversing lamp voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Reversing lamps relay (automatic transaxle)
- Reversing lamp switch (manual transaxle)
- Auto-dimming interior rear view mirror
- BCM
- GPSM
- TCM (automatic transaxle)

PINPOINT TEST T: THE REVERSING LAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
T1 DETERMINE THE TRANSAXLE TYPE • Ignition OFF. • Check the vehicle for a manual transaxle. • **Is the vehicle equipped with a manual transaxle?**	**Yes** GO to T2. **No** GO to T3.
T2 CHECK THE REVERSING LAMP SWITCH • Ignition OFF. • Disconnect: Reversing Lamp Switch C169. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** If equipped with a GPSM, GO to T4. If not equipped with a GPSM, GO to T5. **No** INSTALL a new reversing lamp switch. REFER to Reversing Lamp Switch in this section. TEST the system for normal operation.
T3 CHECK THE REVERSING LAMPS RELAY OUTPUT • Ignition OFF. • Disconnect: Reversing Lamps Relay. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** If equipped with a GPSM, GO to T4. If not equipped with a GPSM, GO to T5. **No** GO to T7.
T4 CHECK THE GPSM FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: GPSM C2398. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** GO to T5. **No** GO to T10.
T5 CHECK THE BCM FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: BCM C2280D. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** If equipped with an auto-dimming interior rear view mirror, GO to T6. If not equipped with an auto-dimming interior rear view mirror, REPAIR circuit CET47 (BU) for a short to voltage. TEST the

	system for normal operation. **No** GO to T11 .
T6 CHECK THE AUTO-DIMMING INTERIOR REAR VIEW MIRROR FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Rear View Mirror C911. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** REPAIR circuit CET47 (BU) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new auto-dimming interior rear view mirror. REFER to Section 501-09 . TEST the system for normal operation.
T7 CHECK THE REVERSING LAMPS RELAY	
• Ignition OFF. • Substitute a known good relay. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** REMOVE the known good relay. GO to T8 . **No** REMOVE the known good relay. INSTALL a new reversing lamps relay. TEST the system for normal operation.
T8 CHECK THE REVERSING LAMPS RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Connect: Reversing Lamps Relay. • Disconnect: TCM C1750A. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** REPAIR circuit CLS28 (BU/WH) for a short to ground. TEST the system for normal operation. **No** GO to T9 .
T9 CHECK THE TCM GEAR STATUS INPUT PID	
• Ignition OFF. • Connect: TCM C1750A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: TCM DataLogger. • Monitor the TCM gear status PID (GEAR_ENGAGED) while placing the gear selector lever through all its positions. • **Does the PID agree with the gear selections?**	**Yes** GO to T12 . **No** REFER to Section 307-11 to continue diagnosis of the gear input.
T10 CHECK FOR CORRECT GPSM OPERATION	

• Ignition OFF.
• Disconnect all the GPSM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the GPSM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
	Yes
	INSTALL a new GPSM . REFER to Section 415-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• **Is the concern still present?**	

T11 CHECK FOR CORRECT BCM OPERATION
• Ignition OFF.
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

T12 CHECK FOR CORRECT TCM OPERATION
• Ignition OFF.
• Disconnect all the TCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the TCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCM. REFER to Section 307-11. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Headlamp Adjustment

Special Tool(s)

ST3041-A	Vision 100 Headlamp Aimer 196-00005 or equivalent

Headlamp Aiming

NOTE: For the photometric aiming procedure, refer to the appropriate photometric headlamp aimer instruction manual.

NOTE: Mechanical aimers cannot be used with VOR- or VOL-type headlamps.

NOTE: Consult your state vehicle inspection manual for recommended tolerance ranges for visual aiming.

NOTE: Horizontal aim is not adjustable.

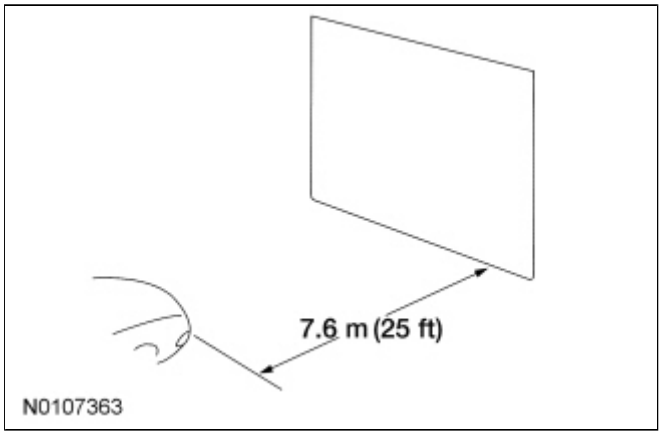
1. The headlamp aiming procedure depends on what type of beam pattern the headlamp is equipped with. Vehicles may come equipped with visually optically aligned left (VOL) or visually optically aligned right (VOR) headlamps. To identify the headlamp beam pattern, look on the headlamp lens. Molded in small letters on the headlamp lens is one of the following:
   - VOL and SAE
   - VOR and SAE

2. Once the headlamp beam pattern is identified, aim the headlamps using one of the following methods as applicable.
   - Photometric aimers can aim VOL- and VOR- headlamps. This is the preferred method of headlamp aiming.
   - Visual or screen method aiming can be used to aim VOL- and VOR- headlamps.
   - Mechanical aimers cannot be used with VOR- or VOL-type headlamps. Aerodynamic lamps that can be aimed mechanically have 3 nibs molded into the lens of the lamp.

3. Before starting headlamp adjustment:
   - check that the vehicle is on level ground.
   - check the tire inflation.
   - check that no other load is in the vehicle other than a half tank of fuel.
   - check that the headlamps are clean.
   - check for correct headlamp operation.
   - if the vehicle is equipped with air suspension, make sure that the switch is on.

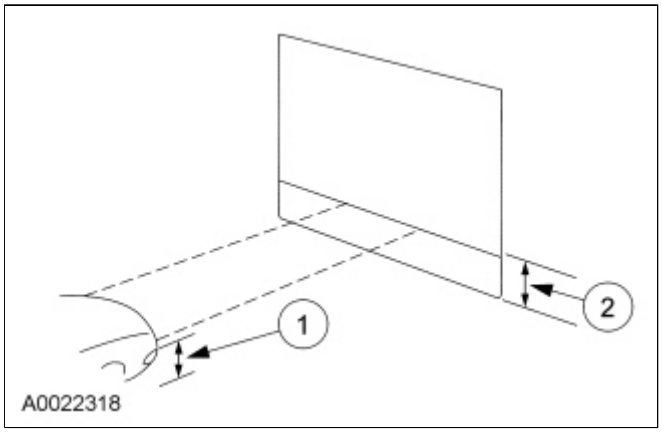
4. **NOTE:** The vertical wall or screen must be a minimum of 2.4 m (8 ft) wide.

   Park the vehicle on a level surface approximately 7.6 m (25 ft) from the vertical wall or screen directly in front of it.



5. **NOTE:** The center of the lamp is marked either on the lens (circle, crosshair or other mark) or on the bulb shield internal to the lamp (crosshair or other mark).

   Mark a horizontal reference line on the vertical wall or screen.
   1. Measure the center of the headlamp height to ground and record the measurement.
   2. Make a 2.4 m (8 ft) horizontal mark (using masking tape) on the vertical wall or screen at the same distance from the ground as previously recorded.

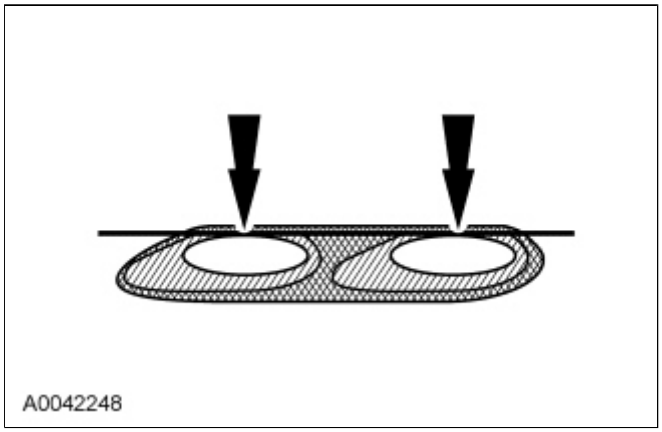


6. **NOTE:** This procedure should be done in a dark environment to effectively see the headlamp beam pattern.

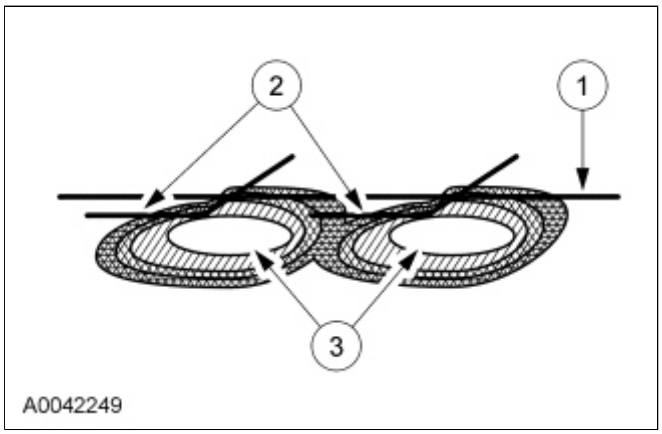
   Turn on the low beam headlamps to illuminate the wall or screen and open the hood.

7. **NOTE:** The appearance of the VOR beam pattern may vary between vehicles.

   For VOR-type headlamps, locate the top edge of this high intensity area a distinct horizontal cutoff in the beam pattern on the wall or screen. Using the adjusting screw, adjust the headlamp until the top edge of this cutoff is even with the horizontal reference line.

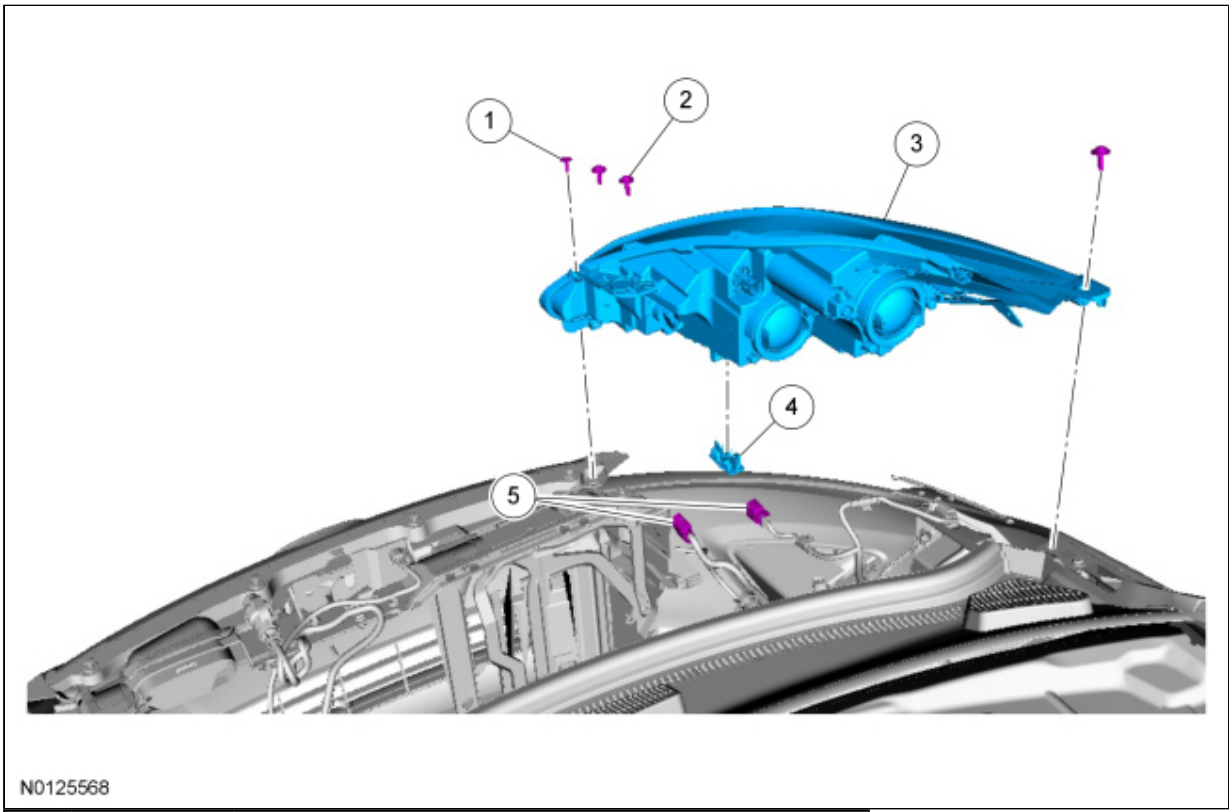


8. For VOL-type headlamps, locate the distinct cutoff in the left portion of the beam pattern. Using the adjusting screw, adjust the headlamp until the edge of this cutoff is positioned 50.2 mm (2 in) below the horizontal reference line.
    1. Horizontal reference line.
    2. Top edge of the beam pattern.
    3. High intensity zone.



Headlamp Assembly

NOTE: RH shown, LH similar.



Item	Part Number	Description
1	W714040	Upper radiator grille reinforcement pin-type retainer
2	W702733	Headlamp assembly bolt (3 required)
3	13008	Headlamp assembly (RH / LH)
4	13N129	Headlamp assembly lower clip
5	—	Headlamp assembly electrical connectors (part of 14K102)

Removal and Installation

1. Remove the headlamp assembly-to-upper radiator grille reinforcement pin-type retainer.

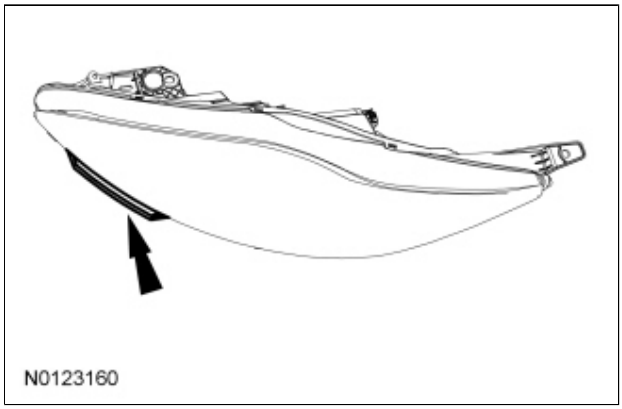
2. Remove the 3 headlamp assembly bolts.
   - To install, tighten to 5 Nm (44 lb-in).

3. Gently lift up on the headlamp assembly to disconnect assembly from the lower clip.

4. Disconnect the headlamp assembly electrical connectors and disengage the wiring assembly clips from the headlamp assembly.

5. **NOTE:** The headlamp assembly has a lip that must fit under the front bumper assembly to insure proper fit.

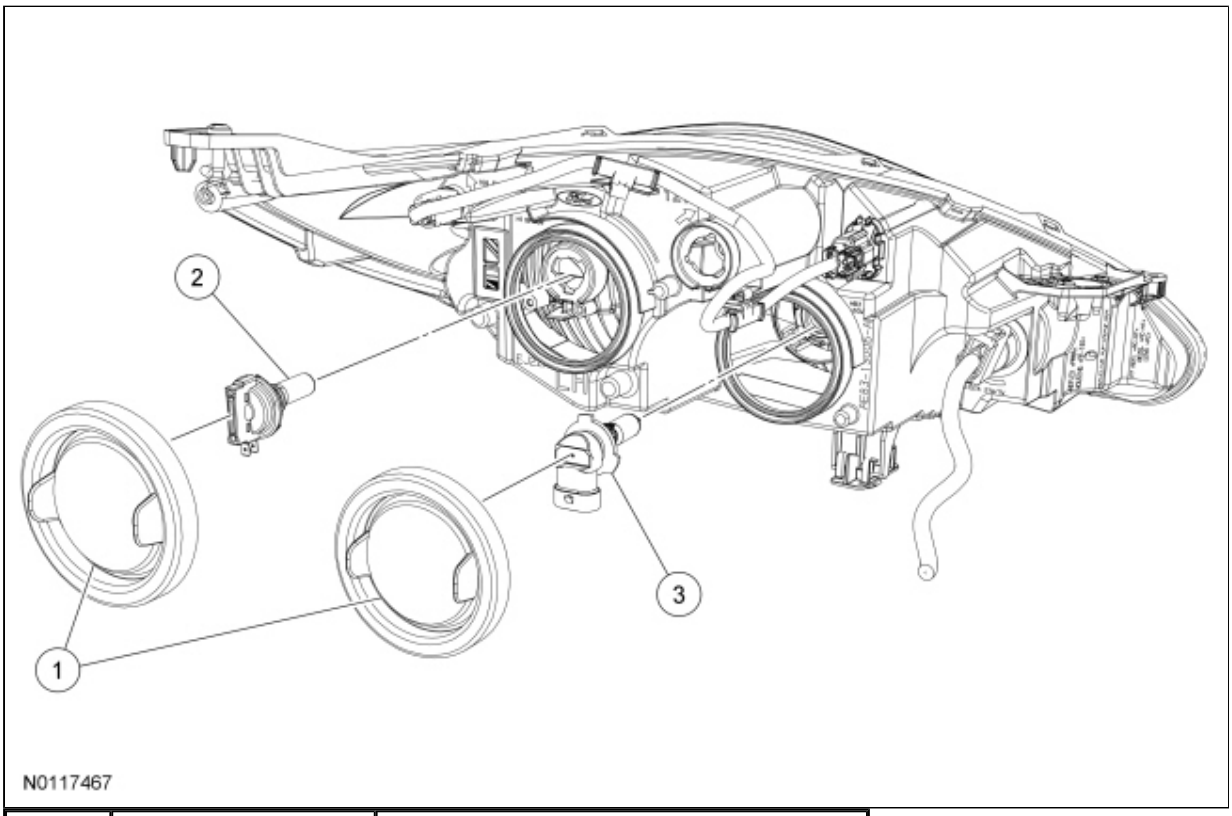
   Remove the headlamp assembly.



6. To install, reverse the removal procedure.
    - If necessary, adjust the headlamps. For additional information, refer to Headlamp Adjustment in this section.

Headlamp Bulb

NOTE: The headlamp assembly is shown removed for clarity.



Item	Part Number	Description
1	13N019	Headlamp bulb cover
2	13N021A	Headlamp low beam bulb
3	13N021B	Headlamp high beam bulb

Removal and Installation

WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamps with the bulb removed.

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

Left Hand Side

1. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.

Right Hand Side

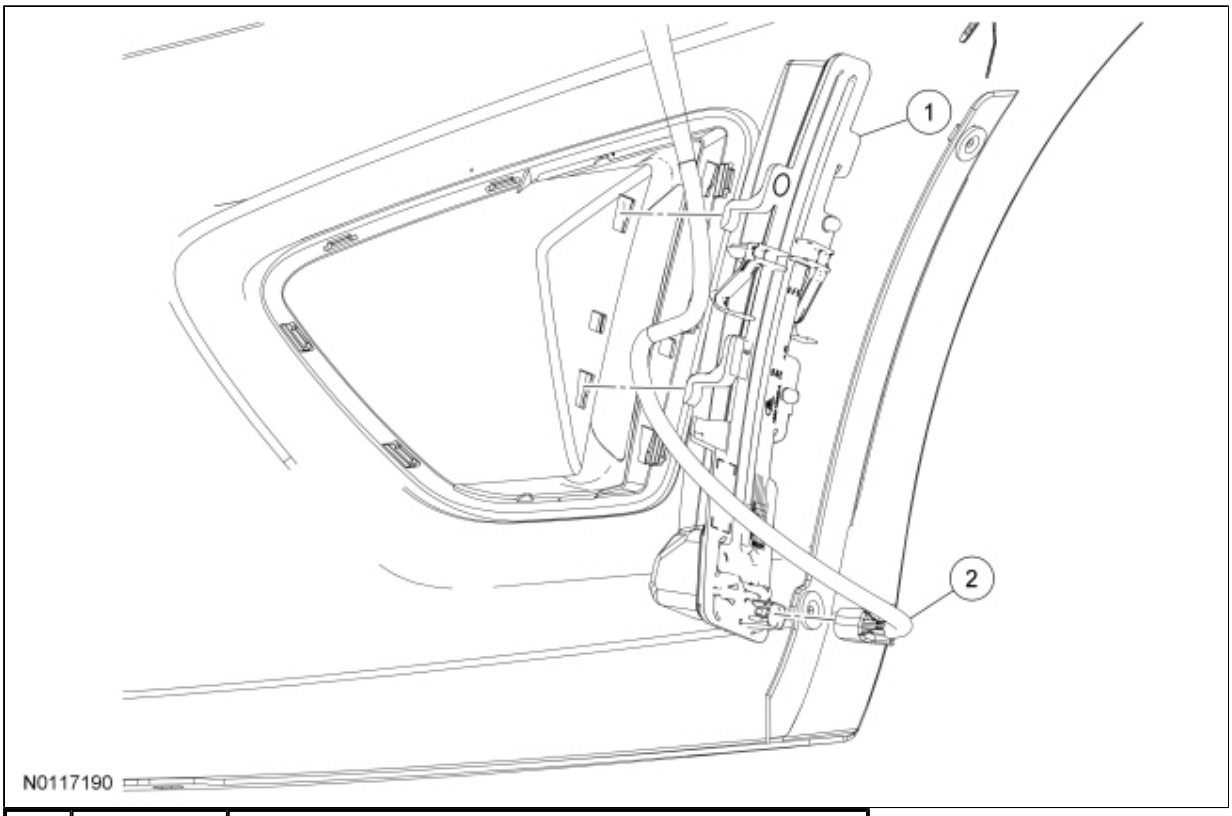
2. Position aside the degas bottle.

Both Sides

3. Remove the headlamp bulb.
    1. Remove the headlamp bulb cover.
    2. Disconnect and remove the headlamp bulb.

4. To install, reverse the removal procedure.

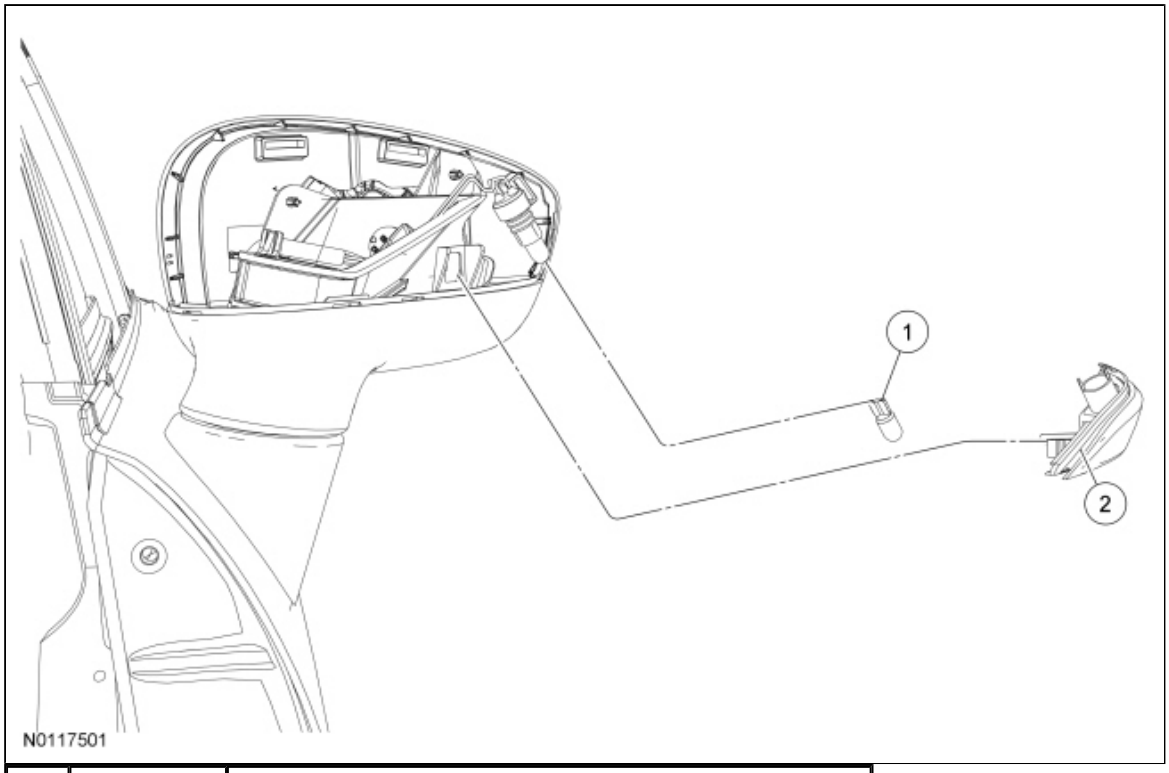
Parking Lamp — Auxiliary



Item	Part Number	Description
1	13200	Supplemental parking lamp assembly (RH/LH)
2	—	Supplemental parking lamp electrical connector (part of 14K012)

1. Remove the front fender splash shield. For additional information, refer to Section 501-02 .
2. Disconnect the supplemental parking lamp electrical connector.
3. Unclip and remove the supplemental parking lamp assembly.
4. To install, reverse the removal procedure.

Turn Signal Lamp — Outside Rear View Mirror

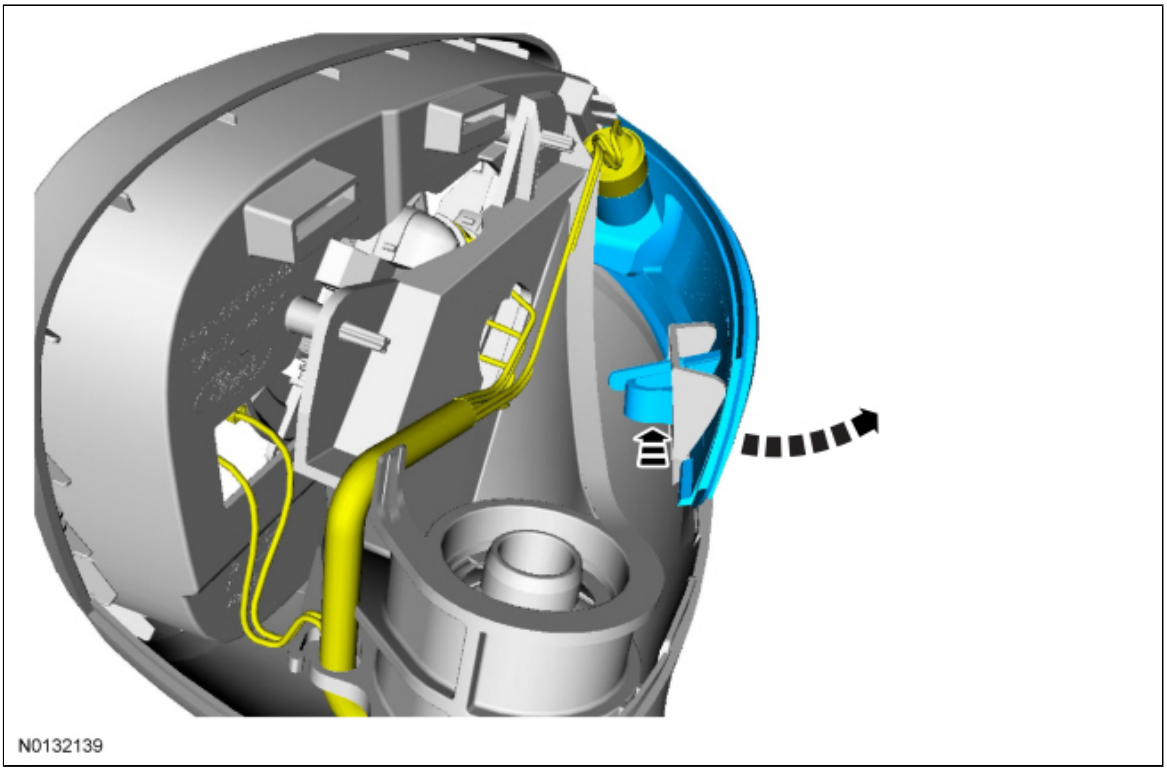


Item	Part Number	Description
1	13466	Outside rear view mirror turn signal lamp bulb
2	13B374	Outside rear view mirror turn signal lamp assembly (RH/LH)

Removal

1. Remove the exterior mirror cover. For additional information, refer to Section 501-09 .

2. Remove the outside rear view mirror turn signal assembly.
    1. Remove the turn signal bulb and socket from the turn signal assembly and position the wiring harness aside.
    2. Release the turn signal clip and remove the turn signal assembly.

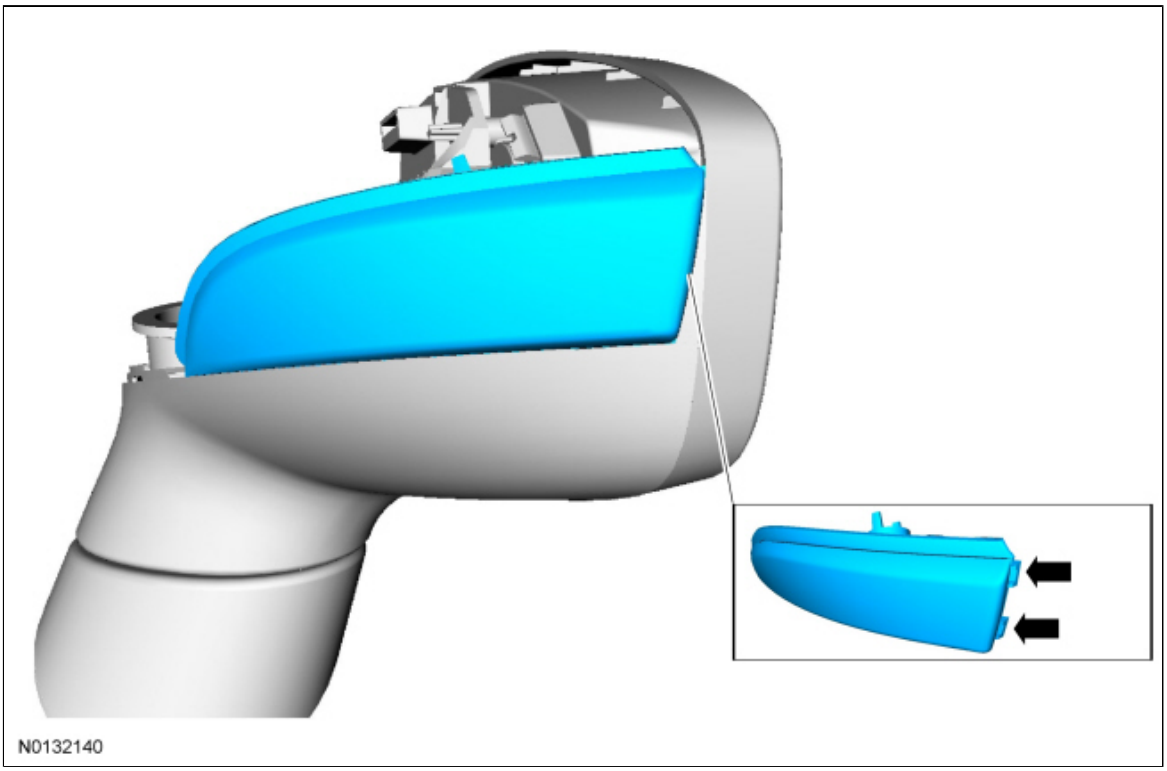


Installation

1. **NOTE:** Bulb and socket will be fully seated in the turn signal assembly when the 2 slots align with the rubber seal.

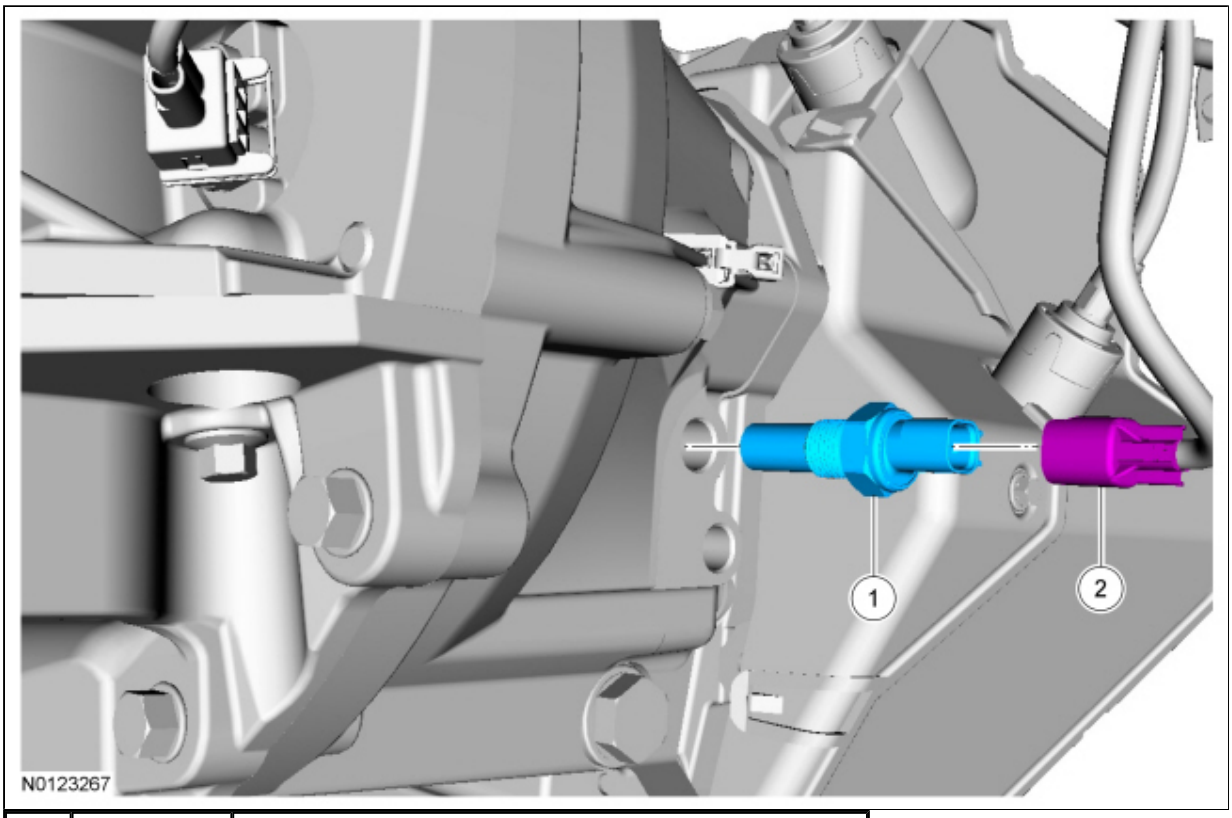
   Install the turn signal bulb and socket into the turn signal assembly.

2. Install the 2 rear hooks of the turn signal assembly under the edge of the rear view mirror and snap the turn signal clip in place.



3. Install the exterior mirror cover. For additional information, refer to Section 501-09 .

Reversing Lamp Switch

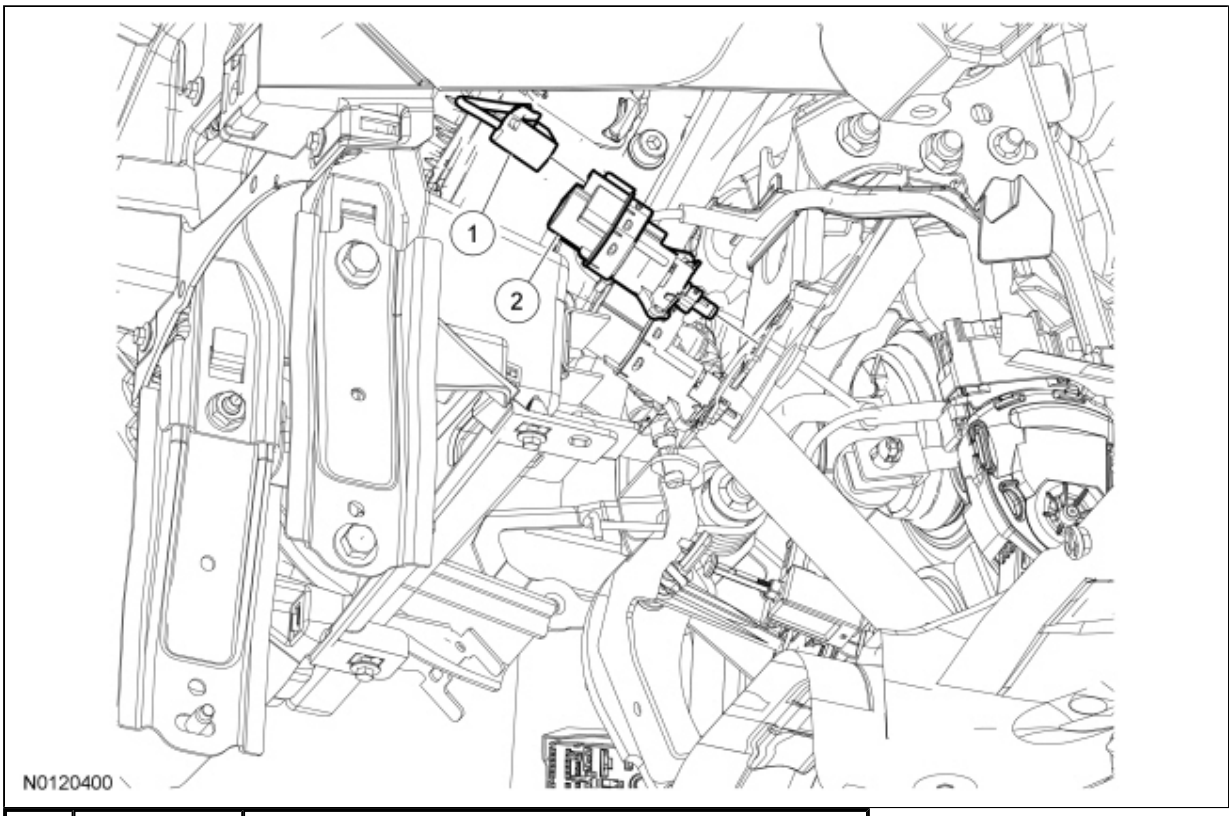


Item	Part Number	Description
1	15520	Reversing lamp switch - 14 Nm (124 lb-in)
2	—	Reversing lamp switch electrical connector (part of 13A690)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Refer to exploded view(s) and any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Stoplamp Switch



Item	Part Number	Description
1	—	Stoplamp switch electrical connector (part of 14K012)
2	13480	Stoplamp lamp switch

Removal and Installation

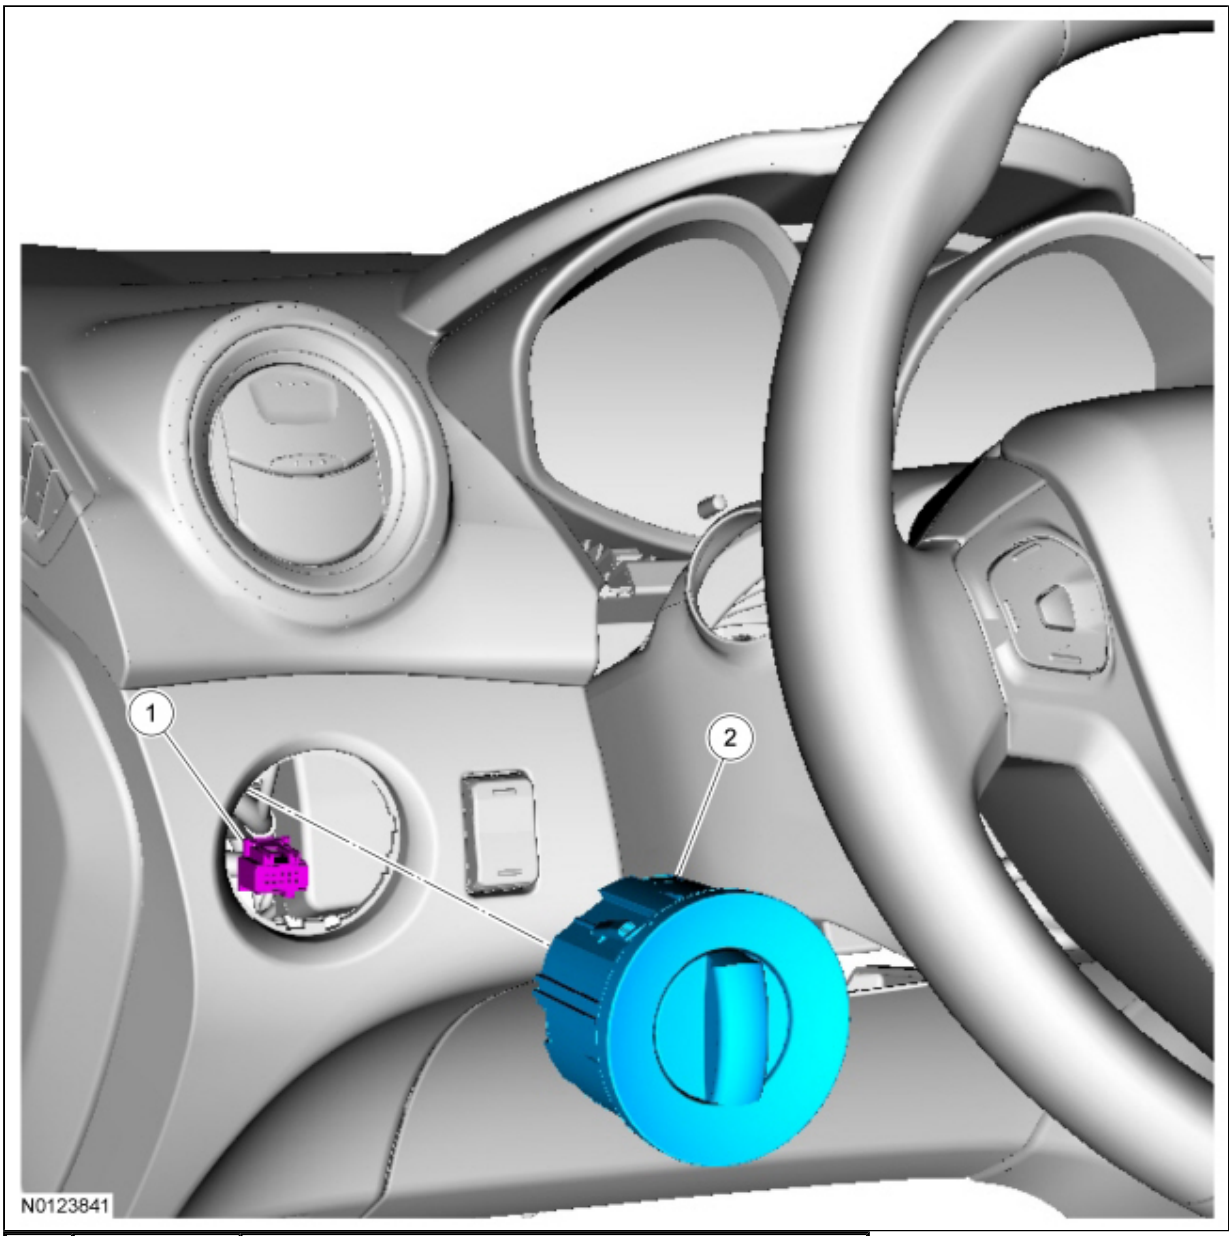
NOTICE: **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch and cruise control deactivation switch. Install these switches with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position results in incorrect adjustment and damages the switches.**

1. **NOTE:** The stoplamp switch is located above the cruise control deactivation switch (if equipped).

   Rotate the stoplamp switch clockwise approximately one-eighth turn to remove the stoplamp switch.

2. To install, reverse the removal procedure.
   - Perform the brake pedal switch adjustment. For additional information, refer to Section 206-09 .

Headlamp Switch



Item	Part Number	Description
1	—	Headlamp switch electrical connector (part of 14K024)
2	11654	Headlamp switch

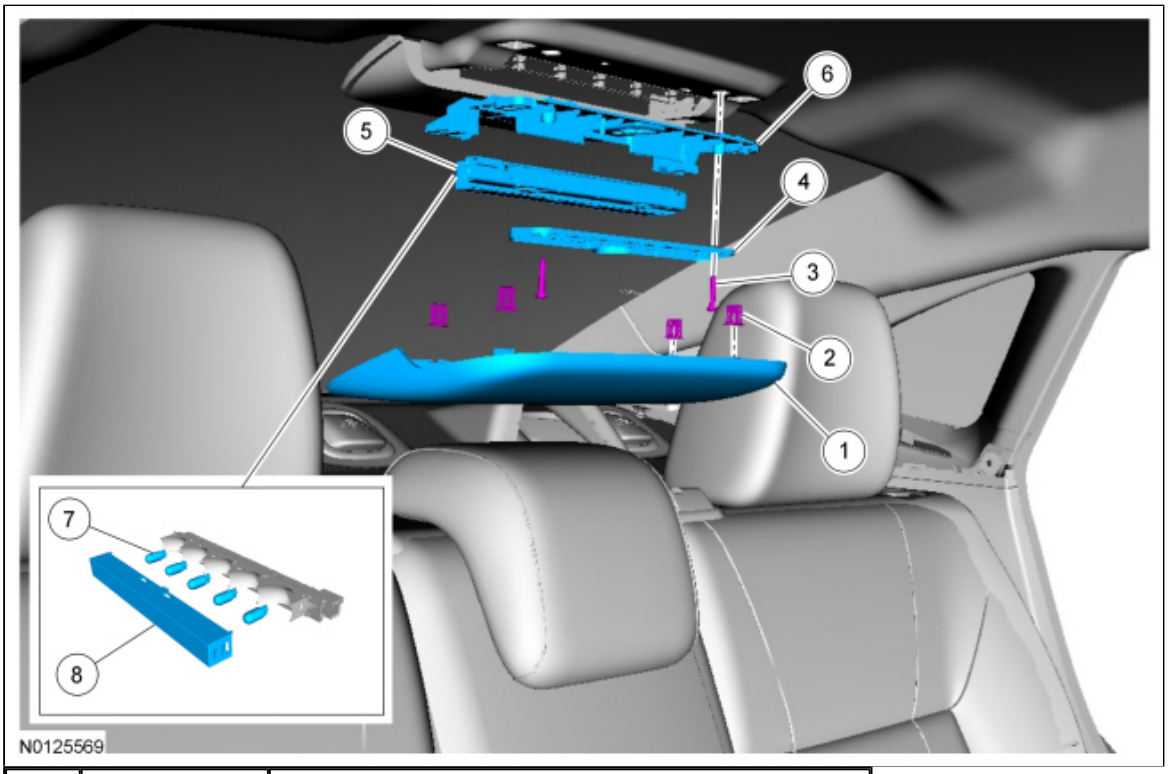
Removal and Installation

1. Using a suitable non-marring tool, work around the outer edge of the switch to release the clips and pull the switch out through the front of the finish panel.
    - Disconnect the electrical connector.

2. To install, reverse the removal procedure.

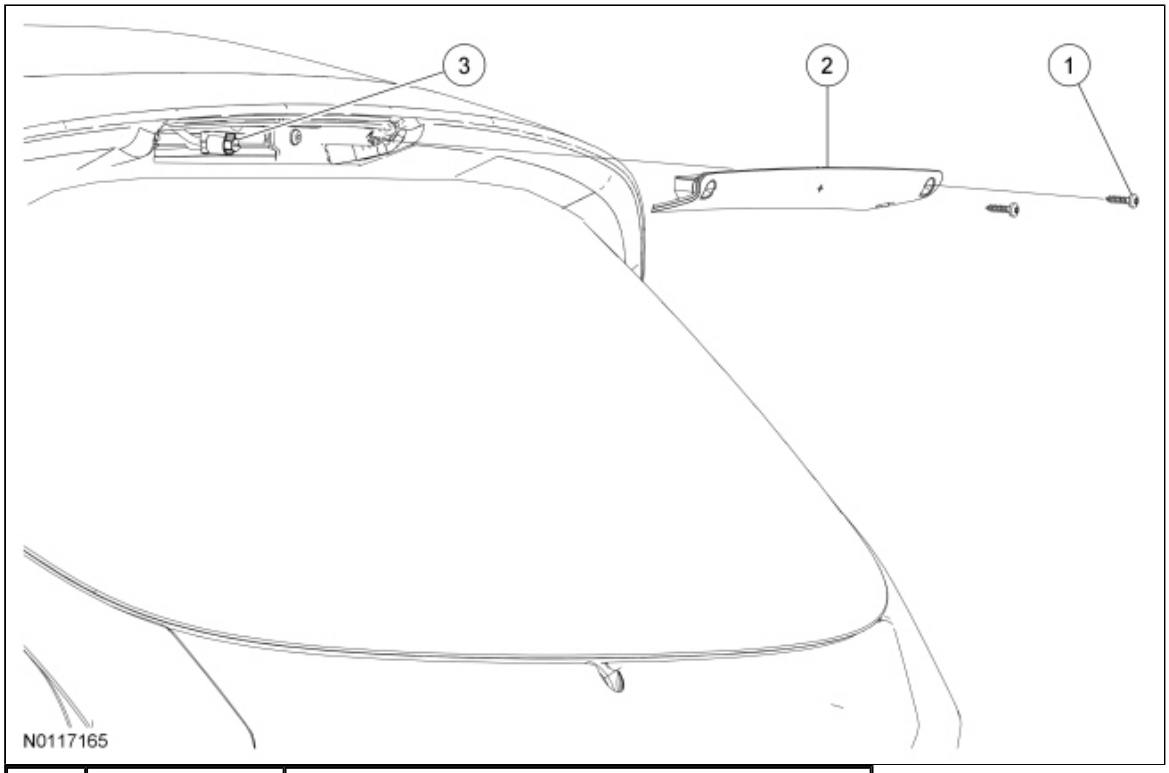
High Mounted Stoplamp

4-Door Sedan



Item	Part Number	Description
1	13466	High mounted stoplamp cover
2	N807389	High mounted stoplamp cover clip (4 required)
3	W502564	High mounted stoplamp screw (2 required)
4	13A624	High mounted stoplamp lower bracket
5	13A613	High mounted stoplamp
6	13A624	High mounted stoplamp upper bracket
7	13466	High mounted stoplamp bulb (5 required)
8	—	High mounted stoplamp lens (part of 13A613)

5-Door Hatchback

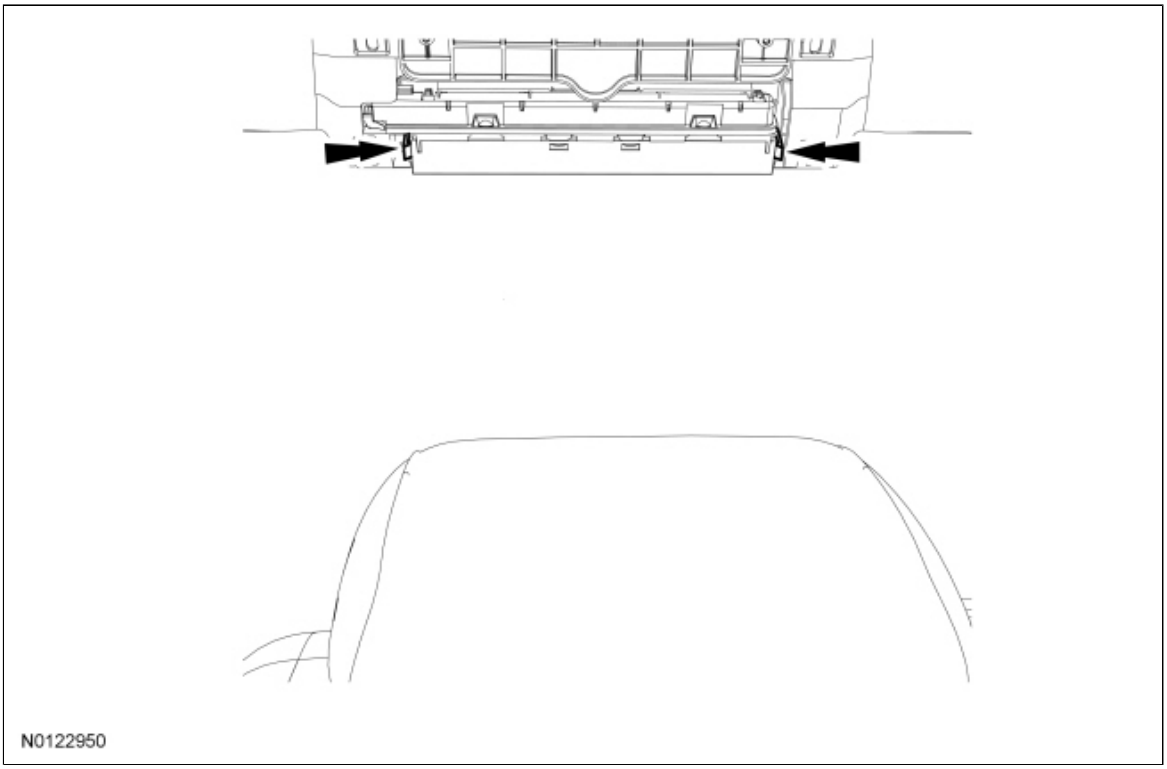


Item	Part Number	Description
1	46058	High mounted stoplamp screw (2 required)
2	13A613	High mounted stoplamp
3	—	High mounted stoplamp connector

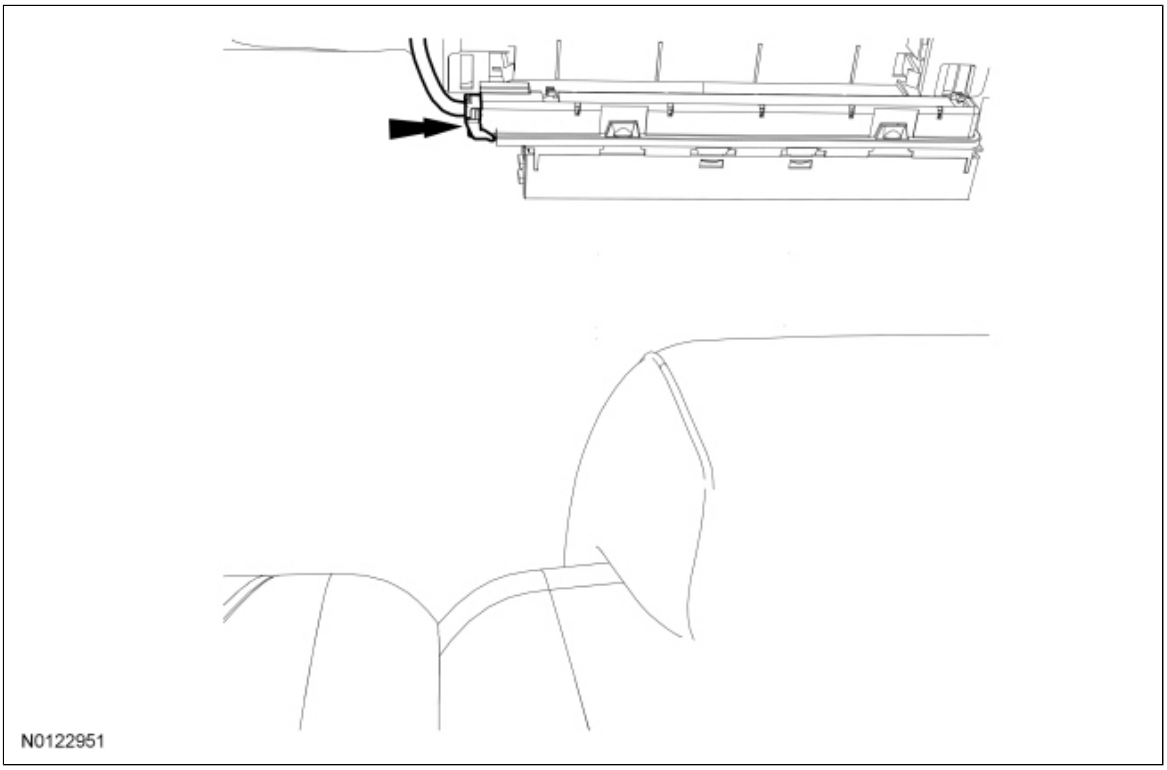
Removal and Installation

4-Door Sedan

1. Remove the high mounted stoplamp assembly cover.
2. Disconnect the 2 clips on the side of the high mounted stoplamp assembly and lower the high mounted stoplamp assembly down.

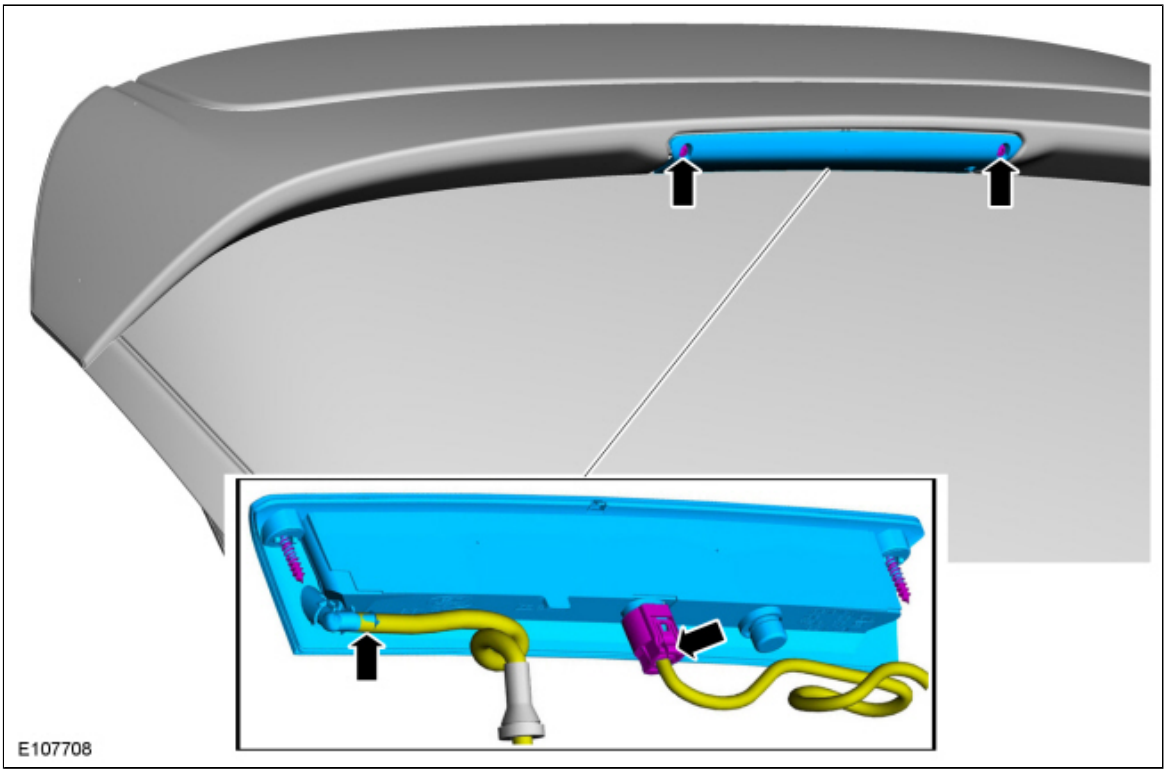


3. Disconnect the high mounted stoplamp assembly electrical connector and remove.



5-Door Hatchback

4. Remove the high mounted stoplamp assembly.
    1. Remove the 2 high mounted stoplamp assembly screws.
    2. Disconnect the high mounted stoplamp assembly electrical connector and the rear window washer hose and remove the high mounted stoplamp assembly.

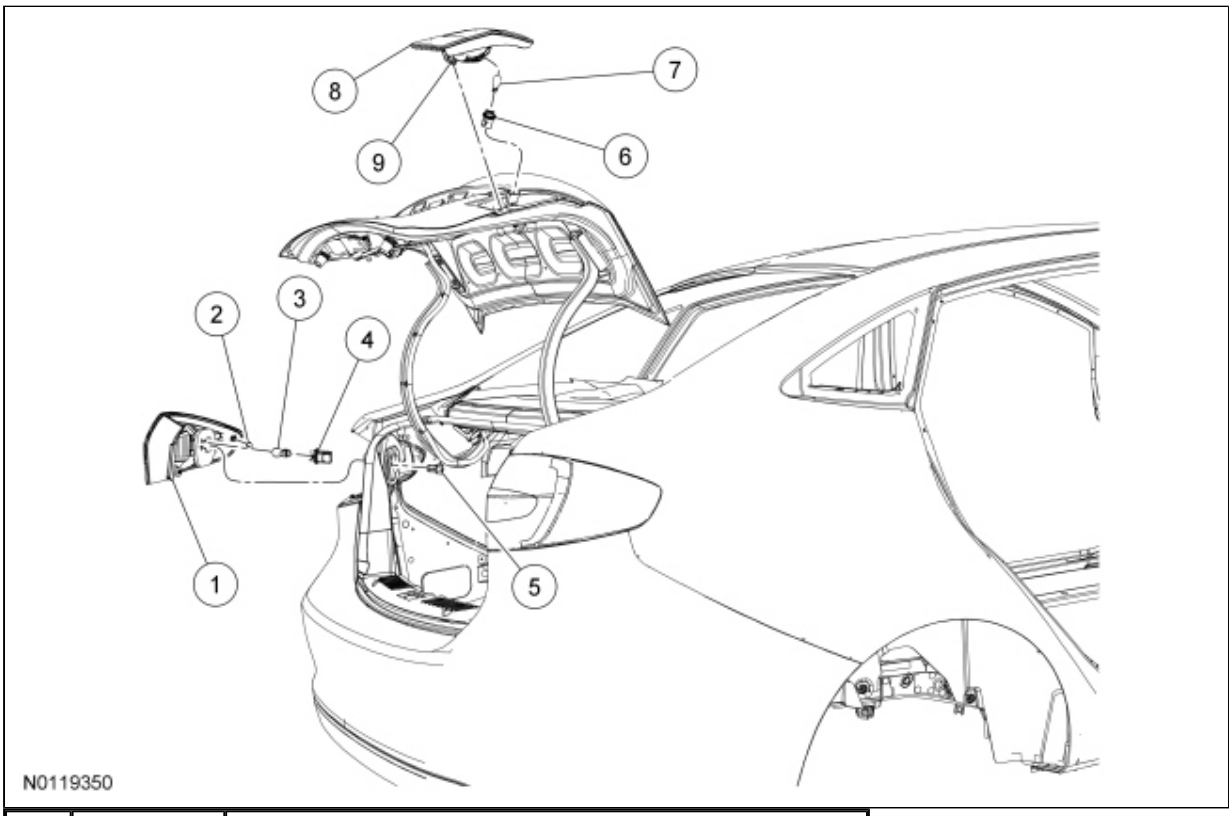


All Vehicles

5. To install, reverse the removal procedure.

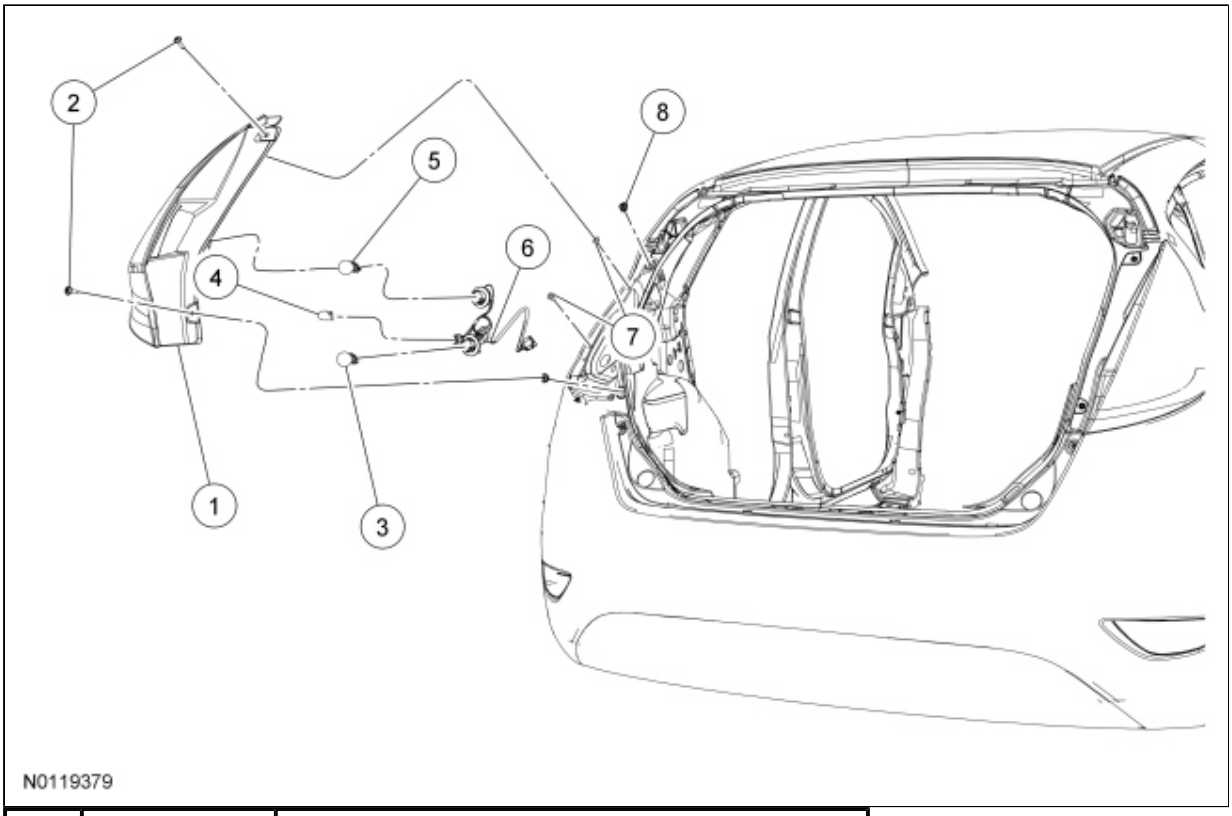
Rear Lamp Assembly

4-Door Sedan



Item	Part Number	Description
1	13404/ 13405	Rear outer lamp assembly (RH/LH)
2	13K262	Rear outer lamp assembly grommet
3	13466	Park/ turn/ stop lamp bulb
4	13411	Park/ turn/ stop lamp bulb socket
5	W707612	Rear outer lamp assembly retaining nut
6	13411	Reverse bulb socket
7	13466	Reverse bulb
8	15500/ 15501	Rear inner lamp assembly (RH/LH)
9	—	Rear inner lamp assembly retaining nut (part of the rear inner lamp assembly)

5-Door Hatchback



Item	Part Number	Description
1	13404/ 13405	Rear lamp assembly (RH/LH)
2	W714309	Rear lamp assembly screws (2 required)
3	13466	Rear lamp assembly lower inner bulb
4	13466	Rear lamp assembly outer bulb
5	13466	Rear lamp assembly upper bulb
6	13410	Rear lamp socket and wire assembly
7	16K262	Rear lamp assembly grommets (2 required)
8	W707977	Rear lamp assembly retainer nut (2 required)

Removal and Installation

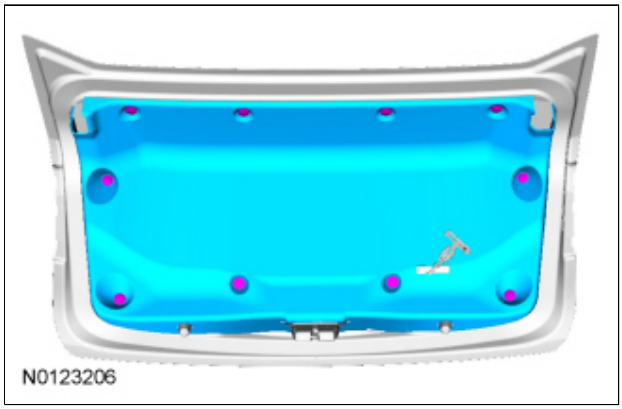
4-Door sedan rear outer lamp assembly

1. Remove the pin-type retainer and position the luggage compartment trim panel aside.

2. Remove the rear outer lamp assembly.
    1. Remove the rear outer lamp assembly retaining nut.
    2. Disconnect and remove the rear outer lamp assembly.

4-Door sedan rear inner lamp assembly

3. Remove the 10 pin-type retainers and the decklid trim panel.



4. Remove the rear inner lamp assembly.
    1. Loosen the rear inner lamp assembly retaining nut.
    2. Disconnect and remove the rear inner lamp assembly.

5-Door hatchback

5. Remove the 2 rear lamp assembly screws.

6. Remove the rear lamp assembly.
    1. Pull the rear lamp assembly out.
    2. Remove the 3 rear lamp assembly bulbs and remove the lamp assembly.

All vehicles

7. To install, reverse removal procedure.

Interior Lighting

The interior lighting system consists of the following components:

- Interior/map lamps
- Luggage compartment lamp
- Door ajar switches (integrated into the door latches)
- Luggage compartment lid/liftgate ajar switch (integrated into the luggage compartment lid/liftgate latch)
- Ambient lighting module (located under the center console)
- Ambient lighting switch (integrated into the passenger heated seat switch)
- Body Control Module (BCM)

The interior lighting system consists of up to 3 subsystems:

- Courtesy lamps
- Demand lamps
- Ambient lighting

Battery Saver

NOTE: Time-out is 10 seconds if the vehicle is in Factory mode or 0 seconds if the vehicle is in Transport mode.

The provides automatic shut-off of the courtesy and demand lamps after a time-out period when the ignition is OFF. A timer in the BCM starts when any of the following occur:

- the ignition is changed to OFF
- any door or luggage compartment lid/liftgate becomes ajar
- the UNLOCK button of the transmitter is pressed
- a door is unlocked using a key
- the door lock switch is pressed

When 10 minutes (30 minutes for demand lamps) have elapsed, the automatically shuts the voltage off to the lamps. The timer restarts (voltage is restored if the BCM is in battery saver mode) if any of the following occurs:

- the ignition is changed out of OFF
- any door, luggage compartment lid or liftgate becomes ajar
- the UNLOCK button of the transmitter is pressed
- a door is unlocked using a key
- the door lock switch is pressed

Courtesy Lamps

The courtesy lamp subsystem consists of the interior/map lamps, the door ajar switches and the BCM . The turns the courtesy lamps on when a door is opened or when an unlock signal is received from the Remote Keyless Entry (RKE) transmitter.

Illuminated Entry/Exit

The illuminated entry and exit features provide temporary illumination of the parking lamps, the

dimmable backlighting, the ambient backlighting and the courtesy lamps. Refer to the following table for additional information.

NOTE: An arbitrator (software programming) within the determines which actions take precedence over others (for example, an open door keeps the courtesy lamps on even when a command to lock the doors is received).

NOTE: For vehicles without Intelligent Access (IA), the timer for the backlighting and ambient lighting is reset to 25 seconds when the key is inserted or removed from the ignition lock cylinder.

Action	Parking Lamps	Courtesy Lamps	Dimmable Backlighting	Ambient Lighting
RKE transmitter or mechanical unlocking of the doors	On for 25 seconds	On for 25 seconds	On for 25 seconds	On for 25 seconds
RKE transmitter or mechanical locking of the doors	Off	Off	Off	Off
Open a closed door after previously unlocking (no ignition state change since unlock)	Off (on for remianing time if unlocked from transmitter or mechanical unlocking of the doors)	On	On	On
Close all doors	Off	On for 25 seconds	On for 25 seconds	On for 25 seconds
Ignition changed to ON	Off	On for 25 seconds	Off	On
Ignition changed out of ON	Off	On for 25 seconds	On for 25 seconds	On for 25 seconds
Open a door after the ignition is changed to OFF	Off	On	Off	Off
Ignition is OFF and doors are unlocked from the door lock switch	Off	On for 25 seconds	Off	Off
Ignition is OFF and doors are locked from the door lock switch	Off	Off	Off	Off

Theater Lighting

The theater lighting option ramps-up the courtesy lamps over 0.7 second when courtesy lamp activation is requested. The theater lighting feature ramps-down the courtesy lamps over 1.7 seconds when interior lighting deactivation is requested by any feature other than the panic alarm or battery saver.

Demand Lamps

The demand lamps subsystem consists of the map/reading lamps and the luggage compartment lamp (sedan) or cargo lamp (5-door) lamp. The energizes the battery saver relay to supply voltage to the demand lamps when the battery saver feature is not active.

Ambient Lighting

The ambient lighting LEDs illuminate the cup holders (front and rear) and the front and rear footwell areas. The ambient lighting subsystem consists of the ambient lighting switch, the ambient lighting module, and the harness with hardwired LEDs located within the floor console and under the instrument

panel footwell areas. The ambient lighting is operational when the ignition is in any state other than OFF (the exception is when it is used in conjunction with the illuminated entry/exit features). The ambient lighting switch cycles the LEDs through 7 different color combinations or to turn the ambient lighting off.

Interior Lighting

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Body Control Module (BCM) supplies voltage (and ground for the courtesy lamps) to the interior lighting system. The interior lighting system illuminates the courtesy lamps to enhance visibility of the interior when a vehicle door is ajar. The BCM controls all interior lighting functions and timing by monitoring inputs from the door ajar switches, luggage compartment lid/liftgate ajar switch, door lock switch, input from the Remote Keyless Entry (RKE) system and the ignition state.

The voltage supply circuit to the BCM for the interior lamps is also used for the horn.

Ambient Lighting

The ambient lighting module provides voltage and ground to the LEDs. The ambient lighting switch is an input to the ambient lighting module. With each press of the ambient lighting switch, the ambient lighting module cycles through a different color variation or turns the ambient lighting feature off. There are 3 different color (red, blue and green) LEDs housed within each LED assembly. By illuminating various color combinations, the LEDs are able to produce 7 different colors of ambient light. The module retains the last color setting between ignition cycles.

Field-Effect Transistor (FET) Protection

A FET is a type of transistor that, when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes a FET protective circuit strategy for many of its outputs (such as a turn lamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down when a fault event is detected. A short circuit DTC sets when the fault event occurs.

The circuit remains off until the fault is corrected and the ignition is cycled off and then back on, the module resets the FET protection and allows the circuit to function.

The FET protected circuits for the interior lighting system are the interior lamp voltage supply, courtesy lamp ground and ambient lighting module voltage supply circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

• Interior/map lamps • Luggage compartment/cargo lamp	• Bulb(s) • Wiring, terminals or connectors • Interior/map lamps • Luggage compartment/cargo lamp • Ambient lighting switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Body Control Module (BCM).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to

the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Body Control Module (BCM) DTC Chart

DTC	Description	Action

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The courtesy lamps do not illuminate with a door open	• Wiring, terminals or connectors • Door latch • Body Control Module (BCM)	• GO to Pinpoint Test A .
• One or more courtesy lamps are inoperative	• Wiring, terminals or connectors • Interior lamp • BCM	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test B .
• The luggage compartment/cargo lamp is inoperative	• Wiring, terminals or connectors • Luggage compartment lid/liftgate latch • Luggage compartment/cargo lamp	• VERIFY the bulb is OK. If OK, GO to Pinpoint Test C .

• The courtesy lamps are always on	• Wiring, terminals or connectors • Door latch • BCM	• GO to Pinpoint Test D .
• The luggage compartment/cargo lamp is always on	• Wiring, terminals or connectors • Luggage compartment lid/liftgate latch	• GO to Pinpoint Test E .
• One or more demand lamps are inoperative	• Wiring, terminals or connectors • Interior/map lamps	• VERIFY the bulbs are OK. If OK, GO to Pinpoint Test F .
• The battery saver does not deactivate after time-out	• Wiring, terminals or connectors • BCM	• GO to Pinpoint Test G .
• The ambient lighting is inoperative	• Wiring, terminals or connectors • Ambient lighting switch • Ambient lighting harness • Ambient lighting module • BCM	• GO to Pinpoint Test H .
• The ambient lighting does not cycle through all color variations	• Wiring, terminals or connectors • Ambient lighting switch • Ambient lighting harness • Ambient lighting module	• GO to Pinpoint Test I .
• The ambient lighting is always on	• Wiring, terminals or connectors • BCM	• GO to Pinpoint Test J .

Pinpoint Tests

Pinpoint Test A: The Courtesy Lamps Do Not Illuminate With A Door Open

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends a voltage signal to each door ajar switch (integrated into the door latch), which is routed to ground when the door is closed (the door ajar switch is closed when the door is closed). When the door is opened, the signal to ground is interrupted, indicating an open door to the BCM . When the BCM determines a door is open, the battery saver relay energizes (if not already energized) to supply voltage to the interior lamps and the BCM provides ground to the courtesy lamps.

The demand lamp system (map lamps) uses the interior lamps ground circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door latch

- BCM

PINPOINT TEST A: THE COURTESY LAMPS DO NOT ILLUMINATE WITH A DOOR OPEN

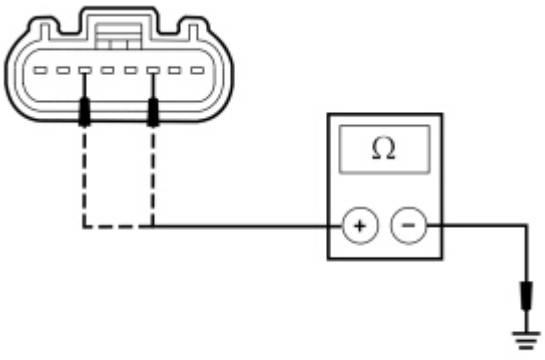
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>A1 CHECK THE OPERATION OF THE COURTESY LAMPS FROM ALL THE DOORS</td><td></td></tr>
<tr><td>NOTE: Make sure the interior lamp switches are in the DOOR or COURTESY position before carrying out this step.
• Open all the doors and observe the interior lamps.
• Do the interior lamps illuminate?</td><td>Yes
CLOSE the doors. GO to A2.

No
CLOSE the doors. GO to Pinpoint Test B.</td></tr>
<tr><td>A2 CHECK THE DOOR AJAR SWITCH OPERATION</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Suspect Door Latch .
• Do the courtesy lamps illuminate?</td><td>Yes
INSTALL a new door latch in question. REFER to Section 501-14. TEST the system for normal operation.

No
GO to A3.</td></tr>
<tr><td>A3 CHECK THE DOOR AJAR SWITCH CIRCUIT FOR A SHORT TO GROUND</td><td></td></tr>
<tr><td>• Disconnect: BCM C2280G.
• Measure the resistance between the suspect door latch, harness side and ground as follows:

<table>
<tr><th>Suspect Door Latch</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>LH front</td><td>C525-3</td><td>CPL26 (GN/VT)</td></tr>
<tr><td>RH front</td><td>C609-6</td><td>CPL31 (WH)</td></tr>
<tr><td>LH rear</td><td>C705-3</td><td>CPL36 (GN)</td></tr>
<tr><td>RH rear</td><td>C805-6</td><td>CPL39 (YE)</td></tr>
</table>

N0114650</td><td>Yes
GO to A4.

No
REPAIR the circuit in question for a short to ground. TEST the system for normal operation.</td></tr>
</table>

• **Is the resistance greater than 10,000 ohms?**	
A4 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: One Or More Courtesy Lamps Are Inoperative

Refer to Wiring Diagrams Cell 89, Interior Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) supplies voltage and ground to the courtesy lamps when requested. The voltage supply is also used for the demand lamp function (map lamps).

- DTC B1091:12 (Courtesy Lamp Sense: Circuit Short To Battery) — a continuous and on-demand DTC that sets when the BCM detects a short to voltage from the courtesy lamp ground controlled circuit.
- DTC B1D14:11 (Interior Lights Circuit "B": Circuit Short to Ground) — a continuous and on-demand DTC that sets when the BCM detects a short to ground from the courtesy lamp voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Interior lamp
- BCM

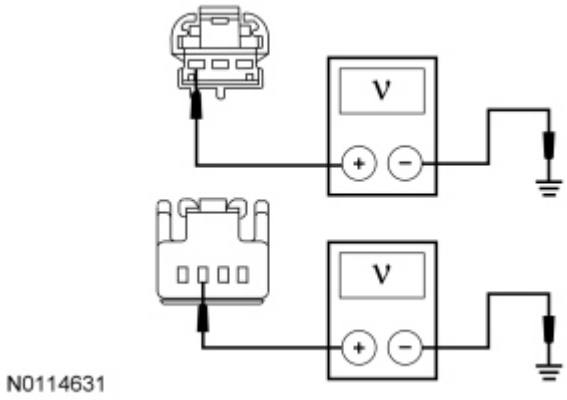
PINPOINT TEST B: ONE OR MORE COURTESY LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE COURTESY LIGHTING WITH THE LH FRONT DOOR OPEN	
NOTE: For vehicles equipped with a moonroof, make sure the interior lamp switches are in the DOOR position before carrying out this step. • Ignition OFF. • Open the LH front door and observe the interior lamps. • **Are all the interior lamps inoperative?**	**Yes** GO to B4. **No** GO to B2.
B2 CHECK FOR VOLTAGE TO THE INOPERATIVE COURTESY LAMP	

- Disconnect: Inoperative Lamp.
- Ignition ON.
- With a door open, measure the voltage between the inoperative interior lamp, harness side and ground as follows:

Inoperative Lamp	Connector-Pin	Circuit
Front (with moonroof)	C926-3	CLN01 (GN/VT)
Front (without moonroof)	C901-3	CLN01 (GN/VT)
Rear	C932-3	CLN01 (GN/VT)



N0114631

- **Is the voltage greater than 10 volts?**

Yes
GO to B3 .

No
REPAIR circuit CLN01 (GN/VT) for an open. TEST the system for normal operation.

B3 CHECK THE INOPERATIVE COURTESY LAMP GROUND CONTROLLED CIRCUIT FOR AN OPEN

- Measure the voltage between the inoperative interior lamp pins, harness side as follows:

Inoperative Lamp	Connector-Pin Circuit	Connector-Pin Circuit
Front (with moonroof)	C926-3 CLN01 (GN/VT)	C926-2 CLN03 (YE/GY)
Front (without moonroof)	C901-3 CLN01 (GN/VT)	C901-1 CLN03 (YE/GY)
Rear	C932-3 CLN01 (GN/VT)	C932-1 CLN03 (YE/GY)

Yes
INSTALL a new interior lamp for the lamp in question. TEST the system for normal operation.

No
REPAIR circuit CLN03 (YE/GY) for an open. TEST the system for normal operation.

 N0114632 • **Is the voltage greater than 10 volts?**	
B4 CHECK THE OPERATION OF THE COURTESY LAMPS FROM ALL THE DOORS	
• Open all the doors and observe the interior lamps. • **Do the interior lamps illuminate?**	**Yes** GO to Pinpoint Test A . **No** CLOSE all the doors. GO to B5 .
B5 CHECK THE OPERATION OF THE MAP LAMP	
• Ignition ON. • Use the map lamp function on the front interior lamp and attempt to turn the lamp on. • **Does the front interior lamp illuminate?**	**Yes** GO to B6 . **No** GO to B8 .
B6 CHECK THE COURTESY LAMPS GROUND CONTROLLED CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: BCM C2280C. • Ignition ON. • Measure the voltage between the BCM C2280C-5, circuit CLN03 (YE/GY), harness side and ground.  N0114633 • **Is any voltage present?**	**Yes** REPAIR circuit CLN03 (YE/GY) for a short to voltage. CYCLE the ignition ON and then OFF. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B7 .
B7 CHECK THE COURTESY LAMPS GROUND CONTROLLED CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the BCM C2280C-5, circuit CLN03 (YE/GY), harness side and the BCM C2280C-4, circuit CLN01 (GN/VT), harness side.	**Yes** GO to B13 . **No** REPAIR circuit CLN03 (YE/GY) for an open. TEST

 N0114634 • **Is the resistance less than 5 ohms?**	the system for normal operation.
B8 ISOLATE THE FRONT INTERIOR LAMP	
• Ignition OFF. • Disconnect: Front Interior Lamp C926 (with moonroof) or C901 (without moonroof). • Cycle the ignition ON and then OFF. • Open the LH front door. • **Does the rear interior lamp illuminate?**	**Yes** INSTALL a new front interior lamp. CLEAR the DTCs. TEST the system for normal operation. **No** CLOSE the LH front door. GO to B9 .
B9 ISOLATE THE LUGGAGE COMPARTMENT/CARGO LAMP	
• Disconnect: Luggage Compartment/Cargo Lamp C489. • Cycle the ignition ON and then OFF. • Open the LH front door. • **Does the rear interior lamp illuminate?**	**Yes** INSTALL a new luggage compartment/cargo lamp. CLEAR the DTCs. TEST the system for normal operation. **No** CLOSE the LH front door. GO to B10 .
B10 ISOLATE THE REAR INTERIOR LAMP	
• Disconnect: Rear Interior Lamp C932. • Cycle the ignition ON and then OFF. • Open the LH front door. • Measure the voltage between the rear interior lamp C932-3, circuit CLN01 (GN/VT), harness side and ground.  N0114635 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new rear interior lamp. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B11 .
B11 CHECK THE INTERIOR LAMP VOLTAGE SUPPLY CIRCUIT	

FOR A SHORT TO GROUND	
• Disconnect: BCM C2280C. • Measure the resistance between the rear interior lamp C932-3, circuit CLN01 (GN/VT), harness side and ground.  N0114635 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CLN01 (GN/VT) for a short to ground. CYCLE the ignition ON and then OFF. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B12.
B12 CHECK THE INTERIOR LAMP VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Connect: Front, Rear and Luggage Compartment/Cargo Lamps . • Measure the resistance between the BCM C2280C-5, circuit CLN03 (YE/GY), harness side and the BCM C2280C-4, circuit CLN01 (GN/VT), harness side.  N0114634 • **Is the resistance less than 5 ohms?**	**Yes** GO to B12. **No** REPAIR circuit CLN01 (GN/VT) for an open. TEST the system for normal operation.
B13 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Luggage Compartment/Cargo Lamp Is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends a voltage signal to the luggage compartment lid/liftgate ajar switch (integrated into the latch) to monitor the ajar switch status. The switch is normally closed when the luggage compartment lid/liftgate is closed, and open when the luggage compartment lid/liftgate is open. The ajar switch also controls the ground side of the luggage compartment lamp. The luggage compartment ajar switch completes the path to ground for the luggage compartment/cargo lamp when the luggage compartment lid/liftgate is open.

- DTC B1178:92 (Boot/Trunk Ajar Switch: Performance Or Incorrect Operation) — an on-demand DTC that sets when the BCM detects an open from the luggage compartment lid/liftgate ajar input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Luggage compartment lid/liftgate latch
- Luggage compartment/cargo lamp

PINPOINT TEST C: THE LUGGAGE COMPARTMENT/CARGO LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE COURTESY LAMP OPERATION	
• Open the LH front door and observe the interior lamps. • **Do the courtesy lamps illuminate?**	**Yes** GO to C2 . **No** GO to Pinpoint Test A .
C2 CHECK THE LUGGAGE COMPARTMENT LID/LIFTGATE AJAR PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM luggage compartment lid/liftgate ajar switch PID while opening and closing the luggage compartment lid/liftgate. • **Does the PID agree with the luggage compartment lid/liftgate positions?**	**Yes** GO to C3 . **No** If the PID always indicates closed, GO to C6 . If the PID always indicates open, GO to C8 .
C3 CHECK FOR VOLTAGE TO THE LUGGAGE COMPARTMENT/CARGO LAMP	
• Ignition OFF. • Open the luggage compartment lid/liftgate. • Disconnect: Luggage Compartment/Cargo Lamp C489. • Measure the voltage between the luggage compartment/cargo lamp C489-1, circuit CLN01 (GN/VT), harness side and the luggage compartment lamp C489-2, circuit CLN13 (WH/BU).	**Yes** INSTALL a new luggage compartment lamp. TEST the system for normal operation.

 N0089982 • **Is the voltage greater than 10 volts?**	**No** GO to C4 .
C4 CHECK THE LUGGAGE COMPARTMENT/CARGO LAMP VOLTAGE SUPPLY CIRCIUT FOR AN OPEN	
• Measure the voltage between the luggage compartment/cargo lamp C489-1, circuit CLN01 (GN/VT), harness side and ground.  N0075717 • **Is the voltage greater than 10 volts?**	**Yes** GO to C5 . **No** REPAIR circuit CLN01 (GN/VT) for an open. TEST the system for normal operation.
C5 CHECK THE LUGGAGE COMPARTMENT/CARGO LAMP GROUND CIRCUIT FOR AN OPEN	
• Connect: Luggage Compartment/Cargo Lamp C489. • Disconnect: Luggage Compartment Lid/Liftgate Latch C4223. • Measure the voltage between the luggage compartment lid/liftgate latch C4223-4, circuit CLN13 (WH/BU), harness side and ground.  N0114636 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new luggage compartment lid/liftgate latch. REFER to Section 501-14 . TEST the system for normal operation. **No** REPAIR circuit CLN13 (WH/BU) for an open. TEST the system for normal operation.
C6 RECHECK THE PID WITH THE LUGGAGE COMPARTMENT/LIFTGATE LATCH DISCONNECTED	
• Disconnect: Luggage Compartment Lid/Liftgate Latch C4223.	**Yes**

• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM luggage compartment lid/liftgate ajar switch PID. • **Does the PID indicate the luggage compartment lid/liftgate is open?**	INSTALL a new luggage compartment lid/liftgate latch. REFER to Section 501-14 . TEST the system for normal operation. **No** GO to C7 .
C7 CHECK THE LUGGAGE COMPARTMENT/LIFTGATE AJAR INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280G. • Measure the resistance between the luggage compartment lid/liftgate latch C4223-3, circuit CPL44 (YE/OG), harness side and ground.  N0114640 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C11 . **No** REPAIR circuit CPL44 (YE/OG) for a short to ground. TEST the system for normal operation.
C8 BYPASS THE LUGGAGE COMPARTMENT/LIFTGATE LATCH	
• Ignition OFF. • Disconnect: Luggage Compartment Lid/Liftgate Latch C4223. • Ignition ON. • Connect a fused jumper wire between the luggage compartment lid/liftgate latch C4223-3, circuit CPL44 (YE/OG), harness side and the luggage compartment lid/liftgate latch C4223-2, circuit GD143 (BK/VT), harness side.  N0114638 • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM luggage compartment lid/liftgate ajar switch PID. • **Does the PID indicate the luggage compartment lid/liftgate is closed?**	**Yes** REMOVE the jumper wire. INSTALL a new luggage compartment lid latch. REFER to Section 501-14 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to C9 .

C9 BYPASS THE LUGGAGE COMPARTMENT/LIFTGATE LATCH GROUND CIRCUIT	
• Connect a fused jumper wire between the luggage compartment lid/liftgate latch C4223-3, circuit CPL44 (YE/OG), harness side and ground.  N0114639 • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM luggage compartment lid/liftgate ajar switch PID. • **Does the PID indicate the luggage compartment lid/liftgate is closed?**	**Yes** REMOVE the jumper wire. REPAIR circuit GD143 (BK/VT) for an open. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to C10.
C10 CHECK THE LUGGAGE COMPARTMENT/LIFTGATE AJAR INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280G. • Measure the resistance between the BCM C2280G-7, circuit CPL44 (YE/OG), harness side and the luggage compartment lid/liftgate latch C4223-3, circuit CPL44 (YE/OG), harness side.  N0114643 • **Is the resistance less than 5 ohms?**	**Yes** GO to C11. **No** REPAIR circuit CPL44 (YE/OG) for an open. TEST the system for normal operation.
C11 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all BCM the connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern

	may have been caused by a loose or corroded connector.

Pinpoint Test D: The Courtesy Lamps Are Always On

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends a voltage signal to each door ajar switch (integrated into the door latch), which is routed to ground when the door is closed (the door ajar switch is closed when the door is closed). When the door is opened, the signal to ground is interrupted, indicating an open door to the BCM . When the BCM determines a door is open, the battery saver relay energizes (if not already energized) to supply voltage to the interior lamps and then the BCM provides ground to the courtesy lamps.

DTC Description	Fault Trigger Conditions
• B1175:92 — Driver Door Ajar Switch: Performance Or Incorrect Operation	An on-demand DTC that sets when the BCM detects an open from the LH front door ajar circuit.
• B1176:92 — Passenger Door Ajar Switch: Performance Or Incorrect Operation	An on-demand DTC that sets when the BCM detects an open from the RH front door ajar circuit.
• B11E9:92 — Left Rear Door Ajar Switch: Performance Or Incorrect Operation	An on-demand DTC that sets when the BCM detects an open from the LH rear door ajar circuit.
• B11EA:92 — Right Rear Door Ajar Switch: Performance Or Incorrect Operation	An on-demand DTC that sets when the BCM detects an open from the RH rear door ajar circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door latch
- BCM

PINPOINT TEST D: THE COURTESY LAMPS ARE ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

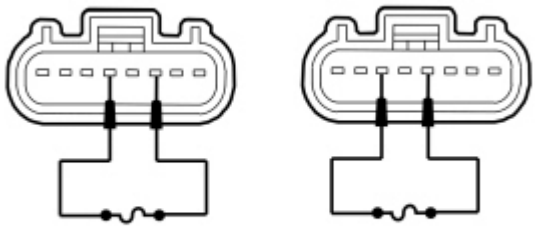
Test Step	Result / Action to Take
D1 CHECK THE DOOR AJAR PIDs	
• Ignition ON. • Close all the doors. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM door ajar switch PIDs while opening and closing all the doors. • **Do all the door ajar switch PID values agree with the door**	**Yes** GO to D5 . **No** GO to D2 .

positions?

D2 BYPASS THE SUSPECT DOOR LATCH

- Ignition OFF.
- Disconnect: Suspect Door Latch .
- Ignition ON.
- Connect a fused jumper wire between the suspect door latch pins, harness side as follows:

Suspect Door Latch	Connector-Pin Circuit	Connector-Pin Circuit
LH front	C525-3 CPL26 (GN/VT)	C525-5 GD143 (BK/VT)
RH front	C609-6 CPL31 (WH)	C609-4 GD145 (BK/BU)
LH rear	C705-3 CPL36 (GN)	C705-5 GD143 (BK/VT)
RH rear	C805-6 CPL39 (YE)	C805-4 GD145 (BK/BU)



N0114641

- Monitor the suspect BCM door ajar switch PID.
- **Does the PID indicate the suspect door is closed?**

Yes
REMOVE the jumper wire. INSTALL a new door latch for the one in question. REFER to Section 501-14 . TEST the system for normal operation.

No
REMOVE the jumper wire. GO to D3 .

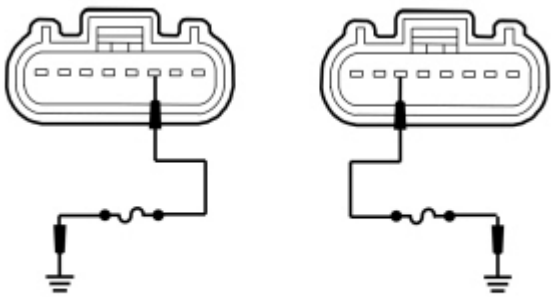
D3 BYPASS THE DOOR LATCH GROUND CIRCUIT

- Connect a fused jumper wire between the suspect door latch, harness side and ground as follows:

Suspect Door Latch	Connector-Pin	Circuit
LH front	C525-3	CPL26 (GN/VT)
RH front	C609-6	CPL31 (WH)
LH rear	C705-3	CPL36 (GN)
RH rear	C805-6	CPL39 (YE)

Yes
REMOVE the jumper wire. REPAIR the door latch ground circuit in question for an open. TEST the system for normal operation.

No
REMOVE the jumper wire. GO to D4 .



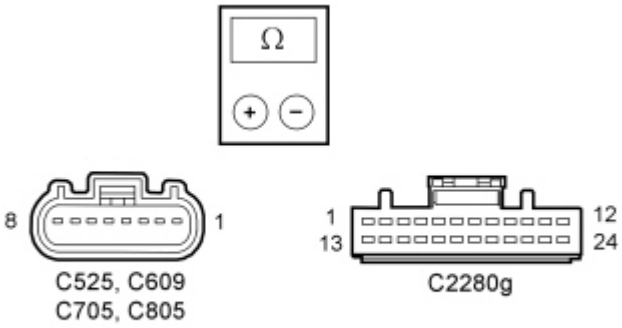
N0114642

- Monitor the suspect BCM door ajar switch PID.
- **Does the PID indicate the suspect door is closed?**

D4 CHECK THE DOOR AJAR SWITCH INPUT CIRCUIT FOR AN OPEN

- Ignition OFF.
- Disconnect: BCM C2280G.
- Measure the resistance between the suspect door ajar switch, harness side and the BCM, harness side as follows:

Suspect Door Ajar Latch Connector-Pin	BCM Connector-Pin	Circuit
LH front	C2280G-10	CPL26 (GN/VT)
RH front	C2280G-22	CPL31 (WH)
LH rear	C2280G-4	CPL36 (GN)
RH rear	C2280G-3	CPL39 (YE)



N0114644

- **Is the resistance less than 5 ohms?**

Yes
GO to D6.

No
REPAIR the door ajar input circuit in question for an open. TEST the system for normal operation.

D5 CHECK THE COURTESY LAMP GROUND CIRCUIT FOR A SHORT TO GROUND

- Ignition OFF.
- Disconnect: BCM C2280C.
- Measure the resistance between the BCM C2280C-5, circuit CLN03 (YE/GY), harness side and ground.

Yes
GO to D6.

No
REPAIR circuit CLN03 (YE/GY) for an open. TEST the system for normal operation.

 N0114645 • **Is the resistance greater than 10,000 ohms?**	
D6 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Luggage Compartment/Cargo Lamp Is Always On

Refer to Wiring Diagrams Cell 89, Interior Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends a voltage signal to the luggage compartment lid/liftgate ajar switch (integrated into the latch) to monitor the ajar switch status. The switch is normally closed when the luggage compartment lid/liftgate is closed, and open when the luggage compartment lid/liftgate is open. The ajar switch also controls the ground side of the luggage compartment lamp. The luggage compartment ajar switch completes the path to ground for the luggage compartment/cargo lamp when the luggage compartment lid/liftgate is open.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Luggage compartment lid/liftgate latch

PINPOINT TEST E: THE LUGGAGE COMPARTMENT/CARGO LAMP IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE LUGGAGE COMPARTMENT LID/LIFTGATE AJAR PID	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM luggage compartment lid/liftgate ajar PID while opening and closing the luggage compartment lid/liftgate. • **Does the PID agree with the luggage compartment lid/liftgate positions?**	**Yes** GO to E2. **No** GO to Pinpoint Test C.
E2 CHECK THE LUGGAGE COMPARTMENT LID/LIFTGATE LATCH	
• Ignition OFF. • Disconnect: Luggage Compartment Lid/Liftgate Latch C4223. • Ignition ON. • **Does the luggage compartment/cargo lamp continue to illuminate?**	**Yes** REPAIR circuit CLN13 (WH/BU) for a short to ground. TEST the system for normal operation. **No** INSTALL a new luggage compartment lid/liftgate latch. REFER to Section 501-14. TEST the system for normal operation.

Pinpoint Test F: One Or More Demand Lamps Are Inoperative

Refer to Wiring Diagrams Cell 89, Interior Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) supplies voltage to the interior lamps when the battery saver feature is not active. This voltage supply is shared with the courtesy lamps. The interior lamps have a dedicated ground circuit that is used for the map lamps to function independently of the courtesy lamp operation.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Interior/map lamps

PINPOINT TEST F: ONE OR MORE DEMAND LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK THE COURTESY LAMP OPERATION	
NOTE: For vehicles equipped with a moonroof, make sure the interior lamp switches are in the DOOR position before carrying out this step. • Check the operation of the courtesy lamps with any door open. • **Do the courtesy lamps operate correctly?**	**Yes** GO to F2. **No** GO to Pinpoint Test B.
F2 DETERMINE IF THE FRONT AND REAR DEMAND LAMPS ARE OPERATIVE	
• Operate the map lamp function from the front and rear interior lamps.	**Yes** REPAIR circuit

<table>
<tr><td>

- **Is the map lamp function inoperative from both lamps?**

</td><td>GD143 (BK/VT) for an open. TEST the system for normal operation.

No
GO to F3 .</td></tr>
<tr><td>F3 CHECK INTERIOR LAMP GROUND CIRCUIT FOR AN OPEN</td><td></td></tr>
<tr><td>

- Ignition OFF.
- Disconnect: Inoperative Interior Lamp.
- Ignition ON.
- Measure the voltage between the inoperative interior lamp pins, harness side as follows:

<table>
<tr><th>Inoperative Lamp</th><th>Connector-Pin

</table>

Pinpoint Test G: The Battery Saver Does Not Deactivate After Time-out

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Body Control Module (BCM) provides a battery saver function that automatically shuts off of the courtesy lamps after 10 minutes and the demand lamps (map lamps and luggage compartment/cargo lamp) after 30 minutes have elapsed in order to save battery power.

If the courtesy lamps remain on after the battery saver feature activates (10 minutes), GO to Pinpoint Test D .

Refer to Interior Lighting , Battery Saver for specific information regarding the conditions which the battery saver activates.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals, or connectors
- BCM

PINPOINT TEST G: THE BATTERY SAVER DOES NOT DEACTIVATE AFTER TIME-OUT

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK THE INTERIOR LAMP VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280C. • Ignition ON. • Turn any map lamp on. • **Does the map lamp turn on?**	**Yes** REPAIR circuit CLN01 (GN/VT) for a short to voltage. TEST the system for normal operation. **No** GO to G2 .
G2 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Ambient Lighting Is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

When the ignition is in any state other than OFF, the Body Control Module (BCM) supplies voltage to the ambient lighting module and the ambient lighting switch. The ambient lighting module supplies voltage and ground to the ambient lighting LEDs. The ambient lighting switch cycles through the 7 color combinations or turns the ambient lighting feature off.

When the ambient lighting switch is pressed, voltage is routed to the ambient lighting module, indicating a request for the module to cycle the ambient lighting to the next setting.

The ambient lighting switch is a momentary contact switch.

- DTC B12F1:11 (Ambient Lighting Zone 1 Output: Circuit Short To Ground) — a continuous and

on-demand DTC that sets when the BCM detects a short to ground from the ambient lighting module voltage supply circuit.
- DTC B12F1:15 (Ambient Lighting Zone 1 Output: Circuit Short To Battery Or Open) — a continuous and on-demand DTC that sets when the BCM detects an open from the ambient lighting module voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals, or connectors
- Ambient lighting switch
- Ambient lighting harness
- Ambient lighting module
- BCM

PINPOINT TEST H: THE AMBIENT LIGHTING IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 CHECK FOR VOLTAGE TO THE AMBIENT LIGHTING MODULE • Ignition OFF. • Disconnect: Ambient Lighting Module C3347. • Ignition ON. • Measure the voltage between the ambient lighting module C3347-1, circuit CBX07 (GN/RD), harness side and ground.  N0107358 • **Is the voltage greater than 10 volts?**	**Yes** GO to H4 . **No** GO to H2 .
H2 CHECK THE AMBIENT LIGHTING MODULE VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: BCM C2280E. • Measure the resistance between the ambient lighting module C3347-1, circuit CBX07 (GN/RD), harness side and ground.	**Yes** GO to H3 . **No** REPAIR circuit CLN02 (VT/BN) for a short to ground. CYCLE the ignition ON and then OFF. CLEAR the DTCs. TEST the system for normal

 N0114651 • **Is the resistance greater than 10,000 ohms?**	operation.
H3 CHECK THE AMBIENT LIGHTING MODULE VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Measure the resistance between the ambient lighting module C3347-1, circuit CBX07 (GN/RD), harness side and the BCM C2280E-24, circuit CLN02 (VT/BN), harness side.  N0114647 • **Is the resistance less than 5 ohms?**	**Yes** GO to H11 . **No** REPAIR circuit CBX07 (GN/RD) or circuit CLN02 (VT/BN) for an open. TEST the system for normal operation.
H4 CHECK THE AMBIENT LIGHTING SWITCH OUTPUT CIRCUIT	
• While pressing and releasing the ambient lighting switch, measure the voltage between the ambient lighting module C3347-2, circuit CLN54 (BN/YE), harness side and ground.  N0107360 • **Is the voltage greater than 10 volts with the switch pressed and 0 volts with the switch released?**	**Yes** GO to H5 . **No** If voltage is always present, GO to H7 . If no voltage is present, GO to H8 .
H5 CHECK THE AMBIENT LIGHTING MODULE GROUND CIRCUIT FOR AN OPEN	
• Measure the voltage between the ambient lighting module C3347-	**Yes**

1, circuit CBX07 (GN/RD), harness side and the ambient lighting module C3347-8, circuit GD908 (BK), harness side.  N0107361 • **Is the voltage greater than 10 volts?**	GO to H6 . **No** REPAIR circuit GD908 (BK) or circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
H6 CHECK THE AMBIENT LIGHTING HARNESS	
• Ignition OFF. • Check any of the diode circuits between the ambient lighting module, harness side as follows: **Connector-Pin Circuit** / **Connector-Pin Circuit** C3347-5 CLN45 (GN) / C3347-4 RLN44 (BN) C3347-6 CLN46 (BU) / C3347-4 RLN44 (BN) C3347-7 CLN44 (OG) / C3347-4 RLN44 (BN)  N0107362 • **Does the meter indicate the circuit is good?**	**Yes** GO to H10 . **No** REPAIR or INSTALL a new ambient lighting harness. TEST the system for normal operation.
H7 CHECK THE AMBIENT LIGHTING SWITCH OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Ambient Lighting Switch C2401. • Ignition ON.	**Yes** REPAIR circuit CLN54 (BN/YE) or circuit

• Measure the voltage between the ambient lighting module C3347-2, circuit CLN54 (BN/YE), harness side and ground.  N0107360 • **Is any voltage present?**	CLN60 (WH/BN) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new ambient lighting switch. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation.
H8 CHECK FOR VOLTAGE TO THE AMBIENT LIGHTING SWITCH	
• Ignition OFF. • Connect: Ambient Lighting Module C3347. • Disconnect: Ambient Lighting Switch C2401. • Ignition ON. • Measure the voltage between the ambient lighting switch C2401-2, circuit CLN02 (VT/BN), harness side and ground.  N0114648 • **Is the voltage greater than 10 volts?**	**Yes** GO to H9 . **No** REPAIR circuit CLN02 (VT/BN) for an open. TEST the system for normal operation.
H9 BYPASS THE AMBIENT LIGHTING SWITCH	
• Connect and remove a fused jumper wire between the ambient lighting switch C2401-2, circuit CLN02 (VT/BN), harness side and the ambient lighting switch C2401-1, circuit CLN60 (WH/BN), harness side.  N0114649	**Yes** REMOVE the jumper wire. INSTALL a new ambient lighting switch. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR circuit CLN54 (BN/YE) or circuit CLN60 (WH/BN) for an open. TEST the system for normal operation.

• **Do the ambient LEDs illuminate and cycle through a color change each time the jumper wire is connected and removed?**	
H10 CHECK FOR CORRECT AMBIENT LIGHTING MODULE OPERATION	

• Disconnect the ambient lighting module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the ambient lighting module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ambient lighting module. REFER to Ambient Lighting Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

H11 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Ambient Lighting Does Not Cycle Through All Color Variations

Refer to Wiring Diagrams Cell 89, Interior Lamps for schematic and connector information.

Normal Operation

When the ignition is in any state other than OFF, the Body Control Module (BCM) supplies voltage to the ambient lighting module and the ambient lighting switch. The ambient lighting module supplies voltage and ground to the ambient lighting LEDs. The ambient lighting switch cycles through the 7 color combinations or turns the ambient lighting feature off.

When the ambient lighting switch is pressed, voltage is routed to the ambient lighting module, indicating a request for the module to cycle the ambient lighting to the next setting.

The ambient lighting switch is a momentary contact switch.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ambient lighting switch
- Ambient lighting harness

N0107362

- **Does the meter indicate good for each circuit check?**

I3 CHECK THE AMBIENT LIGHTING SWITCH OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Ambient Lighting Switch C2401. • Ignition ON. • Measure the voltage between the ambient lighting module C3347-2, circuit CLN60 (WH/BN), harness side and ground.  N0107360 • **Is any voltage present?**	**Yes** REPAIR circuit CLN54 (BN/YE) or circuit CLN60 (WH/BN) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new ambient lighting switch. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation.
I4 CHECK FOR VOLTAGE TO AMBIENT LIGHTING SWITCH	
• Ignition OFF. • Connect: Ambient Lighting Module C3347. • Disconnect: Ambient Lighting Switch C2401. • Ignition ON. • Measure the voltage between the ambient lighting switch C2401-2, circuit CLN02 (VT/BN), harness side and ground.  N0114648 • **Is the voltage greater than 10 volts?**	**Yes** GO to I5 . **No** REPAIR circuit CLN02 (VT/BN) for an open. TEST the system for normal operation.

I5 BYPASS THE AMBIENT LIGHTING SWITCH	
• Connect and remove a fused jumper wire between the ambient lighting switch C2401-2, circuit CLN02 (VT/BN), harness side and the ambient lighting switch C2401-1, circuit CLN60 (WH/BN), harness side.  N0114649 • **Do the ambient LEDs illuminate and cycle through a color change each time the jumper wire is connected and removed?**	**Yes** REMOVE the jumper wire. INSTALL a new ambient lighting switch. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR circuit CLN54 (BN/YE) or circuit CLN60 (WH/BN) for an open. TEST the system for normal operation.
I6 CHECK FOR CORRECT AMBIENT LIGHTING MODULE OPERATION	

• Disconnect the ambient lighting module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the ambient lighting module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ambient lighting module. REFER to Ambient Lighting Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Ambient Lighting Is Always On

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

When the ignition is in any state other than OFF, the Body Control Module (BCM) supplies voltage to the ambient lighting module and the ambient lighting switch.

The ambient lighting also has its own illuminated entry/exit strategy. For additional information regarding this strategy, refer to Interior Lighting , Illuminated Entry/Exit.

- DTC B12F1:15 (Ambient Lighting Zone 1 Output: Circuit Short To Battery Or Open) — a continuous and on-demand DTC that sets when the BCM detects a short to voltage from the ambient lighting module voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals, or connectors
- BCM

PINPOINT TEST J: THE AMBIENT LIGHTING IS ALWAYS ON

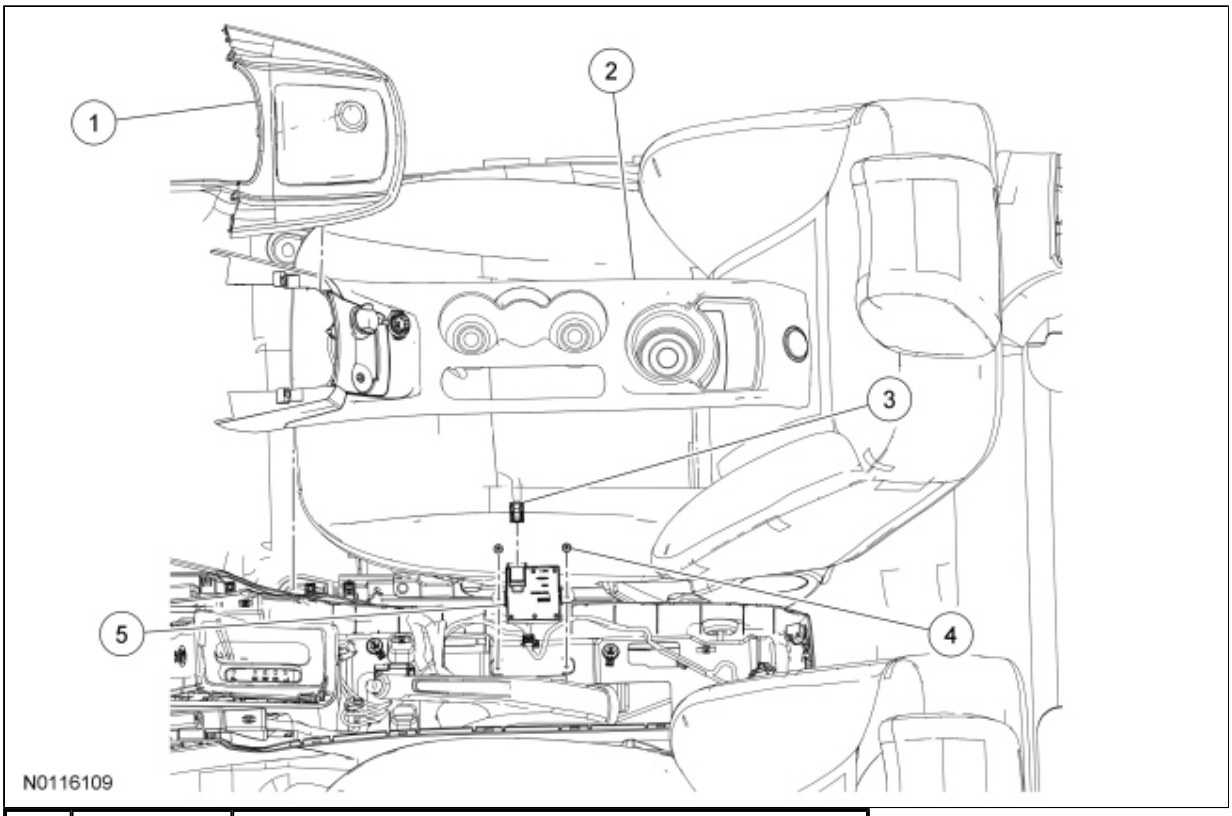
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Under some conditions, the ambient lighting system is active for up to 10 minutes after the ignition is changed to OFF or a door is opened. Make sure the battery saver feature operates correctly before continuing diagnostics.

Test Step	Result / Action to Take
J1 CHECK THE BCM AMBIENT LIGHTING SYSTEM OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280E. • Ignition ON. • **Does the ambient lighting continue to illuminate?**	**Yes** REPAIR circuit CLN54 (BN/YE) or circuit CLN60 (WH/BN) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. **No** GO to J2.
J2 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Ambient Lighting Module



Item	Part Number	Description
1	—	Lower instrument panel finish panel
2	83B01	Floor console finish panel
3	—	Ambient lighting module electrical connector (part of 14K006)
4	W790200	Ambient lighting module screws (2 required)
5	13C788	Ambient lighting module

Removal and Installation

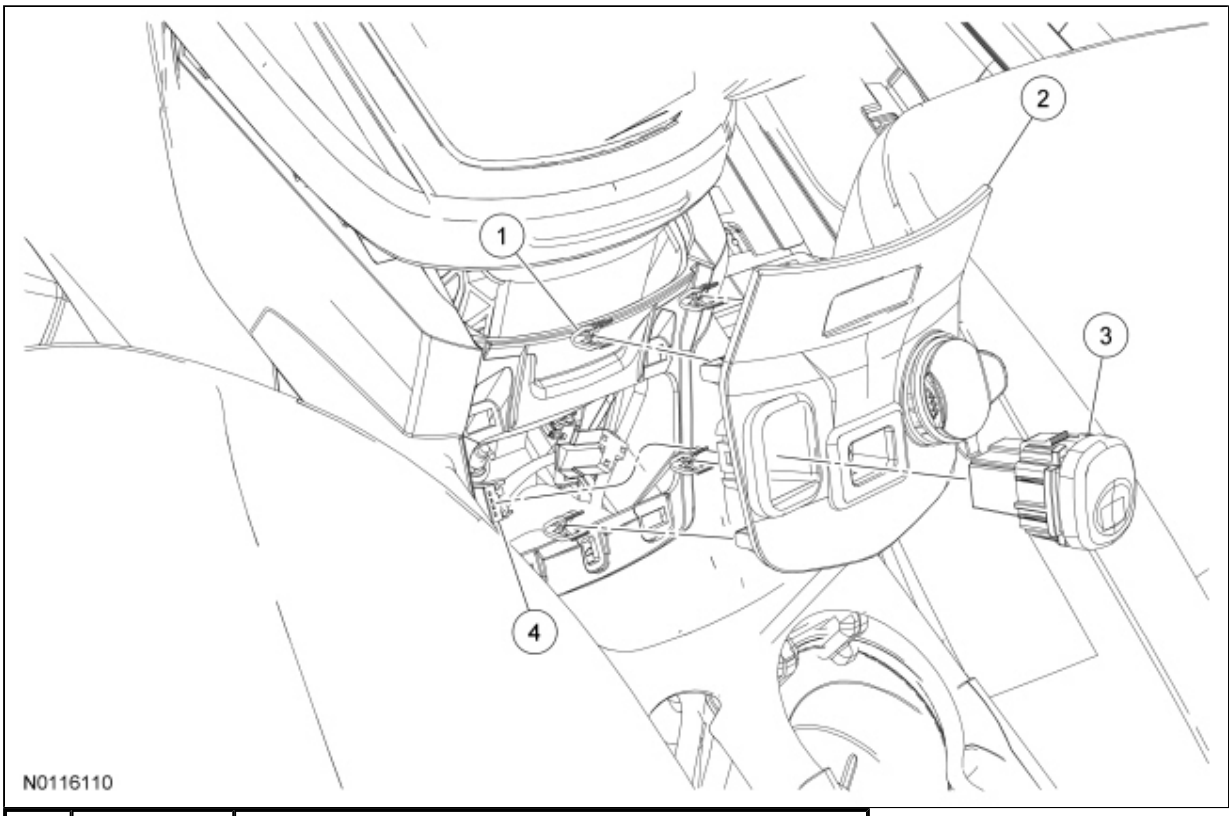
1. Remove the lower instrument panel finish panel. For additional information, refer to Section 501-12 .

2. Remove the floor console finish panel for access to the ambient lighting module. For additional information, refer to the floor console exploded view in Section 501-12 .
   - Lift upward on the rear of the floor console finish panel to release the floor console finish panel clips.
   - If equipped, disconnect the electrical connector.
   - Slide the park brake lever boot and the floor console finish panel over the park brake lever.

3. Remove the ambient lighting module.
   - Remove the 2 screws.
   - Disconnect the electrical connector.

4. To install, reverse the removal procedure.

Ambient Lighting Switch



Item	Part Number	Description
1	W714972-S1	Retaining clip (4 required)
2	15K12A	Media bezel
3	13D806A	Ambient lighting switch
4	—	Ambient lighting switch electrical connector (part of 14E078)

Removal and Installation

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Communications Network

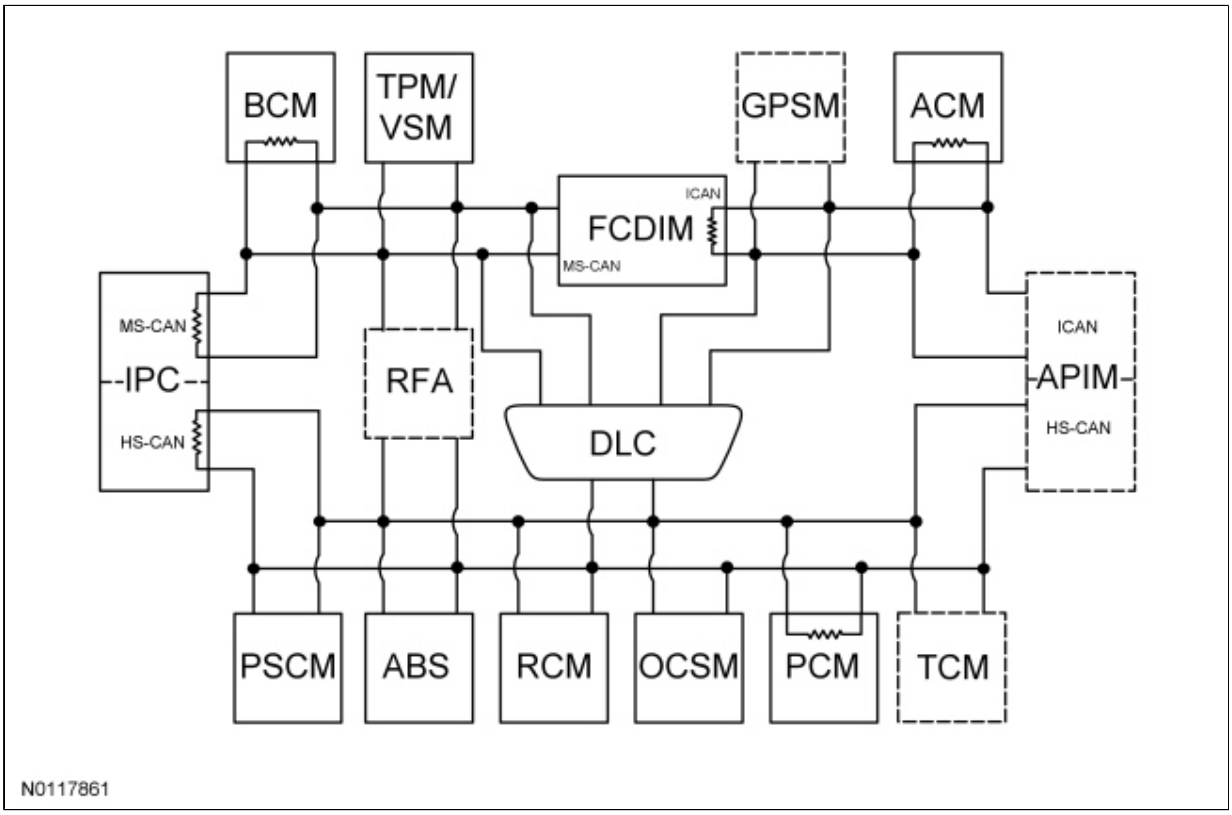
Multiplexing is a method of sending 2 or more signals simultaneously over a single circuit. Multiplexing allows 2 or more electronic modules (nodes) to communicate simultaneously over a twisted-wire pair [data (+) and data (-)] network. The information or messages that can be communicated on these wires consists of commands, status or data. The advantage of using multiplexing is to reduce the weight of the vehicle by reducing the number of redundant components and electrical wiring.

The vehicle has 2 module communication networks connected to the Data Link Connector (DLC) and communicate with the scan tool. The communication networks are:

- High Speed Controller Area Network (HS-CAN)
- Medium Speed Controller Area Network (MS-CAN)

The Infotainment Controller Area Network (I-CAN) is connected to the DLC , but the I-CAN modules communicate with the scan tool over the MS-CAN . The Front Control/Display Interface Module (FCDIM) is used as a gateway module for the messages to transfer between the scan tool and the modules on the I-CAN .

Network Topology



Module Name	Network Type	Termination Module
ABS module	HS-CAN	No
Accessory Protocol Interface Module (APIM) (if equipped)	HS-CAN / I-CAN	No/No
Audio Control Module (ACM)	I-CAN	Yes
Body Control Module (BCM)	MS-CAN	Yes
Front Control/Display Interface Module (FCDIM) (MS-CAN / I-CAN gateway module)	MS-CAN / I-CAN	No/Yes

Global Positioning System Module (GPSM) (if equipped)	I-CAN	No
Instrument Panel Cluster (IPC) (HS-CAN / MS-CAN gateway module)	HS-CAN / MS-CAN	Yes/Yes
Occupant Classification System Module (OCSM)	HS-CAN	No
PCM	HS-CAN	Yes
Power Steering Control Module (PSCM)	HS-CAN	No
Remote Function Actuator (RFA) module (if equipped)	HS-CAN / MS-CAN	No/No
Restraints Control Module (RCM)	HS-CAN	No
Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM)	MS-CAN	No
Transmission Control Module (TCM) (if equipped)	HS-CAN	No

Network Termination

The CAN uses a network termination circuit to improve communication reliability. The network termination of the CAN bus occurs inside the termination modules by termination resistors. Termination modules are located at either end of the bus network. As network messages are broadcast in the form of voltage signals, the network voltage signals are stabilized by the termination resistors. Each termination module has a 120 ohm resistor across the positive and negative bus connection in the termination module. With 2 termination modules on each network, and the 120 ohm resistors located in a parallel circuit configuration, the total network impedance, or total resistance is 60 ohms.

Network termination improves bus message reliability by stabilizing bus voltage, and eliminating electrical interference.

Gateway Module

The IPC is the gateway module, translating HS-CAN to MS-CAN and vice versa. The FCDIM is the gateway module, translating MS-CAN to I-CAN and vice versa, allowing a message to be distributed throughout the three networks. The IPC and the FCDIM are the only modules on this vehicle that have this ability.

Communications Network

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The High Speed Controller Area Network (HS-CAN) operates at a maximum data transfer speed of 500 Kbps and is designed for real time powertrain information transfer and control. Modules on the HS-CAN communicate using bussed messages. The HS-CAN uses an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, the HS-CAN allows sharing of information between all modules on the network.

The Medium Speed Controller Area Network (MS-CAN) operates at a maximum data transfer speed of 125 Kbps for bus messages and is designed for general information transfer. Modules on the MS-CAN communicate using bussed messages. The MS-CAN uses an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, the MS-CAN allows sharing of information between all modules on the network.

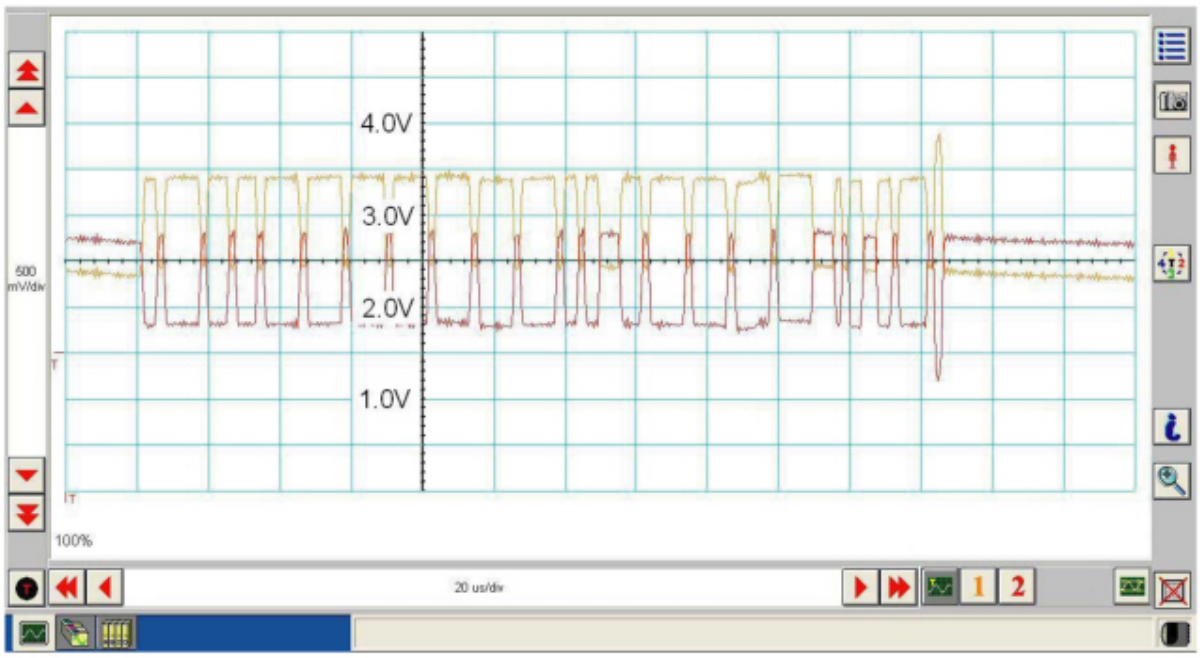
The Infotainment Controller Area Network (I-CAN) operates at a maximum data transfer speed of 500 Kbps and is designed for real time audio and multimedia information transfer and control. Modules on the I-CAN communicate using bussed messages. The I-CAN uses an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. The I-CAN allows sharing of information between all modules on the network. The I-CAN is connected to the Data Link Connector (DLC), but the I-CAN modules communicate with the scan tool over the MS-CAN . The Front Control/Display Interface Module (FCDIM) is used as a gateway module for the messages to transfer between the scan tool and the modules on the I-CAN .

Controller Area Network (CAN) Fault Tolerance

NOTE: The oscilloscope traces below are from the Integrated Diagnostic System (IDS) oscilloscope taken using the IDS pre-configured CAN settings. The traces are for both data (+) and data (-) taken simultaneously (2-channel) at a sample rate of 1 mega-sample per second (1MS/s) or greater.

Traces below are viewed at 500mV per division (vertical axis) and 20 microseconds (20µs) per division (horizontal axis). Readings taken with a different oscilloscope vary from those shown. Compare any suspect readings to a known good vehicle.

Normal CAN Operation

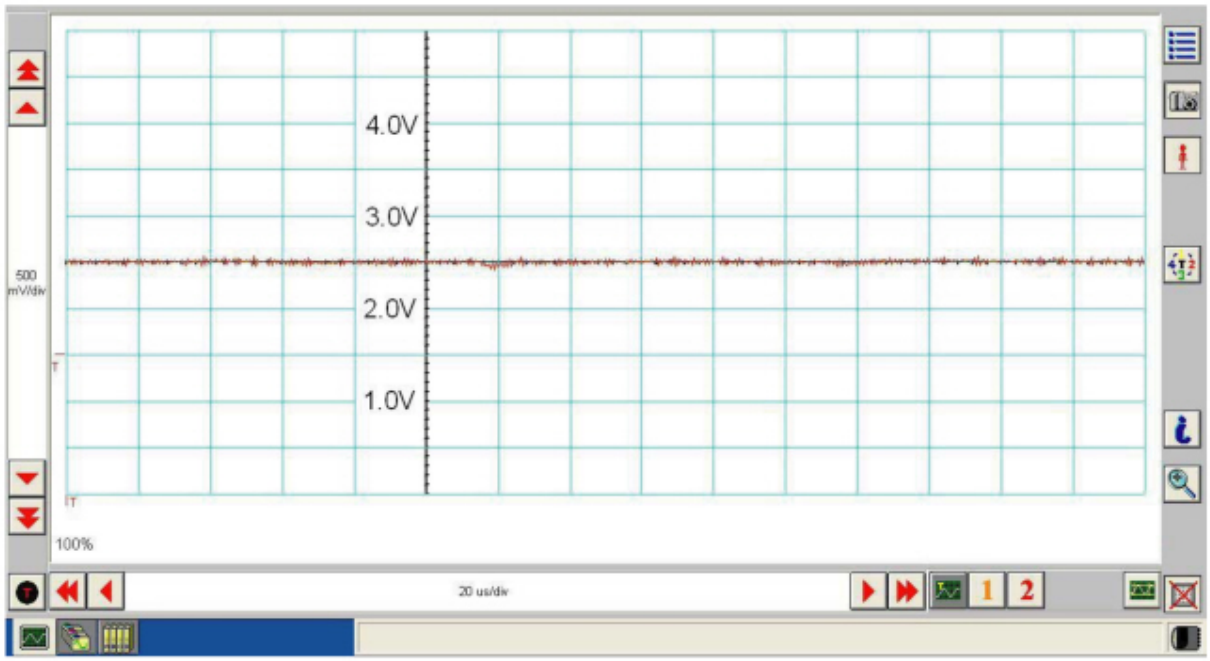


N0102180

The data (+) and data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a message is sent.

Successful communication of a message can usually be identified by the slight spike at the end of a message transmission. Any signals that are significantly different than the normal CAN waveform may cause network DTCs (U-codes) to set or may cause a complete network outage.

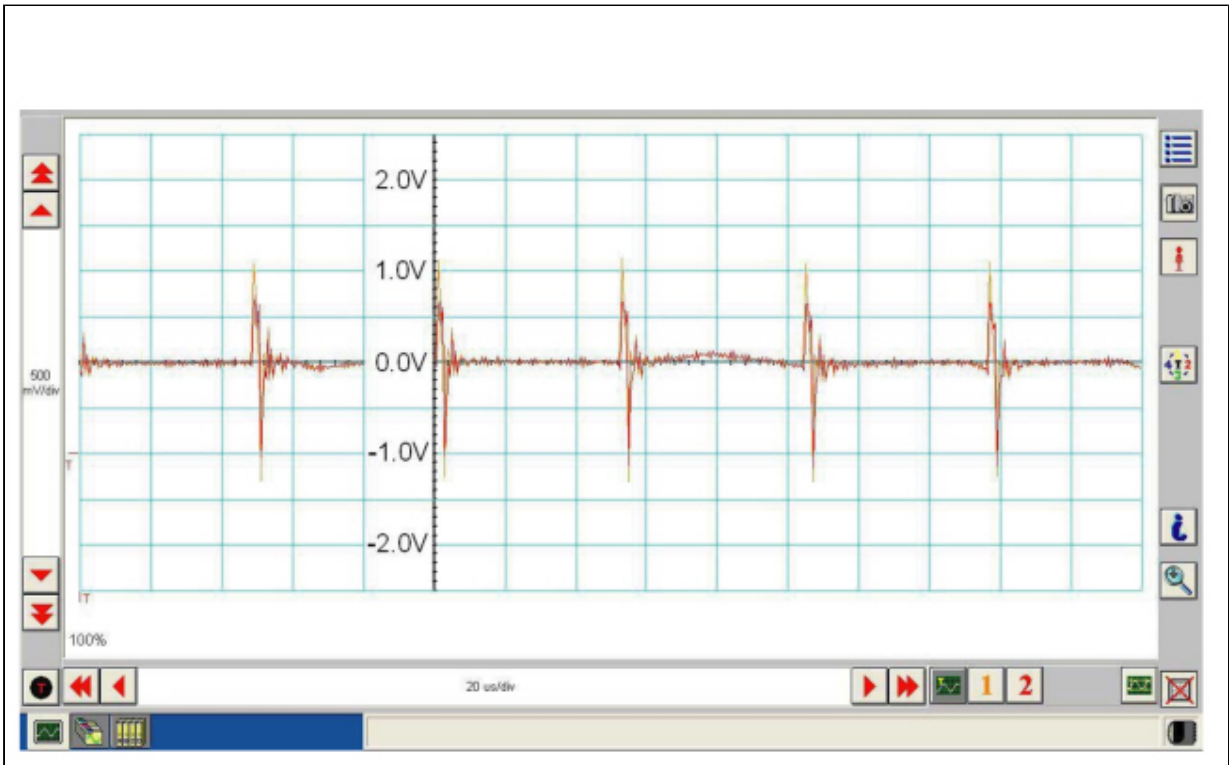
CAN Circuits Shorted Together



N0102181

In the event the data (+) and data (-) circuits become shorted together, the signal stays at base voltage (2.5V) continuously and all communication capabilities are lost.

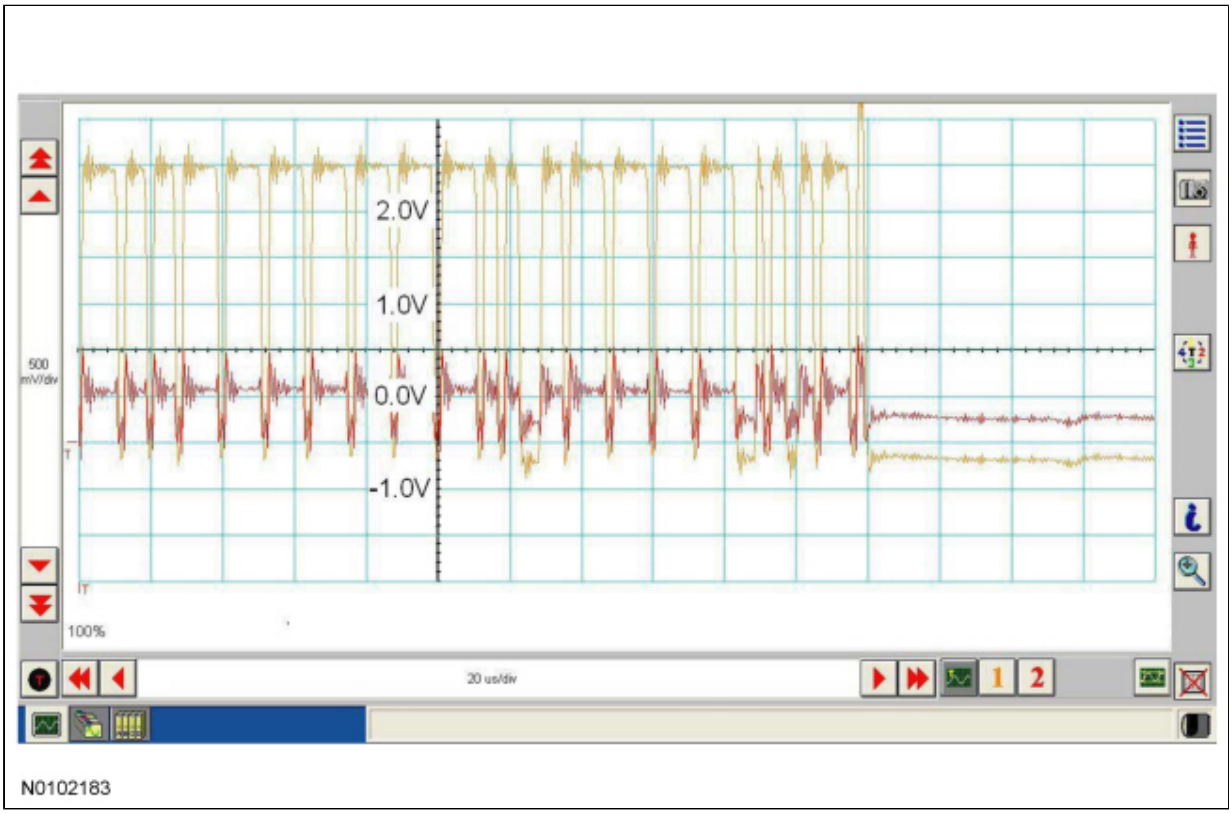
CAN (+) Circuit Shorted To Ground



N0102182

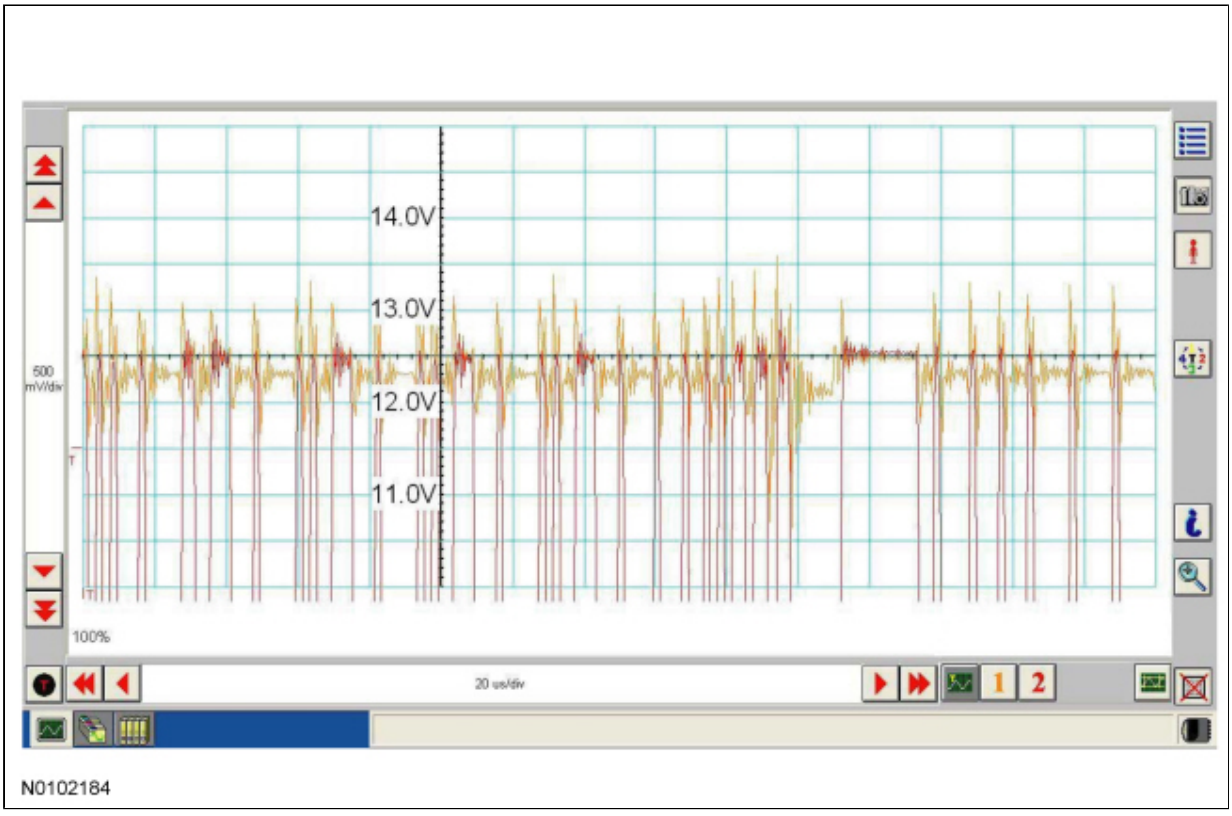
In the event the data (+) circuit becomes shorted to ground, both the data (+) and data (-) circuits are pulled low (0V) and all communication capabilities are lost.

CAN (-) Circuit Shorted To Ground



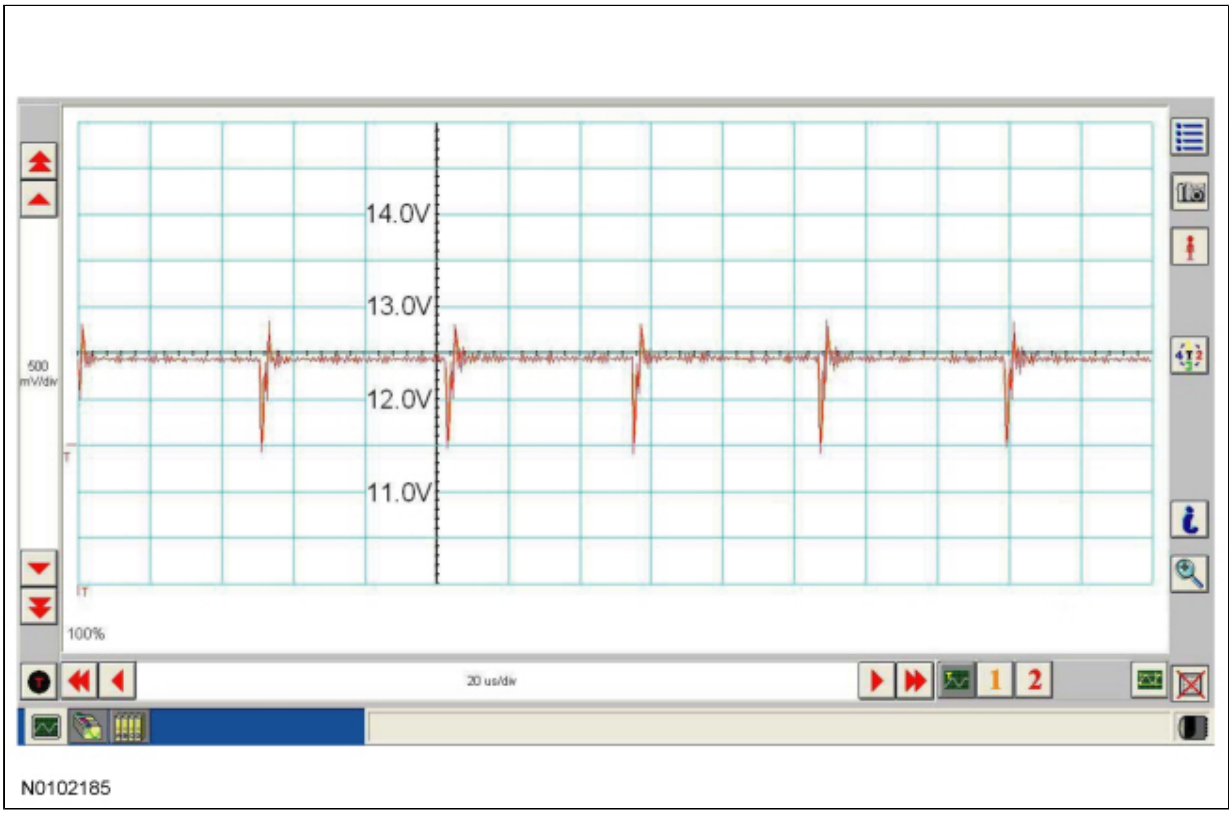
In the event the data (-) circuit becomes shorted to ground, the data (-) circuit is pulled low (0V) and the data (+) circuit reaches near-normal peak voltage (3.0V) during communication but falls to 0V instead of normal base voltage (2.5V). Communication may continue but at a degraded level.

CAN (+) Circuit Shorted To Battery Voltage



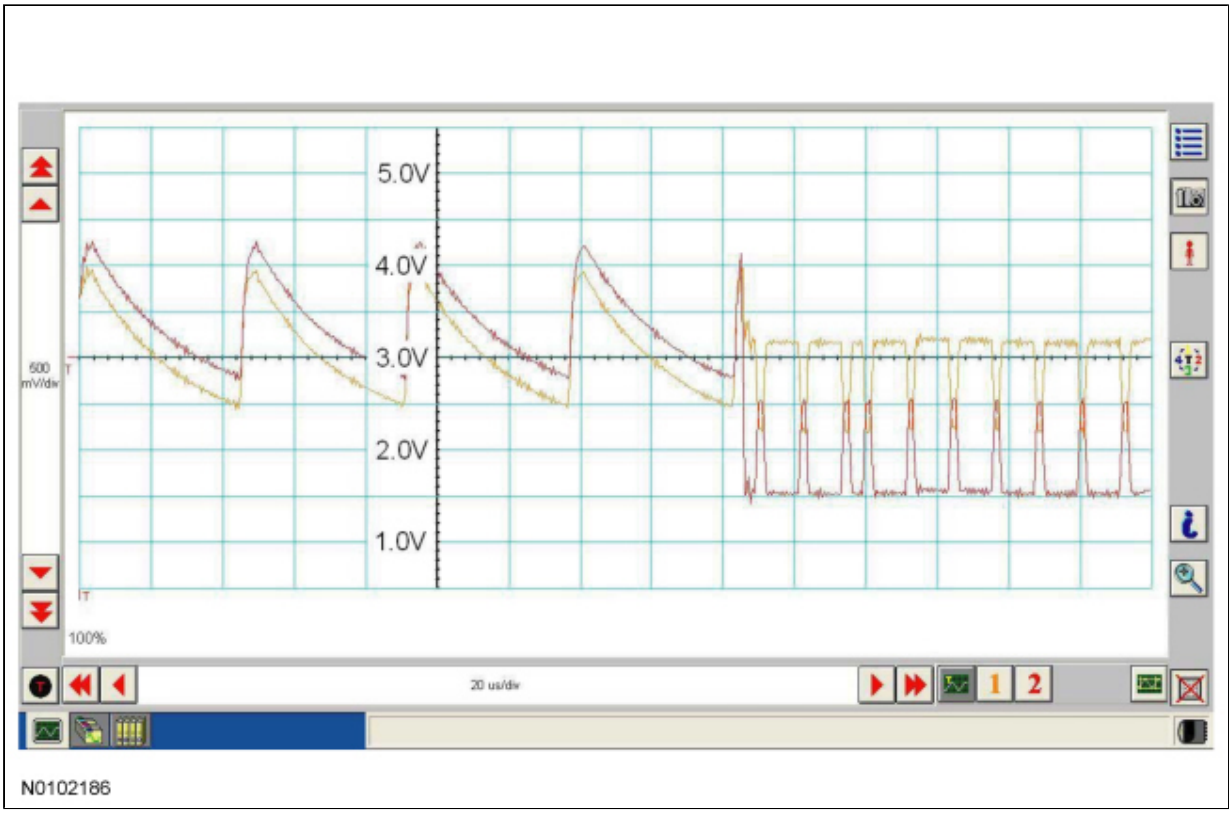
In the event the data (+) circuit becomes shorted to battery voltage, the data (+) circuit is pulled high (12V) and the data (-) circuit falls to abnormally high voltage (above 5V) during communication and reaches battery voltage (12V) for peak voltage. Communication may continue but at a degraded level.

CAN (-) Circuit Shorted To Battery Voltage



In the event the data (-) circuit becomes shorted to battery voltage, both the data (+) and data (-) circuits are pulled high (12V) and all communication capabilities are lost.

CAN Circuit Signal Corruption



Rhythmic oscillations, inductive spikes or random interference can disrupt the network communications. The corruption signal source may be outside electrical interference such as motors or solenoids or internal interference generated from a module on the network. In some cases, an open in either the data (+) or data (-) circuit to a network module may cause the module to emit interference on the one circuit which is still connected. The trace shown is an example of a "sawtooth" pattern transmitted from a module with one open network circuit.

Other corruptions may be present when a module is intermittently powered up and down. The module on power up may initiate communication out of sync with other modules on the network causing momentary communication outages.

Controller Area Network (CAN) Multiplex Messages

Modules on the CAN utilize simultaneous communication of 2 or more messages on the same network circuits. The following chart summarizes the messages sent and received on the network.

CAN Module Communication Message Chart

NOTE: This chart describes the specific HS-CAN and MS-CAN messages broadcast by each module, and the module(s) that receive the message.

NOTE: For the I-CAN , message mapping is not essential to diagnostics as the symptoms arising from a message error are all related to the audio system. For audio system concerns, refer to Section 415-00 .

Broadcast Message	Originating Module	Network Type	Receiving Module(s)

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.
    - If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

Visual Inspection Chart

Electrical

• Battery Junction Box (BJB) fuse(s):
  ▪ 1 (40A) (ABS module)
  ▪ 2 (50A) (Transmission Control Module (TCM))
  ▪ 9 (20A) (ABS module)
  ▪ 16 (15A) (PCM)
  ▪ 27 (7.5A) (PCM, TCM)
• Central Junction Box (CJB) fuse(s):
  ▪ 1 (15A) (Remote Function Actuator (RFA) module)
  ▪ 3 (7.5A) (Instrument Panel Cluster (IPC))
  ▪ 4 (7.5A) (Occupant Classification System Module (OCSM))
  ▪ 5 (15A) (no power to scan tool)
  ▪ 7 (7.5A) (Front Control/Display Interface Module (FCDIM))
  ▪ 9 (20A) (RFA module)
  ▪ 10 (15A) (Audio Control Module (ACM), Accessory Protocol Interface Module (APIM), Global Positioning System Module (GPSM) vehicles built after 1/14/2011)
  ▪ 12 (20A) (Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM))
  ▪ 14 (20A) (RFA module)

  ▪ 19 (7.5A) (ACM , IPC)
  ▪ 20 (10A) (Restraints Control Module (RCM))
  ▪ 21 (10A) (Body Control Module (BCM), IPC , Power Steering Control Module (PSCM))
  ▪ 22 (7.5A) (ABS module, PCM)
  ▪ 23 (10A) (TCM , TPM / VSM)
  ▪ 26 (7.5A) (TPM / VSM)
• Data Link Connector (DLC)
• Wiring, terminals or connectors

3. Connect the scan tool to the DLC .
   - **NOTE:** Make sure to use the latest scan tool software release.

     NOTE: The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

     If the Integrated Diagnostic System (IDS) does not communicate with the VCM :
     - Check the VCM connection to the vehicle.
     - Check the scan tool connection to the VCM .
     - GO to Pinpoint Test R , to diagnose No Power To The Scan Tool.

4. Establish a scan tool session.
   - **NOTE:** The scan tool first attempts to communicate with the PCM, after establishing communication with the PCM, the scan tool then attempts to communicate with all other modules on the vehicle.

     If an IDS session cannot be established with the vehicle, (IDS may state "No communication can be established with the PCM"):
     - Choose "NO" when the scan tool prompts whether or not to retry communication.
     - Enter either a PCM part number, tear tag or calibration number to identify the vehicle and start a session (the PCM part number and 4-character tear tag are printed on the PCM label).
     - GO to Pinpoint Test A , to diagnose The PCM Does Not Respond To The Scan Tool.

5. Carry out the network test.
   - If the network test passes, retrieve and record the continuous memory DTCs and proceed to Step 6.
   - If the network test fails, GO to Symptom Chart to diagnose the failed communication network.
   - If a module fails to communicate during the network test, GO to Symptom Chart .

6. Retrieve and review the DTCs.
   - If the DTCs retrieved are related to the concern, go to DTC Charts. Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes).
   - If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

NOTE: Network DTCs (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, repair procedures such as module reprogramming often set network DTCs. Replacing a module to resolve a network DTC is unlikely to correct the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery, refer to Section 414-01 .

Communication Network DTC Chart

DTC	Description	Source	Action
U0001:00	High Speed Controller Area Network (HS-CAN) Communication Bus: no subtype information	RFA	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0001:88	High Speed Controller Area Network (HS-	• ABS module	The module could not communicate on the network at a point in time. The fault is not currently present (the

	CAN) Communication Bus	• PSCM • PCM	module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0002:81	High Speed Controller Area Network (HS-CAN) Communication Bus Performance	PCM	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0010:00	Medium Speed Controller Area Network (MS-CAN) Communication Bus: no subtype information	RFA	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0010:88	Medium Speed Controller Area Network (MS-CAN) Communication Bus	• BCM • FCDIM	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0028:00	Vehicle Communication Bus A	TCM	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0028:08	Vehicle Communication Bus A: Bus Signal/Message Failures	RCM	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0028:88	Vehicle Communication Bus A: Bus Off	RCM	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0073:00	Control Module Communication Bus "A" Off	TCM	The module could not communicate on the network at a point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U0074:88	Infotainment Controller	FCDIM	The module could not communicate on the network at a

	Area Network (I-CAN) Communication Bus		point in time. The fault is not currently present (the module had to communicate with the scan tool to report this DTC). CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.
U3000:88	Control Module: Bus Off	APIM	The module could not communicate on the network at a point in time. The fault is currently not present since the module is currently communicating with the scan tool reporting this DTC. CLEAR the DTC. REPEAT the network test with the scan tool. VERIFY the integrity of the connectors and wiring Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The vehicle does not start with the scan tool connected to the Data Link Connector (DLC) and/or multiple malfunction indicators are only on when the scan tool is connected to the DLC .	• Wiring, terminals or connectors • Scan tool	• GO to Pinpoint Test R .
• The PCM does not respond to the scan tool	• Wiring, terminals or connectors • PCM	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, Section 5, pinpoint test QA before proceeding to Pinpoint Test A . If pinpoint test QA has been completed, GO to Pinpoint Test A .
• The ABS module does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • ABS module	• GO to Pinpoint Test B .
• The Instrument Panel Cluster (IPC) does not respond to the scan tool	• Fuse(s) • Wiring, terminals or connectors • IPC	• GO to Pinpoint Test C .
• The Occupant Classification System Module (OCSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • OCSM	• GO to Pinpoint Test D .
• The Restraints Control Module (RCM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • RCM	• GO to Pinpoint Test E .
• The Accessory Protocol Interface Module (APIM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors	• GO to Pinpoint Test F .

	• APIM	
• The Remote Function Actuator (RFA) module does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • RFA module	• GO to Pinpoint Test G.
• The Front Control/Display Interface Module (FCDIM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • FCDIM	• GO to Pinpoint Test H.
• The Power Steering Control Module (PSCM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • PSCM	• GO to Pinpoint Test I.
• The Body Control Module (BCM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • BCM	• GO to Pinpoint Test J.
• The Audio Control Module (ACM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • ACM	• GO to Pinpoint Test K.
• The Global Positioning System Module (GPSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • GPSM	• GO to Pinpoint Test L.
• The Transmission Control Module (TCM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • TCM	• GO to Pinpoint Test M.
• The Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • TPM / VSM	• GO to Pinpoint Test N.
• No Medium Speed Controller Area Network (MS-CAN) communication, all modules are not responding	• Wiring, terminals or connectors • BCM • FCDIM • IPC • RFA module (if equipped) • TPM / VSM (if equipped)	• GO to Pinpoint Test O.
• No High Speed Controller Area Network (HS-CAN) communication, all modules are not responding	• Wiring, terminals or connectors • ABS module • APIM (if equipped) • IPC • OCSM • PCM • PSCM • RCM	• GO to Pinpoint Test P.

	• RFA module (if equipped) • TCM (if equipped)	
• No Infotainment Controller Area Network (I-CAN) communication, all modules are not responding	• Wiring, terminals or connectors • ACM • APIM • FCDIM • GPSM	• If the FCDIM does not pass a network test, DIAGNOSE the FCDIM first. GO to Pinpoint Test H . • If the FCDIM passes a network test, GO to Pinpoint Test Q .
• No power to the scan tool	• Fuse • Wiring, terminals or connectors • Scan tool • Data Link Connector (DLC)	• GO to Pinpoint Test R .

Pinpoint Tests

Pinpoint Test A: The PCM Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 23 , Electronic Engine Controls for schematic and connector information.

Normal Operation

The PCM communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 VERIFY WHETHER OTHER HS-CAN MODULES PASS THE NETWORK TEST	
• Enter the following diagnostic mode on the scan tool: Network Test. • In the left hand pane of the IDS network test display screen, verify whether any HS-CAN modules passed the network test. • **Is the text "pass" or a DTC listed next to any of the following modules (if equipped): ABS module, Accessory Protocol Interface Module (APIM), Instrument Panel Cluster (IPC), Occupant Classification System Module (OCSM), Power Steering Control Module (PSCM), PCM, Remote Function Actuator (RFA),**	**Yes** If "pass" or a DTC was listed next to the PCM, a network fault is not currently present. GO to Pinpoint Test r to diagnose an intermittent HS-CAN fault condition.

Restraints Control Module (RCM) orTransmission Control Module (TCM)?	If "pass" or a DTC was listed next to one or more modules other than the PCM, GO to A2 . **No** No modules are currently communicating on the HS-CAN . GO to Pinpoint Test q to diagnose no HS-CAN communication.
A2 PC/ED MANUAL PINPOINT TEST QA VERIFICATION CHECK	
• Verify that pinpoint test QA has been carried out. • **Has pinpoint test QA been carried out?**	**Yes** GO to A3 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, Section 5, pinpoint test QA to diagnose no communication with the PCM.
A3 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** CONNECT the negative battery cable. GO to A5 . **No** GO to A4 .
A4 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN	
• Disconnect: PCM C175B. • Measure the resistance between the PCM C175B-20, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** CONNECT the negative battery cable. GO to A5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0117716 • Measure the resistance between the PCM C175B-19, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0117702 • **Are the resistances less than 5 ohms?**	
A5 CHECK FOR CORRECT PCM OPERATION • Disconnect all the PCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test B: The ABS Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- ABS module

PINPOINT TEST B: THE ABS MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
B1 CHECK THE ABS MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	**Yes** GO to B2 . **No** VERIFY the Battery Junction Box (BJB) fuses 1 (40A), 9 (20A) and Central Junction Box (CJB) fuse 22 (7.5A) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
• Ignition OFF. • Disconnect: ABS Module C135. • Ignition ON. • Measure the voltage between the ABS module C135-1, circuit SBB01 (RD), C135-8, circuit CBP22 (GN/WH) and C135-32, circuit SBB28 (GN/RD), harness side and ground.  N0099473 • **Are the voltages greater than 10 volts?**	
B2 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN	**Yes** GO to B3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the ABS module C135-47, circuit GD123 (BK/GY), harness side and ground.  N0115340 • **Is the resistance less than 5 ohms?**	
B3 CHECK THE HS-CAN CIRCUITS BETWEEN THE ABS MODULE AND THE DLC FOR AN OPEN	

• Measure the resistance between the ABS module C135-12, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0085818 • Measure the resistance between the ABS module C135-13, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0085819 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to B4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

B4 CHECK FOR CORRECT ABS MODULE OPERATION
• Disconnect the ABS module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the ABS module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test C: The Instrument Panel Cluster (IPC) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) communicates with the scan tool and other network modules on the High Speed Controller Area Network (HS-CAN). The IPC does not communicate with the scan tool on the Medium Speed Controller Area Network (MS-CAN).

This pinpoint test is intended to diagnose the following:

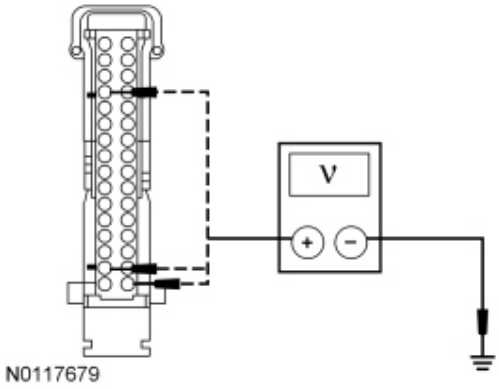
- Fuse(s)
- Wiring, terminals or connectors
- IPC

PINPOINT TEST C: THE IPC DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 413-01 .

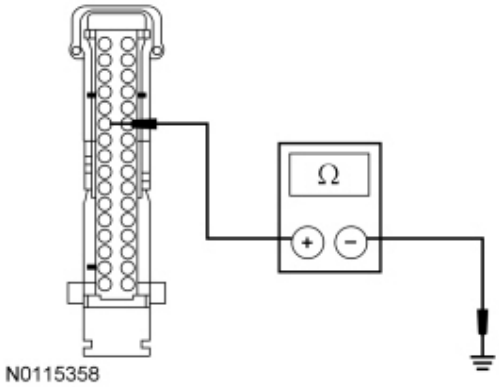
Test Step	Result / Action to Take
C1 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** CONNECT the negative battery cable. GO to C2 . **No** GO to C4 .
C2 CHECK THE IPC VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the IPC , harness side and ground as follows: **Connector-Pin** / **Circuit** C220-4 / CBP21 (BU/GY) C220-15 / CBP19 (BN/WH) C220-32 / SBP03 (BU/RD)	**Yes** GO to C3 . **No** VERIFY the Central Junction Box (CJB) fuse 3 (7.5A), 19 (7.5A) and 21 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.



- **Are the voltages greater than 10 volts?**

C3 CHECK THE IPC GROUND CIRCUIT FOR AN OPEN

- Disconnect: Negative Battery Cable.
- Measure the resistance between IPC C220-6, circuit GD115 (BK/GY) harness side and ground.



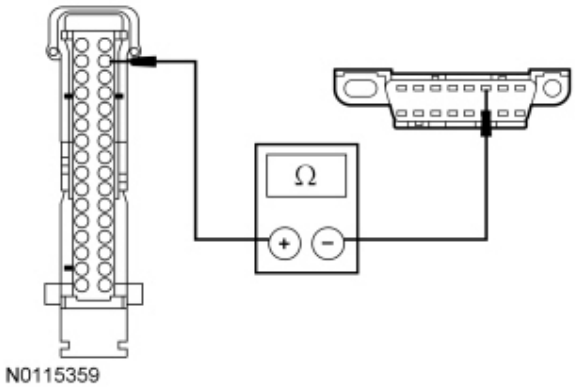
- **Is the resistance less than 5 ohms?**

Yes
GO to C4 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

C4 CHECK THE HS-CAN CIRCUITS BETWEEN THE IPC AND THE DLC FOR AN OPEN

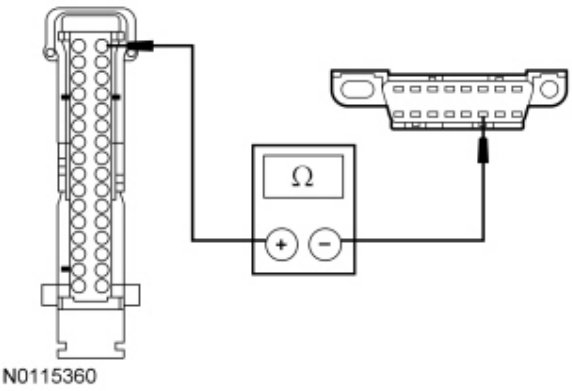
- Measure the resistance between the IPC C220-18, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.



- Measure the resistance between the IPC C220-17, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.

Yes
GO to C5 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0115360

- **Are the resistances less than 5 ohms?**

C5 CHECK THE MS-CAN CIRCUITS BETWEEN THE IPC AND THE DLC FOR AN OPEN	
• Measure the resistance between the IPC C220-23, circuit VDB06 (GY/OG), harness side and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.  N0115361 • Measure the resistance between the IPC C220-22, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0115362 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to C6 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
C6 CHECK FOR CORRECT IPC OPERATION	

• Disconnect all the IPC connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the IPC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused

	by a loose or corroded connector.

Pinpoint Test D: The Occupant Classification System Module (OCSM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Occupant Classification System Module (OCSM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- OCSM

PINPOINT TEST D: THE OCSM DOES NOT RESPOND TO THE SCAN TOOL

WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

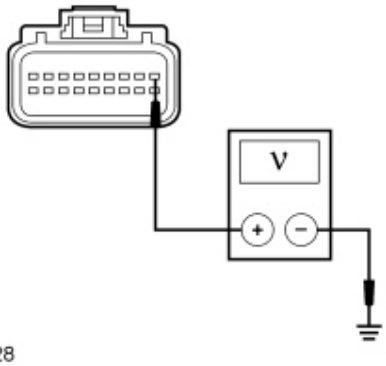
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
D1 CHECK THE OCSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: OCSM C3159. • Deactivate the SRS . Refer to Section 501-20B . • Repower the SRS . Refer to Section 501-20B . • Ignition ON. • Measure the voltage between the OCSM C3159-1, circuit CBP04 (VT), harness side and ground.	**Yes** GO to D2 . **No** VERIFY the Central Junction Box (CJB) fuse 4 (7.5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.



N0060228

- **Is the voltage greater than 10 volts?**

D2 CHECK THE OCSM GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the OCSM C3159-14, circuit GD145 (BK/BU), harness side and ground.  N0060229 • **Is the resistance less than 5 ohms?**	**Yes** GO to D3. **No** REPAIR the circuit. REACTIVATE the SRS. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the network test with the scan tool.
D3 CHECK THE HS-CAN CIRCUITS BETWEEN THE OCSM AND THE DATA LINK CONNECTOR (DLC) FOR AN OPEN • Measure the resistance between the OCSM C3159-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026670 • Measure the resistance between the OCSM C3159-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to D4. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0026671 • **Are the resistances less than 5 ohms?**	
D4 CHECK FOR CORRECT OCSM OPERATION	

• Disconnect the OCSM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the OCSM connector and make sure it seats correctly.
• Verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new OCSM. REACTIVATE the SRS. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test E: The Restraints Control Module (RCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 46, Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- RCM

PINPOINT TEST E: THE RCM DOES NOT RESPOND TO THE SCAN TOOL

WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
E1 CHECK THE RCM CONNECTION	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: RCM C310A. • Disconnect: RCM C310B. • **Are RCM C310A pins 13 and 14 and RCM C310B pins 9 and 10 OK?**	**Yes** GO to E2 . **No** REPAIR the RCM connector pins as necessary. REPOWER the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
E2 CHECK THE RCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Deactivate the SRS . Refer to Section 501-20B . • Repower the SRS . Refer to Section 501-20B . • Ignition ON. • Measure the voltage between the RCM C310A-13, circuit CBP20 (YE/VT), harness side and ground.  N0117680 • **Is the voltage greater than 10 volts?**	**Yes** GO to E3 . **No** VERIFY the Central Junction Box (CJB) fuse 20 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
E3 CHECK THE RCM CASE GROUND	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the RCM C310A-14, circuit GD174 (BK/WH), harness side and ground.  N0117681	**Yes** GO to E4 . **No** REPAIR the circuit. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Is the resistance less than 5 ohms?**	
E4 CHECK THE HS-CAN CIRCUITS BETWEEN THE RCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the RCM C310B-10, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0090002 • Measure the resistance between the RCM C310B-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0090003 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to E5. **No** REPAIR the circuit in question. REACTIVATE the SRS. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the network test with the scan tool.
E5 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RCM. REACTIVATE the SRS. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test F: The Accessory Protocol Interface Module (APIM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130, Audio System/Navigation for schematic and connector information.

Normal Operation

TheAccessory Protocol Interface Module (APIM) communicates with the scan tool and other network modules on the High Speed Controller Area Network (HS-CAN). The APIM does not communicate with the scan tool on the Infotainment Controller Area Network (I-CAN).

This pinpoint test is intended to diagnose the following:

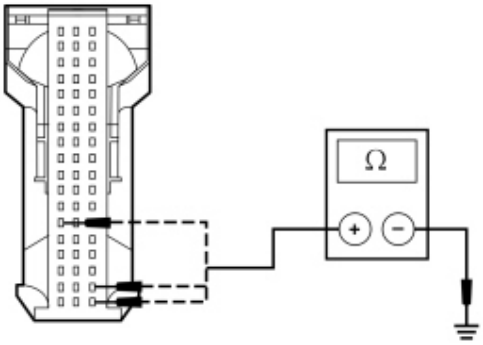
- Fuse
- Wiring, terminals or connectors
- APIM

PINPOINT TEST F: THE APIM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
F1 CHECK THE APIM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: APIM C2383. • Ignition ON. • Measure the voltage between the APIM C2383-1, circuit SBP10 (YE/RD), harness side and ground.  N0077601 • **Is the voltage greater than 10 volts?**	**Yes** GO to F2 . **No** VERIFY the Central Junction Box (CJB) fuse 10 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
F2 CHECK THE APIM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the voltage between the APIM , harness side and ground as follows: **Connector-Pin** / **Circuit** C2383-6 / GD111 (BK/BU) C2383-37 / GD111 (BK/BU) C2383-38 / GD111 (BK/BU)	**Yes** GO to F3 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0117684

- **Are the resistances less than 5 ohms?**

F3 CHECK THE HS-CAN CIRCUITS BETWEEN THE APIM AND THE DLC FOR AN OPEN	
• Measure the resistance between the APIM C2383-53, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0077603 • Measure the resistance between the APIM C2383-54, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0077604 • **Are the resistances less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
F4 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused

	by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test G: The Remote Function Actuator (RFA) Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The Remote Function Actuator (RFA) module communicates with the scan tool and some network modules on the Medium Speed Controller Area Network (MS-CAN), and communicates with other network modules only on the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

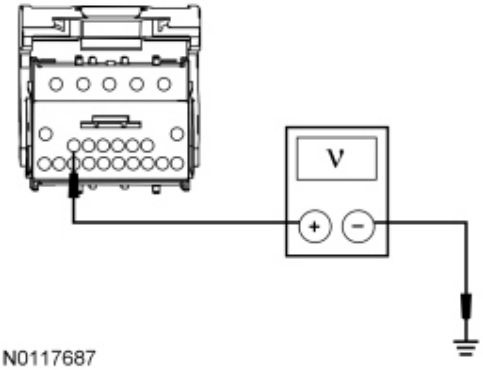
- Fuse
- Wiring, terminals or connectors
- RFA module

PINPOINT TEST G: THE RFA MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

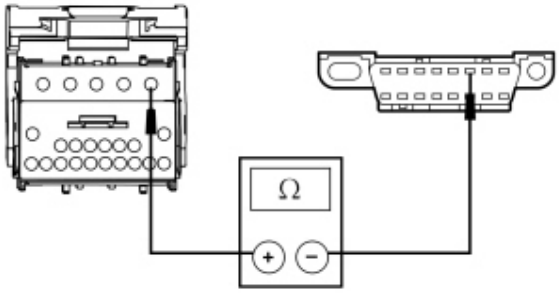
Test Step	Result / Action to Take
G1 CHECK THE RFA MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: RFA module (Gray Hardshell) and C3503B (Green Hardshell). • Ignition ON. • Measure the voltage between the RFA module C3503A-1, circuit SBP09 (RD), harness side and ground; and C3503A-2, circuit SBP14 (BN/RD), harness side and ground.  N0115370 • Measure the voltage between the RFA module C3503A-1, circuit CDC32 (BN/YE), harness side and ground.	**Yes** GO to G2 . **No** VERIFY the Central Junction Box (CJB) fuses 1 (15A), 9 (20A) and 14 (20A) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0117687

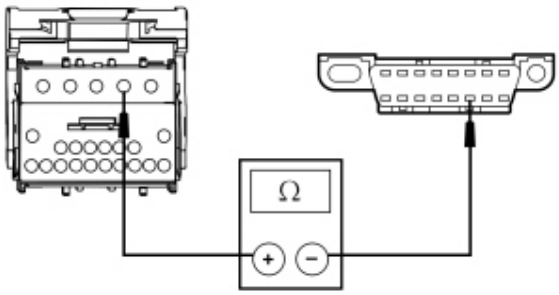
- **Are the voltages greater than 10 volts?**

G2 CHECK THE RFA MODULE GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the RFA module C3503A-1, circuit GD145 (BK/BU), harness side and ground.  N0115440 • Disconnect: RFA module C3503D (Natural Hardshell). • Measure the resistance between the RFA module C3503D-3, circuit GD145 (BK/BU), harness side and ground; and RFA module C3503D-4, circuit GD145 (BK/BU) harness side and ground.  N0115371 • **Are the resistances less than 5 ohms?**	**Yes** GO to G3 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
G3 CHECK THE HS-CAN CIRCUITS BETWEEN THE RFA MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the RFA module C3503B-1, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** GO to G4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0115373

- Measure the resistance between the RFA module C3503B-2, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.

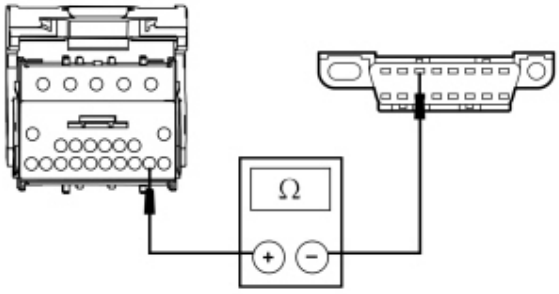


N0115374

- **Are the resistances less than 5 ohms?**

G4 CHECK THE MS-CAN CIRCUITS BETWEEN THE RFA MODULE AND THE DLC FOR AN OPEN

- Measure the resistance between the RFA module C3503B-15, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.



N0115376

- Measure the resistance between the RFA module C3503B-14, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

Yes
CONNECT the negative battery cable. GO to G5 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0115375 • **Are the resistances less than 5 ohms?**	
G5 CHECK FOR CORRECT RFA MODULE OPERATION	

• Disconnect the RFA module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the RFA module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test H: The Front Control/Display Interface Module (FCDIM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130, Audio System/Navigation for schematic and connector information.

Normal Operation

The Front Control/Display Interface Module (FCDIM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN) and with other modules through the Infotainment Controller Area Network (I-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- FCDIM

PINPOINT TEST H: THE FCDIM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01.

Test Step	Result / Action to Take

H1 CHECK THE FCDIM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: FCDIM C2123. • Ignition ON. • Measure the voltage between the FCDIM C2123-1, circuit SBP07 (WH/RD), harness side and ground.  N0115771 • **Are the voltages greater than 10 volts?**	**Yes** GO to H2 . **No** VERIFY the Central Junction Box (CJB) fuse 7 (7.5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
H2 CHECK THE FCDIM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • For vehicles built up to 1/14/2011, measure the resistance between the FCDIM C2123-7, circuit GD115 (BK/GY), harness side and ground.  N0117689 • For vehicles built after 1/14/2011, Measure the resistance between the FCDIM C2123-9, circuit GD115 (BK/GY), harness side and ground.  N0133863 • **Is the resistance less than 5 ohms?**	**Yes** GO to H3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
H3 CHECK THE MS-CAN CIRCUITS BETWEEN THE FCDIM AND THE DLC FOR AN OPEN	

• Measure the resistance between the FCDIM C2123-2, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0117690 • Measure the resistance between the FCDIM C2123-3, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0117691 • **Are the resistances less than 5 ohms?**	**Yes** GO to H4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
H4 CHECK THE I-CAN CIRCUITS BETWEEN THE FCDIM AND THE DLC FOR AN OPEN	
• Measure the resistance between the FCDIM C2123-4, circuit VDB06 (GY/OG), harness side and the DLC C251-1, circuit VDB06 (GY/OG), harness side.  N0116954 • Measure the resistance between the FCDIM C2123-5, circuit VDB07 (VT/OG), harness side and the DLC C251-9, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to H5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0116955 • **Are the resistances less than 5 ohms?**	
H5 CHECK FOR CORRECT FCDIM OPERATION	

• Disconnect the FCDIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the FCDIM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FCDIM. REFER to Section 415-00. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test I: The Power Steering Control Module (PSCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 43, Power Steering Controls for schematic and connector information.

Normal Operation

The PSCM communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- PSCM

PINPOINT TEST I: THE PSCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01.

Test Step	Result / Action to Take
I1 CHECK THE PSCM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF.	**Yes**

• Disconnect: PSCM C2368A and C2368B. • Ignition ON. • Measure the voltage between the PSCM C2368A-1, circuit SBF02 (YE/RD) harness side and ground.  N0117692 • Measure the voltage between the PSCM C2368B-5, circuit CBP21 (BU/GY) harness side and ground.  N0115442 • **Is the voltage greater than 10 volts?**	GO to I2 . **No** VERIFY theBattery Junction Box (BJB) fuse mega 2 (60A) and Central Junction Box (CJB) fuse 21 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
I2 CHECK THE PSCM GROUND CIRCUITS FOR AN OPEN • Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect: PSCM C2368C. • Measure the resistance between the PSCM 2368C-1, circuit GD120 (BK/GN), harness side and ground.  N0115443 • **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
I3 CHECK THE HS-CAN CIRCUITS BETWEEN THE PSCM AND THE DLC FOR AN OPEN • Measure the resistance between the PSCM C2368B-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** CONNECT the negative battery cable. GO to I4 .

 N0115444 • Measure the resistance between the PSCM C2368B-6, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0115445 • **Are the resistances less than 5 ohms?**	**No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
I4 CHECK FOR CORRECT PSCM OPERATION • Disconnect the PSCM connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the PSCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PSCM. REFER to Section 211-02. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test J: The Body Control Module (BCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 13, Power Distribution for schematic and connector information.

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Normal Operation

The Body Control Module (BCM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors

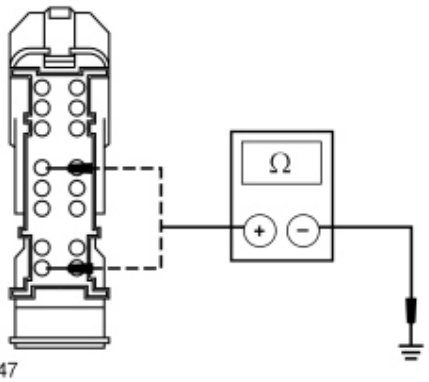
- BCM

PINPOINT TEST J: THE BCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
J1 CHECK THE BCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280B. • Ignition ON. • Measure the voltage between the BCM C2280B-4, circuit CBP21 (BU/GY) harness side and ground.  N0115441 • **Is the voltage greater than 10 volts?**	**Yes** GO to J2 . **No** VERIFY the Central Junction Box (CJB) fuse 21 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
J2 CHECK THE BCM GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the BCM C2280B-7, circuit GD115 (BK/GY), harness side and ground; and C2280B-16, circuit GD115 (BK/GY), harness side and ground.  N0115446 • Disconnect: BCM C2280A. • Measure the resistance between the BCM C2280A-12, circuit GD133 (BK), harness side and ground; and C2280A-16, circuit GD115 (BK/BU), harness side and ground.	**Yes** GO to J3 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0115447

- **Are the resistances less than 5 ohms?**

J3 CHECK THE MS-CAN CIRCUITS BETWEEN THE BCM AND THE DLC FOR AN OPEN	
• Disconnect: BCM C2280F. • Measure the resistance between the BCM C2280F-24, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0115449 • Measure the resistance between the BCM C2280F-23, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0115448 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to J4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
J4 CHECK FOR CORRECT BCM OPERATION	

• Disconnect the BCM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the BCM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The

	concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test K: The Audio Control Module (ACM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The Audio Control Module (ACM) communicates with the scan tool through the MS-CAN . The FCDIM is used as a gateway module.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- ACM

PINPOINT TEST K: THE ACM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
K1 CHECK THE ACM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: ACM C240A. • Ignition ON. • Measure the voltage between the ACM C240A-1, circuit SBP10 (YE/RD), harness side and ground; and for vehicles built up to 1/14/2011 measure the voltage between the ACM C240A-7, circuit CBP19 (BN/WH), harness side and ground.  N0117694 • **Is the voltage greater than 10 volts?**	**Yes** GO to K2 . **No** For vehicles built up to 1/14/2011 VERIFY the Central Junction Box (CJB) fuses 10 (15A) and 19 (7.5A) are OK. For vehicles built after 1/14/2011 VERIFY the Central Junction Box (CJB) fuses 10 (15A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
K2 CHECK THE ACM GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the ACM C240A-13, circuit GD111 (BK/BU), harness side and ground.  N0115452 • **Is the resistance less than 5 ohms?**	**Yes** GO to K3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
K3 CHECK THE I-CAN CIRCUITS BETWEEN THE ACM AND THE FCDIM FOR AN OPEN	
• Disconnect: FCDIM C2123. • Measure the resistance between the ACM C240A-14, circuit VDB06 (GY/OG), harness side and the FCDIM C2123-4, circuit VDB06 (GY/OG), harness side.  N0131471 • Measure the resistance between the ACM C240A-15, circuit VDB07 (VT/OG), harness side and the FCDIM C2123-5, circuit VDB07 (VT/OG), harness side.  N0131472 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to K4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
K4 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
	Yes
	INSTALL a new ACM .
	REFER to Section 415-00 . CLEAR the DTCs.

▪ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	REPEAT the network test with the scan tool. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test L: The Global Positioning System Module (GPSM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The Global Positioning System Module (GPSM) communicates with the scan tool through the MS-CAN . The FCDIM is used as a gateway module.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- GPSM

PINPOINT TEST L: THE GPSM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
L1 CHECK THE GPSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: GPSM C2398. • Ignition ON. • Measure the voltage between the GPSM C2398-1, circuit SBP16 (VT/RD) (vehicles built up to 1/14/2011) circuit SBP10 (YE-RD) (vehicles built after 1/14/2011), harness side and ground.	**Yes** GO to L2 . **No** For vehicles built up to 1/14/2011 VERIFY the Central Junction Box (CJB) fuse 16 (15A) is OK. For vehicles built after 1/14/2011 VERIFY the Central Junction Box (CJB) fuse 10 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to

 N0094349 • **Is the voltage greater than 10 volts?**	identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
L2 CHECK THE GPSM GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the GPSM C2398-6, circuit GD111 (BK/BU), harness side and ground.  N0094350 • **Is the resistance less than 5 ohms?**	**Yes** GO to L3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
L3 CHECK THE I-CAN CIRCUITS BETWEEN THE GPSM AND THE DLC FOR AN OPEN • Disconnect: FCDIM C2123. • Measure the resistance between the GPSM C2398-2, circuit VDB06 (GY/OG), harness side and the FCDIM C2123-4, circuit VDB06 (GY/OG), harness side.  N0131473 • Measure the resistance between the GPSM C2398-3, circuit VDB07 (VT/OG), harness side and the FCDIM C2123-5, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to L4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
L4 CHECK FOR CORRECT GPSM OPERATION	

• Disconnect the GPSM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the GPSM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new GPSM. REFER to Section 415-00. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test M: The Transmission Control Module (TCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 29, Transmission Controls for schematic and connector information.

Normal Operation

TheTransmission Control Module (TCM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- TCM

PINPOINT TEST M: THE TCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01.

Test Step	Result / Action to Take

M1 CHECK THE TCM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Disconnect: TCM C1750A. • Ignition ON. • Measure the voltage between the TCM, harness side and ground as follows: **Connector-Pin / Circuit** C1750A-1 — SBB02 (YE/RD) C1750A-2 — SBB02 (YE/RD) C1750A-18 — SBB27 (BU/RD) C1750A-31 — CBP23 (BN/YE)  N0117698 • **Are the voltages greater than 10 volts?**	**Yes** GO to M2. **No** VERIFY the Battery Junction Box (BJB) fuses 2 (50A), 27 (7.5A) and Central Junction Box (CJB) fuse 23 (10A) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
M2 CHECK THE TCM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the TCM, harness side and ground as follows: **Connector-Pin / Circuit** C1750A-3 — GD187 (BK/GN) C1750A-4 — GD187 (BK/GN) C1750A-5 — GD187 (BK/GN) C1750A-6 — GD187 (BK/GN)  N0117699 • **Are the resistances less than 5 ohms?**	**Yes** GO to M3. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
M3 CHECK THE HS-CAN CIRCUITS BETWEEN THE TCM AND	

THE DLC FOR AN OPEN	
• Measure the resistance between the TCM C1750A-34, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.  N0117700 • Measure the resistance between the TCM C1750A-35, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0117701 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to M4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
M4 CHECK FOR CORRECT TCM OPERATION	

• Disconnect both the TCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the TCM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCM . REFER to Section 307-11 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 118 , Tire Pressure Monitor System for schematic and connector information.

Normal Operation

The Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- TPM / VSM

PINPOINT TEST N: THE TPM / VSM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
N1 CHECK THE TPM / VSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: TPM / VSM C4321A. • Ignition ON. • Measure the voltage between the TPM / VSM , harness side and ground as follows: **Connector-Pin / Circuit** C4321A-20 — CBP26 (BU/WH) C4321A-23 — CBP23 (BN/YE) C4321A-24 — SBP12 (GN/RD)  N0115511 • **Is the voltage greater than 10 volts?**	**Yes** GO to N2 . **No** VERIFY the Central Junction Box (CJB) fuses 12 (20A), 23 (10A) and 26 (7.5A) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
N2 CHECK THE TPM / VSM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the TPM / VSM C4321A-13, circuit GD143 (BK/VT), harness side and ground; and TPM / VSM C4321A-14, circuit GD143 (BK/VT), harness side and ground.	**Yes** GO to N3 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0115512 • **Is the resistance less than 5 ohms?**	
N3 CHECK THE MS-CAN CIRCUITS BETWEEN THE TPM / VSM AND THE DLC FOR AN OPEN • Measure the resistance between the TPM / VSM C4321B-1, circuit VDB06 (GY/OG), harness side and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.  N0115523 • Measure the resistance between the TPM / VSM C4321B-2, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0115524 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to N4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
N4 CHECK FOR CORRECT TPM / VSM OPERATION • Disconnect the TPM / VSM connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the TPM / VSM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TPM / VSM . REFER to Section 204-04 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused

	by a loose or corroded connector.

Pinpoint Test O: No Medium Speed Controller Area Network (MS-CAN) Communication, All Modules Are Not Responding

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Normal Operation

The Medium Speed Controller Area Network (MS-CAN) uses an unshielded twisted-pair cable.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Body Control Module (BCM)
- Front Control/Display Interface Module (FCDIM)
- Instrument Panel Cluster (IPC)
- Remote Function Actuator (RFA) module (if equipped)
- Tire Pressure Monitoring System (TPMS)

PINPOINT TEST O: NO MS-CAN COMMUNICATION, ALL MODULES ARE NOT RESPONDING

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

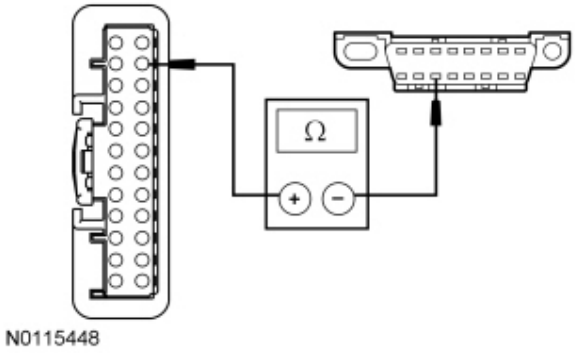
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
O1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Inspect DLC pins 3 and 11 for damage.  N0053178 • **Are DLC pins 3 and 11 OK?**	**Yes** GO to O2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
O2 CHECK THE MS-CAN TERMINATION RESISTANCE	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07	**Yes** GO to O3 . **No**

(VT/OG), harness side.  N0050701 • **Is the resistance between 54 and 66 ohms?**	GO to O5.
O3 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to O4. **No** GO to O12.
O4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect the negative battery cable. • Ignition ON. • Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0050702 • **Are the voltages greater than 6 volts?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to O13.
O5 CHECK THE MS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11,	**Yes** GO to O6.

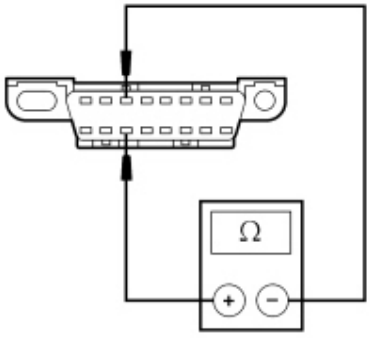
circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 108 and 132 ohms?**	**No** GO to O9.
O6 CHECK THE MS-CAN TERMINATION RESISTOR WITH THE BCM DISCONNECTED	
• Disconnect: BCM C2280F (Black Hardshell). • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to O7. **No** GO to O8.
O7 CHECK THE MS-CAN CIRCUITS BETWEEN THE BCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the BCM C2280F-24, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0115449 • Measure the resistance between the BCM C2280F-23, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to O13. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0115448

- **Are the resistances less than 5 ohms?**

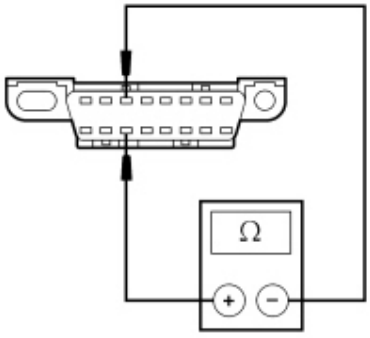
O8 CHECK THE MS-CAN CIRCUITS BETWEEN THE IPC AND THE DLC FOR AN OPEN	
• Disconnect: Instrument Panel Cluster (IPC) C220. • Measure the resistance between the IPC C220-23, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0115361 • Measure the resistance between the IPC C220-22, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0115362 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to O15 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
O9 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG) the harness side.	**Yes** GO to O11 . **No** GO to O10 .



N0050701

- **Is the resistance less than 5 ohms?**

O10 CHECK THE MS-CAN CIRCUITS BETWEEN THE BCM AND THE DLC FOR AN OPEN	
• Measure the resistance between DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG) the harness side.  N0050701 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the DLC or REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** A capacitor internal to a module may still be draining, causing irregular resistance readings. WAIT 5 minutes. REPEAT the pinpoint test.
O11 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
NOTE: Skip to the end of this test step once the suspect module has been identified. • While measuring the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side; disconnect the following modules one at a time until the resistance is greater than 5 ohms. ▪ BCM 2280F ▪ FCDIM C2123 ▪ IPC C220 ▪ RFA module C3503B (if equipped) ▪ TPM / VSM C4321B	**Yes** CONNECT the negative battery cable. For the BCM, GO to O18. For the FCDIM, GO to O19. For the IPC, GO to O20. For the RFA module, GO to O21. For the TPM / VSM, GO to O22. **No** REPAIR circuits VDB06 (GY/OG) and VDB07 (VT/OG) for a short together. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0050701

- **Did the resistance change to greater than 5 ohms with one of the modules disconnected?**

O12 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE MODULES DISCONNECTED	
NOTE: Skip to the end of this test step once the suspect module has been identified. • While measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side ground; and the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground; disconnect the following modules one at a time until the resistance to ground is greater than 10,000 ohms. ▪ BCM 2280F ▪ FCDIM C2123 ▪ IPC C220 ▪ RFA module (if equipped) ▪ TPM / VSM C4321B	**Yes** CONNECT the negative battery cable. For the BCM, GO to O18. For the FCDIM, GO to O19. For the IPC, GO to O20. For the RFA module, GO to O21. For the TPM / VSM, GO to O22. **No** REPAIR the suspect circuit for a short to ground. CLEAR the DTCs. REPEAT the network test with the scan tool.
 N0008947 • **Did the resistance change to greater than 1000 ohms with one of the modules disconnected?**	
O13 CHECK FOR RESTORED COMMUNICATION WITH THE IPC AND BCM DISABLED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuses 3 (7.5A), 19 (7.5) and 21 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to O14. **No** If the vehicle is equipped with RFA module, INSTALL the removed fuses. GO to O15. If the vehicle is not equipped with RFA module, INSTALL the removed fuses. GO to O16

O14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE BCM DISCONNECTED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: BCM C2280F. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** CONNECT the module. GO to Pinpoint Test J. **No** CONNECT the module. GO to Pinpoint Test C.
O15 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RFA MODULE DISABLED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuses 1 (15A), 9 (20A) and 14 (20A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test G. **No** INSTALL the removed fuses.GO to O16
O16 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE TPM / VSM DISABLED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuses 23 (10A), 26 (7.5A) and 12 (20A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test N. **No** INSTALL the removed fuses. GO to O17.
O17 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE FCDIM DISABLED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuse 7 (7.5A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test H. **No** INSTALL the removed fuse. The MS-CAN tests within specification. Verify the correct operation of the scan tool on a known good vehicle.
O18 CHECK THE BCM FOR CORRECT OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

O19 CHECK THE FCDIM FOR CORRECT OPERATION
• Disconnect the FCDIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the FCDIM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FCDIM. REFER to Section 415-00. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

O20 CHECK THE IPC FOR CORRECT OPERATION
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Section 413-01. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

O21 CHECK THE RFA FOR CORRECT OPERATION
• Disconnect all the RFA connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RFA connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA. REFER to Section 419-10. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

O22 CHECK THE TPM / VSM FOR CORRECT OPERATION
• Disconnect the TPM / VSM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the TPM / VSM connector and make sure it seats correctly.
	Yes
	INSTALL a new TPM / VSM. REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door or Tire Pressure Monitoring

• Operate the system and verify the concern is still present. • **Is the concern still present?**	System (TPMS) Module — 5-Door in Section 204-04 . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

Pinpoint Test P: No High Speed Controller Area Network (HS-CAN) Communication, All Modules Are Not Responding

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 23 , Electronic Engine Controls for schematic and connector information.

Normal Operation

The High Speed Controller Area Network (HS-CAN) uses an unshielded twisted-pair cable.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- ABS module
- Accessory Protocol Interface Module (APIM) (if equipped)
- Instrument Panel Cluster (IPC)
- Restraints Control Module (RCM)
- Occupant Classification System Module (OCSM)
- PCM
- Power Steering Control Module (PSCM)
- Remote Function Actuator (RFA) module (if equipped)
- Transmission Control Module (TCM) (if equipped)

PINPOINT TEST P: NO HS-CAN COMMUNICATION, ALL MODULES ARE NOT RESPONDING

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

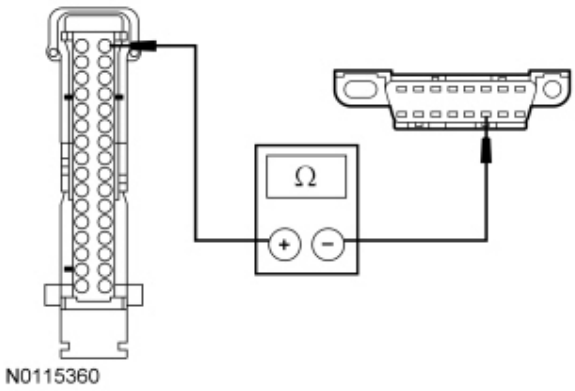
NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
P1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Inspect DLC pins 6 and 14 for damage.	**Yes** GO to P2 .

 A0093867 • **Are DLC pins 6 and 14 OK?**	**No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
P2 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to P3 . **No** GO to P5 .
P3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to P4 . **No** GO to P12 .
P4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect the negative battery cable. • Ignition ON. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0002964 • **Are the voltages greater than 6 volts?**	**No** GO to P13 .
P5 CHECK THE HS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to P6 . **No** GO to P9 .
P6 CHECK THE HS-CAN TERMINATION RESISTOR WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175B. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to P7 . **No** GO to P8 .
P7 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the PCM C175B-20, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** CONNECT the negative battery cable. GO to P27 . **No**

 N0117716 • Measure the resistance between the PCM C175B-19, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0117702 • **Are the resistances less than 5 ohms?**	REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
P8 CHECK THE HS-CAN CIRCUITS BETWEEN THE IPC AND THE DLC FOR AN OPEN • Disconnect: Instrument Panel Cluster (IPC) C220. • Measure the resistance between the IPC C220-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0115359 • Measure the resistance between the IPC C220-17, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to P24 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0115360

- **Are the resistances less than 5 ohms?**

P9 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to P11. **No** GO to P10.
P10 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the DLC or the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** A capacitor internal to a module may still be draining, causing irregular resistance readings. WAIT 5 minutes. REPEAT the pinpoint test.
P11 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
NOTE: Skip to the end of this test step once the suspect module has been identified. • While measuring the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side; disconnect the following modules one at a time	**Yes** CONNECT the negative battery cable. For the APIM, GO to P22. For the ABS module, GO to P23. For the IPC, GO to P24.

until the resistance is greater than 5 ohms. ■ APIM C2383 (if equipped) ■ ABS module C135 ■ IPC C220 ■ OCSM C3159 ■ PSCM C2368 ■ PCM C175B ■ RCM C310B ■ RFA module (if equipped) ■ TCM C1750A (if equipped)  N0026427 • **Did the resistance change to greater than 5 ohms with one of the modules disconnected?**	For the OCSM, GO to P25. For the PSCM, GO to P26. For the PCM, GO to P27. For the RCM, GO to P28. For the RFA, GO to P29. For the TCM, GO to P30. **No** REPAIR circuits VDB04 (WH/BU) and VDB05 (WH) for being shorted together. CLEAR the DTCs. REPEAT the network test with the scan tool.
P12 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE MODULES DISCONNECTED	
NOTE: Skip to the end of this test step once the suspect module has been identified. • While measuring the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground; disconnect the following modules one at a time until the resistance to ground is greater than 1000 ohms. ■ APIM C2383 (if equipped) ■ ABS module C135 ■ IPC C220 ■ OCSM C3159 ■ PSCM C2368 ■ PCM C175B ■ RCM C310B ■ RFA module (if equipped) ■ TCM C1750A (if equipped)  N0002963 • **Did the resistance change to greater than 1000 ohms with one of the modules disconnected?**	**Yes** CONNECT the negative battery cable. For the APIM, GO to P22. For the ABS module, GO to P23. For the IPC, GO to P24. For the OCSM, GO to P25. For the PSCM, GO to P26. For the PCM, GO to P27. For the RCM, GO to P28. For the RFA, GO to P29. For the TCM, GO to P30. **No** REPAIR the suspect circuit for a short to ground. CLEAR the DTCs. REPEAT the network test with the scan tool.
P13 CHECK FOR RESTORED COMMUNICATION WITH THE PCM AND ABS MODULE DISABLED	

NOTE: Establish an Integrated Diagnostic System (IDS) session prior to disabling the PCM in this test step. If the PCM has failed communication during multiple attempts to identify the vehicle, first manually identify the vehicle by entering a PCM part number, calibration number or tear tag when prompted by IDS . **NOTE:** When a vehicle is manually identified by a PCM part number, calibration number or tear tag, the IDS will not automatically run a network test. The network test must be manually selected and run. **NOTE:** When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: Battery Junction Box (BJB) Fuses 1 (40A), 9 (20A), 16 (15A), 27 (7.5A) and CJB Fuse 22 (7.5A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to P14 . **No** INSTALL the removed fuses. GO to P15 .
P14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ABS MODULE DISCONNECTED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: ABS module C135. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** CONNECT the module. GO to Pinpoint Test B . **No** CONNECT the module. GO to Pinpoint Test A .
P15 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE PSCM DISABLED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuse 21 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test I . **No** If the vehicle is equipped with RFA module, INSTALL the removed fuse. GO to P16 . If the vehicle is not equipped with RFA module, INSTALL the removed fuse. GO to P17
P16 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RFA MODULE DISABLED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuses 1 (15A), 9 (20A) and 14 (20A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test G . **No** GO to P17
P17 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RCM DISABLED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuse 20 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test E . **No** If the vehicle is equipped with an APIM , INSTALL the

	removed fuse. GO to P18. If the vehicle is not equipped with an APIM, INSTALL the removed fuse. GO to P19.
P18 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE APIM DISABLED **NOTE:** When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuse 10 (15A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test F. **No** INSTALL the removed fuse. GO to P19.
P19 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE IPC DISABLED **NOTE:** When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuses 3 (7.5A), 19 (7.5A) and 21 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test C. **No** If the vehicle is equipped with an automatic transmission, INSTALL the removed fuses. GO to P20. If the vehicle is not equipped with an automatic transmission, INSTALL the removed fuses. GO to P21
P20 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE TCM DISABLED **NOTE:** When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: BJB Fuses 2 (50A), 27 (7.5A) and CJB Fuse 23 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test M. **No** INSTALL the removed fuses. GO to P21.
P21 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE OCSM DISABLED **NOTE:** When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect: CJB Fuse 4 (7.5A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test D. **No** INSTALL the removed fuse. The HS-CAN tests within specification. Verify the correct operation of the scan tool on a known good vehicle.

P22 CHECK THE APIM FOR CORRECT OPERATION
 	
• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
	Yes
	INSTALL a new APIM. REFER to Section 415-00. CLEAR the DTCs. CONNECT all modules.

• Connect the APIM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
P23 CHECK THE ABS MODULE FOR CORRECT OPERATION	

• Disconnect the ABS module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the ABS module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 419-10 . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

P24 CHECK THE IPC FOR CORRECT OPERATION	

• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

P25 CHECK THE OCSM FOR CORRECT OPERATION	

• Disconnect the OCSM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the OCSM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new OCSM . REFER to Section 501-20B . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or

	corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

P26 CHECK THE PSCM FOR CORRECT OPERATION
• Disconnect the PSCM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PSCM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PSCM. REFER to Section 211-04. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

P27 CHECK THE PCM FOR CORRECT OPERATION
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

P28 CHECK THE RCM FOR CORRECT OPERATION
• Disconnect all the RCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RCM. REFER to Section 501-20B. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

P29 CHECK THE RFA MODULE FOR CORRECT OPERATION • Disconnect all the RFA module connectors.	**Yes**

• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RFA module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	INSTALL a new RFA module. REFER to Section 419-10. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

P30 CHECK THE TCM FOR CORRECT OPERATION	

• Disconnect all the TCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the TCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCM. REFER to Section 307-11. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

Pinpoint Test Q: No Infotainment Controller Area Network (I-CAN) Communication, All Modules Are Not Responding

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Normal Operation

The Infotainment Controller Area Network (I-CAN) uses an unshielded twisted-pair cable. The I-CAN is connected to the Data Link Connector (DLC), but the I-CAN modules communicate with the scan tool over the Medium Speed Controller Area Network (MS-CAN). The Front Control/Display Interface Module (FCDIM) is used as a gateway module for the messages to transfer between the scan tool and the modules on the I-CAN.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Accessory Protocol Interface Module (APIM) (if equipped)
- Audio Control Module (ACM)
- FCDIM
- Global Positioning System Module (GPSM) (if equipped)

PINPOINT TEST Q: NO I-CAN COMMUNICATION, ALL MODULES ARE NOT RESPONDING

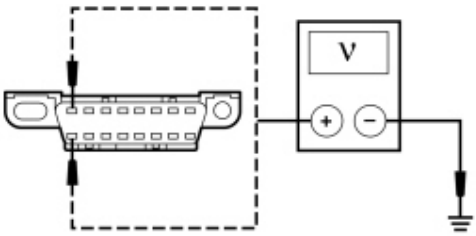
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe**

adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
Q1 CHECK THE I-CAN TERMINATION RESISTANCE	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-1, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-9, circuit VDB07 (VT/OG), harness side.  N0115546 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to Q2 . **No** GO to Q4 .
Q2 CHECK THE I-CAN (+) AND I-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-1, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-9, circuit VDB07 (VT/OG), harness side and ground.  N0115545 • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to Q3 . **No** GO to Q11 .
Q3 CHECK THE I-CAN (+) AND I-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect the negative battery cable. • Ignition ON. • Measure the voltage between the DLC C251-1, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-9, circuit VDB07 (VT/OG), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to Q12 .

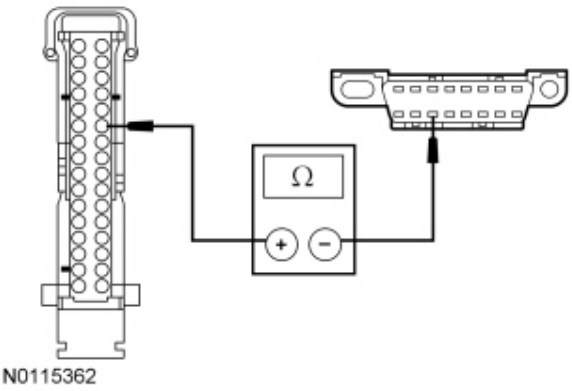


N0115547

- **Are the voltages greater than 6 volts?**

Q4 CHECK THE I-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-1, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-9, circuit VDB07 (VT/OG), harness side.  N0115546 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to Q5 . **No** GO to Q8 .
Q5 CHECK THE I-CAN TERMINATION RESISTOR WITH THE ACM DISCONNECTED	
• Disconnect: ACM C240A. • Measure the resistance between the DLC C251-1, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-9, circuit VDB07 (VT/OG), harness side.  N0115546 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to Q6 . **No** GO to Q7 .
Q6 CHECK THE I-CAN CIRCUITS BETWEEN THE ACM AND THE DLC FOR AN OPEN	
• Measure the resistance between the ACM C240A-14, circuit VDB06 (GY/OG), harness side and the DLC C251-1, circuit VDB06 (GY/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to Q14 . **No**

 N0115453 • Measure the resistance between the ACM C240A-15, circuit VDB07 (VT/OG), harness side and the DLC C251-9, circuit VDB07 (VT/OG), harness side.  N0115454 • **Are the resistances less than 5 ohms?**	REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q7 CHECK THE I-CAN CIRCUITS BETWEEN THE FCDIM AND THE DLC FOR AN OPEN • Disconnect: Front Control/Display Interface Module (FCDIM) C2123. • Measure the resistance between the FCDIM C2123-4, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0115361 • Measure the resistance between the FCDIM C2123-5, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to Q15 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0115362

- **Are the resistances less than 5 ohms?**

Q8 CHECK THE I-CAN (+) AND I-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the DLC C251-1, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-9, circuit VDB07 (VT/OG), the harness side.  N0115546 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q10 . **No** GO to Q9 .
Q9 CHECK THE I-CAN CIRCUITS BETWEEN THE ACM AND THE DLC FOR AN OPEN	
• Measure the resistance between the DLC C251-1, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-9, circuit VDB07 (VT/OG), the harness side.  N0115546 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the DLC or the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** A capacitor internal to a module may still be draining, causing irregular resistance readings. WAIT 5 minutes. REPEAT the pinpoint test.
Q10 CHECK THE I-CAN (+) AND I-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
NOTE: Skip to the end of this test step once the suspect module has been identified. • While measuring the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit	**Yes** CONNECT the negative battery cable. For the APIM , GO to Q13 . For the ACM , GO to Q14 . For the FCDIM ,

VDB07 (VT/OG), harness side; disconnect the following modules one at a time until the resistance is greater than 5 ohms. ■ APIM C2383 (if equipped) ■ ACM C240A ■ FCDIM C2123 ■ GPSM C2398 (if equipped)  N0115546 • **Did the resistance change to greater than 5 ohms with one of the modules disconnected?**	GO to Q15. For the GPSM, GO to Q16. **No** REPAIR the circuits VDB06 (GY/OG) and VDB07 (VT/OG) for a short together. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q11 CHECK THE I-CAN (+) AND I-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE MODULES DISCONNECTED	
NOTE: Skip to the end of this test step once the suspect module has been identified. • While measuring the resistance between the DLC C251-1, circuit VDB06 (GY/OG), harness side ground; and the DLC C251-9, circuit VDB07 (VT/OG), harness side and ground; disconnect the following modules one at a time until the resistance to ground is greater than 1000 ohms. ■ APIM C2383 (if equipped) ■ ACM C240A ■ FCDIM C2123 ■ GPSM C2398 (if equipped)  N0115545 • **Did the resistance change to greater than 1000 ohms with one of the modules disconnected?**	**Yes** CONNECT the negative battery cable. For the APIM, GO to Q13. For the ACM, GO to Q14. For the FCDIM, GO to Q15. For the GPSM, GO to Q16. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q12 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ACM, APIM AND GPSM DISCONNECTED	
NOTE: When re-running the network test, close the network test application first or the screen display reverts back to the previously run network test results. • Disconnect modules one at a time until other HS-CAN modules pass the network test. Skip to the end once network operation is restored. • Disconnect: The ACM C240A.	**Yes** CONNECT the module. For restored communication with the ACM disconnected, GO to Pinpoint Test K. For restored communication with the APIM disconnected, GO to Pinpoint Test F. For

• Enter the following diagnostic mode on the scan tool: Network Test. • Disconnect: The APIM C2383 (if equipped). • Enter the following diagnostic mode on the scan tool: Network Test. • Disconnect: The GPSM C2398 (if equipped). • Enter the following diagnostic mode on the scan tool: Network Test. • **Do all other modules pass the network test?**	restored communication with the GPSM disconnected, GO to Pinpoint Test L . **No** CONNECT the modules. The I-CAN tests within specification. Verify the correct operation of the scan tool on a known good vehicle.
Q13 CHECK THE APIM FOR CORRECT OPERATION	

• Disconnect the APIM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the APIM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new APIM .
	REFER to Section 415-00 .
	CLEAR the DTCs.
	CONNECT all modules.
	REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

Q14 CHECK THE ACM FOR CORRECT OPERATION	

• Disconnect all the ACM connectors .
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM .
	REFER to Section 415-00 .
	CLEAR the DTCs.
	CONNECT all modules.
	REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

Q15 CHECK THE FCDIM FOR CORRECT OPERATION	

• Disconnect the FCDIM connectors .
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the FCDIM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FCDIM .
	REFER to Section 415-00 .
	CLEAR the DTCs.
	CONNECT all modules.
	REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all

	modules. REPEAT the network test with the scan tool.
Q16 CHECK THE GPSM FOR CORRECT OPERATION	

• Disconnect the GPSM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the GPSM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new GPSM. REFER to Section 415-00. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

Pinpoint Test R: No Power To The Scan Tool

Refer to Wiring Diagrams Cell 14, Module Communications Network for schematic and connector information.

Normal Operation

The scan tool is connected to the Data Link Connector (DLC) to communicate with the High Speed Controller Area Network (HS-CAN), the Medium Speed Controller Area Network (MS-CAN) and the Infotainment Controller Area Network (I-CAN).

A loss of ground or poor ground at the DLC may result in HS-CAN, MS-CAN or I-CAN faults while the scan tool is connected.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Scan tool
- DLC

PINPOINT TEST R: NO POWER TO THE SCAN TOOL

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01.

Test Step	Result / Action to Take
R1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the DLC. • Inspect DLC pins 4, 5 and 16 for damage.	**Yes** GO to R2. **No** REPAIR the DLC as

 N0050767 • **Are DLC pins 4, 5 and 16 OK?**	necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
R2 CHECK THE DLC VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Measure the voltage between the DLC C251-16, circuit SBP05 (GY/RD), harness side and ground.  A0057467 • **Is the voltage greater than 10 volts?**	**Yes** GO to R3. **No** VERIFY the Central Junction Box (CJB) fuse 5 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPEAT the network test with the scan tool.
R3 CHECK THE DLC GROUND CIRCUITS FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-4, circuit GD115 (BK/GY), harness side and ground; and between the DLC C251-5, circuit GD115 (BK/GY), harness side and ground.  A0060571 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the scan tool. CONNECT the negative battery cable. REPEAT the network test with the scan tool. **No** REPAIR the circuit in question. REPEAT the network test with the scan tool.

Module Configuration

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Configurable modules accommodate a variety of vehicle options, eliminating the need for many unique modules for one vehicle line. These modules must be configured when replaced as part of a repair procedure. Configurable modules should not be exchanged between vehicles since the settings are unique to each vehicle. Failure to configure a new module may result in incorrect operation and/or DTCs setting.

The following are the 3 different methods of configuration:

- Programmable Module Installation (PMI)
- Module reprogramming (flashing)
- Programmable parameters

Some modules do not support all 3 methods.

Definition of Terms

The following are definitions of configuration terms:

Programmable Module Installation (PMI)

PMI is a scan tool process which configures settings in a new module. Data used for the PMI process is automatically downloaded from the original module and stored when a scan tool session is started. If this data cannot be retrieved from the module being replaced, the scan tool may prompt for As-Built data entry or display a list of parameter values that need to be manually selected. Some modules are reprogrammed during PMI when a strategy/calibration update is available. To carry out PMI, refer to Programmable Module Installation (PMI) in this section.

NOTE: It is important for the scan tool to identify the vehicle and obtain configuration data prior to removing any modules. The new module must be able to communicate with the scan tool in order to carry out PMI.

Module Reprogramming

Module reprogramming (also referred to as flashing) is a scan tool process which updates the strategy/calibration in a module. Reprogramming a module with the same level of software will not improve module operation or repair a hardware failure. Module reprogramming is automatically carried out during PMI when a later strategy/calibration is available.

NOTE: Module reprogramming should be limited to circumstances where a published TSB procedure

recommends doing so.

NOTE: A module cannot communicate with other modules on the communication network while being reprogrammed. Clear any network communication DTCs which may have been set in other modules during the reprogramming process.

Accessory Protocol Interface Module (APIM) Programming

Accessory Protocol Interface Module (APIM) programming is a process that updates the APIM Consumer Interface Processor (CIP) and Vehicle Interface Processor (VIP) software. The VIP programming updates the calibration files in the portion of the APIM that interfaces with the Controller Area Network (CAN). The CIP programming updates calibration files in the portion of the APIM that interfaces with mobile phones and other customer devices.

APIM programming uses the Vehicle Communication Module (VCM) to read and program the VIP software through the Data Link Connector (DLC). A web-based On-Line Automotive Service Information System (OASIS) application is used to read the CIP software via a Universal Serial Bus (USB) cable between the scan tool and the vehicle's USB port. Both the VCM and the OASIS application must be running on the scan tool during APIM programming. To carry out APIM programming, refer to Accessory Protocol Interface Module (APIM) Programming in this section.

Programmable Parameters

Programmable parameters are customer preference items that may be modified by the dealer via scan tool or in some cases, modified by the customer following a procedure listed in the vehicle Owner's Literature. While many configuration options may exist for a module, only a few of these options are programmable parameters.

Adaptive Learning and Calibration

Some modules require a separate learning procedure be carried out if replaced as part of a repair procedure. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

Vehicle Identification (VID) Block

Some PCMs contain a memory area called a Vehicle Identification (VID) block. The PCM VID block commonly stores powertrain configuration items such as Vehicle Identification Number (VIN), tire size, axle ratio, and whether or not the vehicle is equipped with speed control.

Module Address

A unique module address is assigned to each module on the network for identification.

As-Built Data

As-Built data is a VIN -specific module configuration record. During vehicle build, the configuration from all modules is downloaded and stored in the As-Built database. As-Built data does not reflect customer preference items that have been changed from the default state. These items need to be changed using programmable parameters after the module is configured.

NOTE: It is not necessary to obtain As-Built data unless directed to do so by the scan tool. This data may be accessed from the technician service publication web site.

The following chart lists As-Built data addresses and describes specific module configuration information:

Module Configuration and Parameter Chart

Module	Requires PMI	Reprogram/Flash Capable	Requires Adaptive Learning or Calibration	Available Program-mable Parameters
ABS module	Yes	Yes	Yes	Tire size
Accessory Protocol Interface Module (APIM)	Yes	Yes	No	None
Audio Control Module (ACM)	Yes	Yes	No	None
Body Control Module (BCM)	Yes	Yes	No	• Language • Speech Control Language • Tire Circumference • Tire Dimension
Front Control/Display Interface Module (FCDIM)	No	Yes	No	None
Global Positioning System Module (GPSM)	No	No	No	None
Instrument Panel Cluster (IPC)	Yes	Yes	No	• Language • Speech Control Language • Tire Circumference • Tire Dimension
Occupant Classification System Module (OCSM)	No	Yes	• Seat weight sensor re-zero	None
PCM	Yes	Yes	• Adaptive airflow • Idle speed • Refueling event • Fuel trim	None
Power Steering Control Module (PSCM)	No	Yes	No	None
Remote Function Actuator (RFA)	No	Yes	No	None
Restraints Control Module (RCM)	Yes	Yes	• Seat weight sensor re-zero	None
Tire Pressure Monitor Module (TPM)	Yes	Yes	No	Tire placard pressure
Transmission Control Module (TCM)	No	No	Yes	None

Inspection and Verification

This section provides step-by-step module configuration procedures. Carry out the Programmable Module Installation (PMI) procedures in this section when directed here from another workshop manual section to carry out configuration or when DTCs from the list below are present:

DTC Chart

NOTE: Some modules on this vehicle utilize a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous Memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Source	Action
U0300	Internal Control Module Software Incompatibility	• RCM • PSCM	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.
U0300:4A	Internal Control Module Software Incompatibility	• PCM	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.
U2024:54	Control Module Cal-Config Data	• PCM	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.
U2050	No Application Present	• OCSM • TPM	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.
U2051	One or More Calibration Files Missing/Corrupt	• OCSM	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.

Programmable Module Installation (PMI)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is Available

NOTE: Following module installation, some modules require a separate procedure be carried out. For instructions, refer to the specific module removal and installation procedures.

1. Connect the IDS and identify the vehicle as normal.
2. From the Toolbox icon, select Module Programming and press the check mark.
3. Select Programmable Module Installation.
4. Select the module that is being replaced.
5. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
6. Install the new module and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. The IDS downloads the data into the new module and displays Module Configuration Complete.
9. Test module for correct operation.

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available

NOTE: Following module installation, some modules require a separate procedure be carried out. For instructions, refer to the specific module removal and installation procedures.

1. Install the new module.
2. Connect the IDS and identify the vehicle as normal.
3. From the Toolbox icon, select Module Programming and press the check mark.

4. Select Programmable Module Installation.
5. Select the module that was replaced.
6. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. If the data is not available, the IDS displays a screen stating to contact the As-Built Data Center. Retrieve the data from the technician service publication website at this time and press the check mark.
9. Enter the module data and press the check mark.
10. The IDS downloads the data into the new module and displays Module Configuration Complete.
11. Test module for correct operation.

Accessory Protocol Interface Module (APIM) Programming

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10 or equivalent

Accessory Protocol Interface Module (APIM) Programming Using the Integrated Diagnostic System (IDS)

NOTE:

- If a new Accessory Protocol Interface Module (APIM) is being installed, install a new APIM before carrying out the following procedure. For additional information, refer to Section 415-00 .
- When carrying out the programming procedures, follow the scan tool on-screen directions.
- Make sure the battery is fully charged before carrying out the programming steps.
- A hardwired internet connection is strongly recommended when programming.
- If unable to complete programming because operation stops or errors are received, internet browser settings may need to be configured. From the on-line OASIS tab, select the "Service Tips" tab, then select "SYNC Software Programming" under "Job Aids".

NOTE:

- For APIM flash programming:
  - The scan tool and a USB male A to male A cable (CCMUSB2-AM-AM-10 or equivalent) are required.
  - The flash procedure deletes any paired phones that were in the SYNC® system.
  - The file for the flash needs to be downloaded from the online database. Allow for extra time for the file to download. The files are approximately 80 megabyte.

1. **NOTE:** The IDS program must be closed before attempting to program the APIM .

   Open a session for the vehicle from the technician service publication web site, and run On-Line Automotive Service Information System (OASIS) using "Read VIN and DTC's".

2. From the OASIS tab, select the "SYNC" button.

3. There are 3 available options for APIM programming:
   - Standard (latest version of current software and applications): Use this option to update the APIM to the latest software level.

- Custom (show what's available, and let me choose): Use this option to show all the available options that can be programmed, or if a Technical Service Bulletin (TSB) directs for specific software version to be programmed.
- Module Replacement (restore software for newly installed hardware): Use this option when the APIM has been replaced.

4. After selecting 1 of the 3 options (Standard, Custom or Module Replacement), click the "Read SYNC" button to verify the current APIM , Vehicle Interface Processor (VIP) and Consumer Interface Processor (CIP) software levels.
    - The versions are compared to a online database. After the comparison, the available software is displayed.

5. **NOTE:** Do not disconnect the Vehicle Communication Module (VCM) or the USB cable during APIM programming.

   When carrying out the programming procedures, follow the scan tool on-screen directions.

   NOTE: If unable to complete programming because operation stops or errors are received, interned browser settings may need to be configured. From the on-line OASIS tab, select the "Service Tips" tab, then select "SYNC Software Programming" under "Job Aids".

   Select the "Program SYNC" button to begin the APIM programming process.

6. Follow the scan tool on-screen directions for APIM programming.
    - After programming is complete the scan tool displays "Programming has been completed successfully."

Torque Specifications

Description	Nm	lb-ft	lb-in
Anti-theft alarm horn — 4 door sedan	11	—	97
Anti-theft alarm horn — 5 door hatchback	24	18	—

Anti-Theft

The perimeter anti-theft alarm system consists of the following:

- Anti-theft alarm horn (inside the luggage compartment on the passenger side in 4-door sedans. Underneath the left rear D-pillar trim in 5-door hatchbacks.)
- Door ajar input
- Door lock control switch input
- Door disarm switch (part of the driver door latch)
- Hood switch (part of the hood latch)
- Liftgate/luggage compartment ajar input
- Remote Keyless Entry (RKE) transmitter
- Turn signals
- Body Control Module (BCM)
-

The perimeter alarm system protects the vehicle from unauthorized entry by sounding the horn and flashing the turn signals at regular intervals when the system is armed and any door, the hood, or liftgate/luggage compartment is opened without using the key in the driver door lock cylinder, the Remote Keyless Entry (RKE) transmitter, or the Intelligent Access (IA) feature.

Arming the Perimeter Alarm

The perimeter alarm is ready to arm any time when the ignition is off. Any of the following pre-arms the alarm system:

- pressing the LOCK button on a programmed RKE transmitter.
- pressing the door lock control switch to the LOCK position with the door open, then closing the door.
- turning the driver door lock cylinder to the LOCK position.

Once the system is pre-armed, there is a 11-second countdown before the perimeter alarm is armed. Each entry point to the vehicle (hood, door, or liftgate/luggage compartment) are armed separately and must be closed before that entry point begins the 11-second countdown to become armed. If all entry points (hood, doors, and liftgate/luggage compartment) are closed, the turn signals flash indicating all entry points are entering the 11-second countdown.

Disarming the Perimeter Alarm

The perimeter alarm can be disarmed by:

- pressing the UNLOCK button on a programmed RKE transmitter.
- pressing the liftgate/luggage compartment release button on a programmed RKE transmitter.
- turning the driver door lock cylinder to the unlock position.
- using a programmed key to transition the ignition to the RUN mode.
- unlock the driver door or all doors using the IA feature.

Intelligent Access (IA) Key Disable

For security reasons, when the perimeter alarm enters an armed state, theRemote Function Actuator (RFA) module searches the interior of the vehicle for any programmed IA keys. If the RFA module detects any programmed IA keys inside the vehicle when the perimeter alarm is armed, it disables the IA key. The RKE and the IA functions of that key still operate, but the RFA module ignores any start

command associated with that key. The disabled IA key is enabled when the perimeter alarm is disarmed by pressing the RKE unlock button on the IA key, using the IA feature to unlock the doors, or by using the mechanical key blade in the door lock cylinder to unlock the doors.

Anti-Theft

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Body Control Module (BCM) controls the operation of the perimeter alarm based on the following inputs:

- door ajar switches
- hood ajar
- driver door lock cylinder
- door lock control switch
- Passive Anti-Theft System (PATS) input
- and the Remote Keyless Entry (RKE) transmitters

On vehicles equipped with Intelligent Access (IA) the BCM receives the RKE transmitter and IA input from the Remote Function Actuator (RFA) module over the Medium Speed Controller Area Network (MS-CAN). If the perimeter alarm is armed, and the BCM receives an input indicating an unauthorized entry into the vehicle or the ignition is turned to the RUN position without a programmed PATS key, the BCM activates the perimeter alarm. When the perimeter alarm is activated, the anti-theft horn sounds and the turn signals flash in regular intervals. The traffic horn does not sound during a perimeter alarm event.

Battery Disconnect

If the battery is disconnected and then reconnected, the perimeter alarm remains in the same state (disarmed, pre-armed, armed, or activated) it was prior to the battery disconnect.

Alarm Event PIDs

The BCM has PIDs available that show what caused the last alarm events. The 5 BCM alarm event PIDs are ALARM_1 through 5. The cause for the most recent alarm activation is always listed in the first alarm event PID. These PIDs display what caused the alarm to activate and can be a very useful tool when trying to identify the cause of a false alarm activation.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Wiring, terminals or connectors • Hood switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - cefer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B10B1:92	Cabin Set/Reset Switch: Performance or Incorrect Operation	GO to Pinpoint Test A.
P254F:00	Engine Hood Switch Circuit/Open: No Sub Type Information	GO to Pinpoint Test C.
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

Symptom Chart

Condition	Possible Sources	Action
• The alarm system does not arm/disarm from the driver door lock cylinder	• Wiring, terminals or connectors • Driver door set/reset switch (part of the door latch) • Body Control Module (BCM)	• GO to Pinpoint Test A
• The alarm system does not activate from an unauthorized entry at the hood	• Wiring, terminals or connectors • Hood switch (part of the hood latch) • BCM	• GO to Pinpoint Test B.
• The alarm system does not activate from an unauthorized entry at a door	• Door ajar input	• Refer to section Section 417-02 to diagnose the door ajar switch inputs.
• The alarm system does not activate from an unauthorized entry at the liftgate/luggage compartment	• Liftgate/luggage compartment ajar input	• Refer to section Section 417-02 to diagnose the liftgate/luggage compartment ajar switch inputs.
• The alarm system does not arm/no turn signal flash confirmation	• Door ajar input • Hood ajar input • Liftgate/luggage compartment ajar input • Turn signals • Remote Keyless Entry (RKE) transmitter concern • BCM	• GO to Pinpoint Test D.
• No horn output during alarm activation	• Wiring, terminals or connectors • Anti-theft alarm horn • BCM	• GO to Pinpoint Test E.
• The anti-theft alarm horn is always on	• Wiring, terminals or connectors • BCM	• GO to Pinpoint Test F.
• No turn signal flash during alarm	• Turn signals	• REFER to Section 417-01 to diagnose the turn

activation		signals.
• False alarm activation	• Door ajar input • Hood ajar input • Liftgate/luggage compartment ajar input • A valid Passive Anti-Theft System (PATS) key read is **NOT** received when the ignition is turned to RUN	• An intermittent fault exists. MONITOR the BCM alarm event PIDs ALARM_1 through 5 to identify and isolate the cause of the last alarm activations.

Pinpoint Tests

Pinpoint Test A: The Alarm System Does Not Arm/Disarm From The Driver Door Lock Cylinder

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The Body Control Module (BCM) monitors the driver door lock through the set/reset switch (part of the driver door latch) and the set and reset input circuits. When a key in the door lock cylinder is turned to the LOCK position it grounds the set circuit signaling the BCM to arm the alarm. When a key in the door lock cylinder is turned to the UNLOCK position it grounds the reset circuit signaling the BCM to disarm the alarm. The driver door latch uses a dedicated ground circuit for the door ajar and set/reset switches.

- B10B1:92 (Cabin Set/Reset Switch: Performance or Incorrect Operation) — a continuous and on-demand DTC that sets when the BCM detects a short to ground on the driver door lock cylinder set or reset input circuits.

This pinpoint test is intended to diagnose the following:

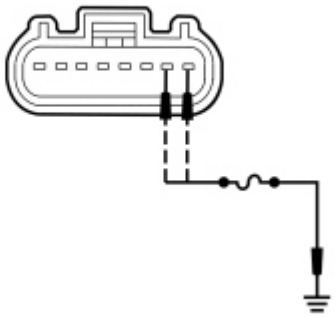
- Wiring, terminals or connectors
- Door set/reset switch (part of the driver door latch)
- BCM

PINPOINT TEST A: THE ALARM SYSTEM DOES NOT ARM/DISARM FROM THE DRIVER DOOR LOCK CYLINDER

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE RECORDED BCM DTCs FROM THE SELF-TEST	
• Check the recorded results from the BCM self-test. • **Is DTC B10B1:92 present?**	**Yes** GO to A2 . **No** GO to A4 .

A2 CHECK THE DRIVER DOOR LATCH FOR A SHORT TO GROUND	
• Disconnect: Driver Door Latch C525. • Clear the BCM DTCs. • Repeat the BCM self-test. • **Is DTC B10B1:92 still present?**	**Yes** GO to A3. **No** INSTALL a new driver door latch. REFER to Section 501-14. TEST the system for normal operation.
A3 CHECK THE SET/RESET CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280G. • Measure the resistance between the BCM C2280G-6, circuit CPL29 (YE/GY), harness side and ground, and between the BCM C2280G-19, circuit CPL28 (VT/BN), harness side and ground  N0116814 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to A7. **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
A4 CHECK THE COURTESY LAMP OPERATION	
• Open and close the driver door while checking the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** GO to A5. **No** REFER to Section 417-02 to diagnose the driver door ajar input concern.
A5 CHECK THE DRIVER DOOR LATCH	
• Disconnect: Driver Door Latch C525. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM PID (KCS_DRVR) while connecting and disconnecting a fused jumper wire between the driver door latch C525-1 CPL29 (YE/GY), harness side and ground, and between the driver door latch C525-2 CPL28 (VT/BN), harness side and ground	**Yes** INSTALL a new driver door latch. REFER to Section 501-14. TEST the system for normal operation. **No** GO to A6.



N0116807

- **Does the PID indicate LOCK and UNLOCK when the jumper wire is connected?**

A6 CHECK THE SET/RESET CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280G. • If the PID did not indicate UNLOCK, measure the resistance between the BCM C2280G-19, circuit CPL28 (VT/BN), harness side and the driver door latch C525-2, circuit CPL28 (VT/BN), harness side.  N0116808 • If the PID did not indicate LOCK, measure the resistance between the BCM C2280G-6, circuit CPL29 (YE/GY), harness side and the driver door latch C525-1, circuit CPL29 (YE/GY), harness side.  N0116809 • **Is the resistance less than 5 ohms?**	**Yes** GO to A7 . **No** REPAIR the circuit in question for an open. TEST the system for normal operation.
A7 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
	Yes
	INSTALL a new BCM . REFER to Section 419-10 .

▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Alarm System Does Not Activate From An Unauthorized Entry At The Hood

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When the alarm system is armed, the Body Control Module (BCM) monitors the hood ajar switch. If the hood is opened while the alarm is armed, the hood ajar switch removes ground from the signal circuit. This signals the BCM that an unauthorized intrusion to the engine compartment has occurred and the alarm is activated.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Hood switch (part of the hood latch)
- BCM

PINPOINT TEST B: THE ALARM SYSTEM DOES NOT ACTIVATE FROM AN UNAUTHORIZED ENTRY AT THE HOOD

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 RETRIEVE THE RECORDED DTCs IN THE BCM	
NOTE: DTC P254F:00 sets if the hood is open. Make sure the hood is closed prior to running the self-test. • Retrieve the recorded DTCs from the BCM self-test. • **Is DTC P254F:00 present?**	**Yes** GO to Pinpoint Test C . **No** GO to B2 .
B2 CHECK THE HOOD SWITCH (HOOD_SW) PID	
• Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM PID (HOOD_SW) while disconnecting the hood switch. • Disconnect: Hood Switch C127. • **Does the BCM PID read AJAR when the switch is disconnected?**	**Yes** INSTALL a new hood latch. REFER to Section 501-14 . TEST the system for normal operation. **No** GO to B3 .
B3 CHECK THE HOOD SWITCH INPUT CIRCUIT FOR A SHORT	

TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280D. • Measure the resistance between the hood switch C127-2, circuit CPL25 (BU/OG), harness side and ground.  N0058785 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR circuit CPL25 (BU/OG) for a short to ground. TEST the system for normal operation.
B4 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: DTC P254F:00

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

When the alarm system is armed, the Body Control Module (BCM) monitors the hood ajar switch. If the hood is opened while the alarm is armed, the hood ajar switch removes ground from the signal circuit. This signals the BCM that an unauthorized intrusion to the engine compartment has occurred and the perimeter alarm is activated.

- DTC P254F:00 (Engine Hood Switch Circuit / Open: No Sub Type Information) — an on-demand DTC that sets when the BCM detects an open in the hood switch circuit during the self-test. This DTC sets if the hood is open during a self-test

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Hood switch
- BCM

PINPOINT TEST C: DTC P254F:00

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE HOOD SWITCH	
• Disconnect: Hood Switch C127. • Connect a fused jumper wire between the hood switch C127-2, circuit CPL25 (BU/OG), harness side and the hood switch C127-1, circuit GD187 (BK/GN), harness side.  N0058786 • Clear the BCM DTCs. • Repeat the BCM self-test. • **Is the BCM DTC P254F:00 retrieved?**	**Yes** REMOVE the jumper wire. GO to C2 . **No** REMOVE the jumper wire. INSTALL a new hood latch. REFER to Section 501-14 . TEST the system for normal operation.
C2 CHECK THE HOOD SWITCH GROUND CIRCUIT	
• Connect a fused jumper wire between the hood switch C127-2, circuit CPL25 (BU/OG), harness side and ground.  N0116813 • Clear the BCM DTCs. • Repeat the BCM self-test. • **Is the BCM DTC P254F:00 retrieved?**	**Yes** GO to C3 . **No** REPAIR circuit GD187 (BK/GN) for an open. TEST the system for normal operation.
C3 CHECK THE HOOD SWITCH SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280D. • Measure the resistance between the hood switch C127-2, circuit CPL25 (BU/OG), harness side and the BCM C2280D-12, circuit CPL25 (BU/OG), harness side.	**Yes** GO to C4 . **No** REPAIR circuit CPL25 (BU/OG) for an open. CLEAR the DTCs. REPEAT the self-test.

 N0116810 • **Is the resistance less than 5 ohms?**	

C4 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The Alarm System Does Not Arm/No Turn Signal Flash Confirmation

Normal Operation

The Body Control Module (BCM) controls the perimeter alarm system and based on inputs either arms, disarms or activates the alarm. When the alarm is activated, the BCM sounds the anti-theft horn and flashes the turn signals at regular intervals. The BCM receives inputs for the door lock status, hood ajar, door ajar and the liftgate/luggage compartment lid ajar. The BCM also receives signals from the Remote Keyless Entry (RKE) transmitters.

For the perimeter alarm to arm and provide a flash of the turn signals, the following conditions must be met:

- ignition must be off
- the hood closed
- all doors closed
- the liftgate/luggage compartment closed
- an electronic lock command received from a Remote Keyless Entry (RKE) transmitter, driver door lock cylinder, or door lock control switch (front door opened and then shut after lock is pressed).
- An Intelligent Access (IA) lock command received (if equipped with IA)

Once all the conditions are met, the alarm system enters a pre-arm phase and begins a 11-second countdown. The perimeter alarm arms after 11 seconds have passed and no unlock command is received or any hood, door or liftgate/luggage compartment is opened.

The perimeter alarm is triggered when any door, the hood, or the liftgate/luggage compartment is opened without first receiving an electronic unlock command from a RKE transmitter, the driver door lock

cylinder, or an IA unlock. The perimeter alarm also activates if the ignition is turned to RUN without a valid Passive Anti-Theft System (PATS) key read received.

This pinpoint test is intended to diagnose the following:

- Door ajar input
- Hood ajar input
- Liftgate/luggage compartment ajar input
- Turn signals
- RKE transmitter concern
- BCM

PINPOINT TEST D: THE ALARM SYSTEM DOES NOT ARM/NO TURN SIGNAL FLASH CONFIRMATION

Test Step	Result / Action to Take
D1 RETRIEVE THE RECORDED DTCs IN THE BCM • Retrieve the recorded DTCs from the BCM self-test. • **Is DTC P254F:00 present?**	**Yes** GO to Pinpoint Test C . **No** GO to D2 .
D2 CHECK THE COURTESY LAMP OPERATION • Open and close all the doors and liftgate/luggage compartment while checking the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** GO to D3 . **No** REFER to Section 417-02 to diagnose the ajar inputs.
D3 VERIFY THE HAZARD LAMP OPERATION • Place the hazard switch in the ON position. • **Do the hazard lamps operate correctly?**	**Yes** GO to D4 . **No** REFER to Section 417-01 to diagnose the hazard lamps.
D4 CHECK THE RKE TRANSMITTER FUNCTION • Using the RKE transmitter, lock and unlock the doors. • **Do the RKE transmitter functions operate correctly?**	**Yes** GO to D5 . **No** REFER to Section 501-14 to diagnose the RKE function.

D5 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused

still present. • **Is the concern still present?**	by a loose or corroded connector.

Pinpoint Test E: No Horn Output During Alarm Activation

Normal Operation

The Body Control Module (BCM) receives voltage for the anti-theft alarm horn from the Battery Junction Box (BJB) fuse 6 (30A). When the perimeter alarm is activated, the BCM cycles voltage on and off to the anti-theft horn causing the horn output to cycle in conjunction with the turn signals flashing. The horn is case grounded.

NOTE: The traffic horn does not sound during a perimeter alarm event.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Anti-theft alarm horn
- BCM

PINPOINT TEST E: NO HORN OUTPUT DURING ALARM ACTIVATION

Test Step	Result / Action to Take
E1 CHECK THE POWER DOOR LOCK OPERATION	
• Press the door lock control switch twice. • **Do the doors lock and unlock?**	**Yes** GO to E2 . **No** REFER to Section 501-14 to diagnose the power door locks.
E2 CHECK FOR VOLTAGE TO THE ANTI-THEFT HORN	
• Disconnect: Anti-Theft Alarm Horn C4380. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Measure the voltage between the anti-theft alarm horn C4380-1, circuit CRT02 (GY/VT), harness side and ground while active commanding the BCM PID (ANTITHFT_HRN) on.  N0116811 • **Is the voltage momentarily greater than 10 volts?**	**Yes** INSTALL a new anti-theft alarm horn. REFER to Anti-Theft Alarm Horn — 4-Door Sedan or Anti-Theft Alarm Horn — 5-Door Hatchback in this section. TEST the system for normal operation. **No** GO to E3 .

E3 CHECK THE ANTI-THEFT HORN OUTPUT CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280C. • Measure the resistance between the anti-theft alarm horn C4380-1, circuit CRT02 (GY/VT), harness side and the BCM C2280C-8, circuit CRT02 (GY/VT), harness side; and between the anti-theft alarm horn C4380-1, circuit CRT02 (GY/VT), harness side and ground.  N0116812 • **Is the resistance less than 5 ohms between the anti-theft alarm horn and the BCM , and greater than 10,000 ohms between the anti-theft alarm horn and ground?**	**Yes** GO to E4 . **No** REPAIR circuit CRT02 (GY/VT) for an open or short to ground. TEST the system for normal operation.
E4 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Anti-Theft Alarm Horn Is Always On

Normal Operation

The Body Control Module (BCM) receives voltage for the anti-theft alarm horn from the Battery Junction Box (BJB) fuse 6 (30A). When the perimeter alarm is activated, the BCM cycles voltage on and off to the horn causing the anti-theft horn output to cycle in conjunction with the turn signals flashing. The horn is case grounded.

This pinpoint test is intended to diagnose the following:

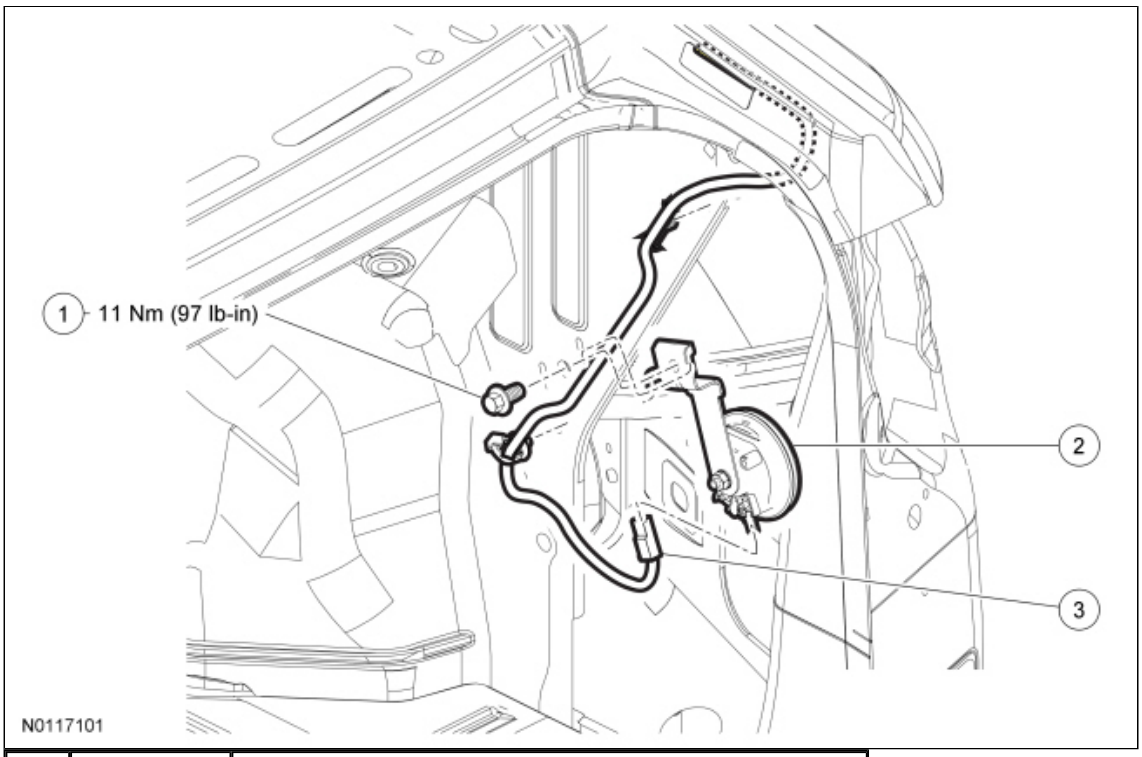
- Wiring, terminals or connectors
- BCM

PINPOINT TEST F: THE ANTI-THEFT ALARM HORN IS ALWAYS ON

Test Step	Result / Action to Take
F1 ISOLATE THE SHORT TO VOLTAGE • Ignition OFF. • Disconnect: BCM C2280C. • Ignition ON. • **Does the anti-theft alarm horn continue to sound?**	**Yes** REPAIR circuit CRT02 (GY/VT) for a short to voltage. TEST the system for normal operation. **No** GO to F2 .

F2 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

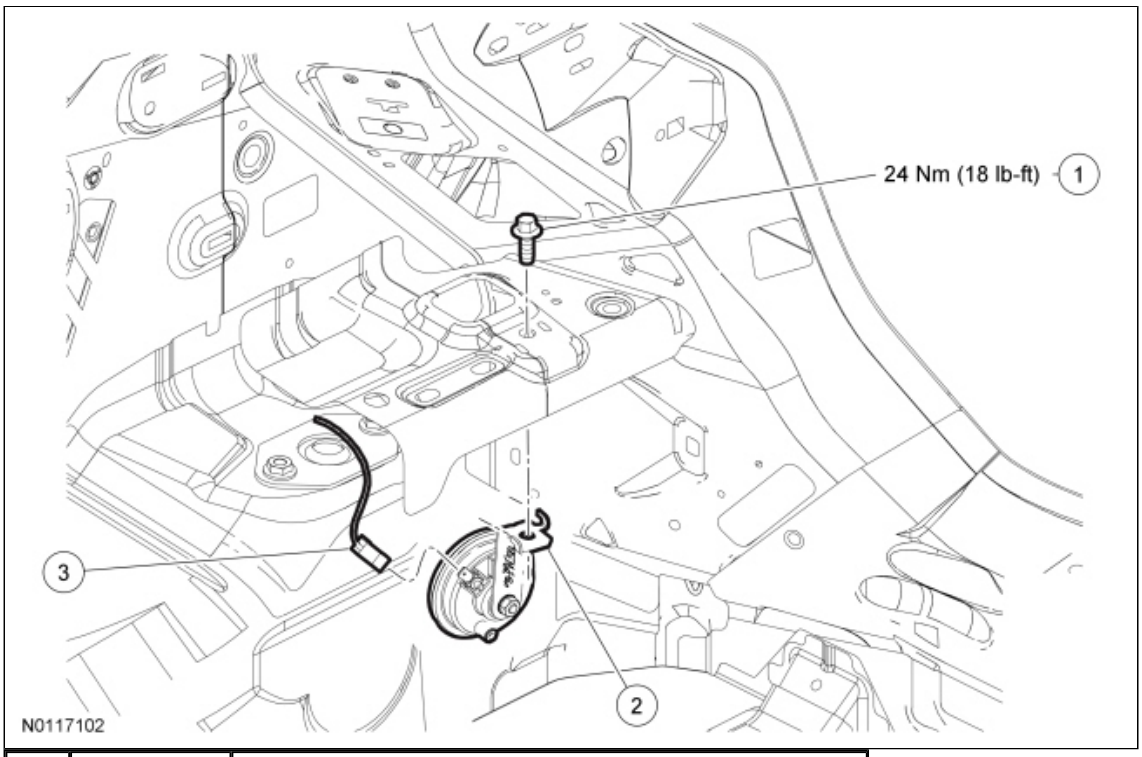
Anti-Theft Alarm Horn — 4-Door Sedan



Item	Part Number	Description
1	W702498	Anti-theft alarm horn bolt
2	13832	Anti-theft alarm horn
3	—	Anti-theft alarm horn electrical connector (part of 14A005)

1. Remove the RH luggage compartment trim panel for access.

Anti-Theft Alarm Horn — 5-Door Hatchback



Item	Part Number	Description
1	W702498	Anti-theft alarm horn bolt
2	13832	Anti-theft alarm horn
3	—	Anti-theft alarm horn electrical connector (part of 14A005)

1. Remove the LH quarter trim panel for access. For additional information, refer to Section 501-05 .

Anti-Theft

Passive Anti-Theft System (PATS) Without Intelligent Access (IA)

Passive Anti-Theft System (PATS) consists of the following components:

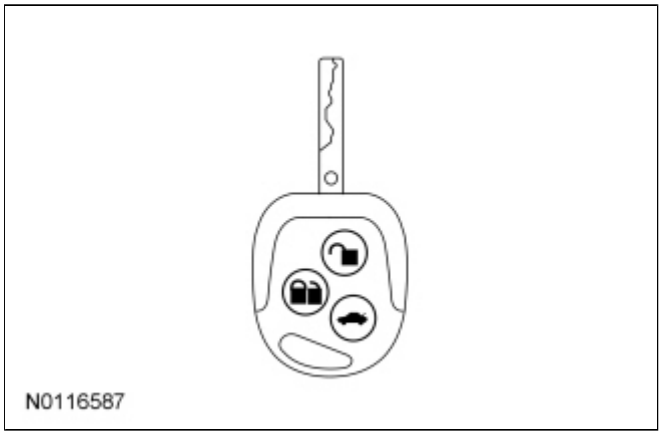
- Anti-theft indicator
- Integrated Keyhead Transmitter (IKT)
- PATS transceiver (located next to the ignition lock cylinder)
- Instrument Panel Cluster (IPC)
- PCM

PATS protects the vehicle from theft by preventing the engine from starting unless a programmed IKT is used.

Passive Anti-Theft System (PATS) Operation

PATS prevents the engine from starting by disabling the starter relay and fuel injector operation. If an unprogrammed key is used or if there is a PATS system concern, the anti-theft indicator in the IPC flashes rapidly and the engine will not start. PATS cannot disable an already running engine.

Passive Anti-Theft System (PATS) Keys



The vehicle comes equipped from the factory with two programmed IKTs . The IKT incorporates both the PATS and Remote Keyless Entry (RKE) transmitter functions in a single device. The key programming is a two step procedure. PATS information is programmed into the IPC and then the RKE transmitter is programmed into the BCM . The IPC accepts the programming of an unlimited number of keys, and the BCM accepts the programming of up to 8 keys. Refer to Key Programming Using Diagnostic Equipment in this section for PATS programming, and then refer to Remote Keyless Entry (RKE) Transmitter Programming in Section 501-14 to program the RKE transmitter.

Passive Anti-Theft System (PATS) With Intelligent Access (IA)

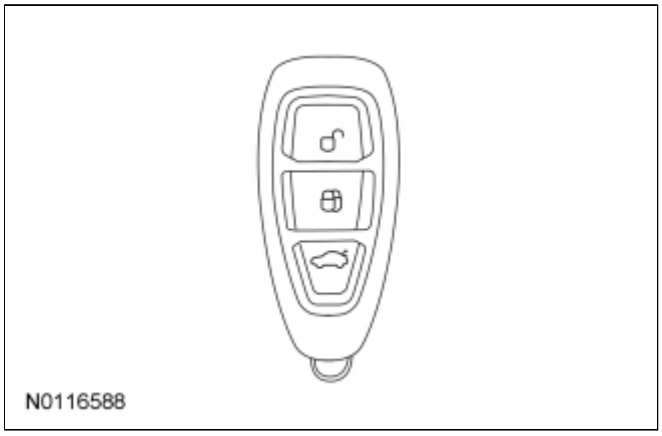
The Passive Anti-Theft System (PATS) consists of the following components:

- IA key
- Front passive start antenna (located in the front of the floor console just below the HVAC controls)
- Center passive start antenna (located on the bottom of the rear of the floor console)
- Rear passive start antenna (located behind the rear seat bottom cushion)
- PATS /backup transceiver (located in the steering column)
- Remote Functions Receiver (RFR) module (located on the top of the headliner in the front)
- Remote Function Actuator (RFA) module
- PCM

Intelligent Access (IA) Passive Anti-Theft System (PATS) Operation

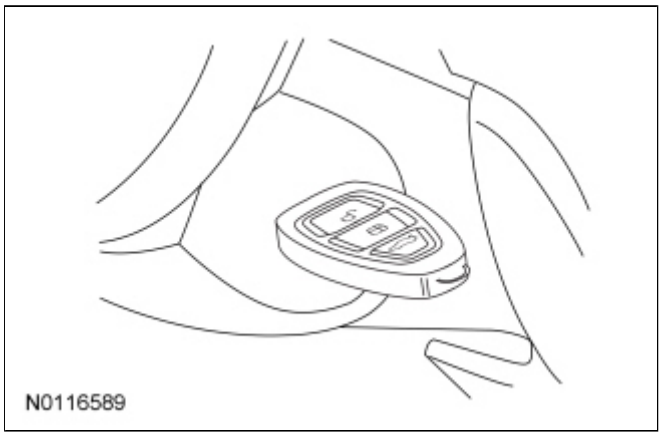
The IA PATS prevents the ignition from transitioning out of the off mode unless a programmed IA key is detected inside the vehicle. If no programmed key is detected inside the vehicle when the START/STOP button is pressed, KEY NOT DETECTED is displayed in the Front Control/Display Interface Module (FCDIM). PATS cannot turn the ignition off or disable an already running engine.

Intelligent Access (IA) Keys



The vehicle is equipped with 2 IA keys. The IA key incorporates both the PATS and the RKE transmitter functions in a single device. The IA key must be located inside the vehicle for vehicle starting. During key programming procedures, the PATS and RKE transmitter of an IA key are both programmed into the RFA module. The RFA module accepts programming of up to 8 IA keys. Refer to Key Programming Using Diagnostic Equipment in this section for key programming information.

PATS /Backup Transceiver



The PATS /backup transceiver is located in the steering column in the same location as a vehicle equipped without IA . If the vehicle does not start normally, place the IA key next to the steering column shroud and attempt to start the vehicle.

Intelligent Access (IA) with Push Button Start Ignition Modes

The IA feature does not require a conventional key to enter or start the vehicle. Once inside the vehicle, the operator activates one of the ignition modes using the brake pedal (automatic transaxle) or clutch pedal (manual transaxle) and the push button start (START/STOP) switch, as follows:

Intelligent Access (IA) with Push Button Start Ignition Modes

Ignition Entry Condition	Desired Ignition Modes	Action
Ignition off	On (engine off)	Press the START/STOP switch without pressing the brake or clutch pedal.
Any ignition mode	Start	Press and hold the brake or clutch pedal and then push the START/STOP switch.
On (engine off)	Ignition off	Push the START/STOP switch.
On (engine running and vehicle in motion)	Ignition off	Press and hold the START/STOP switch for approximately 1 second.

Anti-Theft — Without Intelligent Access (IA)

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

Passive Anti-Theft System (PATS) Operation

The Passive Anti-Theft System (PATS) is controlled by the Instrument Panel Cluster (IPC). There are two main checks that PATS performs before allowing the engine to start. If either of these checks fail, PATS does not allow the engine to start and the anti-theft indicator in the IPC flashes rapidly. These two checks are the IPC verifying the PCM ID to make sure it matches the PCM ID stored in memory and to verify that a programmed key was used to turn the ignition to the RUN or START position.

The first check is initiated when the ignition is turned to the RUN or START position. Once the IPC determines the ignition has been turned to the RUN or START position, it generates a challenge message. It sends this challenge message to the PATS transceiver on the transmit (TX) circuit. The transceiver in turn reads the key and generates a response message that is sent back to the IPC on the receive (RX) circuit. The engine does not start if the message received from the transceiver does not match a key stored in the IPC memory.

Once the IPC determines a programmed key was used to turn the ignition to RUN or START, the IPC sends the PCM a challenge message over the High Speed Controller Area Network (HS-CAN). When the PCM receives the challenge message, it generates a response and sends it back to the IPC . The engine does not start if the response from the PCM does not match the response in the IPC memory.

If both the key verification and PCM ID pass, PATS is enabled the engine is allowed to start. PATS cannot disable an engine that has already been started.

Spare Key Programming

The customer spare key programming allows spare keys to be programmed (up to a maximum of 8) to the IPC without having to use a scan tool. Two programmed keys are required to carry out the

procedure. Refer to Key Programming — Program a Key Using Two Programmed Keys in this section for the customer spare key programming procedure.

Passive Anti-Theft System (PATS) PIDs

The Passive Anti-Theft System (PATS) PIDS are a useful tool when diagnosing a PATS concerns.

IPC PATS PID	PID Description	PID reading required for PATS to be enabled
MASTERKEY	Determines if the key in the ignition lock cylinder is a programmed key.	Present
MIN_KEYS	Minimum number of programmed keys required. This PID always reads 2.	—
N_KEYCODE	Number of keys currently programmed into the Instrument Panel Cluster (IPC).	2 to 8
PATSENABL	Indicates if PATS will allow the engine to start.	Enabled
PCM_ID	Indicates if there is a PCM ID currently stored into the IPC .	Stored
PCM_VFY	Indicates if the PCM ID received by the IPC matches the PCM ID stored in the IPC memory.	Yes

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Large metallic objects or electronic devices on the key ring that can be used to purchase gasoline or similar items • PATS key • Use of a non- PATS key or incorrect PATS key • More than one PATS key on key ring • Aftermarket remote start system installed	• Central Junction Box (CJB) fuse 21 (10A) • Wiring, terminals or connectors • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.

- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Instrument Panel Cluster (IPC) and PCM.

9. If the DTCs retrieved are related to the concern, go to the IPC DTC Chart or the PCM DTC Chart. For all other IPC DTCs, refer to Section 413-01 . For all other PCM DTCs, refer to Section 303-14 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Instrument Panel Cluster (IPC) DTC Chart

DTC	Description	Action
B10D5:94	PATS Antenna: Unexpected Operation	The IPC received an incomplete or corrupt response from the transceiver. INSTALL a new transceiver, REFER to Passive Anti-Theft System (PATS) Transceiver in this section.
B10D7:05	PATS Key: System Programming Failure	GO to Pinpoint Test A .
B10D7:51	PATS Key: Not Programmed	There is an unprogrammed PATS key. PROGRAM the PATS key. REFER to Key Programming — Program a Key Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section.
B10D7:81	PATS Key: Invalid Serial Data Received	GO to Pinpoint Test B .
B10D7:87	PATS Key: Missing Message	GO to Pinpoint Test C .
B10D7:94	PATS Key: Unexpected Operation	GO to Pinpoint Test B .
B10D8:00	PATS Key Less Than Minimum Programmed: No Sub Type Information	Less than 2 keys are programmed into the IPC . CYCLE the customer's second key in the ignition to program (when less than 2 keys are programmed, the IPC automatically programs the first 2 keys that are cycled in the ignition).
B10DA:51	PATS Target Identifier: Not Programmed	There is no PCM ID stored in the IPC . CARRY OUT a parameter reset. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. REPEAT the self-test.
B10DA:62	PATS Target Identifier:	The PCM ID received by the IPC does not match the ID stored

	Signal Compare Failure	in the IPC memory. CARRY OUT a parameter reset. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. REPEAT the self-test.
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

PCM DTC Chart

DTC	Description	Action
U0167:00	Lost Communication With Vehicle Immobilizer Control Module: No Sub Type Information	GO to Pinpoint Test D .
U0426:00	Invalid Data Received From Vehicle Immobilizer Control Module: No Sub Type Information	GO to Pinpoint Test D .
All other DTCs	—	REFER to Section 303-14 .

Symptom Chart

Condition	Possible Sources	Action
• The anti-theft indicator is always/never on	• Instrument Panel Cluster (IPC)	• REFER to Section 413-01 .
• The engine does not start	• Driveability concern • Passive Anti-Theft System (PATS) concern • Starting system concern	• GO to Pinpoint Test E .

Pinpoint Tests

Pinpoint Test A: DTC B10D7:05

Normal Operation

When the Instrument Panel Cluster (IPC) enters a key programming state, it activates the transceiver to read the key in the ignition. The key is programmed into the IPC memory if a valid Passive Anti-Theft System (PATS) key is used and there are no concerns with the PATS .

- DTC B10D7:05 (PATS Key: System Programming Failure) — a continuous DTC that sets when a PATS key is unsuccessfully programmed into the IPC .

This pinpoint test is intended to diagnose the following:

- PATS key

PINPOINT TEST A: DTC B10D7:05

Test Step	Result / Action to Take
A1 CHECK THE BCM DTCs FROM THE SELF-TEST	
• Check the recorded results from the IPC self-test. • **Is DTC B10D5:94, B10D7:81, B10D7:87, or B10D7:94 retrieved?**	**Yes** REFER to the IPC DTC Chart in this section. RESOLVE these DTCs first. **No** GO to A2.
A2 CHECK THE PATS KEY	
• Verify the correct PATS keys are used with the vehicle. Compare the key with the one shown in Anti-Theft in the Description and Operation portion of this section. • **Are the correct keys being used?**	**Yes** ATTEMPT to program the key again. If key programming fails, DISCARD the damaged key and PROGRAM a new key. REFER to Key Programming — Program a Key Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** OBTAIN the correct key(s) for the vehicle. PROGRAM the new key(s). REFER to Key Programming — Program a Key Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: DTC B10D7:81 or B10D7:94

Normal Operation

When the ignition is turned to the RUN or START position, the Instrument Panel Cluster (IPC) activates the transceiver to read the key in the ignition. If the IPC does not receive a PATS key code or if the code is invalid, PATS is disabled and the engine does not start.

- DTC B10D7:81 (PATS Key: Invalid Serial Data Received) — a continuous and on-demand DTC that sets when there is a partial or corrupt PATS key read.
- DTC B10D7:94 (PATS Key: Unexpected Operation) — a continuous and on-demand DTC that sets when there is no PATS key read. This DTC sets if a non- PATS key is used to turn the ignition on.

This pinpoint test is intended to diagnose the following:

- PATS key
- PATS transceiver

PINPOINT TEST B: DTC B10D7:81 OR B10D7:94

NOTE: Large metallic objects or electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key can cause vehicle starting concerns and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition off and restart the engine with all other objects on the key ring held away from the ignition key.

NOTE: Aftermarket or dealer-installed remote start systems may adversely affect the PATS operation. Disconnect these systems before diagnosing any PATS concerns.

Test Step	Result / Action to Take
B1 CHECK THE PATS KEYS • Verify the correct PATS keys are used with the vehicle. Compare the keys with the one shown in Anti-Theft in the Description and Operation portion of this section. • **Are the correct keys being used?**	**Yes** GO to B2. **No** OBTAIN the correct key(s) for the vehicle. PROGRAM the new key(s). REFER to Key Programming — Program a Key Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.
B2 ISOLATE THE PATS KEYS • **NOTE:** Follow this procedure using both PATS keys (using one at a time). • Place a PATS key in the ignition and turn to the RUN position. • Enter the following diagnostic mode on the scan tool: Clear IPC Continuous DTCs. • Cycle the ignition from RUN to OFF and then back to the RUN position. • Enter the following diagnostic mode on the scan tool: BCM Self-Test. • **Is DTC B10D7:81 or B10D7:94 retrieved for both keys?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. **No** DISCARD the key in question and PROGRAM a new key. REFER to Key Programming — Program a Key Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTC B10D7:87

Refer to Wiring Diagrams Cell 112, Passive Anti-Theft System for schematic and connector information.

Normal Operation

The Central Junction Box (CJB) fuse 21 (10A) supplies voltage to the Passive Anti-Theft System (PATS) transceiver. When the ignition is turned to the RUN or START position, the Instrument Panel Cluster (IPC) initiates the key interrogation sequence. The IPC starts the interrogation sequence by generating a signal and sending that signal to the transceiver on the transmit (TX) circuit. When the transceiver receives the signal from the IPC, it reads the PATS key and generates a challenge response to the IPC signal on the receive (RX) circuit.

- DTC B10D7:87 (PATS Key: Missing Message) — a continuous and on-demand DTC that sets when the IPC does not receive a response from the PATS transceiver.

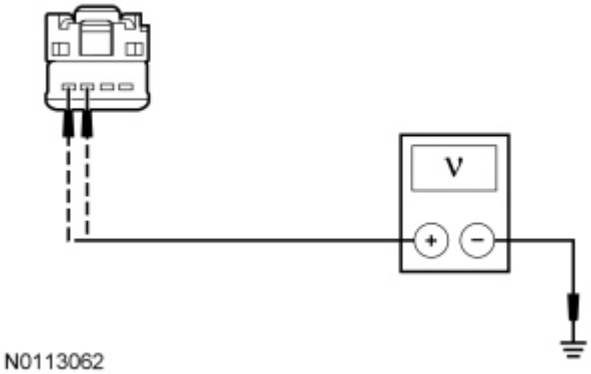
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- PATS transceiver
- IPC

PINPOINT TEST C: DTC B10D7:87

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK FOR VOLTAGE TO THE PATS TRANSCEIVER	
• Disconnect: PATS Transceiver C252. • Ignition ON. • Measure the voltage between the PATS transceiver C252-1, circuit CBP13 (GY/BN), harness side and the PATS transceiver C252-2, circuit GD115 (BK/GY).  N0113061 • **Is the voltage greater than 10 volts?**	**Yes** GO to C3. **No** GO to C2.
C2 CHECK THE PATS TRANSCEIVER VOLTAGE SUPPLY CIRCUIT	
• Measure the voltage between the PATS transceiver C252-1, circuit CBP13 (GY/BN), harness side and ground.  N0002393 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit GD115 (BK/GY) for an open. CLEAR the DTCs. REPEAT the self-test. **No** VERIFY the CJB fuse 21 (10A) is OK. If OK, REPAIR circuit CBP13 (GY/BN) for an open. If not OK, REFER to the Wiring Diagrams mannual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test.
C3 CHECK THE PATS TRANSCEIVER CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the PATS transceiver C252-3, circuit VRT24 (YE/OG), harness side and ground; and between the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side and ground.	**Yes** REPAIR the circuit in question for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to C4.



N0113062

- **Is any voltage present?**

C4 CHECK THE PATS TRANSCEIVER CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the PATS transceiver C252-3, circuit VRT24 (YE/OG), harness side and ground; and between the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side and ground.  N0113063 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to C5 . **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK THE PATS TRANSCEIVER CIRCUITS FOR AN OPEN

- Measure the resistance between the IPC , harness side and the PATS transceiver, harness side as follows:

IPC Connector-Pin	**Circuit**	**PATS Transceiver Connector-Pin**
C220-5	VRT24 (YE/OG)	C252-3
C220-3	VRT23 (VT/GY)	C252-4

Yes
INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. If DTC B10D7:87 is retrieved again, GO to C6 .

No
REPAIR the circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.

 N0116886 • **Are the resistances less than 5 ohms?**	
C6 CHECK FOR CORRECT IPC OPERATION	

• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Section 413-01. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: DTC U0167:00 or U0426:00

Normal Operation

When the ignition is turned to the RUN or START position, the Instrument Panel Cluster (IPC) and the PCM send each other their ID over the High Speed Controller Area Network (HS-CAN). Each module then checks the ID it receives and compares with the ID stored in memory. If the IDs are missing or invalid, Passive Anti-Theft System (PATS) is disabled and does not allow the engine to start.

- DTC U0167:00 (Lost Communication With Vehicle Immobilizer Control Module: No Sub Type Information) — a continuous DTC that sets when the PCM does not receive any PATS data from the IPC over the HS-CAN. The target ID is only sent once per key cycle and within milliseconds of the ignition being turned to the RUN or START position.
- DTC U0426:00 (Invalid Data Received From Vehicle Immobilizer Control Module: No Sub Type Information) — a continuous DTC that sets when the PCM does not receive the expected target ID from the IPC over the HS-CAN. The target ID is only sent once per key cycle and within milliseconds of the ignition being turned to the RUN or START position. This DTC also sets if a new PCM has been installed and the PATS Parameter Reset procedure has not been carried out.

This pinpoint test is intended to diagnose the following:

- HS-CAN concern
- Low battery state of charge
- IPC

PINPOINT TEST D: DTC U0167:00 OR U0426:00

Test Step	Result / Action to Take
D1 CHECK THE IPC DTCs FROM THE SELF-TEST • Check the recorded results from the IPC self-test. • **Are any IPC DTCs retrieved?**	**Yes** REFER to the IPC DTC Chart in this section. **No** GO to D2.
D2 CHECK THE BATTERY STATE OF CHARGE **NOTE:** It might be necessary to check battery voltage while cranking the engine to make sure battery voltage is not dropping and causing the concern. • Carry out the Battery Condition Test In Section 414-01. • **Did the battery pass the Battery Condition Test?**	**Yes** GO to D3. **No** RECHARGE or REPLACE the battery. REFER to Section 414-01.
D3 CHECK FOR COMMUNICATION WITH THE IPC • Enter the following diagnostic mode on the scan tool: Network Test. • **Does the IPC respond to the scan tool?**	**Yes** GO to D4. **No** REFER to Section 418-00.
D4 RECHECK THE PCM DTCs FROM THE SELF-TEST • Enter the following diagnostic mode on the scan tool: Clear PCM Continuous DTCs. • Cycle the ignition from RUN to OFF and then back to the RUN position. • Enter the following diagnostic mode on the scan tool: PCM Self-Test. • **Is DTC U0167:87 or U0426:81 retrieved?**	**Yes** GO to D5. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

D5 CHECK FOR CORRECT IPC OPERATION
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Section 413-01. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Engine Does Not Start

Normal Operation

The Passive Anti-Theft System (PATS) disables the engine from starting by disabling the fuel injectors and starter. When the ignition is turned to the RUN or START position, the PATS reads the PATS key and checks the PCM ID. If an unprogrammed PATS key is used or an invalid PCM ID is received, the PATS disables the engine. If there is a PATS concern that caused the engine to be disabled, the anti-theft indicator flashes in the Instrument Panel Cluster (IPC).

This pinpoint test is intended to diagnose the following:

- Driveability concern
- PATS concern
- Starting system concern

PINPOINT TEST E: THE ENGINE DOES NOT START

Test Step	Result / Action to Take
E1 CHECK FOR COMMUNICATION WITH THE PCM AND THE IPC • Carry out the network test using the scan tool. • **Does the scan tool establish communication with the PCM and the IPC ?**	**Yes** GO to E2 . **No** REFER to Section 418-00 to diagnose the module that is not communicating with the scan tool.
E2 CHECK FOR PATS DTCs • Enter the following diagnostic mode on the scan tool: IPC Self-Test. • Enter the following diagnostic mode on the scan tool: PCM Self-Test. • **Are any PATS DTCs present?**	**Yes** REFER to the DTC Charts in this section. **No** The no-start condition is not caused by PATS . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the cause of the no-start condition.

Anti-Theft — With Intelligent Access (IA)

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

Push Button Start Components

Passive Start Antennas

There are three passive start antennas. The passive start antennas are hardwired to the Remote Function Actuator (RFA) module and, when activated by the RFA module, they transmit a low frequency signal that activates an Intelligent Access (IA) key.

Passive Anti-Theft System (PATS)/Backup Transceiver

The PATS /backup transceiver is used as a backup device. If the vehicle fails to start conventionally, an IA key can be held in close proximity to the transceiver to allow the vehicle to start. The transceiver is wired to the RFA module and when activated it sends out a signal to activate an IA key. Once the key is activated, it sends a signal back to the transceiver which is then sent to the RFA module.

Remote Functions Receiver (RFR) Module

The Remote Functions Receiver (RFR) module is hardwired to the RFA module and is a receiving antenna that receives the high frequency signals from an IA key. It also receives the signals from an Remote Keyless Entry (RKE) command.

IA Key

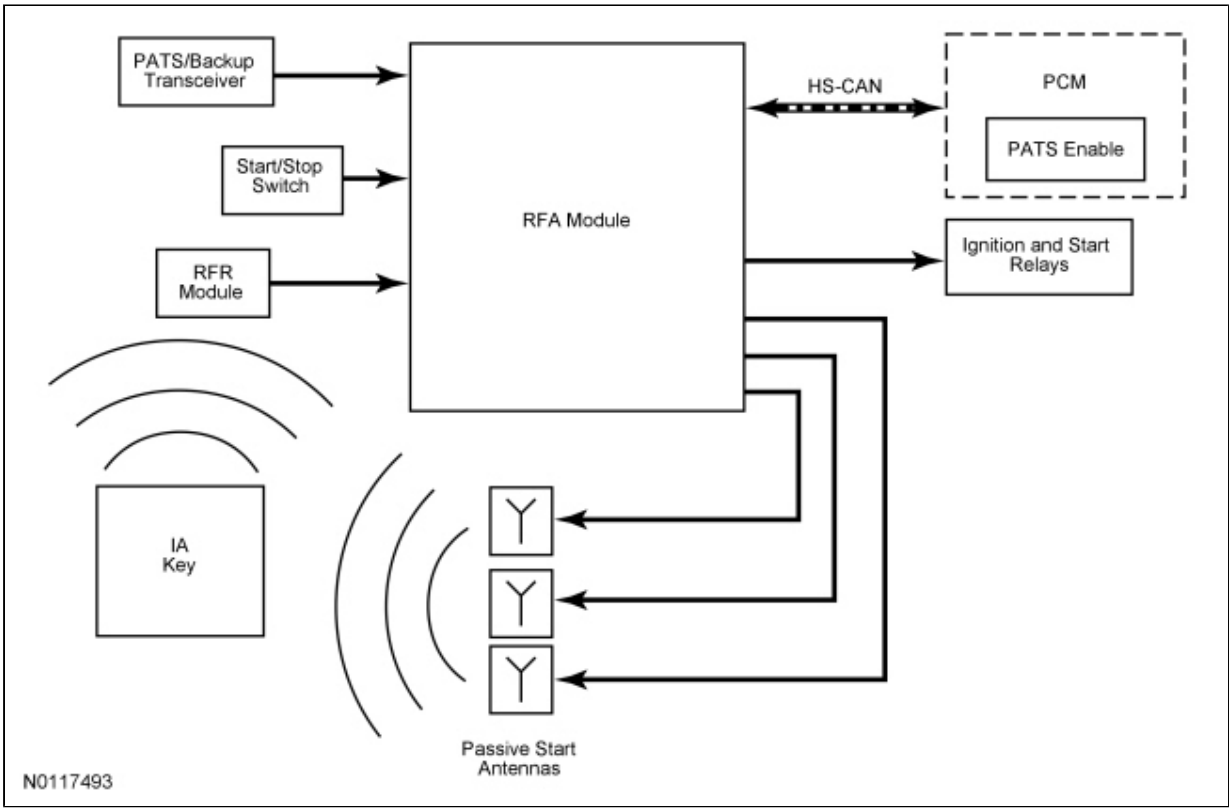
The IA receives the low frequency signals from the passive start antennas. When the IA key is activated by one of the low frequency signals, it sends out a high frequency signal that is received by the RFR module. The IA key also contains a key blade that is used to enter the vehicle as a backup.

Start/Stop Switch

The start/stop switch is a momentary contact switch that is hardwired to the RFA module. When the switch is

pressed, it signals the RFA module that there is a request to either switch the ignition on or start the engine.

Push Button Start Operation



The Passive Anti-Theft System (PATS) function is controlled by the RFA module and PCM.

When the start/stop switch is pressed, the RFA module initiates the key initialization sequence by activating the 3 interior IA passive start antennas. Each passive start antenna transmits a low frequency signal approximately 1 m (3 ft) radius of each antenna. If an IA key is within range of 1 of the 3 interior passive start antennas, the IA key is activated. Once the IA key is activated, it sends the PATS identification code to the Remote Functions Receiver (RFR) module via a high frequency signal. The RFR module interprets the high frequency signal from the IA key and sends the information to the RFA module over a dedicated network. If the RFA module determines that a programmed IA key is inside the vehicle, it allows the ignition to be transitioned out of off. When the ignition is turned on and the PCM initializes, the RFA module and the PCM exchange their IDs over the High Speed Controller Area Network (HS-CAN). If the RFA module receives a valid key code and the correct ID from the PCM, PATS is enabled and allows the engine to start. If PATS disables the engine from starting, the anti-theft indicator in the IPC flashes rapidly.

PATS and the RKE system share the operation of several components including the IA key and the RFR module. If there is a concern with either of these components, both PATS and the RKE system are affected. Refer to Section 501-14 for information on the RKE and IA features.

The RFA module also controls the ignition modes and in conjunction with the PCM controls the starting system. If there is a concern with starting system or the ignition modes, and PATS has been eliminated as the cause, refer to Section 303-06 for a starting system concern or Section 211-05 for the ignition modes.

Backup Starting

The vehicle can experience a PATS no start ff there is a failure of any passive start antenna, the battery in the IA key, or the RFR module. However, in the event of one of these failures, the IA key can be placed next to the PATS /backup transceiver (located in the steering column) to allow the vehicle to start. If a programmed IA key is near the steering column shroud when the PATS /backup transceiver is activated, it activates the IA key and the identification code is sent back to the RFA module.

Interior Passive Start Antenna Ranges

NOTE: Some brands/types of mobile phone or laptop computer chargers may cause interference that could lead to a PATS no-start if the IA key is within a few inches of the charger. If a concern is observed, move the IA key away from the charger and attempt to start the vehicle.

There are 3 passive start antennas that are used solely for the purpose of starting the vehicle. They are located in the front of the floor console, in the rear of the floor console, and behind the rear lower seat cushion. When activated, each antenna sends out a low frequency signal with an approximate range of 1 m (3 ft). A programmed IA key must be in range of 1 of the 3 antennas for PATS to operate.

If an IA key is placed in the far outside edges of the interior, like above a sun visor or in a door map pocket, the vehicle might experience a no-start. If the IA key is located in one of these areas and there is a no-start condition, move the IA key out of the area and attempt to start the vehicle. If the key is outside the range of a passive start antenna, KEY NOT DETECTED is displayed in the Front Control/Display Interface Module (FCDIM).

Key Outside Vehicle Message

The KEY OUTSIDE VEHICLE message is displayed in the FCDIM when the engine has been started or the ignition is in the RUN mode and an IA key is no longer detected inside the vehicle. The RFA module activates all passive start antennas to search the inside of the vehicle for an IA key anytime a door or luggage compartment lid/liftgate is opened and then closed. This strategy prevents the IA key from being separated from an already running vehicle. If an IA key is no longer in the vehicle, the ignition remains in RUN and the engine continues to run. If the start/stop switch is pressed to turn the ignition off, the engine can be re-started without an IA key present inside the vehicle for approximately 10 seconds. After 10 seconds an IA key has to be present to start the engine or transition the ignition out of off. If the driver door is opened during the 10-second countdown, the fast restart feature is disabled, and an IA key is needed to start the engine again.

Passive Anti-Theft System (PATS) PIDs

The Passive Anti-Theft System (PATS) PIDS are a useful tool when diagnosing a PATS concerns.

RFA module PATS PID	PID Description	PID reading required for PATS to be enabled
MASTERKEY	Determines if the key inside the vehicle is a programmed key.	Present
MIN_KEYS	Minimum number of programmed keys required. This PID always reads 2.	—
PATSENABL	Indicates if PATS will allow the engine to start.	Enabled
PCM_ID	Indicates if there is a PCM ID currently stored into the Remote Function Actuator (RFA) module.	Stored
PCM_VFY	Indicates if the PCM ID received by the RFA module matches the PCM ID stored in the RFA module memory.	Yes

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Intelligent Access (IA) key • Large metallic objects or electronic devices on the key ring that can be used to purchase gasoline or similar items	• Central Junction Box (CJB) fuse 7 (7.5A) • Wiring, terminals or

• Start/stop switch	connectors • Mobile phone or laptop computer chargers

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON mode.
     - the air bag warning indicator prove-out (other indicators may NOT prove ignition is ON) confirms ignition ON. If ignition does not turn ON, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, proceed with module self-test diagnostics.

8. Carry out the self-test diagnostics for the RFA module and the PCM.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

NOTE: Refer to Description and Operation, Intelligent Access (IA) with Push Button Start in this section to review the procedures for achieving the various ignition states.

Remote Function Actuator (RFA) Module DTC Chart

DTC	Description	Action
B102B:05	Passive Key: System Programming Failure	Less than 2 keys are programmed into the Remote Function Actuator (RFA) module. If other PATS DTCs are present, address them first. If DTC B102B:05 is the only DTC present, PROGRAM a minimum of 2 keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.
B10C7:1F	Interior Trunk Antenna: Circuit Intermittent	GO to Pinpoint Test K.

B10C8:1F	Interior Centre Antenna: Circuit Intermittent	GO to Pinpoint Test K .
B10C9:1F	Interior Front Antenna: Circuit Intermittent	GO to Pinpoint Test K .
B10D5:13	PATS Antenna: Circuit Open	The RFA module received an incomplete or corrupt response from the transceiver. INSTALL a new transceiver, REFER to Passive Anti-Theft System (PATS) Transceiver in this section.
B10D6:62	PATS Enable Status: Signal Compare Failure	GO to Pinpoint Test I .
B10D7:05	PATS Key: System Programming Failure	GO to Pinpoint Test F .
B10D7:51	PATS Key: Not Programmed	There is an unprogrammed PATS key. PROGRAM the PATS key. REFER to Key Programming Using Diagnostic Equipment in this section.
B10D7:81	PATS Key: Invalid Serial Data Received	GO to Pinpoint Test G .
B10D8:00	Passive Anti-Theft System (PATS) Key Less Than Minimum Programmed: No Sub Type Information	Less than 2 keys are programmed into the RFA module. If other PATS DTCs are present, address them first. If DTC B10D8:00 is the only DTC present, PROGRAM a minimum of 2 keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.
B10D9:87	PATS Transponder: Missing Message	GO to Pinpoint Test H .
B10DA:51	PATS Target Identifier: Not Programmed	There is no PCM ID stored in the RFA module. CARRY OUT a parameter reset of the RFA module and the PCM, then CYCLE the ignition and make an attempt to start the vehicle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. REPEAT the self-test.
B10DA:62	PATS Target Identifier: Signal Compare Failure	There is an incorrect PCM ID stored in the RFA module. CARRY OUT a parameter reset of the RFA module and the PCM, then CYCLE the ignition and make an attempt to start the vehicle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. REPEAT the self-test.
B10E6:11	PATS Power Supply: Circuit Short To Ground	GO to Pinpoint Test H .
B10E6:12	PATS Power Supply: Circuit Short To Battery	GO to Pinpoint Test H .
U0100:87	Lost Communication With ECM/PCM "A": Missing Message	GO to Pinpoint Test I .
U201F:00	External Receiver: No Sub Type Information	GO to Pinpoint Test J .
U201F:13	External Receiver: Circuit Open	GO to Pinpoint Test J .
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

PCM DTC Chart

DTC	Description	Action
U0167:00	Lost Communication With Vehicle Immobilizer Control Module: No Sub Type Information	GO to Pinpoint Test N .
U0426:00	Invalid Data Received From Vehicle Immobilizer Control Module: No Sub Type Information	GO to Pinpoint Test N .

All other DTCs	—	REFER to Section 303-14 .

Symptom Chart

NOTE: Refer to Description and Operation, Intelligent Access (IA) with Push Button Start in this section to review the procedures for achieving the various ignition states.

Condition	Possible Sources	Action
• The anti-theft indicator is always/never on	• Instrument Panel Cluster (IPC)	• REFER to Section 413-01 .
• The vehicle does not start with the Intelligent Access (IA) key in certain areas within the vehicle	• Wiring, terminals or connectors • Environmental interference • Front passive start antenna • Center passive start antenna • Rear passive start antenna • Remote Function Actuator (RFA) module	• GO to Pinpoint Test K .
• The vehicle does not start/unable to transition the ignition out of OFF	• Starting system concern • Driveability concern • Passive Anti-Theft System (PATS) concern	• GO to Pinpoint Test L .
• KEY NOT DETECTED is displayed	• Environmental interference • IA key • IA key battery • IA key not programmed	• GO to Pinpoint Test M .

Pinpoint Tests

Pinpoint Test F: DTC B10D7:05

Normal Operation

When the Remote Function Actuator (RFA) module enters a key programming state, it activates the Passive Anti-Theft System (PATS) transceiver to read the key placed next to it. The key is programmed into the RFA module memory if a valid Intelligent Access (IA) key is used and there are no concerns with the PATS .

- DTC B10D7:05 (PATS Key: System Programming Failure) — sets when a IA key is unsuccessfully programmed into the RFA module.

This pinpoint test is intended to diagnose the following:

- IA key
- PATS transceiver

PINPOINT TEST F: DTC B10D7:05

NOTE: At least 2 IA keys must be present prior to carrying out this pinpoint test.

Test Step	Result / Action to Take
F1 CHECK THE RFA MODULE DTCs FROM THE SELF-TEST	
• Check the recorded results from the RFA module self-test. • **Are any RFA module DTCs retrieved?**	**Yes** REFER to the RFA DTC Chart in this section. **No** GO to F2 .
F2 CHECK THE IA KEYS	
• Verify the correct IA keys are used with the vehicle. Compare the IA keys with the one shown in Anti-Theft in the Description and Operation portion of this section. • **Are the correct keys being used?**	**Yes** ATTEMPT to program the key again, REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. If key programming fails, GO to F3 . **No** OBTAIN the correct key(s) for the vehicle. PROGRAM the new key(s). REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.
F3 CHECK BOTH IA KEYS	
• Program both of the IA keys. Refer to Key Programming Using Diagnostic Equipment in this section. • Press the START/STOP switch with each IA key in the vehicle at a time. • **Does the ignition turn on with only one key?**	**Yes** If only one key operates, REPLACE the key that did not program. PROGRAM the new key. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** If both keys do not program, INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTC B10D7:81

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When the START/STOP switch is pressed, the Remote Function Actuator (RFA) activates all 3 passive start antennas, which send out a low frequency signal. Each passive start antenna has an approximate range of 1 m (3 ft) and are placed in different locations to provide full coverage inside the vehicle. If an Intelligent Access (IA) key is within range of a passive start antenna, the low frequency signal activates the IA key. When the IA key is activated it sends a high frequency signal to the Remote Functions Receiver (RFR) module. The RFR module communicates with the RFA module. If the RFA module determines that a programmed IA key is in the vehicle, it allows the ignition to transition out of off or let the engine start.

NOTE: Some brands/types of mobile phone or laptop computer chargers may cause interference that could lead to a Passive Anti-Theft System (PATS) no-start if the IA key is within a few inches of the charger. If a concern is observed, move the IA key away from the charger and attempt to start the vehicle.

- DTC B10D7:81 (PATS Key: Invalid Serial Data Received) — sets when the RFA module receives a partial or corrupt IA key code.

This pinpoint test is intended to diagnose the following:

- Environmental interference
- IA key

PINPOINT TEST G: DTC B10D7:81

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK THE IA KEYS	
• Verify the correct IA keys are used with the vehicle. Compare the keys with the one shown in Anti-Theft in the Description and Operation portion of this section. • **Are the correct keys being used?**	**Yes** GO to G2. **No** OBTAIN the correct key(s) for the vehicle. PROGRAM the new key(s). REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.
G2 CHECK FOR ENVIRONMENTAL INTERFERENCE	
• Check for the use of any charger or other wireless device that can cause interference with the IA key. If any device is found, remove the device and attempt to start the engine. • **Does the engine start?**	**Yes** INFORM the customer of the cause of the concern and the normal operation of the vehicle. **No** DISCARD the key in question and PROGRAM a new key. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: DTC B10D9:87, B10E6:11, or B10E6:12

Refer to Wiring Diagrams Cell 112, Passive Anti-Theft System for schematic and connector information.

Normal Operation

The Remote Function Actuator (RFA) module supplies voltage to the Passive Anti-Theft System (PATS) transceiver. If the RFA module does not passively detect an Intelligent Access (IA) key, it activates the PATS transceiver as a backup to try and detect a key. The RFA module also activates the PATS transceiver for key programming procedures. The RFA module starts the key interrogation sequence by supplying voltage to the transceiver. Once the transceiver is powered up, the RFA module generates a signal and sends that signal to the transceiver on the transmit (TX) circuit. When the transceiver receives the signal from the RFA module, it reads the PATS key and generates a challenge response to the RFA module signal and sends this response on the receive (RX) circuit.

- DTC B10D9:87 (PATS Transponder: Missing Message) — sets when the RFA module does not receive a response from the PATS transceiver.
- DTC B10E6:11 (PATS Power Supply: Circuit Short To Ground) — sets when the RFA module detects a short to ground on the PATS transceiver voltage supply circuit.
- DTC B10E6:12 (PATS Power Supply: Circuit Short To Battery) — sets when the RFA module detects a short to voltage on the PATS transceiver voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PATS transceiver

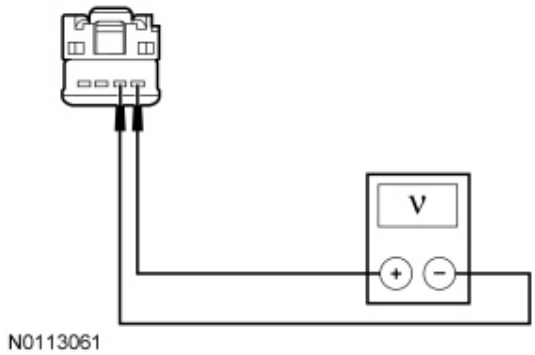
- RFA module

PINPOINT TEST H: DTC B10D9:87, B10E6:11, OR B10E6:12

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 RETRIEVE THE RECORDED RFA MODULE DTCs **NOTE:** If DTC B10E6:11 or B10E6:12 is present with B10D9:87, diagnose B10E6:11 or B10E6:12 first. • Check the recorded results from the RFA module self-test. • **Is DTC B10E6:11 or B10E6:12 present?**	**Yes** For DTC B10E6:11, GO to H2. For DTC B10E6:12, GO to H4. **No** For DTC B10D9:87, GO to H5.
H2 CHECK THE PATS TRANSCEIVER FOR A SHORT TO GROUND • Disconnect: PATS Transceiver C252. • Enter the following diagnostic mode on the scan tool: Clear RFA Module DTCs. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • **Is DTC B10E6:11 present?**	**Yes** GO to H3. **No** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. TEST the system for normal operation.
H3 CHECK THE PATS TRANSCEIVER VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: RFA Module C3503A. • Measure the resistance between the PATS transceiver C252-1, circuit CBP13 (GY/BN), harness side and ground.  N0116887 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H11. **No** REPAIR circuit CBP13 (GY/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
H4 CHECK THE PATS TRANSCEIVER VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: PATS Transceiver C252. • Disconnect: RFA Module C3503A. • Disconnect: Smart Keyless Entry Ignition Relay. • Connect a fused jumper wire between the smart keyless entry ignition relay pin 3, circuit SBP01 (RD), Central Junction Box (CJB) face side	**Yes** REPAIR circuit CBP13 (GY/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test.

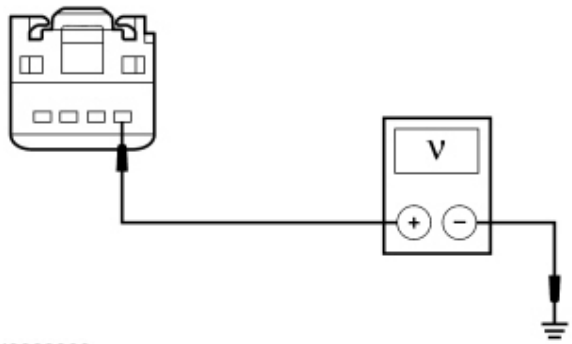
and the smart keyless entry ignition relay pin 5, circuit CDC32 (BN/YE), CJB face side.  N0116586 • Measure the voltage between the PATS transceiver C252-1, circuit CBP13 (GY/BN), harness side and ground.  N0002393 • **Is any voltage present?**	**No** GO to H11 .
H5 CHECK FOR VOLTAGE TO THE PATS TRANSCEIVER	
NOTE: The RFA module only supplies voltage to the PATS transceiver momentarily. It is important to monitor the meter while pressing the START/STOP switch. **NOTE:** Remove all IA keys from inside the vehicle. If the RFA module detects a key, it does not activate the PATS transceiver. • Disconnect: PATS Transceiver C252. • While pressing the START/STOP switch, measure the voltage between the PATS transceiver C252-1, circuit CBP13 (GY/BN), harness side and the PATS transceiver C252-2, circuit GD115 (BK/GY).	**Yes** GO to H8 . **No** GO to H6 .



N0113061

- **Is the voltage momentarily greater than 10 volts?**

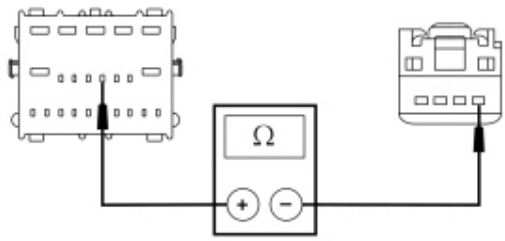
H6 CHECK THE PATS TRANSCEIVER VOLTAGE SUPPLY CIRCUIT	
NOTE: The RFA module only supplies voltage to the PATS transceiver momentarily. It is important to monitor the meter while pressing the START/STOP switch. **NOTE:** Remove all IA keys from inside the vehicle. If the RFA module detects a key, it does not activate the PATS transceiver. • While pressing the START/STOP switch, measure the voltage between the PATS transceiver C252-1, circuit CBP13 (GY/BN), harness side and ground.	**Yes** REPAIR circuit GD115 (BK/GY) for an open. CLEAR the DTCs. REPEAT the self-test. **No** GO to H7.



N0002393

- **Is the voltage momentarily greater than 10 volts?**

H7 CHECK THE PATS TRANSCEIVER VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: RFA Module C3503A. • Measure the resistance between the RFA module C3503A-10, circuit CBP13 (GY/BN), harness side and the PATS transceiver C252-1, circuit CBP13 (GY/BN), harness side	**Yes** GO to H11. **No** REPAIR circuit CBP13 (GY/BN) for an open. CLEAR the DTCs. REPEAT the self-test.

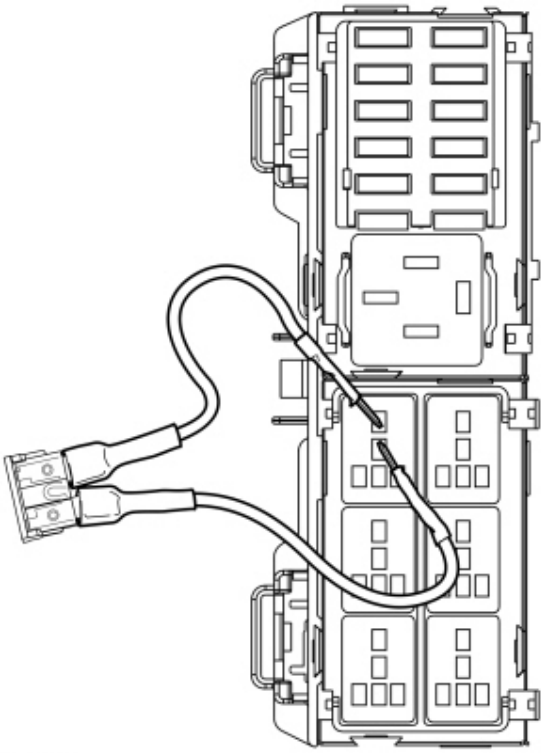


N0117084

- **Is the resistance less than 5 ohms?**

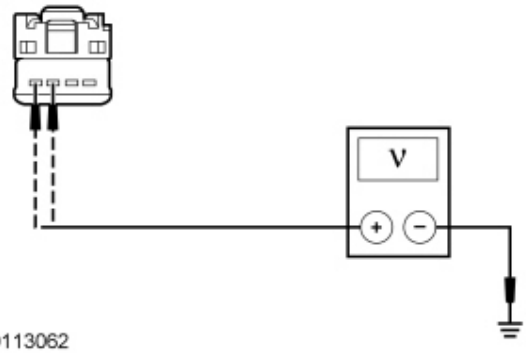
H8 CHECK THE PATS TRANSCEIVER CIRCUITS FOR A SHORT TO VOLTAGE	

- Ignition OFF.
- Disconnect: Smart Keyless Entry Ignition Relay.
- Disconnect: RFA Module C3503A.
- Connect a fused jumper wire between the smart keyless entry ignition relay pin 3, circuit SBP01 (RD), Central Junction Box (CJB) face side and the smart keyless entry ignition relay pin 5, circuit CDC32 (BN/YE), CJB face side.



N0116586

- Measure the voltage between the PATS transceiver C252-3, circuit VRT24 (YE/OG), harness side and ground; and between the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side and ground.



N0113062

- **Is any voltage present?**

Yes
REMOVE the jumper wire. INSTALL the smart keyless entry ignition relay. REPAIR the circuit in question for a short to voltage. CLEAR the DTCs. REPEAT the self-test.

No
REMOVE the jumper wire. INSTALL the smart keyless entry ignition relay. GO to H9 .

H9 CHECK THE PATS TRANSCEIVER CIRCUITS FOR A SHORT TO GROUND

- Measure the resistance between the PATS transceiver C252-3, circuit VRT24 (YE/OG), harness side and ground; and between the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side and ground.

Yes
GO to H10 .

No
REPAIR the circuit in question for a short to ground. CLEAR the DTCs.

 N0113063 • **Are the resistances greater than 10,000 ohms?**	REPEAT the self-test.
H10 CHECK THE PATS TRANSCEIVER CIRCUITS FOR AN OPEN	
• Measure the resistance between the RFA module, harness side and the PATS transceiver, harness side as follows: **RFA Module Connector-Pin** / **Circuit** / **PATS Transceiver Connector-Pin** C3503A-11 / VRT24 (YE/OG) / C252-3 C3503A-12 / VRT23 (VT/GY) / C252-4  N0117085 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. If DTC B10D9:87 is retrieved again, GO to H11. **No** REPAIR the circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.
H11 CHECK FOR CORRECT RFA MODULE OPERATION	

• Disconnect all the RFA module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RFA module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: DTC B10D6:62 or U0100:87

Normal Operation

When the ignition is transitioned out of off, the Remote Function Actuator (RFA) module checks the PCM ID

and compares It with the PCM ID that is stored in the RFA module memory. If the RFA module does not receive the PCM ID or the ID is invalid, Passive Anti-Theft System (PATS) is disabled and does not allow the engine to start.

- DTC B10D6:62 (PATS Enable Status: Signal Compare Failure) — sets when the RFA module does not receive the expected target ID from the PCM over the High Speed Controller Area Network (HS-CAN). The target ID is only sent one time per ignition cycle and is sent within milliseconds of the ignition being transitioned out of off.
- DTC U0100:87 (Lost Communication With ECM/PCM "A": Missing Message) — sets when the RFA module does not receive the target ID from the PCM over the HS-CAN . The target ID is only sent one time per ignition cycle and is sent within milliseconds of the ignition being transitioned out of off.

This pinpoint test is intended to diagnose the following:

- HS-CAN concern
- Low battery state of charge
- PCM

PINPOINT TEST I: DTC B10D6:62 OR U0100:87

Test Step	Result / Action to Take
I1 CHECK THE BATTERY STATE OF CHARGE **NOTE:** It might be necessary to check battery voltage while cranking the engine to make sure battery voltage is not dropping and causing the concern. • Carry out the Battery Condition Test in Section 414-01 . • **Did the battery pass the Battery Condition Test?**	**Yes** GO to I2 . **No** RECHARGE or REPLACE the battery REFER to Section 414-01 .
I2 RETRIEVE THE RFA MODULE DTCs FROM THE SELF-TEST • Check the recorded results from the RFA module self-test. • **Is DTC U0100:00 recorded?**	**Yes** REFER to the RFA module DTC Chart in Section 419-10 . **No** GO to I3 .
I3 RECHECK THE RFA MODULE DTCs FROM THE SELF-TEST • Enter the following diagnostic mode on the scan tool: Clear RFA Module Continuous DTCs. • Cycle the ignition from RUN to OFF and then back to RUN. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • **Is DTC B10D6:62 or U0100:87 retrieved?**	**Yes** GO to I4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

I4 CHECK FOR CORRECT PCM OPERATION
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: DTC U201F:00 or U201F:13

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When the Intelligent Access (IA) key is activated by one of the low frequency passive start antennas, the transmitter in the IA key sends a radio signal to the Remote Functions Receiver (RFR) module. The RFR module then communicates the command to the Remote Function Actuator (RFA) module, and the RFA module either switches the ignition to the requested mode or starts the engine.

The RFR module receives voltage from Central Junction Box (CJB) fuse 7 (7.5A) and has a dedicated ground circuit. The RFR module sends all Remote Keyless Entry (RKE) and IA key information and requests to the RFA module through a dedicated single circuit network.

In the event of a failure with the RFR module, the vehicle experiences a no-start unless the IA key is placed near the Passive Anti-Theft System (PATS) transceiver.

- DTC U201F:00 (External Receiver: No Sub Type Information) — sets when the RFA module has lost communication with the RFR module.
- DTC U201F:13 (External Receiver: Circuit Open) — sets when the RFA module has lost communication with the RFR module with an open communication circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- RFR module
- RFA module

PINPOINT TEST J: DTC U201F:00 OR U201F:13

Test Step	Result / Action to Take
J1 CHECK FOR VOLTAGE TO THE RFR MODULE	
• Disconnect: RFR Module C9026. • Measure the voltage between the RFR module C9026-3, circuit SBP07 (WH/RD), harness side and the RFR module C9026-2, circuit GD143 (BK/VT).  N0116873 • **Is the voltage greater than 10 volts?**	**Yes** GO to J3 . **No** GO to J2 .
J2 CHECK THE RFR MODULE VOLTAGE SUPPLY CIRCUIT	
• Measure the voltage between the RFR module C9026-3, circuit SBP07 (WH/RD), harness side and ground.	**Yes** REPAIR circuit GD143

 N0116874 • **Is the voltage greater than 10 volts?**	(BK/VT) for an open. CLEAR the DTCs. REPEAT the self-test. **No** VERIFY CJB fuse 7 (7.5A) is OK. If OK, REPAIR circuit SBP07 (WH/RD) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test.
J3 CHECK THE RFR MODULE COMMUNICATION CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: RFA Module C3503B. • Disconnect: Smart Keyless Entry Ignition Relay. • Connect a fused jumper wire between the smart keyless entry ignition relay pin 3, circuit SBP01 (RD), Central Junction Box (CJB) face side and the smart keyless entry ignition relay pin 5, circuit CDC32 (BN/YE), CJB face side.  N0116586 • Measure the voltage between the RFR module C9026-1, circuit VDB10 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. INSTALL the smart keyless entry ignition relay. REPAIR circuit VDB10 (GY) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the jumper wire. INSTALL the smart keyless entry ignition relay. GO to J4 .

 N0116875 • **Is any voltage present?**	
J4 CHECK THE RFR MODULE COMMUNICATION CIRCUIT FOR AN OPEN OR SHORT TO GROUND	**Yes** INSTALL a new RFR module. REFER to Remote Functions Receiver (RFR) Module in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, GO to J5. **No** REPAIR circuit VDB10 (GY) for an open or short to ground. CLEAR the DTCs. REPEAT the self-test.
• Measure the resistance between the RFR module C9026-1, circuit VDB10 (GY), harness side and the RFA module C3503B-3, circuit VDB10 (GY), harness side; and between the RFR module C9026-1, circuit VDB10 (GY), harness side and ground.  N0116876 • **Is the resistance less than 5 ohms between the RFR module and the RFA module; and greater than 10,000 ohms between the RFR module and ground?**	
J5 CHECK FOR CORRECT RFA MODULE OPERATION	**Yes** INSTALL a new RFA module. REFER to Section 419-10. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Disconnect all the RFA module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RFA module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**	

Pinpoint Test K: The Vehicle Does Not Start With The Intelligent Access (IA) Key In Certain Areas Within The Vehicle

Refer to Wiring Diagrams Cell 112, Passive Anti-Theft System for schematic and connector information.

Normal Operation

During each vehicle start sequence, when the START/STOP switch is pressed, the Remote Function Actuator (RFA) activates all 3 passive start antennas, which send out a low frequency signal. Each passive start antenna has an approximate range of 1 m (3 ft) and are placed in different locations to provide full coverage inside the

vehicle. If an Intelligent Access (IA) key is within range of a passive start antenna, the low frequency signal activates the IA key. When the IA key is activated it sends a high frequency signal to the Remote Functions Receiver (RFR) module. The RFR module communicates with the RFA module. If the RFA module determines that a programmed IA key is in the vehicle, it allows the ignition to transition out of off or let the engine start.

There are certain areas inside the vehicle where the IA key may not be detected and the message center displays KEY NOT DETECTED. If the IA key is in the far outside edges of the interior (like in a door map pocket or above a sun visor) it might not be detected. Move the IA key to a different location and try to start the vehicle again.

NOTE: Some brands/types of mobile phone or laptop computer chargers may cause interference that could lead to a Passive Anti-Theft System (PATS) no-start if the IA key is within a few inches of the charger. If a concern is observed, move the IA key away from the charger and attempt to start the vehicle.

- DTC B10C7:1F (Interior Trunk Antenna: Circuit Intermittent) — a DTC that sets when an open or short is detected on one of the circuits to the rear passive start antenna.
- DTC B10C8:1F (Interior Centre Antenna: Circuit Intermittent) — a DTC that sets when an open or short is detected on one of the circuits to the center passive start antenna.
- DTC B10C9:1F (Interior Front Antenna: Circuit Intermittent) — a DTC that sets when an open or short is detected on one of the circuits to the front passive start antenna.

This pinpoint test is intended to diagnose the following:

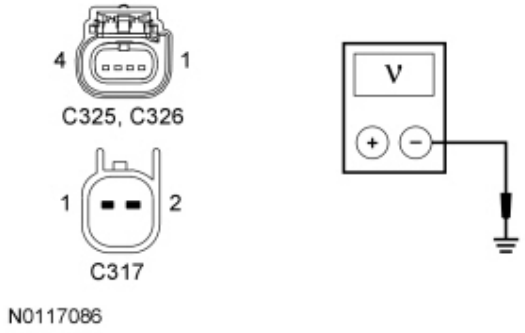
- Wiring, terminals or connectors
- Environmental interference
- Front passive start antenna
- Center passive start antenna
- Rear passive start antenna
- RFA module

PINPOINT TEST K: THE VEHICLE DOES NOT START WITH THE IA KEY IN CERTAIN AREAS WITHIN THE VEHICLE

Test Step	Result / Action to Take
K1 CHECK THE IA KEY LOCATION	
• Check the location of the IA key and if it is placed in the far corners of the interior of the vehicle, move the IA key out of these areas and attempt to start the vehicle. • **Does the vehicle start?**	**Yes** The system is OK. INFORM the customer of the normal vehicle operation. **No** GO to K2.
K2 CHECK FOR ENVIRONMENTAL INTERFERENCE	
• Check for the use of any charger or other wireless device that can cause interference with the IA key. If any device is found, remove the device and attempt to start the engine. • **Does the engine start?**	**Yes** INFORM the customer of the cause of the concern and the normal operation of the vehicle. **No** GO to K3.
K3 CHECK THE PASSIVE START ANTENNA CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: RFA Module C3503E. • Disconnect: Suspect Passive Start Antenna. • Place an IA key next to the PATS /backup transceiver and press the START/STOP switch to switch the ignition to RUN. • Measure the voltage between the suspect passive start antenna,	**Yes** REPAIR the circuit in question for a short to voltage. CLEAR the DTCs. REPEAT the self-test.

harness side and ground as follows:

Suspect Passive Start Antenna Connector-Pin	Circuit
Front C325-1	VPK05 (BN/GN)
Front C325-2	RPK05 (YE/OG)
Center C326-1	VPK06 (GY/VT)
Center C326-2	RPK06 (BU/WH)
Rear C317-1	VPK08 (WH/OG)
Rear C317-2	RPK08 (BN/VT)



- **Is any voltage present?**

No
GO to K4 .

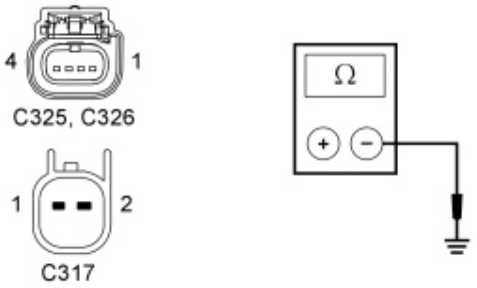
K4 CHECK THE PASSIVE START ANTENNA CIRCUITS FOR A SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the suspect passive start antenna, harness side and ground as follows:

Suspect Passive Start Antenna Connector-Pin	Circuit
Front C325-1	VPK05 (BN/GN)
Front C325-2	RPK05 (YE/OG)
Center C326-1	VPK06 (GY/VT)
Center C326-2	RPK06 (BU/WH)
Rear C317-1	VPK08 (WH/OG)
Rear C317-2	RPK08 (BN/VT)

Yes
GO to K5 .

No
REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-test.



N0117087

- **Are the resistance greater than 10,000 ohms?**

K5 CHECK THE ANTENNA CIRCUITS FOR AN OPEN	
• Measure the resistance between the RFA module C3503E, harness side and the suspect passive start antenna connector, harness side as follows: **RFA Module Connector-Pin** / **Suspect Passive Start Antenna Connector-Pin** / **Circuit** C3503E-9 / Front C325-1 / VPK05 (BN/GN) C3503E-2 / Front C325-2 / RPK05 (YE/OG) C3503E-17 / Center C326-1 / VPK06 (GY/VT) C3503E-5 / Center C326-2 / RPK06 (BU/WH) C3503E-11 / Rear C317-1 / VPK08 (WH/OG) C3503E-4 / Rear C317-2 / RPK08 (BN/VT)  N0117088 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new passive start antenna. REFER to Passive Start Antenna — Front, Passive Start Antenna — Center or Passive Start Antenna — Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, GO to K6. **No** REPAIR the circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.
K6 CHECK FOR CORRECT RFA MODULE OPERATION	

• Disconnect all the RFA module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RFA module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
	Yes
	INSTALL a new RFA module. REFER to Section 419-10. TEST the system for normal operation
	
	No
	The system is operating

• **Is the concern still present?**	correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Vehicle Does Not Start/Unable To Transition The Ignition Out Of OFF

Normal Operation

During each vehicle start sequence, when the START/STOP switch is pressed, the Remote Function Actuator (RFA) activates all 3 passive start antennas, which send out a low frequency signal. If an Intelligent Access (IA) key is within range of a passive start antenna, the low frequency signal activates the IA key. When the IA key is activated it sends a high frequency signal to theRemote Functions Receiver (RFR) module. The RFR module communicates with the RFA module. If the RFA module determines that a programmed IA key is in the vehicle, it allows the ignition to transition out of off or let the engine start.

The vehicle experiences a PATS no-start in the event there is a failure of any passive start antenna, the battery in the IA key, or the RFR module. However, in the event of one of these failures, the IA key can be placed next to the PATS transceiver (located in the steering column) to allow the vehicle to start. The PATS transceiver activates an IA key if it is placed in close proximity. The PATS transceiver is hardwired to the RFA module.

Once the RFA module determines that a programmed IA key is inside the vehicle and receives a request to start the engine, it communicates with the PCM over the High Speed Controller Area Network (HS-CAN). Once the RFA module and the PCM communicate, the RFA module checks the ID of the PCM and compares it with the module ID stored in its own memory. If the RFA module and PCM IDs match then the PATS enables the starter relay and fuel injectors and allows the engine to start.

The IA key disable feature prevents the engine from starting or the ignition from transitioning out of off if the IA key has been disabled. For more information on the IA key disable feature, refer to Section 419-01A .

This pinpoint test is intended to diagnose the following:

- Starting system concern
- Driveability concern
- PATS concern

PINPOINT TEST L: THE VEHICLE DOES NOT START/UNABLE TO TRANSITION THE IGNITION OUT OF OFF

Test Step	Result / Action to Take
L1 CHECK FOR KEY NOT DETECTED	
NOTE: Prior to performing any diagnostics press the unlock button on an IA key to make sure the IA key disable feature was causing the concern. • Check the Front Control/Display Interface Module (FCDIM) while pressing the START/STOP switch. • **Is KEY NOT DETECTED displayed?**	**Yes** GO to Pinpoint Test M . **No** GO to L2 .
L2 CHECK THE IPC OPERATION	
• Observe the Instrument Panel Cluster (IPC) operation while pressing the START/STOP switch. • **Do some of the indicators in the IPC illuminate?**	**Yes** GO to L3 . **No** GO to L4 .
L3 CHECK FOR RFA MODULE DTCs	
• Retrieve the RFA module continuous DTCs. • **Are any RFA module DTCs present?**	**Yes** REFER to DTC Charts in this section.

	No The no-start condition is not PATS -related. REFER to Section 303-06 to diagnose the cause of the no-start condition.
L4 CHECK FOR COMMUNICATION WITH THE SCAN TOOL	
• Refer to Inspection and Verification in Section 418-00 , and follow the procedure to establish a session with the vehicle. • **Does the scan tool establish communication with the vehicle?**	**Yes** REFER to Section 211-05 to diagnose no power in RUN. **No** REFER to Section 418-00 to diagnose no communication with the RFA module or the PCM.

Pinpoint Test M: KEY NOT DETECTED Is Displayed

Normal Operation

During each vehicle start sequence, if the Remote Function Actuator (RFA) module does not detect an Intelligent Access (IA) key inside the vehicle or the Passive Anti-Theft System (PATS)/backup transceiver does not receive an IA key identification code, the Front Control/Display Interface Module (FCDIM) displays the message KEY NOT DETECTED.

NOTE: Some brands/types of mobile phone or laptop computer chargers may cause interference that could lead to a Passive Anti-Theft System (PATS) no-start if the IA key is within a few inches of the charger. If a concern is observed, move the IA key away from the charger and attempt to start the vehicle.

This pinpoint test is intended to diagnose the following:

- Environmental interference
- IA key
- IA key battery
- IA key not programmed

PINPOINT TEST M: KEY NOT DETECTED IS DISPLAYED

Test Step	Result / Action to Take
M1 CHECK THE IA KEY LOCATION	
• Place the IA key in several locations within the vehicle and attempt to start the vehicle • **Does the vehicle start with the IA in certain areas only?**	**Yes** GO to Pinpoint Test K . **No** GO to M2 .
M2 CHECK FOR ENVIRONMENTAL INTERFERENCE	
• Check for the use of any charger or other wireless device that can cause interference with the IA key. If any device is found, remove the device and attempt to start the engine. • **Does the engine start?**	**Yes** INFORM the customer of the cause of the concern and the normal operation of the vehicle. **No** GO to M3 .
M3 CHECK THE IA KEY	
• Place the IA key next to the PATS transceiver and press the START/STOP switch. • **Is KEY NOT DETECTED displayed?**	**Yes** GO to M4 .

	No INSTALL a new IA key battery. DO NOT reprogram the IA key (damaged or dead batteries do not erase IA keys from memory). TEST the system for normal operation.
M4 CHECK THE IA KEY PROGRAMMING	
• Program the IA keys. REFER to Key Programming Using Diagnostic Equipment in this section. • **Does the IA key successfully program?**	**Yes** The concern was caused by an unprogrammed IA key. **No** DISCARD the key in question and PROGRAM a new key. REFER to Key Programming Using Diagnostic Equipment in this section. TEST the system for normal operation

Pinpoint Test N: DTC U0167:00 or U0426:00

Normal Operation

When the ignition is turned to the RUN or START mode, the Remote Function Actuator (RFA) module and the PCM send each other their ID over the High Speed Controller Area Network (HS-CAN). Each module then checks the ID it receives and compares with the ID stored in memory. If the IDs are missing or the IDs are invalid, Passive Anti-Theft System (PATS) is disabled and does not allow the engine to start.

- DTC U0167:00 (Lost Communication With Vehicle Immobilizer Control Module: No Sub Type Information) — a continuous DTC that sets when the PCM does not receive any PATS data from the RFA module over the HS-CAN. The target ID is only sent once per key cycle and within milliseconds of the ignition being turned to the RUN or START mode.
- DTC U0426:00 (Invalid Data Received From Vehicle Immobilizer Control Module: No Sub Type Information) — a continuous DTC that sets when the PCM does not receive the expected target ID from the RFA module over the HS-CAN. The target ID is only sent once per key cycle and within milliseconds of the ignition being turned to the RUN or START mode. This DTC also sets if a new PCM has been installed and the PATS Parameter Reset procedure has not been carried out.

This pinpoint test is intended to diagnose the following:

- HS-CAN concern
- Low battery state of charge
- RFA module

PINPOINT TEST N: DTC U0167:00 OR U0426:00

Test Step	Result / Action to Take
N1 CHECK THE RFA MODULE DTCs FROM THE SELF-TEST	
• Check the recorded results from the RFA module self-test. • **Are any RFA module DTCs retrieved?**	**Yes** REFER to the RFA module DTC Chart in this section. **No** GO to N2.
N2 CHECK THE BATTERY STATE OF CHARGE	
NOTE: It might be necessary to check battery voltage while cranking the engine to make sure battery voltage is not dropping and causing the concern.	**Yes** GO to N3. **No** RECHARGE or REPLACE the battery.

• Carry out the Battery Condition Test In Section 414-01 . • **Did the battery pass the Battery Condition Test?**	REFER to Section 414-01 .
N3 CHECK FOR COMMUNICATION WITH THE RFA MODULE	
• Enter the following diagnostic mode on the scan tool: Network Test. • **Does the RFA module respond to the scan tool?**	**Yes** GO to N4 . **No** REFER to Section 418-00 .
N4 RECHECK THE PCM DTCs FROM THE SELF-TEST	
• Enter the following diagnostic mode on the scan tool: Clear PCM Continuous DTCs. • Cycle the ignition from RUN to OFF and then back to RUN. • Enter the following diagnostic mode on the scan tool: PCM Self-Test. • **Is DTC U0167:87 or U0426:81 retrieved?**	**Yes** GO to N5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
N5 CHECK FOR CORRECT RFA MODULE OPERATION	

• Disconnect all the RFA module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RFA module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10 . TEST the system for normal operation
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Passive Anti-Theft System (PATS) Parameter Reset

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Without Intelligent Access (IA)

1. Turn the key from the OFF position to the RUN position.

2. From the scan tool, enter TOOLBOX. Select Body>Security>PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to Enter PATS security access.

3. **NOTE:** If the Instrument Panel Cluster (IPC) was replaced, program at least two keys to the IPC. After completing step 3, leave the scan tool connected and follow the Key Programming Using Diagnostic Equipment.

   From the scan tool, select "Parameter Reset" and follow the IDS on-screen instructions.

With Intelligent Access (IA)

NOTE: This procedure erases all keys from the Remote Function Actuator (RFA) module. Make sure at least two Intelligent Access (IA) keys are present before performing this procedure.

NOTE: To Enter PATS security access if the RFA module is replaced, start a vehicle session using a tear tag or PCM part number. Refer to Inspection and Verification in Section 418-00 to start a session. PATS security access can still be granted even with the ignition off.

1. From the scan tool, enter TOOLBOX. Select Body>Security>PATS Functions Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to Enter PATS security access.

2. From the scan tool, select "Parameter Reset" and follow the IDS on-screen instructions.

Key Programming Using Diagnostic Equipment

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Without Intelligent Access (IA)

NOTE: Program a minimum of 2 keys into the vehicle.

NOTE: This procedure only programs the Passive Anti-Theft System (PATS) portion of the key into the Instrument Panel Cluster (IPC). It does not program the Remote Keyless Entry (RKE) Transmitter Identification Code (TIC) into the Body Control Module (BCM).

1. Turn the key from the OFF position to the RUN position.

2. From the scan tool, enter TOOLBOX. Select Body>Security>PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to Enter PATS security access.

3. **NOTE:** A maximum of 8 keys can be programmed into the vehicle.

   From the scan tool menu, select the appropriate key programming procedure and follow the on-screen instructions to program the Passive Anti-Theft System (PATS) portion of the key(s).

4. Disconnect the scan tool.

5. Refer to Remote Keyless Entry (RKE) Transmitter Programming in Section 501-14 to program the RKE portion of the key.

With Intelligent Access (IA)

NOTE: Program a minimum of 2 keys into the vehicle.

NOTE: This procedure programs the Passive Anti-Theft System (PATS) and Remote Keyless Entry (RKE) portions of the key into the Remote Function Actuator (RFA) module.

NOTE: To Enter PATS security access if no programmed Intelligent Access (IA) keys are available, start a vehicle session using a tear tag or PCM part number. Refer to Inspection and Verification in Section 418-00 to start a session. PATS security access can still be granted even with the ignition off.

1. From the scan tool, enter TOOLBOX. Select Body>Security>PATS Functions Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to Enter PATS security access.

2. **NOTE:** A maximum of 8 keys can be programmed into the vehicle.

From the scan tool menu, select the appropriate key programming procedure and follow the on-screen instructions to program the IA key(s).

Key Programming — Program a Key Using Two Programmed Keys

NOTE: This procedure is only for vehicles without Intelligent Access (IA). For vehicles with IA the keys can only be programmed using a scan tool.

NOTE: This procedure works only if 2 or more programmed keys are available. If 2 programmed keys are not available, refer to Key Programming Using Diagnostic Equipment in this section.

NOTE: This procedure only programs the Passive Anti-Theft System (PATS) portion of the key into the Instrument Panel Cluster (IPC). It does not program the Remote Keyless Entry (RKE) Transmitter Identification Code (TIC) into the Body Control Module (BCM).

1. Insert the first programmed PATS key into the ignition and turn the key from the OFF position to the RUN position (maintain the key in the RUN position for approximately 3 seconds).

2. Turn the first key to the OFF position and remove the key from the ignition.

3. Within 10 seconds of turning the key to the OFF position, insert a second programmed PATS key into the ignition and turn the key from the OFF position to the RUN position (maintain the key in the RUN position for approximately 3 seconds).

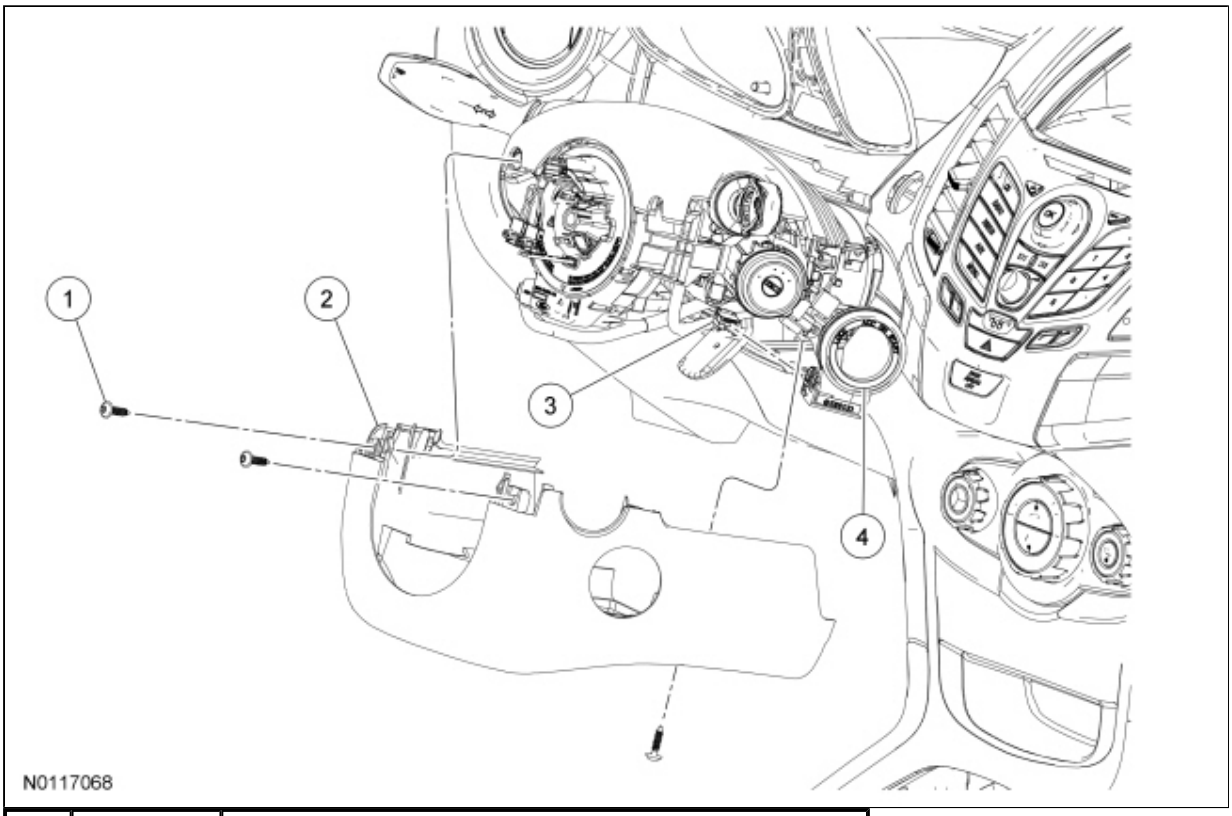
4. Turn the second key to the OFF position and remove the key from the ignition.

5. Within 10 seconds of turning the second key to the OFF position, insert the new, unprogrammed PATS key into the ignition and turn the key from the OFF position to the RUN position (maintain the key in the RUN position for approximately 3 seconds).

6. If it is desired to program additional key(s) (up to a total of 8 keys can be programmed), repeat Steps 1 - 5 for each additional key.

7. Refer to RKE Transmitter Programming in Section 501-14 to program the RKE portion of the key.

Passive Anti-Theft System (PATS) Transceiver



Item	Part Number	Description
1	W714630	Steering column shroud screws (3 required)
2	150101	Lower steering column shroud
3	—	Passive Anti-Theft System (PATS) transceiver electrical connector (part of 14401)
4	15607	PATS transceiver

Removal and Installation

1. **NOTE:** Rotate the steering wheel for access to the lower steering column shroud screws.

   Remove the 3 screws and the lower steering column shroud.

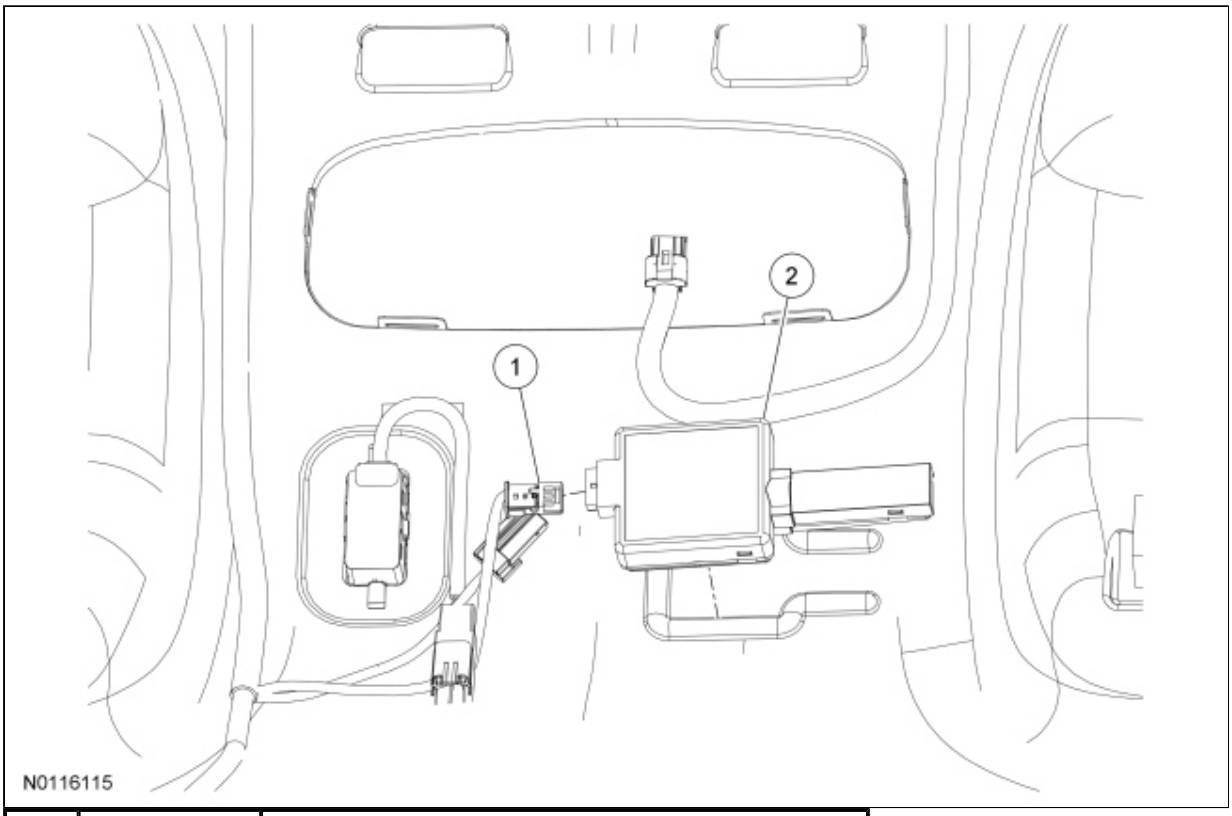
2. Disconnect the Passive Anti-Theft System (PATS) transceiver electrical connector.

3. Using a suitable tool (such as a dentist pick), release the 3 locking tabs and remove the PATS transceiver.

4. **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the Instrument Cluster (IC) again.

   To install, reverse the removal procedure.

Remote Functions Receiver (RFR) Module

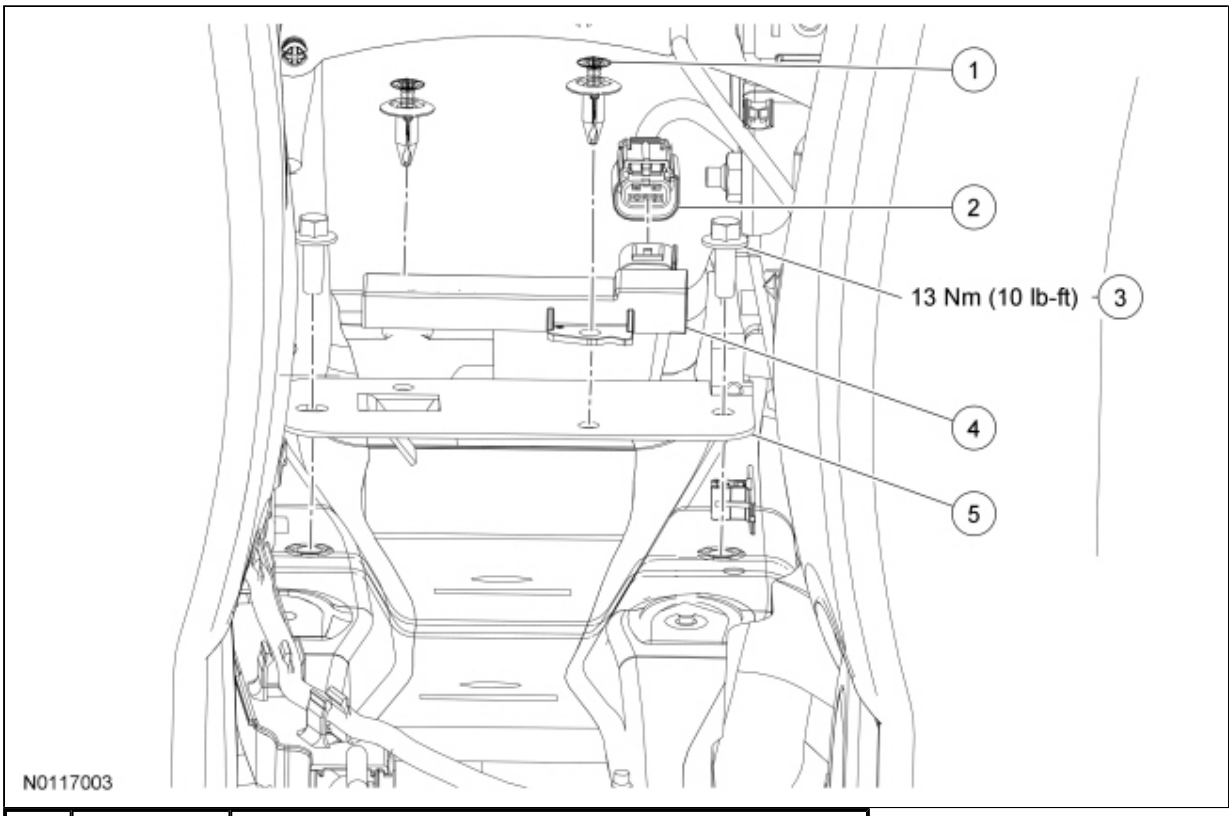


Item	Part Number	Description
1	—	RFR module electrical connector (part of 14334)
2	15K602	Remote Functions Receiver (RFR)

1. Remove the headliner. For additional information, refer to Section 501-05 .
2. Disconnect the Remote Functions Receiver (RFR) module electrical connector.
3. Using a suitable tool (such as a trim removal tool), gently pry the RFR module away from the headliner.
4. **NOTE:** The RFR module is secured to the headliner with 3M Duramix® 4747 Super Fast Adhesive at the assembly plant. When installing the RFR module, make sure to use 3M Duramix® 4747 Super Fast Adhesive to secure the RFR module to the headliner in approximately the same position and orientation on the headliner.

   To install, reverse the removal procedure.

Passive Start Antenna — Front

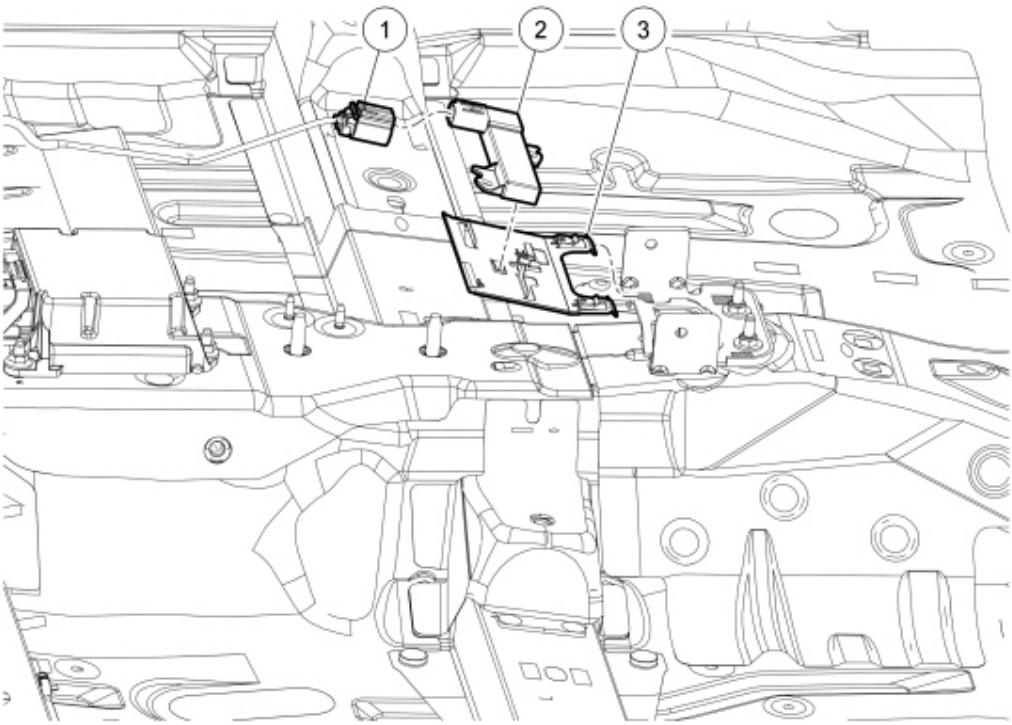


Item	Part Number	Description
1	16K262	Scrivet (2 required)
2	—	Front passive start antenna electrical connector (part of 14K024)
3	W505253	Front passive start antenna bracket bolt (2 required)
4	15603	Front passive start antenna
5	19H217	Front passive start antenna bracket

Removal and Installation

1. Remove the floor console finish panel. For additional information, refer to the exploded view In Section 501-12 .
   - Lift upward on the rear of the floor console finish panel to release the floor console finish panel clips.
   - If equipped, disconnect the electrical connector.
   - Slide the park brake lever boot and the floor console finish panel over the park brake lever.
2. Pull the red lock tab outward and disconnect the front passive start antenna electrical connector.
3. Remove the 2 bolts and the front passive start antenna and bracket assembly.
   - To install, tighten to 13 Nm (10 lb-ft).
4. If required, remove the 2 scrivets and the front passive start antenna.
5. To install, reverse the removal procedure.

Passive Start Antenna — Center

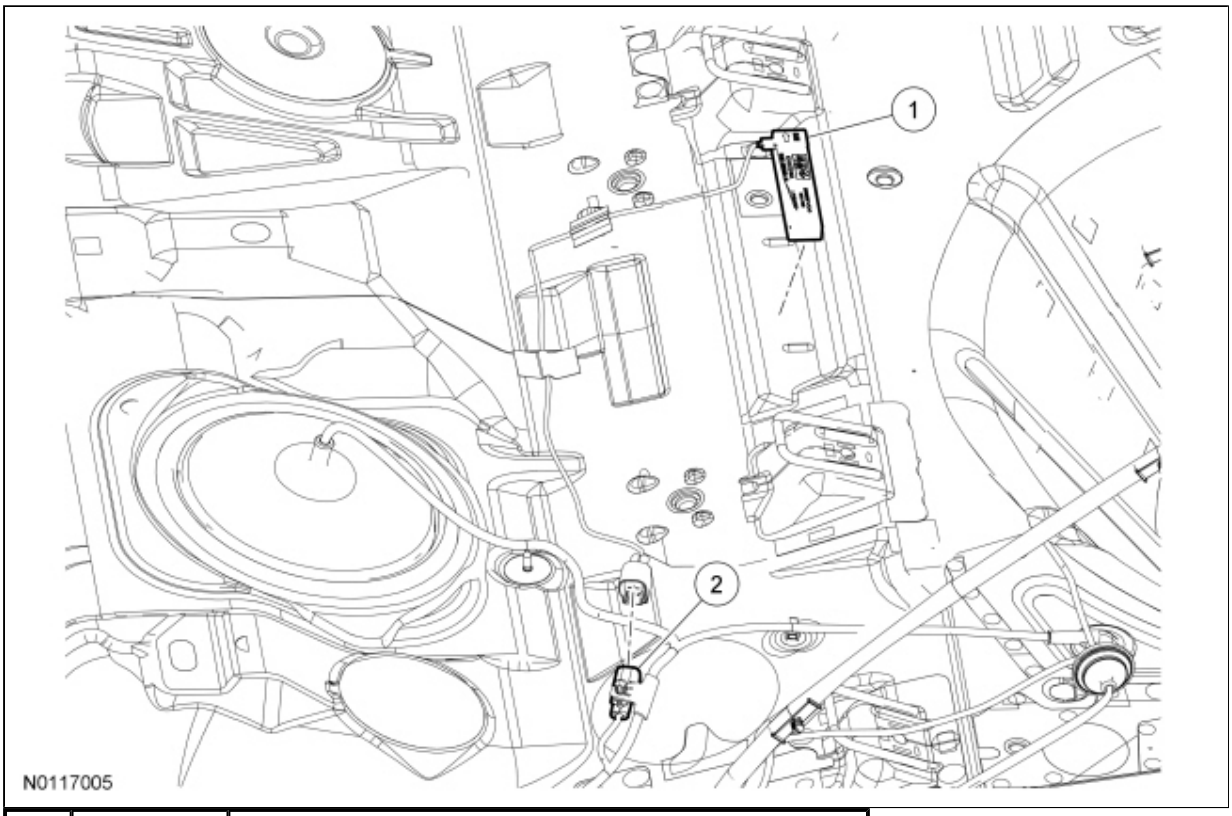


Item	Part Number	Description
1	—	Center passive start antenna electrical connector (part of 14A005)
2	15603	Center passive start antenna
3	W713358	Center passive start antenna bracket (part of 15603)

Removal and Installation

1. Remove the floor console. For additional information, refer to Section 501-12 .
2. Pull the red lock tab outward and disconnect the rear floor console passive start antenna electrical connector.
3. Unclip and remove the center passive start antenna and bracket assembly.
4. If required, remove the center passive start antenna from the center passive start antenna bracket.
5. To install, reverse the removal procedure.

Passive Start Antenna — Rear



Item	Part Number	Description
1	—	Rear passive start antenna
2	15603	Rear passive start antenna electrical connector (part of 14A005)

Removal and Installation

1. Remove the rear seat cushion. For additional information, refer to Section 501-10 .
2. Pull the carpet forward to uncover the rear passive start antenna.
3. Disconnect the rear passive start antenna electrical connector.
4. Using a suitable tool (such as a trim removal tool), pry the rear passive start antenna upward to release the antenna from the floorpan and remove the rear passive start antenna.
    - To install, remove the rear passive start antenna tapes backing and press the antenna to the rear floor.
5. To install, reverse the removal procedure.

Cruise Control

The cruise control system consists of the following components:

- Clutch pedal cruise control deactivator switch (manual transaxle only)
- Cruise control deactivator switch
- Cruise control indicator
- Cruise control switch
- Electronic Throttle Body (ETB)
- Instrument Panel Cluster (IPC)
- Stoplamp switch
- PCM

During normal driving, the vehicle speed may vary slightly from the set speed due to road conditions. The vehicle speed may vary or fluctuate when driving up and down a steep hill. If the vehicle speed decreases more than 16 km/h (10 mph) below the set speed, the cruise control disengages.

For manual transaxle vehicles, it is normal for the engine rpm to increase slightly and then drops off slowly when the clutch pedal is pressed during operation.

Cruise Control

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The cruise control system is controlled by the PCM and the Instrument Panel Cluster (IPC). The cruise control system is designed to maintain a selected vehicle speed between 30 km/h (18 mph) and the maximum limited vehicle speed. The cruise control system is controlled by the steering wheel mounted switches (ON/OFF, SET+, SET-, and CAN/RES), brake pedal inputs and the clutch pedal cruise control deactivator switch (manual transaxle). The cruise control switches are hard-wired to the IPC . The IPC sends a High Speed Controller Area Network (HS-CAN) network message to the PCM to control the cruise control system.

The clockspring provides the electrical interface between the steering column wiring and the cruise control switches in the steering wheel.

The cruise control functions include:

- turning on the cruise control system.
- setting and maintaining the desired vehicle speed.
- accelerating the vehicle speed.
- coasting down to a lower speed.
- resuming the prior vehicle speed.
- turning off the cruise control system.

Pressing and releasing the ON switch turns the cruise control system on. Pressing and releasing the SET+ or SET- switch while the vehicle is traveling at the desired speed activates the cruise control system. The cruise control indicator illuminates green to indicate the cruise control system is active.

Tapping the SET+ or the SET- switch while in the set mode, increases or decreases the maintained vehicle speed by 1.6 km/h (1 mph) per tap. If the respective switch is pressed and held, the vehicle

speed continues to accelerate or decelerate until the switch is released.

Pressing and releasing the OFF switch, or turning the ignition switch to the OFF position, turns the cruise control system off. Applying the brake pedal or clutch pedal (manual transaxle) puts the cruise control system into standby mode.

The CAN/RES switch has a dual function for cancelling or resuming the cruise control system. Pressing the CAN/RES switch, when the cruise control system is active moves the system into the standby mode (cancel function). The cruise control indicator turns off. Pressing the CAN/RES switch when the cruise control system is in the standby mode causes the vehicle to accelerate to the last set speed (resume function). The cruise control indicator illuminates to indicate the system is reactivated. Resume does not function if the OFF switch is pressed, the ignition switch is in the OFF position, or if the current vehicle speed is below the minimum operational speed.

The stoplamp switch and the cruise control deactivator switch are electrical inputs controlling the cruise control system. The stoplamp switch is a normally open switch that is hard-wired to the PCM. When the brake pedal is applied, the switch closes and applies a voltage signal to the PCM, deactivating the cruise control. The cruise control deactivator switch is a normally closed switch that is hard-wired to the IPC . When the brake pedal is applied, the switch opens and removes the ground signal from the IPC . The IPC sends a HS-CAN network message to the PCM to signal that the brake pedal is applied. The PCM compares the inputs from the stoplamp switch and the cruise control deactivator switch. If a deviation occurs, the PCM sets a DTC and the cruise control system is deactivated.

The clutch pedal cruise control deactivator switch is used on vehicles equipped with a manual transaxle. When the clutch pedal is pressed with the cruise control system engaged, the normally open switch closes and provides a ground signal to the IPC . The IPC sends a HS-CAN network message to the PCM to deactivate the cruise control system and place it in standby mode.

The inputs to the PCM are:

- Digital Transmission Range (TR) sensor (automatic transaxle)
- Cruise control switch(es) (networked from the IPC)
- Clutch pedal cruise control deactivator switch (manual transaxle) (networked from the IPC)
- Cruise control deactivator switch (networked from the IPC)
- Stoplamp switch (hard-wired)

The outputs of the PCM are:

- Electronic Throttle Body (ETB) command
- Cruise control Indicator (networked from the IPC)

The vehicle speed is controlled by the PCM through ETB . Cruise control electronics are contained entirely within the PCM.

When the cruise control system is active, the PCM corrects for deviations in the actual vehicle speed by proportionally moving the throttle plate. The PCM modulates the throttle to minimize error between the actual vehicle speed and the desired speed.

The PCM strategy uses the throttle control for smooth accelerations.

The PCM sends a serial message over the HS-CAN to the IPC to command the cruise control indicator to be turned on or off.

In the event of an off command or a deactivation request from the cruise control deactivator switch, the cruise control system carries out a deactivation and immediately returns the throttle to the idle position.

The cruise control system provides self-diagnostics. The cruise control system disables operation and sets a PCM or IPC DTC if it detects certain faults. The IPC does not indicate cruise control faults with an indicator. Fault codes are logged by the PCM or IPC .

Additionally, the following conditions cause the cruise control system to deactivate:

- Transmission gear selector in a position other than D or OD (automatic transaxle)
- Clutch pedal is pressed (manual transaxle)
- The cruise control set speed is overridden with the accelerator pedal for a period longer than 5 minutes
- Vehicle speed loss from set speed of greater than 16 km/h (10 mph) occurs
- Vehicle speed falls below the minimum allowable limit of 30 km/h (18 mph)
- Cruise control switch pressed or stuck longer than 2 minutes
- ABS fault

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Central Junction Box (CJB) fuse 18 (10A) • Wiring, terminals or connectors • Cruise control switch(es) • Clutch pedal cruise control deactivator switch (manual transaxle) • Cruise control deactivator switch • Stoplamp switch • Instrument Panel Cluster (IPC)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM and IPC .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

PCM DTC Chart

DTC	Description	Action
P0504	Brake Switch A / B Correlation	GO to Pinpoint Test B .
P0578	Cruise Control Multifunction Input A Circuit Stuck	The PCM compares the CAN signal from the different inputs of the cruise control switches and determines that one or more of the switches are stuck. DIAGNOSE all other Instrument Panel Cluster (IPC) and PCM DTCs first. If no other DTCs are present, CLEAR the DTC. Make sure no cruise control switches are pressed and REPEAT the self-test. If DTC P0578 sets again, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
P0579	Cruise Control Multifunction Input A Circuit Range/Performance	The PCM internally monitors and compares the CAN signal message from the IPC of the cruise control switch inputs with the PCM cruise control internal state. If the PCM detects a discrepancy between the input message and the PCM then DTC P0597 sets in the PCM. DIAGNOSE all other IPC and PCM DTCs first. If no other DTCs are present, CLEAR the DTC. REPEAT the self-test. If DTC P0597 sets again, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
P0833	Clutch Pedal Switch B Circuit	GO to Pinpoint Test E .
P162D	Internal Control Module Cruise Control Performance	The PCM internally monitors the disable inputs for cruise control. If a cruise control disable is requested and the cruise control output from the PCM is still being controlled then DTC P162D sets in the PCM. DIAGNOSE all other DTCs and symptoms first. If no other DTCs or symptoms are present, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Charts in Section 303-14 .

Instrument Panel Cluster (IPC) DTC Chart

DTC	Description	Action
P0565:01	Cruise Control ON Signal: General Electrical Failure	GO to Pinpoint Test C .
P0566:01	Cruise Control OFF Signal: General Electrical Failure	GO to Pinpoint Test C .
P0567:01	Cruise Control RESUME Signal: General Electrical Failure	GO to Pinpoint Test C .
P0568:01	Cruise Control SET Signal: General Electrical Failure	GO to Pinpoint Test C .

P0569:01	Cruise Control COAST Signal: General Electrical Failure	GO to Pinpoint Test C.
P0579:01	Cruise Control Multifunction Input A Circuit Range/Performance: General Electrical Failure	GO to Pinpoint Test C.
P0581:13	Cruise Control Multi-Function Input A Circuit High: Open Circuit	GO to Pinpoint Test C.
P0704:01	Clutch Switch Input Circuit: General Electrical Failure	GO to Pinpoint Test A.
P1572:01	Brake Pedal Switch Circuit: General Electrical Failure	GO to Pinpoint Test B.
All other DTCs	—	REFER to the Section 413-01.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The cruise control is inoperative	• Wiring, terminals or connectors • Clockspring • Digital Transmission Range (TR) sensor (automatic transaxle) • Cruise control switch • Cruise control deactivator switch • Stoplamp switch • Clutch pedal cruise control deactivator switch (manual transaxle) • Instrument Panel Cluster (IPC) • PCM • ABS module	• GO to Pinpoint Test A.
• The cruise control does not disengage when the clutch pedal is applied	• Wiring, terminals or connectors • Clutch pedal cruise control deactivator switch • IPC • PCM	• GO to Pinpoint Test D.
• The cruise control indicator lamp is always/never on	• Wiring, terminals or connectors • IPC • PCM	• REFER to Section 413-01.
• The cruise control switches do not operate correctly	• Wiring, terminals or connectors • Cruise control switches • Clockspring • PCM • IPC	• GO to Pinpoint Test C.

Pinpoint Tests

Pinpoint Test A: The Cruise Control Is Inoperative

Refer to Wiring Diagrams Cell 31 , Cruise Control for schematic and connector information.

Normal Operation

The cruise control functionality is controlled through the cruise control switches that are hard-wired to the Instrument Panel Cluster (IPC) through a signal and return circuit.

There are 5 cruise control switches with each switch operating a specific function that uses different resistance values. The IPC sends out a reference voltage to the cruise control switches and monitors the voltage drop when a cruise control switch is pressed. The voltage drop varies depending upon the resistance of each switch, providing a specific indication to the IPC which switch is pressed. The IPC sends a network message over the High Speed Controller Area Network (HS-CAN) to the PCM relaying the switch status and requesting cruise control operation.

The stoplamp switch and cruise control deactivator switch signals are inputs to the PCM for the cruise control operation.

When the brake pedal is applied, the normally open stoplamp switch closes and applies a voltage signal to the PCM deactivating the cruise control, if engaged.

The cruise control deactivator switch is a normally closed switch that provides a ground signal to the IPC . When the brake pedal is applied, the switch opens and removes the ground signal to the IPC . The IPC sends a network message over the High Speed Controller Area Network (HS-CAN) to the PCM. This is a redundant signal to the PCM.

The PCM receives both signals and compares the inputs to confirm that the correct brake input sequence is received.

Vehicles equipped with a manual transaxle have an additional clutch pedal cruise control deactivator switch. The clutch pedal cruise control deactivator switch is a normally open switch with the clutch pedal not pressed. When the clutch pedal is applied, the clutch pedal cruise control deactivator switch moves to the closed position, which routes the ground signal to the IPC . The IPC sends a network message over the High Speed Controller Area Network (HS-CAN) to the PCM, deactivating the cruise control system.

- DTC P0704:01 (Clutch Switch Input Circuit: General Electrical Failure) — sets when the IPC detects a short to ground in the clutch pedal cruise control deactivator switch signal during the self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Digital Transmission Range (TR) sensor (automatic transaxle)
- Cruise control switch
- Cruise control deactivator switch
- Stoplamp switch
- Clutch pedal cruise control deactivator switch (manual transaxle)
- IPC
- PCM
- ABS module

PINPOINT TEST A: THE CRUISE CONTROL IS INOPERATIVE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>A1 CHECK FOR DTCs
• Review the recorded DTCs from the PCM and IPC self-test.
• Are any DTCs recorded?</td><td>Yes
For DTC P0704, GO to A5.

Otherwise, REFER to DTC Charts in this section.

No
GO to A2.</td></tr>
<tr><td>A2 CHECK FOR ABS MODULE DTCs
• Review the recorded DTCs from the ABS module self-test.
• Are any DTCs recorded?</td><td>Yes
REFER to Section 206-09. REPAIR all ABS module DTCs and RETEST the system.

No
GO to A3.</td></tr>
<tr><td>A3 MONITOR THE BRAKE PEDAL PIDs
• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Monitor the PCM PIDs BOO1 (stoplamp switch) and BOO2 (cruise control deactivator switch) while applying and releasing the brake pedal as follows:
<table><tr><th>Brake Pedal Position</th><th>BOO1 PID</th><th>BOO2 PID</th></tr><tr><td>Released</td><td>Off</td><td>Off</td></tr><tr><td>Applied lightly</td><td>On</td><td>Off</td></tr><tr><td>Applied firmly</td><td>On</td><td>On</td></tr></table>• Do the PID values agree with the brake pedal position?</td><td>Yes
For automatic transaxle, GO to A4.

For manual transaxle, GO to A5.

No
GO to Pinpoint Test B.</td></tr>
<tr><td>A4 MONITOR THE PCM TRANSGEAR PID
• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Monitor the PCM PID (TRANSGEAR).
• Select DRIVE.
• Does the PID value agree with the TRANSGEAR selector lever position?</td><td>Yes
GO to A6.

No
REFER to Section 307-11 to continue diagnosis of the digital TR sensor.</td></tr>
<tr><td>A5 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH PID
• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Monitor the PCM PID CPP_TOP while pressing and releasing the clutch pedal.
• Does the PID value read "YES" with the clutch pedal pressed and "NO" with the clutch pedal released?</td><td>Yes
GO to A6.

No
If the CPP_TOP value always reads YES (pressed) GO to A7.

If the CPP_TOP value always reads NO (released) GO to Pinpoint Test D.</td></tr>
<tr><td>A6 CHECK THE CRUISE CONTROL SWITCH PID
• Enter the following diagnostic mode on the scan</td><td>Yes</td></tr>
</table>

<table>
<tr><td>tool: IPC DataLogger.
• Press each cruise control switch while monitoring the cruise control switch PID (CRUISE_SW).

<table><tr><th>Cruise Control Switch</th><th>CRUISE_SW PID Value</th></tr><tr><td>—</td><td>NONE Pressed</td></tr><tr><td>CAN/RES</td><td>CANCEL</td></tr><tr><td>ON</td><td>ON</td></tr><tr><td>OFF</td><td>OFF</td></tr><tr><td>SET +</td><td>SET +</td></tr><tr><td>SET -</td><td>SET-</td></tr></table>
• Does the PID value agree with the switch position?</td><td>GO to A8 .

No
If only one switch does not display the correct PID value, INSTALL a new cruise control switch. REFER to Cruise Control Switch in this section. TEST the system for normal operation.

Otherwise, GO to Pinpoint Test C .</td></tr>
<tr><td>A7 CHECK THE CLUTCH PEDAL SWITCH PID WITH THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH DISCONNECTED</td><td></td></tr>
<tr><td>• Disconnect: Clutch Pedal Cruise Control Deactivator Switch C277.
• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Monitor the PCM PID CPP_TOP.
• Does the PID value read NO?</td><td>Yes
INSTALL a new clutch pedal cruise control deactivator switch. REFER to Cruise Control Deactivator Switch in this section. TEST the system for normal operation.

No
REPAIR circuit CE904 (GN/VT) for a short to ground. TEST the system for normal operation.</td></tr>
<tr><td>A8 CHECK FOR CORRECT PCM OPERATION</td><td></td></tr>
<tr><td>• Disconnect all the PCM connectors.
• Check for:
▪ corrosion
▪ damaged pins
▪ pushed-out pins
• Connect all the PCM connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• Is the concern still present?</td><td>Yes
INSTALL a new PCM. REFER to Section 303-14 .

TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</td></tr>
</table>

Pinpoint Test B: DTC P0504 OR DTC P1572:01

Refer to Wiring Diagrams Cell 31 , Cruise Control for schematic and connector information.

Normal Operation

The stoplamp switch and cruise control deactivator switch signals are inputs to the PCM for the cruise control operation.

When the brake pedal is applied, the normally open stoplamp switch closes and applies a voltage signal to the PCM deactivating the cruise control, if engaged.

The cruise control deactivator switch is a normally closed switch that provides a ground signal to the

Instrument Panel Cluster (IPC). When the brake pedal is applied, the switch opens and removes the ground signal to the IPC . The IPC sends a network message over the High Speed Controller Area Network (HS-CAN) to the PCM. This is a redundant signal to the PCM.

The PCM receives both signals and compares the inputs to confirm that the correct brake input sequence is received.

- DTC P0504 (Brake Switch A / B Correlation) — sets when the PCM does not sense the correct sequence of the brake pedal input signal from both the cruise control deactivator and stoplamp switches when the brake pedal is pressed and released.
- DTC P1572:01 (Brake Pedal Switch Circuit: General Electrical Failure) — sets when the IPC detects an open in the cruise control deactivator switch signal during the self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stoplamp switch
- Cruise control deactivator switch
- PCM
- IPC
- Remote Function Actuator (RFA) Module (with Intelligent Access (IA))

PINPOINT TEST B: DTC P0504 OR DTC P1572:01

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK THE OPERATION OF THE STOPLAMPS

• Ignition ON.
• Operate the stoplamps.
• Do the stoplamps operate correctly?</td><td>Yes
GO to B2 .

No
REFER to Section 417-01 to continue diagnosis of the stoplamps.</td></tr>
<tr><td>B2 MONITOR THE BRAKE PEDAL PIDs

• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Monitor the PCM PIDs (BOO1) (stoplamp switch) and (BOO2) (cruise control deactivator switch) while applying and releasing the brake pedal as follows:

<table><tr><th>Brake Pedal Position</th><th>BOO1 PID</th><th>BOO2 PID</th></tr><tr><td>Released</td><td>Off</td><td>Off</td></tr><tr><td>Applied lightly</td><td>On</td><td>Off</td></tr><tr><td>Applied firmly</td><td>On</td><td>On</td></tr></table>
• Do the PID values agree with the brake pedal position?</td><td>Yes
For DTC P0504 GO to B11 .

For P1572:01 GO to B10 .

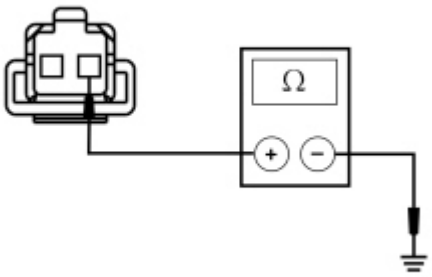
No
For an incorrect BOO1 PID value, GO to B3 .

If the BOO2 PID value always reads OFF, GO to B4 .

If the BOO2 PID value always reads ON, GO</td></tr>
</table>

	to B7 .
B3 CHECK THE STOPLAMP SWITCH CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • While applying the brake pedal, measure the voltage between the PCM C175B-2, circuit CCA26 (BU/GY), harness side and ground.  N0117589 • **Is the voltage greater than 10 volts with the brake pedal applied and 0 volts with the brake pedal released?**	**Yes** GO to B10 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
B4 MONITOR THE CRUISE CONTROL DEACTIVATOR SWITCH PID	
• Ignition OFF. • Disconnect: Cruise Control Deactivator Switch C278. • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID (BOO2). • **Does the B002 PID read ON?**	**Yes** INSTALL a new cruise control deactivator switch. REFER to Cruise Control Deactivator Switch in this section. CLEAR the DTCs. TEST the system for normal operation. **No** If equipped with IA , GO to B5 . Otherwise, GO to B6
B5 THE RFA MODULE FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: RFA Module C3503B. • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID (BOO2). • **Does the B002 PID read ON?**	**Yes** INSTALL a new RFA Module. REFER to Section 419-10 . CLEAR the DTCs. TEST the system for normal operation. **No** GO to B6 .
B6 CHECK THE CRUISE CONTROL DEACTIVATOR SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220. • Measure the resistance between the cruise control deactivator switch C278-2, circuit CCA29 (GN/BU), harness side and ground.	**Yes** GO to B10 . **No** REPAIR the circuit.

 N0116082 • **Is the resistance greater than 10,000 ohms?**	CLEAR the DTCs. TEST the system for normal operation.
B7 CHECK THE CRUISE CONTROL DEACTIVATOR SWITCH FOR AN OPEN • Ignition OFF. • Disconnect: Cruise Control Deactivator Switch C278. • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • CONNECT a fused jumper wire between the cruise control deactivator switch C278-2, circuit CCA29 (GN/BU), harness side and the cruise control deactivator switch C278-1, circuit GD187 (BK/GN), harness side, while monitoring the PCM PID (BOO2).  N0116083 • **Does the BOO2 PID read OFF?**	**Yes** REMOVE the jumper wire. INSTALL a new cruise control deactivator switch. REFER to Cruise Control Deactivator Switch in this section. CLEAR the DTCs. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to B8.
B8 CHECK THE CRUISE CONTROL DEACTIVATOR SWITCH GROUND CIRCUIT FOR AN OPEN • Ignition OFF. • Measure the resistance between the cruise control deactivator switch C278-1, circuit GD187 (BK/GN), harness side and ground.	**Yes** GO to B9. **No** REPAIR the circuit for an open. CLEAR the DTCs. TEST the system for normal operation.



N0116084

- **Is the resistance less than 5 ohms?**

B9 CHECK THE CRUISE CONTROL DEACTIVATOR SWITCH INPUT TO THE IPC FOR AN OPEN	
• Disconnect: IPC C220. • Measure the resistance between the cruise control deactivator switch C278-2, circuit CCA29 (GN/BU), harness side and the IPC C220-29, circuit CCA29 (GN/BU), harness side.  N0116085 • **Is the resistance less than 5 ohms?**	**Yes** GO to B10 . **No** REPAIR the circuit for an open. CLEAR the DTCs. TEST the system for normal operation.
B10 CHECK FOR CORRECT IPC OPERATION	

• Connect: All Disconnected Connectors.
• Disconnect all the IPC connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the IPC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

B11 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they are seated correctly.
	Yes
	INSTALL a new PCM. REFER to Section 303-14 .
	
	TEST the system for normal operation.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Cruise Control Switches Do Not Operate Correctly

Refer to Wiring Diagrams Cell 31 , Cruise Control for schematic and connector information.

Normal Operation

There are 5 cruise control switches with each switch operating a specific function that uses different resistance values. The Instrument Panel Cluster (IPC) sends out a reference voltage to the cruise control switches and monitors the voltage drop when a cruise control switch is pressed. The voltage drop varies depending upon the resistance of each switch, providing a specific indication to the IPC which switch is pressed. The IPC sends a network message over the High Speed Controller Area Network (HS-CAN) to the PCM activating and controlling the cruise control system.

IPC DTCs

DTC Description	Fault Trigger Conditions
P0565:01 - Cruise Control ON Signal: General Electrical Failure	A DTC that sets after 1 minute if the IPC detects the ON switch is pressed and held or stuck.
P0566:01 - Cruise Control OFF Signal: General Electrical Failure	A DTC that sets after 1 minute if the IPC detects the OFF switch is pressed and held or stuck.
P0567:01 - Cruise Control RESUME Signal: General Electrical Failure	A DTC that sets after 1 minute if the IPC detects the CAN/RES switch is pressed and held or stuck.
P0568:01 - Cruise Control SET Signal: General Electrical Failure	A DTC that sets after 1 minute if the IPC detects the SET+ switch is pressed and held or stuck.
P0569:01 - Cruise Control COAST Signal: General Electrical Failure	A DTC that sets after 1 minute if the IPC detects the SET- switch is pressed and held or stuck.
P0579:01 - Cruise Control Multifunction Input A Circuit Range/Performance: General Electrical Failure	A continuous and on-demand DTC that sets if the IPC detects the cruise control switch input is in an unknown state for more than 1 second.
P0581:13 - Cruise Control Multi-Function Input A Circuit High: Open Circuit	A continuous and on-demand DTC that sets after 1 minute if the IPC detects an open in the cruise control switch circuits

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Cruise control switch
- IPC
- PCM

PINPOINT TEST C: THE CRUISE CONTROL SWITCHES DO NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>

CLEAR the DTCs. TEST the system for normal operation.

N0116099

- **Are the resistances less than 5 ohms?**

C10 CHECK THE CLOCKSPRING FOR AN OPEN	
• Disconnect: Clockspring C218C. • Measure the resistance between the clockspring C218B-9, component side and the C218C-2, component side.  N0116100 • Measure the resistance between the clockspring C218B-10, component side and the C218C-3, component side.  N0116101 • **Are the resistances less than 5 ohms?**	**Yes** GO to C11 . **No** INSTALL a new clockspring. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. TEST the system for normal operation.
C11 CHECK THE STEERING WHEEL HARNESS FOR AN OPEN	
• Measure the resistance between the clockspring C218C-2, harness side and the C2999-2, harness side.	**Yes** INSTALL a new cruise control switch. REFER to Cruise Control Switch in this section. INSTALL the driver air bag module. REFER to Section 501-20B .

 N0117591 • Measure the resistance between the clockspring C218C-3, harness side and the C2999-4, harness side.  N0116103 • **Are the resistances less than 5 ohms?**	CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the steering wheel harness or INSTALL a new steering wheel. REFER to Section 211-04 . INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.

C12 CHECK FOR CORRECT IPC OPERATION
• Connect: All Disconnected Connectors.
• Disconnect all the IPC connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the IPC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Section 413-01 . INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Cruise Control Does Not Disengage When The Clutch Pedal Is Pressed

Refer to Wiring Diagrams Cell 31 , Cruise Control for schematic and connector information.

Normal Operation

Vehicles equipped with a manual transaxle have an additional clutch pedal cruise control deactivator

switch. The clutch pedal cruise control deactivator (top travel) switch is a normally open switch with the clutch pedal released. When the clutch pedal is pressed, the clutch pedal cruise control deactivator switch moves to the closed position, which routes the ground signal to the Instrument Panel Cluster (IPC). The IPC sends a network message over the High Speed Controller Area Network (HS-CAN) to the PCM, deactivating the cruise control system.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clutch pedal cruise control deactivator switch
- IPC
- PCM

PINPOINT TEST D: THE CRUISE CONTROL DOES NOT DISENGAGE WHEN THE CLUTCH PEDAL IS PRESSED

Test Step	Result / Action to Take
D1 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID CPP_TOP while pressing and releasing the clutch pedal. • **Does the PID value read "YES" with the clutch pedal pressed and "NO" with the clutch pedal released?**	**Yes** GO to D6. **No** GO to D2.
D2 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH	
• Ignition OFF. • Disconnect: Clutch Pedal Cruise Control Deactivator Switch C277. • Connect a fused jumper wire between the clutch pedal cruise control deactivator switch C277-2, circuit CE904 (GN/VT), harness side and the clutch pedal cruise control deactivator switch C277-3, circuit GD187 (BK/GN), harness side.  N0116095 • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID CPP_TOP. • **Does the PID value read YES?**	**Yes** INSTALL a new clutch pedal cruise control deactivator switch. REFER to Cruise Control Deactivator Switch in this section. TEST the system for normal operation. **No** GO to D3.
D3 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF. • Connect a fused jumper wire between the clutch pedal cruise control deactivator switch C277-2, circuit CE904 (GN/VT), harness side and ground.  N0116096 • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID CPP_TOP. • **Does the PID value read YES?**	**Yes** REPAIR circuit GD187 (BK/GN) for an open. TEST the system for normal operation. **No** GO to D4.
D4 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH SIGNAL CIRCUIT FOR AN OPEN	
• Disconnect: IPC C220. • Measure the resistance between the IPC C220-10, circuit CE904 (GN/VT), harness side and the clutch pedal cruise control deactivator switch C277-2, circuit CE904 (GN/VT), harness side.  N0116097 • **Is the resistance less than 5 ohms?**	**Yes** GO to D5. **No** REPAIR the circuit. TEST the system for normal operation.
D5 CHECK FOR CORRECT IPC OPERATION	

• Disconnect all the IPC connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the IPC connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Section 413-01.
	
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or

	corroded connector.
D6 CHECK FOR CORRECT PCM OPERATION	

• Connect: All Disconnected Connectors.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: DTC P0833

Normal Operation

Vehicles equipped with a manual transaxle have an additional clutch pedal cruise control deactivator switch. The clutch pedal cruise control deactivator switch is a normally open switch with the clutch pedal released. When the clutch pedal is pressed, the clutch pedal cruise control deactivator switch moves to the closed position, which routes the ground signal to the Instrument Panel Cluster (IPC). The IPC sends a network message over the High Speed Controller Area Network (HS-CAN) to the PCM, deactivating the cruise control system.

- DTC P0833 (Clutch Pedal Switch B Circuit) — this is a logic based DTC that sets when the PCM receives the vehicle speed input, indicating vehicle movement and does not detect the switching input signal from the Clutch Pedal Position (CPP) switch or clutch pedal cruise control deactivator switch. This condition disables cruise control.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM

PINPOINT TEST E: DTC P0833

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

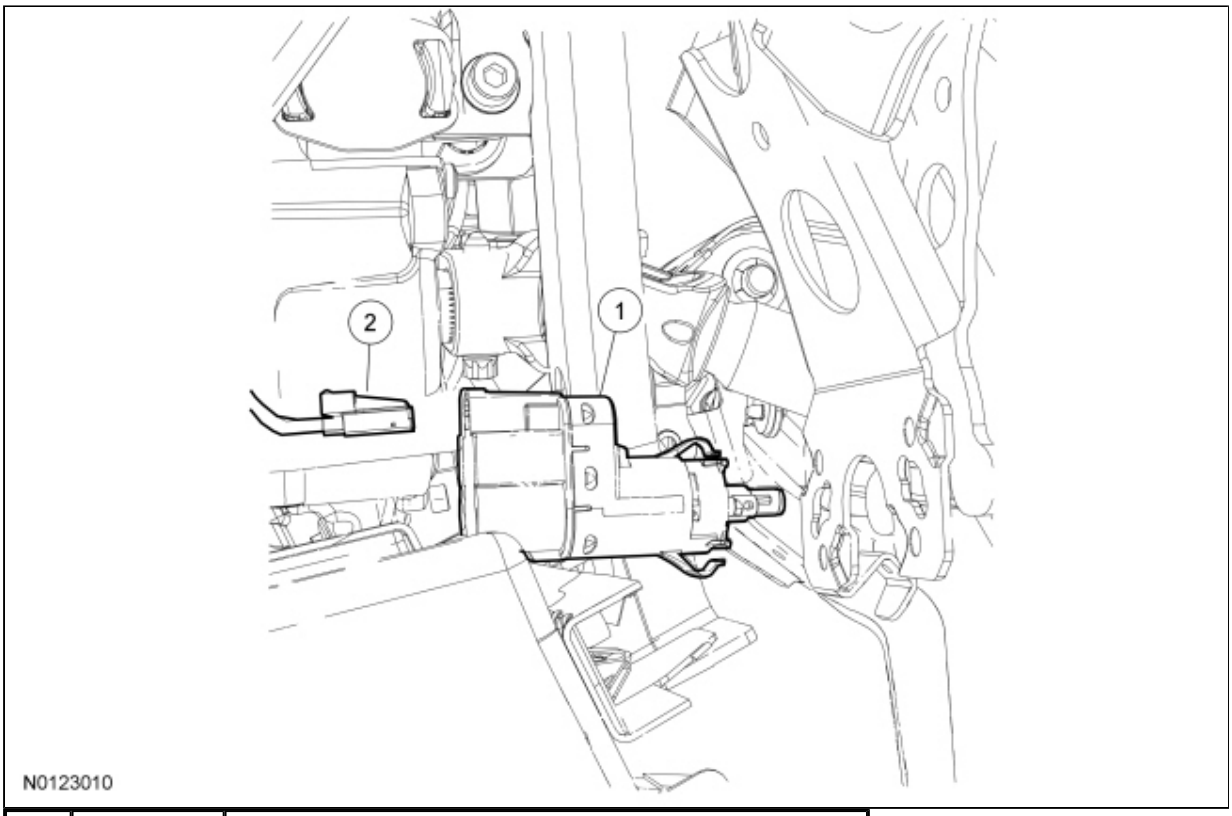
Test Step	Result / Action to Take
E1 CHECK THE CLUTCH PEDAL PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID CPP_TOP and CPP_BOT while pressing and releasing the clutch pedal. • **Does the PID values agree with the clutch pedal position?**	**Yes** GO to E2 . **No** For an incorrect CPP_TOP PID GO to Pinpoint Test D . For an incorrect CPP_BOT PID Section 303-06 to diagnose the CPP switch.
E2 CHECK FOR CORRECT PCM OPERATION	
• Connect: All Disconnected Connectors.	**Yes**

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Cruise Control Deactivator Switch

NOTICE: **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch and cruise control deactivation switch. Install these switches with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position results in incorrect adjustment and damages the switches.**

NOTE: Brake pedal cruise control deactivator switch shown. Clutch pedal cruise control deactivator switch similar.



Item	Part Number	Description
1	7C534	Clutch pedal cruise control deactivator switch
1	9C872	Brake pedal cruise control deactivator switch
2	—	Cruise control deactivator switch electrical connector (part of 14K024)

1. Rotate the cruise control deactivator switch counterclockwise one-quarter turn to remove.
2. If equipped with an automatic transmission, perform the brake pedal switch adjustment. For additional information, refer to Section 206-09 .

Cruise Control Switch

Removal and Installation

1. The cruise control switch is part of the steering wheel controls. For additional information, refer to Section 415-00 .

Torque Specifications

Description	Nm	lb-in
Body Control Module (BCM) nuts	13	115
Remote Function Actuator (RFA) bracket bolts	10	89

Module Controlled Functions

Body Control Module (BCM)

The Body Control Module (BCM) is located under the glove compartment and controls the following:

- Rear window defrost
- Horn
- Battery saver
- Exterior lighting
- Interior lighting
- Ambient lighting
- Dimmable backlighting
- Power door lock system
- Luggage compartment/liftgate release
- Front and rear wipers
- Perimeter alarm
- Remote Keyless Entry (RKE) system (vehicles without Intelligent Access (IA))

Battery Saver

NOTE: Time-out is 10 seconds if the vehicle is in Factory mode or 0 seconds if the vehicle is in Transport mode.

To save battery voltage, the BCM automatically shuts off of the interior and exterior lamps after a time-out period.

For specific information of the battery saver feature for the interior lamps, refer to Section 417-02 .

For specific information of the battery saver feature for the exterior lamps, refer to Section 417-01 .

Remote Function Actuator (RFA) Module

The Remote Function Actuator (RFA) is located under the RH front seat and controls the following:

- Ignition switch modes
- Passive Anti-Theft System (PATS) (vehicles with Intelligent Access (IA))
- Remote Keyless Entry (RKE) system (vehicles with IA)

Refer to the appropriate section in this manual for system specific information and diagnostics.

Diagnostic Trouble Code (DTC) Chart

Each module has a comprehensive DTC chart listed in an appropriate section. Refer to the table below for the appropriate section:

Master DTC Index

ABS Module	REFER to Section 206-09 .
Audio Control Module (ACM)	REFER to Section 415-00 .
Accessory Protocol Interface Module (APIM)	REFER to Section 415-00 .
Body Control Module (BCM)	REFER to the Body Control Module (BCM) DTC Chart in this section.
Front Control/Display Interface Module (FCDIM)	REFER to Section 415-00 .
Global Positioning System Module (GPSM)	REFER to Section 415-00 .
Instrument Panel Cluster (IPC)	REFER to Section 413-01 .
Occupant Classification System (OCS) Module	REFER to Section 501-20B .
Power Steering Control Module (PSCM)	REFER to Section 211-00 .
PCM	REFER to Section 303-14 .
Remote Function Actuator (RFA) Module	REFER to the Remote Function Actuator (RFA) Module DTC Chart in this section.
Restraints Control Module (RCM)	REFER to Section 501-20B .
Transmission Control Module (TCM)	REFER to Section 307-11 .
Vehicle Security Module (VSM)	REFER to Section 204-04 .

Body Control Module (BCM)

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Body Control Module (BCM) controls various systems by monitoring inputs from switches, sensors and messages sent over the Medium Speed Controller Area Network (MS-CAN) from other modules. The BCM activates outputs based on the inputs received. For example, the BCM monitors the headlamp switch position, and based on this input, the BCM may provide voltage to the exterior lamps.

Field-Effect Transistor (FET) Protection

A Field-Effect Transistor (FET) is a type of transistor that, when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes a FET protective circuit strategy for many of its outputs (such as a turn lamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down when a fault event is detected. A short circuit DTC sets when the fault event occurs.

The circuit remains off until the fault is corrected and the ignition state is cycled off and then back on, the module resets the FET protection and allows the circuit to function.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition is in the ON state.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Body Control Module (BCM).

9. If the DTCs retrieved are related to the concern, go to the Body Control Module (BCM) DTC Chart.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B1007:92	High-Beam Headlamp Switch: Performance Or Incorrect Operation	REFER to Section 417-01.
B1008:92	Wiper Mode Switch: Performance Or Incorrect Operation	REFER to Section 501-16.

B1013:23	Heater Rear Defog Switch: Signal Stuck Low	REFER to Section 501-11 .
B1034:12	Left Front Seat Heater Element: Circuit Short To Battery	REFER to Section 501-10 .
B1034:14	Left Front Seat Heater Element: Circuit Short To Ground Or Open	REFER to Section 501-10 .
B1051:92	Front Washer Switch: Performance Or Incorrect Operation	REFER to Section 501-16 .
B1052:92	Rear Washer Switch: Performance Or Incorrect Operation	REFER to Section 501-16 .
B108F:23	Cabin Lock/Unlock Switch: Signal Stuck Low	REFER to Section 501-14 .
B1091:12	Courtesy Lamp Sense: Circuit Short To Battery	REFER to Section 417-02 .
B1092:12	Daytime Running Light Relay: Circuit Short To Battery	REFER to Section 417-01 .
B1092:14	Daytime Running Light Relay: Circuit Short To Ground Or Open	REFER to Section 417-01 .

B115A:23	Front Passenger Seat Heater: Signal Stuck Low	REFER to Section 501-10 .
B115B:23	Front Driver Seat Heater: Signal Stuck Low	REFER to Section 501-10 .
B1175:92	Drivers Door Ajar Switch: Performance Or Incorrect Operation	REFER to Section 417-02 .
B1176:92	Passenger Door Ajar Switch: Performance Or Incorrect Operation	REFER to Section 417-02 .
B1178:92	Boot/Trunk Ajar Switch: Performance Or Incorrect Operation	REFER to Section 417-02 .
B1187:92	Trunk Motor: Performance Or Incorrect Operation	REFER to Section 501-14 .
B11DC:92	Rear Wiper Mode Switch: Performance Or Incorrect Operation	REFER to Section 501-16 .
B11E9:92	Left Rear Door Ajar Switch: Performance Or Incorrect Operation	REFER to Section 417-02 .
B11EA:92	Right Rear Door Ajar Switch: Performance Or Incorrect Operation	REFER to Section 417-02 .
B12F1:11	Ambient Lighting Zone 1 Output: Circuit Short To Ground	REFER to Section 417-02 .
B12F1:15	Ambient Lighting Zone 1 Output: Circuit Short To Battery Or Open	REFER to Section 417-02 .
B132B:12	Left Stop/Turn Lamp: Circuit Short To Battery	REFER to Section 417-01 .
B132B:14	Left Stop/Turn Lamp: Circuit Short To Ground Or Open	REFER to Section 417-01 .
B132C:12	Right Stop/Turn Lamp: Circuit Short To Battery	REFER to Section 417-01 .
B132C:14	Right Stop/Turn Lamp: Circuit Short To Ground Or Open	REFER to Section 417-01 .
B134E:23	Switch Illumination Adjustment Control: Signal Stuck Low	REFER to Section 413-00 .
B1A84:41	Car Configuration Data: General Checksum Failure	CARRY OUT PMI on the BCM . REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC B1A84:41 is retrieved again, INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.
B1A84:51	Car Configuration Data: Not Programmed	CARRY OUT PMI on the BCM . REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC B1A84:51 is retrieved again, INSTALL a new BCM . REFER to Body Control Module (BCM) in this section.

		TEST the system for normal operation.
B1C45:24	Front Wiper Park Position Switch: Signal Stuck High	REFER to Section 501-16 .
B1C53:13	Front Wiper Intermittent Data: Circuit Open	REFER to Section 501-16 .
B1D06:11	Left Turn Indicator: Circuit Short To Ground	REFER to Section 417-01 .
B1D06:15	Left Turn Indicator: Circuit Short To Battery Or Open	REFER to Section 417-01 .
B1D07:11	Right Turn Indicator: Circuit Short To Ground	REFER to Section 417-01 .
B1D07:15	Right Turn Indicator: Circuit Short To Battery Or Open	REFER to Section 417-01 .
B1D14:11	Interior Lights Circuit "B": Circuit Short To Ground	REFER to Section 417-02 .
B1D35:23	Hazard Switch: Signal Stuck Low	REFER to Section 417-01 .
B1D36:92	Turn Indicator Switch: Performance Or Incorrect Operation	REFER to Section 417-01 .
C1137:24	Reverse Gear Switch: Signal Stuck High	REFER to Section 417-01 .
P062F:41	Internal Control Module EEPROM Error: General Checksum Failure	CARRY OUT Programmable Module Installation (PMI) on the BCM . REFER to Section 418-01 .
P062F:46	Internal Control Module EEPROM Error: Calibration/Parameter Memory Failure	CARRY OUT the Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available procedure. REFER to Section 418-01 . TEST the system for normal operation.
P1397:00	System Voltage Out Of Self Test Range: No Sub Type Information	GO to Pinpoint Test A .
P254F:00	Engine Hood Switch Circuit/Open: No Sub Type Information	REFER to Section 419-01A .
U0010:88	Medium Speed CAN Communication Bus: Bus Off	REFER to Section 418-00 .
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	GO to Pinpoint Test B .
U0155:00	Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	GO to Pinpoint Test C .
U0167:00	Lost Communication With Vehicle Immobilizer Control Module: No Sub Type Information	GO to Pinpoint Test D .
U0257:00	Lost Communication With Front Controls/Display Interface Module: No Sub Type Information	GO to Pinpoint Test E .

U0415:68	Invalid Data Received From Anti-Lock Brake System (ABS) Control Module: Event Information	RETRIEVE and REPAIR all non-network DTCs set in the ABS module. REFER to Section 206-09 or the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U2005:81	Vehicle Speed: Invalid Serial Data Received	A speed signal is detected during the self-test. DIAGNOSE any symptoms or other module DTCs that are present. CLEAR the DTCs. REPEAT the BCM self-test. If no other symptoms (inaccurate speedometer) or DTCs are present, INSTALL a new BCM. REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.
U2010:11	Switch Illumination: Circuit Short To Ground	REFER to Section 413-00.
U2101:00	Control Module Configuration Incompatible: No Sub Type Information	CARRY OUT Programmable Module Installation (PMI) on the BCM. REFER to Section 418-01.
U3000:44	Control Module: Data Memory Failure	CARRY OUT PMI on the BCM. REFER to Section 418-01. CLEAR the DTCs. REPEAT the self-test. If DTC U3000:44 is retrieved again, INSTALL a new BCM. REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.
U3000:45	Control Module: Program Memory Failure	CARRY OUT PMI on the BCM. REFER to Section 418-01. CLEAR the DTCs. REPEAT the self-test. If DTC U3000:45 is retrieved again, INSTALL a new BCM. REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test F.
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test G.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the Body Control Module (BCM)	• Fuse(s) • Wiring, terminals or connectors • BCM	• REFER to Section 418-00, The BCM Does Not Respond To The Scan Tool.

Pinpoint Tests

Pinpoint Test A: DTC P1397:00

Normal Operation

- DTC P1397:00 (System Voltage Out Of Self Test Range: No Sub Type Information) — an on-demand DTC that sets when the Body Control Module (BCM) detects voltage below 10 volts or above 15.5 volts from either voltage supply circuit to BCM C2280A-8 or BCM C2280A-14.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- Charging system concern
- BCM

PINPOINT TEST A: DTC P1397:00

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

NOTE: DTC P1397:00 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
A1 CHECK FOR DTCs U3003:16 AND U3003:17 • Check for recorded BCM DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 present?**	**No** GO to A2 . **No** For DTC U3003:16, GO to Pinpoint Test F . For DTC U3003:17, GO to Pinpoint Test G .
A2 RECHECK THE BCM DTCs • Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM Module Self-Test. • Clear the DTCs. Repeat the BCM self-test. • **Is DTC P1397:00 still present?**	**No** GO to A3 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition, during battery charging or while jump starting the vehicle.
A3 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM • Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Carry out the PCM KOEO self-test. • Retrieve the continuous memory DTCs from the PCM. • **Is DTC P0562, P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to A4 .
A4 CHECK FOR DTCs B1317, B1318, B1676, P0563 OR U3003:17 SET IN OTHER MODULES • Enter the following diagnostic mode on the scan tool: Self-Test.	**Yes**

• Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1318, B1676, P0563 (PCM) or U3003:17 set in any other module?**	REFER to Section 414-00 to diagnose the charging system condition. **No** GO to A5.
A5 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to A6.
A6 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Ignition OFF. • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01. • **Is the battery OK and fully charged?**	**Yes** GO to A7. **No** REFER to Section 414-00.
A7 CHECK THE BCM VOLTAGE PID	
• Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM voltage PID. • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to A10. **No** GO to A8.
A8 CHECK THE BCM VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: BCM C2280A. • Ignition ON. • Measure the voltage between the BCM C2280A-8, circuit SBB06 (BN/RD), harness side and ground; and between the BCM C2280A-14, circuit SBB24 (VT/RD), harness side and ground.  N0117256 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to A9. **No** REPAIR circuit SBB06 (BN/RD) or circuit SBB24 (VT/RD) as necessary for high resistance. CLEAR the DTC. REPEAT the self-test.
A9 CHECK THE BCM GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Disconnect: BCM C2280B.	**Yes** GO to A10.

• Measure the resistance between the BCM C2280A-16, circuit GD115 (BK/GY), harness side and ground; and between the BCM C2280B-7, circuit GD115 (BK/GY), harness side and ground.  N0114628 • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit GD115 (BK/GY) for high resistance. CLEAR the DTC. REPEAT the self-test.
A10 CHECK FOR CORRECT BCM OPERATION	

• Disconnect the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC U0121:00

Normal Operation

- DTC U0121:00 (Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information) — sets in the Body Control Module (BCM) if data messages received from the ABS module are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ABS module
- BCM

PINPOINT TEST B: DTC U0121:00

Test Step	Result / Action to Take
B1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON.	**Yes**

• Verify that there is an observable symptom present. • **Is an observable symptom present?**	GO to B2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
B2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the ABS module pass the network test?**	**Yes** GO to B3 . **No** REFER to Section 418-00 , The ABS Module Does Not Respond To The Scan Tool.
B3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test F . For DTC U3003:17, GO to Pinpoint Test G . **No** GO to B4 .
B4 CHECK FOR DTCs U3003:16 AND U3003:17 FROM THE ABS MODULE SELF-TEST	
• Retrieve the continuous memory DTCs from the ABS module. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 206-09 . **No** GO to B5 .
B5 RECHECK THE BCM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the BCM self-test. • **Is DTC U0121:00 still present?**	**Yes** GO to B6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
B6 CHECK FOR DTC U0121:00 or U0121 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0121:00 or DTC U0121 set in any other module?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the BCM self-test. **No** INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.

Pinpoint Test C: DTC U0155:00

Normal Operation

- DTC U0155:00 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information) — sets in the Body Control Module (BCM) if data messages received from the Instrument Panel Cluster (IPC) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- IPC
- BCM

PINPOINT TEST C: DTC U0155:00

Test Step	Result / Action to Take
C1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to C2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
C2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IPC pass the network test?**	**Yes** GO to C3 . **No** REFER to Section 418-00 , The Instrument Panel Cluster (IPC) Does Not Respond To The Scan Tool.
C3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST • Check for recorded BCM DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test F . For DTC U3003:17, GO to Pinpoint Test G . **No** GO to C4 .
C4 CHECK FOR DTC U3006:16 FROM THE IPC SELF-TEST • Retrieve the continuous memory DTCs from the IPC . • **Is DTC U3006:16 recorded?**	**Yes** REFER to Section 413-01 . **No** GO to C5 .
C5 RECHECK THE BCM DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the BCM self-test.	**Yes** GO to C6 . **No** The system is operating correctly at this time. The DTC may have been

• **Is DTC U0155:00 still present?**	set due to high network traffic or an intermittent fault condition.
C6 CHECK FOR DTC U0155:00 or U0155 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155:00 or DTC U0155 set in any other module?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the BCM self-test. **No** INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.

Pinpoint Test D: DTC U0167:00

Normal Operation

- DTC U0167:00 (Lost Communication With Vehicle Immobilizer Control Module: No Sub Type Information) — sets in the Body Control Module (BCM) if data messages received from the Remote Function Actuator (RFA) module are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- RFA module
- BCM

PINPOINT TEST D: DTC U0167:00

Test Step	Result / Action to Take
D1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to D2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
D2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the RFA module pass the network test?**	**Yes** GO to D3 . **No** REFER to Section 418-00 , The Remote Function Actuator (RFA) Module Does Not Respond To The Scan Tool.
D3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test.	**Yes** For DTC U3003:16, GO to Pinpoint Test F . For

• **Is DTC U3003:16 or DTC U3003:17 recorded?**	DTC U3003:17, GO to Pinpoint Test G . **No** GO to D4 .
D4 CHECK FOR DTCs U3003:16 AND U3003:17 FROM THE RFA MODULE SELF-TEST	
• Retrieve the continuous memory DTCs from the RFA module. • **Is DTC U3003:16 or U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test O . For DTC U3003:17, GO to Pinpoint Test P . **No** GO to D5 .
D5 RECHECK THE BCM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the BCM self-test. • **Is DTC U0167:00 still present?**	**Yes** INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. CLEAR the DTCs. REPEAT the BCM self-test. If the concern is still present after the repair, INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test E: DTC U0257:00

Normal Operation

- DTC U0257:00 (Lost Communication With Front Controls/Display Interface Module: No Sub Type Information) — sets in the Body Control Module (BCM) if data messages received from the Front Control/Display Interface Module (FCDIM) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- FCDIM
- BCM

PINPOINT TEST E: DTC U0257:00

Test Step	Result / Action to Take
E1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to E2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

E2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the FCDIM pass the network test?**	**Yes** GO to E3. **No** REFER to Section 418-00, The Front Control/Display Interface Module (FCDIM) Does Not Respond To The Scan Tool.
E3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST • Check for recorded BCM DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test F. For DTC U3003:17, GO to Pinpoint Test G. **No** GO to E4.
E4 CHECK FOR DTCs U3006:16 AND U3006:17 FROM THE FCDIM SELF-TEST • Retrieve the continuous memory DTCs from the FCDIM. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** REFER to Section 415-00. **No** GO to E5.
E5 RECHECK THE BCM DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the BCM self-test. • **Is DTC U0257:00 still present?**	**Yes** GO to E6. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
E6 CHECK FOR DTC U0257:00 OR U0257 SET IN OTHER MODULES • Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0257:00 or DTC U0257 set in any other module?**	**Yes** INSTALL a new FCDIM. REFER to Section 415-00. CLEAR the DTCs. REPEAT the BCM self-test. **No** INSTALL a new BCM. REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.

Pinpoint Test F: DTC U3003:16

Refer to Wiring Diagrams Cell 13, Power Distribution/SJB for schematic and connector information.

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — sets in the Body Control Module (BCM) when the BCM detects that battery voltage has dropped below 9 volts from the voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- BCM

PINPOINT TEST F: DTC U3003:16

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
F1 RECHECK THE BCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM Self-Test. • Clear the DTCs. Repeat the BCM self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to F2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
F2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Carry out the PCM KOEO self-test. • Retrieve the continuous memory DTCs from the PCM. • **Is DTC P0562, P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to F3 .
F3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Ignition OFF. • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to F4 . **No** REFER to Section 414-00 .
F4 CHECK THE BCM VOLTAGE PID	
• Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM voltage PID. • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to F7 . **No** GO to F5 .
F5 CHECK THE BCM VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: BCM C2280A. • Ignition ON. • Measure the voltage between the BCM C2280A-8, circuit SBB06 (BN/RD), harness side and ground; and between the BCM C2280A-14, circuit SBB24 (VT/RD), harness side and ground.	**Yes** GO to F6 . **No** REPAIR circuit SBB06 (BN/RD) or

 N0117256 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	circuit SBB24 (VT/RD) as necessary for high resistance. CLEAR the DTC. REPEAT the self-test.
F6 CHECK THE BCM GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect: BCM C2280D. • Measure the resistance between the BCM C2280A-16, circuit GD115 (BK/GY), harness side and ground; and between the BCM C2280B-7, circuit GD115 (BK/GY), harness side and ground.  N0114628 • **Is the resistance less than 5 ohms?**	**Yes** GO to F7 . **No** REPAIR circuit GD115 (BK/GY) for high resistance. CLEAR the DTC. REPEAT the self-test.
F7 CHECK FOR CORRECT BCM OPERATION	

• Disconnect the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: DTC U3003:17

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — sets in the Body Control Module (BCM) when the BCM detects that battery voltage exceeds 15.9 volts on the voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- BCM

PINPOINT TEST G: DTC U3003:17

NOTE: DTC U3003:17 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
G1 CHECK FOR DTC B1317, B1676, P0563 (PCM) OR U3003:17 SET IN OTHER MODULES • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM) or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to G2 .
G2 CHECK THE BATTERY VOLTAGE • Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to G3 .
G3 RECHECK FOR DTC U3003:17 • Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM Self-Test. • Clear the continuous memory DTCs. • Carry out the BCM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Remote Function Actuator (RFA) Module

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

The Remote Function Actuator (RFA) module is only on vehicles equipped with the Intelligent Access (IA) feature. On vehicles equipped with this option, the RFA controls the IA and related entry/anti-theft systems (such as the power door locks and luggage compartment/liftgate release). The RFA module communicates on the High Speed Controller Area Network (HS-CAN) and the Medium Speed Controller Area Network (MS-CAN). The RFA module controls the following functions:

- IA feature
- Ignition states
- Passive Anti-Theft System (PATS)
- Remote Keyless Entry (RKE) system

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON state.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may NOT prove ignition is in the ON state). If ignition does not change to the ON state, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, Inspection and Verification to establish a scan tool session.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Remote Function Actuator (RFA) module.

9. If the DTCs retrieved are related to the concern, go to the Remote Function Actuator (RFA) Module DTC Chart.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Remote Function Actuator (RFA) Module DTC Chart

NOTE: Refer to Description and Operation, Intelligent Access (IA) with Push Button Start in Section 419-01B to review the procedures for achieving the various ignition states (ignition off, ignition on, ignition start) on vehicles with this feature.

DTC	Description	Action
B102B:05	Passive Key: System Programming Failure	REFER to Section 419-01B.
B108B:23	Start Button Circuit "A": Signal Stuck Low	REFER to Section 211-05.
B108B:29	Start Button Circuit "A": Signal Invalid	REFER to Section 211-05.
B108C:23	Start Button Circuit "B": Signal	REFER to Section 211-05.

	Stuck Low	
B10C6:1F	Exterior Trunk Antenna: Circuit Intermittent	REFER to Section 501-14 .
B10C7:1F	Interior Trunk Antenna: Circuit Intermittent	REFER to Section 419-01B .
B10C8:1F	Interior Centre Antenna: Circuit Intermittent	REFER to Section 419-01B .
B10C9:1F	Interior Front Antenna: Circuit Intermittent	REFER to Section 419-01B .
B10D1:24	Left Front Lock Button: Signal Stuck High	REFER to Section 501-14 .
B10D3:24	Right Front Lock Button: Signal Stuck High	REFER to Section 501-14 .
B10D5:13	PATS Antenna: Circuit Open	REFER to Section 419-01B .
B10D6:62	PATS Enable Status: Signal Compare Failure	REFER to Section 419-01B .
B10D7:05	PATS Key: System Programming Failure	REFER to Section 419-01B .
B10D7:51	PATS Key: Not Programmed	REFER to Section 419-01B .
B10D7:81	PATS Key: Invalid Serial Data Received	REFER to Section 419-01B .
B10D8:00	PATS Key Less Than Minimum Programmed: No Sub Type Information	REFER to Section 419-01B .
B10D9:87	PATS Transponder: Missing Message	REFER to Section 419-01B .
B10DA:51	PATS Target Identifier: Not Programmed	REFER to Section 419-01B .
B10DA:62	PATS Target Identifier: Signal Compare Failure	REFER to Section 419-01B .
B10E6:11	PATS Power Supply: Circuit Short To Ground	REFER to Section 419-01B .
B10E6:12	PATS Power Supply: Circuit Short To Battery	REFER to Section 419-01B .
B10E7:11	Ignition On Relay: Circuit Short To Ground	REFER to Section 211-05 .
B10E7:12	Ignition On Relay: Circuit Short To Battery	REFER to Section 211-05 .
B10E7:16	Ignition On Relay: Circuit Voltage Below Threshold	REFER to Section 211-05 .
B10E7:17	Ignition On Relay: Circuit Voltage Above Threshold	REFER to Section 211-05 .
B113E:24	External Boot/Trunk Release Switch: Signal Stuck High	REFER to Section 501-14 .

P0560:16	System Voltage: Circuit Voltage Below Threshold	REFER to GO to Pinpoint Test H .

P0560:17	System Voltage: Circuit Voltage Above Threshold	REFER to GO to Pinpoint Test I .
P0615:12	Starter Relay Circuit: Circuit Short To Battery	REFER to Section 303-06 .
P081C:62	Park Input Circuit: Signal Compare Failure	REFER to Section 413-01 .
P1571:62	Brake Switch: Signal Compare Failure	REFER to Section 303-06 .
P1708:62	Clutch Switch Circuit: Signal Compare Failure	REFER to Section 303-06 .
U0001:00	High Speed CAN Communication Bus: No Sub Type Information	REFER to Section 418-00 .
U0010:00	Medium Speed CAN communication Bus: No Sub Type Information	REFER to Section 418-00 .
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	REFER to GO to Pinpoint Test J .
U0100:87	Lost Communication With ECM/PCM "A": Missing Message	REFER to Section 419-01B .
U0101:00	Lost Communication with TCM: No Sub Type Information	REFER to GO to Pinpoint Test K .
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	REFER to GO to Pinpoint Test L .
U0140:00	Lost Communication With Body Control Module: No Sub Type Information	REFER to GO to Pinpoint Test M .
U0155:00	Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	REFER to GO to Pinpoint Test N .
U0300:05	Internal Control Module Software Incompatibility: System Programming Failure	CARRY OUT Programmable Module Installation (PMI) on the RFA module. REFER to Section 418-01 .
U201B:54	Control Module Calibration Data #2: Missing Calibration	CARRY OUT Programmable Module Installation (PMI) on the RFA module. REFER to Section 418-01 .
U201F:00	External Receiver: No Sub Type Information	REFER to Section 419-01B .
U201F:13	External Receiver: Circuit Open	REFER to Section 419-01B .
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CARRY OUT Programmable Module Installation (PMI) on the RFA module. REFER to Section 418-01 .
U2101:00	Control Module Configuration Incompatible: No Sub Type Information	CARRY OUT Programmable Module Installation (PMI) on the RFA module. REFER to Section 418-01 .
U3000:01	Control Module: General Electrical Failure	ADDRESS all other DTCs first. CLEAR the DTCs. REPEAT the self-test. If DTC U3000:01 is retrieved again, INSTALL a new RFA . REFER to Remote Function Actuator (RFA) Module in this section.
U3000:42	Control Module: General Memory Failure	ADDRESS all other DTCs first. CLEAR the DTCs. REPEAT the self-test. If DTC U3000:42 is retrieved again, INSTALL a new RFA . REFER to Remote

		Function Actuator (RFA) Module in this section.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	REFER to GO to Pinpoint Test O .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	REFER to GO to Pinpoint Test P .
U3003:62	Battery Voltage: Signal Compare Failure	REFER to GO to Pinpoint Test Q .
U3004:11	Accessory Power Relay: Circuit Short To Ground	REFER to Section 211-05 .
U3004:12	Accessory Power Relay: Circuit Short To Battery	REFER to Section 211-05 .
U300E:62	Ignition Input On: Signal Compare Failure	REFER to Section 211-05 .
U300F:62	Ignition Input Accessory: Signal Compare Failure	REFER to Section 211-05 .
U3010:62	Ignition Input Start: Signal Compare Failure	REFER to Section 211-05 .
U3011:62	Ignition Input Off: Signal Compare Failure	REFER to Section 211-05 .

Symptom Chart

Symptom Chart

NOTE: Refer to Description and Operation, Intelligent Access (IA) with Push Button Start in Section 419-01B to review the procedures for achieving the various ignition states (ignition off, ignition in accessory, ignition on, ignition start) on vehicles with this feature.

Condition	Possible Sources	Action
• No communication with the Remote Function Actuator (RFA) Module	• Fuse • Wiring, terminals or connectors • RFA module	• REFER to Section 418-00 , The Remote Function Actuator (RFA) Module Does Not Respond To The Scan Tool.

Pinpoint Tests

Pinpoint Test H: DTC P0560:16

Normal Operation

- DTC P0560:16 (System Voltage: Circuit Voltage Below Threshold) — sets in the Remote Function Actuator (RFA) module when the RFA module detects that battery voltage has dropped below 9 volts (for more than 10 seconds) from the voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance

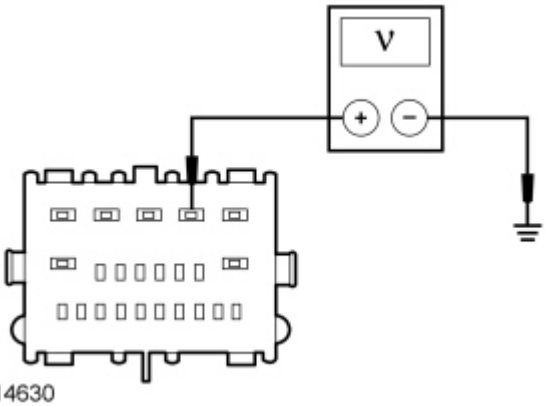
- RFA module

PINPOINT TEST H: DTC P0560:16

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
H1 RECHECK THE RFA MODULE DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • Clear the DTCs. Repeat the RFA module self-test. • **Is DTC P0560:16 still present?**	**Yes** GO to H2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
H2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM • Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Carry out the PCM KOEO self-test. • Retrieve the continuous memory DTCs from the PCM. • **Is DTC P0562, P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to H3 .
H3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE • Ignition OFF. • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to H4 . **No** REFER to Section 414-00 .
H4 CHECK THE RFA MODULE VOLTAGE PID • Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: RFA Module DataLogger. • Monitor the RFA module voltage PID (ECU_Pwr_Sup). • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to H7 . **No** GO to H5 .
H5 CHECK THE RFA MODULE VOLTAGE SUPPLY • Ignition OFF. • Disconnect: RFA Module C3503a. • Ignition ON. • Measure the voltage between the RFA module C3503a-2, circuit SBP14 (BN/RD), harness side and ground.	**Yes** GO to H6 . **No** REPAIR circuit SBP14 (BN/RD) for high resistance. CLEAR the DTC. REPEAT the self-test.



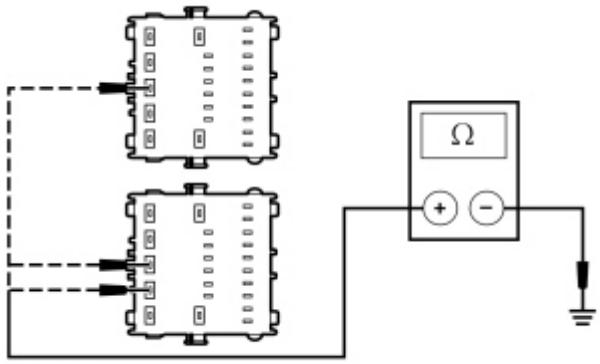
N0114630

- **Is the voltage within 0.2 volt of the recorded battery voltage?**

H6 CHECK THE RFA MODULE GROUND CIRCUIT FOR HIGH RESISTANCE

- Ignition OFF.
- Disconnect: Negative Battery Cable.
- Disconnect: RFA Module C3503d.
- Measure the resistance between the RFA module and ground as follows:

Connector-Pin	Circuit
C3503a-3	GD145 (BK/BU)
C3503d-3	GD145 (BK/BU)
C3503d-4	GD145 (BK/BU)



N0114629

- **Are the resistances less than 5 ohms?**

Yes
GO to H7 .

No
REPAIR circuit GD145 (BK/BU) for high resistance. CLEAR the DTC. REPEAT the self-test.

H7 CHECK FOR CORRECT RFA MODULE OPERATION

- Disconnect the RFA module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the RFA module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation. If the

No
The system is operating correctly at this time. The concern may have been

	caused by a loose or corroded connector.

Pinpoint Test I: DTC P0560:17

Normal Operation

- DTC P0560:17 (System Voltage: Circuit Voltage Above Threshold) — sets in the Remote Function Actuator (RFA) module when the RFA module detects that battery voltage exceeds 16 volts from the voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- RFA module

PINPOINT TEST I: DTC P0560:17

NOTE: DTC P0560:17 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
I1 CHECK FOR DTC B1317, B1676, P0563 (PCM) OR U3003:17 SET IN OTHER MODULES	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to I2.
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM) or U3003:17 set in more than one module?**	
I2 CHECK THE BATTERY VOLTAGE	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to I3.
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 16 volts or higher?**	
I3 RECHECK FOR DTC P0560:17	**Yes** INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • Clear the continuous memory DTCs. • Carry out the RFA module self-test. • **Is DTC P0560:17 present?**	

Pinpoint Test J: DTC U0100:00

Normal Operation

- DTC U0100:00 (Lost Communication With ECM/PCM "A": No Sub Type Information) — sets in the Remote Function Actuator (RFA) module if data messages (engine speed) received from the PCM are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- PCM
- RFA module

PINPOINT TEST J: DTC U0100:00

Test Step	Result / Action to Take
J1 VERIFY THE SCAN TOOL CAN COMMUNICATE WITH THE PCM	
• Connect the scan tool. • Check that a vehicle session can be established using the scan tool. • **Can a vehicle session be established?**	**Yes** GO to J2 . **No** REFER to Section 418-00 , The PCM Does Not Respond To The Scan Tool.
J2 CHECK THE RFA MODULE CONTINUOUS MEMORY DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • Clear the DTCs. Repeat the RFA module self-test. • **Is DTC U0100:00 retrieved again?**	**Yes** GO to J3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
J3 RETRIEVE THE RECORDED DTCs FROM THE RFA MODULE SELF-TEST	
• Check for recorded RFA module DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test O . For DTC U3003:17, GO to Pinpoint Test P . **No** GO to J4 .
J4 CHECK FOR DTC U0100:00 OR DTC U0100 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0100:00 or DTC U0100 set in any other module?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation

Pinpoint Test K: DTC U0101:00

Normal Operation

- DTC U0101:00 (Lost Communication with TCM: No Sub Type Information) — sets in the Remote Function Actuator (RFA) module if data messages received from the Transmission Control Module (TCM) over the High Speed Controller Area Network (HS-CAN) are missing.

This pinpoint test is intended to diagnose the following:

- TCM
- RFA module

PINPOINT TEST K: DTC U0101:00

Test Step	Result / Action to Take
K1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to K2. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
K2 CHECK THE COMMUNICATION NETWORK • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the TCM pass the network test?**	**Yes** GO to K3. **No** REFER to Section 418-00.
K3 RETRIEVE THE RECORDED DTCs FROM THE RFA MODULE SELF-TEST • Check for recorded RFA module DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test O. For DTC U3003:17, GO to Pinpoint Test P. **No** GO to K4.
K4 RECHECK THE RFA MODULE DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the RFA module self-test. • **Is DTC U0101:00 still present?**	**Yes** GO to K5. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
K5 CHECK FOR DTC U0101:00 OR DTC U0101 SET IN OTHER MODULES • Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules.	**Yes** INSTALL a new TCM. REFER to Section 307-11. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new RFA module. REFER to Remote Function

• **Is DTC U0101:00 or DTC U0101 set in any other module?**	Actuator (RFA) Module in this section. TEST the system for normal operation.

Pinpoint Test L: DTC U0121:00

Normal Operation

- DTC U0121:00 (Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information) — sets in the Remote Function Actuator (RFA) module if data messages received from the ABS module are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ABS module
- RFA module

PINPOINT TEST L: DTC U0121:00

Test Step	Result / Action to Take
L1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to L2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
L2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the ABS module pass the network test?**	**Yes** GO to L3 . **No** REFER to Section 418-00 , The ABS Module Does Not Respond To The Scan Tool.
L3 RETRIEVE THE RECORDED DTCs FROM THE RFA MODULE SELF-TEST	
• Check for recorded RFA module DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test O . For DTC U3003:17, GO to Pinpoint Test P . **No** GO to L4
L4 CHECK FOR DTCs U3003:16 AND U3003:17 FROM THE ABS MODULE SELF-TEST	
• Retrieve the continuous memory DTCs from the ABS module. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 206-09 . **No**

	GO to L5 .
L5 RECHECK THE RFA MODULE DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the RFA module self-test. • **Is DTC U0121:00 still present?**	**Yes** GO to L6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
L6 CHECK FOR DTC U0121:00 OR DTC U0121 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0121:00 OR DTC U0121 set in any other module?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation.

Pinpoint Test M: DTC U0140:00

Normal Operation

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub Type Information) — sets in the Remote Function Actuator (RFA) module if data messages received from the Body Control Module (BCM) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- RFA module
- BCM

PINPOINT TEST M: DTC U0140:00

Test Step	Result / Action to Take
M1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to M2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
M2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool:	**Yes** GO to M3 .

Network Test. • Carry out the network test. • **Does the BCM pass the network test?**	**No** REFER to Section 418-00 .
M3 RETRIEVE THE RECORDED DTCs FROM THE RFA MODULE SELF-TEST	
• Check for recorded RFA module DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test O . For DTC U3003:17, GO to Pinpoint Test P . **No** GO to M4 .
M4 CHECK FOR DTCs U3003:16 AND U3003:17 FROM THE BCM SELF-TEST	
• Retrieve the continuous memory DTCs from the BCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test F . For DTC U3003:17, GO to Pinpoint Test G . **No** GO to M5 .
M5 RECHECK THE RFA MODULE DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the RFA module self-test. • **Is DTC U0140:00 still present?**	**Yes** GO to M6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
M6 CHECK FOR DTC U0140:00 OR DTC U0140 OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140:00 or DTC U0140 set in any other module?**	**Yes** INSTALL a new BCM . REFER to Body Control Module (BCM) in this section. TEST the system for normal operation. **No** INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation.

Pinpoint Test N: DTC U0155:00

Normal Operation

- DTC U0155:00 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information) — sets in the Remote Function Actuator (RFA) module if data messages received from the Instrument Panel Cluster (IPC) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- RFA module

- IPC

PINPOINT TEST N: DTC U0155:00

Test Step	Result / Action to Take
N1 VERIFY CUSTOMER CONCERN • Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to N2. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
N2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IPC pass the network test?**	**Yes** GO to N3. **No** REFER to Section 418-00, The IPC Does Not Respond To The Scan Tool.
N3 RETRIEVE THE RECORDED DTCs FROM THE RFA MODULE SELF-TEST • Check for recorded RFA module DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test O. For DTC U3003:17, GO to Pinpoint Test P. **No** GO to N4.
N4 RECHECK THE RFA MODULE DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the RFA module self-test. • **Is DTC U0155:00 still present?**	**Yes** GO to N5. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
N5 CHECK FOR DTC U0155:00 OR DTC U0155 SET IN OTHER MODULES • Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155:00 or DTC U0155 set in any other module?**	**Yes** INSTALL a new IPC. REFER to Section 413-01. **No** INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation.

Pinpoint Test O: DTC U3003:16

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — sets in the Remote Function Actuator (RFA) module when the RFA module detects that battery voltage has dropped below 9 volts (for more than 10 seconds) from the voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- RFA module

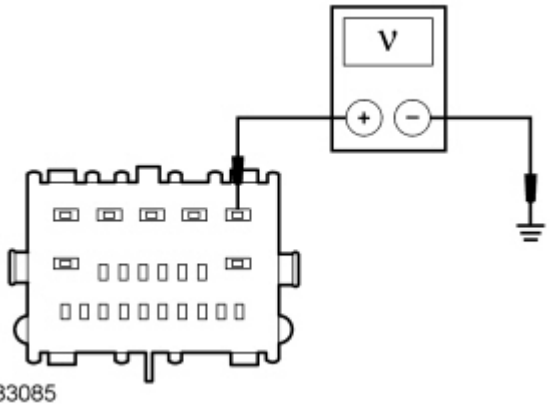
PINPOINT TEST O: DTC U3003:16

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
O1 RECHECK THE RFA MODULE DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • Clear the DTCs. Repeat the RFA module self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to O2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
O2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Carry out the PCM KOEO self-test. • Retrieve the continuous memory DTCs from the PCM. • **Are any low or high voltage DTCs set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to O3 .
O3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Ignition OFF. • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to O4 . **No** REFER to Section 414-00 .
O4 CHECK THE RFA MODULE VOLTAGE PID	
• Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: RFA Module DataLogger. • Monitor the RFA module voltage PID (ECU_VPWR). • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to O7 . **No** GO to O5 .
O5 CHECK THE RFA MODULE VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: RFA Module C3503a.	**Yes** GO to O6 .

- Ignition ON.
- Measure the voltage between the RFA module C3503a-1, circuit SBP09 (RD), harness side and ground.



A0083085

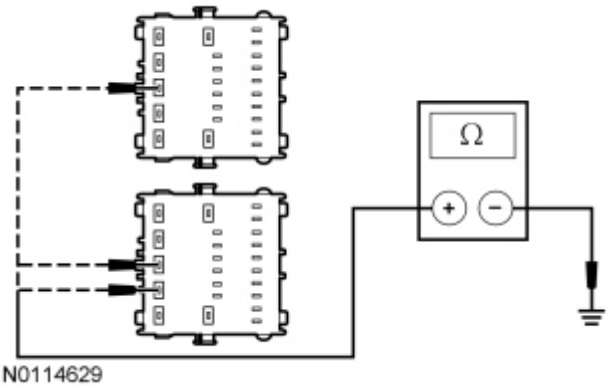
- **Is the voltage within 0.2 volt of the recorded battery voltage?**

No
REPAIR circuit SBP09 (RD) for high resistance. CLEAR the DTC. REPEAT the self-test.

O6 CHECK THE RFA MODULE GROUND CIRCUIT FOR HIGH RESISTANCE

- Ignition OFF.
- Disconnect: Negative Battery Cable.
- Disconnect: RFA Module C3503d.
- Measure the resistance between the RFA module and ground as follows:

Connector-Pin	Circuit
C3503a-3	GD145 (BK/BU)
C3503d-3	GD145 (BK/BU)
C3503d-4	GD145 (BK/BU)



N0114629

- **Are the resistances less than 5 ohms?**

Yes
GO to O7.

No
REPAIR circuit GD145 (BK/BU) for high resistance. CLEAR the DTC. REPEAT the self-test.

O7 CHECK FOR CORRECT RFA MODULE OPERATION

- Disconnect the RFA module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the RFA module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.

Yes
INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation.

• **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: DTC U3003:17

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — sets in the Remote Function Actuator (RFA) module when the RFA module detects that battery voltage exceeds 16 volts from the voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- RFA module

PINPOINT TEST P: DTC U3003:17

NOTE: DTC U3003:17 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
P1 CHECK FOR DTC B1317, B1676, P0563 (PCM) OR U3003:17 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM) or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to P2.
P2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 16 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to P3.
P3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • Clear the continuous memory DTCs. • Carry out the RFA module self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test Q: DTC U3003:62

Normal Operation

- DTC U3003:62 (Battery Voltage: Signal Compare Failure) — a continuous and on-demand DTC that sets when the RFA module detects a difference of 2 volts between the voltage supply circuit and a message (voltage value) received from the PCM over the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- Charging system concern
- RFA module

PINPOINT TEST Q: DTC U3003:62

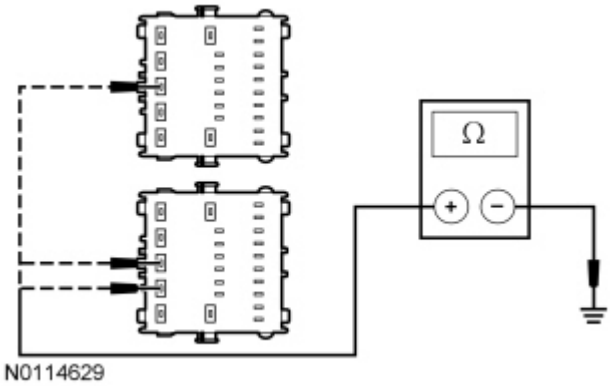
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

NOTE: DTC U3003:62 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
Q1 CHECK FOR DTCs U3003:16 AND U3003:17	
• Check for recorded RFA module DTCs from the self-test. • **Is DTC U3003:16 or DTC U3003:17 present?**	**No** GO to Q2 . **No** For DTC U3003:16, GO to Pinpoint Test O . For DTC U3003:17, GO to Pinpoint Test P .
Q2 RECHECK THE RFA MODULE DTCs	
• Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: RFA Module Self-Test. • Clear the DTCs. Repeat the RFA Module self-test. • **Is DTC U3003:62 still present?**	**Yes** GO to Q3 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition, during battery charging or while jump starting the vehicle.
Q3 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test.	**Yes** REFER to Section 414-00 .

• Carry out the PCM KOEO self-test. • Retrieve the continuous memory DTCs from the PCM. • **Is DTC P0562, P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**No** GO to Q4 .
Q4 CHECK FOR DTCs B1317, B1318 B1676, P0563 OR U3003:62 SET IN OTHER MODULES	
• Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM) or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose the charging system condition. **No** GO to Q5 .
Q5 CHECK THE RFA MODULE VOLTAGE PID	
• Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: RFA Module DataLogger. • Monitor the RFA module voltage PID (ECU_VPWR). • **Is the voltage within .2 volts of the recorded battery voltage?**	**Yes** REFER to Section 414-00 to diagnose the charging system condition. **No** GO to Q6 .
Q6 CHECK THE RFA MODULE VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: RFA Module C3503a . • Ignition ON. • Measure the voltage between the RFA module C3503a-1, circuit SBP09 (RD), harness side and ground.  A0083085 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to Q7 . **No** REPAIR circuit SBP09 (RD) for high resistance. CLEAR the DTC. REPEAT the self-test.
Q7 CHECK THE RFA MODULE GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the RFA module and ground as follows: **Connector-Pin** / **Circuit** C3503a-3 / GD145 (BK/BU) C3503d-3 / GD145 (BK/BU) C3503d-4 / GD145 (BK/BU)	**Yes** GO to Q8 . **No** REPAIR circuit GD145 (BK/BU) for high resistance. CLEAR the DTC. REPEAT the self-test.



- **Are the resistances less than 5 ohms?**

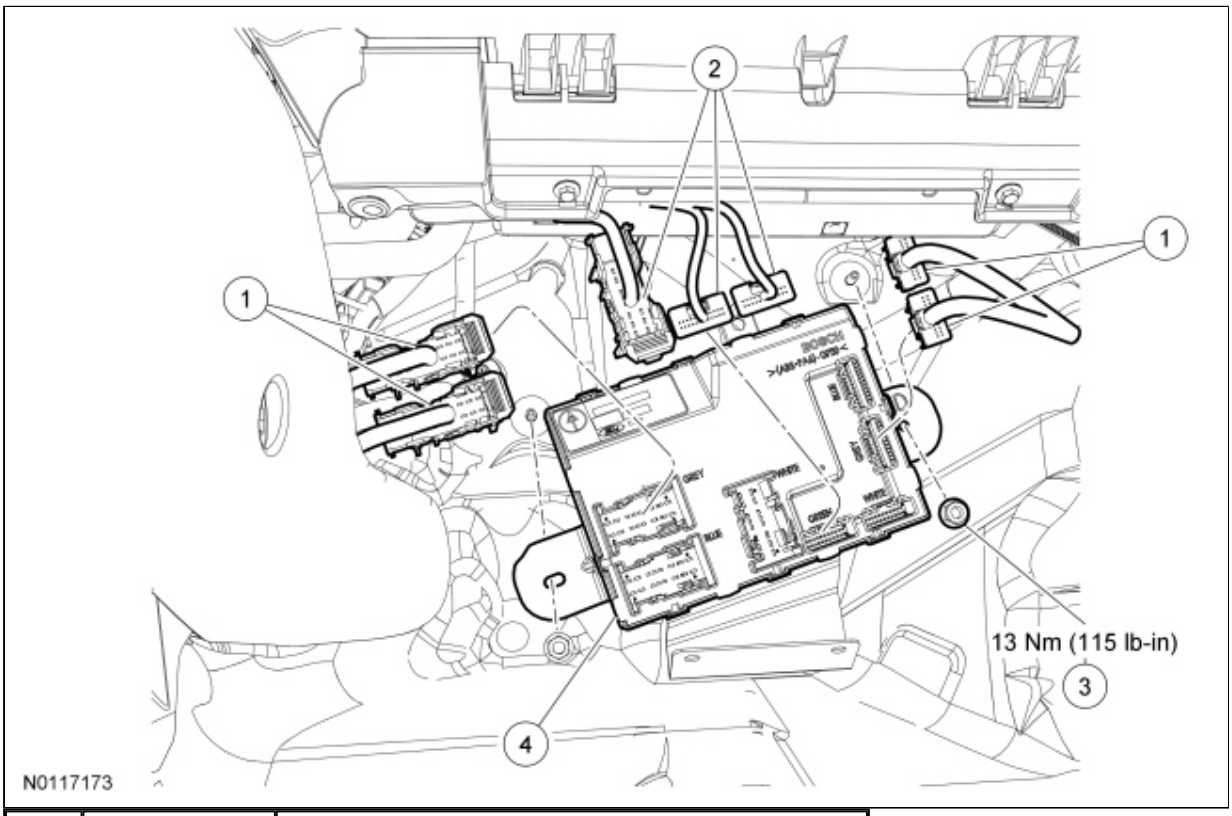
Q8 CHECK FOR CORRECT RFA MODULE OPERATION	

• Disconnect the RFA module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the RFA module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Remote Function Actuator (RFA) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Body Control Module (BCM)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Item	Part Number	Description
1	—	Electrical connectors (part of 14A005)
2	—	Electrical connectors (part of 14K024)
3	W520412-S2	Body Control Module (BCM) nut (2 required)
4	15K600	BCM

Removal

NOTICE: **Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage to the module may result.**

NOTE: Prior to the replacement of the module, it is necessary to upload the module configuration information to a scan tool. This information must be downloaded into the new Body Control Module (BCM) after installation. For additional information, refer to Section 418-01 . A minimum of 2 devices are necessary to complete the configuration.

1. **NOTE:** This step is only necessary if the BCM is being replaced.

Upload the module configuration information from the BCM into the scan tool. For additional information, refer to Section 418-01 .

2. Remove the RH dash closeout panel.

3. Disconnect the 7 electrical connectors.

4. Remove the 2 nuts and the BCM .

Installation

1. Position the BCM and install the 2 nuts.
   - Tighten to 13 Nm (115 lb-in).

2. **NOTE:** If the BCM is not being replaced, this is the last step that is necessary.

   Connect the 7 electrical connectors.

3. Install the RH dash closeout panel.

4. Download the BCM configuration information from the scan tool to the BCM . For additional information, refer to Section 418-01 .

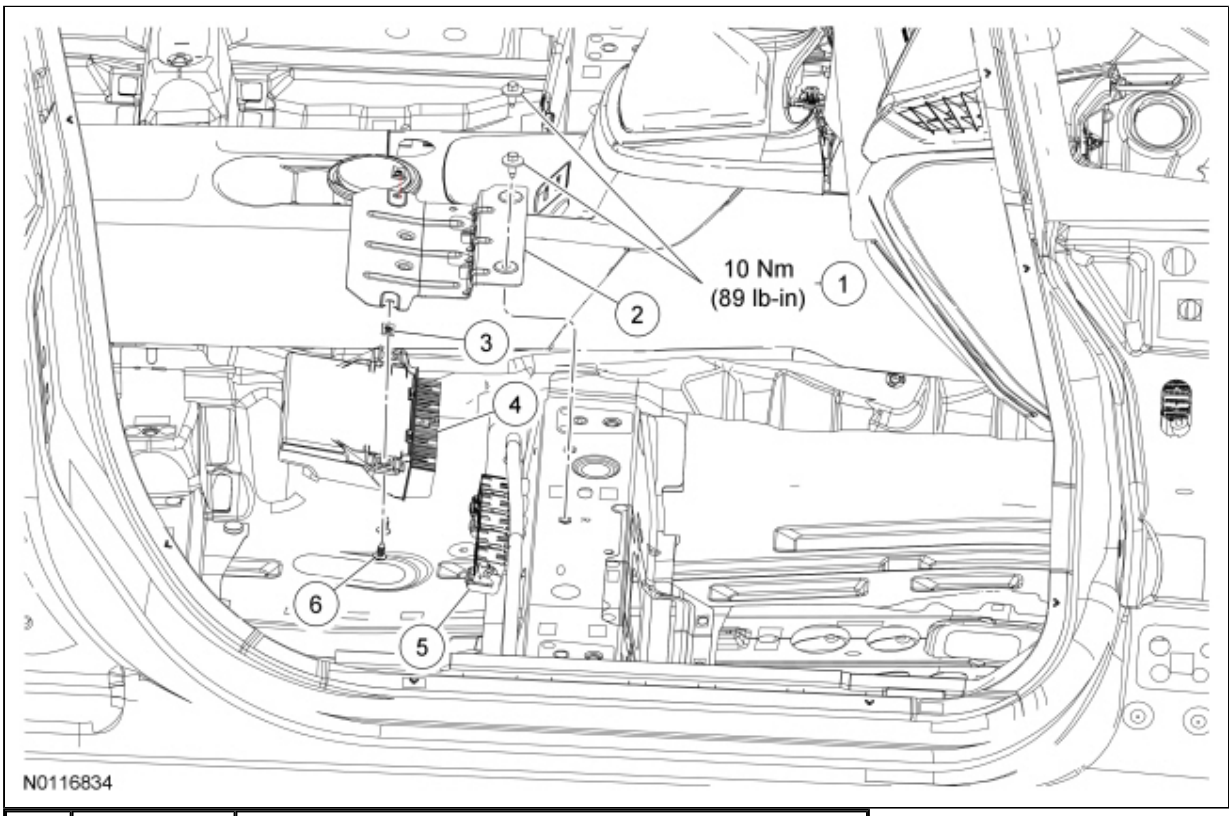
5. Carry out the BCM self-test to confirm all DTCs have been cleared.

6. For vehicles without IA , program all the RKE transmitters into the new BCM . For additional information, refer to Section 501-14 .

Remote Function Actuator (RFA) Module

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Item	Part Number	Description
1	W503922	Remote Function Actuator (RFA) bracket bolt (2 required)
2	—	RFA bracket
3	—	RFA module J-nut (2 required)
4	19G481	RFA module
5	—	RFA module electrical connectors (part of 14A005)
6	—	RFA module screw (2 required)

Removal and Installation

1. **NOTE:** The IA keys need to be programmed into the new RFA module during ignition off. For additional information, refer to Key Programming Using Diagnostic Equipment in Section 419-01B . After the IA keys have been programmed into the new RFA module, the ignition must be turned to the ON mode in order to reset the parameters in the new RFA module and the PCM. For additional information, refer to Passive Anti-Theft System (PATS) Parameter Reset in Section 419-01B .

Remove the passenger seat. For additional information, refer to Section 501-10 .

2. Disconnect the 5 RFA module electrical connectors.

3. Remove the 2 bolts and the RFA module and bracket assembly.
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.
   - Program the IA keys into the new RFA module. For additional information, refer to Key Programming Using Diagnostic Equipment in Section 419-01B .
   - Carry out a Passive Anti-Theft System (PATS) parameter reset. For additional information, refer to Passive Anti-Theft System (PATS) Parameter Reset in Section 419-01B .

F16	15	Global Positioning System Module (GPSM) (early production)
F16	7.5	Exterior rear view mirror switch, Master window control switch (late production)
F17	7.5	Driver heated seat relay, Passenger heated seat relay
F18	10	Left turn relay, Right turn relay, Stoplamp switch
F19	7.5	Audio Control Module (ACM) (early production), Instrument Panel Cluster (IPC)
F20	10	Restraints Control Module (RCM)
F21	10	Body Control Module (BCM), HVAC module, Instrument Panel Cluster (IPC), Power Steering Control Module (PSCM), Passive anti-theft transceiver - without IA, Blower motor relay (BJB)
F22	7.5	Anti-lock Brake System (ABS) module, Accelerator Pedal Position (APP) sensor, Powertrain Control Module (PCM), Floor shifter
F23	10	Transmission Control Module (TCM), Tire Pressure Monitor/Vehicle Security Module (TPM/VSM)

Fuse	Amps	Circuits protected
F24	7.5	Roof opening panel module, Roof opening panel switch
F25	7.5	Exterior rear view mirror, passenger side, Exterior rear view mirror, driver side
F26	7.5	Tire Pressure Monitor/Vehicle Security Module (TPM/VSM)
F27	-	Not used
F28	-	Not used
F29	-	Not used
F30	-	Not used
F31	30	Master window control switch

Introduction

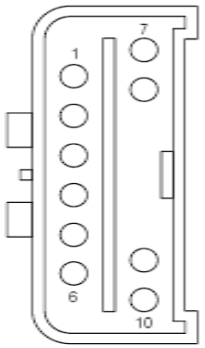
Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

C1

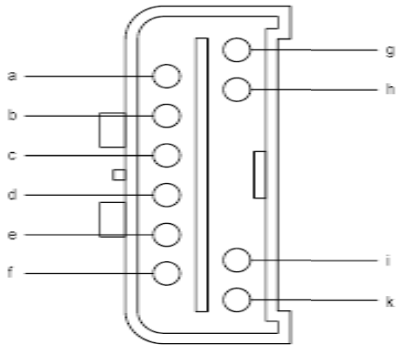
With molded identifiers



MALE

C1

Without molded identifiers



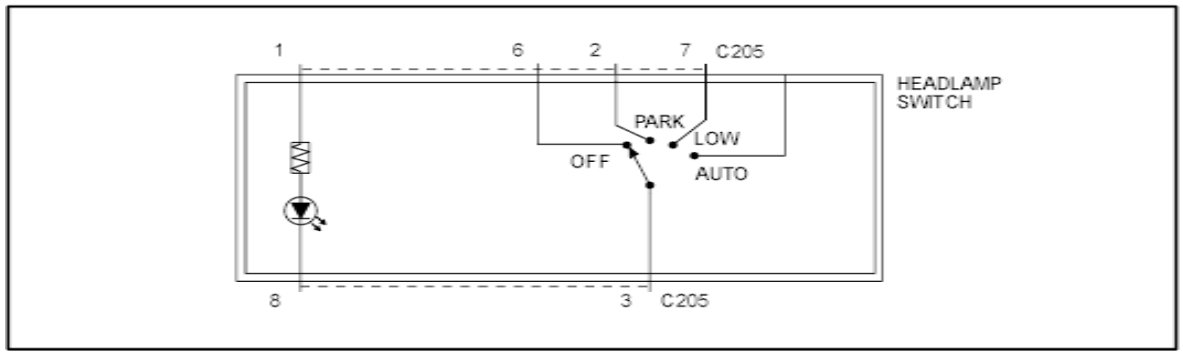
MALE

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

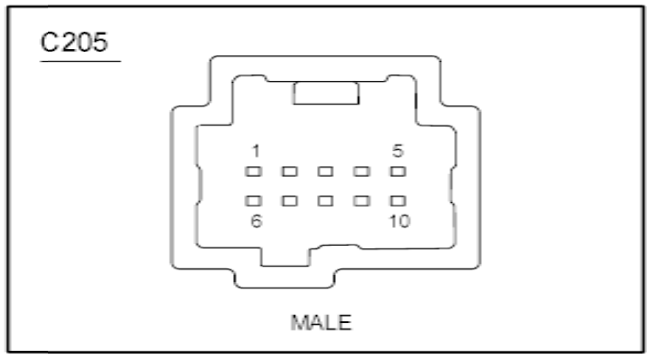
Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Headlamp switch, Exterior lamps

Schematic



Terminals

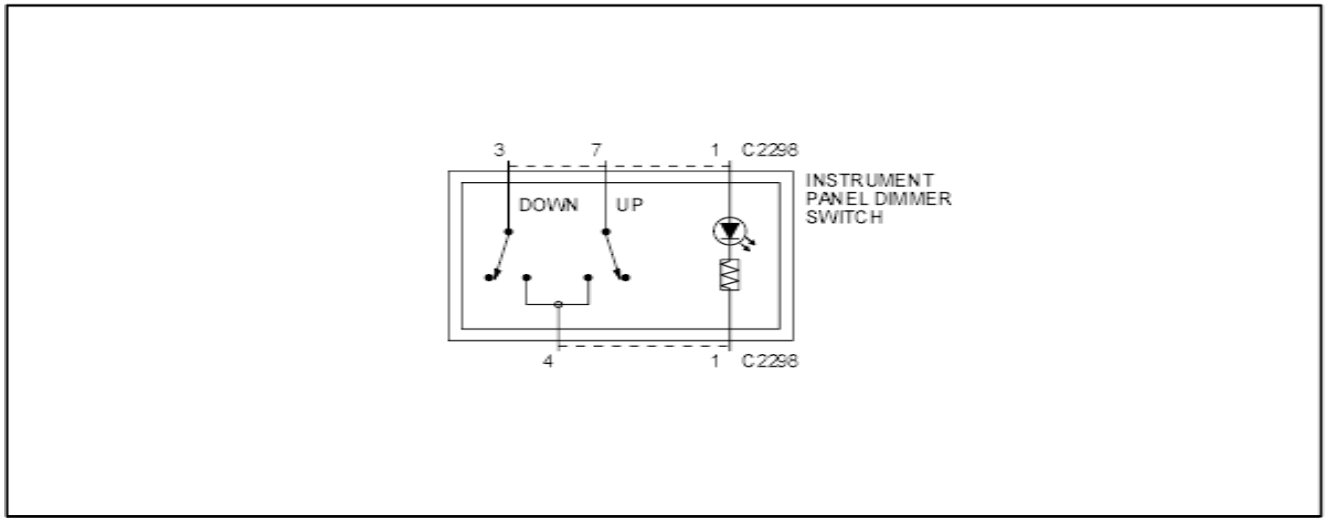


Component testing procedure

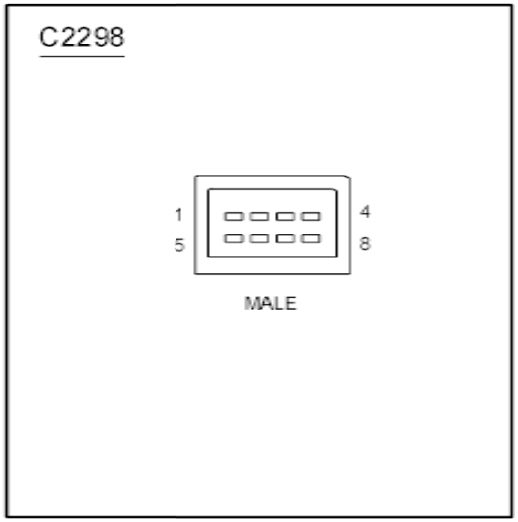
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Headlamp circuit	3 and 7	Off	Open circuit
		Park	Open circuit
		Low	Closed circuit
		Auto	Open circuit
Parking lamps	3 and 2	Off	Open circuit
		Park	Closed circuit
		Low	Open circuit
		Auto	Open circuit
Off	3 and 6	Off	Closed circuit
		Park	Open circuit
		Low	Open circuit
		Auto	Open circuit

Instrument panel dimmer switch

Schematic



Terminals

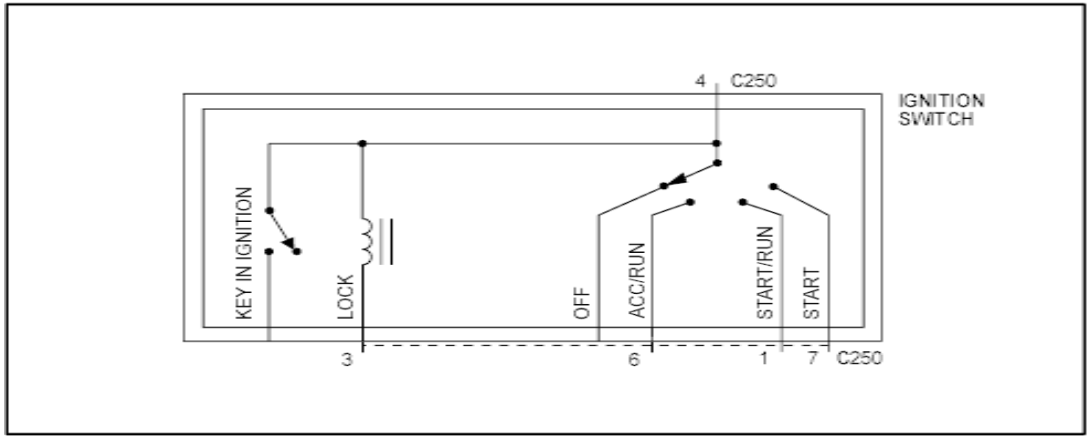


Component testing procedure

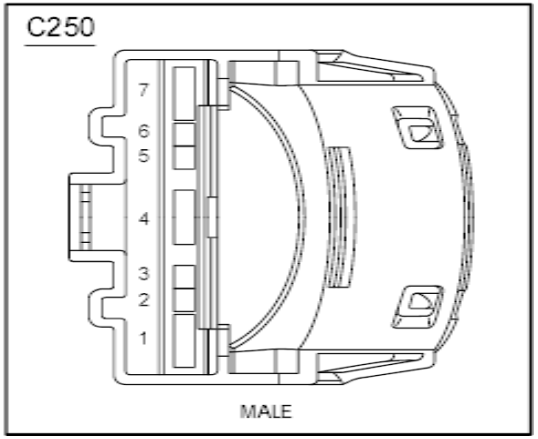
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Interior dimmer Circuit	4 and 7	Dimmer Up	Closed circuit
	4 and 3	Dimmer Dow	Closed circuit

Ignition switch

Schematic



Terminal locations

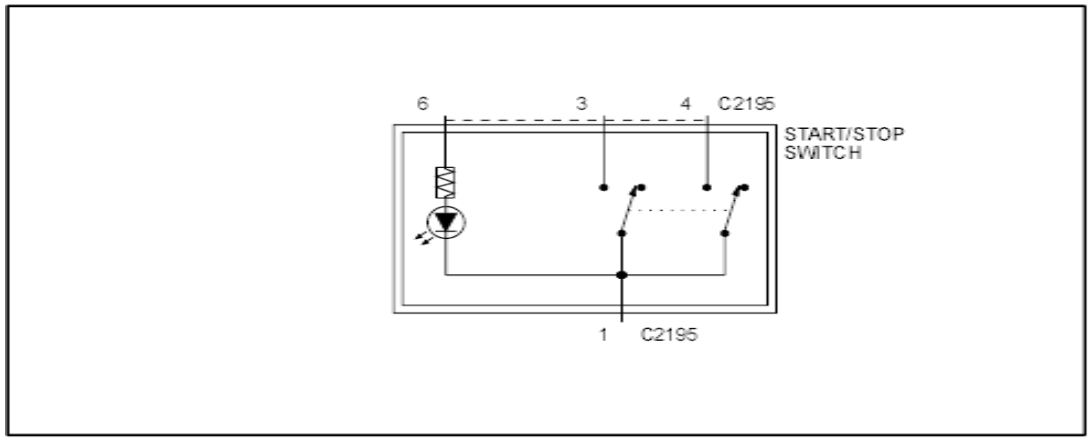


Component testing procedure

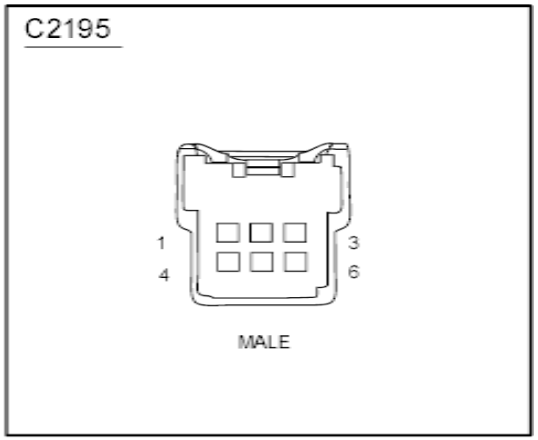
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Starter relay circuit	4 and 7	Off	Open circuit
		Acc	Open circuit
		Run	Open circuit
		Start	Closed circuit
Run/Start power circuit	4 and 1	Off	Open circuit
		Acc	Open circuit
		Run	Closed circuit
		Start	Closed circuit
Run/Acc power circuit	4 and 6	Off	Open circuit
		Acc	Closed circuit
		Run	Closed circuit
		Start	Open circuit
Key removal inhibit circuit	4 and 3		65-75 ?

Start / stop switch

Schematic



Terminal locations

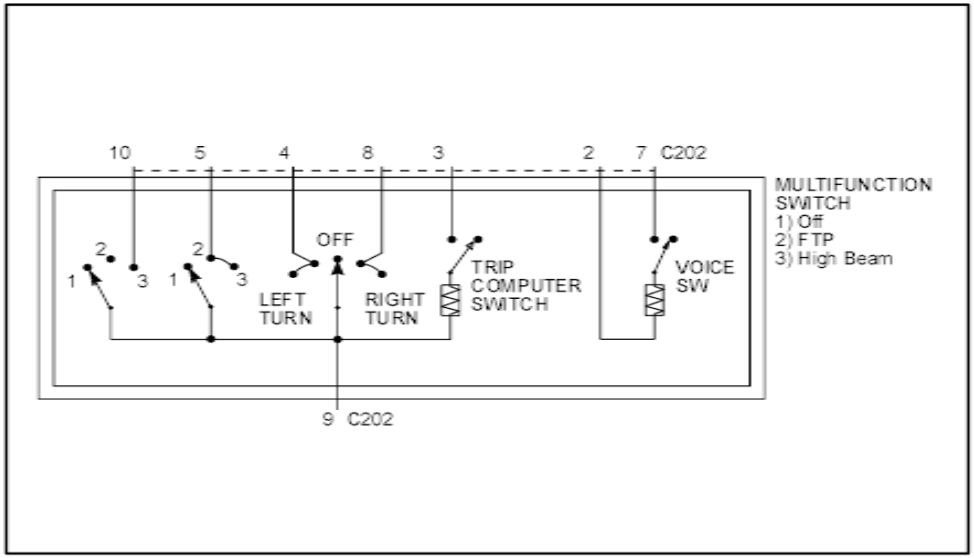


Component testing procedure

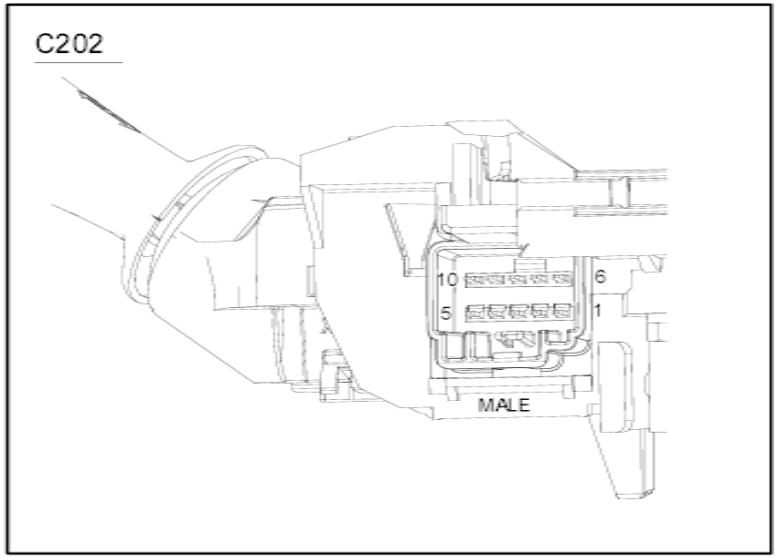
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
SSB 1 power circuit	3 and 1	Pressed	Closed circuit
		Released	Open circuit
SSB 2 power circuit	4 and 1	Pressed	Closed circuit
		Released	Open circuit

Multifunction switch

Schematic



Terminals

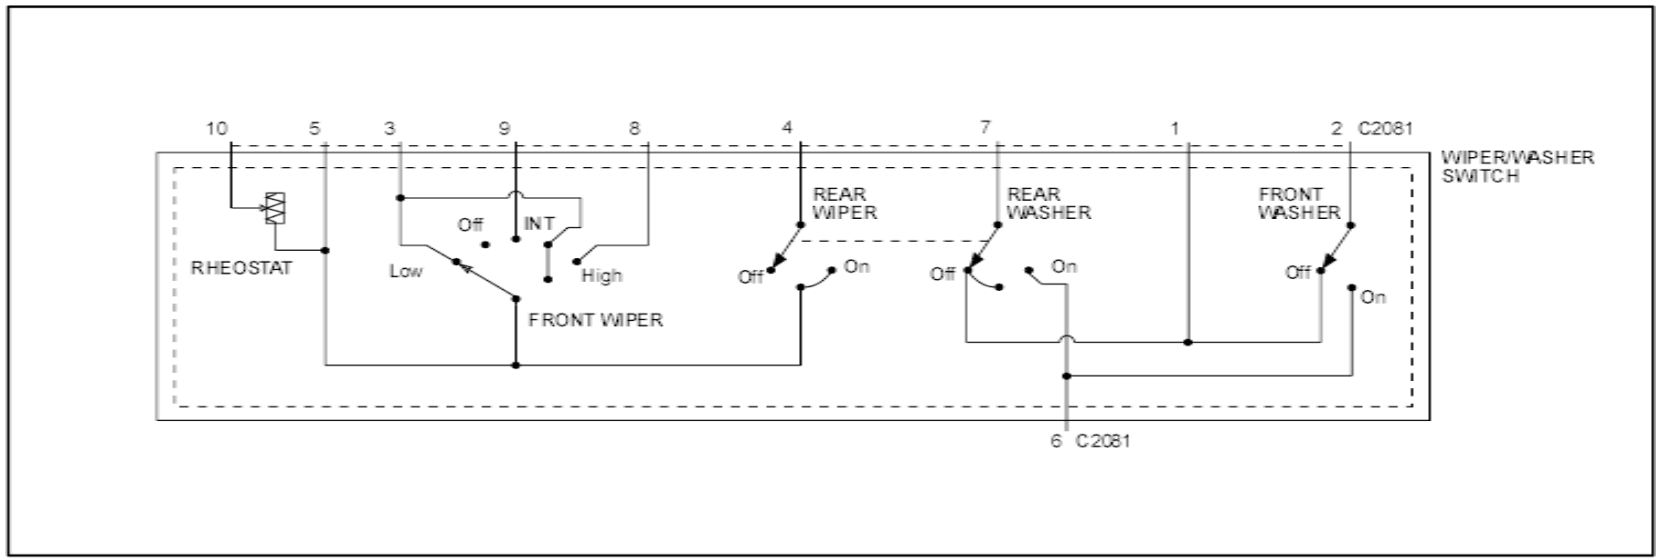


Component testing procedure

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Turn signal	4 and 9	Left turn	Closed circuit
		Off	Open circuit
	8 and 9	Right turn	Closed circuit
		Off	Open circuit
Flash-to-pass	10 and 9	Lever stalk in first detent toward steering wheel	Open circuit
	5 and 9		Closed circuit
High beam	10 and 9	Lever stalk in second detent toward steering wheel	Closed circuit
	5 and 9		Open circuit
Trip computer switch	3 and 9	Pressed	Closed circuit
		Released	Open circuit
Voice Switch	2 and 7	Pressed	Closed circuit
		Released	Open circuit

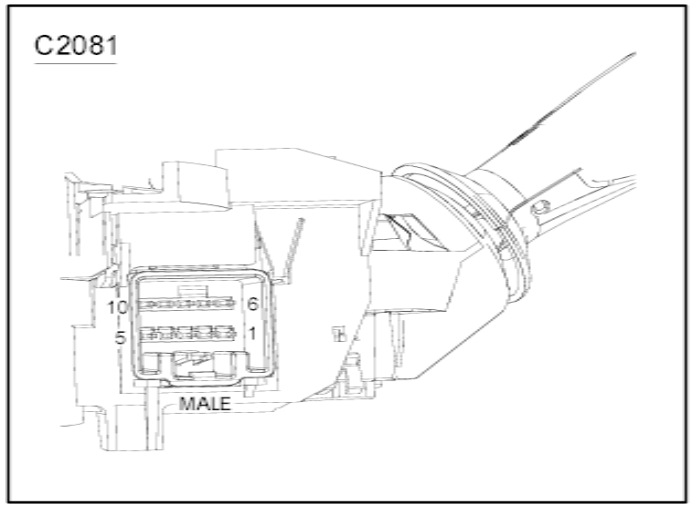
Wiper/Washer switch

Schematic



Terminals

C2081



Multifunction Switch, Wiper/Washer Portion (continued)

Component testing procedure - Front

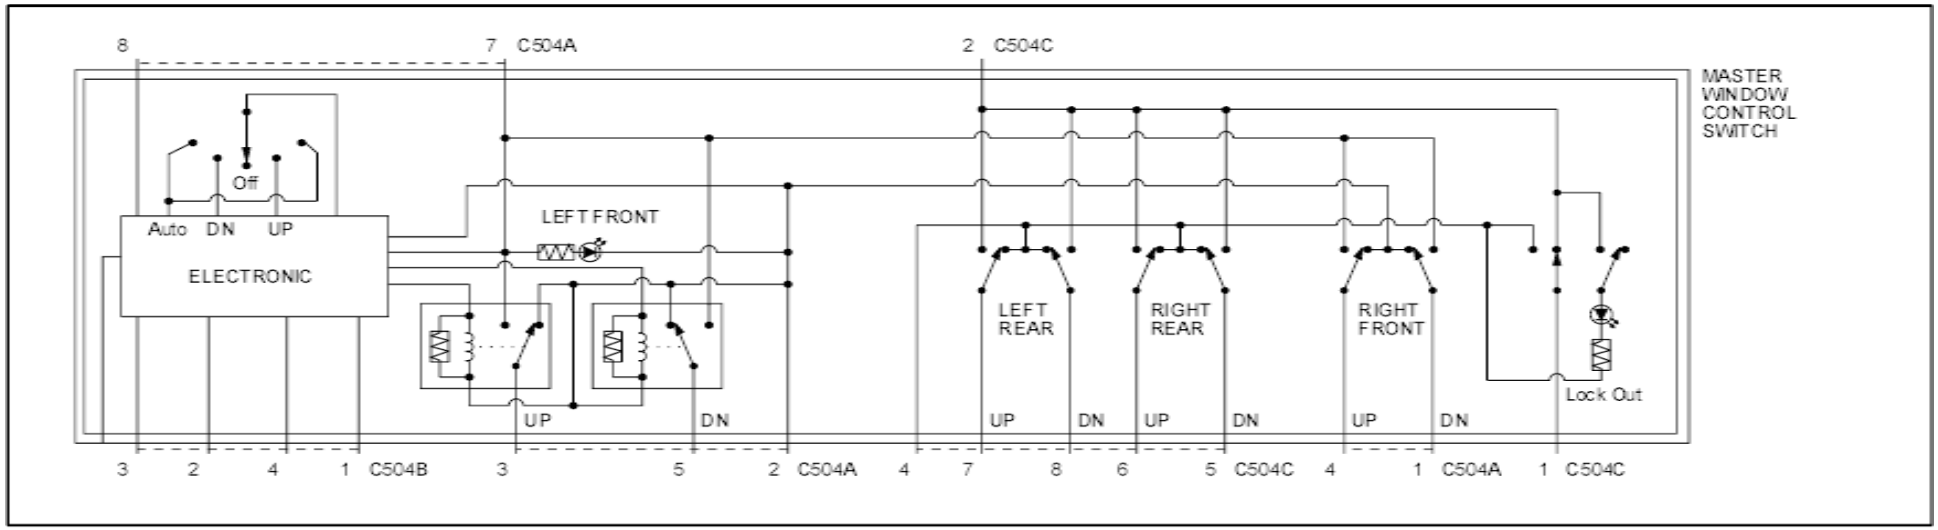
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Washer switch circuit	2 and 6	On	Closed circuit
		Off	Open circuit
Wiper switch circuit	8 and 5	Off	Open circuit
		High	Closed circuit
		Low	Open circuit
	3 and 5	Off	Open circuit
		High	Open circuit
		Low	Closed circuit
Intermittent wiper circuit	9 and 5	On	Closed circuit
		Off	Open circuit
Rheostat	10 and 5	Rotate knob	Ohmmeter will show a change in resistance

Component testing procedure - Rear

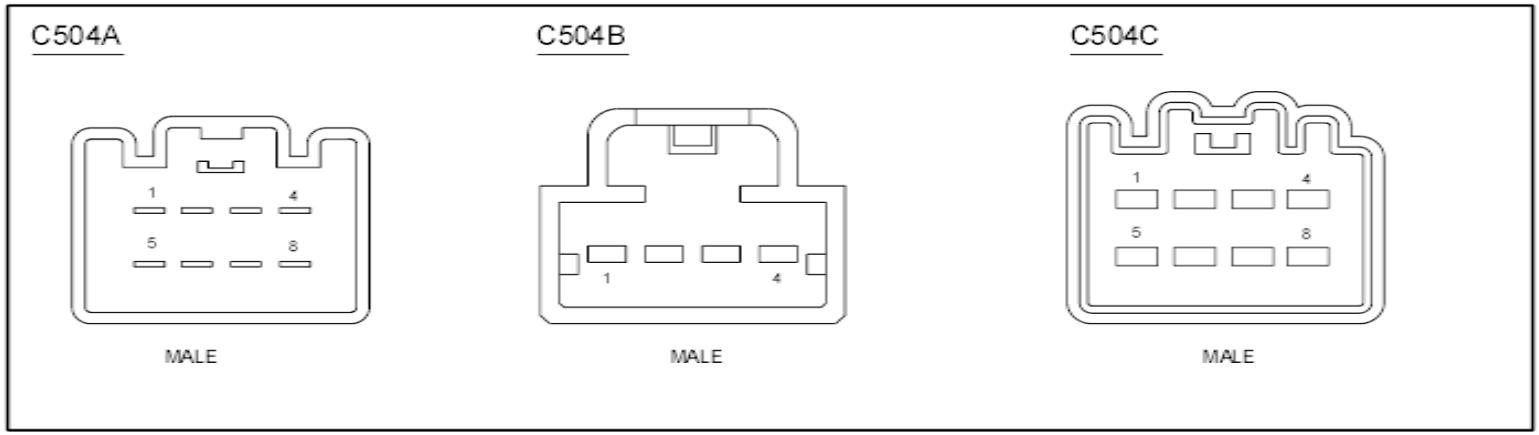
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Washer switch circuit	7 and 6	On	Closed circuit
		Off	Open circuit
Wiper switch circuit	4 and 5	On	Closed circuit
		Off	Open circuit

Master window control switch

Schematic



Terminals



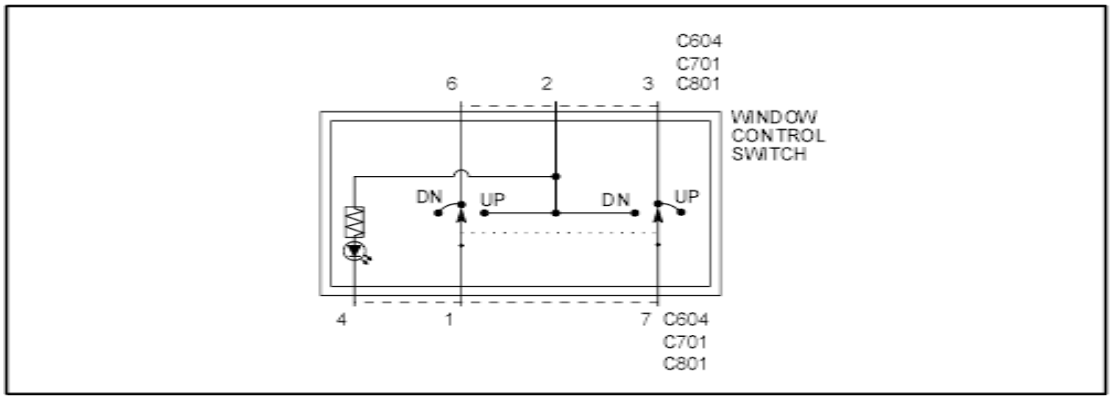
Master window control switch (continued)

Component testing procedure

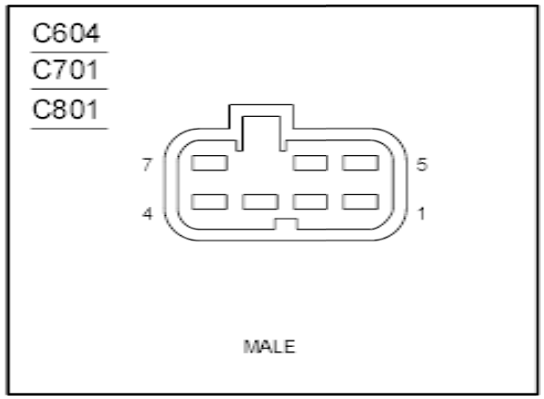
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Power Checks before any other tests	2 (504C) and 7 (C504C)	at rest	Open circuit
	2 (504C) and 8 (C504C)	at rest	Open circuit
	2 (504C) and 6 (C504C)	at rest	Open circuit
	2 (504C) and 5 (C504C)	at rest	Open circuit
	2 (504C) and 4 (C504A)	at rest	Open circuit
	2 (504C and 1 (C504A)	at rest	Open circuit
	2 (504C and 1 (C504C)	at rest	Closed circuit
Ground Checks before any other tests	4 (504C) and 7 (C504C)	at rest	Closed circuit
	4 (504C) and 8 (C504C)	at rest	Closed circuit
	4 (504C) and 6 (C504C)	at rest	Closed circuit
	4 (504C) and 5(C504C)	at rest	Closed circuit
	4 (504C) and 1 (C504C)	at rest	Open circuit
	2 (504A) and 4 (C504A)	at rest	Closed circuit
	2 (504A) and 1 (C504A)	at rest	Closed circuit
Left front window circuit	7 (504A) and 3 (C504A)	Up	Closed circuit
	7 (504A) and 5 (C504A)	Down	Closed circuit
Right front window circuit	7 (504A) and 1 (C504A)	Down	Closed circuit
	7 (504A) and 4 (C504A)	Up	
Left rear window circuit	2 (504C) and 8 (C504C)	Down	Closed circuit
	2 (504C) and 7 (C504C)	Up	
Right rear window circuit	2 (504C) and 5 (C504C)	Down	Closed circuit
	2 (504C) and 6 (C504C)	Up	

Window control switch

Schematic



Terminal locations

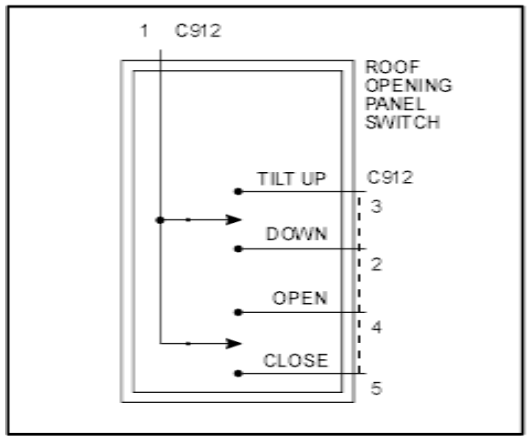


Component testing procedure

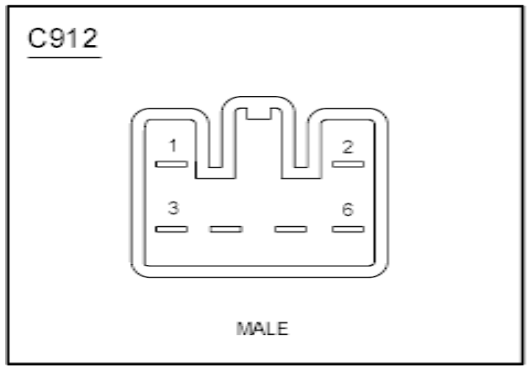
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Window control switches	2 and 1	Up	Closed circuit
	6 and 1		Open circuit
	2 and 7		Open circuit
	3 and 7		Closed circuit
	2 and 7	Down	Closed circuit
	3 and 7		Open circuit
	2 and 1		Open circuit
	6 and 1		Closed circuit

Roof opening panel switch

Schematic



Terminals

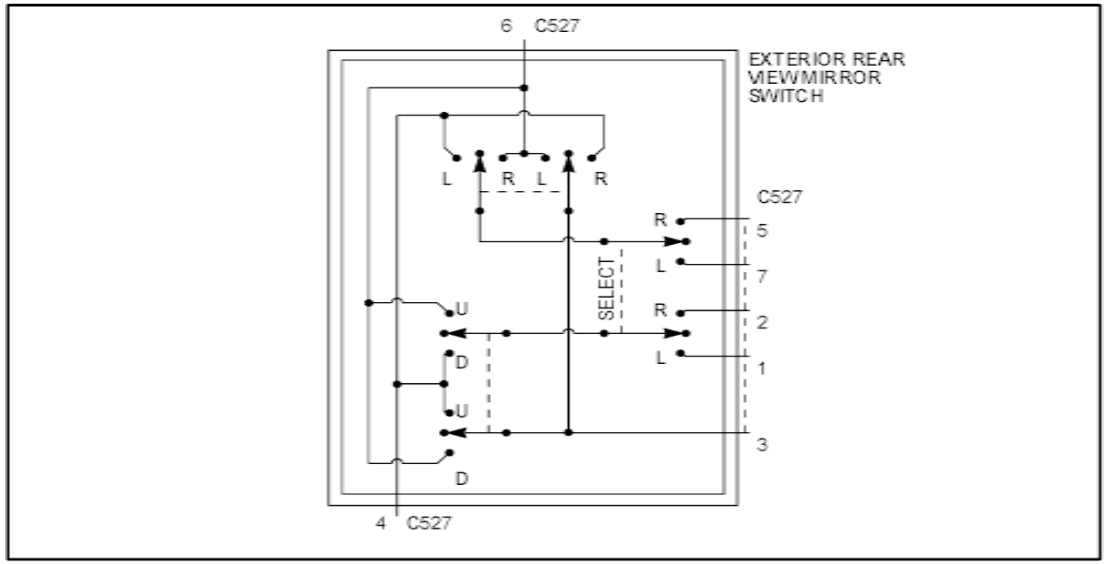


Component testing procedure

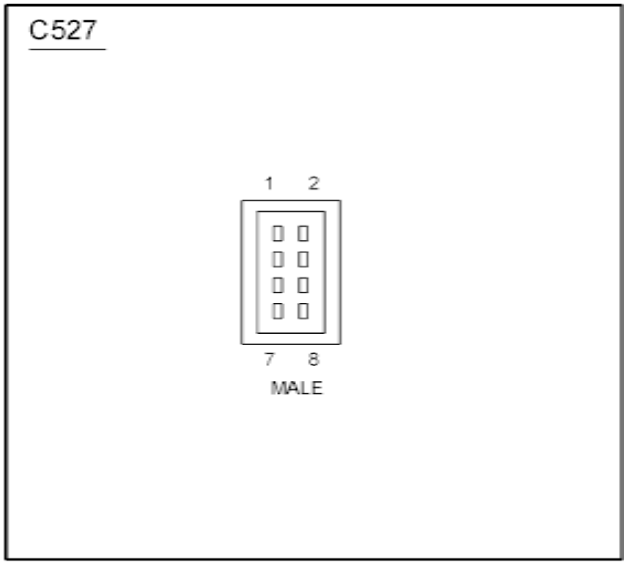
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Tilt	1 and 3	Tilt Up	Closed circuit
	1 and 2	Down	Open circuit
	1 and 4	Open	Open circuit
	1 and 5	Close	Open circuit
Down	1 and 3	Tilt Up	Open circuit
	1 and 2	Down	Closed circuit
	1 and 4	Open	Open circuit
	1 and 5	Close	Open circuit
Open	1 and 3	Tilt Up	Open circuit
	1 and 2	Down	Open circuit
	1 and 4	Open	Closed circuit
	1 and 5	Close	Open circuit
Close	1 and 3	Tilt Up	Open circuit
	1 and 2	Down	Open circuit
	1 and 4	Open	Open circuit
	1 and 5	Close	Closed circuit

Exterior rear view mirror switch

Schematic



Terminal locations

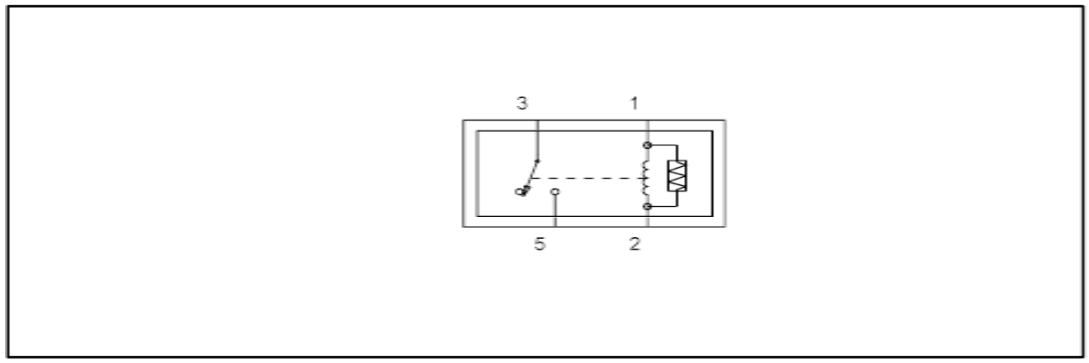


Component testing procedure

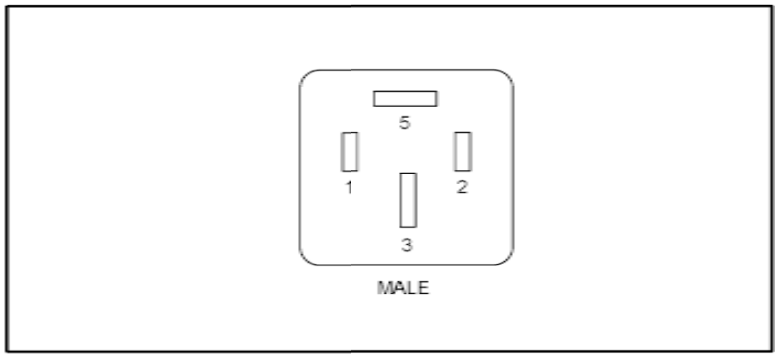
Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Left mirror	6 and 1 3 and 4	Up	Closed circuit
	6 and 3 4 and 1	Down	Closed circuit
	6 and 3 4 and 7	Left	Closed circuit
	6 and 7 4 and 3	Right	Closed circuit
Right mirror	6 and 2 4 and 3	Up	Closed circuit
	6 and 3 4 and 2	Down	Closed circuit
	6 and 3 4 and 5	Left	Closed circuit
	6 and 5 4 and 3	Right	Closed circuit

Relay - High Current ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

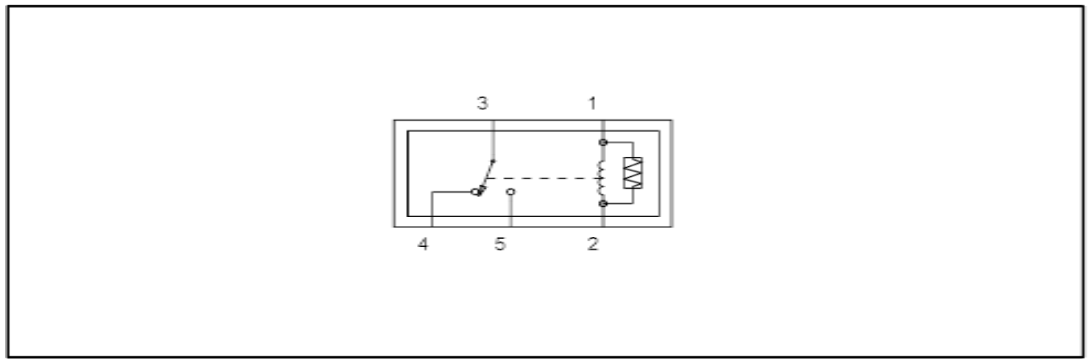
Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	46 - 80 Ohms
Contact	3 and 5	Open circuit
Coil - Contact	2 and 3	Open circuit
	2 and 5	Open circuit

Component testing procedure (voltage applied)

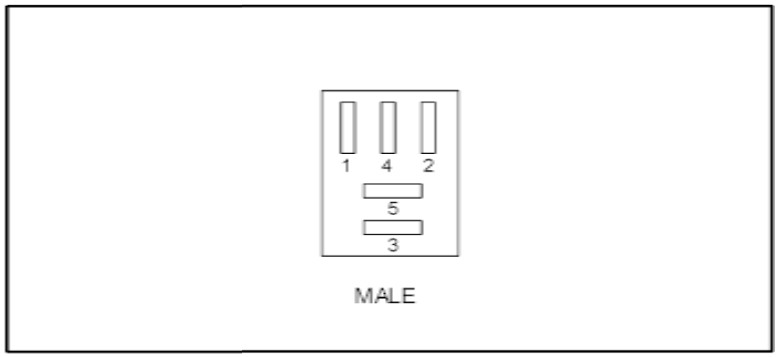
Disconnect the ohmmeter and connect pins 3 and 1 to 12V DC power and pin 2 to ground. Measure voltage between pins 5 and 2. If the voltage is 12V, the relay is okay. If not, replace the relay.

Relay - Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63 - 120
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil - Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter and connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pins 5 and 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pins 4 and 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Vehicle Repair Location Codes

TO PINPOINT THE ACTUAL VEHICLE LOCATION OF A REPAIR, THE VEHICLE REPAIR LOCATION CODE IS REQUIRED.

For example, an "X" has been placed in the quadrant of the vehicle diagrams indicating the location of the repair. See diagrams.

LOCATION CODE, FOR THE EXAMPLE A5/FU - (UNDER THE FLOOR OF DRIVER

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the schematics to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differently in a schematic from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one cell. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

Each cell normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the page to ground at the bottom of the page. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in cell 13 "Power Distribution." Full representation of the ground connections are shown in cell 10 "Grounds."

Switch Positions (2)

Within a schematic, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution schematic in cell 13 "Power Distribution." Splices connected to grounds can be seen completely in cell 10 "Grounds." For all other splices, a reference is given to each off page where that particular splice can be best viewed.

Component Referencing (4)

Components on a schematic have a reference to a component location view or the page where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The page where the component appears in full is listed in the Index. The base part number for a component is listed in cell 150 "Connector Views."

Internal Name and Function Identification Numbers (6)

Some components on each page have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

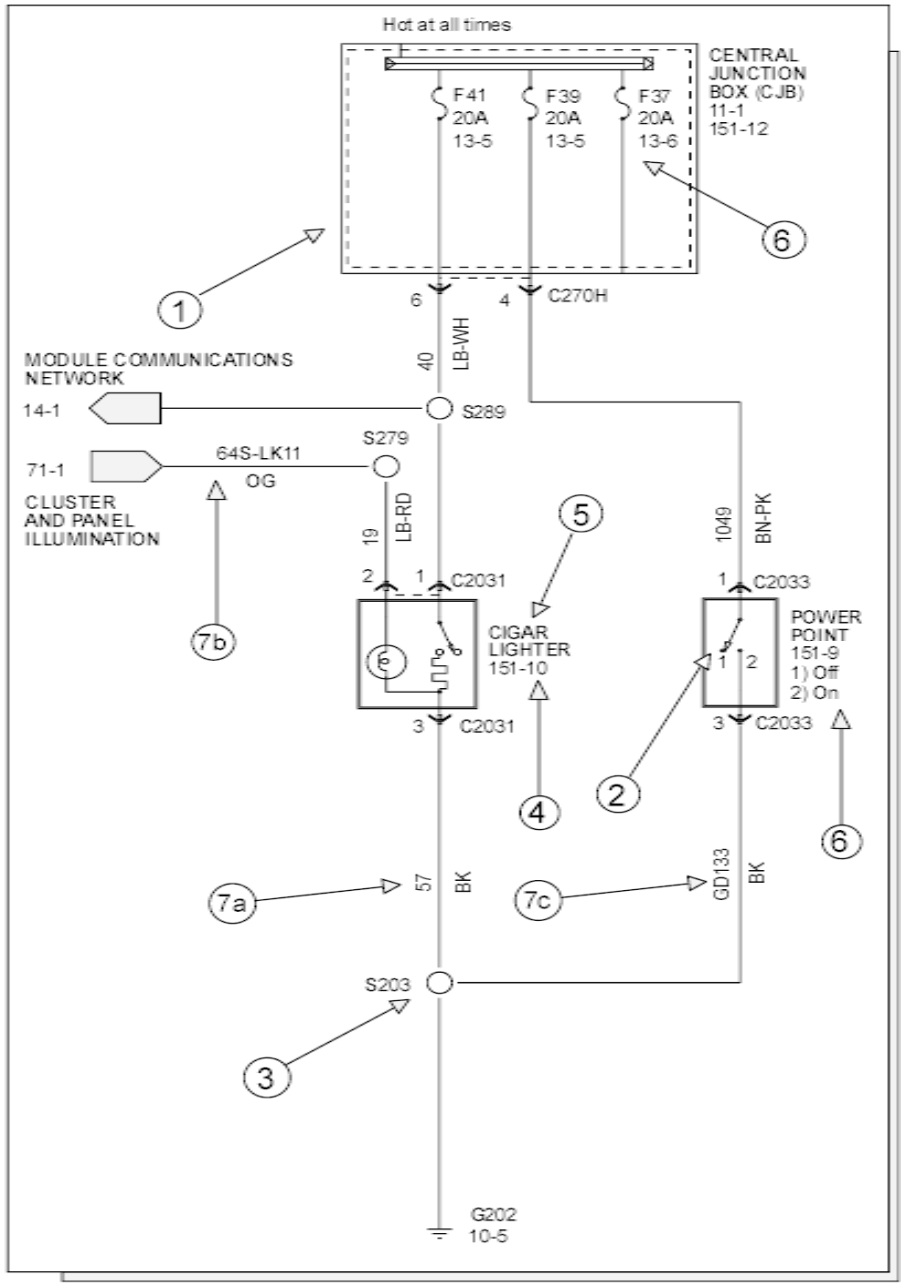
Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

Examples:

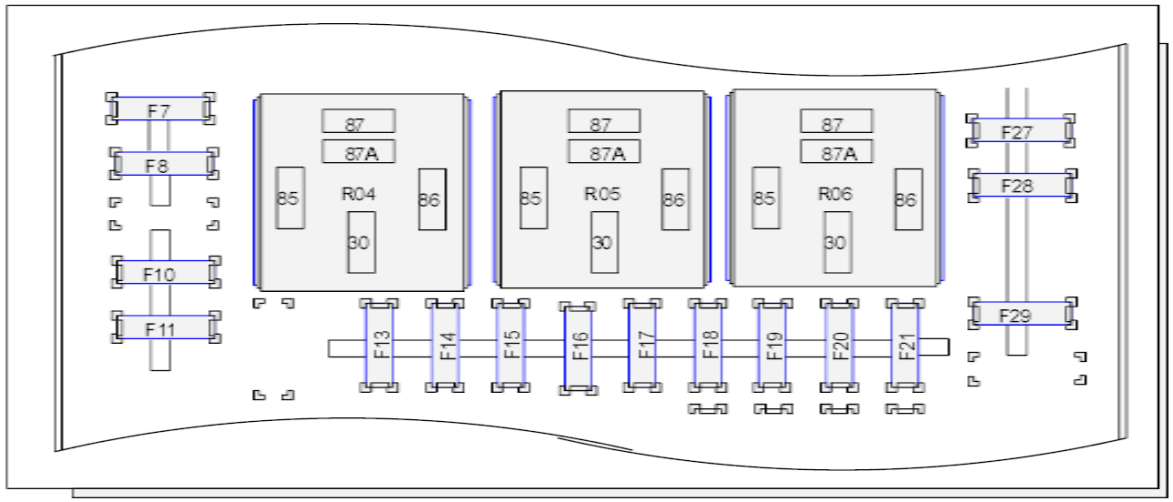
NOTE: Refer to cell 150 "Connector Views" for circuit functions.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the schematics, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in cell 4 "Symbols."



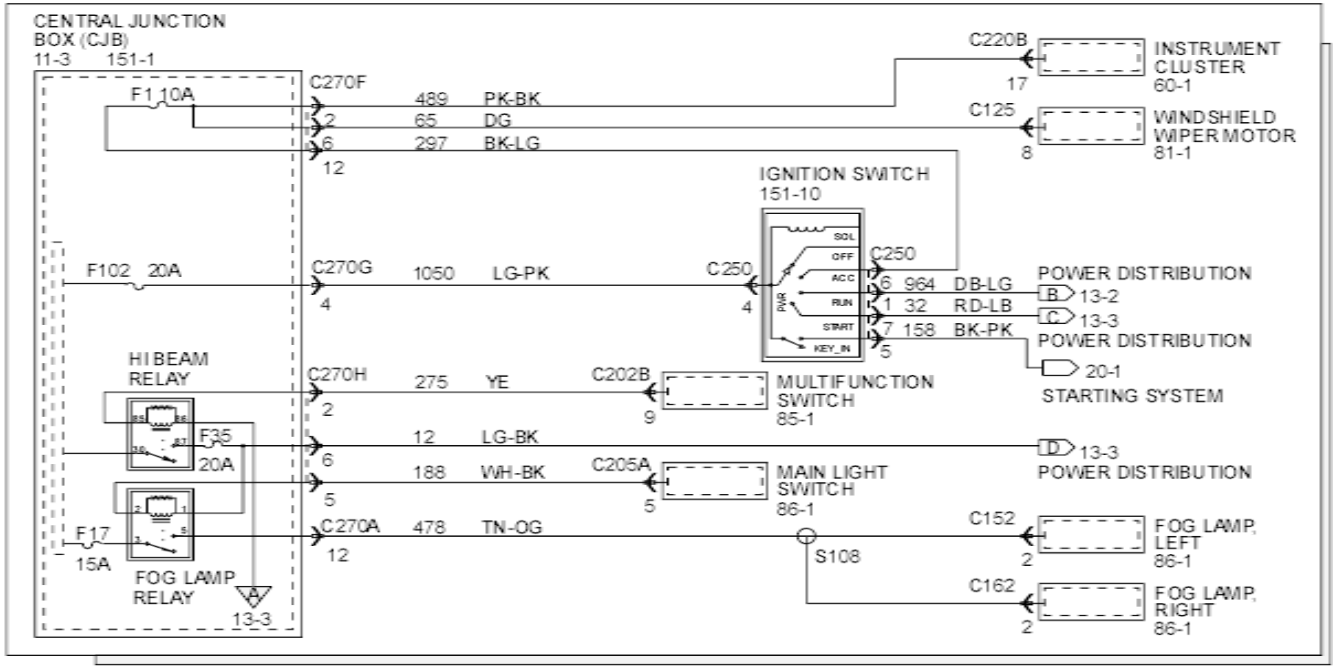
Fuse and Relay Information

Cell 11 "Fuse and Relay Information" contains a view of the fuse/relay box in which fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.



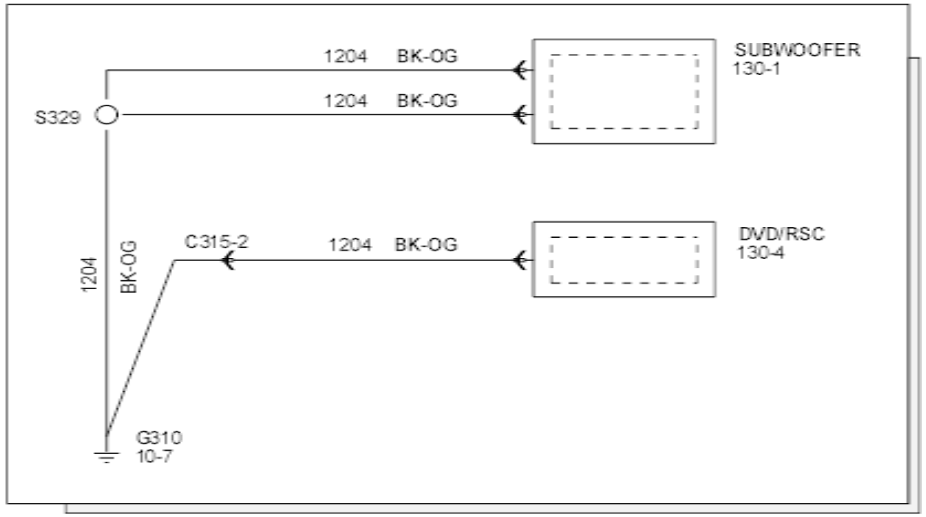
Power Distribution

Cell 13 "Power Distribution" shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.



Ground Distribution

Cell 10 "Grounds" contains the schematic that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual cell schematics as uncluttered as possible.



Component and Connector Information

Cell 150 "Connector Views" show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in cell 152 "Component Location Charts."

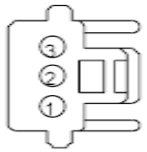
Cell 151 "Component Location Views" shows the components and their connecting wires as they can be found on the vehicle.

Cell 152 "Component Location Charts" helps the user find where the various items depicted on the schematic can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

C904 (GY)

14290

REAR DOME/MAP LAMP (13M614)



Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

WARNINGS

- Always wear safety glasses for eye protection.
- Use safety stands whenever a procedure requires being under a vehicle.
- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.
- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.
- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.
- Keep away from moving parts, especially the fan and belts, when the engine is running.
- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery cell. An explosion could occur.
- Do not smoke when working on a vehicle.
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing loose clothing.

Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right

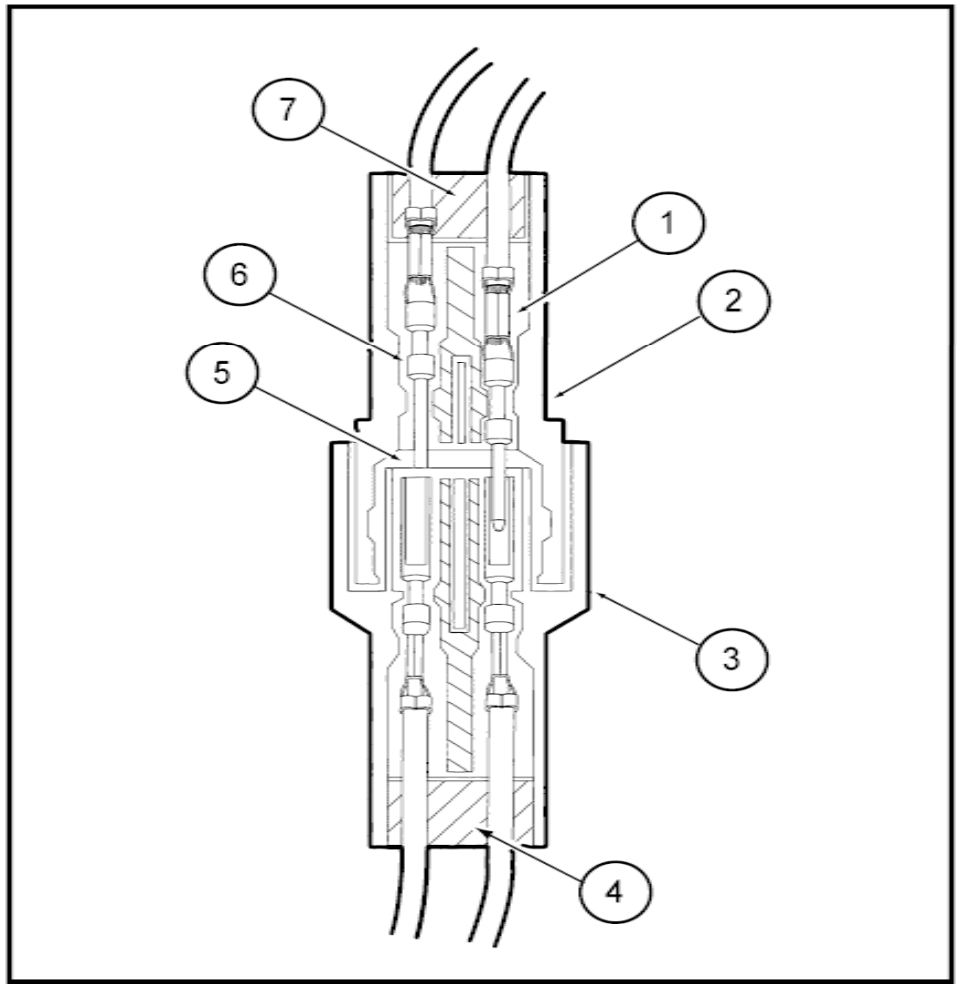
NOTE: Restraint system terminals should not be removed or repaired. If a restraints terminal requires service, replace the affected harness.

Troubleshooting wiring harness and connector hidden concerns

The following illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

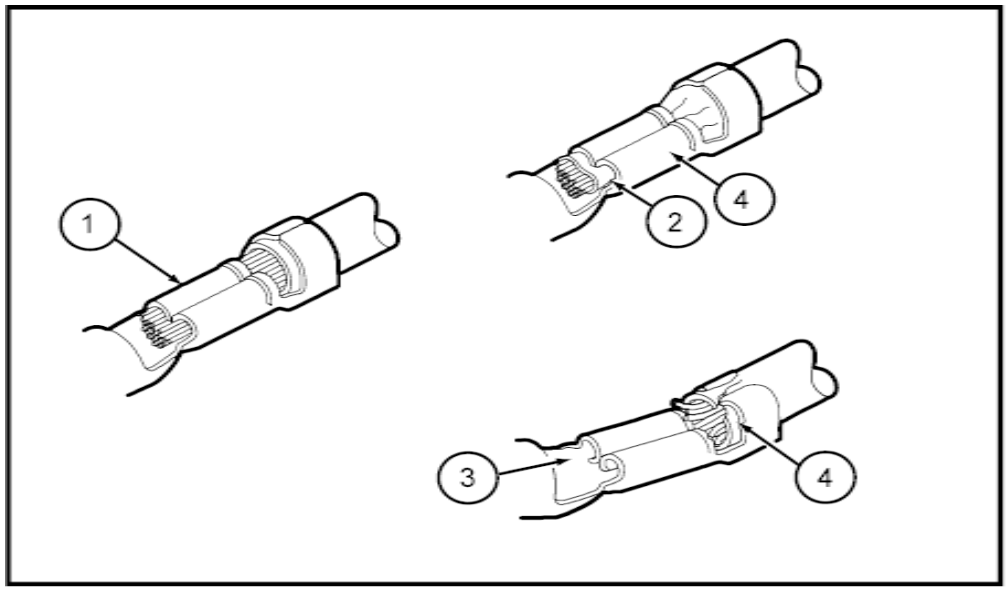
NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.



Terminal not properly seated

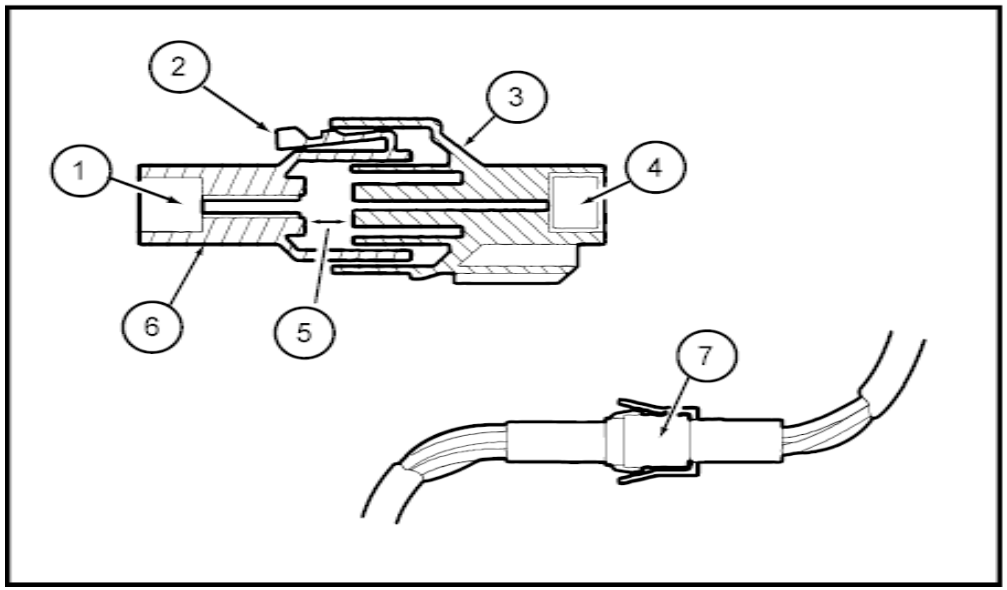
1 = Locked terminal
2 = Male half
3 = Female half
4 = Seal
5 = Intermittent contact
6 = Unlocked terminal (Hidden by wire seal)
7 = Seal

Check for unlocked terminals by pulling each wire at the end of the connector.



Defective insulation stripping

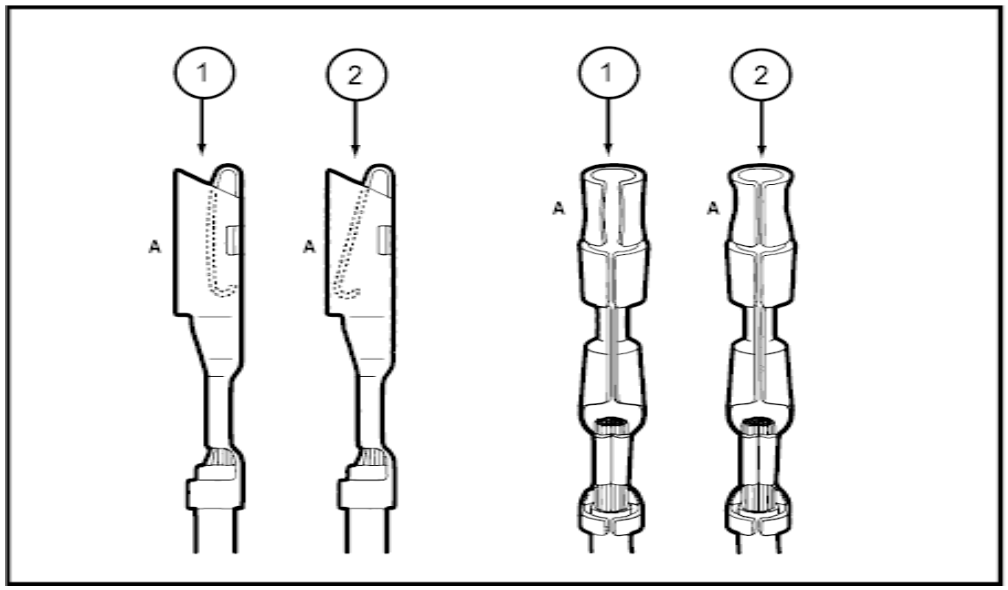
1 = Proper crimp
2 = Insulation not removed
3 = Wire strands missing
4 = Intermittent signals through pierced insulation



Partially mated connectors

1 = Seal
2 = Displaced tab
3 = Female half
4 = Seal
5 = Intermittent contact
6 = Male half
7 = Intermittent contact

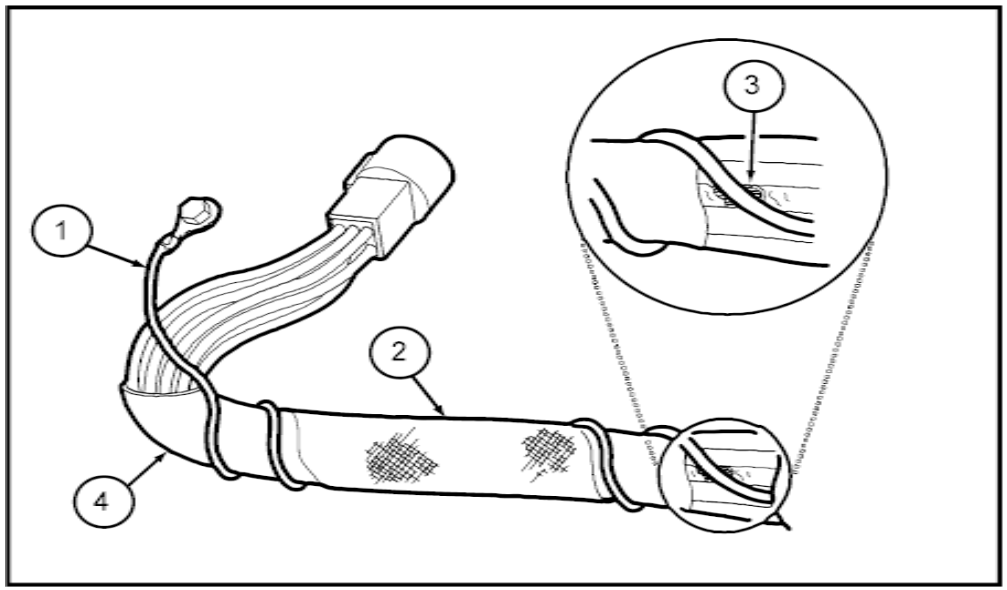
Lock may be displaced into an unlocked position; pull on the connector to verify the lock.



Deformed (enlarged) female terminals

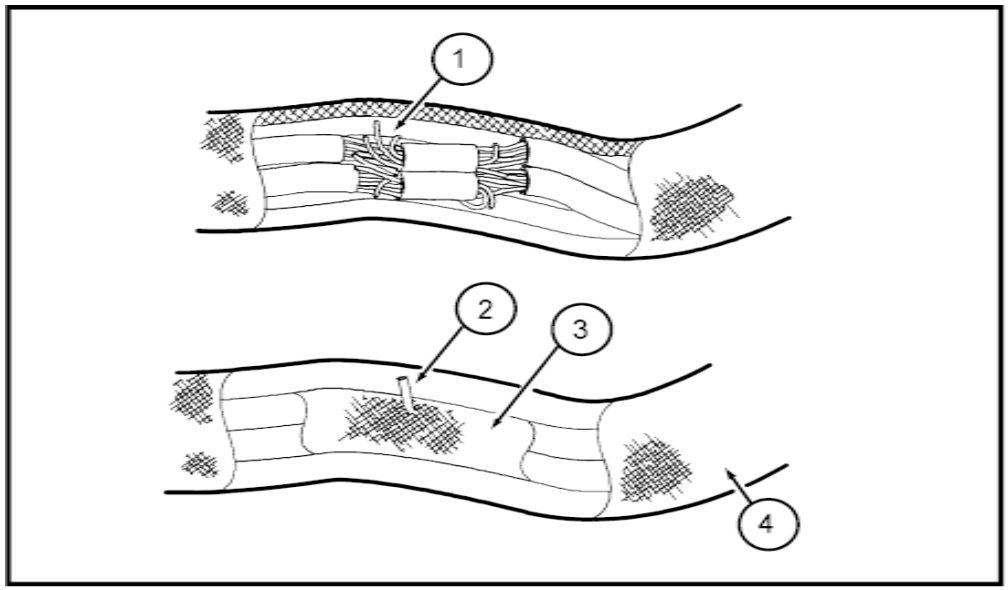
1 = Enlarged
2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.
Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.



Electrical short inside the harness

1 = Solder coated wire to ground
2 = Harness protective tape
3 = Intermittent short
Solder coated wire pierced through the insulation of another circuit.
4 = Grounding foil



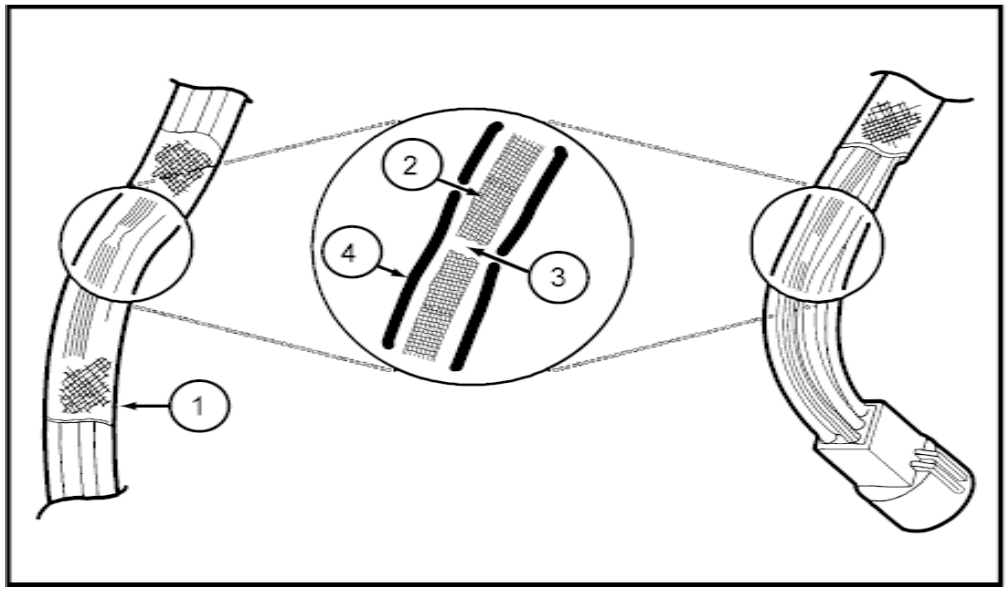
Electrical short within the harness

Splice tape removed

1 = Intermittent short

Splice covered

2 = Wire strand
3 = Splice tape
4 = Harness tape

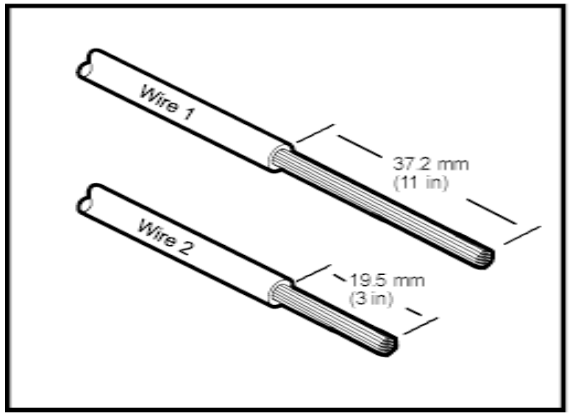


Broken wire strands in harness

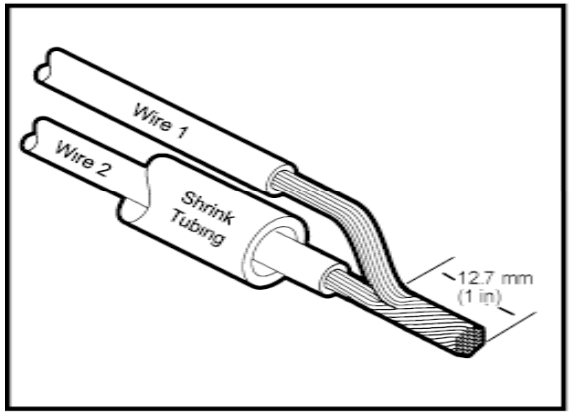
1 = Wiring harness tape
2 = Wiring strand
3 = Broken strands intermittent signal
4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)



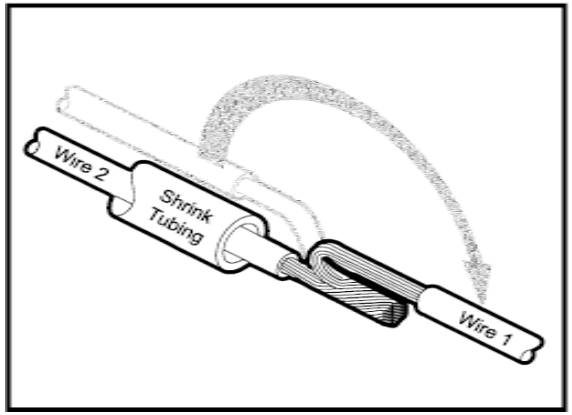
1. Disconnect battery ground cable.
2. Strip wires to appropriate length.



3. Install heat shrink tubing.
4. Twist wires together.
5. Solder wires together.

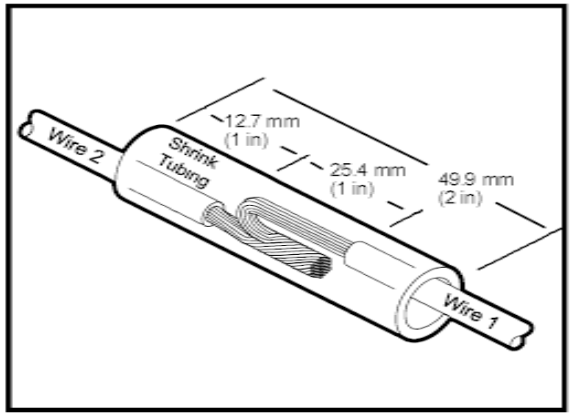
   NOTE: Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

   NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.



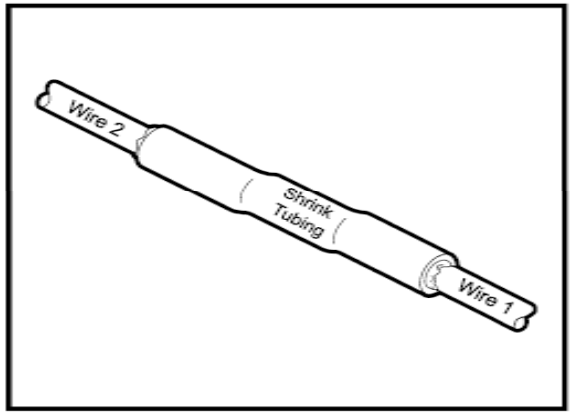
6. Bend wire 1 back in a straight line.

   NOTE: Wait for solder to cool before moving wires.



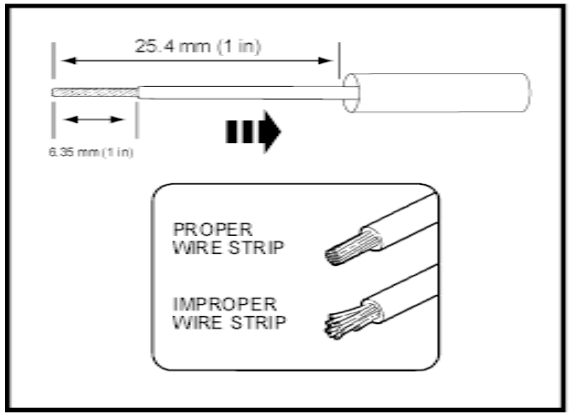
7. Evenly position heat shrink tubing over wire repair.

   NOTE: Overlap tubing on both wires.



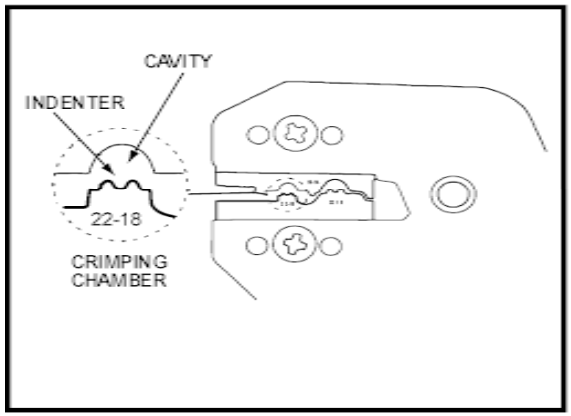
8. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of heat shrink tubing.
9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)



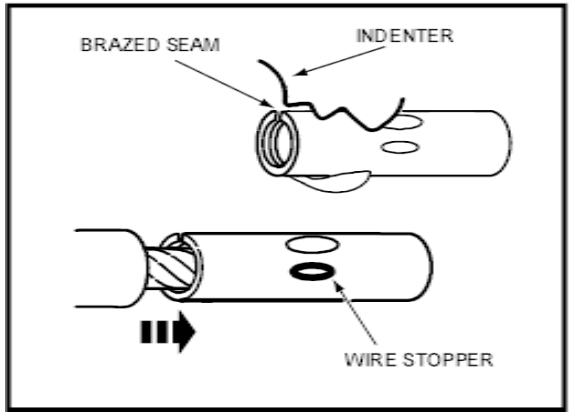
1. Disconnect battery ground cable.
2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands.
3. Install heat shrink tubing.

   NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

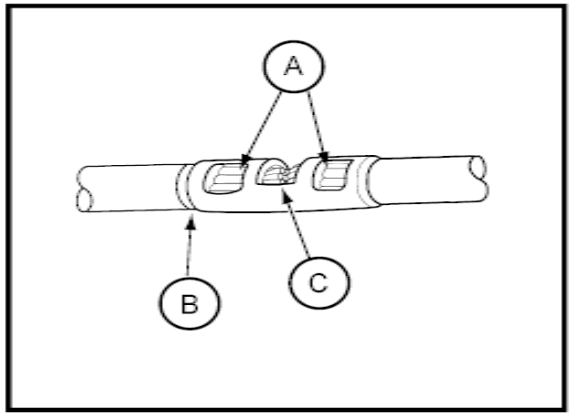


4. Select appropriate wire splice for the wires to be spliced.
5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size stamped on the butt splice.

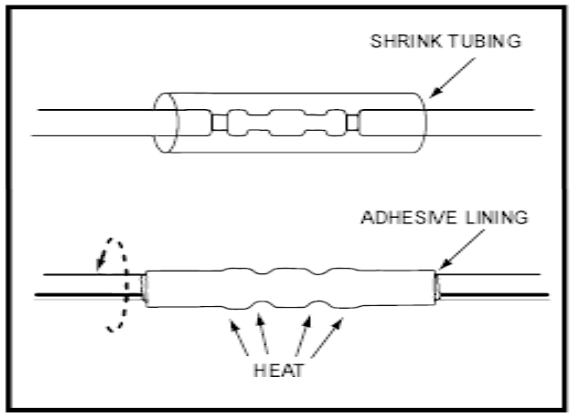
   NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.



6. Center one end of the wire splice in the appropriate crimping chamber.
7. If visible, be sure to place the brazed seam toward the indenter.
8. Insert stripped wire into the barrel.
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.
10. Repeating steps 5-7, crimp the other half of the splice.



11. Check for acceptable crimp.
    a. Crimp should be centered on each end of the butt splice.
    b. Wire insulation does not enter butt splice.
    c. Wire is visible through inspection hole of splices.



12. Evenly position supplied heat shrink tubing over wire repair.
13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing.
14. Reconnect battery ground cable.

This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	**12**	14	**16**	**18**	**20**	**22**	**24**

Appendix B GNU Free Documentation License

Version 1.3, 3 November 2008

Copyright © 2000, 2001, 2002, 2007, 2008, 2009 Free Software Foundation, Inc.
http://fsf.org/

Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

0. PREAMBLE

The purpose of this License is to make a manual, textbook, or other functional and useful document *free* in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or non-commercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released

under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

The "publisher" means any person or entity that distributes copies of the Document to the public.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

3. COPYING IN QUANTITY

   If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

   If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

   If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

   It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

4. MODIFICATIONS

   You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

   A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any,

be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.

B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.

C. State on the Title page the name of the publisher of the Modified Version, as the publisher.

D. Preserve all the copyright notices of the Document.

E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

H. Include an unaltered copy of this License.

I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.

N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.

O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their

titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

5. COMBINING DOCUMENTS

   You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

   The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

   In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements."

6. COLLECTIONS OF DOCUMENTS

   You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

   You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

7. AGGREGATION WITH INDEPENDENT WORKS

   A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

   If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

8. TRANSLATION

   Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

   If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

9. TERMINATION

   You may not copy, modify, sublicense, or distribute the Document except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, or distribute it is void, and will automatically terminate your rights under this License.

   However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

   Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

   Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, receipt of a copy of some or all of the same material does not give you any rights to use it.

10. FUTURE REVISIONS OF THIS LICENSE

    The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

    Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation. If the Document specifies that a proxy can decide which future versions of this License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Document.

11. RELICENSING

    "Massive Multiauthor Collaboration Site" (or "MMC Site") means any World Wide Web server that publishes copyrightable works and also provides prominent facilities for anybody to edit those works. A public wiki that anybody can edit is an example of such a server. A "Massive Multiauthor Collaboration" (or "MMC") contained in the site means any set of copyrightable works thus published on the MMC site.

    "CC-BY-SA" means the Creative Commons Attribution-Share Alike 3.0 license published by Creative Commons Corporation, a not-for-profit corporation with a principal place of business in San Francisco, California, as well as future copyleft versions of that license published by that same organization.

    "Incorporate" means to publish or republish a Document, in whole or in part, as part of another Document.

    An MMC is "eligible for relicensing" if it is licensed under this License, and if all works that were first published under this License somewhere other than this MMC, and subsequently incorporated in whole or in part into the MMC, (1) had no cover texts or invariant sections, and (2) were thus incorporated prior to November 1, 2008.

    The operator of an MMC Site may republish an MMC contained in the site under CC-BY-SA on the same site at any time before August 1, 2009, provided the MMC is eligible for relicensing.

ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

```
Copyright (C)  year  your name.
Permission is granted to copy, distribute and/or modify this document
under the terms of the GNU Free Documentation License, Version 1.3
or any later version published by the Free Software Foundation;
with no Invariant Sections, no Front-Cover Texts, and no Back-Cover
Texts.  A copy of the license is included in the section entitled ``GNU
Free Documentation License''.
```

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the "with. . . Texts." line with this:

```
with the Invariant Sections being list their titles, with
the Front-Cover Texts being list, and with the Back-Cover Texts
being list.
```

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

Appendix C GNU General Public License

Version 3, 29 June 2007

Copyright © 2007 Free Software Foundation, Inc. http://fsf.org/

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program—to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

0. Definitions.

   "This License" refers to version 3 of the GNU General Public License.

   "Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

   "The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

   To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

   A "covered work" means either the unmodified Program or a work based on the Program.

   To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

   To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

   An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

   The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

   A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

   All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

   You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

   Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

   No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

   You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

   You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

   You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

   a. The work must carry prominent notices stating that you modified it, and giving a relevant date.

   b. The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".

   c. You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

   d. If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

   A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

   You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a. Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b. Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c. Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d. Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e. Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source.

The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a. Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
b. Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
c. Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

d. Limiting the use for publicity purposes of names of licensors or authors of the material; or

e. Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

f. Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance.

However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so

available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

    If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

    Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
one line to give the program's name and a brief idea of what it does.
Copyright (C) year name of author

This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or (at
your option) any later version.

This program is distributed in the hope that it will be useful, but
WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program.  If not, see http://www.gnu.org/licenses/.
```

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

```
program Copyright (C) year name of author
This program comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.
```

The hypothetical commands '`show w`' and '`show c`' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an "about box".

You should also get your employer (if you work as a programmer) or school, if any, to sign a "copyright disclaimer" for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see http://www.gnu.org/licenses/.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read http://www.gnu.org/philosophy/why-not-lgpl.html.
