
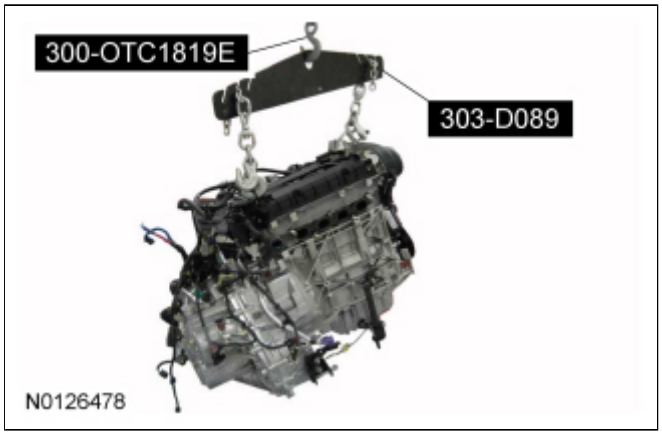
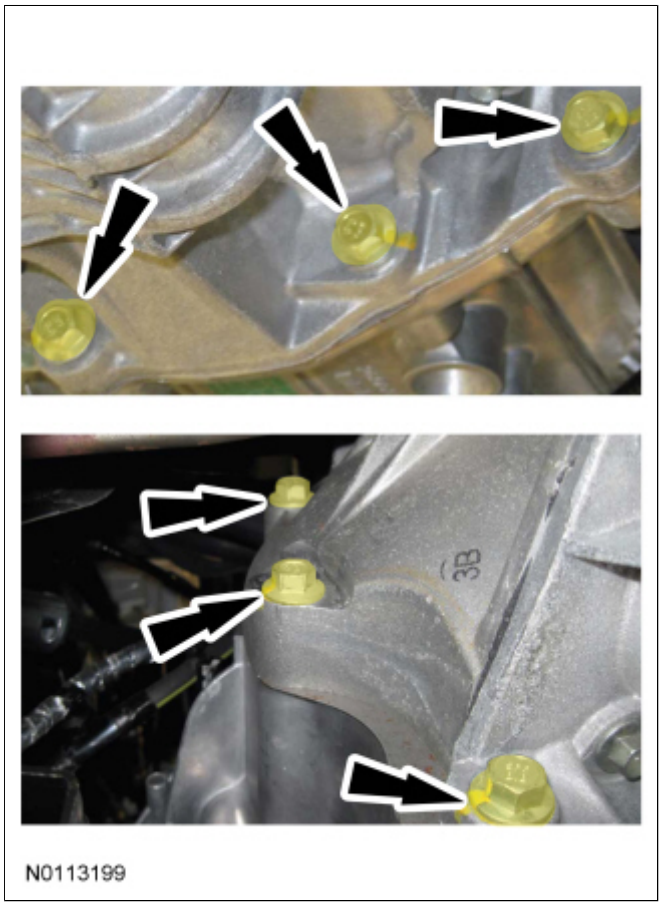
74. **NOTE:** Lower the engine to within a few inches of the floor.

    Using the Floor Crane and Spreader Bar, remove the engine and transaxle assembly from the lift table.



75. Remove the 6 clutch housing-to-engine bolts and separate the engine and transaxle.



Engine

Special Tool(s)

ST1910-A	Engine Stand 014-00232 or equivalent
ST1982-A	Installer, Connecting Rod 303-462 (T94P-6136-AH)
 ST3262-A	Pin, Crankshaft Top Dead Center (TDC) 303-748
ST2417-A	Remover, Input Shaft Oil Seal 308-375
ST1185-A	Slide Hammer 100-001 (T50T-100-A)
ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent
ST3261-A	Tool, Variable Camshaft Timing (VCT) Alignment 303-1097

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques.

Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

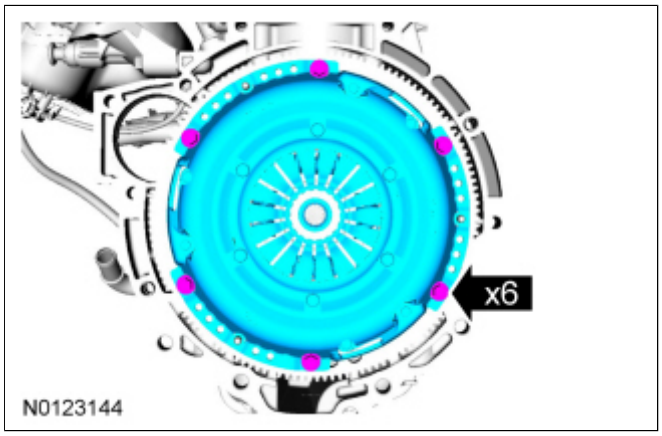
NOTE: For additional information, refer to the exploded view under the Assembly procedure in this section.

Vehicles with manual transaxle

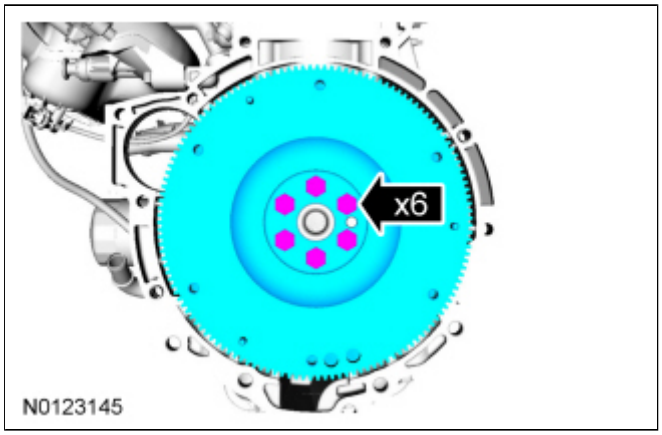
1. **WARNING: The clutch disc and clutch pressure plate are heavy and may fall if not held when the bolts are removed. Failure to follow this instruction may result in serious personal injury.**

   NOTE: Loosen the clutch pressure plate retaining bolts evenly, by two turns at a time.

   Remove and discard the 6 clutch pressure plate retaining bolts, remove the clutch disc and pressure plate.

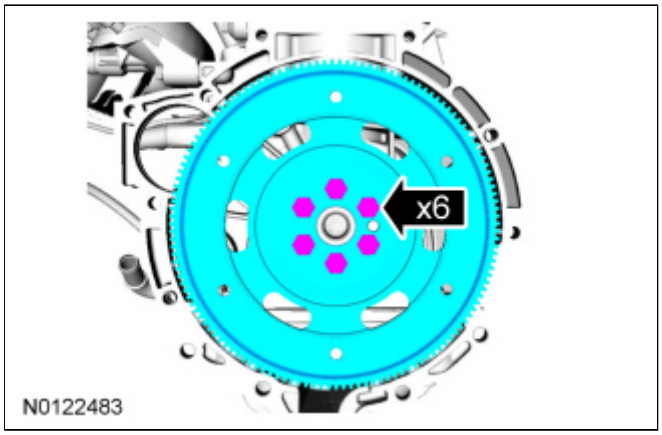


2. Remove the bolts and the flywheel.
   - Discard the bolts.



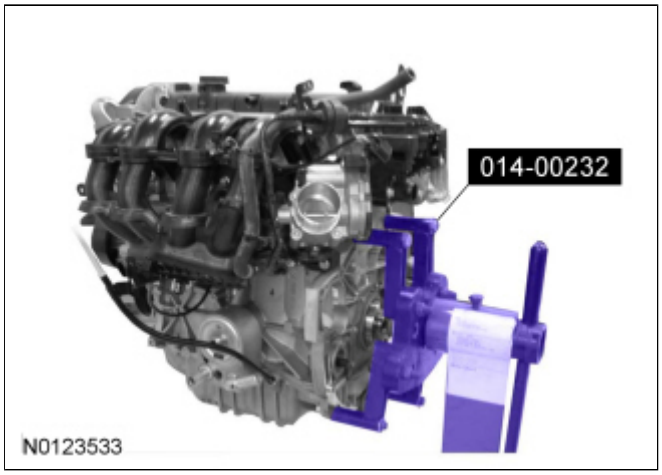
Vehicles with automatic transaxle

3. Remove the bolts and the flexplate.
    - Discard the bolts.

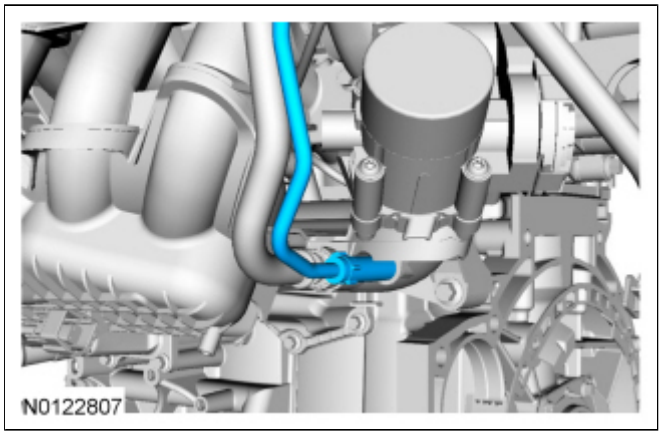


All vehicles

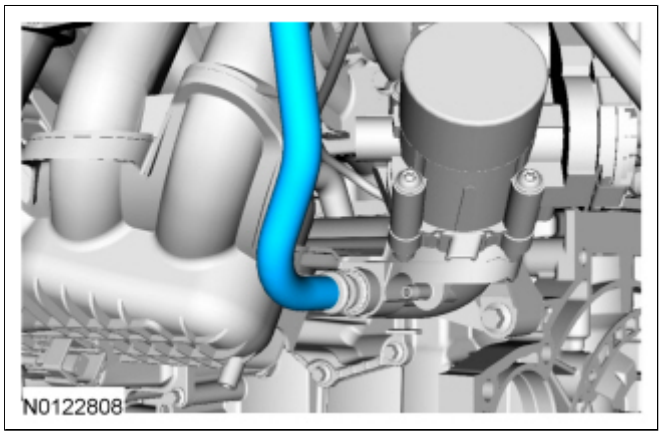
4. Mount the engine on a Engine Stand.



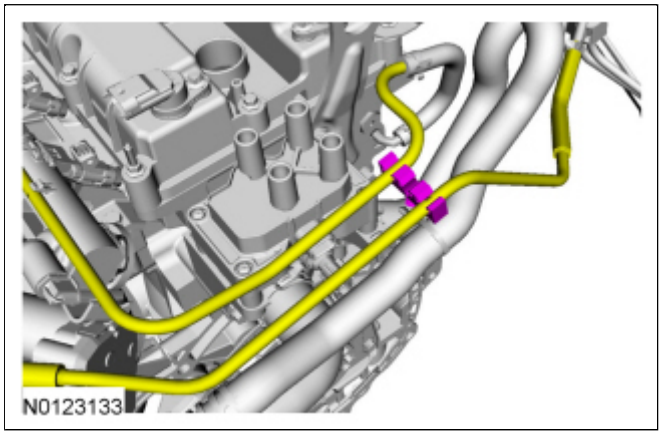
5. Disconnect the Evaporative Emission (EVAP) canister purge valve tube from the intake manifold.



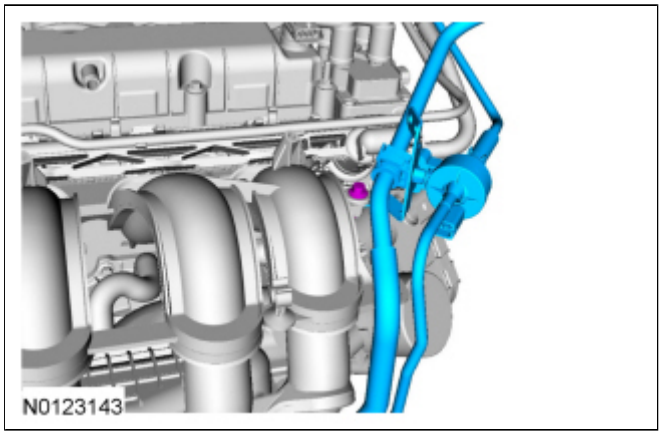
6. Disconnect the brake booster vacuum tube from the intake manifold.



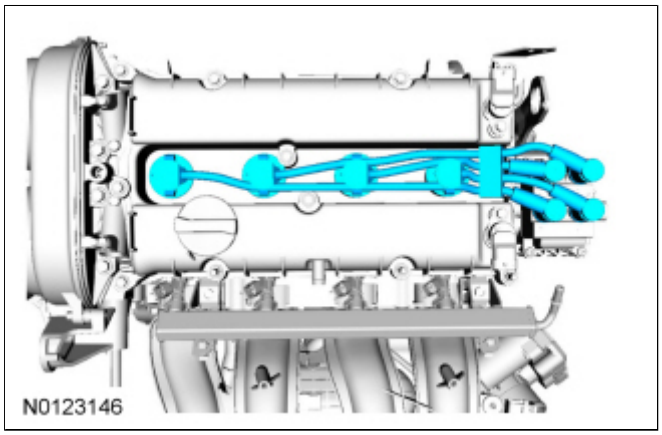
7. Detach the EVAP tube and coolant tube from the coolant outlet bracket retainer.



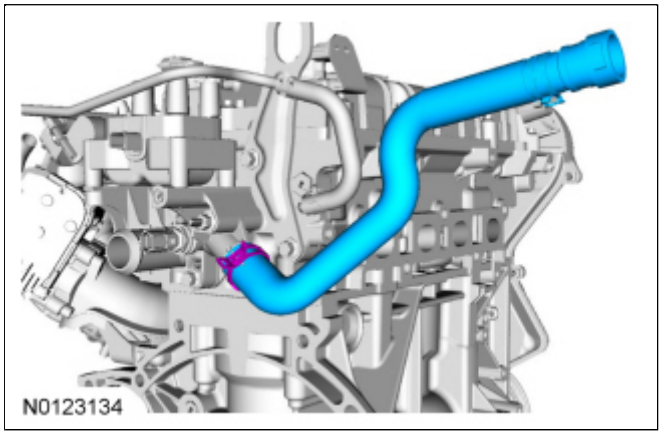
8. Remove the bolt for the EVAP canister purge valve and remove the brake booster vacuum tube and EVAP canister purge valve as an assembly.



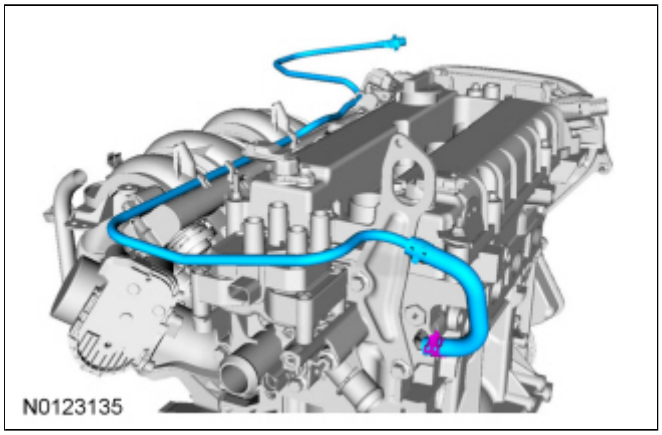
9. Remove the 4 spark plug wires.



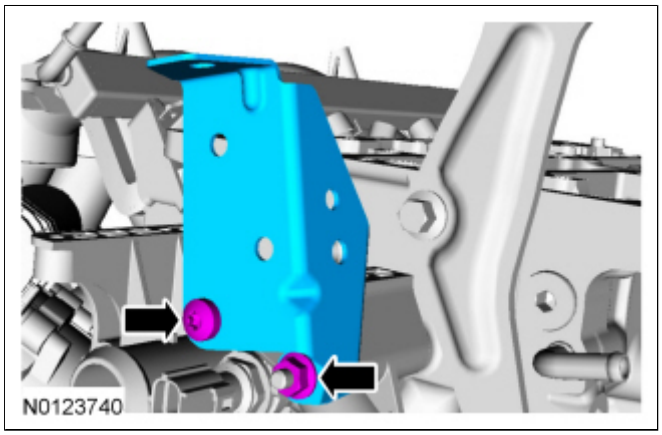
10. Disconnect the coolant hose from the coolant outlet.



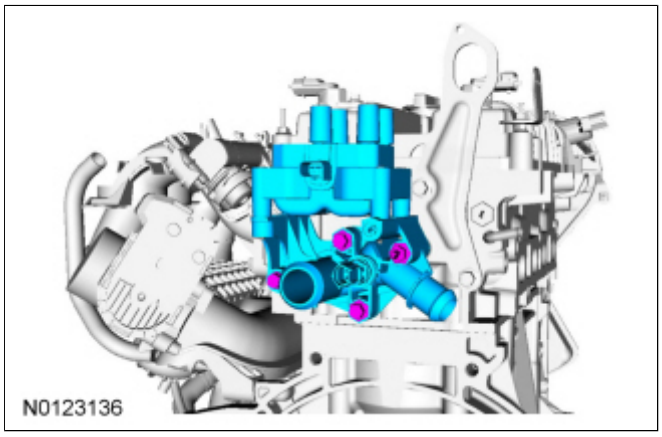
11. Disconnect the coolant return hose from the cylinder head.
    - Detach the coolant tube from the fuel rail retainers.



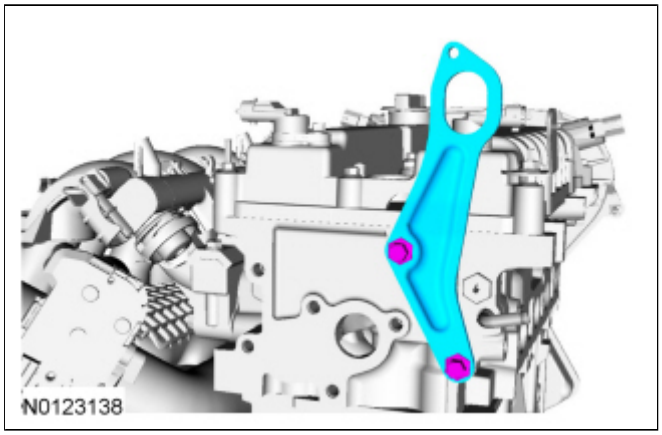
12. Remove the nut, bolt and the bracket from the coolant outlet.



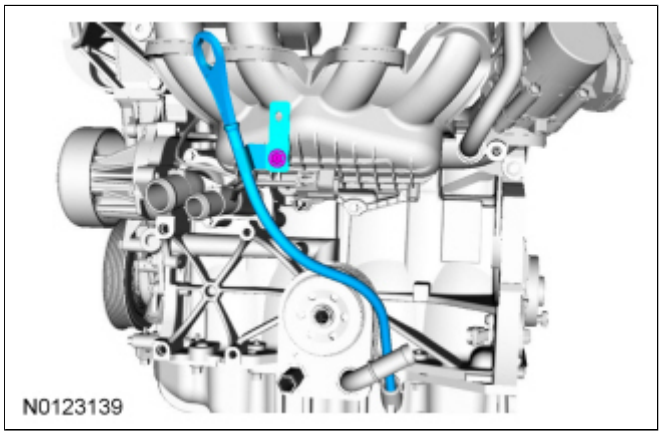
13. Remove the 4 bolts and the coolant outlet and ignition coil assembly.
    - Inspect and replace the gasket, if necessary.



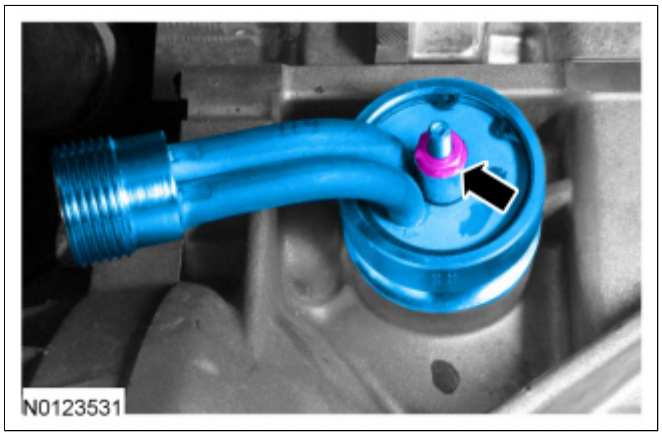
14. Remove the 2 bolts and the engine lift eye.



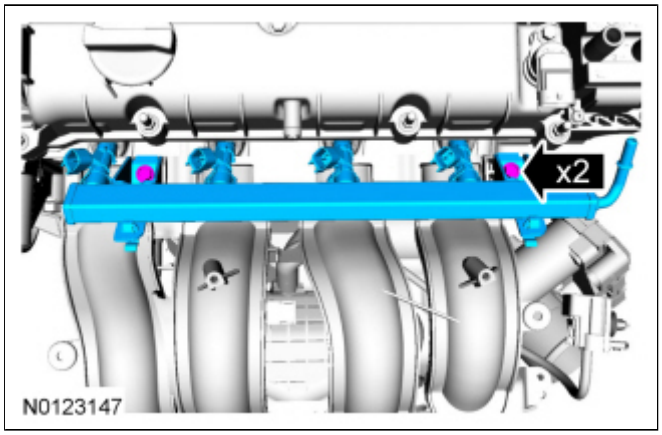
15. Remove the screw and the oil level indicator and tube.
    - Inspect and replace the O-ring seal, if necessary.



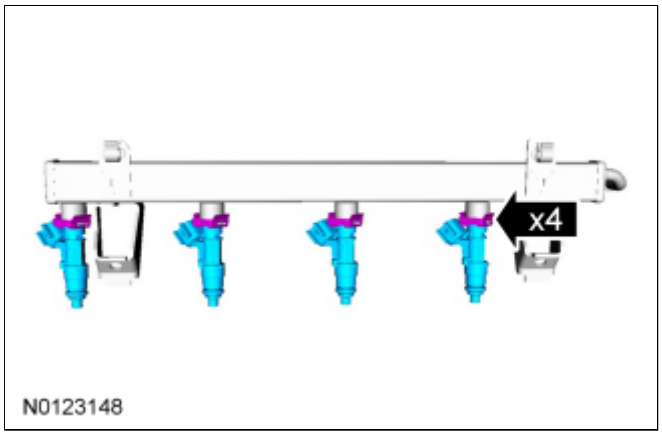
16. If equipped, remove the engine block heater.



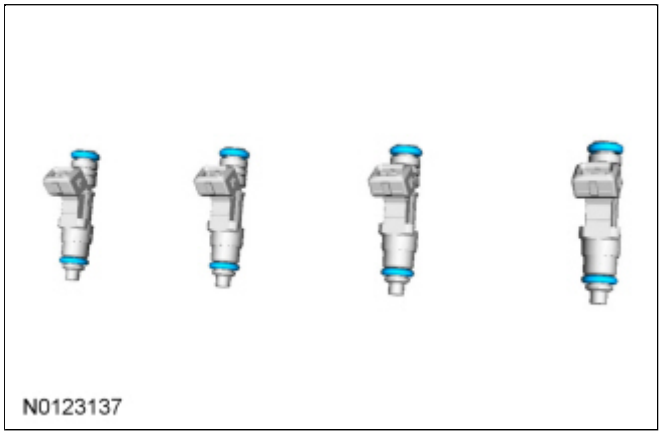
17. Remove the 2 bolts and the fuel rail assembly.



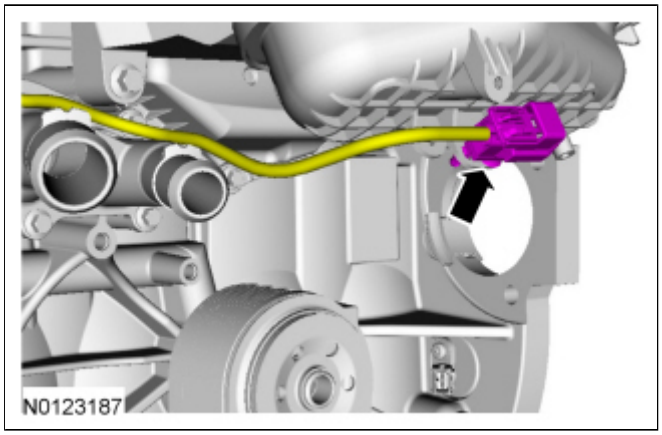
18. Remove the 4 fuel injector clips and the 4 fuel injectors.



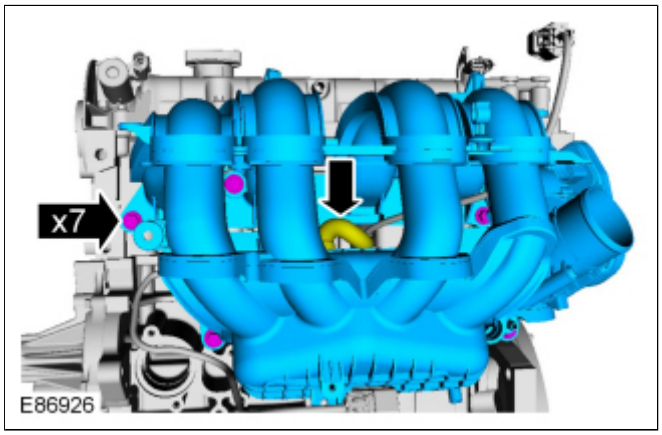
19. Remove and discard the 8 fuel injector O-ring seals.



20. Detach the Knock Sensor (KS) from the bottom of the intake manifold.

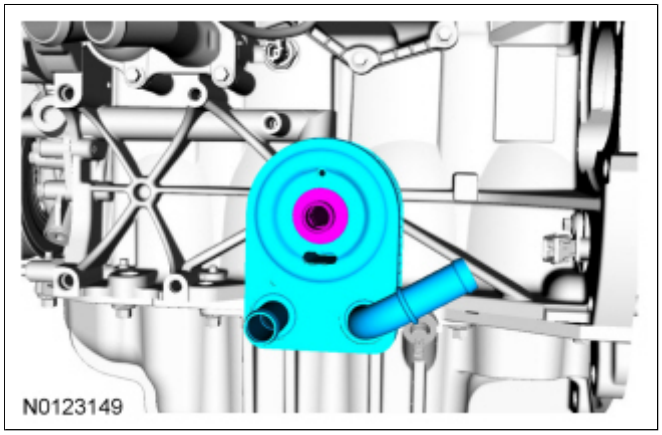


21. Remove the 7 bolts and the intake manifold.
    - Disconnect the PCV hose from the intake manifold.

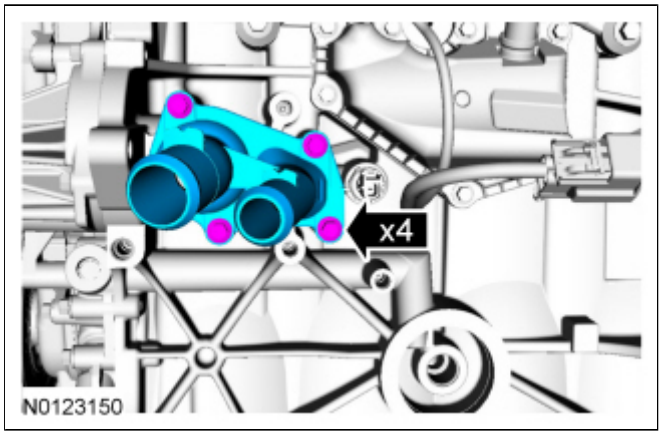


22. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**

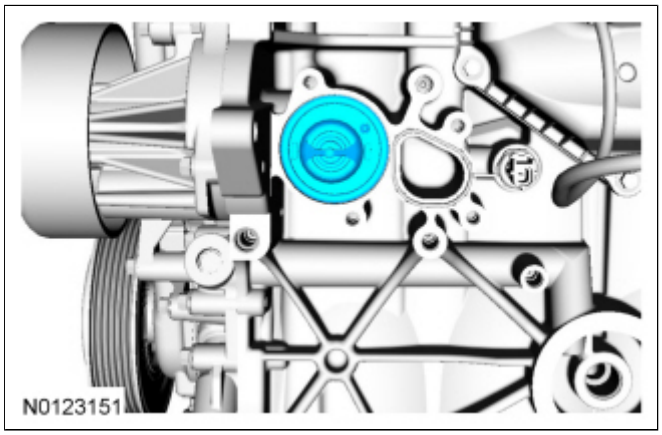
    Remove the bolt and the oil cooler.
    - Discard the oil cooler.



23. Remove the 4 bolts and the thermostat housing
    - Inspect and replace the gasket, if necessary.

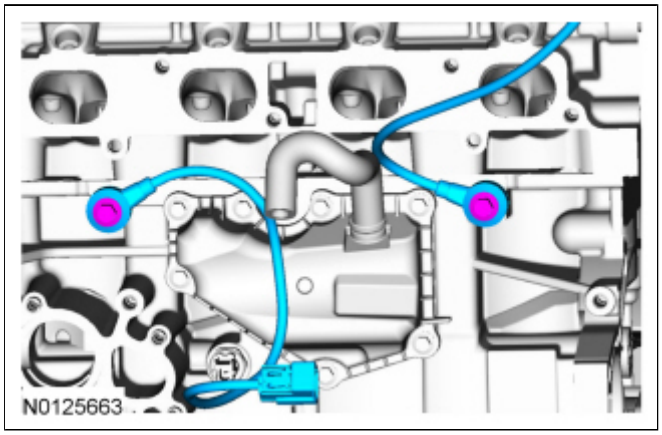


24. Remove the thermostat from the engine block.
    - Inspect the thermostat seal and replace, if necessary.

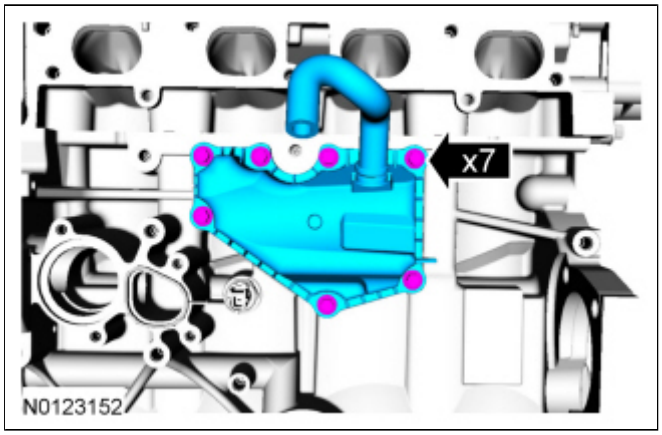


25. **NOTE:** Mark the location of the 2 KS for installation.

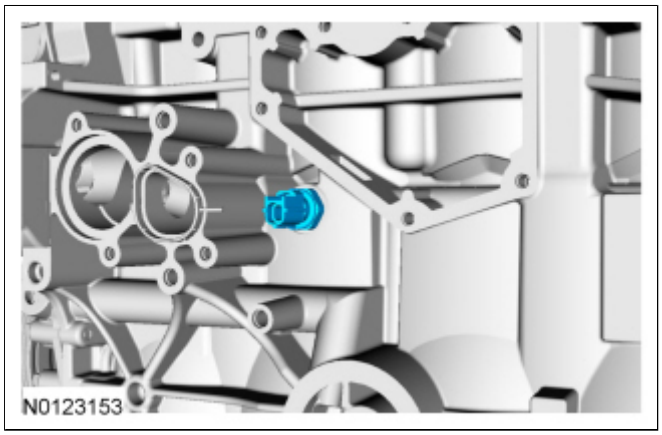
    Remove the 2 bolts and the 2 KS .



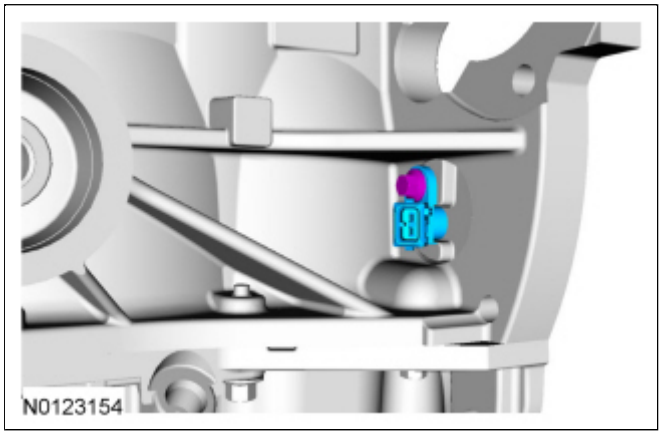
26. Remove the bolts and the crankcase vent oil separator.
    - Inspect and replace the gasket, if necessary.



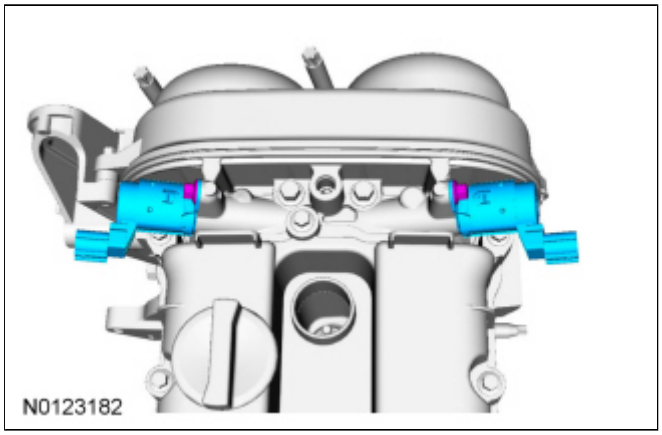
27. Remove the Engine Oil Pressure (EOP) switch.



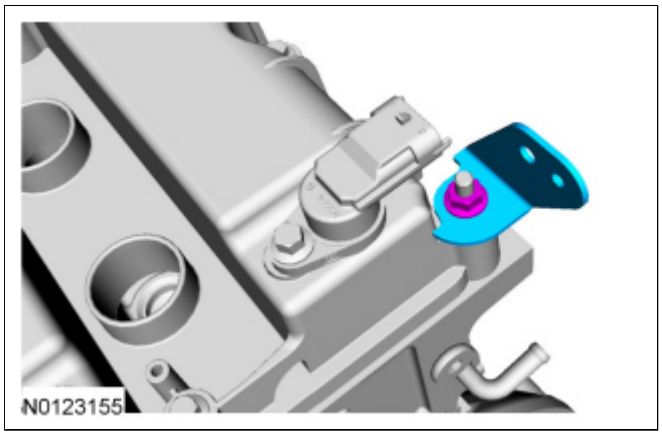
28. Remove the bolt and the Crankshaft Position (CKP) sensor.



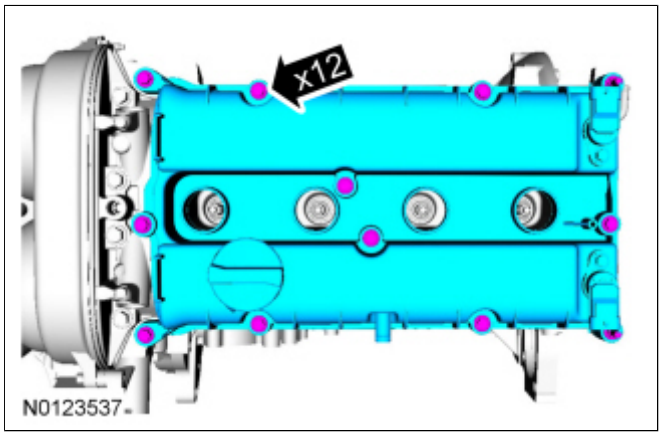
29. Remove the 2 bolts and the Variable Camshaft Timing (VCT) oil control solenoids.



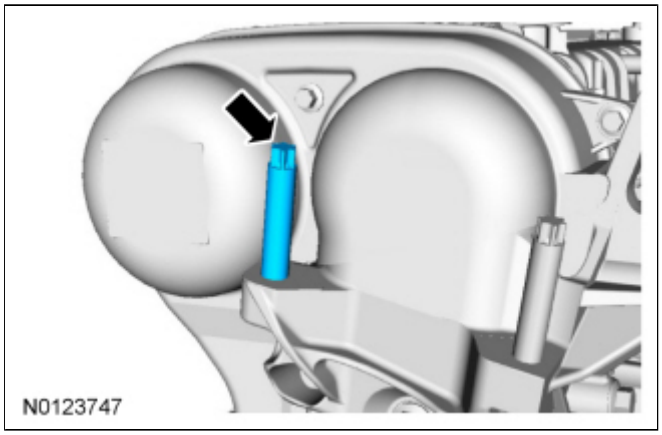
30. Remove the nut and the Heated Oxygen Sensor (HO2S) electrical connector bracket.



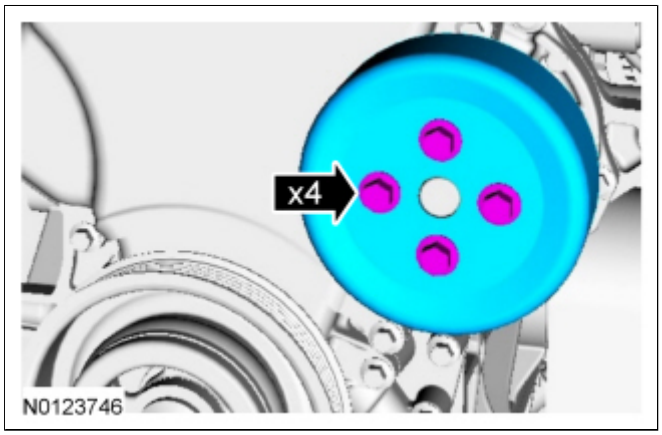
31. Loosen the 12 retainers and remove the valve cover.
    - Discard the gasket.



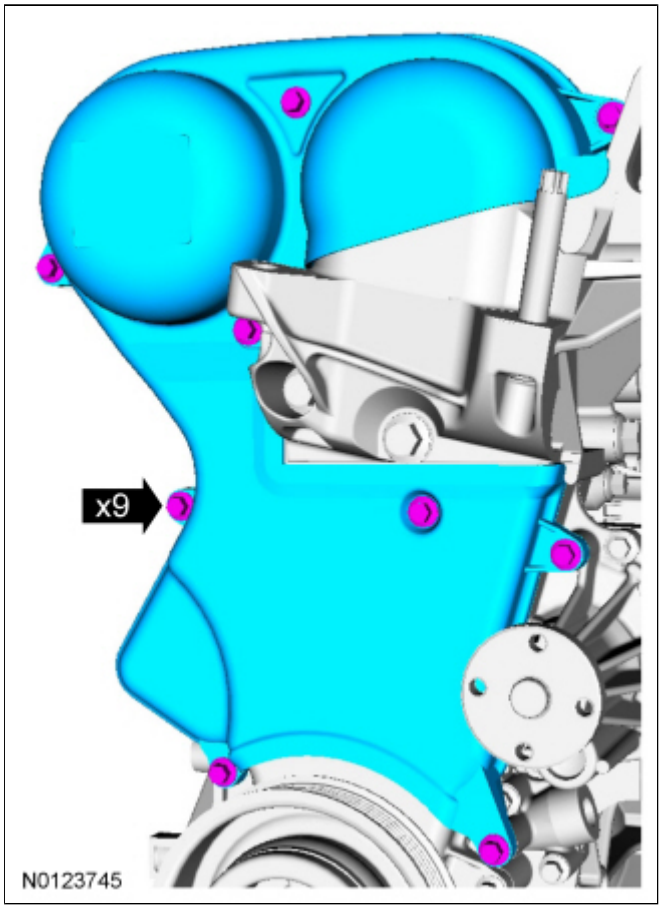
32. Remove the 1 engine mount stud.



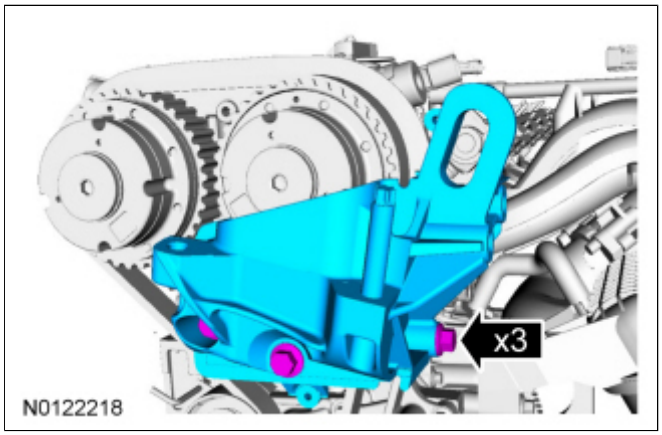
33. Remove the 4 bolts and coolant pump pulley.



34. Remove the 9 bolts and the timing belt cover.

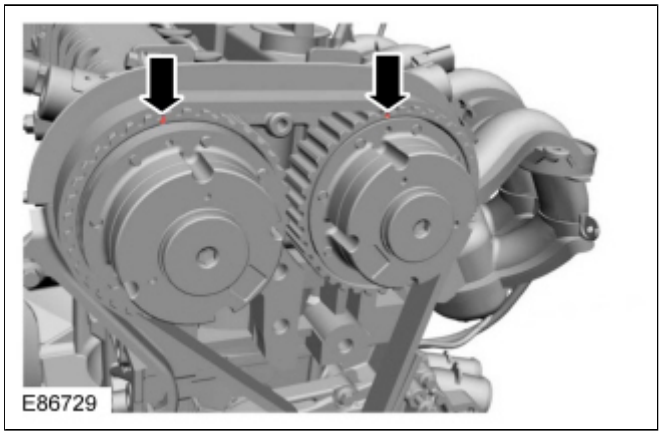


35. Remove the 3 bolts and the engine mount bracket.

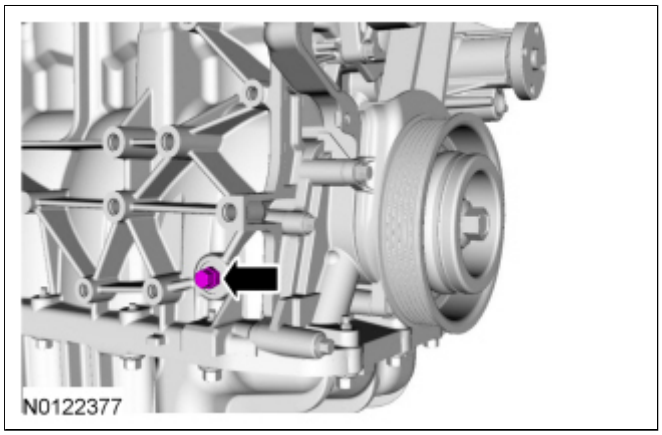


36. ***NOTICE:*** **Only rotate the crankshaft in a clockwise direction.**

    Using the crankshaft pulley bolt, turn the crankshaft clockwise until the markings on the camshaft phaser and sprockets are at the 11 o'clock position as shown.

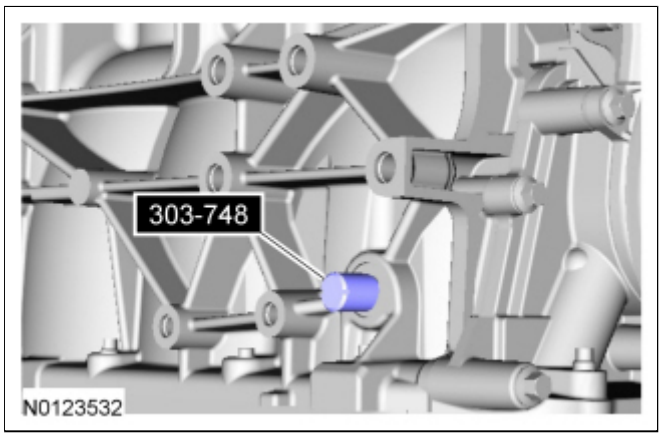


37. Remove the engine plug bolt.



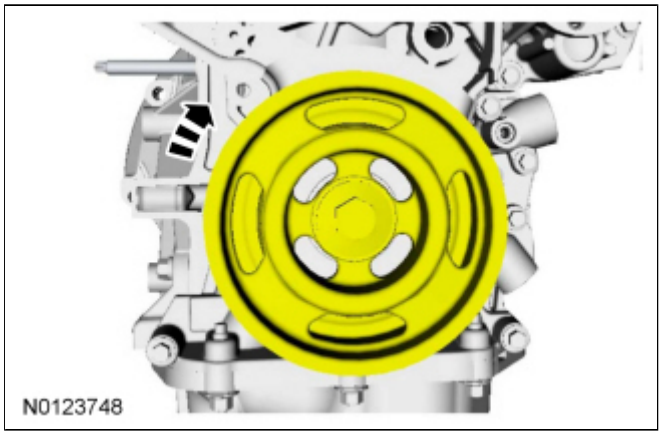
38. **NOTE:** The Crankshaft Top Dead Center (TDC) Timing Pin will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the crankshaft pulley removal and installation.

    Install the Crankshaft TDC Pin.

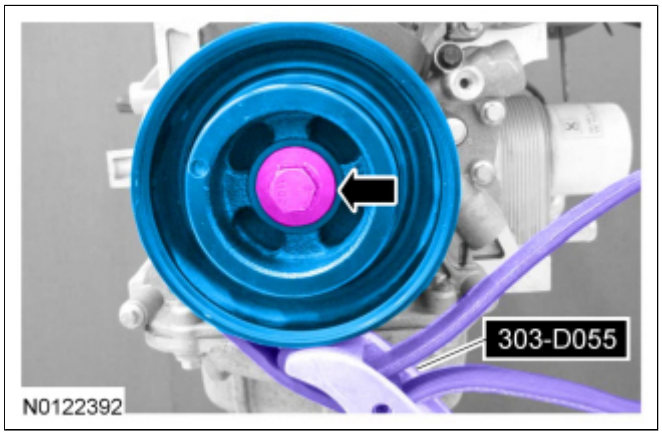


39. **NOTE:** Only rotate the crankshaft clockwise direction.

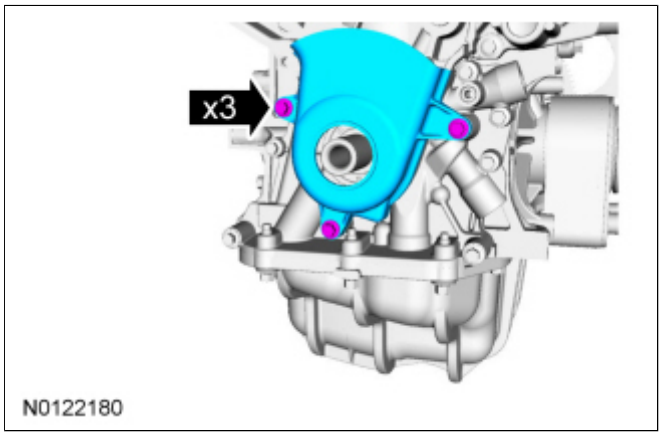
    Rotate the crankshaft until it contacts the Crankshaft TDC Pin.



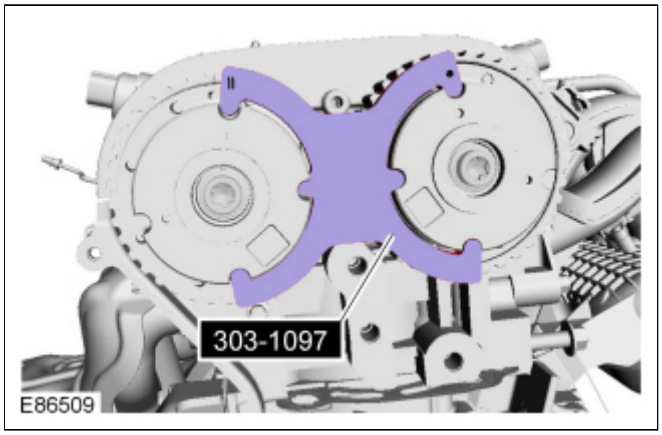
40. Using the Strap Wrench, remove the crankshaft pulley bolt and the crankshaft pulley.
    - Discard the crankshaft pulley bolt.



41. Remove the 3 bolts and the lower timing belt cover.



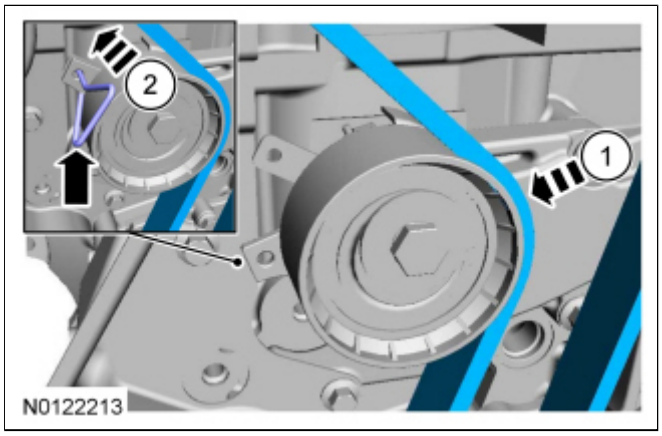
42. Install the VCT Alignment Tool.



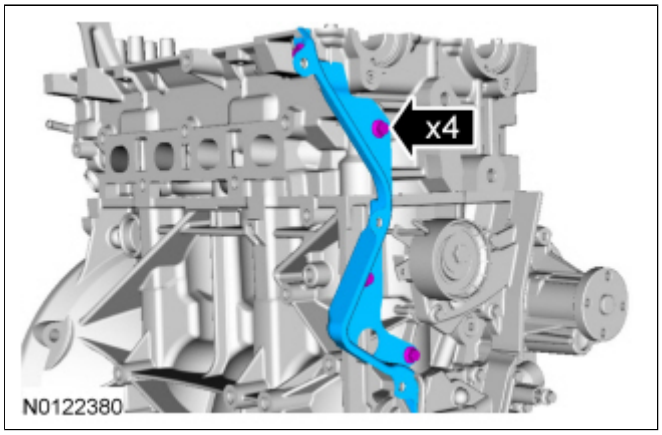
43. **WARNING: The timing belt tensioner spring is under load. Extra care must be taken at all times when handling the tensioner. Failure to follow this instruction may result in personal injury.**

Remove the timing belt.

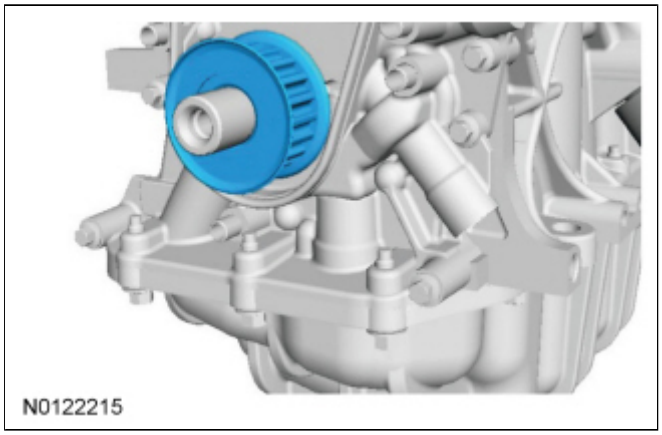
1. Rotate the timing belt tensioner clockwise.
2. Align the 2 holes on the tensioner and install a small screwdriver or holding pin.
    - Remove the timing belt.



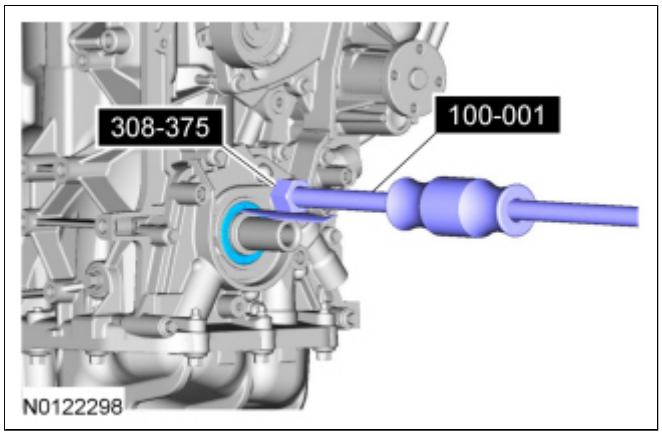
44. Remove the 4 bolts and the timing belt cover backplate.



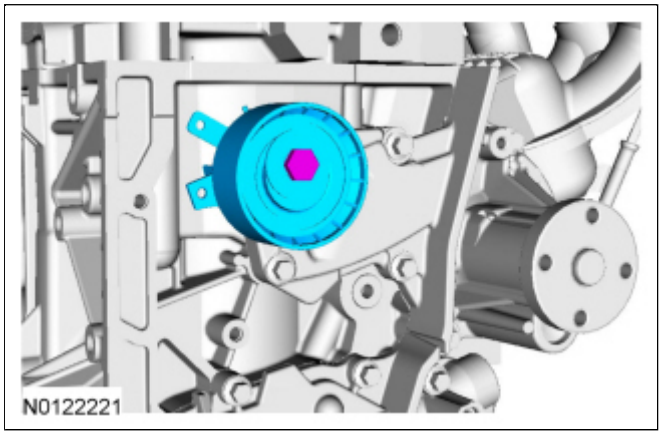
45. Remove the crankshaft sprocket gear.



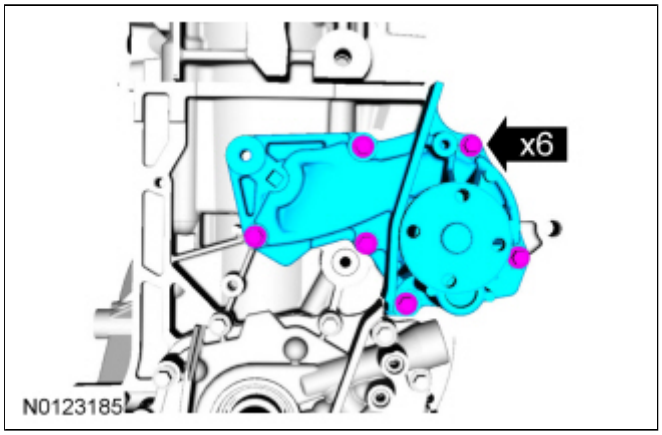
46. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the crankshaft front oil seal.



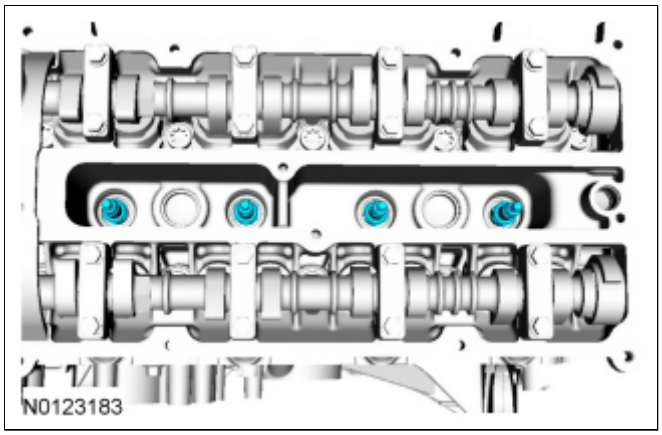
47. Remove the bolt and the timing belt tensioner.



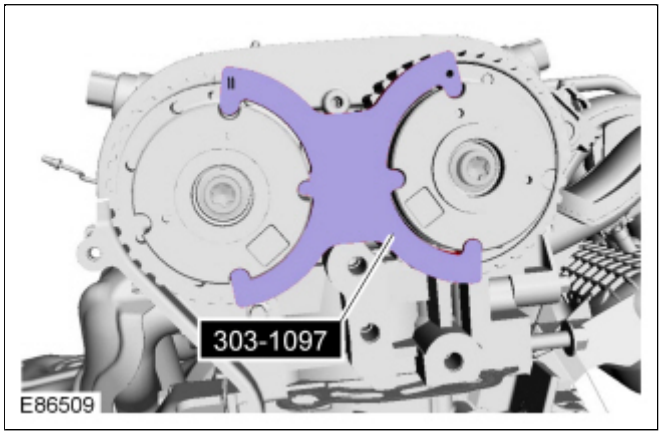
48. Remove the 6 bolts and the coolant pump.
    - Discard the gasket.



49. Remove the 4 spark plugs.

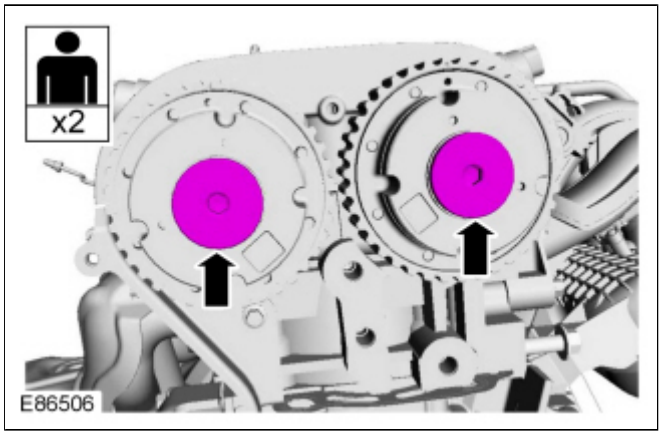


50. Remove the VCT Alignment Tool.



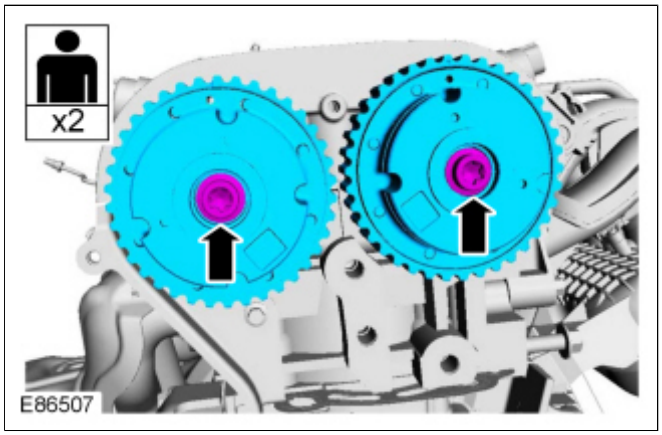
51. ***NOTICE:*** **Use an open-ended wrench to hold the camshafts by the hexagon to prevent the camshafts from turning.**

    Remove the 2 camshaft phaser and sprocket plugs.

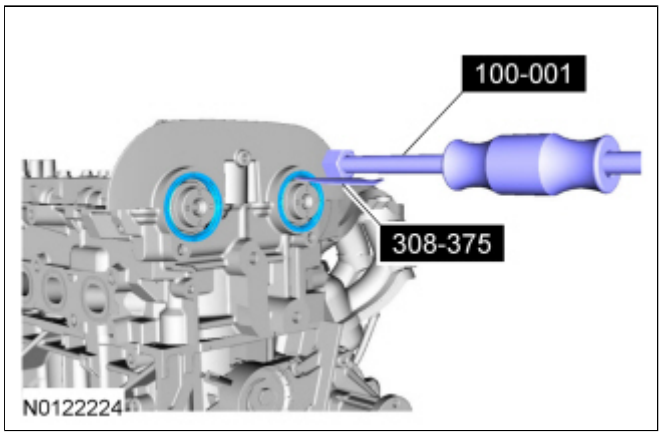


52. ***NOTICE:*** **Use an open-ended wrench to hold the camshafts by the hexagon to prevent the camshafts from turning.**

    Remove the 2 bolts and the camshaft phaser and sprockets.

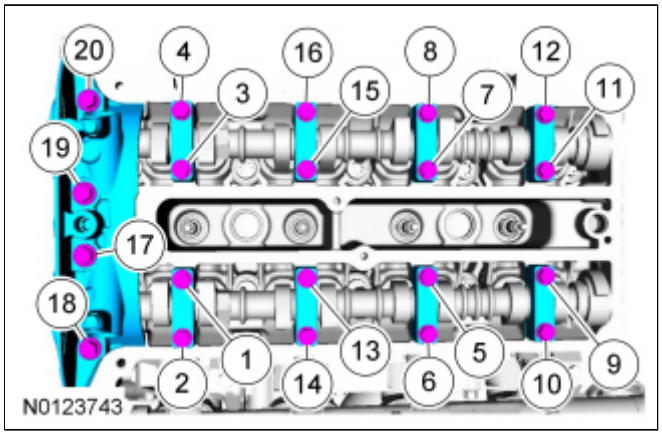


53. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the 2 camshaft oil seals.

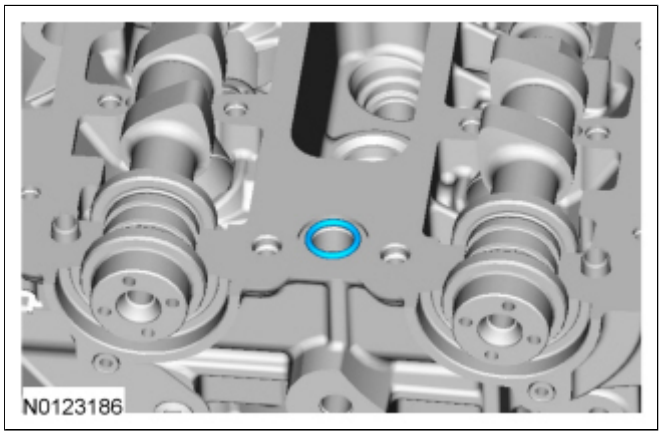


54. **NOTE:** Note the position of each component before removal.

    Remove the bolts for the camshaft bearing caps and VCT bridge in the sequence shown.

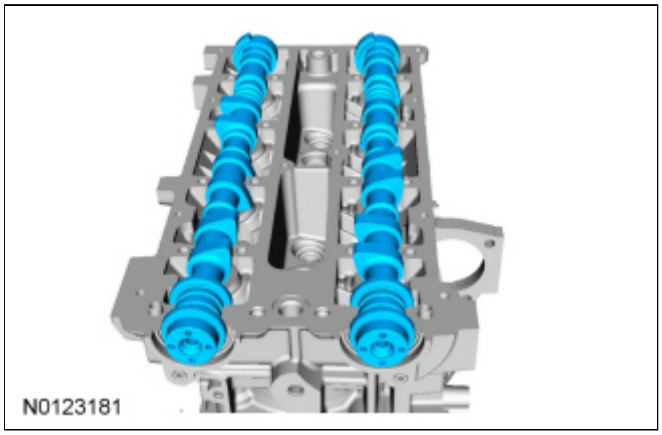


55. Remove the VCT bridge O-ring seal.
    - Inspect and replace the VCT bridge O-ring seal, if necessary.

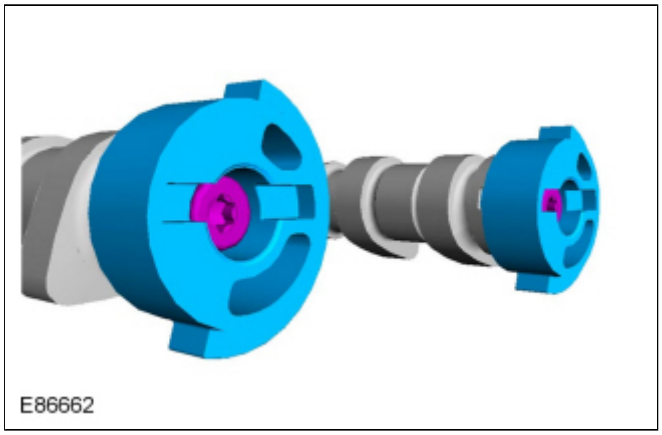


56. ***NOTICE:*** **Do not pry on camshafts when removing or damage to the camshafts may occur.**

    Remove the 2 camshafts from the cylinder head.



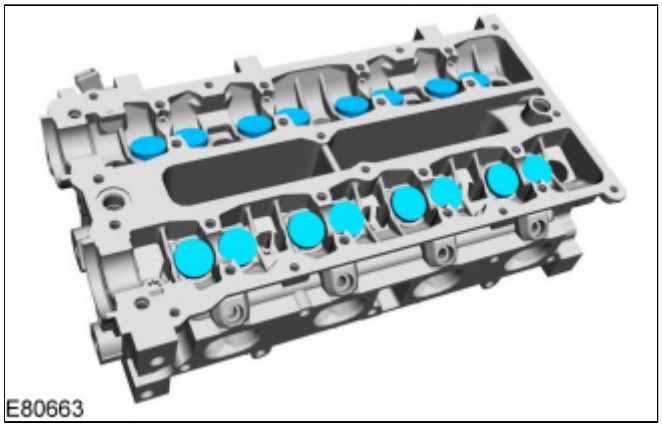
57. If necessary, remove the 2 bolts and the camshaft trigger wheels.



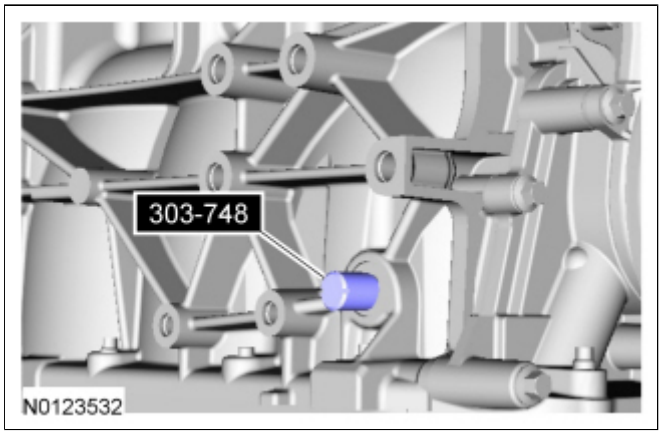
58. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

    NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

    Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

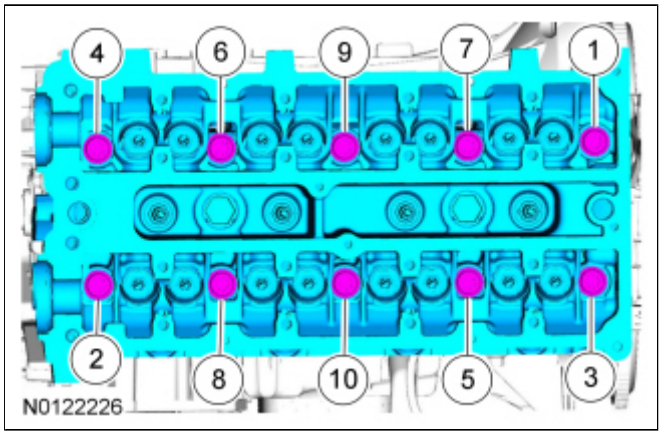


59. Remove the Crankshaft TDC Pin.



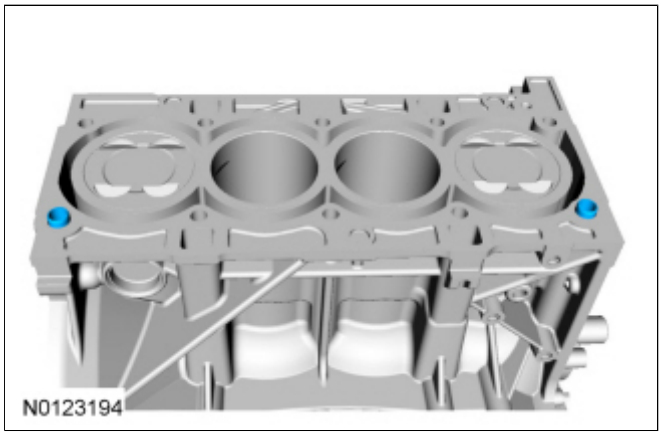
60. **NOTE:** Make sure that the cylinder head is at ambient air temperature before removing the cylinder head bolts.

    Remove the 10 cylinder head bolts in the sequence shown.
    - Remove the cylinder head.
    - Discard the cylinder head bolts and gasket.

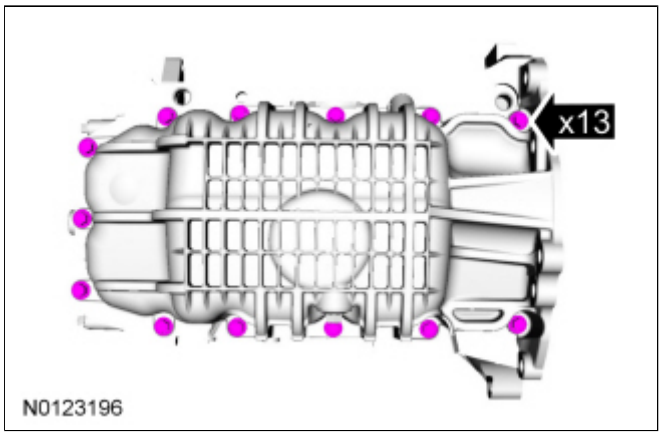


61. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

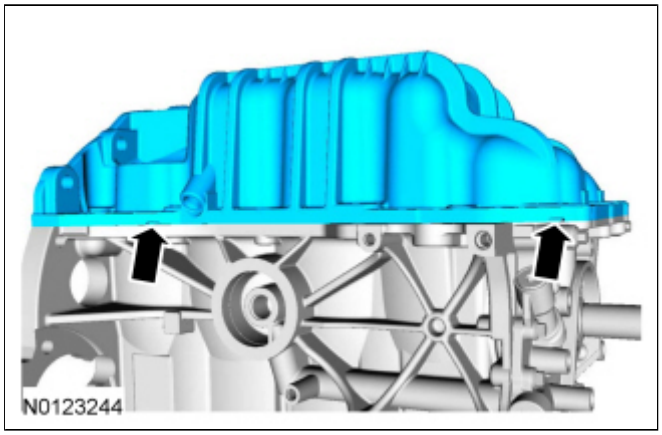
62. Remove the cylinder head alignment dowels.



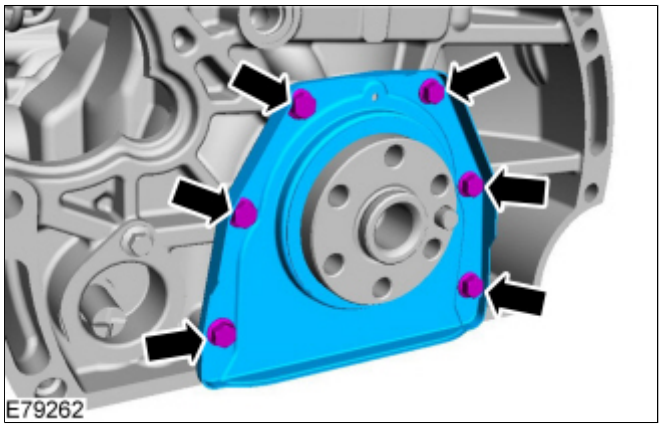
63. Remove the 13 bolts from the oil pan.



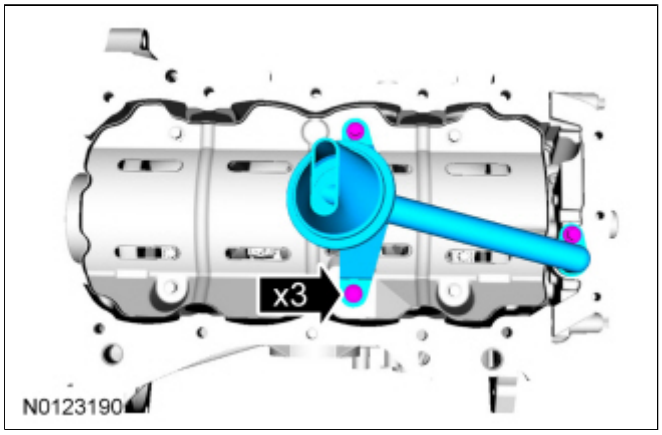
64. Using the pry pads, remove the oil pan.



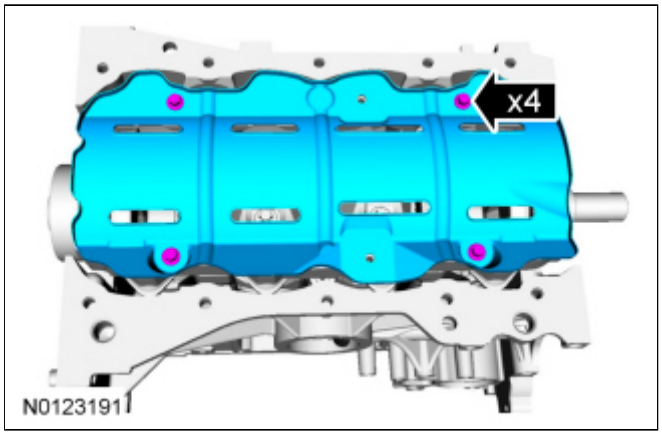
65. Remove the 6 bolts and the crankshaft rear seal.



66. Remove the 3 bolts and the oil pump screen and pickup tube.
    - Inspect and replace the O-ring seal, if necessary.

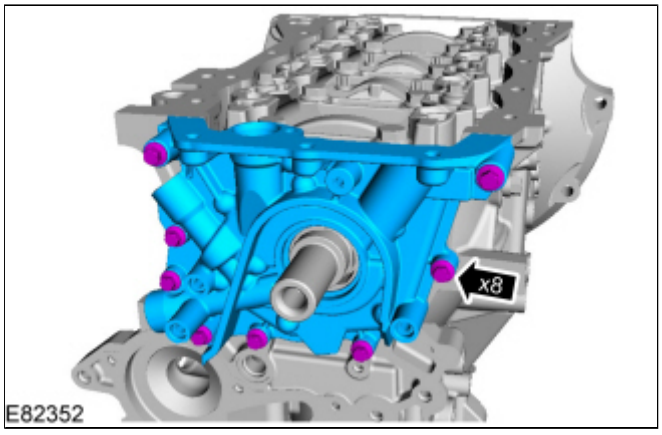


67. Remove the 4 bolts and the windage tray.



68. **NOTE:** Mark the location of the 3 different length bolts.

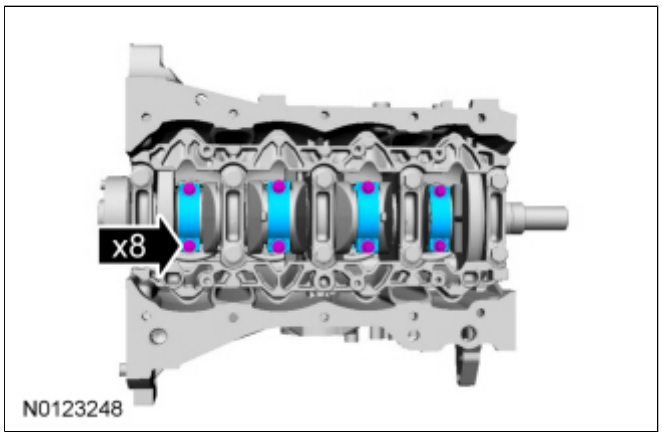
    Remove the 8 bolts and the oil pump.
    - Discard the gasket.



69. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following manufacturer's instructions.

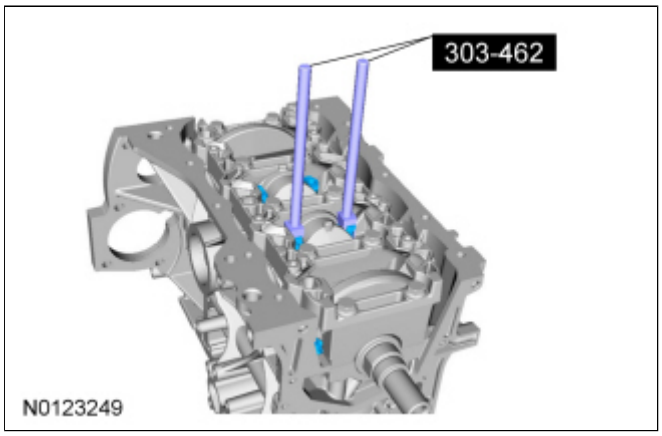
70. **NOTE:** Clearly mark the connecting rods, connecting rod caps and connecting rod bearings in numerical order for correct orientation for reassembly.

    Remove the bolts and the connecting rod cap.



71. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

Using the Connecting Rod Installer, remove the piston/rod assembly from the engine block.



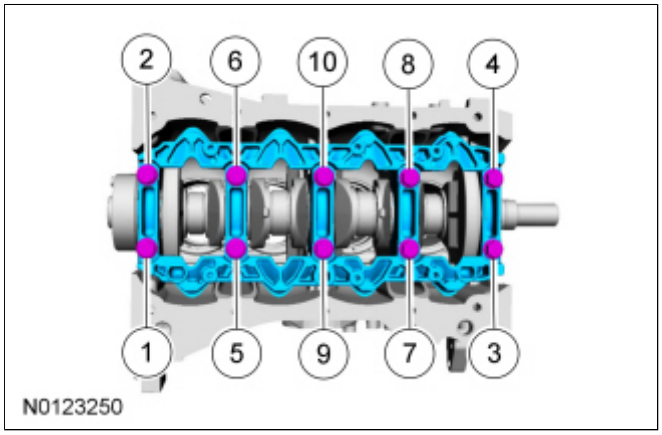
72. Repeat the previous 2 steps until all the piston/rod assemblies are removed from the engine block.

73. **NOTE:** Mark the position of the parts, so they can be installed in their original positions.

    Remove the connecting rod bearings from the connecting rod and cap.

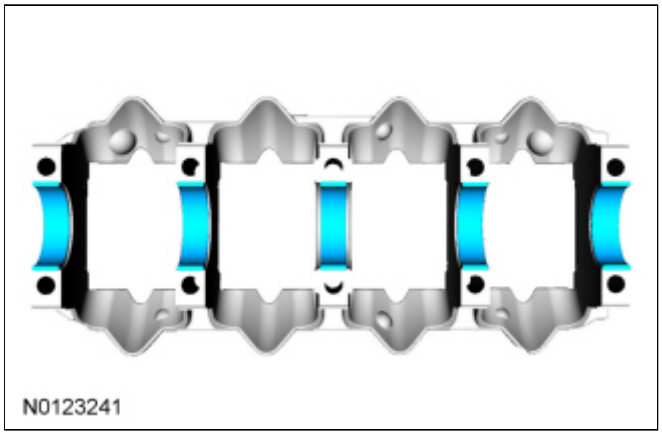
74. **NOTE:** The main bearing beam has 2 arrows pointing towards the front of engine for correct orientation for reassembly.

    Remove the 10 bolts in the sequence shown and the main bearing beam.

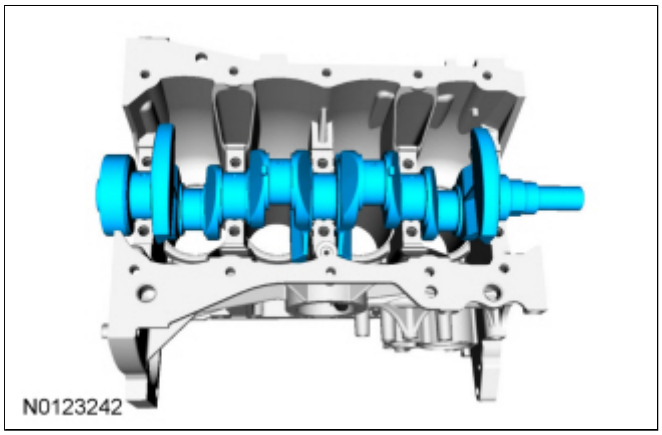


75. **NOTE:** If the main bearings are being reused, mark them in order for correct orientation and reassembly.

    Remove the main bearings from the main bearing beam.



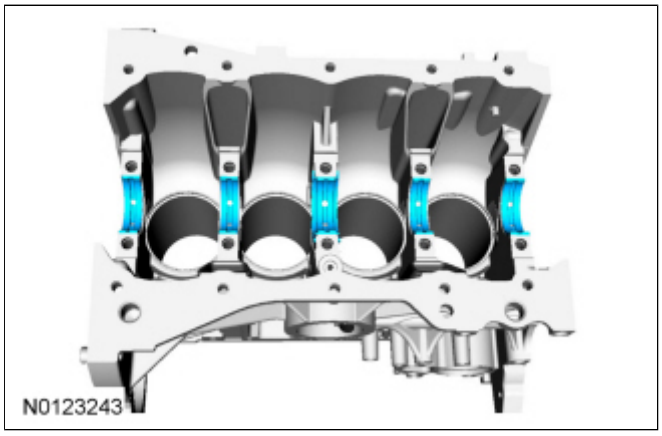
76. Remove the crankshaft from the engine block.



77. **NOTE:** If the main bearings are being reused, mark them in order for correct orientation and reassembly.

    NOTE: The center bulkhead has the thrust bearing.

    Remove the main bearings from the cylinder block.



78. Inspect the cylinder block and main bearing beam.

79. Inspect the pistons and connecting rods. For additional information, refer to Section 303-00 .

Cylinder Head

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)

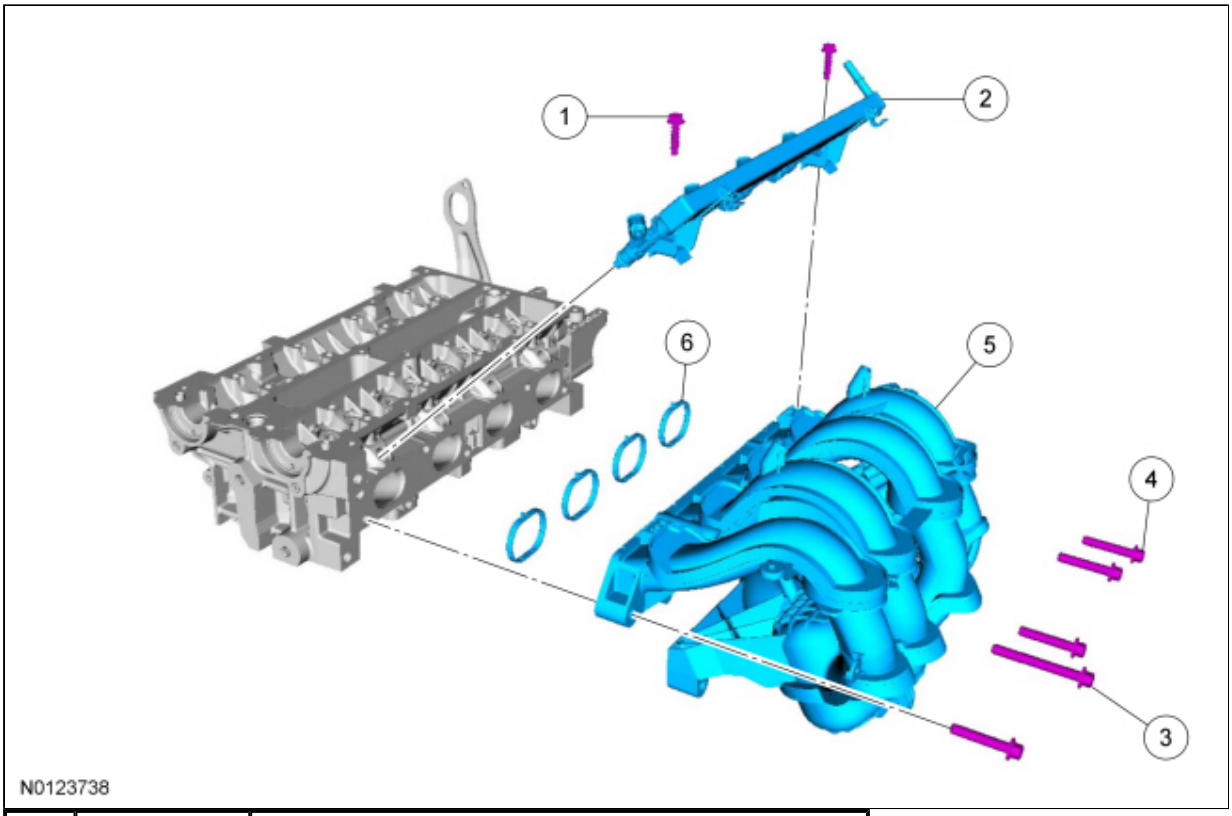
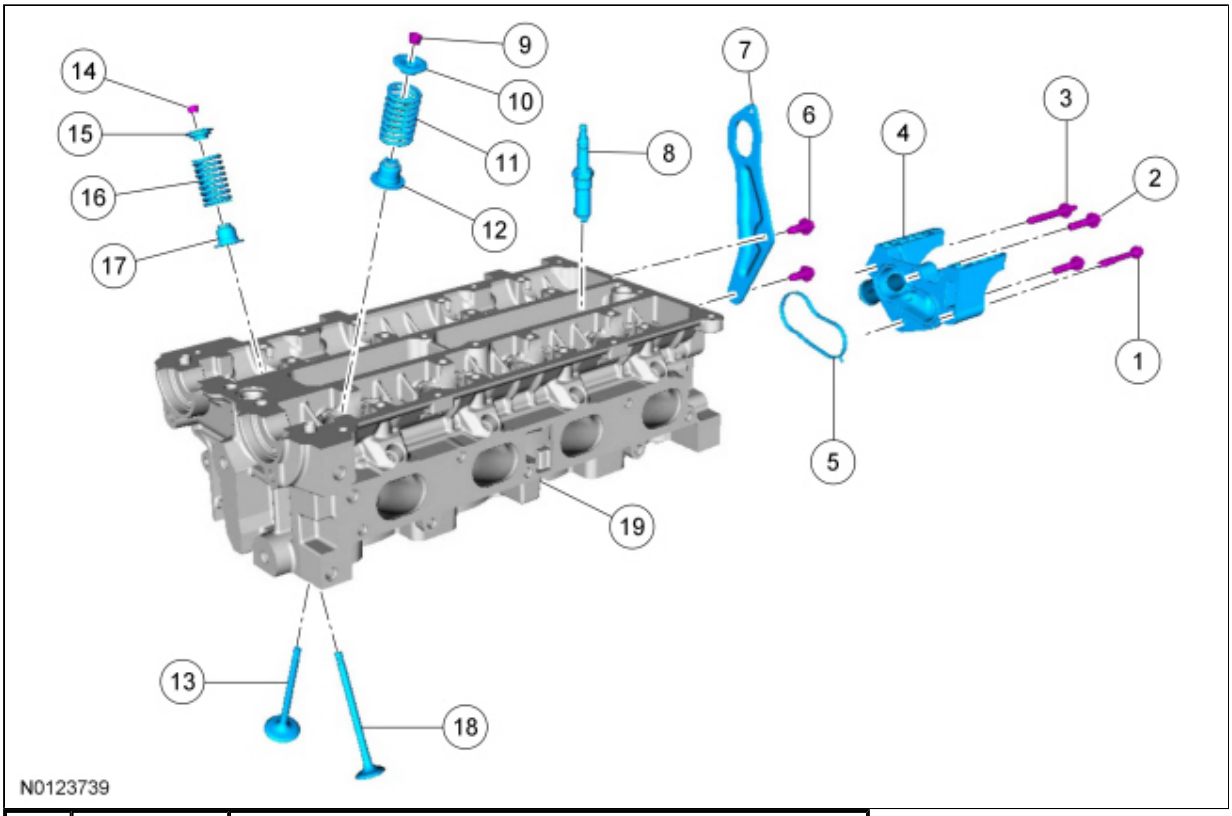
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

Cylinder Head (View 1 of 2)



Item	Part Number	Description
1	W704043	Fuel rail bolt (2 required) - 11 Nm (97 lb-in)
2	9D280	Fuel rail assembly
3	W500117	Intake manifold bolt - 18 Nm (159 lb-in)
4	W500112	Intake manifold bolt (4 required) - 18 Nm (159 lb-in)
5	9424	Intake manifold
6	9439	Intake manifold gasket (4 required)

Cylinder Head (View 2 of 2)



Item	Part Number	Description
1	W714169	Coolant outlet bolt - 19 Nm (168 lb-in)
2	—	Coolant outlet bolt (part of 8K556) (2 required) - 19 Nm (168 lb-in)
3	W713019	Coolant outlet stud bolt - 19 Nm (168 lb-in)
4	8K556	Coolant outlet
5	—	Coolant outlet gasket (part of 8K556)
6	W500223	Lift eye bolt (2 required) - 19 Nm (168 lb-in)
7	—	Lift eye bracket
8	12405	Spark plug (4 required)
9	6518	Intake valve collet (16 required)
10	6514	Intake valve spring retainer (8 required)
11	6513	Intake valve spring (8 required)
12	6571	Intake valve seal (8 required)
13	6507	Intake valve (8 required)
14	6518	Exhaust valve collet (16 required)
15	6514	Exhaust valve spring retainer (8 required)
16	6513	Exhaust valve spring (8 required)
17	6571	Exhaust valve seal (8 required)
18	6505	Exhaust valve (8 required)
19	6049	Cylinder head

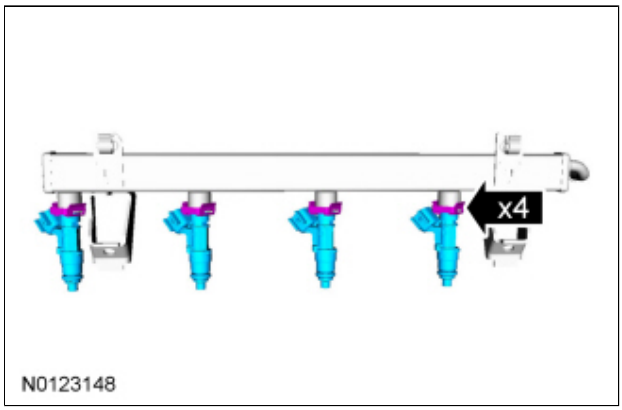
Disassembly

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

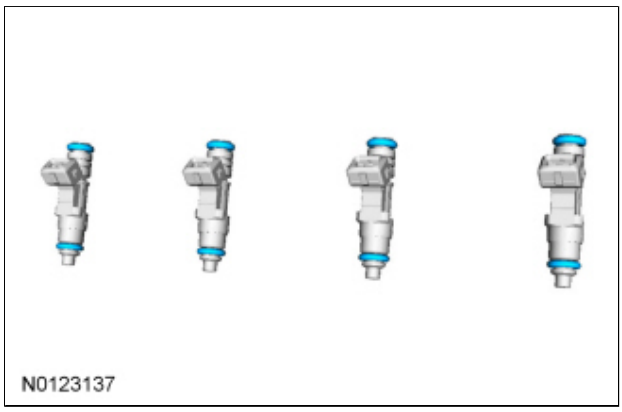
NOTE: If the components are to be reinstalled, mark the location of the components removed, they must be installed in the same location.

1. Remove the 2 bolts and the fuel rail and injectors as an assembly.

2. Remove the 4 fuel injector clips and the 4 fuel injectors.



3. Remove and discard the 8 fuel injector O-ring seals.



4. Remove the 5 bolts and the intake manifold.

5. Remove the 2 bolts and the LH engine lift eye.

6. Remove the 3 bolts, stud bolt and the coolant outlet.
   - Discard the gasket.

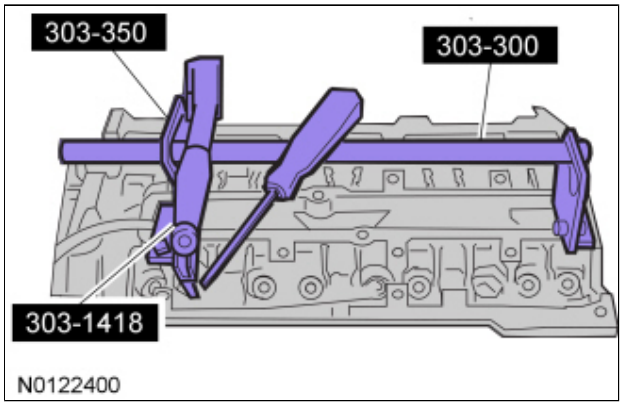
7. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs, or damage can occur to the cylinder head or spark plug.**

   NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

   Remove the 4 spark plugs.

8. **NOTE:** Use a small screwdriver and multi-purpose grease to remove the valve collets.

   Using the Valve Spring Compressors, compress the valve spring and remove the valve spring collets, the valve spring retainers and the valve springs.



9. Inspect the valve springs. For additional information, refer to Section 303-00 .
10. **NOTE:** Note the location of the valves if they are to be reused

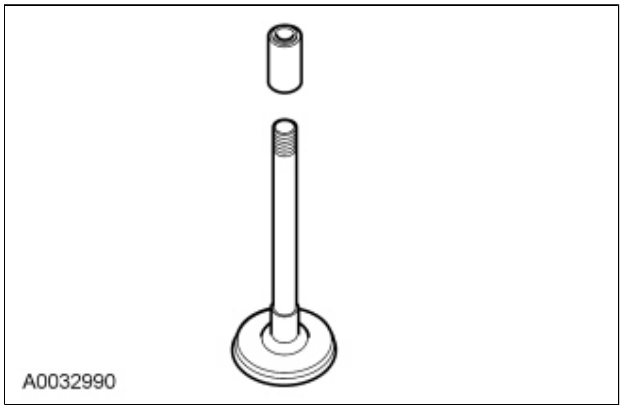
    Remove the valves.
11. Inspect the valves. For additional information, refer to Section 303-00 . Install new parts, as necessary.
12. **NOTE:** Use a valve stem seal pliers (such as Snap-on® YA-8230 or equivalent).

    Using valve stem seal pliers, remove and discard the valve seals.

Assembly

1. **NOTE:** If installing the original valves, make sure the valves are installed in the same position from which they were removed. Coat the valve stems with clean engine oil.

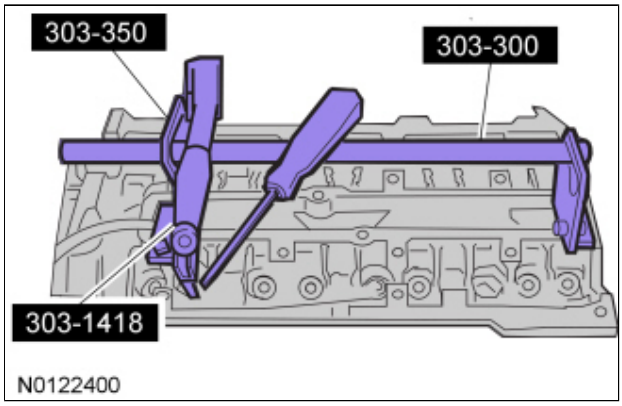
   Install the valves.
2. Install the valve stem seal installation sleeve.



3. **NOTE:** Lubricate the valve stem, guides and valve stem seals with clean engine oil prior to installation.

   Using valve stem seal pliers, install the valve seals.
4. **NOTE:** Check the seating of the valve collet.

   Using the Valve Spring Compressors, install the valve spring.
   - Insert the valve spring and the valve spring retainer.
   - Compress the valve spring and install the valve collet using some multi-purpose grease and a small screwdriver.



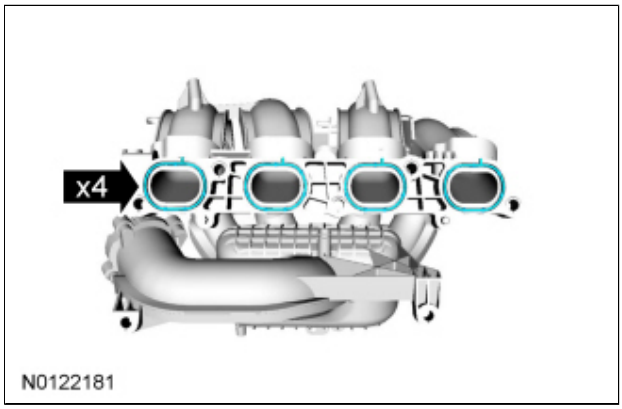
5. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs, or damage can occur to the cylinder head or spark plug.**

   Install the 4 spark plugs.
   - Tighten to 15 Nm (133 lb-in).

6. Using a new gasket, install the coolant outlet, 3 bolts and the stud bolt.
   - Tighten to 19 Nm (168 lb-in).

7. Install the LH engine lift eye and the 2 bolts.
   - Tighten to 19 Nm (168 lb-in).

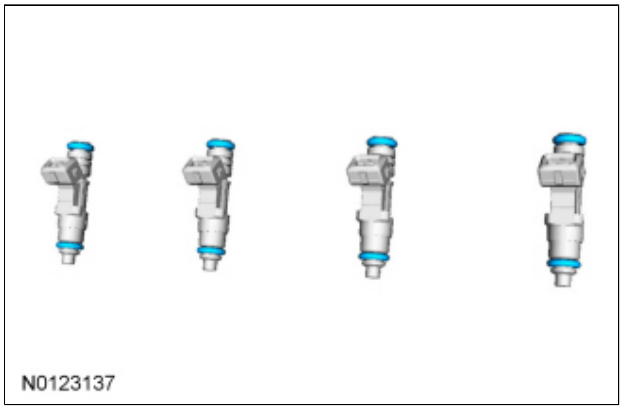
8. Inspect and install new intake manifold gaskets if necessary.



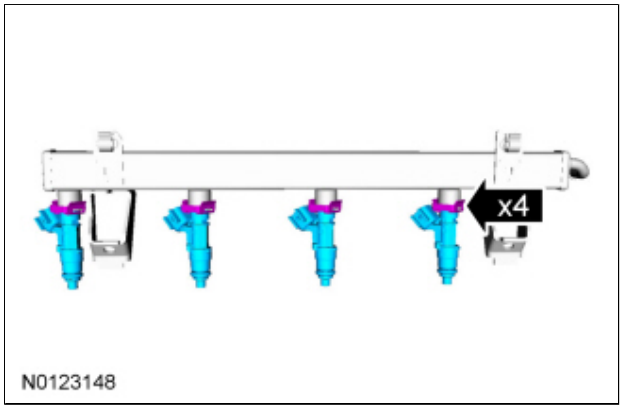
9. Install the intake manifold and the 5 bolts.
   - Tighten to 18 Nm (159 lb-in).

10. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings may cause the fuel system to leak. Do not reuse the O-ring seals.**

    Install the new O-ring seals onto the fuel injectors and lubricate them with clean engine oil.



11. Install the 4 fuel injectors and the 4 fuel injector clips into the fuel rail.

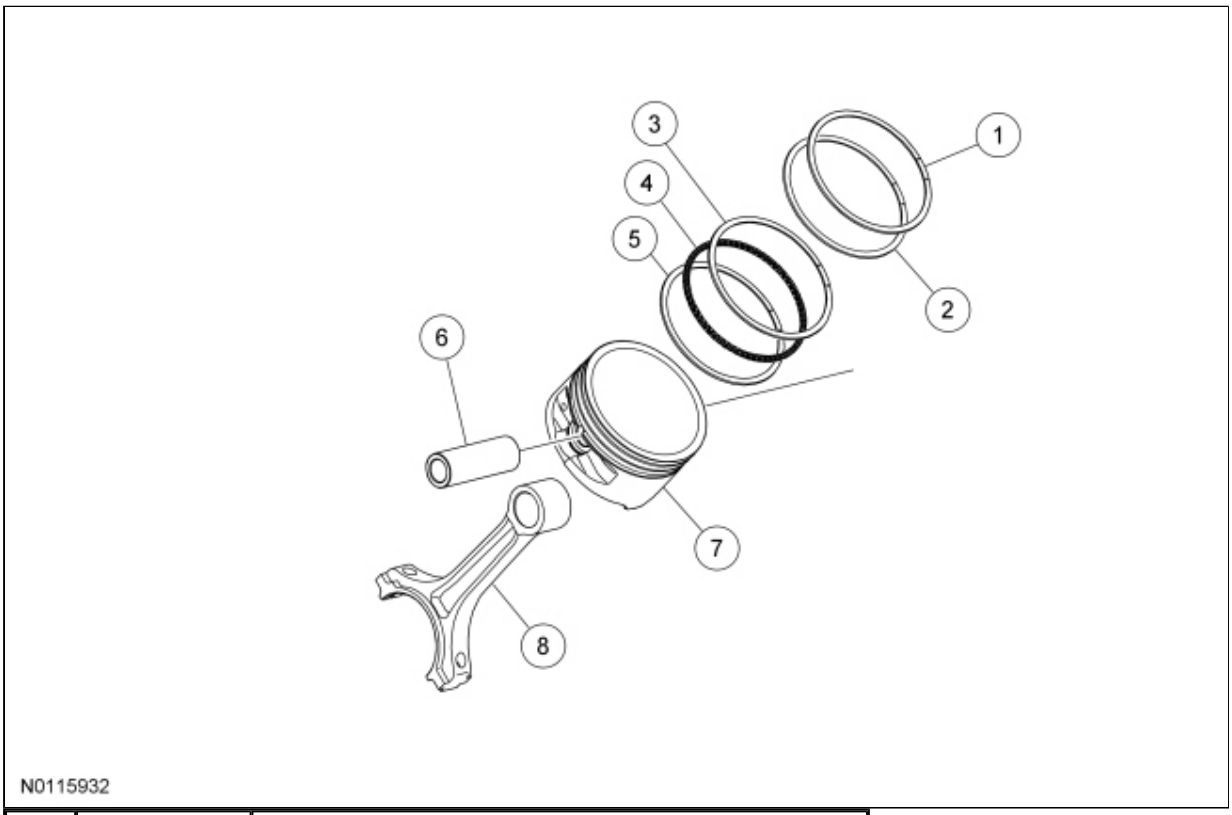


12. Install the fuel rail and fuel injectors as an assembly and install the 2 bolts.
    - Tighten to 11 Nm (97 lb-in).

Piston

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



N0115932

Item	Part Number	Description
1	—	Piston compression upper ring (part of 6148)
2	—	Piston compression lower ring (part of 6148)
3	—	Piston oil control upper segment ring (part of 6148)
4	—	Piston oil control spacer (part of 6148)
5	—	Piston oil control lower segment ring (part of 6148)
6	6135	Piston pin
7	6108	Piston
8	6200	Connecting rod

Disassembly

1. Remove the connecting rod bearings from the connecting rod and cap.
2. Remove the piston rings from the piston.

- Discard the piston rings.

3. **NOTE:** If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

   NOTE: Use a portable multipurpose press (such as OTC® 5180 or equivalent).

   Using the portable multipurpose press, press the piston pin out of the connecting rod and piston assembly.

4. Separate the piston from the connecting rod.

5. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

Assembly

1. **NOTE:** Lubricate all parts with clean engine oil.

   Gradually heat the pin bore side of the connecting rod to approximately 300°C (572°F).

2. Align the piston-to-connecting rod orientation marks, and immediately install the piston pin.

3. Using the portable multipurpose press, press the piston pin into the piston and connecting rod assembly.

4. **NOTE:** The upper and lower compression rings are to be fitted with the identification marks on the upper side.

   Install the piston rings.

5. Make sure the ring gaps (oil spacer — A, oil ring — B, compression ring — C) are correctly spaced around the circumference of the piston.

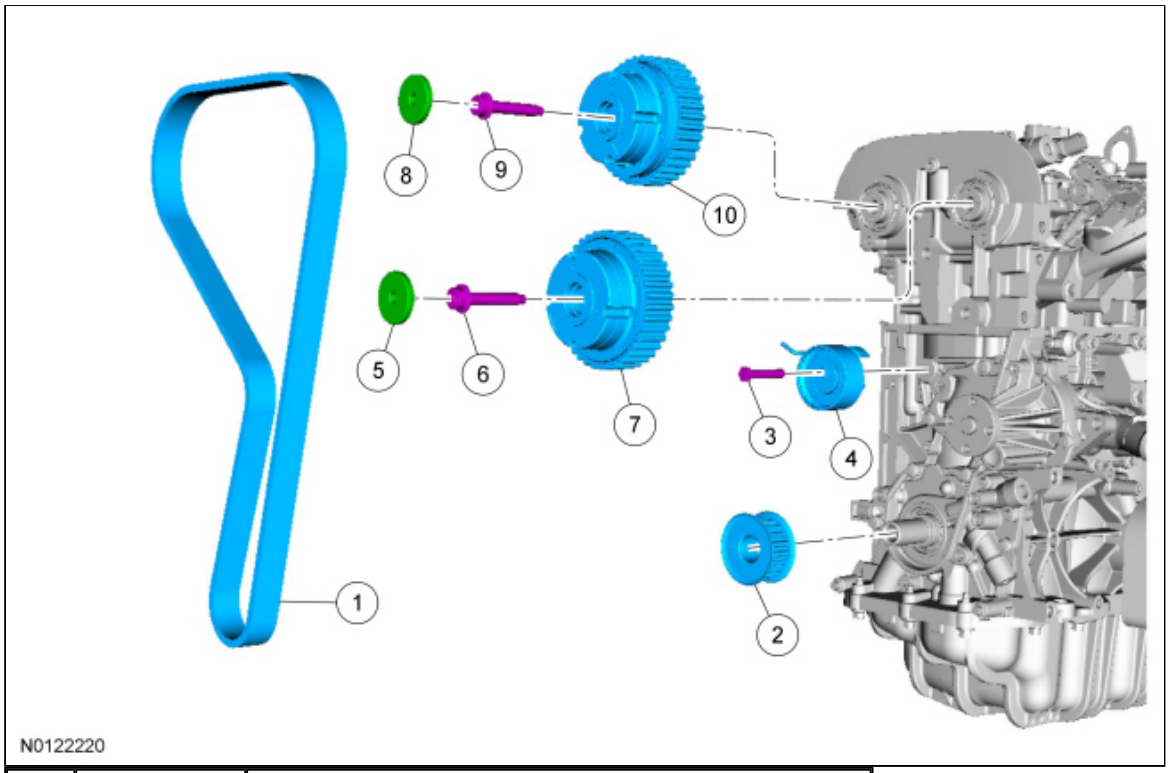
36	9N454	Catalytic converter heat shield

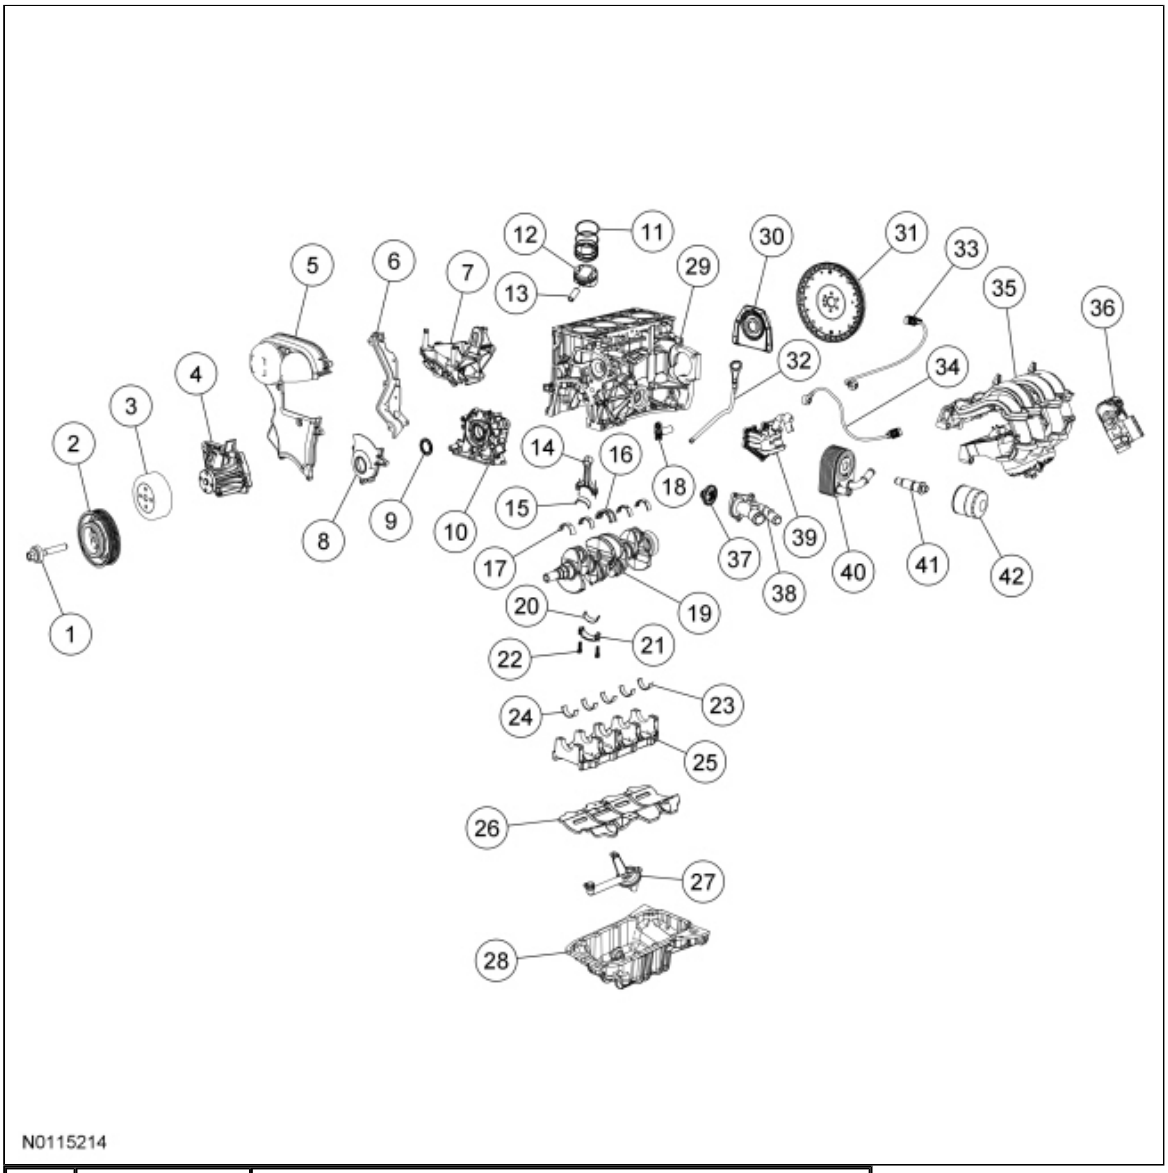
Timing Drive



Item	Part Number	Description
1	6268	Timing belt
2	6306	Crankshaft sprocket gear
3	00812	Timing belt tensioner bolt
4	6K254	Timing belt tensioner

5	W710954	Intake camshaft phaser and sprocket plug and seal
6	6279	Intake camshaft phaser and sprocket bolt
7	6256	Intake camshaft phaser and sprocket
8	W710954	Exhaust camshaft phaser and sprocket plug and seal
9	6279	Exhaust camshaft phaser and sprocket bolt
10	6256	Exhaust camshaft phaser and sprocket

Lower Engine



Item	Part Number	Description
1	6A340	Crankshaft pulley bolt
2	6312	Crankshaft pulley
3	8509	Coolant pump pulley
4	8501	Coolant pump
5	6019	Upper timing belt cover
6	6019	Timing belt cover backplate
7	6038	Engine mount bracket

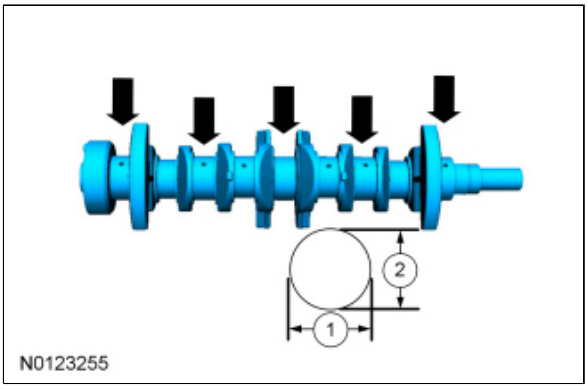
8	6019	Lower timing belt cover
9	6700	Crankshaft front seal
10	6600	Oil pump
11	6148	Piston ring (5 required)
12	6108	Piston (4 required)
13	6135	Piston pin (4 required)
14	6200	Connecting rod (4 required)
15	6211	Upper connecting rod bearing (4 required)
16	6337	Upper main bearing
17	6333	Upper main bearing (4 required)
18	6C315	Crankshaft Position (CKP) sensor
19	6303	Crankshaft
20	6211	Lower connecting rod bearing (4 required)
21	6200	Connecting rod cap (4 required)
22	6200	Connecting rod cap bolt (8 required)
23	6333	Lower main bearing (4 required)
24	6333	Wider lower main bearing
25	—	Lower crankshaft main bearing beam (part of 6010)
26	6687	Windage tray
27	6622	Oil pump screen and pickup tube
28	6675	Oil pan
29	6010	Engine block
30	6K301	Crankshaft rear oil seal with retainer plate
31	6375	Flexplate/Flywheel
32	6754	Oil level indicator tube
33	12A699	LH Knock Sensor (KS)
34	12A699	RH KS
35	9424	Intake manifold
36	9E926	Throttle Body (TB)
37	8575	Thermostat
38	8592	Thermostat housing
39	6A785	Crankcase vent oil separator
40	6A642	Oil cooler
41	6L626	Oil cooler mounting bolt
42	6731	Oil filter

NOTICE: **During engine repair procedures, cleanliness is extremely important. All parts must be thoroughly cleaned and any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

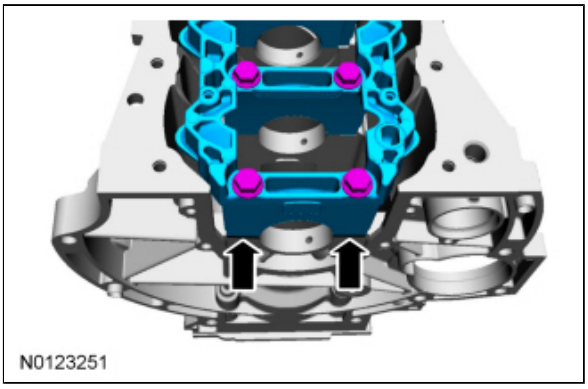
NOTE: Assembly of the engine requires various inspections/measurements of the engine components (engine block, crankshaft, connecting rods, pistons and piston rings). These inspections/measurements will aid in determining if the engine components will require replacement. For additional information, refer to Section 303-00 .

All vehicles

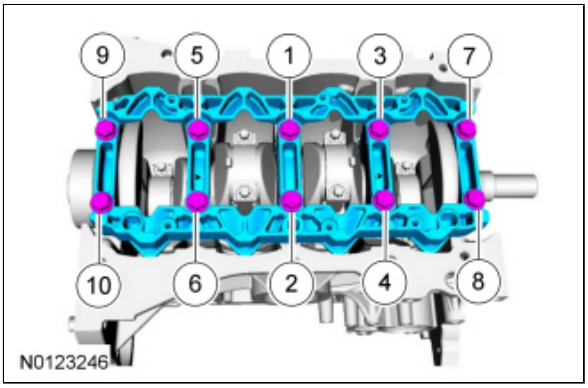
1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions and record the smallest diameter for each journal.



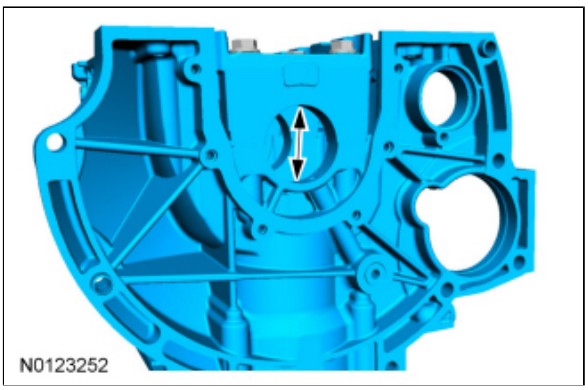
2. Position the main bearing beam in the engine block with the main bearing beam mounted flush with the rear face of the engine block and install the original main bearing beam bolts finger tight.



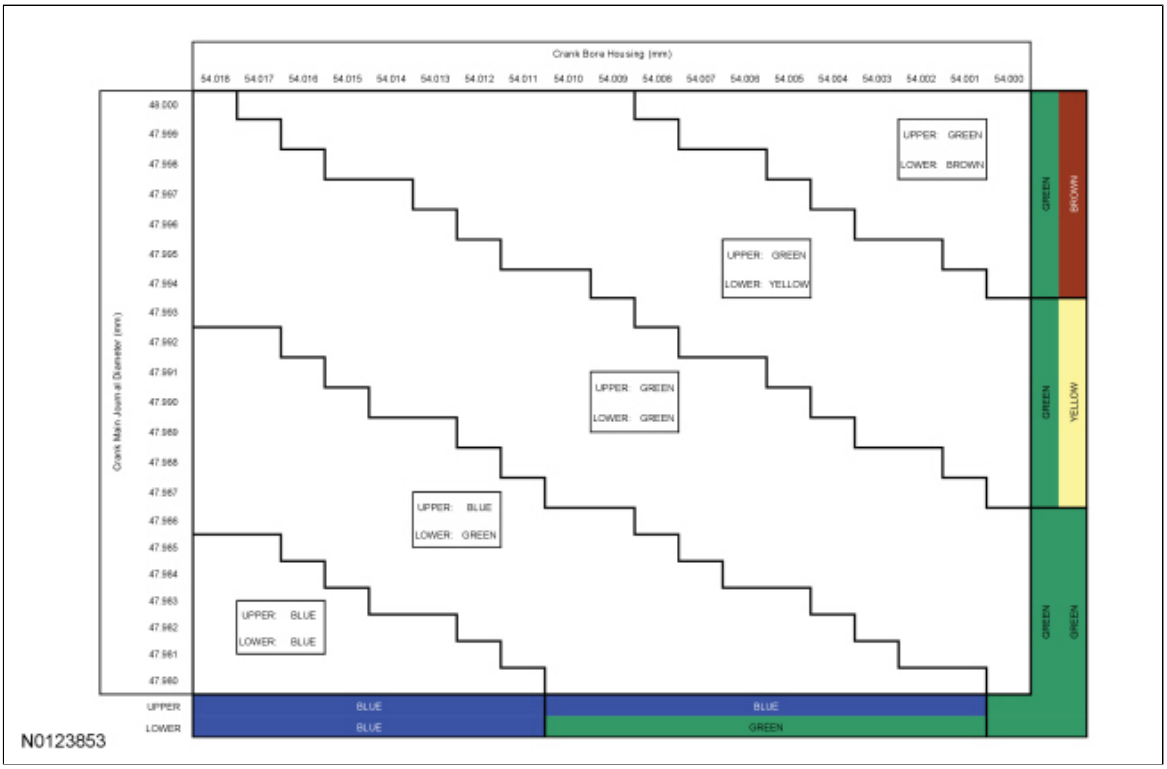
3. Tighten the 10 original main bearing beam bolts in the sequence shown in 2 stages.
   - Stage 1: Tighten to 19 Nm (168 lb-in).
   - Stage 2: Tighten an additional 60 degrees.



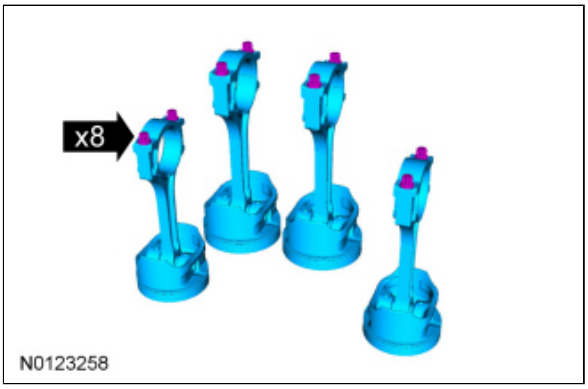
4. Measure each crankshaft block main bearing bore diameter.



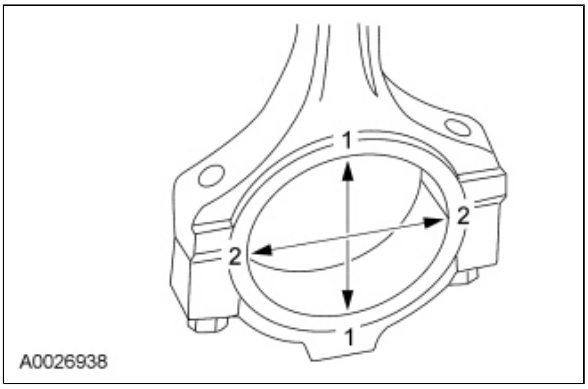
5. Using the chart, select the crankshaft main bearings.



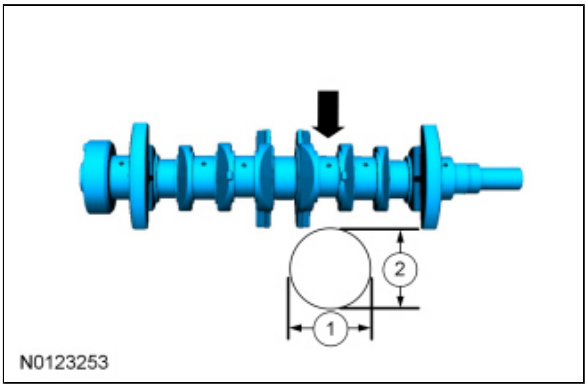
6. Using the original connecting rod cap bolts, install the connecting caps and bolts and tighten the bolts in 2 stages.
    - Stage 1: Tighten to 29 Nm (21 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



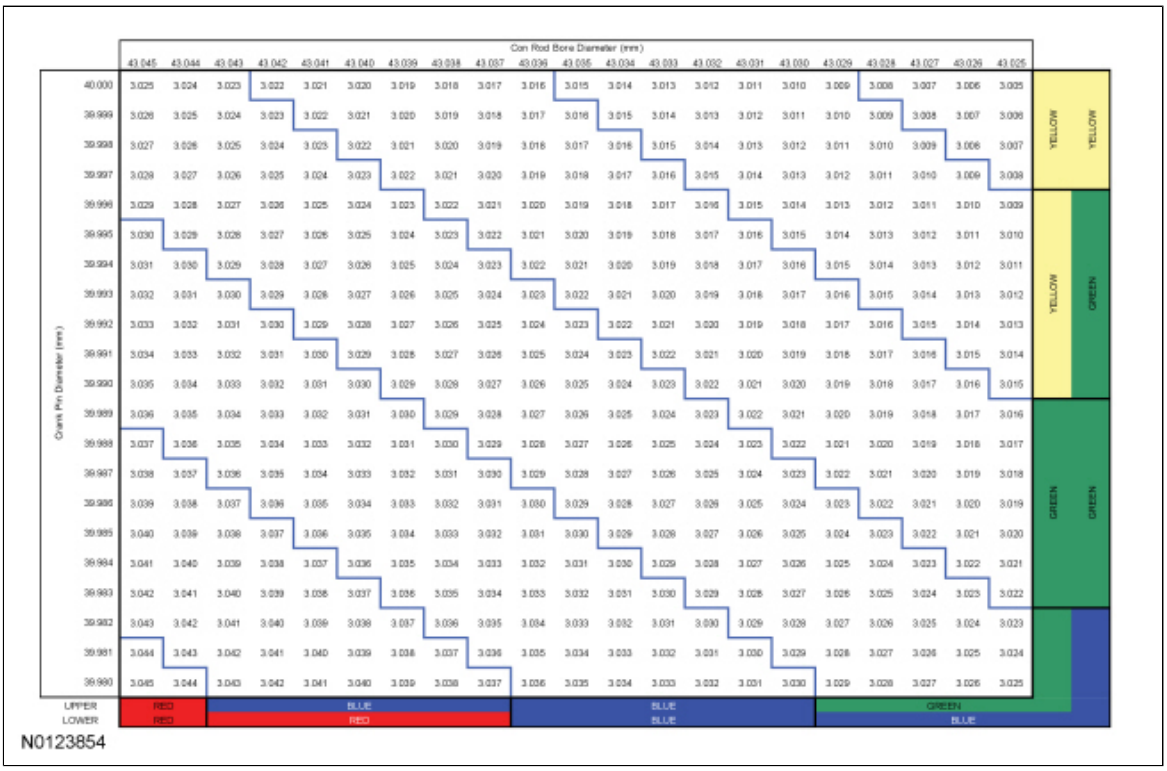
7. Measure the connecting rod large end bore in 2 directions. Record the smallest measurement for each connecting rod.
    - Remove the bolts and the connecting rod cap.
    - Discard the connecting rod cap bolts.



8. Measure each of the crankshaft connecting rod bearing journal diameters in at least 2 directions. Record the smallest measurement for each connecting rod journal.

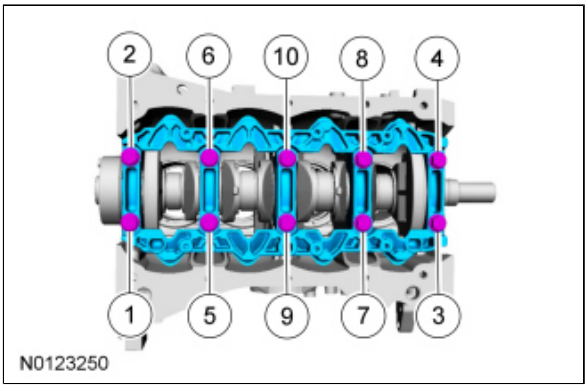


9. Using the chart, select the correct connecting rod bearings for each crankshaft connecting rod journal.



10. **NOTE:** The main bearing beam has 2 arrows pointing towards the front of engine for correct orientation for reassembly.

    Remove the 10 bolts in the sequence shown and the main bearing beam.
    - Discard the main bearing beam bolts.

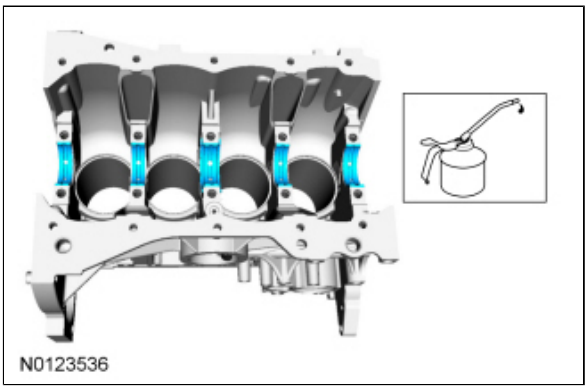


11. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

    NOTE: If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

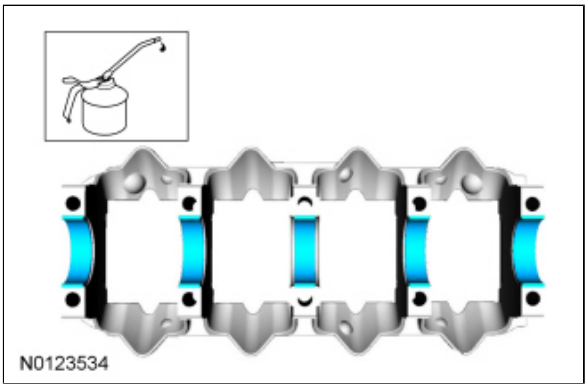
    NOTE: The center bulkhead is the thrust bearing.

    Lubricate the upper crankshaft main bearings with clean engine oil and install the 5 crankshaft main bearings in the cylinder block.



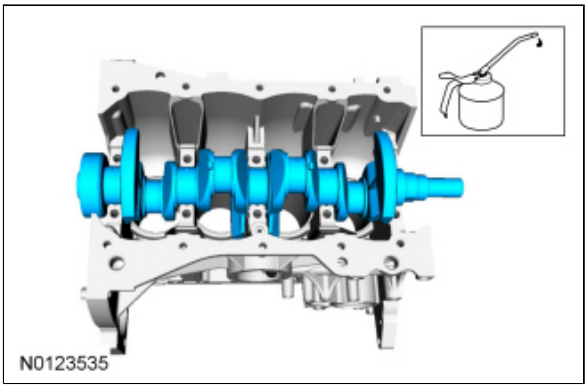
12. **NOTE:** If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

    Lubricate the crankshaft main bearings with clean engine oil and install the 5 crankshaft main bearings in the main bearing beam.

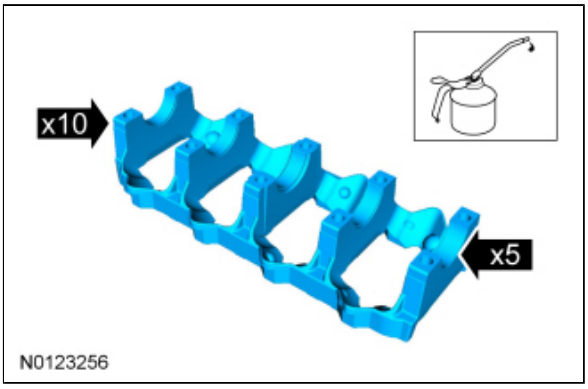


13. **NOTE:** Lubricate journals on the crankshaft with clean engine oil.

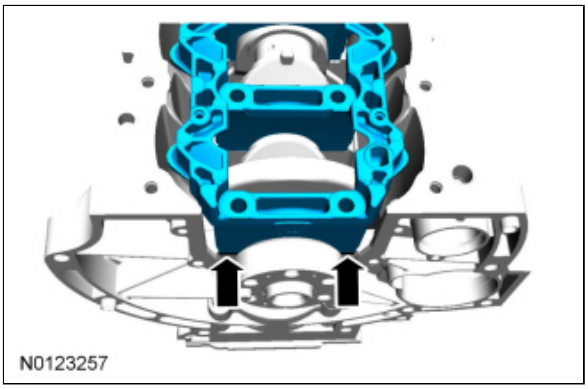
    Position the crankshaft in the cylinder block.



14. Lubricate the 10 main bearing beam side fit surfaces and the 5 main bearing beam bearings with clean engine oil.



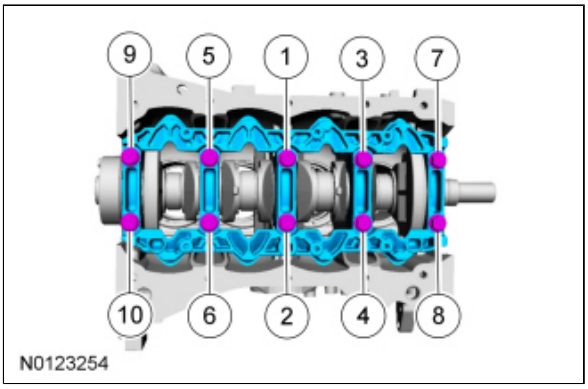
15. Position the main bearing beam in the engine block with the main bearing beam mounted flush with the rear face of the engine block.



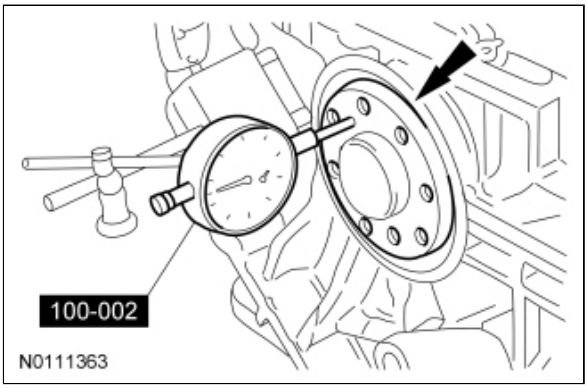
16. **NOTE:** Lubricate the main bearing beam bolts threads and under the bolt heads with clean engine oil.

    NOTE: Position the crankshaft to the rear of the cylinder block, then position the crankshaft to the front of the cylinder block before tightening the main bearing beam bolts.

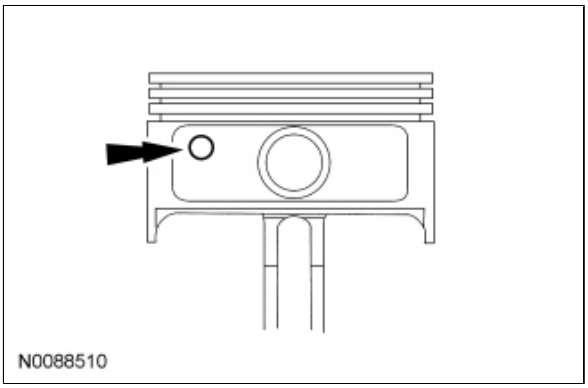
    Install and tighten the 10 new main bearing beam bolts.
    - Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 19 Nm (168 lb-in).
    - Stage 2: Tighten an additional 60 degrees.



17. Using the Dial Indicator Gauge with Holding Fixture, measure crankshaft end play.
    - Position the crankshaft to the rear of the cylinder block.
    - Zero the Dial Indicator Gauge with Holding Fixture.
    - Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.
    - Acceptable crankshaft end play is 0.2-0.43 mm (0.008-0.017 in). If the crankshaft end play exceeds the specified range, install new parts as necessary.



18. Make sure the dimple in the piston faces the front of the engine.

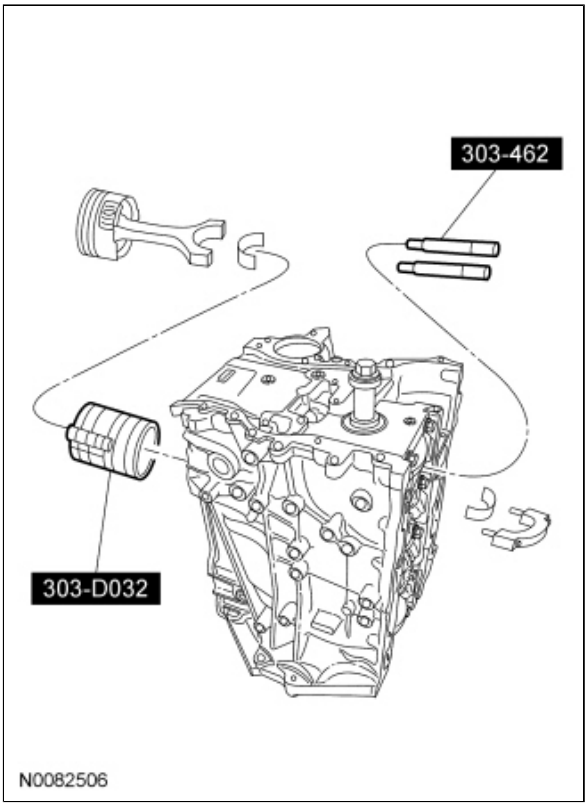


19. ***NOTICE:*** **Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.**

    NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with clean engine oil.

    NOTE: Make sure the piston arrow on top is facing toward the front of the engine.

    Using the Piston Ring Compressor and the Connecting Rod Installer, install the piston and connecting rod assemblies.
    - When installing the pistons and connecting rod assemblies, the oil ring gaps must be positioned 60 degrees apart from each other and a minimum of 90 degrees from the expander gap.
    - The position of the upper and lower compression ring gaps are not controlled for installation.

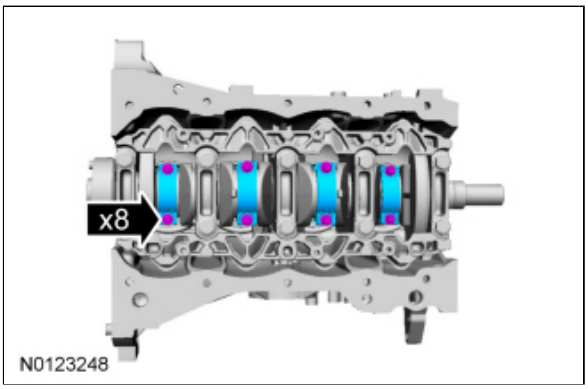


20. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

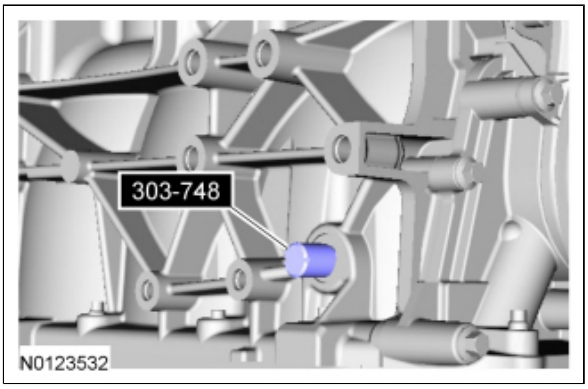
    NOTE: Install connecting rod caps and bolts on the connecting rods for cylinders 1 and 4 first and tighten. Then rotate crankshaft 180 degrees and install connecting rod caps and bolts on connecting rods for cylinders 2 and 3 and tighten.

    NOTE: After installation of each connecting rod cap, rotate the crankshaft to verify smooth operation.

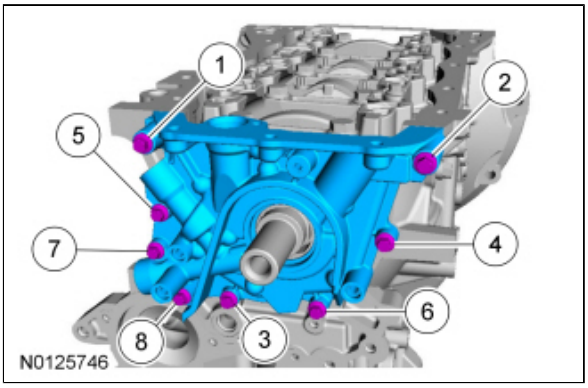
    Install the connecting rod caps and the new bolts and tighten the bolts in 3 stages.
    - Stage 1: Tighten to 18 Nm (159 lb-in).
    - Stage 2: Wait 2 seconds.
    - Stage 3: Tighten an additional 35 degrees.



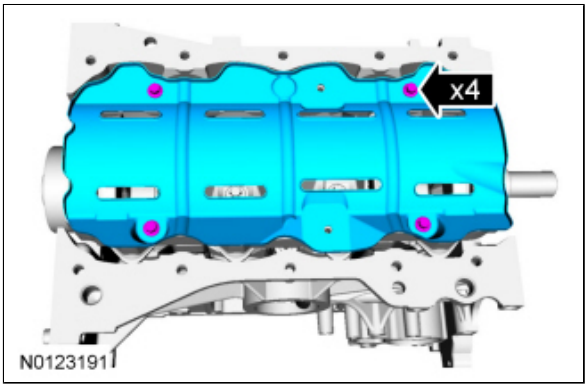
21. Install the Crankshaft Top Dead Center (TDC) Timing Pin and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Pin. The engine is now at TDC .



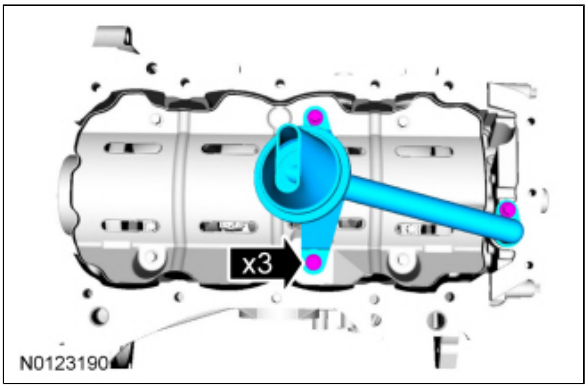
22. Install a new gasket, the oil pump and the 8 bolts in their original position and tighten in sequence shown in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten to 9 Nm (80 lb-in).



23. Install the windage tray and the 4 bolts.
    - Tighten to 9 Nm (80 lb-in).



24. Install the oil pump screen and pickup tube and 3 bolts.
    - Tighten to 9 Nm (80 lb-in).

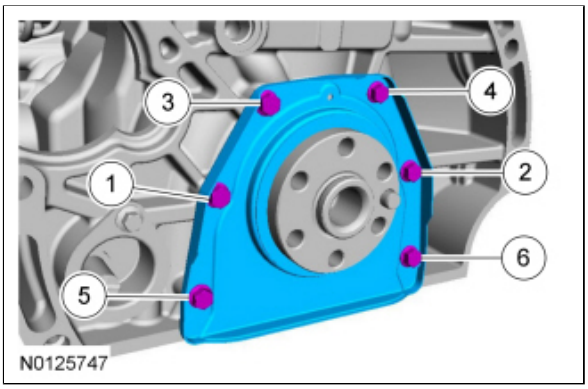


25. **NOTE:** New crankshaft rear seal is supplied with an alignment sleeve which must be removed after installation.

    NOTE: Do not remove the alignment sleeve from the crankshaft rear seal prior to installation on the crankshaft.

    NOTE: Do not lubricate the new crankshaft rear seal.

    Align the crankshaft rear seal and alignment sleeve on the crankshaft and push the crankshaft rear seal off the alignment sleeve onto the crankshaft without stopping until the crankshaft rear seal meets the cylinder block.
    - Install the 6 bolts and tighten in sequence shown in 2 stages.
        - Stage 1: Tighten bolts 1 through 6 to 4 Nm (35 lb-in).
        - Stage 2: Tighten bolts 1 through 6 to 9 Nm (80 lb-in).

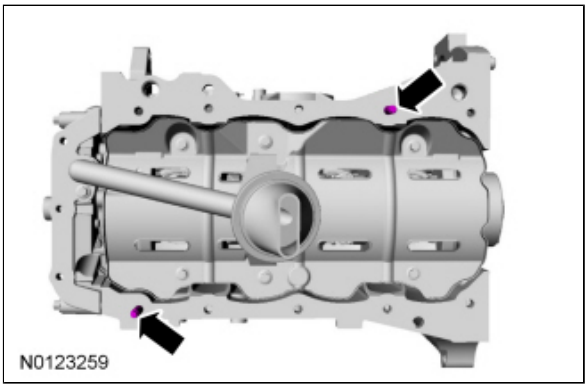


26. Remove the alignment sleeve taking care not to touch the sealing lip.

27. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    Clean and inspect all oil pan mating surfaces.

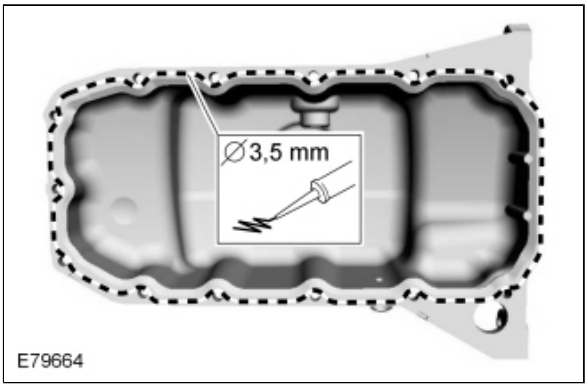
28. Install 2 M8x20 studs for oil pan alignment.



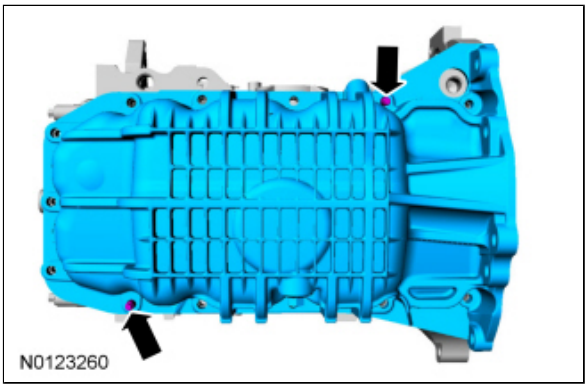
29. **NOTE:** The oil pan must be installed within 5 minutes of applying the sealant.

NOTE: If the oil pan is not secured within 5 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

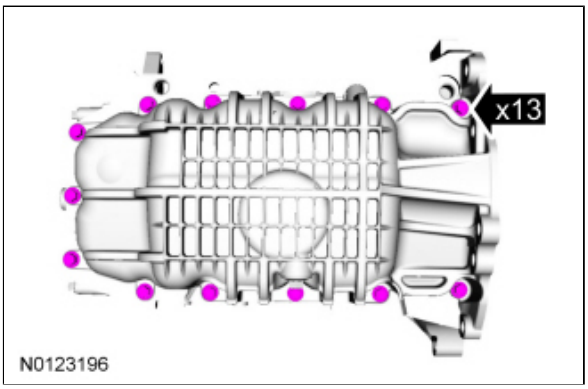
Apply a 3.5 mm (0.137 in) bead of sealant to the oil pan.



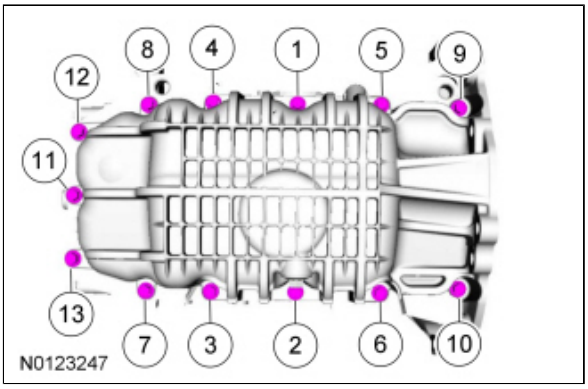
30. Install the oil pan using the 2 studs for alignment.



31. Install 11 bolts finger tight and remove the 2 alignment studs and install the remaining 2 bolts finger tight.



32. Tighten the oil pan bolts in the following sequence in 2 stages.
    - Stage 1: Tighten bolts 1 through 13 to 10 Nm (89 lb-in).
    - Stage 2: Tighten bolts 1 through 13 to 20 Nm (177 lb-in).

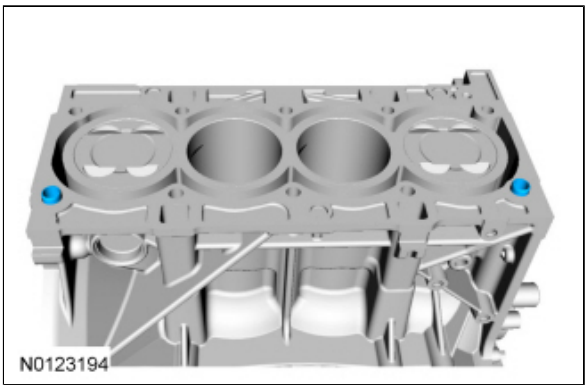


33. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surface of both the cylinder head and the cylinder block in the following sequence.
    1. Apply metal surface prep, following package directions, to remove any traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
    2. Clean the cylinder head bolt holes in the cylinder block. Make sure all coolant, oil or other foreign material is removed.

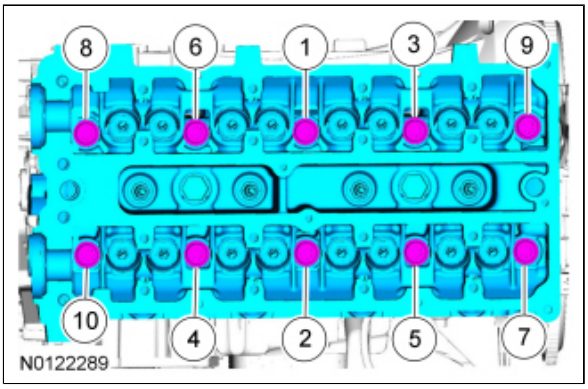
34. Install the cylinder head alignment dowels.
    - Dowels must be fully seated in the cylinder block.



35. **NOTE:** The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

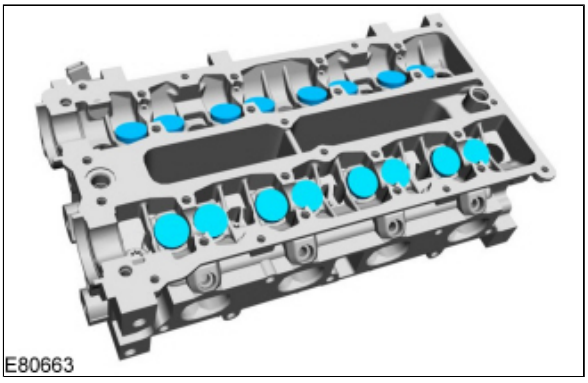
    NOTE: Lubricate the bolts with clean engine oil prior to installation.

    Install the cylinder head gasket, cylinder head and 10 new bolts. Tighten the bolts in the sequence shown in 4 stages:
    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 15 Nm (133 lb-in).
    - Stage 3: Tighten to 35 Nm (26 lb-ft).
    - Stage 4: Turn 75 degrees.

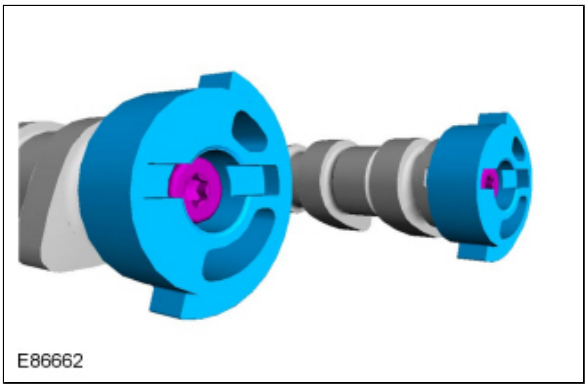


36. **NOTE:** Coat the valve tappets with clean engine oil prior to installation.

    Install the valve tappets.

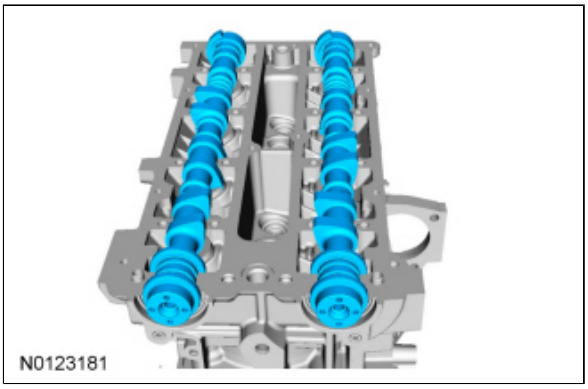


37. If removed, install the camshaft trigger wheels and the 2 bolts.
    - Tighten to 21 Nm (15 lb-ft).

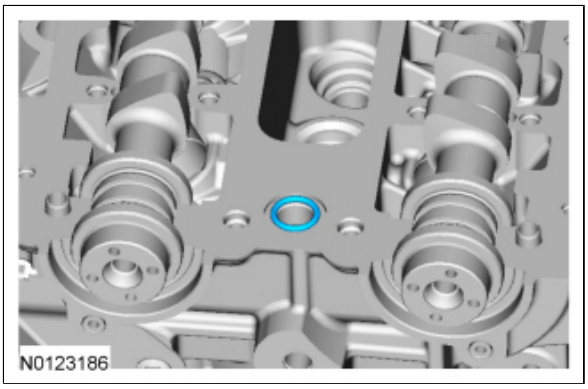


38. **NOTE:** Lubricate the camshafts with clean engine oil.

    Install the camshafts as shown.

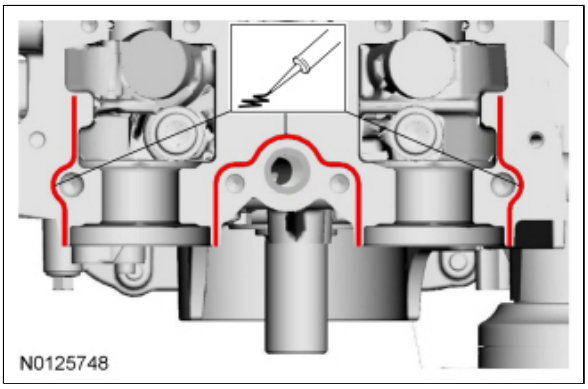


39. Install the Variable Camshaft Timing (VCT) bridge O-ring seal.



40. **NOTE:** The VCT bridge must be installed within 5 minutes of applying the gasket maker to the cylinder head.

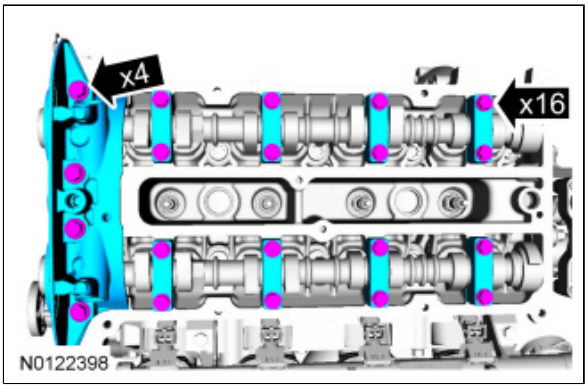
    Apply a 1.5 mm (0.059 in) bead of gasket maker to the cylinder head as shown.



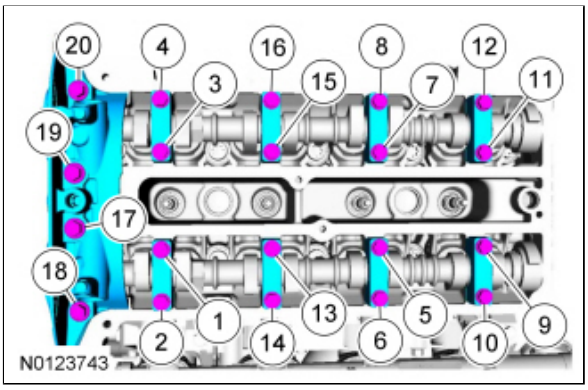
41. ***NOTICE:*** **Make sure that the camshafts and camshaft bearing caps are installed in their original locations or damage to the engine may occur.**

    NOTE: Apply clean engine oil to the bearing surfaces of the camshaft bearing caps and the VCT bridge.

    Install the camshaft bearing caps, VCT bridge and the bolts finger tight.

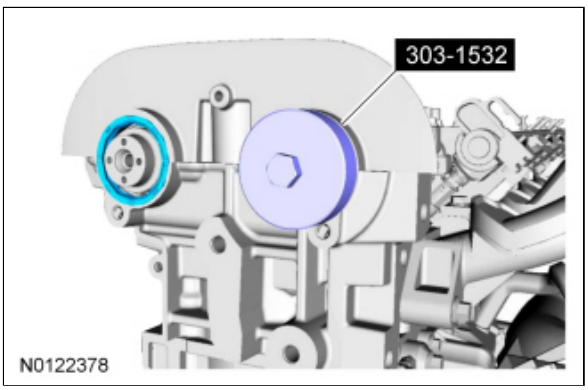


42. Tighten the bolts in the sequence shown in 6 stages.
    - Stage 1: Tighten the bolts evenly, half a turn at a time, until the camshaft bearing caps and the VCT bridge are seated against the cylinder head.
    - Stage 2: Tighten bolts 1 through 16 to 7 Nm (62 lb-in).
    - Stage 3: Tighten bolts 17 through 20 to 10 Nm (89 lb-in).
    - Stage 4: Tighten bolts 1 through 16 an additional 45 degrees.
    - Stage 5: Tighten bolts 17 and 19 an additional 70 degrees.
    - Stage 6: Tighten bolts 18 and 20 an additional 53 degrees.



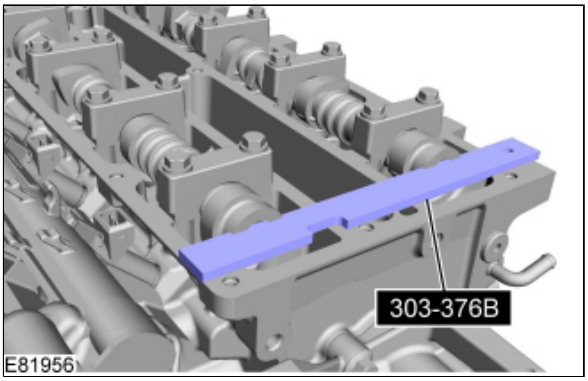
43. If the cylinder head, camshafts or valve tappets were replaced, check the valve clearance. For additional information, refer to Valve Clearance Check in this section.

44. Using the Camshaft Seal Installer, install the 2 camshaft oil seals.



45. ***NOTICE:*** **It may be necessary to use an open-ended wrench to turn the camshafts by the hexagon to align the camshafts.**

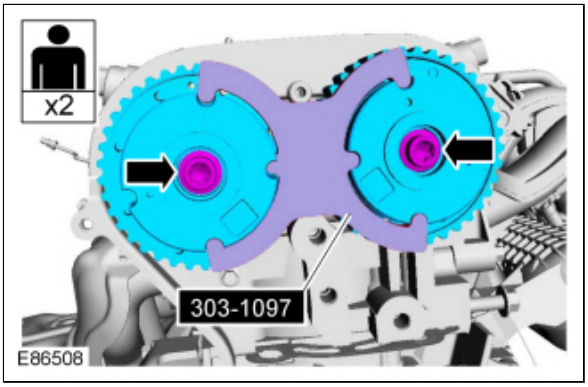
    Install the Camshaft Alignment Plate into the end of the camshafts.



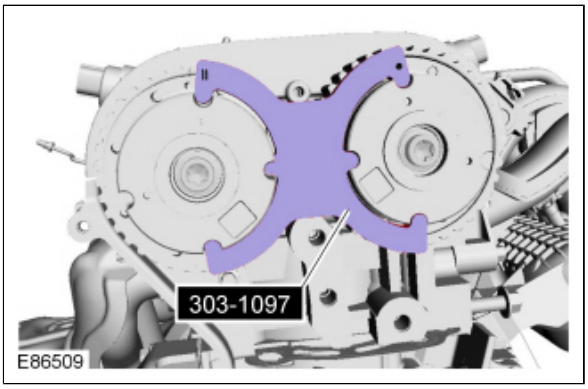
46. ***NOTICE:*** **Use an open-ended wrench to hold the camshafts by the hexagon to prevent the camshafts from turning.**

    NOTE: The timing marks of the camshaft phaser and sprocket must be at the 12 o'clock position.

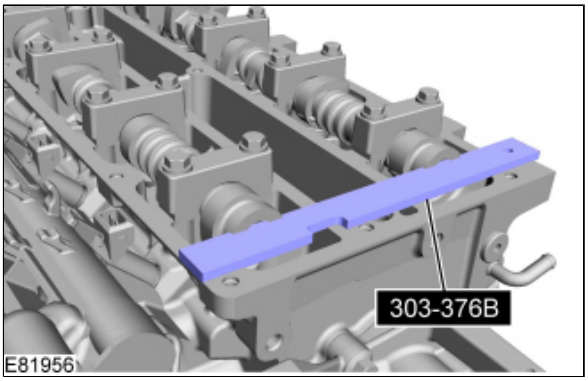
    Install the 2 camshaft phaser and sprocket, bolts and the VCT Alignment Tool.
    - Tighten the 2 bolts to 25 Nm (18 lb-ft).



47. Remove the VCT Alignment Tool.

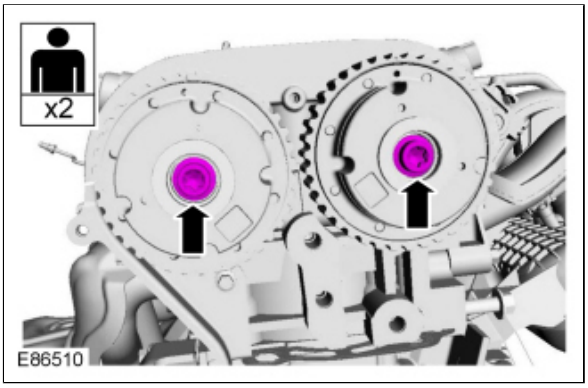


48. Remove the Camshaft Alignment Plate.



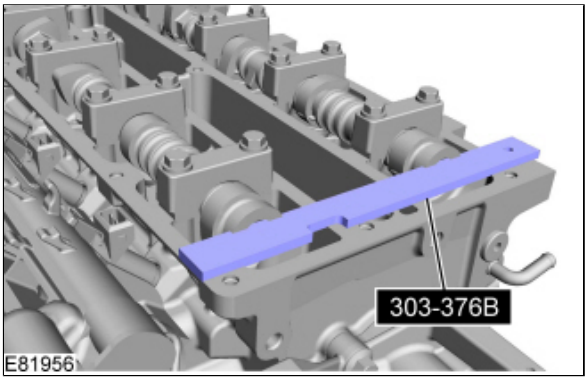
49. ***NOTICE:*** **Use an open-ended wrench to hold the camshafts by the hexagon to prevent the camshafts from turning.**

    Tighten to 2 camshaft phaser and sprocket bolts an additional 75 degrees.



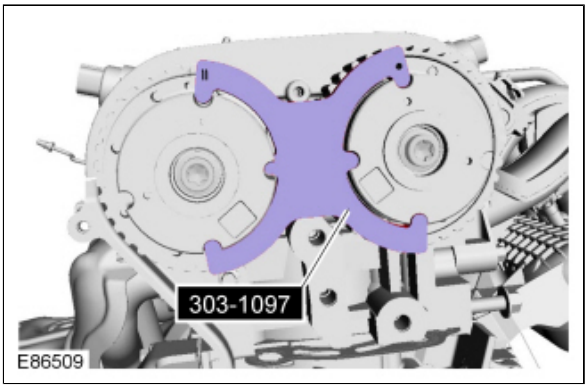
50. **NOTE:** The special tool can only be installed if the valve timing is correct.

    Install the Camshaft Alignment Plate into the end of the camshafts.

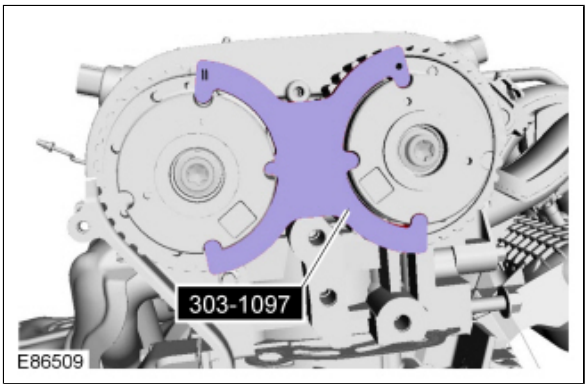


51. **NOTE:** The special tool can only be installed if the valve timing is correct.

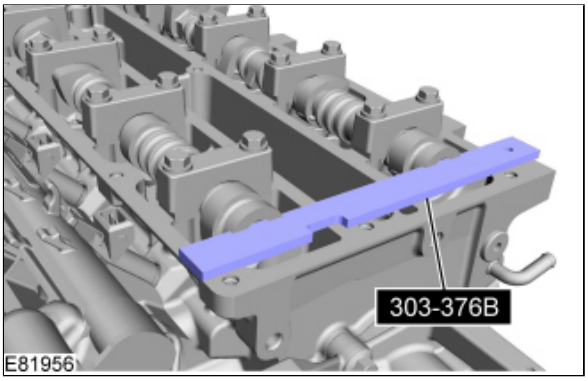
    Install the VCT Alignment Tool.
    - If the special tools cannot be installed, repeat the adjustment according to the preceding steps.



52. Remove the VCT Alignment Tool.



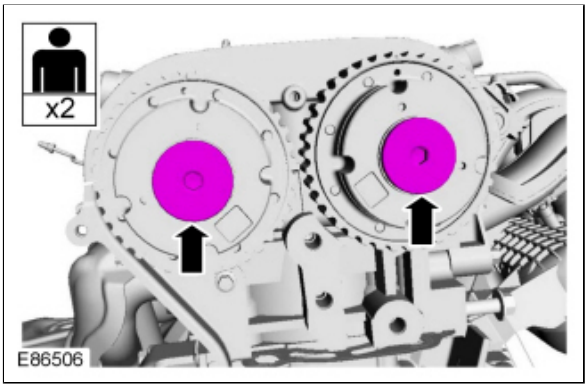
53. Remove the Camshaft Alignment Plate.



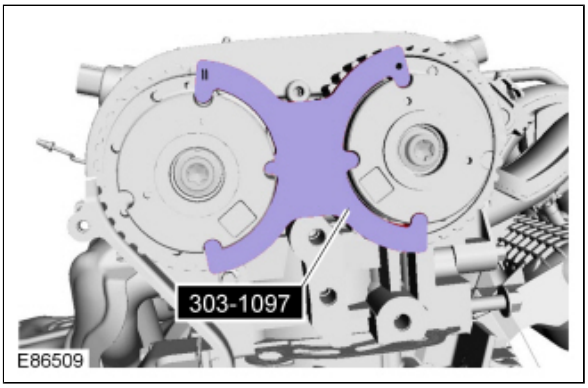
54. ***NOTICE:*** **Use an open-ended wrench to hold the camshafts by the hexagon to prevent the camshafts from turning.**

Install the 2 camshaft phaser and sprocket plugs.

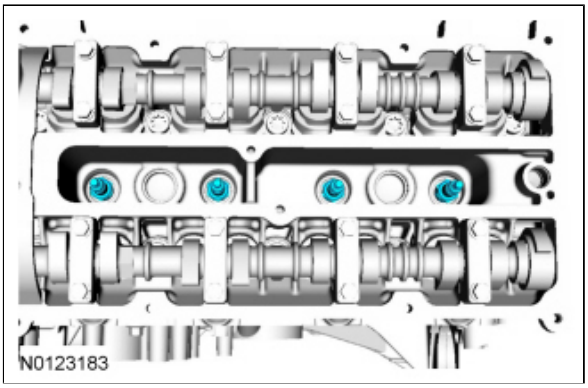
- Tighten to 16 Nm (142 lb-in).



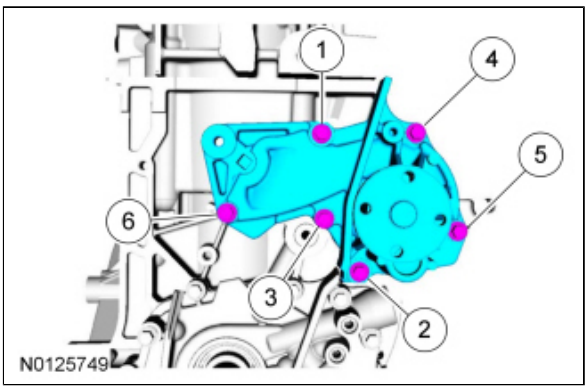
55. Install the VCT Alignment Tool.



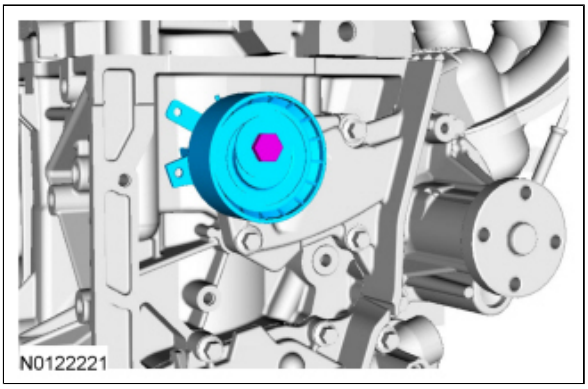
56. Install the 4 spark plugs.
    - Tighten to 15 Nm (133 lb-in).



57. Using a new gasket, install the coolant pump, 6 bolts and tighten in sequence shown in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten to 10 Nm (89 lb-in).

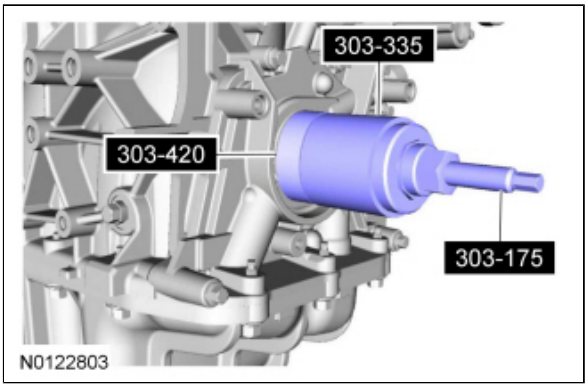


58. Install the timing belt tensioner and the bolt.
    - Tighten to 25 Nm (18 lb-ft).
    - Rotate the timing belt tensioner clockwise and align the 2 holes on the tensioner and install a small screwdriver or holding pin.

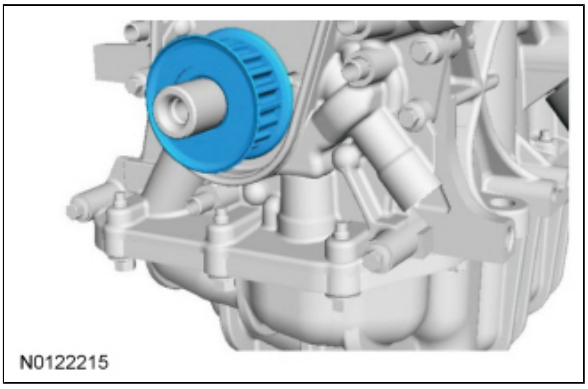


59. **NOTE:** Lubricate the oil seal with clean engine oil.

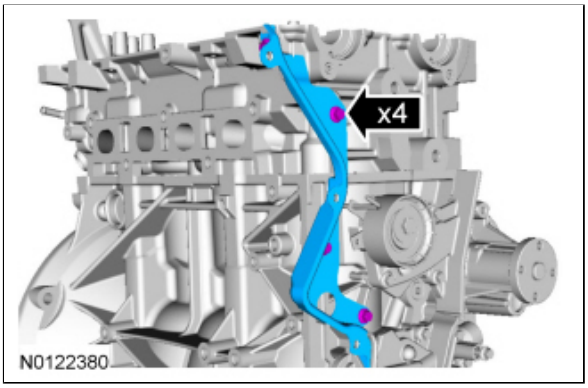
    Using the Crankshaft Vibration Damper Installer, Front Cover Oil Seal Installer and Front Crankshaft Seal Replacer, install the crankshaft front oil seal.



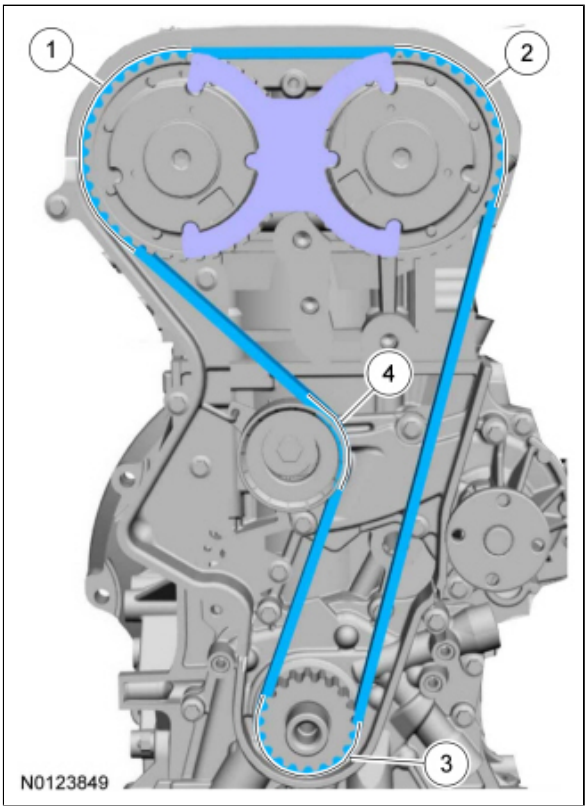
60. Install the crankshaft sprocket gear.



61. Install the timing belt cover backplate and the 4 bolts.
    - Tighten to 9 Nm (80 lb-in).

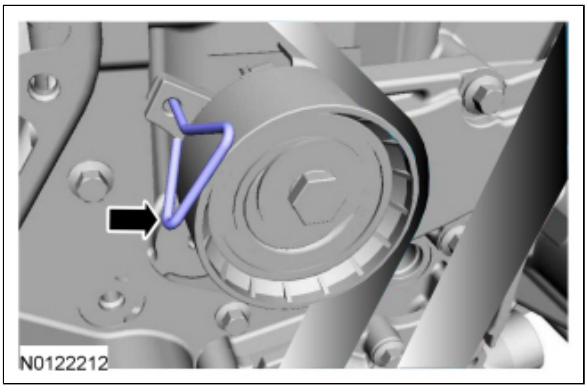


62. Install the timing belt in the sequence shown.

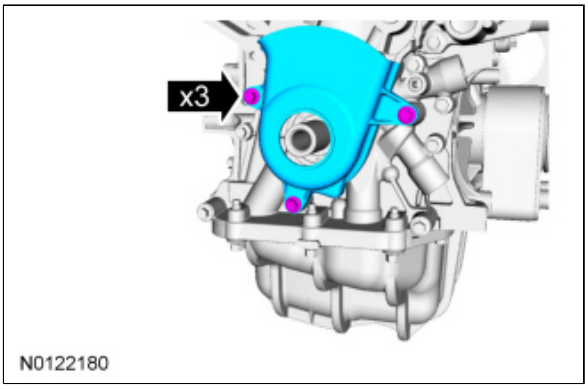


63. **WARNING: The timing belt tensioner spring is under load. Extra care must be taken at all times when handling the tensioner. Failure to follow this instruction may result in personal injury.**

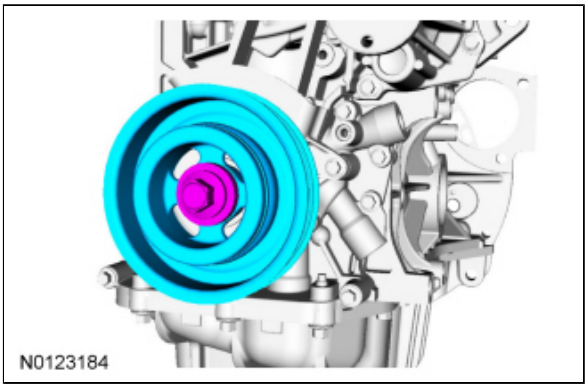
Remove the timing belt tensioner holding tool.



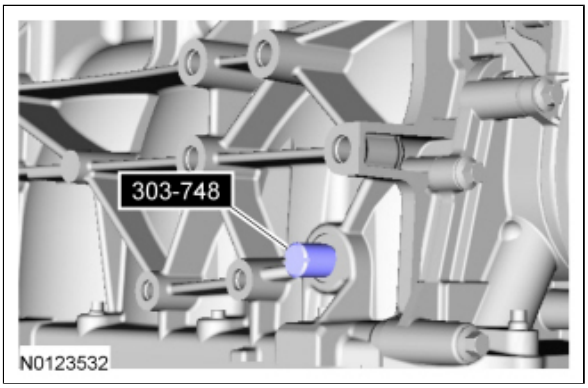
64. Install the lower timing belt cover and the 3 bolts.
    - Tighten to 9 Nm (80 lb-in).



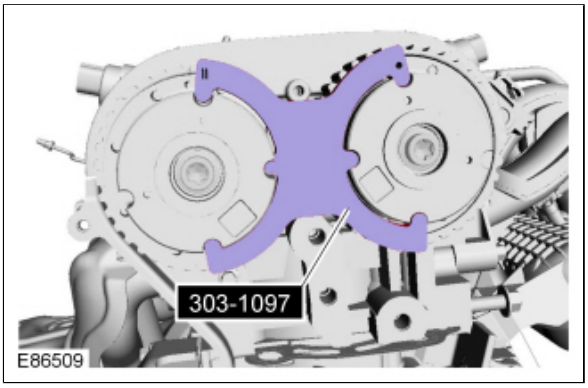
65. Install the crankshaft pulley and the new bolt.
    - Tighten to 100 Nm (74 lb-ft).
    - The final torque of the crankshaft will be completed in following steps.



66. Remove the Crankshaft TDC Timing Pin.

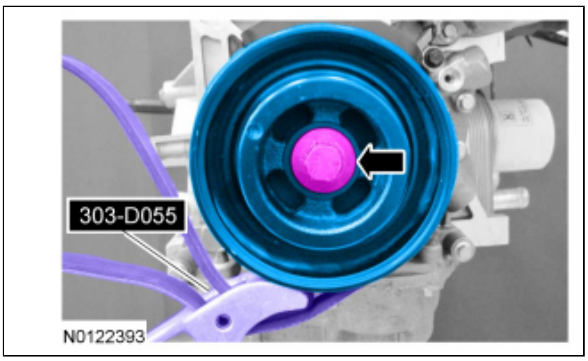


67. Remove the VCT Alignment Tool.



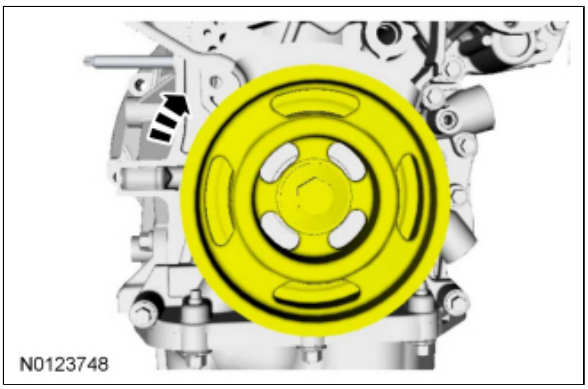
68. Tighten the crankshaft bolt in the following 3 stages.

1. Stage 1: Using the Strap wrench, tighten an additional 90 degrees.
2. Stage 2: Wait for 10 seconds.
3. Stage 3: Using the Strap wrench, tighten an additional 15 degrees.

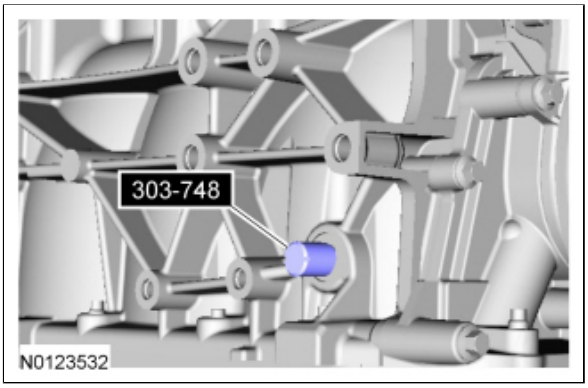


69. **NOTE:** Only rotate the crankshaft clockwise direction.

    Rotate the crankshaft about 1 3/4 turns.

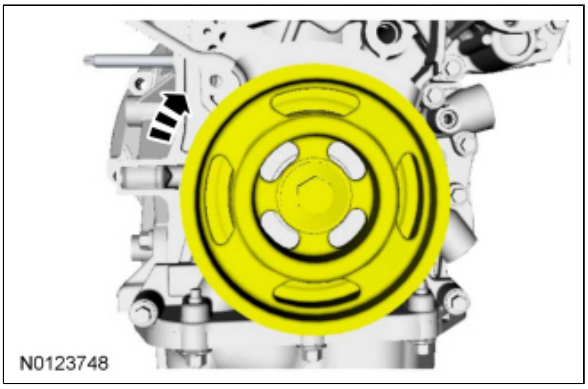


70. Install the Crankshaft TDC Timing Pin.



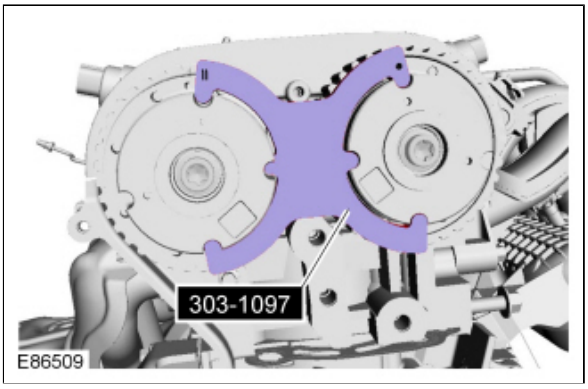
71. **NOTE:** Only rotate the crankshaft clockwise direction.

    Rotate the crankshaft until it stops against the Crankshaft TDC Timing Pin.

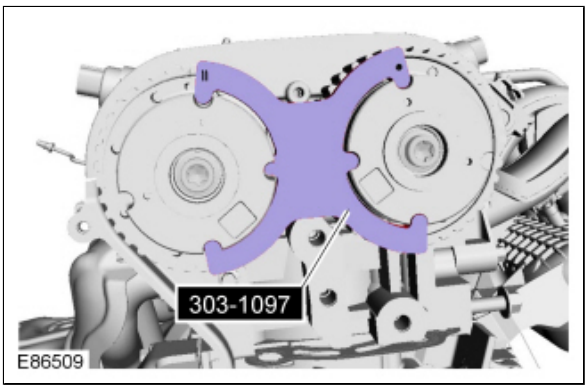


72. **NOTE:** The special tool can only be installed if the valve timing is correct.

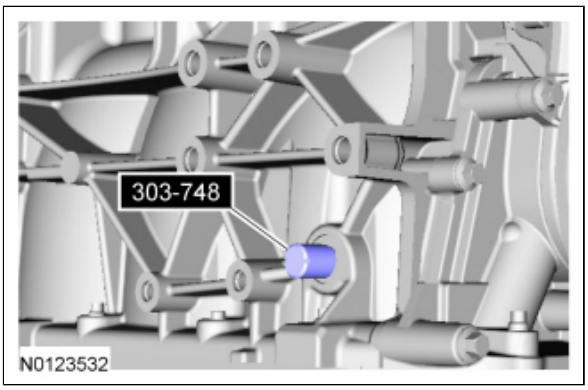
    Install the VCT Alignment Tool.
    - If the special tool cannot be installed, repeat the adjustment according to the preceding steps.



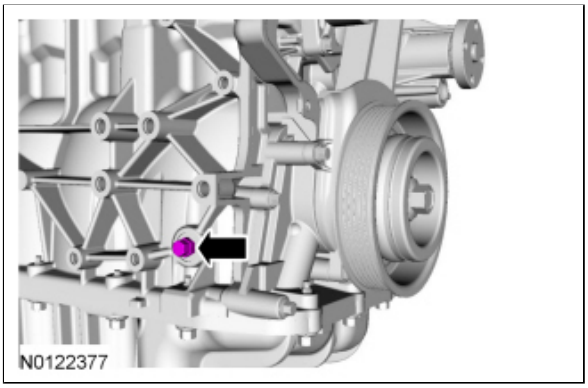
73. Remove the VCT Alignment Tool.



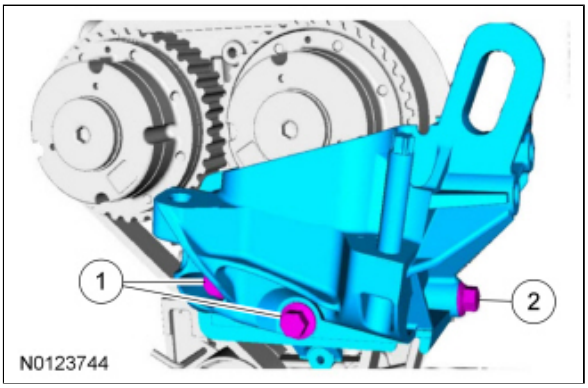
74. Remove the Crankshaft TDC Timing Pin.



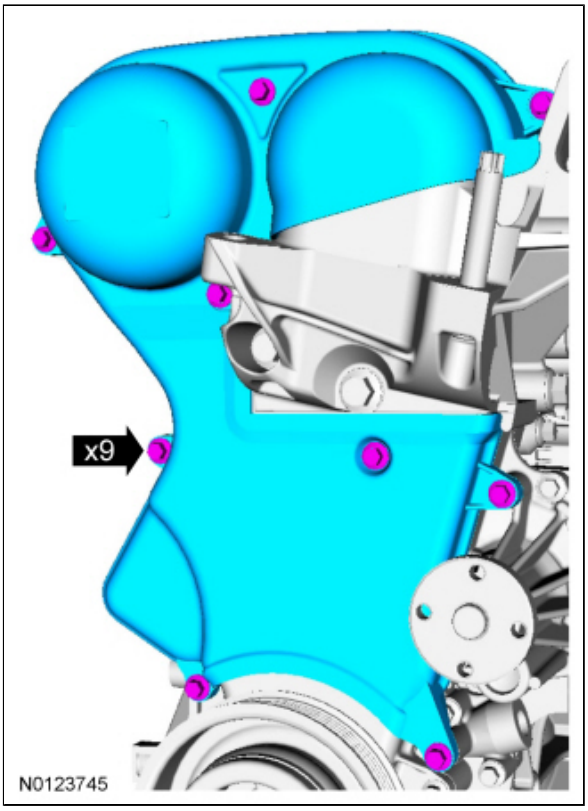
75. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).



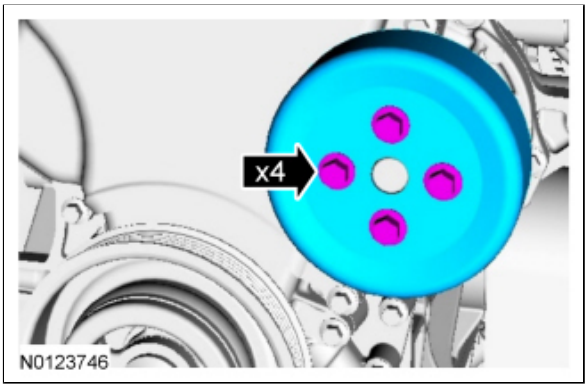
76. Install the engine mount bracket and the 3 bolts finger tight.
    1. Tighten the 2 bolts to 55 Nm (41 lb-ft).
    2. Tighten the bolt to 55 Nm (41 lb-ft).



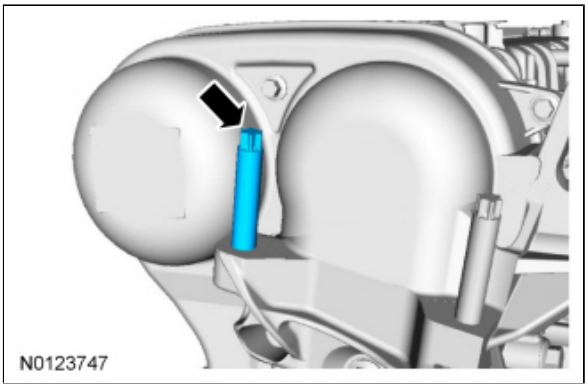
77. Install the timing belt cover and the 9 bolts.
    - Tighten to 9 Nm (80 lb-in).



78. Install the coolant pump pulley and the 4 bolts.
    - Tighten to 20 Nm (177 lb-in).

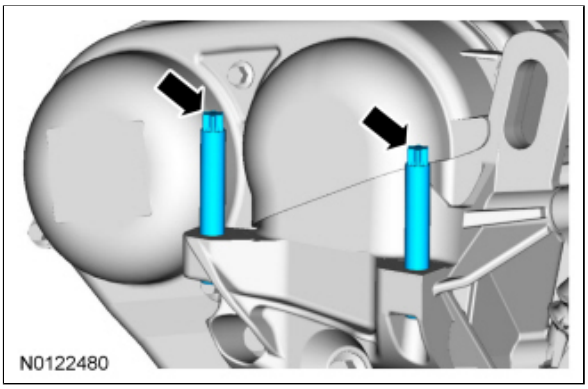


79. Install the 1 engine mount stud finger tight.

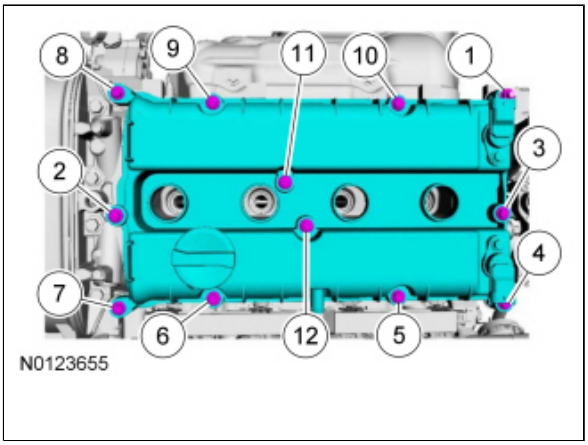


80. ***NOTICE:*** **The 2 engine mount studs must be torqued or damage to the powertrain may occur.**

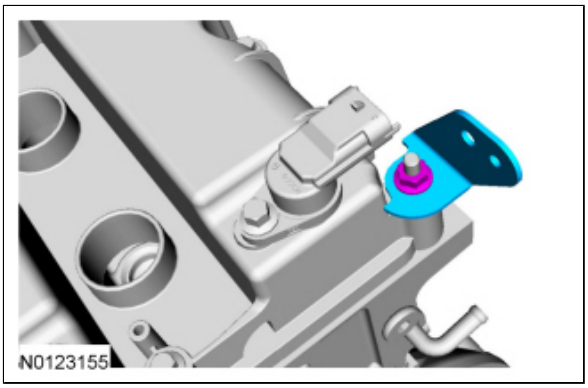
    Torque the 2 engine mount studs before installing the engine mount nuts.
    - Tighten to 8 Nm (71 lb-in).



81. Using a new gasket, install the valve cover and tighten the retainers in sequence shown.
    - Tighten to 9 Nm (80 lb-in).

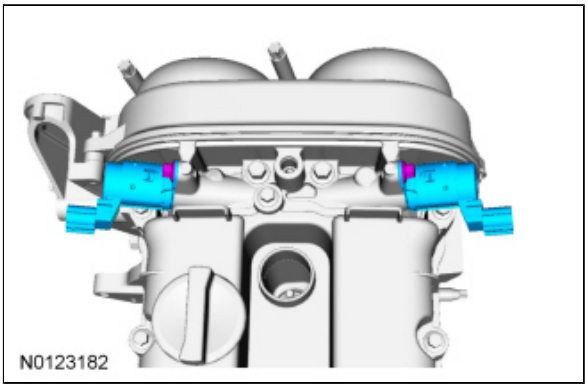


82. Install the Heated Oxygen Sensor (HO2S) electrical connector bracket and the nut.
    - Tighten to 8 Nm (71 lb-in).

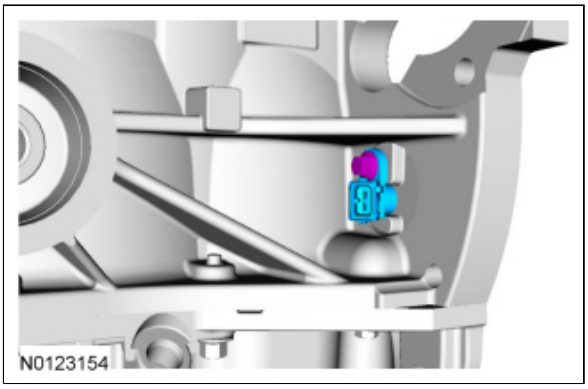


83. **NOTE:** Lubricate the O-ring seals with clean engine oil.

    Install the VCT oil control solenoids and the 2 bolts.
    - Tighten to 8 Nm (71 lb-in).

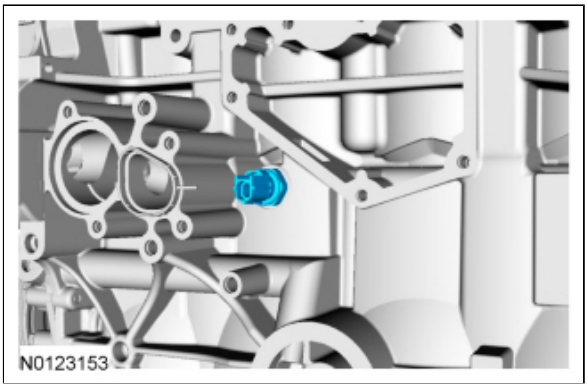


84. Install the Crankshaft Position (CKP) sensor and the bolt.
    - Tighten to 8 Nm (71 lb-in).

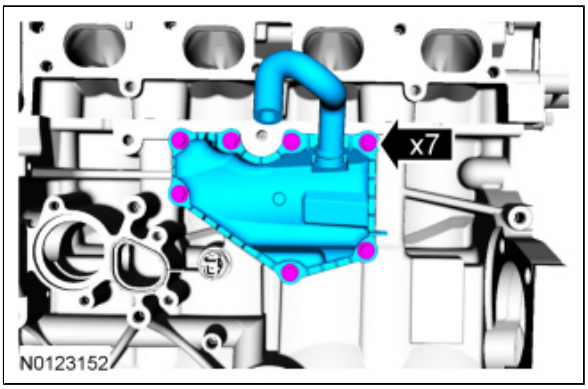


85. **NOTE:** Apply thread sealant to the Engine Oil Pressure (EOP) switch threads.

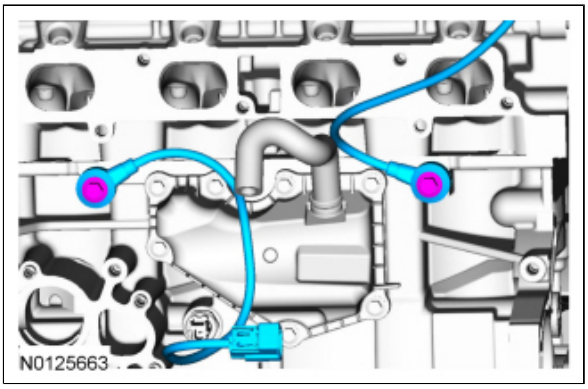
    Install the EOP switch.
    - Tighten to 18 Nm (159 lb-in).



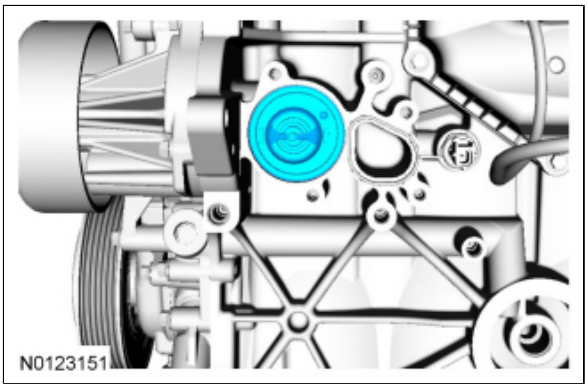
86. Install the crankcase vent oil separator and the bolts.
    - Tighten to 9 Nm (80 lb-in).



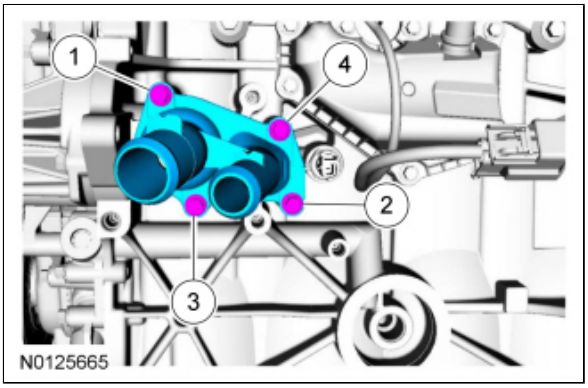
87. Install the RH Knock Sensor (KS) at the 2 o'clock position and the LH KS at the 11 o'clock position and install the bolts.
    - Tighten to 20 Nm (177 lb-in).



88. Install the thermostat and seal in the engine block.

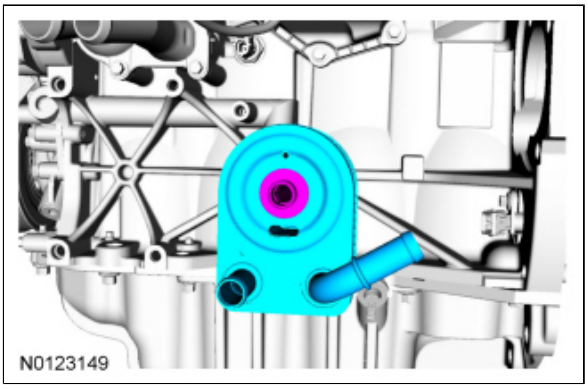


89. Install the gasket, thermostat housing and the 4 bolts finger tight. Tighten the bolts in sequence shown in 2 stages.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 10 Nm (89 lb-in).



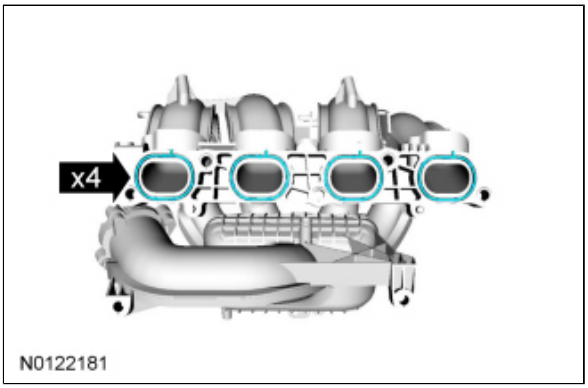
90. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**

    Install the new oil cooler and the bolt.
    - Tighten to 56 Nm (41 lb-ft).

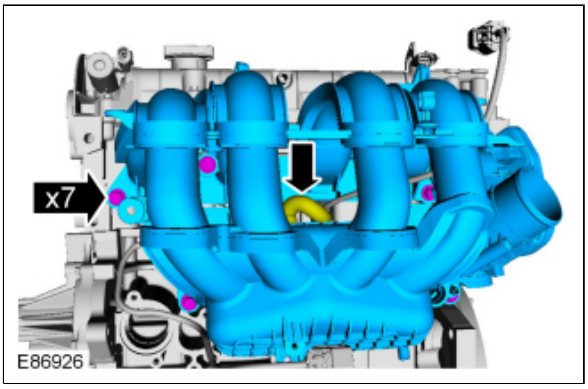


91. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

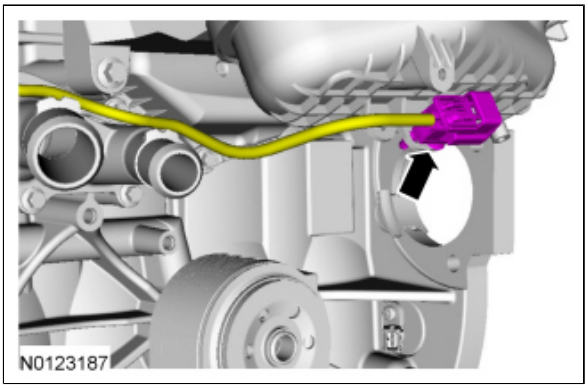
    Inspect and install new intake manifold gaskets if necessary.



92. Install the intake manifold and the 7 bolts.
    - Connect the PCV hose to the intake manifold.
    - Tighten to 18 Nm (159 lb-in).

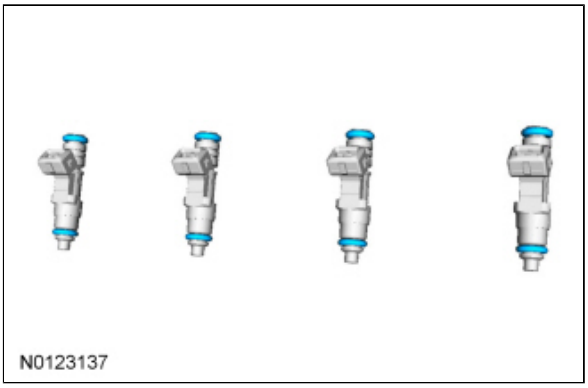


93. Attach the KS electrical connector to the intake manifold.

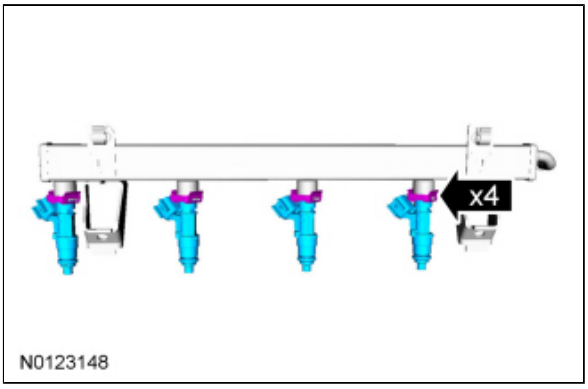


94. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings may cause the fuel system to leak. Do not reuse the O-ring seals.**

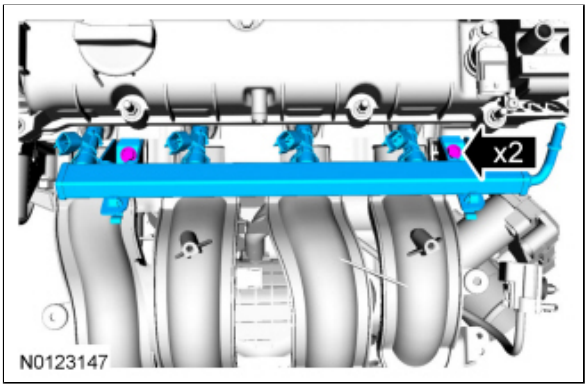
    Install the new O-ring seals onto the fuel injectors and lubricate them with clean engine oil.



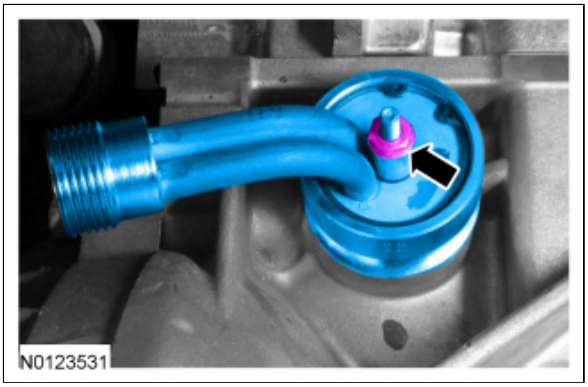
95. Install the 4 fuel injectors and the 4 fuel injector clips into the fuel rail.



96. Install the fuel rail and fuel injectors as an assembly and install the 2 bolts.
    - Tighten to 11 Nm (97 lb-in).

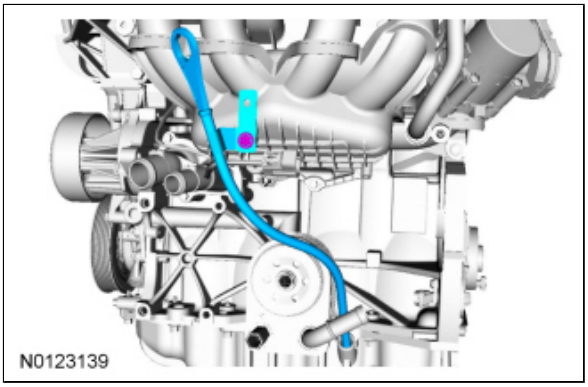


97. If equipped, position the block heater and finger-tighten the nut, making sure the block heater electrical connector points to the 8 o'clock position.
    - Tighten the nut to 3 Nm (27 lb-in).

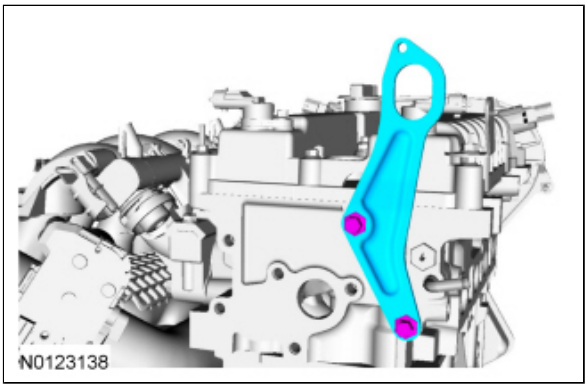


98. **NOTE:** Lubricate the O-ring seal with clean engine oil.

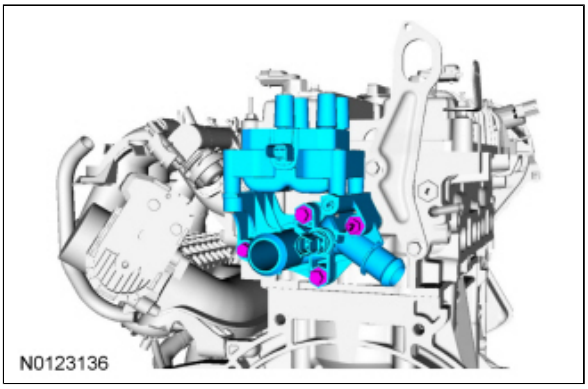
    Install the oil level indicator and tube and the screw.
    - Tighten to 4 Nm (35 lb-in).



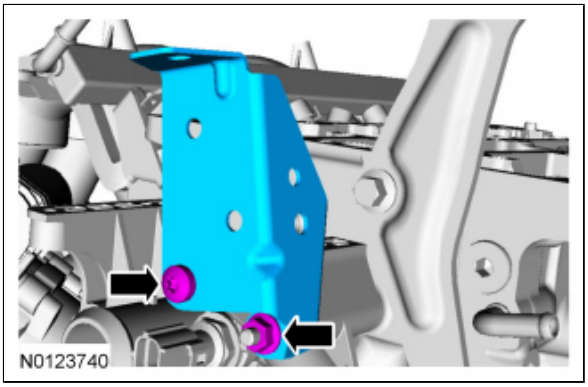
99. Install the LH engine lift eye and the 2 bolts.
    - Tighten to 19 Nm (168 lb-in).



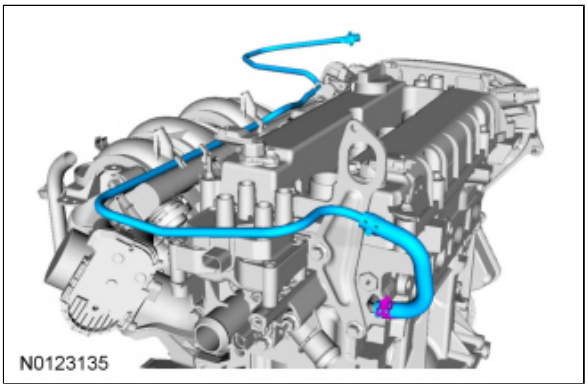
100. Install the ignition coil and coolant outlet assembly and the 4 bolts.
    - Tighten to 19 Nm (168 lb-in).



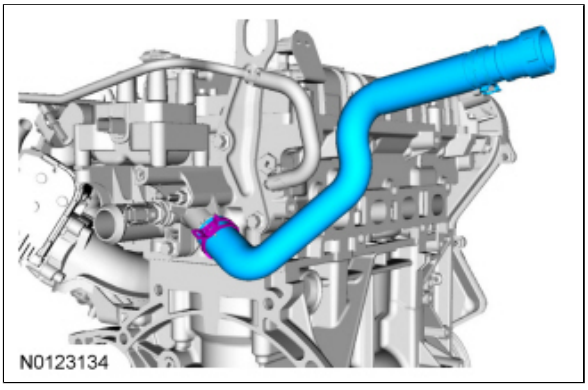
101. Install the coolant outlet bracket, nut and the bolt.
    - Tighten to 6 Nm (53 lb-in).



102. Connect the coolant return hose to the cylinder head.
    - Attach the coolant tube to the fuel rail retainers.

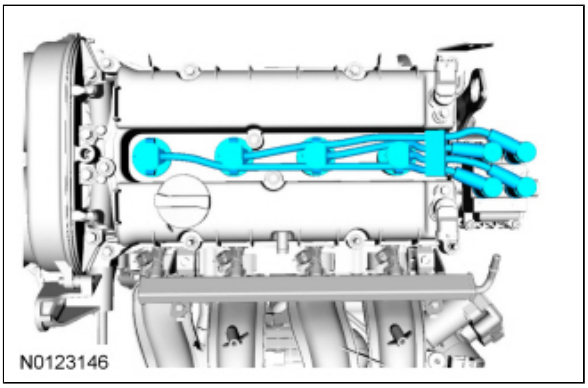


103. Connect the coolant hose to the coolant outlet.

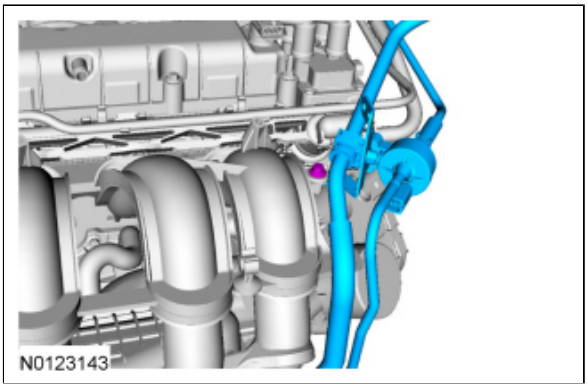


104. **NOTE:** Apply silicone dielectric compound to the inside of the spark plug wire boots.

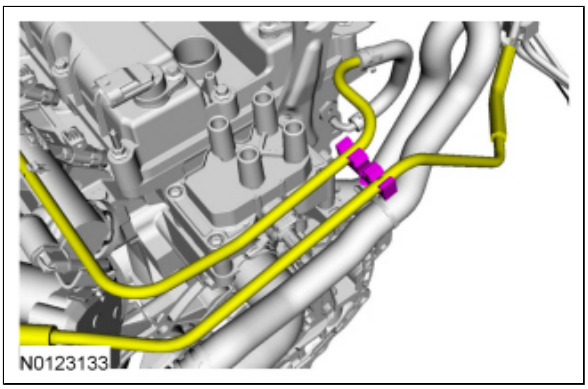
Install the 4 spark plug wires.



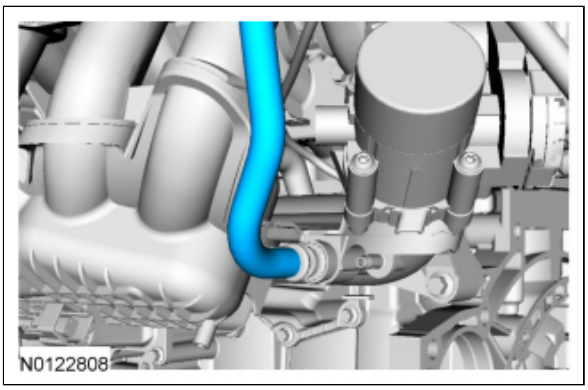
105. Install the Evaporative Emission (EVAP) canister purge valve and the bolt.
    - Tighten to 9 Nm (80 lb-in).



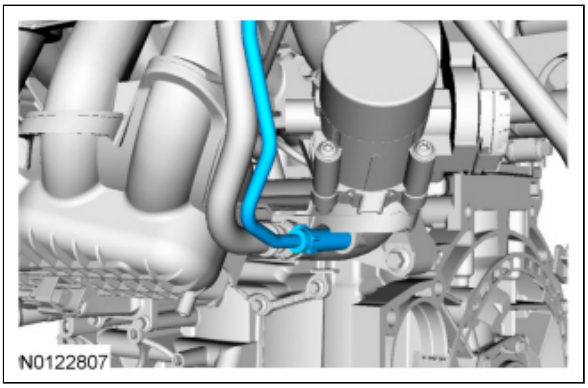
106. Attach the EVAP tube and coolant tube to the coolant outlet bracket retainer.



107. Connect the brake booster vacuum tube to the intake manifold.



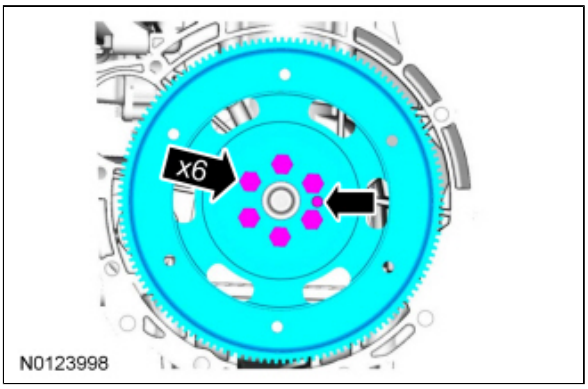
108. Connect the EVAP canister purge valve tube to the intake manifold.



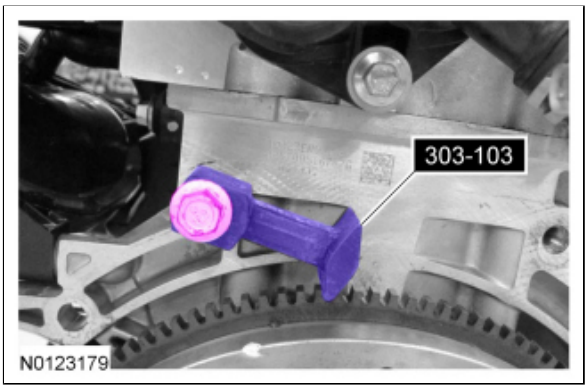
109. Using the Heavy Duty Floor Crane and Spreader Bar, remove the engine from the engine stand.

Vehicles with automatic transaxle

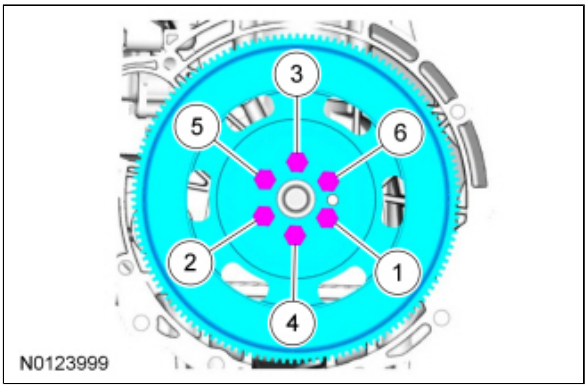
110. Align the flexplate and crankshaft using the dowel pin location hole and install the new bolts finger tight.



111. Install the Flywheel Holding Tool.

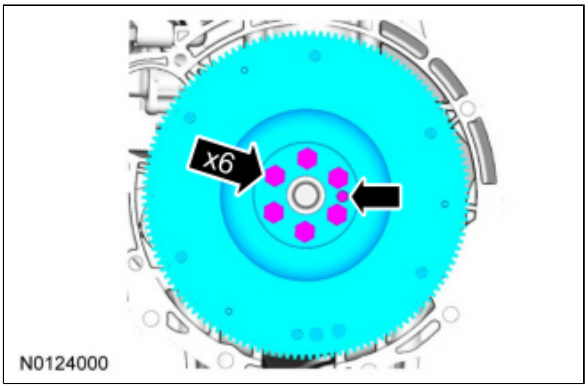


112. Tighten the bolts in the sequence shown in 2 stages:
    - Stage 1: Tighten to 30 Nm (22 lb-ft).
    - Stage 2: Tighten an additional 80 degrees.

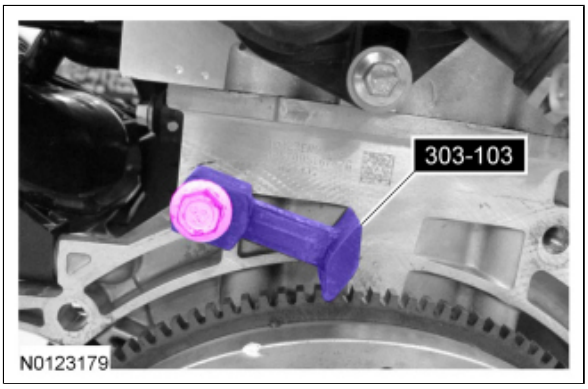


Vehicles with manual transaxle

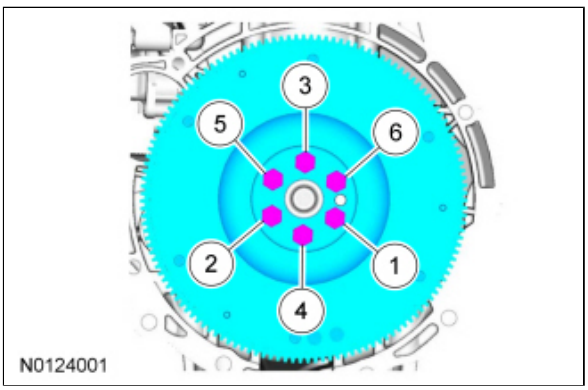
113. Align the flywheel and crankshaft using the dowel pin location hole and install the new bolts finger tight.



114. Install the Flywheel Holding Tool.



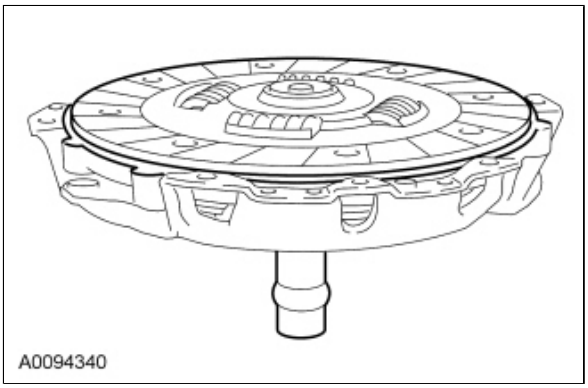
115. Tighten the bolts in the sequence shown in 2 stages:
    - Stage 1: Tighten to 30 Nm (22 lb-ft).
    - Stage 2: Tighten an additional 80 degrees.



116. ***NOTICE:*** **Be sure the clutch is installed correctly in the pressure plate. The side of the clutch marked gearbox side faces the pressure plate fingers. Failure to install the clutch plate will damage the clutch assembly during installation on the flywheel.**

NOTICE: **Do not use cleaners with a petroleum base and do not immerse the clutch pressure plate in solvent or damage may occur.**

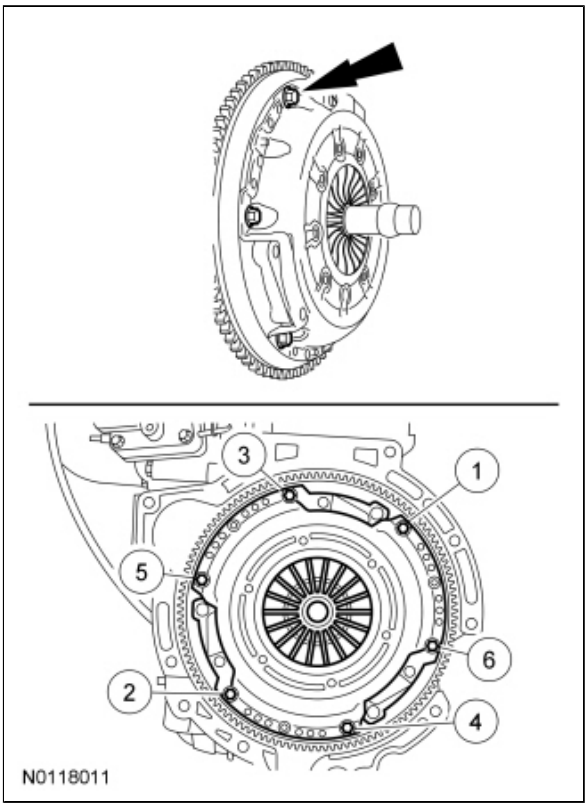
Position the clutch disc on the clutch pressure plate with the side of the clutch marked gearbox side facing the pressure plate fingers. Using a suitable clutch aligner, centralize the clutch disc to the clutch pressure plate.



117. **NOTE:** Use a clutch disc aligner (such as OTC® Clutch Alignment Tool Set 4528 or equivalent).

Using a clutch disc aligner, position the clutch disc and clutch pressure plate on the flywheel. Install the 6 new clutch pressure plate-to-flywheel bolts.

- Tighten the bolts evenly two turns at a time in the pattern shown.
- Tighten to 29 Nm (21 lb-ft).



Engine — Automatic Transaxle

Special Tool(s)

ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E
ST1682-A	Powertrain Lift 300-OTC1585AE
ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST2743A	Adjustable Grip Arm, 1735A 014-00001

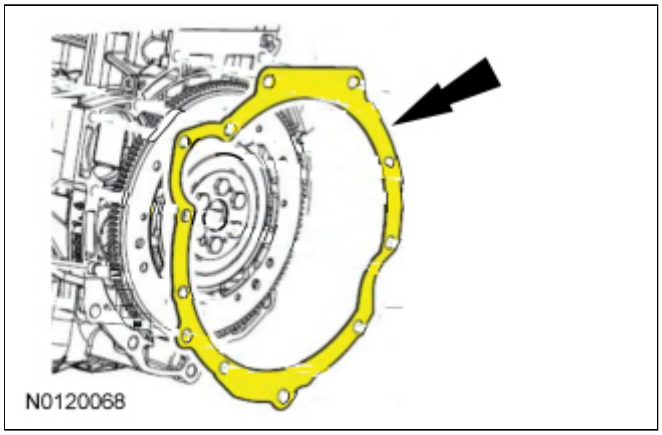
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

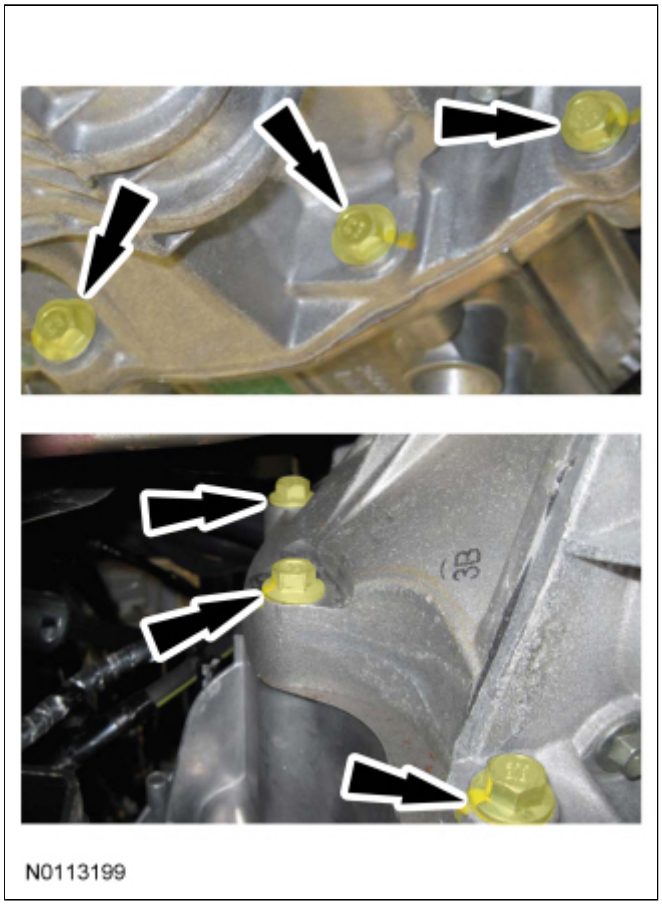
All vehicles

1. ***NOTICE:*** **Use caution not to damage the engine-to-transaxle separator plate or damage can occur.**

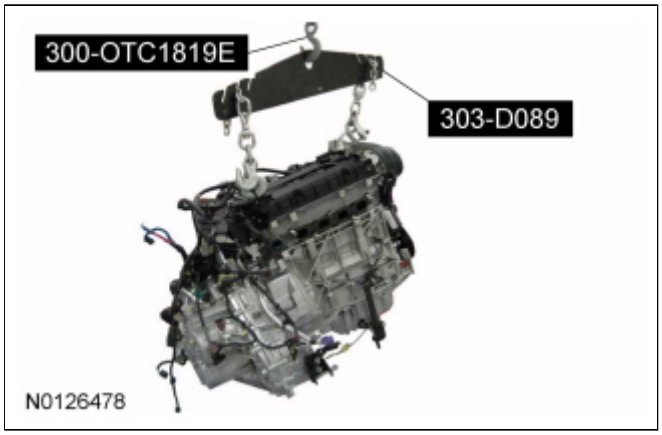
   Install the new engine-to-transaxle separator plate.



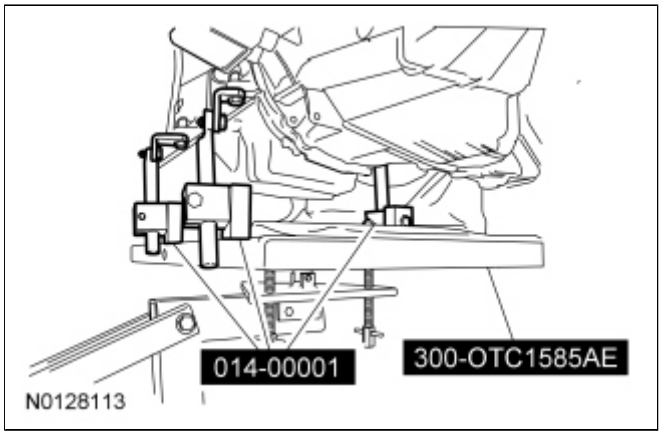
2. Using the Heavy Duty Floor Crane and Spreader Bar, position the engine and transaxle together. Install the 6 engine-to-bellhousing bolts.
    - Tighten to 48 Nm (35 lb-ft).



3. Using the Floor Crane and Spreader Bar, raise the engine and transaxle assembly onto the lift table.



4. Using the Powertrain Lift and Adjustable Grip Arms, secure the engine and transaxle assembly to the lift table.

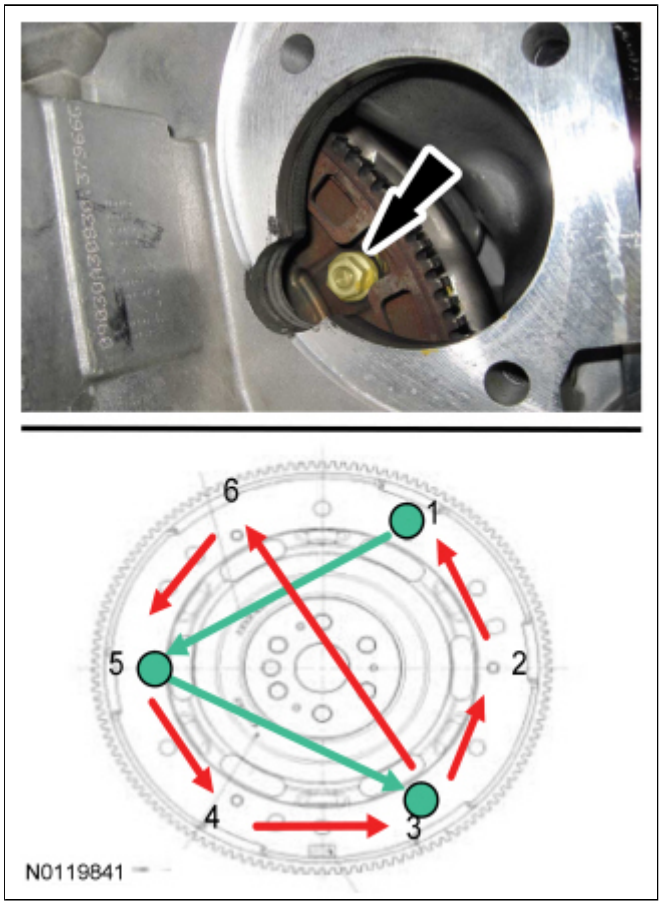


5. ***NOTICE:*** **Rotate the engine in a clockwise direction only or engine damage will occur.**

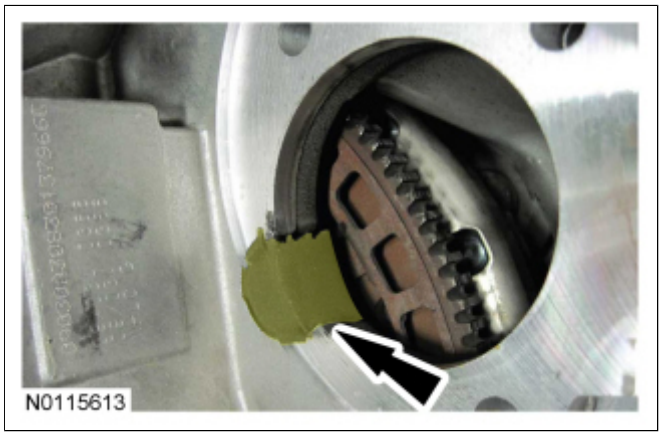
   NOTICE: **Tighten the flexplate-to-clutch nuts in a star pattern or transaxle damage can occur.**

   NOTE: Using a magnetic socket will help ensure ease of installation. If the nuts are dropped in the clutch housing, the transaxle will have to be removed to retrieve them.

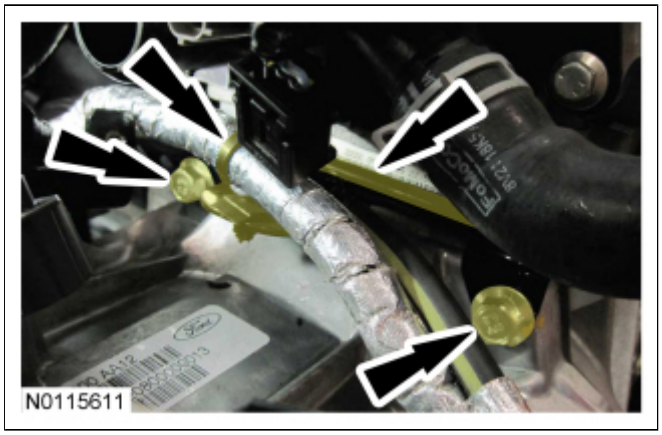
   Install the 6 new flexplate-to-clutch nuts. Tighten the nuts in a star pattern in 2 stages.
   - Stage 1: Tighten nuts 1, 5 and 3 to 12 Nm (106 lb-in).
   - Stage 2: Tighten all nuts to 25 Nm (18 lb-ft).



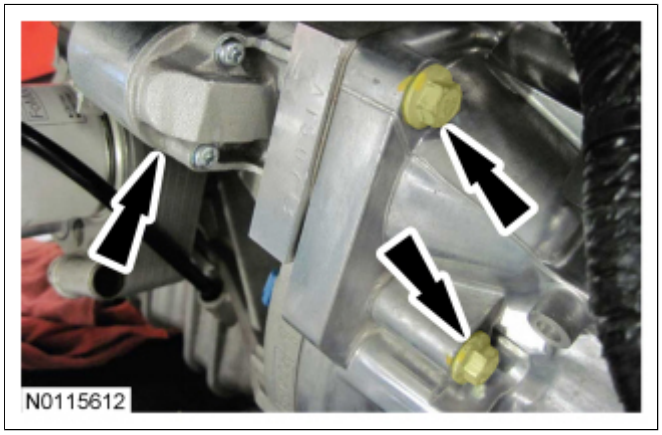
6. Install the flexplate-to-clutch nut access cover.



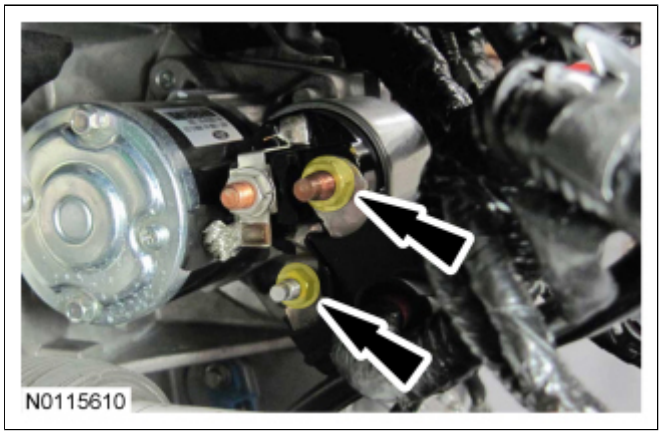
7. Install the 2 upper bellhousing-to-engine bolts and bracket.
    - Tighten to 48 Nm (35 lb-ft).
    - Attach the wiring harness pin-type retainer to the bracket.



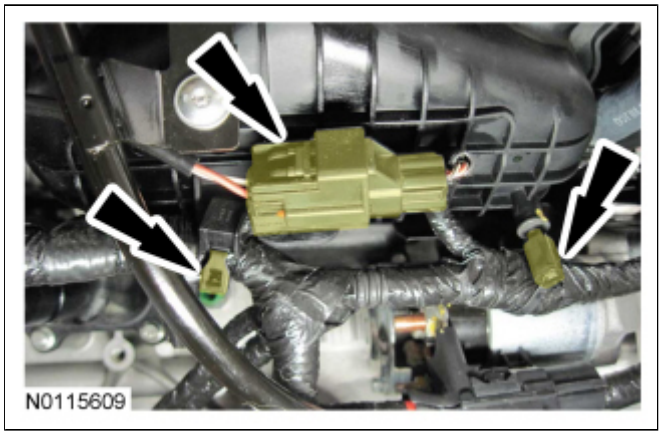
8. Install the starter motor and the 3 bolts (2 shown).
    - Install the 3 bolts finger-tight.
    - Tighten the 2 upper bolts to 48 Nm (35 lb-ft).
    - Tighten the lower bolt to 48 Nm (35 lb-ft).



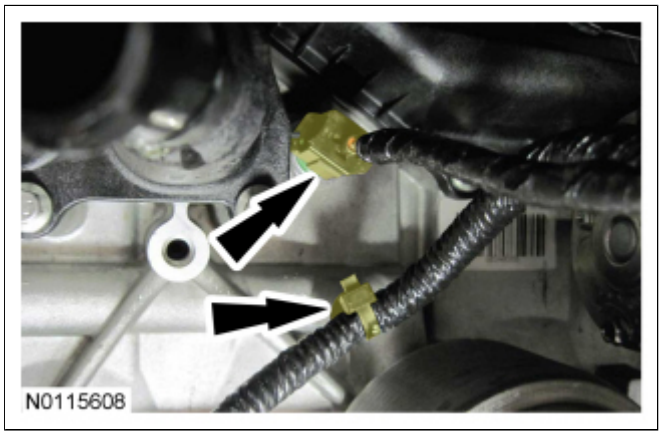
9. Connect the starter motor electrical terminals and install the 2 nuts.
    - Tighten to 10 Nm (89 lb-in).



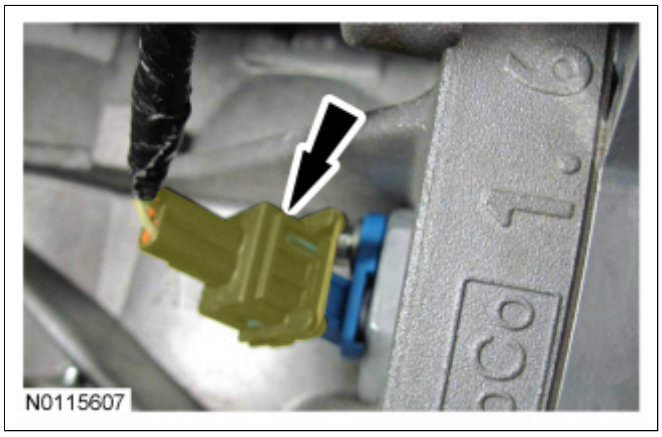
10. Connect the RH Knock Sensor (KS) electrical connector.
    - Attach the 2 wiring harness retainers to the intake manifold.



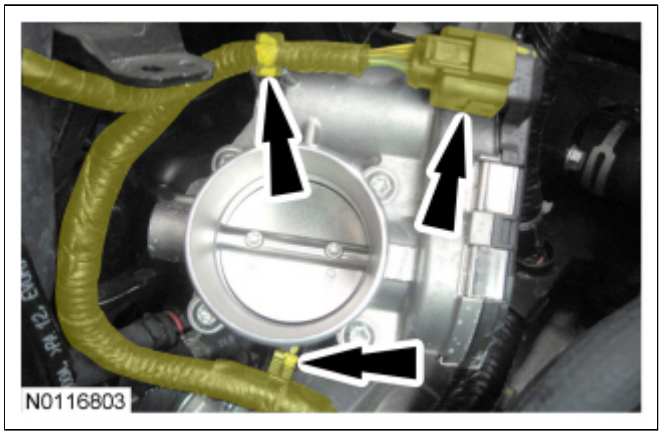
11. Connect the Engine Oil Pressure (EOP) switch electrical connector.
    - Attach the wiring harness retainer to the engine block.



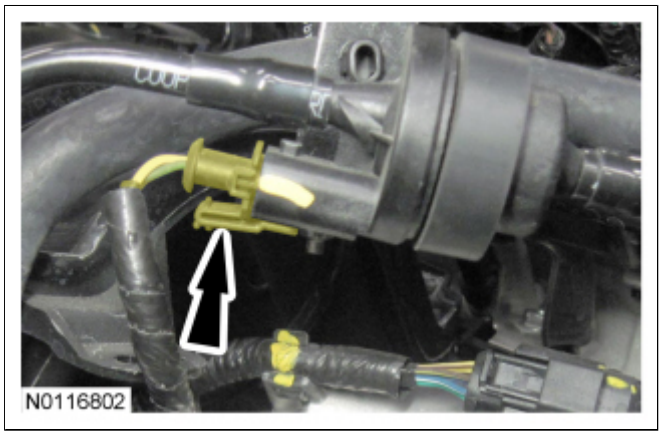
12. Connect the Crankshaft Position (CKP) sensor electrical connector.



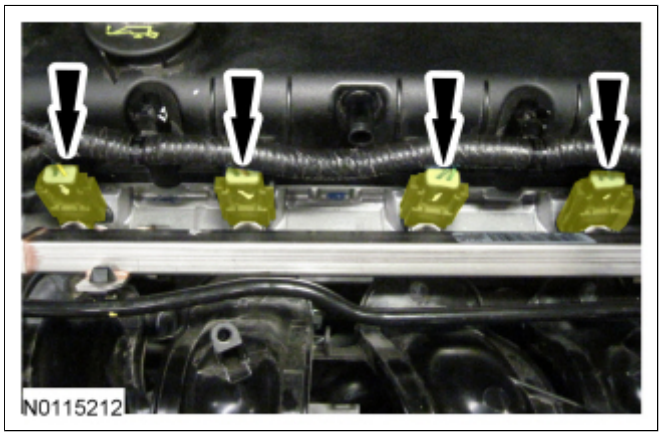
13. Connect the Throttle Body (TB) electrical connector.
    - Attach the 2 wiring harness retainers to the TB .



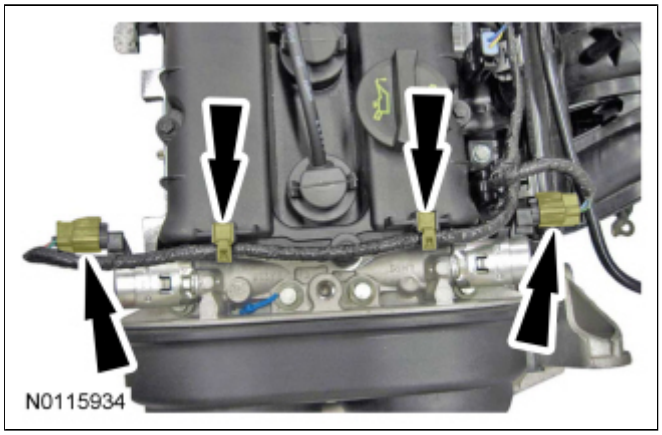
14. Connect the Evaporative Emission (EVAP) canister purge valve electrical connector.



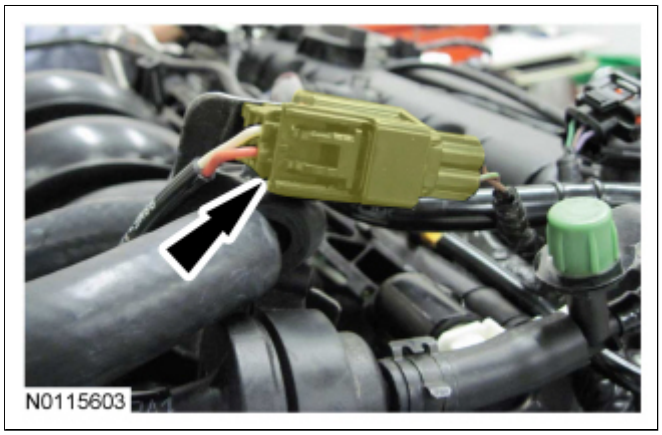
15. Connect the 4 fuel injector electrical connectors.
    - Attach the 2 wiring harness retainers to the valve cover stud bolts.



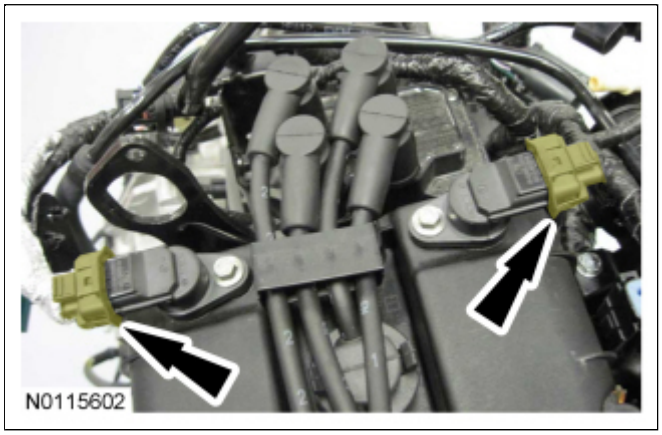
16. Connect the 2 Variable Camshaft Timing (VCT) oil control solenoid electrical connectors.
    - Attach the 2 wiring harness retainers.



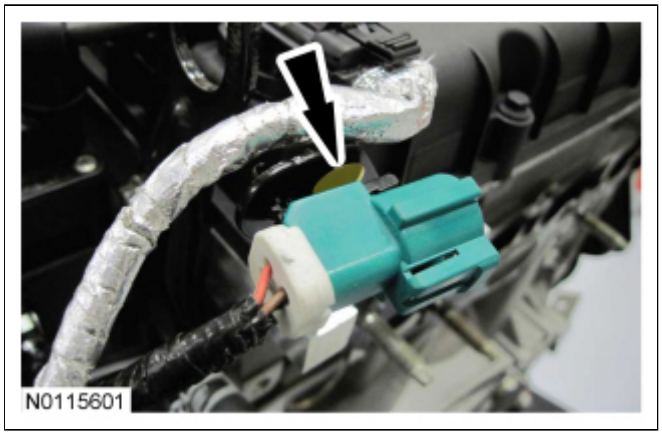
17. Connect and attach the LH KS electrical connector.



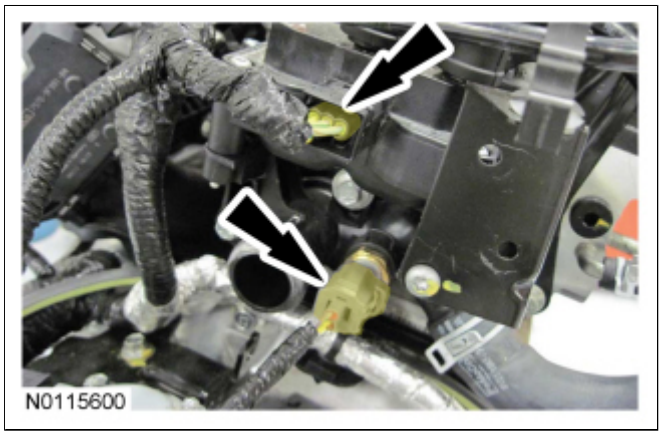
18. Connect the 2 Camshaft Position (CMP) sensor electrical connectors.



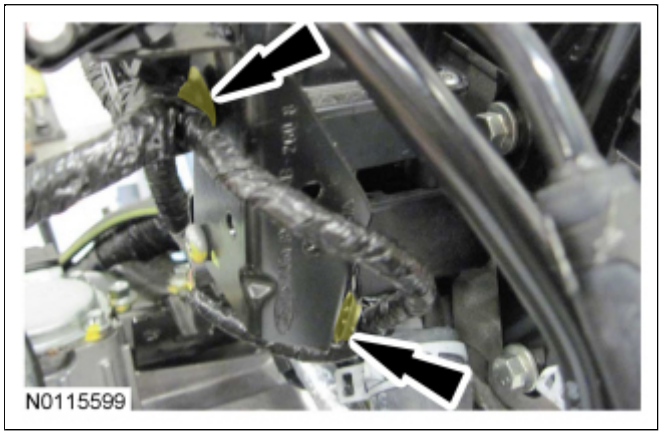
19. Attach the Heated Oxygen Sensor (HO2S) sensor electrical connector pin-type retainer to the bracket.



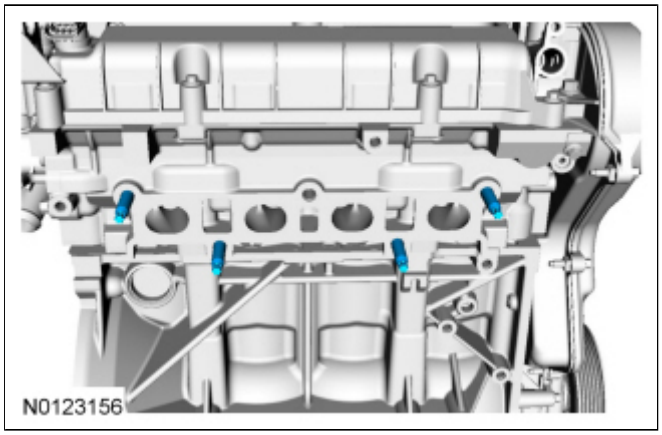
20. Connect the ignition coil and Engine Coolant Temperature (ECT) sensor electrical connectors.



21. Attach the 2 wiring harness retainers to the coolant outlet bracket.

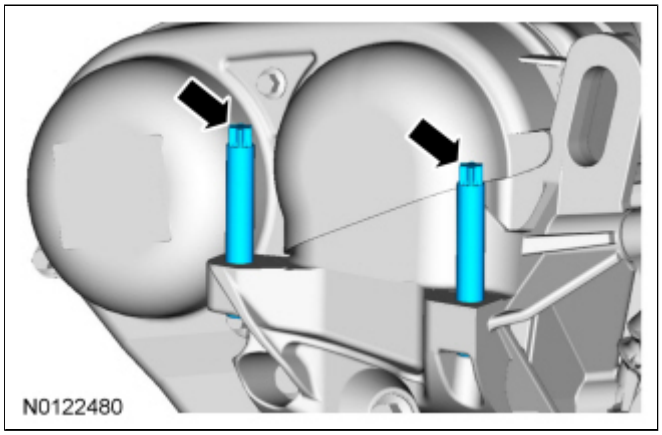


22. Install the 4 new catalytic converter studs.
    - Tighten to 17 Nm (150 lb-in).



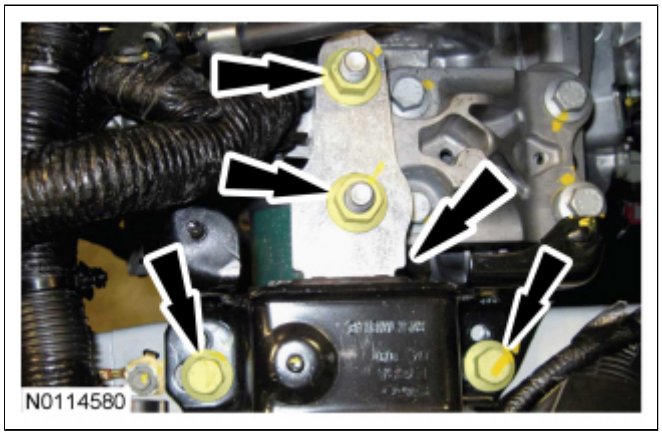
23. ***NOTICE:*** **The engine mount studs must be torqued or damage to the powertrain may occur.**

    Torque the engine mount studs before installing the engine mount nuts.
    - Tighten to 8 Nm (71 lb-in).



24. Using the lift table, position the engine and transaxle assembly in the vehicle.

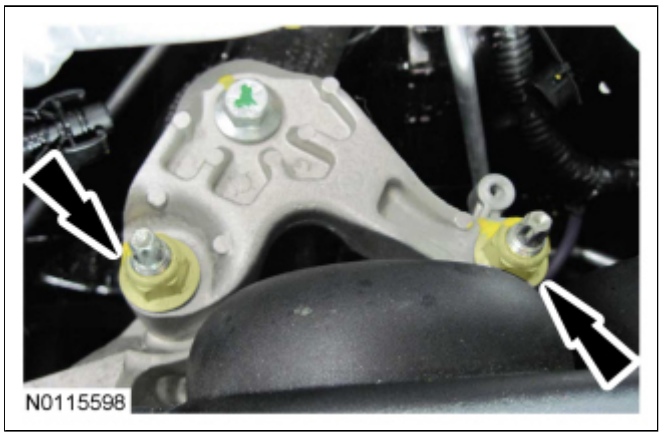
25. Align the transaxle support insulator, install and tighten the 2 nuts and 2 bolts.
    - Tighten the 2 nuts to 125 Nm (92 lb-ft).
    - Tighten the 2 bolts to 90 Nm (66 lb-ft).



26. **NOTE:** Do not loosen the engine mount center bolt or the engine may become improperly positioned.

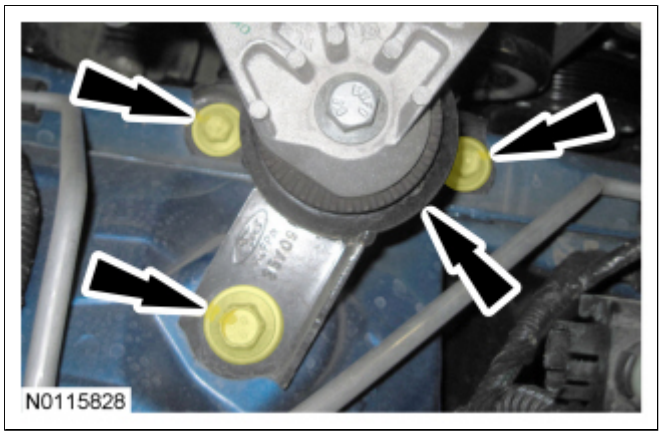
    Install the engine mount and the 2 nuts.

- Tighten the 2 nuts to 80 Nm (59 lb-ft).

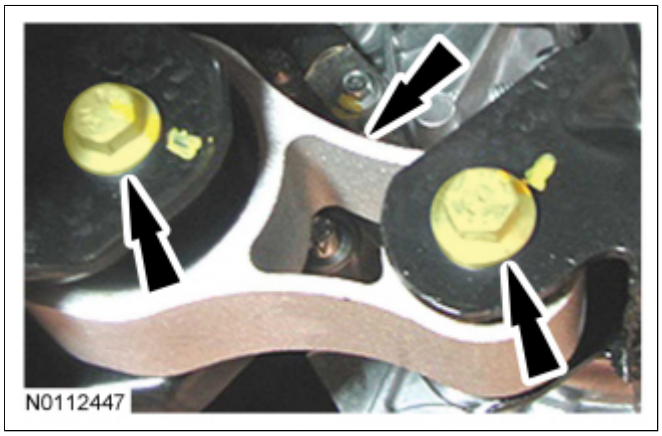


27. Lower the powertrain to the installed position.

28. Install the 3 engine mount bolts.
    - Tighten to 48 Nm (35 lb-ft).

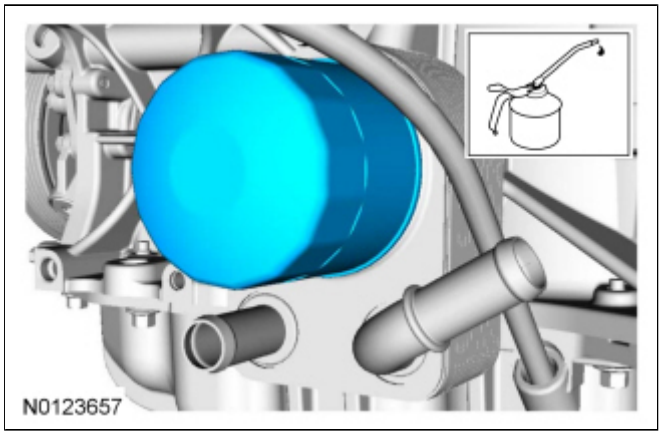


29. Install the transaxle roll restrictor and the 2 bolts.
    - Tighten to 70 Nm (52 lb-ft).



30. **NOTE:** Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.

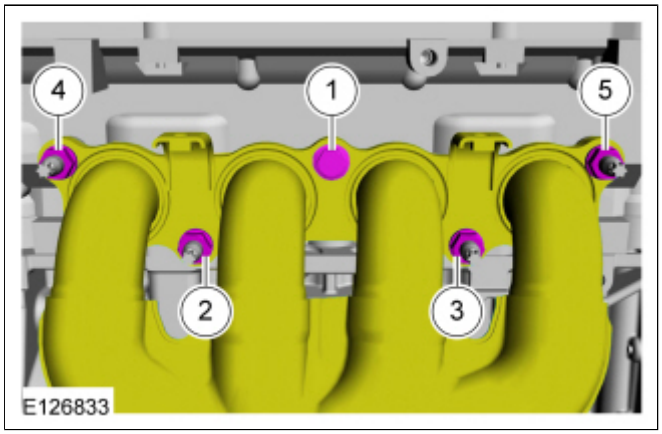
    Install a new engine oil filter.
    - Tighten to 15 Nm (133 lb-in).



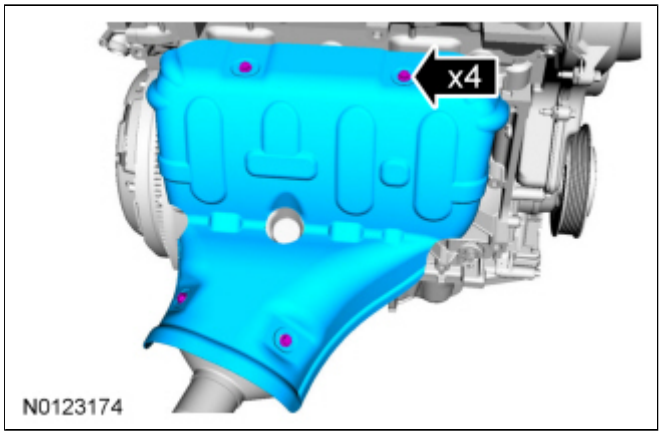
31. If equipped, connect the block heater electrical connector.

32. ***NOTICE:*** **Failure to tighten the catalytic converter manifold fasteners in 20 Nm increments until reaching final torque of 55 Nm will cause the converter to develop an exhaust leak.**

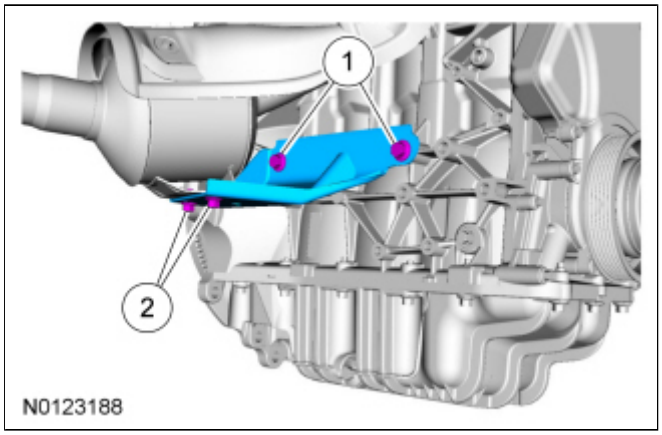
    Tighten the bolt and 4 nuts in the sequence shown, in 3 stages.
    - Stage 1: Tighten all fasteners in sequence to 20 Nm (177 lb-in).
    - Stage 2: Tighten all fasteners in sequence to 40 Nm (30 lb-ft).
    - Stage 3: Tighten all fasteners in sequence to 55 Nm (41 lb-ft).



33. Position the catalytic converter heat shield and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

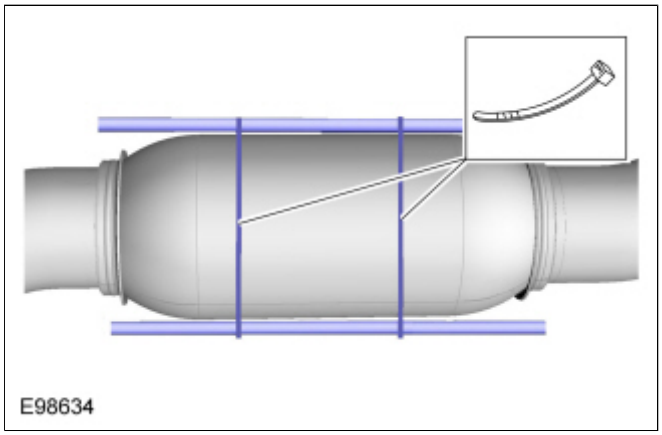


34. Install the lower catalytic converter bracket and the 4 bolts and tighten in sequence shown.
    1. Tighten the catalytic converter bracket-to-engine block bolts to 50 Nm (37 lb-ft).
    2. Tighten the catalytic converter bracket-to-catalytic converter bolts to 25 Nm (18 lb-ft).

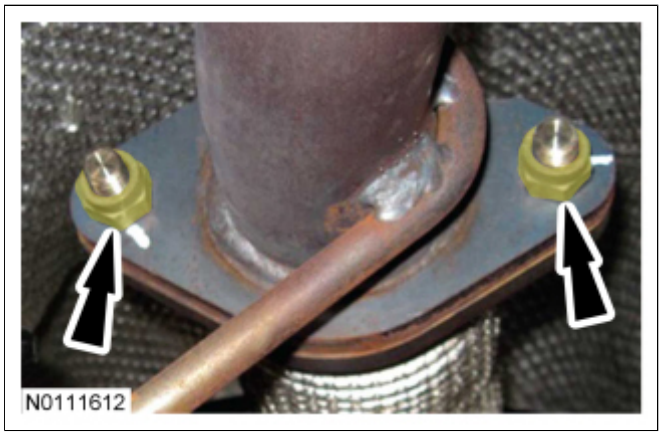


35. ***NOTICE:*** **Do not excessively bend or twist the exhaust flexible pipe. Failure to follow these instructions may cause damage to the flexible pipe.**

    Remove the support for the exhaust flexible pipe.



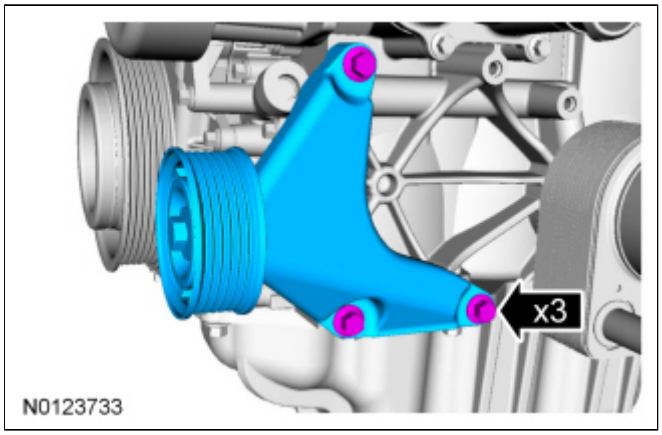
36. Using a new gasket, position the catalytic converter to the muffler and install the 2 catalytic converter nuts.
    - Tighten to 48 Nm (35 lb-ft).



37. Install the Catalyst Monitor Sensor (CMS). For additional information, refer to Section 303-14 .

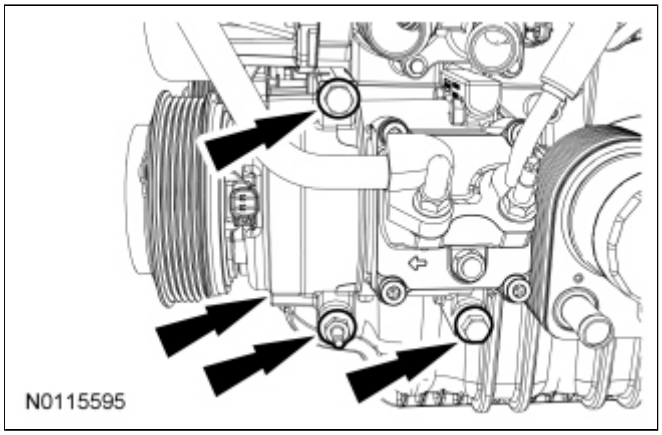
Vehicles without A/C

38. Install the accessory drive belt idler pulley bracket and the 3 bolts.
    - Tighten to 24 Nm (18 lb-ft).

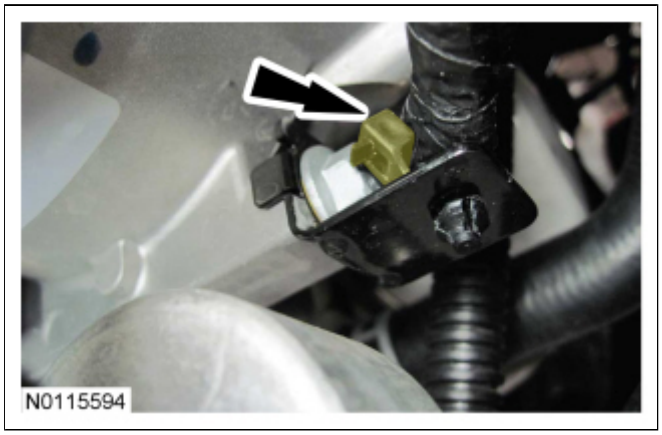


Vehicles with A/C

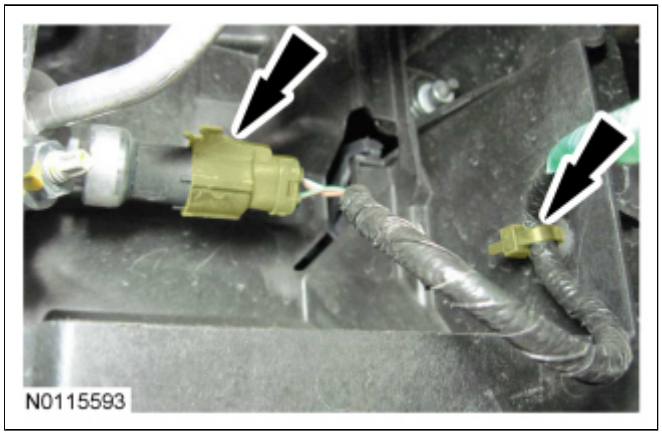
39. Position the A/C compressor and install the 2 bolts and stud bolt.
    - Tighten to 25 Nm (18 lb-ft).



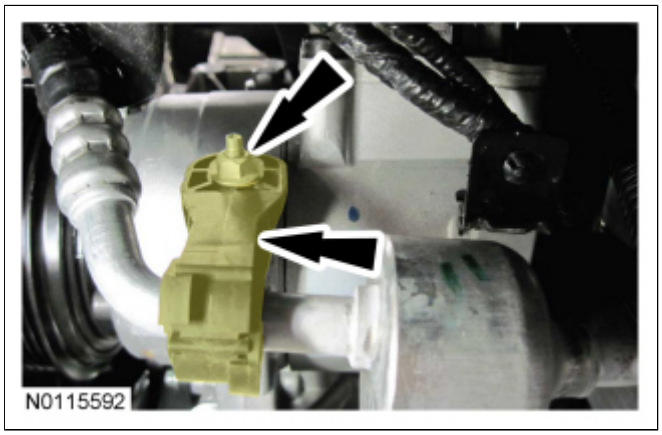
40. Attach the wiring harness retainer to the lower A/C compressor bracket.



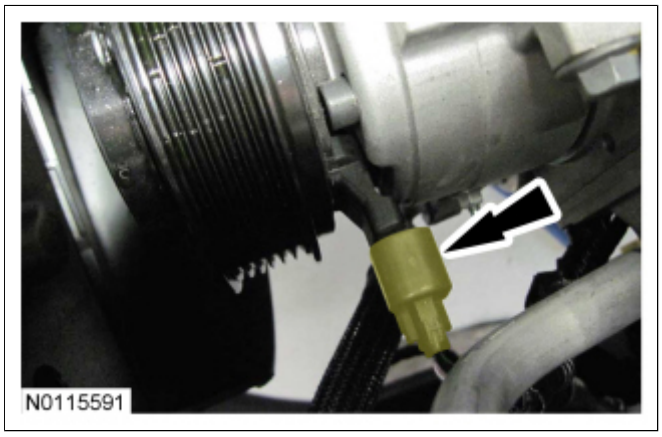
41. Connect the A/C pressure transducer electrical connector.
    - Attach the wiring harness retainer.



42. Position the A/C line bracket and install the nut.
    - Tighten to 9 Nm (80 lb-in).

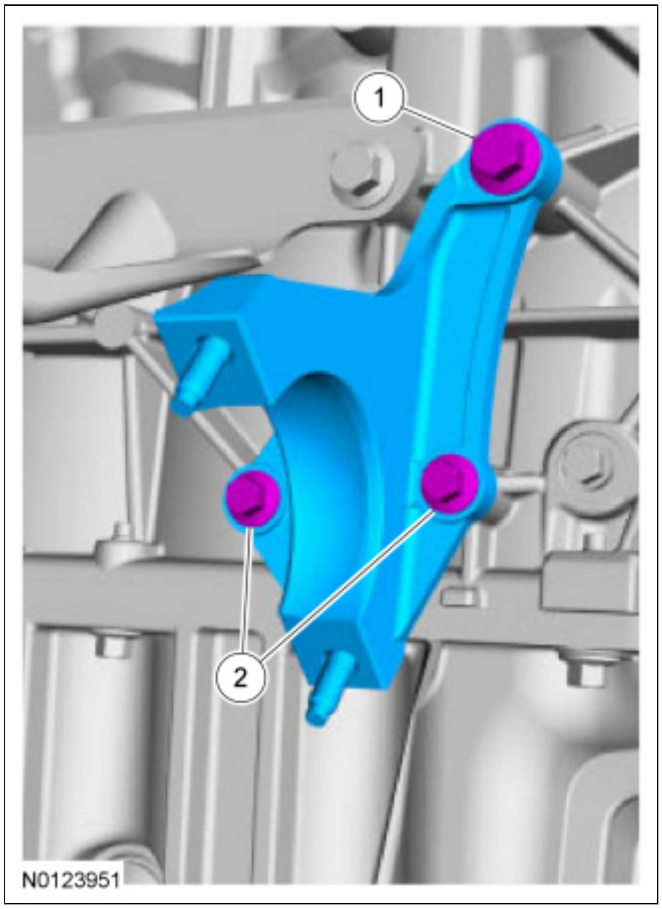


43. Connect the A/C compressor electrical connector.



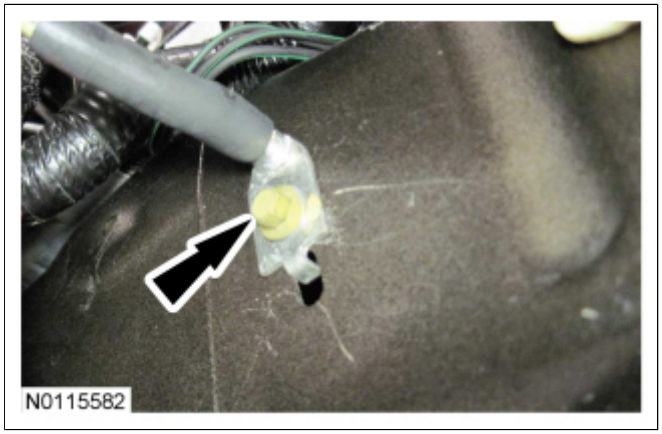
All vehicles

44. Install the halfshaft bracket and the 3 bolts and tighten in sequence shown.
    1. Tighten the top bolt to 48 Nm (35 lb-ft).
    2. Tighten the 2 bottom bolts to 24 Nm (18 lb-ft).

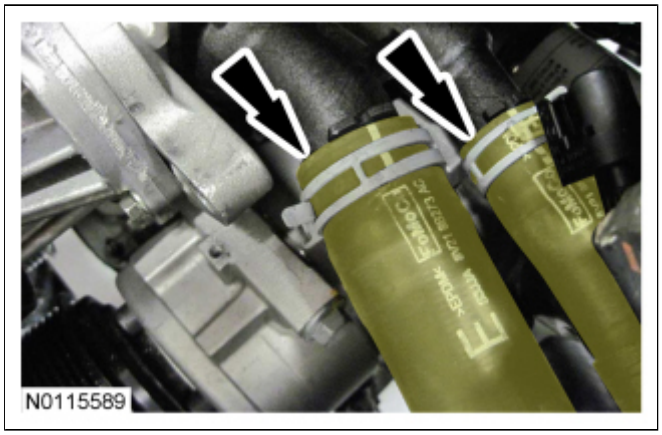


45. Install the RH and LH halfshafts. For additional information, refer to Section 205-04 .

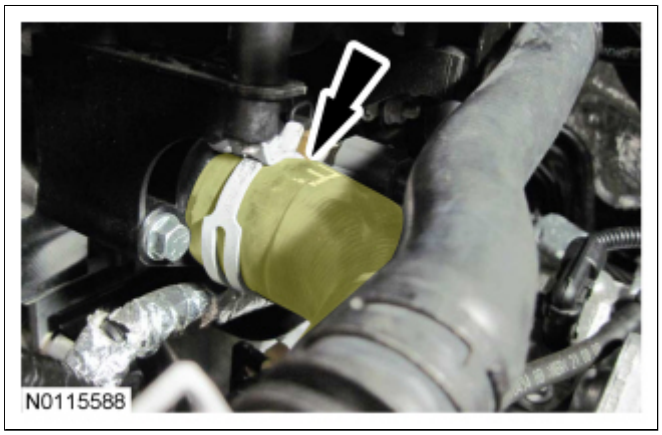
46. Position the engine ground wire and install the bolt.
    - Tighten to 10 Nm (89 lb-in).



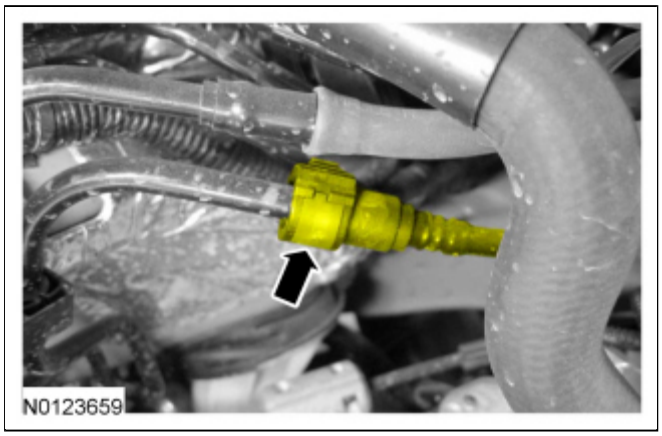
47. Connect the lower radiator hose and coolant hose to the thermostat housing.



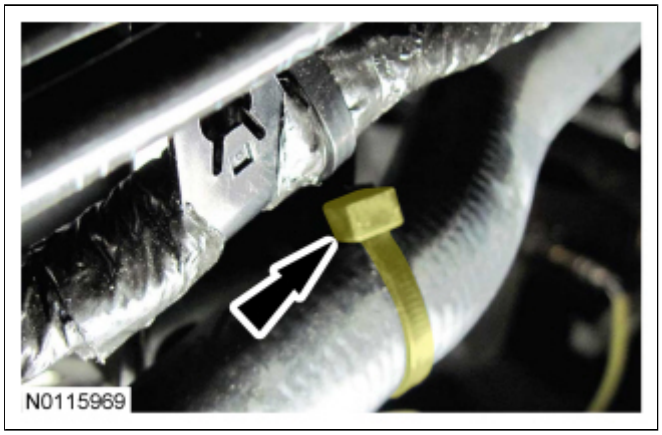
48. Connect the upper radiator hose to the engine.



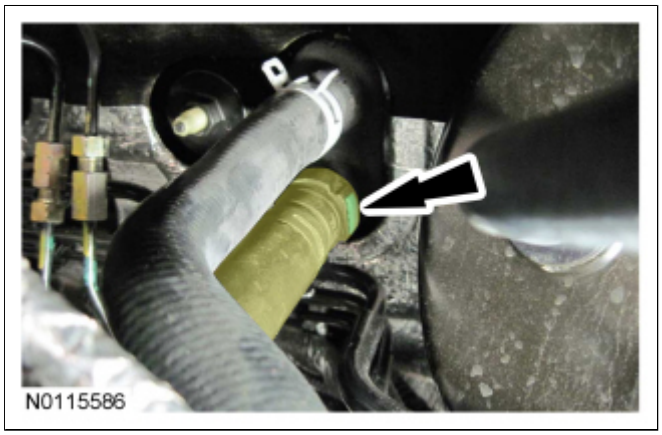
49. Connect the EVAP tube quick connect coupling near the bulk head. For additional information, refer to Section 310-00 .



50. Attach the coolant hose retainer to the coolant outlet bracket.

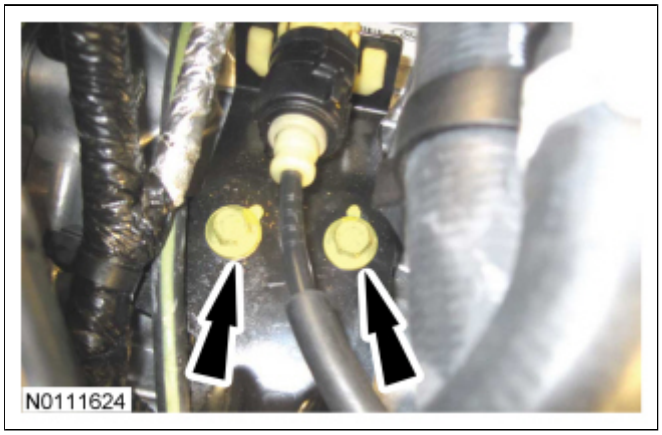


51. Connect the lower heater hose to the heater core.

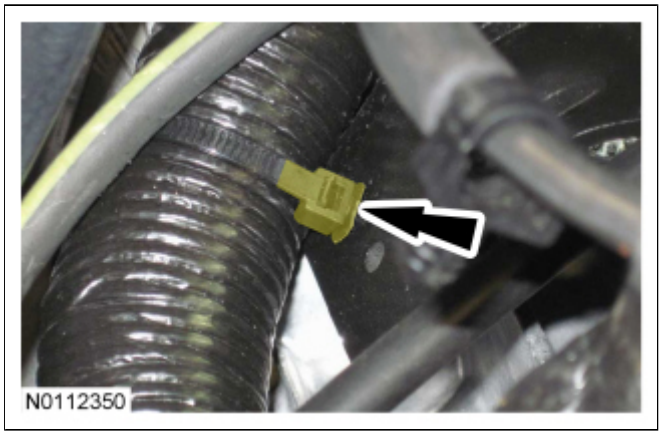


52. Install the HO2S . For additional information, refer to Section 303-14 .

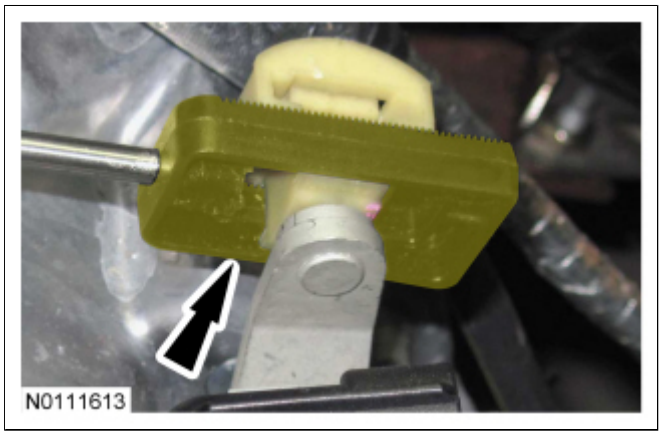
53. Position the selector lever cable and bracket and install the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).



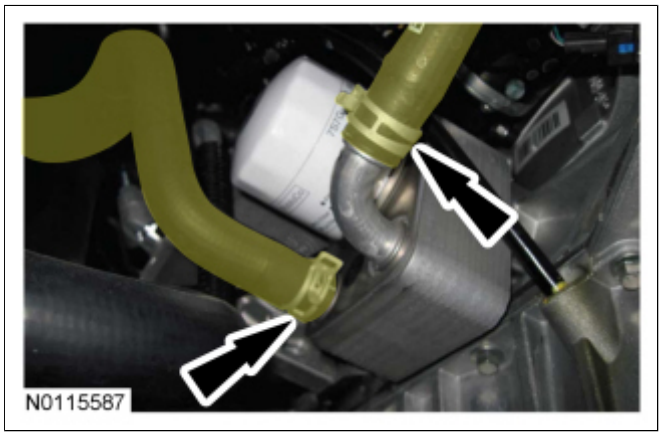
54. Attach the wiring harness retainer to the selector lever cable bracket.



55. Connect the selector lever cable to the control lever.



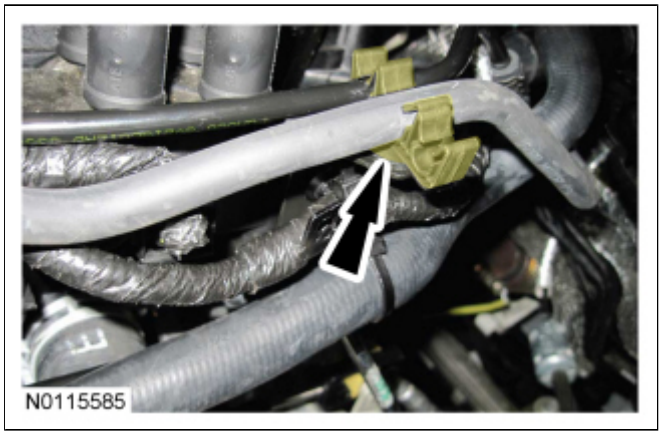
56. Connect the 2 coolant hoses to the engine oil cooler.
    - Attach the oil cooler hose retainer to the upper radiator hose.



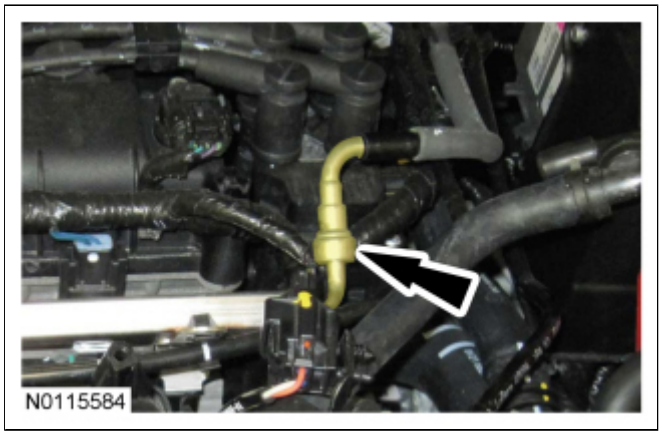
57. Install the cooling fan motor and shroud. For additional information, refer to Section 303-03 .

58. Install the generator. For additional information, refer to Section 414-00 .

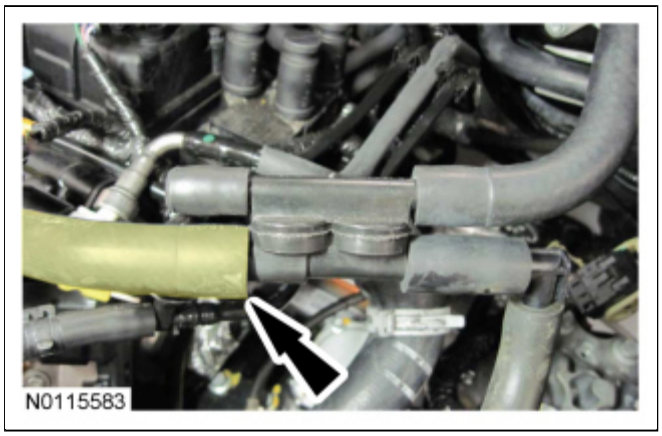
59. Attach the fuel tube to the coolant outlet bracket retainer.



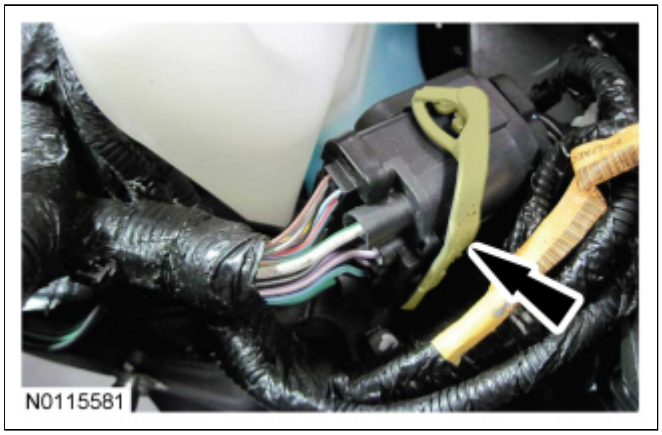
60. Connect the fuel tube spring lock couplings to the fuel rail. For additional information, refer to Section 310-00 .



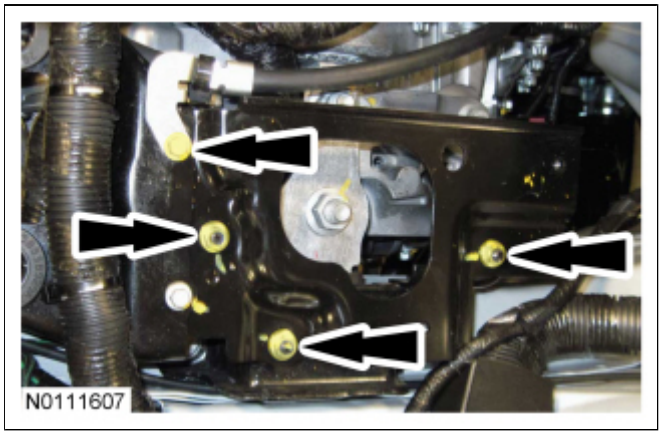
61. Connect the brake booster vacuum hose.



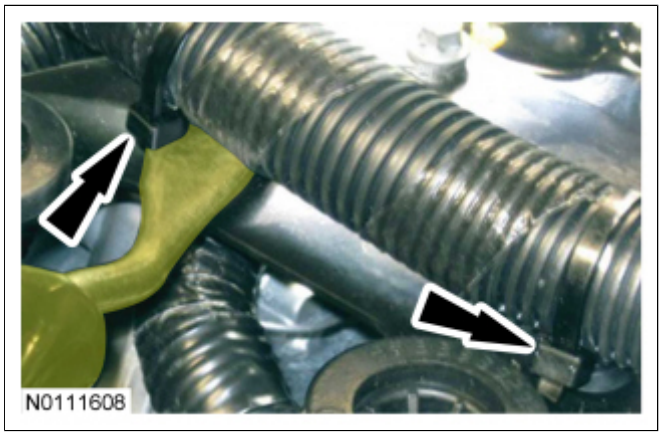
62. Connect the engine harness electrical connector.



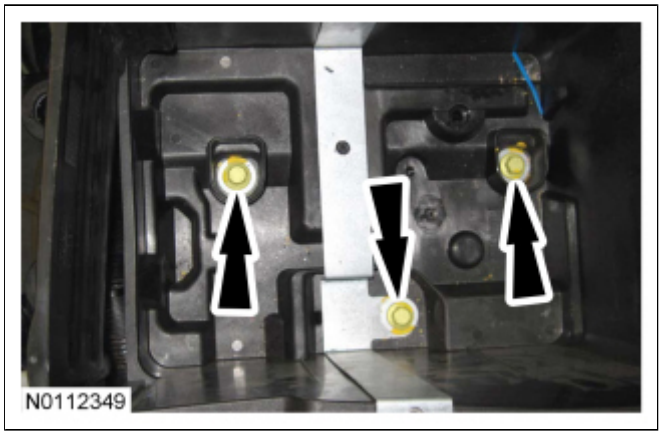
63. Install the battery tray bracket, 3 battery tray nuts and the selector lever cable bolt.
    - Attach the 2 wiring harness retainers to the bottom of the battery tray bracket.
    - Tighten nuts and bolt to 10 Nm (89 lb-in).



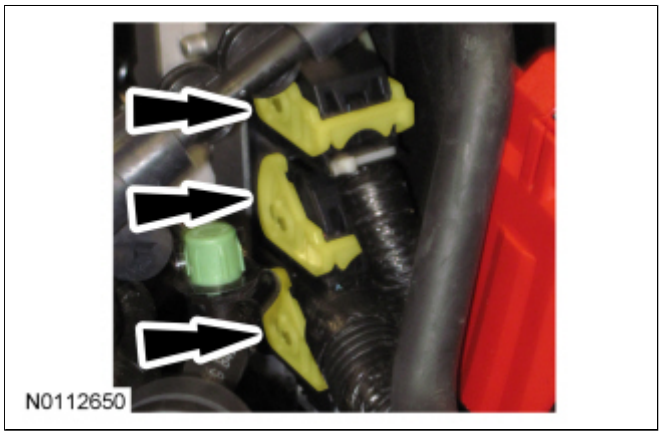
64. Attach the 2 positive battery cable wire harness retainers to battery tray bracket.



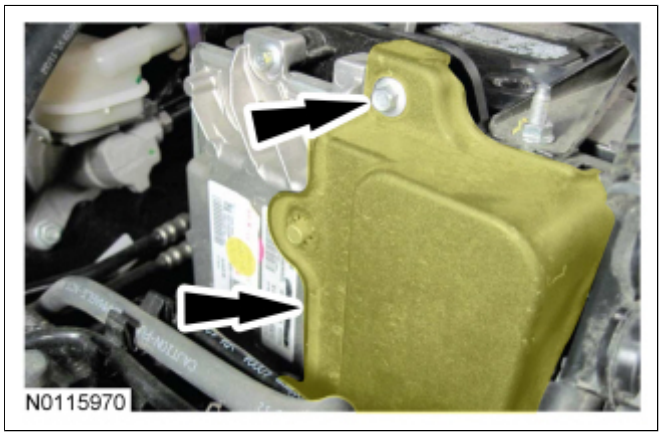
65. Install the battery tray and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



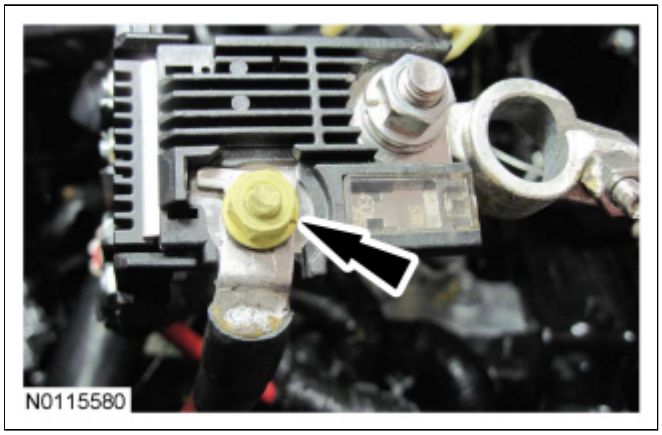
66. Connect the 3 PCM electrical connectors.



67. Install the PCM cover and the bolt.
    - Tighten to 5.4 Nm (47.8 lb-in).

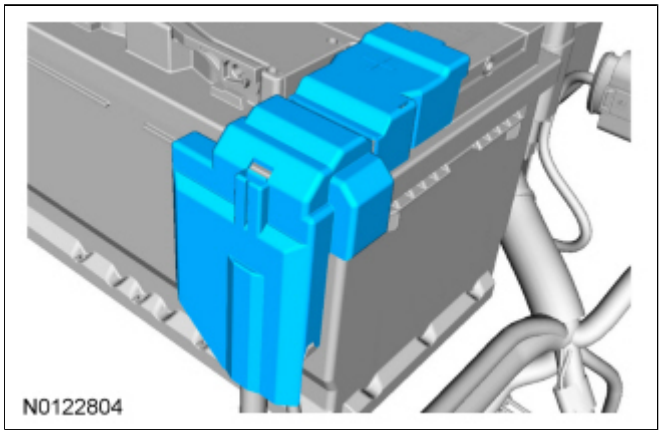


68. Connect the cable and nut to the positive battery cable terminal.
    - Tighten to 10 Nm (89 lb-in).

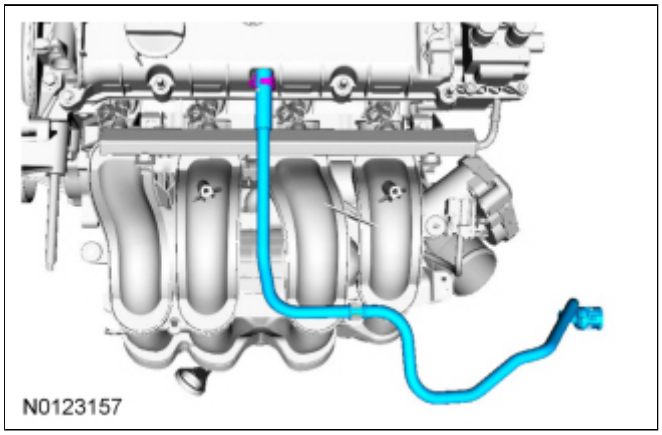


69. Install the battery. For additional information, refer to Section 414-01 .

70. Install the positive battery cable cover.



71. Connect the crankcase vent tube to the valve cover.
    - Attach the crankcase vent tube to the 2 retainers.



72. Install the Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12 .

73. Fill the engine with clean engine oil.

74. Install the degas bottle. For additional information, refer to Section 303-03 .

75. Fill the and bleed cooling system. For additional information, refer to Section 303-03 .

76. Fill the transaxle with transmission fluid. For additional information, refer to Section 307-11 .

77. Adjust the selector lever cable. For additional information, refer to Section 307-05 .

Engine — Manual Transaxle

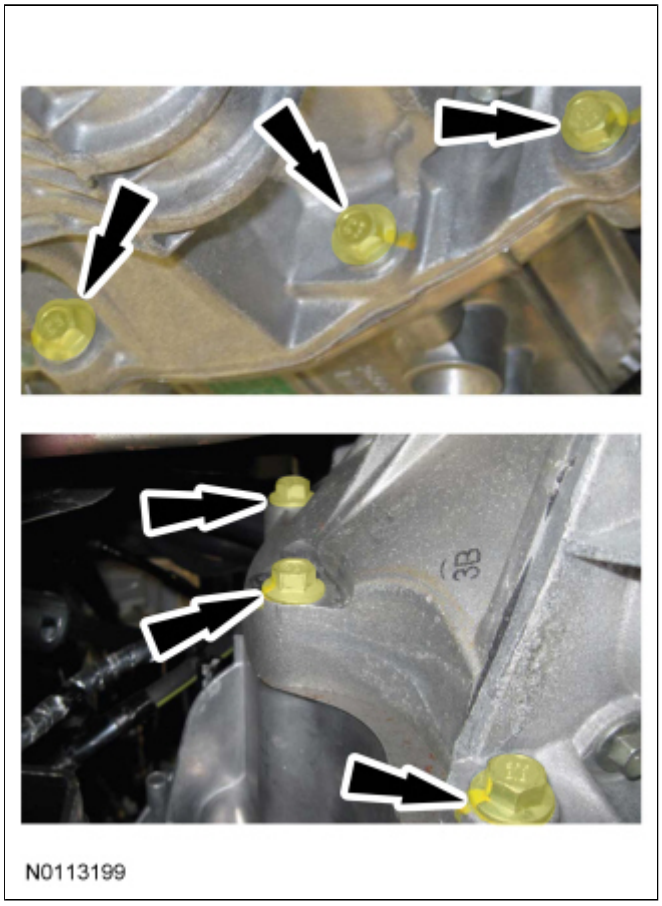
 ST2743A	Adjustable Grip Arm, 1735A 014-00001

Material

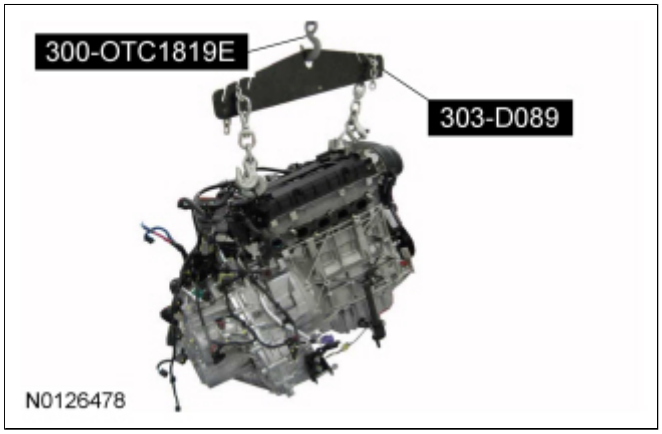
Item	Specification
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

All vehicles

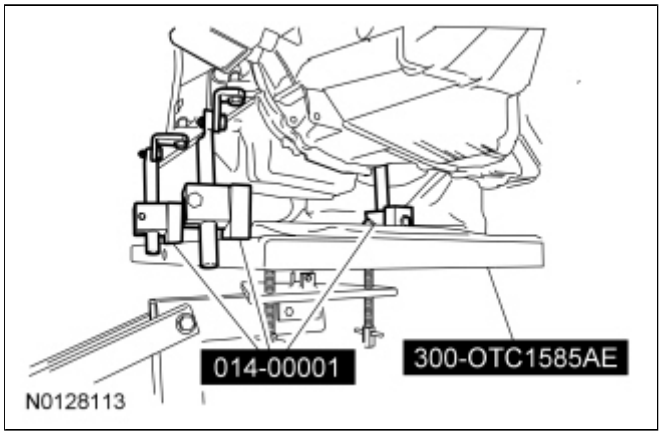
1. Using the Heavy Duty Floor Crane and Spreader Bar, position the engine and transaxle together. Install the 6 engine-to-bellhousing bolts.
    - Tighten to 48 Nm (35 lb-ft).



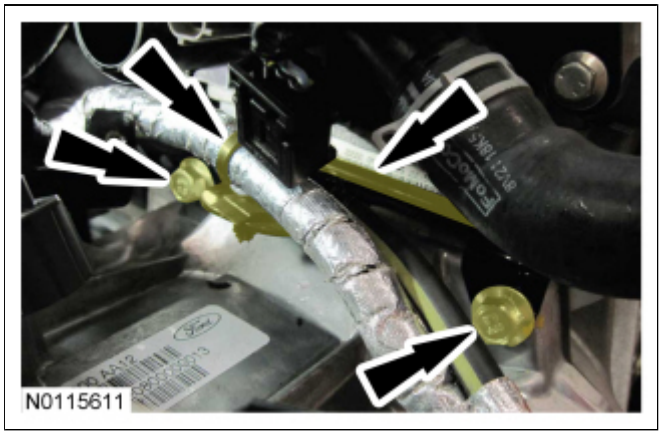
2. Using the Floor Crane and Spreader Bar, raise the engine and transaxle assembly onto the lift table.



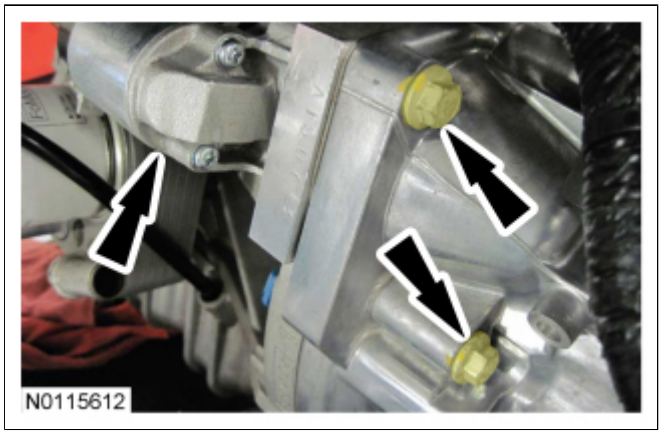
3. Using the Powertrain Lift and Adjustable Grip Arms, secure the engine and transaxle assembly to the lift table.



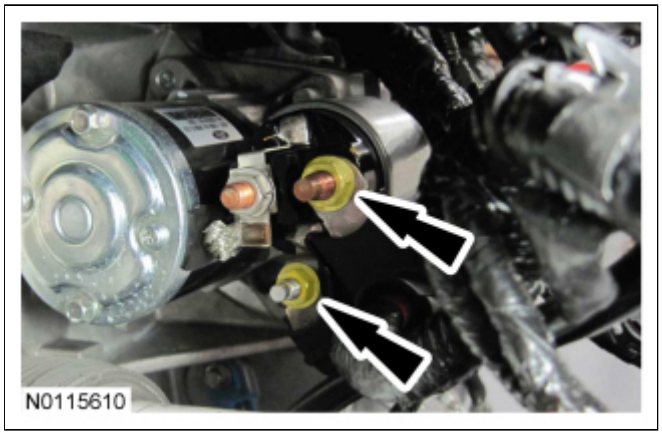
4. Install the 2 upper bellhousing-to-engine bolts and bracket.
    - Tighten to 48 Nm (35 lb-ft).
    - Attach the wiring harness pin-type retainer to the bracket.



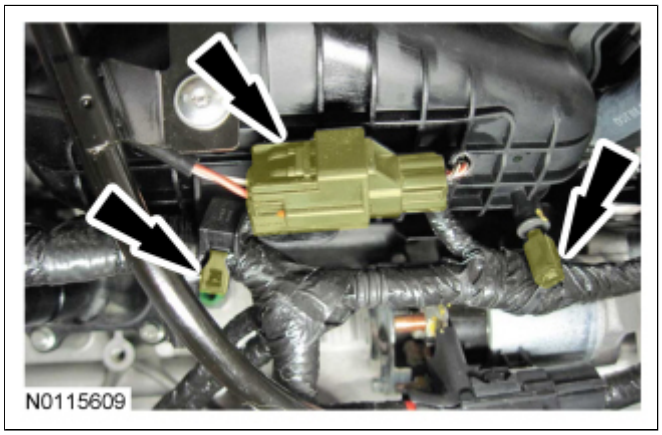
5. Install the starter motor and the 3 bolts (2 shown).
    - Install the 3 bolts finger-tight.
    - Tighten the 2 upper bolts to 48 Nm (35 lb-ft).
    - Tighten the lower bolt to 48 Nm (35 lb-ft).



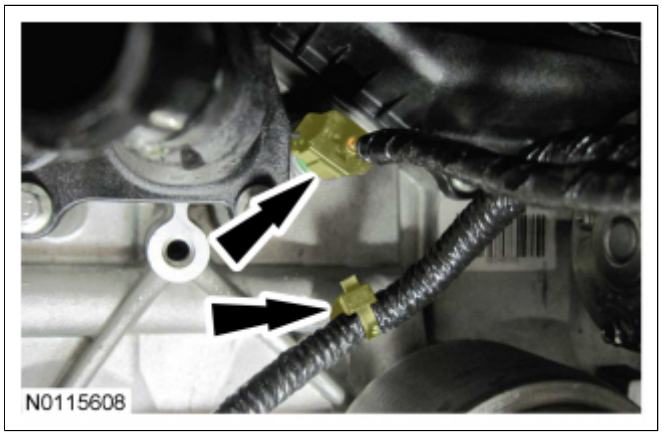
6. Connect the starter motor electrical terminals and install the 2 nuts.
    - Tighten to 10 Nm (89 lb-in).



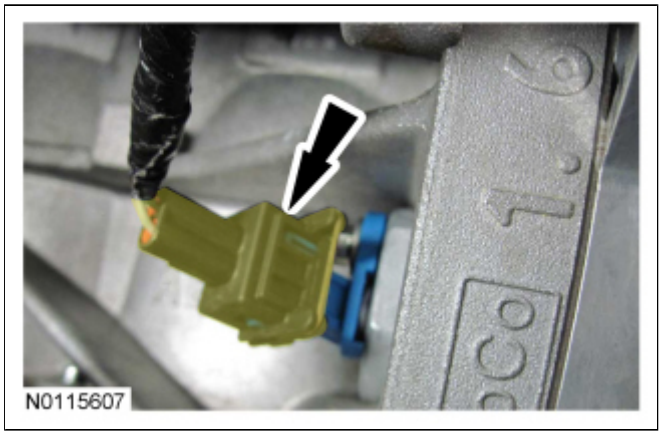
7. Connect the RH Knock Sensor (KS) electrical connector.
    - Attach the 2 wiring harness retainers to the intake manifold.



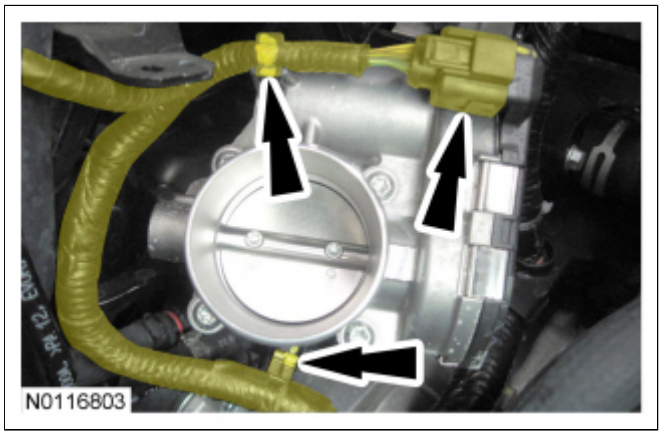
8. Connect the Engine Oil Pressure (EOP) switch electrical connector.
    - Attach the wiring harness retainer to the engine block.



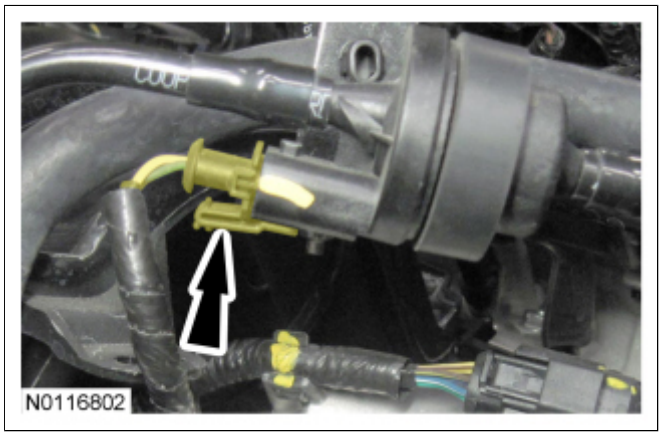
9. Connect the Crankshaft Position (CKP) sensor electrical connector.



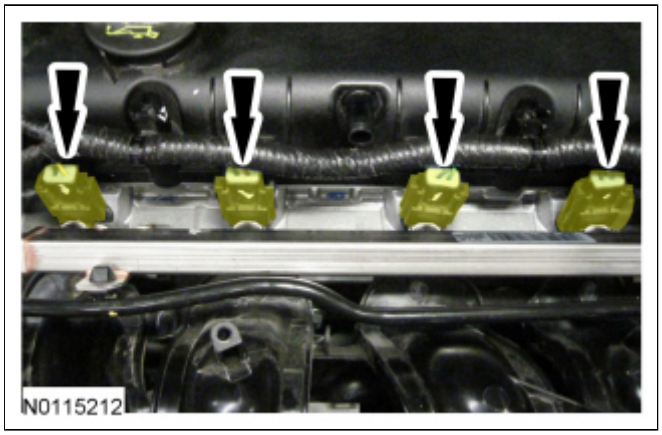
10. Connect the Throttle Body (TB) electrical connector.
    - Attach the 2 wiring harness retainers to the TB .



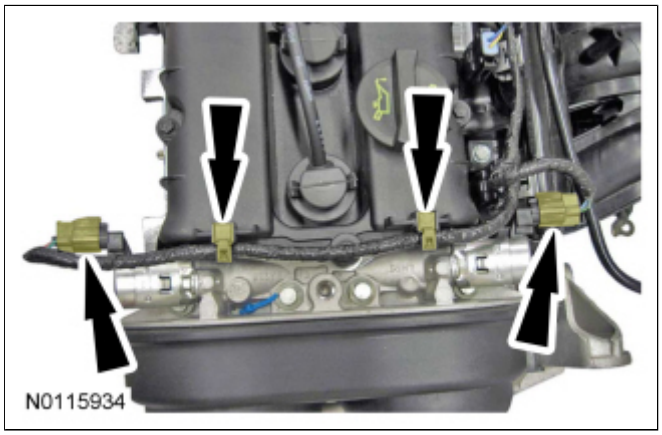
11. Connect the Evaporative Emission (EVAP) canister purge valve electrical connector.



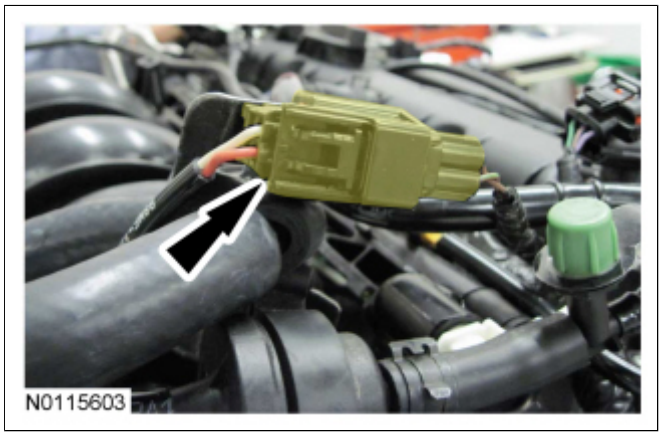
12. Connect the 4 fuel injector electrical connectors.
    - Attach the wiring harness retainers to the valve cover stud bolts.



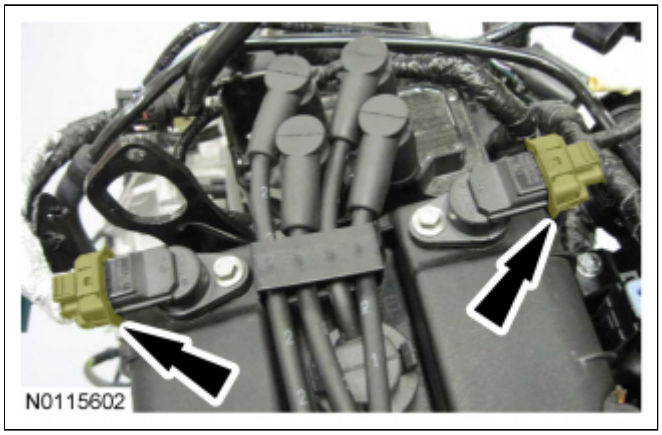
13. Connect the 2 Variable Camshaft Timing (VCT) oil control solenoid electrical connectors.
    - Attach the 2 wiring harness retainers.



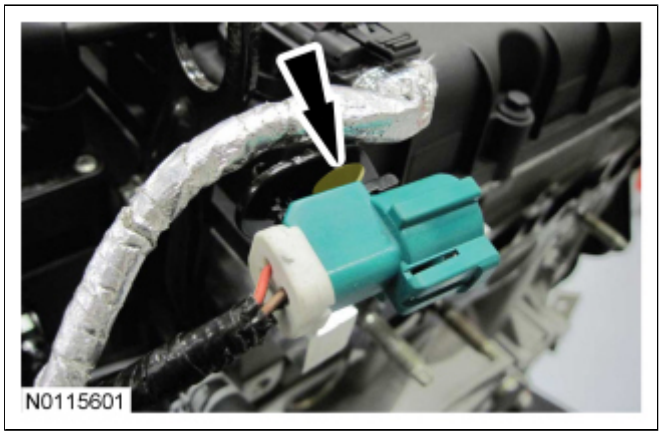
14. Connect and attach the LH KS electrical connector.



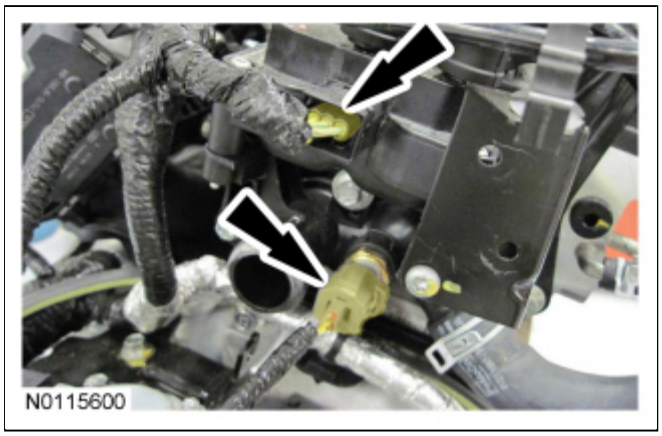
15. Connect the 2 Camshaft Position (CMP) sensor electrical connectors.



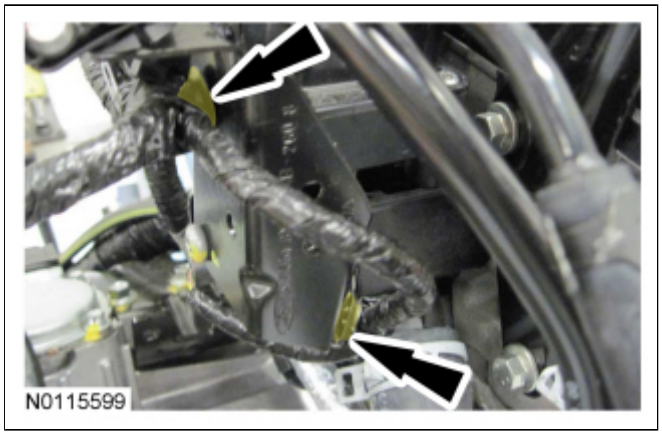
16. Attach the Heated Oxygen Sensor (HO2S) sensor electrical connector pin-type retainer to the bracket.



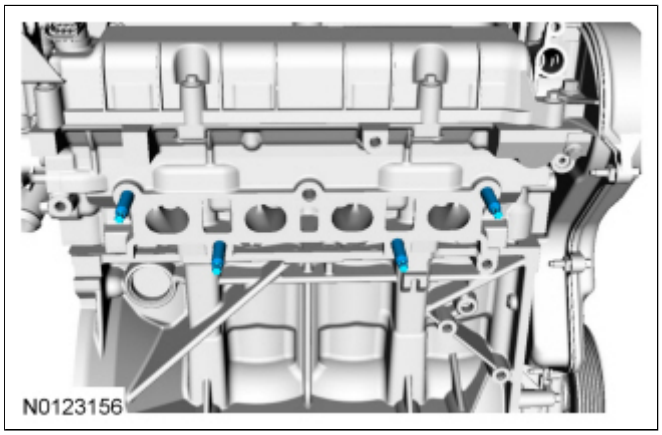
17. Connect the ignition coil and Engine Coolant Temperature (ECT) sensor electrical connectors.



18. Attach the 2 wiring harness retainers to the coolant outlet bracket.

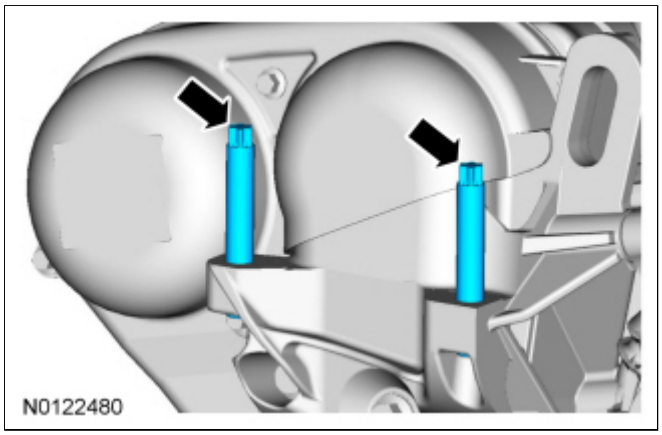


19. Install the 4 new catalytic converter studs.
    - Tighten to 17 Nm (150 lb-in).



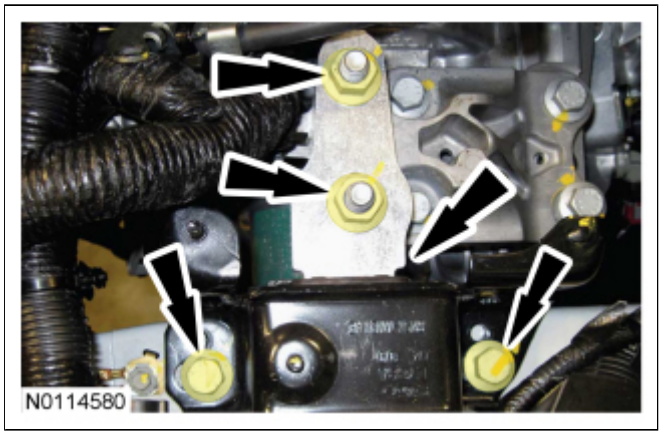
20. ***NOTICE:*** **The engine mount studs must be torqued or damage to the powertrain may occur.**

    Torque the engine mount studs before installing the engine mount nuts.
    - Tighten to 8 Nm (71 lb-in).



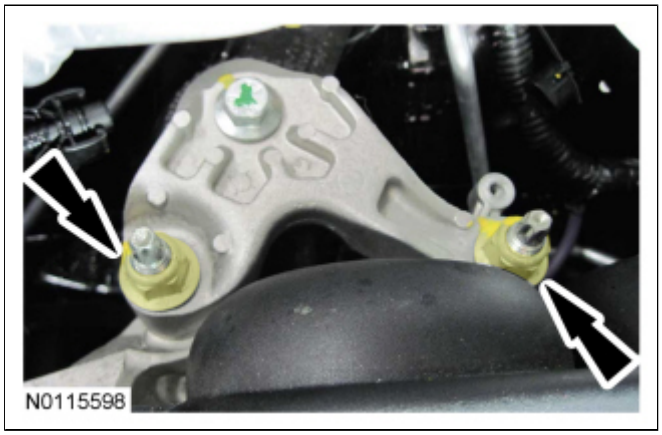
21. Using the lift table, position the engine and transaxle assembly in the vehicle.

22. Align the transaxle support insulator, install and tighten the 2 nuts and 2 bolts.
    - Tighten the 2 nuts to 125 Nm (92 lb-ft).
    - Tighten the 2 bolts to 90 Nm (66 lb-ft).



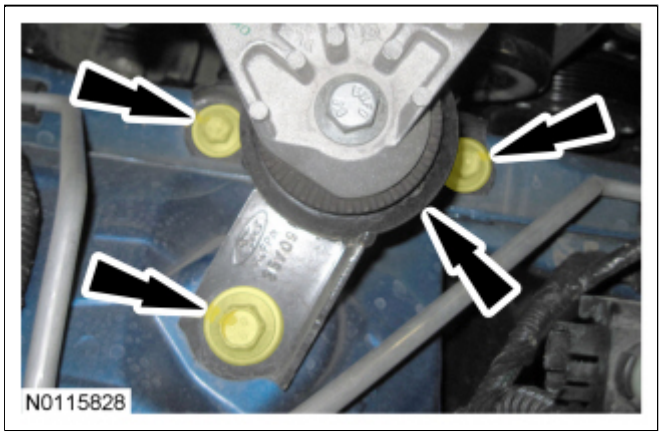
23. **NOTE:** Do not loosen the engine mount center bolt or the engine may become improperly positioned.

    Install the engine mount and the 2 nuts.
    - Tighten the 2 nuts to 80 Nm (59 lb-ft).

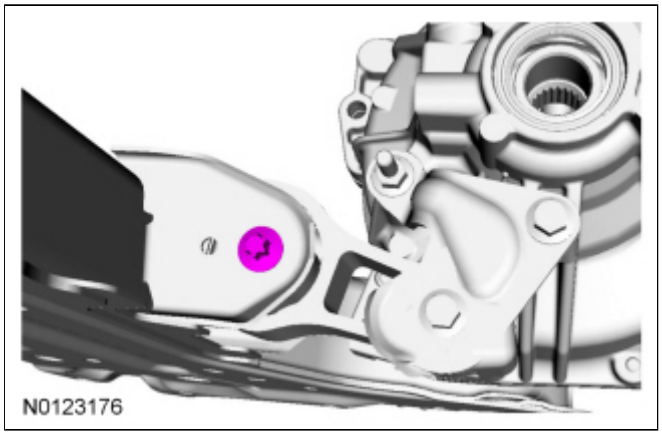


24. Lower the powertrain to the installed position.

25. Install the 3 engine mount bolts.
    - Tighten to 48 Nm (35 lb-ft).

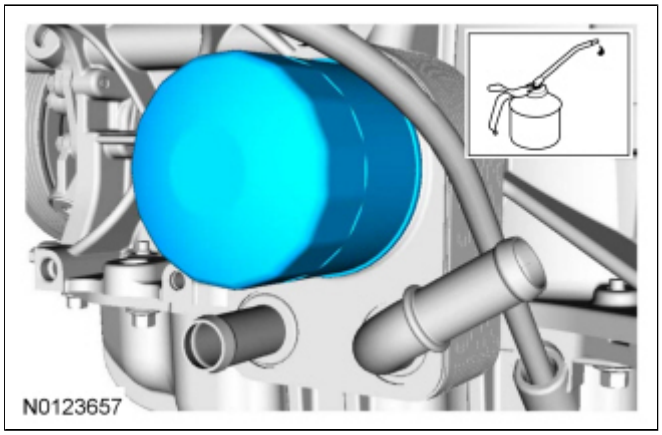


26. Install the transaxle roll restrictor bolt.
    - Tighten to 70 Nm (52 lb-ft).



27. **NOTE:** Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.

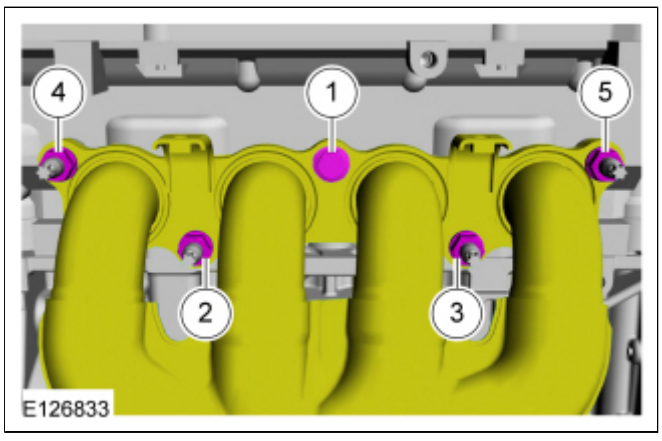
    Install a new engine oil filter.
    - Tighten to 15 Nm (133 lb-in).



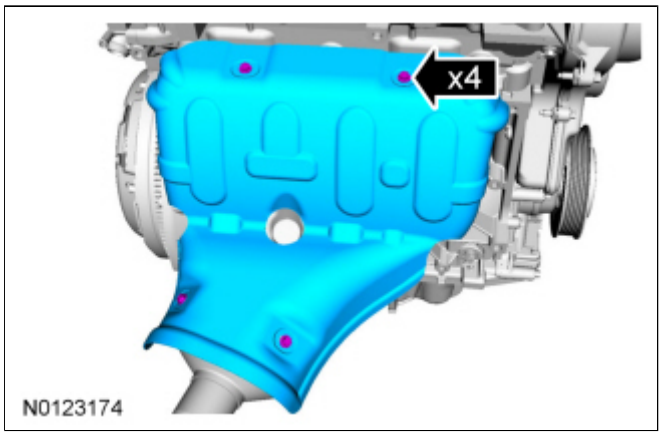
28. If equipped, connect the block heater electrical connector.

29. ***NOTICE:*** **Failure to tighten the catalytic converter manifold fasteners in 20 Nm increments until reaching final torque of 55 Nm will cause the converter to develop an exhaust leak.**

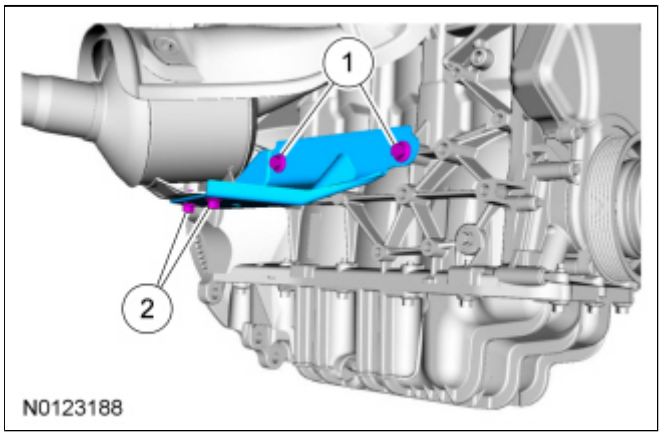
    Tighten the bolt and 4 nuts in the sequence shown, in 3 stages.
    - Stage 1: Tighten all fasteners in sequence to 20 Nm (177 lb-in).
    - Stage 2: Tighten all fasteners in sequence to 40 Nm (30 lb-ft).
    - Stage 3: Tighten all fasteners in sequence to 55 Nm (41 lb-ft).



30. Position the catalytic converter heat shield and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

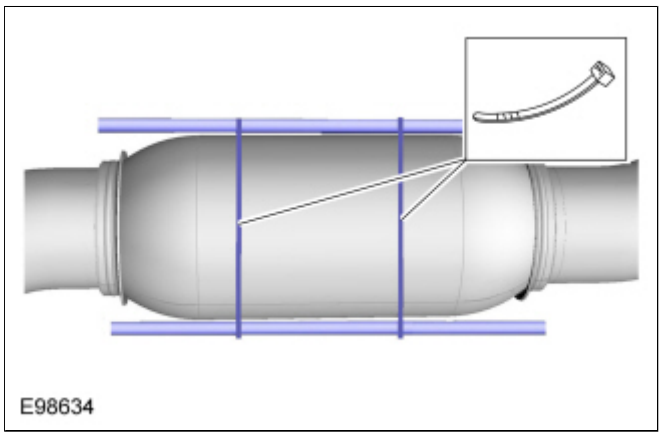


31. Install the lower catalytic converter bracket and the 4 bolts and tighten in sequence shown.
    1. Tighten the catalytic converter bracket-to-engine block bolts to 50 Nm (37 lb-ft).
    2. Tighten the catalytic converter bracket-to-catalytic converter bolts to 25 Nm (18 lb-ft).

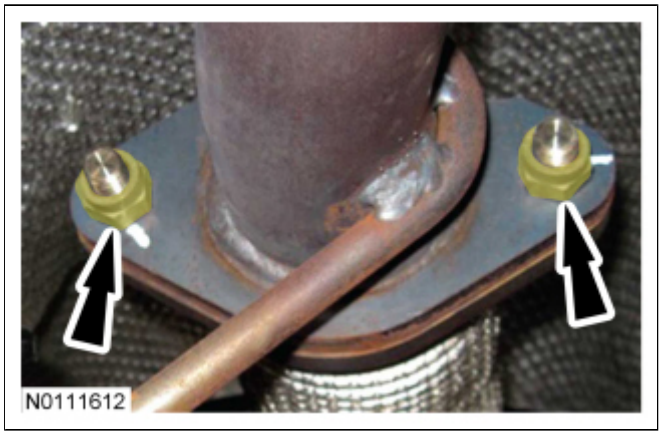


32. ***NOTICE:*** **Do not excessively bend or twist the exhaust flexible pipe. Failure to follow these instructions may cause damage to the flexible pipe.**

    Remove the support for the exhaust flexible pipe.



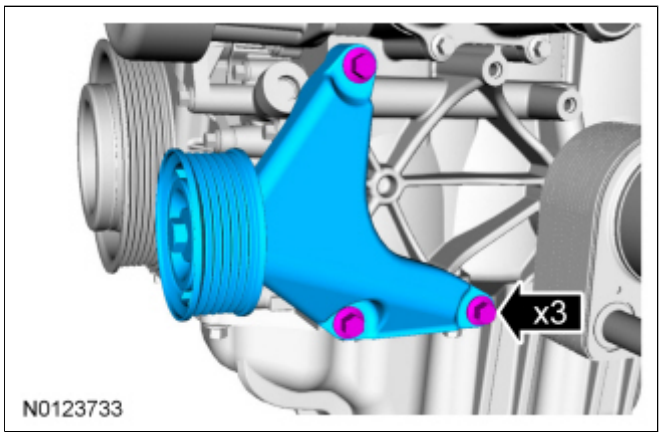
33. Using a new gasket, position the catalytic converter to the muffler and install the 2 catalytic converter nuts.
    - Tighten to 48 Nm (35 lb-ft).



34. Install the Catalyst Monitor Sensor (CMS). For additional information, refer to Section 303-14 .

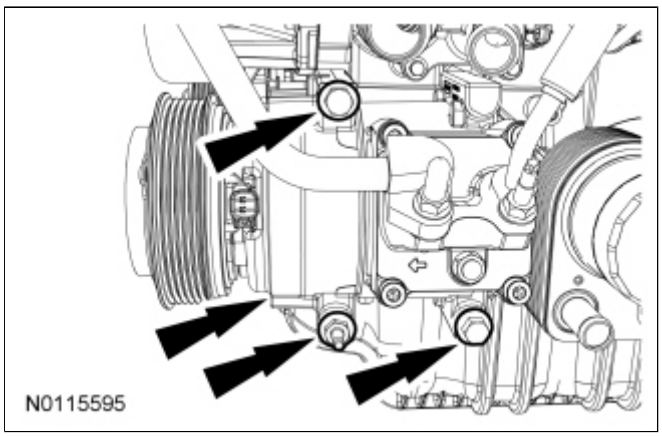
Vehicles without A/C

35. Install the accessory drive belt idler pulley bracket and the 3 bolts.
    - Tighten to 24 Nm (18 lb-ft).

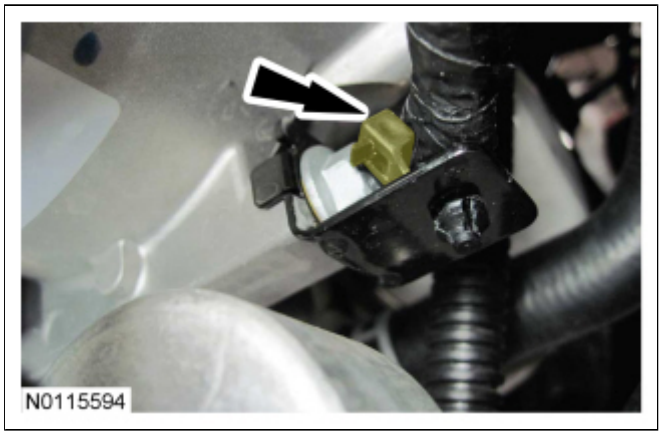


Vehicles with A/C

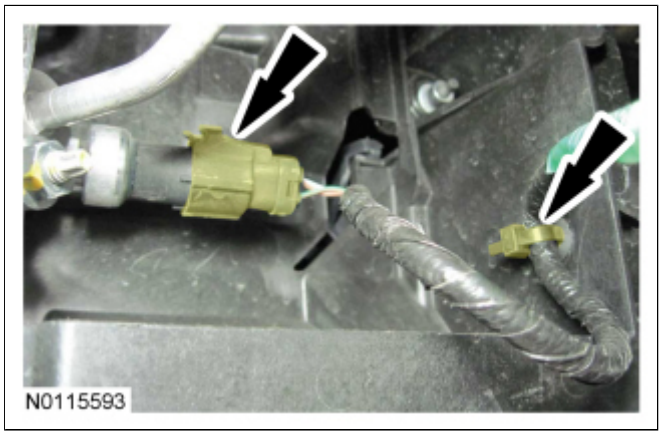
36. Position the A/C compressor and install the 2 bolts and stud bolt.
    - Tighten to 25 Nm (18 lb-ft).



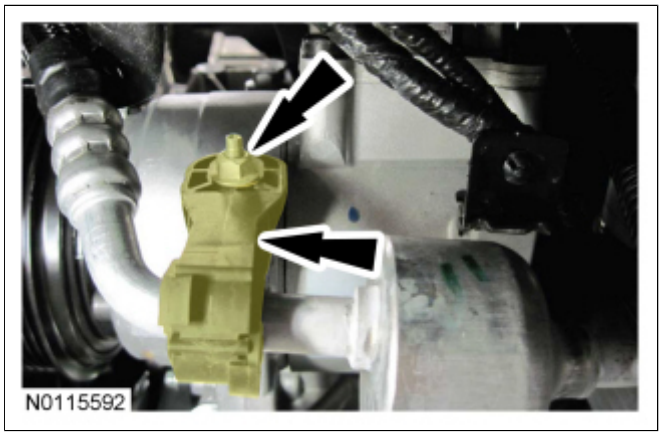
37. Attach the wiring harness retainer to the lower A/C compressor bracket.



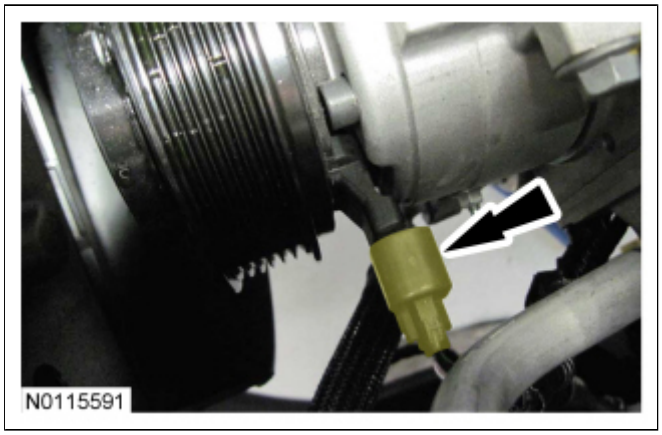
38. Connect the A/C pressure transducer electrical connector.
    - Attach the wiring harness retainer.



39. Position the A/C line bracket and install the nut.
    - Tighten to 9 Nm (80 lb-in).

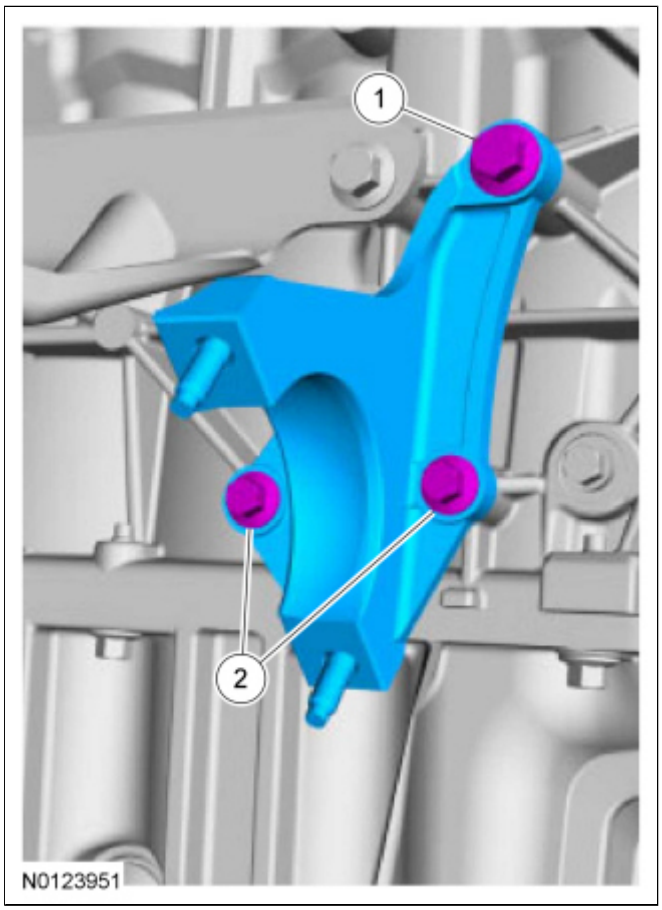


40. Connect the A/C compressor electrical connector.



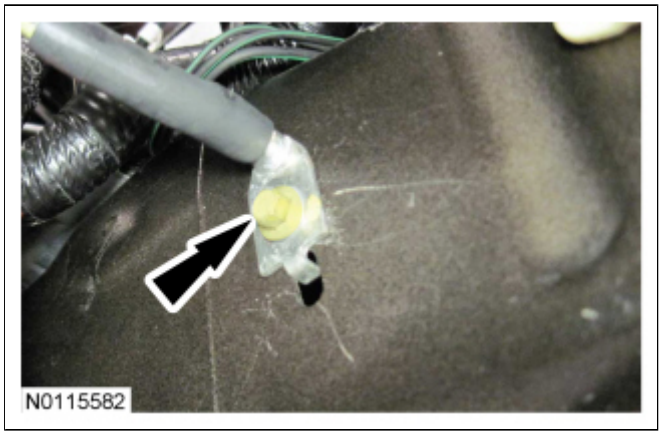
All vehicles

41. Install the halfshaft bracket and the 3 bolts and tighten in sequence shown.
    1. Tighten the top bolt to 48 Nm (35 lb-ft).
    2. Tighten the 2 bottom bolts to 24 Nm (18 lb-ft).

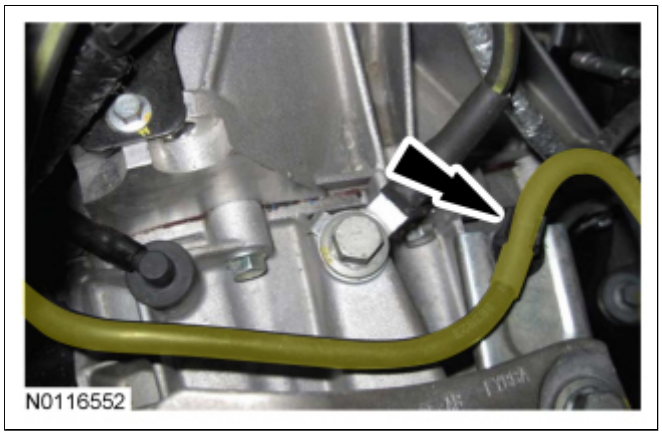


42. Install the RH and LH halfshafts. For additional information, refer to Section 205-04 .

43. Position the engine ground wire and install the bolt.
    - Tighten to 10 Nm (89 lb-in).



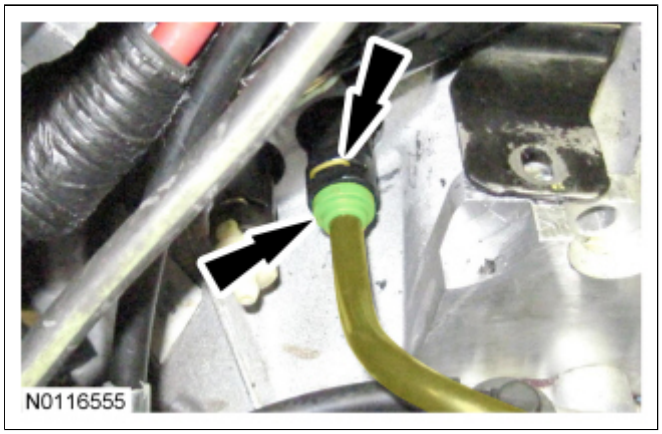
44. Attach the clutch hydraulic hose to the transaxle retainer.



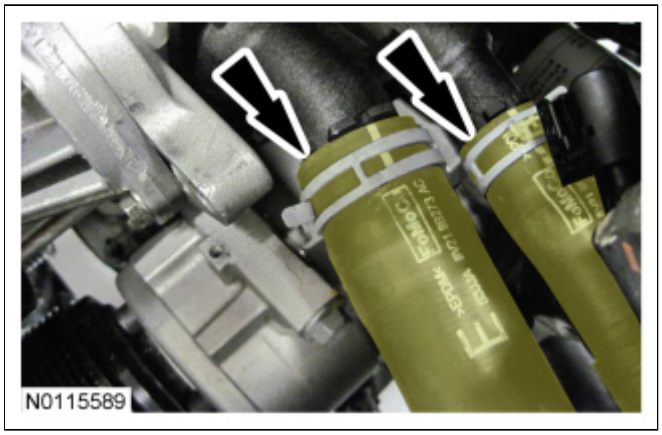
45. **WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

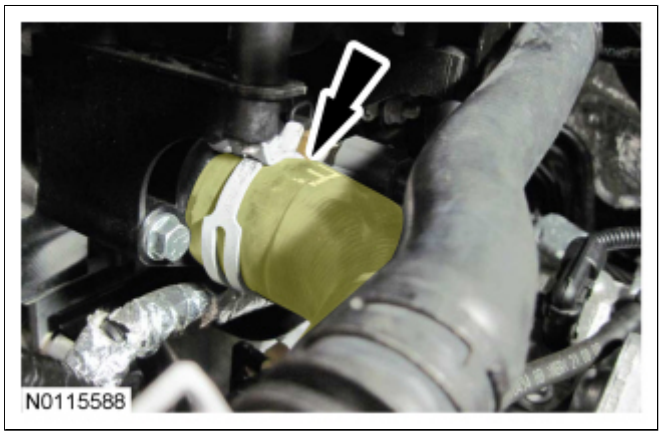
Connect the clutch hydraulic hose and install the clip.



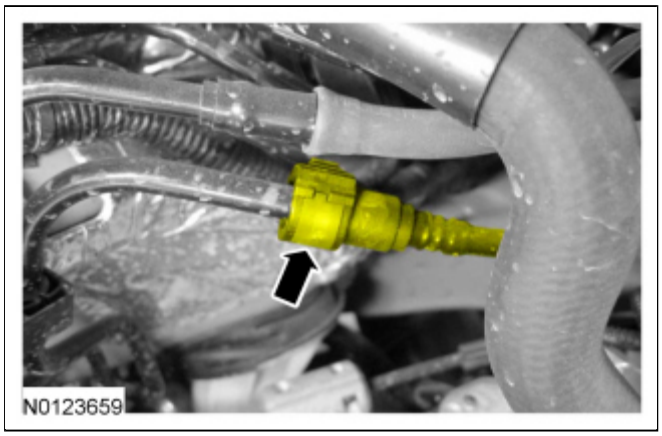
46. Connect the lower radiator hose and coolant hose to the thermostat housing.



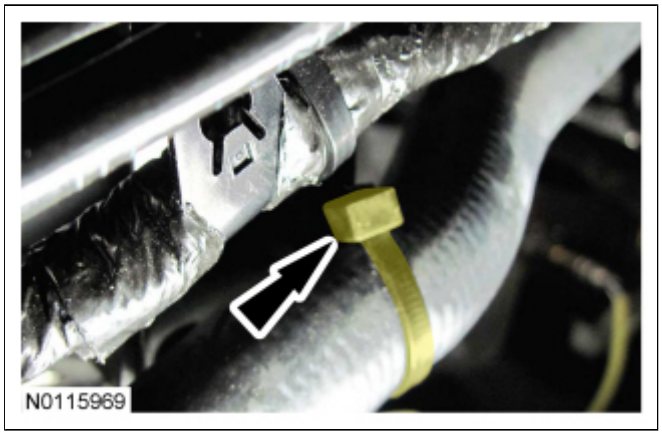
47. Connect the upper radiator hose to the engine.



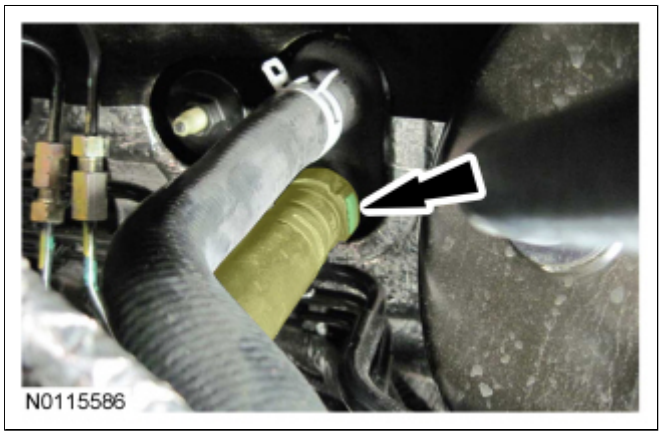
48. Connect the EVAP tube quick connect coupling near the bulk head. For additional information, refer to Section 310-00 .



49. Attach the coolant hose retainer to the coolant outlet bracket.

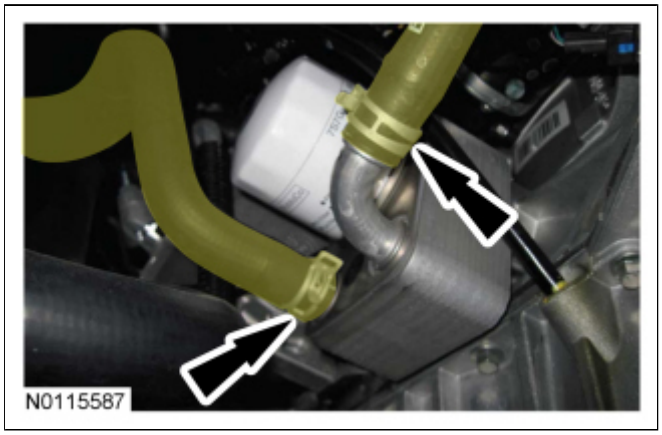


50. Connect the lower heater hose to the heater core.



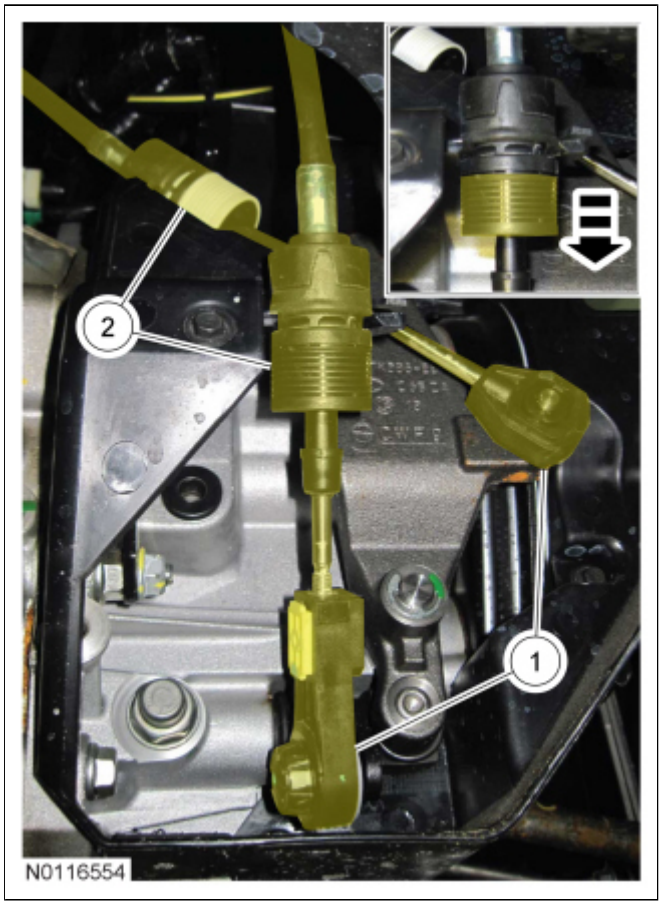
51. Install the HO2S . For additional information, refer to Section 303-14 .

52. Connect the 2 coolant hoses to the engine oil cooler.
    - Attach the oil cooler hose retainer to the upper radiator hose.



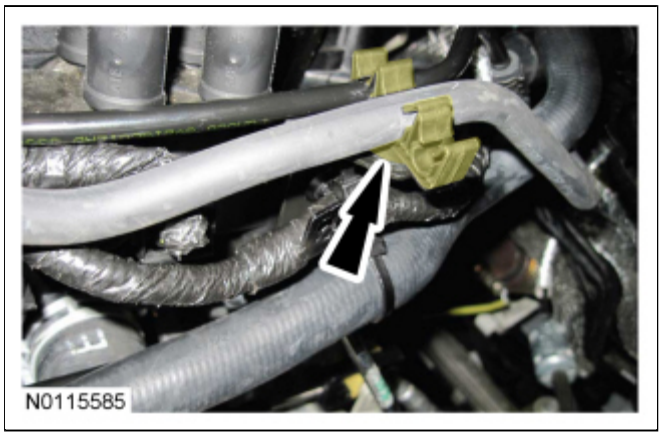
53. Install the cooling fan motor and shroud. For additional information, refer to Section 303-03 .

54. Install the gearshift cables.
    1. Attach the gearshift cables to the transaxle gearshift control levers.
    2. Install the gearshift cable by pulling the lower part of abutment down and installing them in the brackets.

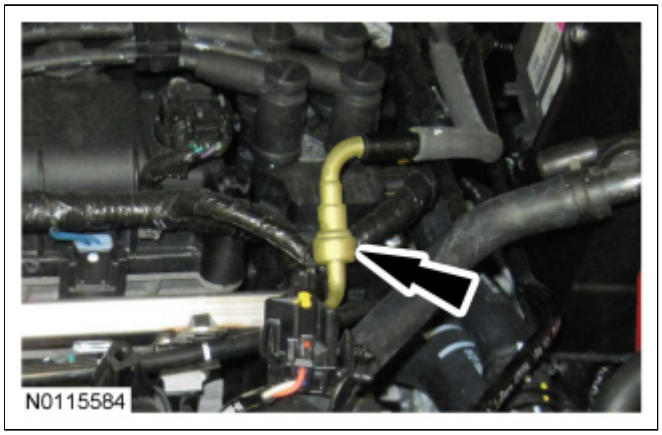


55. Install the generator. For additional information, refer to Section 414-00 .

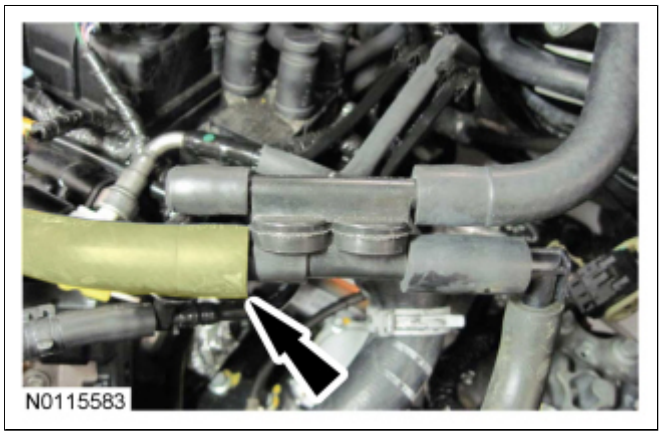
56. Attach the fuel tube to the coolant outlet bracket retainer.



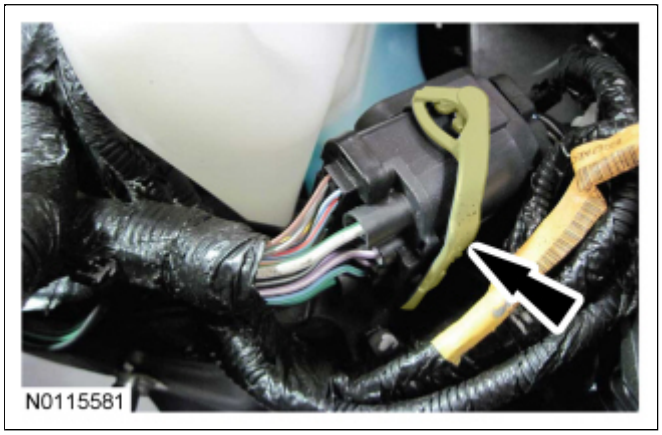
57. Connect the fuel tube spring lock couplings to the fuel rail. For additional information, refer to Section 310-00 .



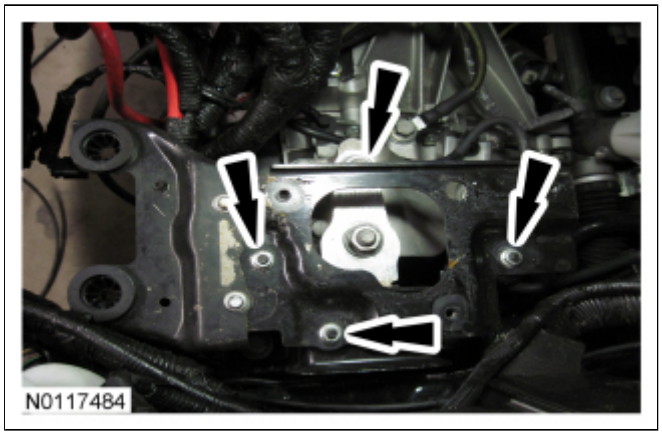
58. Connect the brake booster vacuum hose.



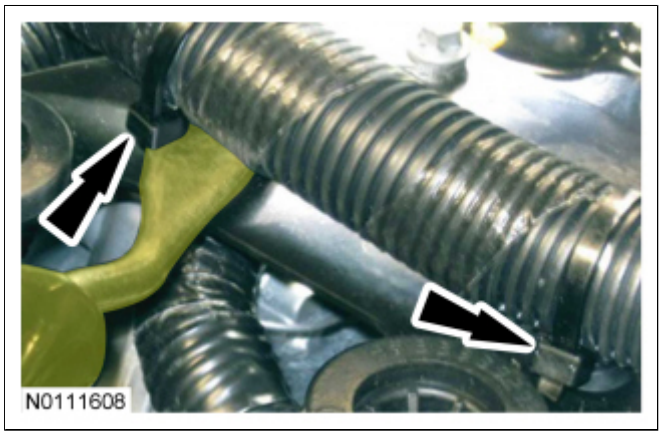
59. Connect the engine harness electrical connector.



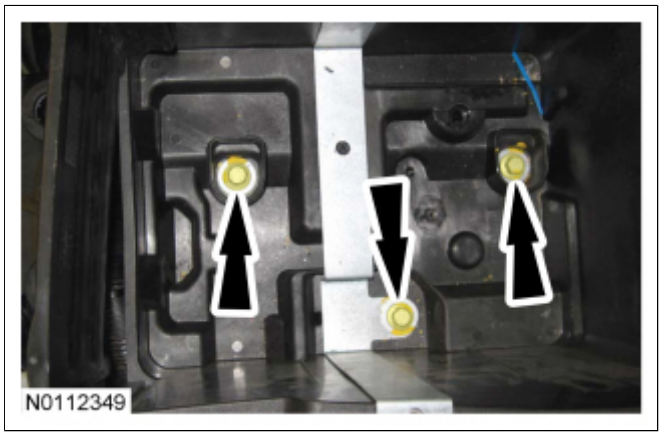
60. Install the battery tray bracket and the 3 battery tray nuts.
    - Attach the 2 wiring harness retainers to the bottom of the battery tray bracket.
    - Tighten nuts and bolt to 10 Nm (89 lb-in).



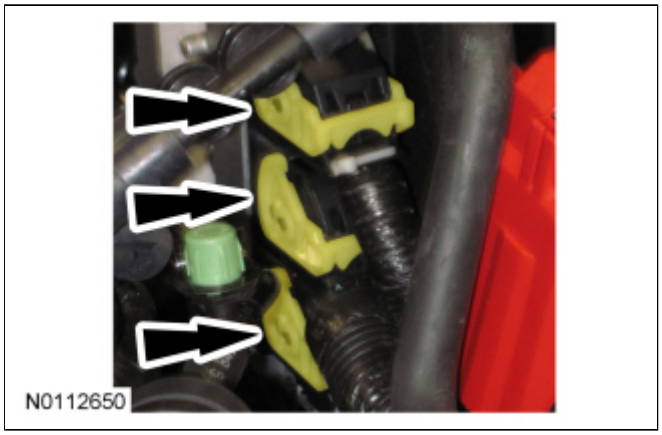
61. Attach the 2 positive battery cable wire harness retainers to battery tray bracket.



62. Install the battery tray and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

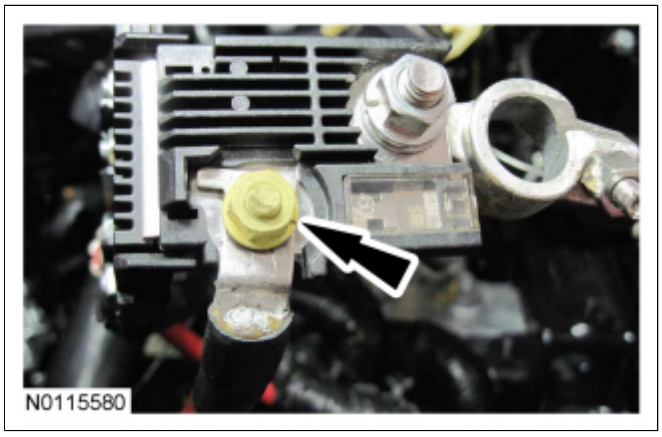


63. Connect the 3 PCM electrical connectors.



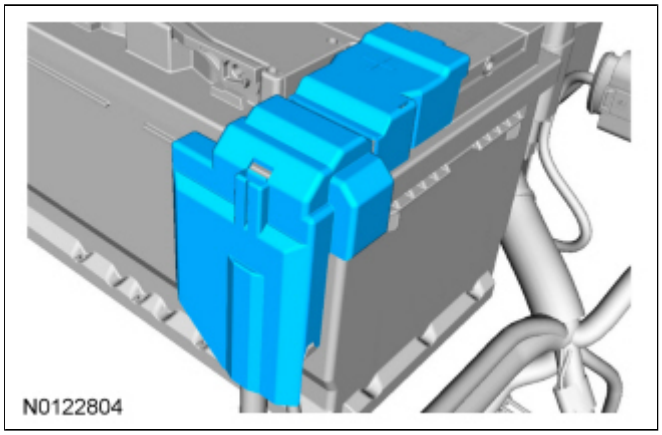
64. Install the PCM cover and the bolt.
    - Tighten to 5.4 Nm (47.8 lb-in).

65. Install the cable and nut to the positive battery cable terminal.
    - Tighten to 10 Nm (89 lb-in).

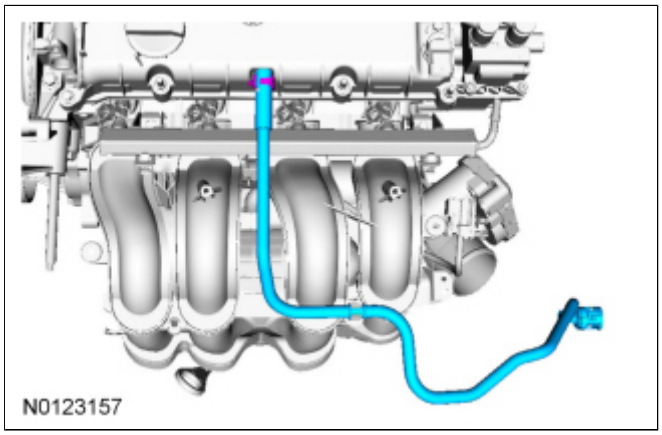


66. Install the battery. For additional information, refer to Section 414-01 .

67. Install the positive battery cable cover.



68. Connect the crankcase vent tube to the valve cover.
    - Attach the crankcase vent tube to the 2 retainers.



69. Install the Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12 .

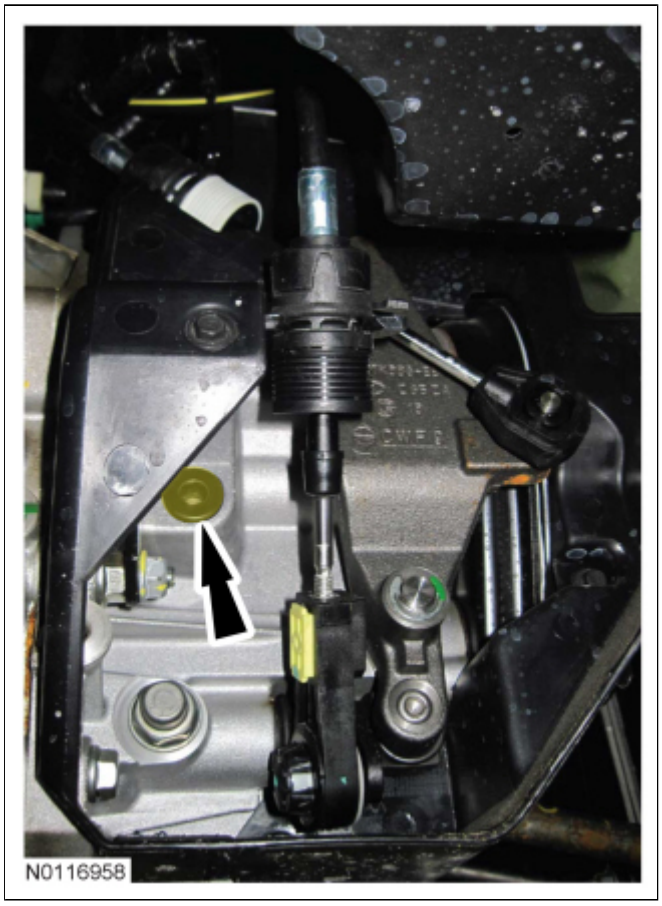
70. Fill the engine with clean engine oil.

71. Install the degas bottle. For additional information, refer to Section 303-03 .

72. Fill the and bleed cooling system. For additional information, refer to Section 303-03 .

73. **NOTE:** Before removing, clean the area around the fill plug.

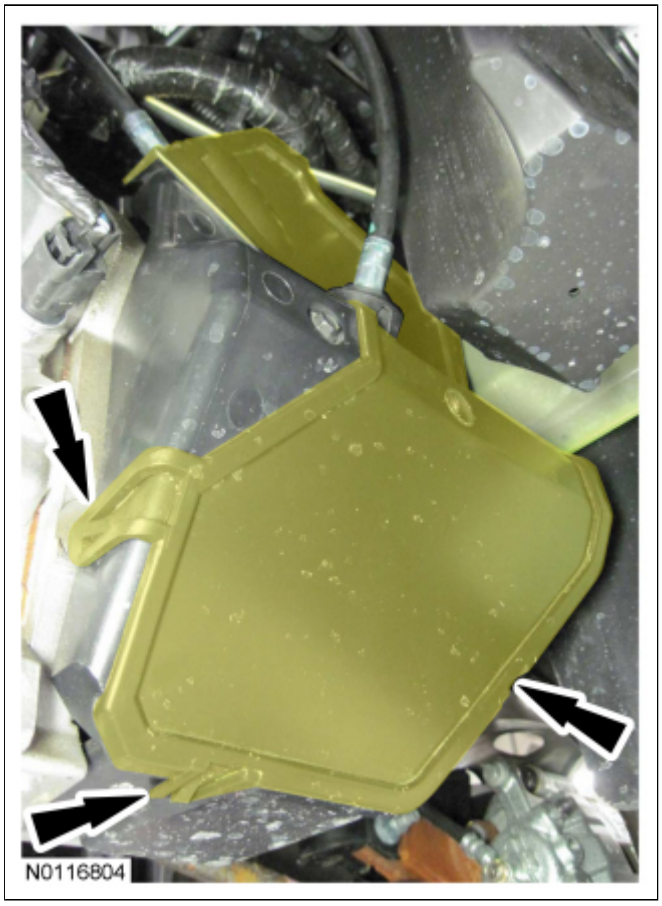
    Remove the fill plug and using a fluid suction gun, fill the transaxle with manual transmission fluid until fluid level is 0.0-5.0 mm (0.0-0.2 in) below the lower edge of the fill hole.
    - Install the fill plug and tighten to 35 Nm (26 lb-ft).



74. Bleed the clutch hydraulic system. For additional information, refer to Section 308-00 .

75. Adjust the gearshift cables. For additional information, refer to Section 308-00 .

76. Install the gearshift cable cover and attach the 7 retainers (2 shown).



N0116804

Material

Item	Specification	Fill Capacity
Motorcraft® Metal Surface Prep ZC-31-A	—	—
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A	—

[a] V-lock design only. Do not install or reinstall a split ring design block heater. Refer to the procedure.

[b] Refer to the procedure.

Engine Cooling

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Orange Engine Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of Motorcraft® Specialty Orange Engine Coolant. Failure to follow these instructions may damage the engine or cooling system.**

NOTE: During normal vehicle operation, Motorcraft Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

The cooling system components include the:

- radiator
- cooling fan motor and shroud
- degas bottle
- radiator drain valve
- coolant pump
- thermostat housing
- block heater (if equipped)

The engine uses a cold side thermostat. This means the thermostat is located at the lower radiator hose connection to the engine, where coolant enters the engine after being cooled by the radiator. During initial warm-up, the cooler coolant from the radiator quickly closes the thermostat after the warm coolant in the engine opens the thermostat slightly. The thermostat opens and closes several times before the coolant coming from the radiator is warm enough to allow the thermostat to remain open. The engine must run much longer than a vehicle with a hot side thermostat before the thermostat remains fully opened.

Engine coolant provides freeze protection, boil protection, corrosion protection and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water. A coolant concentration of 50% will provide freeze point protection down to -37°C (-34°F).

To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft® Specialty Orange Engine Coolant or equivalent meeting Ford specification WSS-M97B44-D (orange color).
- Do not add or mix with any other engine coolant. Mixing coolants degrades the coolant corrosion protection.
- Do not add alcohol, methanol, brine or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Specialty Orange Engine Coolant since a Ford-approved recycling process is not yet available.

ST3254-A	UView® Combustion Leak Tester UVU560000-R
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware or equivalent scan tool

Material

Item	Specification
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Principles of Operation

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine generated heat to the outside air.

The degas bottle removes air from the cooling system, allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor executes once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set, and the Malfunction Indicator Lamp (MIL) is illuminated.

Inspection and Verification

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTE: During normal vehicle operation, Motorcraft Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

NOTE: Vehicles have the pressure relief cap on the degas bottle and no radiator cap.

1. Verify the customer concern.
2. Visually check the engine coolant level at the degas bottle when the system is cold.
3. Make sure the pressure relief cap is installed correctly.
4. Record any cooling system DTCs retrieved. Refer to the PCM DTC chart in this section for DTC descriptions.
5. **NOTE:** Take note of any coolant odor or steam coming from cooling system components.

   If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer concern by operating the engine to duplicate the condition.
6. Visually inspect for obvious signs of any mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Leaks or weeps at:
  ▪ Hoses
  ▪ Tubes
  ▪ Clamp joints
  ▪ Gaskets
  ▪ O-rings
  ▪ Thermostat coolant connection
  ▪ Radiator
  ▪ Pressure relief cap
  ▪ Coolant pump
  ▪ Oil cooler (may leak internally or externally)
  ▪ Heater core (wet floor or coolant odor in vehicle)
  ▪ Degas bottle
  ▪ Cylinder block core plugs
  ▪ Cylinder head core plugs
  ▪ Block heater (if equipped)
 	
• Cracked or damaged:
  ▪ Hoses
  ▪ Tubes
  ▪ Hose clamps
  ▪ Thermostat coolant connection
  ▪ Radiator
  ▪ Pressure relief cap
  ▪ Cooling fan
  ▪ Coolant pump
  ▪ Oil cooler
  ▪ Degas bottle
  ▪ Cylinder block core plugs
  ▪ Cylinder head core plugs
  ▪ Block heater (if equipped)
• Restricted airflow through the A/C condenser/radiator
• Drive belt loose, worn or installed incorrectly
• Broken or weak drive belt tensioner
• Excessive white or light gray exhaust smoke (may have burnt coolant odor)
• Coolant in engine oil
• Engine oil in coolant
	• Inoperative or damaged:
	  ▪ Electric cooling fan
	  ▪ Wiring, connectors, relays or modules
	  ▪ Cylinder Head Temperature (CHT) sensor
	  ▪ Vehicle Speed Sensor (VSS)

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.

8. Inspect the coolant condition.
    1. Inspect the coolant color.
        - Discoloration may indicate that incorrect coolant may have been added to the system. Use of incorrect (green or yellow in color) coolant degrades the corrosion protection of Motorcraft® Specialty Orange Engine Coolant. Addition of Motorcraft® Specialty Green Engine Coolant may cause the color to appear to be a murky green-brown color. The addition of Motorcraft® Premium Gold Engine Coolant, however, may not change the color or appearance of the orange colored coolant. Detection of contamination with Motorcraft® Premium Gold Engine Coolant is determined by the presence of nitrite. If contamination with Motorcraft® Premium Gold Engine Coolant is suspected, test the coolant with the 3-Way HD Antifreeze Coolant Test Kit. Follow the directions on the packaging. If the incorrect coolant has been added to the cooling system, flush the system and refill with the correct mixture of distilled water and Motorcraft® Specialty Orange Engine Coolant. Refer to Cooling System Flushing in this section.
        - A darker orange with the presence of debris could indicate a commercially available stop leak may have been used and could result in loss of coolant flow to critical

parts of the engine. If sediment is present, flush the system and refill with the correct mixture of distilled water and Motorcraft® Specialty Orange Engine Coolant. Refer to Cooling System Flushing in this section.
- A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Specialty Orange Engine Coolant. Refer to Cooling System Flushing in this section.
- An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For engine diagnosis, refer to Section 303-00 . Flush the system and refill with the correct mixture of distilled water and Motorcraft® Specialty Orange Engine Coolant. Refer to Cooling System Flushing in this section.
- A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to component tests in this section. If engine oil is suspected, the cause of the leak may be internal to the engine. For engine diagnosis, refer to Section 303-00 . Flush the system and refill with the correct mixture of distilled water and Motorcraft® Specialty Orange Engine Coolant. Refer to Cooling System Flushing in this section.

2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range of -50°C to -26°C (-58°F to -15°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
   - Maximum coolant concentration is 60/40 for cold weather areas.
   - Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant range and level if necessary:
   - If coolant is low, add specified coolant mixture only.
   - If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
   - If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

10. **NOTE:** Make sure to use the latest scan tool software release.

    If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

11. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

    If the scan tool does not communicate with the VCM :
    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM .
    - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

12. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the PCM.

13. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

14. Clear the continuous DTCs and carry out the self-test diagnostics PCM.

15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other PCM DTCs, refer to Section 303-14 .

16. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

PCM DTC Chart

DTC	Description	Action
P0125	Insufficient Coolant Temp For Closed Loop Fuel Control	GO to Pinpoint Test C .
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	GO to Pinpoint Test C .
P0480	Fan 1 Control Circuit	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0481	Fan 2 Control Circuit	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0691	Fan 1 Control Circuit Low	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0692	Fan 1 Control Circuit High	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0693	Fan 2 Control Circuit Low	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0694	Fan 2 Control Circuit High	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Loss of coolant	• Coolant hoses or tubes • Hose clamps • Coolant pump O-ring seal or gasket • Thermostat O-ring seal or gasket • Thermostat coolant connection • Radiator • Degas bottle • Pressure relief cap • Coolant pump leaking	• GO to Pinpoint Test A .

	from weep hole • Oil cooler (may leak internally or externally) • Heater core • Engine gaskets (may leak internally or externally) • Cylinder block core plugs • Cylinder head core plugs • Block heater (if equipped)	
• The engine overheats	• Low coolant level • External engine coolant leak • Airlock in system • Pressure relief cap installation • Restricted airflow through the A/C condenser/radiator • Internal engine coolant leak • Coolant condition/concentration • Accessory drive components • Non-OEM engine enhancement components • Electric cooling fan • Radiator • Thermostat • Engine Coolant Temperature (ECT) sensor • ECT gauge • Coolant pump • Coolant flow restriction	• GO to Pinpoint Test B .
• The engine does not reach normal operating temperature	• Low coolant level • Thermostat • Electric cooling fan always on • ECT gauge	• GO to Pinpoint Test C .
• The block heater does not operate correctly	• Block heater power cable • Block heater	• CHECK continuity in all 3 power cable circuits. If any circuit measures more than 5 ohms, INSTALL a new power cable. • CHECK the resistance of the block heater. If the resistance does not measure between 12.5 and 17 ohms, INSTALL a new block heater.
• The electric cooling fan is inoperative in one or more speeds or does not operate	• Wiring • Relays • Fuses • Fan control module • Cooling fan motor • Cooling fan resistor	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

correctly		
• The electric cooling fan stays on all the time	• Wiring • Relays	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Noisy electric cooling fan operation	• Foreign material contamination • Fan motor	• REMOVE the foreign material from the cooling fan and shroud. TEST the system for normal operation. If still noisy, INSTALL a new cooling fan assembly.
	• Fan blade detached from fan motor	• INSTALL a new cooling fan assembly.

Pinpoint Tests

Pinpoint Test A: Loss of Coolant

Normal Operation

The engine cooling system is a closed system providing for coolant expansion and contraction as well as changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Coolant loss can be attributed to external or internal leaks anywhere within the cooling system.

This pinpoint test is intended to diagnose the following:

- Coolant hoses or tubes
- Hose clamps
- Thermostat coolant connection O-ring seal or gasket
- Thermostat coolant connection
- Coolant pump gasket
- Radiator
- Pressure relief cap
- Coolant pump
- Oil cooler (may leak internally or externally)
- Heater core
- Engine gaskets (may leak internally or externally)
- Degas bottle
- Engine Coolant Temperature (ECT) sensor
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

PINPOINT TEST A: LOSS OF COOLANT

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is

hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION • Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to A2 .
A2 CHECK THE ENGINE COOLANT LEVEL **NOTE:** Allow the engine to cool before checking the engine coolant level. • Ignition OFF. • Visually inspect the engine coolant level at the degas bottle. • **Is the engine coolant level within specifications?**	**Yes** GO to A3 . **No** ADJUST the engine coolant level as necessary. GO to A3 .
A3 PRESSURE TEST THE ENGINE COOLING SYSTEM • Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK • Inspect the engine coolant in the coolant expansion tank for signs of engine oil. • **Is engine oil evident in the coolant?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to A5 .
A5 CHECK THE ENGINE OIL FOR COOLANT • Remove the oil level indicator from the engine. • **Is coolant evident in the oil?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to A6 .
A6 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES • **NOTE:** Use UView® Combustion Leak Tester part number UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Normal Operation

The engine cooling system maintains the engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through a pulley driven by the accessory drive belt circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine-generated heat to the outside air through the radiator.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components
- Electric cooling fan
- Radiator
- Thermostat
- Engine Coolant Temperature (ECT)
- ECT gauge
- Coolant pump
- Coolant flow restriction

PINPOINT TEST B: THE ENGINE OVERHEATS

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
B1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK FOR AN AIRFLOW OBSTRUCTION	
• Check the radiator or A/C condenser for	**Yes**

an external obstruction such as leaves or cardboard. • **Is an obstruction present?**	REMOVE the obstruction. TEST the system for normal operation. **No** GO to B3.
B3 CHECK THE ENGINE COOLANT LEVEL **NOTE:** Allow the engine to cool before checking the coolant level. • Ignition OFF. • Visually check the engine coolant level in the coolant expansion tank. • **Is the engine coolant level within specification?**	**Yes** GO to B4. **No** ADJUST the engine coolant level as necessary. GO to B4.
B4 PRESSURE TEST THE ENGINE COOLING SYSTEM • Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to B5.
B5 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK • Inspect the engine coolant in the coolant expansion tank for signs of engine oil. • **Is engine oil evident in the coolant?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to B6.
B6 CHECK THE ENGINE OIL FOR COOLANT • Remove the oil level indicator from the engine. • **Is coolant evident in the oil?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to B7.
B7 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES • **NOTE:** Use UView® Combustion Leak Tester part number UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to B8.
B8 CHECK COOLANT CONDITION • Check the coolant for dirt, rust or contamination and check the coolant concentration. • **Is the coolant condition OK?**	**Yes** GO to B9. **No** FLUSH the engine cooling system. REFER to Cooling System Flushing in this section. TEST the system for normal operation.
B9 CHECK THE ELECTRIC COOLING FAN OPERATION • Start the engine. • Place the climate control function selector	**Yes** GO to B10.

in the MAX A/C position and the blower motor switch in the HI position. • **Did the electric cooling fan operate?**	**No** DIAGNOSE the electric cooling fan operation. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B10 CHECK THE COOLANT PUMP OPERATION	
• Start the engine. • Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose. • **Is the heater outlet hose hot?**	**Yes** GO to B11 . **No** INSTALL a new coolant pump. TEST the system for normal operation.
B11 CHECK THE THERMOSTAT OPERATION	
• Start the engine. • Allow the engine to run for 30 minutes. Feel the lower radiator hose. • **Is the lower radiator hose hot?**	**Yes** CHECK the ECT gauge operation. REFER to Section 413-01 . **No** GO to B12 .
B12 VISUALLY INSPECT THE THERMOSTAT	
• Carry out the Thermostat Visual Inspection in the Component Tests portion of this section. • **Is the thermostat damaged?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Normal Operation

The engine cooling system maintains engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through a pulley driven by the accessory drive belt, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions, or when the electric cooling fan operates all of the time. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

- DTC P0125 (Insufficient Coolant Temp for Closed Loop Fuel Control) — Indicates the Engine Coolant Temperature (ECT) sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
- DTC P0128 (Coolant Thermostat [Coolant Temp Below Thermostat Regulating Temperature]) — Indicates that the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- Thermostat
- ECT indicator system (gauge)
- Engine cooling fan always on

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
C1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to C2.
C2 CHECK FOR DTCs P0125 or P0128	
• Check for DTC P0125 or P0128. • **Is DTC P0125 or P0128 present?**	**Yes** GO to C3. **No** The cooling system is operational. If an inoperative ECT gauge is suspected, CHECK the ECT gauge operation. REFER to Section 413-01. If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to Section 412-00. If any other DTCs are retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
C3 CHECK THE ELECTRIC COOLING FAN OPERATION	
• Allow the engine to cool. • Make sure the A/C switch is OFF. • Start the engine. • Check the electric cooling fan. • **Is the electric cooling fan on all the**	**Yes** DIAGNOSE the electric cooling fan operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to C4.

time?	
C4 CHECK THE COOLANT LEVEL	
• **NOTE:** Allow the engine to cool before checking the coolant level. • Visually check the engine coolant level in the coolant expansion tank. • **Is the engine coolant level within specification?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** GO to Pinpoint Test A to diagnose a coolant leak.

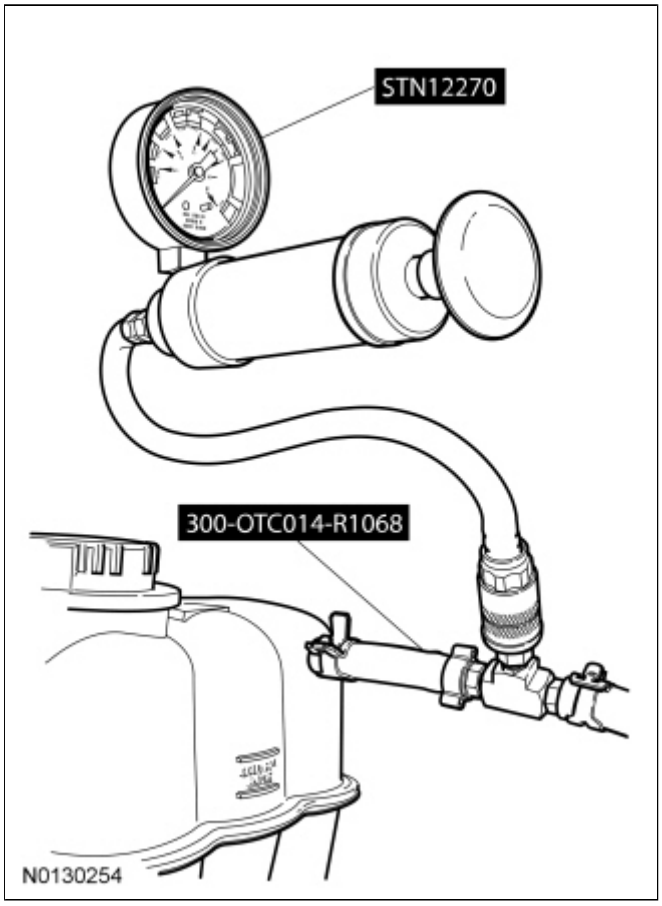
Component Tests

Cooling System Pressure Test

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles have the pressure relief cap on the degas bottle and no radiator cap.

1. Turn the engine OFF.
2. Check the engine coolant level. Adjust the coolant level as necessary.
3. Attach the D-Gas Adapter to the degas bottle nipple and overflow hose. Install the Radiator Tester to the quick connect fitting of the D-Gas Adapter.



4. ***NOTICE:*** **Do not pressurize the cooling system beyond the maximum pressure listed in the specifications table in this section or cooling system components may be damaged.**

   NOTE: If the plunger of the pressure tester is pressed too fast, an incorrect pressure reading results.

   Slowly press the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the specifications table, install a new pressure relief cap.

5. If the system does not hold pressure, remove the pressure relief cap and wash it in clean water to dislodge all of the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. Use fine sandpaper or emery cloth to remove nicks and cuts. Place a shop cloth in the filler neck to prevent debris from falling into the degas bottle. If nicks or cuts are too deep to remove, install a new degas bottle. Install the pressure relief cap.

6. Pressurize the engine cooling system as described in Step 4. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops, inspect for leaks and repair as necessary.

7. If no leaks are found and the pressure drops, the pressure relief cap may be leaking. Install a new pressure relief cap and retest the system.

8. If no leaks are found after a new pressure relief cap is installed, and the pressure drops, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to Section 303-00 to diagnose the engine.

9. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.

2. Examine the thermostat for signs of damage including:
    - Valve not fully seated (light visible through the valve)
    - Foreign material lodged in the main valve
    - Bent or broken frame or flange
    - Bent or broken spring
    - Bent or broken valve or valve stem
    - Wax leaking from wax reservoir or a bulge in the reservoir
    - Any other damage or distortion

3. **NOTE:** If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

   If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

Radiator Leak Test, Removed From Vehicle

NOTICE: **Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.**

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

Leak test the radiator in clean water with air pressurized to the maximum pressure listed in the Specifications.

Cooling System Draining, Filling and Bleeding

Special Tool(s)

ST2818-A	Airlift Cooling System Tester UVU550000 or equivalent

Material

Item	Specification
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Draining

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   NOTICE: **The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly. Using contaminated coolant may damage the engine or cooling system components.**

   NOTE: During normal vehicle operation, Motorcraft Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

   Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure has been released, remove the pressure relief cap.

3. Place a suitable container below the lower radiator hose.
   - Release the clamp, disconnect the lower radiator hose from the radiator and allow the coolant to drain.

Filling and Bleeding with a Vacuum Cooling System Filler

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. If a non-specified**

coolant has been used the cooling system must be chemically flushed. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.

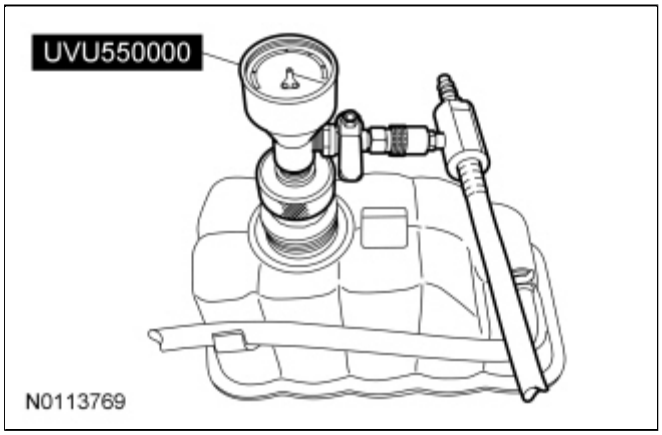
NOTICE: **Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the coolant expansion tank.**

To maintain the integrity of the coolant and the cooling system:

- **Add Motorcraft® Specialty Orange Engine Coolant or equivalent meeting Ford specification WSS-M97B44-D (orange color).**
- **Do not add or mix with any other type of engine coolants. Mixing coolants degrades the coolant's corrosion protection.**
- **Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Specialty Orange Engine Coolant since a Ford-approved recycling process is not yet available.**

1. Connect the lower radiator hose to the radiator and position the clamp.

2. Install the vacuum cooling system filler and follow the manufacturer's instructions to fill and bleed the cooling system.
    - Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
    - For extremely cold climates (less than -37°C [-34°F]):
        - It may be necessary to increase the coolant concentration above 50%.
        - NEVER increase the coolant concentration above 60%.
        - Maximum coolant concentration is 60/40 for cold weather areas.
        - A coolant concentration of 60% will provide freeze point protection down to -50°C (-58°F).
        - Engine coolant concentration above 60% will decrease the overheat protection characteristics of the engine coolant and may damage the engine.
    - For extremely hot climates:
        - It is still necessary to maintain the coolant concentration above 40%.
        - NEVER decrease the coolant concentration below 40%.
        - Minimum coolant concentration is 40/60 for warm weather areas.
        - A coolant concentration of 40% will provide freeze point protection down to -26°C (-15°F).
        - Engine coolant concentration below 40% will decrease the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
    - Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.



Filling and Bleeding without a Vacuum Cooling System Filler

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. If a non-specified coolant has been used the cooling system must be chemically flushed. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the coolant expansion tank.**

To maintain the integrity of the coolant and the cooling system:

- **Add Motorcraft® Specialty Orange Engine Coolant or equivalent meeting Ford specification WSS-M97B44-D (orange color).**
- **Do not add or mix with any other type of engine coolants. Mixing coolants degrades the coolant's corrosion protection.**
- **Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Specialty Orange Engine Coolant since a Ford-approved recycling process is not yet available.**

1. Connect the lower radiator hose to the radiator and position the clamp.

2. Fill the radiator through the degas bottle until the coolant level is at the max fill line on the degas bottle.
    - Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
    - For extremely cold climates (less than -37°C [-34°F]):
        - It may be necessary to increase the coolant concentration above 50%.
        - NEVER increase the coolant concentration above 60%.
        - Maximum coolant concentration is 60/40 for cold weather areas.
        - A coolant concentration of 60% will provide freeze point protection down to -50°C (-58°F).
        - Engine coolant concentration above 60% will decrease the overheat protection characteristics of the engine coolant and may damage the engine.
    - For extremely hot climates:
        - It is still necessary to maintain the coolant concentration above 40%.
        - NEVER decrease the coolant concentration below 40%.
        - Minimum coolant concentration is 40/60 for warm weather areas.
        - A coolant concentration of 40% will provide freeze point protection down to -26°C (-15°F).
        - Engine coolant concentration below 40% will decrease the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
    - Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.

3. Install the pressure relief cap.

4. ***NOTICE:*** **If the engine overheats or the fluid level in the coolant expansion tank drops below the min fill line, allow the engine to cool. Once engine is cool, add coolant to the coolant expansion tank to the max fill line. Failure to follow these instructions may damage the engine.**

Start the engine, run and hold at 2,500 rpm for 15 minutes.

5. ***NOTICE:*** **If the engine overheats or the fluid level in the coolant expansion tank drops below the min fill line, allow the engine to cool. Once engine is cool, add coolant to the coolant expansion tank to the max fill line. Failure to follow these instructions may damage the engine.**

   Increase the engine speed to 5,000 rpm and then decrease to idle. Repeat six times.

6. ***NOTICE:*** **If the engine overheats or the fluid level in the coolant expansion tank drops below the min fill line, allow the engine to cool. Once engine is cool, add coolant to the coolant expansion tank to the max fill line. Failure to follow these instructions may damage the engine.**

   Increase the engine speed to 4,000 rpm for ten seconds, then return the engine speed to 2,500 rpm and hold for another ten minutes.

7. Decrease the engine speed to idle, shut the engine off and allow to cool.

8. Check the engine and cooling system for any leaks.

9. Check the coolant level in the degas bottle and fill as necessary.

Cooling System Flushing

Special Tool(s)

ST1167-A	Drain Kit 164-R3662
 ST1168-A	Flush Kit 164-R3658 or equivalent
ST2421-A	Pro Flush and Fill 023-00154 or equivalent

Material

Item	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

1. **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the thermostat. For additional information, refer to Thermostat in this section.

3. Install the coolant hose connection without the thermostat.
   - Tighten the bolts to 10 Nm (89 lb-in).

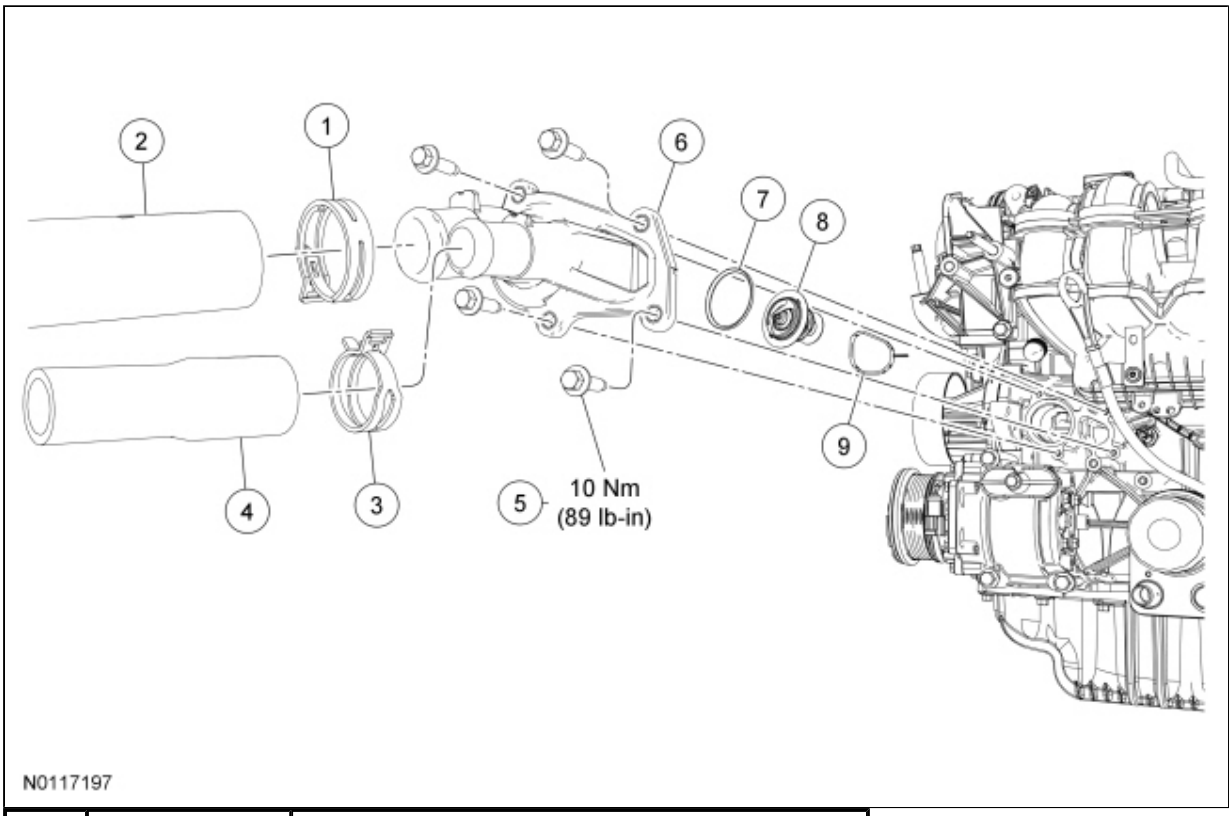
4. **NOTE:** Refer to the cooling system Pro Flush and Fill operating instructions for specific vehicle hook-up.

   Use cooling system Pro Flush and Fill, Flush Kit and Drain Kit to flush the cooling system.
   - Use Motorcraft® Premium Cooling System Flush. Follow the directions on the packaging.

5. Install the thermostat. For additional information, refer to Thermostat in this section.

6. Fill the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat



Item	Part Number	Description
1	W527338	Lower radiator hose clamp
2	8286	Lower radiator hose
3	W527314	Oil cooler hose clamp
4	8K276	Oil cooler hose
5	W500214	Coolant connection bolt (4 required)
6	8592	Coolant connection
7	8255	Thermostat O-ring seal (part of 8575)
8	8575	Thermostat
9	6840	Coolant connection gasket (part of 8592)

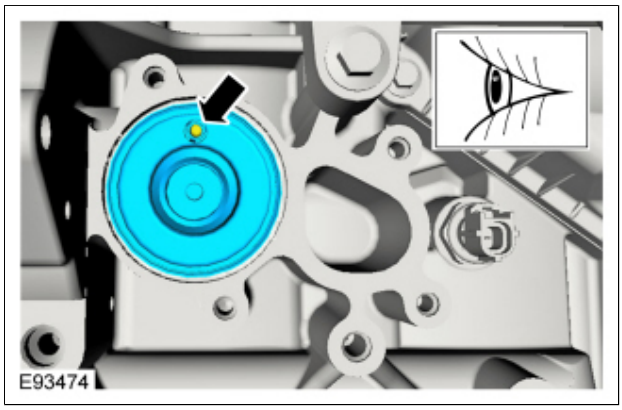
Removal

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Remove the generator. For additional information, refer to Section 414-00 .
3. Release the clamp and disconnect the lower radiator hose from the coolant connection.
4. Release the clamp and disconnect the oil cooler hose from the coolant connection.
5. Remove the 4 bolts, the coolant connection and the gasket.
   - Discard the gasket.

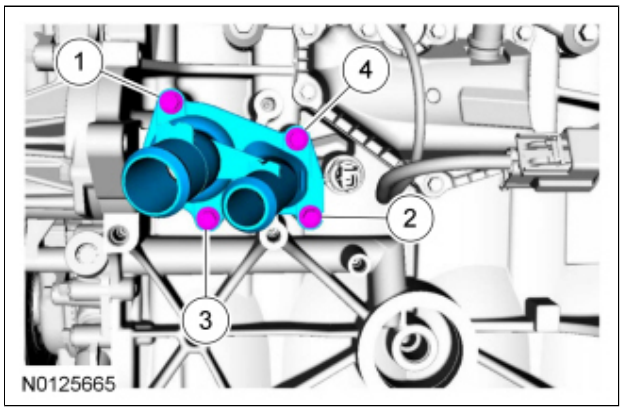
6. Remove the thermostat and the O-ring seal.
    - Discard the O-ring seal.

Installation

1. Position the thermostat and an new O-ring seal.
    - Position the thermostat with the weep hole at the 12 o'clock position.



2. Position a new gasket, the coolant connection and install the 4 bolts finger tight. Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 10 Nm (89 lb-in).

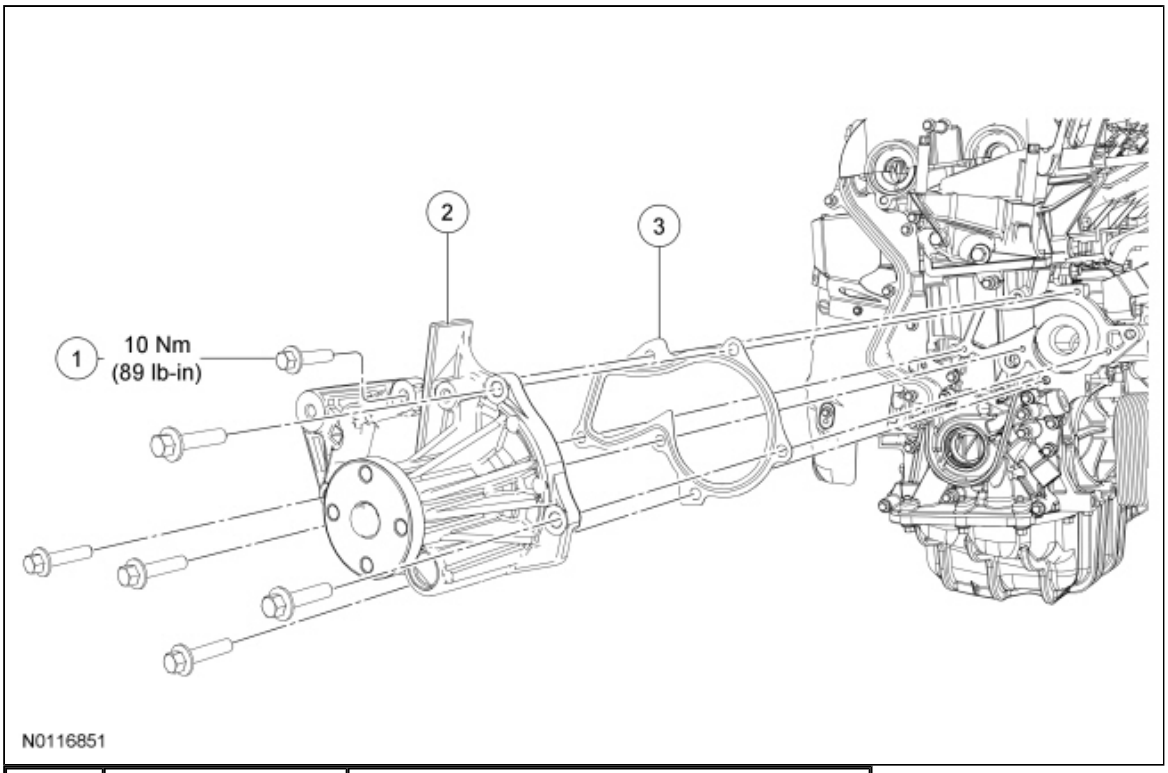


3. Connect the oil cooler hose to the coolant connection and position the clamp.
4. Connect the lower radiator hose to the coolant connection and position the clamp.
5. Install the generator. For additional information, refer to Section 414-00 .
6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Pump

Special Tool(s)

 ST3262-A	Pin, Crankshaft Top Dead Center (TDC) 303-748
 ST3276-A	Tool, Timing Belt Holding 303-1556



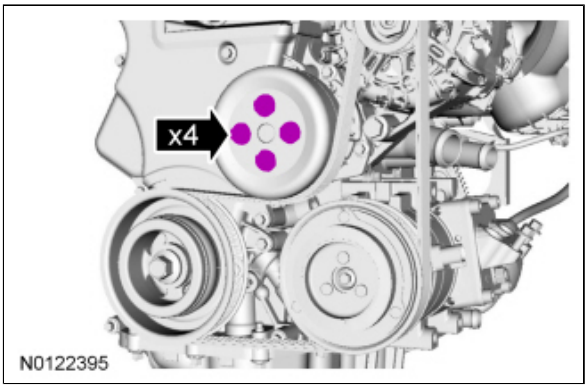
Item	Part Number	Description
1	W713043	Coolant pump bolt (6 required)
2	8501	Coolant pump
3	8507	Coolant pump gasket

Removal

All vehicles

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

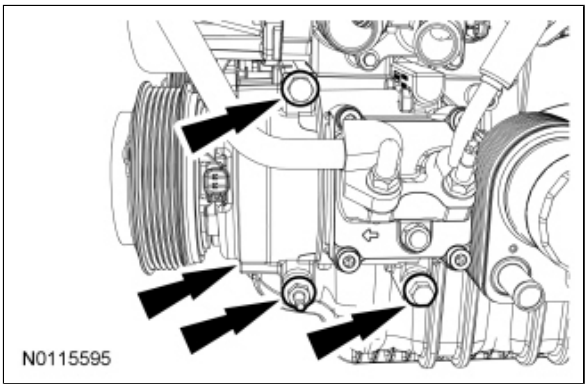
2. Loosen the 4 coolant pump pulley bolts.



3. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

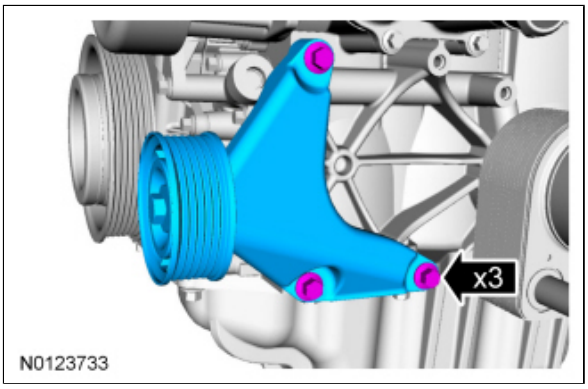
Vehicles with A/C

4. Remove the 2 bolts, the studbolt, position the A/C compressor aside and support it with a length of mechanic's wire.



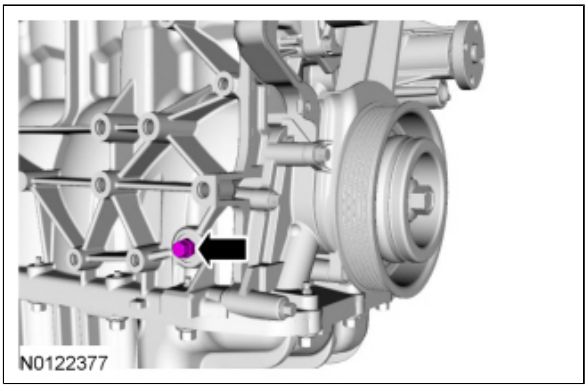
Vehicles without A/C

5. Remove the 3 bolts and the accessory drive belt idler pulley bracket.



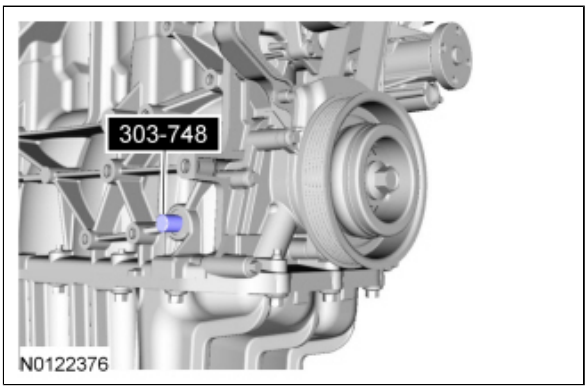
All vehicles

6. Remove the engine plug bolt.



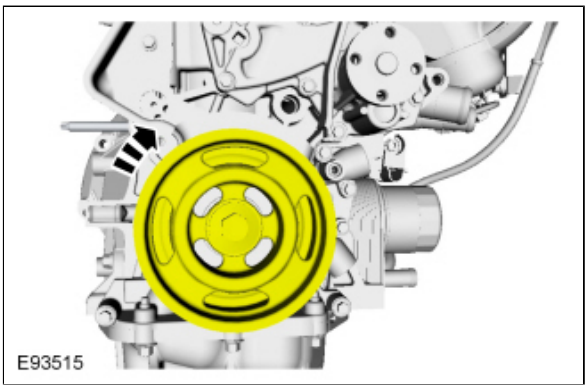
7. **NOTE:** The Crankshaft Top Dead Center (TDC) Pin will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the coolant pump removal and installation.

   Install the Crankshaft TDC Pin.



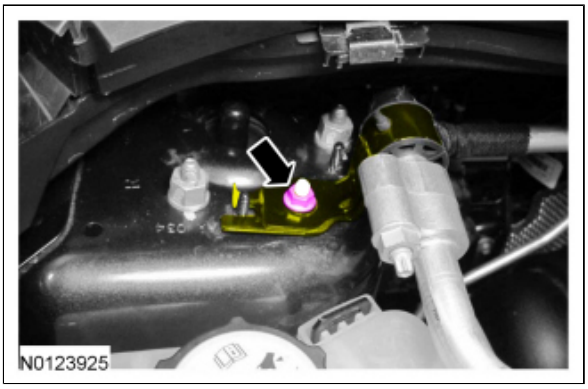
8. **NOTE:** Only rotate the crankshaft in the clockwise direction.

   Rotate the crankshaft until it stops against the Crankshaft TDC Pin.



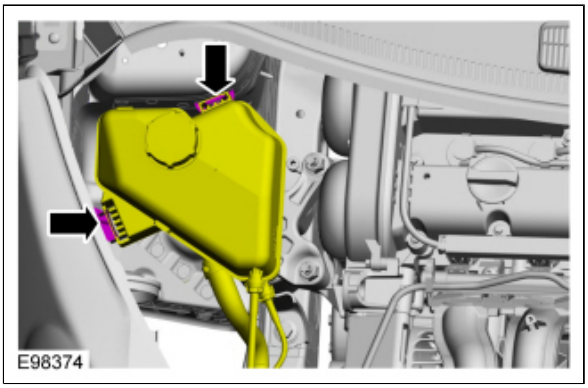
Vehicles with A/C

9. Remove the nut and position the A/C bracket aside.



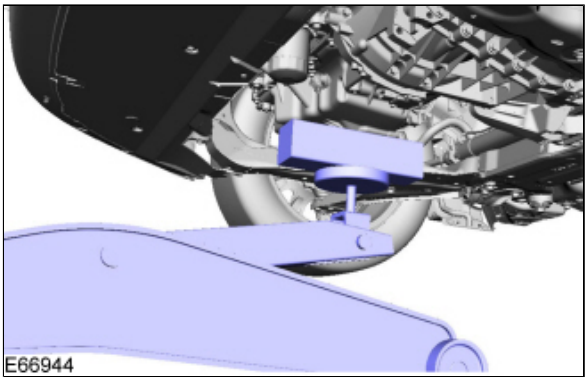
All vehicles

10. Release the 2 tabs and position the degas bottle aside.



11. ***NOTICE:*** **Use a wooden block to protect the oil pan when supporting the engine**

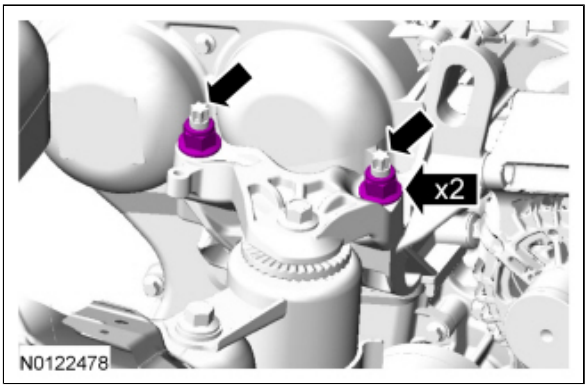
    Using a floor jack and a block of wood, support the engine.



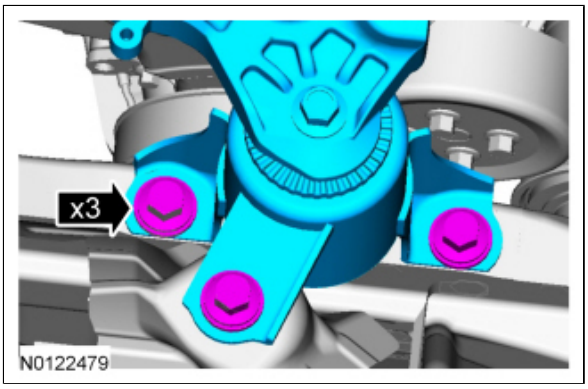
12. ***NOTICE:*** **Hold the engine mount studs while removing the engine mount nuts or the powertrain may be damaged.**

    NOTE: Do not loosen the engine mount center bolt or the engine may become improperly positioned.

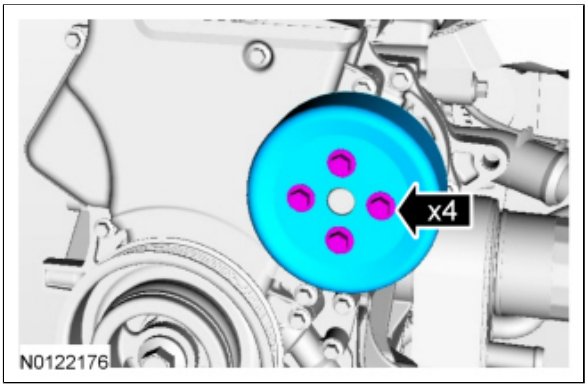
    Using the holding feature to prevent the engine mount studs from turning, remove the 2 engine mount nuts.



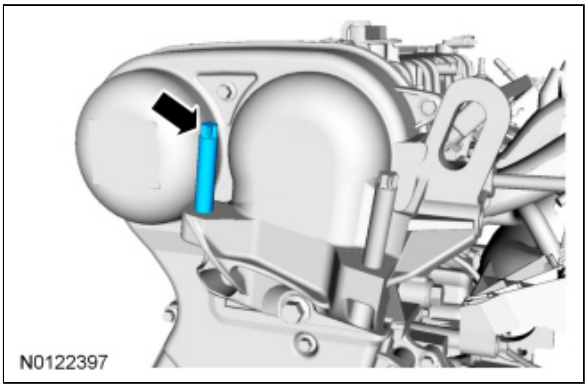
13. Remove the 3 bolts and the engine mount.



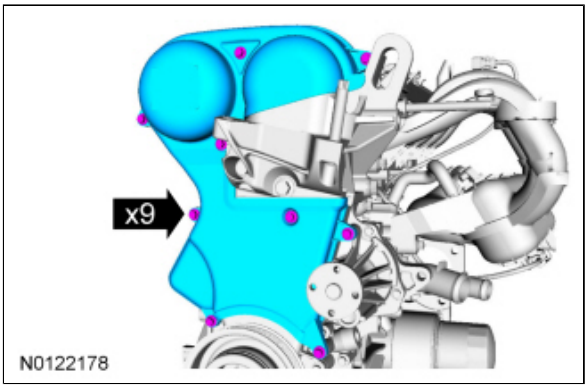
14. Remove the 4 bolts and the coolant pump pulley.



15. Remove the 1 engine mount stud.



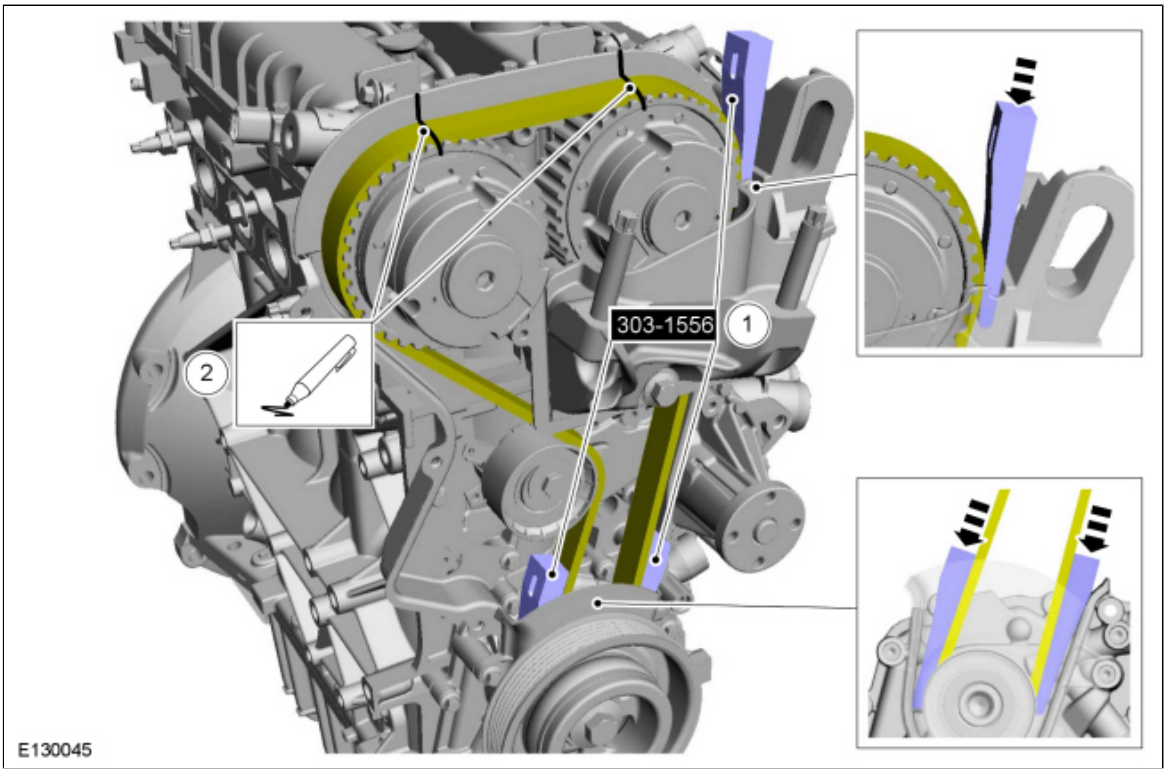
16. Remove the 9 bolts and the timing belt cover.



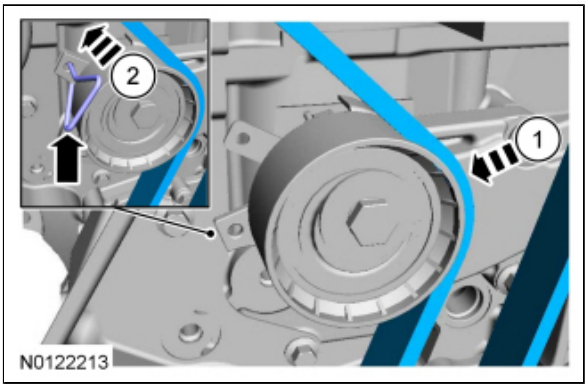
17. ***NOTICE:*** **Do not rotate the crankshaft while installing the special tool or the engine may be damaged.**

Hold the timing belt in position.

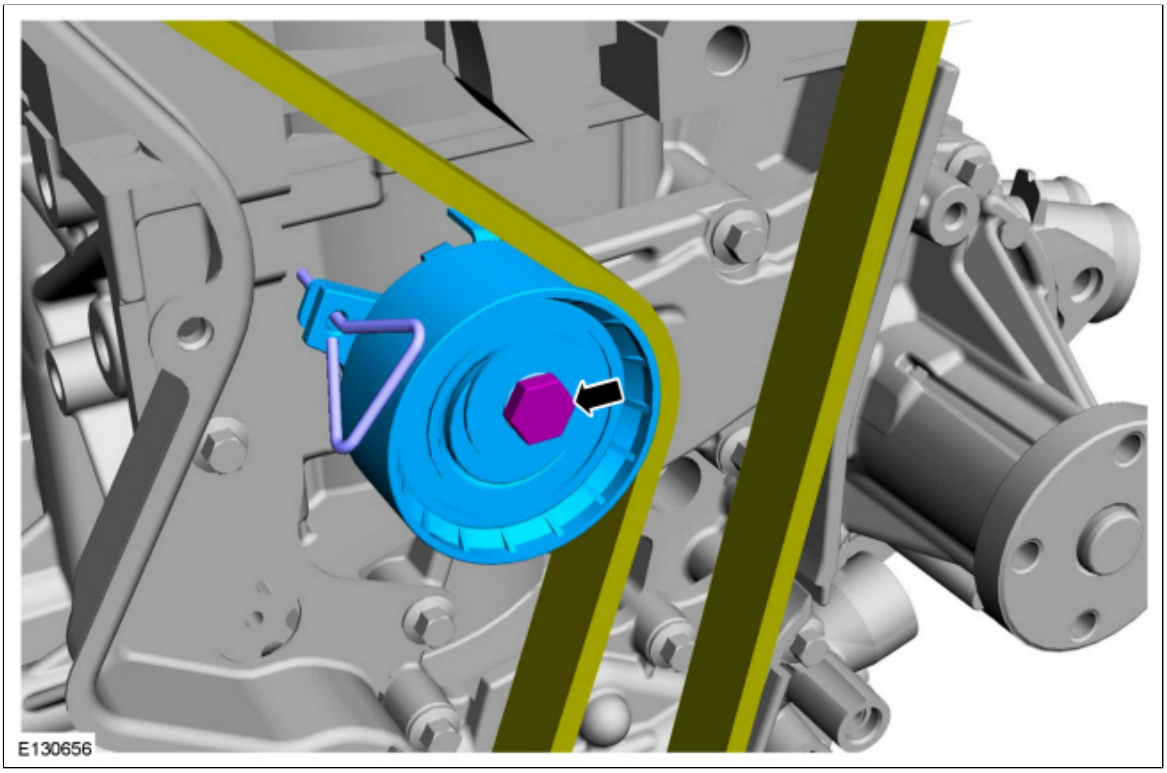
1. Install the Timing Belt Holding Tools in 3 places as shown.
2. Mark the position of the timing belt for assembly reference.



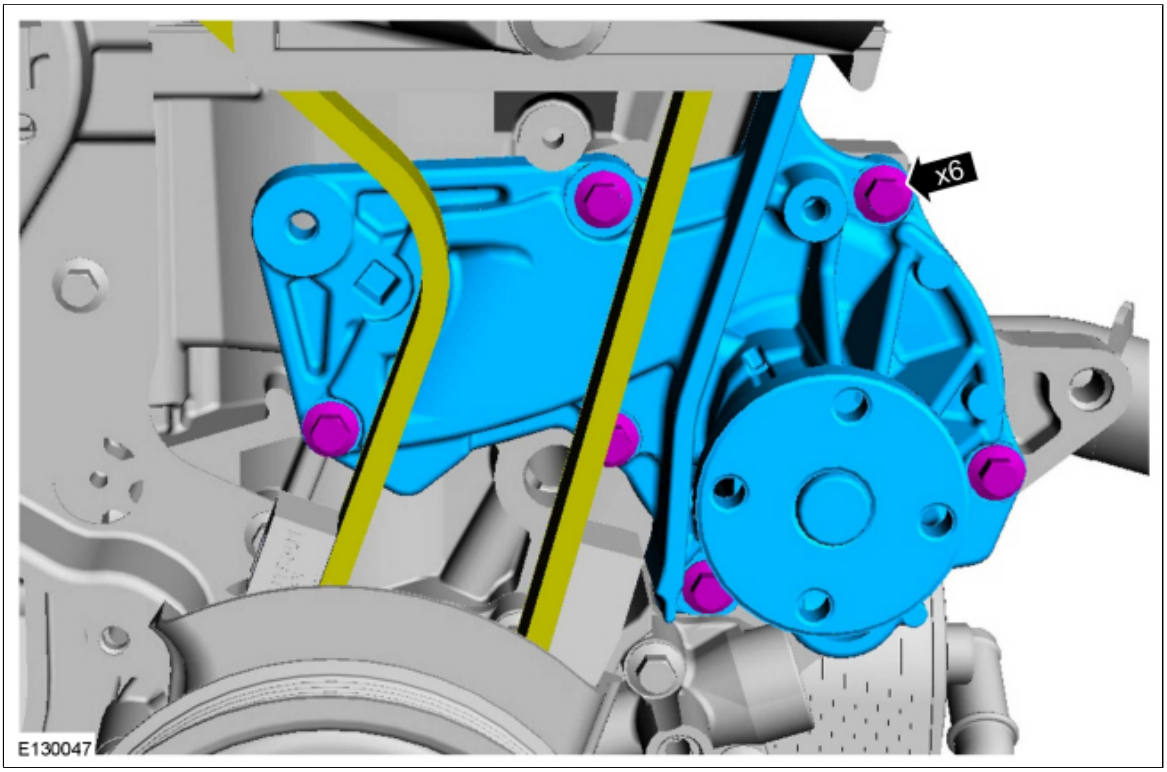
18. Release the timing belt tension.
    1. Rotate the timing belt tensioner clockwise.
    2. Align the 2 holes on the tensioner and install a small screwdriver or holding pin.



19. Remove the bolt and the timing belt tensioner.
    - Discard the bolt.



20. Remove the 6 bolts, the coolant pump and the gasket.
    - Discard the gasket.

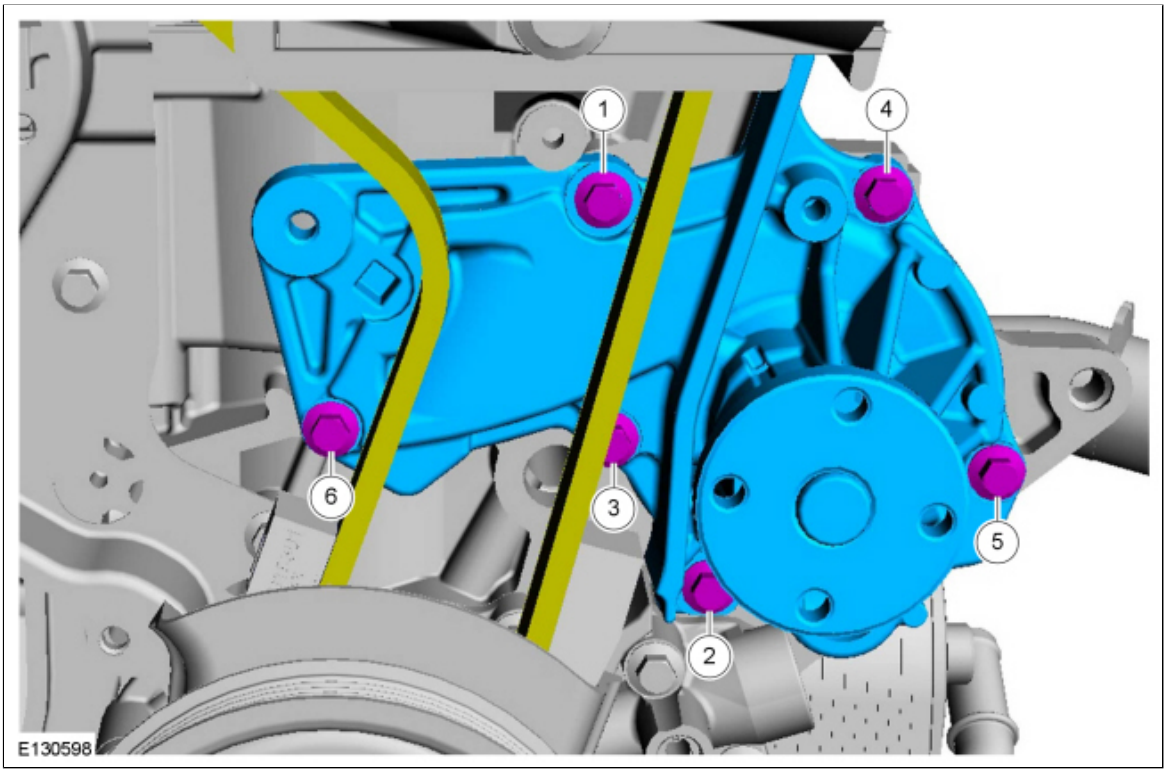


Installation

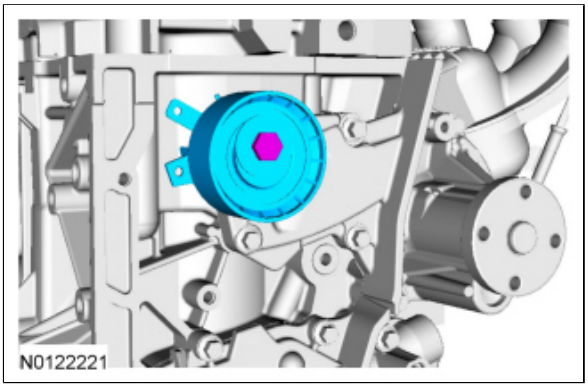
All vehicles

1. Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging.

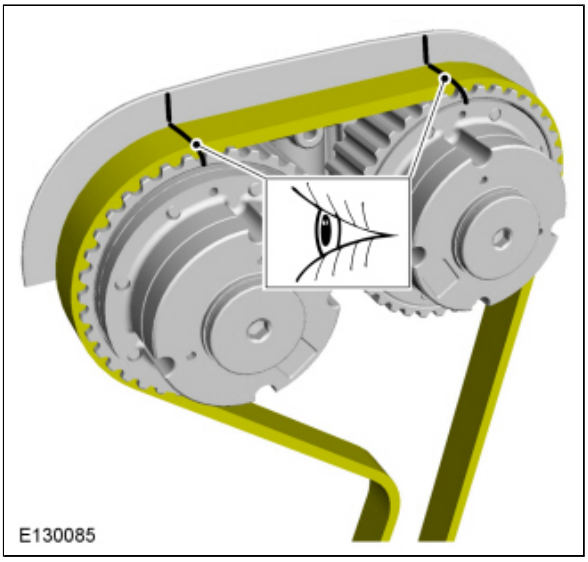
2. Install a new gasket, the coolant pump and the 6 bolts.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).



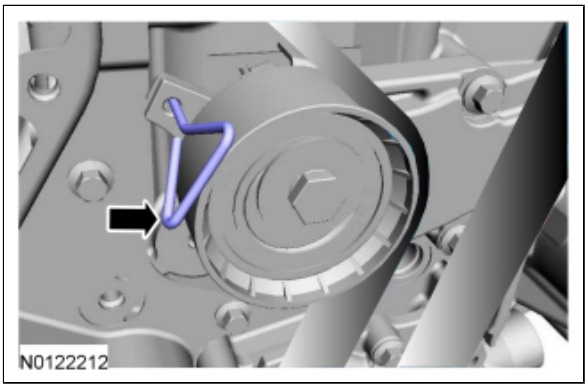
3. Position the timing belt tensioner and install a new bolt.
    - Tighten to 20 Nm (177 lb-in).



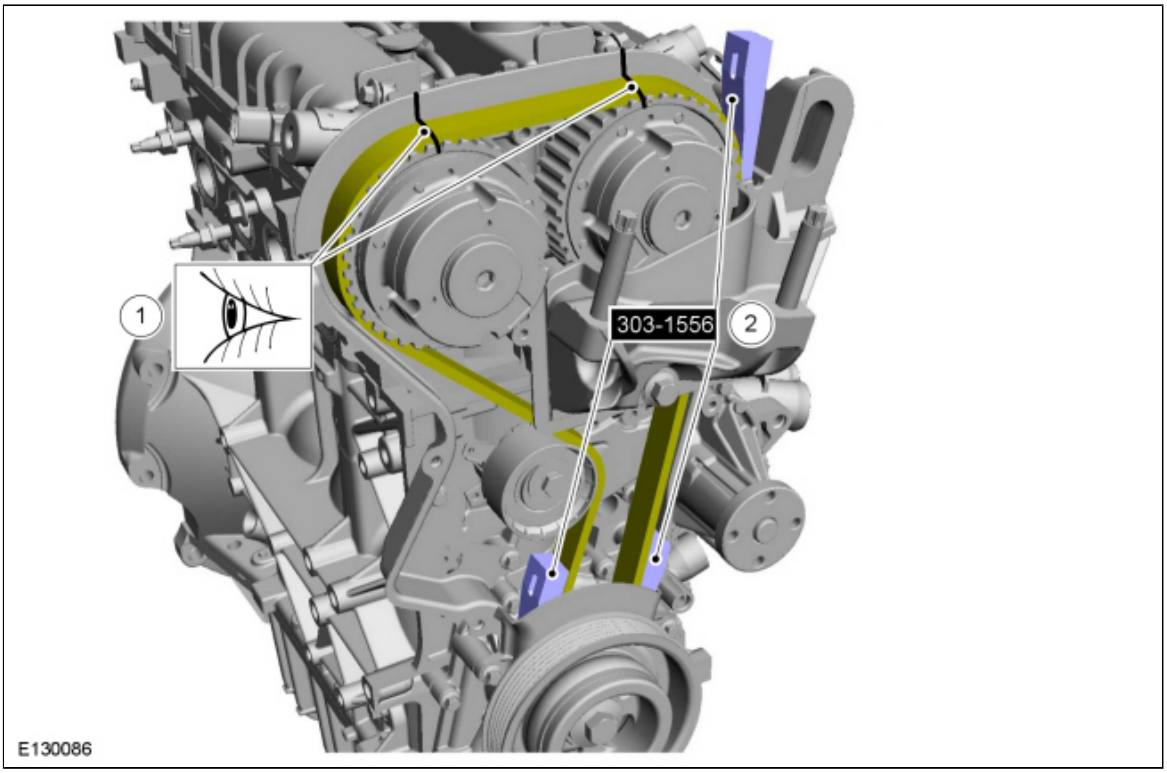
4. Make sure the timing belt is in the position noted during removal.



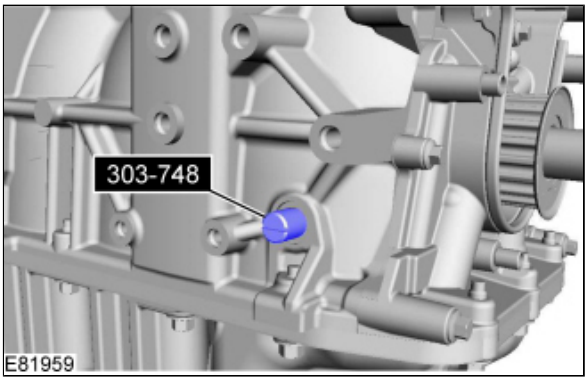
5. Remove the timing belt tensioner holding tool.



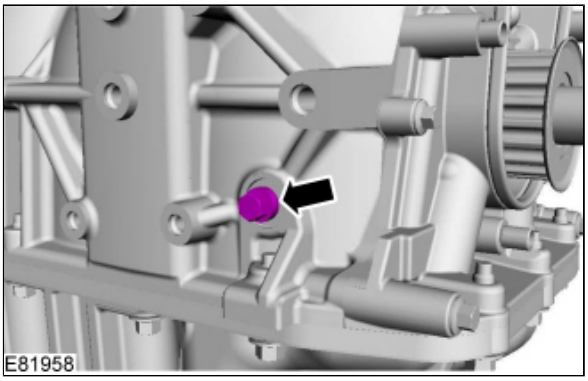
6. Remove the Timing Belt Holding Tools.
    1. Make sure the timing belt is in the position noted during removal.
    2. Remove the 3 Timing Belt Holding Tools.



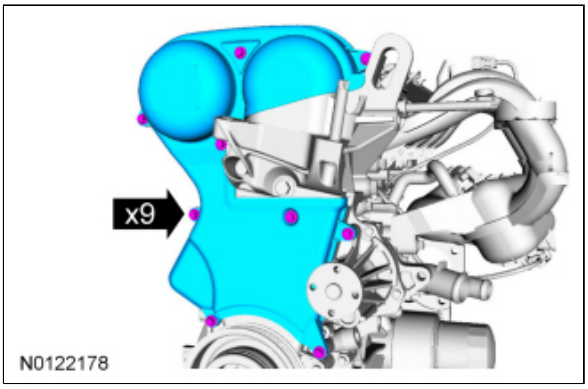
7. Remove the Crankshaft TDC Pin.



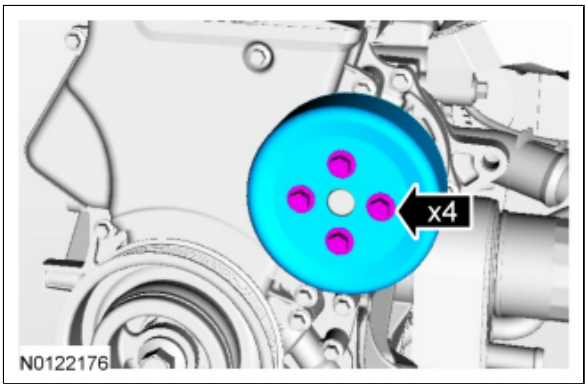
8. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).



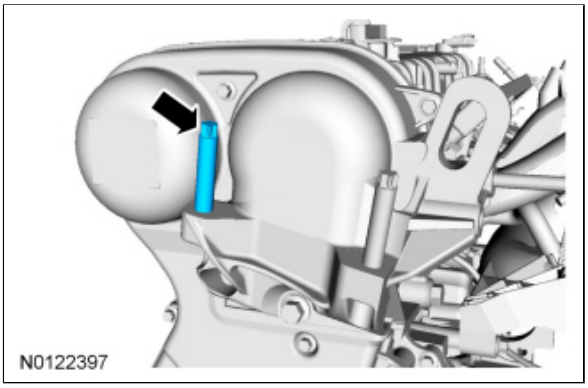
9. Position the timing belt cover and install the 9 bolts.
    - Tighten to 9 Nm (80 lb-in).



10. Position the coolant pump pulley and install the 4 bolts finger tight.

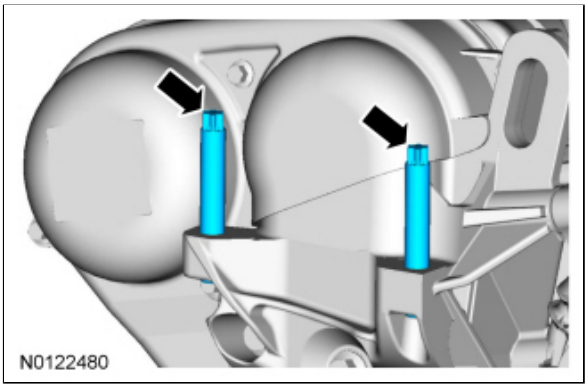


11. Install the 1 engine mount stud finger tight.



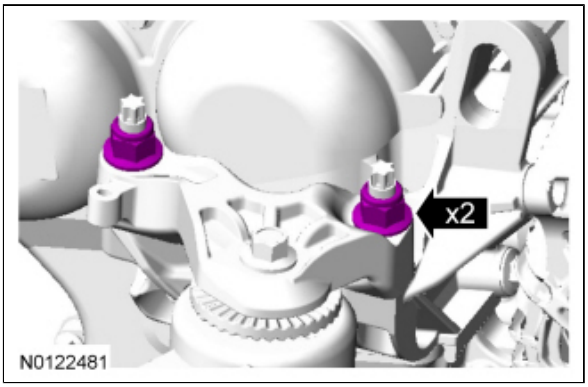
12. ***NOTICE:*** **The 2 engine mount studs must be tightened to specification or the powertrain may be damaged.**

    Tighten the 2 engine mount studs to specification before installing the engine mount nuts.
    - Tighten to 8 Nm (71 lb-in).

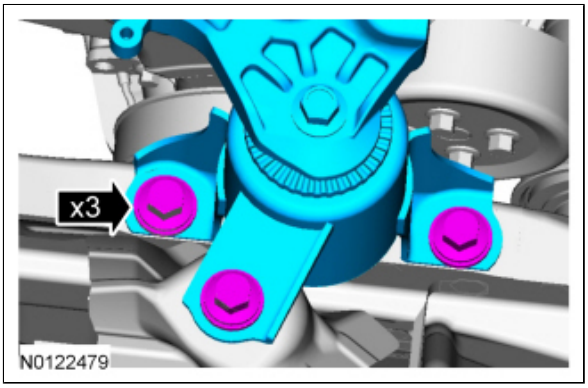


13. **NOTE:** Do not loosen the engine mount center bolt or the engine may become improperly positioned.

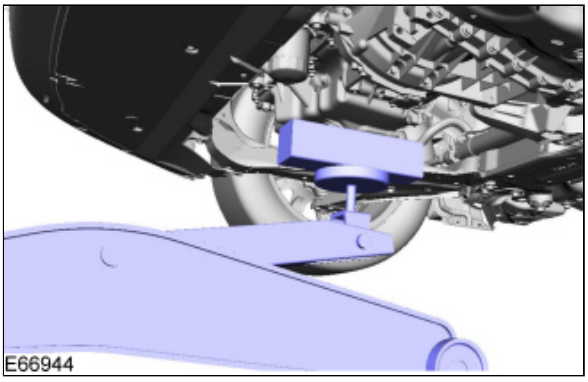
    Position the engine mount and install the 2 nuts.
    - Tighten to 80 Nm (59 lb-ft).



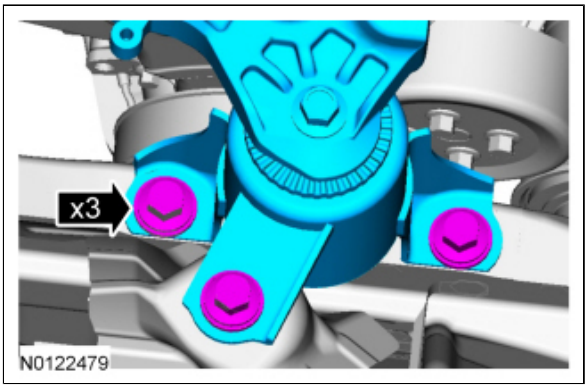
14. Install the 3 engine mount bolts finger tight.



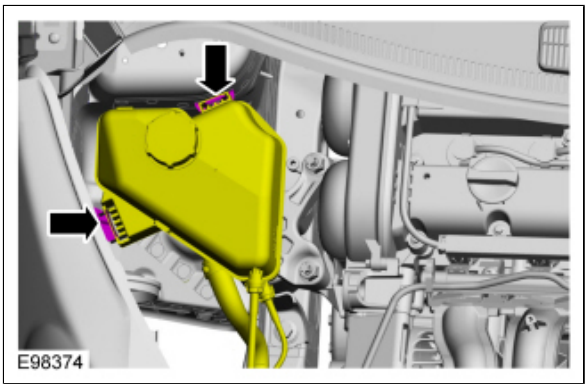
15. Remove the jack and the wood block.



16. Tighten the 3 engine mount bolts.
    - Tighten to 48 Nm (35 lb-ft).

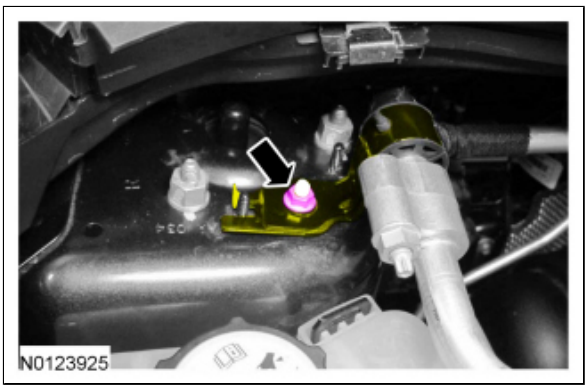


17. Install the degas bottle.

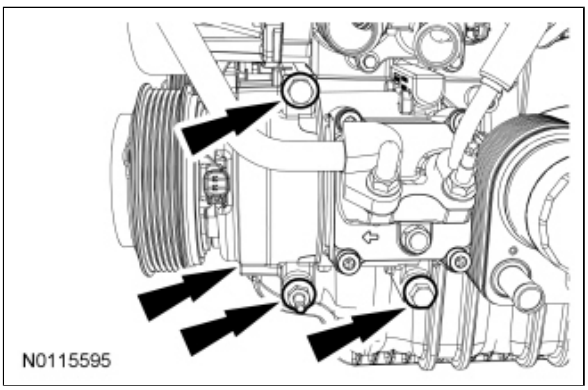


Vehicles with A/C

18. Position the A/C bracket and install the nut.
    - Tighten to 10 Nm (89 lb-in).

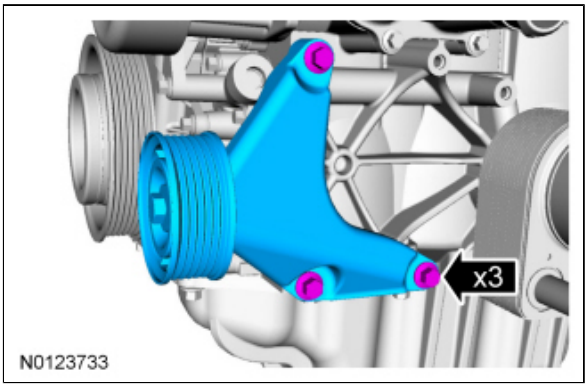


19. Position the A/C compressor and install the 2 bolts and the studbolt.
    - Tighten to 24 Nm (18 lb-ft).



Vehicles without A/C

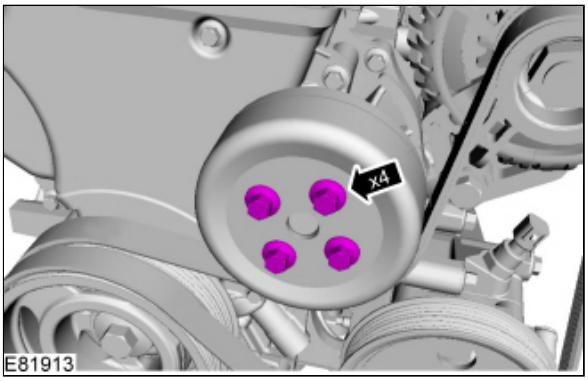
20. Position the accessory drive belt idler pulley bracket and install the 3 bolts.
    - Tighten to 24 Nm (18 lb-ft).



All vehicles

21. Install the accessory drive belt. For additional information, refer to Section 303-05 .

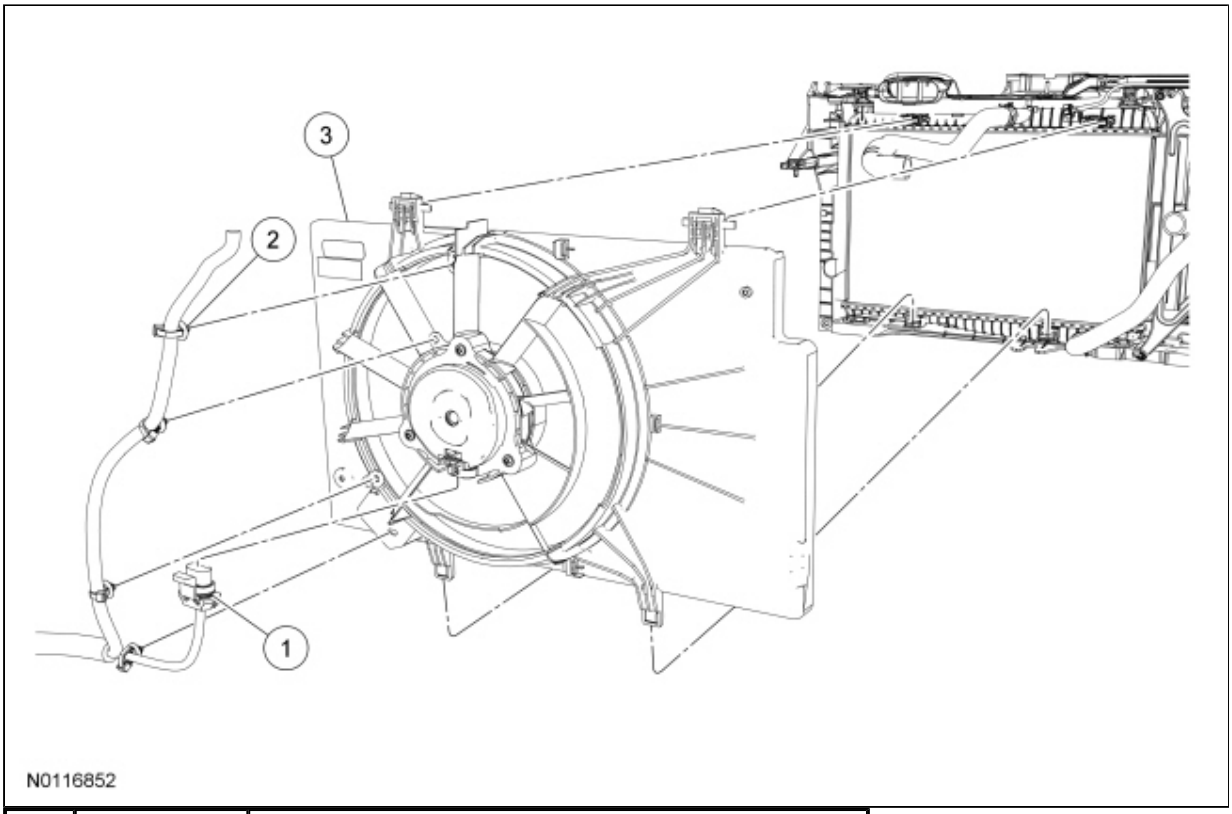
22. Tighten the 4 coolant pump pulley bolts.
    - Tighten to 20 Nm (177 lb-in).



23. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

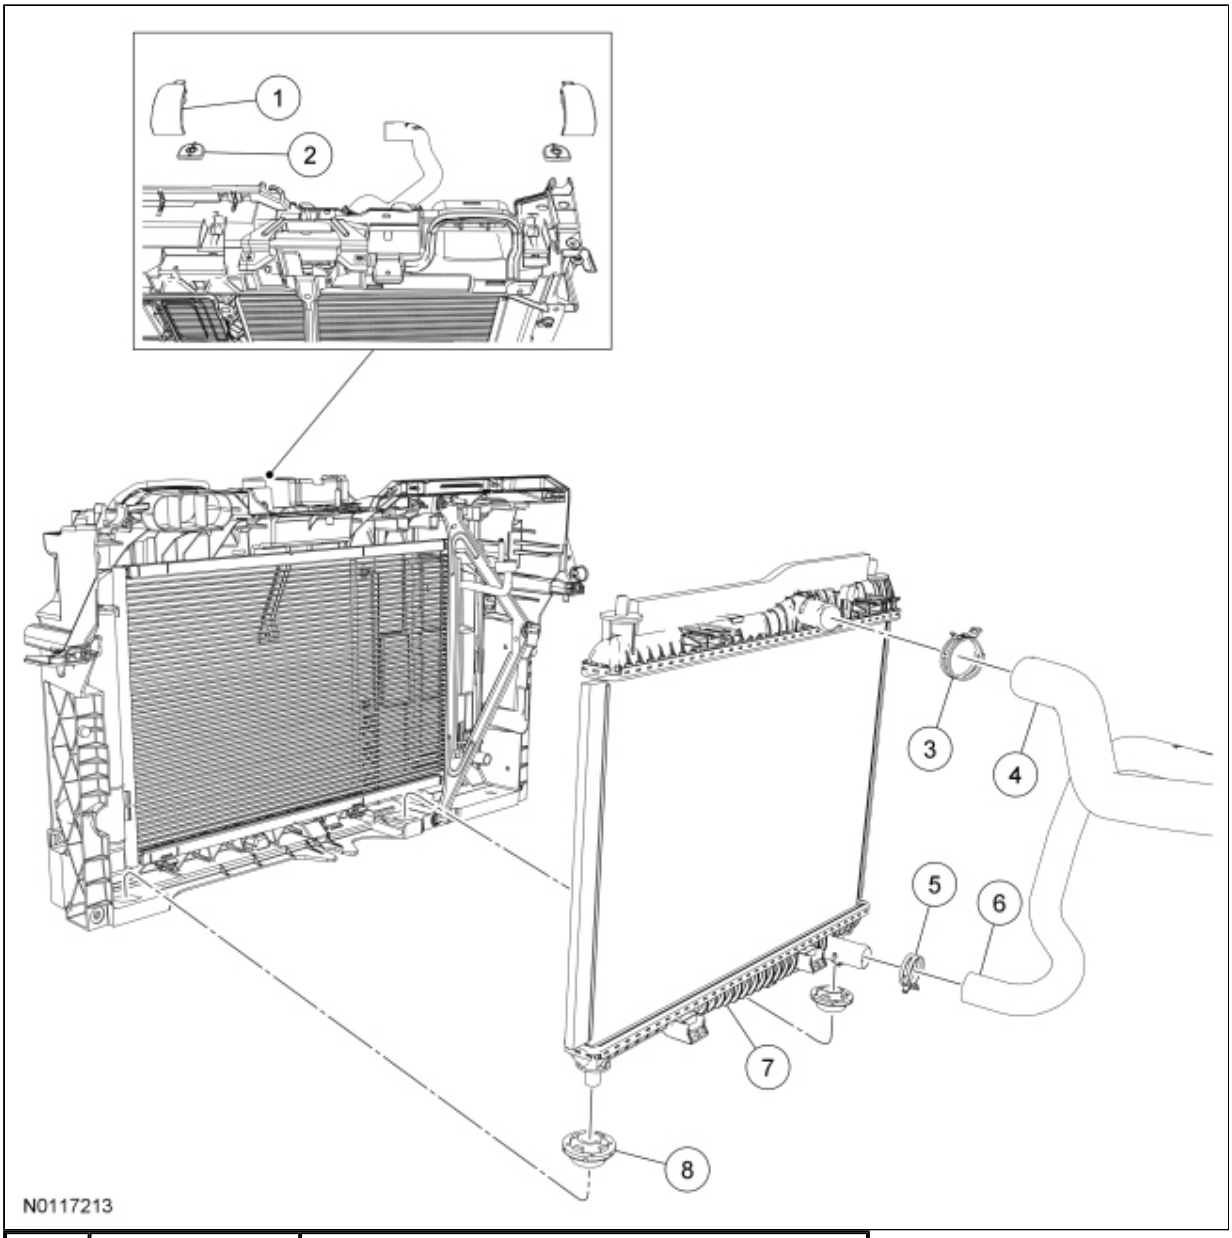
Radiator and Cooling Fan — Exploded View

Cooling Fan Motor and Shroud



Item	Part Number	Description
1	14A464	Cooling fan electrical connector (part of 14K021)
2	14A169	Cooling fan wiring harness retainer (part of 14K021)
3	8C607	Cooling fan motor and shroud

Radiator and Hoses



Item	Part Number	Description
1	8B069	Radiator mounting bracket (2 required)
2	8124A	Upper radiator insulator (2 required)
3	W527317	Upper radiator hose clamp
4	8B274	Upper radiator hose
5	W527317	Lower radiator hose clamp
6	8286	Lower radiator hose
7	8005	Radiator
8	8124B	Lower radiator insulator (2 required)

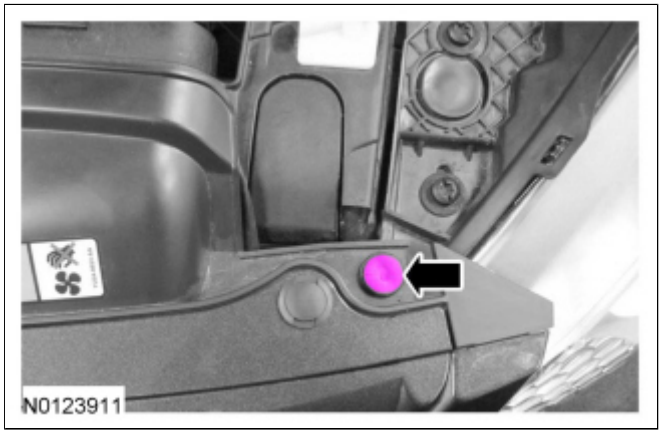
1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Radiator

Removal

All vehicles

1. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud in this section.
2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
3. Release the clamp and disconnect the upper radiator hose from the radiator.
4. Remove the trim pushpin on the LH side of the grille.



5. Remove the 2 radiator clips and the 2 rubber grommets.

Vehicles with A/C

6. Release the 2 A/C condenser condenser clips from the radiator and push the radiator up and the A/C condenser down to detach the condenser from the radiator.

All vehicles

7. Tilt the top of the radiator toward the engine, lift the radiator off the radiator supports and remove the radiator.

Installation

Vehicles with A/C

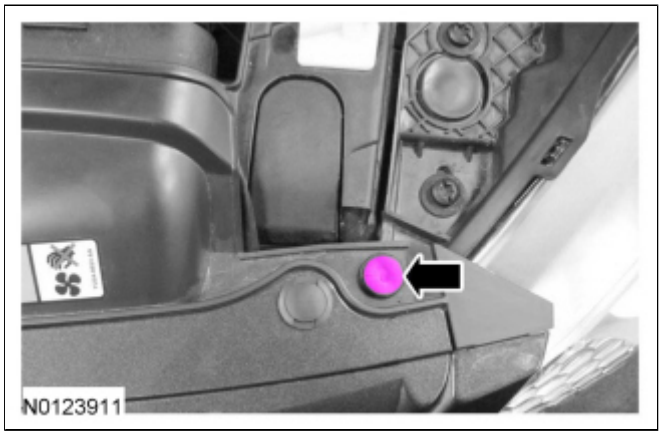
1. Position the radiator in the vehicle, slide the A/C condenser into the top slots on the radiator and clip the A/C condenser to the bottom of the radiator.
2. Position the radiator and A/C condenser assembly on the radiator supports.

Vehicles without A/C

3. Position the radiator on the radiator supports.

All vehicles

4. Install the 2 rubber grommets and the 2 radiator clips.
5. Install the trim pushpin on the LH side of the grille.

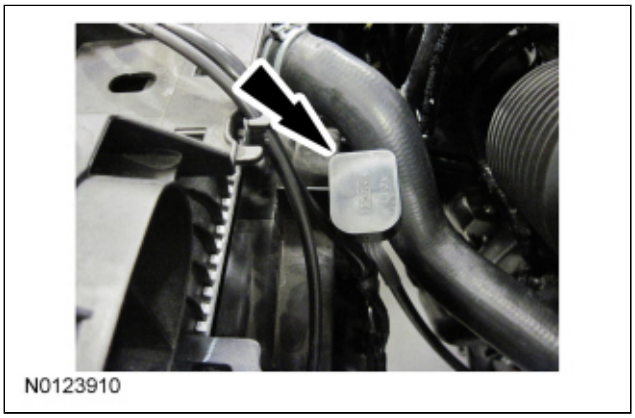


6. Connect the upper radiator hose and position the clamp.
7. Install the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud in this section.
8. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Cooling Fan Motor and Shroud

Removal and Installation

1. Remove the air cleaner. For additional information, refer to Section 303-12 .
2. Detach the transmission vent hose from the cooling fan and shroud.



N0123910

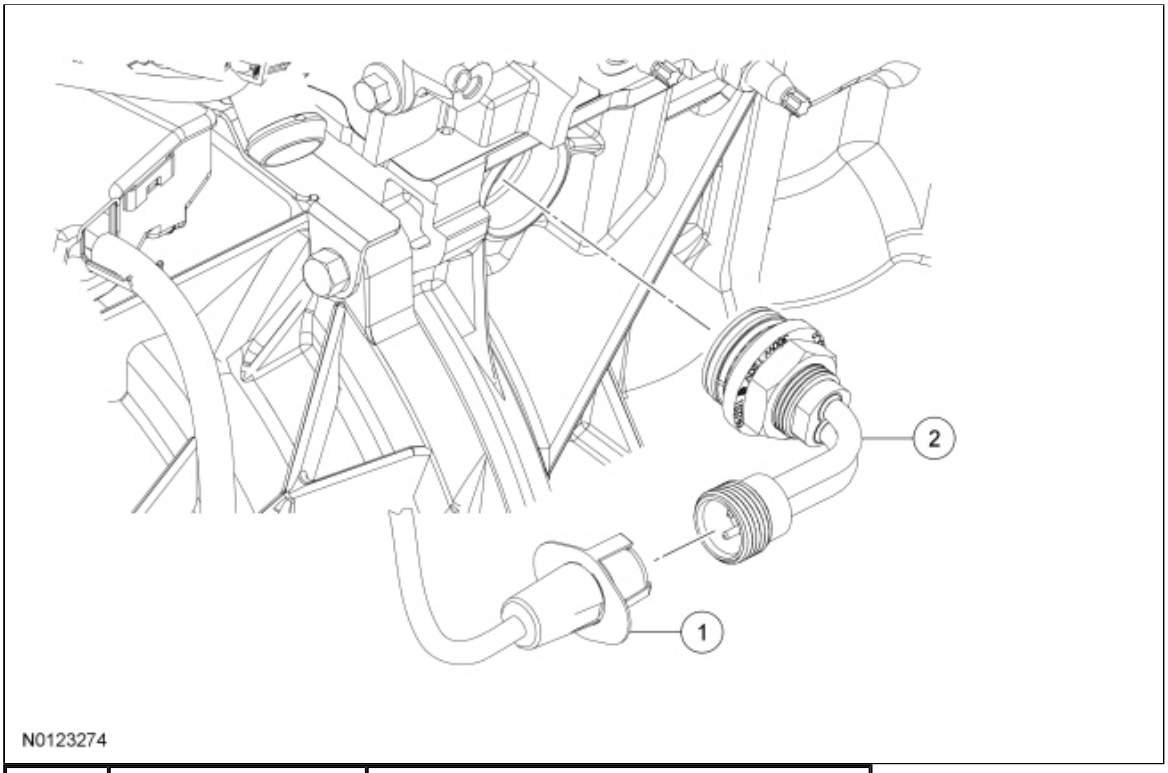
3. Detach the upper 2 wiring harness pushpins from the cooling fan shroud.
4. Release the 2 cooling fan shroud clips.
5. Detach the lower 2 wiring harness pushpins from the cooling fan shroud and disconnect the cooling fan electrical connector.
6. Remove the cooling fan and shroud.
7. To install, reverse the removal procedure.

Block Heater

Material

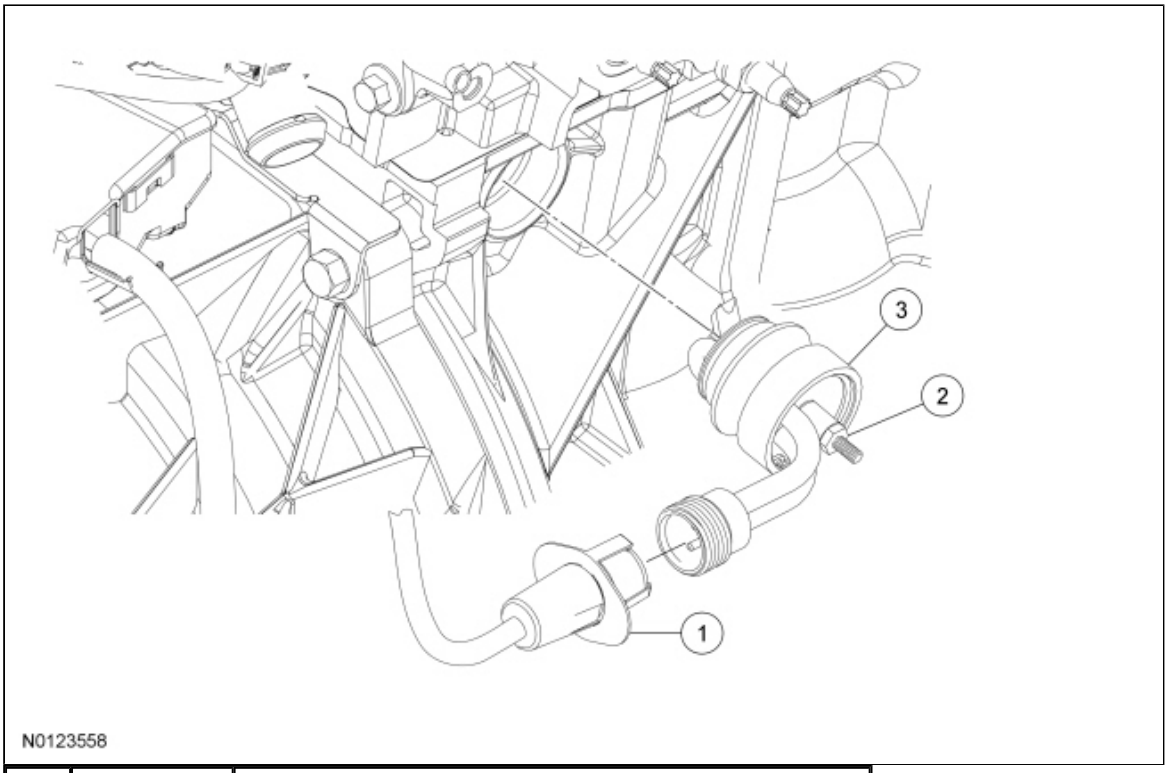
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Split Ring Design



Item	Part Number	Description
1	6B018	Block heater wiring harness
2	6A051	Block heater

V-Lock Design



Item	Part Number	Description
1	6B018	Block heater wiring harness
2	—	Block heater retaining nut (part of 6A051) 3 Nm (27 lb-in)
3	6A051	Block heater

Removal

All vehicles

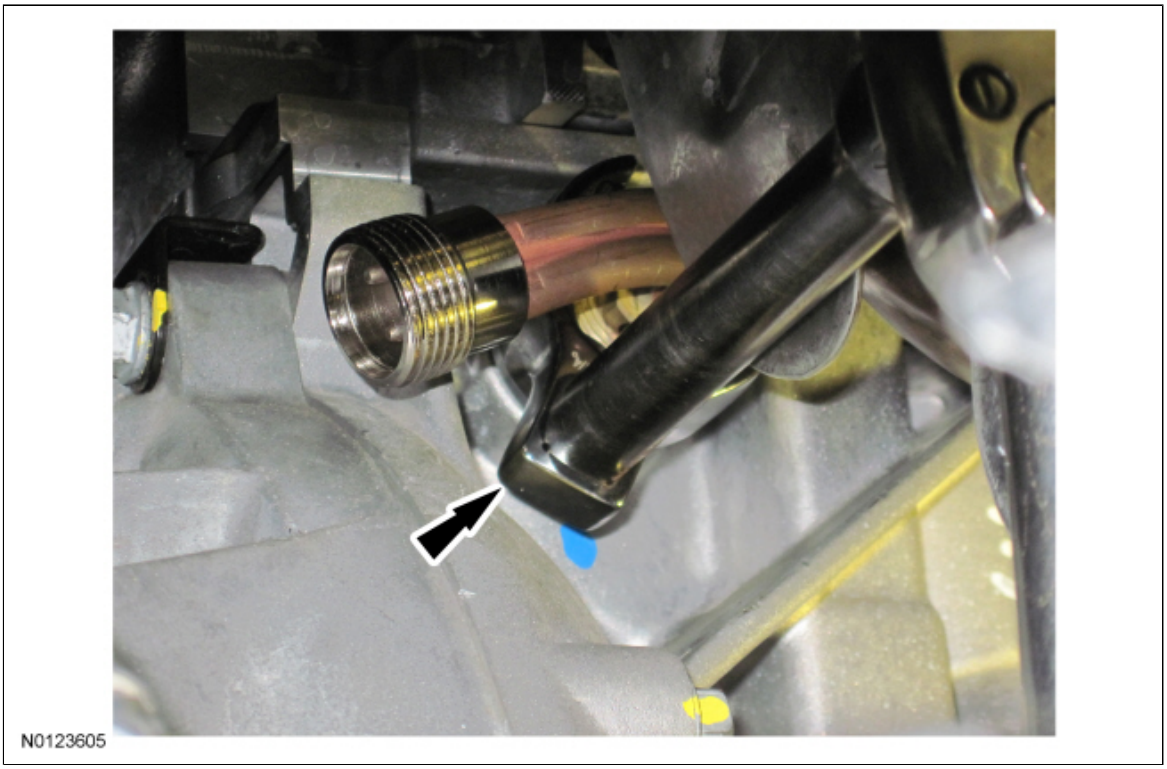
1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Disconnect the block heater electrical connector.

Vehicles equipped with a split ring design block heater

3. **NOTE:** Use a 1 1/4 in, 12-point flare nut crowfoot wrench (such as Snap-on® stock number AN850820B, or equivalent) to remove the block heater.

   Remove the block heater.



Vehicles equipped with a V-lock design block heater

4. Remove the block heater retaining nut and the block heater, then remove the V-lock and the threaded rod.

Installation

NOTE: Install only a V-lock design block heater.

1. Clean the engine block mating surface with Motorcraft® Metal Surface Prep. Follow the directions on the packaging.

2. Position the block heater and finger-tighten the nut, making sure the block heater electrical connector points to the 8 o'clock position.

3. Tighten the block heater nut.
   - Tighten to 3 Nm (27 lb-in).

4. ***NOTICE:*** **Route the block heater power cable away from hot or rotating components, or the cable can be damaged.**

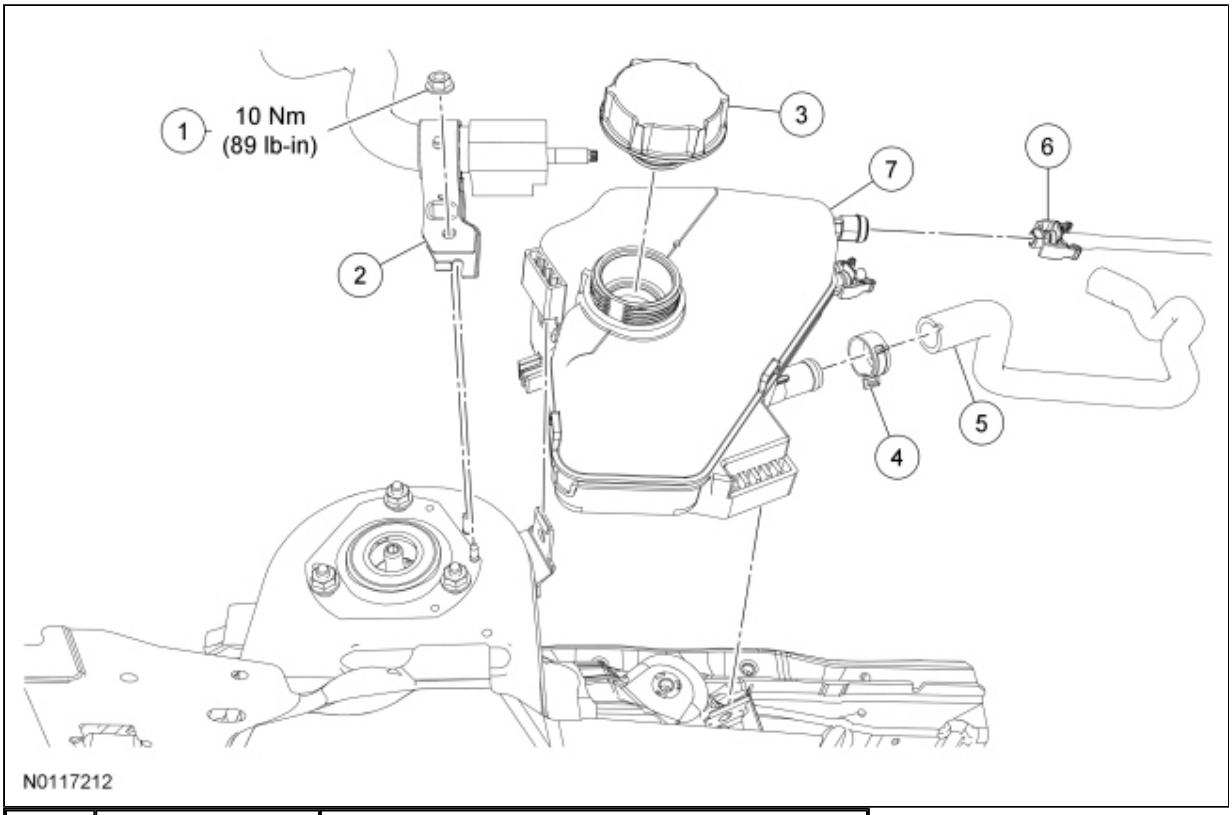
   Connect the electrical connector.

5. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Degas Bottle

Material

Item	Specification
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D



Item	Part Number	Description
1	W520412	A/C tube bracket nut
2	19D626	A/C tube bracket
3	8100	Pressure relief cap
4	W527311	Degas bottle-to-engine hose clamp
5	8K276	Degas bottle-to-engine hose
6	8B081	Engine-to-degas bottle hose
7	8A080	Degas bottle

Removal and Installation

1. Remove the A/C tube bracket nut and detach the bracket from the stud.
   - To install, tighten to 10 Nm (89 lb-in).

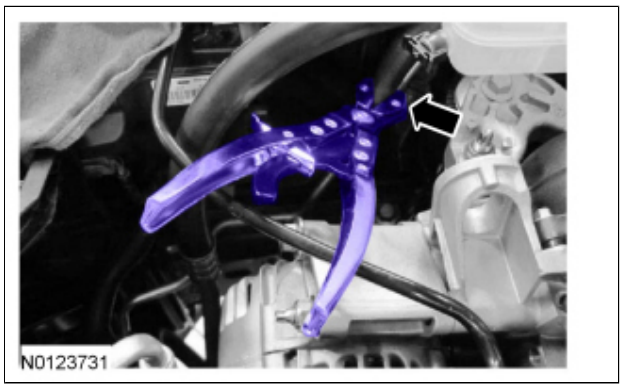
2. **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when**

the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: During normal vehicle operation, Motorcraft Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure has been released, remove the pressure relief cap.

3. Using hose pinch pliers, clamp the degas bottle-to-engine hose.



4. Using a suitable suction device, siphon the coolant from the degas bottle.
5. Squeeze the tabs and disconnect the engine-to-degas bottle hose.
6. Release the 2 clips and lift the degas bottle hose to access the degas bottle-to-engine hose.
7. Release the clamp, disconnect the degas bottle-to-engine hose and remove the degas bottle.
8. To install, reverse the removal procedure.
9. Fill the degas bottle with a 50/50 mixture of Motorcraft® Specialty Orange Engine Coolant and distilled water.

Fuel Pump (FP) control module nuts	5	44
Fuel rail bolts	11	97
Throttle Body (TB) bolts	8	71

Fuel Charging and Controls

Sequential Multi-Port Fuel Injection (SFI)

System Overview

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI) system.
- Pulse Width Modulated (PWM).
- Mass Air Flow (MAF) sensor controlled.

Component List

The fuel charging and controls system consists of the:

- Throttle Body (TB)
- fuel injectors
- fuel rail
- Fuel Pump (FP) control module

System Components

Throttle Body (TB)

The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.
- cannot be cleaned.

Fuel Injectors

The fuel injectors:

NOTICE: **Handle the fuel injectors and fuel rail with extreme care to prevent damage to sealing areas and sensitive fuel-metering orifices.**

- are electronically operated by the PCM.

- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, injecting fuel into the intake port in the cylinder head.
- are deposit resistant.

Fuel Rail

The fuel rail receives fuel from the fuel supply tube and delivers fuel to the fuel injectors

NOTICE: **Handle the fuel injectors and fuel rail with extreme care to prevent damage to sealing areas and sensitive fuel-metering orifices.**

Fuel Pump (FP) Control Module

The FP control module is electronically operated by the PCM and controls voltage to the FP depending on engine load.

System Operation

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order, in accordance with engine demand on a tuned intake manifold.

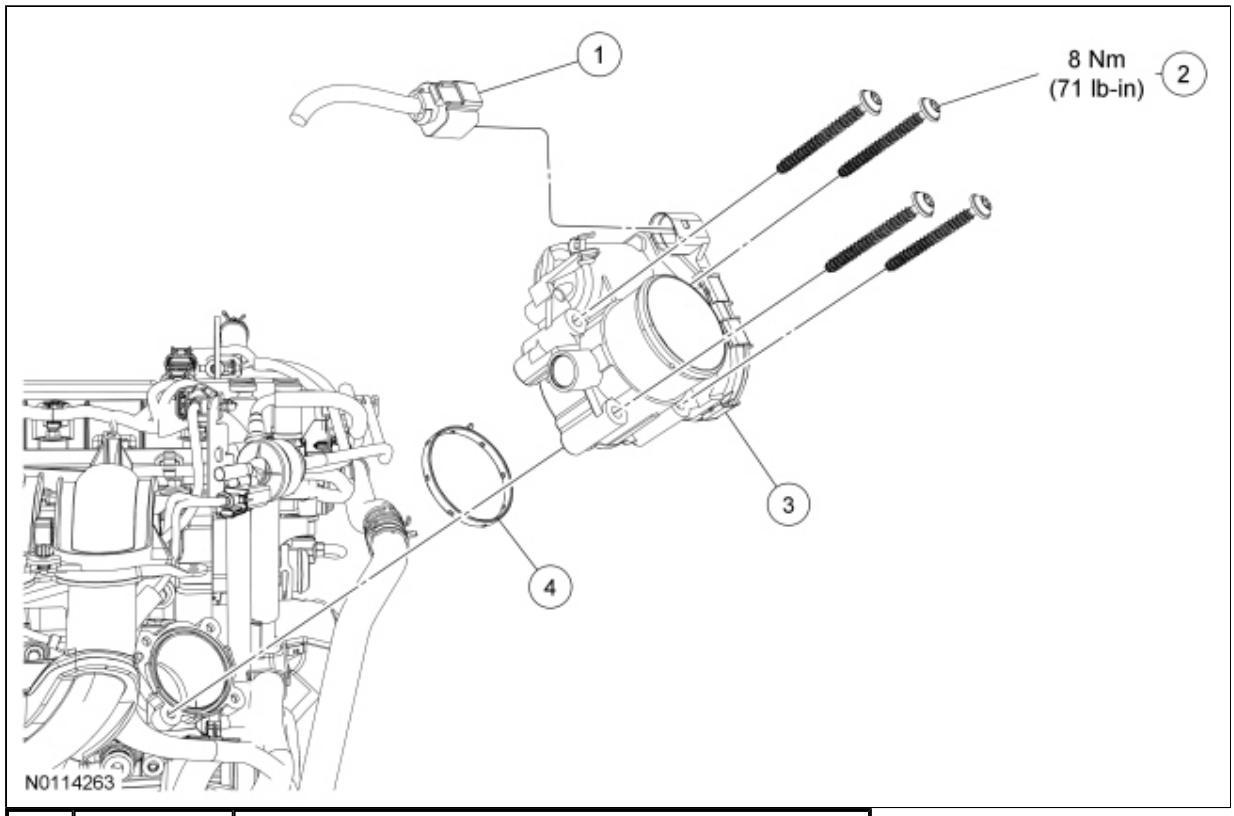
The basic fuel requirement of the engine is determined from the data supplied to the PCM by the MAF sensor. The MAF sensor measures the amount of air being drawn into the engine.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Fuel Charging and Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

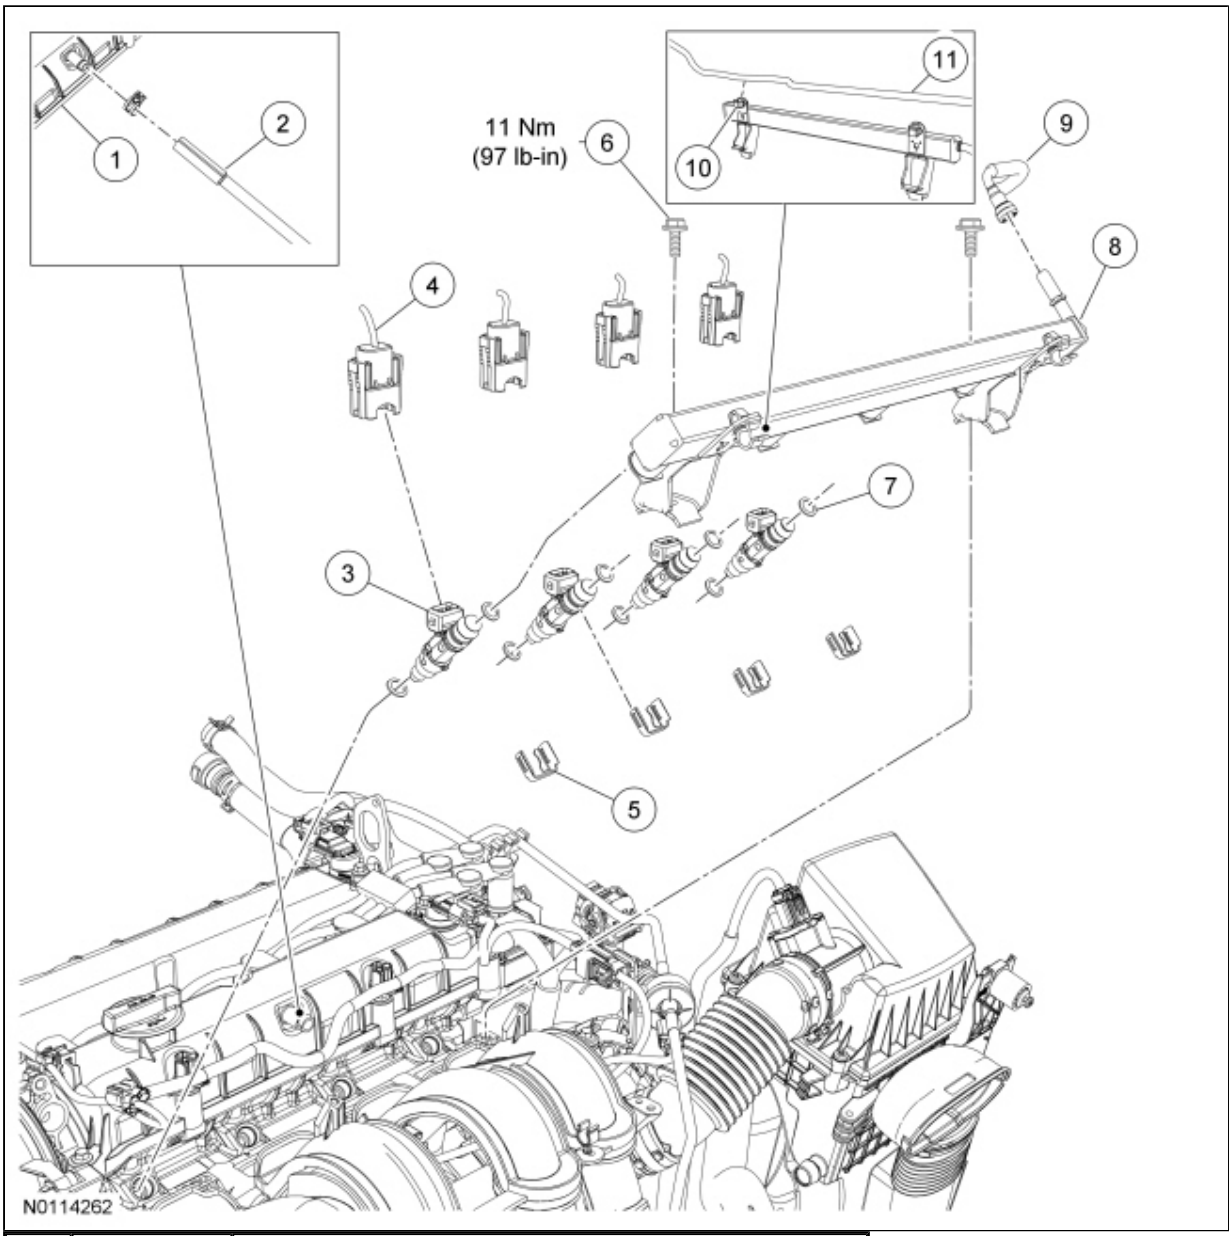


Item	Part Number	Description
1	—	Electronic throttle control electrical connector (part of 12A581)
2	W708972	Throttle Body (TB) bolt (4 required)
3	9E926	TB
4	9E936	TB gasket

Removal and Installation

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the electronic throttle control electrical connector.
3. Remove the 4 bolts and the Throttle Body (TB).
   - Remove and discard the TB gasket.
   - To install, tighten to 8 Nm (71 lb-in).
4. To install, reverse the removal procedure.
   - Install a new TB gasket.
5. If the TB was replaced, turn the key ON without cranking the engine for 1 minute to allow the PCM to learn the adaptive table values for the new TB .

Fuel Rail and Fuel Injector — Exploded View



Item	Part Number	Description

11	8B081	Degas bottle vent hose

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Fuel Rail

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the valve cover vent hose from the valve cover and position the hose out of the way.
4. Disconnect the degas bottle vent hose from the two clips on the fuel rail.

5. Disconnect the fuel tube-to-fuel rail spring lock coupling. For additional information, refer to Section 310-00 .

6. Disconnect the 4 fuel injector electrical connectors.

7. Remove the 2 bolts, the fuel rail and the 4 injectors.
   - To install, tighten to 11 Nm (97 lb-in).

8. ***NOTICE:*** **Use O-ring seals that are made of special fuel resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

   Remove the fuel injector retaining clips and the fuel injectors.
   - Remove and discard the O-ring seals.

9. **NOTE:** Install new O-ring seals and lubricate them with clean engine oil.

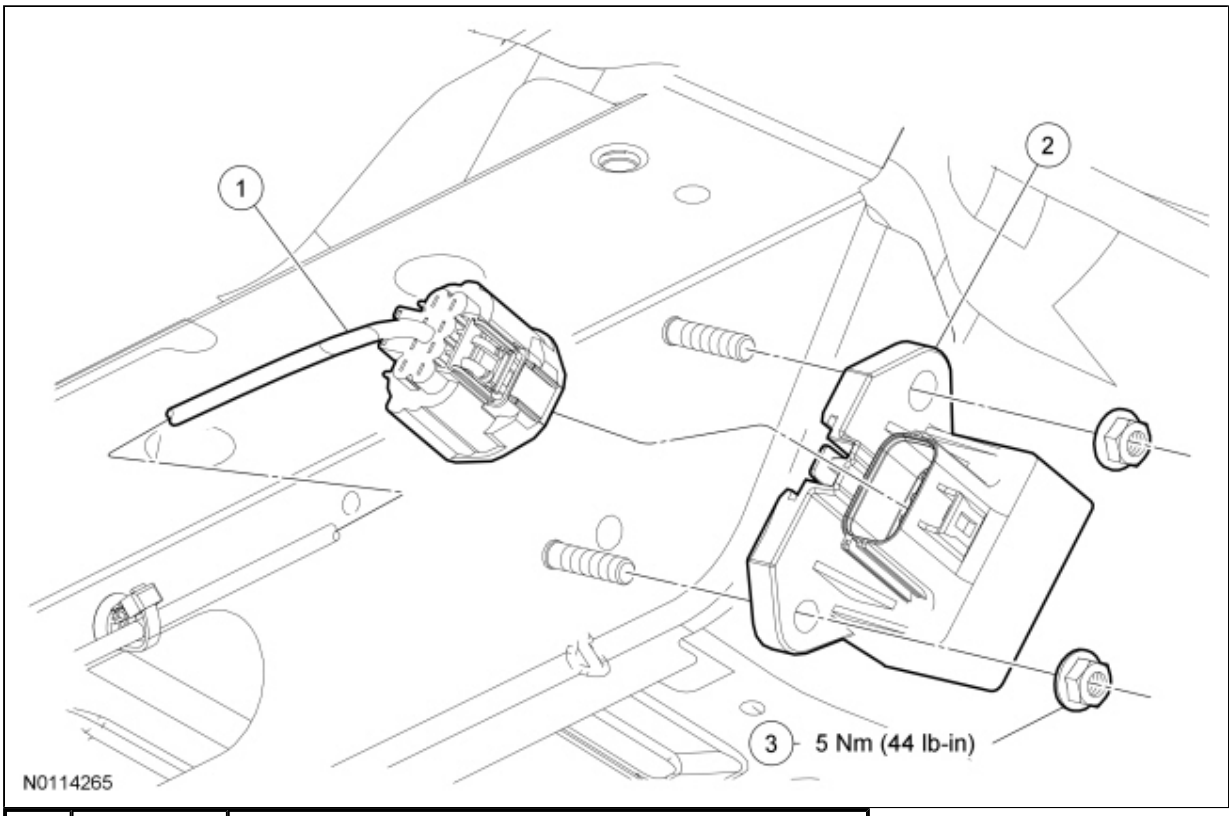
   To install, reverse the removal procedure.

Fuel Injectors

Removal and Installation

1. The fuel injectors are serviced with the fuel rail. For additional information, refer to Fuel Rail and Fuel Injector — Exploded View and Fuel Rail in this section.

Fuel Pump Control Module



Item	Part Number	Description
1	—	Fuel Pump (FP) control module electrical connector (part of 14A005)
2	9D370	FP control module
3	W711330	FP control module nut (2 required)

Removal and Installation

1. Remove the LH front seat. For additional information, refer to Section 501-10 .
2. Remove the scuff plate trim panel and the cowl side trim panel. For additional information, refer to Section 501-05 .
3. **NOTE:** The Fuel Pump (FP) control module is located on the rear surface of the LH front seat mount.

   Disconnect the FP control module electrical connector.
4. ***NOTICE:*** **Do not overtighten the fasteners or damage to the module may occur.**

   Remove the 2 FP control module nuts.
   - To install, tighten to 5 Nm (44 lb-in).
5. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Accessory drive belt idler pulley bolt (without A/C only)	24	18	—
Accessory drive belt idler pulley bracket bolt (without A/C only)	24	18	—
Accessory drive belt splash shield bolts	9	—	80

Accessory Drive

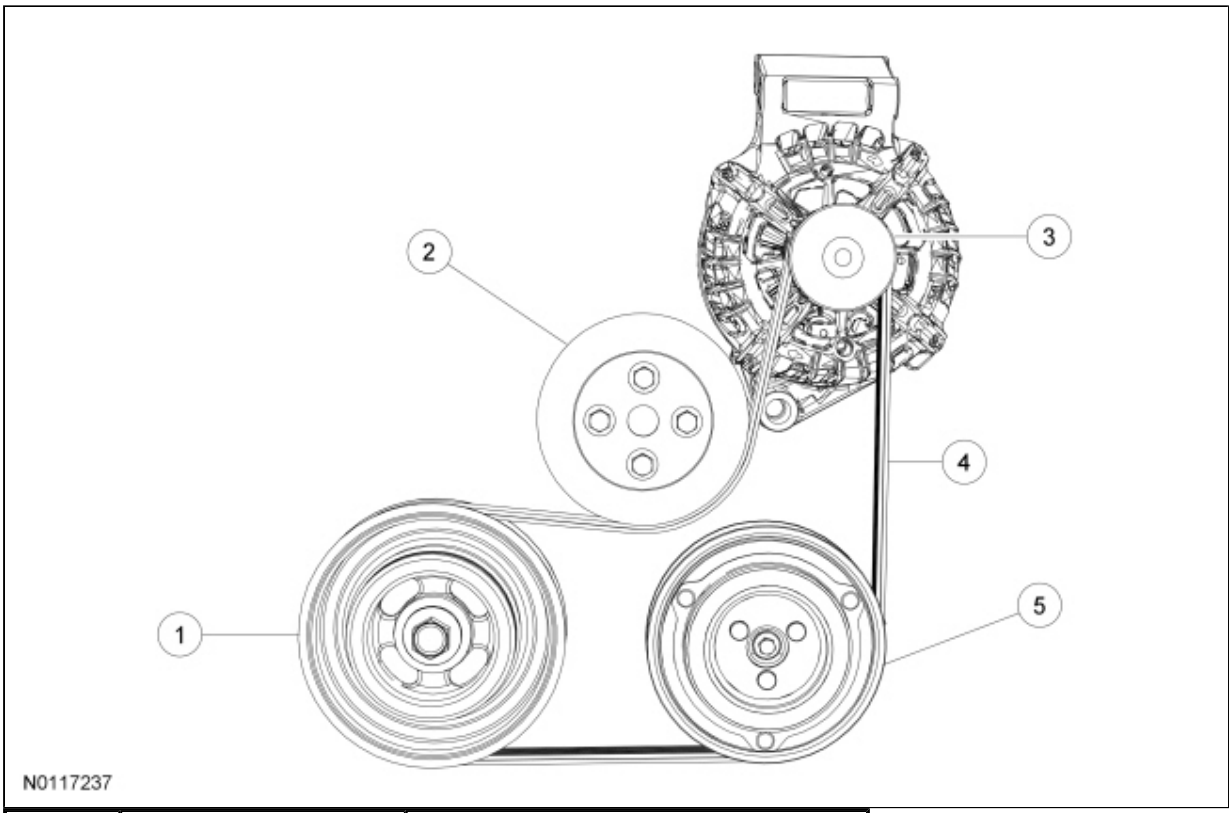
The accessory drive:

- has a single serpentine drive belt with 6 ribs.
- is not adjustable.

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.

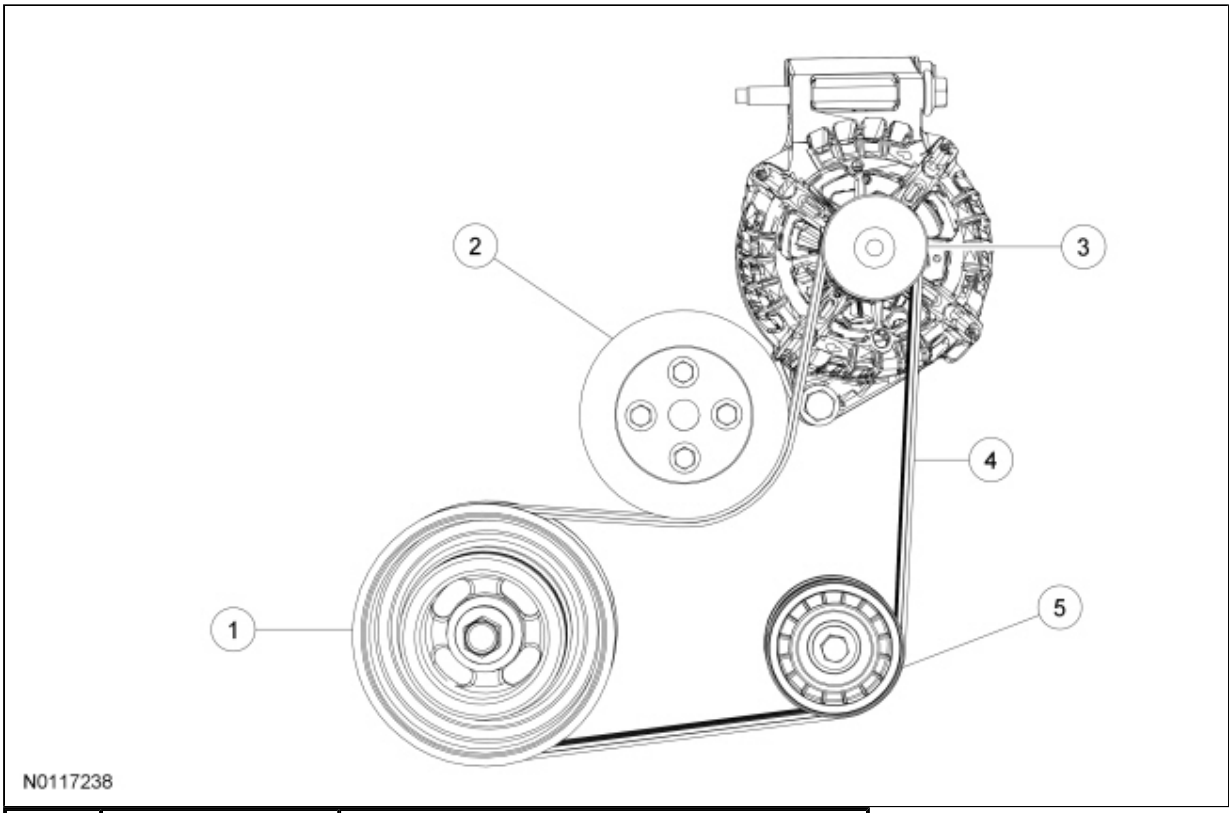
Accessory Drive Belt Routing

With A/C



Item	Part Number	Description
1	6316	Crankshaft pulley
2	8509	Coolant pump pulley
3	10344	Generator pulley
4	6C301	Accessory drive belt
5	19D784	A/C compressor pulley

Without A/C



Item	Part Number	Description
1	6316	Crankshaft pulley
2	8509	Coolant pump pulley
3	10344	Generator pulley
4	6C301	Accessory drive belt
5	6C344	Accessory drive belt Idler pulley

Accessory Drive

Inspection and Verification

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical damage.

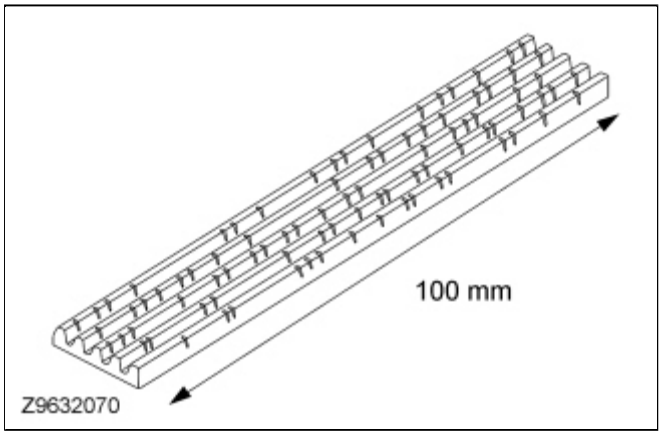
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Loose accessory drive belt • Damaged pulleys

3. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.

4. If a concern is found, correct the condition before proceeding to the next step.

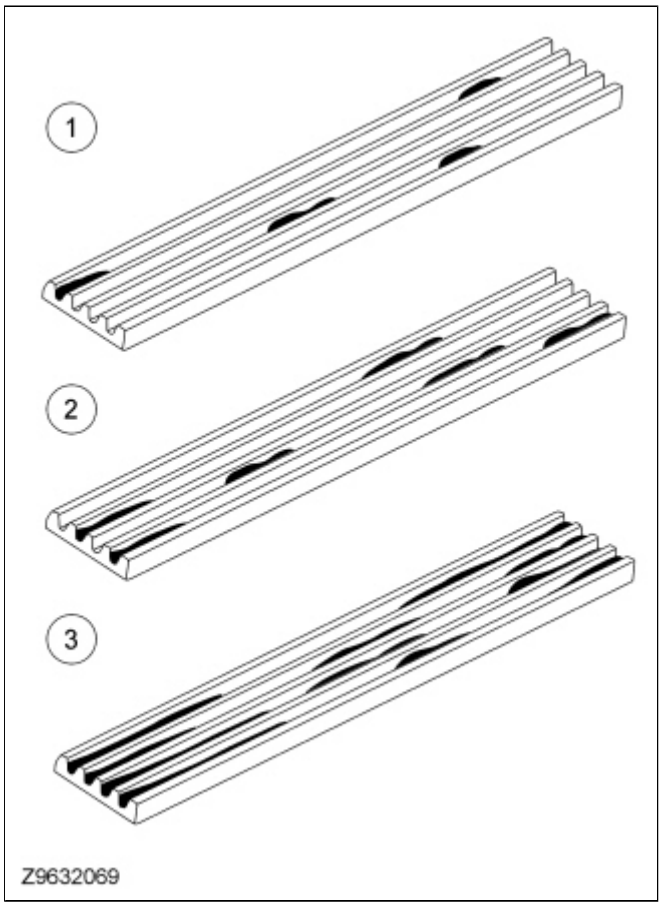
V-Ribbed Serpentine Drive Belt With Cracks Across Ribs



5. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.

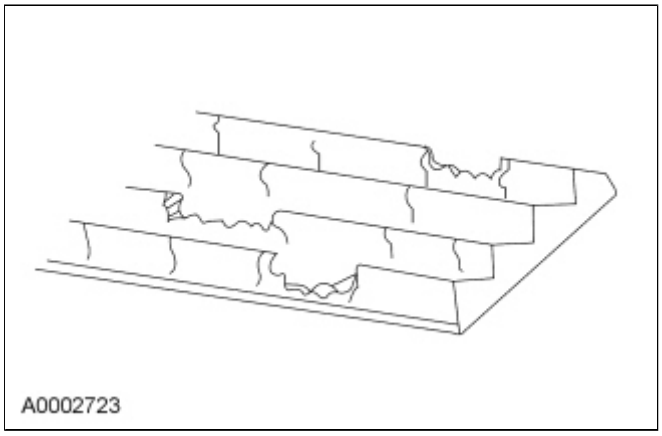
V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.



6. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing



7. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

8. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Accessory drive belt cracking (over 15 cracks in a rib over a distance of 100 mm [4.0 in])	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification in this section. INSTALL a new accessory drive belt as necessary.
• Accessory drive belt chunking	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification in this section. INSTALL a new accessory drive belt as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
• Accessory drive belt noise, squeal, chirping or flutter	• Defective/worn or incorrect accessory drive belt • Misaligned pulley (s) • Pulley runout • Damaged or worn accessory drive component or idler • Fluid contamination of accessory drive belt or pulleys	• REFER to Component Tests, Drive Belt — Noise/Flutter in this section. REPAIR or INSTALL new parts as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
	• Accessory drive component failure	• CHECK the accessory drive components. INSTALL new components as necessary.
	• Accessory drive belt idler pulley bearing failure	• INSPECT the accessory drive belt idler pulley for freedom of rotation and damage. INSTALL a new accessory drive belt idler pulley as necessary.
• Premature accessory drive belt wear	• Defective or incorrect accessory drive belt • Misaligned pulley (s) • Pulley runout	• REFER to Component Tests, Drive Belt — Noise/Flutter and Drive Belt — Incorrect Installation in this section. REPAIR or INSTALL new parts as necessary.

	• Damaged accessories • Incorrectly installed drive belt • Fluid contamination	
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.

Component Tests

Drive Belt — Noise/Flutter

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - the A/C system is overcharged.
  - the A/C condenser core airflow is blocked.
  - the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine),

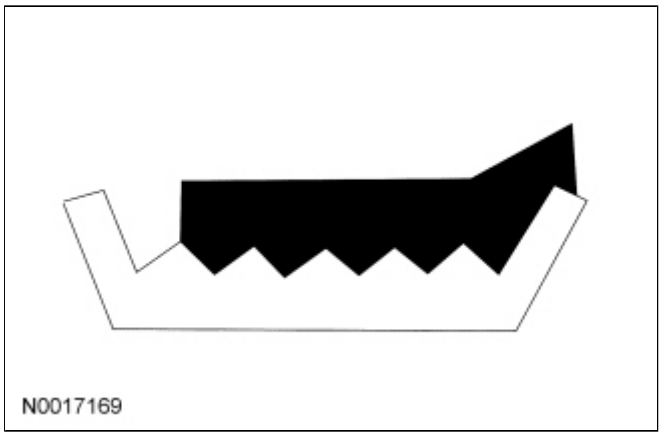
and rinsed with clean water.
- Install a new accessory drive belt if the drive belt is worn or damaged.

Drive Belt — Incorrect Installation

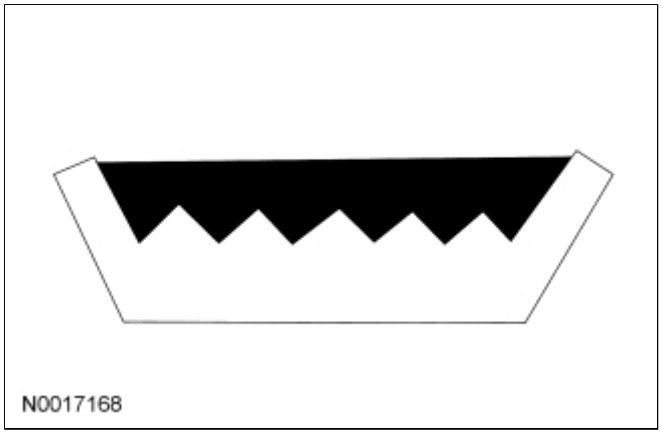
NOTICE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation



Correct Installation



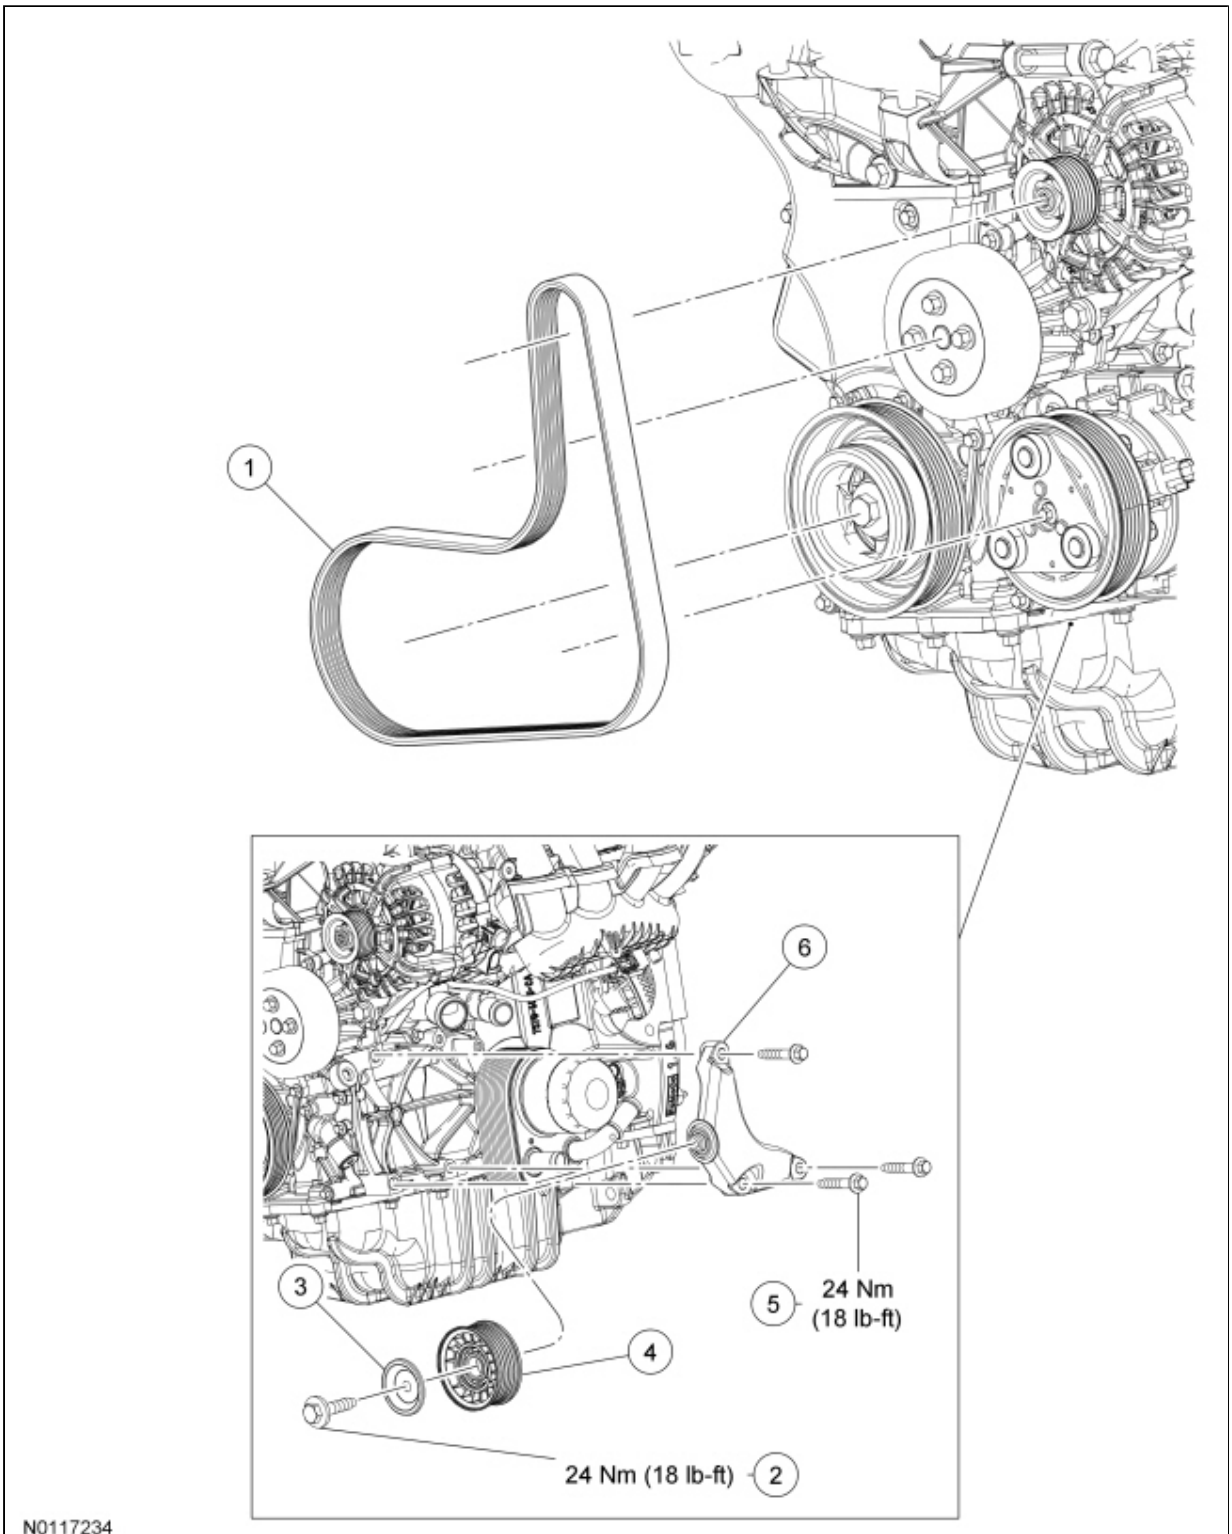
With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference

condition and recheck the accessory drive belt tracking.

- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Front End Accessory Drive (FEAD) — Exploded View



Item	Part Number	Description
1	6C301	Accessory drive belt
2	W709601	Accessory drive belt idler pulley (without A/C only)

3	8687	Accessory drive belt idler pulley washer (without A/C only)
4	6C344	Accessory drive belt idler pulley (without A/C only)
5	W500311	Accessory drive belt idler pulley bracket bolt (without A/C only) (3 required)
6	8680	Accessory drive belt idler pulley bracket (without A/C only)

1. For additional information, refer to the procedures in this section.

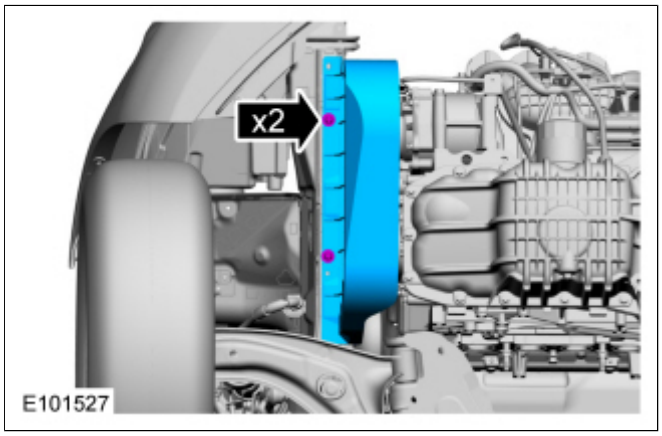
Accessory Drive Belt

Removal

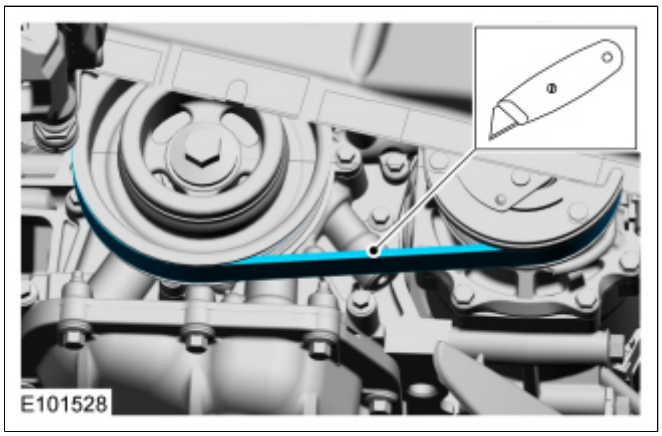
NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 2 bolts and the accessory drive belt splash shield.



3. Cut and discard accessory drive belt.

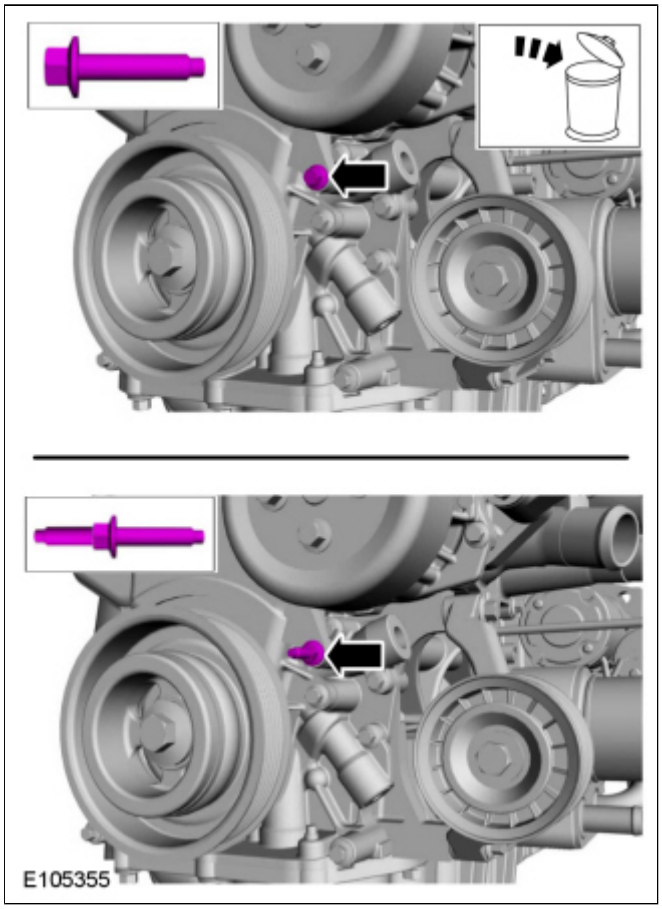


Installation

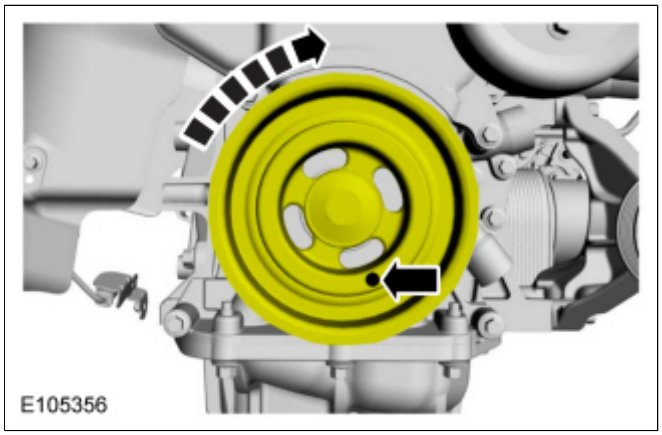
NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.**

NOTICE: **Only rotate the crankshaft clockwise or damage to the engine can occur.**

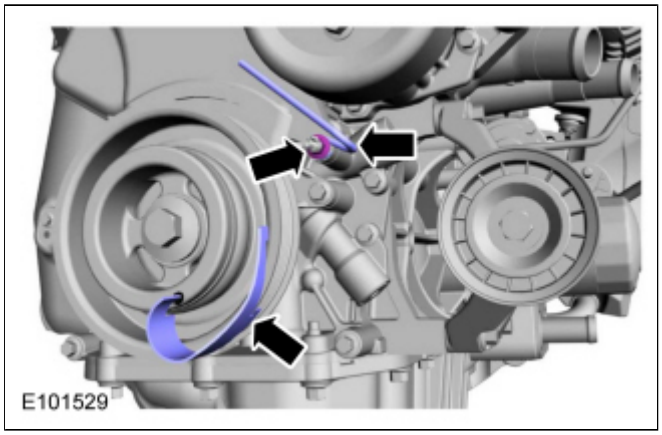
1. Remove and discard the bolt. Install the stud bolt supplied with the new accessory drive belt.
   - Tighten the stud bolt to 9 Nm (80 lb-in).



2. Rotate the crankshaft clockwise until the designated hole is at the 5 o'clock position.

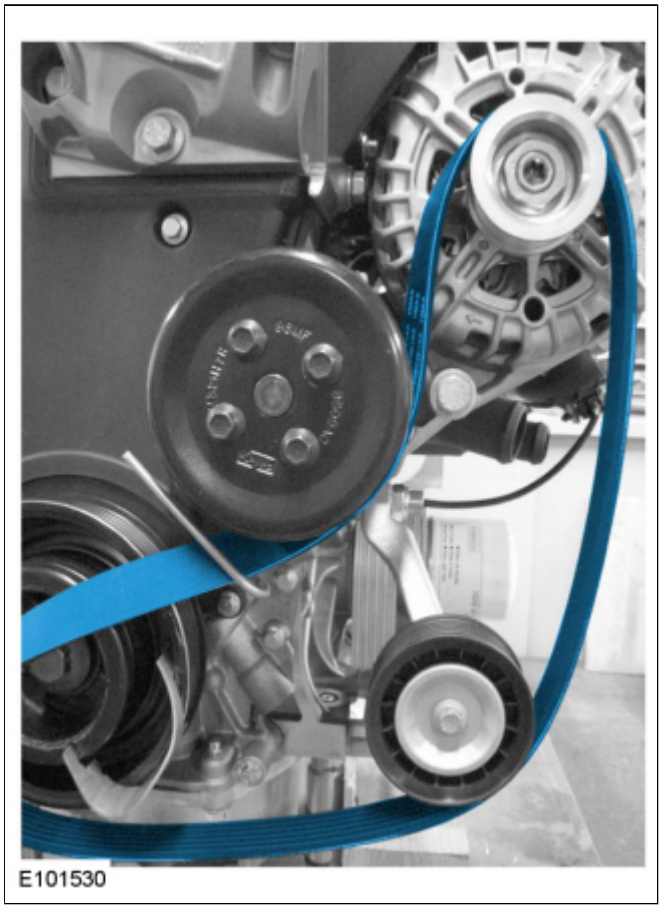


3. Install the tools supplied with the new accessory drive belt as shown.
    - Install the supplied nut finger tight.



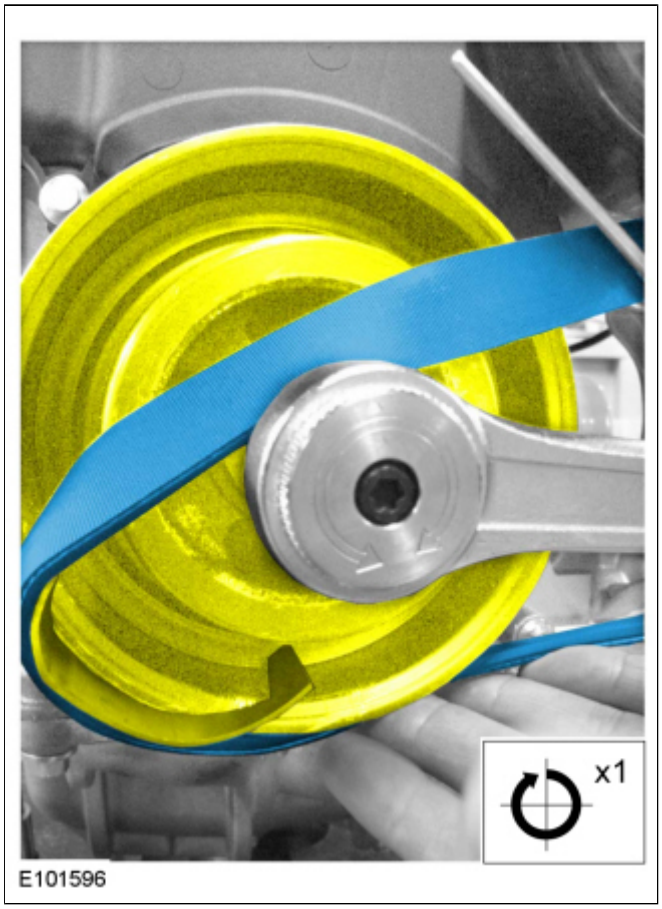
4. **NOTE:** Without A/C shown, with A/C similar.

   Position the accessory drive belt onto the coolant pump, generator and idler pulleys as shown.

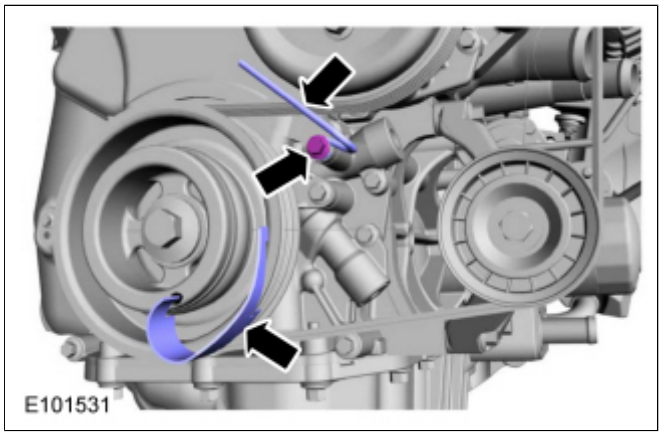


5. **NOTE:** After installation, verify the accessory drive belt is correctly seated on all of the pulleys.

   Rotate the crankshaft clockwise 1 full rotation.

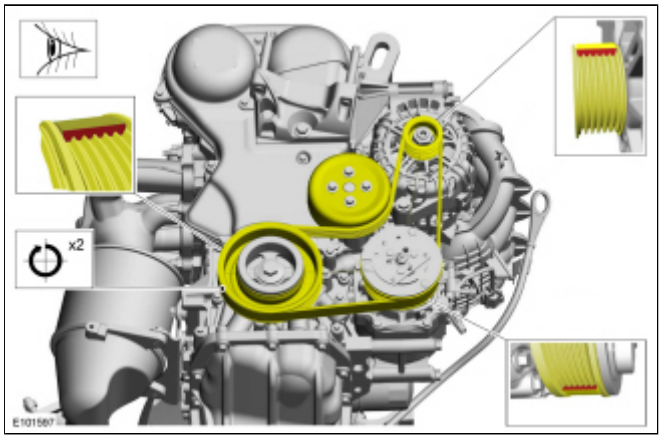


6. Remove the nut and the special tools. Leave the stud bolt installed.

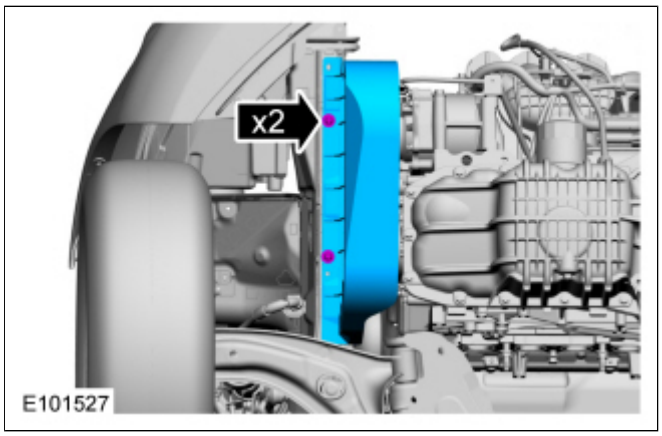


7. **NOTE:** With A/C shown, without A/C similar.

   Verify the accessory drive belt is correctly seated on all of the pulleys.



8. Position the accessory drive belt splash shield and install the 2 bolts.
    - Tighten to 9 Nm (80 lb-in).



Torque Specifications

Description	Nm	lb-ft	lb-in
Starter motor bolts	48	35	—
Starter motor solenoid battery cable nut	10	—	89
Starter motor solenoid wire nut	10	—	89

Starting System

The starting system consists of the following:

Without Intelligent Access

- Battery
- Battery cables
- Ignition switch
- Starter motor
- Starter relay (located in the Battery Junction Box (BJB)
- PCM (located in the engine compartment attached to the battery tray)
- Transmission Range (TR) sensor (automatic transaxle-equipped vehicles) (located on the transaxle)
- Clutch Pedal Position (CPP) switch (manual transmission-equipped vehicles) (located on the clutch pedal)
- Transmission Control Module (TCM) (located on the transaxle)
- Integrated Keyhead Transmitters (IKTs)

With Intelligent Access

- Battery
- Battery cables
- Start/stop switch
- Starter motor
- Starter relay (located in the BJB
- PCM (located in the engine compartment attached to the battery tray)
- Brake pedal switch (automatic transaxle)
- TR sensor (automatic transaxle-equipped vehicles) (located on the transaxle)
- CPP switch (manual transmission-equipped vehicles) (located on the clutch pedal)
- TCM (located on the transaxle)
- Intelligent Access (IA) key
- Remote Function Actuator (RFA) module

Starting System

Special Tool(s)

ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST3094-A	Test Light SGT27000 or equivalent 250-300 mA incandescent bulb test lamp
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation — Without Intelligent Access (IA)

NOTE: This vehicle is equipped with Passive Anti-Theft System (PATS) that disables the engine if an unprogrammed PATS key is used or an invalid PCM ID is received. PATS is controlled by the Instrument Panel Cluster (IPC). If there is a PATS concern that caused the engine to be disabled, the anti-theft light flashes rapidly in the IPC. Refer to Section 419-01B to diagnose a PATS concern.

The starting system is electronically controlled by the PCM. The PCM receives the following inputs:

- Correctly coded ignition key from the IPC
- Clutch pedal applied from the Clutch Pedal Position (CPP) switch (vehicles equipped with manual transaxle)
- Transaxle in PARK or NEUTRAL from the Transmission Range (TR) sensor (vehicles equipped with automatic transaxle)
- Request to start the engine, ignition switch in the START position

Under normal operation when the ignition is turned to the START position the IPC generates a key verification message. It sends this message to the PATS transceiver. The transceiver reads the key and sends a key verification message back to the IPC. If the message received does not match the key verified in the IPC memory, the engine will not crank and start. Once the IPC determines the correct programmed key was used to START the vehicle, the IPC sends the PCM a request to crank and start

the engine. When the PCM receives the message, it generates a response and sends it back to the IPC . If the response from the PCM does not match the response in the IPC memory, PATS is not enabled and the engine does not crank. If both the key verification and PCM ID pass, PATS is enabled. The PCM recognizes the correct electronically coded passive key and provides voltage and ground to the starter relay coil. The starter relay coil is energized causing the relay contacts to close providing voltage to the starter solenoid, allowing the starter motor to crank and start the engine. The PCM disengages the starter once an engine rpm threshold is reached, a set crank time is exceeded or the ignition is turned OFF. For additional information, refer to Section 419-01B .

Vehicles equipped with an automatic transaxle have a TR sensor. The TR sensor prevents operation of the starter unless the transaxle is in NEUTRAL or PARK.

Vehicles equipped a manual transaxle have a CPP switch. The CPP switch prevents operation of the starter unless the clutch pedal is fully pressed.

Principles of Operation — With Intelligent Access (IA)

NOTE: This vehicle is equipped with Passive Anti-Theft System (PATS) that disables the engine if an unprogrammed PATS key is used or an invalid PCM ID is received. PATS is controlled by the Remote Function Actuator (RFA) module. If there is a PATS concern that caused the engine to be disabled, the anti-theft light flashes rapidly in the Instrument Panel Cluster (IPC). Refer to Section 419-01B to diagnose a PATS concern.

The Intelligent Access (IA) starting system is electronically controlled by the RFA module which acts as the PATS control function. The RFA module receives the following inputs:

- Correctly coded ignition key from PATS
- Clutch pedal applied input from the Clutch Pedal Position (CPP) switch (vehicles equipped with manual transaxle)
- Transaxle in PARK or NEUTRAL from the Transmission Control Module (TCM) (vehicles equipped with automatic transaxle)
- Request to start the engine, start/stop switch is pushed
- Brake pedal applied input (automatic transaxle)

During a start event, the start/stop button is pushed in combination with either the brake or clutch pedal input. The RFA module receives a request to start the engine. The RFA module recognizes the correct electronically coded passive key and provides voltage to the starter relay coil and signals the PCM. The PCM recognizes the correct inputs and provides ground to energize the relay coil and close the relay contacts. The starter relay contacts close, providing voltage to the starter solenoid, allowing the starter to crank and start the engine. The PCM disengages the starter once an engine rpm threshold is reached, a set crank time is exceeded or the stop/start button is pressed indicating an engine shutdown request.

Vehicles equipped with an automatic transaxle have a TR sensor. The TR sensor prevents operation of the starter unless the transaxle is in NEUTRAL or PARK.

Vehicles equipped a manual transaxle have a CPP switch. The CPP switch prevents operation of the starter unless the clutch pedal is fully pressed.

Inspection and Verification

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: Make sure the anti-theft system is functioning correctly before carrying out a logical starting system diagnosis. Address anti-theft system concerns before continuing. Refer to Section 419-01B .

1. Verify the customer concern.

2. Remove the accessory drive belt. Refer to Section 303-05 . Verify the crankshaft and each of the components driven by the accessory drive belt rotate and are not seized or damaged.

3. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Starter motor • Starter motor bolts • IA key (with Intelligent access) • Start/stop button (with IA)	• Battery • Battery cables • High-current Battery Junction Box (BJB) mega fuse 1 (450A) • BJB fuse 11(30A) • Wiring, terminals or connectors • Starter relay • PATS • Loose or corroded connections

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. For vehicles **without Intelligent Access,** if the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

8. For vehicles **with Intelligent Access,** if the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON mode.
     - the air bag warning indicator prove-out (other indicators may NOT prove ignition is ON) confirms ignition ON. If ignition does not turn ON, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 , to diagnose no response from the PCM.

9. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, proceed with module self-test diagnostics.

10. Carry out the self-test diagnostics for the Transmission Control Module (TCM) (if equipped), RFA module (if equipped) and the PCM.

11. If the DTCs retrieved are related to the concern, go to DTC Charts.

12. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The engine does not crank — without Intelligent Access (IA)	• Fuse • Battery • Battery cables • Passive Anti-Theft System (PATS) • Starter motor • Wiring, terminals or connectors • PCM • Starter relay • Ignition switch • Transmission Range (TR) sensor (automatic transaxle only) • Transmission Control Module (TCM) (automatic transaxle only) • CPP switch (manual transaxle only)	• GO to Pinpoint Test A.
• The engine does not crank — with Intelligent Access (IA)	• Fuse • Battery • Battery cables • PATS • Starter motor • Wiring, terminals or connectors • PCM • Remote Function Actuator (RFA) module • Starter relay • Start/stop switch • Brake switch input • TCM (automatic transaxle only) • CPP switch (manual transaxle only)	• GO to Pinpoint Test B.
• Unusual starter noise	• Starter motor • Starter motor	• GO to Pinpoint Test D.

	mounting • Flywheel or flexplate ring gear • Starter motor engagement	
• The engine cranks slowly	• Battery • Starter motor • Circuitry	• CARRY OUT the Starter Motor Component Test.
• The starter spins but the engine does not crank	• Starter motor	• INSPECT the flywheel/flexplate ring gear for missing teeth. CHECK the starter motor for correct mounting. If concern persists, INSTALL a new starter motor. REFER to Starter Motor in this section. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank — Without Intelligent Access

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

Under normal operation the ignition switch is turned to the START position, the PCM receives a request to start the engine. The PCM receives a signal from theTransmission Control Module (TCM) that the vehicle is in PARK or NEUTRAL as determined by the TR sensor (vehicles equipped with an automatic transaxle) or from the Clutch Pedal Position (CPP) switch indicating the clutch pedal is fully pressed (vehicles equipped with manual transaxle). The PCM supplies voltage and ground to energize the starter relay coil. The energized coil causes the starter relay contacts to close. This allows voltage to be supplied from Battery Junction Box (BJB) fuse 11 (30A) to the starter solenoid. The starter solenoid is grounded at the starter. Energizing the starter solenoid closes the solenoid contacts allowing voltage directly from the battery to the starter, engaging the starter drive into the ring gear causing the engine to crank and start. The PCM disengages the starter once an engine rpm threshold is reached, a set crank time is exceeded or the ignition is turned OFF.

- DTC P0850:00 (Park/Neutral Switch Input Circuit: No Sub Type Information) — sets when the message from the P/N_SW CLUTCH 2 circuit is invalid causing a mismatch with the High Speed Controller Area Network (HS-CAN) message from the TCM .
- DTC P0851:00 (Park/Neutral Switch Input Circuit Low: No Sub Type Information) — sets when the PCM detects a short to ground on the P/N_SW/CLUTCH 2 circuit.

This pinpoint test is intended to diagnose the following:

- Battery
- Battery cables
- Passive Anti-Theft System (PATS)
- Ignition switch
- Fuse
- Starter motor
- Starter relay
- Wiring, terminals or connectors
- PCM
- TCM (automatic transaxle)
- Clutch Pedal Position (CPP) switch (manual transaxle only)

PINPOINT TEST A: THE ENGINE DOES NOT CRANK — WITHOUT INTELLIGENT ACCESS

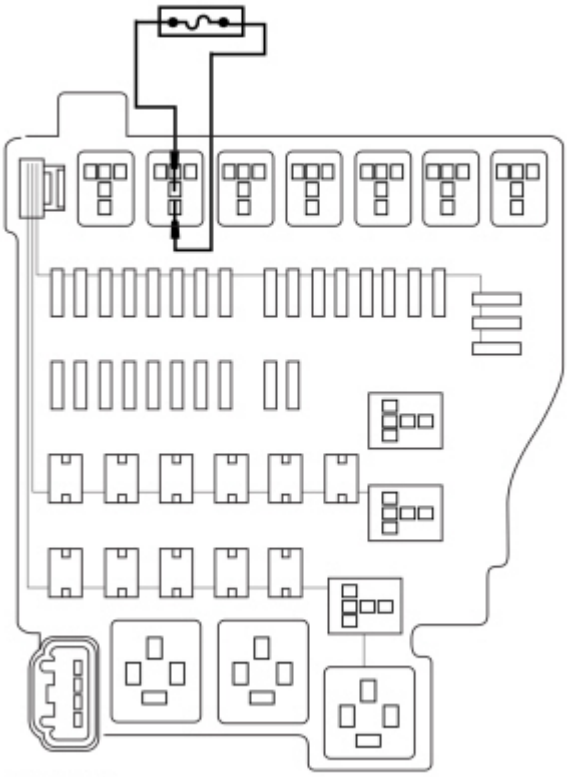
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE BATTERY • Check the battery condition and state of charge. Refer to Diagnosis and Testing in Section 414-01 . • **Is the battery OK?**	**Yes** GO to A2 . **No** CHARGE or INSTALL a new battery as necessary. REFER to Section 414-01 . TEST the system for normal operation.
A2 RETRIEVE DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM — Self-Test. • Enter the following diagnostic mode on the scan tool: IPC — Self-Test. • Enter the following diagnostic mode on the scan tool: TCM — Self-Test. • **Were DTCs retrieved on-demand during self-test?**	**Yes** For IPC DTCs, REFER to Section 413-01 . For all TCM DTCs, REFER to Section 307-11 . For PCM DTC P0617:12, GO to Pinpoint Test C . For PCM DTC P0850:00, GO to A4 . For DTC P0851:00, GO to A7 . For all other PCM DTCs, REFER to Section 303-14 . **No** For automatic transaxle, GO to A3 . For manual transaxle, GO to A9 .
A3 CHECK THE PCM TRANSMISSION PARK OR NEUTRAL RANGE SWITCH (TRP/N) PID • Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • While observing the TRP/N PID, place the gear selector in NEUTRAL and then PARK. • **Does the PID indicate YES with the gear selector in NEUTRAL or PARK?**	**Yes** GO to A10 . **No** GO to A4 .
A4 CHECK THE P/N_SW/CLUTCH 2 CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: PCM C175B. • Disconnect: TCM C1750A. • Ignition ON. • Measure the voltage between PCM C175B-7, circuit CE903 (BU/OG), harness side and ground.	**Yes** REPAIR circuit CE903 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

 N0130041 • **Is any voltage present?**	operation. **No** GO to A5 .
A5 CHECK THE P/N_SW/CLUTCH 2 CIRCUIT FOR AN OPEN • Ignition OFF. • Measure the resistance between PCM C175B-7, circuit CE903 (BU/OG), harness side and TCM C1750A-39, circuit CE903 (BU/OG), harness side.  N0130362 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR circuit CE903 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A6 CHECK THE TCM TRANSMISSION RANGE INPUT ALLOWING ENGINE START (TR_CRANK) AND PCM TRANSMISSION PARK OR NEUTRAL RANGE SWITCH (TRP/N) PIDs • Connect: PCM C175B. • Connect: TCM C1750A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCM . • While observing the TR_CRANK PID, place the gear selector in NEUTRAL and then PARK. • Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • While observing the TRP/N PID, place the gear selector in NEUTRAL and then PARK. • **Do the PIDs indicate YES with the gear selector position in NEUTRAL or PARK?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** If the concern is with TRP/N PID, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. If the concern is with TR_CRANK PID,

	INSTALL a new TCM. REFER to Section 307-11. TEST the system for normal operation.
A7 CHECK FOR DTC WITH TCM DISCONNECTED	
• Ignition OFF. • Disconnect: TCM C1750A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM — Self-Test. • **Was DTC P0851:00 retrieved on-demand during self-test?**	**Yes** GO to A8. **No** INSTALL a new TCM. REFER to Section 307-11. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A8 CHECK THE P/N_SWITCH CLUTCH 2 CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between PCM C175B-7, circuit CE903 (BU/OG), harness side and ground.  N0130042 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. TEST the system for normal operation. **No** REPAIR circuit CE903 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A9 CHECK THE PCM CLUTCH PEDAL AT OR NEAR BOTTOM OF TRAVEL (CPP_BOT) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • While observing the CPP_BOT PID, fully disengage the clutch. • **Does the PID change from NO to YES?**	**Yes** GO to A10. **No** GO to A23.
A10 CHECK THE PCM STARTER RELAY ENABLE (STRT_RLY) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • **NOTE:** For manual transaxle, fully disengage the clutch. • Monitor the STRT_RLY PID while holding the key in the START position. • **Does the PID change from DISENGAGED to ENGAGED?**	**Yes** GO to A11. **No** GO to A21.
A11 CHECK THE STARTER RELAY	
• Swap the starter relay with a known good relay and attempt to crank the engine. • **Does the engine crank?**	**Yes** INSTALL a new starter relay. TEST the system for normal operation. **No**

	GO to A12 .
A12 CHECK THE VOLTAGE TO THE STARTER RELAY	
• Ignition OFF. • Disconnect: Starter Relay. • Measure the voltage between Battery Junction Box (BJB) starter relay cavity pin 3, circuit SBB11 (BU/RD), harness side and ground.  N0115734 • **Is the voltage greater than 10 volts?**	**Yes** GO to A13 . **No** VERIFY BJB fuse 11 (30A) is OK. If OK, REPAIR circuit SBB11 (BU/RD) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
A13 CHECK THE STARTER MOTOR OPERATION AT THE STARTER RELAY	
• Ignition OFF. • With the transaxle in PARK or NEUTRAL, connect one end of a fused jumper wire to BJB starter relay cavity 3, circuit SBB11 (BU/RD) and momentarily connect the other end of the fused jumper wire to BJB starter relay cavity 5, circuit CDC26 (GY/OG).	**Yes** GO to A19 . **No** GO to A14 .



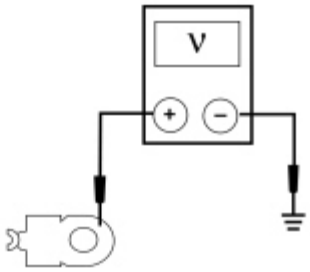
N0114473

- **Did the starter engage and the engine crank?**

A14 CHECK THE BATTERY GROUND CABLE	
• Measure the voltage between the positive battery post and the battery ground cable connection at the engine.  AJ0280-A • **Is the voltage greater than 10 volts?**	**Yes** GO to A15 . **No** CARRY OUT the Starter Motor — Ground Circuit Test. REFER to Component Test in this section. TEST the system for normal operation.
A15 CHECK THE STARTER MOTOR GROUND	
• Measure the voltage between the positive battery post and the starter motor case.	**Yes** GO to A16 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal

 N0042835 • **Is the voltage greater than 10 volts?**	operation.
A16 CHECK THE VOLTAGE TO THE STARTER MOTOR	
• Measure the voltage between starter solenoid C197A, circuit SBF01 (RD) and ground.  N0042836 • **Is the voltage greater than 10 volts?**	**Yes** GO to A17 . **No** INSTALL a new positive battery cable. REFER to Section 414-01 . TEST the system for normal operation.
A17 CHECK THE STARTER MOTOR	
• Connect one end of a fused jumper wire to starter solenoid C197A, circuit SBF01 (RD) and momentarily connect the other end of the fused jumper wire to starter solenoid C197B, circuit CDC26 (GY/OG).  N0084970 • **Did the starter engage and the engine crank?**	**Yes** GO to A18 . **No** INSTALL a new starter motor. REFER to Starter Motor in this section. TEST the system for normal operation.
A18 CHECK FOR START INPUT AT THE STARTER	
• Connect: Starter Relay. • Disconnect: Starter Solenoid C197B. • Measure the voltage between the starter solenoid C197B-1, circuit CDC26 (GY/OG) and ground, while holding the key in the START	**Yes** CLEAN the starter solenoid "S" terminal and connector. CHECK

position.



N0115632

- **Is the voltage greater than 10 volts?**

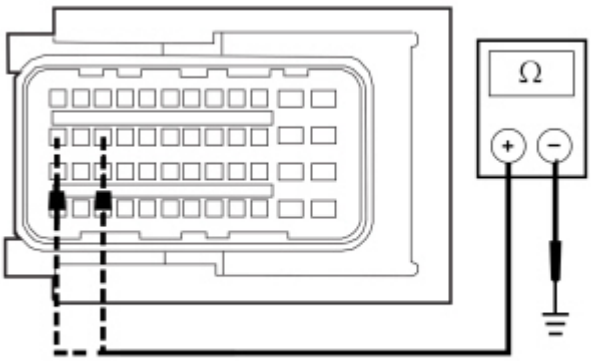
the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation.

No
REPAIR circuit CDC26 (GY/OG) for an open. TEST the system for normal operation.

A19 CHECK THE PCM START CIRCUITS FOR A SHORT TO GROUND

- Ignition OFF.
- Disconnect: PCM C175B.
- Disconnect: Starter Relay.
- Disconnect: IPC C220.
- Disconnect: ACM C240A (Vehicles Built After 1/14/2011).
- Measure the resistance between PCM C175B, harness side and ground, using the following chart.

PCM Connector	Circuit
C175B-24	CDC12 (YE)
C175B-22	CDC54 (WH/GN)



N0130364

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to A20 .

No
REPAIR the affected circuit for a short to ground. TEST the system for normal operation.

A20 CHECK THE PCM START CIRCUITS FOR AN OPEN

- Measure the resistance between PCM C175B, harness side and BJB starter relay cavity, using the following chart.

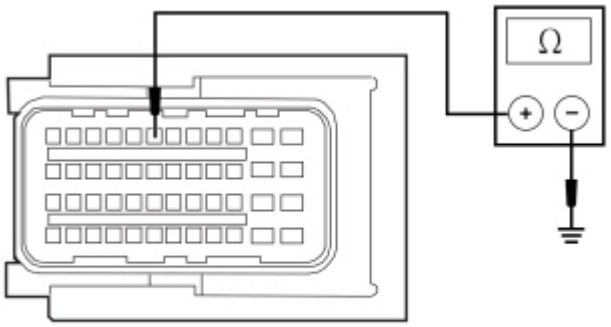
PCM Connector	Circuit	BJB
C175B-24	CDC12 (YE)	BJB starter relay cavity 2
C175B-22	CDC54 (WH/GN)	BJB starter relay cavity 1

Yes
INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

No
REPAIR the affected circuit for an open. TEST the system for

  N0131351 • **Are the resistances less than 5 ohms?**	normal operation.
A21 CHECK THE START CIRCUIT FOR VOLTAGE AT THE PCM	
• Disconnect: PCM C175B. • Measure the voltage between PCM C175B-9, circuit CDC35 (BU/WH) and ground, while holding the key in the START position.  N0130361 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** GO to A22 .
A22 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the ignition switch pass the component test?**	**Yes** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation. **No**

	INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation.
A23 CHECK THE CPP SWITCH CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: CPP Switch C257. • Disconnect: PCM C175B. • Measure the resistance between CPP switch C257-1, circuit CE903 (BU/OG), harness side and PCM C175B-7, circuit CE903 (BU/OG), harness side.  N0129623 • **Is the resistance less than 5 ohms?**	**Yes** GO to A24 . **No** REPAIR circuit CE903 (BU/OG) for an open. TEST the system for normal operation.
A24 CHECK THE CPP GROUND CIRCUIT FOR AN OPEN • Measure the resistance between CPP switch C257-2, circuit GD187 (BK/GN), harness side and ground.  N0095736 • **Is the resistance less than 5 ohms?**	**Yes** GO to A25 . **No** REPAIR circuit GD187 (BK/GN) for an open. TEST the system for normal operation.
A25 CHECK THE CPP SWITCH • Connect: CPP Switch C257. • Measure the resistance between PCM C175B-7, circuit CE903 (BU/OG), harness side and ground while depressing the clutch pedal.	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new CPP switch. REFER to Section 303-14 . TEST the system for normal operation.



N0130042

- **Is the resistance less than 5 ohms?**

Pinpoint Test B: The Engine Does Not Crank — With Intelligent Access (IA)

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

Under normal operation the start/stop switch, when pushed in combination with pressing either the brake or clutch pedal (depending upon transaxle), provides the Remote Function Actuator (RFA) module a request to start the engine. The RFA module and PCM receive a signal from the Transmission Control Module (TCM) that the vehicle is in PARK or NEUTRAL (vehicles equipped with an automatic transaxle) or from the Clutch Pedal Position (CPP) switch when the clutch pedal is fully pressed (vehicles equipped with manual transaxle). The RFA module supplies voltage to the starter relay coil and signals the PCM to provide ground to the relay coil. The energized coil causes the starter relay contacts to close. This allows voltage to be supplied from Battery Junction Box (BJB) fuse 11 (30A) to the starter solenoid. The starter solenoid is grounded at the starter. Energizing the starter solenoid closes the solenoid contacts allowing voltage directly from the battery to the starter, engaging the starter drive into the ring gear causing the engine to crank and start. The PCM disengages the starter once an engine rpm threshold is reached, a set crank time is exceeded or the stop/start button is pressed indicating engine shut down.

- DTC P0850:00 (Park/Neutral Switch Input Circuit: No Sub Type Information) — sets when the message from the P/N_SW CLUTCH 2 circuit is invalid causing a mismatch with the High Speed Controller Area Network (HS-CAN) message from the TCM .
- DTC P0851:00 (Park/Neutral Switch Input Circuit Low: No Sub Type Information) — sets when the PCM detects a short to ground on the P/N_SW/CLUTCH 2 circuit.
- DTC P1708:62 (Clutch Switch Circuit: Signal Compare Failure) — sets when the clutch switch input to the RFA module indicates the clutch pedal is pressed but the Medium Speed Controller Area Network (MS-CAN) message transmitted by the Instrument Panel Cluster (IPC) module indicates the clutch pedal is not pressed.

This pinpoint test is intended to diagnose the following:

- Battery
- Battery cables
- Start/stop switch
- Cruise control deactivation switch
- Fuses
- PATS
- Starter motor
- Starter relay
- Wiring, terminals or connectors
- PCM
- TCM (automatic transaxle)
- Clutch Pedal Position (CPP) switch (manual transaxle only)

- RFA module

PINPOINT TEST B: THE ENGINE DOES NOT CRANK — WITH INTELLIGENT ACCESS (IA)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

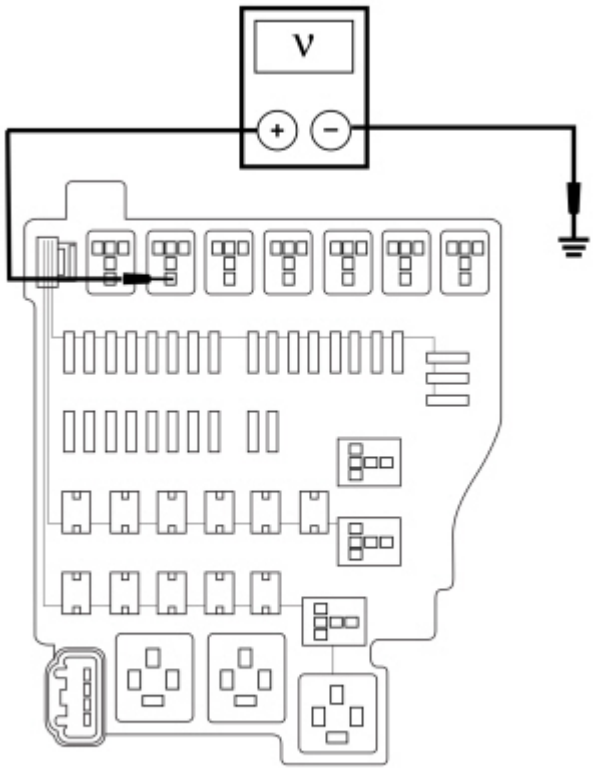
Test Step	Result / Action to Take
B1 CHECK THE BATTERY	
• Check the battery condition and state of charge. Refer to Diagnosis and Testing in Section 414-01 . • **Is the battery OK?**	**Yes** GO to B2 . **No** CHARGE or INSTALL a new battery as necessary. REFER to Section 414-01 . TEST the system for normal operation.
B2 CHECK FOR KEY NOT DETECTED	
NOTE: There are certain areas inside the vehicle where the IA key may not be detected and the message center displays KEY NOT DETECTED. If the IA key is in the far outside edges of the interior (like in a door map pocket or above a sun visor) it might not be detected. Move the IA key to a different location and try to crank the vehicle again. • Check the Front Control/Display Interface Module (FCDIM) while pressing the start/stop switch. • **Is KEY NOT DETECTED displayed?**	**Yes** REFER to Section 419-01B to diagnose KEY NOT DETECTED is displayed. **No** GO to B3 .
B3 CHECK THE IPC OPERATION	
• Observe the Instrument Panel Cluster (IPC) operation while pressing the start/stop switch. • **Do some indicators in the IPC illuminate?**	**Yes** GO to B5 . **No** GO to B4 .
B4 CHECK FOR COMMUNICATION WITH THE SCAN TOOL	
• Refer to Inspection and Verification in Section 418-00 , and follow the procedure to establish a session with the vehicle. • **Does the RFA module pass the network test?**	**Yes** REFER to Section 211-05 to diagnose no power in RUN. **No** REFER to Section 418-00 to diagnose no communication with the RFA module or PCM.
B5 RETRIEVED DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM — Self-Test. • Enter the following diagnostic mode on the scan tool: RFA module — Self-Test. • Enter the following diagnostic mode on the scan tool: TCM — Self-	**Yes** For RFA module DTC P1708:62, GO to B33 . For RFA module DTC P0615:12, GO to Pinpoint Test C . For all

Test. • Enter the following diagnostic mode on the scan tool: PCM — Self-Test. • **Were DTCs retrieved on-demand during self-test?**	other RFA module DTCs, REFER to Section 419-01B. For PCM DTC P0617:12, GO to Pinpoint Test C. For PCM DTC P0850:00, GO to B10. For DTC P0851:00, GO to B13. For all other PCM DTCs, REFER to Section 303-14. For all TCM DTCs, REFER to Section 307-11. **No** For automatic transaxle, GO to B6. For manual transaxle, GO to B15.
B6 CHECK THE RFA MODULE BRAKE SWITCH (BRAKE_SW) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — RFA module. • While observing the BRAKE_SW PID, apply the brake pedal. • **Does the PID change from OFF to ON?**	**Yes** GO to B9. **No** GO to B7.
B7 CHECK THE CRUISE CONTROL DEACTIVATION CIRCUIT TO THE RFA MODULE FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220. • Disconnect: RFA module C3503B. • Disconnect: Cruise Control Deactivation Switch C278. • Measure the resistance between RFA module C3503B-21, circuit CCA29 (GN/BU), harness side and ground.  N0116354 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B8. **No** REPAIR circuit CCA29 (GN/BU). TEST the system for normal operation.
B8 CHECK THE BRAKE SWITCH	
• Connect: Cruise Control Deactivation Switch C278. • Measure the resistance between RFA module C3503B-21, circuit CCA29 (GN/BU) and ground while applying the brake pedal.	**Yes** INSTALL a new RFA module. REFER to Section 419-10. TEST the system for normal

 N0116354 • **Is the resistance greater than 10,000 ohms?**	operation. **No** INSTALL a new cruise control deactivation switch. REFER to Section 419-03 . TEST the system for normal operation.
B9 CHECK THE PCM TRANSMISSION P/N SWITCH (TRN/P) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM . • While observing the TRP/N PID, place the gear selector in NEUTRAL and then PARK. • **Does the PID indicate YES with the gear selector in NEUTRAL or PARK?**	**Yes** GO to B16 . **No** GO to B10 .
B10 CHECK THE P/N_SW/CLUTCH 2 CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Disconnect: TCM C1750A. • Ignition ON. • Measure the voltage between PCM C175B-7, circuit CE903 (BU/OG), harness side and ground.  N0130041 • **Is any voltage present?**	**Yes** REPAIR circuit CE903 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B11 .
B11 CHECK THE P/N_SW/CLUTCH 2 CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between PCM C175B-7, circuit CE903 (BU/OG), harness side and TCM C1750A-39, circuit CE903 (BU/OG), harness side.	**Yes** GO to B12 . **No** REPAIR circuit CE903 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0130362 • **Is the resistance less than 5 ohms?**	
B12 CHECK THE TCM TRANSMISSION RANGE INPUT ALLOWING ENGINE START (TR_CRANK) AND PCM TRANSMISSION PARK OR NEUTRAL RANGE SWITCH (TRP/N) PIDs	
• Connect: PCM C175B. • Connect: TCM C1750A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — TCM. • While observing the TR_CRANK PID, place the gear selector in PARK and then NEUTRAL. • Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • While observing the TRP/N PID, place the gear selector in PARK and then NEUTRAL. • **Do the PIDs indicate YES with the gear selector in NEUTRAL or PARK?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** If the concern is with TRP/N PID, INSTALL a new PCM. REFER to Section 303-14. TEST the system for correct operation. If the concern is with TR_CRANK PID, INSTALL a new TCM. REFER to Section 307-11. TEST the system for normal operation.
B13 CHECK FOR A DTC WITH THE TCM DISCONNECTED	
• Ignition OFF. • Disconnect: TCM C1750A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM — Self-Test. • **Was DTC P0851:00 retrieved on-demand during self-test?**	**Yes** GO to B14. **No** INSTALL a new TCM. REFER to Section 307-11. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B14 CHECK THE P/N_SW/CLUTCH 2 CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between PCM C175B-7, circuit CE903	**Yes** INSTALL a new PCM. REFER to Section 303-

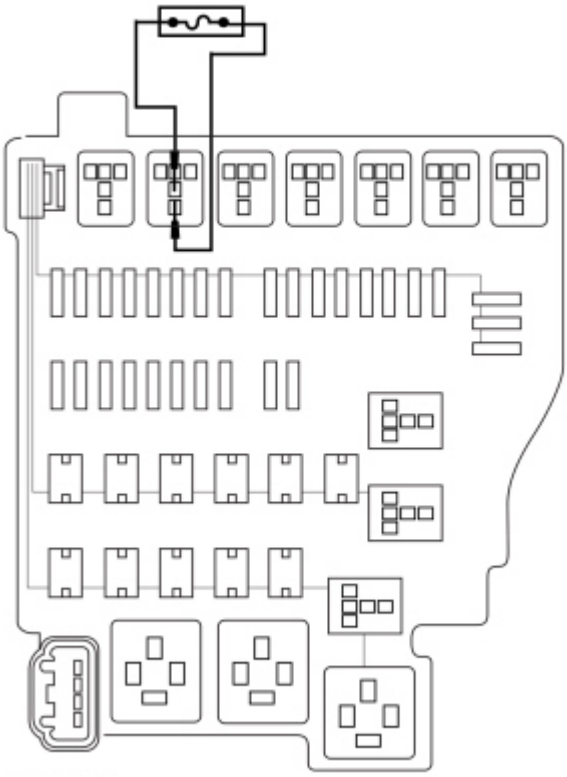
(BU/OG), harness side and ground.  N0130042 • **Is the resistance greater than 10,000 ohms?**	14 . TEST the system for normal operation. **No** REPAIR circuit CE903 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B15 CHECK THE PCM CLUTCH PEDAL AT OR NEAR BOTTOM OF TRAVEL (CPP_BOT) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • While observing the CPP_BOT PID, fully disengage the clutch. • **Does the PID change from NO to YES?**	**Yes** GO to B16 . **No** GO to B30 .
B16 CHECK THE PCM STARTER RELAY ENABLE (STRT_RLY) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • **NOTE:** For manual transaxle, fully disengage the clutch. • Monitor the STRT_RLY PID while pressing the start/stop switch and the brake or clutch pedal. • **Does the PID change from DISENGAGED to ENGAGED?**	**Yes** GO to B17 . **No** REFER to Section 211-05 to diagnose the no power in start concern.
B17 CHECK THE STARTER RELAY	
• Swap the starter relay with a known good relay and attempt to crank the engine. • **Does the engine crank?**	**Yes** INSTALL a new starter relay. TEST the system for normal operation. **No** GO to B18 .
B18 CHECK THE VOLTAGE TO THE STARTER RELAY	
• Ignition OFF. • Disconnect: Starter Relay. • Measure the voltage between Battery Junction Box (BJB) starter relay cavity 3, circuit SBB11 (BU/RD), harness side and ground.	**Yes** GO to B19 . **No** VERIFY BJB fuse 11 (30A) is OK. If OK, REPAIR circuit SBB11 (BU/RD) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.



N0115734

- **Is the voltage greater than 10 volts?**

B19 CHECK THE STARTER MOTOR OPERATION AT THE STARTER RELAY	
• Ignition OFF. • With the transaxle in PARK or NEUTRAL, connect one end of a fused jumper wire to BJB starter relay cavity 3, circuit SBB11 (BU/RD) and momentarily connect the other end of the fused jumper wire to BJB starter relay cavity 5, circuit CDC26 (GY/OG).	**Yes** GO to B25 . **No** GO to B20 .



N0114473

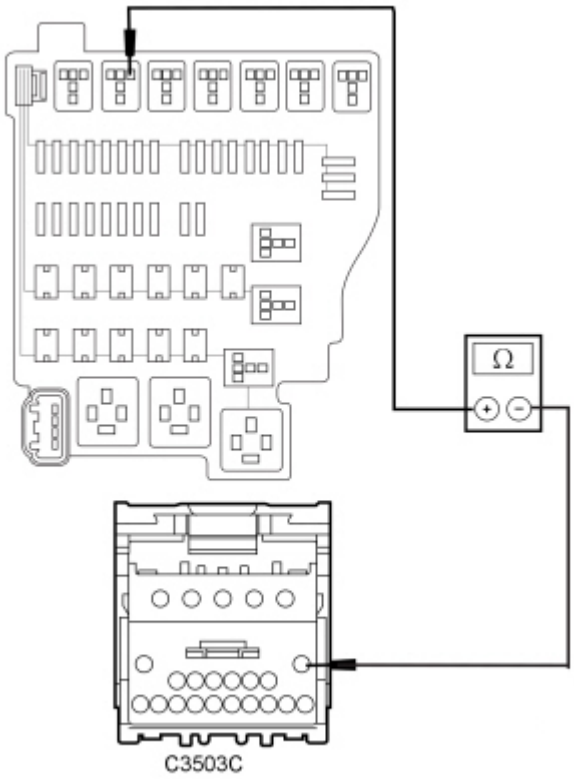
- **Did the starter engage and the engine crank?**

B20 CHECK THE BATTERY GROUND CABLE	
• Measure the voltage between the positive battery post and the battery ground cable connection at the engine.  AJ0280-A • **Is the voltage greater than 10 volts?**	**Yes** GO to B21 . **No** CARRY OUT the Starter Motor — Ground Circuit Test. REFER to Component Test in this section. TEST the system for normal operation.
B21 CHECK THE STARTER MOTOR GROUND	
• Measure the voltage between the positive battery post and the starter motor case.	**Yes** GO to B22 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for

 N0042835 • **Is the voltage greater than 10 volts?**	normal operation.
B22 CHECK THE VOLTAGE TO THE STARTER MOTOR	
• Measure the voltage between starter solenoid C197A-1, circuit SBF01 (RD) and ground.  N0042836 • **Is the voltage greater than 10 volts?**	**Yes** GO to B23 . **No** INSTALL a new positive battery cable. REFER to Section 414-01 . TEST the system for normal operation.
B23 CHECK THE STARTER MOTOR FOR CORRECT OPERATION	
• Connect one end of a fused jumper wire to starter solenoid C197A-1, circuit SBF01 (RD) and momentarily connect the other end of the fused jumper wire to starter solenoid C197B, circuit CDC26 (GY/OG).  N0084970 • **Did the starter engage and the engine crank?**	**Yes** GO to B24 . **No** INSTALL a new starter motor. REFER to Starter Motor in this section. TEST the system for normal operation.
B24 CHECK FOR START INPUT AT THE STARTER	
• Connect: Starter Relay. • Disconnect: Starter Solenoid C197B. • Measure the voltage between the starter solenoid C197B-1, circuit CDC26 (GY/OG) and ground, while pressing the start/stop switch	**Yes** CLEAN the starter solenoid "S" terminal and connector. CHECK

and the brake or clutch pedal.  N0115632 • **Is the voltage greater than 10 volts?**	the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation. **No** REPAIR circuit CDC26 (GY/OG) for an open. TEST the system for normal operation.
B25 CHECK THE RFA MODULE STARTER REQUEST CIRCUIT FOR VOLTAGE	
• Measure the voltage between BJB starter relay cavity 1, circuit CDC54 (WH/GN), harness side and ground while pressing the start/stop switch and the brake or clutch pedal.  N0116347 • **Is the voltage greater than 10 volts?**	**Yes** GO to B28 . **No** GO to B26 .
B26 CHECK THE RFA MODULE STARTER REQUEST CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: IPC C220. • Disconnect: RFA C3503C. • Disconnect: ACM C240A (Vehicles Built After 1/14/2011). • Measure the resistance between BJB starter relay cavity 1, circuit CDC54 (WH/GN), harness side and ground.	**Yes** GO to B27 . **No** REPAIR circuit CDC54

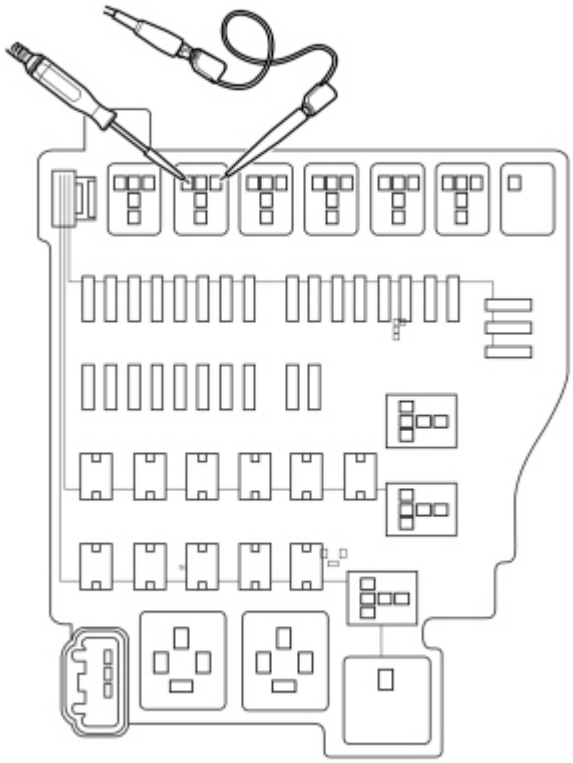
 N0116949 • **Is the resistance greater than 10,000 ohms?**	(WH/GN). TEST the system for normal operation.
B27 CHECK THE RFA MODULE STARTER REQUEST CIRCUIT FOR AN OPEN	
• Measure the resistance between BJB starter relay cavity 1, circuit CDC54 (WH/GN), harness side and RFA module C3503C-6.	**Yes** INSTALL a new RFA module. REFER to Section 419-10 . TEST the system for normal operation. **No** REPAIR circuit CDC54 (WH/GN). TEST the system for normal operation.



N0116356

- **Is the resistance less than 0.5 ohm?**

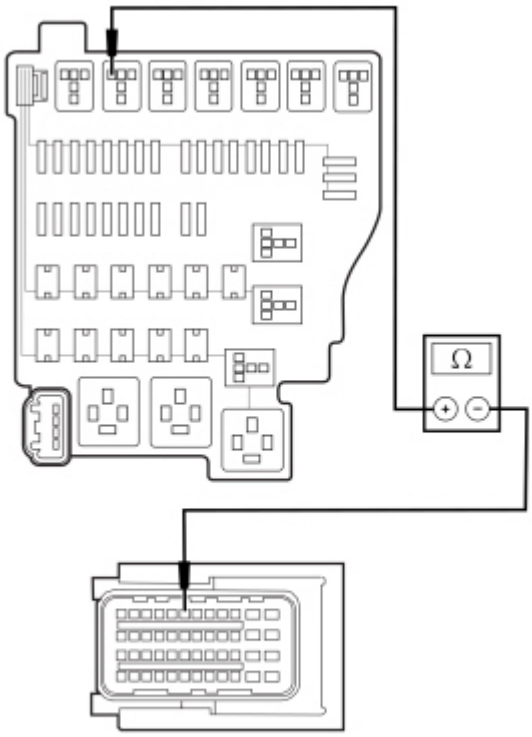
B28 CHECK THE PCM STARTER CONTROL CIRCUIT	
• Connect a 12-volt test light between BJB starter relay cavity 1, circuit CDC54 (WH/GN) and BJB starter relay cavity 2, circuit CDC12 (YE), then press the brake or clutch pedal and press the start/start switch.	**Yes** INSTALL a new starter relay. TEST the system for normal operation. **No** GO to B29.



N0116351

- **Does the test light illuminate?**

B29 CHECK THE STARTER CONTROL CIRCUIT FOR AN OPEN	
• Disconnect: PCM C175B. • Measure the resistance between BJB starter relay cavity 2, circuit CDC12 (YE), harness side and PCM C175B-24, circuit CDC12 (YE), harness side.	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** REPAIR circuit CDC12 (YE). TEST the system for normal operation.

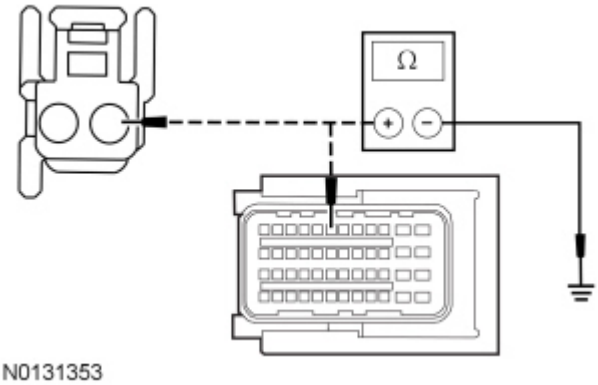


N0131352

- **Is the resistance less than 5 ohms?**

B30 CHECK THE P/N_SW/CLUTCH 2 CIRCUIT FOR AN OPEN OR SHORT TO GROUND	

• Ignition OFF.
• Disconnect: CPP Switch C257.
• Disconnect: RFA Module C3503B.
• Disconnect: PCM C175B.
• Measure the resistance between:
  ▪ CPP switch C257-1, circuit CE903 (BU/OG), harness side and PCM C175B-7, circuit CE903 (BU/OG), harness side.
  ▪ PCM C175B-7, circuit CE903 (BU/OG), harness side and ground.
	Yes
	GO to B31.
	
	No
	REPAIR circuit CE903 (BU-OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

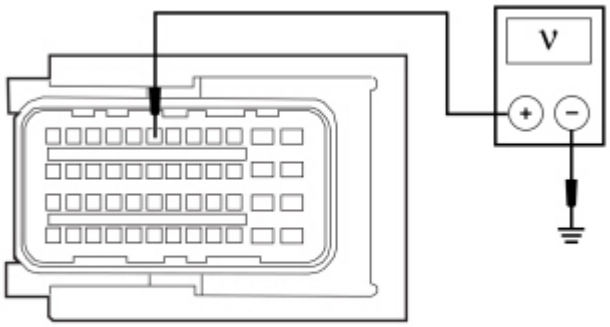


N0131353

- **Is the resistance greater than 10,000 ohms between the PCM and ground; and less than 5 ohms between the PCM and CPP switch?**

B31 CHECK THE CPP GROUND CIRCUIT FOR AN OPEN	

• Measure the resistance between CPP switch C257-2, circuit GD187 (BK/GN), harness side and ground.  N0095736 • **Is the resistance less than 5 ohms?**	**Yes** GO to B32 . **No** REPAIR circuit GD187 (BK/GN) for an open. CLEAR DTCs. REPEAT the self-test. TEST the system for normal operation.
B32 CHECK THE CPP SWITCH	
• Connect: CPP Switch C257. • Measure the resistance between PCM C175B-7, circuit CE903 (BU/OG), harness side and ground while pressing the clutch pedal.  N0130042 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new CPP switch. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B33 CHECK THE P/N_SW/CLUTCH 2 CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: CPP Switch C257. • Disconnect: RFA Module C3503B. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between PCM C175B-7, circuit CE903 (BU/OG), harness side and ground.	**Yes** REPAIR circuit CE903 (BU-OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B34 .



N0130041

- **Is any voltage present?**

B34 CHECK THE P/N_SW/CLUTCH 2 INPUT CIRCUIT FOR AN OPEN BETWEEN THE PCM AND RFA MODULE	
• Ignition OFF. • Measure the resistance between RFA module C3503B-17, circuit CE903 (BU/OG), harness side and PCM C175B-7, circuit CE903 (BU/OG), harness side.  N0129627 • **Is the resistance less than 5 ohms?**	**Yes** GO to B35 . **No** REPAIR circuit CE903 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B35 CHECK THE PCM CLUTCH PEDAL AT OR NEAR BOTTOM OF TRAVEL (CPP_BOT) AND RFA MODULE CLUTCH SWITCH (CLUTCH_SW) PIDs	
• Ignition OFF. • Connect: CPP Switch C257. • Connect: RFA Module C3503B. • Connect: PCM C175B. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger— PCM. • While observing the CPP_BOT PID, fully engage and disengage the clutch pedal. • Enter the following diagnostic mode on the scan tool: DataLogger— RFA module. • While observing the CLUTCH_SW PID, fully engage and disengage the clutch. • **Do both PIDs agree with the clutch pedal position?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation. **No** If the concern is with CPP_BOT PID, INSTALL a new PCM. REFER to Section 303-14 . If the concern is with CLUTCH _SW PID, INSTALL a new RFA module. REFER to

	Section 419-10 . TEST the system for normal operation.

Pinpoint Test C: DTC P0615:12 or P0617:12

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Normal Operation — (Without Intelligent Access)

When the ignition is turned to the START position, the PCM receives a request to start the engine and supplies voltage to the starter relay coil. The PCM monitors the start request circuit for faults. If voltage is detected on the start request circuit and the starter relay is not in an active state, the PCM sets a DTC.

- DTC P0617:12 (Starter Relay Circuit High: Circuit Short to Battery) — sets when the PCM detects excessive current on the starter relay circuit and the output is not activated.

Normal Operation — With Intelligent Access (IA)

When the start/stop switch is pressed and released along with either the brake pedal (vehicles equipped with automatic transaxle) or Clutch Pedal Position (CPP) switch (vehicles equipped with manual transaxle) input, the Remote Function Actuator (RFA) module receives a request from the Intelligent Access (IA) key to start the engine. The RFA module then supplies voltage to the starter relay coil. The RFA module monitors the start request circuit for faults. If voltage is detected on the start request circuit and the starter relay is not in an active state, the RFA module sets a DTC.

- DTC P0615:12 (Starter Relay Circuit High: Circuit Short to Battery) — sets when the RFA module detects current output above threshold on the starter relay circuit and the output is not activated.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RFA module
- PCM
- Starter relay

PINPOINT TEST C: DTCs P0615:12 OR P0617:12

Test Step	Result / Action to Take
C1 RETRIEVE DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM — Self-Test (vehicles without IA). • Enter the following diagnostic mode on the scan tool: Self Test — RFA Module (vehicles equipped with IA). • **Are DTCs present on-demand during self-test?**	**Yes** GO to C2 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
C2 CHECK THE STARTER REQUEST CIRCUIT FOR A SHORT	

TO VOLTAGE	
• Ignition OFF. • Disconnect: Starter Relay. • Disconnect: ACM C240A (Vehicles Built After 1/14/2011). • Disconnect: RFA module C3503C or PCM C175B. • Ignition ON. • Measure the voltage between BJB starter relay cavity 1, circuit CDC54 (WH/GN), harness side and ground.  N0116347 • **Is any voltage present?**	**Yes** REPAIR circuit CDC54 (WH/GN). CLEAR the DTCs. REPEAT the self-test. **No** GO to C3 .
C3 CHECK THE STARTER RELAY	
• Swap the starter relay with a known good relay. • Enter the following diagnostic mode on the scan tool: Self Test — RFA module or PCM. • **Was RFA DTC P0615:12 or PCM DTC P0617:12 retrieved on-demand during self-test?**	**Yes** **For vehicles without IA ,** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. **For vehicles with IA** INSTALL a new RFA module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new starter relay. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: Unusual Starter Noise

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

Correct starter operation relies on correct mounting of the starter to the engine, alignment of the starter ring gear to the flywheel or flexplate and correct functioning of the starter assembly (internal gears, bearings).

This pinpoint test is intended to diagnose the following:

- Starter motor
- Starter motor mounting
- Starter motor engagement
- Flywheel or flexplate ring gear

PINPOINT TEST D: UNUSUAL STARTER NOISE

Test Step	Result / Action to Take
D1 CHECK THE STARTER MOTOR MOUNTING	
• Inspect the starter motor mounting bolts for looseness. • **Is the starter motor mounted correctly?**	**Yes** GO to D2 . **No** INSTALL the starter motor correctly. REFER to Starter Motor in this section.
D2 CHECK FOR ENGINE NOISE	
• Ignition OFF. • Connect a remote starter switch between the starter solenoid "B" and "S" terminals.  AJ0286-A • Engage the starter motor and verify the noise is due to the starter operation. • **Is the noise due to the starter motor engagement?**	**Yes** GO to D3 . **No** REFER to Section 303-00 to continue the diagnosis.
D3 CHECK FOR UNUSUAL WEAR	
• Remove the starter motor. Refer to Starter Motor in this section. • Inspect the ring gear for damaged or worn teeth. • **Is the noise due to ring gear tooth damage?**	**Yes** INSTALL a new flexplate/flywheel ring gear. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. REFER to Starter Motor in this section. TEST the system for normal

	operation. **No** INSTALL a new starter motor. REFER to Starter Motor in this section.

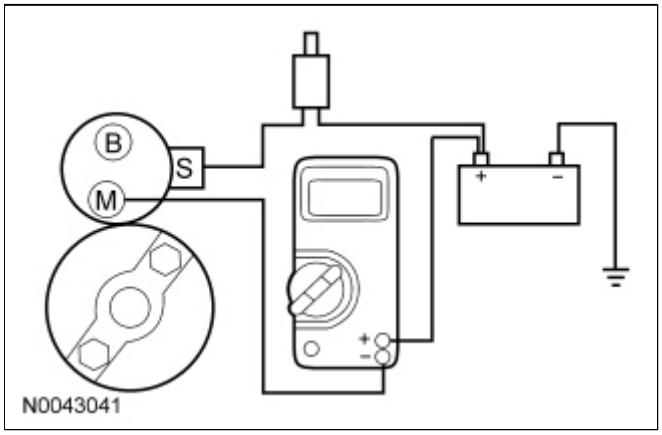
Component Tests

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

Always make the Fluke 77-IV Digital Multimeter connections at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor — Feed Circuit Test

1. Make sure the battery is fully charged. Carry out the battery condition test. Refer to Diagnosis and Testing in Section 414-01 .
2. Connect a remote starter switch between the starter solenoid "S" terminal and the battery positive (+) terminal.
3. Connect the Fluke 77-IV Digital Multimeter positive lead to the battery positive (+) post. Connect the negative lead to the "M" terminal.



4. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.
5. If the voltage reading is 0.5 volt or less, go to the Starter Motor — Ground Circuit Component Test.
6. If the voltage reading is greater than 0.5 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the Fluke 77-IV Digital Multimeter negative lead to the starter solenoid "B" terminal and repeat the test. If the voltage reading at the "B" terminal is lower than 0.5 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.

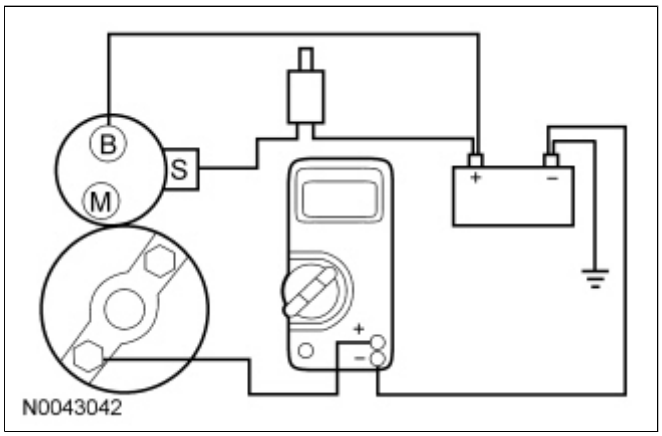
7. Remove the cables from solenoid "B", "S" and "M" terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.5 volt when checked at the "M" terminal and less than 0.5 volt when checked at the "B" terminal, the concern is in the solenoid contacts. Install a new starter motor.

8. If the voltage reading taken at the solenoid "B" terminal is still greater than 0.5 volt after cleaning the cables and the connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable. Refer to Section 414-01 .

Starter Motor — Ground Circuit Test

A no or slow crank condition can be caused by excessive resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the Fluke 77-IV Digital Multimeter positive lead to the starter motor housing (make sure the connection is clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

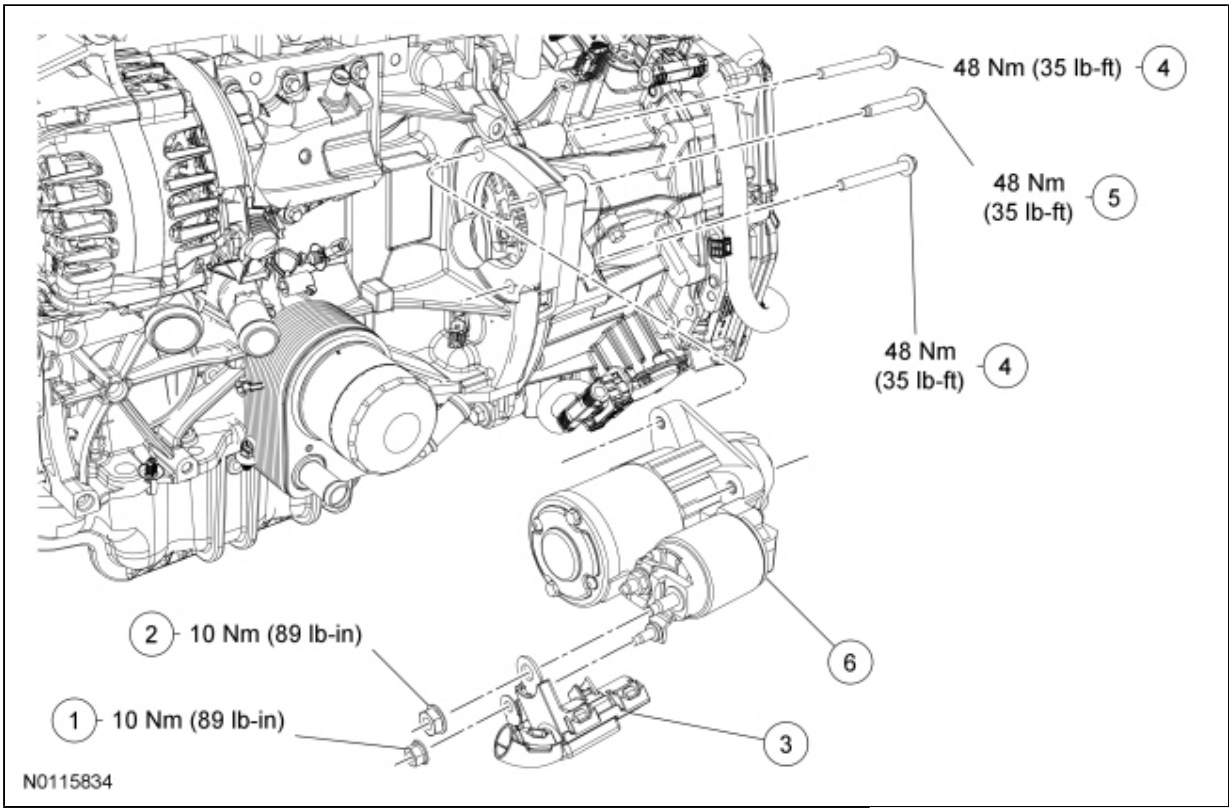


2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.

3. If the voltage is greater than 0.5 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connections. Retest.

4. If the voltage is greater than 0.5 volt, install a new negative battery cable. If the voltage reading is less than 0.5 volt and the engine still does not crank or cranks slowly, install a new starter motor.

Starter Motor



Item	Part Number	Description
1	W704141	Starter solenoid wire nut
2	W701596	Starter solenoid battery cable nut
3	14A240	Starter motor solenoid wire harness terminal cover
4	W702042	Starter motor bolt (if equiped with IB5 transmission)
4	W500132	Starter motor bolt (if equiped with DPS6 transmission)
5	W500125	Starter motor bolt (if equiped with IB5 transmission)
5	W709638	Starter motor bolt (if equiped with DPS6 transmission)
6	11000	Starter motor

Removal and Installation

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the starter solenoid wire nut.
   - To install, tighten to 10 Nm (89 lb-in).
4. Remove the starter solenoid battery cable nut and the starter motor solenoid wire harness terminal

cover.
    - To install, tighten to 10 Nm (89 lb-in).

5. Remove the bolts and the starter motor.
    - To install, tighten to 48 Nm (35 lb-ft).

6. To install, reverse the removal procedure.

Engine Ignition

The Electronic Ignition (EI) system consists of the:

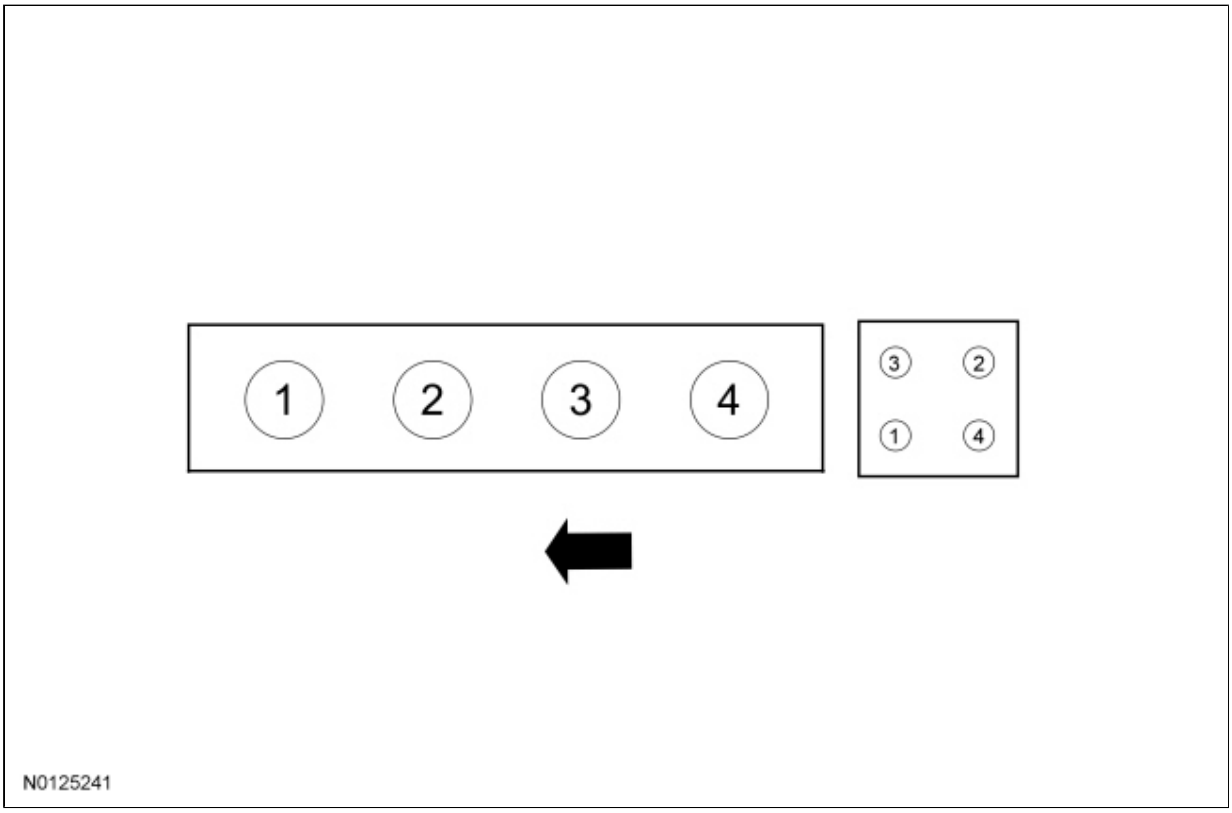
- ignition coil
- spark plug wires
- spark plugs

The ignition coil is controlled by the PCM and fires 2 spark plugs simultaneously.

The spark plug wires carry high voltage pulses from the ignition coil to the spark plugs.

The spark plug ignites the fuel and air mixture.

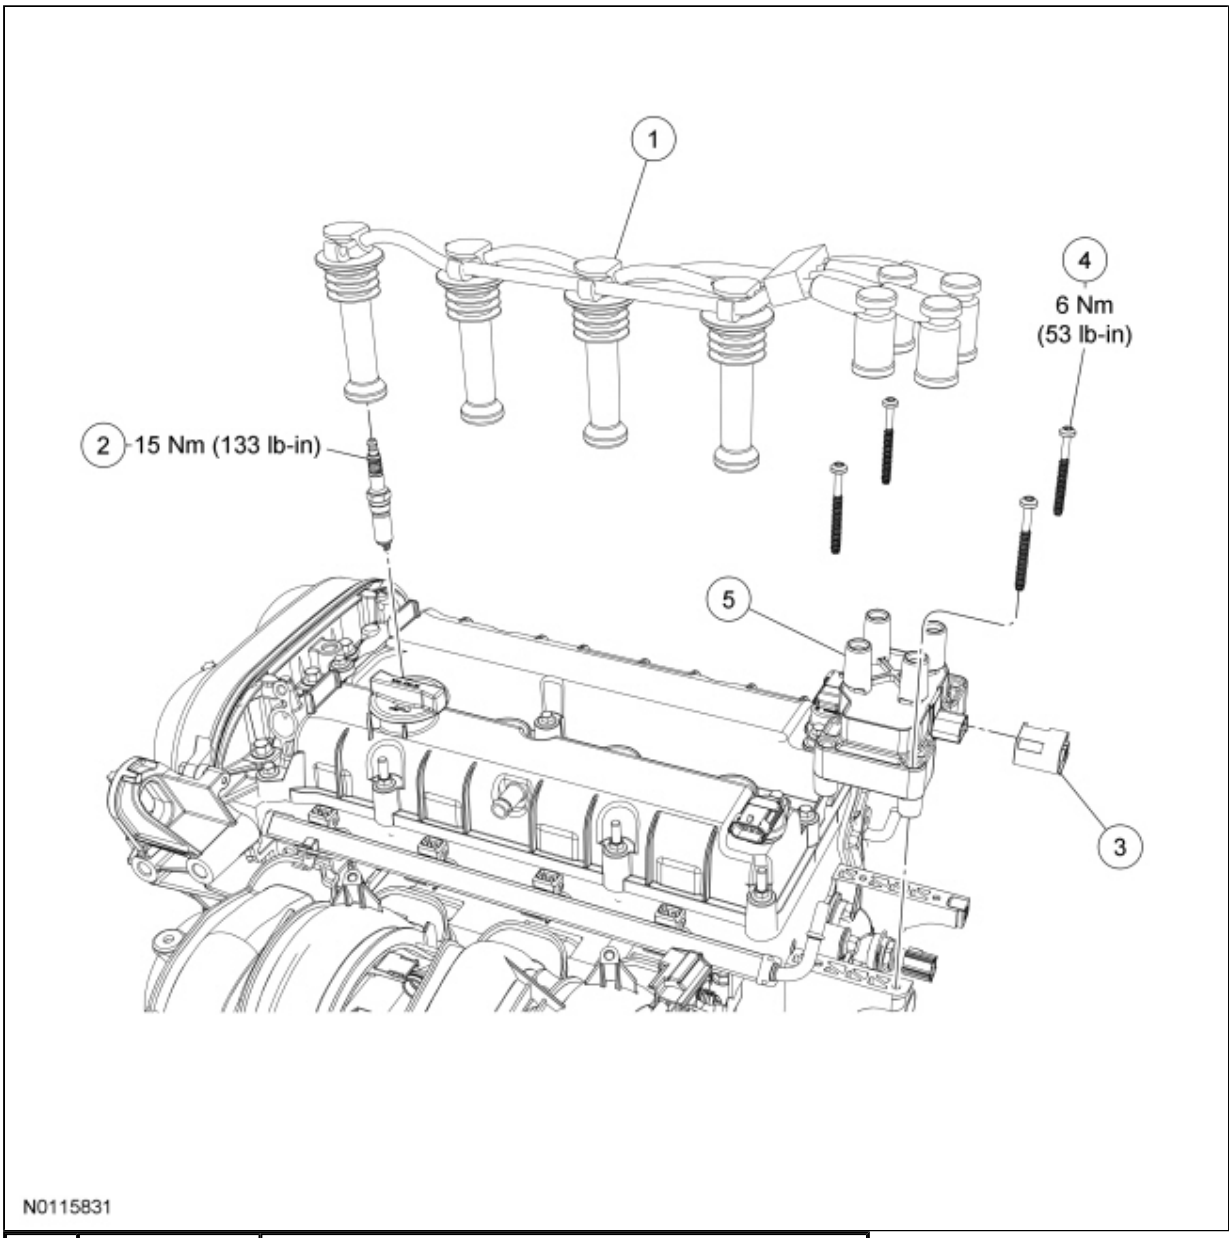
Coil Terminal-to-Cylinder Relationship



Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the ignition system.

Engine Ignition Components — Exploded View



Item	Part Number	Description
1	12280	Spark plug wire (4 required)
2	12405	Spark plug (4 required)

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Ignition Coil

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

1. ***NOTICE:*** **Spark plug wires must be connected correctly. For additional information, refer to the Coil Terminal-to-Cylinder Relationship illustration in the Description and Operation, Engine Ignition portion of this section. Failure to follow this instruction may result in poor engine performance.**

   NOTICE: **Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.**

   Disconnect the spark plug wires from the ignition coil by slightly twisting while pulling upwards.

2. Disconnect the ignition coil electrical connector.

3. Remove the 4 ignition coil bolts.
   - To install, tighten to 6 Nm (53 lb-in).

4. Remove the ignition coil.

5. **NOTE:** Wipe the coil towers with a clean cloth dampened with soap and water. Remove any soap film and dry with compressed air. Inspect for cracks, carbon tracking and dirt.

   To install, reverse the removal procedure.
   - Apply silicone dielectric compound to the inside of the spark plug wire boots prior to installation.

Spark Plugs

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

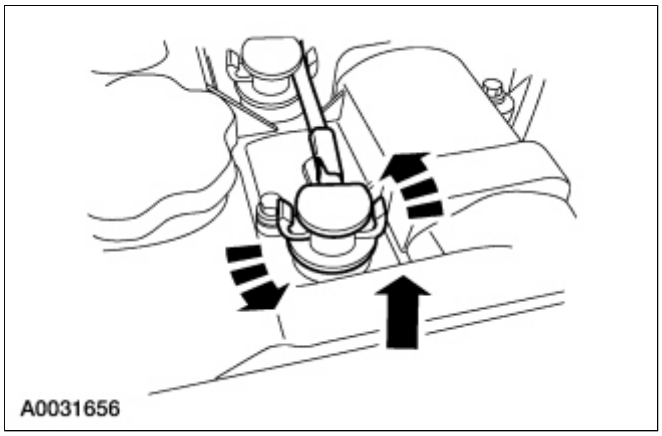
Removal and Installation

1. Detach the spark plug wire if routed through another spark plug wire.

2. ***NOTICE:*** **Spark plug wires must be connected correctly. For additional information, refer to the Coil Terminal-to-Cylinder Relationship illustration in the Description and Operation, Engine Ignition portion of this section. Failure to follow this instruction may result in poor engine performance.**

   NOTICE: **Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.**

   Disconnect the spark plug wires from the spark plugs by slightly twisting while pulling upwards.



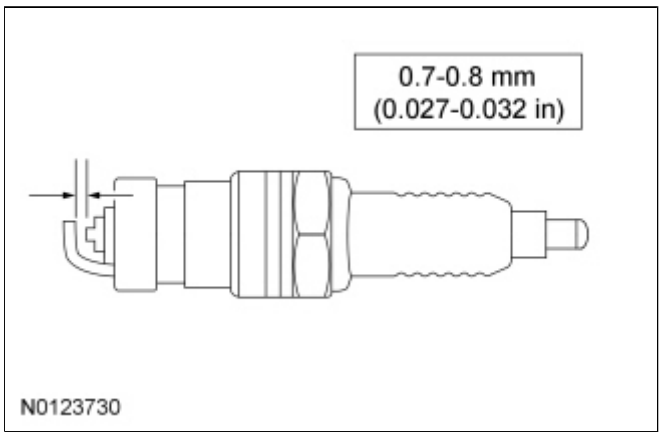
3. **NOTE:** Remove any foreign material with compressed air.

Remove the spark plugs.

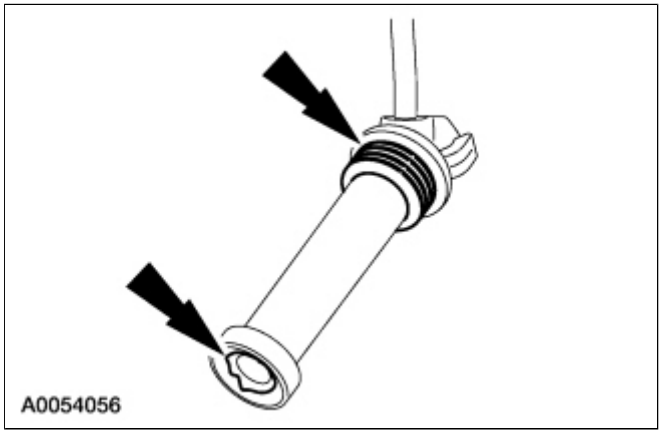
- To install, tighten to 15 Nm (133 lb-in).

4. Inspect the spark pugs. For additional information refer to the Spark Plug Inspection procedure in Section 303-00 .

5. Check and adjust the spark plug gap as necessary.



6. To install, reverse the removal procedure.
   - Apply silicone dielectric compound to the locations shown.



Spark Plug Wires

Torque Specifications

Description	Nm	lb-in
Crankcase vent oil separator bolts	9	80

Engine Emission Control

Crankcase Ventilation

System Overview

NOTE: The vehicle emission vacuum routing diagrams are contained in the Description and Operation subsection of Evaporative Emissions. Refer to Section 303-13 .

NOTE: Do not permanently remove or render inoperative any part of the vehicle emission control system including related hardware. Failure to comply may violate applicable state and federal laws.

The crankcase ventilation system gathers blow-by vapors from the crankcase and returns them to the intake manifold and air cleaner for combustion.

Component List

The crankcase ventilation system consists of the following components:

- a crankcase vent oil separator located on the engine block
- a valve cover vent hose connected to the air cleaner
- a crankcase vent oil separator hose connected to the intake manifold
- a crankcase pressure regulator located inside the crankcase vent oil separator housing

System Components

The crankcase vent oil separator removes vaporized oil from the blow-by vapors and returns the separated oil to the crankcase.

The crankcase pressure regulator controls the return of the blow-by pressure to the intake manifold through the crankcase vent oil separator hose.

The valve cover vent hose vents excessive crankcase pressure to the air cleaner and allows fresh air into the crankcase to prevent premature degradation of the engine oil.

System Operation

During high intake manifold vacuum situations the blow-by pressure flows through the crankcase pressure regulator and is returned to the intake manifold through the crankcase vent oil separator hose. During low intake manifold vacuum situations the crankcase pressure regulator restricts flow to the intake manifold causing blow-by pressure to flow through the valve cover vent hose to the air cleaner.

Engine Emission Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Crankcase Vent Oil Separator

Removal and Installation

NOTICE: **Clean and inspect the crankcase vent oil separator for damage prior to installation. The crankcase vent oil separator gasket cannot be reused and must be replaced prior to installation of the crankcase vent oil separator.**

1. Remove the intake manifold. For additional information, refer to Section 303-01 .

2. Remove the crankcase vent oil separator hose.

3. Remove the 7 bolts and the crankcase vent oil separator.
   - Remove and discard the crankcase vent oil separator gasket.

4. To install, reverse the removal procedure.
   1. Install a new crankcase vent oil separator gasket.
   2. Tighten the 7 crankcase vent oil separator bolts to 9 Nm (80 lb-in).

3	6N664	Crankcase vent oil separator hose
4	W500214	Crankcase vent oil separator bolt (7 required)

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Torque Specifications

Description	Nm	lb-in
Air Cleaner (ACL) cover screws	2	18
ACL outlet pipe clamps	3	27

Intake Air Distribution and Filtering

The air intake system consists of the following:

- Air Cleaner (ACL)
- ACL element
- Mass Air Flow (MAF) sensor
- ACL outlet pipe

The air intake system:

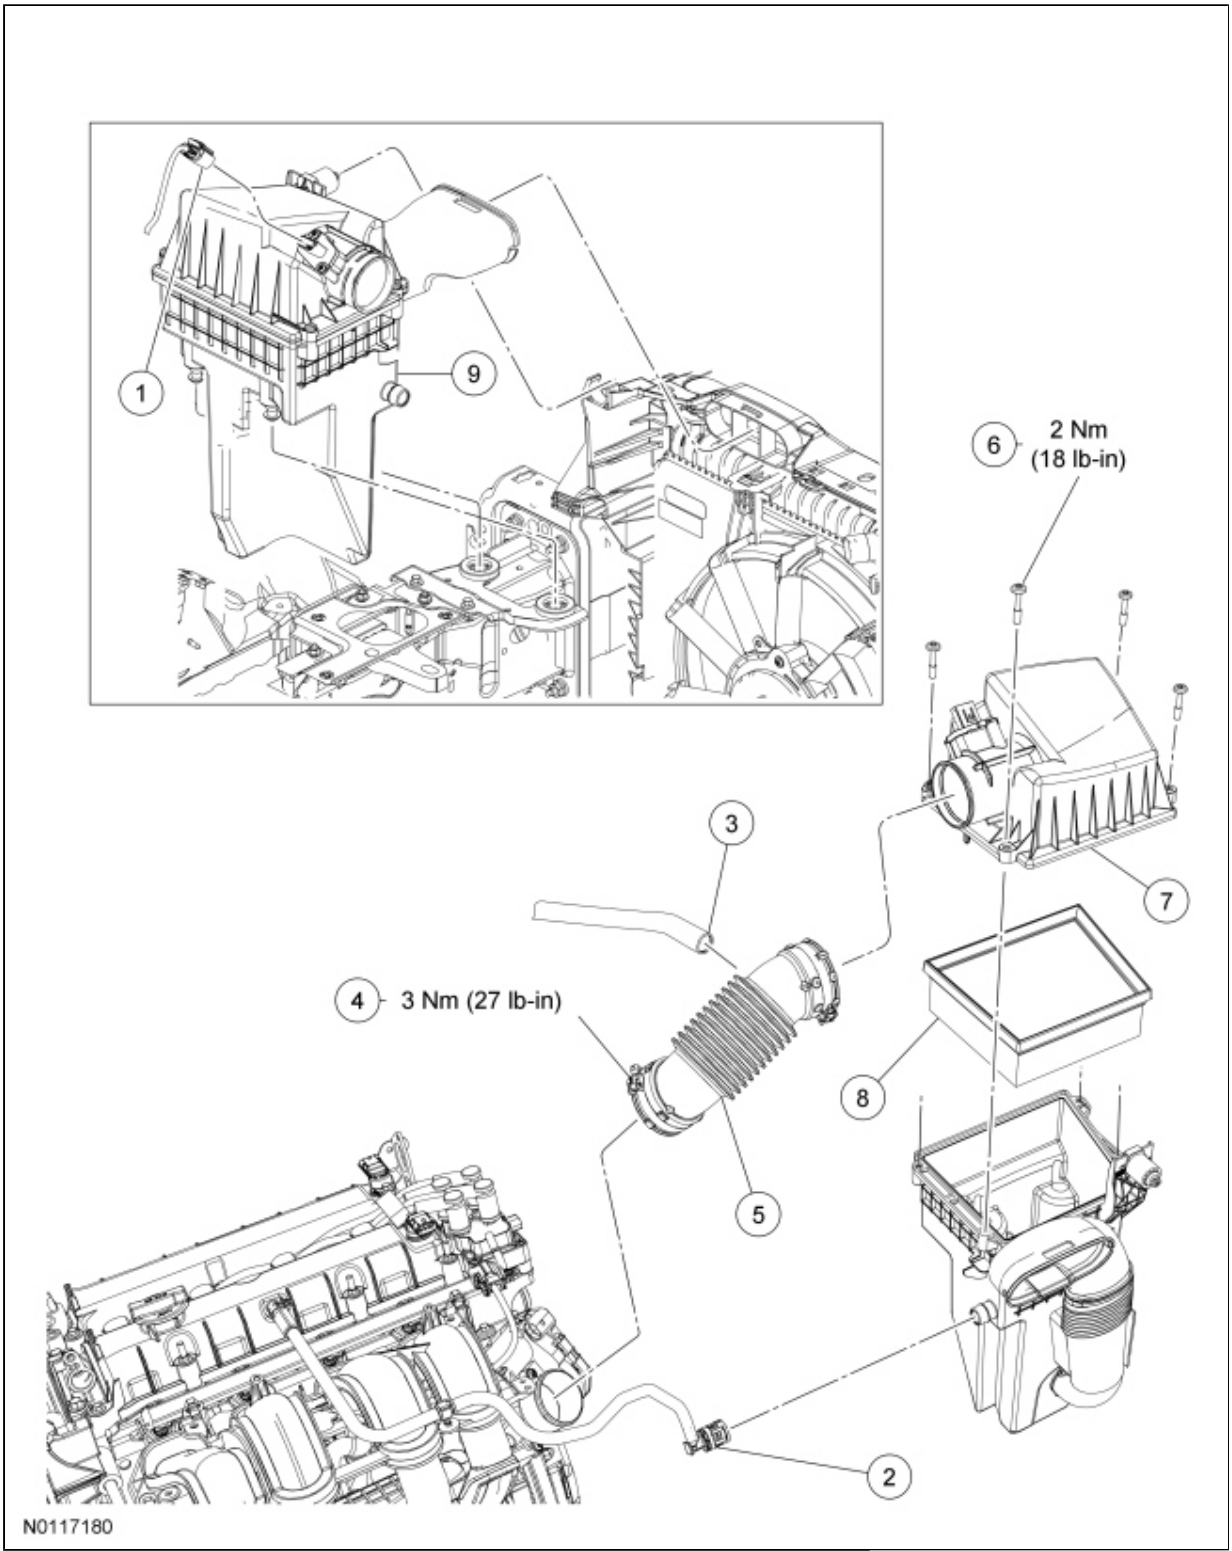
- cleans intake air with an ACL element.
- measures airflow with a MAF sensor.

The ACL contains an ACL element made of treated, pleated paper. A new ACL element must be installed periodically as scheduled. Engine performance and fuel economy are adversely affected when maximum restriction of the ACL element is reached.

Intake Air Distribution and Filtering

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Intake Air System Components — Exploded View



Item	Part Number	Description

Torque Specifications

Description	Nm	lb-in
Evaporative Emission (EVAP) canister nuts	7	62
EVAP canister purge valve bolt	9	80
Natural vacuum leak detection module nut	7	62

Evaporative Emissions

The Evaporative Emission (EVAP) system consists of the:

- EVAP canister.
- EVAP canister purge valve.
- fuel tank.
- fuel vapor tubes
- natural vacuum leak detection module.

The EVAP system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister that are generated during vehicle operation hot soak or vehicle refueling, until they can be consumed by the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.

The fuel vapors are routed:

- to the EVAP canister through a vapor tube.
- to the engine when the EVAP canister purge valve is opened.

The EVAP canister:

- is located under the rear of the vehicle.
- contains activated carbon.
- stores fuel vapors.

The EVAP canister purge valve:

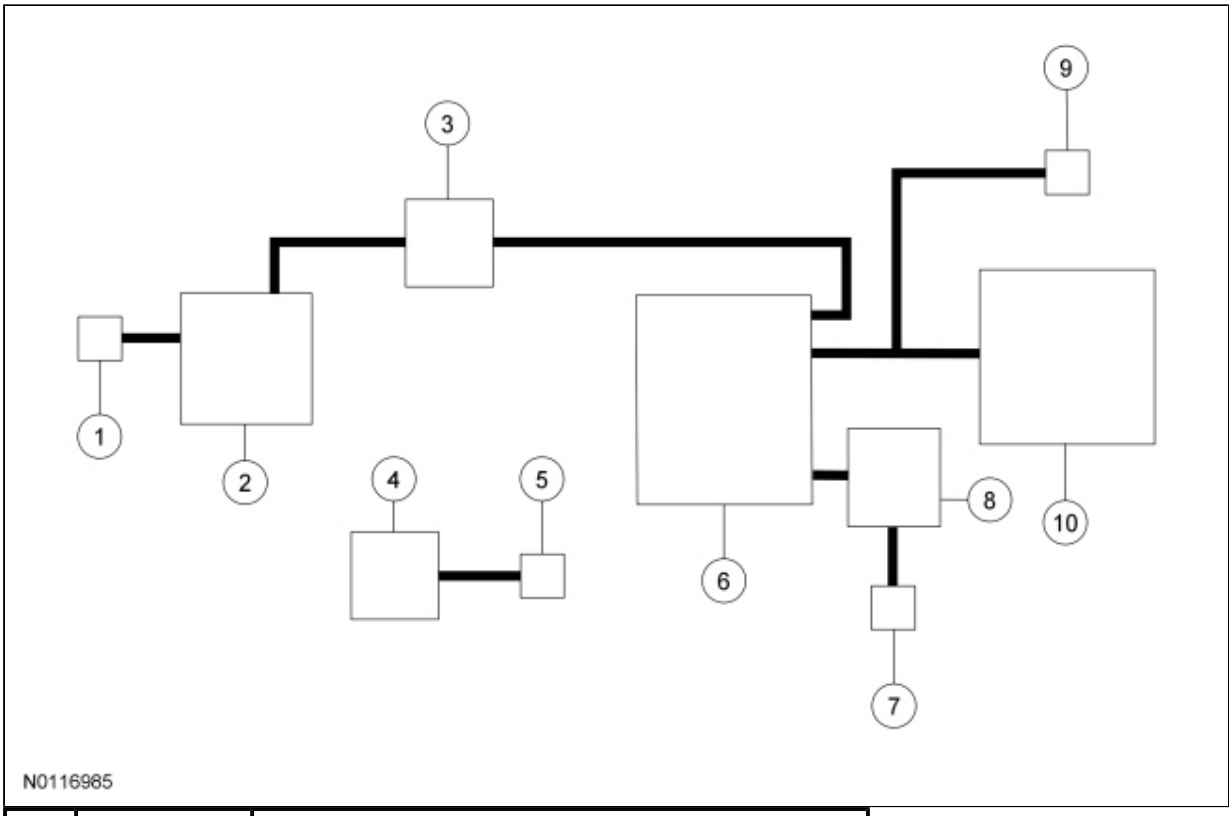
- is normally closed.
- regulates the purging of the EVAP canister.

The natural vacuum leak detection module:

- completes a series of checks to confirm the integrity of the enhanced EVAP system components in the engine running state and the ignition OFF state.

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for additional information on the EVAP system.

Vehicle Emission Vacuum Routing



Item	Part Number	Description
1	6A666	PCV valve
2	9425	Intake manifold
3	9C047	Evaporative Emission (EVAP) canister purge valve
4	6582	Valve cover
5	9R504	Air Cleaner (ACL) outlet tube
6	9D653	EVAP canister
7	9G297	Fresh air hose
8	9A228	Natural vacuum leak detection module
9	9034	Fuel tank filler pipe
10	9002	Fuel tank

Evaporative Emissions

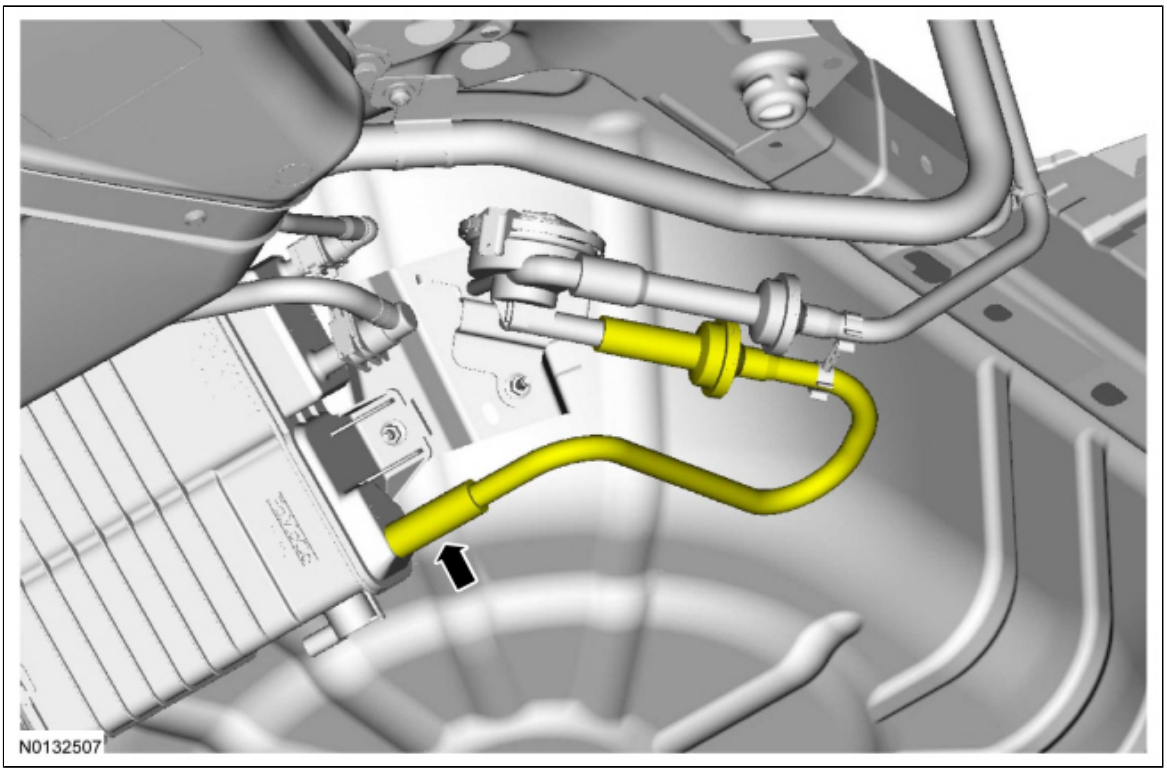
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Evaporative Emission System Leak Test

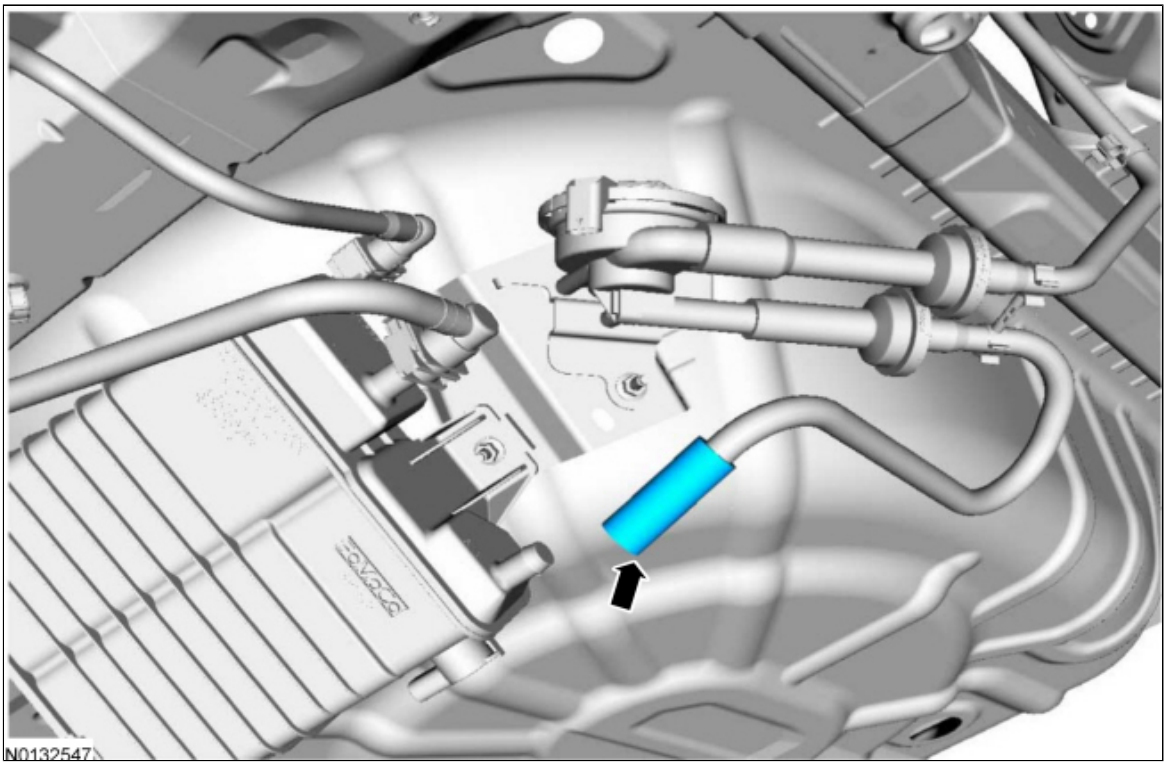
Special Tool(s)

ST2817-A	VACUTEC Smoke Machine Fuel EVAP Emissions System Tester 218-0002 or equivalent

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the natural vacuum leak detection module hose from the carbon canister.



3. Connect the VACUTEC Smoke Machine Fuel EVAP Emissions System Tester to the carbon canister port, use a suitable adapter hose. For additional information refer to the manufacturer's instructions.



4. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter into the Easy Fuel ^{TM} (capless) fuel tank filler pipe assembly.

5. **NOTE:** Direct smoke to the carbon canister port only. Smoke directed towards the natural vacuum leak detection module or filter may cause damage and/or restrict vapor lines

   Introduce smoke from the VACUTEC Smoke Machine Fuel EVAP Emissions System Tester into the EVAP system and verify that smoke is exiting the fuel tank filler pipe neck area. For additional information, refer to the manufacturer's instructions.

6. Remove the supplemental refueling adapter once smoke is observed exiting the fuel tank filler pipe neck area.

7. Continue to enter smoke into the system for 60 seconds to obtain pressure.

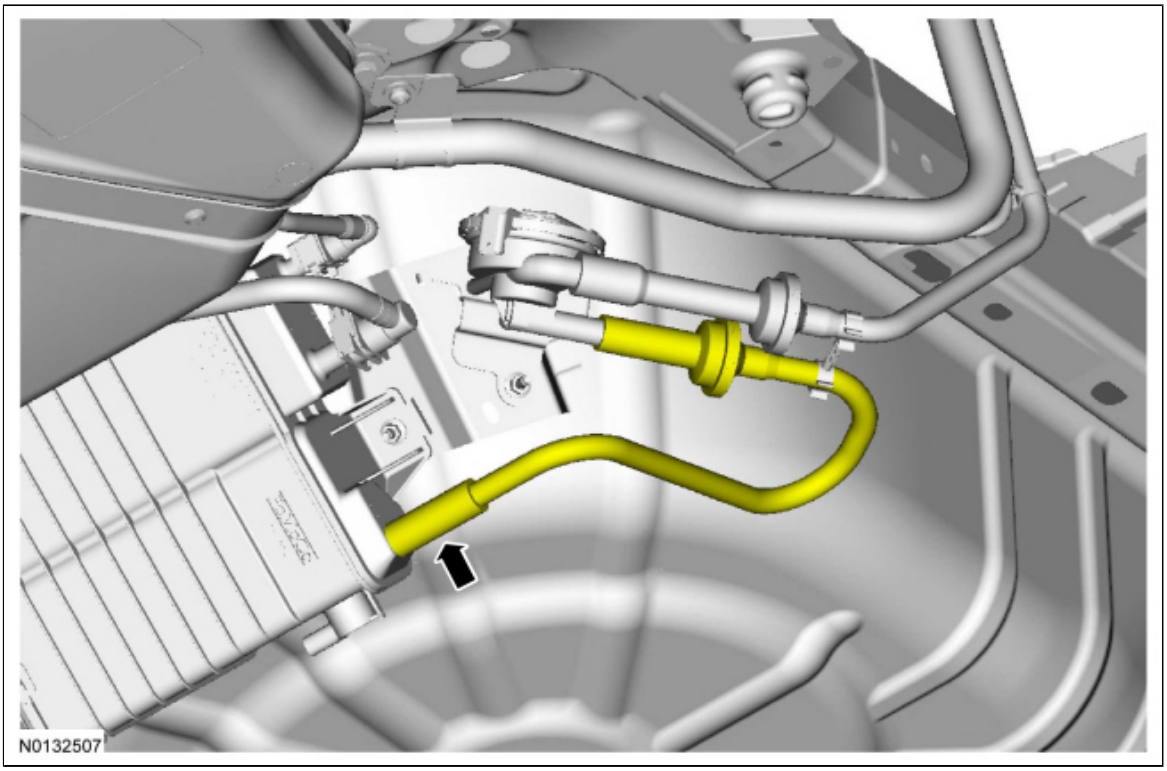
8. Press and release the remote start button in intervals of 15 seconds ON and 15 seconds OFF while checking for exiting smoke.

9. Use the halogen light provided with the VACUTEC Smoke Machine Fuel EVAP Emissions System Tester to follow the EVAP system path and look for smoke exiting at the source of the leak(s).

10. If smoke is observed at:
    - the capless fuel fill insert, clean capless insert (per SSM 21018). If leak persists, replace the fuel filler pipe assembly.
    - a vapor tube joint, disconnect and reconnect the components. If leak persists, replace both components that make up the joint.

11. **NOTE:** If the vehicle fails the IDS leak verification test but a leak cannot be found using the smoke machine, replace the natural vacuum leak detection module and fresh air hose assemblies.

    After smoke testing is completed, reconnect the natural vacuum leak detection module vapor hose to the carbon canister.



12. Re-run the IDS leak verification test to confirm the source of the leak has been corrected.

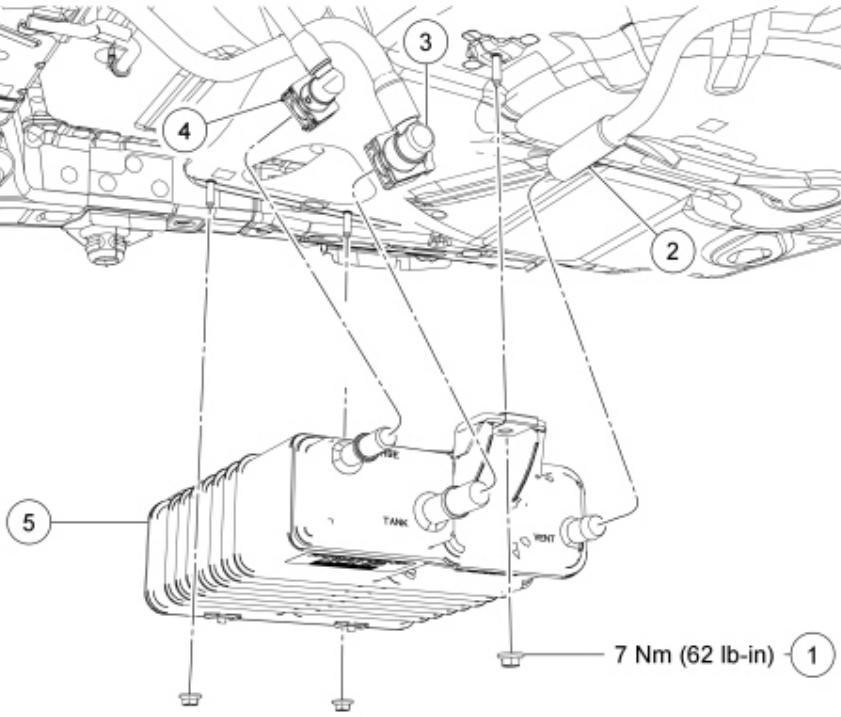
2	—	Intake manifold fitting (part of 9424)
3	9L291	Fuel vapor tube
4	—	EVAP canister purge valve electrical connector (part of 12B581)
5	W700475	Wiring harness retainer (part of 12B581)
6	—	Vacuum hose retainer (part of 19048)

7	W500213	EVAP canister purge valve bolt

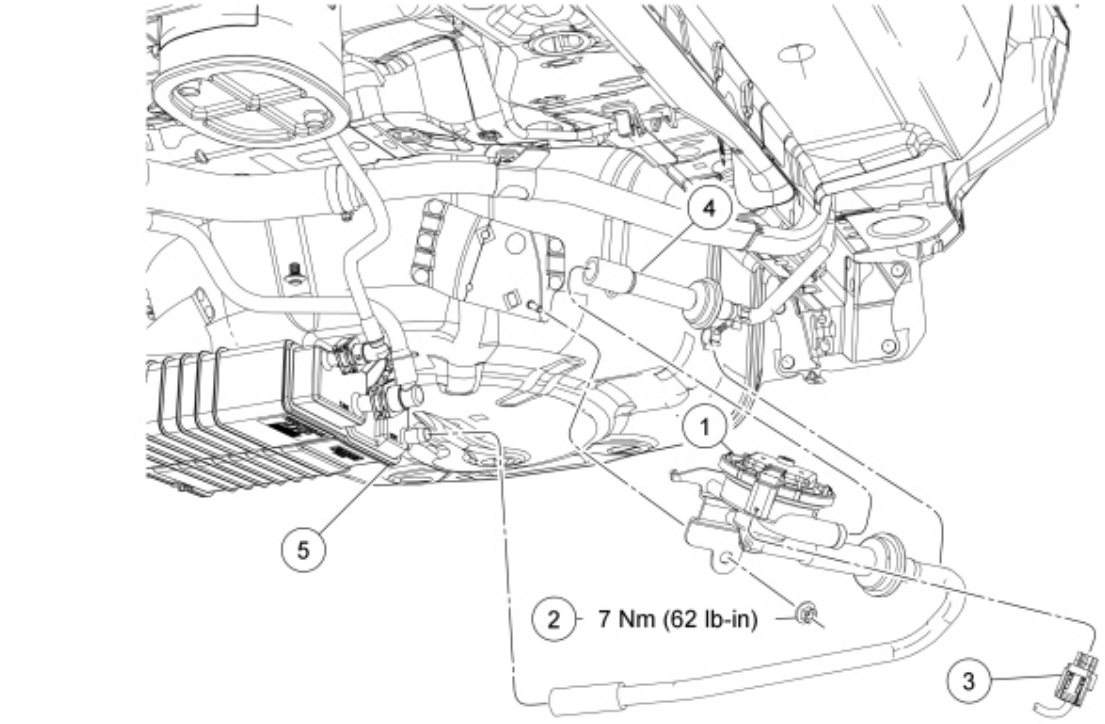
Evaporative Emission (EVAP) Canister

NOTE: Five door vehicle shown, four door vehicle similar.



Item	Part Number	Description
1	W707142	Evaporative Emission (EVAP) canister nut (3 required)
2	—	EVAP hose (part of 9A228)
3	9B033	Fuel vapor tube (to fuel tank)
4	9B337	Fuel vapor tube (to canister purge valve)
5	9D653	EVAP canister

Natural Vacuum Leak Detection Module

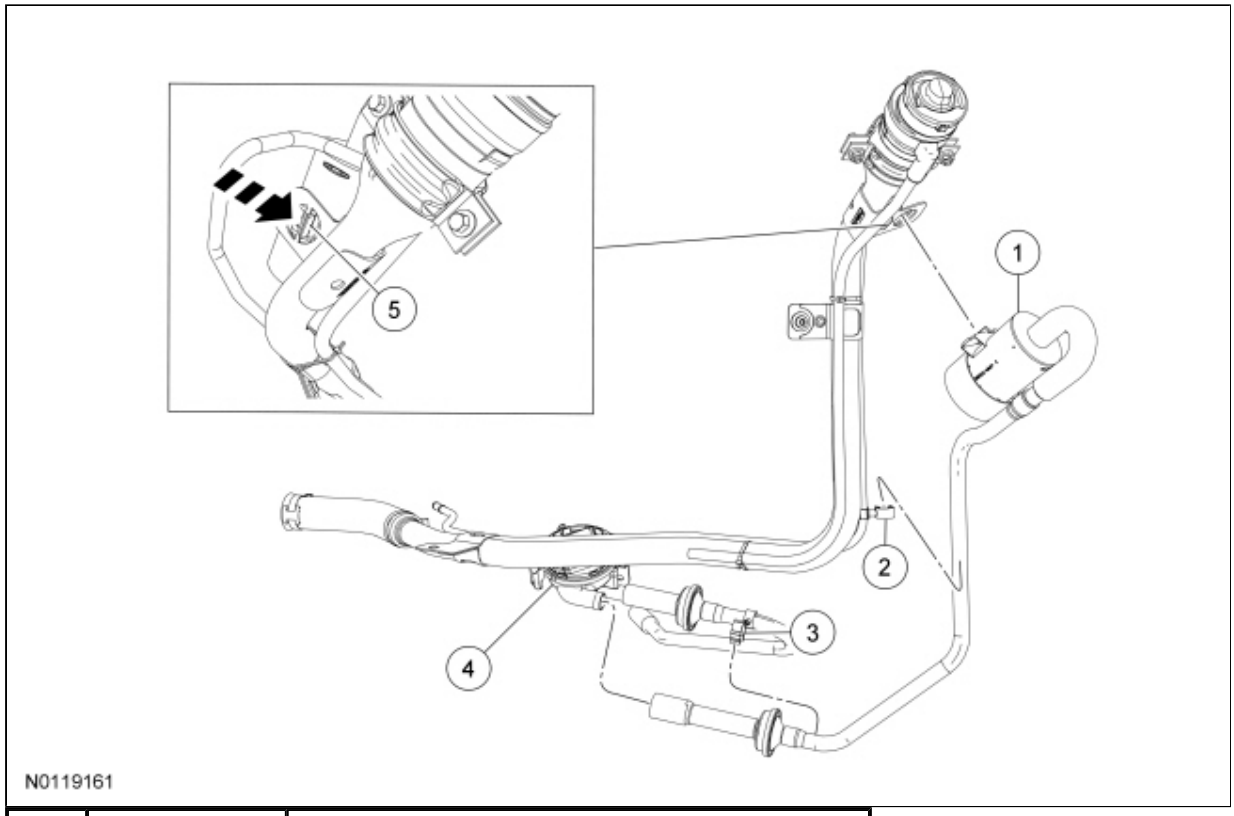


Item	Part Number	Description
1	9J279	Natural vacuum leak detection module
2	W707142	Natural vacuum leak detection module nut
3	—	Natural vacuum leak detection module electrical connector (part of 14A005)
4	9G297	Fresh air hose
5	9D653	EVAP canister

Evaporative Emission (EVAP) Fresh Air Hose

NOTE: The LH wheel liner must be positioned aside to access the fresh air hose.

NOTE: Press the release tab to disengage the fresh air hose from the fuel filler pipe bracket.



Item	Part Number	Description
1	9G297	Fresh air hose
2	W715398	Fresh air hose retainer
3	—	Hose retainer (part of 9A228)
4	9J279	Natural vacuum leak detection module
5	—	Fresh air hose release tab (part of 9G297)

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: After installing an Evaporative Emission (EVAP) canister or Evaporative Emission (EVAP) canister purge valve, carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

PCM cover bolt	5.4	47.8
Variable Camshaft Timing (VCT) oil control solenoid	8	71

[a] Refer to the procedure for the specification.

Electronic Engine Controls

The electronic engine controls consist of the following:

- PCM
- Camshaft Position (CMP) sensor (2 required)
- Clutch Pedal Position (CPP) switch (manual transmission only)
- Crankshaft Position (CKP) sensor
- Mass Air Flow (MAF) sensor
- Heated Oxygen Sensor (HO2S)
- Catalyst Monitor Sensor (CMS)
- Knock Sensor (KS) (2 required)
- Engine Coolant Temperature (ECT) sensor
- Variable Camshaft Timing (VCT) oil control solenoid (2 required)

The PCM:

- accepts input from various engine sensors and generates output signals to control fuel injection, ignition and emissions.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CPP sensor:

- sends a signal through the instrument cluster to the PCM. The PCM needs this signal to improve engine running performance during gear changes.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.

The MAF sensor:

- uses a hot-film element to measure the amount of air entering the engine.

The HO2S :

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The CMS :

- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The KS :

- is used to detect engine detonation.

- sends a voltage signal to the PCM.

The ECT sensor:

- sends the PCM a signal indicating engine coolant temperature.
- voltage decreases as coolant temperature increases.

The VCT oil control solenoid:

- is an electronic solenoid that actuates the flow of oil to the variable camshaft. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for additional information on electronic engine control components.

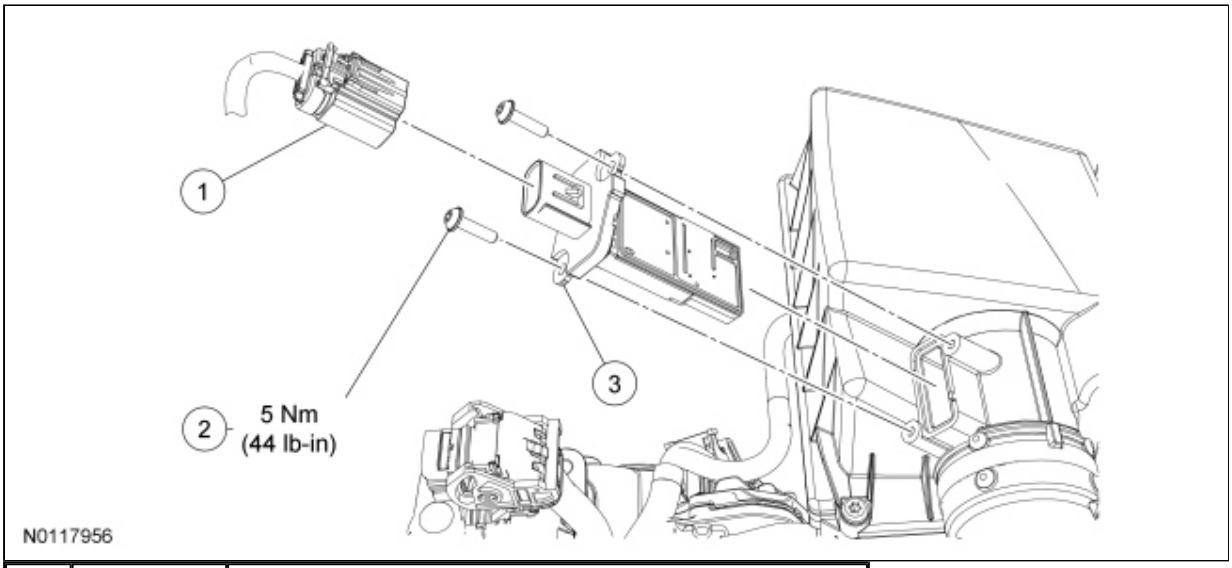
Mass Air Flow (MAF) Sensor



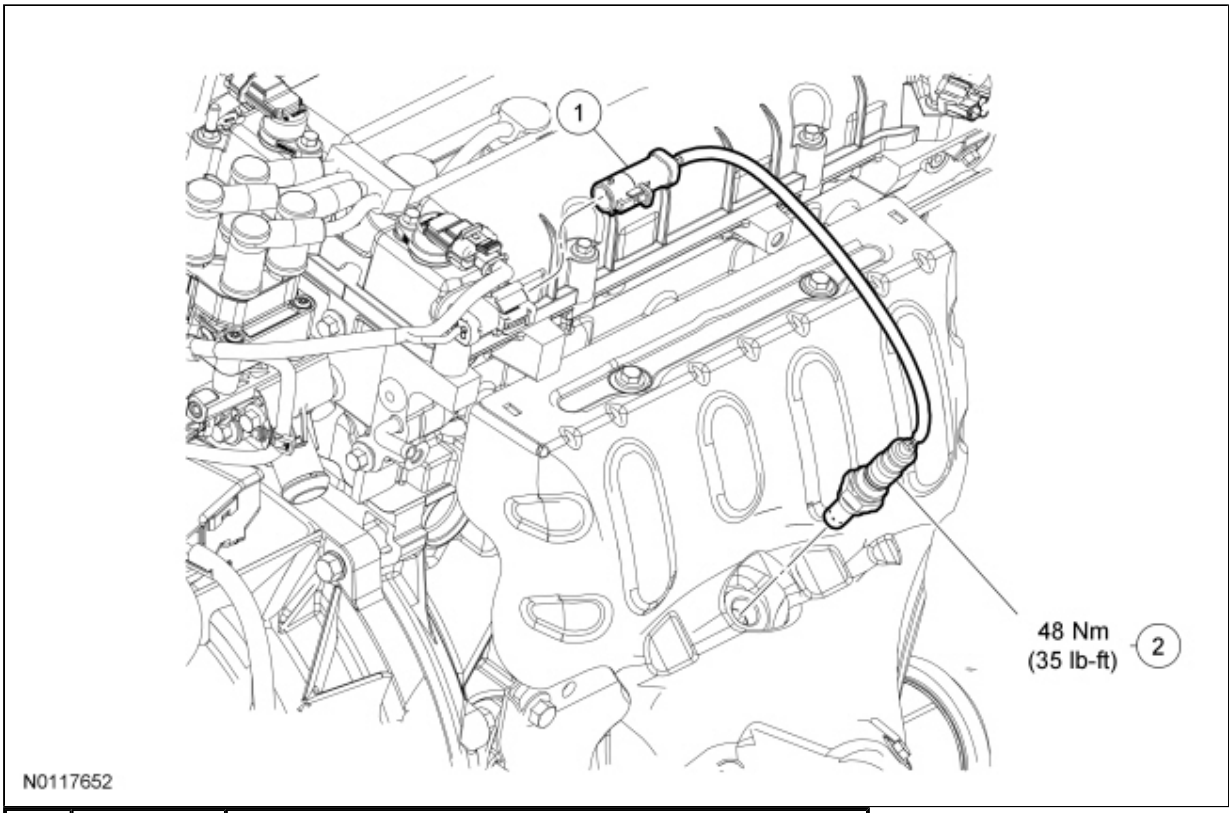
Item	Part Number	Description
1	—	Mass Air Flow (MAF) sensor electrical connector (part of 12B581)
2	—	MAF sensor screw (2 required)
3	12B579	MAF sensor

Heated Oxygen Sensor (HO2S) Sensor

NOTE: If necessary, lubricate the HO2S with penetrating and lock lubricant to assist in removal.

NOTE: Apply anti-seize to the threads of the HO2S prior to installing.

NOTE: The correct torque wrench setting must be calculated when using a commercially available exhaust gas sensor socket to install the HO2S . Refer to the Torque Wrench Adapter Formulas in the Appendix.



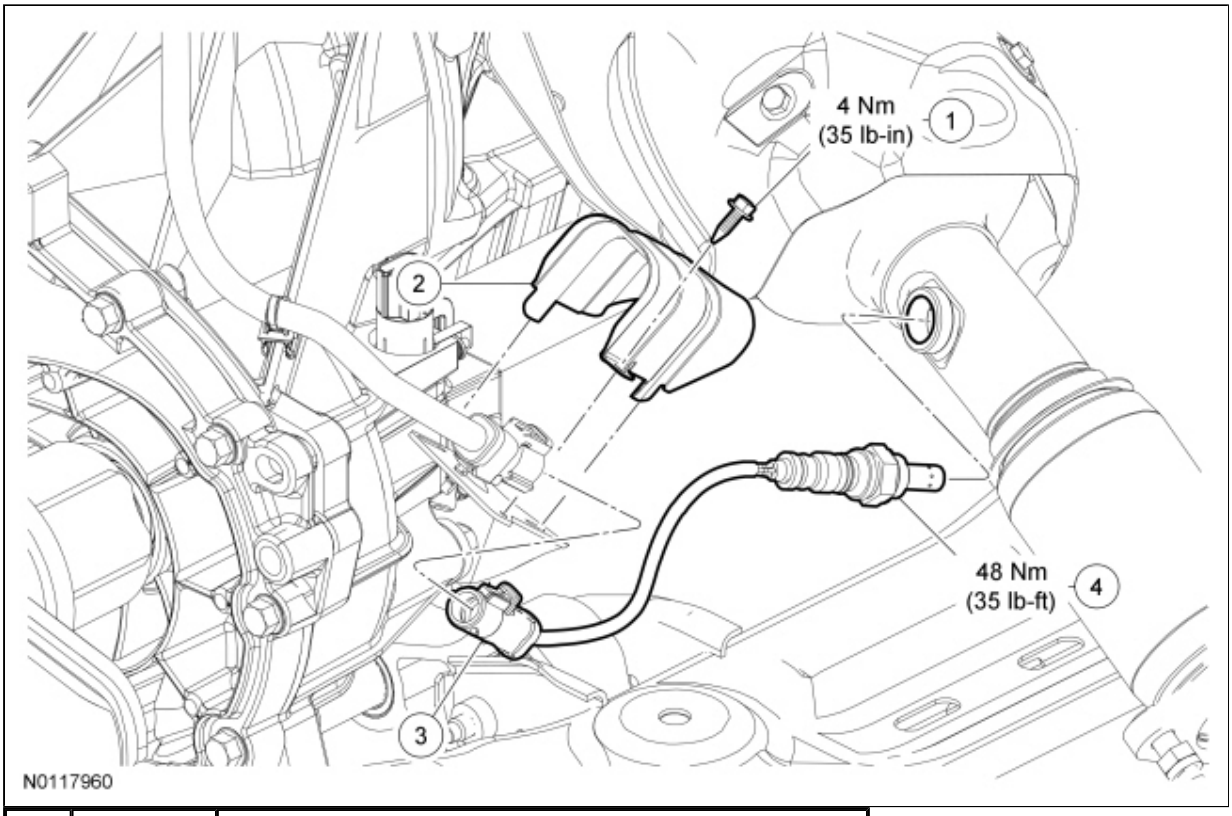
Item	Part Number	Description
1	—	Heated Oxygen Sensor (HO2S) electrical connector (part of 9G444)
2	9G444	HO2S

Catalyst Monitor Sensor (CMS)

NOTE: If necessary, lubricate the CMS with penetrating and lock lubricant to assist in removal.

NOTE: Apply anti-seize to the threads of the CMS prior to installing.

NOTE: The correct torque wrench setting must be calculated when using a commercially available exhaust gas sensor socket to install the CMS . Refer to the Torque Wrench Adapter Formulas in the Appendix.

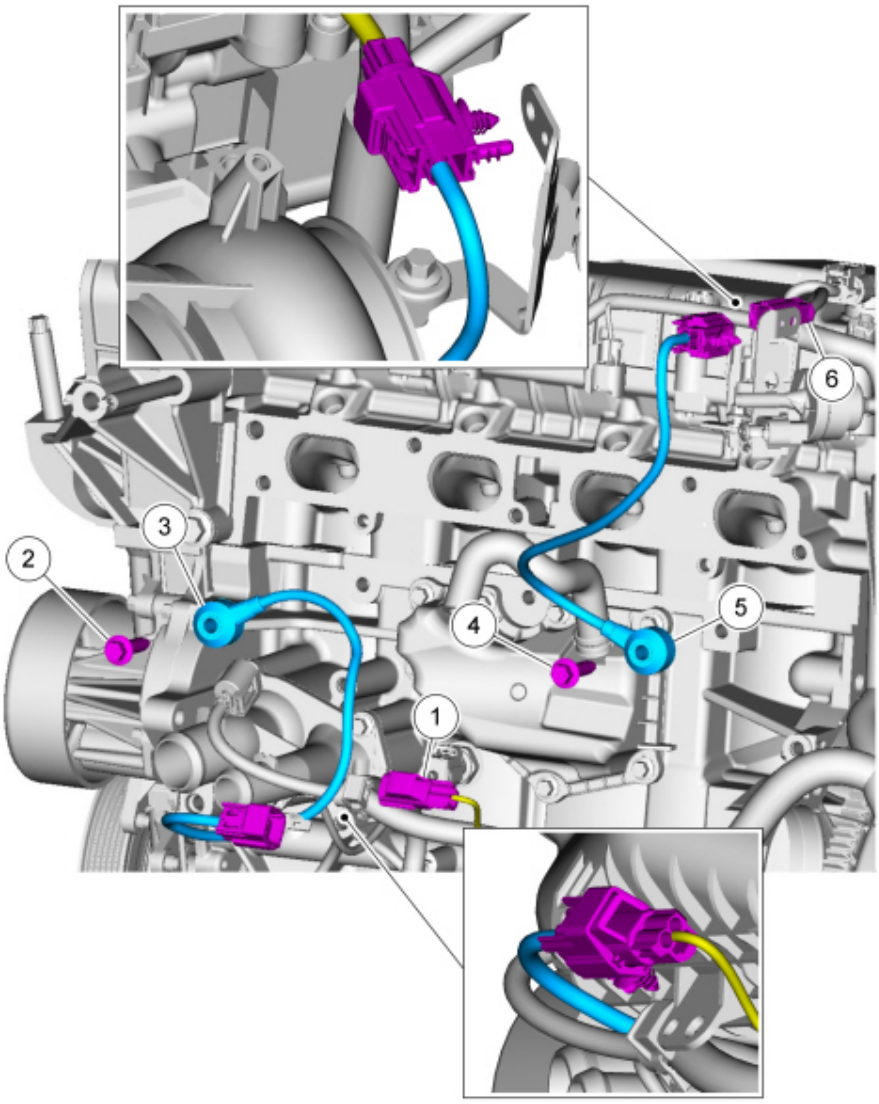


Item	Part Number	Description
1	W705981	Catalyst Monitor Sensor (CMS) electrical connector heat shield screw (manual transmission only)
2	14A163	CMS electrical connector heat shield (manual transmission only)
3	—	CMS electrical connector (part of 12B581)
4	9F472	CMS

Knock Sensor (KS)

NOTICE: **The RH Knock Sensor (KS) must be installed in the 2 o'clock position and the LH KS must be installed in the 11 o'clock position. Failure to follow these instructions may result in damage to the engine.**

NOTE: The intake manifold must be removed to access the KS . For additional information, refer to Section 303-01 .



N0124080

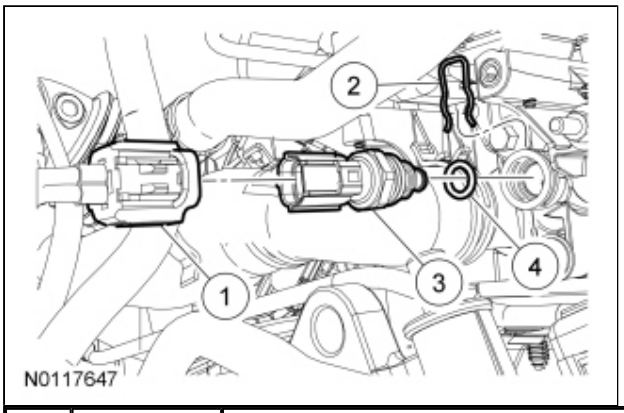
Item	Part Number	Description
1	—	RH Knock Sensor (KS) electrical connector (part of 12B581)
2	W500225	RH KS bolt - 20 Nm (177 lb-in)
3	12A699	RH KS
4	W500225	LH KS bolt - 20 Nm (177 lb-in)
5	12A699	LH KS
6	—	LH KS electrical connector (part of 12B581)

Engine Coolant Temperature (ECT) Sensor

NOTE: Drain the engine cooling system prior to removal of the ECT sensor.

NOTE: Fill and bleed the engine cooling system after installing the ECT sensor.

NOTE: The ignition coil must be removed to access the ECT sensor. For additional information, refer to Section 303-07 .

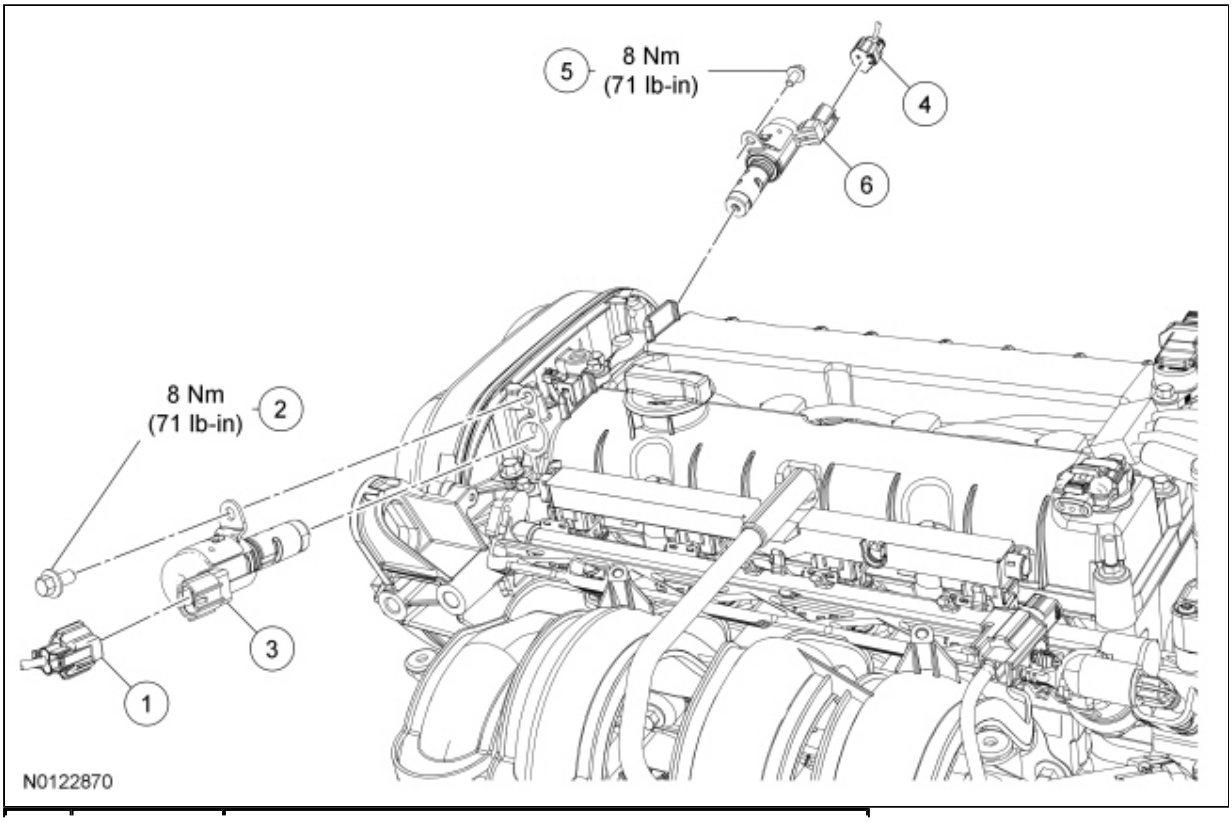


Item	Part Number	Description
1	—	Engine Coolant Temperature (ECT) sensor electrical connector (part of 12B581)
2	W703355	ECT sensor retaining clip
3	12A648	ECT sensor
	—	Engine Coolant Temperature (ECT) sensor O-ring seal (part of 12A648)

Variable Camshaft Timing (VCT) Oil Control Solenoid

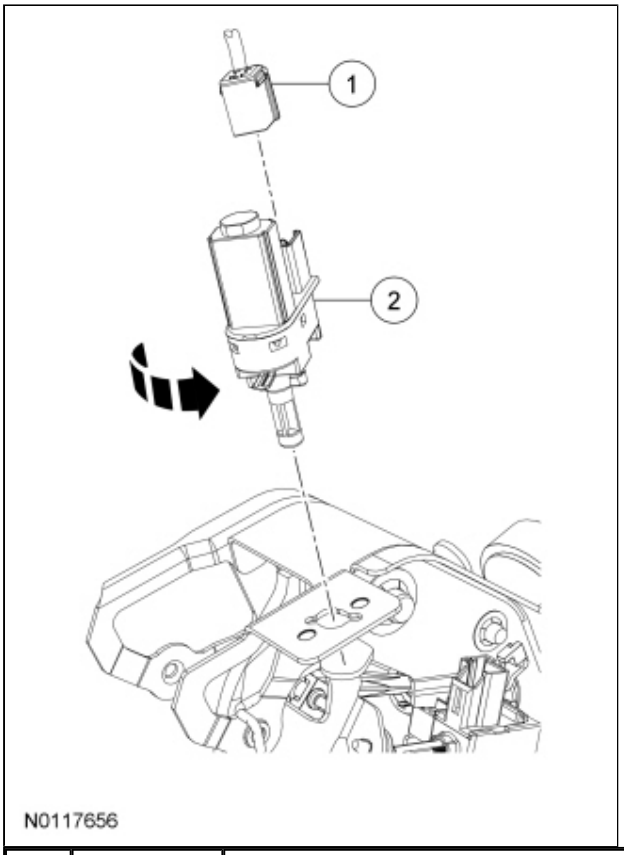
NOTE: Intake solenoid shown, exhaust solenoid similar.

NOTE: Lubricate the O-ring seals with clean engine oil.



Item	Part Number	Description
1	—	LH Variable Camshaft Timing (VCT) oil control solenoid electrical connector
2	W500011	VCT oil control solenoid bolt (2 required)
3	6L713	VCT oil control solenoid (2 required)

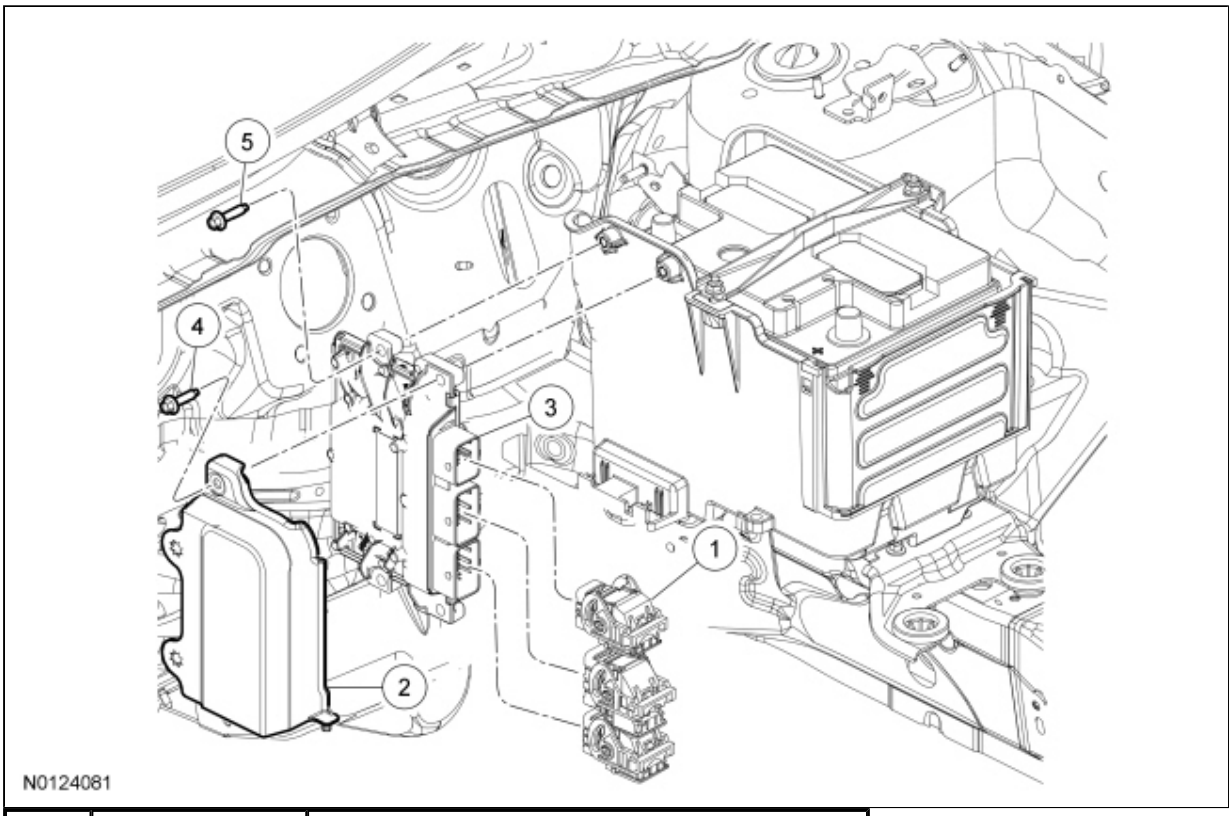
Clutch Pedal Position (CPP) Switch



Item	Part Number	Description
1	—	Clutch Pedal Position (CPP) switch electrical connector (part of 14290)
2	11A152	CPP switch

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Powertrain Control Module (PCM)



Item	Part Number	Description
1	—	PCM electrical connector (3 required)
2	12C514	PCM cover
3	12A650	PCM
4	W700005	PCM cover bolt - 5.4 Nm (47.8 lb-in)
3	W700005	PCM bolt - 5.4 Nm (47.8 lb-in)

Removal

1. **NOTE:** PCM installation DOES NOT require new keys or programming of keys, only a Parameter Reset of the Passive Anti-Theft System (PATS).

   Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

2. Remove the bolt and the PCM cover.

3. Disconnect the 3 PCM electrical connectors.

4. Remove the bolt and the PCM.

Installation

1. ***NOTICE:*** **The PCM and PCM cover can be easily damaged by excessive fastener torque. Do not exceed 5.4 Nm (47.8 lb-in).**

   Position the PCM and install the bolt.

- Tighten to 5.4 Nm (47.8 lb-in).

2. Connect the 3 PCM electrical connectors.

3. ***NOTICE:*** **The PCM and PCM cover can be easily damaged by excessive fastener torque. Do not exceed 5.4 Nm (47.8 lb-in).**

   Position the PCM cover and install the bolt.
   - Tighten to 5.4 Nm (47.8 lb-in).

4. **NOTE:** If the Programmable Module Installation (PMI) procedure was not successful in downloading the data from the vehicles original PCM, then the oil life data of the vehicle is lost. If this occurs, and the oil life cannot be determined through service history or customer interview, it is recommended the vehicle engine oil and filter be changed and the oil change minder reset.

   Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

5. Reprogram the PATS . Carry out the Parameter Reset procedure. For additional information, refer to Section 419-01B .

Alignment Specifications

NOTE: All alignment specifications are with the vehicle fuel tank full.

Rear	39 mm (1.535 in) ± 9 mm (0.354 in)

Torque Specifications

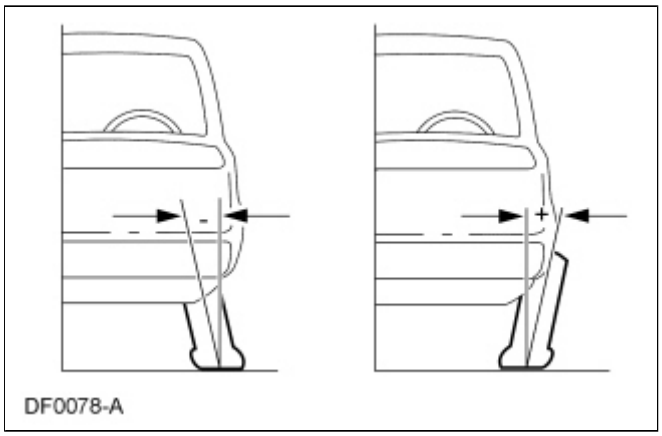
Description	Nm	lb-ft
Tie-rod end jam nut	85	63

Wheel Alignment Angles

Camber

NOTE: Wheel alignment angles can be affected by subframe position. Subframe alignment may be necessary if wheel alignment cannot be achieved.

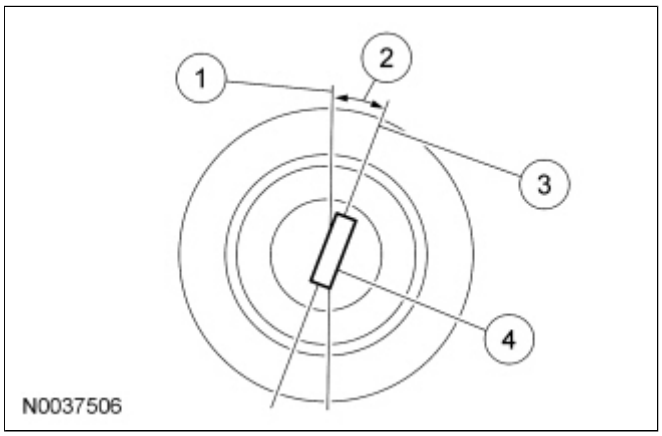
Negative and Positive Camber



Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear. The camber setting is not adjustable.

Caster

Caster is the deviation from vertical of an imaginary line drawn through the pivot points (top of strut and lower ball joint), when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear. The caster setting is not adjustable.



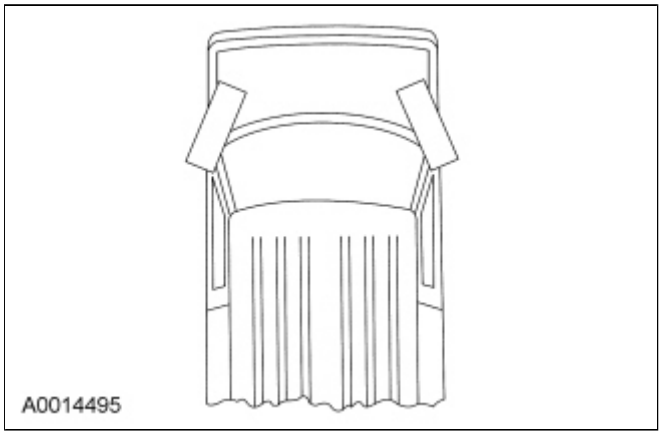
Item	Description
1	True vertical

2	Positive caster angle
3	Strut centerline
4	Pivot centerline

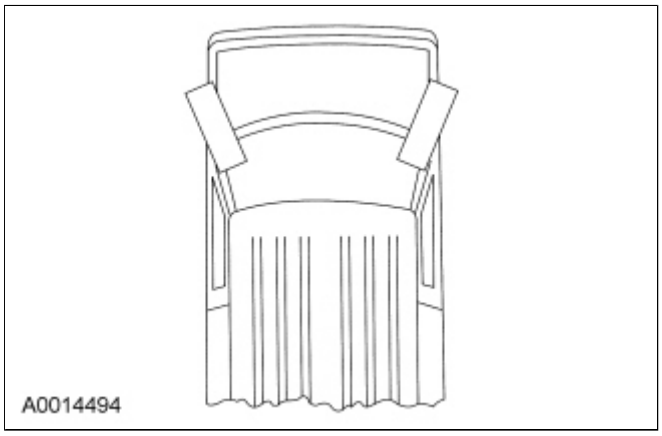
A backward tilt is positive (+) and a forward tilt is negative (-). Front caster adjustment is not a separate procedure on this vehicle.

Toe

Positive Toe (Toe In)

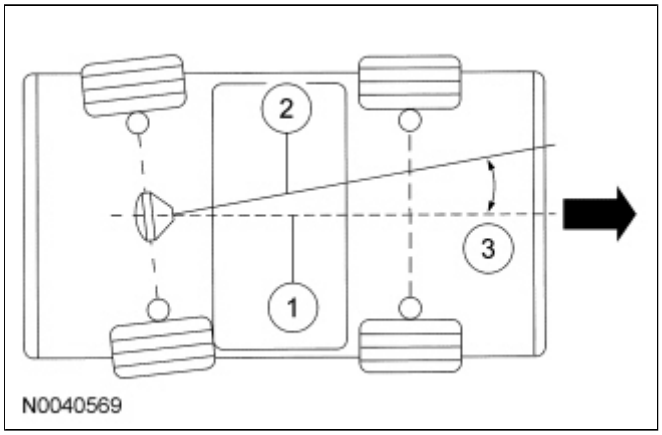


Negative Toe (Toe Out)



The vehicle toe setting affects tire wear and directional stability.

Incorrect Thrust Angle (Dogtracking)



Item	Description
1	Vertical centerline
2	Axle centerline
3	Thrust angle

Incorrect thrust angle (also known as dogtracking) is the condition in which the rear axle is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as experienced by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and experienced by the driver as small rotational oscillations of the steering wheel. For wheel and tire diagnosis, refer to Section 204-04 .

Poor Returnability/Sticky Steering

Poor returnability and sticky steering are used to describe the poor return of the steering wheel to center after a turn or steering correction.

Drift/Pull

Pull is a tugging sensation felt by the hands on the steering wheel that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull on a flat road causes a consistent deviation from the straight-ahead path and requires constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (wind or road crown).

Suspension System

Inspection and Verification

1. Road test the vehicle.
   - If any suspension alignment or ride height concerns are present, GO to Symptom Chart - Suspension System .
   - Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are present, GO to Symptom Chart - NVH .
2. Inspect the tires.
   - Check the tire pressures with all normal loads in the vehicle and the tires cold. Refer to the Vehicle Certification (VC) label.
   - Verify that all tires are sized to specification. Refer to the VC label.
   - Inspect the tires for incorrect wear and damage. Install new tires as necessary.
3. Inspect the chassis and underbody.
   - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
4. Inspect for aftermarket equipment.
   - Check for aftermarket changes to the steering, suspension, and wheel and tire components (such as competition or heavy duty). The specifications shown in this manual do not apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
• Front or rear suspension components • Suspension fastener(s) • Incorrect spring usage • Spring(s) • Shock absorber(s) • Strut(s) • Suspension bushing(s) • Steering system components • Subframe • Wheel bearing and wheel hub(s) • Tires • Non-OEM parts or modifications

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
6. If the fault is not visually evident, or GO to Symptom Chart - NVH .

Symptom Chart — Suspension System

Symptom Chart — Suspension System

Condition	Possible Sources	Action

• Vehicle drifts/pulls	• Unevenly loaded or overloaded vehicle • Tires/tire pressure • Alignment is not within specification • Brake drag • Steering components • Subframe misalignment	• GO to Pinpoint Test A .
• Wander	• Overloaded, unevenly or incorrectly loaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Ball joint(s)	• INSPECT the ball joints. REFER to the Ball Joint Inspection component test in this section.
	• Damaged or missing front strut mount bearing(s)	• INSTALL a new front strut mount bearing(s) as necessary. REFER to Section 204-01 .
	• Loose, worn or damaged front wheel bearing(s)	• INSPECT the wheel bearings. INSTALL new wheel bearings as necessary.
	• Loose, worn or damaged suspension component(s)	• INSTALL new suspension component(s) as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
	• Loose suspension fasteners	• INSPECT the suspension fasteners. TIGHTEN to specification. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to Section 211-00 .
	• Wheel alignment (excessive total front toe out)	• ADJUST as necessary. REFER to Toe Adjustment — Front in this section.
• Front bottoming or riding low	• Worn, damaged or incorrect springs	• MEASURE the ride height. REFER to Ride Height Measurement in this section. INSTALL new springs as necessary. REFER to Section 204-01 .
	• Worn front strut(s)	• INSTALL new struts as necessary. REFER to Section 204-01 .
• Abnormal/incorrect tire wear	• Incorrect tire pressure (rapid center rib or inner and outer edge wear)	• ADJUST the tire pressure. REFER to the Vehicle Certification (VC) label. REFER to Diagnosis and Testing for further tire wear diagnosis.
	• Incorrect tire rotation intervals	• REFER to Section 100-03 .
	• High-speed cornering • Excessive front or rear toe (inner or outer edge wear) • Excessive	• REFER to Section 204-04 Diagnosis and Testing for further tire wear diagnosis.

	negative or positive camber (inner or outer edge wear) • Front or rear suspension components	• INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
• Sticky steering, poor returnability	• Damaged or worn front strut mount bearing(s) • Binding ball joints • Steering components	• INSTALL a new front strut mount bearing(s) as necessary. REFER to Section 204-01 . • REFER to the Ball Joint Inspection component test in this section. • INSPECT the steering system. INSTALL new components as necessary. REFER to Section 211-02 for steering system diagnosis.
• Steering wheel off-center	• Unequal front or rear toe setting (side-to-side) • Steering components	• CHECK the wheel alignment. REFER to Toe Adjustment — Front in this section. ADJUST as necessary. • INSPECT the steering system. INSTALL new components as necessary. REFER to Section 211-00 .
• Sway or roll	• Overloaded, unevenly or incorrectly loaded vehicle • Loose wheel nut (s) • Strut(s) or shock absorber(s) • Loose stabilizer bracket-to-frame bolts • Worn stabilizer bar bushings or links • Damaged or broken stabilizer bar • Worn spring(s)	• NOTIFY the customer of incorrect vehicle loading. • TIGHTEN the wheel nut(s) to specification. REFER to Section 204-04 . • INSTALL new struts or shock absorbers as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension. • TIGHTEN the bolts to specification. REFER to Section 204-01 . • INSTALL new stabilizer bar bushings or links as necessary. REFER to Section 204-01 . • INSTALL a new stabilizer bar as necessary. REFER to Section 204-01 . • INSTALL new springs as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
• Vehicle leans to one side	• Unevenly loaded or overloaded vehicle • Front or rear suspension components	• NOTIFY the customer of incorrect vehicle loading. • INSPECT the front and rear suspension systems. INSTALL new suspension components as necessary. REFER to Section 204-01 for front suspension or Section

	• Incorrect drive axle(s) ride height. Side-to-side lean out of specification	204-02 for rear suspension. • MEASURE the ride height. REFER to Ride Height Measurement in this section. INSPECT the front and rear suspension systems. REPAIR or INSTALL new components as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Squeak or grunt — noise from the suspension	• Front or rear suspension components	• INSPECT the front or rear suspension. INSTALL new components as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
• Clunk — noise from the front suspension, occurs in and out of turns	• Loose front suspension	• INSPECT for loose nuts or bolts. TIGHTEN to specifications. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
• Clunk — noise from the rear suspension, occurs when shifting from REVERSE to DRIVE	• Loose rear suspension components	• INSPECT for loose or damaged rear suspension components. REPAIR or INSTALL new components as necessary. REFER to Section 204-02 .
• Click or pop — noise from the front suspension. More noticeable over rough roads or over bumps	• Worn or damaged ball joint(s)	• CARRY OUT a ball joint inspection. INSTALL new ball joint(s) or control arm(s) as necessary. REFER to Section 204-00 .
• Front suspension noise — a squeak, creak or rattle noise. Occurs mostly over bumps or while turning	• Front suspension components • Loose or damaged front struts, shock absorber(s) or shock absorber bushing(s) • Damaged spring or spring mount(s) • Damaged or worn control/radius arm bushing(s) • Worn or damaged stabilizer bar bushings or link(s) • Worn or damaged upper strut mount	• INSPECT the front suspension. INSTALL new components as necessary. REFER to Section 204-01 .

	bearing(s)	
• Rear suspension noise — a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Loose or damaged rear shock absorber(s) or shock absorber bushing(s) • Damaged spring or spring mount(s) • Damaged or worn control arm bushing(s) • Worn or damaged stabilizer bar bushing(s) or link (s)	• INSPECT the rear suspension. INSTALL new components as necessary. REFER to Section 204-02 .
• Shudder — occurs during acceleration from a slow speed or stop	• Incorrect ride height causing incorrect driveline angle	• REFER to Section 205-00 for driveline angle diagnosis.
• Shimmy	• Loose wheel nut(s) • Loose front suspension fastener(s) • Loose front wheel bearing(s) • Strut(s) or shock absorber(s)	• TIGHTEN the nut(s) to specification. REFER to Section 204-04 . • TIGHTEN the fastener(s) to specification. REFER to Section 204-01 . • INSPECT the front wheel bearing(s). INSTALL new bearing(s) as necessary. REFER to Section 204-01 . • INSTALL new struts or shock absorbers as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
• Shimmy — most noticeable on coast/deceleration. Also hard steering condition	• Excessive positive caster	• INSPECT the front suspension. REFER to Section 204-01 in this section. REPAIR or INSTALL new suspension components as necessary.
• Rough/harsh ride	• Incorrect tire pressure • Low ride height • Loose, worn or damaged suspension component(s)	• ADJUST the tire pressure. REFER to the VC label. • MEASURE the ride height. REFER to Ride Height Measurement in this section. INSTALL new springs as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension. • INSTALL new suspension component(s) as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.

Pinpoint Tests

Pinpoint Test A: Vehicle Drifts/Pulls

This pinpoint test is intended to diagnose the following:

- Unevenly loaded vehicle
- Tire pressure
- Tire forces
- Brake drag
- Incorrect vehicle alignment
- Steering system

PINPOINT TEST A: VEHICLE DRIFTS/PULLS

Test Step	Result / Action to Take
A1 CHECK FOR UNEVENLY LOADED VEHICLE	
• Visually check the vehicle for an uneven loading condition. • **Is the vehicle unevenly loaded?**	**Yes** ADVISE the customer of uneven loading condition. **No** GO to A2.
A2 CHECK THE TIRE PRESSURES AND TIRE CONDITIONS	
• Check the tire pressures. Refer to the VC label located on the driver door jamb. Check the tires for uneven/abnormal wear. Refer to Diagnosis and Testing —Wheels and Tires in Section 204-04. • **Are the tire pressures and tire conditions OK?**	**Yes** GO to A3. **No** ADJUST the tire pressures to the specified pressure or INSTALL new tires as necessary.
A3 ISOLATE TIRE DRIFT/PULL CONDITION	
• **NOTE:** It is important to determine if tire forces are the cause of a drift/pull condition. Changing the position of the wheel and tire assemblies on the vehicle may correct a pull/drift condition. A tire or tires that are causing a drift/pull should not be removed from service unless it has been determined that the tire(s) are worn beyond specification. Refer to Diagnosis and Testing — Wheels and Tires in Section 204-04 • Cross the front wheel and tire assemblies from left-to-right. Refer to Section 204-04. • **Does the vehicle drift/pull?**	**Yes** If the vehicle drifts/pulls in the opposite direction, tire forces are causing the drift/pull. ROTATE the wheel and tire assemblies front-to-rear. REFER to Section 204-04. If the vehicle drifts/pulls in the same direction, GO to A4. **No** Tire forces were causing the drift/pull and the concern has been corrected.
A4 CHECK SUBFRAME ALIGNMENT	

• **NOTE:** RH and LH dimensions are identical. All measurements on center.
• Using the following measurements, check the subframe alignment.
  ◦ Location 1 — 260 mm (10.236 in).
  ◦ Location 2 — 666 mm (26.22 in).
	Yes
	GO to A5.
	
	No
	REMOVE and DISCARD the 2 rearward subframe bolts. LOOSEN the 2 forward subframe bolts. Using the measurements listed above, ALIGN the subframe. TIGHTEN the 2 forward subframe bolts to 60 Nm (44 lb-ft). TIGHTEN the 2 new rearward subframe bolts to 100 Nm (74 lb-ft). TIGHTEN the 2 new rearward

 • **Is the subframe aligned correctly?**	subframe bolts an additional 240 degrees. Vehicle wheel alignment must be reset after the subframe is moved. ADJUST the alignment as necessary. REFER to General Procedures in this section.
A5 CHECK FOR BRAKE DRAG	
• Spin all four wheel and tire assemblies by hand and check for brake drag. • **Do the wheels spin freely?**	**Yes** GO to A6 . **No** REFER to Section 206-00 to diagnose brake drag condition.
A6 CHECK THE WHEEL ALIGNMENT	
• Using alignment equipment and the manufacturer's instructions, check the wheel alignment. • **Is the wheel alignment out of specification?**	**Yes** ADJUST the alignment as necessary. REFER to General Procedures in this section. **No** REFER to Section 211-00 to diagnose steering system drift/pull/wander condition.

Component Tests

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. Install a new wheel bearing as necessary.

2. **NOTE:** In order to obtain accurate measurements, the suspension must be in full rebound with the weight of the vehicle supported by the frame.

   Raise and support the vehicle by the frame to allow the wheels to hang in the rebound position.

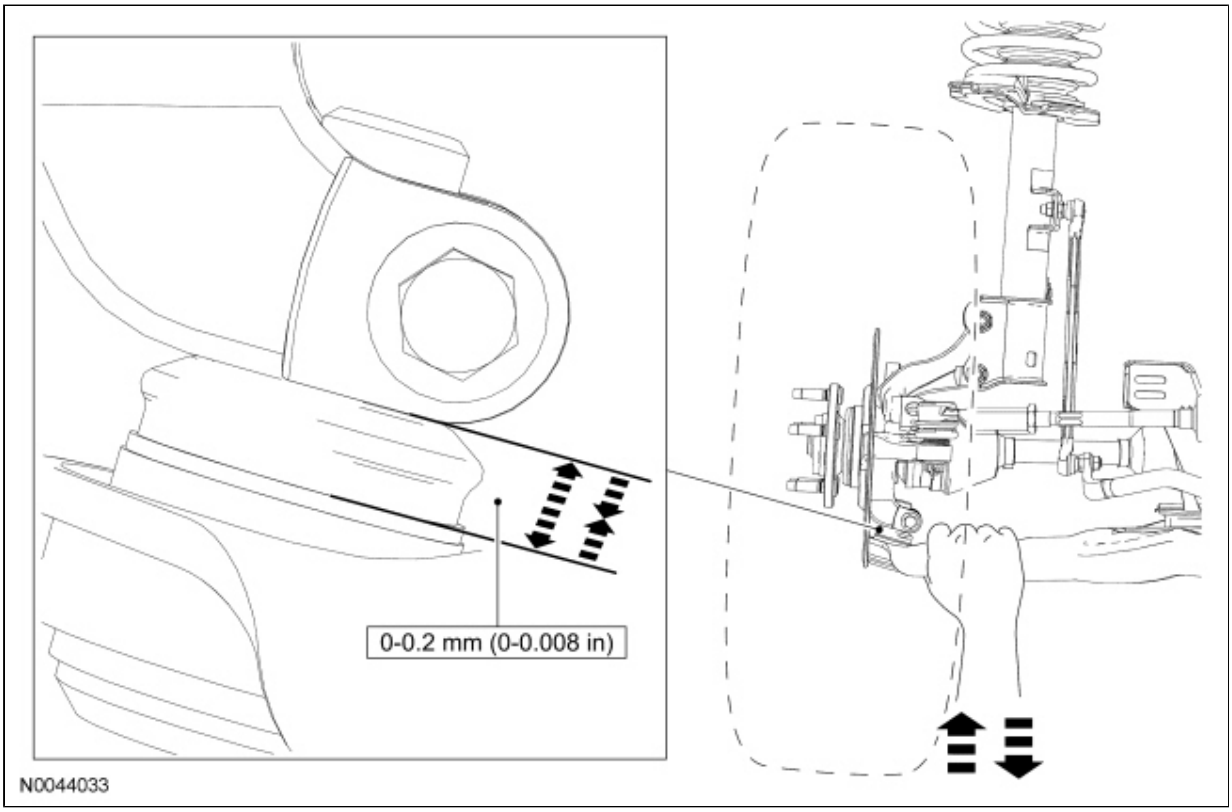
3. Inspect the ball joint and ball joint boot for damage.
    - If the ball joint or ball joint boot is damaged, install a new ball joint as necessary. Refer to Section 204-01 .

4. ***NOTICE:*** **Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

   Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the lower control arm by hand. Note any relative vertical movement between the wheel knuckle and lower arm at the lower ball joint.
    - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
    - If relative movement is found, continue with Step 5.

5. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis (center line) of the ball joint.

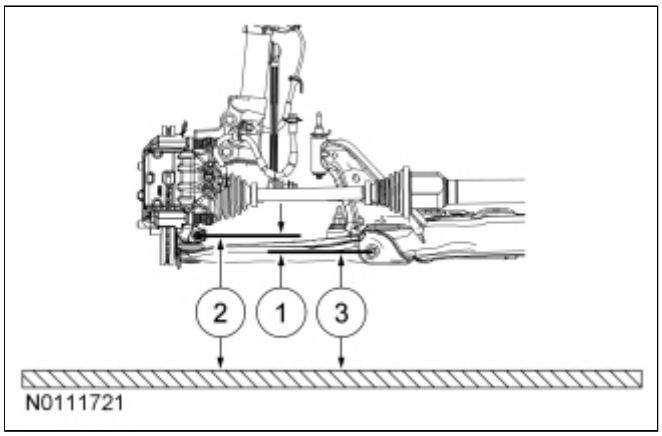
   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the lower control arm and the wheel knuckle or ball joint stud.



6. Measure the ball joint deflection while an assistant pushes up and pulls down on the lower control arm, by hand.
    - If the deflection exceeds the specification, a new ball joint must be installed. Refer to Section 204-01 .
    - If the deflection meets the specification, no further action is required.

Ride Height Measurement

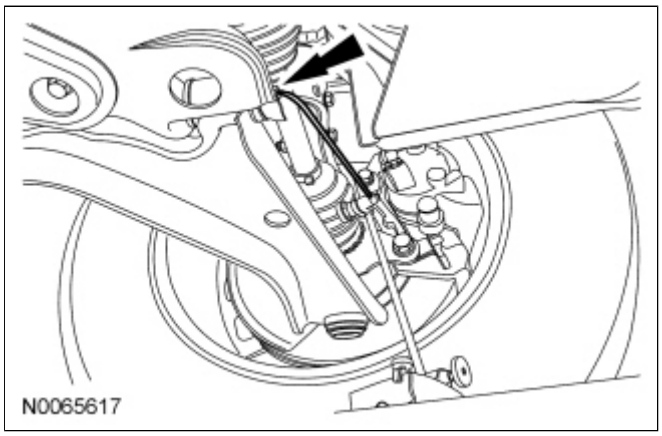
Front Ride Height Measurement



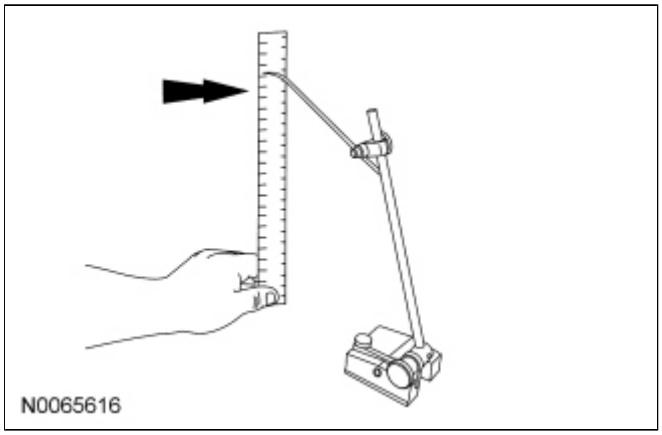
Item	Description
1	Ride height = 2 - 3
2	Measurement 2
3	Measurement 3

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

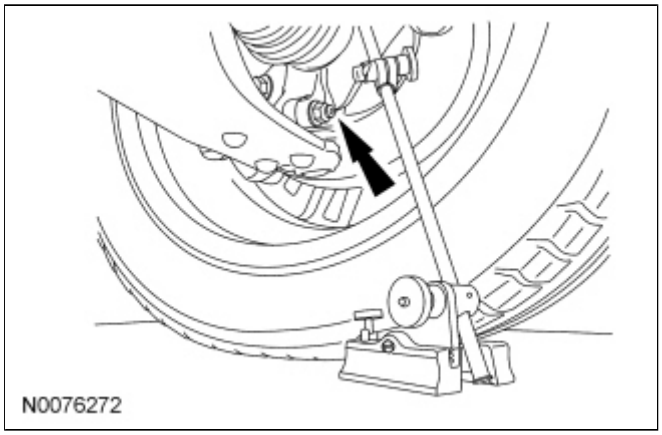
1. Position the surface gauge on the same flat, level surface, adjust the gauge arm until the scriber point is located in the center of the lower arm forward bolt.
    - Lock the surface gauge in this position.



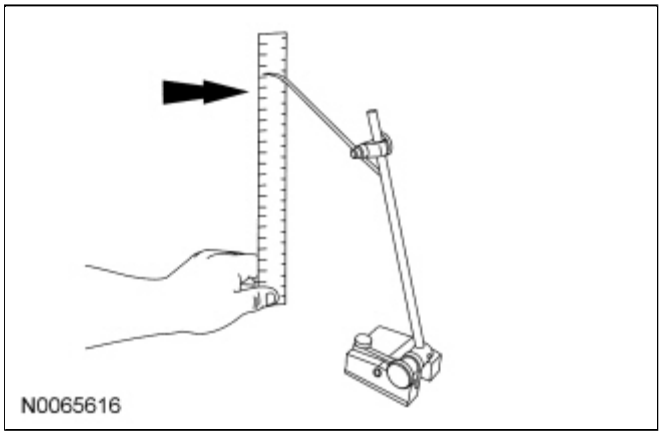
2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 2).



3. Position a suitable surface gauge (such as Starrett 57D Surface Gauge), on a flat, level surface and adjust the gauge arm until the scriber point is located in the center of the ball joint bolt.
    - Lock the surface gauge in this position.

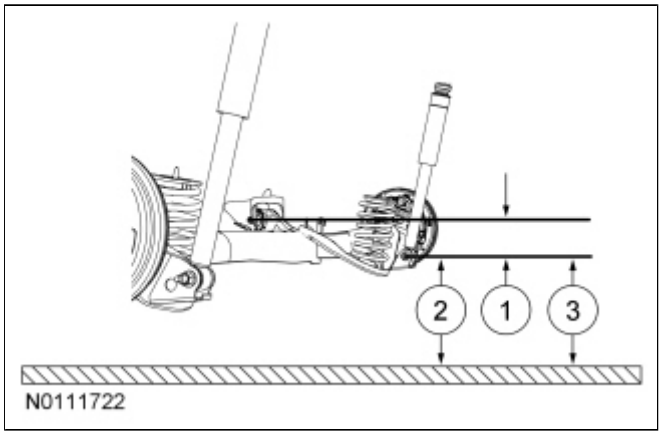


4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 3).



5. Subtract measurement 3 from measurement 2 to obtain the front ride height.
    - Refer to Specifications in this section.

Rear Ride Height Measurement



Item	Description
1	Ride height = 2 - 3
2	Measurement 2
3	Measurement 3

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

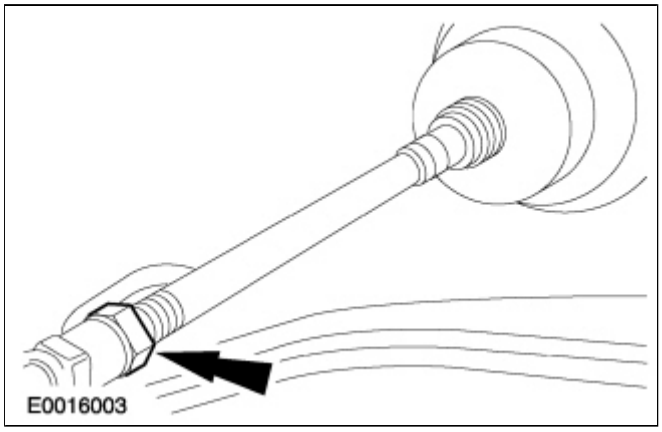
1. Measure the distance between the flat level surface and the forward lower arm inboard bolt (measurement 2).

2. Measure the distance between the flat level surface and the center of the forward lower arm outboard bolt (measurement 3).

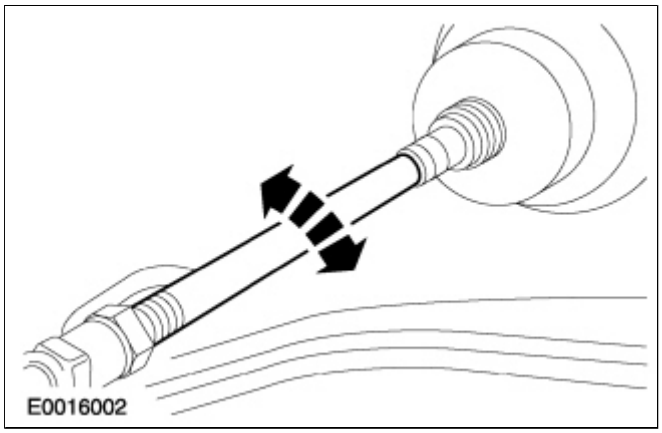
3. Subtract measurement 3 from measurement 2 to obtain the rear ride height.
    - Refer to Specifications in this section.

Toe Adjustment — Front

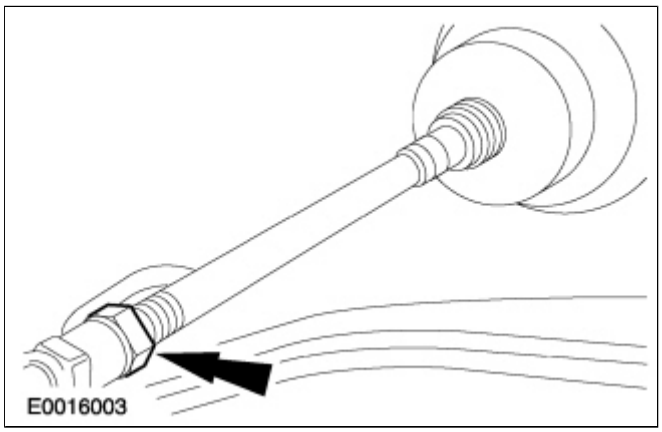
1. Using a suitable steering wheel holding device, lock the steering wheel in the straight ahead position.
2. Using alignment equipment and the manufacturer's instructions, measure the toe.
3. Loosen the tie-rod end jam nuts.



4. Rotate the tie rods as necessary to adjust the toe setting.



5. Tighten the tie-rod end jam nuts to 85 Nm (63 lb-ft).



6. Recheck the toe settings, adjust as necessary.

Torque Specifications

Description	Nm	lb-ft	lb-in
Ball joint nut	52	38	—
Brake caliper guide pin bolts	28	21	—
Brake flexible hose bracket bolt	26	19	—
Lower arm forward bolt [a]	—	—	—
Lower arm rearward bolt [a]	—	—	—
Stabilizer bar bracket bolts	48	35	—
Stabilizer bar link nuts	48	35	—
Strut rod nut	48	35	—
Strut upper nuts	30	22	—
Tie-rod end nut	53	39	—
Wheel hub nut	255	188	—
Wheel knuckle-to-strut nuts [a]	—	—	—
Wheel speed sensor bolt	9	—	80

[a] Refer to the procedure in this section.

Front Suspension

The front suspension consists of the following components:

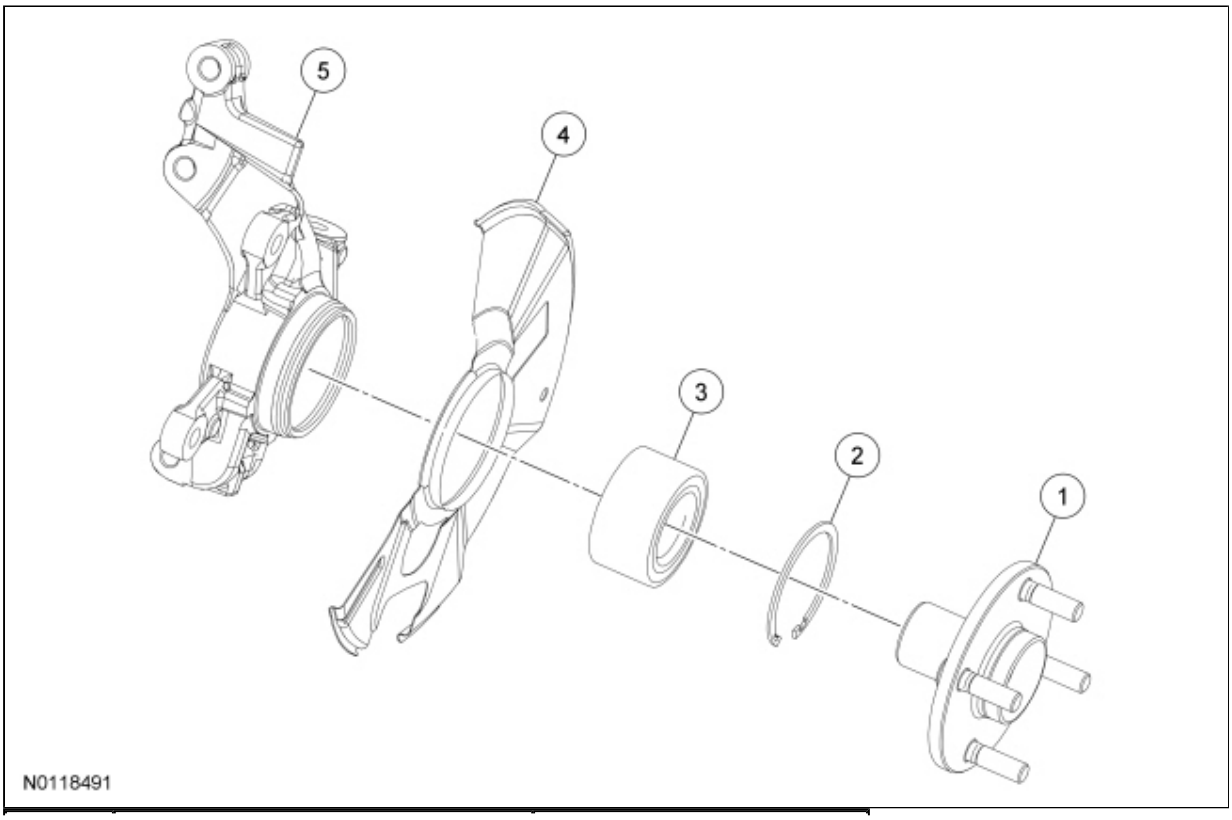
- Lower arms
- Stabilizer bar, bushings and links
- Strut and spring assemblies
- Wheel bearings
- Wheel hubs
- Wheel knuckles
- Wheel studs

The front suspension utilizes a MacPherson strut system. This suspension system incorporates a strut assembly that takes the place of the upper arm and ball joint. The strut performs the function of a shock absorber and is encompassed by a coil spring. The strut and spring assembly carries the sprung weight of the vehicle and is also the pivot point for the steering knuckle. This system uses a lower control arm and ball joint for the lower (unloaded) pivot point of the steering knuckle.

Wheel Bearing

Special Tool(s)

ST2446-A	Installer, Wheel Hub Bearing Cup 205-147
 ST1895-A	Pinion Bearing Cone Remover 205-D0002 (D79L-4621-A) or equivalent
ST1861-A	Remover/Installer, Wheel Hub Cup 204-020
ST2446-A	Step Plate 205-117



Item	Part Number	Description
1	1104	Wheel hub
2	7059	Snap ring
3	1215	Wheel bearing
4	2K005LH/ 2K004RH	Brake disc shield
5	3K186 LH/ 3K185 RH	Wheel knuckle

Removal

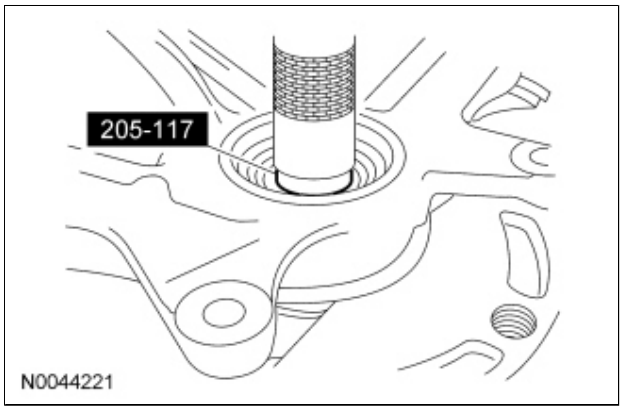
NOTICE: **When the wheel hub is pressed from the bearing, the bearing inner race will come out with the hub. Never try to install the race back into the bearing. Always install a new bearing.**

NOTICE: **Make sure to keep the knuckle level and supported during pressing operations, or damage to the knuckle can occur. Support the knuckle as close to the bearing bore as possible. Do not use knuckle extremities as supports.**

NOTE: If removing the wheel hub, the wheel bearing must be replaced.

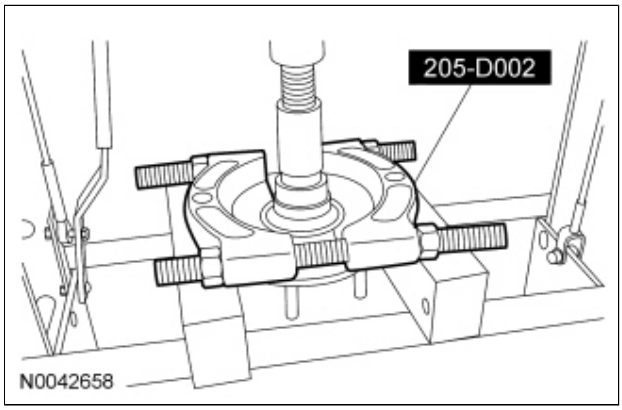
NOTE: The Anti-Lock Brake System (ABS) tone ring is part of the wheel bearing assembly.

1. Remove the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.
2. Using the Step Plate and a suitable press, remove the wheel hub from the wheel bearing.



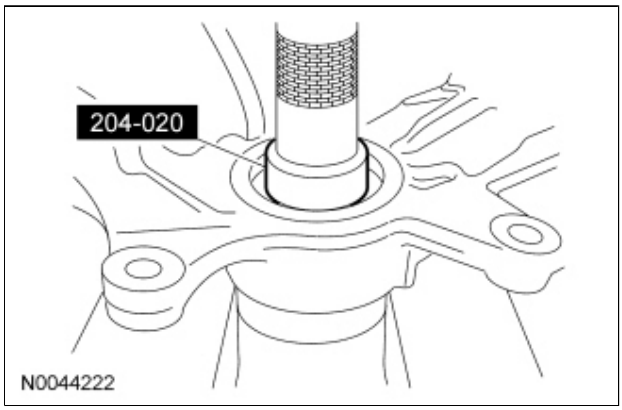
3. **NOTE:** This step may not be necessary if the inner wheel bearing race remains in the wheel knuckle after removing the wheel hub.

   Using the Pinion Bearing Cone Remover and a suitable press, remove the inner wheel bearing race from the wheel hub.



4. Remove the snap ring.

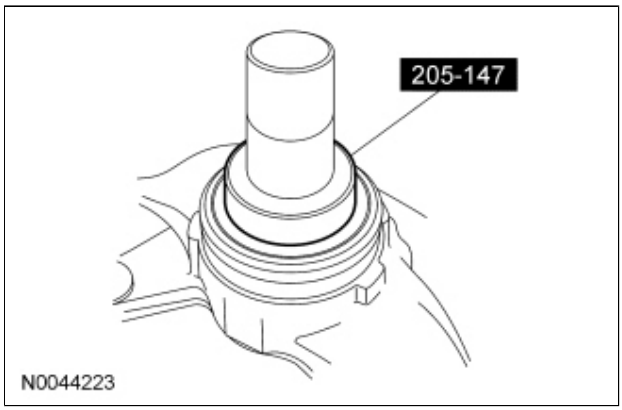
5. Using the Wheel Hub Cup Remover/Installer and a suitable press, remove the outer wheel bearing race from the wheel knuckle.



Installation

NOTE: Install the wheel bearing with the pink colored wheel speed sensor ring facing towards the transmission side.

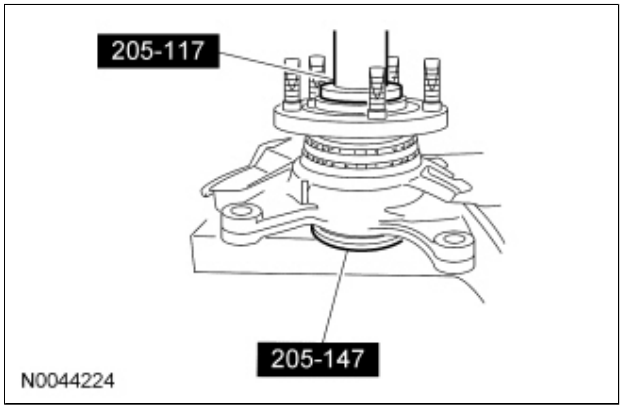
1. Using the Wheel Hub Bearing Cup Installer and a suitable press, install the wheel bearing into the wheel knuckle.



2. Install the snap ring.

3. ***NOTICE:*** **The wheel bearing inner race must be supported during hub installation. Failure to do so will damage the bearing.**

   Using the Wheel Hub Bearing Cup Installer, Step Plate and a suitable press, install the wheel hub into the wheel bearing.

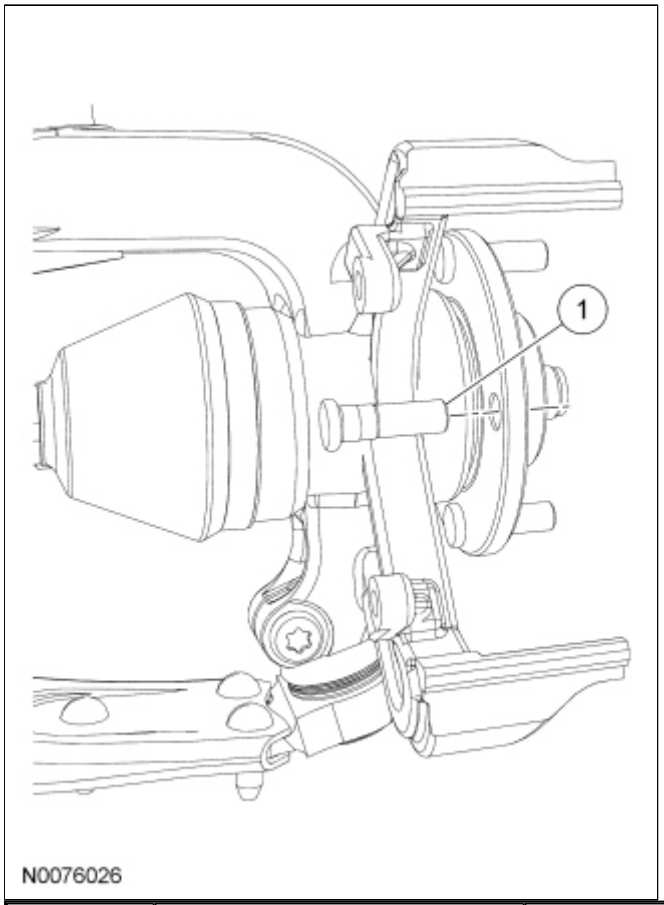


4. Install the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.

Wheel Studs

Special Tool(s)

 ST1106-A	Remover, Tie-Rod End 211-001 (TOOL-3290-D)



Item	Part Number	Description
1	1107	Wheel stud

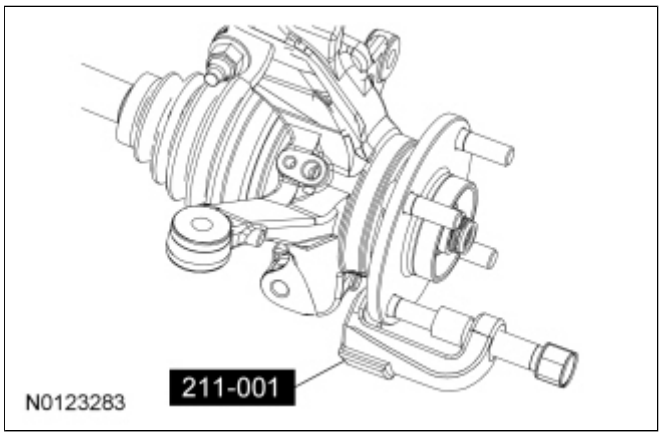
Removal

1. ***NOTICE:*** **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.**

   NOTE: Make sure the steering wheel is in the UNLOCKED position.

Remove the brake disc. For additional information, refer to Section 206-03 .

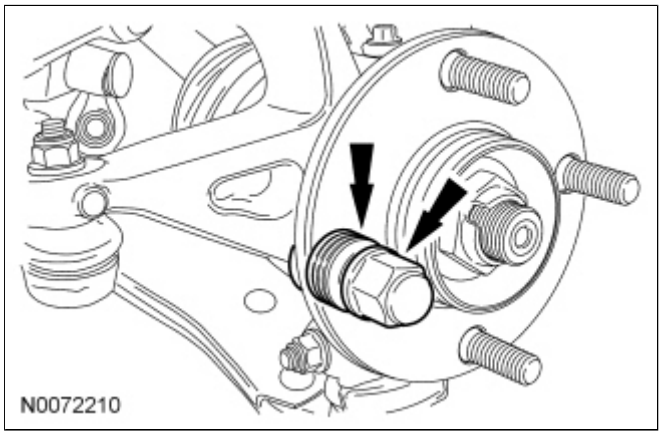
2. Using the Tie-Rod End Remover, remove the wheel stud.



Installation

1. **NOTE:** Make sure to use washers that have an ID that is larger than the OD of the wheel stud serrations. Use enough washers (approximately 4) to allow the wheel stud to fully seat against the hub flange.

   Position the wheel stud in the flange, making sure the serrations on the stud line up with the serrations in the flange. Install the washers and a wheel nut.



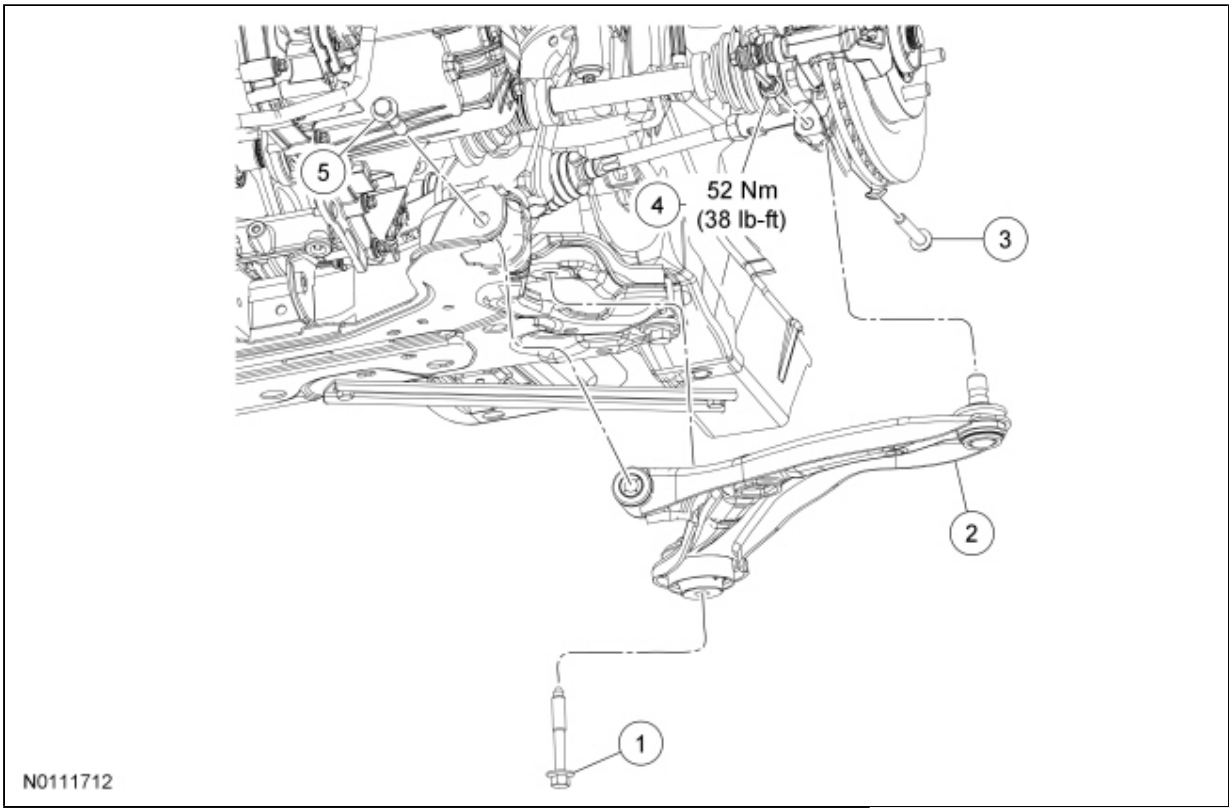
2. ***NOTICE:*** **Do not use power tools to install the wheel stud or damage to the flange may occur.**

   Tighten the wheel nut until the stud is seated against the hub flange.

3. Remove the wheel nut and the washers. Discard the wheel nut.

4. Install the brake disc. For additional information, refer to Section 206-03 .

Lower Arm



Item	Part Number	Description
1	W703432	Rear lower arm bolt
2	3079 LH / 3078 RH	Lower arm
3	W709618	Ball joint bolt
4	W520203	Ball joint nut
5	W703432	Forward lower arm bolt

Removal

NOTICE: **Suspension fasteners are critical parts that affect performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

NOTICE: **Use care when releasing the lower arm and wheel knuckle into the resting position or damage to the ball joint seal may occur.**

NOTICE: **Tighten suspension bushing fasteners with the weight of the vehicle resting on the wheel and tires or incorrect clamp load and bushing damage may occur.**

NOTICE: **Do not use a prying device or separator fork between the ball joint and the wheel knuckle. Damage to the ball joint or ball joint seal may result. Only use the pry bar by inserting it into the lower control arm body opening.**

2. Remove and discard the ball joint nut and bolt. Using a pry bar, separate the ball joint stud from the

wheel knuckle.

3. Remove and discard the forward and rear lower arm bolts and remove the lower arm.

Installation

NOTE: Do not tighten the forward and rear lower arm bolts at this time.

1. Position the lower arm and loosely install the new forward and rear bolts.
2. Insert the ball joint stud into the wheel knuckle and install the new ball joint bolt and nut.
   - Tighten to 52 Nm (38 lb-ft).
3. Install the wheel and tire. For additional information, refer to Section 204-04 .
4. Lower the hoist so the weight of the vehicle is resting on the wheels and tires.
5. Tighten the new forward and rear lower arm bolts in 2 stages
   - Stage 1: Tighten to 63 Nm (46 lb-ft).
   - Stage 2: Tighten an additional 180 degrees.
6. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

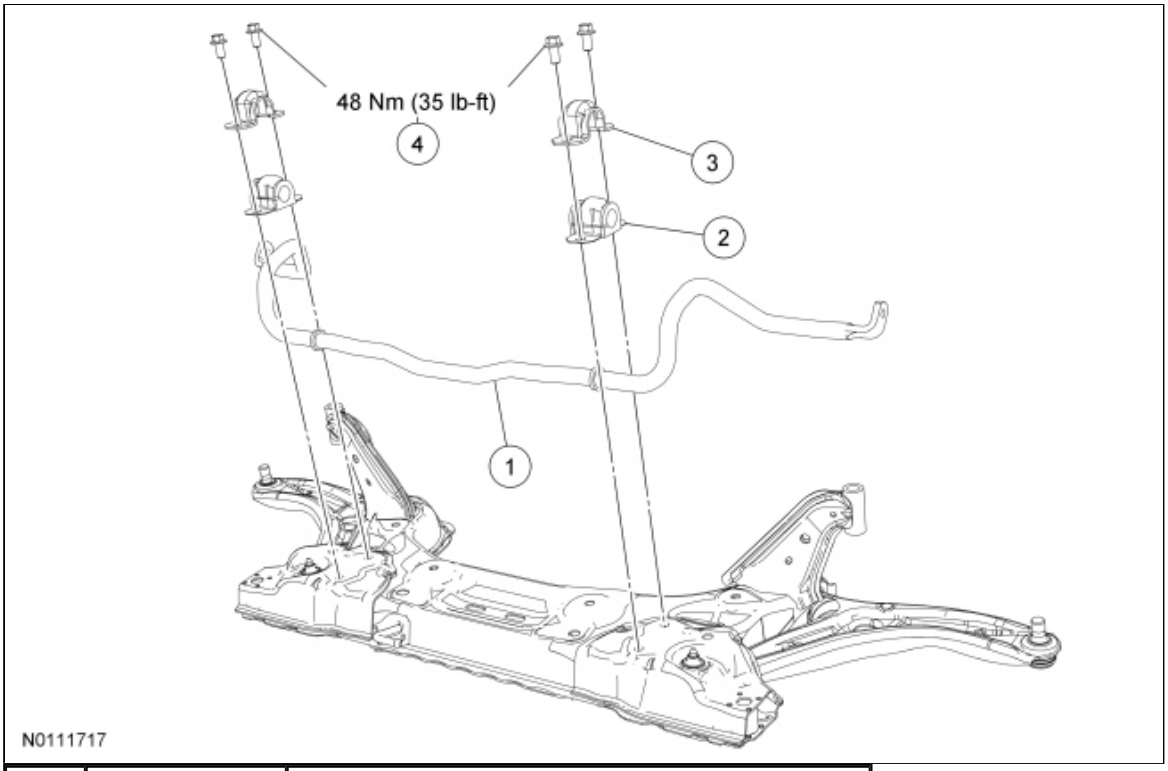
Stabilizer Bar

Special Tool(s)

ST2783-A	Remover, Tie Rod End 211-001 (Tool-3290-D)

General Equipment

Transmission Jack

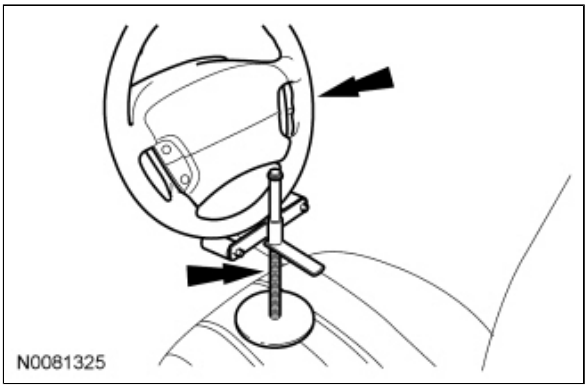


Item	Part Number	Description
1	5482	Stabilizer bar
2	5484	Stabilizer bar bushing (2 required)
3	5486	Stabilizer bar bushing bracket (2 required)
4	W500032	Stabilizer bar bracket bolt (4 required)

Removal

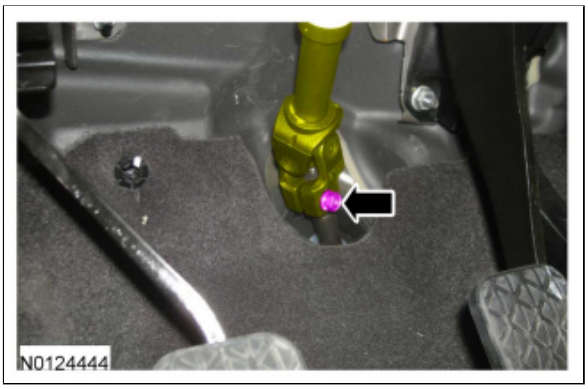
NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.**

1. Using a suitable holding device, hold the steering wheel in the straight-ahead position.



2. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the steering column shaft has rotated, remove and recenter the clockspring. For additional information, refer to Section 501-20B .**

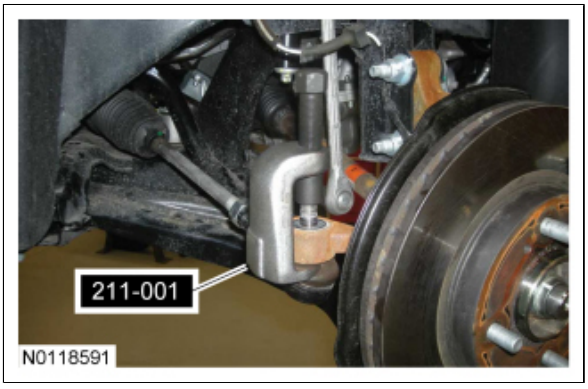
   Remove and discard the steering column shaft-to-steering gear bolt and disconnect the steering column shaft from the steering gear.



3. Remove the front wheels and tires. For additional information, refer to Section 100-04 .

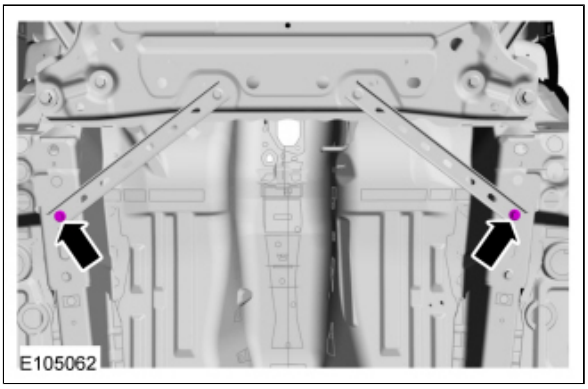
4. Remove and discard the 2 outer tie rod nuts.

5. Using the Tie Rod End Remover, separate the outer tie rods from the wheel knuckles.

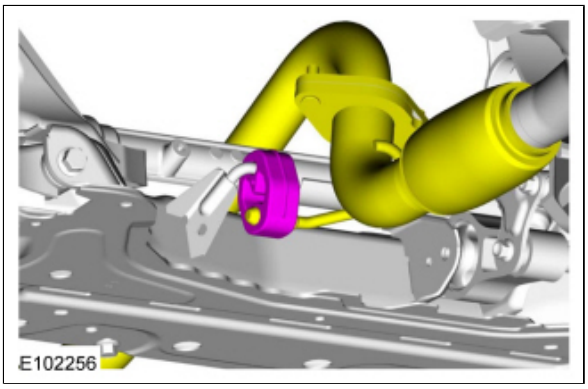


6. Remove and discard the 2 stabilizer bar link-to-stabilizer bar nuts and disconnect the stabilizer bar links from the stabilizer bar.

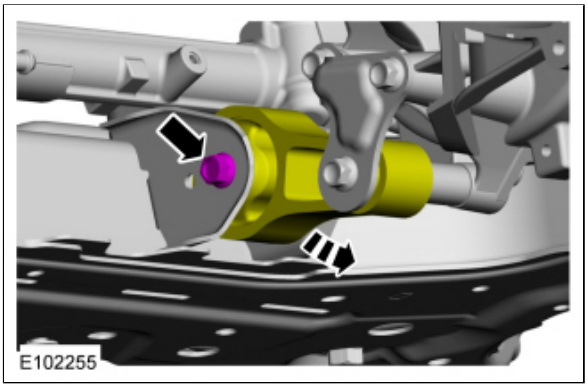
7. Remove the 2 subframe brace-to-body bolts.



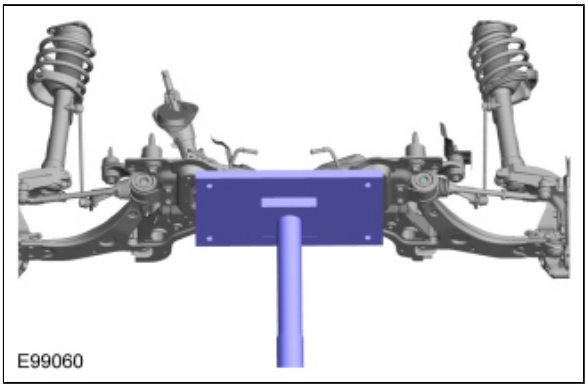
8. Disconnect the exhaust isolator.



9. Remove the engine roll restrictor bolt.

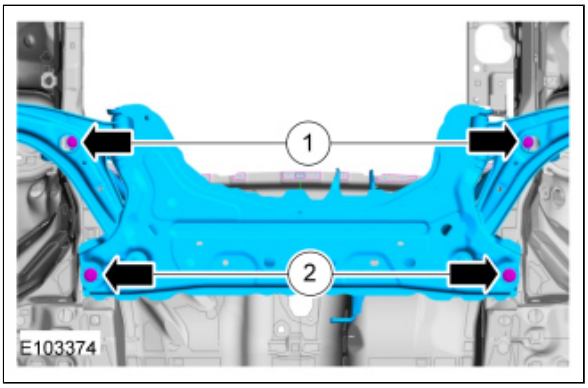


10. Support the front subframe using a suitable transmission jack.

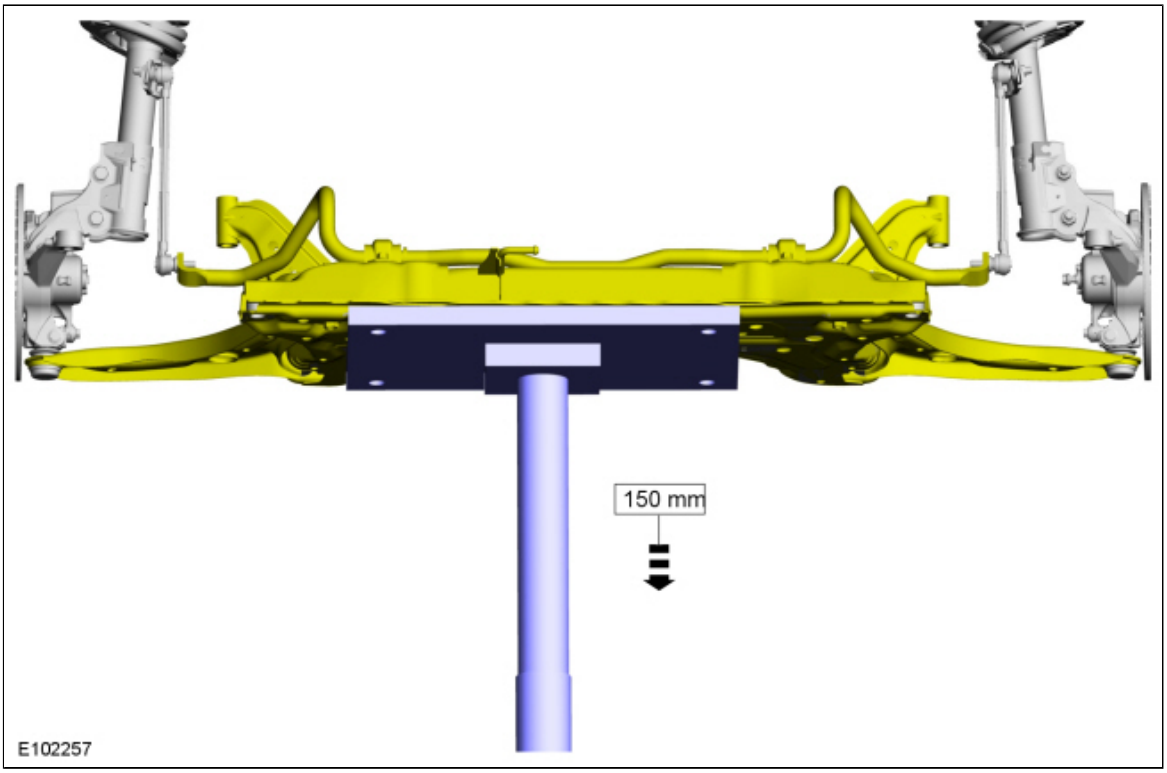


11. Mark the position of the subframe-to-frame mounting location at each mounting point on the vehicle frame rails to aide in installation.

12. Remove the 4 subframe bolts and discard the 2 rearward bolts.



13. Lower the front subframe approximately 155 mm (6.102 in).



14. Remove the stabilizer bar bracket bolts and brackets.
    - Discard the bolts.
15. Remove the stabilizer bar bushings.
16. Remove the stabilizer bar.

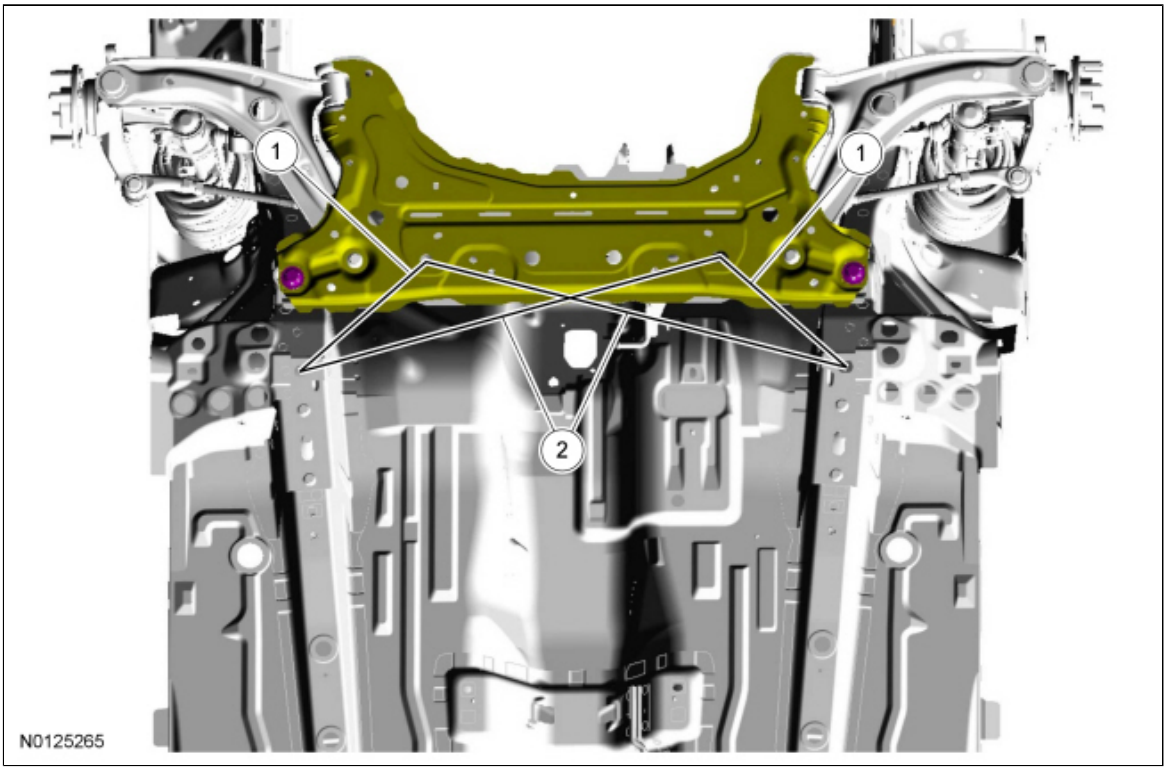
Installation

NOTICE: **The stabilizer bar bushings must be positioned correctly with the slit in the bushing toward the rear of the vehicle or damage to the bushings may occur.**

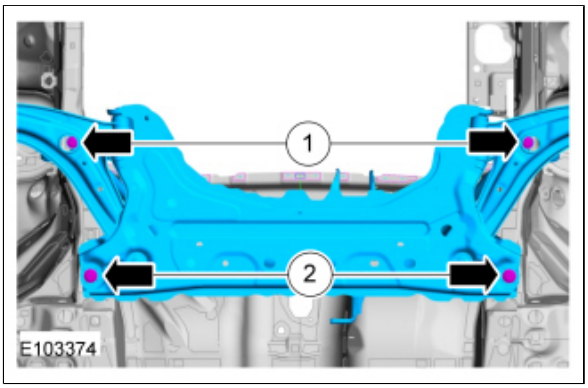
1. Position the stabilizer bar with the bushings installed with the slit in the bushing toward the rear of the vehicle.
2. Position the stabilizer bar brackets and install the new bolts.
    - Tighten to 48 Nm (35 lb-ft).
3. Raise the subframe and loosely Install the 4 subframe bolts.
4. Align the subframe to the locating marks made during removal.

5. **NOTE:** RH and LH dimensions are identical. All measurements on center.

   Measure for correct positioning of the subframe to vehicle underbody.
   1. Location 1 — 260 mm (10.236 in)
   2. Location 2 — 666 mm (26.22 in)

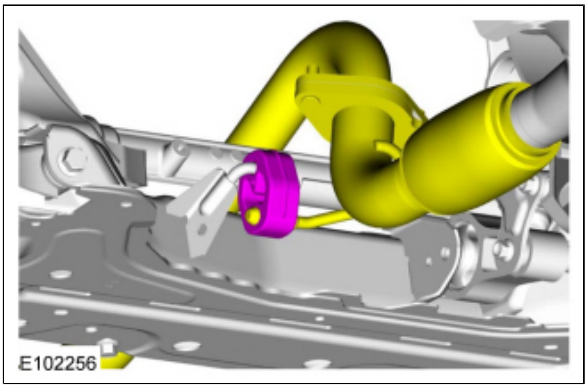


6. Tighten the subframe bolts.
   1. Tighten the forward bolts to 60 Nm (44 lb-ft).
   2. Tighten the new rearward bolts to 100 Nm (74 lb-ft).
      - Tighten the rearward bolts an additional 240°.

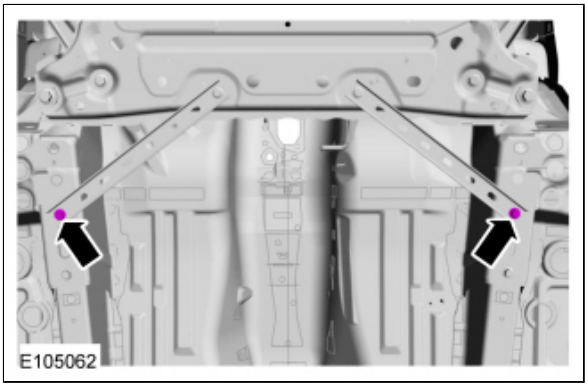


7. Position the engine roll restrictor and install the engine roll restrictor bolt.
   - Tighten to 50 Nm (37 lb-ft).

8. Connect the exhaust isolator.



9. Install the 2 subframe brace-to-body bolts.
    - Tighten to 50 Nm (37 lb-ft).

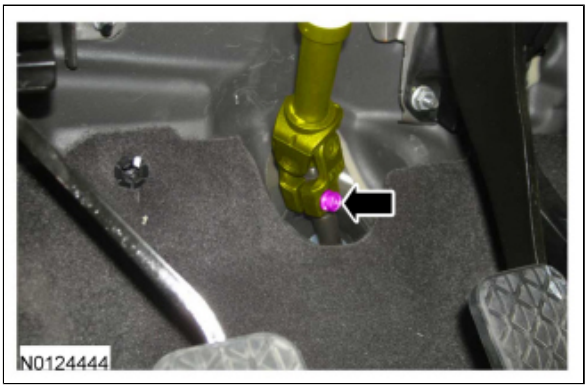


10. Position the stabilizer bar links and install the 2 new stabilizer bar link-to-stabilizer bar nuts.
    - Tighten to 48 Nm (35 lb-ft).

11. Position the outer tie rods and install the new 2 outer tie rod nuts.
    - Tighten to 53 Nm (39 lb-ft).

12. **WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

    Connect the steering column shaft and install a new steering column shaft-to-steering gear bolt.
    - Tighten to 32 Nm (24 lb-ft).

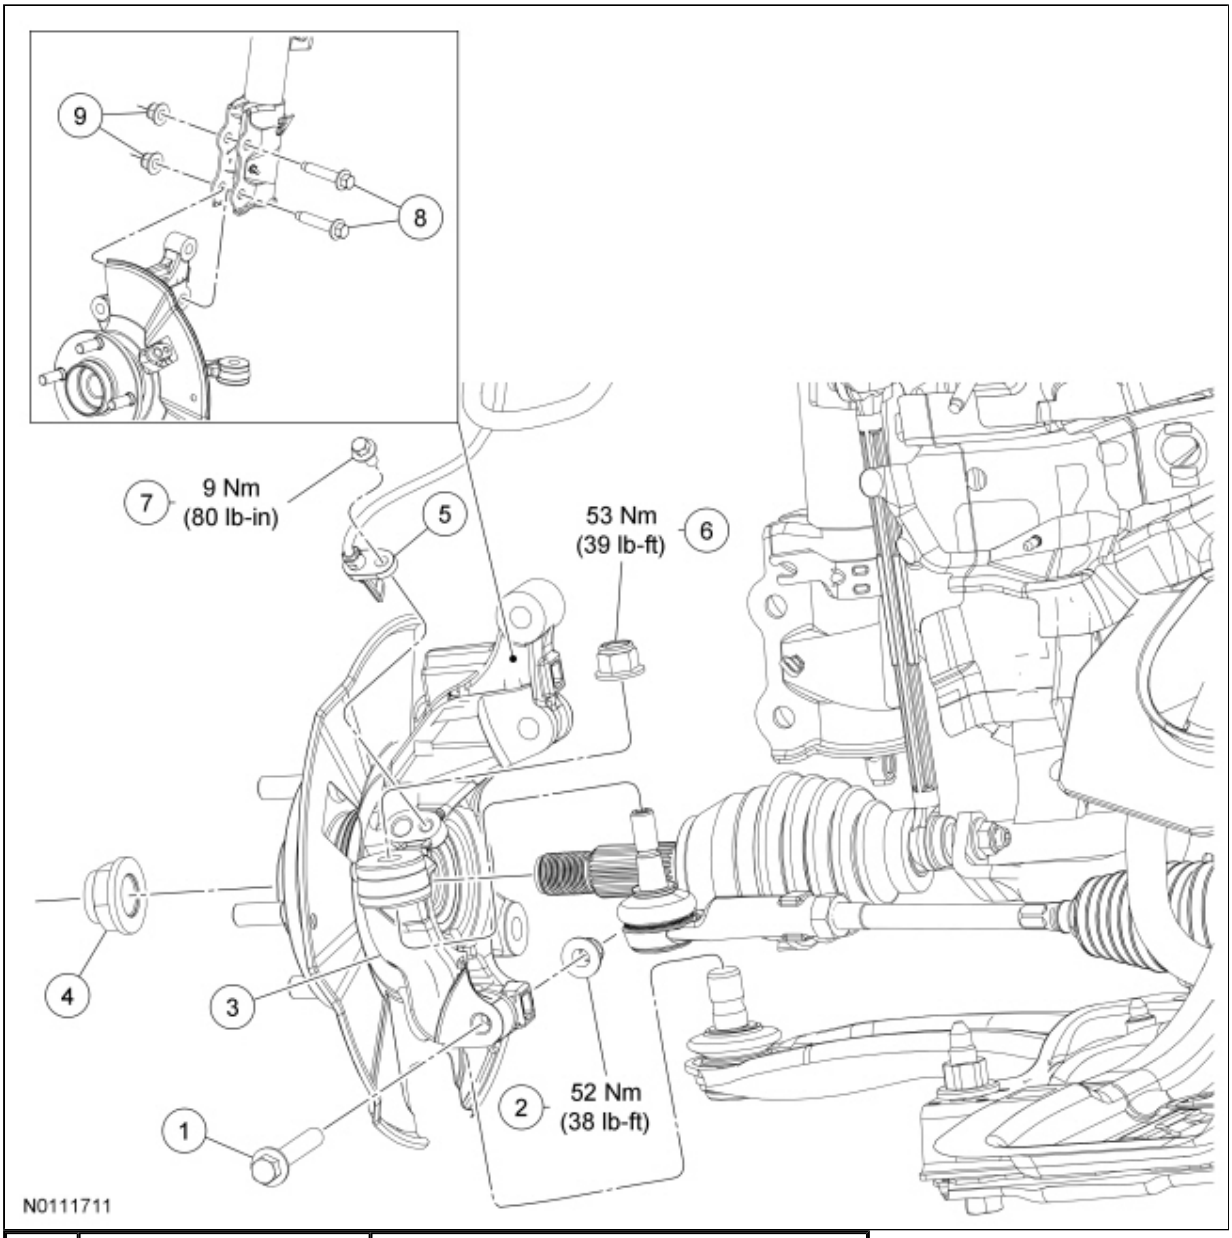


13. Check and, if necessary, adjust the front toe. For additional information, refer to Section 204-00 .

Wheel Knuckle

Special Tool(s)

ST2138-A	Installer, Halfshaft 204-161 (T97P-1175-A)
ST2272-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent
 ST1106-A	Remover, Tie-Rod End 211-001 (TOOL-3290-D)



Item	Part Number	Description
1	W709618	Ball joint bolt
2	W520203	Ball joint nut
3	3K186 LH / 3K185 RH	Wheel knuckle and hub assembly
4	W713640	Wheel hub nut
5	2C204	Wheel speed sensor
6	W520204	Tie-rod end nut
7	W500011	Wheel speed sensor bolt
8	W709618	Wheel knuckle-to-strut bolt (2 required)
9	W520203	Wheel knuckle-to-strut nut (2 required)

Removal

NOTICE: **Suspension fasteners are critical parts that affect performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

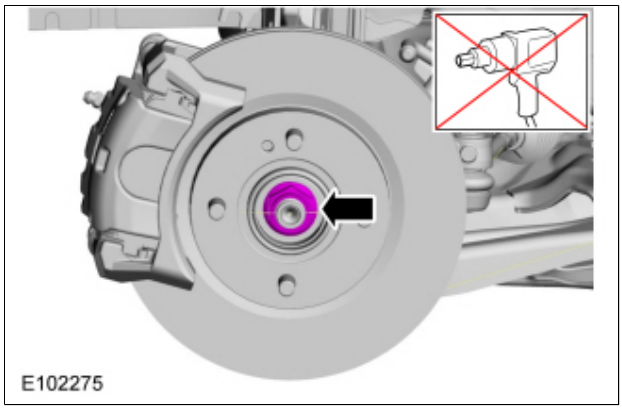
NOTICE: **Do not tighten the wheel hub nut with the vehicle on the ground. Tighten the nut to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

NOTICE: **Install and tighten the new wheel hub nut to specification in a continuous rotation. Always install a new wheel hub nut after loosening or when not tightened to specification in a continuous rotation or damage to the component may occur.**

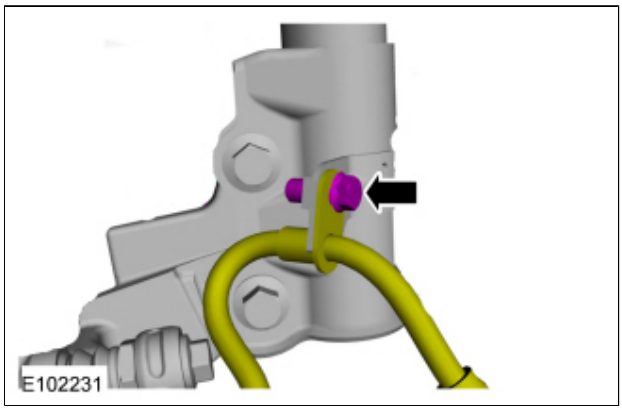
1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

NOTE: Apply the brake to prevent the halfshaft from rotating while loosening the wheel hub nut.

2. Remove and discard the wheel hub nut.



3. Remove the brake flexible hose bracket bolt and disconnect the brake flexible hose from the strut and spring assembly.



NOTICE: **Do not allow the brake caliper to hang from the brake hose or damage to the brake hose can occur.**

4. Remove the 2 brake caliper anchor plate bolts and position the brake caliper assembly aside.
   - Support the brake caliper assembly using mechanic's wire.

5. Remove the brake disc.

6. If equipped with Anti-Lock Brake System (ABS), remove the wheel speed sensor bolt and position the wheel speed sensor aside.

NOTICE: **Do not remove the tie-rod end nut or damage to the tie-rod end may occur.**

7. Loosen the tie-rod end nut.

8. Using the Tie-Rod End Remover, detach the tie-rod end from the wheel knuckle.
   - Remove and discard the tie-rod end nut.

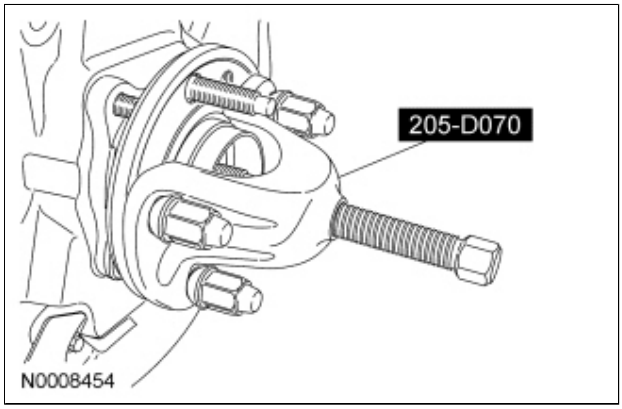
NOTICE: **Do not use a prying device or separator fork between the ball joint and the wheel knuckle. Damage to the ball joint or ball joint seal may result. Only use the pry bar by inserting it into the lower arm body opening.**

NOTICE: **Use care when releasing the lower arm and wheel knuckle into the resting position or damage to the ball joint seal may occur.**

9. Remove and discard the ball joint nut and bolt. Using a pry bar, separate the ball joint stud from the wheel knuckle.

10. ***NOTICE:*** **Do not bend the inner joint more than 18 degrees or the outer joint more than 45 degrees. Damage to the halfshaft will occur.**

    Using the Front Wheel Hub Remover, press the halfshaft from the wheel hub and detach the halfshaft from the wheel hub
    - Support the halfshaft.



11. Remove and discard the wheel knuckle-to-strut nuts and bolts.

12. Remove the wheel knuckle.
    - If necessary, remove the wheel bearing and hub. For additional information, refer to Wheel Bearing in this section.

Installation

1. Position the wheel knuckle and install new wheel knuckle-to-strut bolts and nuts.
    - Tighten to 80 Nm (59 lb-ft) and then tighten an additional 90 degrees.

2. Insert the halfshaft into the wheel hub.

3. Insert the ball joint stud into the wheel knuckle and install the new ball joint bolt and nut.
    - Tighten to 52 Nm (38 lb-ft).

4. Attach the tie-rod end to the wheel knuckle and install a new tie-rod end nut.

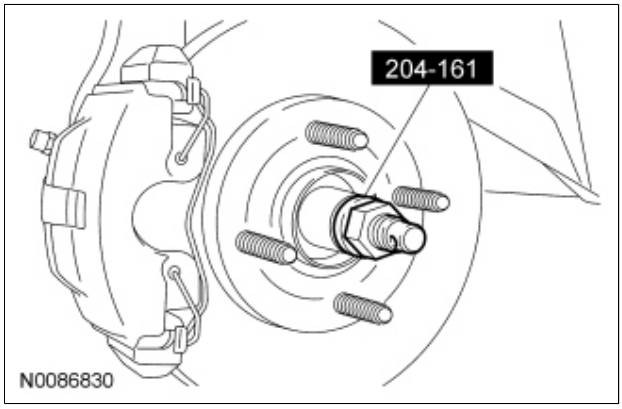
- Tighten to 53 Nm (39 lb-ft).

5. If equipped with ABS, position the wheel speed sensor and install the wheel speed sensor bolt.
   - Tighten to 9 Nm (80 lb-in).

6. Install the brake disc.

7. Position the brake caliper assembly and install the 2 brake caliper anchor plate bolts.
   - Tighten to 68 Nm (50 lb-ft).

8. Using the Halfshaft Installer, install the halfshaft into the wheel hub.



9. Connect the brake flexible hose to the strut and spring assembly and install the brake flexible hose bracket bolt.
   - Tighten to 26 Nm (19 lb-ft).

10. ***NOTICE:*** **Do not tighten the wheel hub nut with the vehicle on the ground. Tighten the nut to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

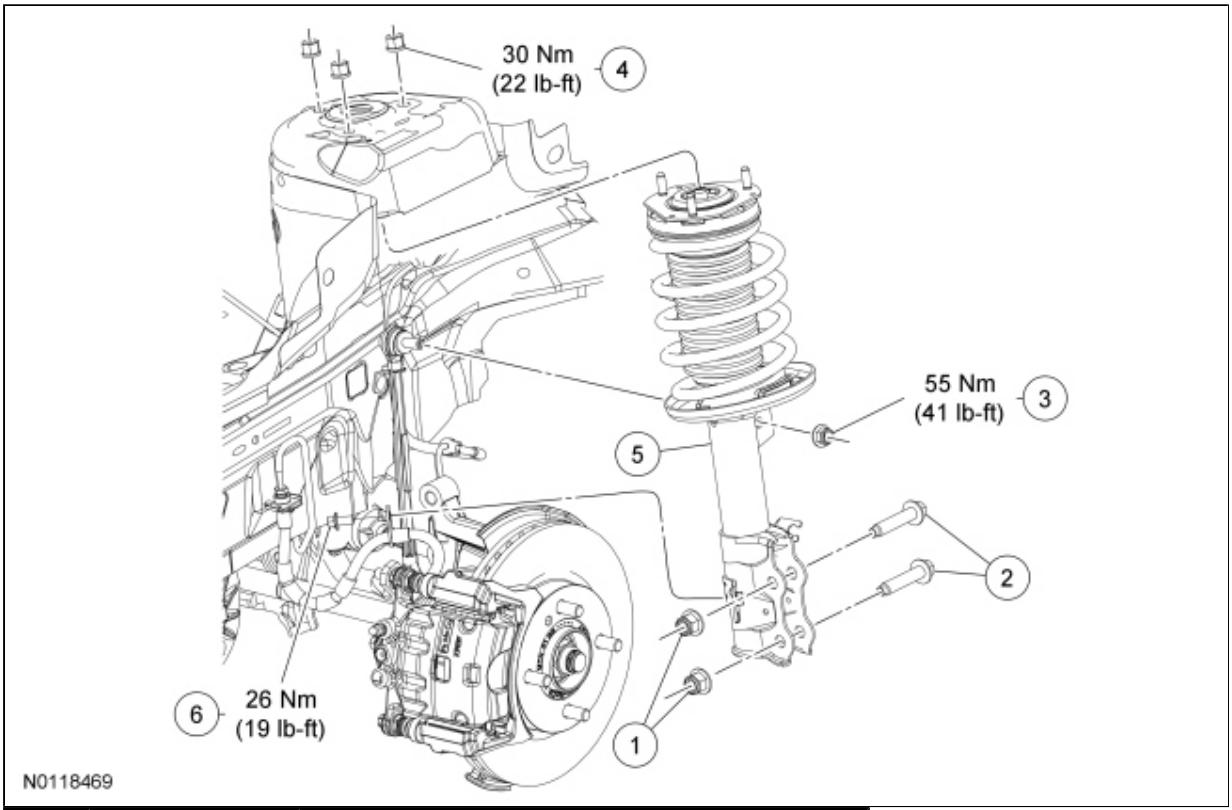
    NOTICE: **Install and tighten the new wheel hub nut to specification in a continuous rotation. Always install a new wheel hub nut after loosening or when not tightened to specification in a continuous rotation, or damage to the components may occur.**

    NOTE: Apply the brake to prevent the halfshaft from rotating while tightening the wheel hub nut.

    Install a new wheel hub nut.
    - Tighten to 255 Nm (188 lb-ft).

11. Install the wheel and tire. For additional information, refer to Section 204-04.

Strut and Spring Assembly



Item	Part Number	Description
1	W520214	Wheel knuckle-to-strut nut (2 required)
2	W500742	Wheel knuckle-to-strut bolt (2 required)
3	W713760	Stabilizer bar link upper nut
4	W715409	Strut upper nut (3 required)
5	18124	Strut and spring assembly
6	W500222	Brake hose bracket to strut bolt

Removal and Installation

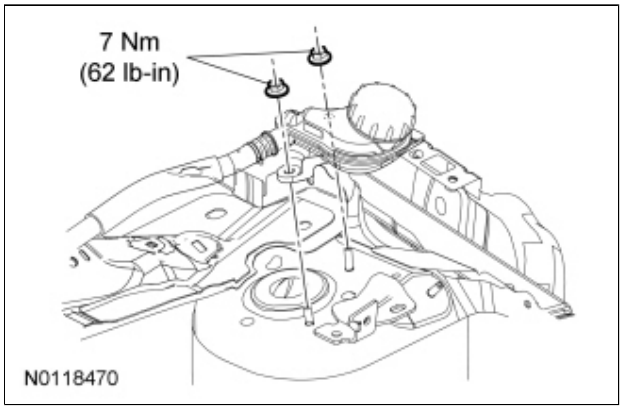
NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.**

NOTICE: **Support the strut and spring assembly to prevent damage.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

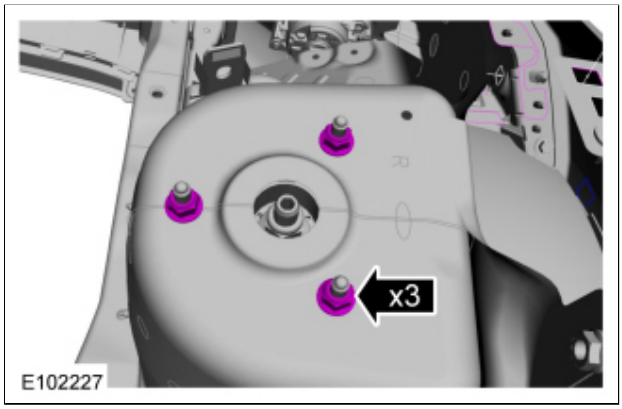
NOTE: Drivers side only

2. Position aside the brake fluid reservoir (main container).
   - To install, tighten to 7 Nm (62 lb-in).



3. Position aside the air conditioner hose support bracket.
    - To install, tighten to 7 Nm (62 lb-in).

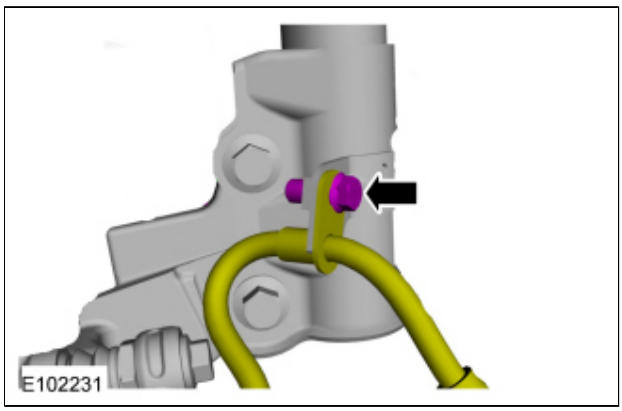
4. Remove and discard the 3 strut and spring assembly upper mount nuts.
    - To install, tighten the new nuts to 30 Nm (22 lb-ft).



5. Disconnect the wheel speed sensor harness from the strut and spring assembly bracket.

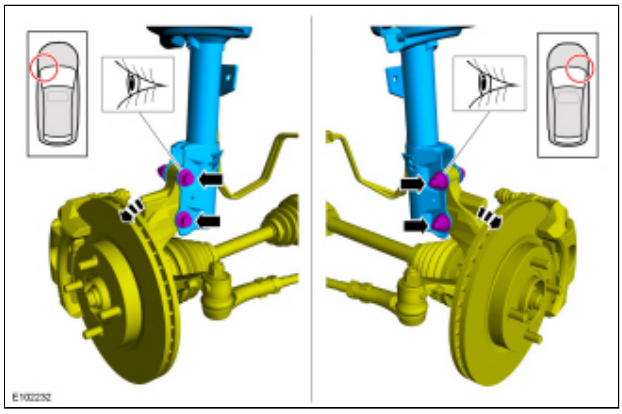
6. Remove the stabilizer bar link upper nut and detach the link from the strut.
    - Discard the nut.
    - To install, tighten the new nut to 55 Nm (41 lb-ft).

7. Remove the brake flexible hose bracket bolt and disconnect the hose from the strut and spring assembly.
    - To install, tighten to 26 Nm (19 lb-ft).



8. Remove the wheel knuckle-to-strut nuts, bolts and the strut and spring assembly.
    - Discard the wheel knuckle-to-strut nuts and bolts.
    - To install, tighten the new wheel knuckle-to-strut nuts to 80 Nm (59 lb-ft) and then tighten an

additional 90 degrees.



9. **NOTE:** Insert LH knuckle-to-strut bolts from the knuckle arm side.

   Insert RH knuckle-to-strut bolts from the brake caliper side.

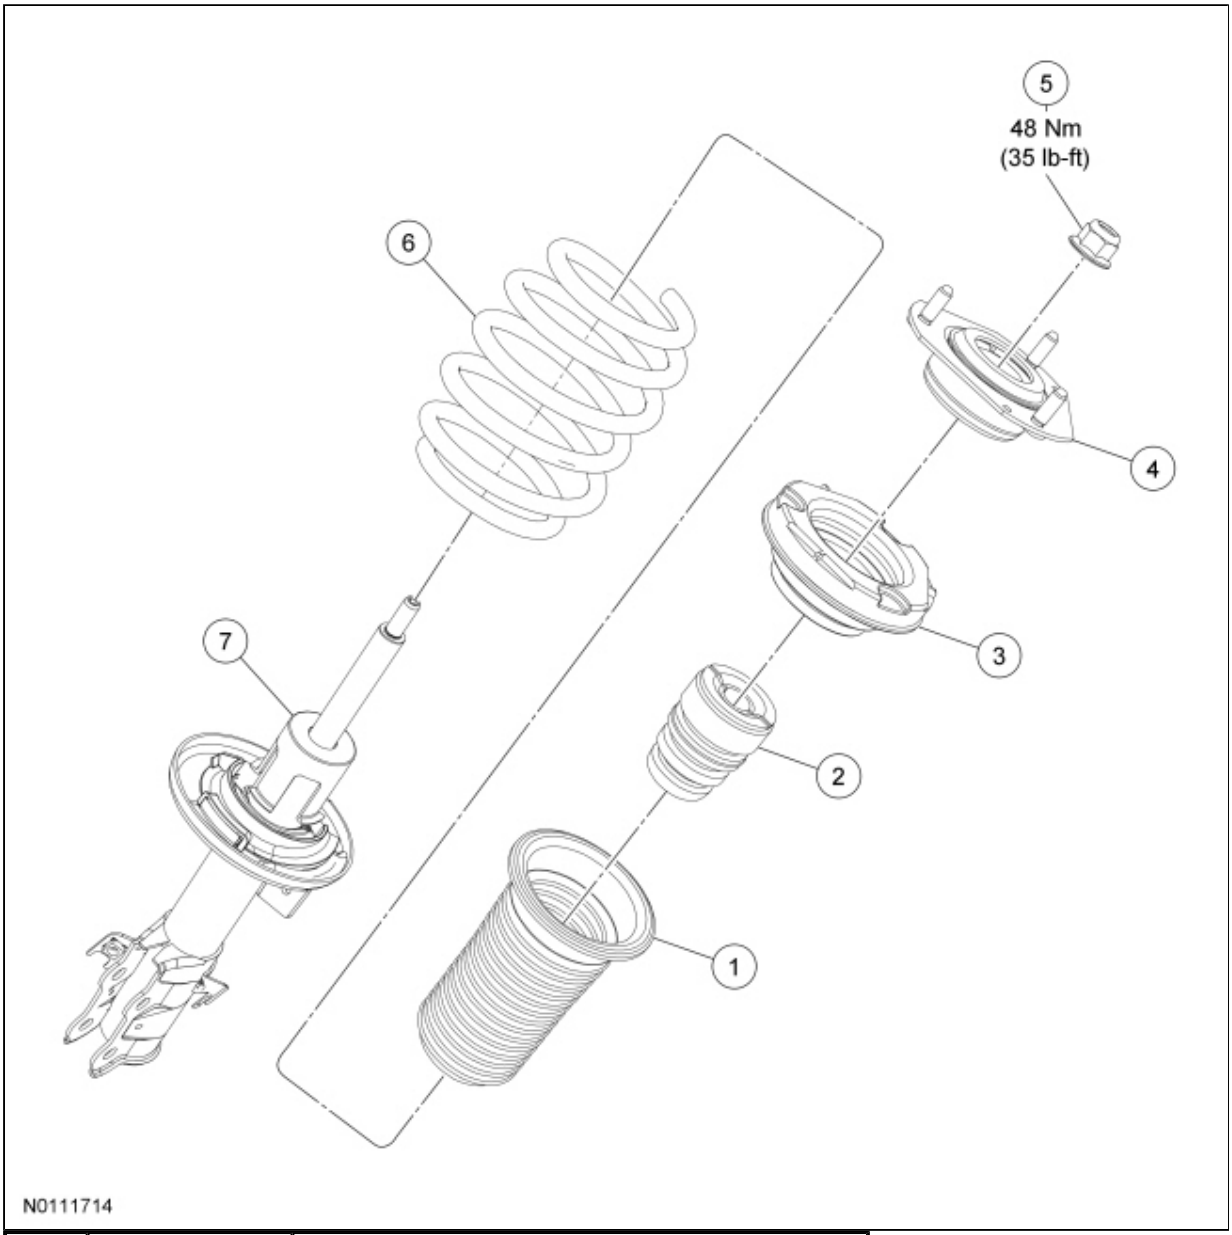
   To install, reverse the removal procedure.

10. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Strut and Spring Assembly

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A



Item	Part Number	Description
1	5349	Dust boot
2	3020	Jounce bumper
3	18198	Spring upper seat and bearing assembly
4	18183	Upper mount

5	W708922	Strut rod nut
6	5310	Spring
7	18124	Strut assembly

Disassembly and Assembly

WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.

WARNING: Keep all body parts clear of shock absorbers or strut rods. Shock absorbers or struts can extend unassisted. Failure to follow this instruction may result in serious personal injury.

***NOTICE:* Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

***NOTICE:* When installing a suitable spring compressor, use care not to damage the spring coating.**

1. Remove the strut and spring assembly. For additional information, refer to Strut and Spring Assembly in this section.

WARNING: Do not attempt to disassemble the shock absorber and spring assembly without using a spring compressor. Assemblies are under extreme load. Failure to follow this instruction may result in serious personal injury.

WARNING: The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.

2. Using a suitable coil spring compressor, compress the spring.
3. **NOTE:** Use the hex-holding feature to prevent the strut rod from rotating while removing the nut.

   Carefully remove and discard the strut rod nut.
   - To install, tighten the new nut to 48 Nm (35 lb-ft).
4. Remove the upper mount, spring upper seat and bearing assembly and the dust boot.
5. Remove the strut and jounce bumper.
6. Carefully remove the spring from the spring compressor.
7. ***NOTICE:* Make sure the upper mount is correctly seated before assembly or damage to the upper mount may occur.**

   ***NOTICE:* Make sure the spring is installed with the flat surface facing up and with the spring end correctly positioned against the spring seat (color code at the bottom). This is to prevent spring seat damage and incorrect spring position.**

   NOTE: During assembly, apply the specified silicone brake grease to the strut rod and the top and sides of the outermost part of the dust boot.

   To assemble, reverse the disassembly procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake tube fitting	18	—	159
Shock absorber lower bolt	115	85	—
Shock absorber upper bolt	25	18	—
Trailing arm bolts [a]	—	—	—
Wheel speed sensor bolt	9	—	80
Wheel hub and bearing assembly bolts [a]	—	—	—

[a] Refer to the procedure for specification.

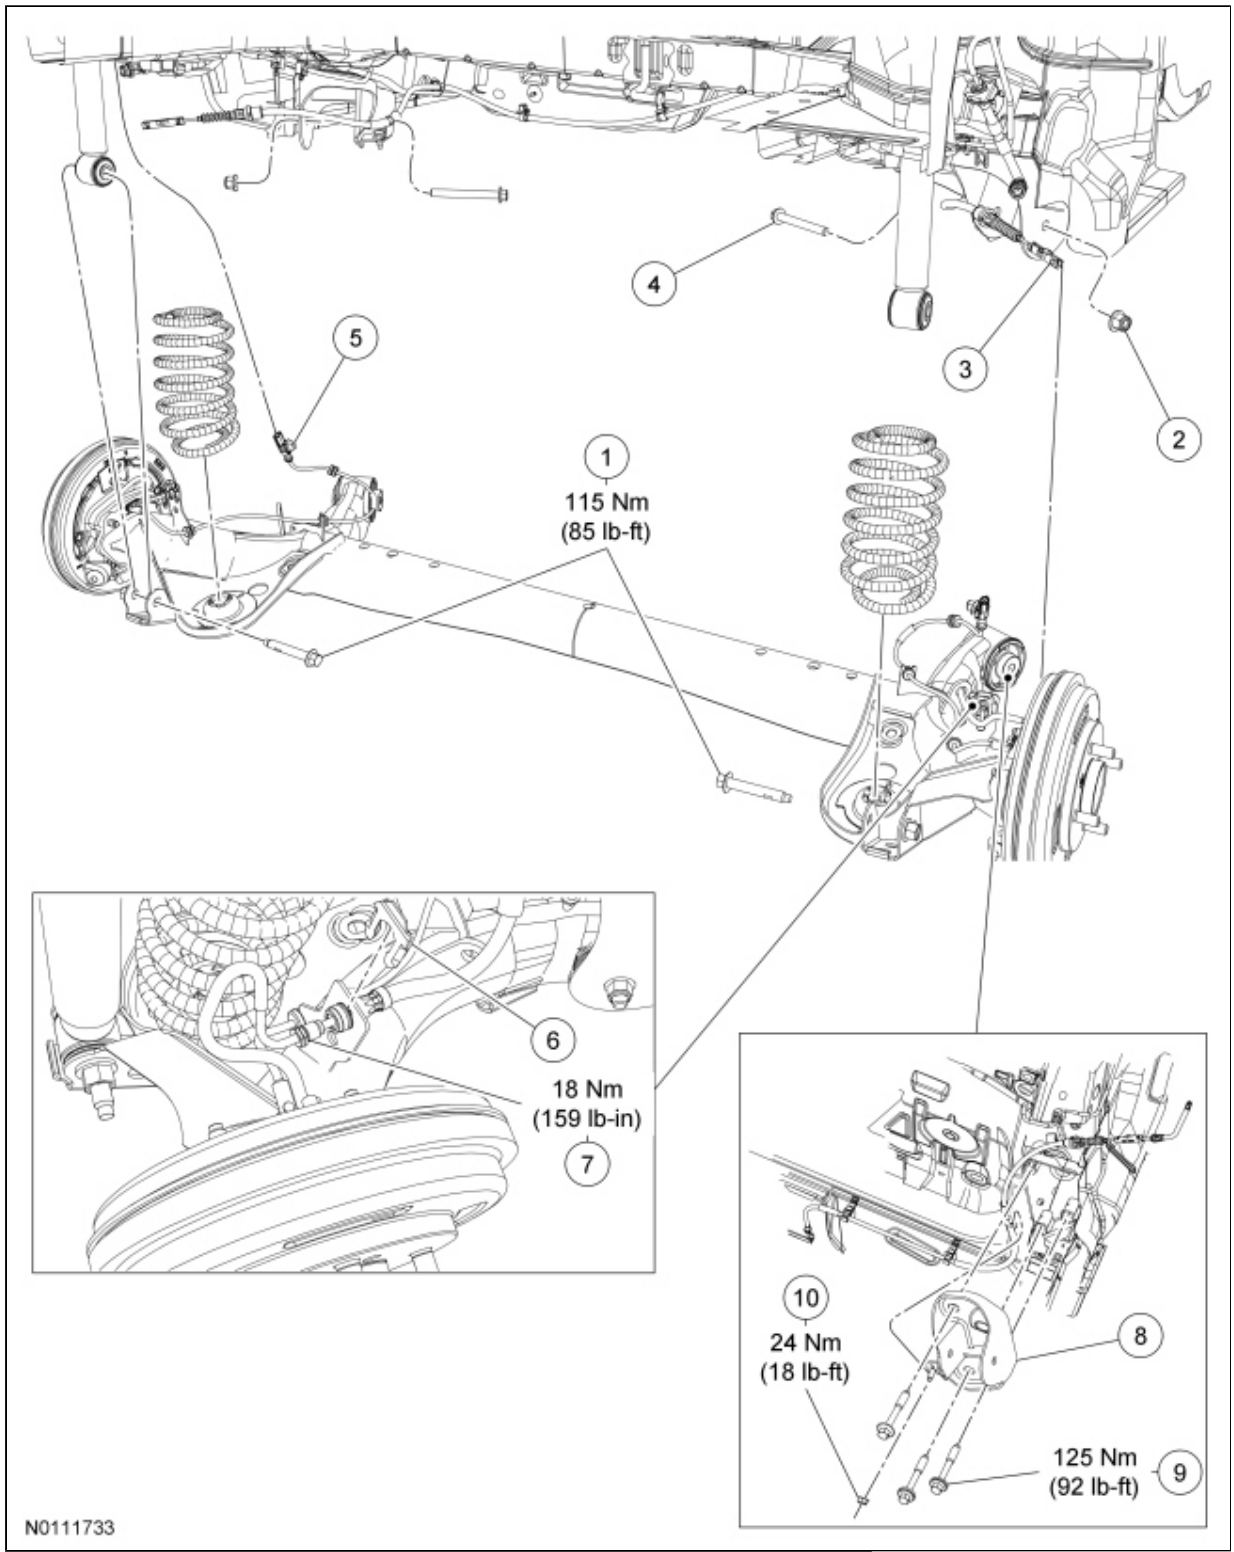
Rear Suspension

The rear suspension consists of the following components:

- Twist-beam axle (torsionally rigid axle)
- Coil springs
- Shock absorbers
- Wheel bearing and wheel hub assemblies
- Wheel studs

If compression takes place on both wheels evenly (for example when a load is placed on the vehicle), the whole axle unit swivels evenly in the rubber-metal bearings. If only one wheel is compressed, the cross-beam twists (undergoes torsion) and acts as a stabilizer. This minimizes track and toe changes.

Axle



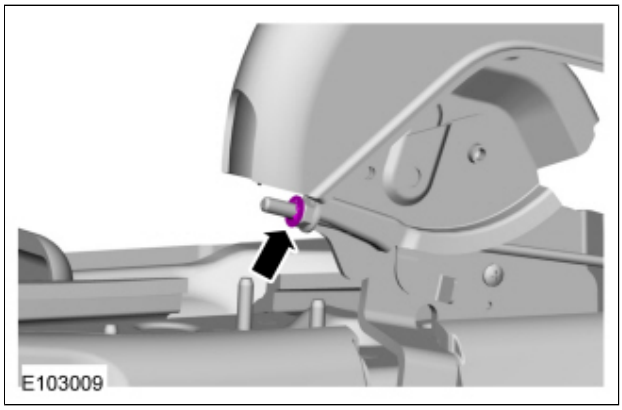
Item	Part Number	Description
1	W713343	Shock absorber lower bolt (2 required)
2	W520214	Trailing arm nut (2 required)

3	—	Front parking brake cable-to-RH rear parking brake cable union (part of 2A635) (2 required)
4	W500553	Trailing arm bolt (2 required)
5	—	Anti-Lock Brake System (ABS) connector (part of 2B372) (2 required)
6	W700936	Clip (2 required)
7	—	Brake tube fitting (part of 2267)
8	5596	Bracket assembly (2 required)
9	W708508	Bracket-to-frame bolts (6 required)
10	W520413	Parking brake cable bracket nut (2 required)

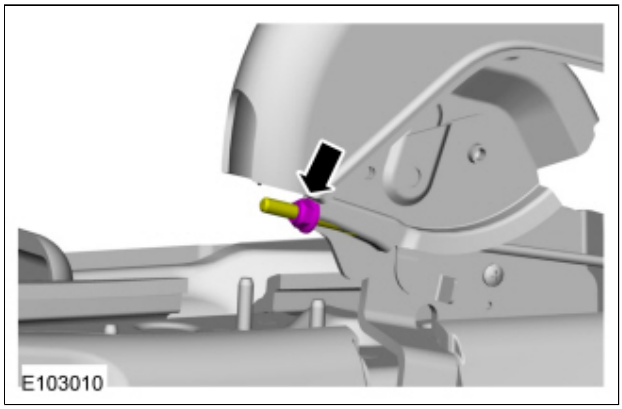
Removal

NOTICE: **Suspension fasteners are critical parts that affect performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

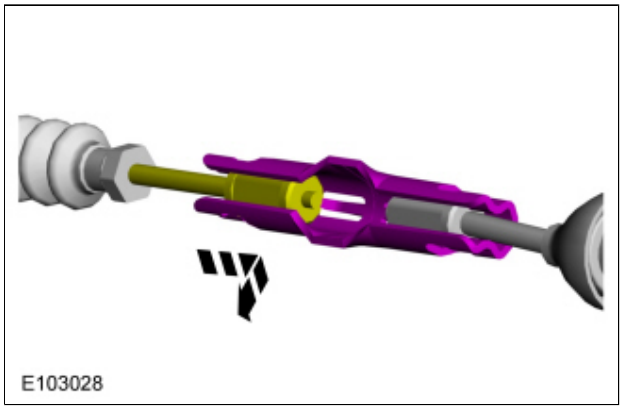
1. Remove the floor console. For additional information, refer to Section 501-12 .
2. Remove the parking brake adjustment nut retaining clip.



3. Loosen the parking brake adjustment nut 5 turns.

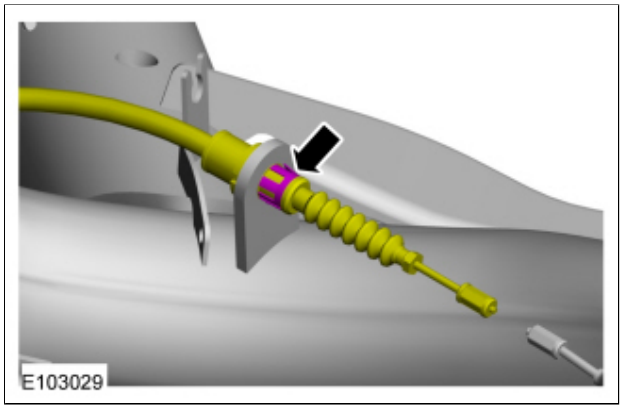


4. Remove the wheel and tire. For additional information, refer to Section 204-04 .
5. Disconnect both parking brake actuation lever cables.



6. **NOTE:** RH side shown, LH side similar.

   Compress the clips and pull both parking brake cables through the mounting brackets.

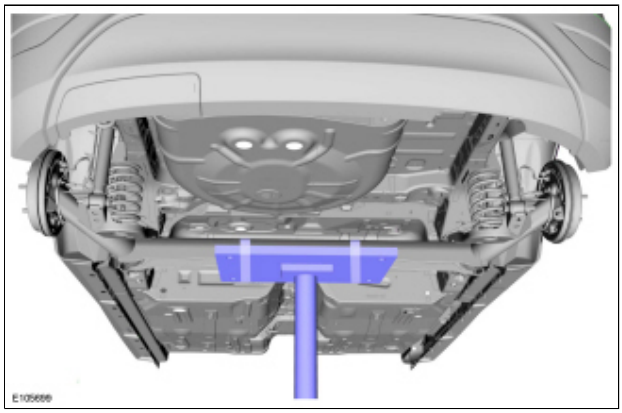


7. **NOTE:** Cap the brake tube connections to prevent fluid loss.

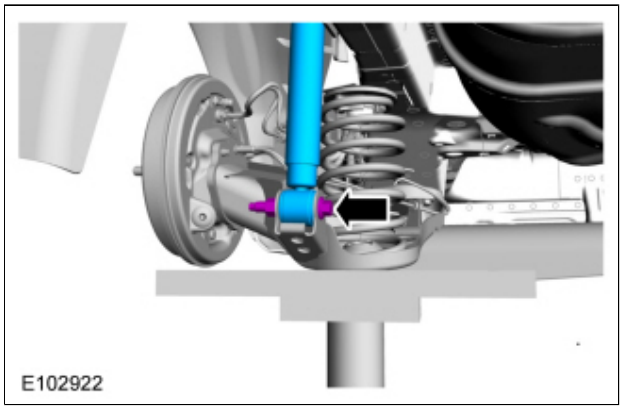
   Disconnect the rear brake tube fittings from the rear brake hoses and remove the clips.
   - To install, tighten to 18 Nm (159 lb-in).

8. Remove the wheel bearing and wheel hub assemblies. For additional information, refer to Wheel Bearing and Wheel Hub .

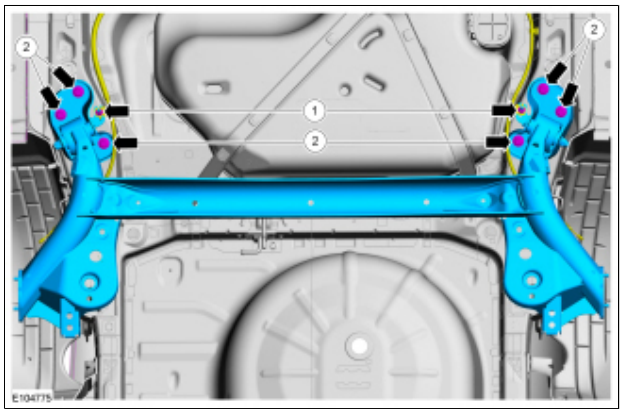
9. Using a suitable jackstand, support the rear axle assembly.



10. Remove and discard the 2 shock absorber lower bolts.
    - To install, tighten to 115 Nm (85 lb-ft).



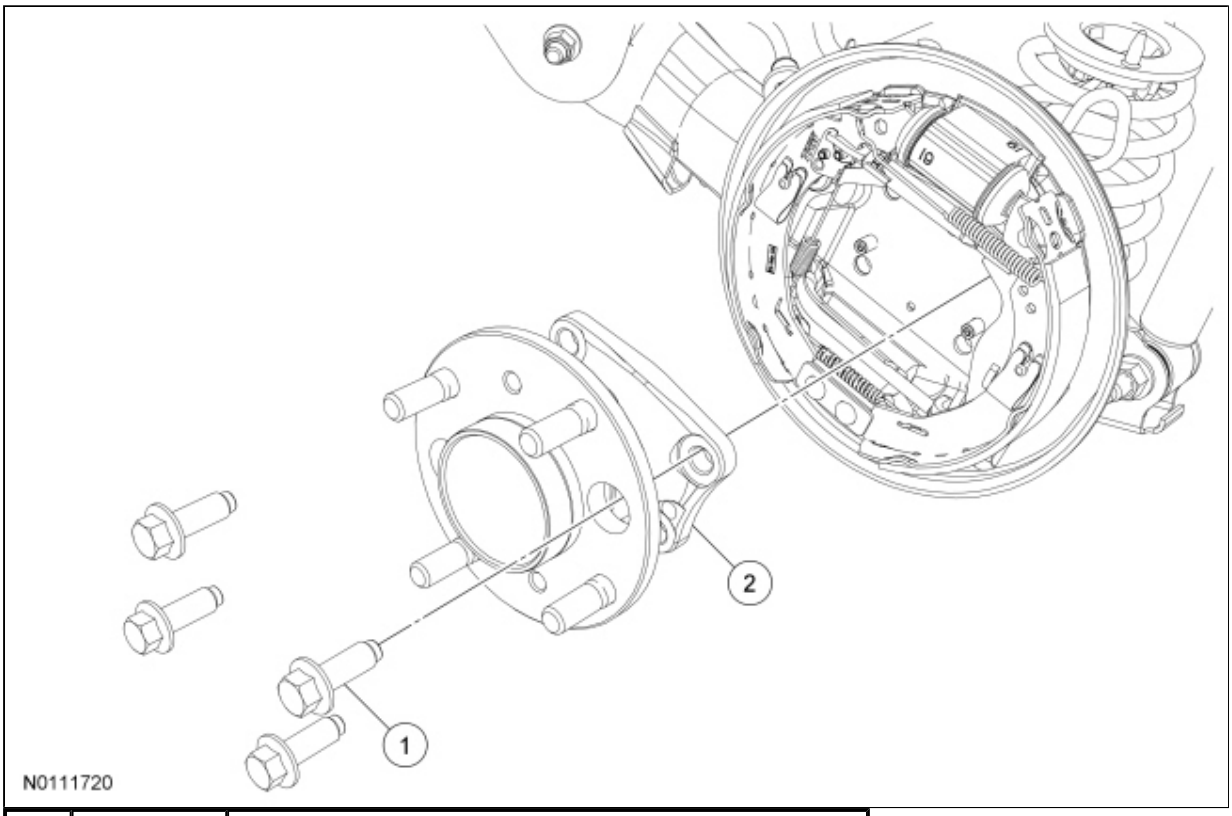
11. Remove the 2 parking brake cable bracket nuts.
    - To install, tighten to 24 Nm (18 lb-ft).



12. Remove the 6 bracket-to-frame bolts and remove the axle assembly
    - To install, tighten to 125 Nm (92 lb-ft).

13. To install, reverse the removal procedure.
    - Bleed the brake wheel cylinders. For additional information, refer to Component Bleeding in Section 206-00 .

Wheel Bearing and Wheel Hub

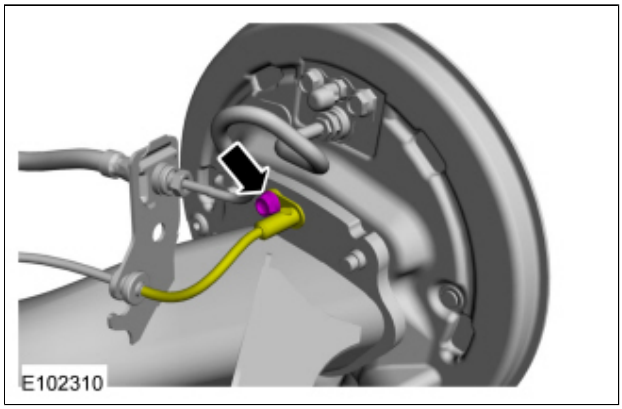


Item	Part Number	Description
1	W711918	Wheel bearing and wheel hub assembly bolt (4 required) (install new)
2	1109	Wheel bearing and wheel hub assembly

Removal

NOTICE: **Suspension fasteners are critical parts that affect performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

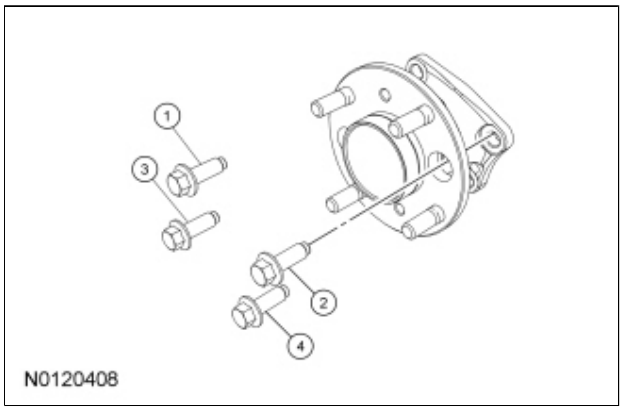
1. Remove the brake drum. For additional information, refer to Section 206-02 .
2. Remove the wheel speed sensor bolt and remove the wheel speed sensor.



3. Remove the wheel bearing and wheel hub assembly.
    - Remove and discard the 4 wheel bearing and wheel hub assembly bolts.
    - Remove the wheel bearing and wheel hub assembly.

Installation

1. Install the wheel bearing and wheel hub assembly with 4 new bolts in the sequence shown.
    1. Tighten all 4 bolts to 65 Nm (48 lb-ft).
    2. Loosen each bolt 90 degrees.
    3. Tighten each bolt to 65 Nm (48 lb-ft) using the sequence shown.



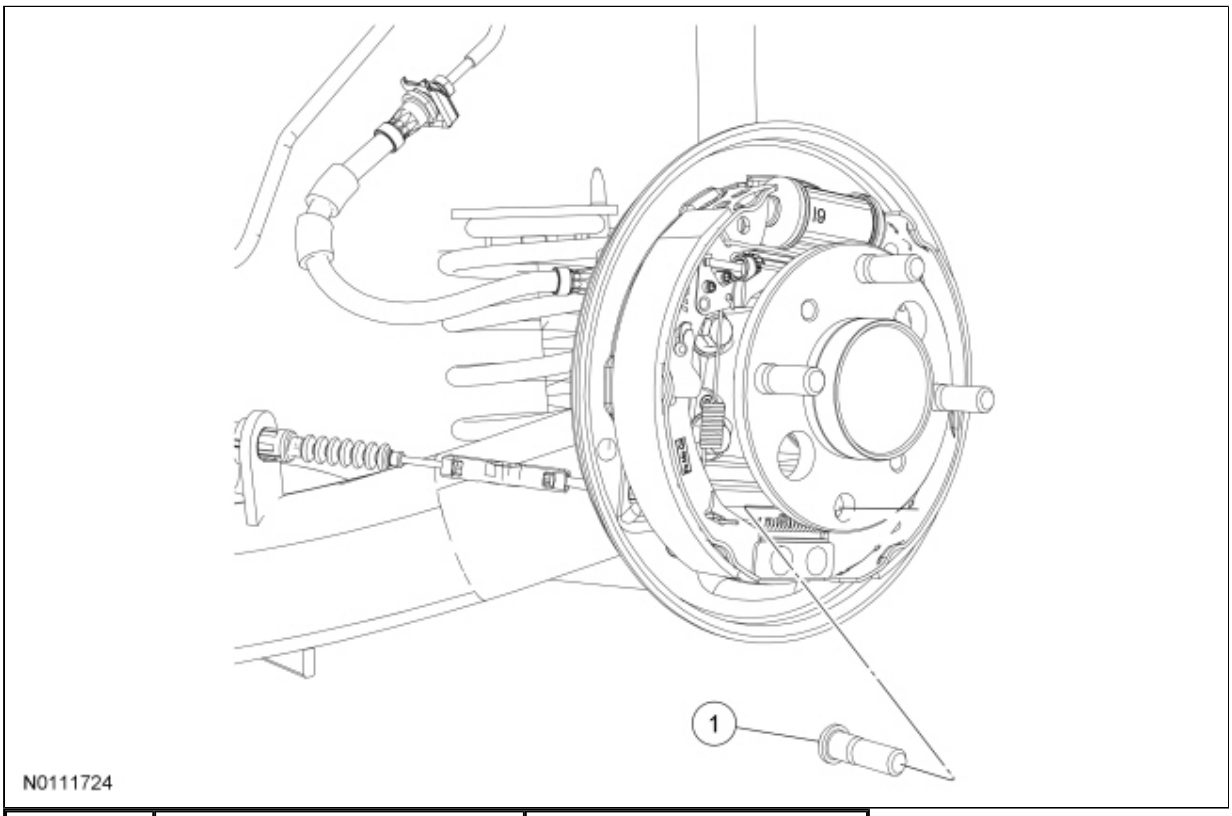
2. Install the wheel speed sensor and install the wheel speed sensor bolt.
    - Tighten to 9 Nm (80 lb-in).

3. Install the brake drum. For additional information, refer to Section 206-02 .

Wheel Studs

Special Tool(s)

ST1106-A	Remover, Tie-Rod End 211-001 (TOOL-3290-D)



Item	Part Number	Description
1	1107	Wheel stud

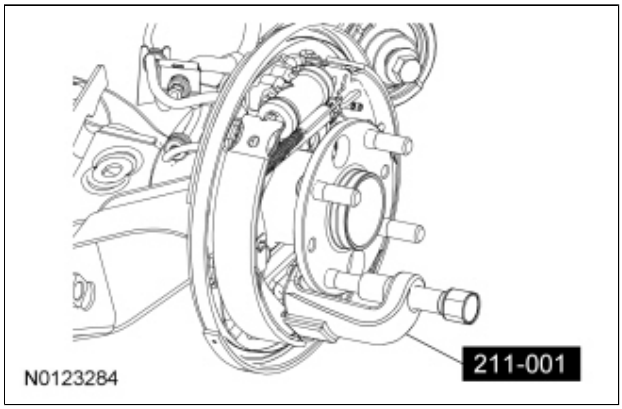
Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the brake drum. For additional information, refer to Section 206-02 .

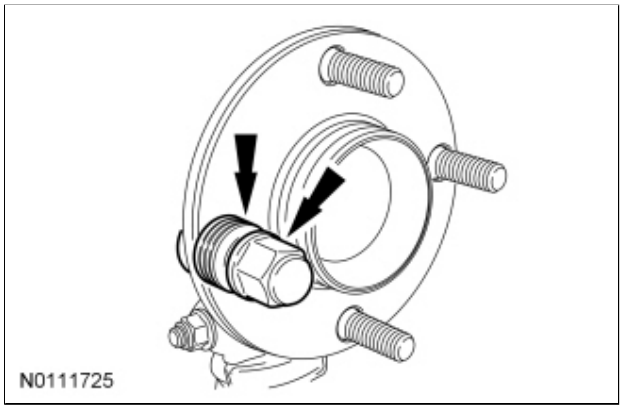
NOTICE: **Never use a hammer to remove a wheel stud. Damage to the wheel hub may result.**

2. Using the Tie-Rod End Remover, remove the wheel stud.



3. **NOTE:** Make sure to use washers that have an ID that is larger than the OD of the wheel stud serrations. Use enough washers (approximately 4) to allow the wheel stud to fully seat against the hub flange.

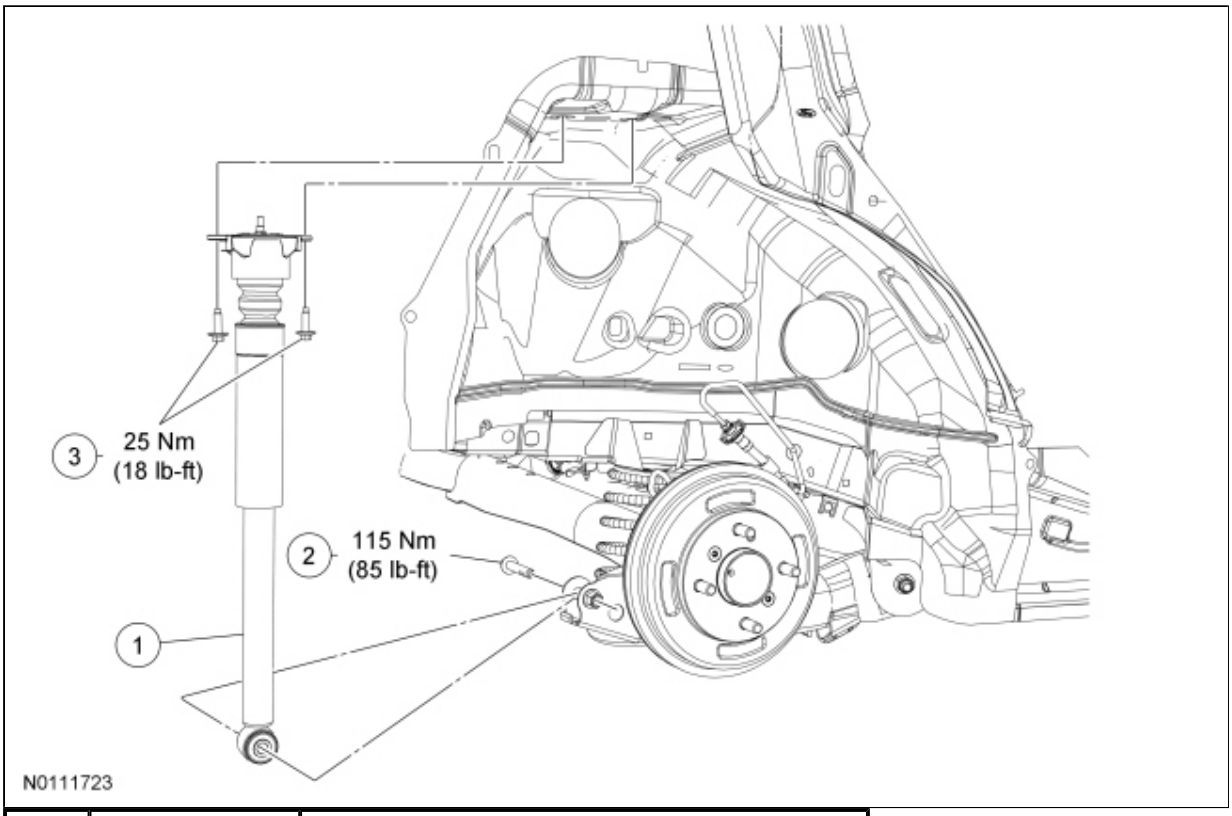
   Position the new wheel stud in the wheel hub, aligning the serrations in the wheel hub flange made by the original wheel stud.
   - Place approximately 4 washers over the outside end of the wheel stud and thread a standard wheel nut onto the wheel stud with the flat side against the washers.
   - Tighten the wheel nut until the wheel stud head seats against the back side of the wheel hub flange.



4. Remove the wheel nut and washers.

5. Install the brake drum. For additional information, refer to Section 206-02 .

Shock Absorber



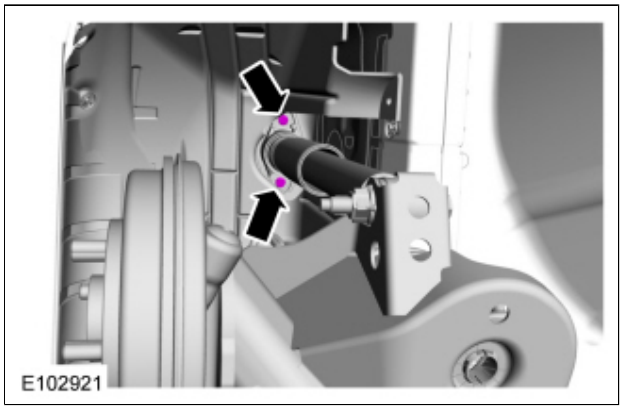
Item	Part Number	Description
1	18125	Shock absorber
2	W713343	Shock absorber lower bolt
3	W708828	Shock absorber upper bolt (2 required)

Removal

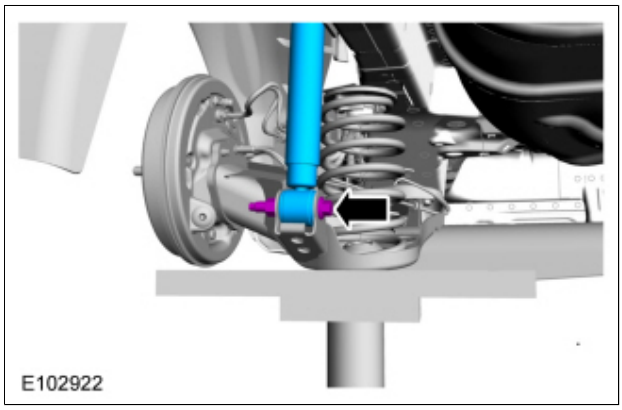
NOTICE: **Suspension fasteners are critical parts that affect performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

1. Using a suitable jackstand, support the rear axle.

2. Remove and discard the two shock absorber upper bolts.
   - To install, tighten the new bolts to 25 Nm (18 lb-ft).



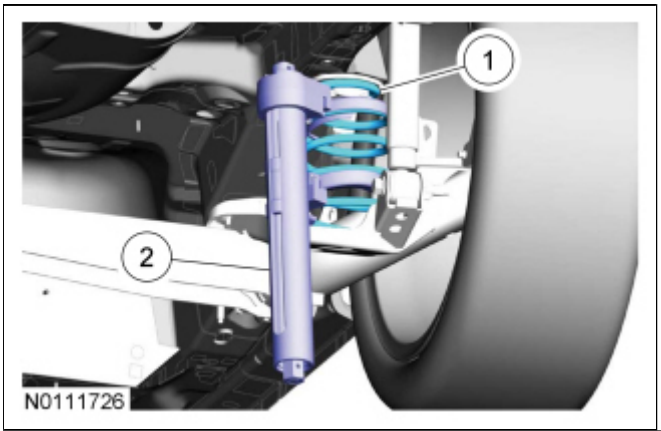
3. Remove and discard the shock absorber lower bolt and remove the shock absorber.
    - To install, tighten the new bolt to 115 Nm (85 lb-ft).



4. ***NOTICE:*** **Tighten the shock absorber lower bolt while the suspension is at curb height or bushing damage and incorrect clamp load may occur.**

    To install, reverse the removal procedure.

Spring



Item	Part Number	Description
1	5560	Spring
2	—	Spring compressor

Removal and Installation

WARNING: The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.

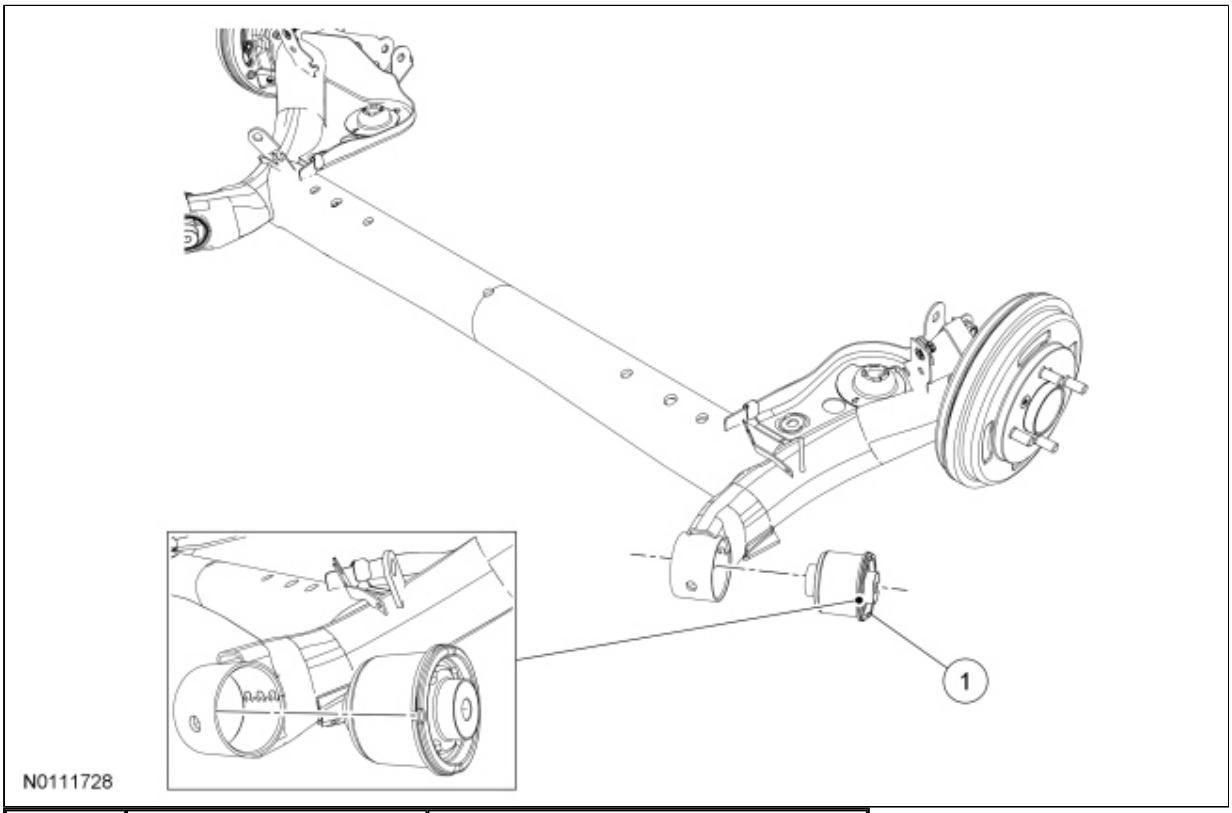
1. Using a suitable spring compressor, compress the spring.
2. Remove the spring.
3. ***NOTICE:*** **Make sure the upper spring seat is installed, and the spring ends butt correctly against the upper and lower spring seats.**

   To install, reverse the removal procedure.

Trailing Arm Bushing

Special Tool(s)

	Installer, Spindle/Axle Shaft 205-199
	Installer, Front Wheel Spindle Oil Seal 205-353
	Installer, Input Shaft Bearing 308-062



Item	Part Number	Description
1	5A638	Trailing arm bushing

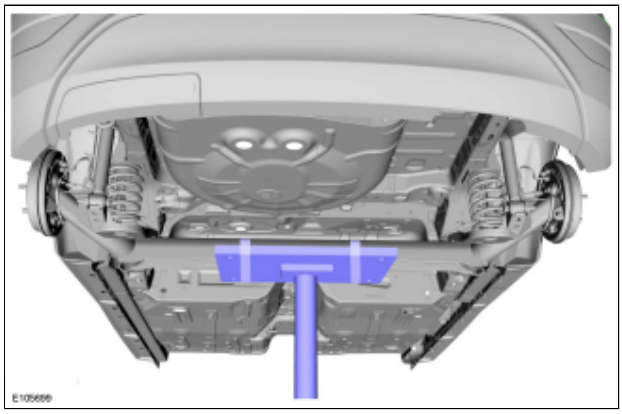
Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the**

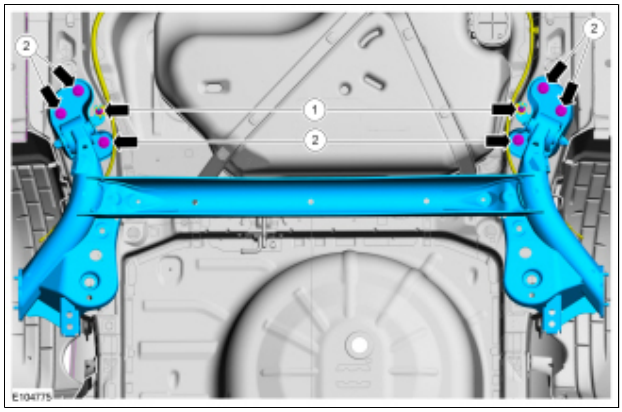
same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Using a suitable jackstand, support the rear axle assembly.

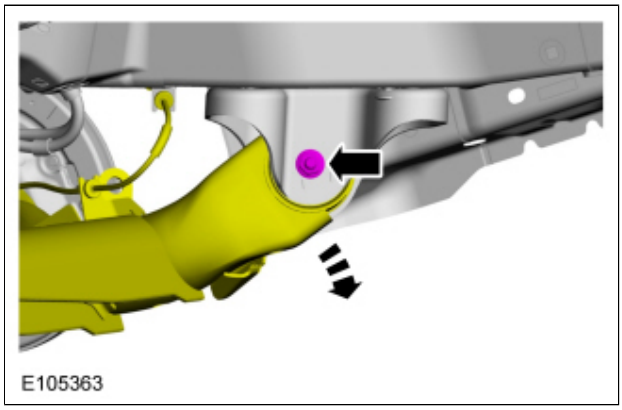


3. Remove the 2 parking brake cable bracket bolts.
   - To Install, tighten to 24 Nm (18 lb-ft).

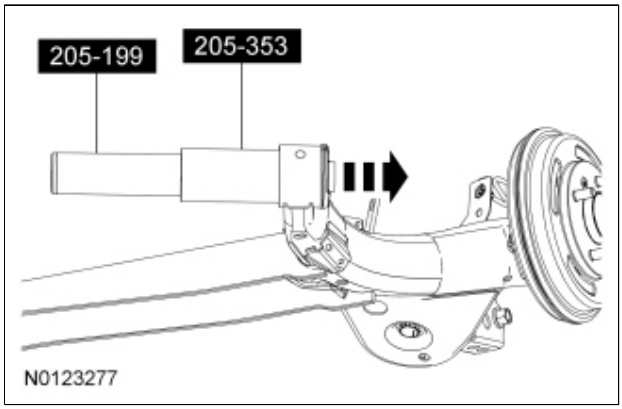


4. Remove the 6 axle bracket-to-frame bolts and remove the axle assembly.
   - To install, tighten to 125 Nm (92 lb-ft).

5. Lower the subframe and remove the 2 trailing arm bolts.
   - To install, tighten to 80 Nm (59 lb-ft) then tighten an additional 120 degrees.

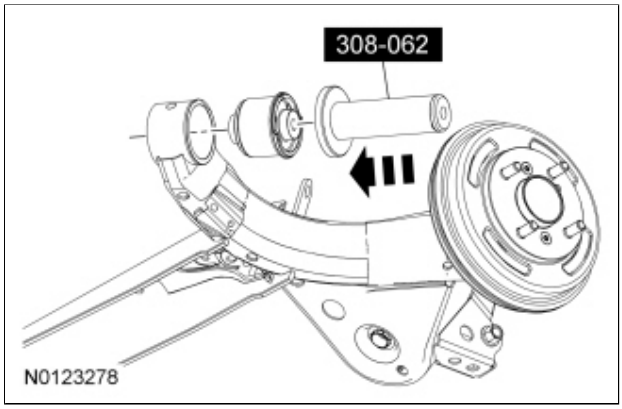


6. Using the special tools, remove the trailing arm bushing.



Installation

1. Using the special tool, install the trailing arm bushing.



2. To install, reverse the removal procedure.

Wheels And Tires

Safety Precautions

WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

WARNING: Always match the tire size to the wheel size during assembly. Incorrect matching can result in tire bead damage or tire separation from the wheel. Failure to follow this instruction may result in serious personal injury to technician or vehicle occupant(s).

WARNING: Before servicing any tire, ask the customer if anyone injected a tire sealant into the tire. Tire sealants may be flammable and can burn or explode if exposed to an ignition source. Failure to follow this instruction may result in serious personal injury.

WARNING: Replacement wheels must be equivalent to the original equipment wheels in:

- **load carrying capacity.**
- **diameter, width and offset.**
- **pilot hole and bolt circle.**

Combined load carrying capacity of replacement wheels for a given axle, must be equal to or greater than that axle's gross axle weight rating (GAWR) identified on the vehicle's Safety Compliance Certification label. All other specifications should be evaluated by measurement of both the original wheel and the replacement wheel. If specifications are not equivalent, the safety and handling of the vehicle may be degraded, which may result in serious injury to the vehicle occupant(s).

WARNING: Never use wheels different than the original equipment. Additionally, never use wheel nuts different than the original equipment. Failure to follow these instructions may result in damage to the wheel or mounting system. This damage could cause the wheel to come off while the vehicle is being driven, which could result in serious personal injury or death to vehicle occupant(s).

WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Keep eyes away from valve stem when deflating tires. Reduce air pressure in tire as much as possible by pushing in valve core plunger prior to removing the core. Escaping air can carry particles that can injure the eyes. Failure to follow these instructions may result in serious personal injury.

WARNING: Only use replacement tires that are the same size, load index, speed rating and type (such as P-metric versus LT-metric or all-season versus all-terrain) as those originally provided by Ford. The recommended tire and wheel size may be found on either the Safety

Compliance Certification Label or the Tire Label, which is located on the B-pillar or edge of the driver's door. If the information is not found on these labels, consult a Ford dealer. Use of any tire or wheel not recommended by Ford can affect the safety and performance of the vehicle, which could result in an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally, the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power transfer unit failure.

NOTICE: **Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents or damage to the wheel finish may occur. Use Wheel and Tire Cleaner ZC-27-A or -B or equivalent.**

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, rotate the tires at recommended intervals.

Tire Pressure Monitoring System (TPMS)

NOTE: The Tire Pressure Monitor (TPM) module is identified by the scan tool as the Vehicle Security Module (VSM).

The TPMS includes:

- the TPM / VSM, a stand alone receiver located in the driver's side luggage compartment (4-door), or in the driver's side cargo area (5-door).
- four tire pressure sensors.

TPM / VSM

The TPM / VSM contains the TPMS functionality. Refer to Tire Pressure Monitoring System in Diagnosis and Testing for TPMS fault diagnosis and repair.

The TPM / VSM compares the information of each tire pressure sensor transmission against a pressure limit. If the TPM / VSM determines that the tire pressure has fallen below the minimum pressure the TPM / VSM communicates this to the Instrument Panel Cluster (IPC) on the vehicle communication network.

Tire Pressure Monitoring System (TPMS) Pressure Sensor

The TPM / VSM uses tire pressure sensors to monitor the tire pressure in the 4 road tires. The tire pressure sensors transmit radio frequency signals to the TPM / VSM approximately once every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph).

The tire pressure sensors are battery operated and mounted on the valve stem.

Instrument Panel Cluster (IPC)

The IPC illuminates the TPMS indicator when it receives a message from the TPM / VSM.

For additional Information, refer to Section 413-01 for diagnosis and repair of the IPC.

Wheels And Tires

Special Tool(s)

ST2869-A	Digital Tire Gauge 204-354
ST3058-A	Hunter Road Force® Wheel Balancer GSP9700 Series

Inspection and Verification

WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, GO to Symptom Chart - NVH .

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

The use of any other tire/wheel size, load range or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- braking performance.

New wheels need to be installed when the vehicle wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire label located on the driver door or door pillar attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect the tires for signs of uneven wear. Refer to the following descriptions to identify the type of wear and GO to Symptom Chart - Tire Wear for the appropriate repair action to be carried out.

2. Check the tires for:
   - cuts.
   - stone bruises.
   - abrasions.
   - blisters.
   - embedded objects.

3. Check the valve stems for:
   - cracks.
   - cuts.

Install a new valve stem when damage is found or anytime a new tire is installed.

4. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become less than 2/32 inch.

Tire Wear

Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread-wear indicators.

Abnormal/Incorrect Tire Wear

Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread and that creates performance-related issues.

Abnormal/incorrect wear can be caused by numerous factors, some of which include driving style (aggressive, passive), climate (hot, cold), road conditions, vehicle loading and maintenance (correct tire pressure, rotation intervals and balance). It is important to determine the root cause of wear on a vehicle

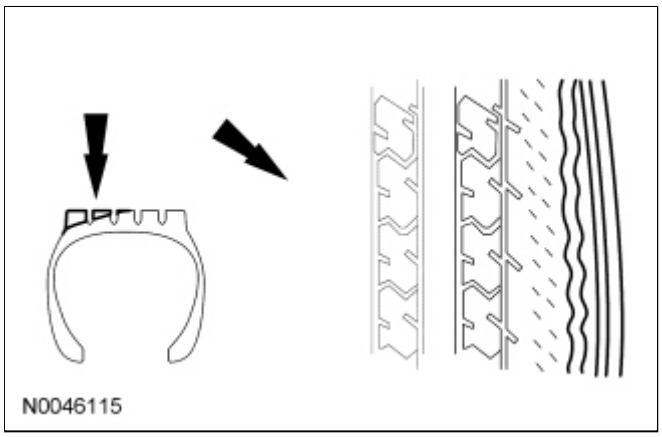
before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than 2/32 inch and the tire is not causing a vehicle performance (noise/vibration) concern.

Some abnormal/incorrect wear patterns look the same all the way around the tread of the tire, other wear patterns are not consistent and can occur in various spots on the tread area. The underlying causes of the 6 wear categories are different. Refer to the following descriptions to identify the type of wear and GO to Symptom Chart - Tire Wear for the appropriate repair action to be carried out.

Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.

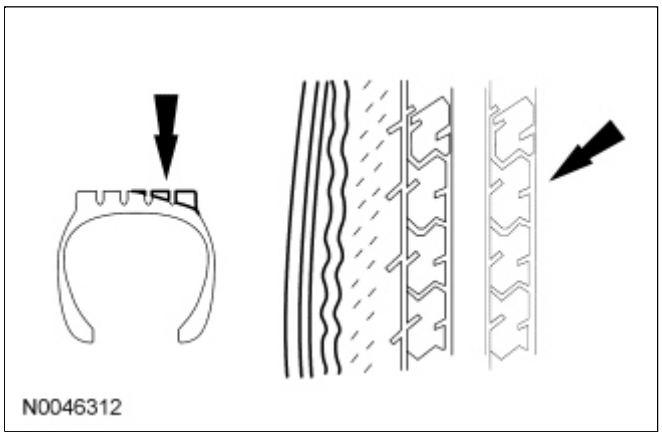
NOTE: RF tire shown, others similar.



Outer Edge/Shoulder Wear

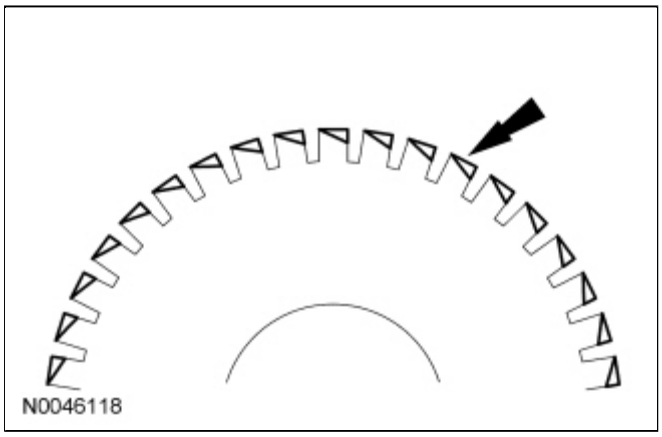
Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.

NOTE: RF tire shown, others similar.



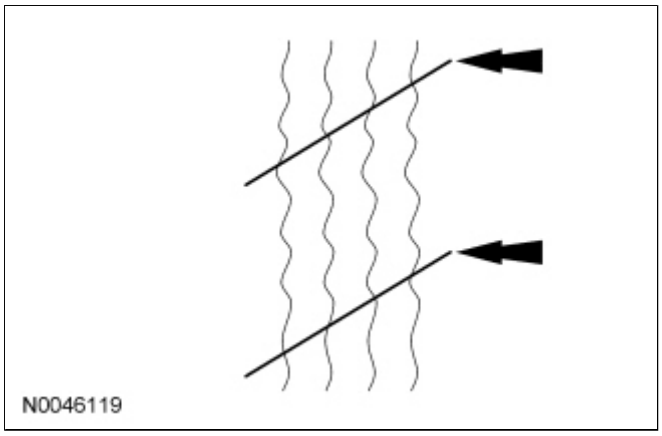
Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. To determine whether tires have this type of wear, visually inspect the tires in both the inside and outside shoulder ribs. In some instances, it may be necessary to measure the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib.



Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, the difference in tread depth along the diagonal wear pattern may need to be measured.



Symptom Chart — Tire Wear

Symptom Chart — Tire Wear

NOTE: For suspension system and additional alignment diagnosis, refer to Section 204-00 .

Condition	Possible Sources	Action
• Inner edge/shoulder wear	• Excessive toe out and/or negative camber	• GO to Pinpoint Test A .
	• Incorrect wheel and tire assembly rotation intervals	• GO to Pinpoint Test A .
	• High-speed cornering	• GO to Pinpoint Test A .
• Outer	• Excessive toe in	• GO to Pinpoint Test B .

edge/shoulder wear	and/or positive camber • Incorrect wheel and tire assembly rotation intervals • High-speed cornering	• GO to Pinpoint Test B . • GO to Pinpoint Test B .
• Heel/toe wear	• Excessive toe in/out • Incorrect wheel and tire assembly rotation intervals	• ROTATE the wheel and tire assemblies. CHECK the alignment, ADJUST as necessary.
• Diagonal wear	• Excessive toe in/out • Incorrect tire rotation intervals • Loose, worn or damaged suspension components	• GO to Pinpoint Test C . • GO to Pinpoint Test C . • REFER to Section 204-00 .

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Wobble or shimmy	• Bent wheel	• INSTALL a new wheel as necessary.
	• Damaged tire	• INSTALL a new tire as necessary.
	• Loose wheel nuts	• TIGHTEN to specification.
• High-speed shake	• Tires/wheels	• REFER to Wheel and Tire Runout Component Tests in this section.
• Vehicle vibration	• Tires/wheels	• REFER to Wheel and Tire Runout Component Tests in this section.

Pinpoint Tests

For a description of the various tire wear patterns, refer to Inspection and Verification.

Pinpoint Test A: Inner Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe out
- Incorrect wheel and tire rotation

PINPOINT TEST A: INNER EDGE/SHOULDER WEAR

Test Step	Result / Action to Take
A1 MEASURE THE TREAD DEPTH • Using a tread depth gauge or similar tool, measure the inside edge/shoulder tread depth. • **Is the tread depth greater than 2/32 inch?**	**Yes** ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal +0.15 degrees (toe in). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test B: Outer Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe in
- Incorrect wheel and tire rotation

PINPOINT TEST B: OUTER EDGE/SHOULDER WEAR

Test Step	Result / Action to Take
B1 MEASURE THE TREAD DEPTH • Using a tread depth gauge or similar tool, measure the outside edge/shoulder tread depth. • **Is the tread depth greater than 2/32 inch?**	**Yes** ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal -0.15 degrees (toe out). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test C: Diagonal Wear

This pinpoint test is intended to diagnose the following:

- Incorrect wheel and tire rotation
- Excessive toe in/out
- Incorrect tire inflation
- Loose, worn or damaged suspension components

PINPOINT TEST C: DIAGONAL WEAR

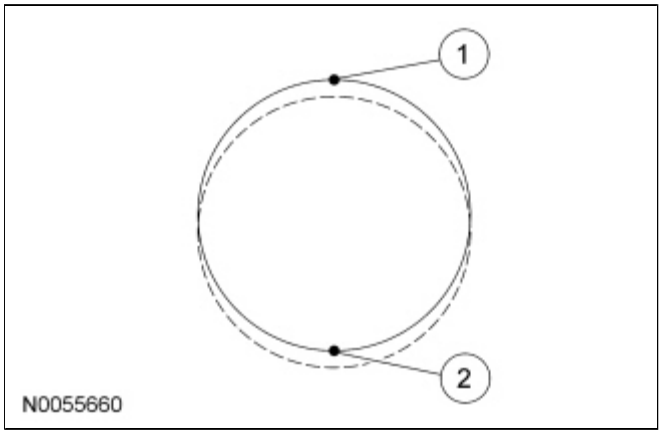
Test Step	Result / Action to Take
C1 MEASURE THE	

TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the tread depth of the wear pattern. • **Is the tread depth greater than 2/32 inch?**	**Yes** If no performance concerns (noise/vibration) are present, the tire can remain in service. CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 .

Component Tests

Radial Runout

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular to the circumference. On a wheel and tire assembly, this means measuring the center tire tread rib. The center rib is indicative of the condition of the tire as a whole. Total runout is the difference between the maximum-to-minimum gauge reading. The high spot is the location of maximum runout.



Item	Description
1	High spot
2	Low spot

Loaded Runout Measurement (Hunter Road Force® 9700 Series Wheel Balancer)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) may correct themselves after the tires have been in service for 320 km (200 mi).

This procedure is intended to assist with the diagnosis of wheel and tire assembly runout and/or force variation issues.

The Hunter Road Force® 9700 Series Wheel Balancer measures the wheel and tire assembly's loaded runout and the tire's radial spring rate. The balancer then converts the runout into pounds of force (termed as Road Force®). Measuring loaded runout (Road Force®) is more effective than measuring unloaded runout using a dial indicator.

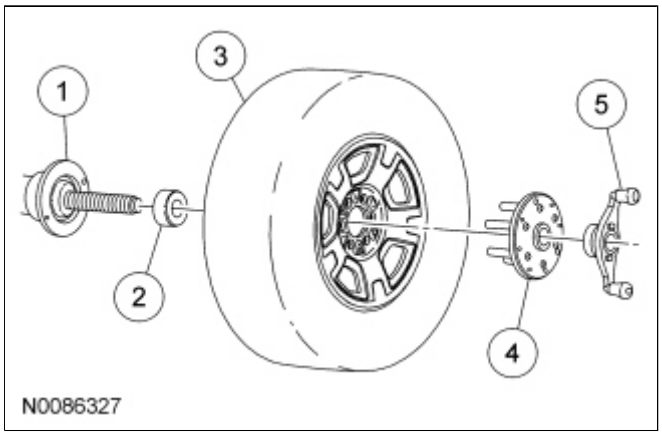
1. Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.
2. Remove the wheel and tire assemblies. Refer to Wheel and Tire in this section.
3. **NOTE:** Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure that the tire pressures are set to the correct pressure as indicated on the Vehicle Certification (VC) label.
4. ***NOTICE:*** **Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

   NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

   NOTE: The wheel balancer inflation station must be turned OFF for tires with inflation pressures of 414 kPa (60 psi) or above.

   Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel balancer adapters on the PTS website.



Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

5. Measure the Road Force®.
   - Temporarily mark the high spot and the Road Force® value on the sidewall of the tire. If the wheel and tire assembly Road Force® value is greater than 9 kg (20 lb), carry out the Match Mounting procedure to optimize the wheel and tire assembly.
   - If the wheel and tire assembly Road Force® value is 9 kg (20 lb) or less, permanently mark the high spot and the Road Force® value on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on

the vehicle using the Wheel-to-Hub Optimization procedure.

Runout Measurement (Dial Indicator)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) will correct themselves after the tires have been in service for 320 km (200 mi).

NOTE: Loaded run-out measurements are the preferred method for verifying tire serviceability. While a dial indicator can be used to optimize the position of the tire on the wheel, the unloaded run-out measurement cannot accurately determine if the tire should be removed from service.

The following procedures should be used if normal diagnostics leads to a potential runout issue.

Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Radial runout measurements can be taken using a dial indicator and should be measured with the wheel and tire assembly mounted on a suitable wheel balancer. The dial indicator should be mounted securely to eliminate gauge movement when measuring runout.

1. **NOTE:** Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure that the tire pressures are set to the correct pressure as indicated on the VC label.

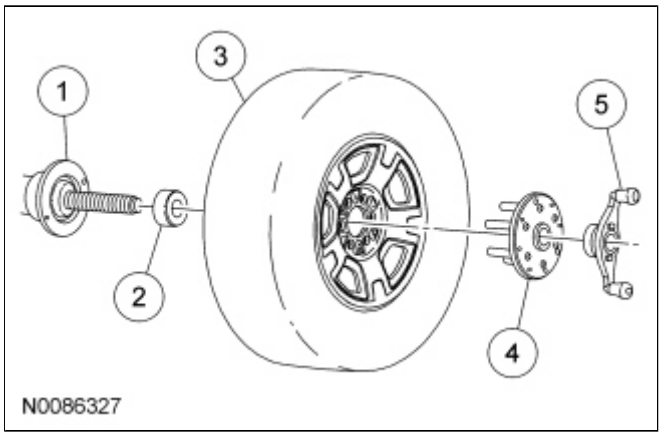
2. Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.

3. Remove the wheel and tire assemblies. Refer to Wheel and Tire in this section.

4. ***NOTICE:*** **Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

   NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

   Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel balancer adapters on the PTS website.

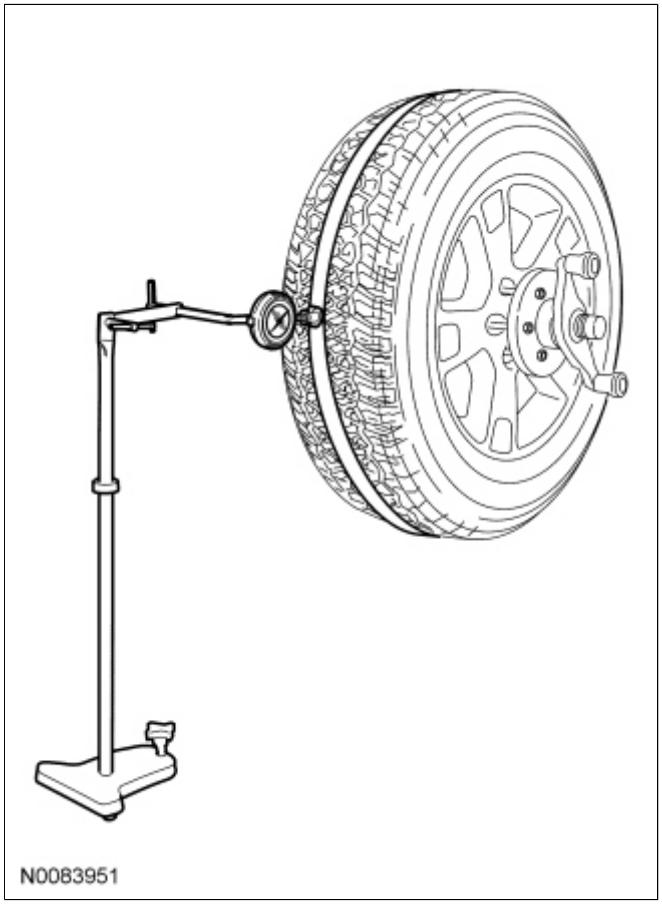


Item	Description
1	Wheel balancer
2	Cone

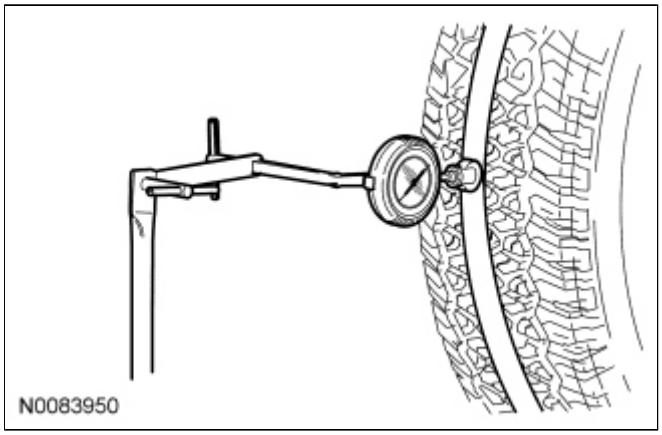
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

5. **NOTE:** Masking tape can be applied on the center tread rib to allow for a smoother measuring surface. Some fluctuation of the gauge reading is expected. Observe the overall sweep of the gauge from the highest to the lowest spot on the tire.

   Position a suitable dial indicator and stand with the dial indicator on the center tread rib.
   - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
   - Adjust the runout gauge to read 0.
   - Rotate the wheel and tire assembly one complete revolution to make sure that the low spot has been found and that the dial indicator returns to a 0 reading.



6. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.
   - Note the variance (runout) from 0 on the dial of the gauge.
   - If the runout reading of a wheel and tire assembly is greater than 1.14 mm (0.045 in), locate and temporarily mark the high spot and runout reading on the sidewall of the tire and carry out the Match Mounting procedure to optimize the wheel and tire assembly.
   - If the runout reading of a wheel and tire assembly is 1.14 mm (0.045 in) or less, permanently mark the high spot and the runout reading on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.

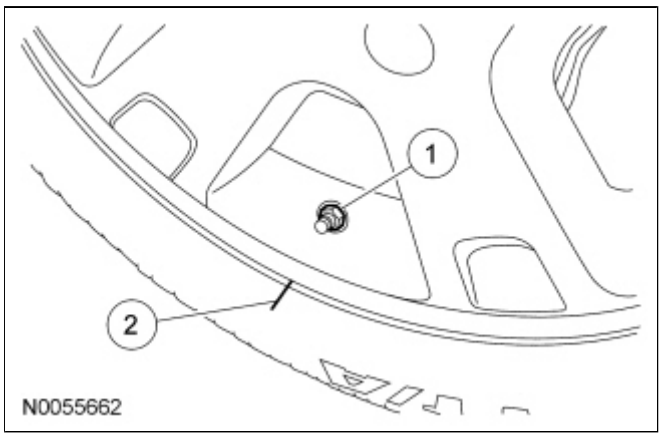


Match Mounting

NOTE: Road Force® values in illustrations are shown in pounds.

Match mounting is a technique used to reduce radial runout or road force on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel.

1. Position the wheel and tire assembly on a tire machine and put a reference mark on the tire sidewall at the valve stem position.



Item	Description
1	Valve stem
2	Reference mark

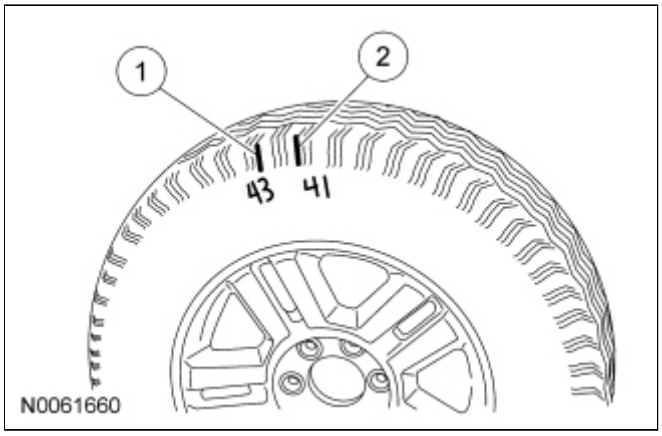
2. ***NOTICE:*** **For vehicles equipped with a Tire Pressure Monitoring System (TPMS), the sensor may be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the Disassembly and Assembly procedure. Failure to follow these instructions may result in TPMS component damage.**

   NOTE: Always make sure that the final high spot and measurement values are permanently marked on the inward sidewall of the tire for reference during future wheel and tire service.

   Using a suitable tire machine, separate the tire beads from the wheel.
   - Lubricate the tire beads using a suitable fast drying, corrosion inhibiting tire bead lubricant.
   - Position the tire 180 degrees (half-way around) on the rim so the valve stem reference mark is now opposite the valve stem.

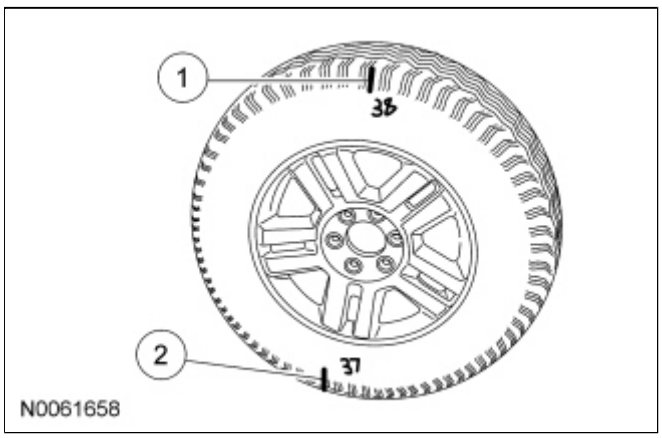
3. Re-inflate the wheel and tire assembly to the specified air pressure and measure the assembly again using a suitable dial indicator or Hunter Road Force® 9700 Series Wheel Balancer. Mark the second high spot on the tire.
    - If the runout or Road Force® is reduced to within specifications, the concern has been resolved. Balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

4. If the second runout or Road Force® measurement is still not within specification and both high spots are close to each other (within 101.6 mm [4 in]), the root cause is probably the tire (the high spot followed the tire).
    - To be **SURE** that the tire is causing the high runout, it is necessary to have 2 runout or Road Force® measurements that are not within specification and the high spots must be in approximately the same location on the tire's sidewall. If the tire is the cause, install a new tire, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.
    - If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.



Item	Description
1	First high spot on the tire
2	Second high spot on the tire

5. If the second high spot is still above specification and is within 101.6 mm (4 in) of being opposite the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. If the wheel runout exceeds 1.14 mm (0.045 in), install a new wheel, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

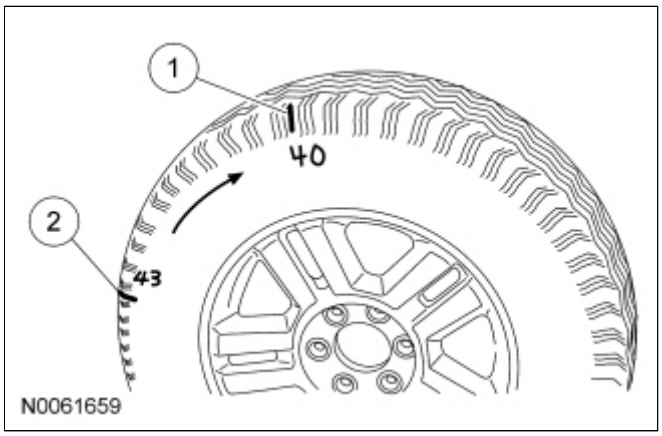


Item	Description

1	First high spot on the tire
2	Second high spot on the tire

6. **NOTE:** If the second high spot did not follow the wheel or the tire and the runout is still not within specification, improvements may be made by rotating the tire 90 degrees (one-fourth turn).

   Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the shortest direction).
   - Separate the tire beads from the wheel and rotate the tire 90 degrees (one-fourth turn) in the direction of the arrow.

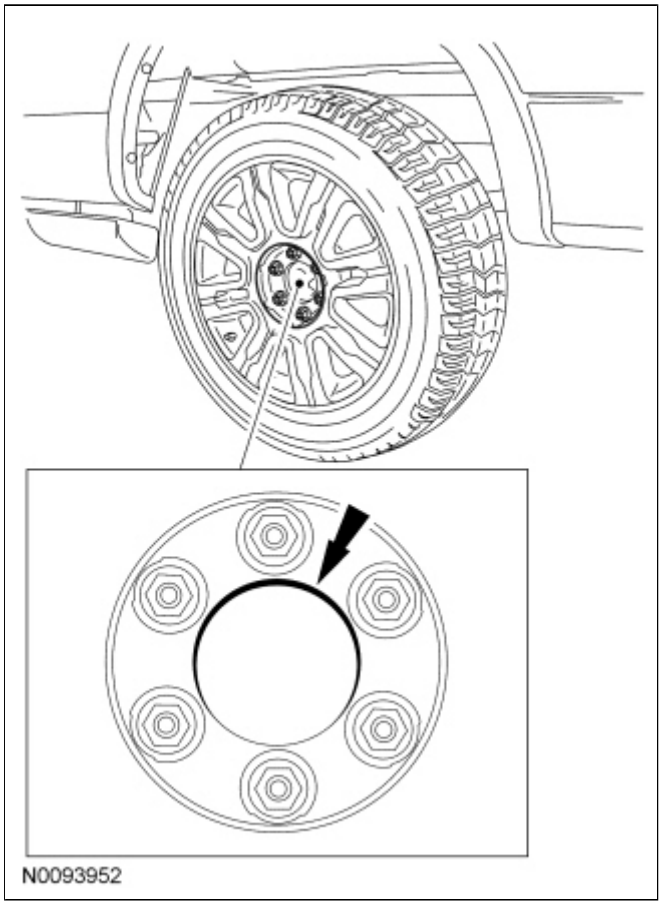


Item	Description
1	First high spot on the tire
2	Second high spot on the tire

Wheel-to-Hub Optimization

Wheel-to-hub optimization is important. Clearance between the wheel and hub can be used to offset or neutralize the Road Force® or run-out of the wheel and tire assembly. For every 0.001 inch of wheel-to-hub clearance, the Road Force® can be affected between 1 and 3 pounds depending on the tire stiffness.

NOTE: The example below illustrates how the clearance between the wheel and the hub can be used to offset the high spot of radial run-out or Road Force®. Following the procedure will make sure of the best optimization.



1. Position the wheel and tire assembly on the vehicle so that the high spot location of radial run-out or Road Force® is at the 6 o'clock position and install the wheel nuts by hand until snug.

2. **NOTE:** Do not allow the full weight of the vehicle to rest on the tires while tightening the wheel nuts.

   Lower the vehicle until the tires make contact with the ground, slightly loading the suspension. Tighten the wheel nuts as described in Wheel and Tire in this section.

Tire Pressure Monitoring System

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363, or Customer Activation Tool, Tire Pressure Monitor 8C2T-1AZ03-AA
ST2869-A	Digital Tire Pressure Gauge 204-354
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: The Tire Pressure Monitor (TPM) module is identified by the scan tool as the Vehicle Security Module (VSM).

The Tire Pressure Monitoring System (TPMS) uses tire pressure sensors located in the wheels to monitor the tire pressure of all 4 tires (there is no sensor in the spare tire). Each sensor has a unique identifier that is transmitted to the TPMS receiver during system training. The TPM / VSM retains these identifiers in memory and associates them with a vehicle position based on the training order. The sensors transmit tire pressure information to the TPM / VSM via radio frequency signals once every 60 seconds when vehicle speed exceeds 32 km/h (20 mph), or once every 6 hours when stationary. The TPM / VSM function compares tire pressure information against a low-pressure limit. If it determines the tire pressure has fallen below this limit, the TPM /

VSM sends a message requesting illumination of the TPMS indicator to the Instrument Panel Cluster (IPC) over the Medium Speed Controller Area Network (MS-CAN) bus. The IPC illuminates the TPMS indicator when commanded by the TPM / VSM .

Radio Frequency Interference (RFI) can create intermittent TPMS issues that are difficult to diagnose. RFI can be caused by the addition of aftermarket equipment that blocks the TPMS sensor transmissions from getting to the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM). Devices causing RFI can prevent the module from communicating with any of the 4 tire pressure sensors.

Tire Pressure Monitoring System (TPMS) Indicator

The TPMS indicator may display faults that cannot be resolved by the customer. Treat these messages as TPMS DTCs or symptoms that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Is On Continuously from Key ON.

The TPMS indicator is illuminated continuously when the ignition is turned to the ON position and any of the tire pressures are low. A DTC is not present for this condition and the TPMS status PID: TP_STAT equals LOW. When this condition exists, the tire pressure must be adjusted in all tires to the recommended cold pressure as noted on the Vehicle Certification (VC) label. GO to Symptom Chart .

Ambient Temperature Change and Tire Pressure

NOTICE: **Do not inflate tires more than maximum tire pressure stamped on the tire sidewall. Premature tire wear or damage to the tire may result.**

Tire pressures fluctuate with temperature changes. For this reason, set tire pressures to specification when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, adjust the tire inflation pressure accordingly.

If the tires are inflated to specification at shop temperatures and the vehicle is moved outdoors when the outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the TPMS and illuminate the TPMS indicator.

As the ambient temperature decreases by 6°C (10°F), tire pressure decreases 7 kPa (1 psi). Adjust the tire pressure by 7 kPa (1 psi) for each 6°C (10°F) ambient temperature drop as necessary to maintain tire pressure as specified on the Vehicle Certification (VC) label. Refer to the following tables to adjust the tire pressure indoors for colder outside temperatures.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]

** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70˚F. Max Pressure Adjustment is 7 psi.

-34	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670
-40	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670

[1]When Outside (Ambient) Temperature is greater than 21˚C (70˚F), Inflate tires to placard pressure.
[1]Use the table to adjust tire pressure for P-metric and LT tires only.
[1]Do NOT use table for Commercial Truck Tires (i.e. 19.5 inch tires for F450 & F550). See F-Super Duty Service Manual for tire inflation procedure.

N0057700

Tire Pressure Monitoring System (TPMS) Indicator Flashes For 70 seconds From Key ON And Then Remains On Continuously

The TPMS indicator flashes for 70 seconds and then remains on continuously if the TPMS is malfunctioning. The TP_STAT PID can be used to determine why the TPMS indicator is flashing.

Tire Pressure Monitoring System (TPMS) PID Definitions

TPM / VSM Status PID

The TPM / VSM monitors the TPMS status. The TPMS status can be monitored using the scan tool PID TP_STAT. The PID has 4 valid states:

1. TP_STAT = SENSOR FAULT.
   - SENSOR FAULT is displayed if the TPM / VSM has not heard from 1 to 3 TPMS sensors for 20 minutes when the vehicle speed is above 32 km/h (20 mph).

2. TP_STAT = SYSTEM FAULT.
   - SYSTEM FAULT is displayed if the TPM / VSM does not receive a signal transmission from all 4 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph).

3. TP_STAT = LOW.
    - LOW is displayed if the TPM / VSM has detected that at least 1 TPMS sensor is reporting low tire pressure.

4. TP_STAT = ACTIVE.
    - ACTIVE is displayed if the TPMS is functioning normally.

TPMS Last Warning Event PID Definitions

The TPMS uses the TPMS last warning event PIDs to store detailed information about the last 5 times the TPMS indicator was illuminated. These PIDs can be used to acquire more information about a particular TPMS event.

EVT1_IGN through EVT5_IGN

The number of key cycles since the TPMS indicator was illuminated. This PID cycles from zero to 255 and then starts over from zero again. Use this PID to determine how long ago a TPMS event occurred and the time (in key cycles) between events.

EVT1_TLOC through EVT5_TLOC

This is the last programmed location for the sensor causing each TPMS event. Due to tire rotation, the sensor may no longer be at the location indicated. It is suggested that all the PIDs be recorded, the system retrained, and the sensor identifier PIDs be used to pinpoint the actual location of each sensor.

EVT1_PSI through EVT5_PSI

This is the tire pressure associated with each TPMS indicator event. This can be used to identify the TPMS events that were due to low pressure and to determine when a sensor is transmitting inaccurate tire pressure.

EVT1_STAT through EVT5_STAT

Describes the warning status of each TPMS event by using the information received from the TPMS status (TP_STAT) PID. If there is a communication issue, the status could be NORMAL.

- UNKNOWN
- NORMAL (normal operation)
- LOW (low pressure event)
- FAULT (sensor fault or system fault)

EVT1_TxID through EVT5_TxID

This is the unique identifier of the sensor involved in each TPMS event. EVT1 is the most recent event that triggered the TPMS indicator.

Wheel Rotation and Sensor Training Techniques

Moving a Problem Sensor/Wheel to a Different Position

If a sensor in a certain location has caused several events, yet the sensor trains and seems to operate normally, moving that particular sensor/wheel to a different location on the vehicle can isolate the issue to a certain sensor/wheel location. Carry out a road test following sensor/wheel relocation to attempt to recreate the fault. This determines whether the fault followed the sensor or remained in the original sensor location.

Training Sensors in a Different Order

This is a technique to get past a left front sensor that may not be responding to determine if the remaining sensors train to the module. This can help save time determining if other sensors are having issues or if the module is experiencing training difficulties with a certain location.

NOTE: Training known good sensors from another vehicle cannot differentiate between a faulted module and RFI .

Training Known Good Sensors From Another Vehicle

Use this technique to differentiate between a sensor fault and a module fault. If neither the originally installed sensors nor the known good sensors can be trained, then a module fault or RFI concern is present. See items that cause RFI , below. Do not replace the original sensors.

Items That Cause RFI

Non-OEM Equipment

The following equipment has been found to cause RFI :

- Video equipment has been found to cause RFI especially when the video and power supply lines are near the TPMS .
- Car alarms (even those installed by dealerships) can create enough RFI to cause the TPMS to malfunction or lose considerable range. These car alarms can sometimes be difficult to locate, as they are usually hidden somewhere out of the way.
- Many different in-vehicle cell phone chargers have been found to cause considerable RFI . The vehicles with the power point closest to the TPM / VSM are the most affected. It must be noted that most cell phone chargers do not produce high levels of RFI all of the time. This depends on the state of charge of the cell phone battery. The phone must be almost completely discharged in some cases.
- Power supplies and DC/AC inverters typically create significant RFI . Most consumer grade equipment has very little filtering or shielding.

OEM Modules

In some cases, the RFI may actually be caused by a module or ground on the vehicle. A poor ground or loose ground shield can disable the system. Modules that have microcontrollers using clock circuits to create the timing pulses for the microprocessor may radiate RFI .

Using Customer's Electronics to Pinpoint the Radio Frequency Interference (RFI) Source

This can be a way to determine the cause of an issue well before the sensors and module are replaced with little or no affect on the system performance. Since this takes more up-front work, it relies on working with the customer to determine what equipment was being used at the time of the event.

Options for Eliminating Intermittent TPMS Conditions Caused by RFI

- If an OEM component or customer device is causing an RFI issue, the device can be replaced.
- If a phone charger is causing an RFI issue, the customer should consult with their cell phone provider to acquire a different phone charger.
- If a device such as an dealer-installed alarm is causing an RFI issue, the device could be moved to another location on the vehicle. In the case of a portable device, the power cord could be moved to another power point location.

In summary, if the RFI source is present and cannot be moved or replaced, the intermittent issue remains. The TPMS system must accept RFI and the unwanted system operation it can cause.

Inspection and Verification

1. Keep the following items in mind when diagnosing any TPMS related issue:
    - The tire pressure sensors are not designed to be used with aftermarket wheels. The use of run-flat tires (tires with steel body cord plies in the tire sidewall) that are not originally equipped, may block the TPMS signal and are not recommended.
    - Non-OEM modifications made to the vehicle may result in false TPMS warnings.
    - Swapping wheels on vehicles with the same TPMS sensors sets a fault if the sensors are not trained. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
    - The tire pressure calibrations in the TPM / VSM for the system cannot be changed to use lower tire pressures than those listed on the Vehicle Certification (VC) label.
    - Certain non-OEM electronic equipment may cause RFI and false TPMS warnings. To aid in

diagnosis, obtain information from the owner regarding any equipment that has been added or was in use at the time the TPMS fault occurred.
- It may be necessary to disconnect any electronic add-on equipment to verify its impact on TPMS operation. For intermittent cases, it may be necessary to ask the customer to provide portable electronic equipment to verify its impact on the system.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Low tire pressure • Tire Pressure Monitoring System (TPMS) sensor damaged or missing • Spare tire installed as a road wheel • Incorrect TPMS sensor installed • TPMS sensor installed incorrectly • Non-OEM wheels installed (aftermarket rims) • Non-OEM equipped run-flat tires installed • Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks)	• Wiring, terminals or connectors • Electrical connectors • TPM / VSM missing or damaged • Aftermarket electronic accessories (in-car chargers or supplies, DC/AC inverters, video screens, car alarms)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the TPM / VSM module.

9. If the DTCs retrieved are related to the concern, go to the TPM / VSM DTC Chart. For all other DTCs, refer to the Master DTC Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) DTC Chart

DTC	Description	Action
B106A	TPMS Sensor Pressure Range Bit Incorrect State	GO to Pinpoint Test D .
B106B	Tire Pressure Sensor Low Battery	DTC B106B can be set during TPM / VSM configuration. If DTC B106B was set during configuration, DISREGARD the DTC. If DTC B106B was not set during configuration. GO to Pinpoint Test D .
B106E	Solid State Driver Disabled Due To Short Circuit	GO to Pinpoint Test E .
B106F	Module Disabled Due To External Fault	GO to Pinpoint Test E .
B1217	Horn Relay Coil Circuit Failure	If the horn sounds continuously, REFER to Section 413-06 . If the horn does not sound continuously, GO to Pinpoint Test E .
B1218	Horn Relay Coil Circuit Short to VBatt	GO to Pinpoint Test E .
B1317	Battery Voltage High	GO to Pinpoint Test F .
B1342	ECU Is Faulted	**NOTE:** If other DTCs are present, REPAIR them before installing a new component. CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved, INSTALL a new module. REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
B1359	Ignition Run/Acc Circuit Failure	GO to Pinpoint Test G .
B1363	Ignition Start Circuit Failure	GO to Pinpoint Test G .
B2477	Module Configuration Failure	Only present in a new or reconfigured module. To configure the TPM / VSM REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
B2868	Left Front Tire Pressure Sensor Fault	Only present in a new or reconfigured module. To configure the TPM / VSM REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
B2869	Right Front Tire Pressure Sensor Fault	Only present in a new or reconfigured module. To configure the TPM / VSM REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section.
B2870	Right Rear Tire Pressure Sensor Fault	Only present in a new or reconfigured module. To configure the TPM / VSM . REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
B2871	Left Rear Tire Pressure Sensor Fault	Only present in a new or reconfigured module. To configure the TPM / VSM . REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
B2872	Tire Pressure Sensor Fault	If DTC B287A is also present, GO to Pinpoint Test K . Otherwise, GO to Pinpoint Test J .
B287A	Tire Pressure System Fault	GO to Pinpoint Test K .
C2780	ECU in Manufacturer	To configure the TPM / VSM REFER to Tire Pressure Monitoring System

	Sub-state	(TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
U0155	Lost Communication With Instrument Panel Cluster	GO to Pinpoint Test L.
U2023	Fault Received From External Node	RETRIEVE and REPAIR all non-network DTCs in the IPC. REFER to Section 413-01.
U2050	No Application Present	CONFIGURE the TPM / VSM. REFER to Programmable Module Installation (PMI) in Section 418-01. CARRY OUT the TPM / VSM self-test. If DTC U2050 returns, INSTALL a new TPM / VSM. REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.

Symptom Chart

Symptom Chart

NOTE: Failure of a TPMS component may not cause the message center to display a fault message or a DTC to be stored. The Symptom Chart is a starting point to begin diagnosis of these concerns.

Condition	Possible Sources	Action
• Tire Pressure Monitoring System (TPMS) indicator ON continuously from key ON with no related DTCs present	• Tire pressure not set to specifications listed on the Vehicle Certification (VC) label	• GO to Pinpoint Test I.
• TPMS indicator flashes for 70 seconds from key ON and then remains on continuously	• TPMS sensor(s) not trained to the TPM / VSM • TPMS sensor(s) not installed • Spare tire in use or road wheel missing for extended duration • Incorrect TPMS sensor installed • Network communication concern • TPM / VSM	• RETRIEVE the DTCs. FOLLOW diagnostics for the DTCs present. REFER to DTC Charts in this section.
• The TPMS does not enter sensor training mode when using the TPMS sensor training procedure	• Stoplamp switch open circuitry • Vehicle communication network • TPM / VSM	• GO to Pinpoint Test H.
• The Tire Pressure Monitoring System (TPMS) enters sensor training mode but one or more sensors do not train and DTCs are present	• TPMS sensor(s) • Vehicle communication issue • TPM / VSM	• RETRIEVE and RECORD DTCs. REFER to Tire Pressure Monitoring System (TPMS) DTC Chart in this section.

• The Tire Pressure Monitoring System (TPMS) enters sensor training mode but one or more sensors do not train and no DTCs are present	• TPMS sensor(s) • Attempting to install a banded TPMS sensor that is not compatible with a valve stem mounted sensor	• TRAIN all 4 tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • If a sensor does not respond to the Tire Pressure Monitor Activation Tool, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor again. If the sensor still does not respond, ATTEMPT to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, ATTEMPT to train the sensor with the vehicle doors open. • If the sensor(s) fails to train a second time, INSTALL a new sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Tests

Pinpoint Test D: DTCs B106A, B106B

Normal Operation

If there is a fault in the Tire Pressure Monitoring System (TPMS), such as a damaged or missing sensor(s), damaged module or a communication issue within the vehicle, DTCs are set in the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM). The TPMS warning indicator flashes for 70 seconds and then remains on continuously when the ignition switch is turned to the ON position.

- DTC B106A (TPMS Sensor Range Bit Incorrect State) — sets if an attempt has been made to train a non-compatible sensor.
- DTC B106B (Tire Pressure Sensor Low Battery) — sets if an attempt has been made to train a tire pressure sensor(s) with a low battery. This DTC can also set in the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) during configuration.

This pinpoint test is intended to diagnose the following:

- Non-compatible sensor
- Tire pressure sensor battery
- Tire pressure sensor(s)

PINPOINT TEST D: DTCs B106A, B106B

Test Step	Result / Action to Take
D1 DETERMINE WHICH SENSOR HAS A LOW BATTERY OR IS NON-COMPATIBLE	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure**	**Yes** CLEAR the DTCs. REPEAT the self-test. VERIFY system operation. **No** **Before installing a new sensor(s)** : If a sensor does not respond

sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the TPM / VSM ?	to the Tire Pressure Monitor Activation Tool, MOVE the vehicle to ROTATE the wheels at least one-fourth of a turn and ATTEMPT to ACTIVATE the same sensor again. If the sensor still does not respond, ATTEMPT to ACTIVATE the same sensor again using the customer activation tool (if available). If the sensor still fails to train, ATTEMPT to TRAIN the sensor with the vehicle doors open. If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Test E: DTCs B106E, B106F, B1217 and B1218

Refer to Wiring Diagrams Cell 118 , Tire Pressure Monitoring System (TPMS) for schematic and connector information.

Normal Operation

The Tire Pressure Monitoring System (TPMS) uses the horn as a feedback signal during TPMS sensor training and activation by sending a ground signal to the Body Control Module (BCM). When the BCM receives this ground signal it activates the horn relay and sounds the horn.

The TPMS monitors the circuit for shorts to voltage, ground and opens. If one of these conditions is detected, the appropriate DTC sets.

The TPM / VSM utilizes a Field-Effect Transistor (FET) (in place of a fuse) to protect itself during a short circuit condition, the FET is also known as a solid state driver. The FET is only designed to withstand a certain amount of use.

The TPMS keeps track of how many times DTC B106E is set and once that counter reaches a predetermined number (based off of FET durability) DTC B106F (and usually B1342) set. DTCs B1217, B1218 and/or B106E also set along with B106F. The only way to clear B106F is by installing a new Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM). Repair the circuit conditions that set DTCs B1217, B1218 and/or B106E before installing a new TPM / VSM .

DTC Description	Fault Trigger Condition
• B1217 — Horn Relay Coil Circuit Failure	This DTC sets when the TPMS detects an open or a short to ground on horn control circuit. A short to ground on the horn control circuit causes the horn to sound continuously.
• B1218 — Horn Relay Coil Circuit Short to VBatt	This DTC sets when the TPMS detects a short to battery voltage.
• B106E — Solid State Driver Disabled Due to Short Circuit	This DTC sets when the TPMS has protected the horn control circuit and the horn driver has been deactivated until the vehicle is serviced.
• B106F — Module Disabled Due to External Fault	This DTC sets when DTC B106F indicates the horn control driver has reached the end of its life expectancy and has been permanently disabled.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TPM / VSM
- BCM module

PINPOINT TEST E: DTCs B106E, B106F, B1217 AND B1218

Test Step	Result / Action to Take

E1 CHECK THE HORN OPERATION	
NOTICE: **If DTC B106F is present, correct the fault condition prior to installing a new Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM). Failure to correct the fault condition first may cause damage to the new TPM / VSM, resulting in a repeat repair.** • Push the horn pad. • **Does the horn sound?**	**Yes** GO to E2. **No** GO to Section 413-06 to diagnose the horn.
E2 CHECK THE HORN CIRCUIT FUNCTION	
NOTICE: **If the jumper wire fails, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, test the system for normal operation. If DTC B106E is present, Clear the DTCs and repeat the self-test (required to enable the horn driver if DTC B106E is present). Test the system for normal operation. If DTC B106F is present, install a new TPM / VSM. Refer to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. Test the system for normal operation.** • Ignition OFF. • Disconnect: TPM / VSM C4321B. • Ignition ON. • Connect a fused jumper wire between the TPM / VSM, C4321B-9 CRH03 (BN), harness side and ground.  N0113349 • **Does the horn sound?**	**Yes** REMOVE the jumper wire. GO to E3 **No** REMOVE the jumper wire. REPAIR circuit CRH03 (BN) for an open circuit. CLEAR the DTCs and REPEAT the self-test.
E3 CHECK FOR CORRECT TPMS OPERATION	

• Disconnect all the TPM / VSM electrical connectors.
• Check the connectors for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the TPM / VSM connectors and make sure that they are seated correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new TPM / VSM. REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded

	connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC B1317

Refer to Wiring Diagrams Cell 118 , Tire Pressure Monitoring System (TPMS) for schematic and connector information.

Normal Operation

The Tire Pressure Monitoring System (TPMS) monitors the voltage from the battery to determine if it exceeds specific thresholds. DTC B1317 sets in continuous memory if the TPMS detects battery voltage above 16 volts.

- DTC B1317 (Battery Voltage High) — sets if the voltage supplied to the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) exceeds 16 volts during the TPM / VSM self-test or normal operation, with vehicle speed greater than 5 km/h (3 mph).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Charging system concern
- TPM / VSM

PINPOINT TEST F: DTC B1317

NOTE: DTC B1317 can be set if the vehicle has been recently jump started or the battery has been recently charged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
F1 RETRIEVE ALL CMDTCs IN ALL MODULES • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: VSM Self-Test. • **Is DTC B1317 present?**	**Yes** REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. **No** GO to F2 .
F2 CHECK BATTERY CONDITION • Ignition OFF. • Refer to Section 414-01 and carry out the battery condition test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 . CLEAR all CMDTCs . TEST the system for normal operation. If the battery passed the condition test and did not require a

	recharge, GO to F3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
F3 CHECK THE CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine rpm to increase above 2,000 rpm while performing this step or the generator may self-excite and result in default charging system output voltage. If engine rpm has gone above 2,000 rpm, shut the vehicle off and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery: ▪ Turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes.  AJ0210-A • **Is the battery voltage between 13-15.2 volts?**	**Yes** GO to F4 **No** REFER to Section 414-00 to diagnose battery and charging system. TEST the system for normal operation.
F4 CHECK FOR CORRECT TPMS OPERATION	
• Disconnect all the TPM / VSM electrical connectors. • Check the connectors for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect all the TPM / VSM connectors and make sure that they are seated correctly. • **Is the concern still present?**	**Yes** INSTALL a new TPM / VSM . REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTCs B1359 and B1363

Refer to Wiring Diagrams Cell 118 , Tire Pressure Monitoring System (TPMS) for schematic and connector information.

Normal Operation

The Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) receives voltage from the Central Junction Box (CJB).

- DTC B1359 (Ignition Run/Acc Circuit Failure) — sets if the TPMS detects that the RUN/ACC input is open or shorted to ground. This DTC also sets set if the self-test is performed with the ignition in the OFF or ACC positions.
- DTC B1363 (Ignition Start Circuit Failure) — sets if the TPMS detects that the RUN/START input is open or shorted to ground. This DTC also sets set if the self-test is performed with the ignition in the OFF or ACC positions.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- TPM / VSM
- Ignition switch

PINPOINT TEST G: DTCs B1359 and B1363

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK VOLTAGE TO THE TPM / VSM • Ignition In ACC. • Disconnect: TPM / VSM C4321A. • Ignition ON. • Measure the voltage between the TPM / VSM C4321A-20, circuit CBP26 (BU/WH), harness side and ground.  N0113350 • Measure the voltage between the TPM / VSM C4321A-23, circuit CBP23 (BN/YE), harness side and ground.  N0113351 • **Are the voltages greater than 10 volts?**	**Yes** GO to G2 **No** VERIFY the CJB fuses 26 (7.5A) and 23 (10A) are OK. If OK, REPAIR open in circuit CBP26 (BU/WH) or circuit CBP23 (BN/YE). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the short circuit.

G2 CHECK FOR CORRECT TPMS OPERATION	

• Disconnect all the TPM / VSM electrical connectors.
• Check the connectors for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the TPM / VSM connectors and make sure that they are seated correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new TPM / VSM. REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: The Tire Pressure Monitoring System (TPMS) Does Not Enter Sensor Training Mode When Using the TPMS Sensor Training Procedure

Normal Operation

For the TPMS to enter TPMS sensor training mode, the TPM / VSM must receive valid inputs from the stoplamp switch (OFF-ON-OFF) and it must receive valid Vehicle Speed Sensor (VSS) input (0 km/h [0 mph]). The TPM / VSM also monitors the ignition switch status (both OFF and RUN). Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section for the complete sensor training procedure.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stoplamp switch state
- TPM / VSM

PINPOINT TEST H: TPM / VSM DOES NOT ENTER SENSOR TRAINING MODE WHEN USING THE TPMS TRAINING PROCEDURE

Test Step	Result / Action to Take
H1 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: VSM Self-Test. • **Are there any TPM / VSM DTCs present?**	**Yes** GO to the TPM / VSM DTC chart in this section. **No** GO to H2
H2 CHECK THE TPMS BRAKE ON/OFF (BOO_INPUT) PID	
• Enter the following diagnostic mode on the scan tool: VSM DataLogger. • Monitor the BOO_INPUT PID (TPMS receives the brake pedal information from the Instrument Panel Cluster (IPC)). • Press and release the brake pedal while monitoring the PID. • **Do the brake pedal PID values match the brake pedal positions?**	**Yes** GO to H3. **No** REFER to Section 417-01 to continue diagnosis of the stoplamps.
H3 CHECK THE TPMS VEHICLE SPEED SENSOR (VSS) PID	
• Monitor the VSS PID (TPMS	**Yes**

receives vehicle speed from the IPC). • **Is the vehicle speed less than 5 km/h (3 mph)?**	GO to H4 . **No** REFER to Section 413-01 continue diagnosis of the vehicle speed.
H4 CHECK FOR CORRECT TPMS OPERATION	
• Disconnect all the TPM / VSM electrical connectors. • Check the connectors for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect all the TPM / VSM connectors and make sure that they are seated correctly. • Attempt to train the TPMS sensors again. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Is the concern still present?**	**Yes** The TPMS sensors may not be present. DISMOUNT the tire. REFER to Wheel and Tire in this section. VERIFY that the sensors are present and mounted to the wheels. If missing, INSTALL new TPMS sensors. If the TPMS sensors are present, INSTALL a new TPM / VSM . REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: TPMS Indicator On Continuously From Key ON With No Related DTCs Present

Normal Operation

The TPMS function compares each tire pressure sensor transmission against a low pressure limit. If the pressure falls below this limit, the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) communicates this on the Medium Speed Controller Area Network (MS-CAN) to the Instrument Panel Cluster (IPC). The IPC illuminates the TPMS indicator.

This pinpoint test is intended to diagnose the following:

- Low tire pressure
- Spare tire in use
- Stuck TPMS sensor

PINPOINT TEST I: TPMS INDICATOR ON CONTINUOUSLY FROM KEY ON WITH NO TPMS RELATED DTCs PRESENT IN THE TPM / VSM

Test Step	Result / Action to Take
I1 DETERMINE TPMS SYSTEM STATUS (TP_STAT) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: VSM DataLogger. • Read and record the TP_STAT PID. • **Is the TPMS system status LOW?**	**Yes** GO to I2 . **No** IF TP_STAT = SENSOR FAULT, GO to Pinpoint Test J . IF TP_STAT = SYSTEM FAULT, GO to Pinpoint Test K . IF TP_STAT = SYSTEM ACTIVE, the TPMS system is working as designed at this time. If an issue was reported by the customer, REFER to the symptom chart in this section.
I2 CHECK LOW PRESSURE DETECTED	

NOTE: The spare tire is not programmable even if it is equipped with a TPMS sensor. If a damaged road wheel is located in the trunk, the sensor may still be recognized by the TPM / VSM as low. Make sure the spare tire is not currently in use. To restore TPMS functionality, repair the damaged road wheel and re-mount it to the vehicle. • Check spare tire location. • **Is the spare tire in use?**	**Yes** REPAIR and REMOUNT the wheel to the vehicle. REFER to Wheel and Tire in this section. ADJUST tire pressures to the required pressure as defined on the Vehicle Certification (VC) label located in the driver door jam. **No** GO to I3.
I3 CHECK FOR LOW TIRE PRESSURE	
• Using the Digital Tire Gauge, measure and record the tire pressure in all 4 road tires. • Adjust the pressure for those found to be below the specification listed on the VC label. • Activate each sensor at least twice with the training tool or customer activation tool to make sure the module gets the latest tire pressure data. Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation or drive the vehicle for at least 2 minutes above 32 km/h (20 mph) to clear the low pressure warning. Do not train the sensors at this time. • **Has the TPMS indicator gone out?**	**Yes** The system is functioning normally. INFORM the customer that correct tire pressure maintenance is a customer responsibility and the details are provided in the Owner's Literature. **No** GO to I4.
I4 CHECK FOR STUCK TPMS SENSOR	

• Read and record the following PIDs:
  ▪ LF_PRES
  ▪ RF_PRES
  ▪ LR_PRES
  ▪ RR_PRES
• Using the Digital Tire Gauge, measure the actual tire pressures.
• Compare the tire pressure PIDs with the actual tire pressures.
• **Do the compared tire pressure values match within ± 5 psi and has the TPMS indicator gone out?**
	Yes
	The system is functioning normally.
	
	No
	INSTALL a new TPMS sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Test J: DTC B2872

Normal Operation

If there is a concern with 1, 2 or 3 TPMS sensors, the TPMS sets DTC B2872. The TPMS indicator flashes for 70 seconds from key ON and then remains ON continuously. This symptom occurs when the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) does not hear from a sensor or is incapable of hearing a sensor (s) for 20 minutes.

- DTC B2872 (Tire Pressure Sensor Fault) — sets if the TPMS has been unable to communicate with 1 or more sensors (up to 3) for more than 20 minutes.

This pinpoint test is intended to diagnose the following:

- TPMS sensors not trained to the TPMS
- TPMS sensors not transmitting / damaged
- TPMS sensors missing
- Incorrect TPMS sensor installed
- Spare tire in use
- Radio Frequency Interference (RFI)

PINPOINT TEST J: DTC B2872

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors go into "sleep mode" to

conserve battery power. It becomes necessary to wake them up so that they transmit the latest tire pressure information to the TPM / VSM . Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

Test Step	Result / Action to Take
J1 CHECK TPMS SENSOR IDENTIFIERS AND FOR SPARE TIRE USE	**Yes** REPAIR and REMOUNT the wheel to the vehicle. REFER to Wheel and Tire in this section. ADJUST the tire pressure to the required pressure as specified on the Vehicle Certification (VC) label located in the driver door jam. **No** GO to J2 .

NOTE: Make sure that all aftermarket electronic equipment has been disconnected (if possible) and that the customer has been questioned about the kinds of electronic equipment they may have been using in the vehicle when this issue was identified.
• Connect the scan tool.
• **NOTE:** A spare tire cannot be programmed to the vehicle, even if equipped with a TPMS sensor. If a damaged road wheel is located in the trunk and the TPM / VSM cannot communicate with it, or if the damaged wheel has been dropped off at a dealership or repair shop, the TPM / VSM sets a TPMS sensor fault.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: VSM DataLogger.
• Read and record the following PIDs:
  ▪ Left Front Tire Transmitter Identifier (LF_ID)
  ▪ Right Front Tire Transmitter Identifier (RF_ID)
  ▪ Left Rear Tire Transmitter Identifier (LR_ID)
  ▪ Right Rear Tire Transmitter Identifier (RR_ID)
• **Is the spare tire in use?**	

J2 CARRY OUT TPMS SENSOR TRAINING	**Yes** GO to J3 . **No** GO to J4 .
• Training the TPMS sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all the sensors train?**	
J3 COMPARE THE SENSOR IDENTIFIERS BEFORE AND AFTER SENSOR TRAINING	**Yes** Sensor identifiers that did not match were mounted to the vehicle without the required sensor training. Sensor training in the previous step has corrected the condition. **No** REFER to Tire Pressure Monitoring System (TPMS) PID Definitions in this section for more information on repairing intermittent conditions .

• Ignition ON.
• Enter the following diagnostic mode on the scan tool: VSM DataLogger.
• Read and record the following PIDs:
  ▪ Left Front Tire Transmitter Identifier (LF_ID)
  ▪ Right Front Tire Transmitter Identifier (RF_ID)
  ▪ Left Rear Tire Transmitter Identifier (LR_ID)
  ▪ Right Rear Tire Transmitter Identifier (RR_ID)
• Compare the recorded transmitter identifier PID readings taken before sensor training with the readings taken after sensor training.
• **Did all the sensors match?**	

J4 SENSOR(S) NOT RESPONDING TO TRAINING	**Yes** The system is functioning normally. **No** REFER to Tire Pressure Monitoring System (TPMS) principles of operation in this section for additional information on training sensors.
• **NOTE:** Sensor(s) that fail to train may be broken, missing, effected by RFI or the wrong sensor(s) may be installed. • Dismount tire and inspect the suspect TPMS sensor(s). • Install a new sensor(s) as necessary. Refer to Tire Pressure Monitoring System (TPMS) Sensor in this section. • Retrain the TPMS sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all the tire pressure sensors transmit to the TPM / VSM ?**	

Pinpoint Test K: DTCs B2872, B287A

NOTE: If the vehicle has been stationary for more then 30 minutes, the sensors go into sleep mode to conserve battery power. It becomes necessary to wake them up to transmit the latest tire pressure information to the Tire Pressure Monitoring System (TPMS). Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

Normal Operation

The TPMS normally receives a response from all 4 sensors, if the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) does not receive a response from one or more sensors, the TPMS system sets DTCs B2872 and B287A. When no response is received from all four sensors, the TPMS indicator flashes for 70 seconds from key ON and then remains ON continuously.

- DTC B2872 (Tire Pressure Sensor Fault) — sets if the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) has been unable to communicate with 1 or more sensors (up to 3) for more than 20 minutes.
- DTC B287A (Tire Pressure System Fault) — sets if the TPM / VSM has been unable to communicate with all 4 sensors for more than 20 minutes.
- TP_STAT = SYSTEM FAULT is displayed if the TPM / VSM does not receive a signal transmission from all 4 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph).

This pinpoint test is intended to diagnose the following:

- TPMS sensors not trained to the TPM / VSM
- TPMS sensors missing
- Incorrect TPMS sensor installed
- TPMS
- Radio Frequency Interference (RFI)

PINPOINT TEST K: DTCs B2872, B287A

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors go into sleep mode" to conserve battery power. It is necessary to wake them up to transmit the latest tire pressure information to the TPM / VSM . Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

Test Step	Result / Action to Take
K1 CHECK TPMS SENSOR IDENTIFIERS (IDs) AND CARRY OUT TPMS SENSOR TRAINING PROCEDURE	

NOTE: Make sure that all aftermarket electronic equipment has been disconnected (if possible) and that the customer has been questioned about the kinds of electronic equipment they may have been using in the vehicle when this issue was identified.
• Connect the scan tool.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: VSM DataLogger.
• Read and record the following PIDs:
  ▪ Left Front Tire Transmitter Identifier (LF_ID)
  ▪ Right Front Tire Transmitter Identifier (RF_ID)
  ▪ Left Rear Tire Transmitter Identifier (LR_ID)
  ▪ Right Rear Tire Transmitter Identifier (RR_ID)
• Train the TPMS sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: VSM DataLogger .
• Read and record the following PIDs:
  ▪ Left Front Tire Transmitter Identifier (LF_ID)
	Yes
	GO to K2 .
	
	No
	GO to K3 .

▪ Right Front Tire Transmitter Identifier (RF_ID) ▪ Left Rear Tire Transmitter Identifier (LR_ID) ▪ Right Rear Tire Transmitter Identifier (RR_ID) • **Did all the sensors train?**	
K2 COMPARE THE SENSOR IDENTIFIERS BEFORE AND AFTER SENSOR TRAINING	
• Read and record the following PIDs: ▪ Left Front Tire Transmitter Identifier (LF_ID) ▪ Right Front Tire Transmitter Identifier (RF_ID) ▪ Left Rear Tire Transmitter Identifier (LR_ID) ▪ Right Rear Tire Transmitter Identifier (RR_ID) • Compare the recorded PID readings taken before sensor training with the readings taken after sensor training. • **Did all the sensors match?**	**Yes** If all the sensors trained, REFER to Tire Pressure Monitoring System (TPMS) principles of operation in this section for additional Information on training sensors. **No** Any sensor identifiers that do not match were mounted to the vehicle without the required sensor training. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
K3 SENSOR(S) NOT RESPONDING TO TRAINING	
• **NOTE:** Sensor(s) that won't train may be broken, missing, or the wrong sensor(s) may be installed. • Dismount tire and inspect the suspect TPMS sensor(s). • Install a new sensor(s) as necessary. Refer to Tire Pressure Monitoring System (TPMS) Sensor in this section. • Retrain the TPMS sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all the TPMS sensors transmit to the TPM / VSM ?**	**Yes** The system is functioning normally. **No** GO to K4 .
K4 CHECK TPMS SYSTEM OPERATION	
• Disconnect all the TPM / VSM electrical connectors. • Check the connectors for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect all the TPM / VSM connectors and make sure that they are seated correctly. • Attempt to train the TPMS sensors again. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Is the concern still present?**	**Yes** GO to K5 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
K5 CHECK TPM / VSM	
NOTE: Make sure that all aftermarket electronic equipment has been disconnected (if possible) and that the customer has been questioned about the kinds of electronic equipment they may have been using in the vehicle when this issue was identified. A faulty TPM / VSM and a module affected by can behave in the same way. Care must be taken to make sure the root cause of the issue is clearly identified. • Attempt to train the TPMS sensors with all aftermarket electronic equipment disconnected. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all the TPMS sensors transmit to the TPM / VSM ?**	**Yes** If the concern and/or DTCs return after the road test, the customer needs to be informed that their aftermarket equipment is causing unwanted RFI with the TPM / VSM and the system is functioning as designed under Federal Communications guidelines. **No** INSTALL a new TPM / VSM . REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.

Pinpoint Test L: DTC U0155

Refer to Wiring Diagrams Cell 118 , Tire Pressure Monitoring System (TPMS) for schematic and connector information.

Normal Operation

- DTC U0155 (Lost Communication With Instrument Panel Cluster) — this DTC sets in the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) if the vehicle speed or stoplamp switch messages that should be received from the Instrument Panel Cluster (IPC) are missing for 10 seconds or longer. If a communications failure is detected by the TPM / VSM , the DTC U0155 is present in the module.

This pinpoint test is intended to diagnose the following:

- Network communication concern
- IPC
- TPM / VSM

PINPOINT TEST L: DTC U0155

Test Step	Result / Action to Take
L1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to L2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
L2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: IPC Network Test. • Carry out the network test. • **Does the IPC pass the network test?**	**Yes** GO to L3 . **No** REFER to Section 418-00 .
L3 RETRIEVE THE RECORDED DTCs FROM THE TPM / VSM AND IPC SELF-TESTS	
• Check for recorded TPM / VSM and IPC DTCs from the self-test. • **Is DTC U3003:16 (or B1318) or DTC U3003:17 (or B1317) recorded?**	**Yes** For the TPM / VSM , REFER to DTC Chart in this section. For the IPC , REFER to Section 413-01 . **No** GO to L4 .
L4 CHECK FOR DTC U0155 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: VSM Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155:00 or DTC**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation. REPEAT the ABS module self-test. **No** INSTALL a new TPM / VSM . REFER to Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan or Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback in this section. TEST the system for normal operation.

U0155 set in more than one module?	

Tire Pressure Monitoring System (TPMS) Sensor Training

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363, or Customer Activation Tool, Tire Pressure Monitor 8CZT-1A203-AA
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the Tire Pressure Monitor (TPM)Vehicle Security Module (VSM). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

NOTE: The TPMS Sensor Training procedure must be done on a single vehicle, in an area without Radio Frequency Interference (RFI) and at least 1 m (3 ft) away from other vehicles equipped with TPMS .

RFI is generated by certain electrical motors and appliance operation, cellular telephone chargers, remote transmitters, power inverters and portable entertainment equipment.

NOTE: The TPM / VSM has a 2-minute time limit between sensor responses. If the TPM / VSM does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the entire procedure must be repeated.

NOTE: For vehicles with different front and rear tire pressures the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

1. **NOTE:** An animated version of this procedure is available on-line.

   Turn the ignition switch to the OFF position, then press and release the brake pedal.

2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

3. Press and release the brake pedal.

4. Turn the ignition switch to the OFF position.

5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
   - The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully.

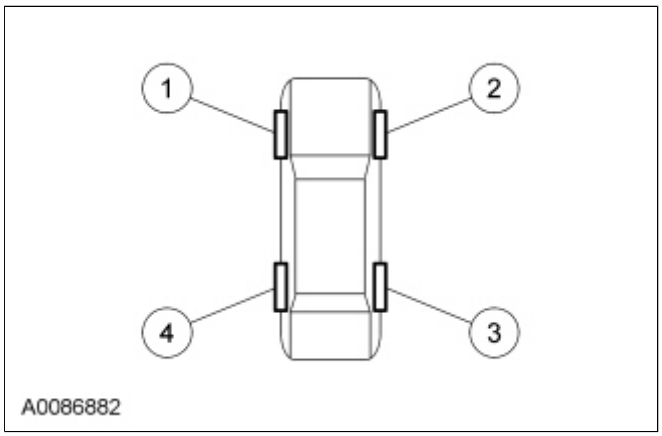
6. **NOTE:** It may take up to 6 seconds to activate a tire pressure sensor. During this time, the Tire

Pressure Monitor Activation Tool must remain in place at the valve stem.

NOTE: If a sensor does not respond to the Tire Pressure Monitor Activation Tool, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again. If the sensor still does not respond, attempt to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, attempt to train the sensor with the vehicle doors open.

Place the Tire Pressure Monitor Activation Tool on the LF tire sidewall at the valve stem. Press and release the test button on the Tire Pressure Monitor Activation Tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the TPM / VSM . An animated version of this procedure is available on-line.

7. Within 2 minutes of the horn sounding, place the Tire Pressure Monitor Activation Tool on the RF tire sidewall at the valve stem and press and release the test button to train the RF tire pressure sensor.



8. **NOTE:** Do not wait more than 2 minutes between training each sensor or the TPM / VSM will time out and the entire procedure must be repeated.

   Repeat Step 7 for the RR and LR tires.
   The procedure is completed after the last tire has been trained.
   Successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor identifiers trained to the TPM / VSM and document them on the applicable warranty claim.

10. **NOTE:** This step is required to clear DTC C2780, cause the TPM / VSM to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed TPM / VSM .

    If the sensors are being trained due to the installation of a new TPM / VSM , clear any DTCs and carry out the TPM / VSM On-Demand Self Test.

Tire Pressure Monitoring System (TPMS) Sensor Activation

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363, or Customer Activation Tool, Tire Pressure Monitor

NOTE: The tire pressure sensors will go into a "sleep mode" when a vehicle is stationary to conserve battery power. The sensors do not transmit information while in sleep mode. It will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position.

2. Position the Tire Pressure Monitor Activation Tool against the LF tire sidewall at the tire valve stem.

3. **NOTE:** The Tire Pressure Monitor Activation Tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor. This feedback may not always be present, do not rely on it as a confirmation that the module heard a particular sensor.

   NOTE: If a sensor does not respond to the Tire Pressure Monitor Activation Tool, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again. If the sensor still does not respond, attempt to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, attempt to train the sensor with the vehicle doors open.

   Press the test button on the Tire Pressure Monitor Activation Tool to activate the sensor. Activate the sensor at least 2 times.

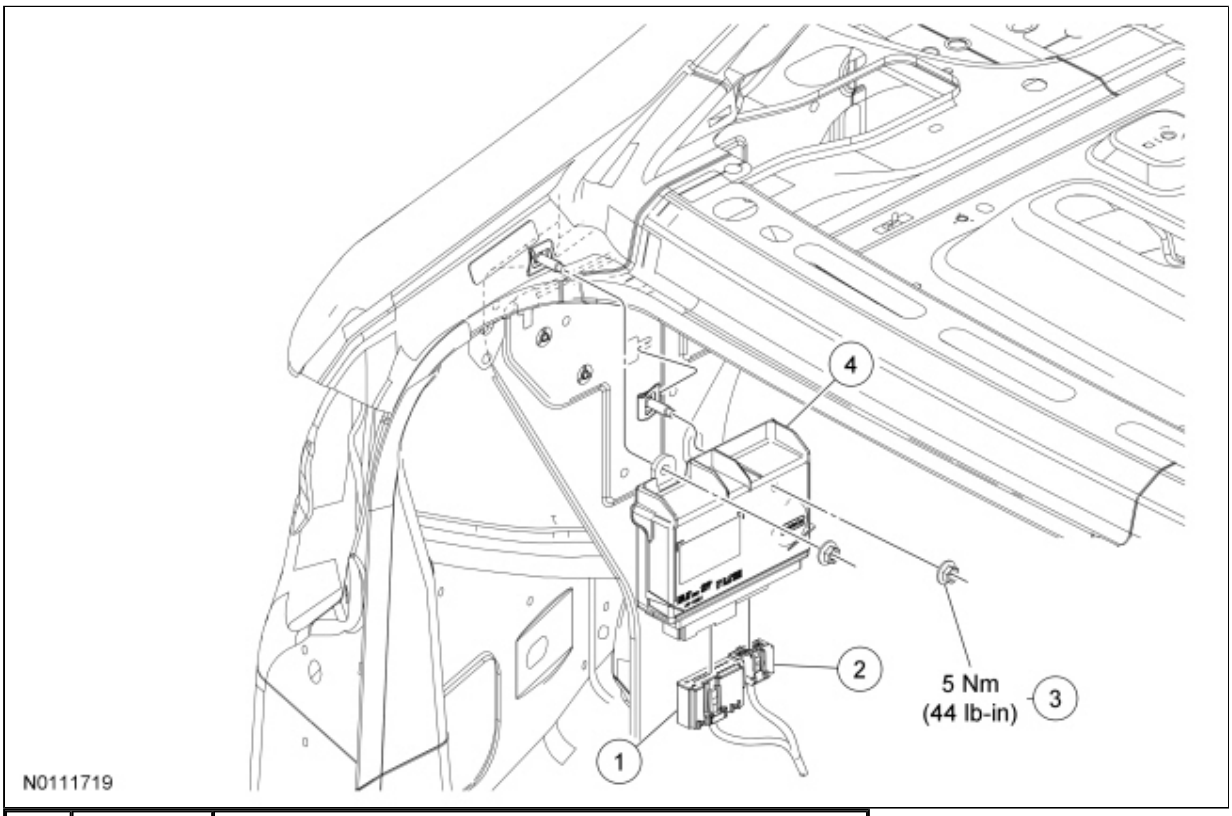
4. Repeat Steps 2 and 3 for the remaining tires.

5. If the Tire Pressure Monitoring System (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart in Diagnosis and Testing in this section.

Tire Pressure Monitoring System (TPMS) Module — 4-Door Sedan

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Item	Part Number	Description
1	—	Tire Pressure Monitoring System (TPMS)/Vehicle Security Module (VSM) electrical connector (part of 14401)
2	—	External antenna coax connector
3	W711330	TPMS / VSM nut (2 required)
4	15K602	TPMS / VSM

Removal

NOTICE: **Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

NOTE: The Tire Pressure Monitoring System (TPMS)/Vehicle Security Module (VSM) is also identified as the VSM .

NOTE: Prior to the replacement of the TPMS / VSM , upload the module configuration information to a scan tool. This information must be downloaded into the new TPMS / VSM after installation. For additional information, refer to Section 418-01 .

NOTE: The steps included in this procedure are critical to restoring the TPMS to normal operation. A new TPMS / VSM is delivered in a manufacturing mode with 6 pre-set DTCs related to the TPMS . To clear the DTCs, successful configuration of the TPMS / VSM must occur, followed by successful TPMS sensor training, and a successful self-test. The DTCs are as follows:

- B2477 — Module Configuration Failure
- B2868 — Left Front Tire Pressure Sensor Fault
- B2869 — Right Front Tire Pressure Sensor Fault
- B2870 — Right Rear Tire Pressure Sensor Fault
- B2871 — Left Rear Tire Pressure Sensor Fault
- C2780 — ECU in Manufacturer Sub-State

1. **NOTE:** This step is necessary only if the TPMS / VSM is being replaced.

   Upload the module configuration information from the TPMS / VSM . For additional information, refer to Section 418-01 .

2. Position aside the LH cargo area trim panel.

3. Disconnect the 2 TPMS / VSM electrical connectors.

4. Remove the 2 nuts and the TPMS / VSM .

Installation

1. Position the TPMS / VSM and install the 2 nuts.
   - Tighten to 5 Nm (44 lb-in).

2. Connect the 2 TPMS / VSM electrical connectors.

3. Position the LH cargo area trim panel.

4. **NOTE:** When successful, this step provides the calibration necessary for the TPMS / VSM operation and clears DTC B2477. The clearing of this DTC indicates the calibration data has been successfully downloaded to the new TPMS / VSM .

   Download the TPMS / VSM configuration information from the scan tool. For additional information, refer to Section 418-01 .

5. **NOTE:** When successful, this step clears DTCs B2868, B2869, B2870 and B2871. The clearing of these DTCs indicates the TPMS / VSM has recognized the tire pressure sensors during the training procedure.

   Train the tire pressure sensors. For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

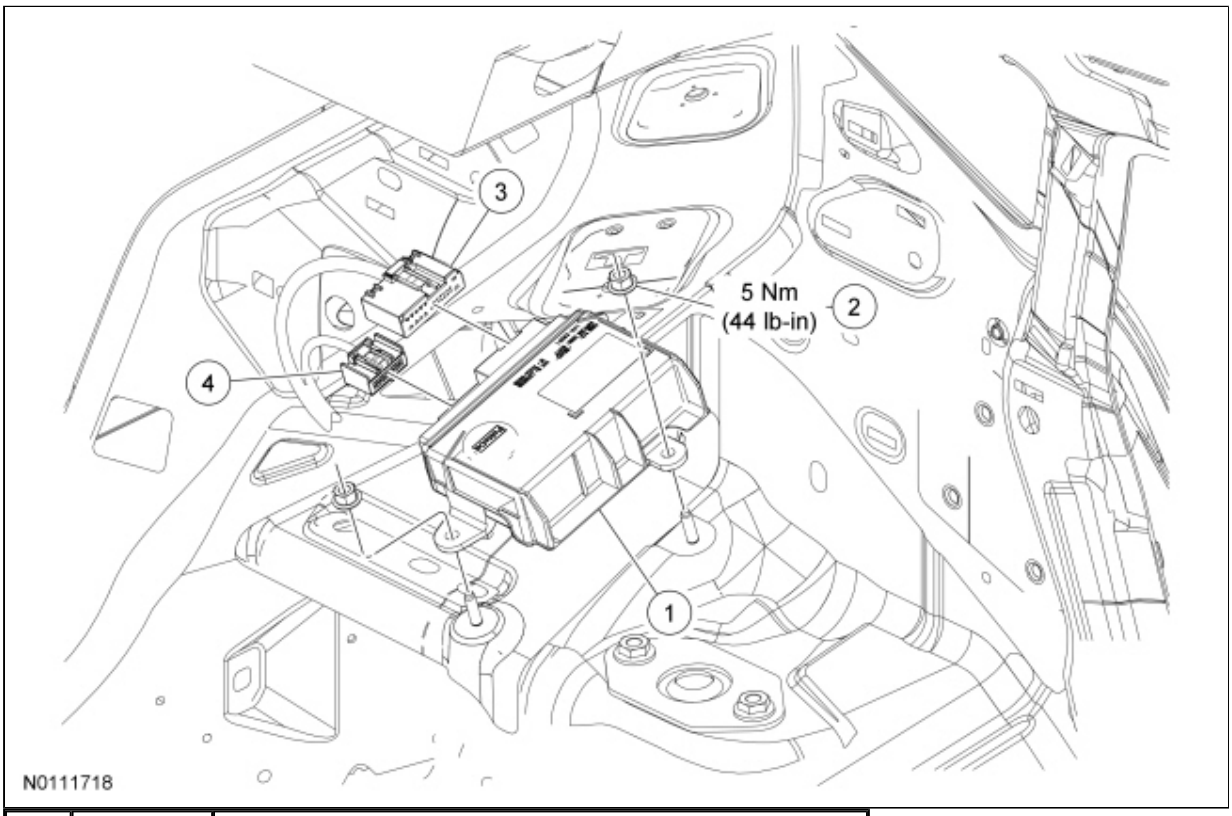
6. **NOTE:** DTC C2780 will not clear if any other DTCs are present in the TPMS / VSM . When successful, this step clears DTC C2780.

   Carry out the TPMS / VSM self-test (including an on-demand self-test). Repeat the self-test to confirm all DTCs have been cleared.

Tire Pressure Monitoring System (TPMS) Module — 5-Door Hatchback

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Item	Part Number	Description
1	—	Tire Pressure Monitoring System (TPMS)/Vehicle Security Module (VSM) electrical connector (part of 14401)
2	—	External antenna coax connector
3	W711330	TPMS / VSM nut (2 required)
4	15K602	TPMS / VSM

Removal

NOTICE: **Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

NOTE: The Tire Pressure Monitoring System (TPMS)/Vehicle Security Module (VSM) is also identified as the VSM .

NOTE: Prior to the replacement of the TPMS / VSM , upload the module configuration information to a scan tool. This information must be downloaded into the new TPMS / VSM after installation. For additional information, refer to Section 418-01 .

NOTE: The steps included in this procedure are critical to restoring the TPMS to normal operation. A new TPMS / VSM is delivered in a manufacturing mode with 6 pre-set DTCs related to the TPMS . To clear the DTCs, successful configuration of the TPMS / VSM must occur, followed by successful TPMS sensor training, and a successful self-test. The DTCs are as follows:

- B2477 — Module Configuration Failure
- B2868 — Left Front Tire Pressure Sensor Fault
- B2869 — Right Front Tire Pressure Sensor Fault
- B2870 — Right Rear Tire Pressure Sensor Fault
- B2871 — Left Rear Tire Pressure Sensor Fault
- C2780 — ECU in Manufacturer Sub-State

1. **NOTE:** This step is necessary only if the TPMS / VSM is being replaced.

   Upload the module configuration information from the TPMS / VSM . For additional information, refer to Section 418-01 .

2. Remove the LH quarter trim panel. For additional information, refer to Section 501-05

3. Disconnect the 2 TPMS / VSM electrical connectors.

4. Remove the 2 nuts and the TPMS / VSM .

Installation

1. Position the TPMS / VSM and install the 2 nuts.
   - Tighten to 5 Nm (44 lb-in).

2. Connect the 2 TPMS / VSM electrical connectors.

3. Install the LH quarter trim panel. For additional information, refer to Section 501-05

4. **NOTE:** When successful, this step provides the calibration necessary for the TPMS / VSM operation and clears DTC B2477. The clearing of this DTC indicates the calibration data has been successfully downloaded to the new TPMS / VSM .

   Download the TPMS / VSM configuration information from the scan tool. For additional information, refer to Section 418-01 .

5. **NOTE:** When successful, this step clears DTCs B2868, B2869, B2870 and B2871. The clearing of these DTCs indicates the TPMS / VSM has recognized the tire pressure sensors during the training procedure.

   Train the tire pressure sensors. For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

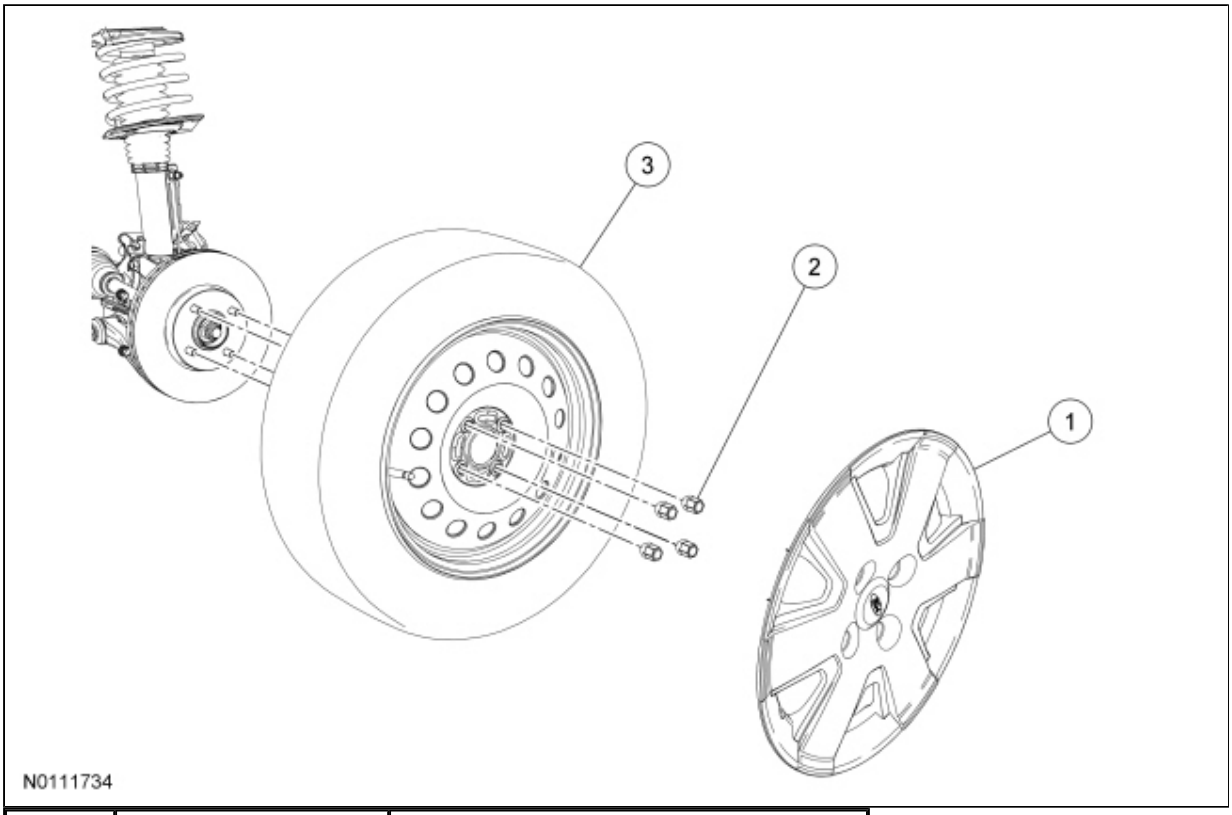
6. **NOTE:** DTC C2780 will not clear if any other DTCs are present in the TPMS / VSM . When successful, this step clears DTC C2780.

   Carry out the TPMS / VSM self-test (including an on-demand self test). Repeat the self-test to confirm all DTCs have been cleared.

Wheel and Tire

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	—



Item	Part Number	Description
1	1130	Wheel cover
2	1012	Wheel nut (4 required)
3	—	Wheel and tire assembly

Removal

All vehicles

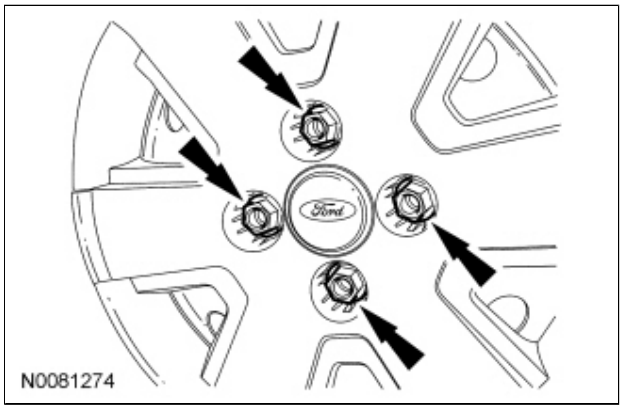
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Vehicles equipped with wheel cover

2. ***NOTICE:*** **Do not use heat to loosen a seized wheel nut. Heat may damage the wheel and wheel bearings.**

   NOTICE: **Remove the wheel nuts prior to removing the wheel cover or damage to the wheel cover may occur.**

Remove the 4 wheel nuts.



3. Remove the wheel cover and the wheel and tire.

Vehicles equipped with aluminum wheels

4. Remove the 4 wheel nuts and the wheel and tire assembly.

Installation

All vehicles

1. **WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surface of the wheel and the mounting surface of the wheel hub, brake drum or brake disc. Make sure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Failure to follow these instructions when installing wheels may result in the wheel nuts loosening and the wheel coming off while the vehicle is in motion, which could result in loss of control, leading to serious injury or death to vehicle occupant(s).**

   NOTICE: **Apply a thin coat of anti-seize lubricant to the interface between the wheel pilot bore and the hub pilot. Do not allow the anti-seize lubricant to contact the wheel-to-brake disc/drum mounting surface, wheel studs, wheel nuts, brake pads or brake disc friction surfaces. Damage to components may occur.**

   Clean the wheel mounting surfaces and apply a thin coat of anti-seize lubricant to the wheel hub pilot surface (wheel only).

2. Install the wheel and tire assembly.

Vehicles with wheel cover

3. Align the wheel cover valve stem opening with the valve stem.
   - Install the 4 wheel nuts and tighten by hand while ensuring alignment of the wheel and wheel cover assembly.

All vehicles

4. **WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   NOTICE: **Failure to tighten the wheel nuts in a star/cross pattern can result in high brake disc runout, which speeds up the development of brake roughness, shudder and vibration.**

   NOTE: The wheel nut torque specification is for clean, dry wheel studs and wheel nut threads.

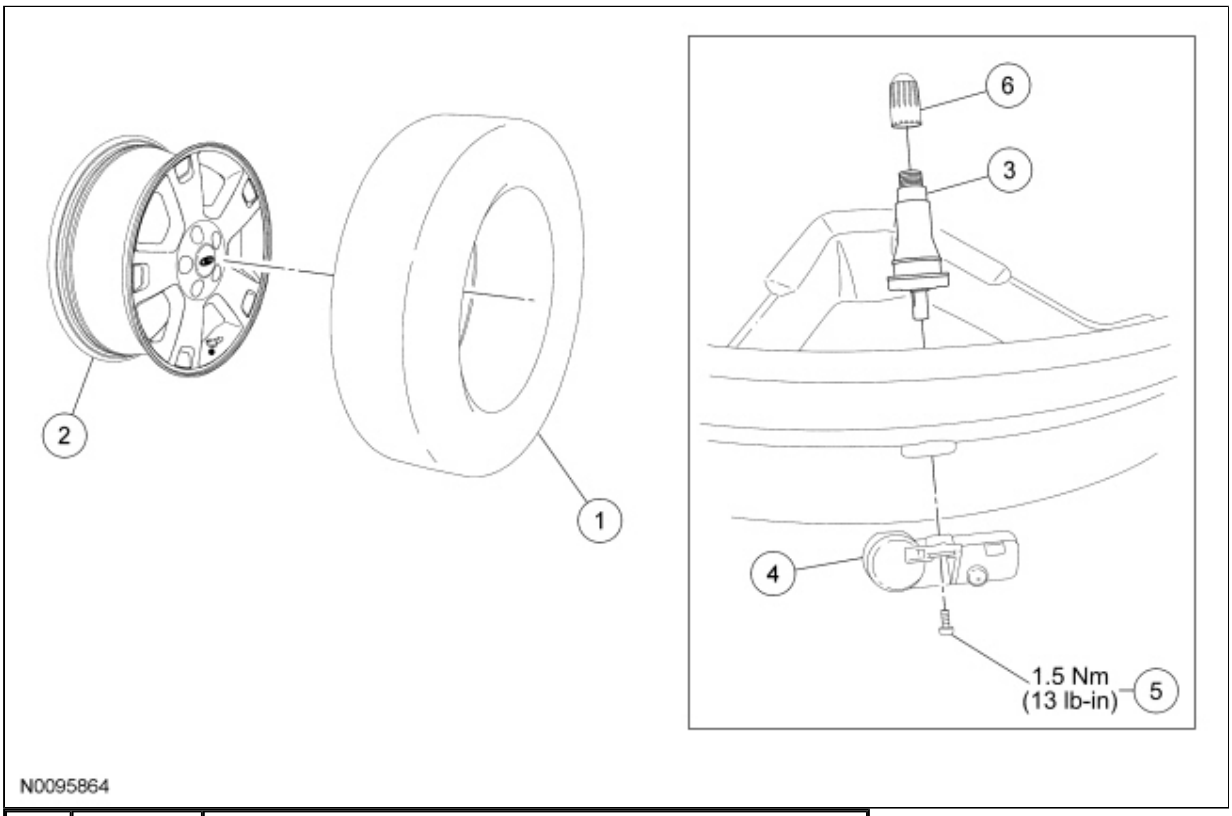
Install the 4 wheel nuts and tighten by hand.

- Tighten the wheel nuts in a star/cross pattern to 135 Nm (100 lb-ft).

Wheel and Tire

Special Tool(s)

ST2869-A	Digital Tire Pressure Gauge 204-354



N0095864

Item	Part Number	Description
1	1508	Tire
2	1007	Wheel
3	1700	Valve stem and screw (also part of 1A189)
4	1A189	Tire Pressure Monitoring System (TPMS) sensor (a new sensor assembly includes W714266 screw and 1700 valve stem and cap)
5	—	Valve stem-to- TPMS sensor screw (part of 1700)
6	1A163	Valve stem cap (also part of 1A189)

Disassembly

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the

battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Failure to follow the instructions below may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**

NOTICE: **The Tire Pressure Monitoring System (TPMS) sensor is mounted to the valve stem. Removal of the valve stem requires dismounting the tire from the wheel and removal of the TPMS sensor.**

NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

1. Remove the wheel and tire. For additional information, refer to Wheel and Tire in this section.

2. ***NOTICE:*** **The valve stem is connected to the Tire Pressure Monitoring System (TPMS) sensor. Do not pull the valve stem from the wheel, or damage to the sensor will occur.**

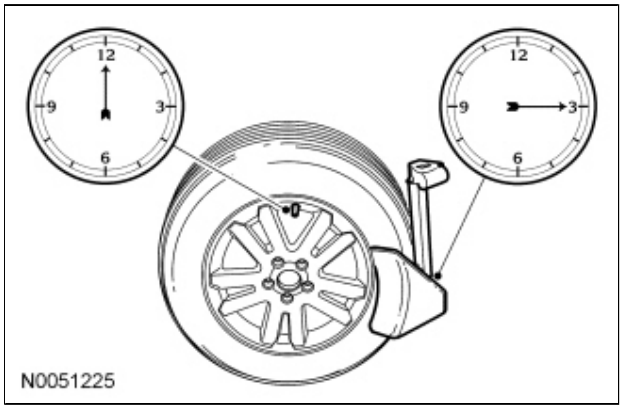
   Remove the valve stem core and fully deflate all air from the tire.
   - If a new Tire Pressure Monitoring System (TPMS) sensor is being installed, remove and discard the valve stem-to-sensor screw and the sensor.

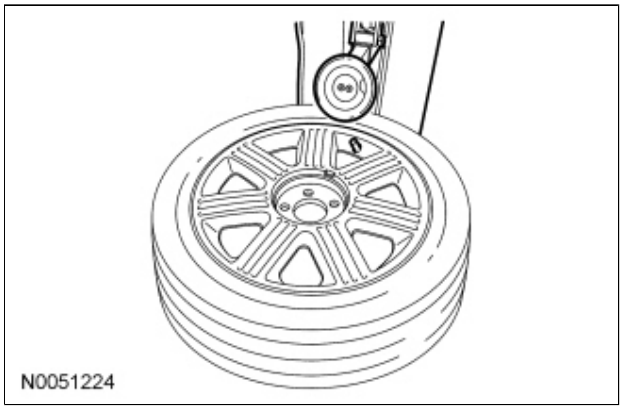
NOTICE: **Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the Tire Pressure Monitoring System (TPMS) sensor may occur.**

3. ***NOTICE:*** **Tire and valve stem position is critical to prevent damage to the Tire Pressure Monitoring System (TPMS) sensor when using a paddle-type bead separator.**

   NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position.

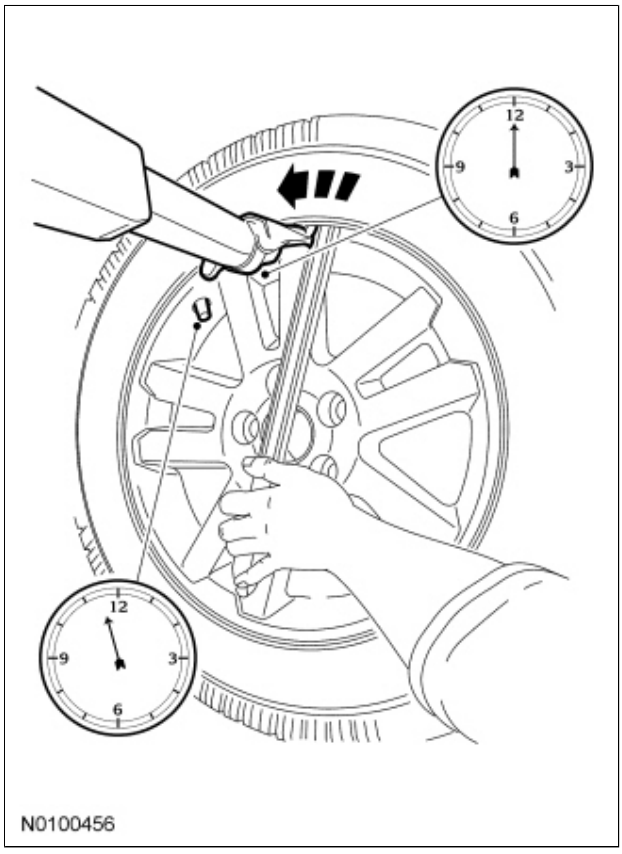
   Position the wheel and tire assembly on a suitable tire machine and separate both beads of the tire from the wheel.
   - For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6 o'clock position and the paddle at the 3 o'clock position.
   - For a roller-type tire machine, align the valve stem with the roller at any position.





4. **NOTE:** Index-mark the valve stem and wheel weight positions on the tire.

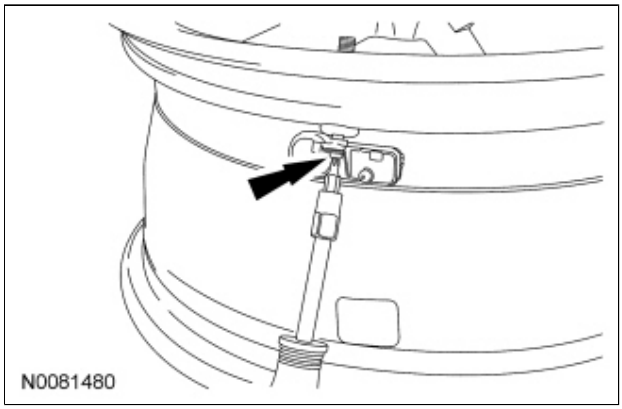
   Place the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.



5. Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.

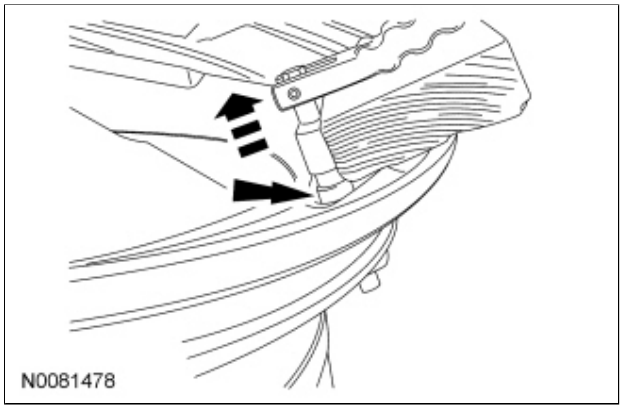
6. **NOTE:** A new valve stem must be installed whenever a new tire or wheel is installed.

   Remove the TPMS sensor in the following sequence.
   1. Using a T10 Torx, remove the valve stem-to- TPMS sensor screw.
   2. Carefully and firmly, pull the sensor straight down and separate it from the valve stem.



7. ***NOTICE:*** **Use care not to damage the wheel surface when removing the valve stem.**

   Using a suitable valve stem puller and a wood block, remove the valve stem from the wheel.



8. **NOTE:** When installing a new wheel, always install a new valve stem and sensor screw. Reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused.

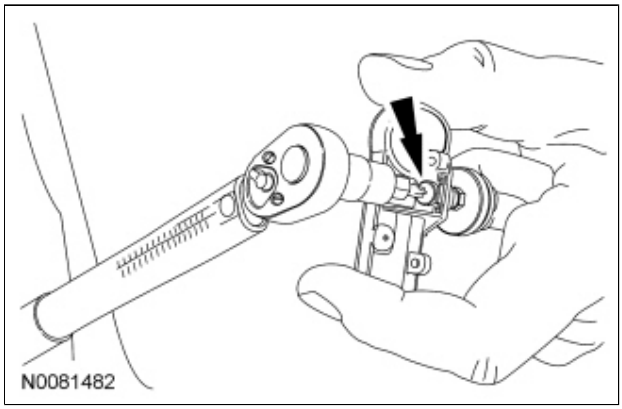
   If the TPMS sensor is being reused, inspect the TPMS sensor for damage and install a new sensor as necessary.

Assembly

NOTICE: **Damage to the Tire Pressure Monitoring System (TPMS) sensor may result if the tire mounting is not carried out as instructed.**

1. ***NOTICE:*** **To prevent Tire Pressure Monitoring System (TPMS) sensor and valve stem damage, the valve stem must be installed onto the TPMS sensor and then installed into the wheel as an assembly.**

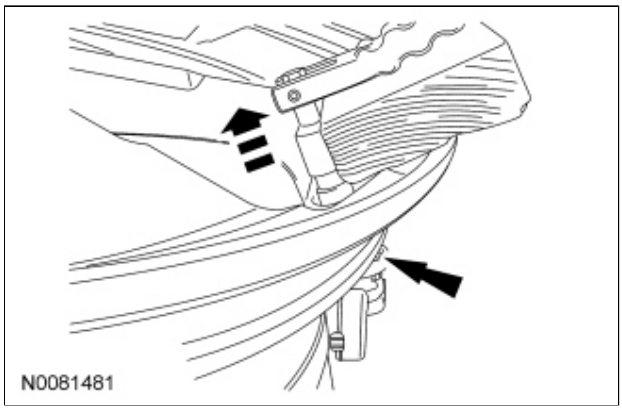
   Install a new valve stem onto the TPMS sensor.
   - Tighten the new valve stem-to- TPMS sensor screw to 1.5 Nm (13 lb-in).



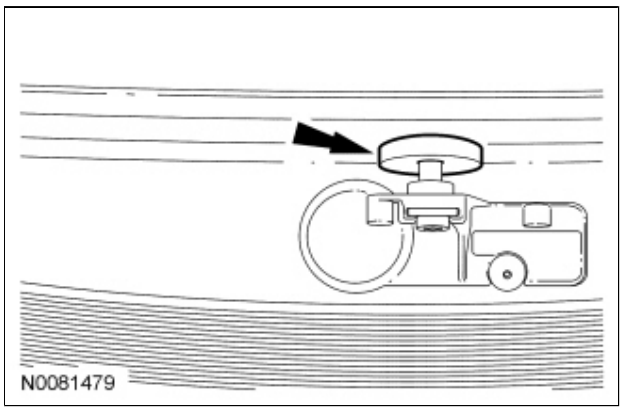
2. ***NOTICE:*** **It is important to pull the valve stem and Tire Pressure Monitoring System (TPMS) sensor assembly through the wheel rim hole in a direction parallel to the valve stem hole axis. If the assembly is pulled through at an angle, damage to the valve stem and sensor assembly may occur.**

   NOTICE: **Use care not to damage the wheel surface when installing the valve stem and Tire Pressure Monitoring System (TPMS) sensor assembly.**

   Lubricate the valve stem with soapy water and install the valve stem and TPMS sensor assembly into the wheel using a block of wood and a suitable valve stem installer.



3. Make sure the valve stem rubber is fully seated against the wheel.

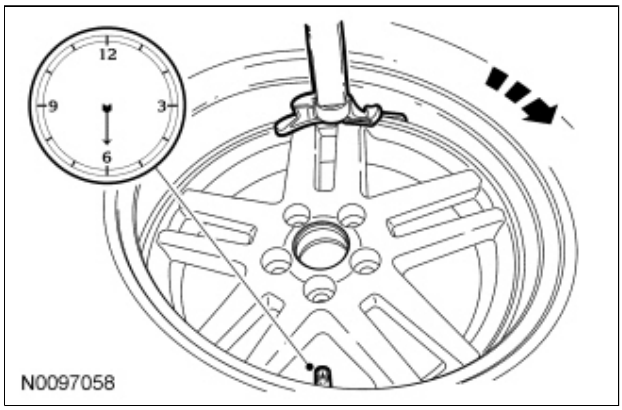


4. **NOTE:** Lubricate the tire beads using a suitable fast-drying, corrosion-inhibiting tire bead lubricant.

   NOTE: Do not mount the tire at this time.

   Position the wheel on the turntable of the tire machine, then lubricate and position the bottom bead of the tire on the wheel.

5. Position the wheel to align the valve stem with the machine arm, at the 6 o'clock position, and mount the bottom bead of the tire.



6. Reposition the wheel to align the valve stem with the machine arm at the 6 o'clock position, and mount the top bead of the tire.

7. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to make sure that accurate values are obtained.

   Inflate the tire to the pressure specified on the Vehicle Certification (VC) label located on the driver door or door pillar.
   - Proceed to Step 8 if the tire beads do not seat at the specified inflation pressure.

8. **WARNING: If there is a need to exceed the maximum pressure indicated on the sidewall of the tire, in order to seat the beads, follow ALL the steps listed below. Failure to follow these steps may result in serious personal injury.**

   The following steps should only be carried out if the tire beads cannot be seated by inflating the tire up to the maximum inflation pressure listed on the tire sidewall.
   1. Relubricate the tire bead and wheel bead seat area.
   2. Install a remote valve and pressure gauge.
   3. Wear eye and ear protection and stand at a minimum of 3.65 m (12 ft) away from the wheel and tire assembly.
   4. Inflate the tire using the remote valve and tire gauge until the beads have seated or until the pressure gauge is 138 kPa (20 psi) more than maximum inflation pressure on tire sidewall. If beads have not seated, deflate the tire and proceed to the next step.
   5. Place the wheel and tire assembly in an OSHA-approved tire safety cage.
   6. Inflate the tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 276 kPa (40 psi) more than maximum inflation pressure on the tire sidewall. **Do not exceed 276 kPa (40 psi) above the maximum pressure on tire sidewall. Install a new tire if the beads do not seat at this pressure.**

9. Install the wheel and tire. For additional information, refer to Wheel and Tire in this section.

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

1. **NOTE:** The Tire Pressure Monitoring System (TPMS) sensor cannot be removed without disassembly of the wheel and tire.

   Disassemble the wheel and tire. For additional information, refer to Wheel and Tire in this section.

Driveline System

The driveline system consists of the following:

- Right halfshaft with inner and outer CV joint
- Left halfshaft with inner and outer CV joint
- Intermediate shaft connecting the transaxle to the right halfshaft
- Intermediate shaft bearing that supports the inner right halfshaft CV joint
- Circlips that retain the intermediate shaft and left halfshaft inner CV joint in the transaxle differential side gears
- Splined outer CV joints that mesh with the front drive hubs
- Outboard CV joint wheel hub nuts that secure the CV joints to the wheel hubs

The transaxle contains the differential assembly. The differential receives torque directly from the transmission. Inside the differential, side gears are splined to the right inboard CV joint and intermediate shaft. The differential allows the halfshaft and intermediate shaft to be driven at different speeds as required, such as when cornering. The rotational direction of the halfshafts determines the vehicle movement. The articulation of the front wheels, both in steering and normal jounce and rebound, is controlled by the CV joint. Both plunge and multi-ball style CV joints are used. The CV joints are permanently lubricated with a special high temperature grease and require no periodic maintenance.

Halfshaft Handling

NOTICE: **Excessive pulling force on the interconnecting shaft between the joints of the halfshaft will result in internal joint damage and separation. Axial loads used in assisting removal should be applied through the inboard joint housing only. Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the Constant Velocity (CV) joints. Do not over-angle the CV joints. Damage will occur to an assembled inner CV joint if it is over-plunged outward from the joint housing.**

NOTE: Never use the halfshaft assembly as a lever to position other components. Always support the free-end of the halfshaft. Do not allow the boots to contact sharp edges or hot exhaust components.

Handle all halfshaft components carefully during removal and installation procedures.

Driveline System

Principals of Operation

Driveline System — General Information

The driveline system enables the power generated by the engine and transferred through the transaxle to place the vehicle in motion. Rotational torque received from the transaxle is delivered to the front wheels by halfshafts. The CV joints at the ends of the shafts allow the shafts to rotate smoothly in an allowable angle plane. The rotational torque is introduced into the differential ring gear which drives the differential. The differential divides the torque between the left and right axle shafts, while permitting the shafts to turn at different speeds when required, such as when cornering.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• CV joints, housings, boots and clamps • Intermediate shaft support bearing • Intermediate shaft support bracket

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - NVH .

Intermediate Shaft Support Bearing

With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . Rotate the intermediate shaft by hand. If the support bearing shows any signs of roughness or wear, install a new intermediate shaft bearing. Refer to Section 205-04 .

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely

system and continue diagnosis.

Condition	Possible Sources	Action
• Driveline clunk — loud clunk when shifting from reverse to drive	• Damaged or worn CV joints • Loose hub nut	• INSPECT the CV joints for wear or damage. INSTALL a new halfshaft as necessary. REFER to Section 205-04 . CHECK the torque on the hub nut. REPLACE the hub nut if the torque is not at specification. REFER to Section 205-04 .
• Driveline clunk (Front Wheel Drive (FWD) vehicles) — occurs during acceleration or from cruise to coast/deceleration	• Damaged or worn inner CV joint • Loose hub nut	• INSPECT the inner CV joint and boot. INSTALL a new halfshaft as necessary. REFER to Section 205-04 . CHECK the torque on the hub nut. REPLACE the hub nut if the torque is not at specification. REFER to Section 205-04 .
• Driveline clunk — occurs as the vehicle starts to move forward following a stop	• Loose hub nut	• CHECK the torque on the hub nut. REPLACE the hub nut if the torque is not at specification. REFER to Section 205-04 .
• Clicking, popping or grinding — occurs while the vehicle is turning	• Inadequate or contaminated lubrication in the CV joints • Another component contacting the halfshaft	• CHECK the CV boots and joints for wear or damage. INSTALL new boot(s) or halfshaft as necessary. REFER to Section 205-04 . • CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary.
• Grunting — normally associated with a shudder experienced during acceleration from a complete stop	• Halfshaft CV joint binding	• CLEAN the CV joint and INSTALL a new halfshaft as necessary. REFER to Section 205-04 .

CV Joint Capacities

Description	Liters
Grease, inner tripod joints	Full sachet
Grease, outer joints	Full sachet

Torque Specifications

Description	Nm	lb-ft
Ball joint nut	62	46
Brake hose bracket bolt	25	18
Shield and bearing retainer strap nuts [a]	—	—
Stabilizer bar link upper nut	48	35
Wheel hub nut [a]	—	—

[a] Refer to Halfshaft—Exploded View in this section.

Front Drive Halfshafts

The front halfshafts consist of the following:

- CV joints at both ends to make sure that the rotation is smooth
- Tripod CV joints (with tripod, running rollers and tripod housing) are fitted on the transmission side
- CV joints nearest the wheel are caged ball joints (with ball star, ball cage and ball shell)
- LH tripod joint is secured in the differential with a circlip
- Intermediate shaft (RH side) is secured in the differential by the intermediate shaft bearing
- Tripod housing of the tripod CV joint for the RH front halfshaft and the intermediate shaft are attached as a unique part
- Outboard CV joints are attached to the splined wheel hubs with nuts that control wheel bearing preload

The front halfshafts transmit torque generated by the engine from the transaxle to the wheels. In order to allow vertical and horizontal movement of the wheels, the front drive halfshafts operate at varying lengths and angles. The tripod CV joints allow for changes in halfshaft length during axial movements. The caged balls of the outer CV joint permit the articulation of the front wheels and retain the stability of the intermediate and interconnecting shafts.

Special care should be taken when removing and installing or assembling and disassembling front halfshafts. The inner tripod joint must not be bent at more than 18 degrees. Do not allow the boots to come into contact with sharp edges or the hot exhaust system. Do not drop the front halfshaft as this can damage the inside of the boots without any signs of damage showing on the outside. Do not use front halfshafts as levering tools for the installation of other components. The front halfshafts must always be supported when disconnected from the wheel ends.

Halfshaft — Exploded View

Special Tool(s)

ST2138-A	Installer, Halfshaft 204-161 (T97P-1175-A)
ST2272-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent
ST1582-A	Remover, Halfshaft 205-241 (T86P-3514-A)
ST2038-A	Remover, Halfshaft (Plate) 205-290 (T89P-3415-B)
ST2789-A	Slide Hammer 100-001 (T50T-100-A)
16089	Remover, Halfshaft 308-256

Wheel End Components

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure correct retention of these parts.**

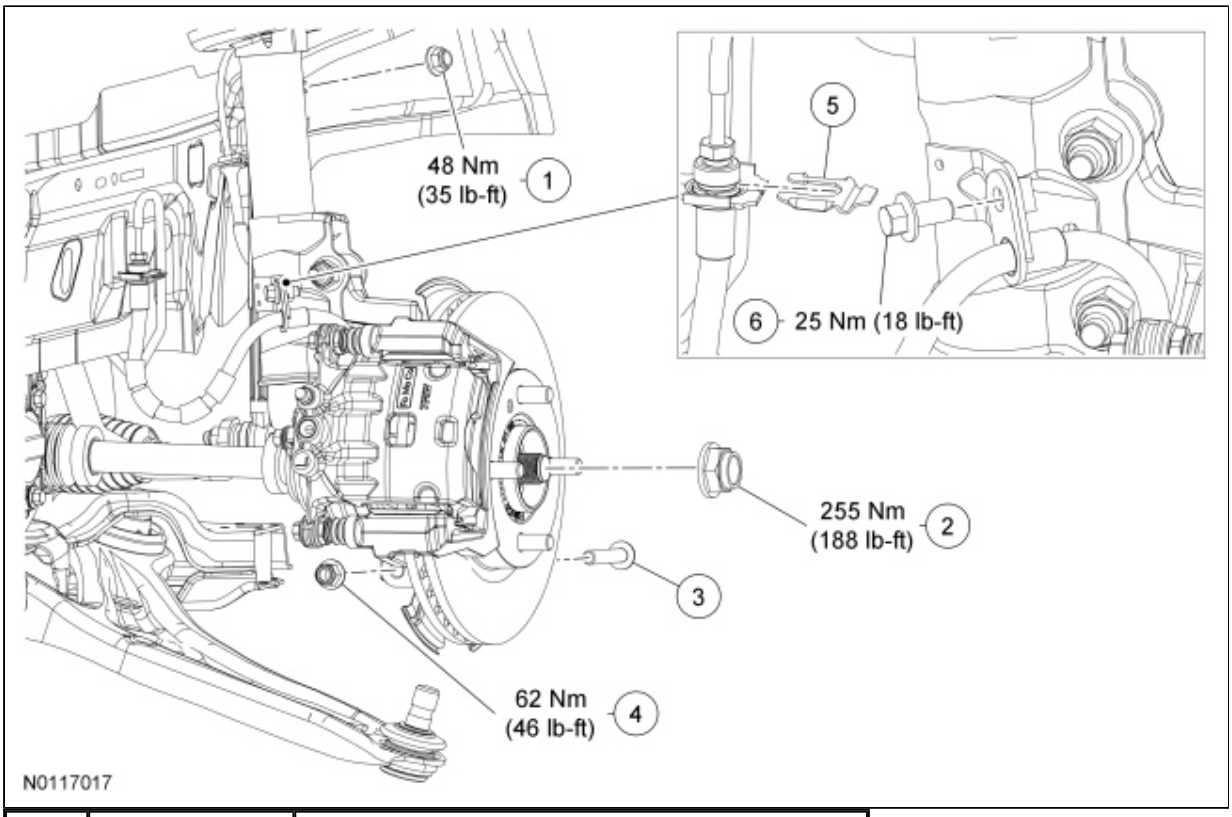
NOTICE: **Do not tighten the wheel hub nut with the vehicle on the ground. Tighten the nut to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

NOTICE: **Install and tighten the new wheel hub nut to specification in a continuous rotation. Always**

install a new wheel hub nut after loosening or when not tightened to specification in a continuous rotation or damage to the components may occur.

NOTE: Apply the brake to keep the halfshaft from rotating while tightening the wheel hub nut.

NOTE: LH shown, RH similar.



Item	Part Number	Description
1	W713760	Stabilizer bar link upper nut (install new)
2	W713640	Wheel hub nut (install new)
3	W709618	Ball joint bolt (install new)
4	W520203	Ball joint nut (install new)
5	W700936	Brake hose clip
6	W500222	Brake hose bracket bolt

Halfshafts

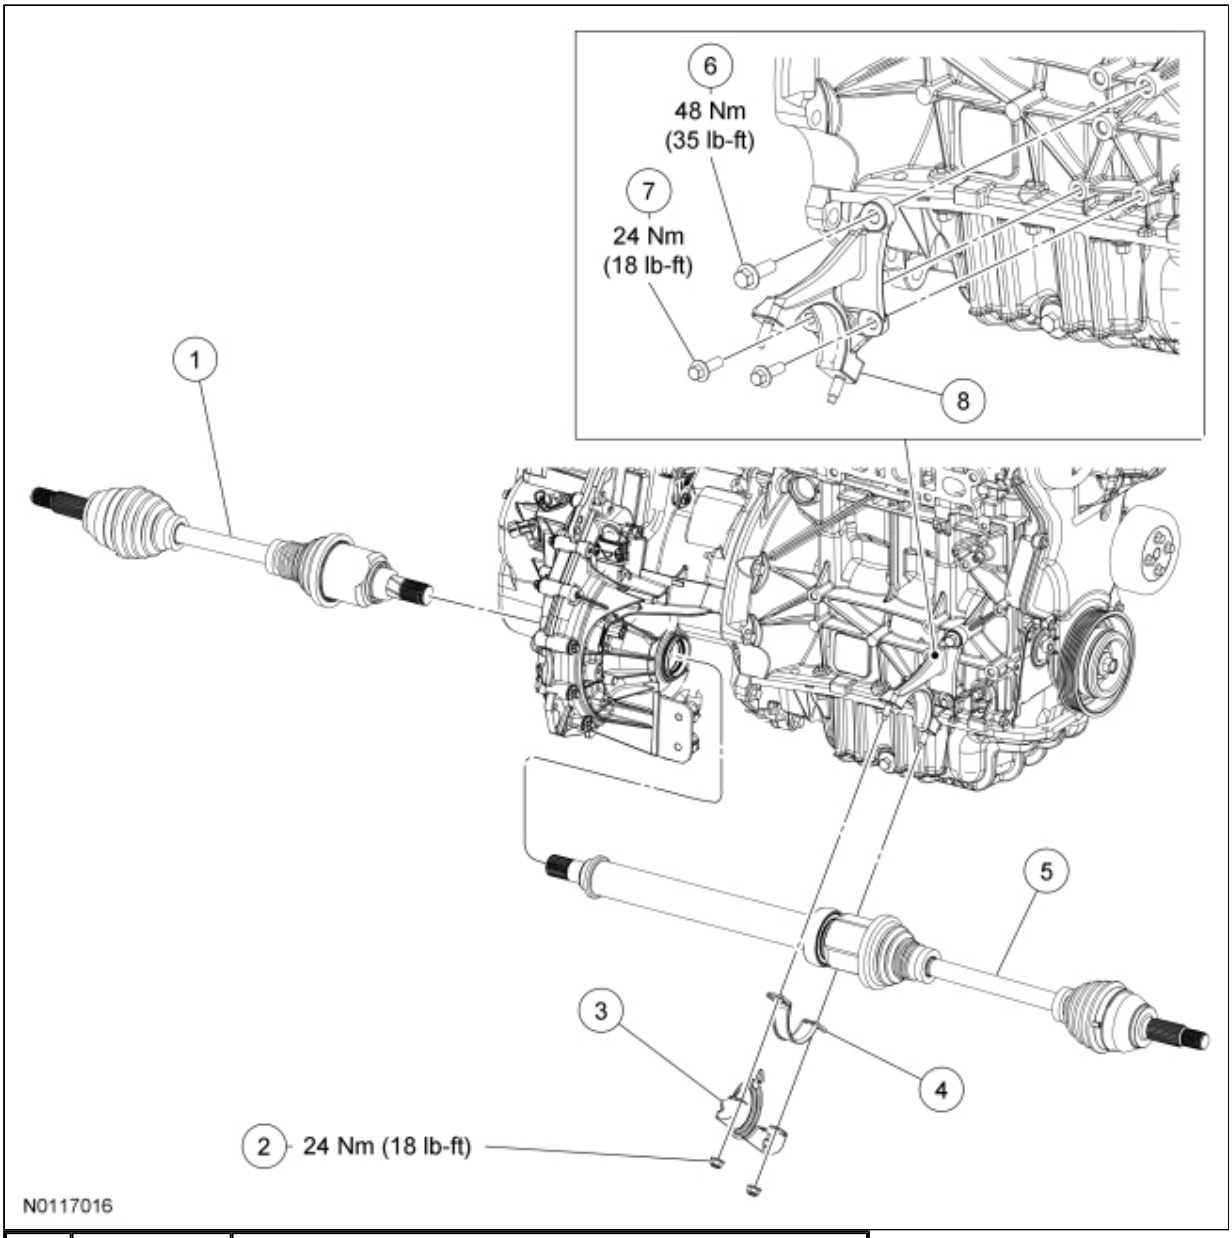
NOTICE: **Install the bearing retainer strap (item 4) on the bracket studs before the shield (item 3) and tighten the nuts evenly in stages (alternating from top to bottom) or incorrect bearing clampload may occur causing component damage.**

NOTICE: **The inner joint must not be bent more than 18 degrees. The outer joint must not be bent more than 45 degrees. Damage to the halfshaft will occur.**

NOTICE: **Install a new halfshaft seal any time the halfshaft is removed from the transmission/transaxle or a leak may occur. For additional Information refer to Section 307-11 .**

NOTE: Install the RH halfshaft shield so the clip is seated in the notch on the support bracket.

NOTE: For halfshaft CV boot service, refer to Halfshaft — RH or Halfshaft — LH In this section.



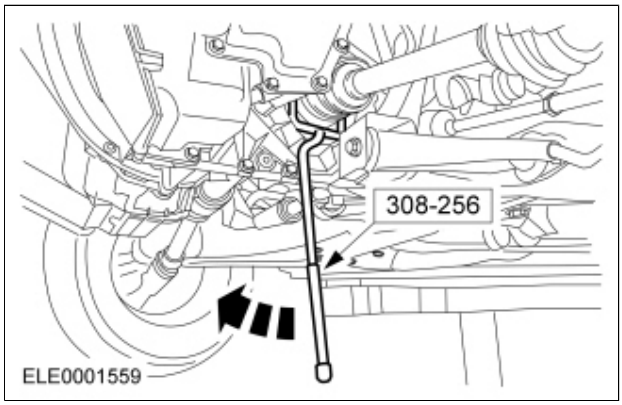
Item	Part Number	Description
1	3B437	LH halfshaft assembly
2	W520102	Shield and bearing retainer strap nuts (2 required, install new)
3	3N278	Shield
4	3N324	Bearing retainer strap (install new)
5	3B436	RH halfshaft assembly
6	W500034	Support bracket upper bolt
7	W500024	Support bracket lower bolt (2 required)
8	3K305	Support bracket

Removal and Installation

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications and Special Tools. Items in the exploded views may not be listed in order of removal.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

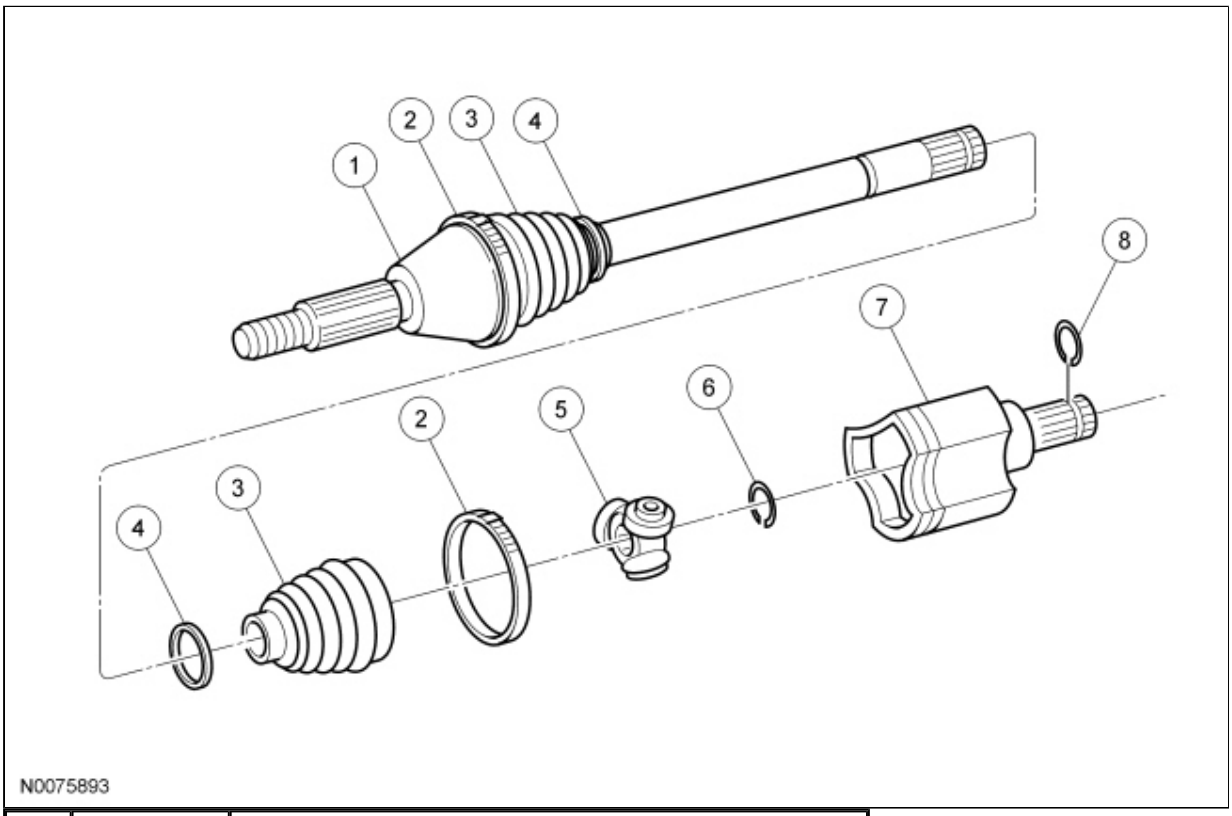
3. Vehicles equipped with a manual transmission, use special tool 308-256 to detach the LH halfshaft.



Halfshaft — LH

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)



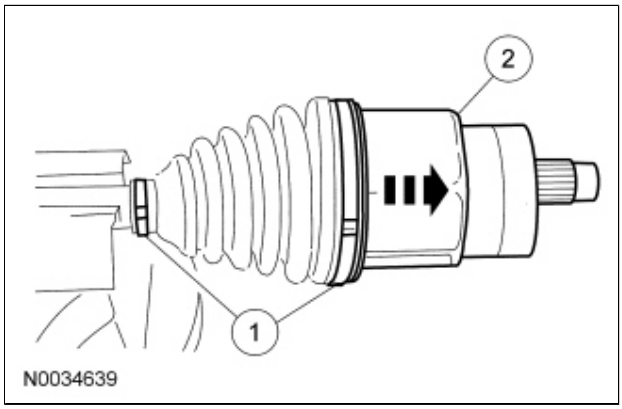
Item	Part Number	Description
1	—	Outboard fixed ball CV joint (part of 3B437 halfshaft assembly)
2	—	Large CV boot clamps (part of 4A804 boot kit)
3	—	CV boot (part of 4A804 boot kit)
4	—	Small CV boot clamps (part of 4A804 boot kit)
5	—	Tripod star with roller (part of 3B437 halfshaft assembly)
6	—	Tripod snap-ring (part of 3B437 halfshaft assembly)
7	—	Inboard tripod housing (part of 3B437 halfshaft assembly)
8	—	Halfshaft retaining circlip

Disassembly

1. Remove the LH halfshaft assembly. For additional information, refer to Halfshaft — Exploded View in this

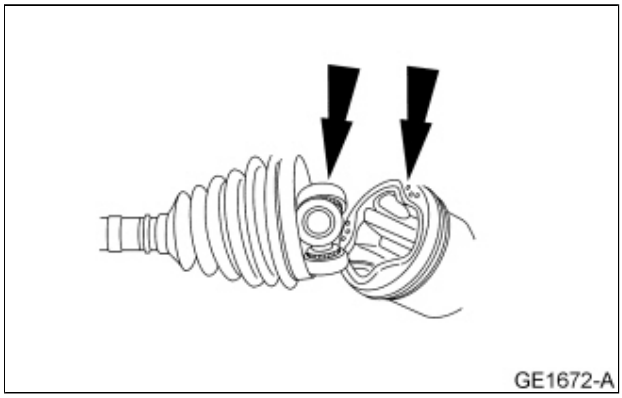
section.

2. Clamp the intermediate shaft in a soft-jawed vise.
    1. Remove and discard the 2 inner CV boot clamps.
    2. Remove the inner CV joint housing.

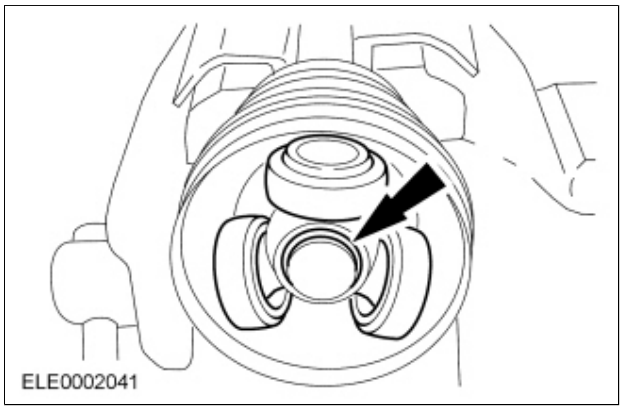


3. Push the boot back along the shaft.

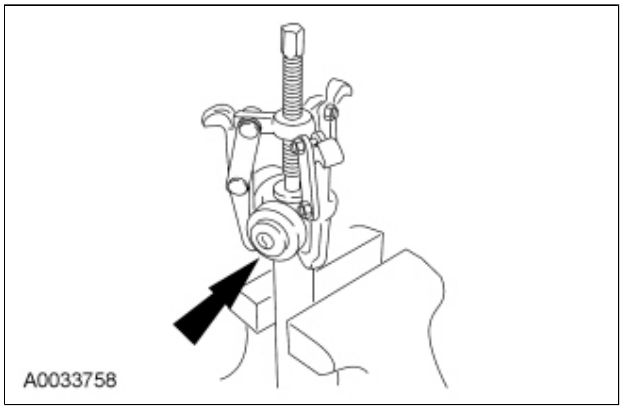
4. Separate the tripod joint from the housing and remove all of the grease.



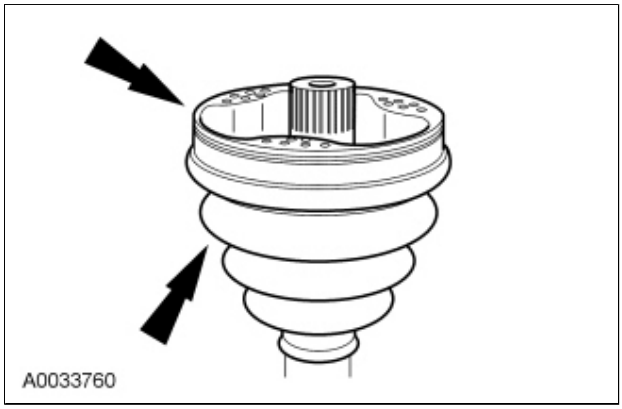
5. Remove and discard the snap ring.



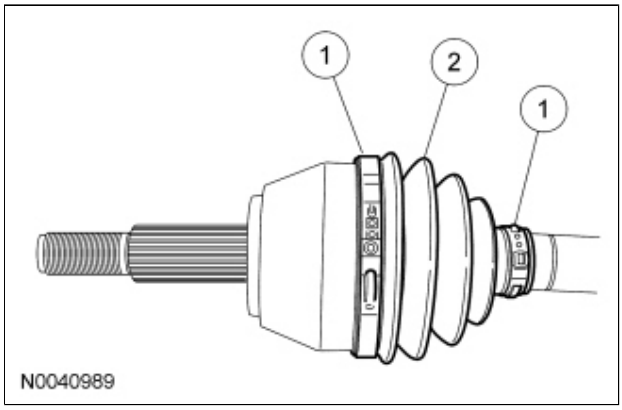
6. Using a suitable 3-jaw puller, remove the tripod joint.



7. Remove and discard the inner CV joint boot.



8. Remove and discard the outboard CV boot and boot insert.
    1. Remove and discard the 2 boot clamps.
    2. Pull the outboard boot down the length of the shaft and off the inboard end.
        - Remove the CV joint grease.



Assembly

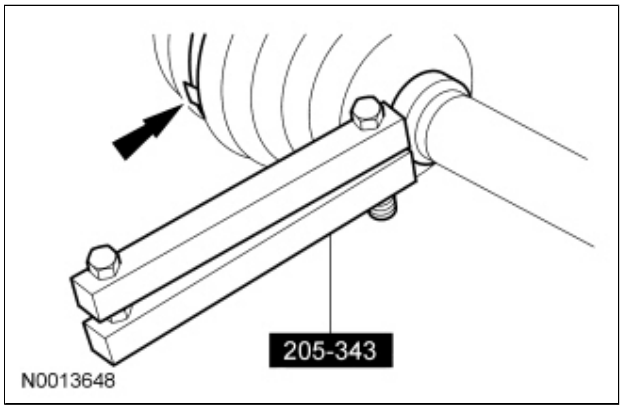
NOTICE: **The inner joint must not be bent at more than 18 degrees; the outer joint must not be bent at more than 45 degrees or damage to the component my occur.**

NOTICE: **Use care not to damage the boot or component damage may occur.**

1. **NOTE:** Install the outboard CV boot from the inboard end.

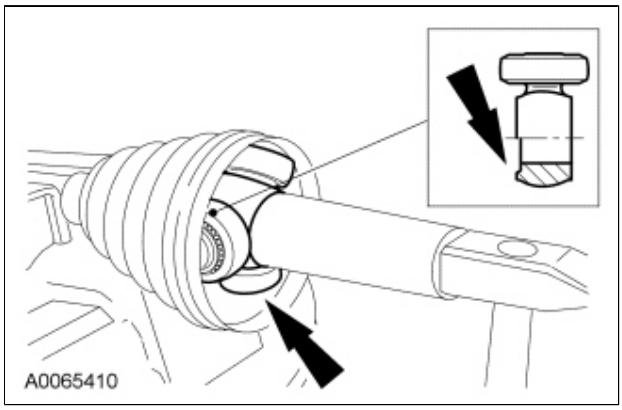
    Install the outboard CV boot and install half the grease in the sachet (supplied with boot kit) into the outer joint and the remainder in the CV joint boot.
    - Slide a small flat-blade screwdriver under the boot seat to allow the air to escape.
    - Position the CV boot and remove the screwdriver.

2. Using the Constant Velocity Joint Boot Clamp Installer, install the 2 new outboard boot clamps.

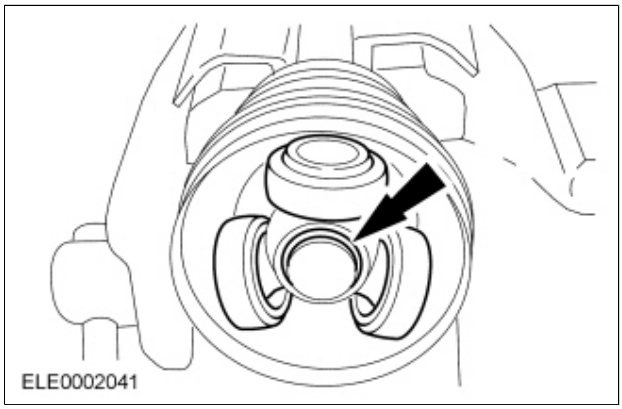


3. ***NOTICE:*** **Do not damage the tripod joint roller bearings or component damage may occur.**

   Install the tripod joint on the inboard end of the shaft.
   - Using a suitable driver, push the tripod joint onto the front drive halfshaft as far as it will go.



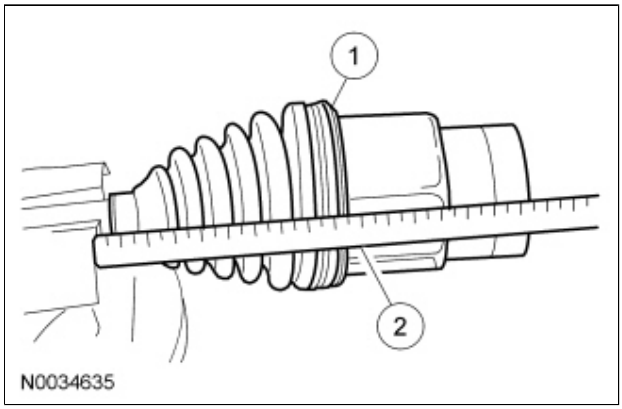
4. Install a new snap ring.



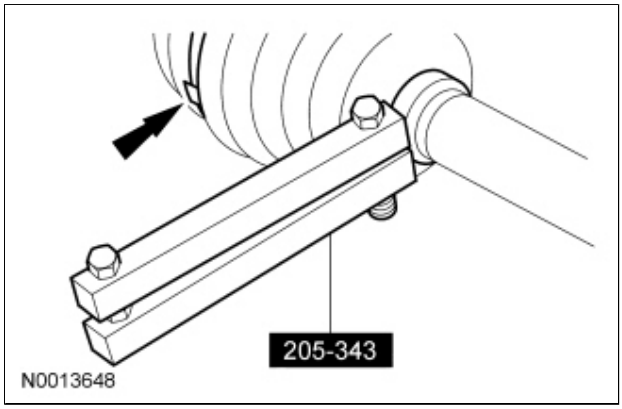
5. Install half of the sachet of grease (supplied with boot kit) into the tripod joint housing. Inject the other half of the grease into the boot.

6. ***NOTICE:*** **Use care not to damage the boot or component damage may occur.**

   Install the tripod joint into the tripod joint housing.
   1. Insert a small flat-blade screwdriver under the boot seat to allow the air to escape.
   2. Slide the tripod joint in as far as it will go, then pull it out 20 mm (0.787 in).
   - Remove the screwdriver.



7. Using the Constant Velocity Joint Boot Clamp Installer, install the 2 new CV boot clamps.

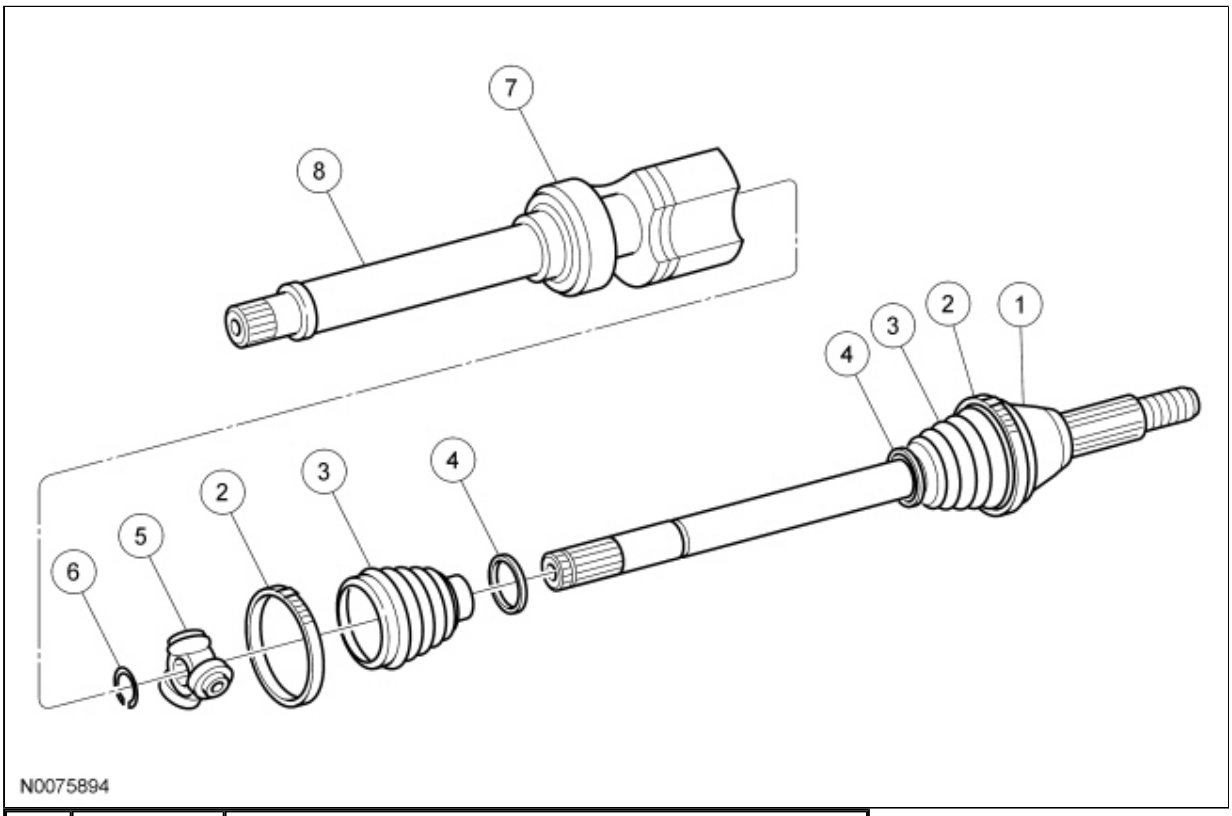


8. Install the LH halfshaft assembly. For additional information, refer to Halfshaft — Exploded View in this section.

Halfshaft — RH

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)



Item	Part Number	Description
1	—	Outboard fixed ball CV joint (part of 3B436 halfshaft assembly)
2	—	Large CV joint boot clamps (part of 4A804 boot kit)
3	—	Outboard CV boots (part of 4A804 boot kit)
4	—	Small CV joint boot clamps (part of 4A804 boot kit)
5	—	Tripod joint (part of 3B436 halfshaft assembly)
6	—	Snap ring (part of 3B436 halfshaft assembly)
7	—	Intermediate shaft support bearing (part of 3B436 halfshaft assembly)
8	—	Intermediate shaft (part of 3B436 halfshaft assembly)

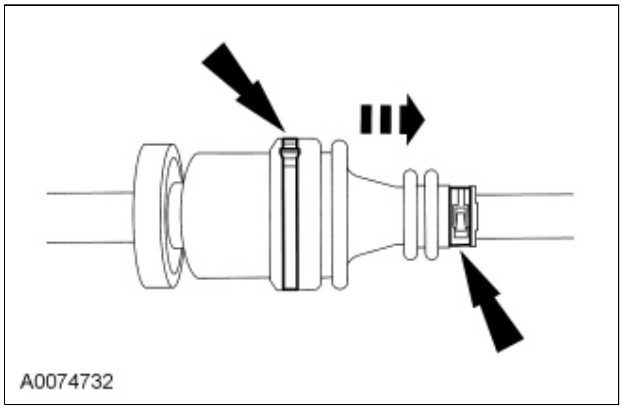
Disassembly

NOTICE: **The inner joint must not be bent at more than 18 degrees; the outer joint must not be bent at**

more than 45 degrees or damage to the component may occur.

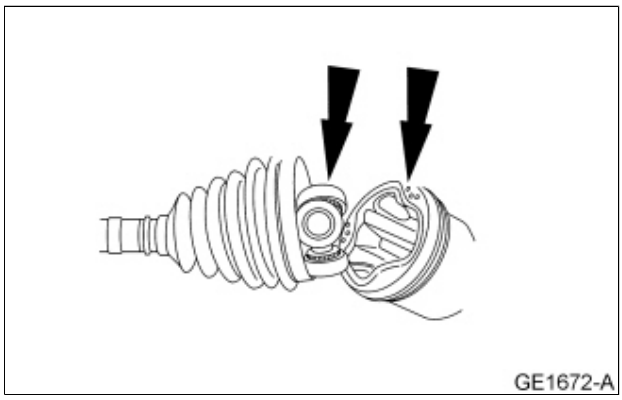
1. Remove the RH halfshaft assembly. For additional information, refer to Halfshaft — Exploded View in this section.

2. Clamp the intermediate shaft in a soft-jawed vise.
   - Remove and discard the 2 inner boot clamps.

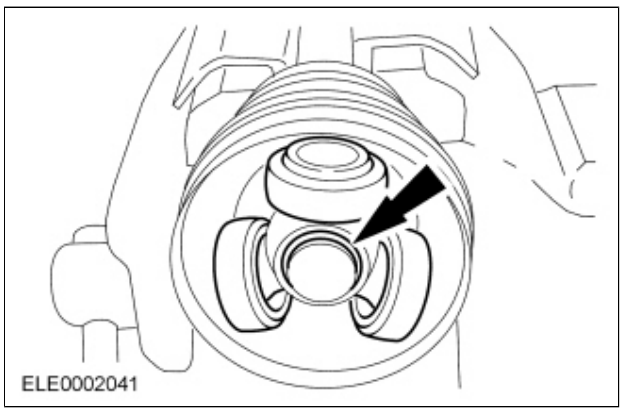


3. Push the boot back along the shaft.

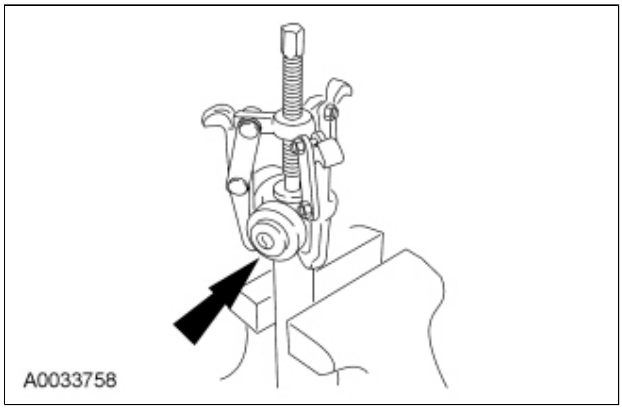
4. Separate the tripod joint from the housing and remove all the grease.



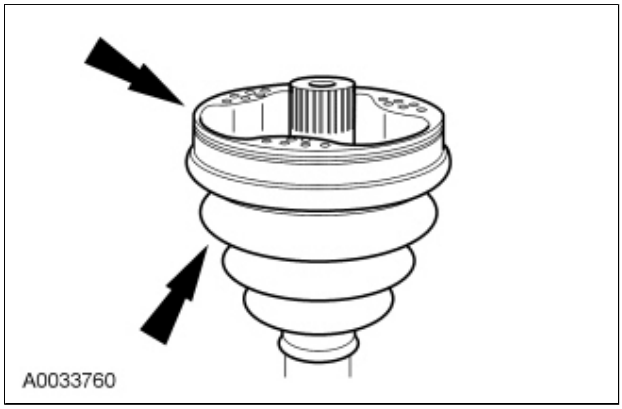
5. Remove and discard the snap ring.



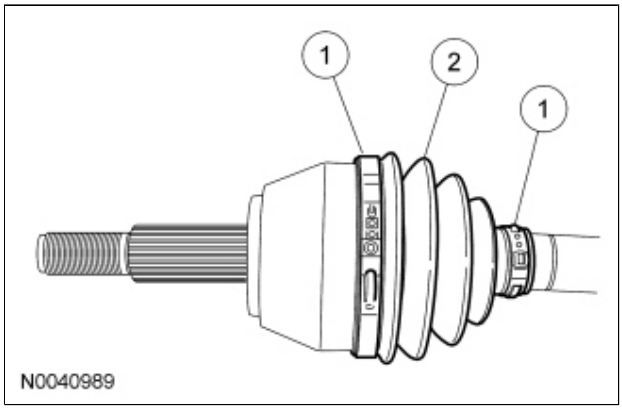
6. Using a suitable 3-jaw puller, remove the tripod joint.



7. Remove and discard the inner CV joint boot and boot insert.



8. Remove and discard the outboard CV boot.
    1. Remove and discard the 2 CV boot clamps.
    2. Remove and discard the boot.
        - Remove the CV joint grease.



Assembly

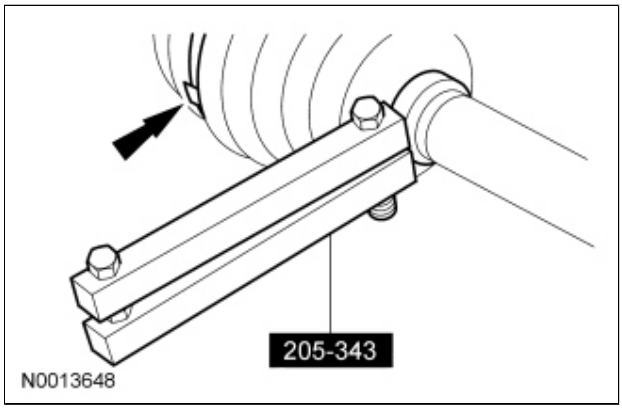
NOTICE: **The inner joint must not be bent at more than 18 degrees; the outer joint must not be bent at more than 45 degrees or damage to the component may occur.**

1. Install the outboard CV boot and install half the grease in the sachet (supplied with boot kit) into the outer joint and the remainder in the CV joint boot.

2. ***NOTICE:*** **Use care not to damage the boot or component damage may occur.**

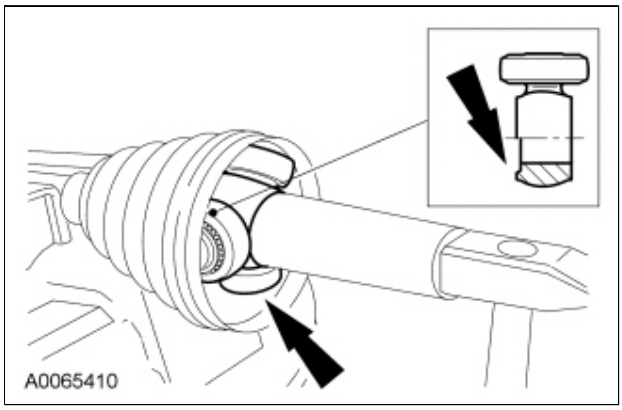
   Position the boot on the outer CV joint.
    - Slide a small flat-blade screwdriver under the boot seat to allow the air to escape.
    - Position the CV boot and remove the screwdriver.

3. Using the Constant Velocity Joint Boot Clamp Installer, install the 2 new clamps in boot ring grooves.

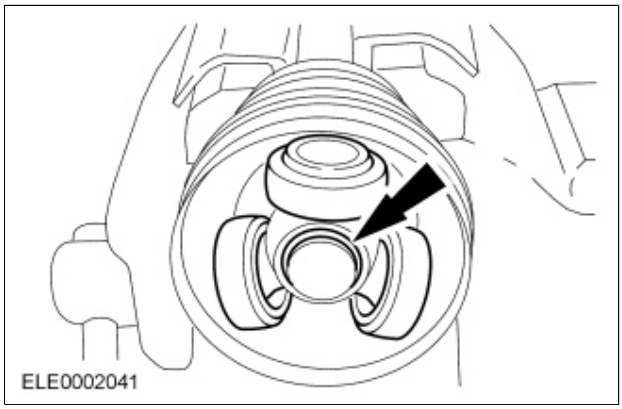


4. ***NOTICE:*** **Do not damage the tripod joint roller bearings or component damage may occur.**

   Install the tripod joint.
   - Using a suitable driver, push the tripod joint onto the front drive halfshaft as far as it will go.

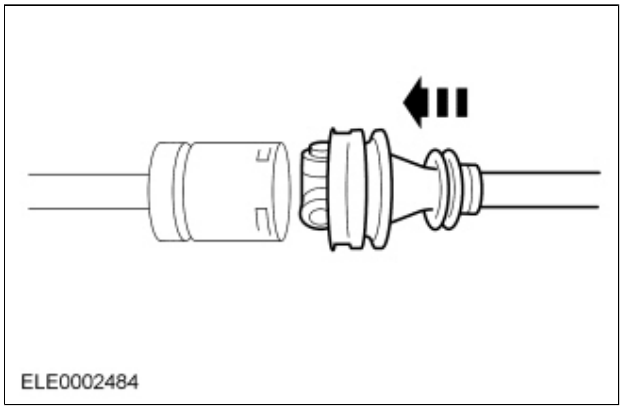


5. Install a new snap ring.

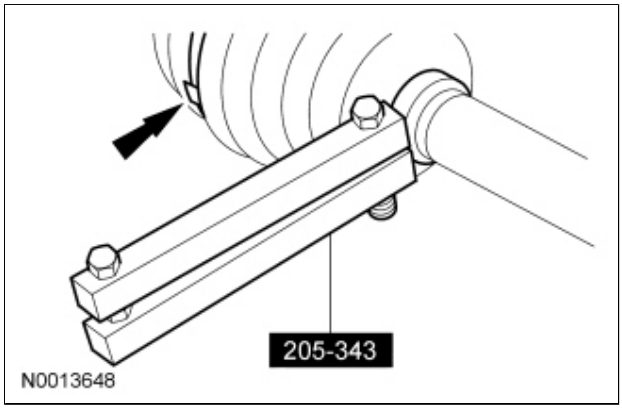


6. Install half of the sachet of grease (supplied with boot kit) into the tripod joint housing. Inject the other half of the grease into the boot.

7. Install the tripod joint into the tripod joint housing.



8. Using the Constant Velocity Joint Boot Clamp Installer, install the 2 new inner CV boot clamps.



9. Install the RH halfshaft assembly. For additional information, refer to Halfshaft — Exploded View in this section.

Minimum brake pad thickness	3.0 mm (0.118 in)
Minimum brake shoe thickness	3.75 mm (0.147 in)

Torque Specifications

Description	Nm	lb-in
Brake caliper bleeder screws	10	89
Wheel cylinder bleeder screws	6	54
Master cylinder brake tube fittings	18	155

Brake System

The brake system consists of the following components:

- Fixed brake pedal
- Front disc brake system
- Brake master cylinder and fluid reservoir
- Mechanical parking brake system
- ABS
- Rear drum brake system
- Red brake light indicator
- Vacuum-assisted power brake booster

For information on:

- the hydraulic brake actuation system, refer to Section 206-06 .
- the front disc brakes, refer to Section 206-03 .
- the parking brake actuation system, refer to Section 206-05 .
- the ABS, refer to Section 206-09 .
- the rear drum brake system, refer to Section 206-02 .
- the vacuum assisted power brake booster, refer to Section 206-07 .

Principles of Operation

Brake System

Applying the brake pedal uses lever action to push a rod into the brake booster which, through the use of vacuum, boosts the force of the rod and then transmits this force into the master cylinder. This produces hydraulic pressure in the master cylinder. On vehicles not equipped with ABS, the hydraulic pressure is transmitted by brake fluid through the brake tubes to the individual brake calipers. On vehicles equipped with ABS, the hydraulic pressure is transmitted by brake fluid through the brake tubes to the ABS Hydraulic Control Unit (HCU), which then distributes that pressure through brake tubes to the individual brake calipers. The brake calipers use hydraulic pressure to apply the pads. The application of the brake pads will cause the rotation of the wheels to slow or stop, depending on how much brake pressure is applied. The parking brakes carry out the same function except that they are mechanically actuated by a cable that connects only to the rear brakes.

Brake Master Cylinder Compensator Ports

The purpose of the compensator ports in the brake master cylinder is to supply additional brake fluid from the master cylinder reservoir when needed by the brake system due to brake lining wear and allow brake fluid to return to the master cylinder reservoir when the brakes are released. The returning brake fluid creates a slight turbulence in the master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged. Clogged compensator ports may cause the brakes to hang up or not fully release.

Red Brake Warning Indicator

The red brake warning indicator alerts the driver to certain conditions that exist in the brake system. The Instrument Cluster (IC) performs a bulb check when the ignition key is turned to the RUN position. The conditions that cause the indicator to illuminate are low brake fluid level, the parking brake is applied or there is a fault in the ABS (if the yellow ABS warning indicator is also illuminated). To diagnose red brake warning indicator concerns, refer to Section 413-01.

Inspection And Verification

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Blistering or swelling of rubber brake components can indicate contamination of the brake fluid by a petroleum-based substance. The entire hydraulic brake system must be flushed with clean, specified brake fluid and contaminated rubber components must be replaced to prevent recontamination.**

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

The first indication that something may be wrong in the brake system is a change in the feel through the brake pedal. The brake warning indicator in the Instrument Cluster (IC) and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. If multiple wheels are locked, check the brake pedal free play to verify brake pedal is not partially applied. These operations may release the brakes, but will not correct the concern. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

1. Verify the customer concern.
   - For parking brake concerns, refer to Section 206-05 .
   - For ABS concerns, refer to Section 206-09 .
   - For all other concerns, continue with the next step.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Brake fluid level and condition • Brake master cylinder • Brake master cylinder reservoir • Brake booster • Brake booster check valve • Brake booster vacuum hose • Brake hoses and tubes • Brake caliper, guide pins and anchor plate • Brake discs/drums • Brake pads/shoes • Brake pedal, bracket and booster linkage • Aftermarket modifications	• Brake fluid level switch • Parking brake switch • Wiring, terminals or connectors

3. Visually inspect the suspension system and tires for obvious signs of wear or damage.

- For suspension system concerns, refer to Section 204-00 .
- For tire concerns, refer to Section 204-04 .

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident, GO to Symptom Chart - Brake System or GO to Symptom Chart - NVH .

Symptom Chart

Symptom Chart — Brake System

Symptom Chart — Brake System

Condition	Possible Sources	Action
• The red brake warning indicator and the yellow ABS warning indicator are illuminated	• DTCs in the ABS module	• REFER to Section 206-09 to diagnose the ABS.
• The red brake warning indicator is always/never on	• Brake fluid level switch • Parking brake switch • Wiring, terminals or connectors • Instrument Cluster (IC) • Smart Junction Box (SJB) • Electronic Brake Distribution (EBD)	• REFER to 413-01 to diagnose the red brake warning indicator.
• Brakes drag	• Parking brake component	• REFER to Section 206-05 to diagnose the parking brake system.
	• Incorrect brake shoe and/or parking brake cable adjustment	• ADJUST the brake shoes and parking brake cables. REFER to Parking Brake Cable Adjustment in Section 206-05 .
	• Wheel cylinder (s) • Brake flexible hose • Brake caliper and/or guide pins	• INSPECT the brake system components. REFER to Brake System Inspection in this section.
	• Brake booster • Brake master cylinder	• CARRY OUT the Brake Master Cylinder — Compensator Port Component Test in this section.
	• Hydraulic Control Unit (HCU)	• REFER to Section 206-09 to diagnose the HCU .
	• Stoplamp switch	• VERIFY correct installation of the stoplamp switch. REFER to Section 417-01 .
	• Cruise control deactivator	• VERIFY correct installation of the cruise control deactivator

	switch	switch. REFER to Section 419-03 .
• Brakes lock up under light brake pedal force	• Stoplamp switch	• VERIFY correct installation of the stoplamp switch. REFER to Section 417-01 .
	• Cruise control deactivator switch	• VERIFY correct installation of the cruise control deactivator switch. REFER to Section 419-03 .
	• Brake calipers and/or guide pins • Wheel cylinders and/or brake hardware • Brake flexible hose • Brake pads/shoes • Brake discs/drums	• INSPECT the brake system components. REFER to Brake System Inspection in this section.
	• ABS	• REFER to Section 206-09 to diagnose the ABS.
• Vehicle pulls or drifts during braking	• Brake calipers and/or guide pins • Wheel cylinders and/or brake shoe hardware • Brake flexible hose • Brake pads/shoes • Brake discs/drums	• INSPECT the brake system components. REFER to Brake System Inspection in this section.
	• Tires	• REFER to Section 204-04 to diagnose tire concerns.
	• Suspension component(s) and/or wheel alignment	• REFER to Section 204-00 to diagnose suspension system.
• Brake pedal goes down fast or eases down slowly	• Brake fluid leaks and/or air in the system	• INSPECT the system for leaks. REPAIR as necessary. BLEED the system. REFER to Brake System Bleeding in this section.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder — Bypass Condition Component Test in this section.
	• HCU	• REFER to Section 206-09 to diagnose the HCU .
• Excessive brake pedal travel (low/spongy pedal)	• Brake fluid leaks and/or air in the system	• INSPECT the system for leaks. REPAIR as necessary. BLEED the system. REFER to Brake System Bleeding in this section.
	• Incorrect brake shoe adjustment	• REFER to Section 206-02 for the brake shoe adjustment procedure.
	• Brake master	• CARRY OUT the Brake Master

	cylinder • Brake calipers and/or guide pins • Brake flexible hose	Cylinder — Bypass Condition Component Test in this section. • INSPECT the brake calipers and guide pins. REFER to Brake System Inspection in this section. • INSPECT the brake flexible hoses during brake application. REFER to Brake System Inspection in this section.
• Erratic brake pedal travel	• Brake pedal • ABS	• INSPECT the brake pedal for binding, obstructions and correct installation. REPAIR as necessary. CHECK the brake pedal fasteners for correct torque. REFER to Specifications in Section 206-06 . • REFER to Section 206-09 to diagnose the ABS.
• Excessive brake pedal effort	• Insufficient vacuum for brake booster operation • Brake booster manifold vacuum hose • Brake booster • Brake booster check valve • Brake pads/shoes	• CARRY OUT the Brake Booster Component Test in this section. • INSPECT the brake pads/shoes. REFER to Brake System Inspection in this section.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Vibration when the brakes are applied	• Brake disc (s)/drum(s) • Suspension components	• GO to Pinpoint Test A .
• Brake vibration/shudder — occurs when the brake pedal is released	• Brake drag	• GO to Symptom Chart - Brake System .
• Rattling noise	• Caliper guide	• CHECK the caliper guide pins

	pins or guide pin bolts • Missing or damaged anti-rattle clips or springs • Missing or damaged brake shoe hardware • Loose or bent brake disc shield	and guide pin bolts. REFER to Brake System Inspection in this section. • CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to Section 206-03 . • CHECK the brake shoes for missing or broken hardware. INSTALL new components as necessary. REFER to Section 206-02 . • Realign the brake disc shield to create a 5 mm (0.196 in) minimum clearance between the brake disc shield and the brake disc rotor.
• Squealing noise — occurs on first (morning) brake application	• Brake pads/shoes	• Acceptable condition. Caused by humidity and low brake pad temperature.
• Squealing noise — a continuous squeal	• Brake pads/shoes	• INSPECT the brake pads/shoes. REFER to Brake System Inspection in this section.
• Squealing noise — an intermittent squeal	• Brake pads/shoes	• Acceptable condition. Caused by cold, heat, water, mud or snow.
• Groaning noise — occurs at low speeds with brake lightly applied (creeping)	• Brake pads/shoes	• Acceptable condition.
• Grinding/moaning noise — continuous	• Brake pads/shoes • Brake disc/drums	• INSPECT the brake pads/drums, brake discs/drums and attaching hardware for damage. VERIFY brake components are within specifications. REFER to Brake System Inspection in this section.

Pinpoint Tests

Pinpoint Test A: Vibration When the Brakes are Applied

Normal Operation

During moderate to heavy braking, noise from the Hydraulic Control Unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation or steering wheel nibble when the brakes are applied (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component.

PINPOINT TEST A: VIBRATION WHEN THE BRAKES ARE APPLIED

Test Step	Result / Action to Take
A1 ROAD TEST THE VEHICLE — LIGHT BRAKING	
• Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force. • **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**	**Yes** GO to A4 . **No** GO to A2 .
A2 ROAD TEST THE VEHICLE — MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** GO to A3 . **No** The concern is not present at this time.
A3 CHECK ABS OPERATION	
• **NOTE:** During moderate to heavy braking, noise from the HCU and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct operation of the ABS. Pedal pulsation or steering wheel nibble with the frequency proportional to vehicle speed indicates a concern with a brake or suspension component. • Road test the vehicle and apply the brakes on a dry, firm surface, then apply the brakes on a wet, snowy or loose surface (such as gravel). • **Is the vibration/shudder only present on a wet, snowy or loose surface?**	**Yes** This is a normal operating condition of the ABS. **No** GO to A5 .
A4 ISOLATE BRAKE VIBRATION	
• **NOTE:** This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed to the next test step. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake.	**Yes** GO to A7 . **No** GO to A5 .

• Apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89-97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test. • **Is there a vibration/shudder?**	
A5 CHECK THE FRONT SUSPENSION	
• Check the front suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** GO to A6 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
A6 CHECK THE FRONT BRAKE DISCS	
• Inspect the front brake discs. Refer to Brake System Inspection in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** GO to A7 . **No** The concern has been repaired.
A7 CHECK THE REAR SUSPENSION	
• Check the rear suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** INSPECT the rear brake drums. REFER to Brake System Inspection in this section. **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

Component Tests

Brake Booster

1. Disconnect the check valve from the brake booster and connect a suitable vacuum/pressure tester to the booster side of the check valve.

2. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
   - Allow the engine to reach normal operating temperature.

3. **NOTE:** Subtract approximately 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.

   Verify that vacuum is available at the check valve with engine running at normal idle speed.
   - The vacuum gauge should read between 51-74 kPa (15-22 in-Hg).
   - If specified vacuum is available, stop the engine, connect the check valve and continue with Step 5.
   - If specified vacuum is not available, continue with Step 4.

4. Disconnect the check valve from the vacuum hose and verify that the specified vacuum is available at the hose with the engine at idle speed and the transmission in NEUTRAL.
   - If specified vacuum is available, stop the engine, install a new check valve and continue with Step 5.
   - If specified vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to Section 303-00 to diagnose the no/low vacuum condition.

5. Apply the brake pedal several times to exhaust all vacuum from the system.

6. Apply the brake pedal and hold it in the applied position. Start the engine and verify that the brake pedal moves downward after the engine starts.
   - If the brake pedal moves, the brake booster is operating correctly.
   - If the brake pedal does not move, install a new brake booster. Refer to Section 206-07 .

7. Operate the engine a minimum of 20 seconds at idle. Stop the engine and let the vehicle stand for 10 minutes, then apply the brake pedal. The brake pedal feel should be the same as that noted with the engine operating.
   - If the brake pedal feels hard (no power assist), install a new brake booster check valve and retest.
   - If condition still exists, install a new brake booster. Refer to Section 206-07 .
   - If the brake pedal feels the same as noted with the engine operating, the check valve is functioning properly.

Brake Master Cylinder — Bypass Condition

1. Inspect the master cylinder. Refer to Brake System Inspection in this section.

2. Disconnect the brake tubes from the master cylinder.

3. Plug the outlet ports of the master cylinder.

4. **NOTE:** Make sure that the outlet port plugs do not show signs of leakage.

   Lightly apply the brakes and hold for 10 seconds. Release the brakes and then reapply with heavy force. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new brake master cylinder must be installed.
   - If brake pedal height is maintained, reinstall brake tubes and tighten to specifications. Refer to Specifications in this section. After installation, bleed the brake system. Refer to Brake System Bleeding in this section.

Brake Master Cylinder — Compensator Port

1. Inspect the master cylinder. Refer to Brake System Inspection in this section.

2. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

3. Apply and release the brakes.

4. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If an excessive amount of brake drag exists at multiple wheels, continue to Step 5.
   - If an excessive amount of brake drag exists at only one wheel, it indicates a possible seized brake caliper, brake wheel cylinder or parking brake component. Repair or install new components as necessary.

5. Check the brake pedal switches and the brake pedal free play to verify that the brake pedal is not partially applied.

6. Loosen the brake master cylinder nuts and position the brake master cylinder away from the brake booster.

7. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If the brake drag is no longer present, install a new brake booster. Refer to Section 206-07 .
   - If the brake drag is still present, install a new master cylinder. Refer to Section 206-06 .

Brake System Inspection

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Brake Pads

NOTE: It is not required to install new brake pads when the brake discs are machined.

1. Inspect and measure the thickness of the brake pad friction material. For additional information, refer to Specifications in this section.
    - Minor surface cracks do not require pad replacement, however, if there are missing chunks or cracks in the lining through to the backing plate, install new brake pads. For additional information, refer to Section 206-03 for front brake pads.
    - If the thickness of the friction material is less than the specified thickness, install new brake pads. For additional information, refer to Section 206-03 for front disc brakes.
    - If the friction material shows taper wear that is not within specifications, install new brake pads and verify the caliper guide pins are functioning correctly. For additional information, refer to Brake Caliper Guide Pins inspection.

Brake Shoes

1. Inspect and measure the thickness of the brake shoe friction material. For additional information, refer to Specifications in this section.
    - Minor surface cracks do not require shoe replacement, however, if there are missing chunks or cracks in the lining through to the backing plate, install new brake shoes.
    - If the thickness of the friction material is less than the specified thickness, install new brake shoes.
    - Verify that the mounting hardware is installed correctly and operating correctly. Install new hardware as necessary.
    - Verify that the backing plate contact points are free of corrosion that may cause binding. Clean or install new as necessary.
    - Verify correct brake shoe adjustment.
    - For additional information, refer to Section 206-02 .

Brake Discs

NOTICE: **Using an impact tool without a torque socket will lead to unevenly tightened wheel nuts. This causes brake disc on-vehicle lateral runout and brake roughness.**

NOTE: It is generally not required to install new brake discs to address noise issues.

1. Inspect the brake disc and measure the brake disc thickness. Record the measurement, refer to Specifications in this section.
    - If the brake disc is cracked or otherwise damaged, install a new brake disc. For additional information, refer to Section 206-03 for front brakes.
    - If the measurement is below the minimum thickness specification, install a new brake disc. For additional information, refer to Section 206-03 for front brakes.
    - If the diagnosis has revealed vibration in the steering wheel, seat or pedal while braking that varies with vehicle speed, machine the brake disc. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, discs must be above the minimum thickness specification. For additional information, refer to Specifications and Brake Disc Machining in this section.

Brake Drums

NOTE: It is generally not required to install new brake drums to address noise issues.

1. Inspect the brake drums and measure the brake drum diameter. Record the measurements, refer to Specifications in this section.
    - If the brake drum is cracked or otherwise damaged, install a new brake drum.
    - If the diameter measurement is more than the maximum specification, install a new brake drum.
    - Heavily scored brake drums, similar to that caused by shoes worn down to the backing plate, should be machined. In order to machine, drums must be below the maximum diameter specification.
    - For additional information, refer to Section 206-02 .

Wheel Cylinders

1. Inspect the wheel cylinders for leaks, damage to seals, and piston corrosion or binding.
    - If the wheel cylinder is leaking or otherwise damaged, install a new wheel cylinder. For additional information, refer to Section 206-02 .

Brake Calipers

1. Inspect the brake calipers for leaks, damage to seals, and piston corrosion or binding.
    - If the brake caliper is leaking or otherwise damaged, install a new brake caliper. For additional information, refer to Section 206-03 for front brake calipers.

Brake Caliper Guide Pins

1. The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, carry out the following steps.
    - Disassemble the brake caliper guide pins and inspect the guide pins and guide pin bores for wear, damage and corrosion. If bore is worn or damaged, replace the damaged component.
    - Use a wire brush, rolled-up sandpaper or emery cloth to remove all corrosion and foreign material from the caliper guide pin bores. Clean any remaining foreign material from the bores with brake parts cleaner and compressed air.

- Assemble the caliper guide pins using new caliper seals, boots and guide pins. Use an ample amount of the specified grease to lubricate the bores and guide pins.
- Inspect the brake pads. For additional information, refer to Brake System Inspection in this section.

Brake Flexible Hoses and Tubes

NOTICE: **Never use copper tubing. It is subject to fatigue, cracking and corrosion, which may result in brake tube failure.**

NOTE: Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.

1. Inspect brake tubes for corrosion, cracks, leaks or any other signs of damage.
   - If a section of the brake tube is damaged, the entire section must be installed with a new tube of the same type, size, shape and length.
   - When installing the hydraulic brake tubing, hoses or connectors, tighten all connections to specifications. After installation, bleed the brake system. For additional information, refer to Brake System Bleeding in this section.

2. Inspect the brake flexible hoses for cracks, leaks and swelling during brake application or any other signs of damage.
   - Install a new brake flexible hose if the hose shows signs of softening, cracking or other damage. For additional information, refer to Section 206-03 for the front brake flexible hose or Section 206-02 for the rear brake flexible hose.

Brake Master Cylinder

NOTE: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will fall during brake application and rise during release. The net fluid level (such as after brake application and release) will remain unchanged. Fluid level will decrease with pad wear.

NOTE: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

1. Inspect the brake master cylinder for fluid leaks.
   - Install a new master cylinder or brake fluid reservoir if signs of excessive leaking are present. For additional information, refer to Section 206-06 .
   - To check for correct brake master cylinder operation, refer to Component Tests in this section.

Brake Booster

1. Inspect the brake booster for excessive corrosion or damage. Inspect the vacuum hoses for leaks and kinks.
   - Install a new brake booster if signs of excessive corrosion or damage is found. For additional information, refer to Section 206-07 .
   - Repair or replace vacuum hoses as necessary.
   - To check for correct brake booster operation, refer to Component Tests in this section.

Brake Disc Machining

NOTE: Do not use a bench lathe to machine the brake discs. Use an on-vehicle brake lathe only. Read the entire operating manual and/or view the video shipped with the lathe before installing, operating or repairing the lathe.

NOTE: An on-vehicle brake lathe with an automatic runout adjustment feature is preferred. However, if the lathe is not self adjusting, the lathe oscillation must be adjusted using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in). If the runout adjustment (automatic or manual) is carried out correctly prior to machining, then the final brake disc runout will be within specification, and a runout measurement is not necessary after machining.

NOTE: Do not machine new brake discs.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specifications.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. ***NOTICE:*** **Do not allow the caliper to hang from the brake hose or damage to the hose may occur.**

   NOTE: It is not necessary to disconnect the brake tube from the brake caliper.

   Remove the bolts and position the brake caliper or brake caliper and anchor plate assembly aside, as required.
   - Support the brake caliper using mechanic's wire.

3. Install the hub adapter using:
   - four wheel nuts on a 4-stud wheel hub.
   - five wheel nuts on a 5-stud wheel hub.
   - six wheel nuts on a 6-stud wheel hub.
   - four wheel nuts on a 7- or 8-stud wheel hub.
   - five wheel nuts on a 10-stud wheel hub.

4. Install the cutting lathe.

5. If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in).

6. Center the cutting head, adjust the cutting bits and install the chip deflector/silencer.

7. **NOTE:** The depth of the cut should be between 0.10 and 0.40 mm (0.004 and 0.015 in). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.

   Machine the brake disc.

8. Remove the lathe and the silencer.

9. Remove the wheel nuts and hub adapter.

10. Remove the metal shavings.

11. Measure the brake disc thickness.
    - If the measurement is below the minimum specification, install a new brake disc. For additional information, refer to Section 206-03 .

12. **NOTE:** It is not required to install new brake pads if friction material is within specifications. For additional information, refer to Specifications in this section.

    Position the brake caliper or brake caliper and anchor plate assembly.
    - Install the bolts.
    - For fastener torque specifications, refer to Section 206-03 .

13. Install the wheel and tire. For additional information, refer to Section 204-04 .

Brake System Bleeding

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Pressure Bleeding

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

***NOTICE:* Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: The Hydraulic Control Unit (HCU) bleeding procedure must be carried out if the HCU or any components upstream of the HCU are installed new.

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

1. Clean all dirt from the brake master cylinder filler cap and remove the filler cap.
   - Fill the brake master cylinder reservoir with clean, specified brake fluid.

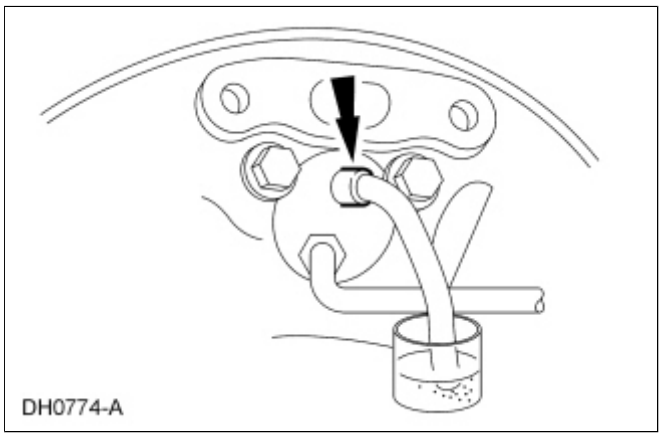
2. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the

adapter.

Install the bleeder adapter to the brake master cylinder reservoir, and attach the bleeder tank hose to the fitting on the adapter.

3. **NOTE:** Make sure the bleeder tank contains enough clean, specified brake fluid to complete the bleeding operation.

   Open the valve on the bleeder tank.
   - Apply 207-345 kPa (30-50 psi) to the brake system.



4. Remove the RR bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

5. Loosen the RR bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RR bleeder screw to specifications. Refer to Specifications in this section. Remove the rubber hose.

6. Continue bleeding the rest of the system, going in order from the LR bleeder screw to the RF bleeder screw, ending with the LF bleeder screw.
   - Tighten the brake caliper and wheel cylinder bleeder screws to specifications. Refer to Specifications in this section.

7. Close the bleeder tank valve. Remove the tank hose from the adapter and remove the adapter. Fill the reservoir with clean, specified brake fluid and install the reservoir cap.

Manual Bleeding

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation.

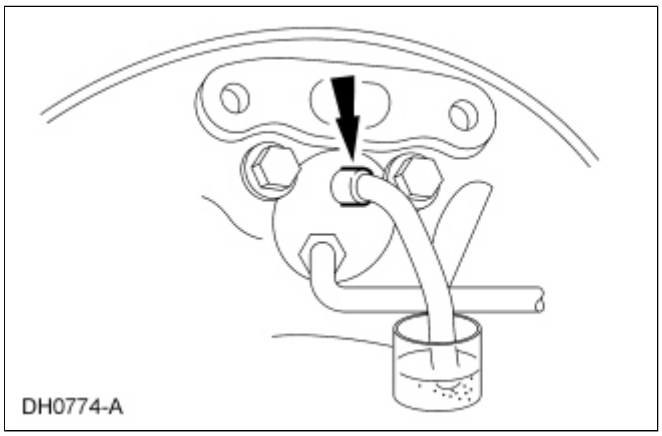
Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

1. Clean all the dirt from around the brake fluid reservoir cap and remove the filler cap.
    - Fill the brake master cylinder reservoir with clean, specified brake fluid.

2. Remove the RR bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



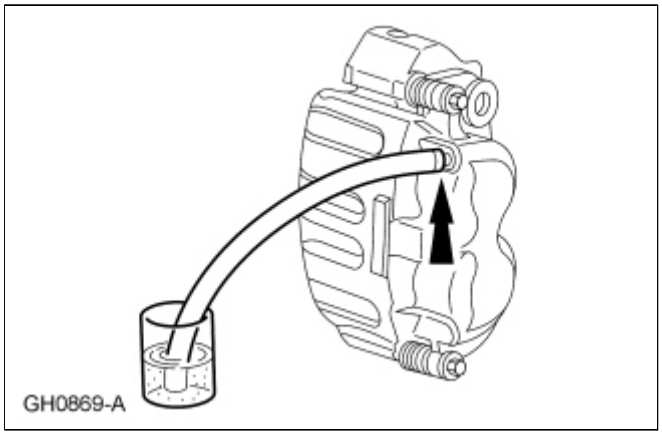
3. Have an assistant pump and then hold firm pressure on the brake pedal.

4. Loosen the RR bleeder screw until a stream of brake fluid comes out. While an assistant maintains pressure on the brake pedal, tighten the RR bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

5. Tighten the RR bleeder screw to specifications. Refer to Specifications in this section. Remove the rubber hose and install the bleeder screw cap.

6. Repeat Steps 2 through 5 for the LR bleeder screw.

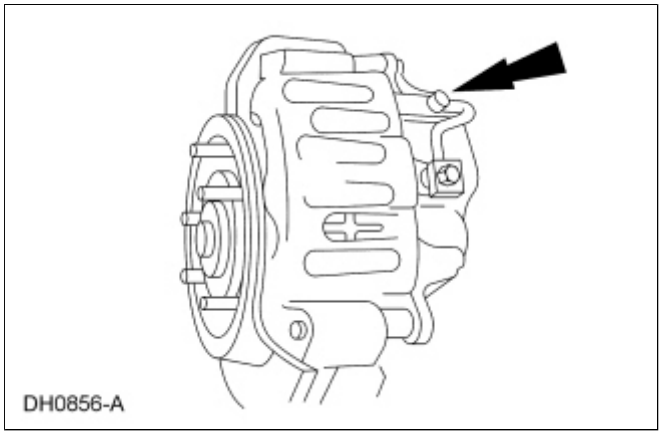
7. Remove the RF bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RF bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



8. Have an assistant pump and then hold firm pressure on the brake pedal.

9. Loosen the RF bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the RF bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

10. Tighten the RF bleeder screw to specifications. Refer to Specifications in this section. Remove the rubber hose and install the bleeder screw cap.



11. Repeat Steps 7 through 10 for the LF bleeder screw.

Hydraulic Control Unit (HCU) Bleeding

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation.

Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

1. Follow the Pressure Bleeding or Manual Bleeding procedure steps to bleed the system.
2. Connect the scan tool and follow the ABS Service Bleed instructions.
3. Repeat the Pressure Bleeding or Manual Bleeding procedure steps to bleed the system.

Component Bleeding

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Master Cylinder

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

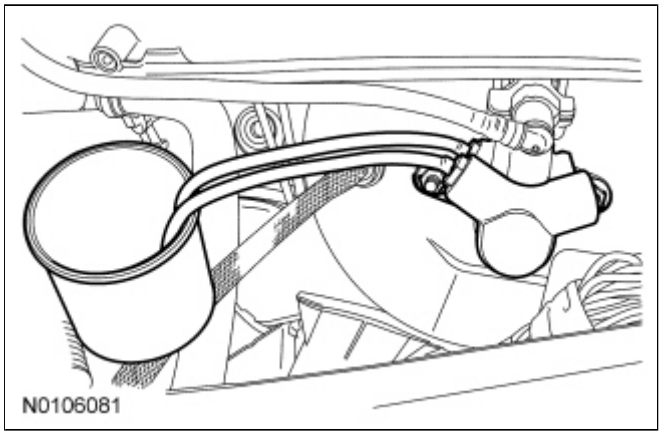
WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: When the brake master cylinder has been installed new or the system has been emptied or partially emptied, it must be primed to prevent air from entering the system.

1. Disconnect the brake outlet tubes from the master cylinder.

2. Install short brake tubes onto the primary and secondary ports with the ends submerged in a container partially filled with clean, specified brake fluid.



3. Have an assistant pump the brake pedal until clear fluid flows from the brake tubes without air bubbles.

4. Remove the short brake tubes, and install the master cylinder brake tubes.
   - Tighten the brake tube fittings to specifications. Refer to Specifications in this section.

5. Bleed the brake system. For additional information, refer to Brake System Bleeding in this section.

Brake Caliper

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

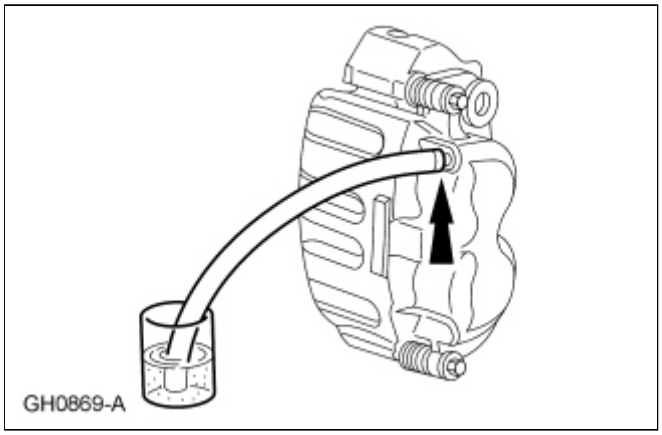
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.

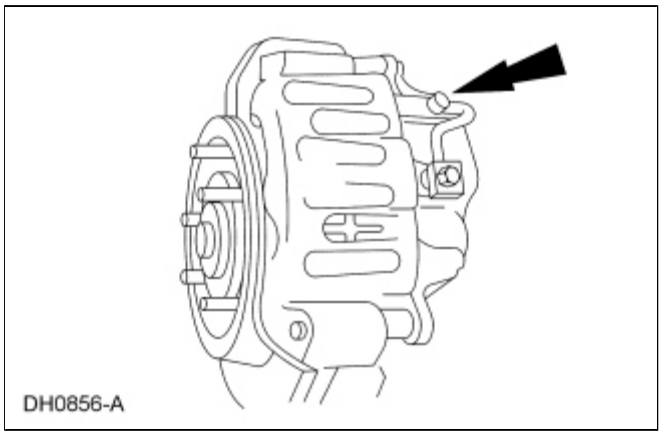
1. Remove the bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.

3. Loosen the bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.

4. Tighten the bleeder screw to specifications. Refer to Specifications in this section. Remove the rubber hose and install the bleeder screw cap.



Wheel Cylinder

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

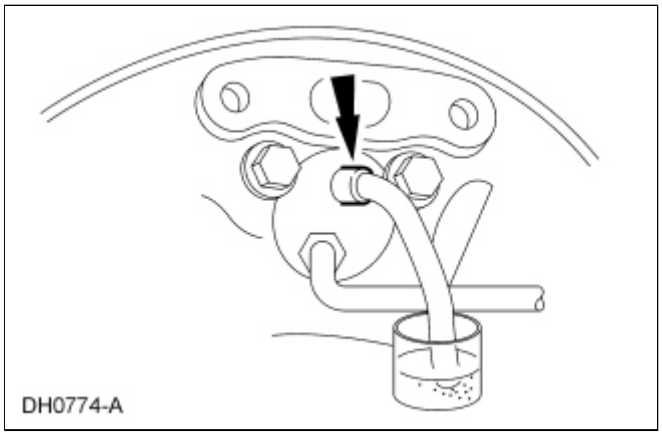
WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking

performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: It is not necessary to do a complete brake system bleed if only the wheel cylinder was disconnected or installed new.

1. Remove the bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.

3. Loosen the bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

4. Tighten the bleeder screw to specifications. Refer to Specifications in this section. Remove the rubber hose and install the bleeder screw cap.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	630 ml (1.33 pt)
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A	—
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—	—

Drum Brake Specification

Description	mm	Inch
Brake drum discard diameter	202	8.03
Brake lining discard thickness	1	0.039

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake tube fittings	18	—	159
Wheel cylinder bolt	12	—	106
Brake drum retainers	13	—	115

Drum Brake

The drum brake system consists of the following components:

- Brake backing plate
- Brake drum
- Brake flexible hose
- Brake shoe hardware kit
- Brake shoes
- Self-adjuster
- Wheel cylinder

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the wheel cylinders moving the brake shoes against the friction surface of the brake drum. The friction of the brake shoes on the brake drum causes the slowing or stopping of wheel rotation and the vehicle.

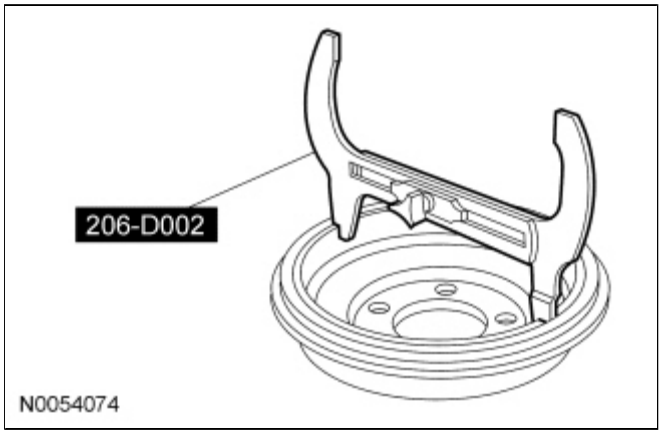
Brake Shoe Adjustment

Special Tool(s)

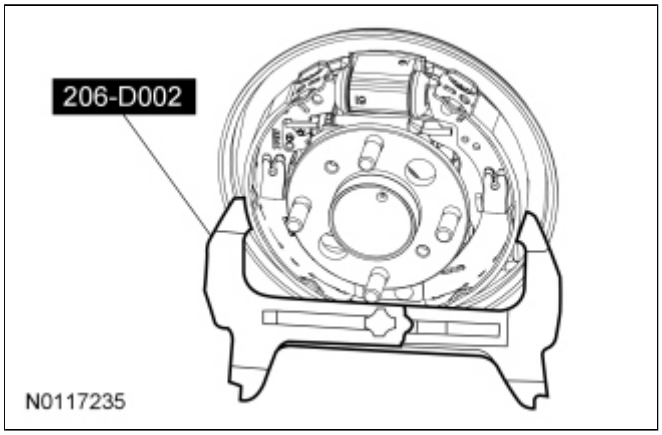
ST1468-A	Brake Adjustment Gauge 206-D002 (D81L-1103-A) or equivalent

1. Remove the brake drum. For additional information, refer to Drum Brake System — Exploded View in this section.

2. Using the Brake Adjustment Gauge, measure the inside diameter of the brake drum.



3. Position the Brake Adjustment Gauge on the brake shoes and linings and adjust accordingly.



4. Install the brake drum. For additional information, refer to Drum Brake System — Exploded View in this section.

Drum Brake System — Exploded View

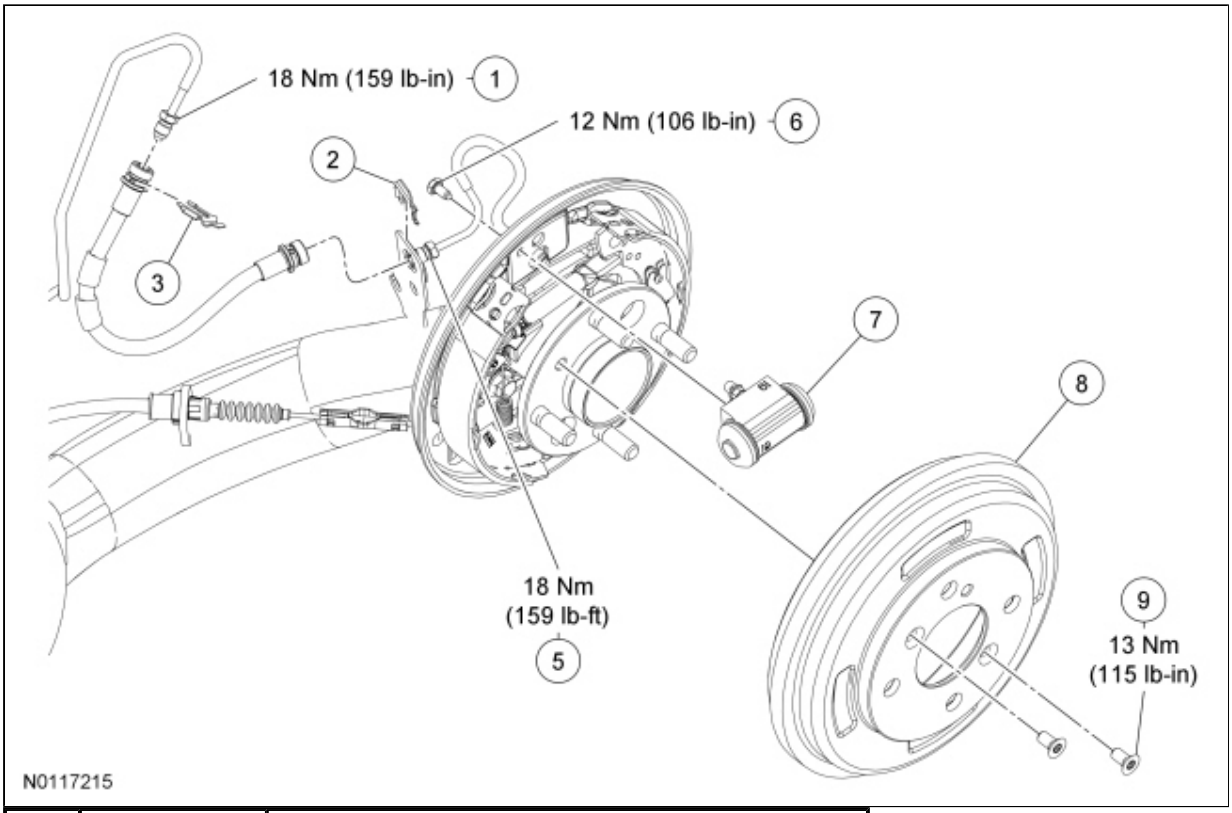
Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

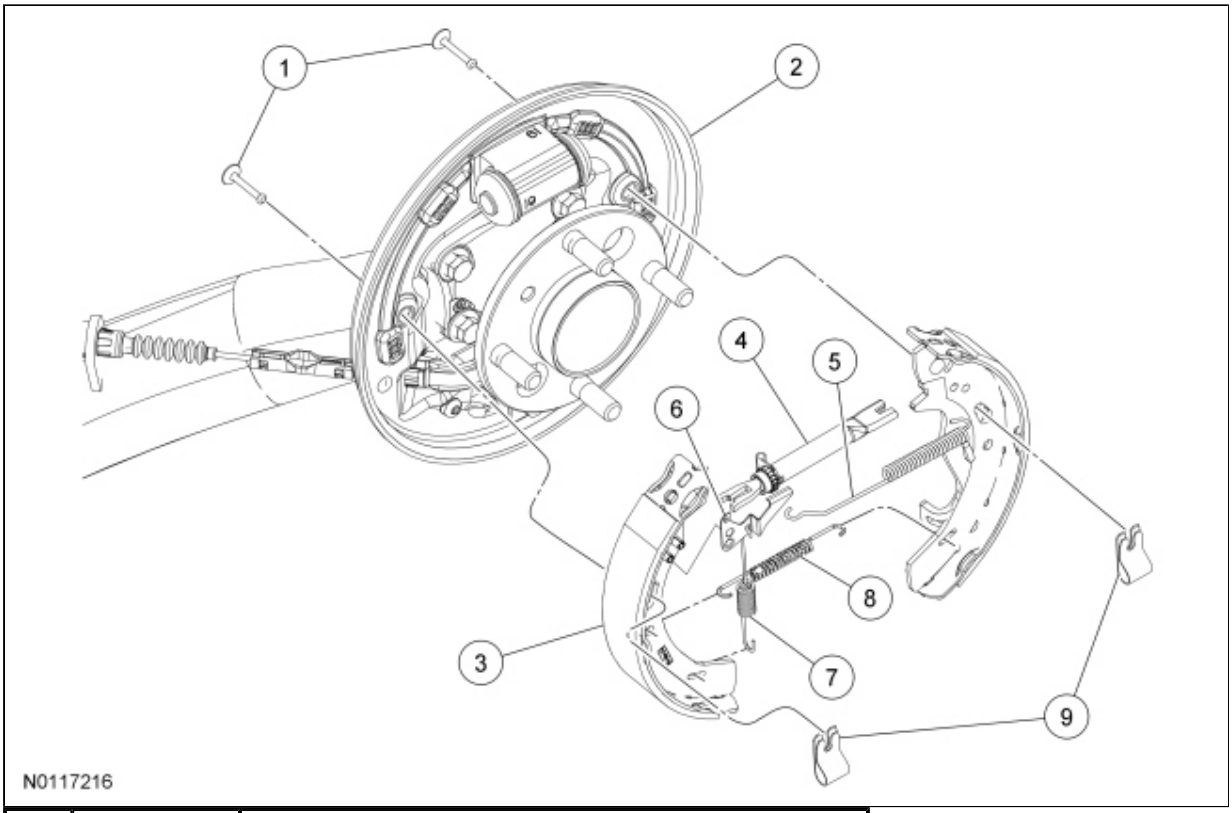


Item	Part Number	Description
1	—	Brake tube fitting (part of 2L111 RH / 2268 LH)
2	W700936	Brake hose clip
3	W700936	Brake hose clip
4	2282	Brake flexible hose
5	—	Brake tube fitting (2 required) (part of 2268)
6	2248	Wheel cylinder bolt
7	2261	Wheel cylinder
8	1126	Brake drum
9	W505741	Brake drum retainers (2 required)

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

NOTE: Make sure that all mating surfaces are free of foreign material and apply the specified silicone grease to the brake shoe contact points on the brake backing plate.



Item	Part Number	Description
1	—	Brake shoe hold-down pin (2 required) (part of 2A225)
2	2211	Backing plate
3	—	Brake shoe (part of 2200)
4	2K286	Self-adjuster assembly
5	—	Upper return spring (part of 2A225)
6	—	Self-adjuster lever (part of 2K286)
7	—	Self-adjuster lever spring (part of 2K286)
8	—	Lower return spring (part of 2A225)
9	—	Brake shoe hold-down clip (2 required) (part of 2A225)

Removal and Installation

NOTE: For brake system and component bleeding procedures, refer to Section 206-00 .

NOTE: If removing the the drum brake backing plate, the wheel hub and bearing must be removed. For additional information, refer to Section 204-02

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications and Special Tools. Items in the exploded views may not be listed in order of removal.

Front Disc Brake

The front brake disc system consists of the following components:

- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake flexible hose

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing of wheel rotation and the vehicle.

Removal and Installation

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTICE: **Do not allow the brake caliper to hang from the brake flexible hose or damage to the hose can occur.**

NOTICE: **Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.**

NOTICE: **Protect the caliper pistons and boots when pushing the caliper pistons into the caliper piston bores or damage to components may occur.**

NOTE: If installing new brake pads, install all of the new hardware and lubricant supplied with the brake pad kit.

NOTE: For brake system and component bleeding procedures, refer to Section 206-00 .

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications and Special Tools. Items in the exploded views may not be listed in order of

removal.

Parking Brake

The parking brake system consists of the following components:

- Parking brake control
- Parking brake cable equalizer
- Parking brake warning indicator switch
- Rear parking brake cables and conduits
- Rear brake shoes
- Rear brake shoe actuators

The parking brake system is cable operated and controlled by an independent hand-operated parking brake control. The parking brake control actuates the rear brake shoes directly through a cable system.

A red brake warning indicator, located in the instrument cluster, will illuminate to signal the driver that the parking brake is applied. For information and diagnosis of the brake warning indicator, refer to Section 413-01.

Parking Brake

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Principles of Operation

The parking brake system is cable-actuated and controlled by an independent hand-operated parking brake control that is not self adjusting, The parking brake system is actuated when the parking brake control is pulled up. The parking brake cables are connected to the parking brake control by the parking brake equalizer. When the parking brake control is pulled, the equalizer pulls on both rear parking brake cables, which are attached to the parking brake actuators and apply the brake shoes. When the parking brake release button is pressed and the brake control is released, the tension on the parking brake cables return the system to the released position.

Inspection and Verification

1. Verify the customer concern.
2. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
3. Visually inspect for obvious signs of mechanical or electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical
• Brake shoe actuators • Brake shoe hardware • Brake shoe backing plate • Parking brake cable equalizer • Parking brake control • Rear parking brake cables and conduits

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. If the concern is not visually evident, verify the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The red brake warning indicator is always illuminated	• Parking brake not fully released • Low brake fluid level • Wiring, terminals or connectors • Brake master cylinder inoperative	• RELEASE the parking brake. TEST the system for normal operation. • REFER to Section 206-00 to diagnose the hydraulic brake system. • REFER to Section 206-00 to diagnose the brake warning indicator circuit. • CARRY OUT the Brake Master Cylinder Component Test. REFER to Component Tests in Section 206-00 .
• The parking brake will not apply	• Rear brake shoes out of adjustment • Parking brake cables out of adjustment • Parking brake control • Parking brake cables • Parking brake cable equalizer • Rear brake shoes and/or hardware	• VERIFY rear brake shoe adjustment, ADJUST as necessary. REFER to Section 206-02 . • VERIFY parking brake cable adjustment, ADJUST as necessary. REFER to Parking Brake Cable Adjustment in this section. • GO to Pinpoint Test A .
• The parking brake will not release and/or rear brakes drag	• Parking brake control • Parking brake cables • Parking brake cable equalizer • Rear brake shoes and/or hardware	• GO to Pinpoint Test B .

Pinpoint Tests

Pinpoint Test A: The Parking Brake Will Not Apply

Normal Operation

When the parking brake control is pulled, the parking brake equalizer pulls on both rear parking brake cables, which are attached to the parking brake actuators and apply the brake shoes.

This pinpoint test is intended to diagnose the following:

- Parking brake cables and conduits

- Parking brake control
- Parking brake equalizer
- Rear brake hardware
- Rear brake shoes

PINPOINT TEST A: THE PARKING BRAKE WILL NOT APPLY

Test Step	Result / Action to Take
A1 CHECK THE PARKING BRAKE CONTROL FOR CORRECT OPERATION • Pull the parking brake control handle. • **Does the parking brake control move?**	**Yes** GO to A2 . **No** GO to A4 .

A2 CHECK FOR BROKEN CABLES AND HARDWARE
• **NOTE:** Have an assistant pull and release the parking brake handle to help isolate disconnected cables or cables that do not move.
• Inspect the following items for damage and correct connections:
  ▪ Parking brake control
  ▪ Parking brake equalizer
  ▪ LH rear cable
  ▪ RH rear cable
• **Is any damage found or are any components disconnected?**
	Yes
	CONNECT the component(s) or INSTALL new parking brake component(s) as necessary. TEST the system for normal operation.
	
	No
	GO to A3 .

A3 CHECK THE PARKING BRAKE SHOES AND HARDWARE • Remove the rear brake drum. Refer to Section 206-02 . Inspect the brake shoes and hardware for damage and/or missing components. • **Is any damage found or are any components missing?**	**Yes** INSTALL new components as necessary. REFER to Section 206-02 . TEST the system for normal operation. **No** VERIFY that the rear brake shoes and linings are within thickness specifications. REFER to Specifications in Section 206-00 . INSTALL new brake shoes as necessary. REFER to Section 206-02 . TEST the system for normal operation.
A4 ISOLATE THE PARKING BRAKE CONTROL AND FRONT PARKING BRAKE CABLE • Disconnect the rear cables from the cable equalizer. • Pull the parking brake control handle. • **Does the parking brake control move?**	**Yes** GO to A5 . **No** INSTALL a new parking brake control. REFER to Parking Brake — Exploded View in this section. TEST the system for normal operation.
A5 ISOLATE THE REAR PARKING	

BRAKE CABLES	
• Remove the rear brake drum. Refer to Section 206-02 . • Disconnect the parking brake cables from the brake shoe actuators. • While holding the rear cable conduit, attempt to slide the rear cable inside the conduit. • **Does the rear cable slide freely inside the conduit?**	**Yes** The system is operating normally at this time. The concern may have been cause by a seized or binding component. CLEAN and LUBRICATE the brake backing plate using the specified materials. CONNECT all cables and INSTALL all components. TEST the system for normal operation. **No** INSTALL new rear brake cable(s). REFER to Parking Brake — Exploded View in this section. TEST the system for normal operation.

Pinpoint Test B: The Parking Brake Will Not Release and/or Rear Brakes Drag

Normal Operation

When the parking brake release button is pressed and the brake control is released, the tension on the parking brake cables return the system to the released position.

This pinpoint test is intended to diagnose the following:

- Parking brake cables and conduits
- Parking brake control
- Parking brake equalizer
- Rear brake hardware
- Rear brake shoes

PINPOINT TEST B: THE PARKING BRAKE WILL NOT RELEASE AND/OR REAR BRAKES DRAG

Test Step	Result / Action to Take
B1 ISOLATE THE PARKING BRAKE CONTROL	
• Disconnect the rear cables from the cable equalizer. • **Does the parking brake release?**	**Yes** INSTALL a new parking brake control. REFER to Parking Brake — Exploded View in this section. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK THE REAR BRAKE SHOES AND HARDWARE	
• Remove the rear brake drum. Refer to Section 206-02 . • Inspect the brake shoes, hardware and backing plate. • **Are the shoes, hardware and backing plate in good condition?**	**Yes** GO to B3 . **No** INSTALL new components as necessary. REFER to Section 206-02 . TEST the system for normal operation.
B3 ISOLATE THE REAR	

PARKING BRAKE CABLES	
• Disconnect the parking brake cables from the brake shoe actuators. • While holding the rear cable conduit, attempt to slide the rear cable inside the conduit. • **Does the rear cable slide freely inside the conduit?**	**Yes** The system is operating normally at this time. The concern may have been cause by a seized or binding component. CLEAN and LUBRICATE the brake backing plate using the specified materials. CONNECT all cables and INSTALL all components. TEST the system for normal operation. **No** INSTALL new rear brake cable(s). REFER to Parking Brake — Exploded View in this section. TEST the system for normal operation.

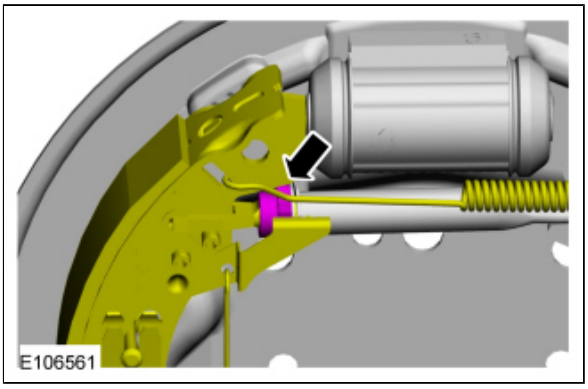
Parking Brake Cable Adjustment

1. Remove the floor console finish panel to access the parking brake cable adjuster nut. For additional information, refer to the floor console procedure exploded view in Section 501-12 .

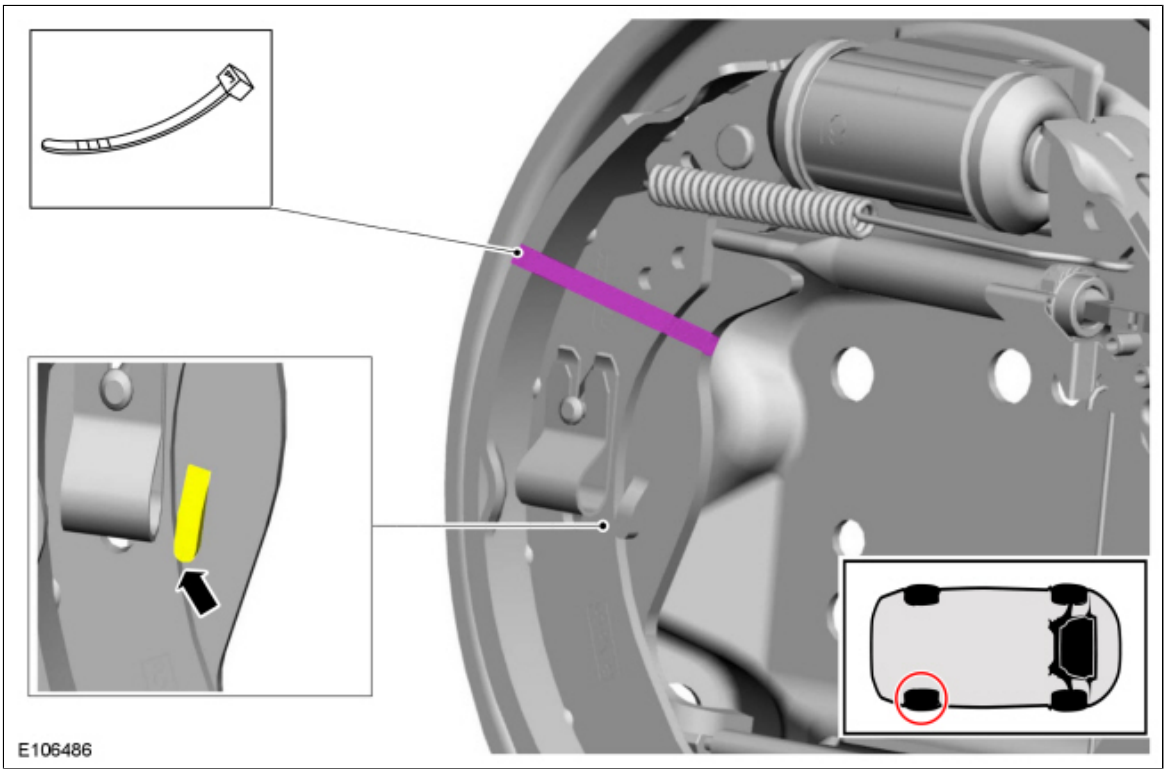
2. Make sure the parking brake control handle is in the fully released position.

3. Remove the brake drums For additional information, refer to . Section 206-02
   - Inspect drum brake assembly. Install new components as necessary.

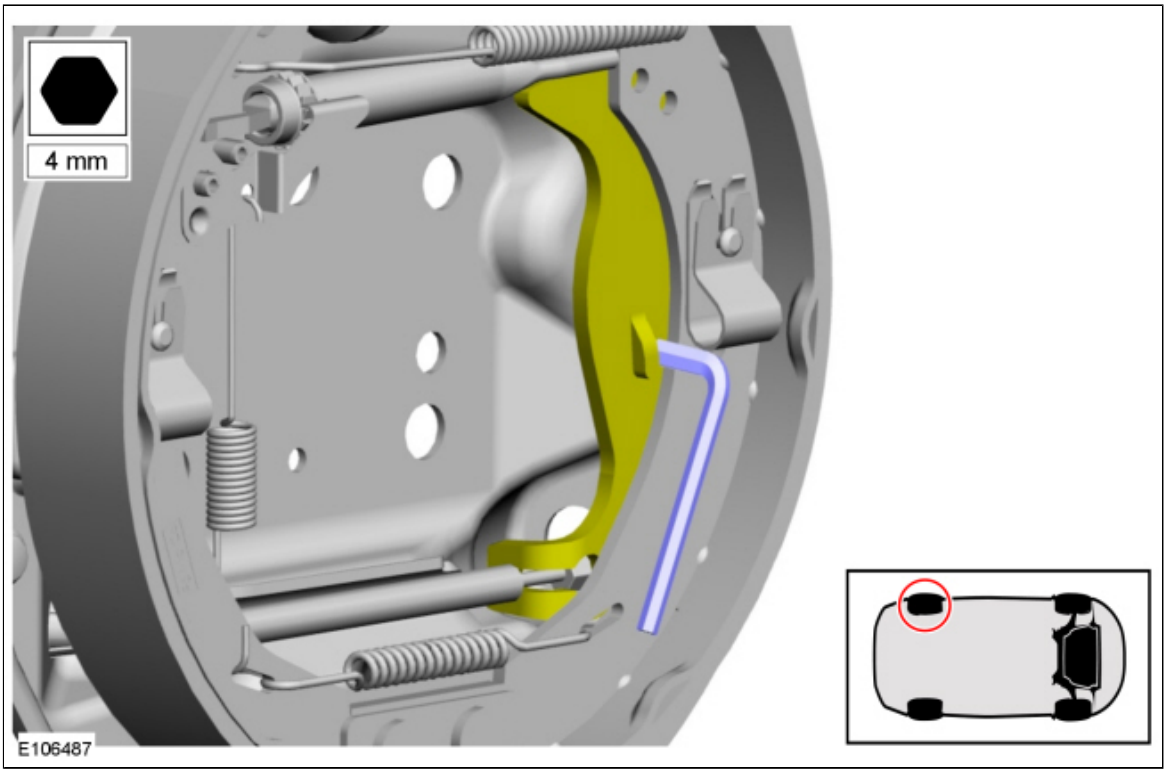
4. Loosen the self-adjuster one full turn on both axle ends.



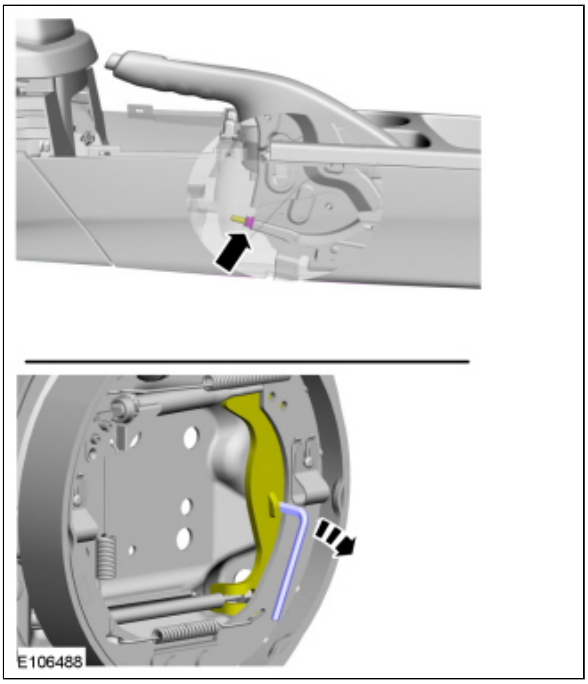
5. Using a cable tie, secure the parking brake actuation lever to the brake shoe as shown on the passenger side rear.



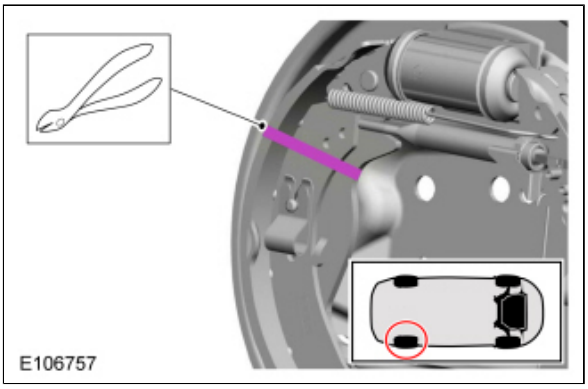
6. Install a 4mm allen wrench against the parking brake actuation lever on driver side rear only.



7. Adjust the parking brake cable adjuster nut until the allen wrench falls out.



8. Remove the cable tie.

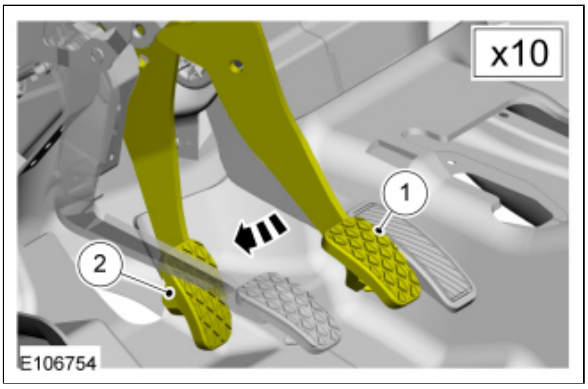


9. Adjust the brake shoes. For additional information, refer to Section 206-02

10. If new rear cables have been installed, carry out the following sub steps. If new rear cables have not been installed, proceed to step 11.
    1. Cycle parking brake control lever to the 10th notch 10 times to stretch the new cables.
    2. Remove the rear drums and verify that the gap exists between the parking brake stop lever and the brake shoe web.
    3. If the gap is zero, repeat step 2 and steps 4 thru 9.

11. After assembling the wheel, verify the wheel turns freely to ensure there is no brake drag present.

12. Fully depress the brake pedal 10 times. Apply the parking brake to verify correct operation.

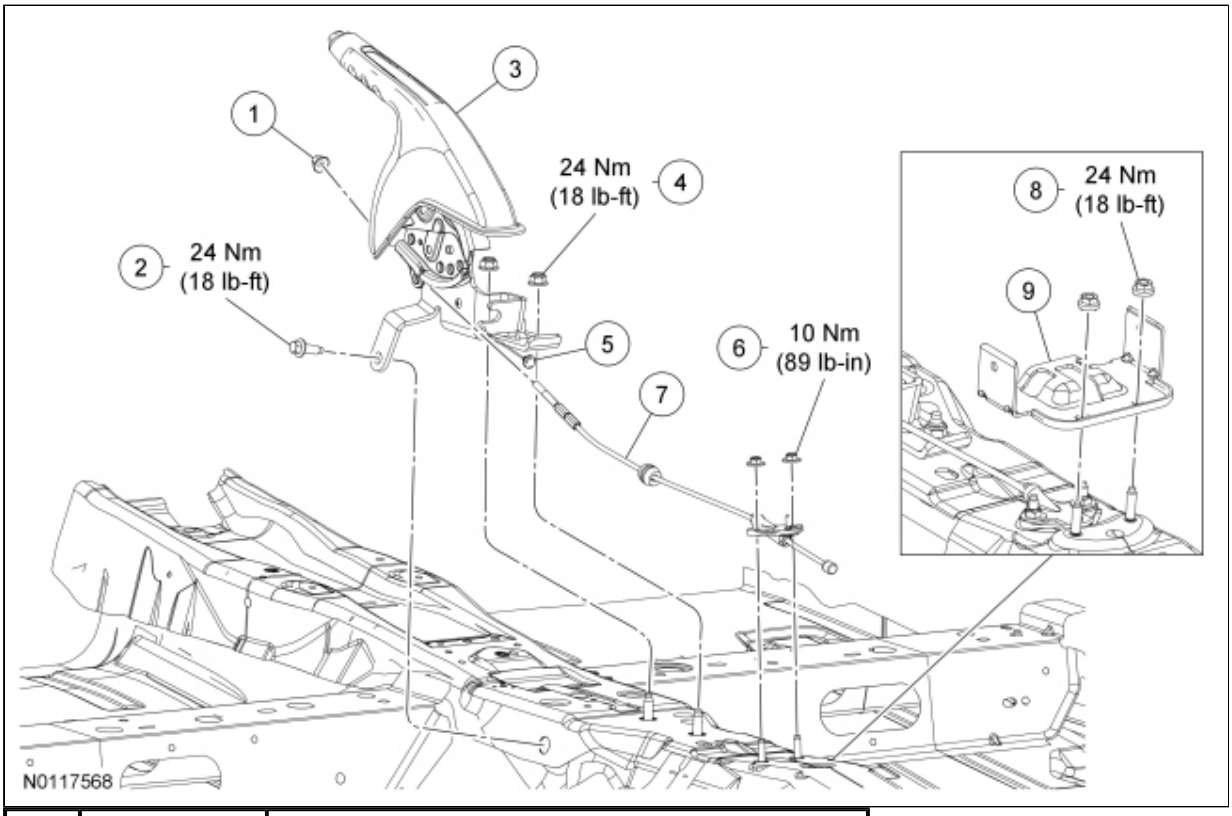


13. Install the floor console finish panel. For additional information, refer to the floor console exploded view in Section 501-12

Parking Brake — Exploded View

Parking Brake Control

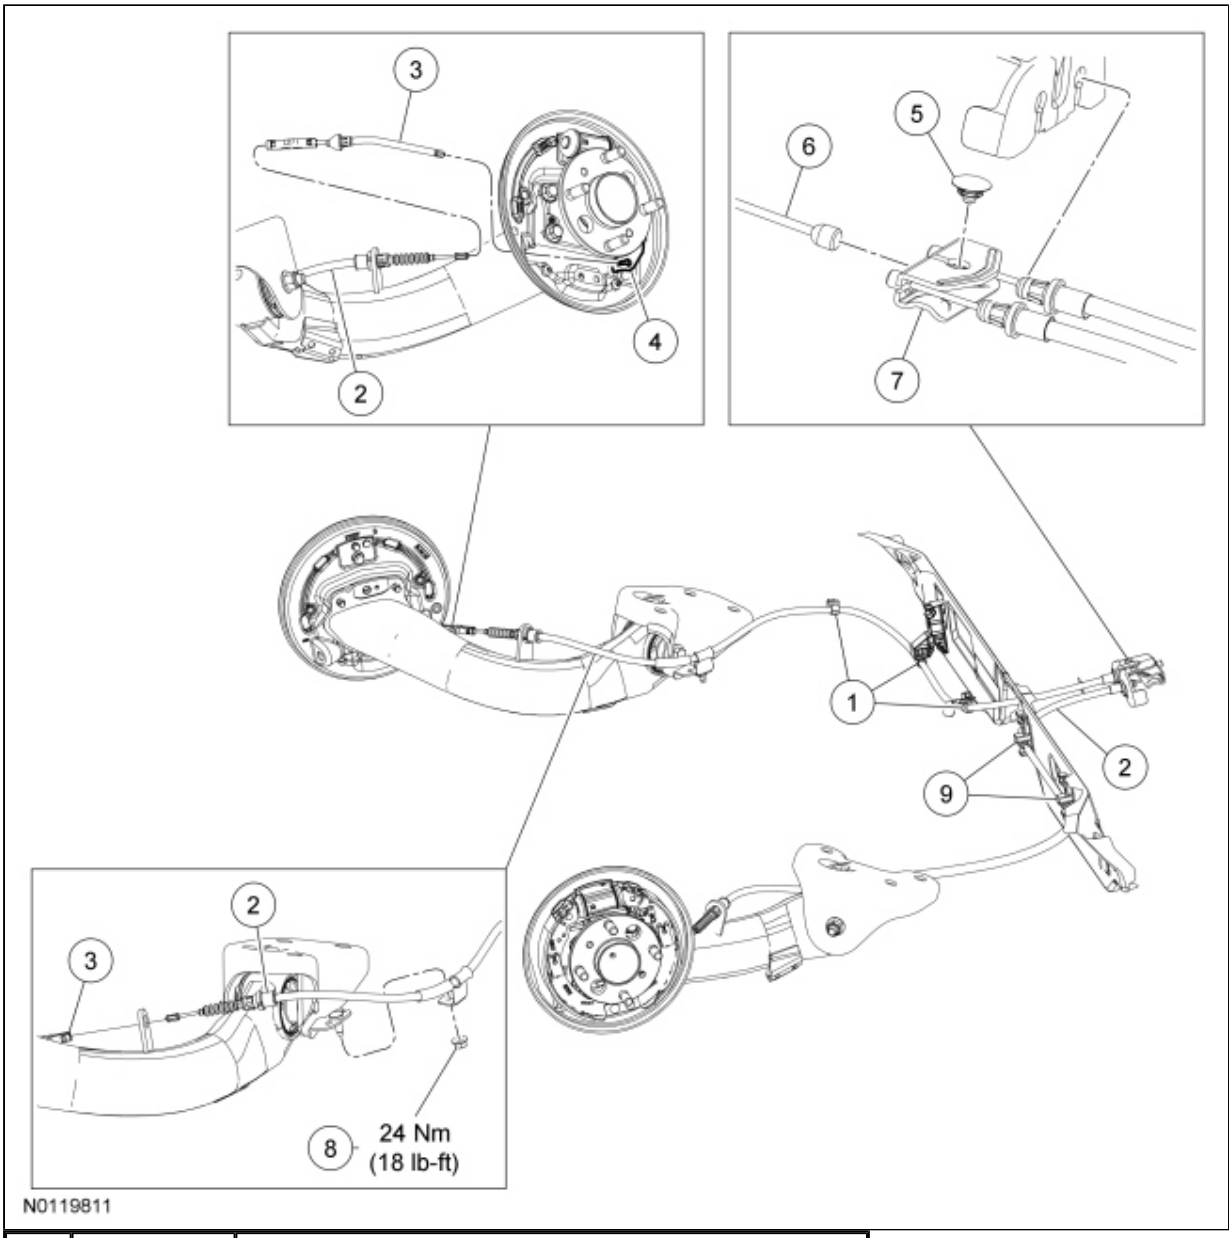
NOTE: The parking brake switch is not serviced separately . If a new parking brake switch is needed, a new parking brake control must be installed.



Item	Part Number	Description
1	—	Parking brake cable adjuster nut (part of 2853)
2	W500223	Parking brake control bolt
3	2780	Parking brake control
4	W520102	Parking brake control nut (2 required)
5	7H406	Pin type retainer
6	W702751	Front parking brake cable nut (2 required)
7	2853	Front parking brake cable
8	W702751	Floor console bracket nut
9	58045B32	Floor console bracket

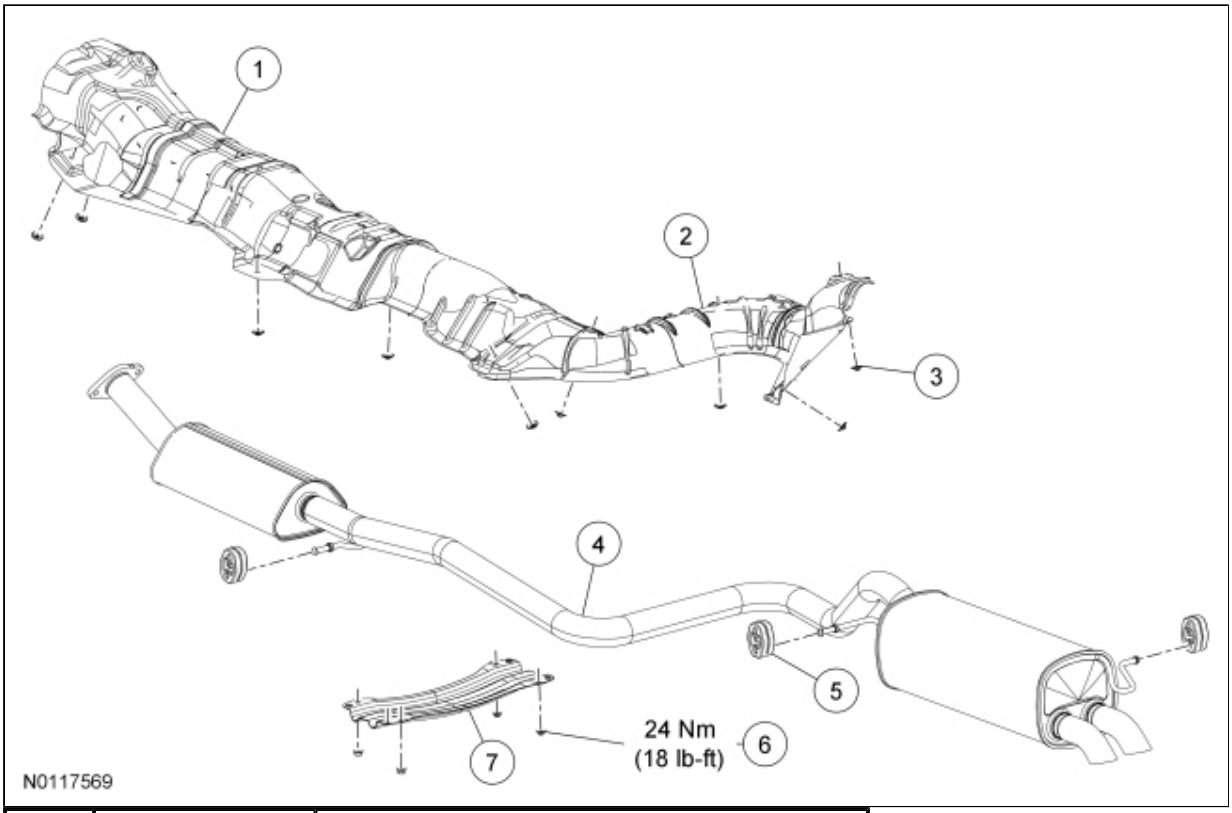
Parking Brake Cables

NOTICE: **Use care when releasing the RH rear parking brake cable from the plastic brackets or damage to the brackets may occur.**



Item	Part Number	Description
1	—	Parking brake cable retainers (3 required) (part of 2A603)
2	2A603	Rear parking brake cable
3	2A635	Parking brake actuation lever cable (2 required)
4	—	Parking brake actuation lever (2 required) (part of 2200)
5	W708952	Plug
6	2853	Front parking brake cable
7	—	Equalizer (part of 2A603)
8	W520413	Parking brake cable bracket nut
9	9A335	Parking brake cable bracket (2 required)

Heat Shields, Exhaust System and Crossmember



Item	Part Number	Description
1	5411434	Exhaust heat shield
2	54114B06	Exhaust heat shield
3	W709729	Exhaust heat shield nut (9 required)
4	5230	Muffler assembly
5	5A262	Exhaust insulator (3 required)
6	W520102	Crossmember nut (8 required)
7	58108K38	Crossmember

Removal and Installation

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications and Special tools. Items in the exploded views may not be listed in order of removal.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the driver seat and the floor console to access the parking brake control.
   - For the driver seat, refer to Section 501-10 .
   - For the floor console, refer to Section 501-12 .

4. Loosen the front parking brake cable adjuster nut 5 turns to release the tension for parking brake service. Remove the floor console finish panel to access the nut. For additional information, refer to the floor console procedure exploded view in Section 501-12 .

5. Remove the crossmember and lower the exhaust and the exhaust heat shields in order to access the parking brake equalizer.

6. Adjust the parking brake cables after parking brake component service. For additional information, refer to Parking Brake Cable Adjustment in this section.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	648 ml (1.37 pt) (manual transmission) 586 ml (1.24 pt) (automatic transmission)

Torque Specifications

Description	Nm	lb-ft	lb-in

Brake fluid reservoir nuts	7	—	62
Brake master cylinder nuts	20	—	177
Brake pedal bracket nuts	25	18	—
Knee air bag bracket nuts	8	—	71
Primary brake tube fitting	17	—	150
Secondary brake tube fitting	17	—	150
Steering shaft-to-steering gear bolt	32	24	—

Hydraulic Brake Actuation

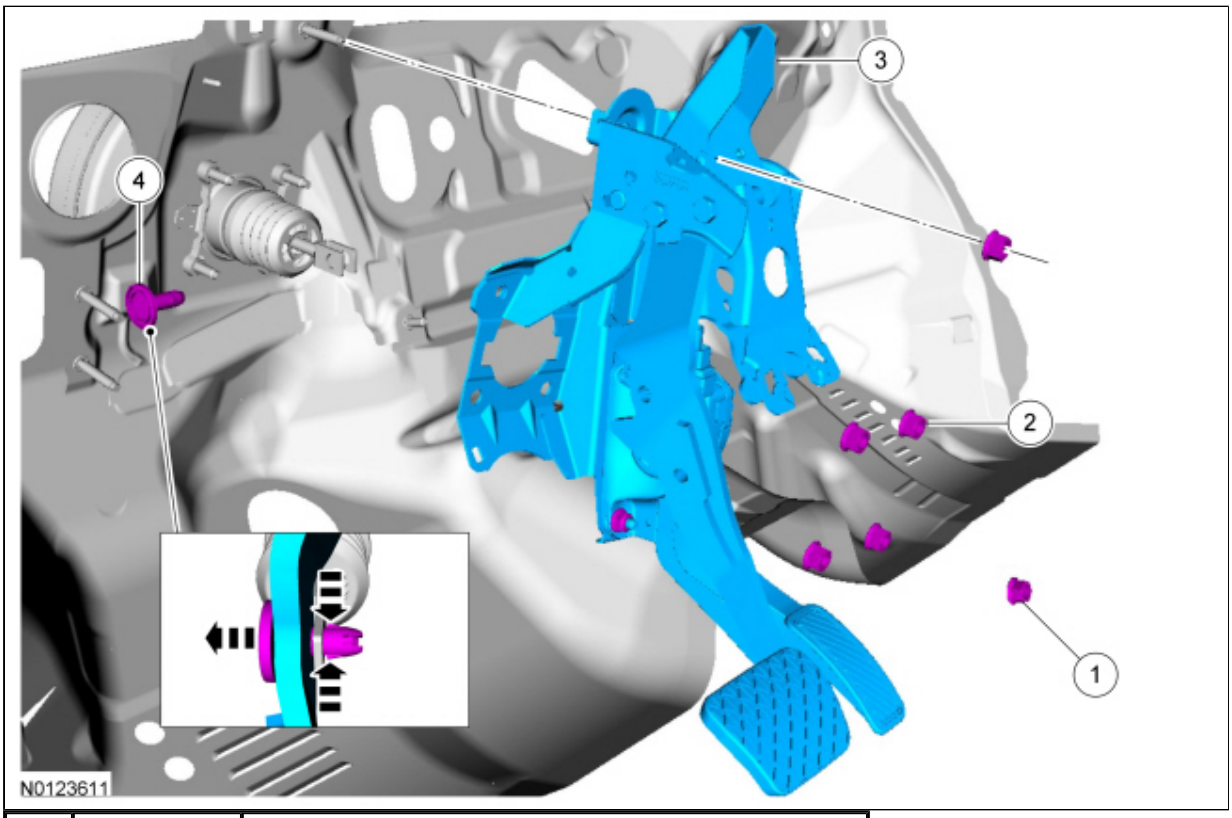
The hydraulic brake actuation system consists of the following components:

- Brake master cylinder and fluid reservoir
- Brake pedal and bracket
- Brake tubes and hoses

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is pushed through the double-walled steel tube and flexible hoses to the front brake calipers and rear wheel cylinders. The brake fluid enters the calipers and cylinders, forcing the pistons and brake pads/shoes outward against the friction surface, slowing or stopping rotation. When the brake pedal is released, brake fluid pressure is relieved, returning the caliper pistons, wheel cylinders, brake pads and brake shoes to the unapplied position.

Brake Pedal and Bracket

NOTE: Automatic transmission shown, manual transmission similar.



Item	Part Number	Description
1	W706840	Brake pedal bracket nut (2 required) - 25 Nm (18 lb-ft)
2	W706840	Brake booster nut (4 required) - 25 Nm (18 lb-ft)
3	2455	Brake pedal and bracket assembly
4	2L523	Brake booster push rod clevis locking pin

Removal and Installation

1. Remove the knee air bag module. For additional information, refer to Section 501-20B .

2. ***NOTICE:*** **Do not service the brake pedal without first removing the stoplamp switch. Remove this switch with the brake pedal in the at-rest position. Attempting to remove this switch when the plunger is extended (during pedal apply) results in damage to the switch.**

   Remove the stoplamp switch. For additional information, refer to Section 417-01 .

3. ***NOTICE:*** **Do not service the brake pedal without first removing the cruise control deactivator switch. Remove this switch with the brake pedal in the at-rest position. Attempting to remove this switch when the plunger is extended (during pedal apply) results in damage to the switch.**

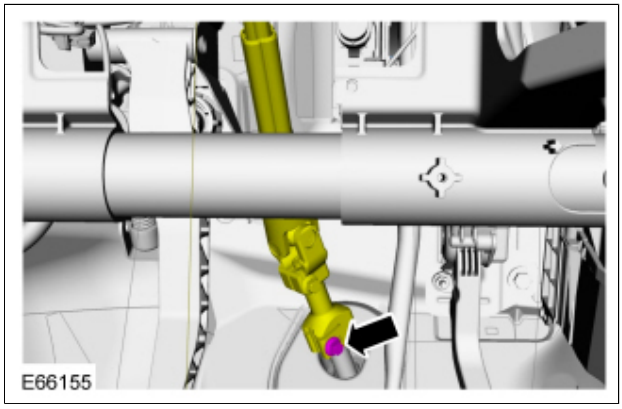
   Remove the cruise control deactivator switch. For additional information, refer to Section 419-03 .

4. Using a suitable holding device, hold the steering wheel in the straight-ahead position.

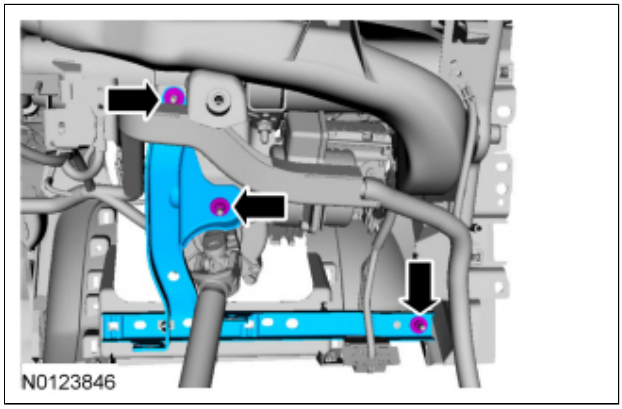
5. **WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   NOTICE: **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence the steering column has rotated, remove and recenter the clockspring. For additional information, refer to Section 501-20B .**

   Remove and discard the steering shaft-to-steering gear bolt, then disconnect the steering shaft from the steering gear.
   - To install, tighten the new bolt to 32 Nm (24 lb-ft).



6. Remove the 3 nuts and position the knee air bag bracket aside.
   - To install, tighten to 8 Nm (71 lb-in).



7. **NOTE:** The booster push rod clevis locking pin is a one-time use only part. Any time the booster push rod clevis locking pin is removed, install a new booster push rod clevis locking pin.

   NOTE: Use an 11 mm, 12-point socket or wrench to compress the 2 locking tabs on the clevis pin.

   Remove and discard the brake booster push rod clevis locking pin, then position the booster push rod aside.

8. Disconnect the accelerator pedal electrical connector.

9. Detach the wire harness from the brake pedal bracket.

10. Remove the 4 brake booster nuts and the 2 brake pedal bracket nuts.
    - To install, tighten to 25 Nm (18 lb-ft).

11. **NOTE:** The accelerator pedal is removed with the brake pedal bracket, but is serviced separately from the brake pedal bracket.

Remove the brake pedal and bracket assembly.

12. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch and cruise control deactivation switch. Install these switches with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position results in incorrect adjustment and damages the switches.**

    To install, reverse the removal procedure.

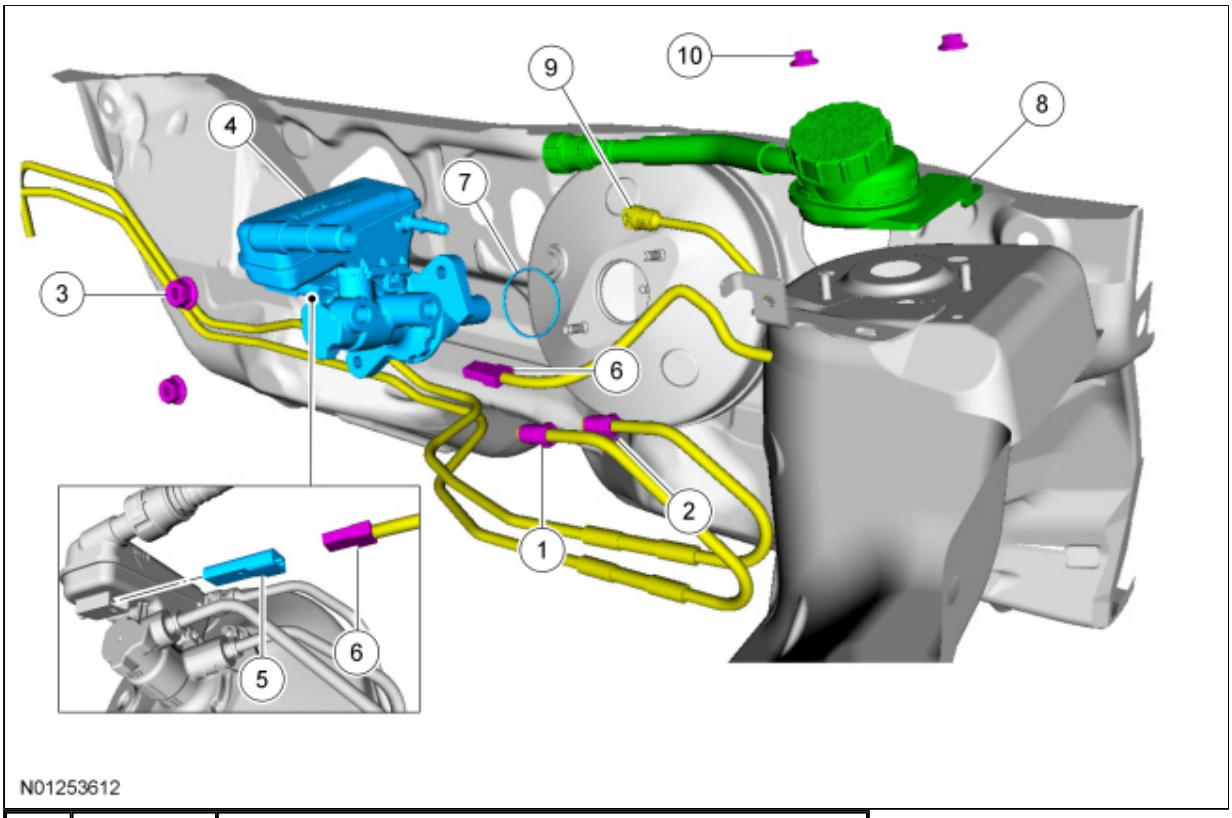
13. Verify correct stoplamp switch and cruise control deactivator switch installation. For additional information, refer to Brake Pedal Switch Adjustment in Section 206-09 .

Brake Master Cylinder

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Manual transmission shown, automatic transmission similar.



Item	Part Number	Description
1	—	Primary brake tube fitting (part of 2M020) - 17 Nm (150 lb-in)
2	—	Secondary brake tube fitting (part of 2M019) - 17 Nm (150 lb-in)
3	—	Brake master cylinder nut (2 required) (part of 2140) (also part of kit 2C144) - 20 Nm (177 lb-in)
4	2140	Brake master cylinder
5	2C251	Brake fluid level switch (also part of 2140)
6	—	Brake fluid level switch electrical connector (part of 14K012)
7	—	Brake booster-to-master cylinder O-ring (part of 2140) (also part of kit 2C144)
8	2K478	Brake fluid reservoir

9	7T504	Brake master cylinder-to-clutch master cylinder tube (manual transmission only)
10	W711330	Brake fluid reservoir nut (2 required) - 7 Nm (62 lb-in)

Removal and Installation

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.**

1. Disconnect the vacuum tube from the brake booster.
2. Detach the vacuum tube from the cowl and position aside.
3. Remove the battery tray. For additional information, refer to Section 414-01 .
4. Remove the 2 brake fluid reservoir nuts.
   - To install, tighten to 7 Nm (62 lb-in).
5. Disconnect the brake fluid reservoir tube from the master cylinder.
6. If equipped with a manual transmission, disconnect the brake master cylinder-to-clutch master cylinder tube from the master cylinder.
7. Disconnect the brake fluid level switch electrical connector.
8. Disconnect the primary and secondary brake tubes from the master cylinder.
   - To install, tighten to 17 Nm (150 lb-in).
9. Remove and discard the 2 brake master cylinder nuts.
   - To install, tighten the new brake master cylinder nuts to 20 Nm (177 lb-in).
10. Remove the brake master cylinder and discard the brake booster-to-master cylinder O-ring.
11. **NOTE:** Before installing the master cylinder make sure a new brake booster-to-master cylinder O-ring is in place and the mating faces are clean.

    To install, reverse the removal procedure.
12. Bleed the master cylinder. For additional information, refer to Component Bleeding in Section 206-00 .
13. If equipped with a manual transmission, bleed the hydraulic clutch system. For additional information, refer to Section 308-00 .

Brake Fluid Reservoir

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTICE: **Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or**

plastic surface, immediately wash it with water.

1. Refer to exploded view and any Warnings, Notices, Materials and Specifications. Items in the exploded views may not be listed in order of removal.

Torque Specifications

Description	Nm	lb-ft
Brake booster nuts	25	18

Brake Booster

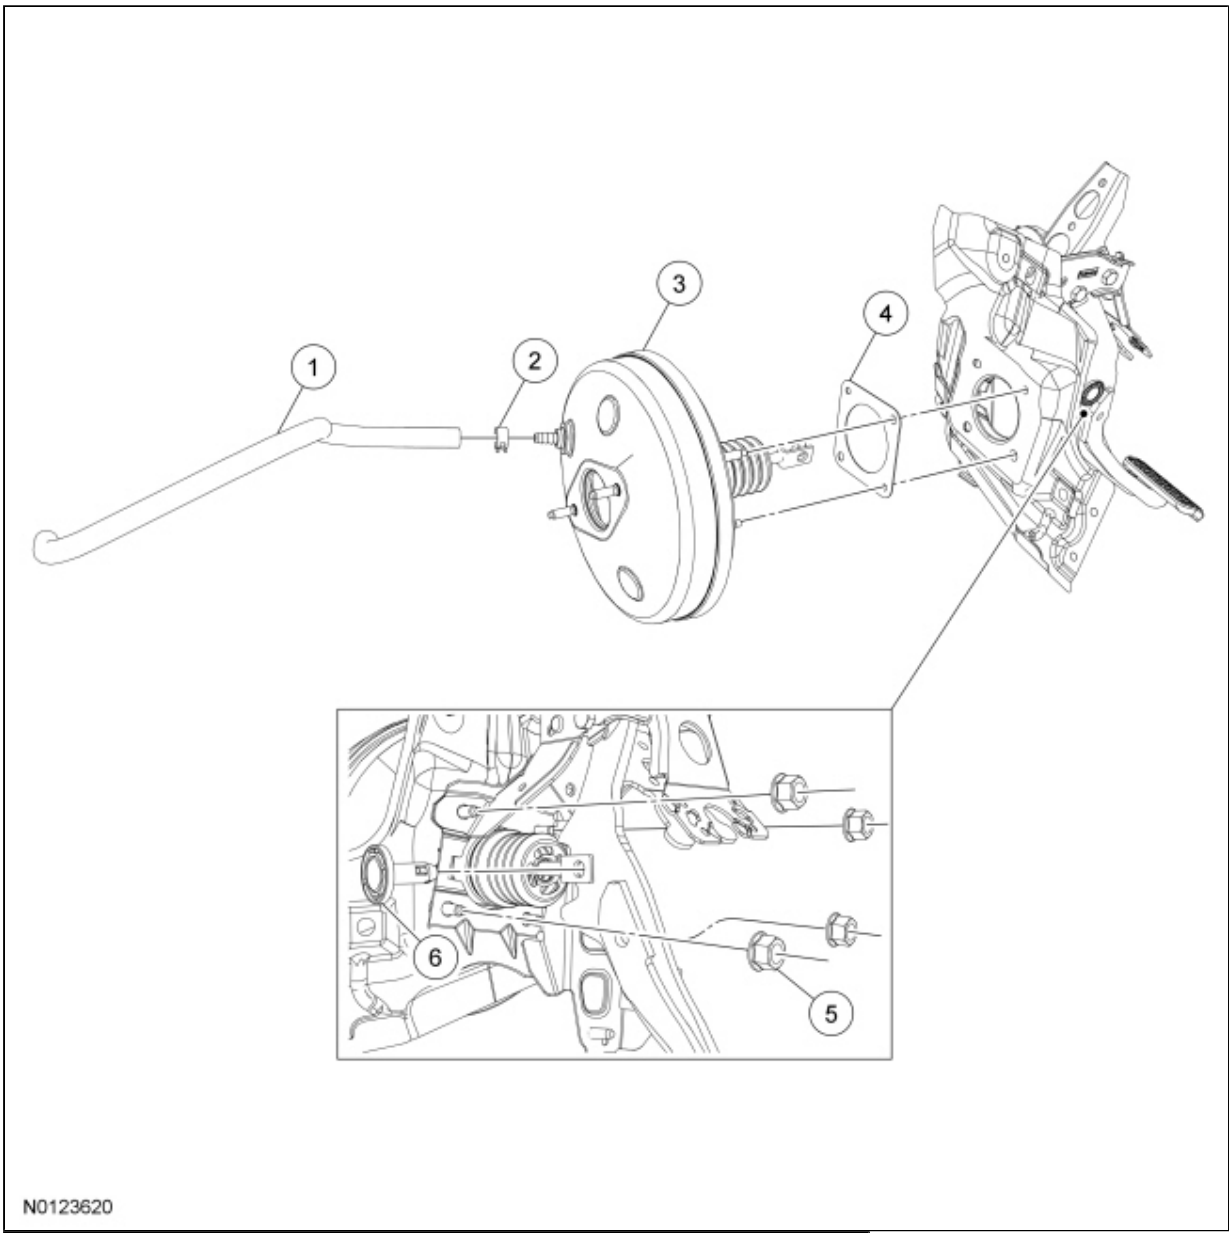
The brake booster consists of:

- brake booster assembly
- brake booster vacuum hose
- brake booster vacuum check valve

The brake booster is a single-diaphragm type which utilizes engine vacuum to reduce brake pedal effort and travel. The brake booster is divided into separate vacuum and atmospheric chambers by the diaphragms. Engine vacuum is supplied to the brake booster through the brake booster hose and a one-way check valve. The check valve retains the engine vacuum in the brake booster and allows for several power-assisted brake applications with the engine off.

When the brake pedal is applied, vacuum replaces the atmospheric pressure in the brake booster, reducing the effort required at the brake pedal to slow the vehicle. When the brake pedal is released, vacuum returns to the brake booster through the brake booster vacuum hose and check valve.

Brake Booster



Item	Part Number	Description
1	9C490	Vacuum hose
2	—	Spring clamp (part of 9C490)
3	2B195	Brake booster
4	2M078	Brake booster seal
5	W706840	Brake booster nut (4 required) - 25 Nm (18 lb-ft)
6	2L523	Brake booster push rod clevis locking pin

Removal and Installation

1. Remove the brake master cylinder. For additional information, refer to Brake Master Cylinder in Section 206-06 .

2. ***NOTICE:*** **Do not service the brake pedal without first removing the stoplamp switch. Remove this switch with the brake pedal in the at-rest position. Attempting to remove this switch when the plunger is extended (during pedal apply) results in damage to the switch.**

   Remove the stoplamp switch. For additional information, refer to Section 417-01 .

3. ***NOTICE:*** **Do not service the brake pedal without first removing the cruise control deactivator switch. Remove this switch with the brake pedal in the at-rest position. Attempting to remove this switch when the plunger is extended (during pedal apply) results in damage to the switch.**

   Remove the cruise control deactivator switch. For additional information, refer to Section 419-03 .

4. **NOTE:** The brake booster push rod clevis locking pin is a one-time use only part. Any time the brake booster push rod clevis locking pin is removed, install a new brake booster push rod clevis locking pin.

   NOTE: Use an 11 mm, 12-point socket or wrench to compress the 2 locking tabs on the brake booster push rod clevis locking pin.

   Remove and discard the brake booster push rod clevis locking pin, then position the brake booster push rod aside.

5. Remove the 4 brake booster nuts.
   - To install, tighten to 25 Nm (18 lb-ft).

6. Remove the brake booster.

7. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch and cruise control deactivator switch. Install these switches with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position results in incorrect adjustment and damages the switches.**

   To install, reverse the removal procedure.

8. Verify correct stoplamp switch and cruise control deactivator switch installation. For additional information, refer to Brake Pedal Switch Adjustment in Section 206-09 .

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	630 ml (1.33 pt)

Torque Specifications

Description	Nm	lb-ft	lb-in
ABS module-to-Hydraulic Control Unit (HCU) screws	2	—	18
Brake tube fittings	17	—	150
Evaporator outlet tube bracket nut	8	—	71
HCU bracket bolts	24	18	—
HCU bracket-to-support plate bolts	9	—	80
HCU support plate bolts	9	—	80
Wheel speed sensor bolts	9	—	80

Anti-Lock Control

Anti-Lock Braking

The ABS consists of the following components:

- ABS module — attached to the Hydraulic Control Unit (HCU) and cannot be serviced separately from the HCU .
- HCU — which contains several valves (inlet, outlet, isolation and dump) and the hydraulic pump motor. The HCU is mounted on the RH side of the engine compartment and is serviced with the ABS module.
- Front wheel speed sensors — one sensor is located in each front wheel knuckle. The sensors are serviced separately from the knuckle.
- Rear wheel speed sensors — one sensor is located at each rear wheel end, is mounted to the brake backing plate and can be serviced separately.
- Wheel bearing magnetic strip — the wheel bearing magnetic strip is part of the wheel bearing and is serviced with the bearing.

ABS aids in the prevention of wheel lock-up during braking events allowing the driver to maintain steering control and stop in the shortest distance possible under most conditions. This is accomplished by the ABS module and HCU modulating brake fluid pressure to the affected brake caliper(s) and wheel cylinder(s).

When the ABS activates, the driver may notice the following operational symptoms:

- A rumble or grinding sound may be heard (HCU pump motor)
- If the driver's foot is on the brake pedal, a vibration may be felt in the brake pedal (HCU pump motor and valves)

Electronic Brake Distribution (EBD)

The ABS module and HCU incorporate a strategy called Electronic Brake Distribution (EBD). The EBD strategy uses the HCU as an electronic proportioning valve to create a balanced braking condition between the front and rear wheels and minimize the chance of rear wheel lockup during hard braking. A slight bump sensation may be felt in the brake pedal when EBD is active.

ABS with Advance Trac®

The ABS with Advance Trac® system consists of the same components as the conventional ABS above with the following additional components:

- Stability control sensors — located inside the Restraints Control Module (RCM) under the front floor console, and contains several sensors (yaw rate, lateral and longitudinal accelerometers).
- Steering wheel rotation sensor — is part of the Electronic Power Assist Steering (EPAS) column assembly and is not available separately for service.

The Advance Trac® system is comprised of traction control and Electronic Stability Control (ESC). ABS and the traction control portion of the Advance Trac® system will operate with the transmission in reverse gear, but ESC will be disabled.

Traction Control System

The traction control system aids in the prevention of excessive wheel spin which allows the vehicle to maintain traction during acceleration. This is accomplished in the same manner as anti-lock braking

(brake traction control) but also includes using the PCM for modulating engine torque (engine traction control). The traction control system can be disabled by the driver through the message center. The system will remain disabled until the driver enables it through the message center or until the ignition is cycled to OFF and back to RUN.

Electronic Stability Control (ESC) System

The ESC system constantly monitors vehicle direction of travel relative to the intended course and aids in keeping the vehicle traveling along that course. The ESC also aids in keeping the vehicle stable during sudden or abrupt maneuvers. This is accomplished in the same manner as anti-lock braking and traction control. ESC cannot be disabled by the driver.

When either of these 2 systems activate, the driver may notice the same operational symptoms as ABS along with the following additional symptoms:

- A small deceleration or a reduction in the acceleration of the vehicle (PCM modulating engine torque)
- The stability/traction control indicator (also known as the sliding-car icon) flashes (indicating a traction or stability event is taking place)

Stability/Traction Indicator

The stability/traction indicator (also known as the sliding-car icon) is located in the Instrument Panel Cluster (IPC). It alerts the driver to a stability/traction event taking place (flashes twice per second) and to alert the driver of potential concerns in the AdvanceTrac® system (illuminates solidly).

Stability/Traction OFF Indicator

The stability/traction OFF indicator (also known as the sliding-car OFF icon) is located in the IPC . Illumination of the indicator confirms to the driver that the brake traction control portion of the Advance Trac® system has been disabled when the TRACTION CNTRL setting in the message center is set to OFF.

Hill Start Assist (Automatic transmission only)

Hill start assist helps the driver when accelerating from a stop on an incline or side of a hill. Hill start assist supports the driver during drive-off situations on upward gradients. When the driver releases the vehicle brake, hill start assist prevents the vehicle from rolling back in the opposite direction.

Anti-Lock Control

Special Tool(s)

ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST3030-A	Rotunda Active Wheel Speed Sensor Tester 105-R0110 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operations

Anti-Lock Braking

The ABS module continuously monitors and compares the rotational speed of each wheel. This is accomplished through the use of 4 active wheel speed sensors, 1 for each wheel. The wheel speed sensors are connected to the ABS module by 2 circuits. One circuit provides voltage for sensor operation and the other circuit provides sensor input to the ABS module. As the wheels spin, the wheel bearing magnetic strip passes through the magnetic field generated by the active wheel speed sensor. The active wheel speed sensor sends a square wave signal to the ABS module to indicate individual wheel speed.

The ABS module uses a Hydraulic Control Unit (HCU) to isolate and modulate hydraulic pressure to the caliper(s) and wheel cylinder(s). The HCU contains several solenoid-controlled valves, a pump motor, an accumulator and several sensors. The fluid flows through 4 normally open inlet valves inside the HCU, and through the outlet ports of the HCU to the brake calipers and wheel cylinders. If the ABS module senses that a wheel is nearing a lockup condition based on wheel speed sensor data and deceleration algorithms, the module closes the normally open inlet valve for that wheel. This isolates the corresponding caliper or wheel cylinder. The ABS module reads the wheel speed sensor signal from the affected wheel again. If the wheel is still decelerating (locking up), the module opens the normally closed

outlet valve allowing a controlled amount of hydraulic pressure in the brake caliper to be relieved into the HCU accumulator. The ABS pump motor runs during an ABS braking event so sufficient brake fluid pressure is consistently available to the HCU valves. This procedure of closing and opening valves is repeated several times per second until the speed of the affected wheel matches the speeds of the other wheels. Once this has been accomplished, the ABS module returns the solenoid valves to their normal position.

The ABS module is self-monitoring. When the ignition is turned to the RUN position, the ABS module carries out a preliminary electrical check of the wheel speed sensor circuitry by sending voltage through the sensor and checking for the voltage to return. At speeds above 20 km/h (12 mph), without the brake pedal being pressed, the pump motor is commanded on for approximately one-half second to check pump motor operation. Also, during all phases of operation while the vehicle is in motion, the ABS module checks for correct operation of the wheel speed sensors. In the event the ABS module detects a concern, the module sets a DTC and sends a message to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) to illuminate the yellow ABS warning indicator and/or the stability/traction control indicator (sliding-car icon). If the concern is severe enough, ABS may be disabled. Normal power-assisted braking, however, remains.

Electronic Brake Distribution (EBD)

The ABS module incorporates a strategy called Electronic Brake Distribution (EBD). The EBD strategy uses the HCU as an electronic proportioning valve. On initial application of the brake pedal, full pressure is applied to the rear brakes. The ABS module uses wheel speed input to calculate an estimated rate of deceleration. Once vehicle deceleration exceeds a certain threshold, the ABS module closes the appropriate solenoid valves in the HCU to hold the rear brake pressure constant while allowing the front brake pressure to build. This creates a balanced braking condition between the front and rear wheels and minimizes the chance of rear wheel lockup during hard braking. As the vehicle decelerates, the valves are opened to increase the rear brake pressure in proportion to the front brake pressure.

If there is a DTC in the ABS module specifically for the HCU or there are 2 or more wheel speed sensor DTCs set, EBD is disabled. When EBD is disabled, the ABS warning indicator, the red brake warning indicator and the stability/traction control indicator (sliding-car icon) illuminate.

AdvanceTrac® Stability Enhancement System

The AdvanceTrac® system provides the following stability enhancement features for certain driving situations:

- Traction Control System — helps to avoid excessive drive-wheel spin and loss of traction.
- Electronic Stability Control (ESC) System — helps to avoid skids and lateral slides.

Traction Control System

The traction control system uses the ABS and the PCM to limit wheel spin. When the ABS module detects a wheel spinning excessively, brake pressure to the appropriate brake caliper is modulated. This is accomplished by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN that a traction control event is taking place. When the IPC receives this message, it flashes the stability/traction control indicator (sliding-car icon). If the event is severe enough, the ABS module sends a message to the PCM over the HS-CAN to assist with traction control. When the PCM receives this message, it adjusts engine timing and decreases fuel injector pulses. Once the affected wheel returns to normal speed, the ABS module returns the solenoid valves in the HCU to their normal position, deactivates the hydraulic pump motor and sends another message over the HS-CAN indicating the traction event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC extinguishes the sliding-car icon.

Once vehicle speed reaches or exceeds 100 km/h (62 mph), traction control is accomplished only

through PCM intervention.

Certain DTCs in the ABS module disable the traction control system. Depending on the DTCs present, the yellow ABS warning indicator and/or the sliding-car icon is illuminated.

The driver is able to enable and disable the traction control portion of the Advance Trac®. This is independent of the ABS and ESC functions, which cannot be disabled by the driver. To disable or enable the traction control system, the TRACTION CNTRL setting in the message center is changed from ON to OFF. When the driver disables the traction control system, the IPC communicates traction control system status to the ABS module over the HS-CAN bus. The ABS module will no longer intervene when a traction event is detected. The ABS module sends a message to the IPC over the to HS-CAN bus illuminate the stability/traction control OFF indicator (sliding-car OFF icon), which indicates to the driver that the traction control system is disabled. The system automatically restores to full functionality when the ignition is cycled to OFF and then back to RUN.

Electronic Stability Control (ESC) System

The ESC system is controlled by the ABS module and uses the same wheel speed sensors and wheel bearing magnetic strips used for anti-lock braking. The ESC system also uses input from the stability control sensors for the ESC system to help maintain vehicle stability. They include the yaw rate sensor, lateral accelerometer and longitudinal accelerometer and are located in the Restraints Control Module (RCM).

The ABS module uses the various sensors to continuously monitor vehicle direction of travel relative to the intended course. If the ABS module determines from all these inputs that the vehicle is unable to travel in the intended direction, it modulates brake pressure to the appropriate brake caliper(s) or wheel cylinder(s) by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN that a stability event is taking place. When the IPC receives this message, it flashes the sliding-car icon. Under certain conditions during a stability event, the PCM may be requested to reduce engine torque as it does for traction control. Once the stability condition has been corrected, the ABS module sends another message over the HS-CAN indicating that the event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC extinguishes the sliding-car icon.

Certain DTCs being present in the ABS module may disable the ESC system. Depending on the DTCs present, the yellow ABS warning indicator and/or the sliding-car icon is illuminated.

Hill Start Assist (Automatic transmission only)

Hill start assist helps the driver when accelerating from a stop on an incline or side of a hill. Hill start assist supports the driver during drive-off situations on upward gradients when the driver releases the vehicle brake by preventing the vehicle from rolling back in the opposite direction. The system engages automatically when the following conditions are met:

- Road inclination of approximately 4 degrees or more is detected.
- The driver applies the vehicle brake and the vehicle is at a complete stop.
- The vehicle transmission information must indicate that the driver intends to drive up the hill.
- The parking brake is not engaged.

When the driver releases the brake pedal in drive gear, hill start assist holds the car stationary for up to 3 seconds giving the driver time to accelerate the vehicle. As the vehicle accelerates hill start assist gradually reduces the brake pressure to ensure that the vehicle is neither rolling back nor driving off until there is sufficient driving torque to accelerate the vehicle forward. Hill start assist functions if the vehicle is facing downhill if the reverse gear is selected.

There is 1 message displayed by the multifunction display that informs the driver of the status of the hill start assist. HILL START ASSIST NOT AVAILABLE is displayed and the hill start assist telltale in the IPC is illuminated when it is not available.

Stability Control Sensors

The stability control sensors for the ESC system include the yaw rate sensor, lateral accelerometer and longitudinal accelerometer. The sensors are housed in the RCM which sends sensor information to the ABS module over a dedicated Controller Area Network (CAN). If any of the sensors are defective, install a new RCM.

- The yaw rate sensor measures the relative vehicle motion about the vertical axis through its center of gravity.
- The lateral accelerometer measures the acceleration that corresponds to the force involved when the vehicle moves sideways.
- The longitudinal accelerometer measures the acceleration corresponding to the force involved when the vehicle moves forward and rearward in the horizontal plane, along the centerline of the vehicle front and rear wheels.

Lateral acceleration has 2 forms. The first is the centrifugal acceleration that occurs when the vehicle travels around in a circle. The second is the acceleration due to gravity. On level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor measures some lateral acceleration due to gravity, even though the vehicle is not moving.

Steering Sensor

The Power Steering Control Module (PSCM) uses the steering sensor to determine speed and rotation direction of the steering wheel. This information is transmitted to the ABS module along the HS-CAN. The sensor is attached to the Electronic Power Assist Steering (EPAS) column assembly and cannot be serviced separately.

ABS Module Configuration

ABS module configuration is a scan tool process which configures specific vehicle settings in a new ABS module. If installing a new ABS module, it must be configured. Refer to Programmable Module Installation (PMI) in Section 418-01.

ABS Module Calibration

The calibration procedure is also required for the ABS module to learn the "zero-position" of the steering and stability control sensors.

To calibrate the ABS module, connect the scan tool and carry out the IVD Initialization sequence, following the scan tool directions. The vehicle must be on a level surface and not moving during calibration. If a DTC is retrieved after calibration, refer to the ABS Module DTC Chart in this section.

Inspection and Verification

1. Verify the customer concern.

2. Verify the stoplamps operate correctly by pressing and releasing the brake pedal. If the stoplamps do not operate correctly, refer to Section 417-01. If the stoplamps operate correctly, proceed to the next step.

3. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Base brake system
• Hydraulic Control Unit (HCU)
• Incorrectly inflated tires
• Mismatched wheels or tires on vehicle
• Suspension components
• Wheel bearing magnetic strip
	• ABS module
	• Battery Junction Box (BJB) fuse(s):
	  ▪ 1 (40A)
	  ▪ 9 (20A)
	• Central Junction Box (CJB) fuse(s):
	  ▪ 22 (7.5A)
	• Stoplamp switch
	• PCM
	• Wheel speed sensors
	• Wiring, terminals or connectors

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record continuous memory DTCs.

9. Clear the continuous DTCs and carry out the self-test diagnostics for the ABS module.

10. If the DTCs retrieved are related to the concern, go to the ABS Module DTC Chart or the IPC DTC Chart. For all other DTCs, refer to Section 419-10.

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

ABS Module DTC Chart

DTC	Description	Action
C0001:49	TCS Control Channel "A" Valve 1: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0001:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0002:49	TCS Control Channel "A" Valve 2: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0002:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0003:49	TCS Control Channel "B" Valve 1: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0003:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0004:49	TCS Control Channel "B" Valve 2: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0004:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0010:49	Left Front Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0010:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0011:49	Left Front Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0011:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0014:49	Right Front Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0014:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0015:49	Right Front Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0015:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0018:49	Left Rear Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0018:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0019:49	Left Rear Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0019:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C001C:49	Right Rear Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C001C:49 returns, INSTALL a new ABS module. REFER to

		Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C001D:49	Right Rear Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C001D:49 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0020:11	ABS Pump Motor Control: Circuit Short To Ground	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. TEST drive the vehicle. REPEAT the self-test. DTC C0020:11 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
C0020:12	ABS Pump Motor Control: Circuit Short To Battery	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. TEST drive the vehicle. REPEAT the self-test. DTC C0020:12 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.

U0422:68	Invalid Data received From	DTC U0422:68 sets when the ABS module receives invalid

	Body Control Module: Event Information	network data from the BCM. This DTC refers to the IPC not the Body Control Module (BCM), this vehicle is using the IPC as a gateway module. RETRIEVE and REPAIR all non-network DTCs in the IPC. REFER to Section 413-01.
U0452:68	Invalid Data received From Restraints Control Module: Event Information	GO to Pinpoint Test I.
U2007:46	Valve(s): Calibration/Parameter Memory Failure	This DTC indicates that part of the ABS module has failed internally. CONFIGURE the ABS module. CARRY OUT PMI. REFER to Section 418-01. CLEAR the DTCs. REPEAT the self-test. If DTC U2007:46 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CONFIGURE the ABS module. CARRY OUT PMI. REFER to Section 418-01. TEST the system for normal operation.
U2100:41	Initial Configuration Not Complete: General Checksum Failure	CONFIGURE the ABS module. CARRY OUT PMI. REFER to Section 418-01. REPEAT the self-test. If U2100:41 returns, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
U2100:54	Initial Configuration Not Complete: Missing Calibration	CONFIGURE the ABS module. CARRY OUT PMI. REFER to Section 418-01. TEST the system for normal operation.
U2100:55	Initial Configuration Not Complete: Not Configured	CONFIGURE the ABS module. CARRY OUT the PMI. REFER to Section 418-01. TEST the system for normal operation.
U2101:00	Control Module Configuration Incompatible: No Sub Type Information	CONFIGURE the ABS module. CARRY OUT the PMI. REFER to Section 418-01. TEST the system for normal operation. CONFIGURE the ABS module. CARRY OUT the PMI. REFER to Section 418-01. TEST the system for normal operation.
U3000:41	Control Module: General Checksum Failure	This DTC sets if the vehicle battery is disconnected within 1 minute of the ignition being turned OFF. This doesn't allow enough time for the stability sensor information to be recorded to the ABS module memory. CARRY out the IVD Initialization sequence, following the scan tool directions. CLEAR the DTCs. TEST the system for normal operation.
U3000:43	Control Module: Special Memory Failure	CLEAR the DTCs. CARRY OUT the ABS module self-test. RETRIEVE and RECORD any DTCs. If DTC U3000:43 is retrieved again, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
U3000:47	Control Module: Watchdog Safety Failure	This DTC can set if the ABS module electrical connector is not fully seated and locked. DISCONNECT the ABS module C135. INSPECT the connector for bent or loose pins. If OK, RECONNECT C135. CLEAR the DTCs. REPEAT the self-test. If DTC U3000:47 is retrieved again, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
U3000:49	Control Module: Internal Electronic Failure	CLEAR the DTCs. CARRY OUT the ABS module self-test. RETRIEVE and RECORD any DTCs. If DTC U3000:49 is retrieved again, INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.

U3002:62	Vehicle Identification Number: Signal Compare Failure	**NOTE:** This DTC sets if the ABS module cannot communicate with the IPC. Correct any network communications DTCs prior to diagnosing DTC U3002:62. GO to Pinpoint Test K.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test L.
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test L.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the ABS module	• Fuse • Wiring, terminals or connectors • ABS module	• REFER to Section 418-00, The ABS Module Does Not Respond To The Scan Tool.
• No communication with the Instrument Panel Cluster (IPC)	• Fuse • Wiring, terminals or connectors • IPC	• REFER to Section 418-00, The IPC Does Not Respond To The Scan Tool.
• The red brake warning indicator is always/never on	• Wiring, terminals or connectors • Brake fluid level switch • Parking brake switch • IPC	• REFER to Diagnosis and Testing in Section 413-01.
• The yellow ABS warning indicator is always/never on	• Wiring, terminals or connectors • IPC • ABS module	• RETRIEVE and RECORD any ABS module DTCs. If DTCs are present, GO to the ABS Module DTC Chart in this section. If no DTCs are present, REFER to Diagnosis and Testing in Section 413-01. • If scan tool is unable to communicate with the ABS module, REFER to Section 418-00.
• The stability/traction control indicator (sliding-car icon) is never/always on	• Wiring, terminals or connectors • IPC • ABS module	• RETRIEVE and RECORD any ABS module DTCs. If DTCs are present, GO to the ABS Module DTC Chart. If no DTCs are present, REFER to Diagnosis and Testing in Section 413-01.
• The stability/traction control OFF indicator (sliding-car OFF icon) is never/always on	• Wiring, terminals or connectors • IPC • ABS module	• RETRIEVE and RECORD any ABS module DTCs. If DTCs are present, GO to the ABS Module DTC Chart. If no DTCs are present, REFER to Diagnosis and Testing in

		Section 413-01 .
• Spongy brake pedal with no warning indicator	• Air in the brake hydraulic system • Base brake system	• REFER to Section 206-00 .
• Unintended ABS activation with no DTCs present	• Incorrect or worn tires • Underinflated tire (s) • Worn or damaged suspension components • Missing, damaged or misaligned wheel bearing magnetic strips	• INSPECT the wheels and tires, front and rear suspension and the wheel bearing magnetic strips. REPAIR or INSTALL new as necessary.

Pinpoint Tests

Pinpoint Test A: DTCs C0020:13, C0020:71

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module uses an internal solid state switch to operate the ABS pump motor. The ABS module tests the ABS pump motor by activating it for 30 milliseconds. While the pump motor is being activated, the ABS module monitors the voltage drop across the ABS pump motor solid state switch and the amount of current the ABS pump motor draws through the solid state switch. If the voltage drop is too high or if the ABS pump motor is drawing too much current, the ABS module sets a DTC. After 30 milliseconds have passed, the ABS module stops applying voltage to the pump motor and observes the voltage that the spinning ABS pump motor is generating. The voltage generated by the motor indicates how fast the motor is spinning. Voltage that is too low indicates that the motor is not spinning freely and a DTC sets.

The ABS module uses fused battery voltage from Battery Junction Box (BJB) to power the ABS pump motor. The ABS module provides ground for the ABS pump motor. Insufficient power or ground along the circuits causes multiple DTCs to set.

- C0020:13 (ABS Pump Motor Control: Circuit Open) — this DTC sets if the voltage supplied to the ABS module is less than 10 volts, if there is an open or high resistance on the ABS pump motor circuit between the ABS module and the Hydraulic Control Unit (HCU), or if the ABS module is faulted internally.
- C0020:71 (ABS Pump Motor Control: Actuator Stuck) — this DTC sets if the ABS module detects that the ABS pump motor is not rotating when it is commanded to run.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Hydraulic pump motor
- ABS module

PINPOINT TEST A: DTCs C0020:13 AND C0020:71

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE PUMP MOTOR (PMP_MTR) ACTIVE COMMAND • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module. • Toggle the PMP_MTR active command ON. • **Listen for the ABS pump motor noise, does the ABS pump motor run for approximately 2 seconds?**	**Yes** TOGGLE the PMP_MTR active command OFF. CLEAR the DTCs. DRIVE the vehicle at speeds greater than 20 km/h (12 mph). RETRIEVE the DTCs. If DTC C0020:13 or 71 is retrieved, GO to A5. For all other ABS module DTCs, GO to the DTC Chart in this section. If no ABS module DTCs are retrieved, the system is operating correctly at this time. **No** TOGGLE the PMP_MTR active command OFF. GO to A2.

A2 CHECK THE ABS MODULE GROUND EYELET
• Ignition OFF.
• Remove the bolt retaining G107/G108 at the inner RF fender.
  ▪ Clean the chassis mating surface and ground eyelets.
  ▪ Install the ground eyelet to the chassis with the retaining bolt.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module.
• **Is the concern still present?**
	Yes
	GO to A3.
	
	No
	The concern was caused by a loose or corroded connector. CLEAR the DTCs. REPEAT self-test.

A3 CHECK THE PUMP MOTOR VOLTAGE SUPPLY TO THE ABS MODULE • Ignition OFF. • Disconnect: ABS module C135. • Measure the voltage between ABS module C135-1, circuit SBB01 (RD), harness side and ground.  N0113382 • **Is the voltage greater than 10 volts?**	**Yes** GO to A4. **No** VERIFY that BJB fuse 1 (40A) is OK. If OK, REPAIR circuit SBB01 (RD). If the fuse is not OK, REFER to the Wiring Diagrams manual to identify the cause of the circuit short. CLEAR the DTCs and REPEAT the self-test.

A4 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN	
NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 . • Ignition OFF. • Disconnect: Battery Cable — Negative. • Measure the resistance between ABS module C135-47, circuit GD123 (BK/GY), harness side and ground.  N0113354 • **Is the resistance less than 5 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit GD123 (BK/GY) for an open circuit. CLEAR the DTCs. REPEAT the self-test.
A5 CHECK FOR CORRECT ABS MODULE OPERATION	

• Connect: Battery Cable — Negative.
• Check ABS module C135 for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: ABS Module C135.
• Make sure the connector is seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section.
	
	CLEAR the DTCs. DRIVE the vehicle at speeds greater than 20 km/h (12 mph). TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: DTCs C0030:07; C0031:29, 2F, 64; C0033:07; C0034:29, 2F, 64; C0036:07: C0037:29, 2F, 64; C0039:07; C003A:29, 2F or C003A:64

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensor and wheel bearing magnetic strip generate a square wave signal to the ABS module that is proportional to wheel speed. The ABS module compares wheel speed inputs from all wheel speed sensors to determine an impending wheel lockup.

DTC Description	Fault Trigger Conditions

• C0030:07 — Left Front Tone Wheel: Mechanical Failure • C0033:07 — Right Front Tone Wheel: Mechanical Failure • C0036:07 — Left Rear Tone Wheel: Mechanical Failure • C0039:07 — Right Rear Tone Wheel: Mechanical Failure	These DTCs set if there is damage to the wheel bearing magnetic strip or damage to the wheel bearing, or contamination or deformation of the bearing seal.
• C0031:29 — Left Front Wheel Speed Sensor: Signal Invalid • C0031:64 — Left Front Wheel Speed Sensor: Signal Plausibility Failure • C0034:29 — Right Front Wheel Speed Sensor: Signal Invalid • C0034:64 — Right Front Wheel Speed Sensor: Signal Plausibility Failure • C0037:29 — Left Rear Wheel Speed Sensor: Signal Invalid • C0037:64 — Left Rear Wheel Speed Sensor: Signal Plausibility Failure • C003A:29 — Right Rear Wheel Speed Sensor: Signal Invalid • C003A:64 — Right Rear Wheel Speed Sensor: Signal Plausibility Failure	These DTCs set if any of the wheel bearing magnetic strips are damaged or defective or not mounted properly. Also sets if the tire size is incorrect or incorrect wheel speed sensor or bearing is installed.
• C0031:2F — Left Front Wheel Speed Sensor: Signal Erratic • C0034:2F — Right Front Wheel Speed Sensor: Signal Erratic • C0037:2F — Left Rear Wheel Speed Sensor: Signal Erratic • C003A:2F — Right Rear Wheel Speed Sensor: Signal Erratic	These DTCs set if any of the wheel bearing magnetic strips are damaged or defective or not mounted properly. Also sets if the tire size is incorrect, incorrect bearing is installed, or high frequency interference is present.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Wheel speed sensor(s)
- Wheel bearing magnetic strip(s)
- ABS module

PINPOINT TEST B: DTC C0030:07; C0031:29, 2F, 64; C0033:07; C0034:29, 2F, 64; C0036:07: C0037:29, 2F, 64; C0039:07; C003A:29, 2F or 64

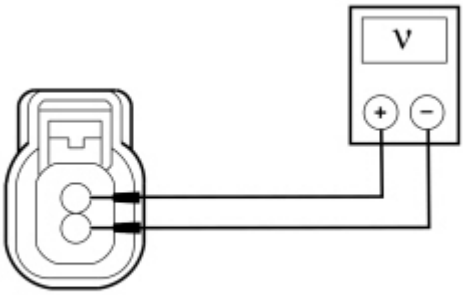
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the**

correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK THE DTCs FROM THE SELF-TEST • Review the DTCs retrieved and recorded during Inspection and Verification. • **Are DTCs C0031:01; C0034:01; C0037:01 and/or C003A:01 present?**	**Yes** GO to Pinpoint Test D . **No** GO to B2 .
B2 CHECK THE TIRES SIZE AND PRESSURE • Verify that all tires and wheels are the same size and the tire size and inflation pressures are correct as indicated on the Vehicle Certification (VC) label. • **Are the wheels and tires OK?**	**Yes** GO to B3 . **No** INSTALL the correct size tire or ADJUST tire pressure as necessary.
B3 MONITOR THE WHEEL SPEED SENSOR PIDs • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module. • Drive the vehicle at a speed greater than 20 km/h (12 mph) while monitoring the following PIDs: ▪ Left front wheel speed sensor (LF_WSPD) ▪ Right front wheel speed sensor (RF_WSPD) ▪ Left rear wheel speed sensor (LR_WSPD) ▪ Right rear wheel speed sensor (RR_WSPD) • **Are the wheel speed PIDs consistent with each other, within 5 km/h (3 mph) and the vehicle speed as indicated on the speedometer?**	**Yes** GO to B11 . **No** GO to B4 .
B4 CHECK THE WHEEL SPEED SENSOR FOR DAMAGE • **NOTE:** Examine the wheel speed sensor wire carefully with a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component. • Inspect the wheel speed sensor and harness for abrasion, broken connector tabs or water intrusion. • **Is the wheel speed sensor and harness OK?**	**Yes** GO to B5 . **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front , or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test.
B5 INSPECT THE WHEEL SPEED SENSOR MOUNTING • Ignition OFF. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Inspect the wheel speed sensor and fastener for looseness. • **Are the wheel speed sensor and fastener tight?**	**Yes** GO to B6 . **No** TIGHTEN the wheel speed sensor to specification. REFER to Specifications in this section. CLEAR the DTCs. REPEAT the self-test.
B6 CHECK WHEEL BEARING MAGNETIC STRIP FOR DAMAGE • Inspect the wheel bearings for abnormal wear or roughness and for deformation or contamination of the seal and magnetic strip.	**Yes** For wheel speed sensor testing with the Rotunda

• **Are the wheel bearing(s) OK?**	Active Wheel Speed Sensor Tester, GO to B7 . For wheel speed sensor testing without the Rotunda Active Wheel Speed Sensor Tester, GO to B9 . **No** INSTALL a new wheel bearing as necessary. REFER to Section 204-01 for front wheel bearings or Section 204-02 for rear wheel bearings. CLEAR the DTCs. REPEAT the self-test.
B7 CHECK THE ABS MODULE OUTPUT USING THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor. • Connect the Rotunda Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Ignition ON. • Select the correct system polarity on the Rotunda Active Wheel Speed Sensor Tester and turn the power switch to the ON position. • **Is the module output LED illuminated?**	**Yes** GO to B8 . **No** GO to B12 .
B8 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Rotunda Active Wheel Speed Sensor Tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green, but do not flash, INSPECT the wheel bearing magnetic strip(s) and INSTALL new if necessary. If the wheel bearing magnetic strip is OK, INSTALL a new wheel speed sensor. REFER to Wheel

	Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test.
B9 CHECK FOR CORRECT ABS MODULE OUTPUT • Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor. • Ignition ON. **Vehicles Built Up To 1/14/2011**  N0113356 • **For vehicles built up to 1/14/2011** , measure the voltage between the suspect wheel speed sensor connector pins, harness side as follows: **Vehicles Built Up To 1/14/2011** **Location** / **Connector-Pin/ Circuit** / **Connector-Pin/ Circuit** LH front: C150-1 VCA03 (VT/WH) / C150-2 RCA17 (YE) RH front: C160-1 VCA05 (GY/VT) / C160-2 RCA19 (VT) LH rear: C440-1 VCA04 (BU/OG) / C440-2 RCA18 (BN/GN) RH rear: C426-1 VCA06 (WH/OG) / C426-2 RCA20 (BN) **Vehicles Built After 1/14/2011**	**Yes** For vehicles built up to 1/14/2011, GO to B10 . For vehicles built after 1/14/2011, GO to B11 . **No** GO to B12 .



N0129358

- **For vehicles built after 1/14/2011** , measure the voltage between the suspect wheel speed sensor connector pins, harness side as follows:

Vehicles Built After 1/14/2011

Location	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH front	C1315-1 VCA03 (VT/WH)	C1315-2 RCA17 (YE)
RH front	C1316-1 VCA05 (GY/VT)	C1316-2 RCA19 (VT)
LH rear	C4296-1 VCA04 (BU/OG)	C4296-2 RCA18 (BN/GN)
RH rear	C4318-1 VCA06 (WH/OG)	C4318-2 RCA20 (BN)

- **Is the voltage greater than 10 volts?**

B10 CHECK THE WHEEL SPEED SENSOR OUTPUT

NOTE: Digital Multimeter must have the leads in the current sensing ports and the correct range selected.

- **For LF wheel speed sensor DTCs** :
  - connect the meter between LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor pin 1, component side.
  - connect a fused jumper wire between LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side and LF wheel speed sensor pin 2, component side.
- **For RF wheel speed sensor DTCs** :
  - connect the meter between RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor pin 1, component side.
  - connect a fused jumper wire between RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side and RF wheel speed sensor pin 2, component side.
- **For LR wheel speed sensor DTCs** :
  - connect the meter between LR wheel speed sensor C440-1, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor pin 1, component side.
  - connect a fused jumper wire between LR wheel

Yes
GO to B12 .

No
INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front , or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test.

speed sensor C440-2, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor pin 2, component side. • **For RR wheel speed sensor DTCs** : ▪ connect the meter between RR wheel speed sensor C426-1, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor pin 1, component side. ▪ connect a fused jumper wire between RR wheel speed sensor C426-2, circuit RCA20 (BN), harness side and RR wheel speed sensor pin 2, component side. • Ignition ON. • Measure the current while slightly rotating the wheel, using incremental turns. • **Does the digital multimeter indicate the current switches between the low state (5 to 8 mA) and the high state (12 to 16 mA)?**	
B11 CHECK THE OUTPUT OF THE WHEEL SPEED SENSOR **NOTE:** Digital Multimeter must have the leads in the current sensing ports and the correct range selected. • **For LF wheel speed sensor DTCs** : ▪ connect the meter between LF wheel speed sensor C1316-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor pin 1, component side. ▪ connect a fused jumper wire between LF wheel speed sensor C1316-2, circuit RCA17 (YE), harness side and LF wheel speed sensor pin 2, component side. • **For RF wheel speed sensor DTCs** : ▪ connect the meter between RF wheel speed sensor C1315-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor pin 1, component side. ▪ connect a fused jumper wire between RF wheel speed sensor C1315-2, circuit RCA19 (VT), harness side and RF wheel speed sensor pin 2, component side. • **For LR wheel speed sensor DTCs** : ▪ connect the meter between LR wheel speed sensor C4296-1, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor pin 1, component side. ▪ connect a fused jumper wire between LR wheel speed sensor C4296-2, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor pin 2, component side. • **For RR wheel speed sensor DTCs** : ▪ connect the meter between RR wheel speed sensor C4318-1, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor pin 1, component side. ▪ connect a fused jumper wire between RR wheel speed sensor C4318-2, circuit RCA20 (BN), harness side and RR wheel speed sensor pin 2, component side. • Ignition ON. • Measure the current while slightly rotating the wheel, using incremental turns. • **Does the digital multimeter indicate the current switches between the low state (5 to 8 mA) and the high state (12 to 16 mA)?**	**Yes** GO to B12 . **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front , or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test.
B12 CHECK FOR CORRECT ABS MODULE OPERATION • Ignition OFF. • Disconnect: ABS Module C135. • Check for:	**Yes** INSTALL a new ABS module. REFER to Hydraulic Control

■ corrosion ■ pushed-out pins ■ spread terminals • Connect: ABS Module C135. • Connect: Suspect Wheel Speed Sensor. • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	Unit (HCU) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTCs C0044:28, C0044:49 and C0044:64

Normal Operation

The ABS module uses internal pressure sensors to determine correct operation by monitoring internal Hydraulic Control Unit (HCU) hydraulic pressures. These DTCs set if the brake pressure sensor signals do not match. This fault could set by either an internal ABS module failure or a pressure sensor failure. The pressure sensors are internal to the HCU and cannot be serviced separately.

- DTC C0044:28 (Brake Pressure Sensor "A": Signal Bias Level Out of Range / Zero Adjustment Failure) — this DTC sets if the brake pressure sensor signals do not match. This fault could set by a misadjusted stoplamp switch or improperly installed brake pedal. An internal ABS module failure or a pressure sensor failure can also cause this DTC to set. When the ABS module sets DTC C0044:28, a message is also sent to the Transmission Control Module (TCM) along the High Speed Controller Area Network (HS-CAN) bus. After received this message from the ABS module, the TCM places the automatic transmission into NEUTRAL. There is no corresponding DTC set in the Transmission Control Module (TCM).
- DTC C0044:49 (Brake Pressure Sensor "A": Internal Electronic Failure) — this DTC sets if the brake pressure sensor signals do not match. This fault could set by either an internal ABS module failure or a pressure sensor failure.
- DTC C0044:64 (Brake Pressure Sensor "A": Signal Plausibility Failure) — this DTC sets if the brake pressure sensor signals do not match. This fault could set by either an internal ABS module failure or a pressure sensor failure.

This pinpoint test is intended to diagnose the following:

- ABS module
- HCU

PINPOINT TEST C: DTCs C0044:28, C0044:49 AND C0044:64

Test Step	Result / Action to Take
C1 CHECK THE STOPLAMP SWITCH, CRUISE CONTROL DEACTIVATOR SWITCH AND BRAKE PEDAL AND BRACKET	
• Inspect the stoplamp switch, cruise control deactivator switch and brake pedal assembly, verify there is no brake pedal pressure unintentionally applied due to incorrect stoplamp switch, cruise control deactivator switch or brake pedal installation. • **Are the stoplamp switch, cruise control deactivator switch and brake pedal OK?**	**Yes** If DTC C0044:28 is set, GO to C3. Otherwise, GO to C2. **No** REPAIR or INSTALL new components as necessary. REFER to Section 206-06.

C2 CHECK FOR DTC C0044:49 AND/OR C0044:64 TO RETURN	
• Ignition ON. • Using a scan tool, clear all ABS module CMDTCs. • Test drive the vehicle at speeds greater than 32 km/h (20 mph). • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Is DTC C0044:49 and/or C0044:64 present?**	**Yes** GO to C3. **No** The system is operating correctly at this time. The concern may have been caused by air trapped in the hydraulic brake system. REFER to Section 206-00 on bleeding the base brake system. TEST the system for normal operation.
C3 CARRY OUT THE BRAKE PEDAL SWITCH ADJUSTMENT PROCEDURE	
• Refer to Brake Pedal Switch Adjustment in this section. • **Did the stoplamp switch and cruise control deactivator switch pass the brake pedal switch adjustment test?**	**Yes** GO to C4. **No** INSTALL a new stoplamp switch or cruise control deactivator switch as required. REFER to Section 417-01 (stoplamp switch) or Section 419-03 (cruise control deactivator switch).
C4 CHECK FOR CORRECT ABS MODULE TO HCU TORQUE VALUES	
• Verify all ABS module-to- HCU fasteners are tightened to their correct torque specifications. Refer to Specifications in this section. • **Are the ABS module-to- HCU fasteners tightened correctly?**	**Yes** INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** TIGHTEN all ABS module-to- HCU fasteners. CLEAR the DTCs. GO to C5.
C5 CHECK FOR DTCs C0044:28, C0044:49 AND/OR C0044:64	
• Test drive the vehicle at speeds greater than 32 km/h (20 mph). • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • Record all ABS module DTCs. • **Is DTC C0044:28, C0044:49 and/or C0044:64 present?**	**Yes** INSTALL a new HCU. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern was likely cause by incorrectly tightened fasteners.

Pinpoint Test D: DTCs C0031:01; C0034:01; C0037:01, C003A:01, C0031:19, C0034:19, C0037:19, C003A:19

Refer to Wiring Diagrams Cell 42, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

Active wheel speed sensors generate a square wave signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition switch is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the wheel speed sensors and their circuitry to determine if

they are functional.

DTC Description	Fault Trigger Condition
• C0031:01 — Left Front Wheel Speed Sensor: General Electrical Failure • C0034:01 — Right Front Wheel Speed Sensor: General Electrical Failure • C0037:01 — Left Rear Wheel Speed Sensor: General Electrical Failure • C003A:01 — Right Rear Wheel Speed Sensor: General Electrical Failure • C0031:19 — LF Wheel Speed Sensor Signal: Circuit Current Above Threshold • C0034:19 — RF Wheel Speed Sensor Signal: Circuit Current Above Threshold • C0037:19 — LR Wheel Speed Sensor Signal: Circuit Current Above Threshold • C003A:19 — RR Wheel Speed Sensor Signal: Circuit Current Above Threshold	These DTCs set if any of the wheel speed sensor's signal current is below 4.5 mA or above 20 mA for longer than 140 milliseconds, or if either sensor circuit is shorted to ground or battery voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Wheel speed sensors
- ABS module

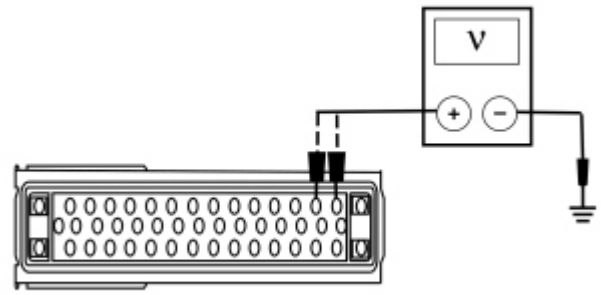
PINPOINT TEST D: DTCs C0031:01; C0034:01; C0037:01, C003A:01, C0031:19, C0034:19, C0037:19, C003A:19

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK FOR FAULT REPEATABILITY	
• Ignition ON. • Using the scan tool, clear the ABS module DTCs. • Drive the vehicle at least 20 km/h (12 mph). • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Is the concern still present?**	**Yes** If the Rotunda Active Wheel Speed Sensor Tester is available, GO to D2 . If the Rotunda Active Wheel Speed Sensor Tester is not available, GO to D4 . **No** INSPECT the wheel speed sensors, wheel speed sensor wiring and wheel bearing magnetic strip. REPAIR or INSTALL new

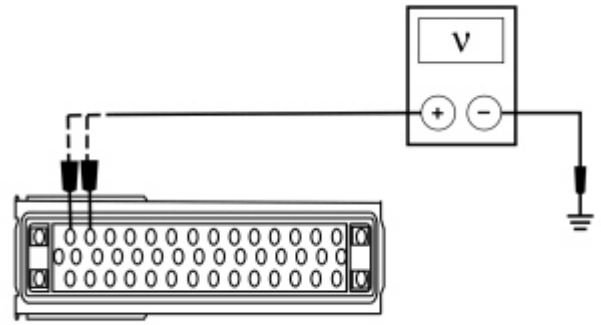
	as necessary. If any other DTCs are retrieved, GO to the ABS Module DTC Chart in this section.
D2 CHECK THE ABS MODULE OUTPUT USING THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor. • Connect the Rotunda Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Ignition ON. • Select the correct system polarity on the Rotunda Active Wheel Speed Sensor Tester and turn the power switch to the ON position. • **Is the module output LED illuminated?**	**Yes** GO to D3 . **No** GO to D6 .
D3 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Rotunda Active Wheel Speed Sensor Tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green, but do not flash, INSPECT the wheel bearing magnetic strip and INSTALL new if necessary. If the wheel bearing magnetic strip is OK, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test.
D4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO BATTERY VOLTAGE	
• Ignition OFF. • Disconnect: ABS Module C135.	**Yes** REPAIR the affected circuit

- Disconnect: Suspect Wheel Speed Sensor.
- Ignition ON.
- **For DTC C0031:01, 19 (LF)** , measure the voltage between:
  - ABS module C135-45, circuit VCA03 (VT/WH), harness side and ground.
  - ABS module C135-46, circuit RCA17 (YE), harness side and ground.



N0113390

- **For DTC C0034:01, 19 (RF)** , measure the voltage between:
  - ABS module C135-33, circuit RCA19 (VT), harness side and ground.
  - ABS module C135-34, circuit VCA05 (GY/VT), harness side and ground.

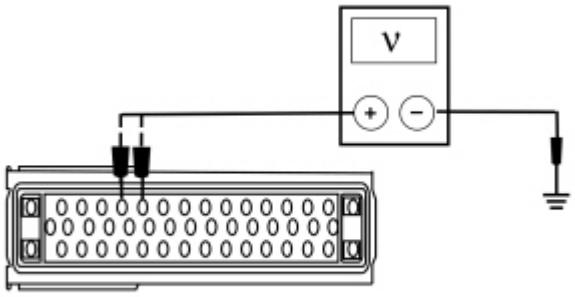


N0113388

- **For DTC C0037:01, 19 (LR)** , measure the voltage between:
  - ABS module C135-36, circuit VCA04 (BU/OG), harness side and ground.
  - ABS module C135-37, circuit RCA18 (BN/GN), harness side and ground.

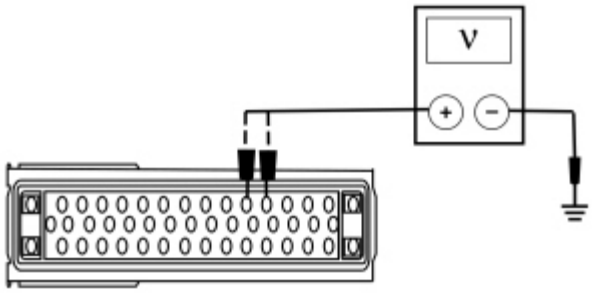
(s) for a short to voltage. CLEAR the DTCs. REPEAT the self-test.

No
GO to D5 .



N0113392

- **For DTC C003A:01, 19 (RR)** , measure the voltage between:
  - ABS module C135-42, circuit RCA20 (BN), harness side and ground.
  - ABS module C135-43, circuit VCA06 (WH/OG), harness side and ground.

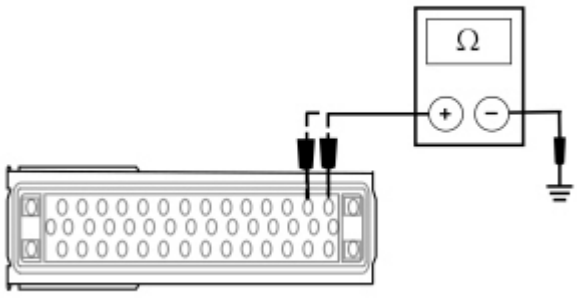


N0113389

- **Is any voltage present?**

D5 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND	

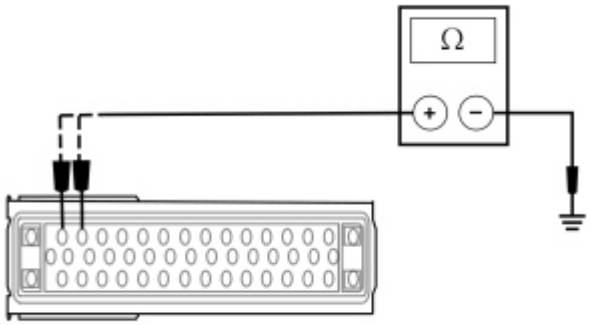
• Ignition OFF.
• **For DTC C0031:01, 19 (LF)** , measure the resistance between:
  ▪ ABS module C135-45, circuit VCA03 (VT/WH), harness side and ground.
  ▪ ABS module C135-46, circuit RCA17 (YE), harness side and ground.
	Yes
	GO to D6 .
	
	No
	REPAIR the affected circuit (s) for a short to ground. CLEAR the DTCs. REPEAT the self-test.



N0113362

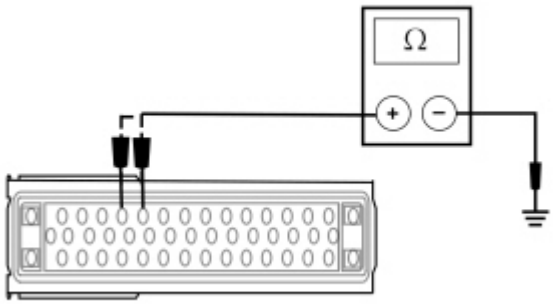
- **For DTC C0034:01, 19 (RF)** , measure the resistance

between:
- ABS module C135-34, circuit VCA05 (GY/VT), harness side and ground.
- ABS module C135-33, circuit RCA19 (VT), harness side and ground.



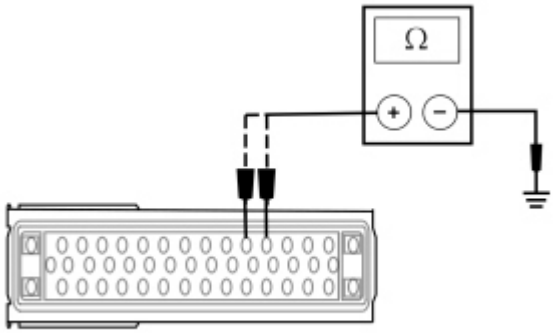
N0113363

- **For DTC C0037:01, 19 (LR)** , measure the resistance between:
  - ABS module C135-36, circuit VCA04 (BU/OG), harness side and ground.
  - ABS module C135-37, circuit RCA18 (BN/GN), harness side and ground.



N0113364

- **For DTC C003A:01, 19 (RR)** , measure the resistance between:
  - ABS module C135-43, circuit VCA06 (WH/OG), harness side and ground.
  - ABS module C135-42, circuit RCA20 (BN), harness side and ground.



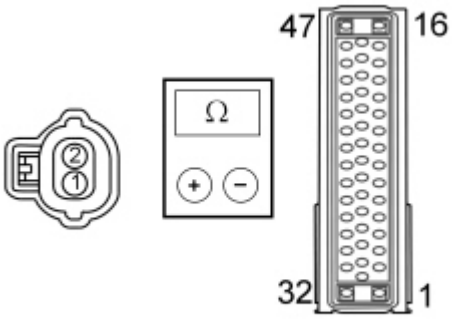
N0113365

- **Are the resistances greater than 10,000 ohms?**

D6 CHECK THE WHEEL SPEED CIRCUITS FOR AN OPEN

- Ignition OFF.
- Disconnect: ABS Module C135 (if not previously disconnected).
- Disconnect: Suspect Wheel Speed Sensor (if not previously disconnected).

Vehicles Built Up To 1/14/2011



N0113366

- **For vehicles built up to 1/14/2011** , measure the resistance between ABS module connector C135, harness side and the suspect wheel speed sensor connector, harness side as indicated in the following chart:

Vehicles Built Up To 1/14/2011

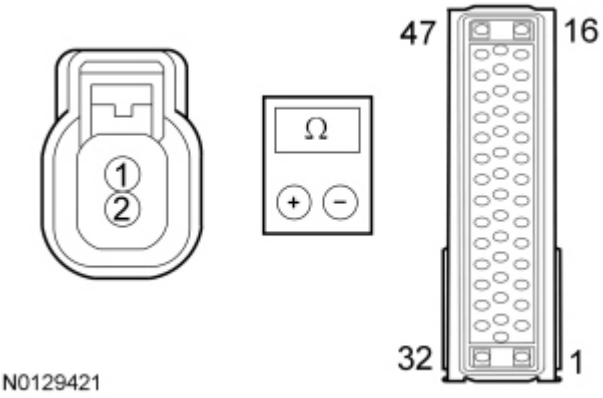
DTC	ABS Module	Circuit	Wheel Speed Sensor
C0031:01, 19	C135-45	VCA03 (VT/WH)	C150-1
	C135-46	RCA17 (YE)	C150-2
C0034:01, 19	C135-34	VCA05 (GY/VT)	C160-1
	C135-33	RCA19 (VT)	C160-2
C0037:01, 19	C135-36	VCA04 (BU/OG)	C440-1
	C135-37	RCA18 (BN/GN)	C440-2
C003A:01,	C135-43	VCA06	C426-1

Yes
GO to D7 .

No
REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.

19	C135-42	(WH/OG) RCA20 (BN)	C426-2

Vehicles Built After 1/14/2011



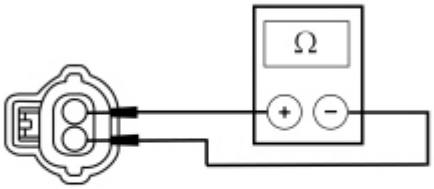
- **For vehicles built after 1/14/2011** , measure the resistance between ABS module connector C135, harness side and the suspect wheel speed sensor connector, harness side as indicated in the following chart:

Vehicles Built After 1/14/2011

DTC	ABS Module	Circuit	Wheel Speed Sensor
C0031:01, 19	C135-45	VCA03 (VT/WH)	C1315-1
	C135-46	RCA17 (YE)	C1315-2
C0034:01, 19	C135-34	VCA05 (GY/VT)	C1316-1
	C135-33	RCA19 (VT)	C1316-2
C0037:01, 19	C135-36	VCA04 (BU/OG)	C4296-1
	C135-37	RCA18 (BN/GN)	C4296-2
C003A:01, 19	C135-43	VCA06 (WH/OG)	C4318-1
	C135-42	RCA20 (BN)	C4318-2

- **Are the resistances less than 5 ohms?**

D7 CHECK FOR SHORTED WHEEL SPEED SENSOR CIRCUITS **Vehicles Built Up To 1/14/2011**	**Yes** GO to D8 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.



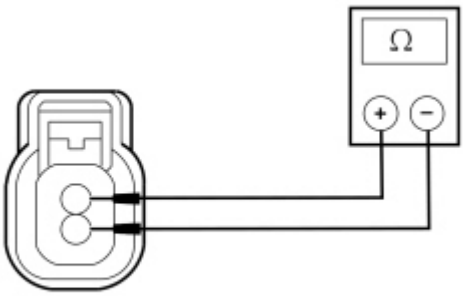
N0113367

- **For vehicles built up to 1/14/2011** , measure the resistance between the suspect wheel speed sensor connector pins, harness side as follows:

Vehicles Built Up To 1/14/2011

DTC	Connector-Pin/ Circuit	Connector-Pin/ Circuit
C0031:01, 19	C150-1 VCA03 (VT/WH)	C150-2 RCA17 (YE)
C0034:01, 19	C160-1 VCA05 (GY/VT)	C160-2 RCA19 (VT)
C0037:01, 19	C440-1 VCA04 (BU/OG)	C440-2 RCA18 (BN/GN)
C003A:01, 19	C426-1 VCA06 (WH/OG)	C426-2 RCA20 (BN)

Vehicles Built After 1/14/2011



N0129359

- **For vehicles built after 1/14/2011** , measure the resistance between the suspect wheel speed sensor connector pins, harness side as follows:

Vehicles Built After 1/14/2011

DTC	Connector-Pin/ Circuit	Connector-Pin/ Circuit
C0031:01,	C1316-1	C1316-2

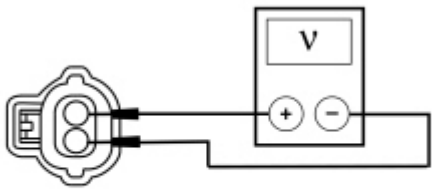
19	VCA03 (VT/WH)	RCA17 (YE)
C0034:01, 19	C1315-1 VCA05 (GY/VT)	C1315-2 RCA19 (VT)
C0037:01, 19	C4296-1 VCA04 (BU/OG)	C4296-2 RCA18 (BN/GN)
C003A:01, 19	C4318-1 VCA06 (WH/OG)	C4318-2 RCA20 (BN)

- **Is the resistance greater 10,000 ohms?**

D8 CHECK FOR CORRECT ABS MODULE OUTPUT

- Connect: ABS Module C135.
- Ignition ON.

Vehicles Built Up To 1/14/2011



N0113356

- **For vehicles built up to 1/14/2011** , measure the voltage between the suspect wheel speed sensor connector pins, harness side as follows:

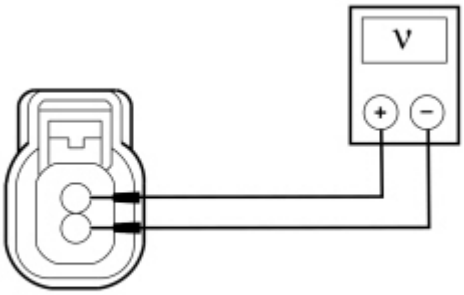
Vehicles Built Up To 1/14/2011

DTC	Connector-Pin/ Circuit	Connector-Pin/ Circuit
C0031:01, 19	C150-1 VCA03 (VT/WH)	C150-2 RCA17 (YE)
C0034:01, 19	C160-1 VCA05 (GY/VT)	C160-2 RCA19 (VT)
C0037:01, 19	C440-1 VCA04 (BU/OG)	C440-2 RCA18 (BN/GN)
C003A:01, 19	C426-1 VCA06 (WH/OG)	C426-2 RCA20 (BN)

Vehicles Built After 1/14/2011

Yes
INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front , or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test.

No
GO to D9 .



N0129358

- **For vehicles built after 1/14/2011** , measure the voltage between the suspect wheel speed sensor connector pins, harness side as follows:

Vehicles Built After 1/14/2011

DTC	Connector-Pin/ Circuit	Connector-Pin/ Circuit
C0031:01, 19	C1316-1 VCA03 (VT/WH)	C1316-2 RCA17 (YE)
C0034:01, 19	C1315-1 VCA05 (GY/VT)	C1315-2 RCA19 (VT)
C0037:01, 19	C4296-1 VCA04 (BU/OG)	C4296-2 RCA18 (BN/GN)
C003A:01, 19	C4318-1 VCA06 (WH/OG)	C4318-2 RCA20 (BN)

- **Is the voltage greater than 10 volts?**

D9 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect: ABS Module C135.
• Check for:
  ▪ corrosion
  ▪ pushed-out pins
  ▪ spread terminals
• Connect: ABS Module C135.
• Make sure the connector is seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTC U0100:00

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

- DTC U0100:00 (Lost Communication With ECM/PCM "A": No Sub Type Information) — this DTC sets if the brake pedal position switch, and traction control messages that should be received from the ECM/PCM are missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- ABS module

PINPOINT TEST E: DTC U0100

Test Step	Result / Action to Take
E1 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Using a scan tool, carry out the network test. • **Does the PCM pass the network test?**	**Yes** GO to E2. **No** REFER to Section 418-00.
E2 CHECK THE ABS MODULE CMDTCs • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • Using a scan tool, clear the ABS module DTCs. • Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Is DTC U0100:00 present?**	**Yes** GO to E3. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
E3 CHECK THE ABS MODULE FOR BATTERY VOLTAGE DTCs • Review the ABS module DTCs retrieved in the previous step. • **Is DTC U3003:16 or DTC U3003:17 present?**	**Yes** GO to Pinpoint Test L. **No** GO to E4.
E4 CHECK THE PCM CMDTCs • Using a scan tool, carry out the PCM Key ON Engine OFF (KOEO) self-test. • **Is DTC P1794:16 or P1794:17 present?**	**Yes** DIAGNOSE the PCM DTCs. REFER to Section 414-00 **No** GO to E5.
E5 CHECK FOR DTC U0100 SET IN OTHER MODULES • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs. • **Is DTC U0100:00 or DTC U0100 set in more than one module?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. TEST the system for normal operation. REPEAT the ABS module self-test.

	No INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.

Pinpoint Test F: DTC U0101:00

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

- DTC U0101:00 (Lost Communication With TCM: No Sub Type Information — this DTC sets in the ABS module if the PRNDL message that should be received from the Transmission Control Module (TCM) is missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TCM
- ABS module

PINPOINT TEST F: DTC U0101

Test Step	Result / Action to Take
F1 CHECK THE COMMUNICATION NETWORK	**Yes** GO to F2 . **No** REFER to Section 418-00 .
• Ignition ON. • Using a scan tool, carry out the network test. • **Does the TCM pass the network test?**	
F2 CHECK THE ABS MODULE CMDTCs	**Yes** GO to F3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • Using a scan tool, clear the ABS module DTCs. • Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Is DTC U0101:00 present?**	
F3 CHECK THE ABS MODULE FOR BATTERY VOLTAGE DTCs	**Yes** GO to Pinpoint Test L . **No** GO to F4 .
• Review the ABS module DTCs retrieved in the previous step. • **Is DTC U3003:16 or DTC U3003:17 present?**	
F4 CHECK THE TCM CMDTCs	**Yes** DIAGNOSE the TCM DTCs. REFER to Section 307-11 .
• Enter the following diagnostic mode on the scan tool: Self Test — TCM . • **Is DTC P0702, P0882 or P0883**	

present?	**No** GO to F5 .
F5 CHECK FOR DTC U0101 SET IN OTHER MODULES	
• Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0101:00 or DTC U0101 set in more than one module?**	**Yes** INSTALL a new TCM . REFER to Section 307-11 . TEST the system for normal operation. REPEAT the ABS module self-test. **No** INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.

Pinpoint Test G: DTC U0131:00

Normal Operation

- DTC U0131:00 (Lost Communication With Power Steering Control Module: No Sub Type Information) — this DTC sets if the steering sensor message that should be received from the Power Steering Control Module (PSCM) is missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PSCM
- ABS module

PINPOINT TEST G: DTC U0131:00

Test Step	Result / Action to Take
G1 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Using a scan tool, carry out the network test. • **Does the PSCM pass the network test?**	**Yes** GO to G2 . **No** REFER to Section 418-00 .
G2 CHECK THE ABS MODULE CMDTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • Using a scan tool, clear the ABS module DTCs. • Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Is DTC U0131:00 present?**	**Yes** GO to G3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
G3 CHECK THE ABS MODULE FOR BATTERY VOLTAGE DTCs	
• Review the ABS module DTCs	**Yes**

retrieved in the previous step. • **Is DTC U3003:16 or DTC U3003:17 present?**	GO to Pinpoint Test L . **No** GO to G4 .
G4 CHECK THE PSCM CMDTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — PSCM . • **Is DTC P0702, P0882 or P0883 present?**	**Yes** DIAGNOSE the PSCM DTCs. REFER to Section 307-11 . **No** GO to G5 .
G5 CHECK FOR DTC U0131:00 SET IN OTHER MODULES	
• Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0131:00 or DTC U0131 set in more than one module?**	**Yes** INSTALL a new PSCM . REFER to Section 211-00 . TEST the system for normal operation. CLEAR the DTCs. REPEAT the ABS module self-test. **No** INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.

Pinpoint Test H: DTCs U0140:00

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub Type Information) — this DTC sets in the ABS module if it cannot transmit or receive messages to the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN) for 5 seconds or longer. This DTC is actually referring to the IPC as this vehicle is using the IPC as a gateway module and never directly establishes communications with the BCM .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- IPC
- ABS module

PINPOINT TEST H: DTC U0140:00

Test Step	Result / Action to Take
H1 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Using a scan tool, carry out the network test. • **Does the PSCM pass the network test?**	**Yes** GO to H2 . **No** REFER to Section 418-00 .
H2 CHECK THE ABS MODULE CMDTCs	
• Enter the following diagnostic mode on the scan tool: Self Test	**Yes** GO to H3 .

— ABS Module. • Using a scan tool, clear the ABS module DTCs. • Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Is DTC U0140:00 present?**	**No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
H3 CHECK THE ABS MODULE FOR BATTERY VOLTAGE DTCs	
• Review the ABS module DTCs retrieved in the previous step. • **Is DTC U3003:16 or DTC U3003:17 present?**	**Yes** GO to Pinpoint Test L . **No** GO to H4 .
H4 CHECK THE IPC CMDTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — IPC . • **Is DTC U3006:16 or U3006:17 present?**	**Yes** DIAGNOSE the IPC DTCs. REFER to Section 413-01 . **No** GO to H5 .
H5 CHECK FOR DTC U0140:00 SET IN OTHER MODULES	
• Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0140:00 or DTC U0140 set in more than one module?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation. CLEAR the DTCs. REPEAT the ABS module self-test. **No** INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.

Pinpoint Test I: DTC C0061:28, C0061:64, C0062:28, C0062:64, C0062:76, C0063:28, C0063:64, U0151:00, U0452:68

Refer to Wiring Diagrams Cell 14 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module uses information received from several sensors (wheel speed sensors, steering wheel rotation sensor, stability/traction control system sensors, etc.) to determine if vehicle stability or traction warrants ESC interaction. If an event is going to occur, the ABS module adjusts the brake torque at specific wheels and the PCM reduces engine torque to make the vehicle more stable. Once the ABS module has determined that the stability event has been corrected, it returns the brake and engine torque to normal and continues to monitor the vehicle. DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected. The Restraints Control Module (RCM) measures the yaw rate and vehicle acceleration, then sends the signal through a secondary, dedicated Controller Area Network (CAN) to the ABS module. This dedicated CAN is used only for communication between the RCM and the ABS module. The ABS module uses this information for AdvanceTrac® system operation. The ABS module also compares this information to information it receives from other sensors (brake pedal input, steering wheel) to determine how valid the information is and to determine if an instability event is about to occur. The yaw rate sensor, lateral and longitudinal accelerometers are contained in the RCM .

DTC Description	Fault Trigger Conditions
DTC C0061:28 Lateral Acceleration Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC indicates that the lateral acceleration sensor signal is out of range.
DTC C0061:64 Lateral Acceleration Sensor: Signal Plausibility Failure	This DTC sets if one of the sensor signals does not match the other sensor signals.
DTC C0062:28 Longitudinal Acceleration Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC indicates that the longitudinal acceleration sensor signal is out of range.
DTC C0062:64 Longitudinal Acceleration Sensor: Signal Plausibility Failure	This DTC sets if one of the sensor signals does not match the other sensor signals.
DTC C0062:76 Longitudinal Acceleration Sensor: Wrong Mounting Position	This DTC sets if the RCM is loose or mounted incorrectly.
DTC C0063:28 Yaw Rate Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC indicates that the yaw rate sensor signal is out of range.
DTC C0063:64 Yaw Rate Sensor: Signal Plausibility Failure	This DTC sets if one of the sensor signals does not match the other sensor signals.
DTC U0151:00 Lost Communication With Restraints Control Module: No Sub Type Information	This DTC sets in the ABS module if it does not receive Yaw, or other sensor messages from the Restraints Control Module (RCM) for 5 seconds or longer.
DTC U0452:68 Invalid Data received From Restraints Control Module: Event Information	This DTC sets when the ABS module receives invalid network data from the RCM.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM
- ABS module

PINPOINT TEST I: DTC C0061:28, C0061:64, C0062:28, C0062:64, C0062:76, C0063:28, C0063:64, U0151:00, U0452:68

WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

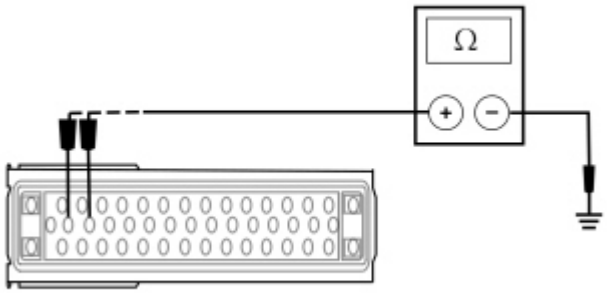
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
I1 CHECK FOR AN HS-CAN COMMUNICATION CONCERN WITH THE RCM	
• Connect the scan tool. • Ignition ON. • **NOTE:** The network test does not test the dedicated CAN communications between the ABS module and RCM. • Using the scan tool, carry out the network test. • **Does the RCM pass the network test?**	**Yes** GO to I2. **No** REFER to Section 418-00, The Restraints Control Module (RCM) Does Not Respond To The Scan Tool.
I2 VERIFY THE RCM PART NUMBER	
• Enter the following diagnostic mode on the scan tool: Log Viewer. • Retrieve and record the RCM part number from the log viewer. • Check the part number recorded against the number listed in the parts catalog. • **Does the part number on the RCM match the part number listed in the parts catalog?**	**Yes** GO to I3. **No** INSTALL the correct RCM. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the self-test.
I3 CHECK FOR RCM AND ABS DTCs	
• Enter the following diagnostic mode on the scan tool: Self-Test — RCM. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Are any RCM DTCs retrieved on-demand self-test?**	**Yes** REFER to Section 501-20B to diagnose the RCM DTCs. TEST the system for normal operation. **No** If only one of the following ABS module DTCs C0061:28, C0061:64, C0062:28, C0062:64, C0063:28, C0063:64, U0452:68 was retrieved, GO to I4. If more than one ABS module DTC C0061:28, C0061:64, C0062:28, C0062:64, C0063:28, C0063:64,U0452:68 was retrieved, GO to I7. For DTC C0062:76 GO to I12. For DTC U0151:00 GO to I7. For all other DTCs, REFER to the ABS Module DTC Chart.
I4 CHECK THE ABS MODULE YAW RATE (YAW_RATE) PID	
• Enter the following diagnostic mode on the scan tool: ABS Module DataLogger. • **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the YAW_RATE PID.	**Yes** GO to I5. **No** GO to I13.

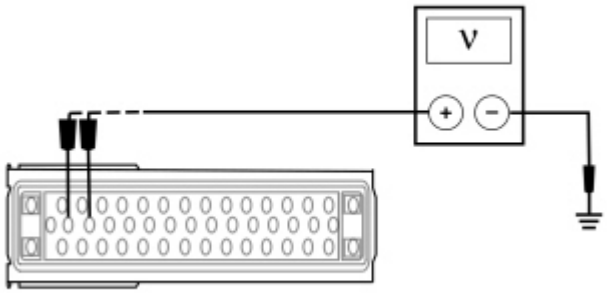
• **Is the YAW_RATE PID value between -0.05 and 0.05?**	
I5 CHECK THE ABS MODULE LATERAL ACCELERATION (LAT_ACCL) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LAT_ACCL PID. • **Is the LAT_ACCL PID value between -0.4 and 0.4?**	**Yes** GO to I6 . **No** GO to I13 .
I6 CHECK THE ABS MODULE LONGITUDINAL ACCELERATION (LONG_ACCL) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LONG_ACCL PID. • **Is the LONG_ACCL PID value between -0.4 and 0.4?**	**Yes** GO to I7 . **No** GO to I13 .
I7 CHECK THE DEDICATED CAN CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Disconnect: ABS Module C135. • Disconnect: RCM C310A and C310B. • Measure the resistance between the ABS module C135, harness side and the RCM C310B, harness side as indicated in the following chart: **ABS Module / Circuit / RCM** C135-18 / VCA23 (BU/WH) / C310B-20 C135-19 / VCA24 (GN/OG) / C310B-19  N0113370 • **Are the resistances less than 5 ohms?**	**Yes** GO to I8 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. CYCLE the ignition key. REPEAT the self-test.
I8 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ▪ ABS module C135-19, circuit VCA24 (GN/OG), harness side. ▪ ABS module C135-18, circuit VCA23 (BU/WH), harness side.	**Yes** GO to I9 . **No** REPAIR the affected circuit (s). TEST the system for normal operation.



N0113371

- **Are the resistances greater than 10,000 ohms?**

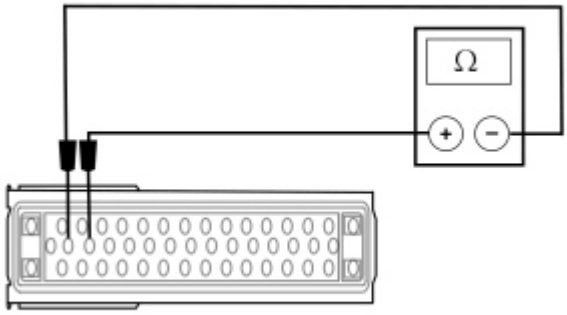
I9 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between ABS module C135-19, circuit VCA24 (GN/OG), harness side and ABS module C135-18, circuit VCA23 (BU/WH), harness side.  N0113372 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I10 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.
I10 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO VOLTAGE	
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Ignition ON. • Measure the voltage between ground and: ▪ ABS module C135-19, circuit VCA24 (GN/OG), harness side. ▪ ABS module C135-18, circuit VCA23 (BU/WH), harness side.	**Yes** REPAIR the affected circuit (s) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to I11 .



N0113369

- **Is any voltage present?**

I11 CHECK RCM TERMINATING RESISTOR	

• Ignition OFF.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B.
• Prior to reconnecting any previously disconnected SRS component:
  ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to RCM in Section 501-20B.
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information.
 	
• Connect: RCM C310A and C310B.
• Measure the resistance between ABS module C135-18, circuit VCA23 (BU/WH), harness side and C135-19, circuit VCA24 (GN/OG), harness side.
 	
  	


N0113372
 	
• **Is the resistance between 108 and 132 ohms?**
	Yes
	GO to I12.
	
	No
	INSTALL a new RCM.
	REFER to Section 501-20B.
	CLEAR all CMDTCs.
	PERFORM a road test.
	REPEAT the self test. If the concern is still present, GO to I14. If other DTCs are present, REFER to the appropriate DTC chart.

I12 CHECK THE RCM INSTALLATION AND MOUNTING SURFACE	
• Ignition OFF. • If not previously directed to do so, depower the Supplemental Restraint System (SRS). Refer to Supplemental Restraint System (SRS) Depowering and	**Yes** GO to I13. **No** REPAIR or INSTALL new as

Repowering in Section 501-20B . • Inspect the Restraints Control Module (RCM) installation and make sure that the fasteners are fully seated and tightened correctly. Refer to RCM in Section 501-20B . • Inspect the mounting surface for damage, corrosion or foreign material. • **Is the RCM installed correctly and is the mounting surface clean and free from damage?**	necessary. REPOWER the SRS . REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . CLEAR all CMDTCs . PERFORM a road test. REPEAT the self test.
I13 CHECK FOR AN INTERMITTENT FAULT	
• Disconnect: RCM C310A and C310B. • Disconnect: ABS module C135. ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Perform a road test. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module. • **Is the concern still present?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CLEAR all CMDTCs . PERFORM a road test. REPEAT the self test. If the concern is still present, GO to I14 . If other DTCs are present, REFER to the appropriate DTC chart. **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.**
I14 CHECK THE ABS MODULE FOR CORRECT OPERATION	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to RCM in Section 501-20B . ▪ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Perform a road test. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module.	**Yes** INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• **Is the concern still present?**	

Pinpoint Test J: DTC U0151:88

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) measures vehicle yaw rate, lateral acceleration and longitudinal acceleration and then sends the information to the ABS module along a dedicated pair of Controller Area Network (CAN) circuits. This dedicated CAN is used only for communication between the RCM and the ABS module. The yaw rate sensor, lateral accelerometer and longitudinal accelerometer are contained in the RCM .

- DTC U0151:88 (Lost Communication With Restraints Control Module: Bus Off) — This DTC can set if either of the dedicated CAN circuits are open, shorted to ground or shorted to each other. Other DTCs indicating missing messages or invalid signals from the RCM sensors can set as a result of a dedicated CAN fault.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM
- ABS module

PINPOINT TEST J: DTC U0151:88

WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

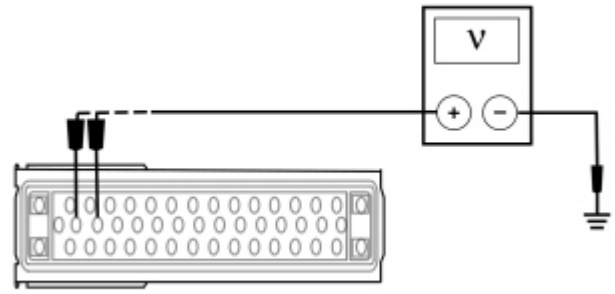
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

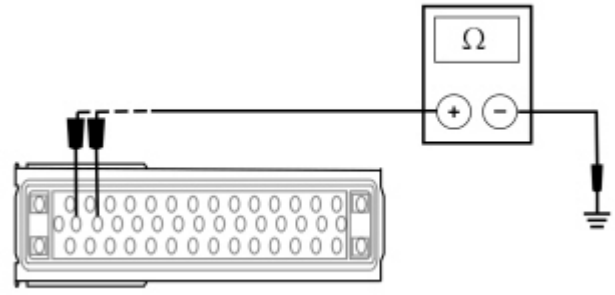
Test Step	Result / Action to Take
J1 CHECK FOR AN HS-CAN CONCERN WITH THE RCM	
• Ignition ON. • **NOTE:** The Network Test does not test the dedicated CAN communications between the ABS module and RCM . • Using a scan tool, carry out the Network Test. • **Does the RCM pass the Network Test?**	**Yes** GO to J2 . **No** REFER to Section 418-00 to diagnose the RCM does

	not respond to scan tool.
J2 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO VOLTAGE	

• **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**
• Depower the SRS . Refer to Refer to Supplemental Restraint System (SRS) Depowering and Repowering Section 501-20B .
• Disconnect: ABS Module C135 .
• Disconnect: RCM C310A .
• Disconnect: RCM C310B .
• Ignition ON.
• Measure the voltage between ground and:
  ▪ ABS module C135-19, circuit VCA24 (GN/OG), harness side.
  ▪ ABS module C135-18, circuit VCA23 (BU/WH), harness side.
  	


N0113369
• **Is any voltage present?**
	Yes
	REPAIR the affected circuit (s) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. GO to J10 .
	
	No
	GO to J3 .

J3 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO GROUND	

• Ignition OFF.
• Measure the resistance between ground and:
  ▪ ABS module C135-19, circuit VCA24 (GN/OG), harness side.
  ▪ ABS module C135-18, circuit VCA23 (BU/WH), harness side.
  	


N0113371
	Yes
	GO to J4 .
	
	No
	REPAIR the affected circuit (s). TEST the system for normal operation. GO to J10 .

• **Are the resistances greater than 10,000 ohms?**	
J4 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between ABS module C135-19, circuit VCA24 (GN/OG), harness side and ABS module C135-18, circuit VCA23 (BU/WH), harness side.  N0113372 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J5 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. GO to J10 .
J5 CHECK THE DEDICATED CAN CIRCUITS FOR AN OPEN	
• Measure the resistance between the ABS module C135, harness side and the RCM C310B, harness side as indicated in the following chart: **ABS Module** / **Circuit** / **RCM** C135-18 / VCA23 (BU/WH) / C310B-20 C135-19 / VCA24 (GN/OG) / C310B-19  N0113370 • **Are the resistances less than 5 ohms?**	**Yes** GO to J6 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. CYCLE the ignition key. REPEAT the self-test. GO to J10 .
J6 CHECK RCM TERMINATING RESISTOR	
• Prior to reconnecting any previously disconnected SRS component: ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ▪ inspect wire harness for any damage, pinched, cut or pierced wires. ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer	**Yes** GO to J7 . **No** GO to J8 .

to RCM in Section 501-20B . ■ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: RCM C310A . • Connect: RCM C310B . • Measure the resistance between ABS module C135-19, circuit VCA24 (GN/OG), harness side and ABS module C135-18, circuit VCA23 (BU/WH), harness side.  N0113372 • **Is the resistance between 108 and 132 ohms?**	
J7 CHECK THE ABS MODULE FOR CORRECT OPERATION • Prior to reconnecting any previously disconnected SRS component: ■ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ■ inspect wire harness for any damage, pinched, cut or pierced wires. ■ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to RCM in Section 501-20B . ■ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ■ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Was DTC U0151 retrieved on-demand during the self-test?**	**Yes** INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. GO to J10 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. GO to J10 .
J8 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs will be recorded.	**Yes** INSTALL a new RCM . REFER to Section 501-20B . GO to J10 .

• If previously directed to repower the SRS, depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B.
• Prior to reconnecting any previously disconnected SRS component:
  ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to RCM Removal and Installation in Section 501-20B.
  ▪ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information.
 	
• Connect: All Previously Disconnected Component (s)/Connector(s).
• Repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM.
• **Were DTCs U0028:08 and/or U0028:88 retrieved on-demand during self-test?**
	No
	In the process of diagnosing the fault, the fault condition has become intermittent.
	
	CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** GO to J9.

J9 CHECK FOR AN INTERMITTENT FAULT
 	
• Ignition OFF.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B.
• Disconnect RCM C310B and ABS module C135:
  ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5, Connector Repair Procedures for schematic and connector information.
 	
• Connect: All Previously Disconnected Component (s)/Connector(s).
• Repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — RCM.
• **Are any RCM DTCs retrieved on-demand during the self-test?**
	Yes
	REFER to the Restraints Control Module (RCM) DTC Chart in Section 501-20B.
	
	No
	The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** GO to J10.

J10 CHECK FOR ADDITIONAL SRS DTCs • Ignition OFF. • **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the

follow this instruction may result in serious personal injury or death in the event of an accidental deployment. • Reconnect all SRS components (if previously disconnected). ▪ If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B. • Ignition ON. • Using a scan tool, clear all RCM CMDTCs. • Enter the following diagnostic mode on the scan tool: Self Test — RCM. • **Were any DTCs retrieved on-demand from the RCM during self-test?**	appropriate DTC Chart in this section and/or Section 501-20B for pinpoint test direction. **No** CLEAR all CMDTCs. PROVE OUT the SRS. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B. Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test K: DTC U3002:62

Refer to Wiring Diagrams Cell 42, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

When the ignition is turned to the RUN position, the ABS module and the IPC share Vehicle Identification Number (VIN) information over the High Speed Controller Area Network (HS-CAN) bus. Correct any network communications DTCs prior to diagnosing DTC U3002:62

- DTC U3002:62 (Vehicle Identification Number: Signal Compare Failure) — this DTC sets when the VIN message sent by the IPC over the HS-CAN does not match the VIN stored in the ABS module.

This pinpoint test is intended to diagnose the following:

- Module configuration (ABS and IPC)
- ABS module

PINPOINT TEST K: DTC U3002:62

Test Step	Result / Action to Take
K1 VERIFY IPC VIN	**Yes** GO to K2. **No** CARRY OUT Programmable Module Installation (PMI) for the IPC. REFER to Section 418-01. TEST the system for normal operation.
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Log Viewer. • Compare the VIN in Log Viewer to the vehicle VIN plate. • **Does VIN in Log Viewer match the vehicle VIN plate?**	
K2 VERIFY ABS MODULE PART NUMBER	**Yes** CARRY OUT PMI for the ABS module. Refer to Section 418-01. TEST the system for normal operation. **No** INSTALL a new ABS module. REFER to
• Retrieve and record the ABS module part number from Log Viewer and verify that the vehicle has the correct ABS module installed. • **Is the correct ABS module installed in the vehicle?**	

	Hydraulic Control Unit (HCU) in this section. CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test.

Pinpoint Test L: DTCs U3003:16, U3003:17

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The operating voltage required to supply the ABS module, hydraulic pump and isolation valves is in a range between 10 and 16 volts.

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) — this DTC sets if the voltage supplied to the ABS module falls below 10 volts during the ABS module self-test or normal operation, with vehicle speed greater than 5 km/h (3 mph.
- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) — this DTC sets if the voltage supplied to the ABS module is greater than 17 volts during the ABS module self-test or normal operation, with vehicle speed greater than 5 km/h (3 mph.

This pinpoint test is intended to diagnose the following:

- Module configuration (ABS and PCM)
- ABS module

PINPOINT TEST L: DTCs U3003:16 AND U3003:17

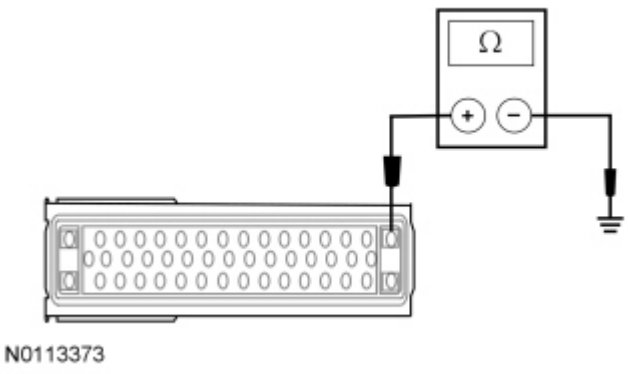
NOTE: DTCs U3003:16 and U3003:17 can set if the vehicle has been recently jump started, the 12-volt battery has been recently charged or the 12-volt battery has been discharged. The 12-volt battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to inspection and verification in this section.

Test Step	Result / Action to Take
L1 RETRIEVE ALL CMDTCs IN ALL MODULES • Connect: ABS Module C135. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — CMDTCs . • **Are there battery, voltage or charging system DTCs present in more than one module?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** For ABS DTC U3003:16 GO to L2 . For ABS DTC U3003:17 GO to L6
L2 CHECK BATTERY CONDITION • Ignition OFF. • Refer to Section 414-01 and carry out the Battery — Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes

	(CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to L3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.

L3 CHECK THE ABS MODULE GROUND EYELET
 	
• Ignition OFF.
• Remove the bolt retaining G107/G108 at the inner RF fender.
  ▪ Clean the chassis mating surface and ground eyelets.
  ▪ Install the ground eyelet to the chassis with the retaining bolt.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module.
• **Is the concern still present?**
	Yes
	GO to L4 .
	
	No
	The concern was caused by a loose or corroded connector. CLEAR the DTCs. REPEAT self-test.

L4 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN
 	
NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01
 	
• Ignition OFF.
• Disconnect: Battery Cable — Negative.
• Disconnect: ABS Module C135.
• Measure the resistance between ground and:
  ▪ ABS module C135-47, circuit GD123 (BK/GY), harness side.
  ▪ Repeat this measurement while wiggling the harness.
 	
  	


N0113373
 	
• **Is the resistance less than 5 ohms?**
	Yes
	GO to L5 .
	
	No
	The concern was caused by a loose or corroded connector. CLEAR the DTCs. REPEAT self-test.

L5 CHECK FOR VOLTAGE AT THE ABS MODULE
 	
• Connect: Battery Cable — Negative.
• Ignition ON.
• Measure the voltage between ground and:
  ▪ ABS module C135-1, SBB01 (RD), harness side.
  ▪ ABS module C135-8, CBP22 (GN/OG), harness side.
	Yes
	GO to L6 .
	
	No
	VERIFY that BJB fuses 1

■ ABS module C135-32, SBB28 (GN/RD), harness side.  N0113375 • **Are the voltages greater than 10 volts?**	(40A), and 9 (20A) and CJB 22 (7.5A) are OK. If OK, REPAIR the affected circuit (s). If the fuses are not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs and REPEAT the self-test.
L6 CHECK CHARGING SYSTEM VOLTAGE • Start the engine. • Measure the voltage of the battery with and without a load on the charging system as follows: ■ Turn off all accessories and measure battery voltage. ■ Turn on headlights and HVAC fan on high and measure battery voltage.  AJ0210-A • **Are the voltages between 13 and 15.2 volts?**	**Yes** GO to L7 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.
L7 CHECK FOR CORRECT ABS MODULE OPERATION • Ignition OFF. • Disconnect: ABS Module C135. • Check for: ■ corrosion ■ pushed-out pins ■ spread terminals • Connect: ABS Module C135. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Brake Pedal Switch Adjustment

NOTICE: **Do not press the brake pedal when installing or removing the brake pedal position switch or damage to the brake pedal-mounted switches can occur.**

1. Inspect both brake pedal position switches and brake pedal assembly to verify there is no brake pedal pressure unintentionally applied due to incorrect brake pedal position switch or brake pedal installation.
   - Correct any concerns before proceeding to the next step.

2. Confirm that all fasteners retaining the brake pedal assembly are correctly tightened. For additional information, refer to Section 206-06 .

3. Using the Integrated Diagnostic System (IDS) scan tool, select DataLogger->Chassis->Braking->Brake Switch Parameters.

4. **NOTE:** Using the scan tool record function makes it easier to observe the brake pressure sensor readings.

   Turn the ignition to the ON position.

5. Slowly apply the brake pedal to generate the pressure graph for the BPS PID.
   - The rate of brake pedal apply must not exceed 5 psi per second as indicated by the scan tool.

6. Record the initial value of the BPS PID when BRAKE_LAMP and CRUISE_CANCL change from OFF to ON.
   - If BRAKE_LAMP and CRUISE_CANCL transition to ON before the BPS PID reads 44 psi or less, the brake pedal position switch is correctly installed.
   - If BRAKE_LAMP and CRUISE_CANCL transition to ON after the BPS PID reads greater than 44 psi, replace the stoplamp switch and cruise control deactivation switch (if equipped). Clear all DTCs and repeat Steps 3-6 to verify that the BRAKE_LAMP and CRUISE_CANCL transition to ON before the BPS PID reads 44 psi or less.

Hydraulic Control Unit (HCU)

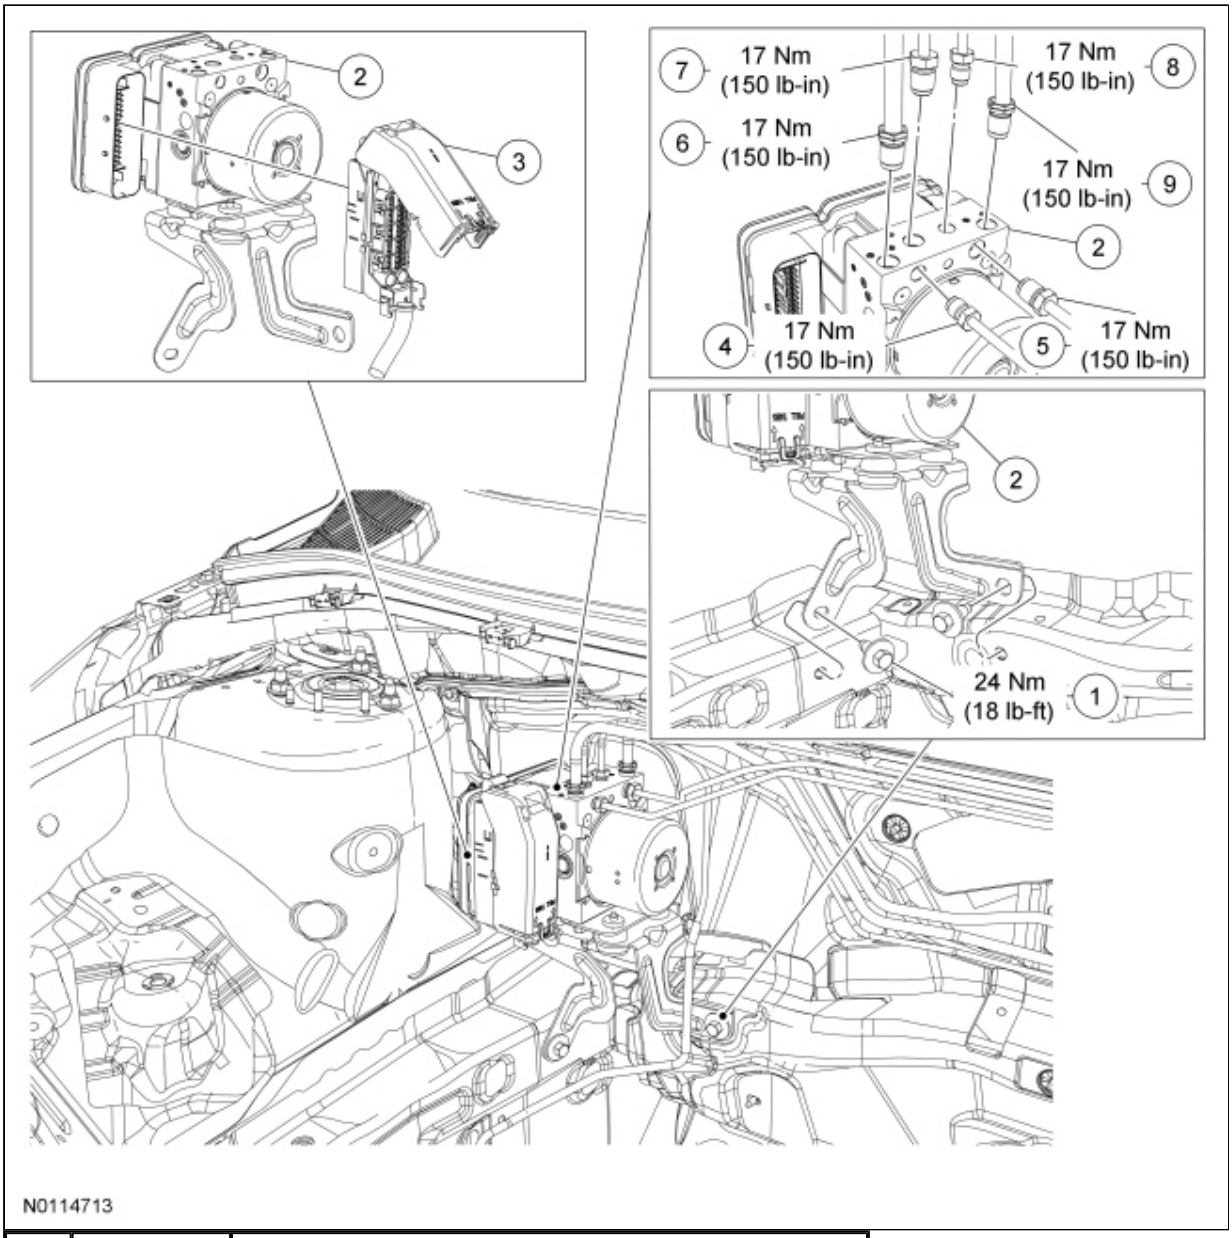
Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

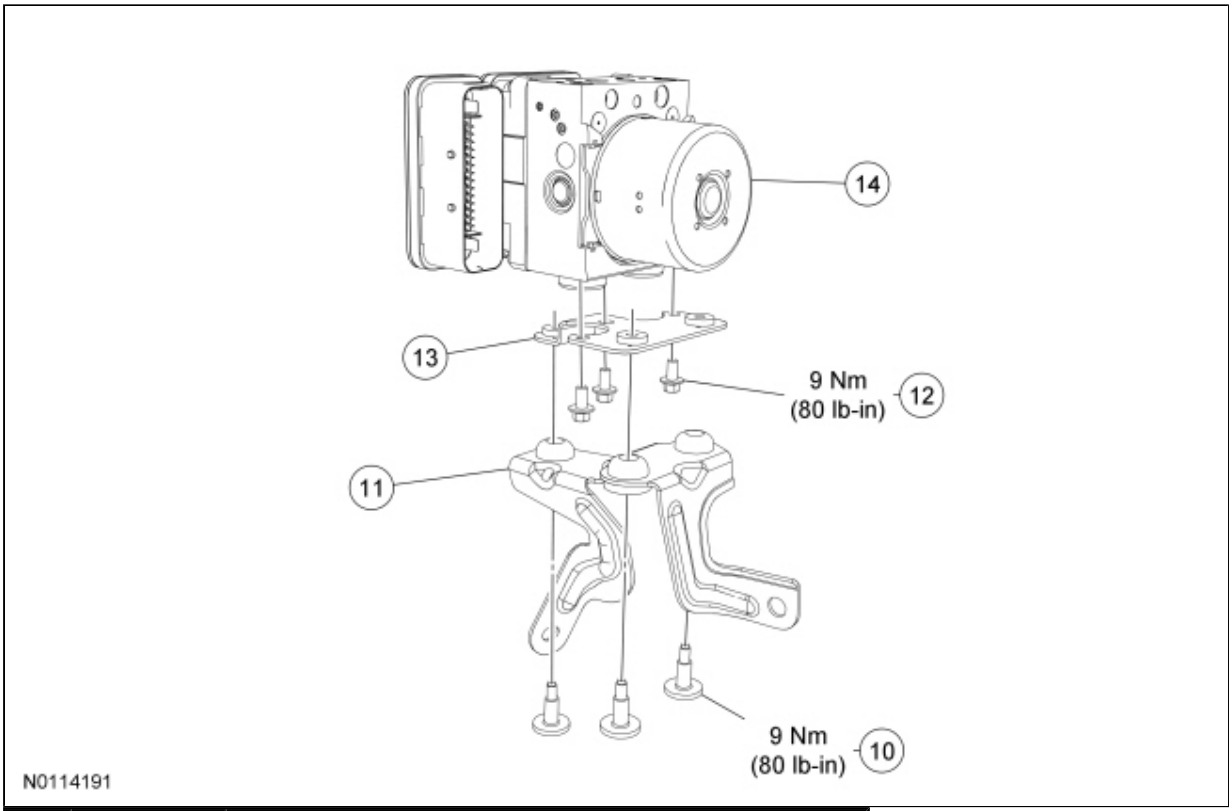
Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Hydraulic Control Unit (HCU), Brake Tubes, Electrical Connector and Bracket



Item	Part Number	Description
1	W706859	Hydraulic Control Unit (HCU) bracket-to-frame bolt (2 required)
2	2C405	HCU /ABS module assembly
3	—	HCU /ABS module electrical connector (part of 14A464)
4	—	RH rear brake tube fitting (part of 2C294)
5	—	LH rear brake tube fitting (part of 2C295)
6	—	Master cylinder primary brake tube fitting (part of 2M020)
7	—	LH front brake tube fitting (part of 2264)
8	—	RH front brake tube fitting (part of 2263)
9	—	Master cylinder secondary brake tube fitting (part of 2M019)

Hydraulic Control Unit (HCU) and Brackets



Item	Part Number	Description
10	W703244	Hydraulic Control Unit (HCU) support plate-to-bracket bolt (3 required)
11	2C304	HCU bracket
12	W500011	HCU -to-support plate bolt (3 required)
13	2C325	HCU support plate
14	2C405	HCU /ABS module assembly

Removal and Installation

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

***NOTICE:* Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

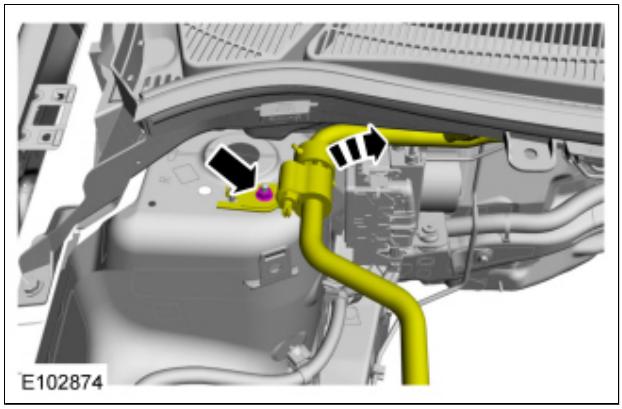
NOTE: The Hydraulic Control Unit (HCU) and ABS module are serviced as an assembly.

1. If installing a new HCU /ABS module, connect the scan tool and upload the module configuration information from the ABS module. For additional information, refer to Section 418-01 .

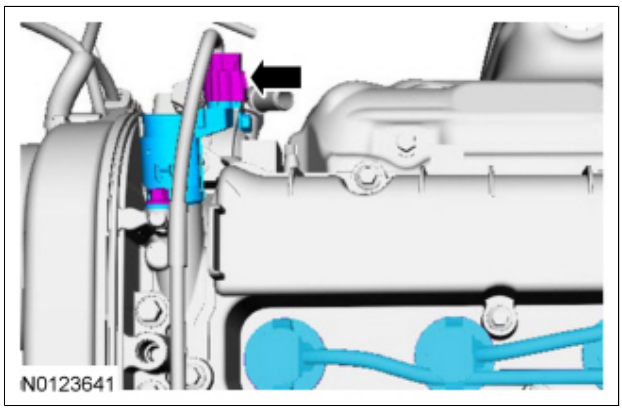
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the 2 HCU bracket-to-frame bolts.
   - To install, tighten to 24 Nm (18 lb-ft).

4. Remove the nut and evaporator outlet tube bracket.
    - To install, tighten to 8 Nm (71 lb-in).



5. Disconnect the exhaust camshaft Variable Camshaft Timing (VCT) oil control solenoid electrical connector.



6. **NOTE:** Cap the brake tube connections to prevent fluid loss or dirt contamination.

   Disconnect the 6 brake tubes from the HCU .
    - To install, tighten the brake tube fittings to 17 Nm (150 lb-in).

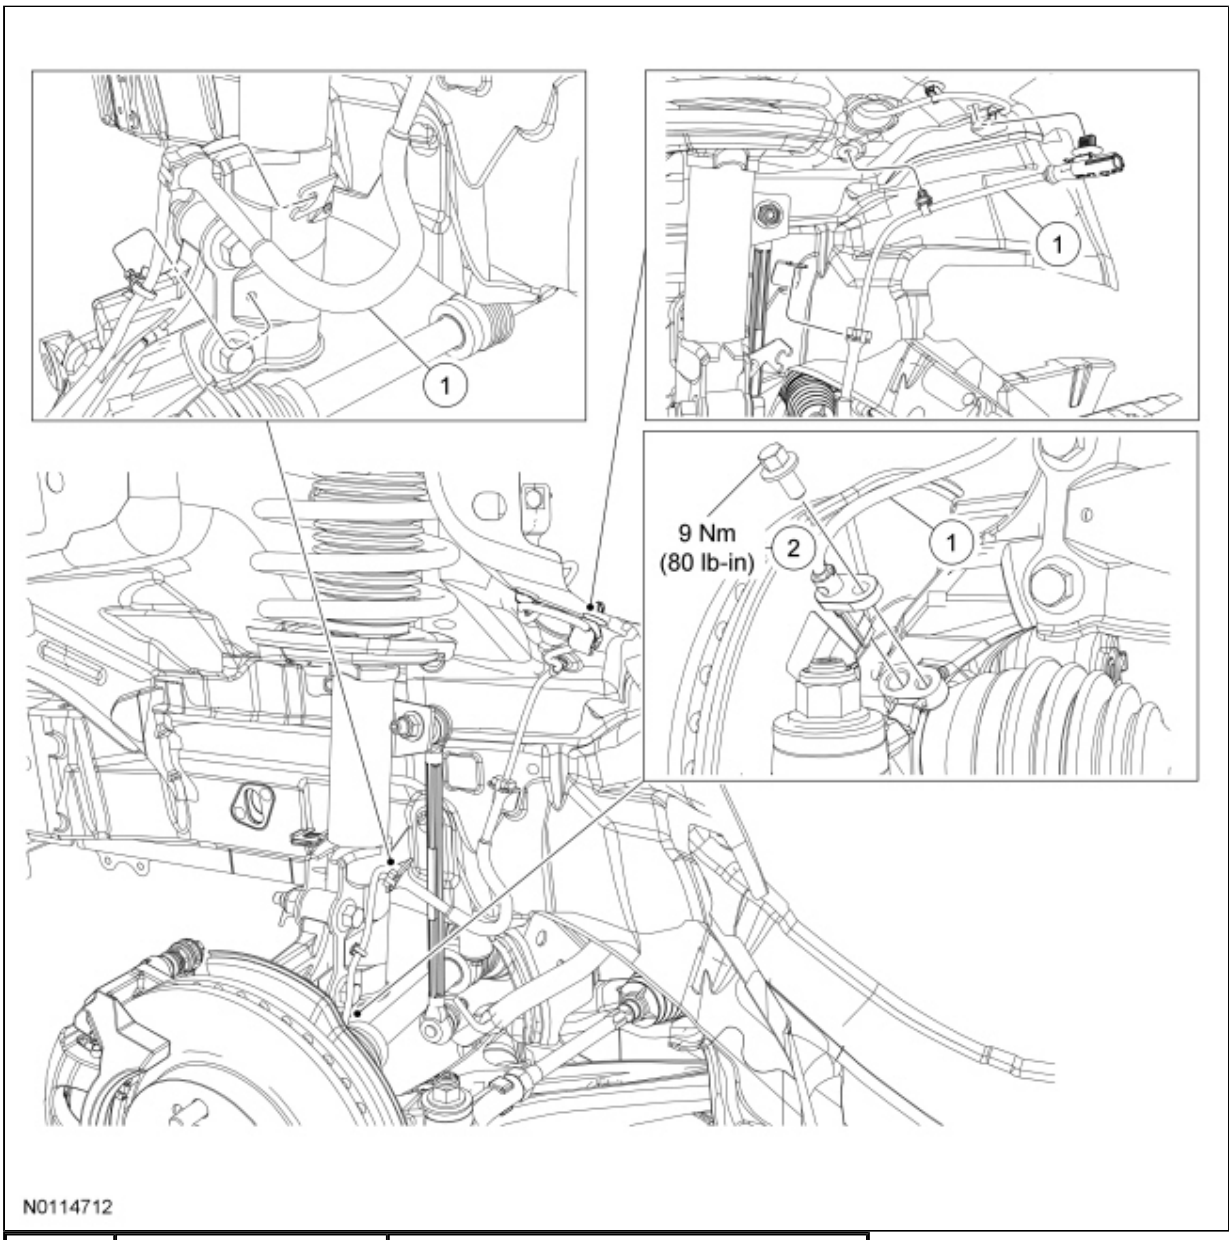
7. Disconnect the HCU /ABS module electrical connector.

8. Position the HCU to the center line of the vehicle and remove the HCU .

9. To install, reverse the removal procedure.
    1. If a new HCU /ABS module was installed, download the module configuration information from the scan tool. For additional information, refer to Section 418-01 .
    2. Bleed the brake system. For additional information, refer to Section 206-00 .

Wheel Speed Sensor — Front

NOTE: LH shown, RH similar.

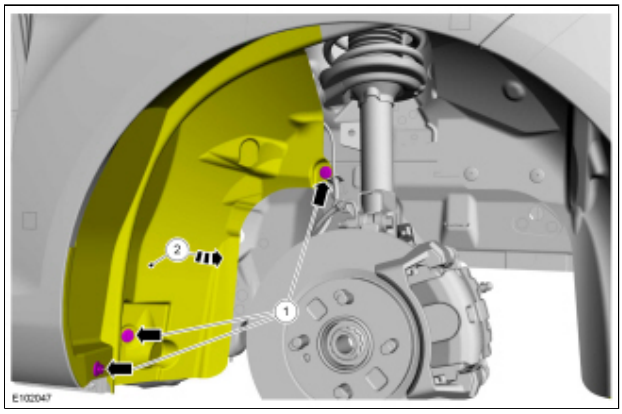


Item	Part Number	Description
1	2C204	Wheel speed sensor
2	W500011	Wheel speed sensor bolt

Removal and Installation

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Position the rear portion of the splash shield aside.
    1. Remove the 3 pushpin retainers.
    2. Position the splash shield aside.



3. Disconnect the wheel speed sensor electrical connector.

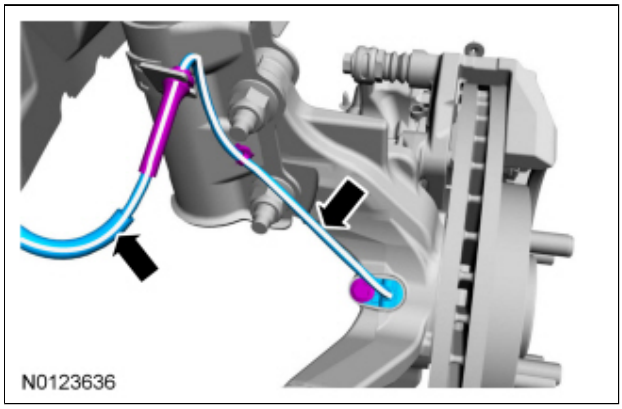
4. Detach the wheel speed sensor from the body and wheel knuckle.

5. Remove the wheel speed sensor bolt.
   - To install, tighten to 9 Nm (80 lb-in).

6. Remove the wheel speed sensor.

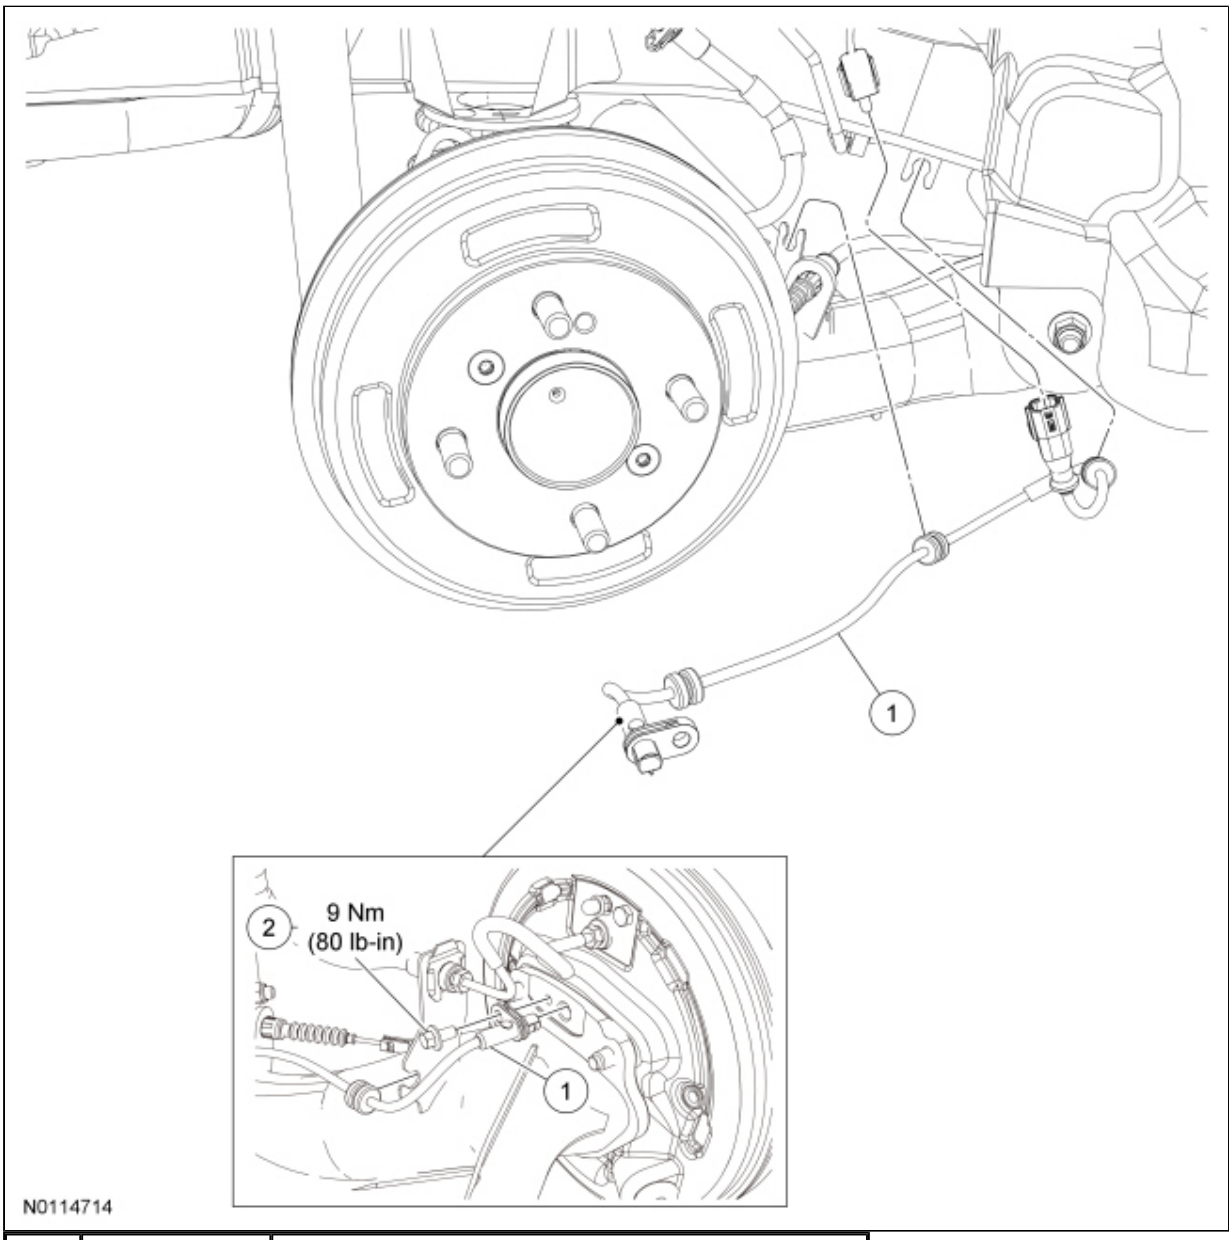
7. ***NOTICE:*** **The white stripe on the wheel speed sensor harness is used for orientation purposes. Correct routing of the wheel speed sensor and harness is essential to prevent contact damage to the harness.**

   To install, reverse the removal procedure.



Wheel Speed Sensor — Rear

NOTE: RH shown, LH similar. Wheel and tire removed for clarity.



Item	Part Number	Description
1	2C204	Wheel speed sensor
2	W500011	Wheel speed sensor bolt (also part of 2C204)

Removal and Installation

1. Refer to exploded view(s) and any Warnings, Notices, Notes, Materials, Specifications and Special Tools. Items in the exploded views may not be listed in order of removal.

Torque Specifications

Description	Nm	lb-ft	lb-in
Battery tray bolts	10	—	89
Cross brace bolts	40	30	—
Exhaust flange nuts	47	35	—

15	7A256	Manual control lever
16	W714072-S437	Selector lever cable bracket bolts (2 required)

External Controls

The transaxle external controls system consists of the following components:

- Selector lever assembly
- Selector lever cable and bracket
- Brake Shift Interlock Actuator (BSIA)
- Transmission Control Switch (TCS)

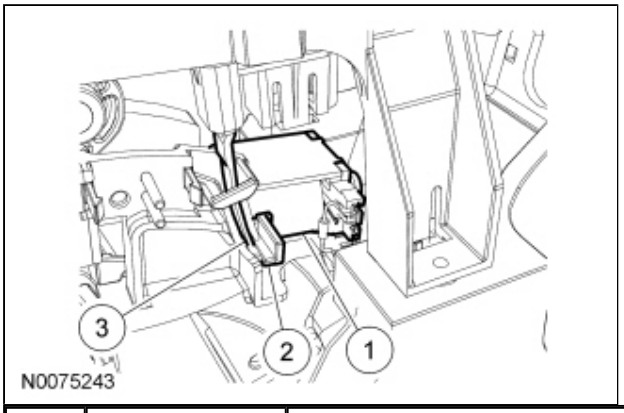
The selector lever controls the transaxle gear selection through the selector lever cable. When the selector lever is moved to the desired mode of operation it moves the selector lever cable which moves the manual control lever on the transaxle. This results in the desired gear selection. The selector lever knob controls the cable detent and selector lever locking position.

Range Selection

Range Positions		
P	Park	In the PARK position, • there is no power flow through the transaxle. • the parking pawl locks the final drive. • the engine may be started. • the ignition key may be removed.
R	Reverse	In the REVERSE position, • the vehicle may be operated in a rearward direction, at a reduced rear ratio. • engine braking occurs.
N	Neutral	In the NEUTRAL position, • the vehicle is able to roll. • there is no power flow through the transaxle. • the output shaft is not held and is free to turn. • the engine may be started.
D	Drive position with Grade Assist	DRIVE is the normal position for most forward driving. The DRIVE position provides • automatic shifts —1st through 6th gears. • maximum fuel economy during normal operation.
L	Manual Low	Manual L position allows for 1st gear when the vehicle reaches slower speeds. This position provides

		• maximum engine braking. • downshifts to the lowest available gear for the current vehicle speed.

Brake Shift Interlock Actuator (BSIA)



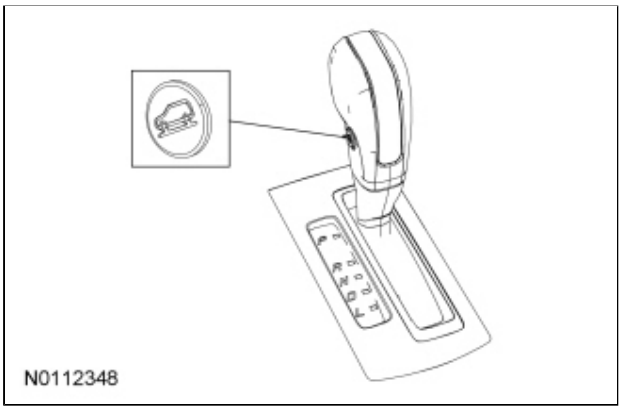
Item	Part Number	Description
1	—	Actuator (part of 7210)
2	—	Blocker (part of 7210)
3	—	Manual release mechanism (part of 7210)

Location

The BSIA is part of the selector lever assembly.

The brake shift interlock system prevents the selector lever from being moved out of PARK unless the requirements to do so are met. The ignition switch must be in the ON position and the brake pedal must be pressed. The brake pedal position is detected by the Brake Pedal Position (BPP) switch. In the event the vehicle will not come out of PARK, the manual release mechanism mechanically bypasses the electric portion of the brake shift interlock system allowing the selector lever to be moved out of PARK. The manual release mechanism is part of the selector lever assembly. If PARK is selected again, the selector lever will be locked again.

Drive with Grade Assist



Drive with Overdrive (O/D) cancel and grade assist is activated when the Transmission Control Switch (TCS) is pressed. The TCS is located on the selector lever knob. When the TCS is pressed, the 6th gear or O/D upshift is prevented or the transaxle shifts down to 5th gear. The TCS is meant to be used when driving conditions cause excessive shifting from 6th to other gears such as hilly terrain, mountainous areas or when engine braking is required.

Grade Assist

- O/D is cancelled.
- The transaxle operates in gears 1 through 5.
- The Grade Assist lamp illuminates on the Instrument Panel Cluster (IPC).
- Improves vehicle handling in hilly terrain or mountainous areas by providing engine braking and extending lower gear operation on uphill climbs.
- Provides additional engine braking through the automatic transaxle shift strategy which reacts to vehicle inputs (vehicle acceleration, accelerator pedal, brake pedal and vehicle speed).
- The transaxle selects gears that provide the desired engine braking which is based on the vehicle inputs. Engine braking increases engine rpm.

Returning to DRIVE mode on flat terrain provides the best fuel economy and transaxle performance. The transaxle returns to O/D when the TCS is pressed again or the key is turned OFF.

Gear Availability

MANUAL LEVER POSITION	TRANSAXLE GEAR OPERATION	DESCRIPTION
P	Park	Forward or reverse gears not available. Final drive is held to the transaxle case.
R	Reverse	Transaxle allows reverse only.
N	Neutral	Forward or reverse gears not available. Final drive moves freely.
D	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6	6 forward gears are available. Gears are dependent on vehicle speed and throttle position with coast braking.
D Grade Assist	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ← 6	1st through 5th gears are available. Transaxle shifts to 5th gear if button is pressed when the transaxle is in 6th gear. Transaxle provides engine braking.
L	[1] ← 2 ← 3 ← 4 ← 5 ← 6	1st gear hold with engine braking, the transaxle downshifts to 1st gear when L is selected above a calibrated speed under minimum to moderate accelerator pedal position.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom. GO to Symptom Chart - External Controls or GO to Symptom Chart - NVH .

Symptom Chart — External Controls

Condition	Possible Sources	Action
• Brake shift interlock system does not release/lock correctly	• Circuitry open/shorted • Central Junction Box (CJB) fuse 18 (10A) • Brake Pedal Position (BPP) switch	• GO to Pinpoint Test A .
	• Brake Shift Interlock Actuator (BSIA)	• INSTALL a new selector lever assembly. REFER to Selector Lever in this section.
	• Transmission Range (TR) sensor	• DIAGNOSE and REPAIR all TR sensor DTCs. REFER to Section 307-11 .
• Transmission Control Switch (TCS) does not operate correctly	• Instrument Panel Cluster (IPC) • Circuitry open/shorted • CJB fuse 22 (7.5A) • Transmission Control Module	• GO to Pinpoint Test B .

	(TCM) • Transmission Control Switch (TCS)	
• Selector lever linkage is out of correct gear relationship	• Selector lever linkage out of adjustment • Loose selector lever cable bracket	• REFER to Selector Lever Cable Adjustment in this section. • CHECK the selector lever cable bracket. TIGHTEN as necessary.
• Unable to remove the key from the ignition	• Circuitry shorted • Ignition lock cylinder • Ignition switch • Selector lever	• REFER to Diagnosis and Testing in Section 211-05 .
• Selector lever making creaking noise	• Excessive dirt/dust in the selector lever slide	• CLEAN selector lever slide.
• Selector lever binding	• Selector lever bezel damaged • Selector lever damaged • Selector lever cable damaged • Internal transaxle components damaged	• CHECK the selector lever bezel for damage. If necessary, INSTALL a new selector lever. REFER to Selector Lever . • CHECK the selector lever for damage. If necessary, INSTALL a new selector lever assembly. REFER to Selector Lever . • CHECK the selector lever cable for damage. If necessary, INSTALL a new selector lever cable. REFER to Selector Lever Cable in this section. • CHECK manual control lever and internal transaxle components for damage. REFER to Section 307-11 .
• Brake shift interlock override does not release the selector lever	• Brake shift interlock override damaged	• INSPECT the selector lever for damage. If necessary, INSTALL a new selector lever. REFER to Selector Lever .

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action

• Vibration — a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	• Selector lever cable incorrectly routed, grounded out or loose	• CHECK the selector lever cable. REPAIR as necessary.

Pinpoint Tests

Pinpoint Test A: The Brake Shift Interlock System Does Not Release/Lock Correctly

Refer to Wiring Diagrams Cell 29 , Transmission Controls for schematic and connector information.

Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

PINPOINT TEST A: THE BRAKE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

Test Step	Result / Action to Take
A1 TEST THE BRAKE LIGHTS	
• Apply the brake pedal and view the brake lights. • **Do the brake lights illuminate?**	**Yes** GO to A2 . **No** REFER to Section 417-01 .
A2 TEST THE BSIA POWER CIRCUIT	
• Disconnect: Selector Lever Harness C3245. • Ignition ON. • Measure the voltage between selector lever harness C3245-1, circuit CCA26 (BU/GY), vehicle harness side and ground, while applying the brake pedal.  N0098237 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** REPAIR circuit CCA26 (BU/GY) for an open.
A3 TEST THE TCM	
• Ignition OFF. • Measure the resistance between selector lever harness C3245-5 circuit GD115 (BK/GY) and ground.  N0098240	**Yes** INSTALL a new selector lever. REFER to Selector Lever in this section. **No** GO to A4 .

• **Is the resistance less than 5 ohms?**	
A4 TEST THE BSIA GROUND CIRCUIT	
• Disconnect: Transmission Control Module (TCM) C1ET02. • Measure the resistance between selector lever harness C3245-12 and C1ET02-49.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new TCM. **No** REPAIR circuit CET53 (BU/OG) for an open.

Pinpoint Test B: Transmission Control Switch (TCS) Does Not Operate Correctly

PINPOINT TEST B: TCS DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
B1 TEST THE IPC	
• Connect the scan tool. • Using the scan tool, monitor the TCS_DEPRES PID while cycling the Transmission Control Switch (TCS). • **Does the TCS_DEPRES PID cycle from DEPRESSED to NOT DEPRESSED?**	**Yes** REFER to Section 413-01. **No** GO to B2.
B2 CHECK CJB FUSE 22 (7.5A)	
• Ignition OFF. • Check fuse: Central Junction Box (CJB) 22 (7.5A). • **Is the resistance less than 5 ohms?**	**Yes** GO to B3. **No** GO to B4.
B3 CHECK FOR VOLTAGE AT THE SELECTOR LEVER CONNECTOR	
• Disconnect: Selector Lever Harness C3245. • Ignition ON. • Measure the voltage between selector lever harness C3245-6, circuit CBP22 (GN/OG), vehicle harness side and ground.	**Yes** GO to B4. **No** REPAIR circuit CBP22 (GN/OG). RECONNECT all components. TEST the system for normal operation.

 N0115695 • **Is the resistance less than 5 ohms?**	
B4 TEST THE TCS	**Yes** GO to B5 . **No** INSPECT the selector lever wiring harness for damage. REPAIR the wiring harness as required. If the selector lever wiring harness is not damaged, INSTALL a new selector lever knob. REFER to Selector Lever Knob in this section. TEST the system for normal operation.
• Measure the resistance between selector lever harness C3245 pins 6 and 7, component side, while cycling the TCS .  N0098243 • **Is the resistance less than 5 ohms when pressed and greater than 10,000 ohms when released?**	
B5 TEST THE TCS SIGNAL CIRCUIT FOR A SHORT TO GROUND	**Yes** GO to B6 . **No** REPAIR circuit CE417 (GY/BN) for a short to ground. TEST the system for normal operation.
• Ignition OFF. • Disconnect: Transmission Control Module (TCM) C1ET02. • Measure the resistance between selector lever harness C3245-7, circuit CE417 (GY/BN) and ground.  N0115696 • **Is the resistance greater than 10,000 ohms?**	
B6 TEST THE TCS SIGNAL CIRCUIT FOR AN OPEN CIRCUIT	**Yes**
• Measure the resistance between selector lever harness	

C3245-7, circuit CE417 (GY/BN) and TCM C1ET02-11.  • **Is the resistance greater than 10,000 ohms?**	INSTALL a new TCM . REFER to Section 307-11 . **No** REPAIR circuit CE417 (GY/BN) for an open. RECONNECT all components. TEST the system for normal operation.

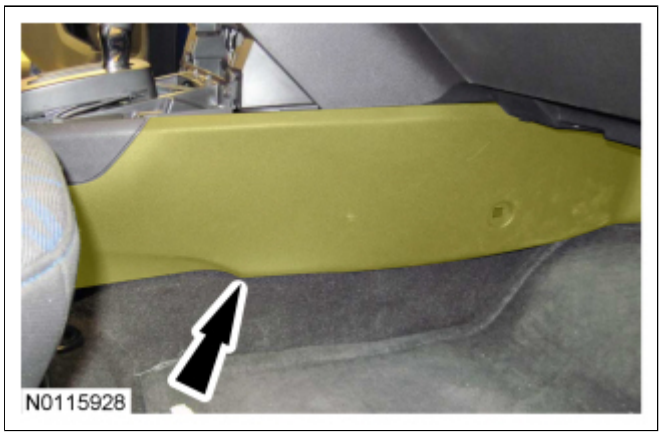
Brake Shift Interlock Override

NOTE: If it is necessary to use the brake shift interlock override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.

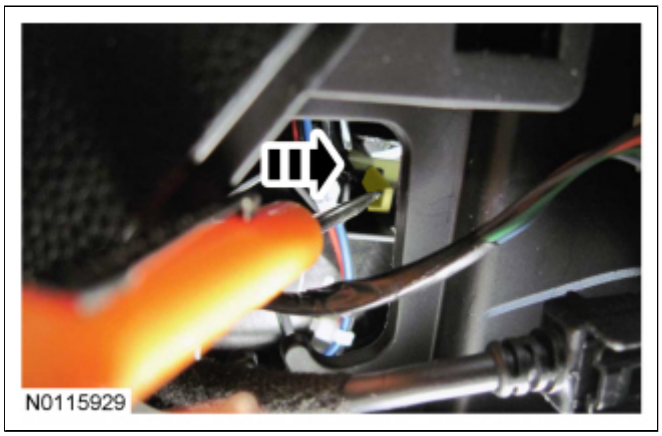
This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON or RUN position unless the brake pedal is depressed.

Perform the following if the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is depressed:

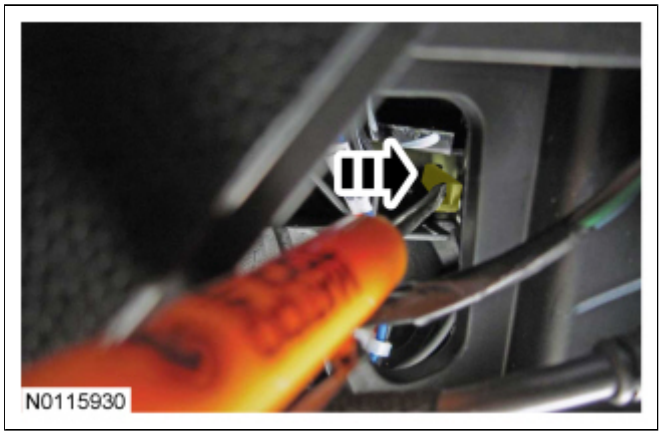
1. Apply the parking brake.
2. Turn the ignition key to the ON position.
3. Remove the center console side panel.



4. Locate the brake shift interlock override mechanism on the Brake Shift Interlock Actuator (BSIA).



5. Using an suitable tool, depress the brake shift interlock override mechanism on the BSIA , apply the brake, depress the button on the selector lever and move the selector lever into NEUTRAL.



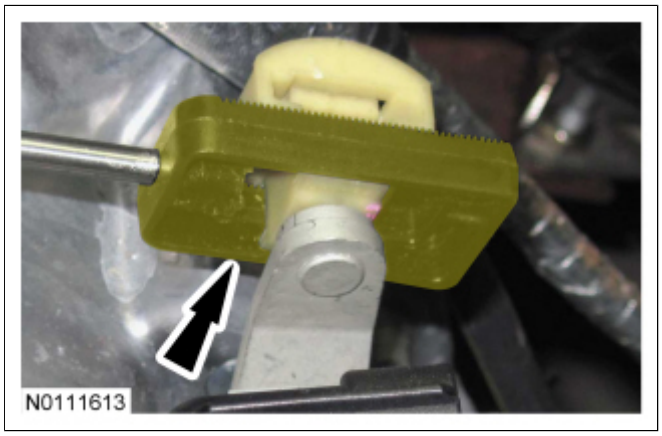
6. Start the vehicle.
7. To install, reverse the procedure.

Selector Lever Cable Adjustment

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

1. Disconnect the selector lever cable end from the manual control lever.

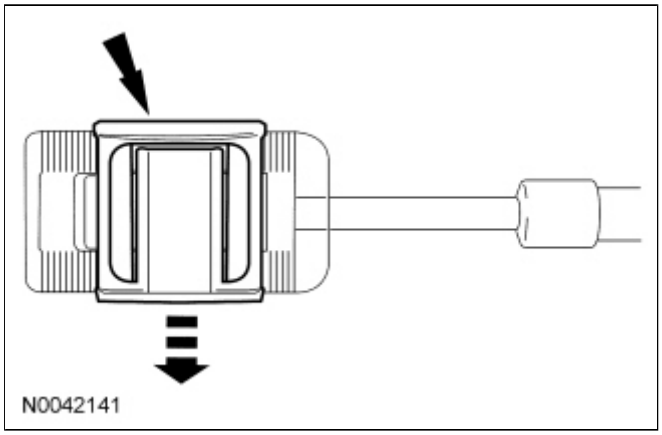


N0111613

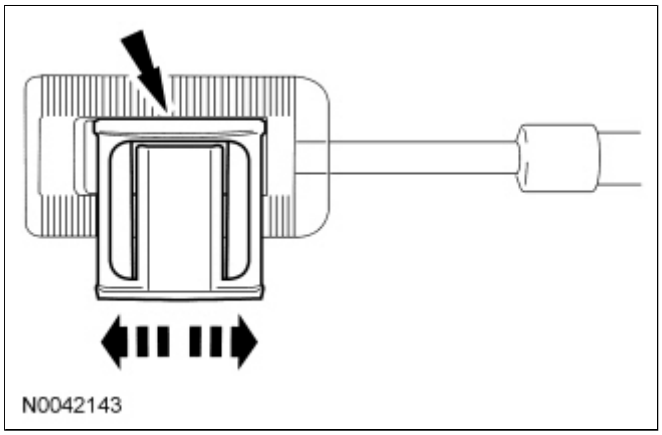
2. Place the manual control lever in the D position as indicated on the transaxle case.
3. Place the manual control lever in the P position as indicated on the transaxle case.
4. Place the manual control lever in the D position as indicated on the transaxle case.
5. Place the selector lever in the D position.

N0111772

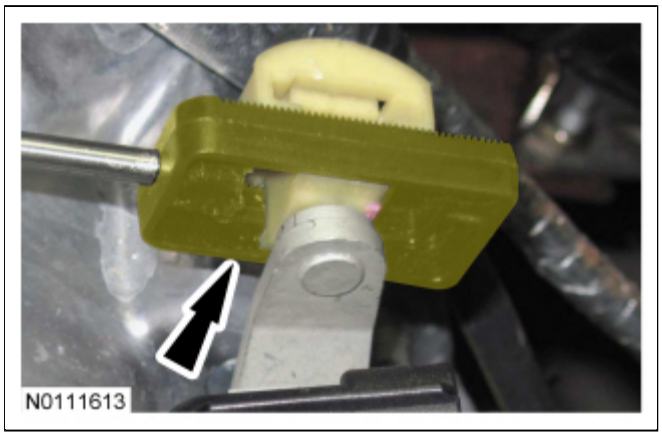
6. Unlock the selector lever cable adjuster by sliding the locking tab over.



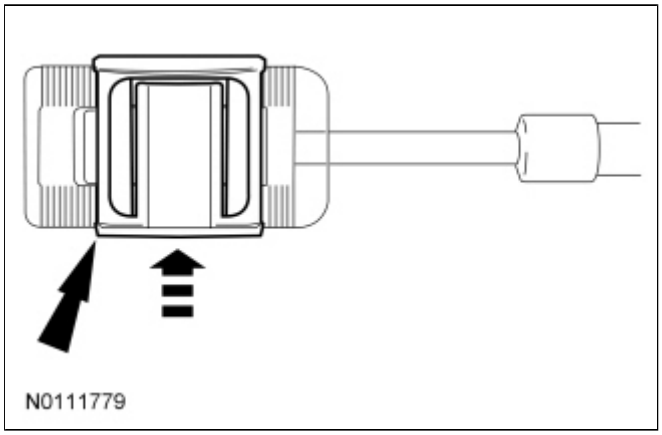
7. Slide the selector lever cable end forward or backward to align it with the manual control lever.



8. With the selector lever cable adjuster locking tab released, connect the selector lever cable end to the manual control lever.



9. Slide the locking tab back to lock the selector lever cable adjuster.

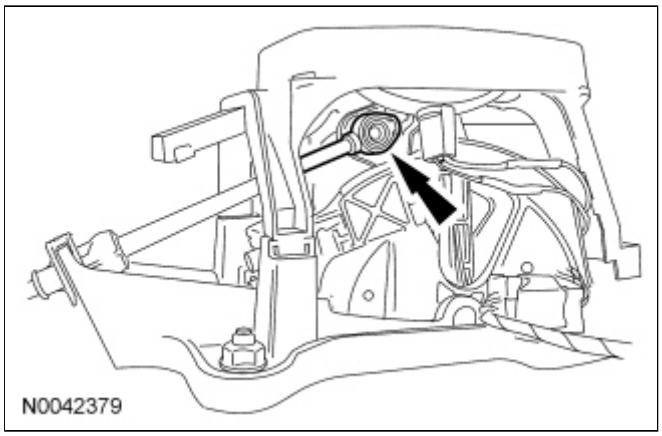


10. Verify that the vehicle only starts in PARK and NEUTRAL and the reverse lamps illuminate in REVERSE.

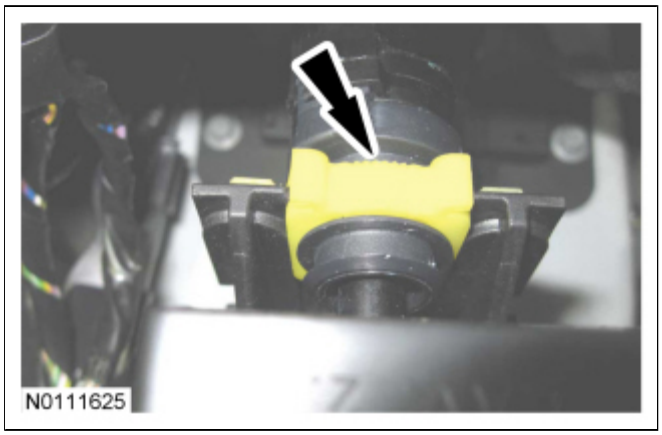
Selector Lever Cable

Removal

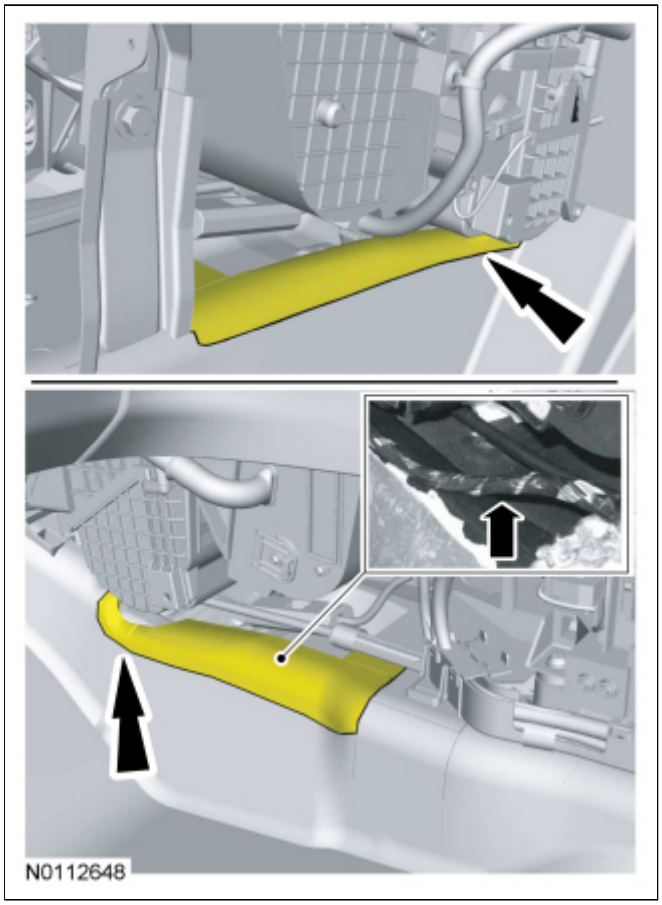
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the floor console. For additional information, refer to Section 501-12 .
3. Disconnect the selector lever cable end from the selector lever ball stud.



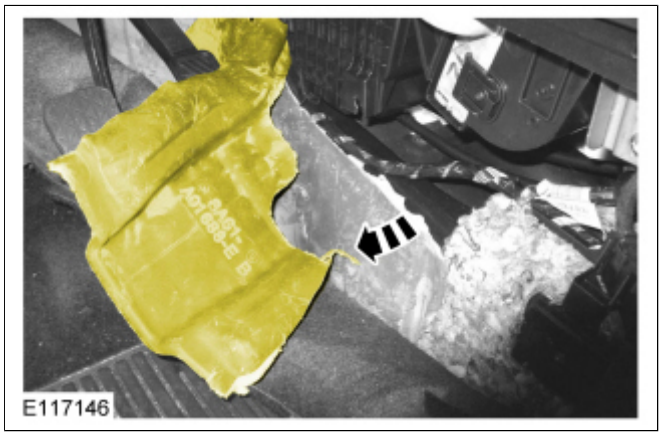
4. Release the locking tab on the selector lever cable clip and remove the selector lever cable from the selector lever housing.



5. Using a suitable tool, cut the carpet in the center under the heater core and evaporator core housing to gain access to the selector lever cable grommet in the following sequence.
    1. Begin cutting the carpet where the selector lever cable is exposed and cut the carpet back until the tool no longer fits between the floor and the heater core and evaporator core housing.
    2. To cut the carpet further forward, access the carpet with the tool through the LH side of the heater core and evaporator core housing.

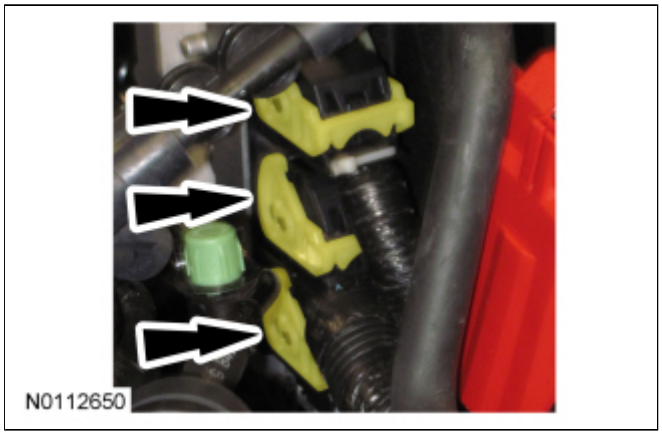


6. Position the carpet aside to access the selector lever cable grommet.

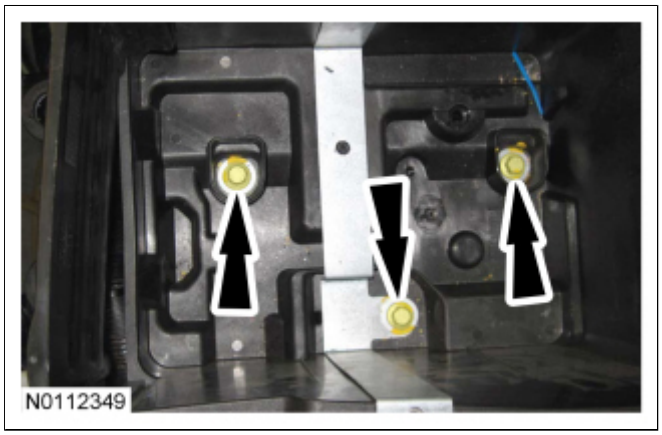


7. Remove the battery. For additional information, refer to Section 414-01 .

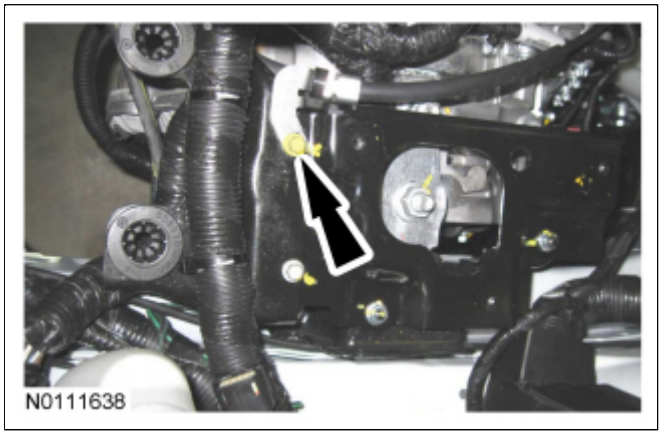
8. Disconnect the 3 PCM electrical connectors.



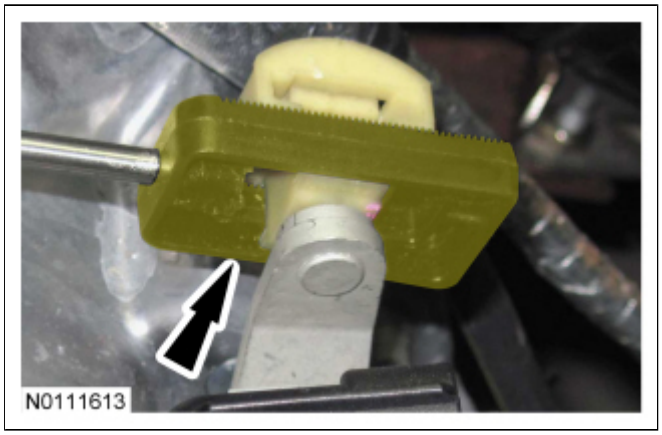
9. Remove the 3 battery tray bolts and the battery tray.



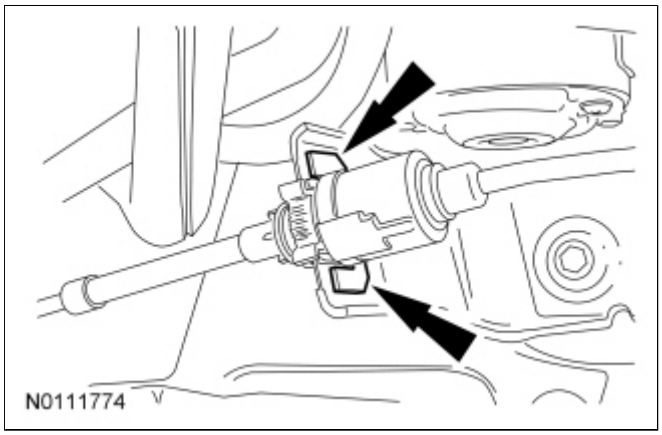
10. Remove the selector lever cable bracket bolt.



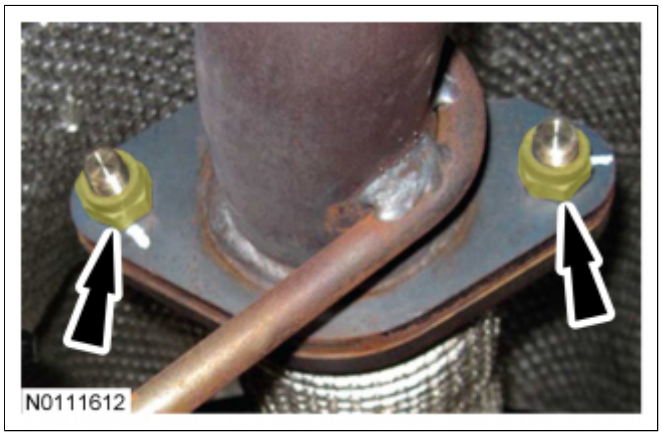
11. Disconnect the selector lever cable end from the manual control lever.



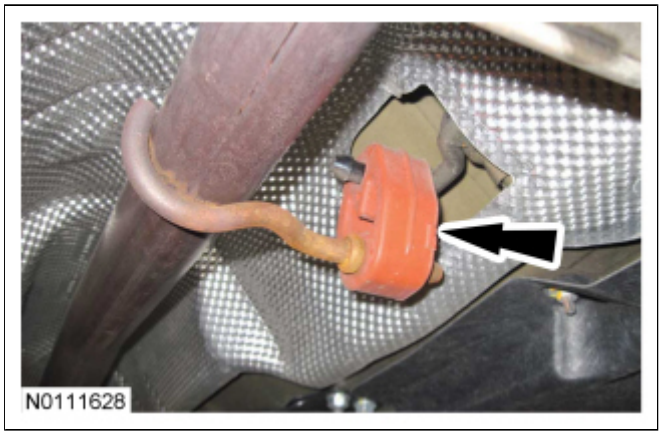
12. Disconnect the selector lever cable from the selector lever cable bracket.

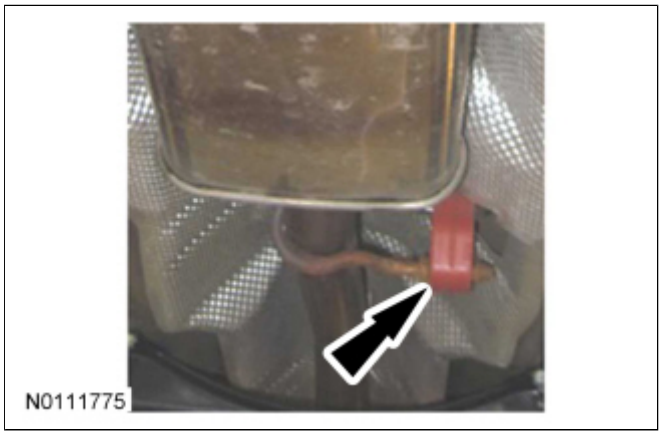


13. Remove and discard the 2 exhaust flange nuts and disconnect the exhaust flange.
    - Discard the exhaust flange gasket.

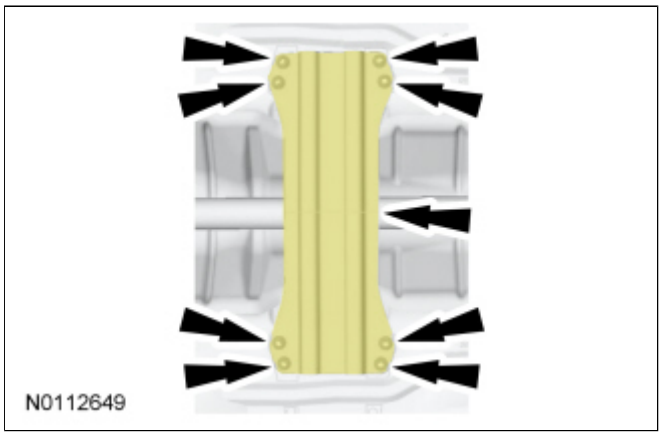


14. Disconnect the exhaust hangers and support the exhaust with wire.

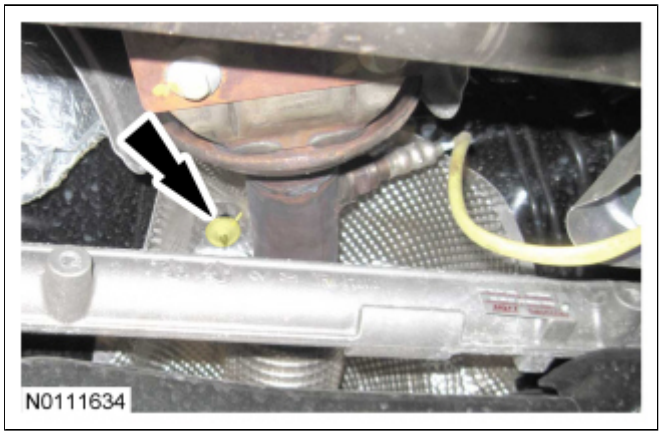


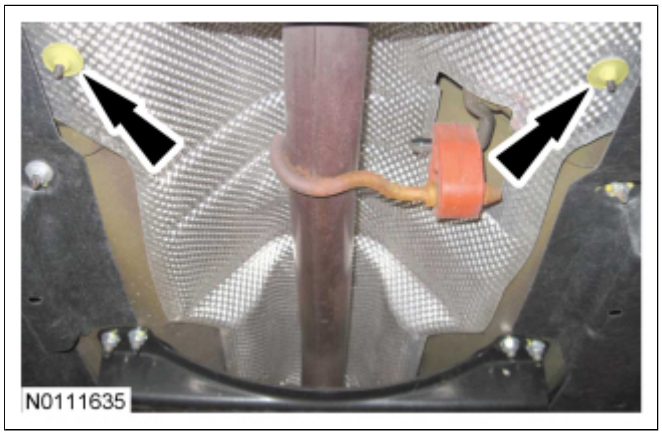


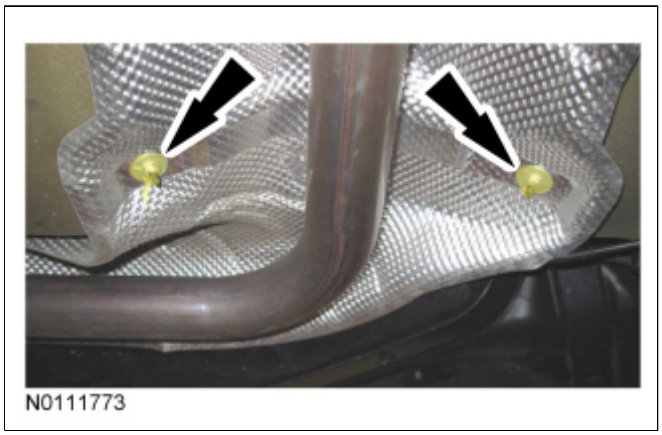
15. Remove the 8 bolts and remove the cross brace.



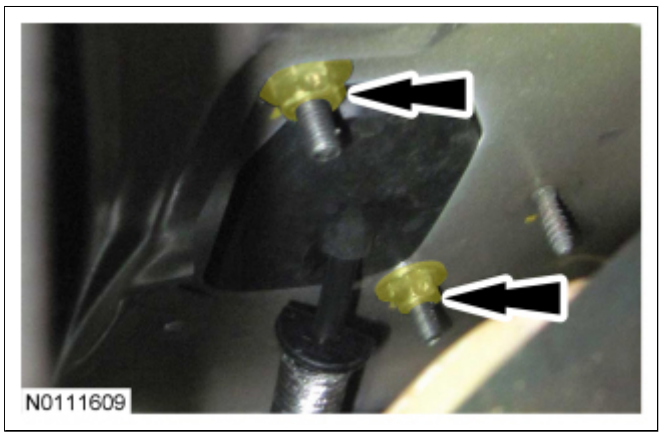
16. Remove the 6 exhaust heat shield fasteners (5 shown) and the exhaust heat shield.







17. Remove the 2 selector lever cable grommet nuts.



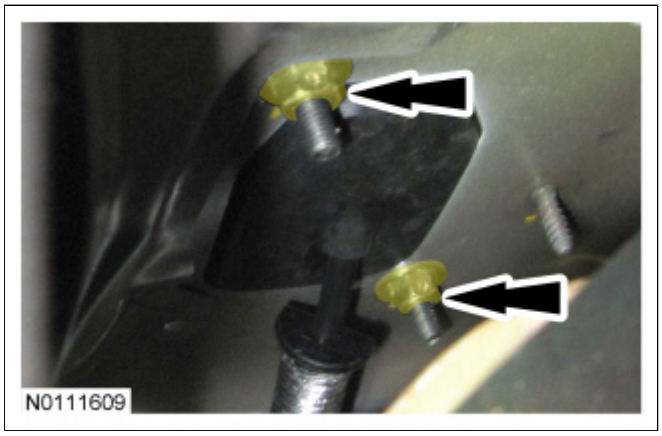
18. **NOTE:** Remove the selector lever cable from outside of the vehicle.

    Remove the selector lever cable.

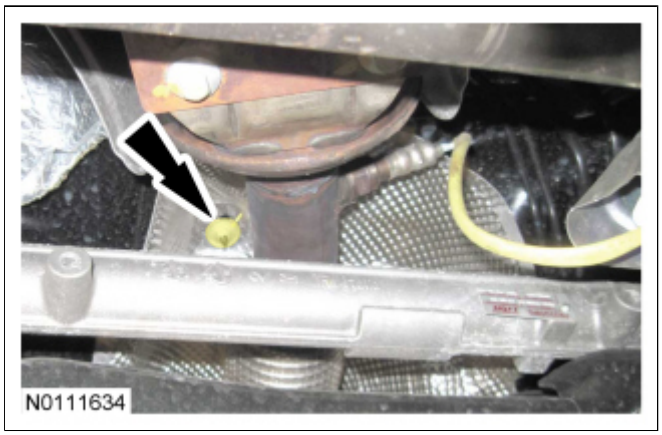
Installation

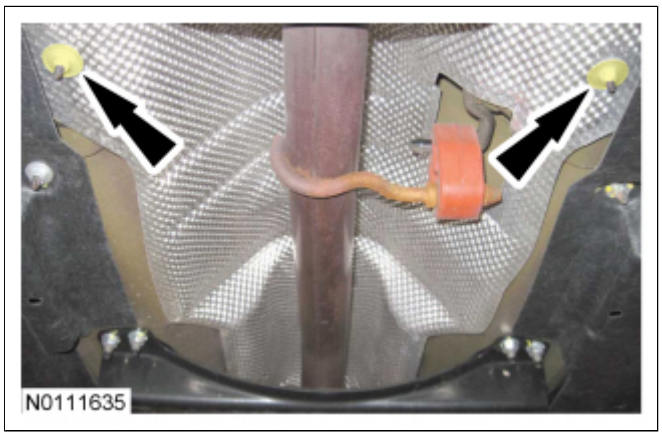
1. Position the selector lever cable grommet in place.

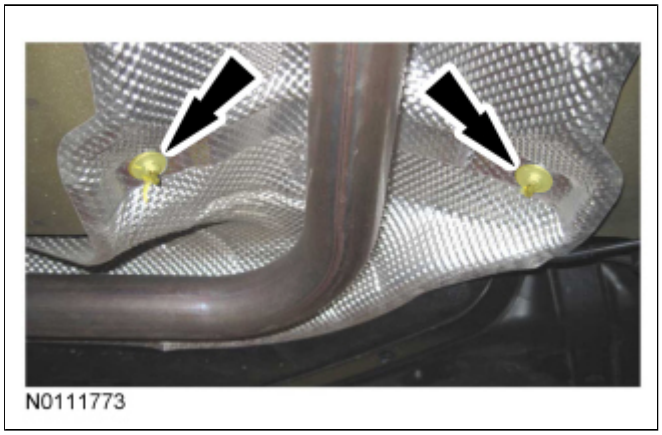
2. Install the 2 selector lever cable grommet nuts.
    - Tighten to 9 Nm (80 lb-in).



3. Install the exhaust heat shield and the 6 exhaust heat shield fasteners (5 shown).

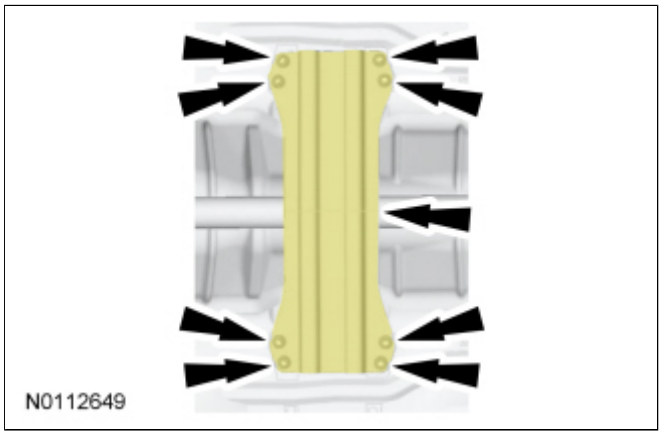






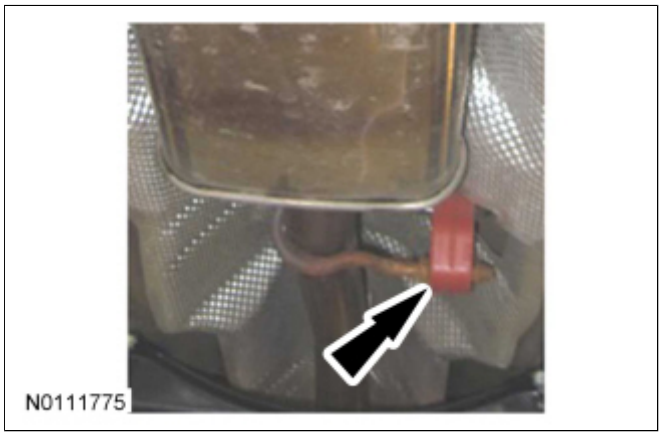
N0111773

4. Install the cross brace and the 8 cross brace bolts.
    - Tighten to 40 Nm (30 lb-ft).

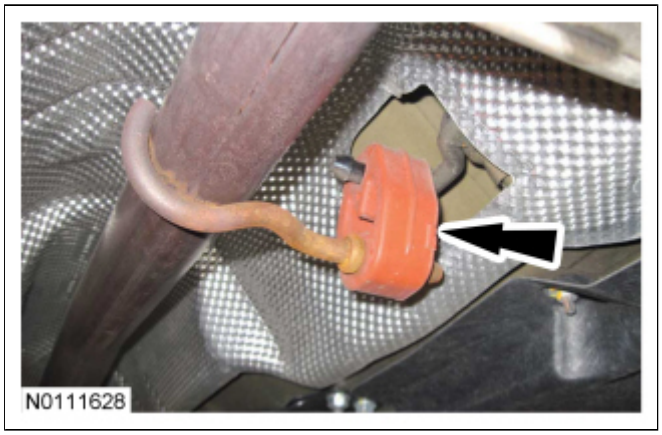


N0112649

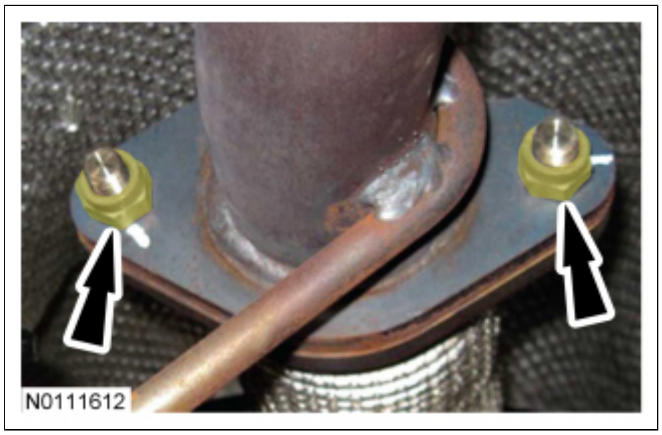
5. Connect the exhaust hangers.



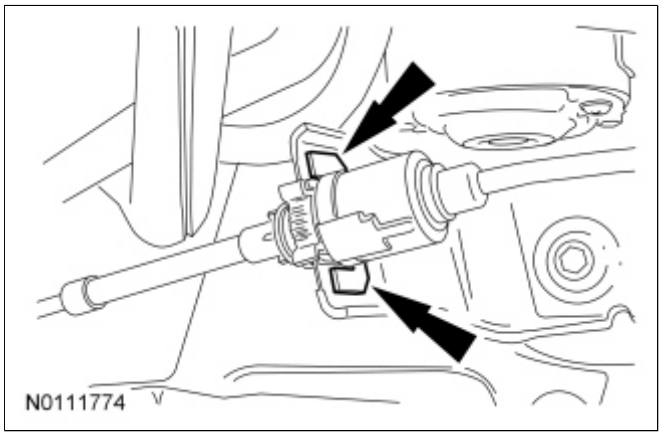
N0111775



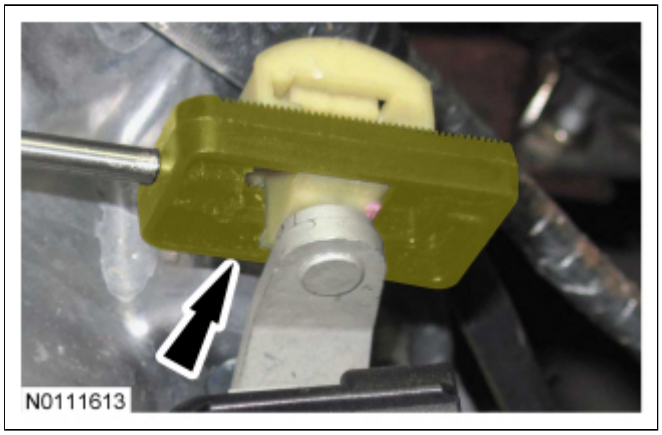
6. Using a new exhaust flange gasket and 2 new exhaust flange nuts, connect the exhaust flange.
    - Tighten to 47 Nm (35 lb-ft).



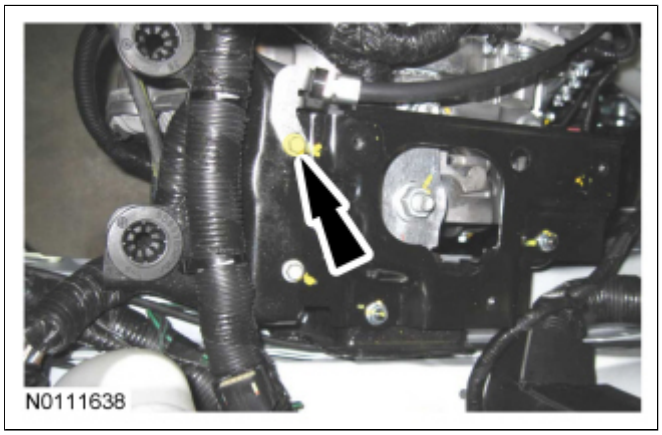
7. Connect the selector lever cable to the selector lever cable bracket.



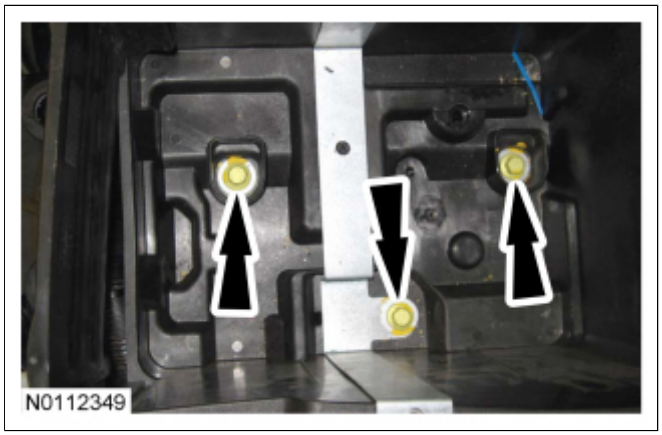
8. Connect the selector lever cable end to the manual control lever.



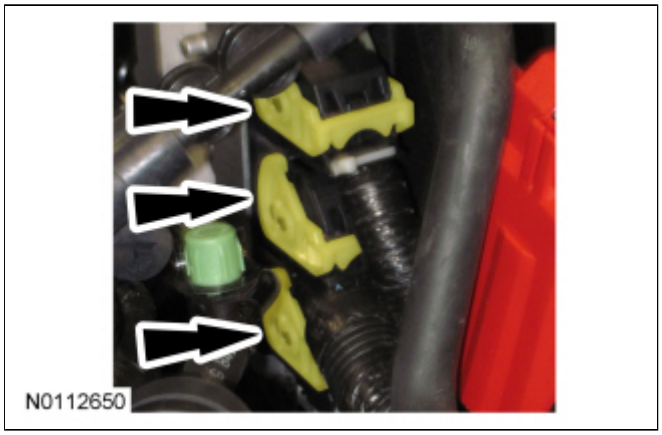
9. Install the selector lever cable bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



10. Install the battery tray and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

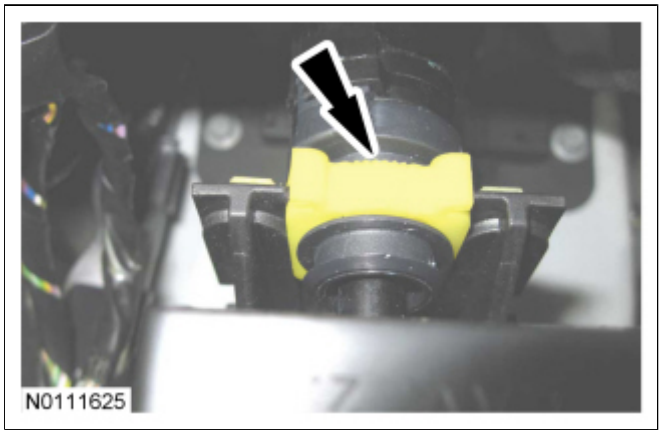


11. Connect the 3 PCM electrical connectors.

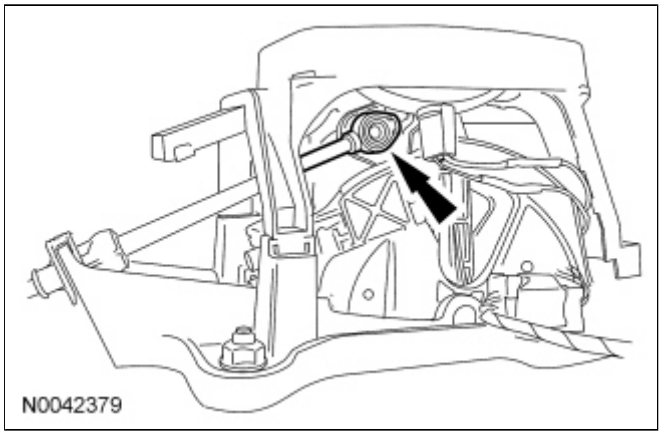


12. Install the battery. For additional information, refer to Section 414-01 .

13. Install the selector lever cable on the selector lever housing.



14. Connect the selector lever cable end to the selector lever ball stud.



15. Position the carpet back in place under the heater core and evaporator core housing.

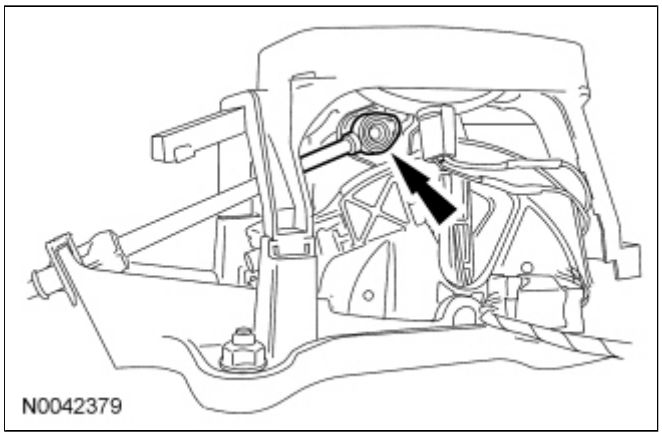
16. Install the floor console. For additional information, refer to Section 501-12 .

17. Adjust the selector lever cable. For additional information, refer to Selector Lever Cable Adjustment in this section.

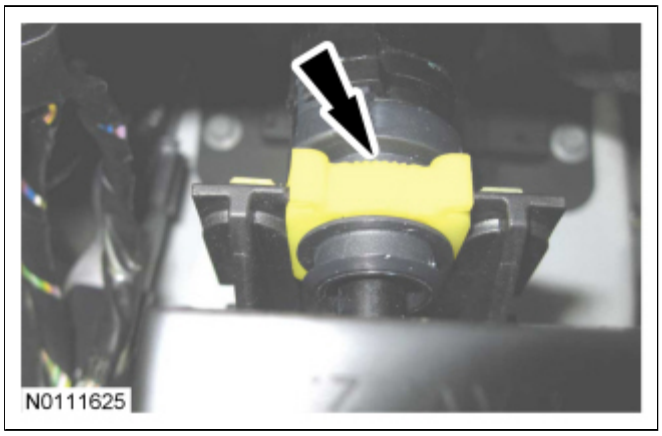
Selector Lever

Removal

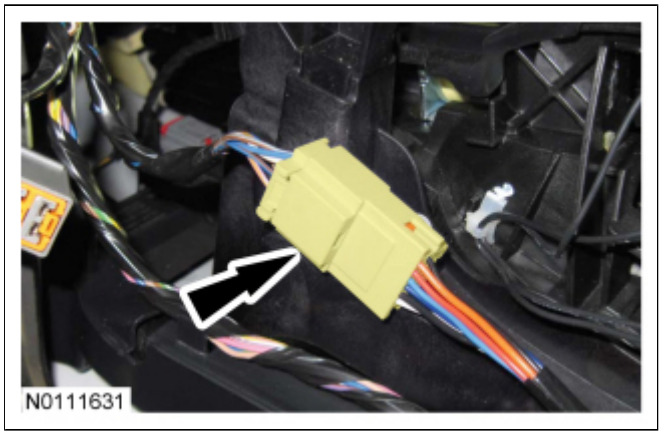
1. Remove the floor console. For additional information, refer to Section 501-12 .
2. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .
3. Disconnect the selector lever cable end from the selector lever ball stud.



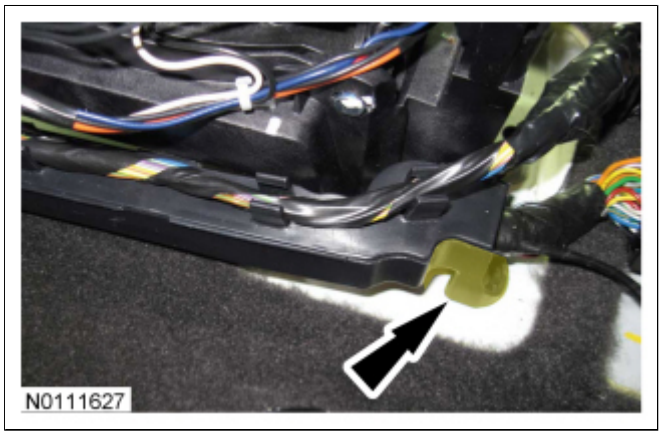
4. Release the locking tab on the selector lever cable clip and remove the selector lever cable from the selector lever housing.



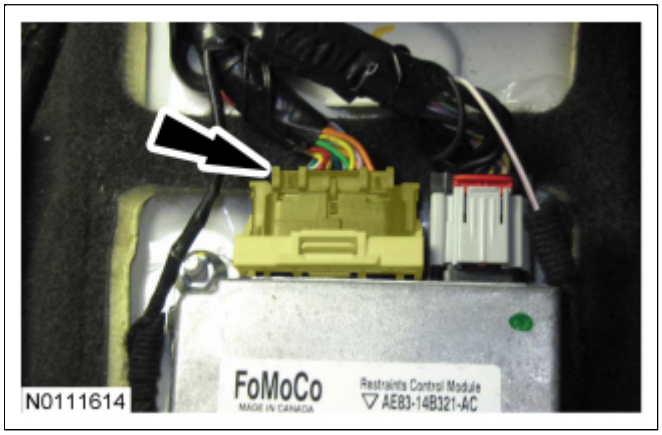
5. Disconnect the selector lever electrical connector.



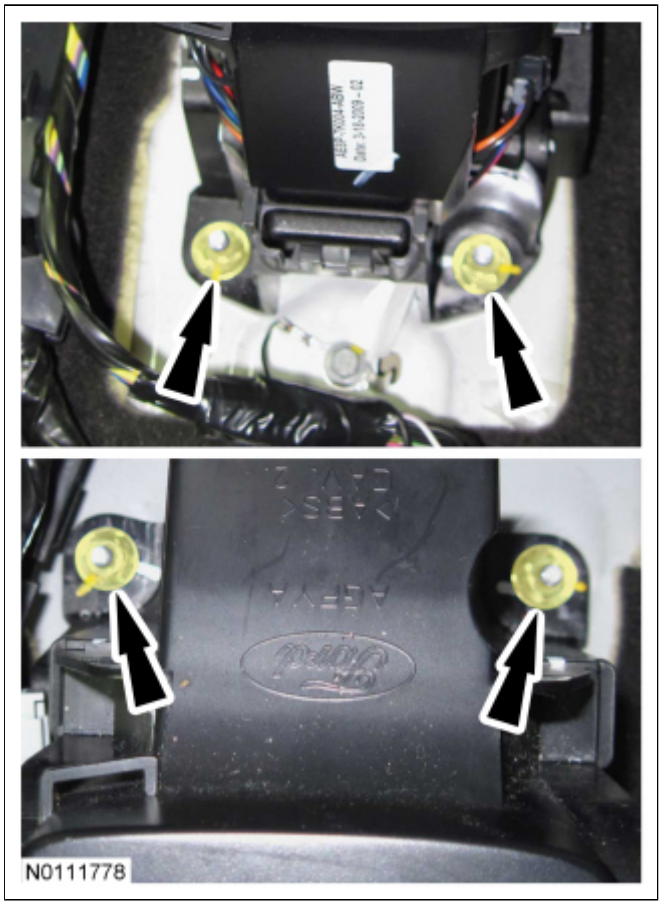
6. Using a suitable tool, remove the wiring harness from the selector lever base.



7. Disconnect the Restraints Control Module (RCM) electrical connector.

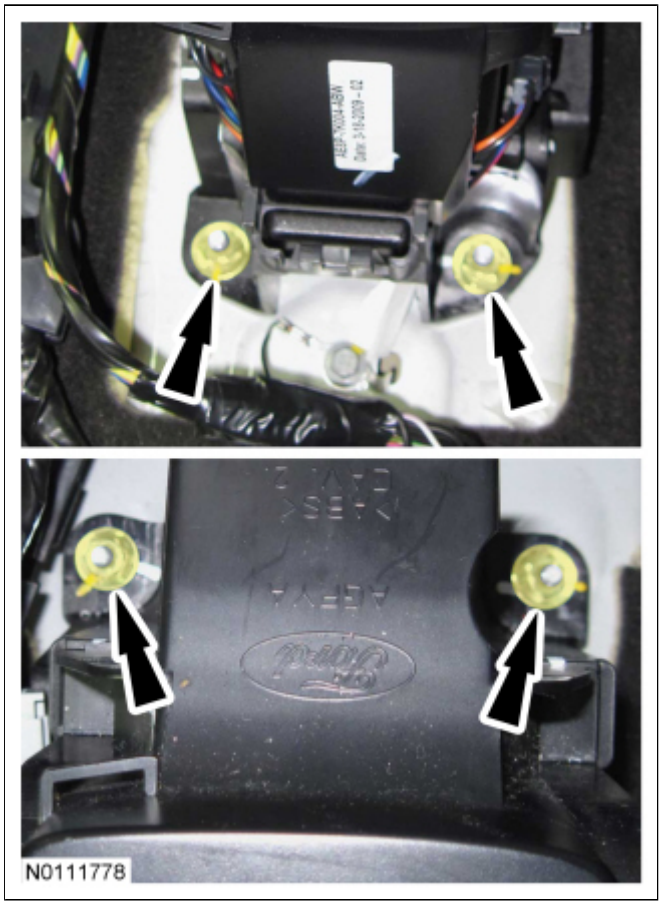


8. Remove the 4 selector lever nuts and remove the selector lever.



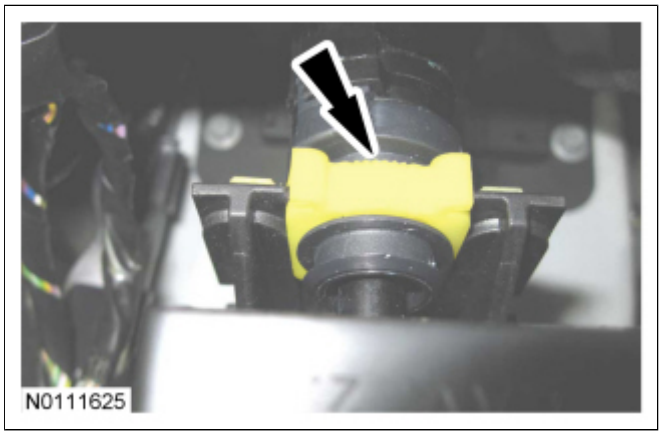
Installation

1. Install the selector lever and the 4 selector lever nuts.
    - Tighten to 9 Nm (80 lb-in).



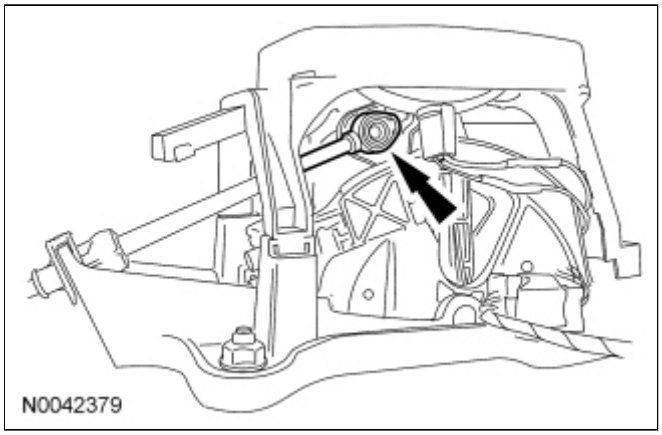
2. **NOTE:** When installing the selector lever cable, make sure the selector lever cable locking tabs are locked in place. Press the selector lever cable into the bracket and listen for the selector lever cable to click in place. Pull back on the selector lever cable to make sure it is locked into the selector lever cable bracket.

   Install the selector lever cable in the selector lever housing.

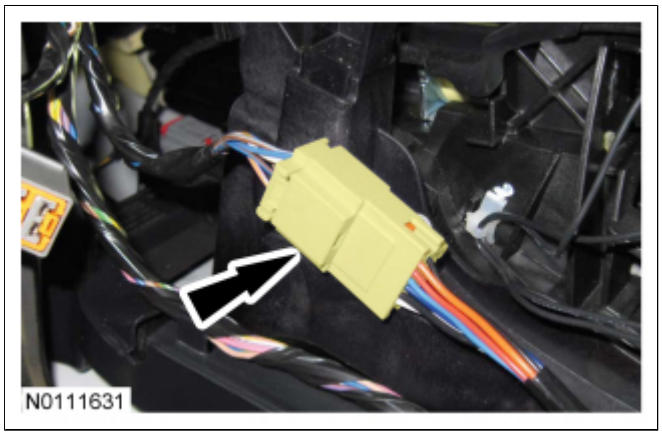


3. **NOTE:** Make sure the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable end to make sure the selector lever cable end is correctly installed.

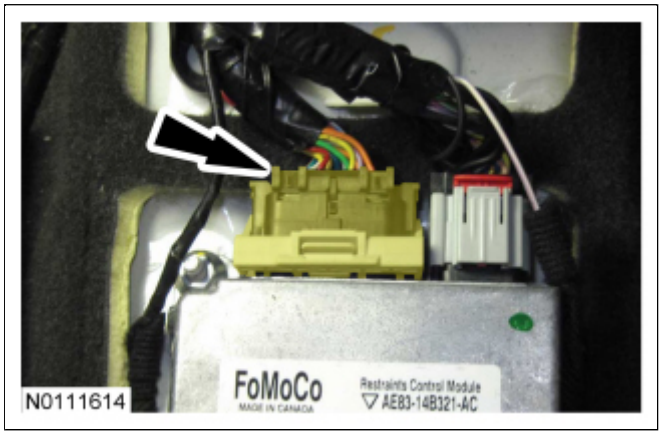
   Connect the selector lever cable end to the selector lever ball stud.



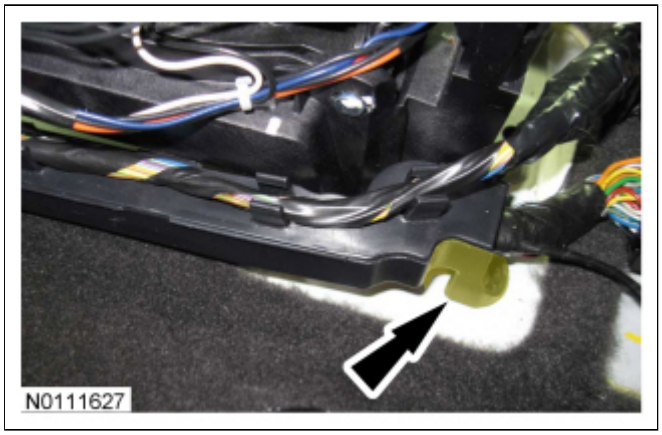
4. Connect the selector lever electrical connector.



5. Connect the RCM electrical connector.



6. Connect the wiring harness to the selector lever base.



7. Install the floor console. For additional information, refer to Section 501-12 .

8. Repower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .

9. Adjust the selector lever cable. For additional information, refer to Selector Lever Cable Adjustment in this section.

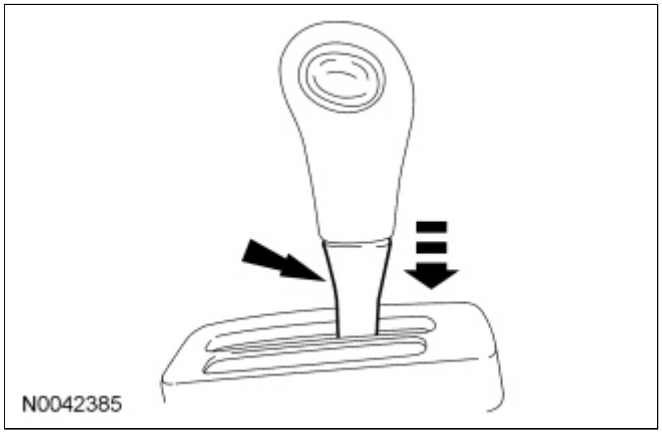
Selector Lever Knob

Removal

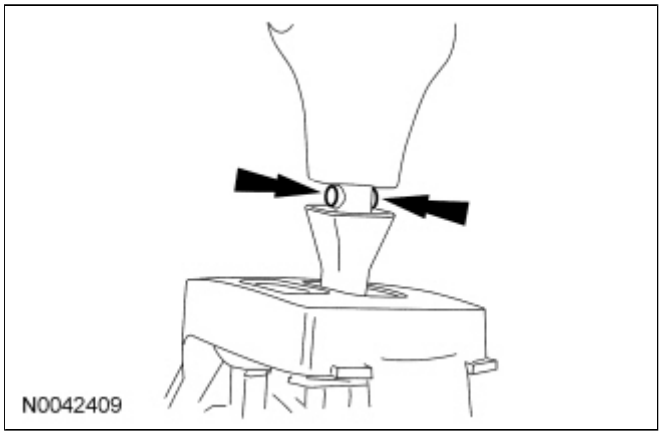
1. Remove the selector lever trim ring.

2. Remove the upper console panel.

3. Slide the selector lever knob bezel downward.

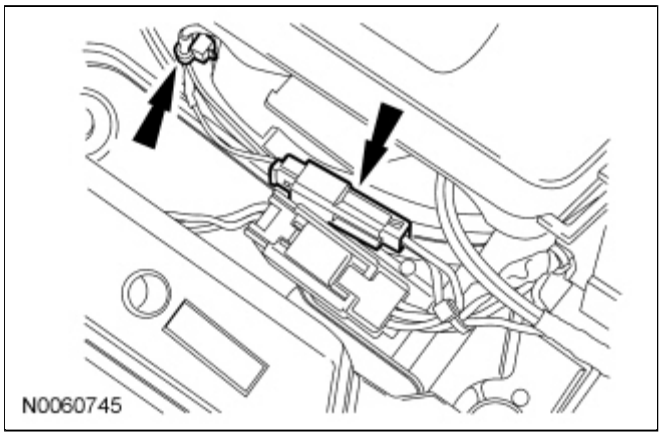


4. Remove and discard the 2 selector lever knob screws.



5. Remove the center console LH panel.

6. Disconnect the Transmission Control Switch (TCS) electrical connector and remove the wiring harness fastener from the selector lever housing.

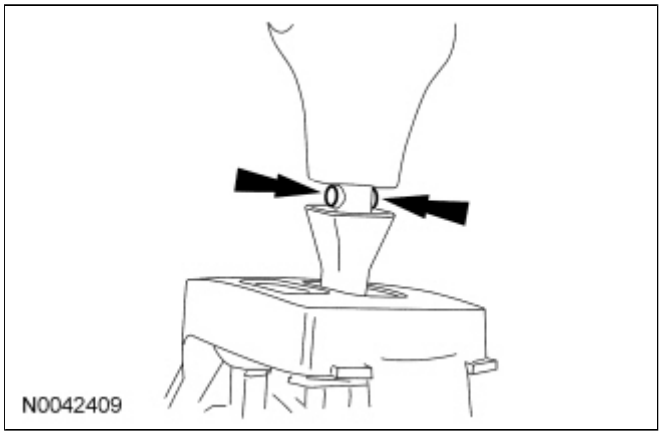


7. Remove the selector lever knob.

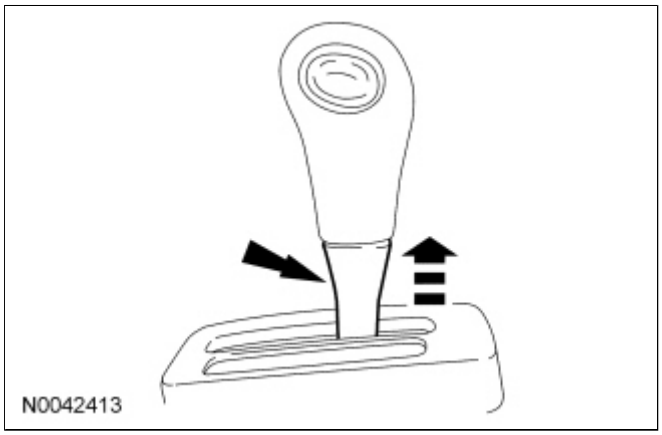
Installation

1. ***NOTICE:*** **Do not overtighten the selector lever knob screws or damage to the selector lever or selector lever knob may occur.**

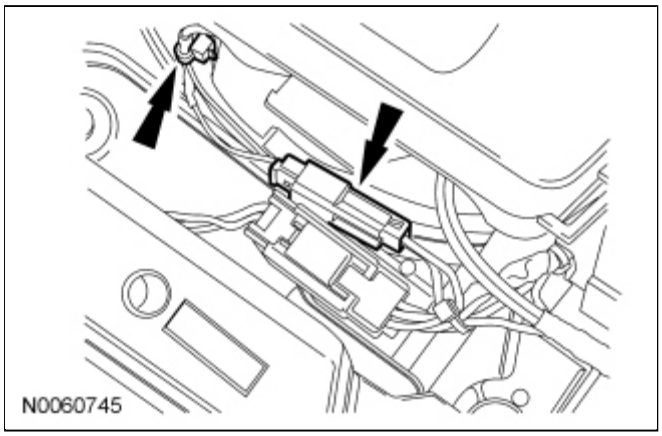
   Install the selector lever knob and the 2 new selector lever knob screws.
   - Tighten to 2 Nm (18 lb-in).



2. Slide the selector lever knob bezel up and into place.



3. Connect the TCS electrical connector and install the wiring harness fastener to the selector lever housing.



4. Install the center console LH panel.

5. Install the upper console panel.

6. Install the selector lever trim ring.

7. Verify the selector lever knob functions correctly.

Transaxle Description

This DPS6 is a fully automatic, dry dual clutch, automatic shifting manual, electronically controlled 6-speed transaxle.

Its abbreviated designation DPS6 means:

- D — Dry Dual Clutch
- P — Powershift
- S — Synchronized
- 6 — 6-speed transaxle

This transaxle features the following:

- Computer Control with electro-mechanical actuation
- Two piece aluminum housing design
- Six (6) discrete stepped forward gears and one (1) reverse gear
- Dual Output shafts with two separate final drive ratios
- Full ball and roller bearing design for all gears and shafts
- All gears are bevel cut for improved NVH characteristics and power transfer
- All gears are in constant mesh for no loss of torque during the shifting process
- All cast construction of shift fork/linkage mechanisms

This transaxle features two nested input shafts driven by a compact dry dual clutch system. These two shafts are used in conjunction with each other to provide seamless shifting through the six (6) available ratios with overdrive in the two top gears. As each gear is selected, the appropriate clutch is activated to drive the vehicle. Each consecutive gear is then preselected for the next “shift” operation as power is shifted from one clutch to the other and back again as moving up and down through the individual gears

This transaxle is designed to be operated in the same manner as a conventional torque converter equipped automatic transaxle. It provides the smooth application of power, but with the bonus of efficiencies found only in a manual transaxle. By delivering the power with a dual clutch system, fluid volume is limited to less than 2 liters as compared against a conventional automatic transaxle, and that is only within the gearbox case itself. The actuation of the clutch system is controlled by a dedicated computer through two individual electrically driven clutch motors and actuator systems.

This transaxle provides six (6) discrete forward ratios with overdrive in the top two gears and a reverse gear, giving a continuous flow of power for acceleration and deceleration

The selector lever gives the driver a choice of P, R, N, D and L.

With the selector lever in the D position, you can operate the Transmission Control Switch (TCS)/Grade Assist switch on the selector lever to prevent the transaxle from shifting into 6th gear.

If a fault occurs continued motoring is guaranteed in the following limited conditions based on the failure: 1st, 3rd and 5th gear if a fault with clutch 2 and/or relational components occurs. 2nd, 4th, 6th and reverse if a fault with clutch 1 and/or relational components occurs.

This transaxle can be tested using a scan tool through the Data Link Connector (DLC) in the passenger compartment.

Internal components are based on manual transaxle technologies that include:

- Dry friction clutches to transmit power between the engine and transaxle

- Lay shaft gearing for high efficiency and uncoupled ratio selection
- Rotating sequential shift drums for fast response
- Synchronizers with dog clutches to pre-select and direct the power flow
- Splash fluid lubrication without filter and external oil coolers

This transaxle is two transaxles within one housing that share a common:

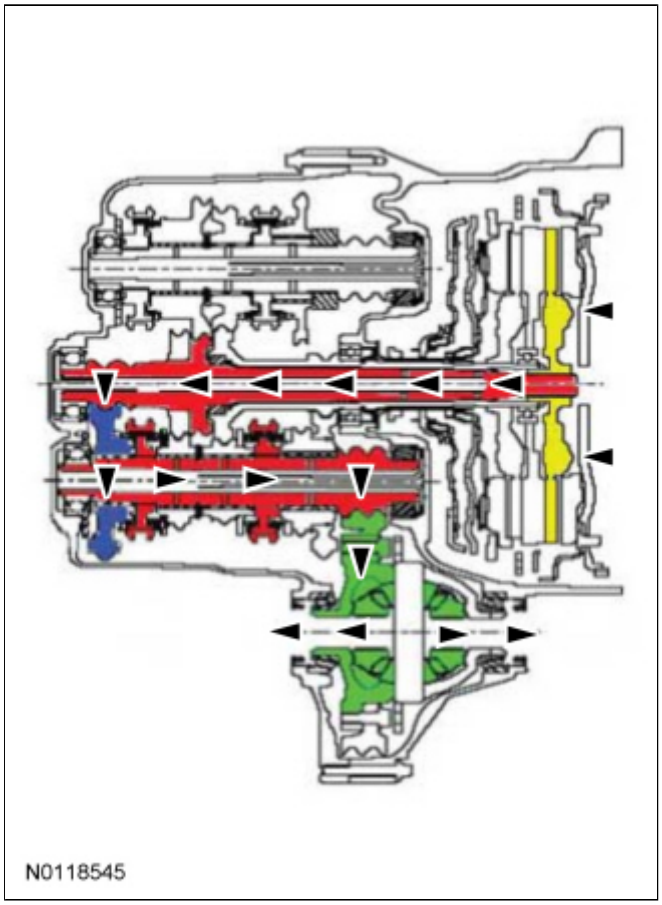
- Final drive which includes two output shaft pinions
- Differential assembly
- Output Shaft Speed (OSS) sensor
- Transmission Range (TR) sensor
- Park system
- Transmission Control Module (TCM)

The first consists of three odd gear ratios (1st, 3rd & 5th):

- Odd input clutch and actuator system including a clutch motor
- Odd or inner input shaft with input shaft speed sensor 1 and related speed gears
- Odd synchronizer system including a shift motor (part of TCM), shift drum, shift forks and transfer assemblies.

The second consists of three even gear ratios and reverse (2nd, 4th, 6th & Reverse):

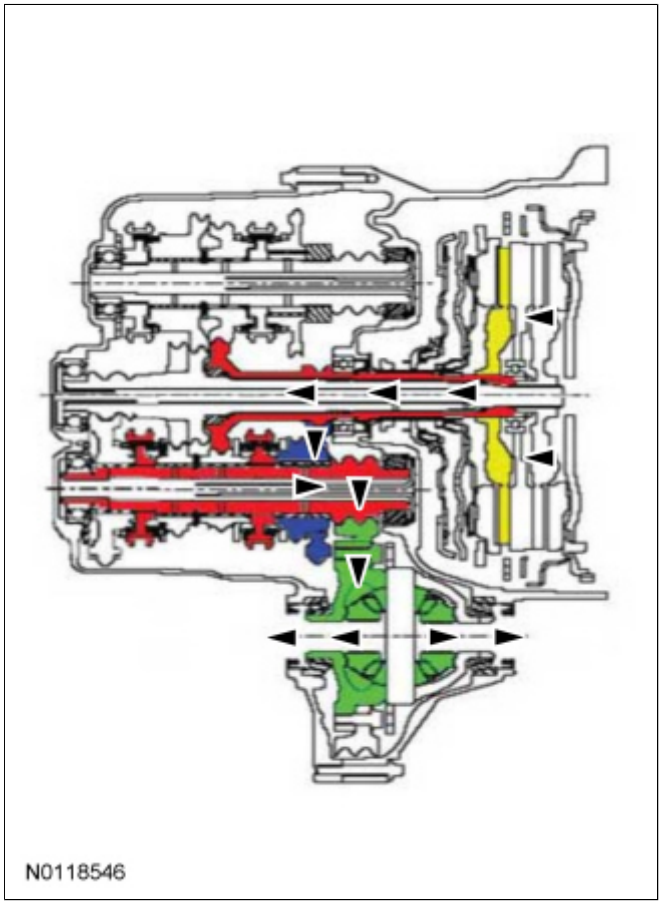
- Even input clutch and actuator system including a clutch motor
- Outer or hollow input shaft with input shaft speed sensor 2 and related speed gears.
- Even synchronizer system including a shift motor (part of TCM), shift drum, shift forks and transfer assemblies



1st Gear

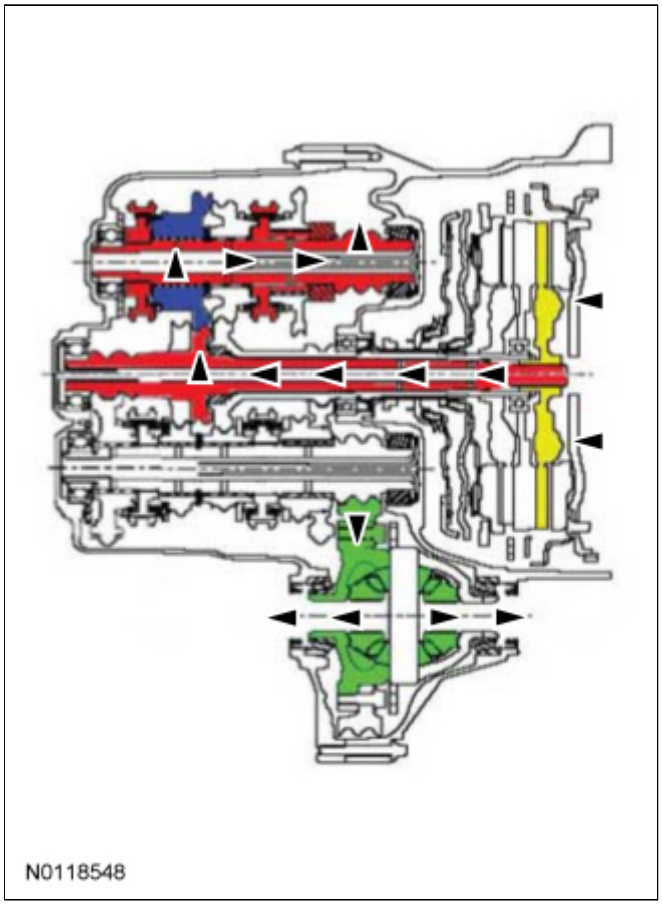
The torque is introduced into the dual clutch via the flywheel. From there, the power is transmitted via

clutch 1 to the inner input shaft. The inner input shaft transmits the torque to the first gear of the output shaft. The torque is transmitted to the differential via the output pinion.



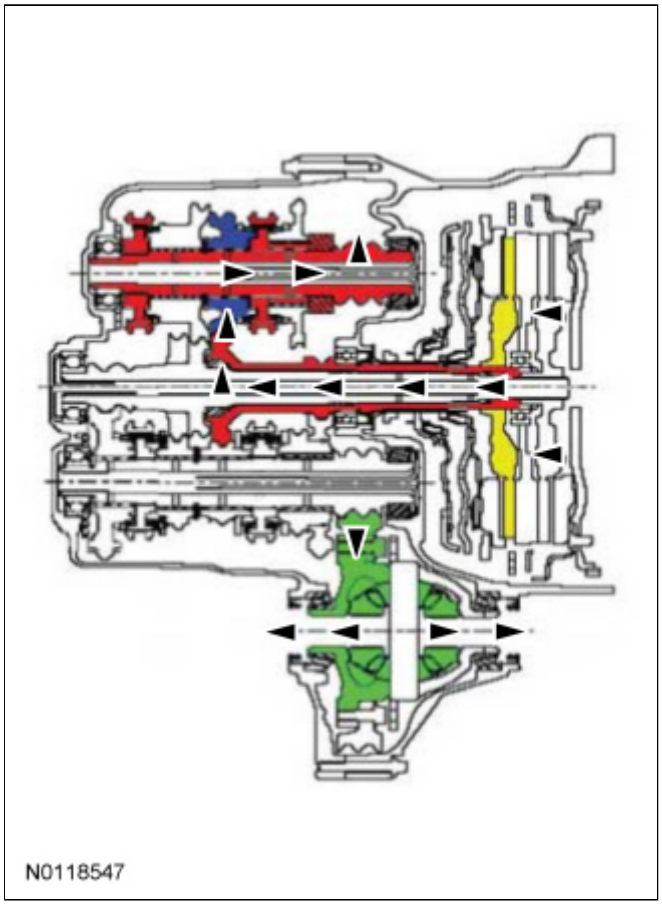
2nd Gear

The torque is introduced into the dual clutch via the flywheel. From there, the power is transmitted via clutch 2 to the hollow input shaft. The inner input shaft transmits the torque to the second gear of the output shaft. The torque is transmitted to the differential via the output pinion.



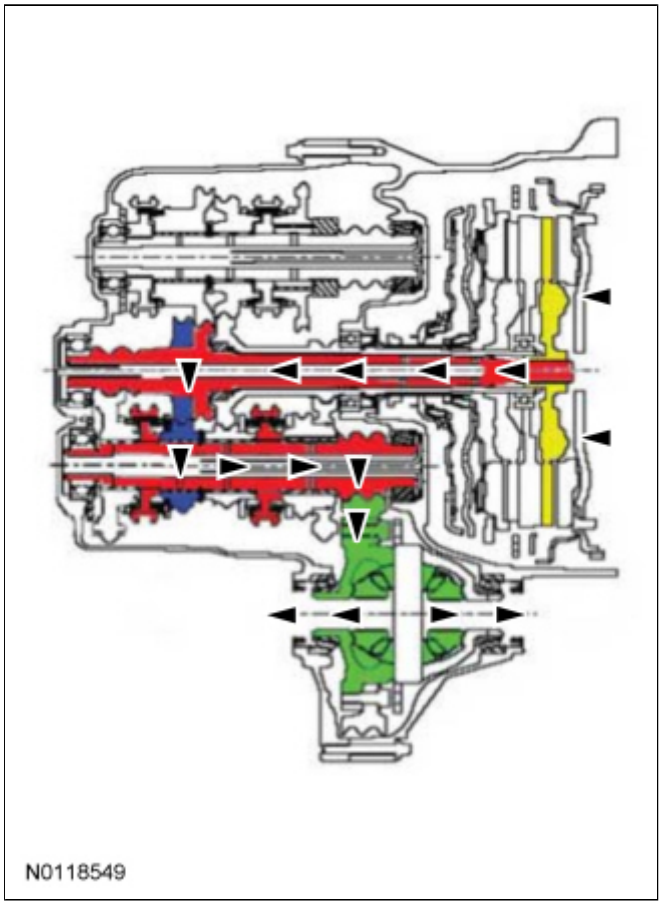
3rd Gear

The torque is introduced into the dual clutch via the flywheel. From there, the power is transmitted via clutch 1 to the inner input shaft. The inner input shaft transmits the torque to the third gear of the output shaft. The torque is transmitted to the differential via the output pinion.



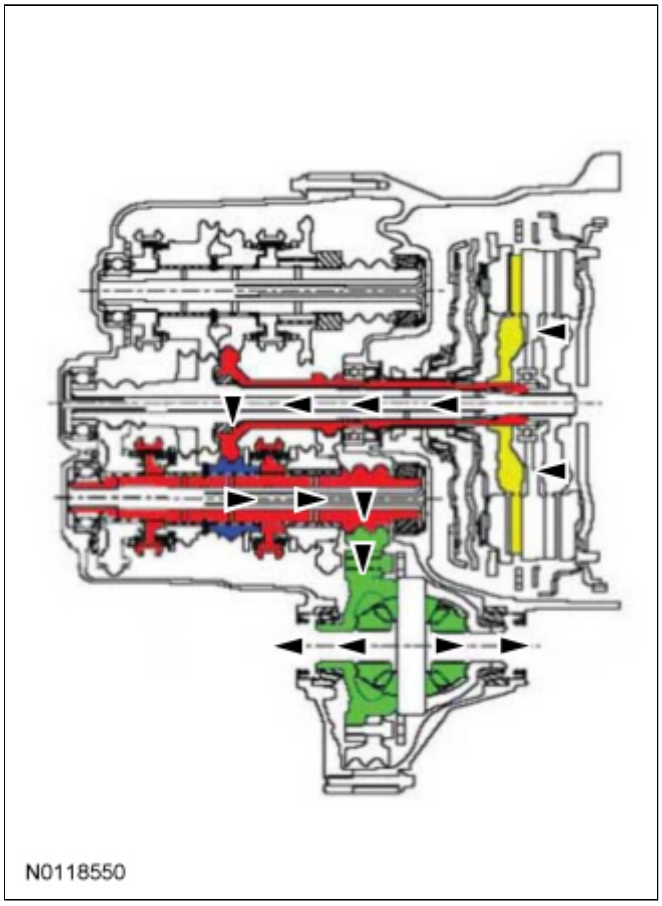
4th Gear

The torque is introduced into the dual clutch via the flywheel. From there, the power is transmitted via clutch 2 to the hollow input shaft. The hollow input shaft transmits the torque to the fourth gear of the output shaft. The torque is transmitted to the differential via the output pinion.



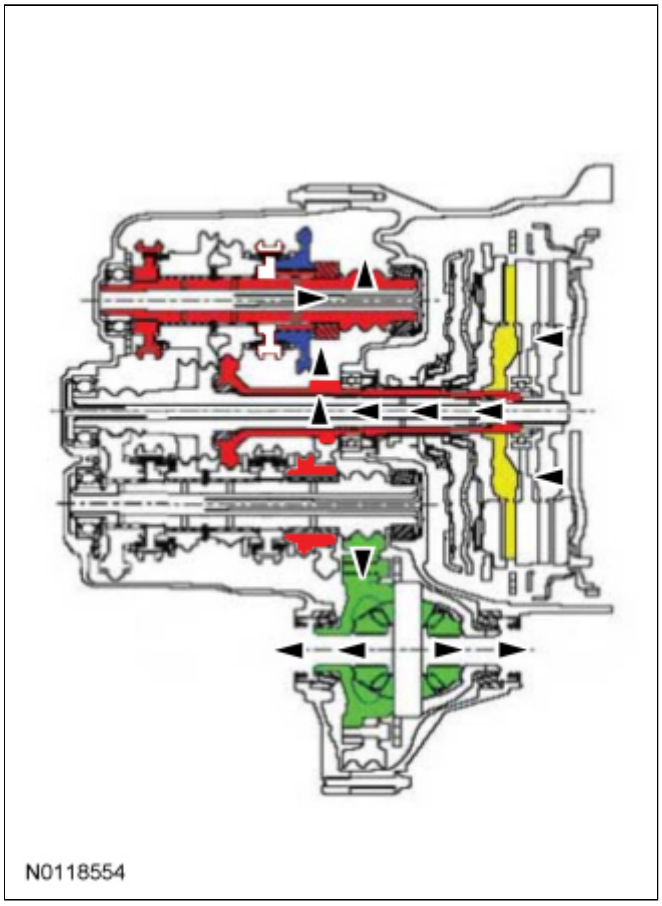
5th Gear

The torque is introduced into the dual clutch via the flywheel. From there, the power is transmitted via clutch 1 to the inner input shaft. The inner input shaft transmits the torque to the fifth gear of the output shaft. The torque is transmitted to the differential via the output pinion.



6th Gear

The torque is introduced into the dual clutch via the flywheel. From there, the power is transmitted via clutch 2 to the hollow input shaft. The hollow input shaft transmits the torque to the sixth gear of the output shaft. The torque is transmitted to the differential via the output pinion.

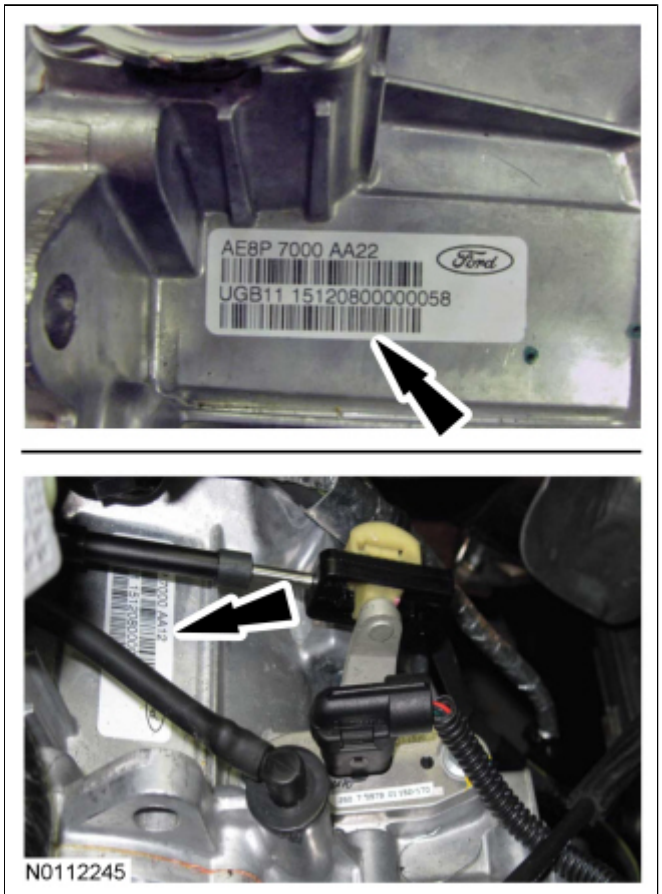


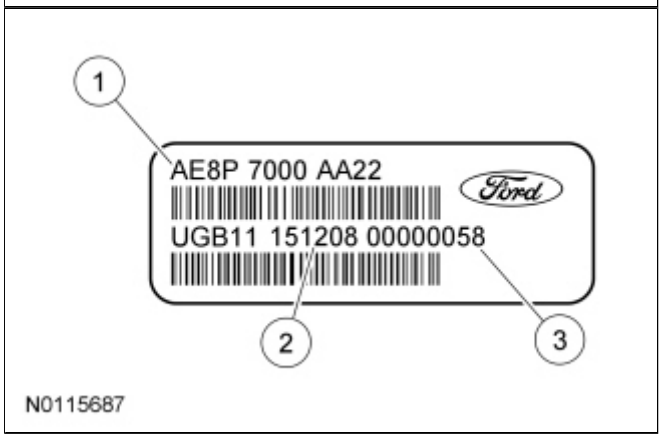
Reverse

The torque is introduced into the dual clutch via the flywheel. From there, the power is transmitted via clutch 2 to the hollow input shaft. The hollow input shaft now transmits the torque to the reverse/2nd double gear which acts as an idler gear to reverse the direction of rotation. This idler transmits torque to the reverse gear of the output shaft. The torque is transmitted to the differential via the output pinion.

Identification Tags

When servicing the transaxle, refer to the identification tag located on the case.

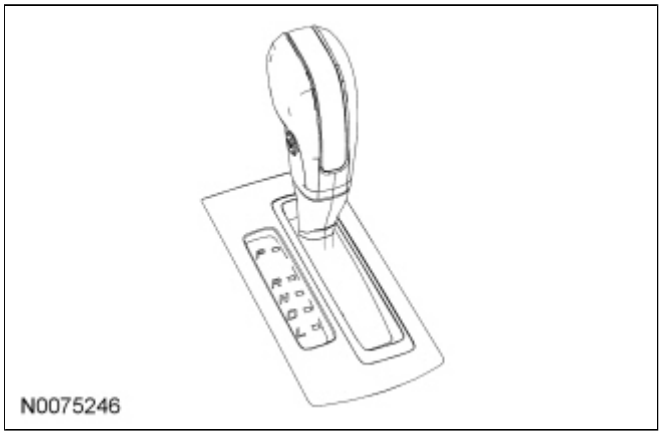




Item	Description
1	Part number
2	Build date
3	Serial number

Range Selection

The transaxle range selector has 5 positions: P, R, N, D, L.



Range Positions		
P	Park	In the PARK position: • there is no power flow through the transaxle. • the parking pawl locks the final drive. • the engine may be started. • the ignition key may be removed.
R	Reverse	In the REVERSE position: • the vehicle may be operated in a rearward direction, at a reduced rear ratio. • engine braking occurs.
N	Neutral	In the NEUTRAL position: • the vehicle is able to roll. • there is no power flow through the transaxle. • the output shaft is not held and is free to turn. • the engine may be started.
D	Drive position with Grade Assist	DRIVE is the normal position for most forward driving. The DRIVE position provides: • automatic shifts —1st through 6th gears. • maximum fuel economy during normal operation. • with Transmission Control Switch (TCS)/Grade assist switch pressed, only gears 1-5 are available.

L	Manual Low	Manual L position allows for 1st gear when the vehicle reaches slower speeds. This position provides: • maximum engine braking. • downshifts to the lowest available gear for the current vehicle speed.

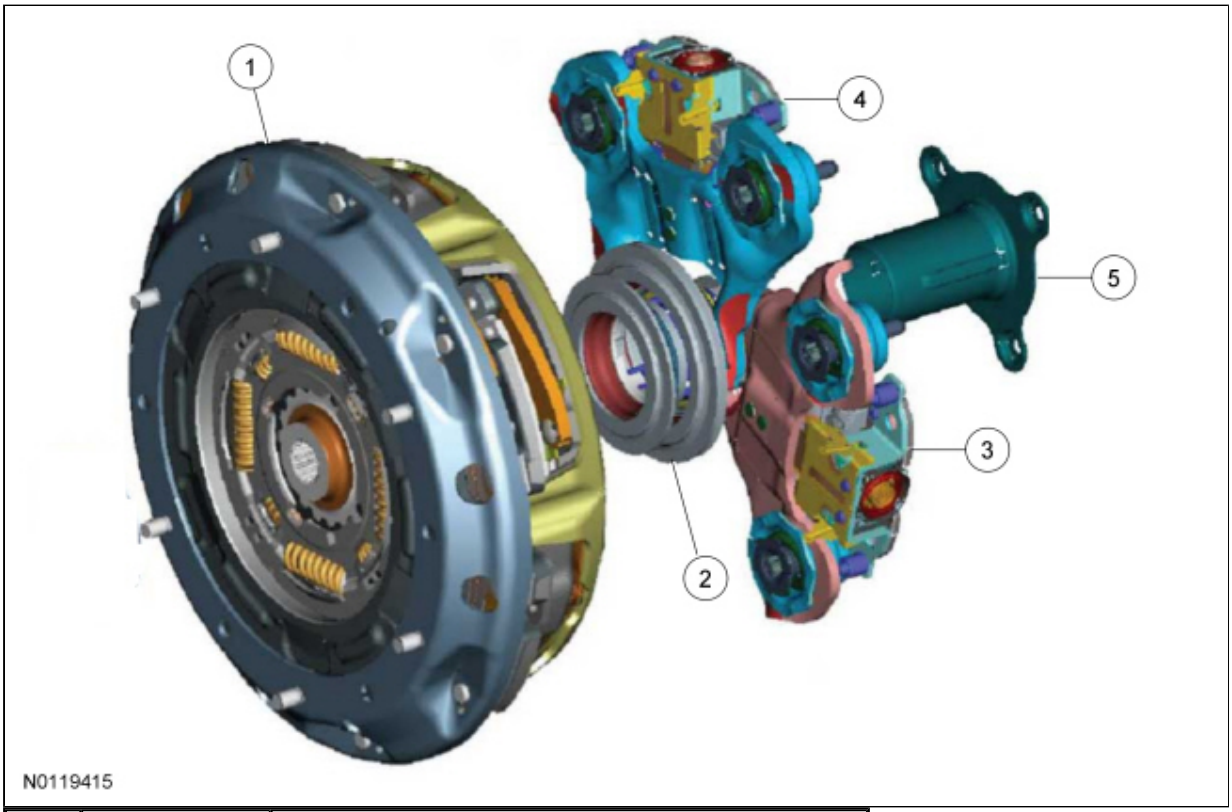
Main Components and Functions

This transmission system has been divided into 6 sub-systems that relate to specific functional areas. These sub-systems are:

- a clutch/actuator system which transfers engine crankshaft speed and torque.
- an active input system which includes applied clutch disc, bearings, speed gears and output shaft.
- a passive input system which includes disengaged clutch disc, bearings, speed gears and an output shaft system.
- a synchronizer/engagement system which includes a torque carrying interface between speed gear and output shaft.
- a differential system that is the final drive output system which includes drive pinions, ring gear, support bearings and side gears.
- an electrical control system which includes control system logic, Transmission Control Module (TCM), speed sensors, electric motors and a wire harness.

Sub-System Overview

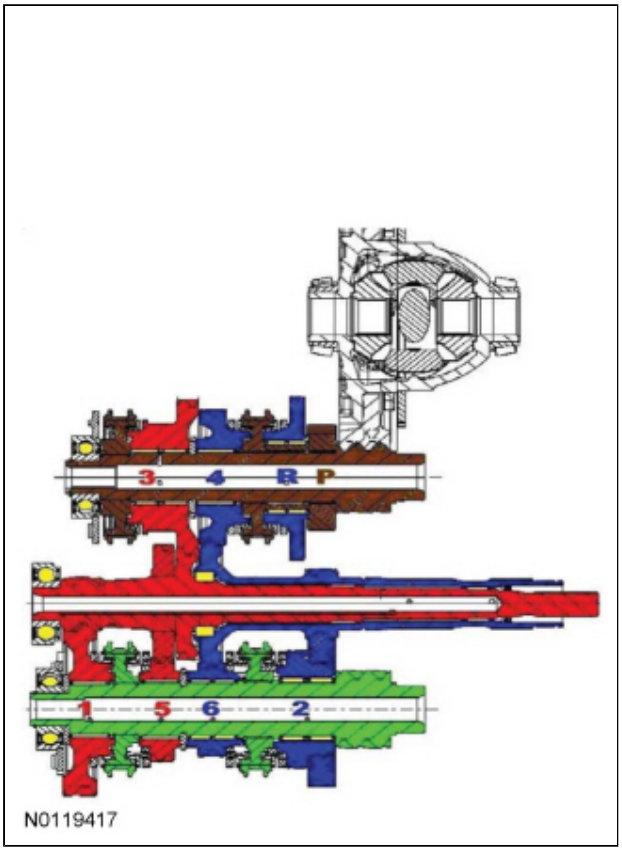
Clutch/Actuator System



Item	Part Number	Description
1	7B546	Clutch assembly
2	7A508	Clutch engagement system bearing assembly
3	7515	Clutch engagement system actuator lever 1
4	7515	Clutch engagement system actuator lever 2
5	7A564	Clutch engagement system guide tube

The clutch and actuator sub – system consists of engine crankshaft mounted rotating components. These include, a center flywheel, odd and even clutch pressure plates, clutch actuating mechanisms and engagement components. The clutch actuators are independent systems within the clutch housing that apply an axial force to the clutch diaphragm springs causing their respective clutch to apply. This apply force is reacted back into the transaxle through the input shaft unlike a manual transaxle dry clutch system, no thrust is applied to the engine crankshaft. Normally the clutch capacity commands are mutually exclusive (to prevent tie-up) with minor overlaps to allow synchronous shifting. A clutch “touch point” position must be established by a learning algorithm within the system software. Establishing the touch point is the system’s method for ensuring that the displacement-based clutch actuation system is properly calibrated. This is necessary so that the clutch capacity can be controlled correctly by the TCM and be engaged and released to the required torque capacity and within the required time.

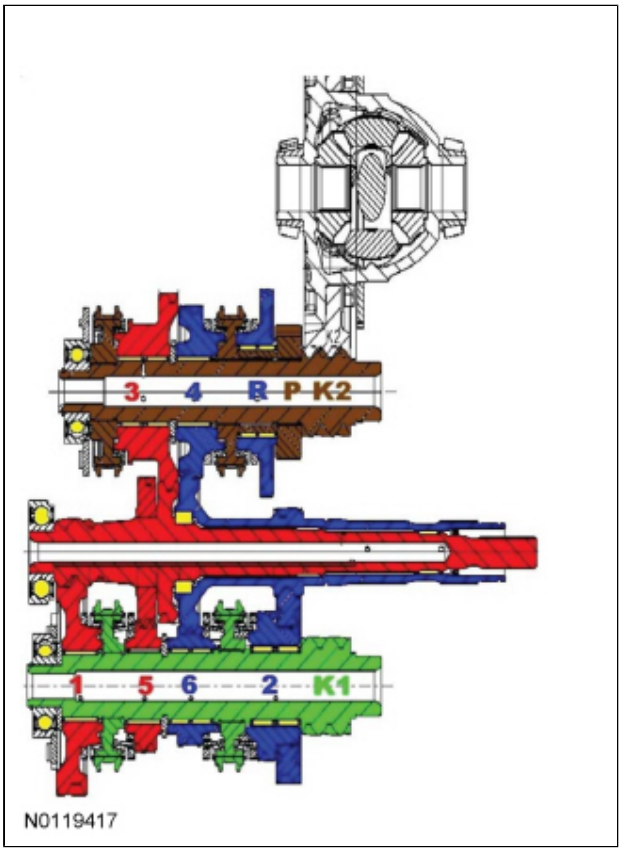
Active Input System



ACTIVE INPUT GEAR	PASSIVE INPUT GEAR	OUTPUT
1	2	K1
3	4	K2
5	6	K1
	R	
2	1	K1
4	3	K2
6	5	K1
R		K2

The active input system of the transaxle can be viewed as two transaxles within a common housing (one for 1st, 3rd & 5th and another for Reverse, 2nd, 4th & 6th). For any driving gear there is one transaxle actively engaged in the power flow between the engine and the wheels and one that is disconnected or passive. This section will discuss considerations for the driving input shaft system whether it be the ODD or EVEN transaxle. The driving or active input shaft system consists of the input shaft and clutch disc, support bearings and the meshed speed gears with their needle roller bearings.

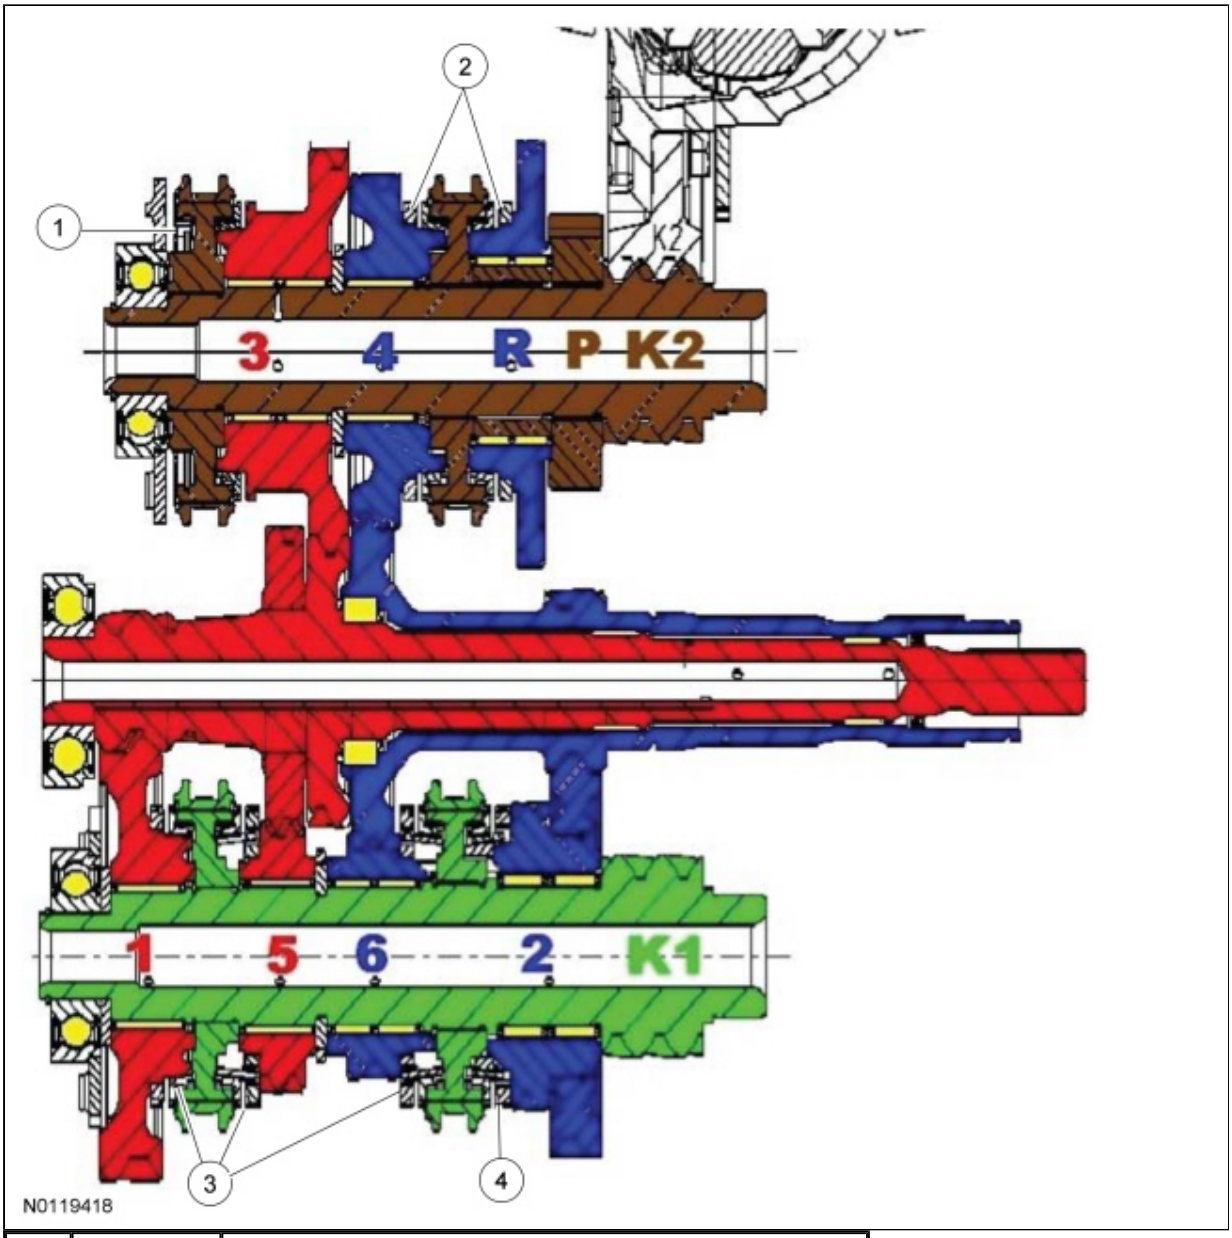
Passive Input System



ACTIVE INPUT GEAR	PASSIVE INPUT GEAR	OUTPUT
1	2	K1
3	4	K2
5	6	K1
	R	
2	1	K1
4	3	K2
6	5	K1
R		K2

The passive input system can be viewed as two transaxles within a common housing (one for 1st, 3rd & 5th and another for Reverse, 2nd, 4th & 6th). For any driving gear there is one transaxle actively engaged in the power flow between the engine and the wheels and one that is disconnected or passive. The non-driving, or passive input shaft system consists of the input shaft and clutch disc, support bearings and the meshed speed gears with their needle roller bearings.

Synchronizer Systems



Item	Part Number	Description
1	—	3rd gear single cone synchronizer system (part of 7060)
2	—	4th gear and reverse gear single cone synchronizer systems (part of 7060)
3	—	1st, 5th and 6th gears single cone synchronizer systems (part of 7060)
4	—	2nd gear dual cone synchronizer system (part of 7060)

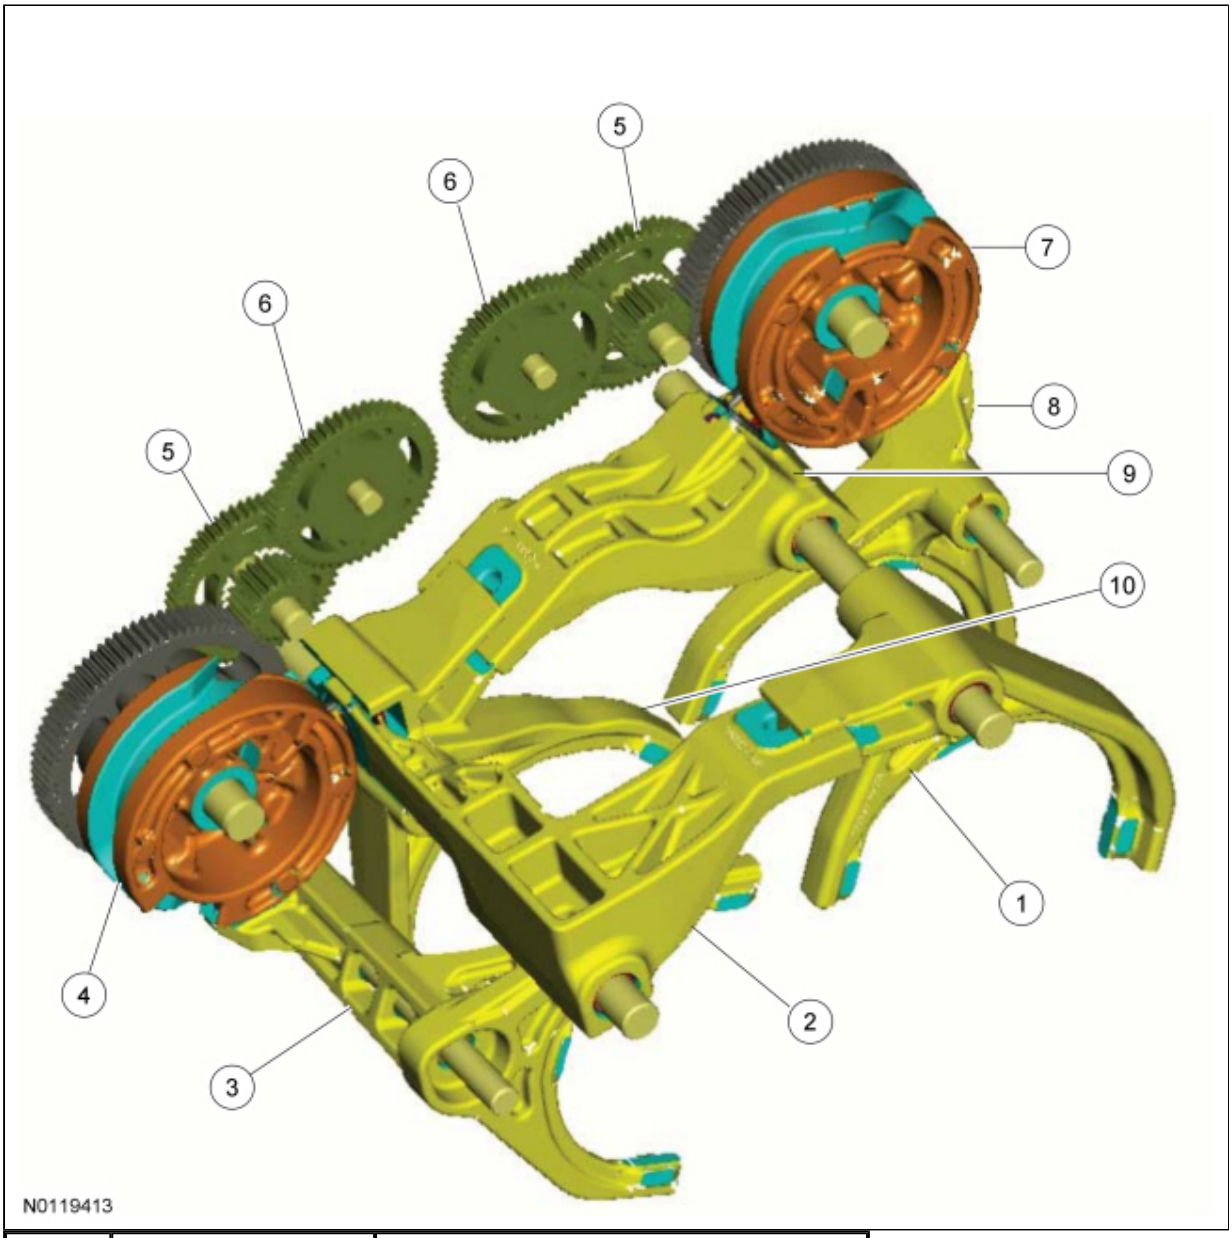
The synchronizer systems are comprised of single and dual cone synchronizer systems. The synchronizers are designed to act as the torque carrying interfaces between each speed gear and corresponding output shaft. The synchronizer design and function are similar to manual transaxle operations.

Basic Synchronizer Hardware Operation

As in manual transaxle operation, gear pre-selection is made by sliding the synchronizer sleeve towards a speed gear. This causes the internal splines of the synchronizer sleeve to bridge a gap between the output hub and the external spline feature of the speed gear, thus transmitting speed and torque between the gear and output shaft. Synchronizers are small cone wet friction clutches mounted to the transaxle output shaft. They are used to bring the rotation speed of the engaging speed gear in sync with the output shaft speed. After synchronous speed has been attained the final power flow connection is made possible and the synchronizer

sleeve is permitted to pass by and engage the external spline teeth on the speed gear.

Shift Fork Mechanical System Overview

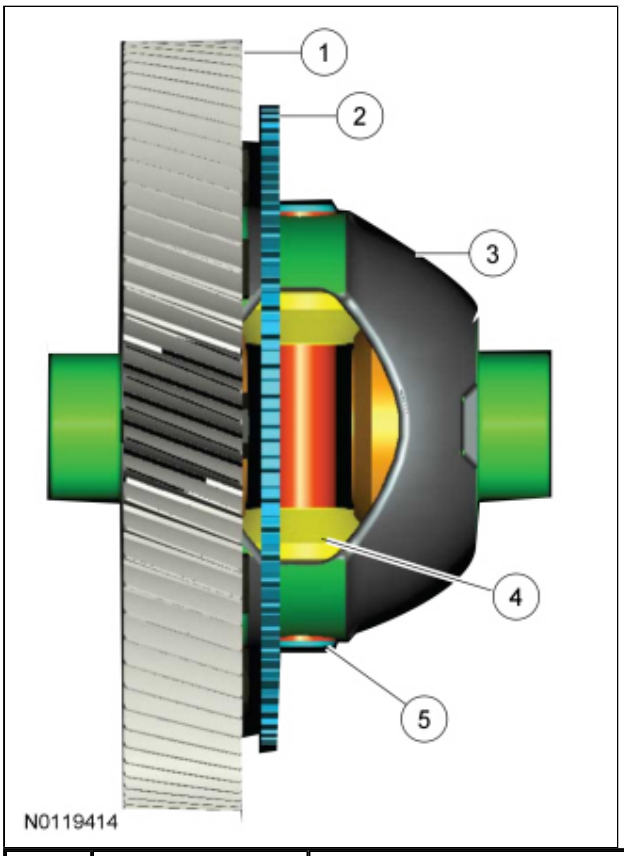


Item	Part Number	Description
1	7230	3rd gear shift fork
2	7P081	3rd gear linkage
3	7230	1st/5th gear shift fork
4	7J047	Shift drum 1
5	7J048	Small clock gear
6	7J049	Large clock gear
7	7J047	Shift drum 2
8	7230	Reverse/4th gear shift fork
9	7P081	2nd/6th linkage
10	7230	2nd/6th gear shift fork

The shift system consists of two independent sub-systems for controlling the transaxle synchronizer pre – selections and engagements. Using this arrangement provides an independent control of the two transaxles

and a mechanical interlock that prevents two gears within the same transaxle from being engaged simultaneously. The TCM houses two electric motors that mesh with and drive the first double gear wheel, which drives the second double gear which finally drives the shift drum. Gearing between the shift motors and the drums reduce speed and multiply torque. Position sensors in the TCM detect feedback of the motor angular position. Shift drum position is learned by the TCM during a teach-in process that involves rotating each drum against hard stops located on the shift drum and the transaxle housing.

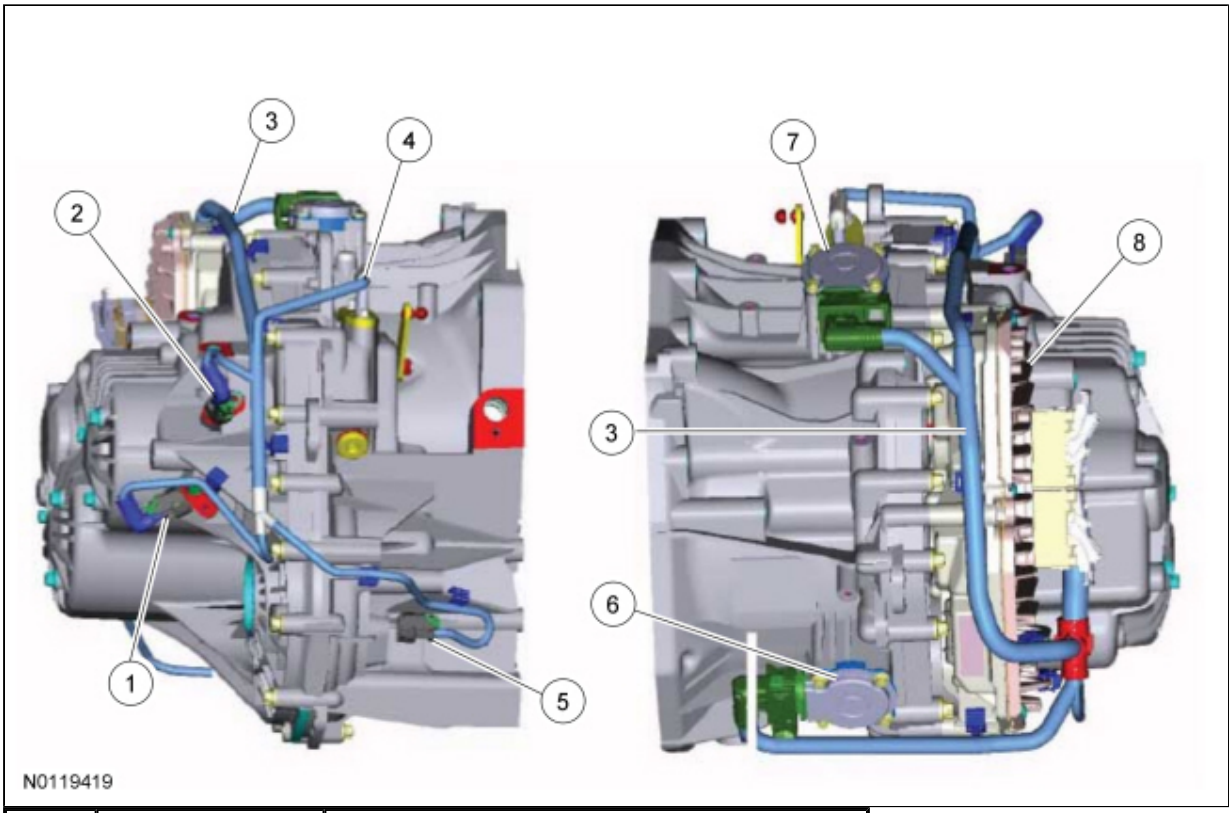
Differential System



Item	Part Number	Description
1	7D392	Differential ring gear
2	7H150	Differential impulse ring
3	—	Differential carrier (part of 4026)
4	—	Differential pinion gear (part of 4026)
5	—	Differential pinion shaft (part of 4026)

The output shaft system consists of the output shaft gears, differential ring (final drive) gear and the differential assembly. Typically when a vehicle is traveling down the road both wheels are rotating at the same speed; however, when a vehicle is turning, the outside wheel must travel a greater distance than the inside wheel. To do this, in the same time, the outside wheel must rotate faster than the inside wheel. The differential is designed to provide speed compensation for the wheels to allow the vehicle to negotiate turns smoothly.

Electrical Control System



Item	Part Number	Description
1	7M101	Input shaft speed sensor 1
2	7M101	Input shaft speed sensor 2
3	7G276	Wiring harness
4	7F293	Transmission Range (TR) sensor
5	7H103	Output Shaft Speed (OSS) sensor
6	7C604	Clutch motor 2
7	7C604	Clutch motor 1
8	7Z369	TCM

Electrical components function:

- Input shaft speed sensor 1 measures the speed and the rotating direction of the input shaft 1. The input shaft can be stationary.
- Input shaft speed sensor 2 measures the speed of the input shaft 2. The rotation direction is not measured.
- OSS sensor measures the speed of the output shaft. The rotation direction is not measured.
- Two electrical clutch motors are used to actuate the dual clutch in the transmission – one motor for each clutch. The motors work independently of each other. When the clutch is fully closed, the clutch motor provides the holding torque in addition with spring force. The clutch motors work against a clutch spring and self disengage with no electrical power.
- TR sensor detects the angular position of the shift lever shaft.
- TCM is an assembly of an electronic module, sensors, and electrical motors.
- The TCM 's electrical motors (2) control the mechanical shift fork system. The shift drums are the link from electrical to mechanical operation. The TCM collects incoming vehicle, transmission and driver demand signals and uses these signals to select the next required gear ratio. The TCM receives transmission sensor signals and transmits clutch motor current through externally mounted wire harness. The TCM uses these signals to control shift feel.

Transaxle Electronic Control System

Overview Electronic Transaxle Control

The electronic transaxle control system includes:

- a Transmission Control Module (TCM)
- a Transmission Range (TR) sensor
- an Output Shaft Speed (OSS) sensor
- 2 input shaft speed sensors each with pre-measured shims.
- 2 shift motors
- 2 clutch motors
- a Brake Pedal Position (BPP) switch
- a Brake Shift Interlock Actuator (BSIA)
- a starter inhibitor relay
- an Transmission Control Switch (TCS)/Grade Assist button
- an TCS /Grade Assist Indicator

Electrical System Components

Transmission Control Module (TCM)

The TCM is an assembly of an electronic module, sensors, and electrical actuators. It combines a control module and two electric motors for gear shifting. The primary function of TCM is to collect incoming data signals to control the transaxle, perform the interpretation of incoming data signals, communicate with the periphery and connect the electrical and mechanical contact to the signal transmitter and actuating elements. Vehicle and transaxle interface is achieved via two connectors; vehicle and transaxle connector. The transaxle connector plug is located at the TCM and is the electrical connection between the TCM and the clutch actuators and the sensors. The vehicle connector is located at the TCM and is the electrical connection between TCM and the vehicle. The TCM is a programmable module.

Transmission Range (TR) Sensor

The TR sensor detects the position of the manual control lever shaft. The TR sensor is mounted on the transaxle. The TR sensor allows the vehicle to start in PARK and NEUTRAL positions. The TR sensor output signal is linear over the measurement range and the TCM receives the selector lever position.

The signals of the TR sensor are used for the following functions:

- to recognize the selector lever position.
- to actuate the starter inhibitor relay.
- to actuate the reversing lamps.

No substitute signal is available for the TR sensor.

If the connection is cut, the vehicle cannot be started.

The TR sensor requires to be calibrated through the adaptive learning procedures.

Output Shaft Speed (OSS) Sensor

The OSS sensor measures the speed of the output shaft. The rotation direction is not measured.

The OSS sensor is located in the clutch housing above the differential.

The OSS sensor is an inductive sensor which detects the vehicle speed by means of an impulse ring on the differential.

The signal is used for the following functions among other things:

- to determine the shift timing.
- to supply the vehicle speed input signal for the TCM .

Input Shaft Speed Sensors

Input shaft speed sensor 1 measures the input speed and the rotating direction of the input shaft 1. The input shaft can be stationary. Therefore it is necessary, that the sensor system can detect the stationary state of the input shaft accurate. By being stationary the sensor must not indicate speed unequal to 0 (also not, if the motor runs by high speeds). The slow rolling of the car has to be detected safely.

Input shaft speed sensor 2 measures the input speed of the input shaft 2. The rotation direction is not measured.

Shift Motors

Two electric motors are used to shift the gears in the transaxle, one motor for gears 1-3-5 and one motor for gears R-2-4-6. The gear shifting is made by two shift drums connected to shift motor pinion via two ideal gears. The max shifting force is 1500 N (337 lb). The motors are integrated in the TCM and work independently of each other.

Clutch Motors

Two electrically commuted motors are used to actuate the double clutch in the transaxle – one motor per clutch. The motors work independently of each other. When the clutch is fully closed, the motor provides the holding torque in addition with spring force. The clutch motors work against a clutch spring and are disengaged when they reach the zero position (rest position) with the spring force.

Brake Pedal Position (BPP) Switch

The BPP switch is mounted on the brake pedal bracket.

The signal of the BPP switch is used by the PCM for the following functions:

- to activate the Brake Shift Interlock Actuator (BSIA) when the brake pedal is pressed in PARK.

No substitute signal is available for the BPP switch.

If the connection to the BPP switch is cut, the selector lever cannot be moved out of PARK.

Brake Shift Interlock Actuator (BSIA)

When the ignition is switched to the ON or RUN position, the BSIA is actuated by pressing the brake (signal from the BPP switch). This retracts the blocker so that the selector lever can be moved out of

PARK.

Brake Shift Interlock Override

NOTE: If PARK is selected again, the selector lever is locked again.

If the brake signal should fail due to a malfunction, manual unlocking of the selector lever is possible.

For this, the release of the mechanism must be done by removing the side console panel and using a suitable tool press the BSIA lever until the selector lever can be moved out of PARK.

Starter Inhibitor Relay

The relay prevents the engine starting in selector lever positions R, D and L.

The relay obtains the information about the position of the selector lever directly from the TR sensor.

Transmission Control Switch (TCS) Button

The TCS button is located on the selector lever.

Grade Assist improves vehicle handling in hilly terrain or mountainous areas by providing additional engine braking and extends lower gear operation on uphill climbs. Additional engine braking is provided through the automatic transaxle shift strategy which reacts to vehicle inputs including vehicle acceleration, accelerator pedal, brake pedal and vehicle speed. The transaxle will select gears that will provide the desired engine braking, based on the vehicle inputs, the engine rpm during engine braking will increase. It is recommended to return to DRIVE mode on flat terrain to provide the best fuel economy and transaxle function. The transaxle returns to Overdrive (O/D) and grade assist is cancelled when the TCS is pressed again.

TCS /Grade Assist Indicator

The TCS /Grade Assist indicator is located in the Instrument Cluster (IC).

It tells the driver that shifting into 6th gear is prevented by the transaxle control.

The O/D /Grade Assist light flashes to tell the driver that the transaxle control has switched to the emergency operating mode.

Emergency Operating Program

If correct gear shifting can no longer be guaranteed due to failure of certain signals, the TCM changes to an emergency operating program.

The driver is informed of the operation of the emergency operating program by the illumination of the powertrain warning indicator in the IC .

Continued motoring is guaranteed in the following limited conditions based on the failure:

- 1st, 3rd and 5th gear if a fault with clutch 2 and/or relational components occurs.
- 2nd, 4th, 6th and reverse if a fault with clutch 1 and/or relational components occurs.

Diagnostic Strategy

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Troubleshooting an electronically-controlled automatic transaxle is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

Preliminary Inspection

- Verify the concern by operating the vehicle.
- Check the transmission fluid levels and condition.
- Check selector lever linkages for correct adjustment.

Diagnostics

- Carry out On-Board Diagnostic (OBD) procedures Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER).
- Record all DTCs.
- Repair all non-transaxle DTCs first.
- Repair all transaxle DTCs second.
- Erase all continuous DTCs and attempt to repeat them.
- Repair all continuous DTCs.
- If only pass DTCs are obtained, proceed to the Diagnosis by Symptom Index. Refer to Diagnosis By Symptom in this section for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Preliminary Inspection

Determine Customer Concern

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting
- Engagement
- Noise/vibration — check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent or temperature dependent.

Transmission Fluid Level and Condition Check

NOTICE: **If transaxle noise is reported, first check the transmission fluid level. The vehicle should not be driven if the transmission fluid level is low or damage can occur.**

NOTE: The vehicle should not be driven if the transmission fluid level is low.

An incorrect transmission fluid level may affect the transaxle operation and can result in transaxle damage. To correctly check and add transmission fluid to the transaxle, refer to Transmission Draining and Filling in this section.

A low transmission fluid level can result in poor transaxle shifting, engagement or damage. It can also indicate a leak in the transaxle seals.

1. Check the transmission fluid condition.
    - Observe the color of the transmission fluid. Allow the transmission fluid to drip onto a white cloth and examine the stain. Check the transmission fluid for contamination or metal particles.
        - Transmission fluid should appear nearly clear.

Visual Inspection

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Visually inspect the vehicle for obvious causes of the customer concern. Check for:

- Electronic add-on items
- Vehicle modification

- Leaks; refer to Leakage Inspection in this section.

Inspect the Selector Lever and Components

Check selector lever linkage adjustment by matching the detents in the selector lever with those in the transaxle. If they do not match, adjust the selector lever cable. Refer to Section 307-05 .

Inspect the selector lever and components for:

- binding
- signs of damage.
- broken clips
- binding
- cable not fully seated or in brackets
- hold-down bracket bolts are loose
- correct routing
- correct adjustment

Evaluation of the Transaxle

1. During the road test, use the following driving methods to diagnose the problem.
    - Start the engine.
    - Evaluate the noise in NEUTRAL while the vehicle is parked.
        - Check whether the noise is present.
        - With the parking brake engaged, move the selector lever to DRIVE. Apply very slight pressure to the throttle and note if the noise level is reduced.
        - With the vehicle in PARK, check whether the noise is present as the engine speed is increased. If the noise reduces, note the engine speed at which this occurs.
    - Listen for any change in noise while changing engine rpm.
    - Drive the vehicle and allow it to shift through all of the gear ranges, including reverse. Listen for any change in noise in a particular gear.

- Drive the vehicle in the gear in which the noise is most noticeable. Listen for any change in noise.
- Drive the vehicle in the gear in which the noise is most noticeable and shift the transaxle into NEUTRAL. Allow the vehicle to coast. Note any change in noise.

2. Compare the road test results with the symptom charts. It is a list of conditions that are typical faults into which the transaxle will fall:

GO to Diagnosis By Symptom .

Diagnostic Parameters Identification (PID) Chart

Accessing PIDs

The following general PID list may be of use to the technician when exercising output state control:

PIDs	PID Description
1stBLCK_GR_JMP	1st Gear Is Blocked Due To Gear Jump Occurred
1stBLOCK_TMP	1st Gear Is Blocked Temporarily Protect Mode
2ndBLCK_GR_JMP	2nd Gear Is Blocked Due To Gear Jump Occurred
2ndBLOCK_TMP	2nd Gear Is Blocked Temporarily Protect Mode
3rdBLCK_GR_JMP	3rd Gear Is Blocked Due To Gear Jump Occurred
3rdBLOCK_TMP	3rd Gear Is Blocked Temporarily Protect Mode
4thBLCK_GR_JMP	4th Gear Is Blocked Due To Gear Jump Occurred
4thBLOCK_TMP	4th Gear Is Blocked Temporarily Protect Mode
5thBLCK_GR_JMP	5th Gear Is Blocked Due To Gear Jump Occurred
5thBLOCK_TMP	5th Gear Is Blocked Temporarily Protect Mode
6thBLCK_GR_JMP	6th Gear Is Blocked Due To Gear Jump Occurred
6thBLOCK_TMP	6th Gear Is Blocked Temporarily Protect Mode
CLTC_A_BLCK	Clutch A Actuator Blocked [a]
CLTC_A_CLOS_F	Clutch A Reference Position Closed Failed [a]
CLTC_A_CUR_MES	Clutch A Actuator Current - Measured [a]
CLTC_A_F_MANAG	Clutch A Failure Management Status [a]
CLTC_A_LOWCONF	Clutch A Low Confidence In Sensed Position [a]
CLTC_A_MTR_DSD	Clutch A Actuator Motor - Desired [a]
CLTC_A_OPEN_F	Clutch A Reference Position Open Direction Failed [a]
CLTC_A_POS_F	Clutch Motor A - Position Sensor Fault
CLTC_A_SEQ_F	Clutch Motor A - Phase Sequence Fault
CLTC_A_SLFDIAG	Clutch A Self Diagnostic Procedure Status [a]
CLTC_A_SLIPMES	Clutch A Measured Slip [a]
CLTC_A_SPRNG	Clutch A Spring Cannot Fully Open Clutch [a]
CLTC_B_BLCK	Clutch B Actuator Blocked [b]
CLTC_B_CLOSE_F	Clutch B Reference Position Closed Failed [b]
CLTC_B_CUR_MES	Clutch B Actuator Current - Measured [b]
CLTC_B_F_MANAG	Clutch B Failure Management Status [b]
CLTC_B_LOWCONF	Clutch B Low Confidence In Sensed Position

CLTC_B_MTR_DSD	Clutch B Actuator Motor - Desired [b]
CLTC_B_OPEN_F	Clutch B Reference Position Open Direction Failed [b]
CLTC_B_POS_F	Clutch Motor B - Position Sensor Fault
CLTC_B_SEQ_F	Clutch Motor B - Phase Sequence Fault
CLTC_B_SLFDIAG	Clutch B Self Diagnostic Procedure Status [b]
CLTC_B_SLIPMES	Clutch B Measured Slip [b]
CLTC_B_SPRNG	Clutch B Spring Cannot Fully Open Clutch [b]
CLTC_MTR_A_F	Clutch Motor A - Phase Circuit Fault
CLTC_MTR_B_F	Clutch Motor B - Phase Circuit Fault
CLUTCH_A_OPEN	Clutch A Is Completely Open - Measured
CLUTCH_B_OPEN	Clutch B Is Completely Open - Measured
FOOT_BRAKE	Foot Brake - Foot brake state used by strategy
GEAR_CMD	Gear Commanded
GEAR_ENGAGED	Transmission Gear Engaged
GEAR_OSC	Gear Command by Output State Control
GEARBX_SF_A_F	Gearbox Error Status for Shift Fork A
GEARBX_SF_B_F	Gearbox Error Status for Shift Fork B
ISS_A_PC_F	Input Shaft Speed Sensor A - Power/Circuit Fault
ISS_A_RAW	Input Shaft Speed A - Raw
ISS_B_PC_F	Input Shaft Speed Sensor B - Power/Circuit Fault
ISS_B_RAW	Input Shaft Speed B - Raw
ISS_EFFECT_RPM	Effective Input Shaft Speed
OSS_PC_F	Output Shaft Speed Sensor - Power or Circuit Fault
OSS_SRC	Unfiltered Output Shaft Speed A
REVBLCK_GR_JMP	Reverse Gear Is Blocked Due To Gear Jump Occurred
REVBLOCK_TMP	Reverse Is Blocked Temporarily Protect Mode
RLC	Reverse Lamp Control
RLC_F	Reverse Control Lamp Status
SF_A_CURR_MES	Shift Fork A Actuator Current - Measured
SF_A_ENGAG_STA	Shift Fork A Engagement Control Status
SF_A_GRRAT_MES	Shift Fork A Gear Ratio - Measured
SF_A_POS_MES	Shift Fork A Actuator Position - Measured
SF_A_POS_STAT	Position Signal Status for Shift Fork A Actuator
SF_A_POS_TARG	Shift Fork A Actuator Position - Target
SF_A_ROTAT_MES	Shift Fork A Rotational Position - Measured
SF_B_CURR_MES	Shift Fork B Actuator Current - Measured
SF_B_ENGAG_STA	Shift Fork B Engagement Control Status
SF_B_GRRAT_MES	Shift Fork B Gear Ratio - Measured
SF_B_POS_MES	Shift Fork B Actuator Position - Measured
SF_B_POS_STAT	Position Signal Status for Shift Fork B Actuator
SF_B_POS_TARG	Shift Fork B Actuator Position - Target

SF_B_ROTAT_MES	Shift Fork B Rotational Position - Measured
SHFRK_A_CAL_E1	Self Calibration Error - Shift Fork A Movement
SHFRK_A_CAL_E2	Self Calibration Error - Shift Fork A Reference
SHFRK_B_CAL_E1	Self Calibration Error - Shift Fork B Movement
SHFRK_B_CAL_E2	Self Calibration Error - Shift Fork B Reference
SHFRK_NO_CAL_0	Self Calibration Prevented - Brake Input Status
SHFRK_NO_CAL_1	Self Calibration Prevented - Clutch A is Not Open
SHFRK_NO_CAL_2	Self Calibration Prevented - Clutch B is Not Open
SHFRK_NO_CAL_3	Self Calibration Prevented - Output Shaft Speed
SHFRK_NO_CAL_4	Self Calibration Prevented - Actuator Supply Voltage
SHFTLCK_ALLW	Transmission Range Shift Lock Output Allow
SHFTLCK_ALLW_F	Transmission Range Shift Lock Output Allow Status
SHIFT_A	Shifting In Progress on Shift Fork A
SHIFT_B	Shifting In Progress on Shift Fork B
TCIL	Transmission Control Indicator Light
TCS_DEPRES	Transmission Control Switch Pressed
TCS_STATE	Transmission Control Switch Requested State
TR_A_DC	Transmission Range Sensor Input A Duty Cycle
TR_A_POS_MEAS	Transmission Range Sensor A Position - Measured
TR_A_UR	Transmission Range Sensor Input A Unreliable
TR_B_DC	Transmission Range Sensor Input B Duty Cycle
TR_B_POS_MEAS	Transmission Range Sensor B Position - Measured
TR_B_UR	Transmission Range Sensor Input B Unreliable
TR_CORRECTED	Transmission Range Sensor Position - Corrected
TR_CRANK	Transmission Range Input Allowing Engine Start
TR_CRANK_F	Park Neutral Starter Enable Output Fault Detected
TR_SUPPLY_F	Transmission Range Supply Voltage Output Fault
TRAN_RAT	Transmission Gear Ratio

[a] Clutch A = Clutch 1
[b] Clutch B = Clutch 2

Diagnostic Trouble Code (DTC) Charts

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

DTC Chart

Five Digit DTC	Description	Condition	Symptom	Action
C0044:28	Brake pressure sensor A: signal bias level out of range / zero adjustment failure	Brake pressure sensor signals do not match	Transaxle defaults to NEUTRAL	For additional information, refer to Section 206-09 .
P06A6	Sensor reference voltage A circuit range/performance	Input shaft speed sensor 1 power supply circuit failure	Disabled 3rd and 5th gears. Only engage in 1st gear at a stop. Neutral shift drum 1 after launch.	GO to Pinpoint Test C .
P06A7	Sensor reference voltage B circuit range/performance	Input shaft speed sensor power supply circuit failure	Disabled 2nd, 4th and 6th gears. Neutral shift drum 2 in forward range.	GO to Pinpoint Test C .
P06A8	Sensor reference voltage C circuit range/performance	Output Shaft Speed (OSS) power supply circuit failure.	Substitute Anti-Lock Brake System (ABS) wheel speed, input shaft speed sensor 1 or input shaft speed sensor 2 for OSS .	GO to Pinpoint Test C .
P0700	Transmission control system DTC present	TCM has sent a DTC error code to PCM indicating that additional TCM DTCs may be present.	Malfunction Indicator Lamp (MIL) may be illuminated. Other transmission concerns present.	Code set in PCM to indicate that there is a transmission code(s) present and technician should check the TCM for codes. RERUN OBD test and retrieve transmission DTCs from TCM .
P0701	Wrong engine control fault - monitors the torque up and engine speed requests from the Transmission	Transmission control system range/performance	Will turn on Malfunction Indicator Lamp (MIL).	See more specific DTC. If no other DTCs are set, clear code and re-test.

	Control Module (TCM), if it finds a fault it turns off these requests			
P0702	Transmission control system electrical	Sets with P0882 (voltage out of range low) or P0883 (voltage out of range high)	See more specific DTC.	• Verify TR sensor adaptive learning. For additional information, refer to Transmission Adaptive Learning in this section. • Adjust selector lever cable. Refer to Section 307-05. If concern still present, replace TR sensor.
P0706	TR sensor A circuit range/performance	TR sensor A frequency out of range (200-300 Hz). Code does not set for open, short to ground or short to power (duty cycle less than 2.0 or greater than 98.0 disables this code)	• Default to NEUTRAL at low speed. • Crank disabled if fault present at start-up • Will turn on Malfunction Indicator Lamp (MIL).	GO to Pinpoint Test D.
P0707	TR sensor A circuit low	TR sensor A duty cycle out of range low (below Park Min duty cycle)	• Default to NEUTRAL at low speed. • Crank disabled if fault present at start-up • Will turn on MIL.	• Verify TR sensor adaptive learning. For additional information, refer to Transmission Adaptive Learning in this section. • Adjust selector lever cable. Refer to Section 307-05. If concern still present, replace TR sensor.
P0708	TR sensor A circuit high	TR sensor A duty cycle out of range high (below Low Max duty cycle).	• Default to NEUTRAL at low speed. • Crank disabled if fault present at start-up • Will turn on MIL.	GO to Pinpoint Test D.
P0709	TR sensor A circuit intermittent	TR intermittent PARK or NEUTRAL signal during pre-crank test	• Sets with P0706, P0707 or	GO to Pinpoint Test D.

			P0708. • Will turn on MIL .	
P0715	Insufficient input from input shaft speed sensor	Input shaft speed sensor 1 circuit failure detected	Disabled 3rd and 5th gears. Only engages in 1st at a stop, Neutral Shift Drum 1 after launch.	GO to Pinpoint Test C .
P0716	Input shaft speed sensor A circuit	Erratic input shaft speed sensor 1 signal - noisy signal, out of range high, or not plausible. Detection of this fault is disabled if a power supply (P06A6) or circuit fault (P0715) is present.	Disabled 3rd and 5th gears. Only engages in 1st at a stop, neutral shift drum 1 after launch.	GO to Pinpoint Test C .
P0717	Input shaft speed sensor A circuit no signal	Input shaft speed sensor 1 failed to 0 speed. Detection of this fault is disabled if a power supply (P06A6) or circuit fault (P0715) is present	Disabled 3rd and 5th gears. Only engages in 1st at a stop, neutral shift drum 1 after launch.	GO to Pinpoint Test C .
P0718	Input shaft speed sensor A signal intermittent	PCM has detected an erratic input shaft speed sensor signal.	• Disabled 3rd and 5th gears. Only engages in 1st at a stop, neutral shift drum 1 after launch. • Sets with P06A6, P0715, P0716 or P0717 • Will turn on Malfunction Indicator Lamp (MIL).	GO to Pinpoint Test C .
P0720	Insufficient input from OSS sensor circuit	OSS circuit failure detected.	Substitute ABS wheel speed, input shaft speed sensor 1 or input shaft speed sensor 2 for OSS	GO to Pinpoint Test C .
P0721	OSS sensor signal error	Erratic OSS signal - noisy signal, out of range high, or not plausible. Detection of this fault is disabled if a power supply (P06A8) or circuit fault (P0720) is present.	Substitute ABS wheel speed, input shaft speed sensor 1 or input shaft speed sensor 2 for OSS	GO to Pinpoint Test C .
P0722	OSS sensor no signal	OSS failed to 0 speed when vehicle	Substitute ABS wheel speed, input	GO to Pinpoint Test C .

		conditions indicate OSS should be non-zero. Detection of this fault is disabled if a power supply (P06A8) or circuit fault (P0720) is present.	shaft speed sensor 1 or input shaft speed sensor 2 for OSS	
P0723	OSS sensor circuit intermittent	Sets with P0720, P0721 or P0722	• Substitute ABS wheel speed, input shaft speed sensor 1 or input shaft speed sensor 2 for OSS • Will turn on Malfunction Indicator Lamp (MIL).	GO to Pinpoint Test C .
P072B	Stuck in reverse	Shift drum 2 is unable to disengage REVERSE gear	• Shift drum 2 mechanical fault. • Shift drum 2 motor fault. • Electrical faults that prevent shift drum 2 from rotating (open circuits cannot be detected during operation). • Clutch 2 stuck on (if undetected may prevent shift drum 2 movement). • 2nd, 4th and 6th gears disabled.	• REPAIR all speed sensor, clutch motor 2, and clutch 2 performance DTCs first. • GO to Pinpoint Test B . • INSPECT shift drum, shift fork, synchronizer and TCM Shift Motors for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P072C	Stuck in gear 1	Shift drum 1 is unable to disengage 1st gear	• Shift drum 1 mechanical fault. • Shift drum 1 motor fault. • Electrical faults that prevent shift drum 1 from rotating (open circuits cannot be detected during operation). • Clutch 1 stuck on (if undetected	• REPAIR all speed sensor, clutch motor 1, and clutch 1 performance DTCs first. • GO to Pinpoint Test B . • INSPECT shift drum, shift fork, synchronizer and TCM shift motors for wear or damage. REPLACE as needed. REFER to Transaxle in

			may prevent shift drum 1 movement). • 3rd and 5th gears disabled.	this section.
P072D	Stuck in gear 2	Shift drum 2 is unable to disengage 2nd gear	• Shift drum 2 mechanical fault. • Shift drum 2 motor fault. • Electrical faults that prevent shift drum 2 from rotating (open circuits cannot be detected during operation). • Clutch 2 stuck on (if undetected may prevent shift drum 2 movement). • REVERSE, 4th and 6th gears disabled.	• REPAIR all speed sensor, clutch motor 2, and clutch 2 performance DTCs first. • GO to Pinpoint Test B . • INSPECT shift drum, shift fork, synchronizer and TCM shift motors for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P072E	Stuck in gear 3	Shift drum 1 is unable to disengage 3rd gear	• Shift drum 1 mechanical fault. • Shift drum 1 motor fault. • Electrical faults that prevent shift drum 1 from rotating (open circuits cannot be detected during operation). • Clutch 1 stuck on (if undetected may prevent shift drum 1 movement). • 1st and 5th gears disabled.	• REPAIR all speed sensor, clutch motor 1, and clutch 1 performance DTCs first. • GO to Pinpoint Test B . • INSPECT shift drum, shift fork, synchronizer and TCM shift motors for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P072F	Stuck in gear 4	Shift drum 2 unable to disengage 4th gear	• Shift drum 2 mechanical fault. • Shift drum 2 motor fault. • Electrical faults that	• REPAIR all speed sensor, clutch motor 2, and clutch 2 performance DTCs first. • GO to Pinpoint

			prevent shift drum 2 from rotating (open circuits cannot be detected during operation). • Clutch 2 stuck on (if undetected may prevent shift drum 2 movement). • REVERSE, 2nd and 6th gears disabled.	Test B . • INSPECT shift drum, shift fork, synchronizer and TCM shift motors for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P073A	Stuck in gear 5	Shift drum 1 unable to disengage 5th gear	• Shift drum 1 mechanical fault. • Shift drum 1 motor fault. • Electrical faults that prevent shift drum 1 from rotating (open circuits cannot be detected during operation). • Clutch 1 stuck on (if undetected may prevent shift drum 1 movement). • 1st and 3rd gears disabled.	• REPAIR all speed sensor, clutch motor 1, and clutch 1 performance DTCs first. • GO to Pinpoint Test B . • INSPECT shift drum, shift fork, synchronizer and TCM shift motors for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P073B	Stuck in gear 6	Shift drum 2 unable to disengage 6th gear	• Shift drum 2 mechanical fault. • Shift drum 2 motor fault. • Electrical faults that prevent shift drum 2 from rotating (open circuits cannot be detected during operation). • Clutch 2 stuck on (if undetected may prevent shift drum 2	• REPAIR all speed sensor, clutch motor 2, and clutch 2 performance DTCs first. • GO to Pinpoint Test B . • INSPECT shift drum, shift fork, synchronizer and TCM shift motors for wear or damage. REPLACE as needed. REFER to Transaxle in this section.

			movement). • REVERSE, 2nd and 4th gears disabled.	
P073E	Unable to engage reverse	Shift drum 2 is unable to engage REVERSE	• Motor turns, but cannot synchronize and engage REVERSE gear. • Reverse gear is disabled.	INSPECT shift fork and synchronizer for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P073F	Unable to engage gear 1	Shift drum 1 is unable to engage 1st gear	• Motor turns, but cannot synchronize and engage 1st gear. • 1st gear disabled.	INSPECT shift fork and synchronizer for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P074A	Unable to engage gear 2	Shift drum 2 is unable to engage 2nd gear	• Motor turns, but cannot synchronize and engage 2nd gear. • 2nd gear disabled. • For certain faults shift drum controls will not pass through a failed gear; reverse, 4th and 6th gears may also be disabled.	INSPECT shift fork and synchronizer for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P074B	Unable to engage gear 3	Shift drum 1 is unable to engage 3rd gear	• Motor turns, but cannot synchronize and engage 3rd gear. • 3rd gear disabled. • For certain faults shift drum controls will not pass through a failed gear; 1st and 5th gears may also be disabled.	INSPECT shift fork and synchronizer for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P074C	Unable to engage gear 4	Shift drum 2 is unable to engage 4th gear	• Motor turns, but cannot synchronize and engage 4th gear. • 4th gear disabled.	INSPECT shift fork and synchronizer for wear or damage. REPLACE as needed. REFER to Transaxle in this section.

			• For certain faults shift drum controls will not pass through a failed gear; reverse, 2nd and 6th gears may also be disabled.	
P074D	Unable to engage gear 5	Shift drum 1 is unable to engage 5th gear	• Motor turns, but cannot synchronize and engage 5th gear. • 5th gear disabled.	INSPECT shift fork and synchronizer for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P074E	Unable to engage gear 6	Shift drum 2 is unable to engage 6th gear	• Motor turns, but cannot synchronize and engage 6th gear. • 6th gear disabled.	INSPECT shift fork and synchronizer for wear or damage. REPLACE as needed. REFER to Transaxle in this section.
P07A2	Transmission friction element A performance/stuck off	Clutch A (1st, 3rd and 5th gears) stuck off [a]	1st, 3rd and 5th gears disabled.	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P07A3	Transmission friction element A stuck on	Clutch A (1st, 3rd and 5th gears) spring fault or clutch motor 1 is blocked, preventing it traveling its full range. [a]	• Spring. • Blockage. • 3rd and 5th gears disabled.	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P07A4	Transmission friction element B performance/stuck off	Clutch B (R, 2nd, 4th and 6th) stuck off. [b]	Reverse, 2nd, 4th and 6th gears disabled	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P07A5	Transmission friction element B stuck on	Clutch B (reverse, 2nd, 4th and 6th gears) spring fault or clutch motor 2 is blocked, preventing it traveling its full range. [b]	• Spring. • Blockage. • Reverse, 2nd, 4th and 6th gears disabled.	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P0805	Clutch position sensor A circuit	Clutch motor 1 (ATIC) fault	1st, 3rd and 5th gears disabled.	GO to Pinpoint Test A.
P0806	Clutch position sensor A circuit range/performance	Clutch motor 1 hall sensor fault detected	1st, 3rd and 5th gears disabled	GO to Pinpoint Test A.
P0809	Clutch position sensor A circuit intermittent	Clutch motor 1 sequence fault detected	1st, 3rd and 5th gears disabled.	GO to Pinpoint Test A.
P087A	Clutch position sensor B circuit	Clutch motor 2 (ATIC) fault detected	Reverse, 2nd, 4th and 6th gears disabled.	GO to Pinpoint Test A.

P087B	Clutch position sensor B circuit range/performance	Clutch motor 2 hall sensor fault detected	Reverse, 2nd, 4th and 6th gears disabled.	GO to Pinpoint Test A .
P087E	Clutch position sensor B circuit intermittent	Clutch motor 2 sequence fault detected	Reverse, 2nd, 4th and 6th gears disabled.	GO to Pinpoint Test A .
P0882	TCM power input signal low	TCM voltage out of range - low	Shift drums will not engage new gears.	GO to Pinpoint Test A .
P0883	TCM power input signal high	TCM voltage out of range - high	No noticeable problems.	Section 414-00 .
P0900	Clutch A actuator control circuit / open	Clutch motor 1 open circuit fault detected	1st. 3rd and 5th gears disabled.	GO to Pinpoint Test A .
P0901	Clutch A actuator control circuit range/performance	Sets with P0900, P0902 or P0903	Will turn on MIL .	GO to Pinpoint Test A .
P0902	Clutch A actuator control circuit low	Clutch motor 1 short to ground fault detected	1st, 3rd and 5th gears disabled.	GO to Pinpoint Test A .
P0903	Clutch A actuator control circuit high	Clutch motor 1 short to power fault detected	1st, 3rd and 5th gears disabled.	GO to Pinpoint Test A .
P090A	Clutch B actuator control circuit / open	Clutch motor 2 open circuit fault detected	Reverse, 2nd, 4th and 6th gears disabled.	GO to Pinpoint Test A .
P090B	Clutch B actuator control circuit performance	Sets with P090A, P090C or P090D	Will turn on MIL .	GO to Pinpoint Test A .
P090C	Clutch B actuator control circuit low	Clutch motor 2 short to ground fault detected	Reverse, 2nd, 4th and 6th gears disabled.	GO to Pinpoint Test A .
P090D	Clutch B Actuator Control Circuit High	Clutch motor 2 short to power fault detected	Reverse, 2nd, 4th and 6th gears disabled.	GO to Pinpoint Test A .
P163E	TCM programming error	Gear ratio calibration error	• Gear ratios used within Ford software and shift drum controls do not match. • The calibration does not match the hardware.	Verify TCM calibration. For additional information, refer to Transmission Adaptive Learning in this section.
P2700	Transmission friction element A apply time range/performance	—	—	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P2701	Transmission friction element B apply time range/performance	—	—	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P2765	Input speed sensor 2	Input shaft speed 2	2nd, 4th and 6th	GO to Pinpoint Test

	circuit	circuit failure detected	gears disabled.	C .
P2766	Input speed sensor 2 circuit range / performance	Erratic input shaft speed sensor 1 signal - noisy signal, out of range high, or not plausible	2nd, 4th and 6th gears disabled.	GO to Pinpoint Test C .
P2767	Input speed sensor 2 circuit no signal	Input shaft speed sensor failed to 0 speed when vehicle conditions indicate that input shaft speed sensor should be non-zero	2nd, 4th and 6th gears disabled.	GO to Pinpoint Test C .
P2768	Input speed sensor 2 circuit intermittent	Sets with P06A7, P2765, P2766 or P2767	• 2nd, 4th and 6th gears disabled. • Will turn on MIL .	GO to Pinpoint Test C .
P2801	TR sensor B circuit range/performance	TR B frequency out of range (200-300 Hz). Code does not set for open, short to ground or short to power (duty cycle less than 2.0 or greater than 98.0 disables this code.	• Default to neutral at low speed. • Crank disabled if fault present at start-up	GO to Pinpoint Test D .
P2802	TR sensor B circuit low	TR sensor B duty cycle out of range low	• Default to neutral at low speed. • Crank disabled if fault present at start-up	GO to Pinpoint Test D .
P2803	TR sensor B circuit high	TR sensor B duty cycle out of range high	• Default to neutral at low speed. • Crank disabled if fault present at start-up	GO to Pinpoint Test D .
P2804	TR sensor B circuit intermittent	Sets with P2801, P2802 or P2803	See P0706, P0707 and P0708.	GO to Pinpoint Test D .
P2805	TR sensor A / B correlation	TR sensor A and B sum must be 100 +/- 2x sensor tolerance. If both are "in-range" (no other DTC's set) but the sum fails to add up to 100% this DTC will set	• Defaults to neutral at low speed. • Crank disabled if fault present at start up.	GO to Pinpoint Test D .
P2831	Shift fork A position circuit intermittent	Shift drum motor 1 fault detected	Shift drum 1 will no longer move, so only the current gear is available on shift drum 1	GO to Pinpoint Test B .
P2832	Shift fork A position	Shift drum - shift	• 1st, 3rd, and	GO to Pinpoint Test

	circuit range/performance	drum controls found an error with shift drum 1 that indicated it has lost position confidence.	5th gears disabled. • If shift drum 1 indicates state of shift drum 1 unknown the transaxle will default to neutral.	B .
P2835	Shift fork A position circuit intermittent	Shift drum motor 1 sequence fault detected	Disables all the gears but the current engaged gear.	GO to Pinpoint Test B .
P2836	Shift fork B position circuit	Shift drum motor 2 fault detected	Shift drum will no longer move. Current gear is the only gear available.	GO to Pinpoint Test B .
P2837	Shift fork B position circuit range/performance	Shift drum 2 - shift drum controls found an error with shift drum 2 that indicated it has lost position confidence	• Reverse, 2nd, 4th and 6th gears disabled. • If shift drum control indicates state of shift drum 2 as unknown the transaxle will default to neutral.	GO to Pinpoint Test B .
P283A	Shift fork B position circuit intermittent	Shift drum motor 2 sequence fault detected	Disables all gears but the current gear.	GO to Pinpoint Test B .
P285B	Shift fork A actuator circuit / open	Shift drum motor 2 open circuit fault detected	Disables all gears but the current gear.	GO to Pinpoint Test B .
P285C	Shift fork A actuator circuit performance	Sets with P285F, P2861 or P2862	• Disables all gears but the current gear. • Will turn on MIL .	GO to Pinpoint Test B .
P285D	Shift fork A actuator circuit low	Shift drum motor 1 short to ground fault detected	Disables all gears but the current gear.	GO to Pinpoint Test B .
P285E	Shift fork A actuator circuit high	Shift drum motor 1 short to power fault detected	Disables all gears but the current gear.	GO to Pinpoint Test B .
P285F	Shift fork B actuator circuit / open	Shift drum motor 1 open circuit fault detected	Disables all gears but the current gear.	GO to Pinpoint Test B .
P2860	Shift fork B actuator circuit performance	Sets with P285F, P2861 or P2862	• Disables all gears but the current gear. • Will turn on MIL .	GO to Pinpoint Test B .
P2861	Shift fork B actuator circuit low	Shift drum motor 2 short to ground fault	Disables all gears but the current gear.	GO to Pinpoint Test B .

		detected		
P2862	Shift fork B actuator circuit high	Shift drum motor 2 short to power fault detected	Disables all gears but the current gear.	GO to Pinpoint Test B .
P286F	Clutch A disengagement time performance/too slow	TIP unintended launch protection or wrong driving direction tripped.	Disables clutch 1.	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P2872	Clutch A stuck engaged	Clutch confidence error	Neutral shift drum 1 and disables all gears with clutch 1 on.	• GO to Pinpoint Test B . • Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P2877	Clutch B disengagement time performance/too slow	TIP unintended launch protection or wrong driving direction tripped.	Disables clutch 2.	Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P287A	Clutch B stuck engaged	Clutch confidence error	Neutral shift drum 2 and disables all gears with clutch 2 on.	• GO to Pinpoint Test B . • Check the clutch for wear or damage. For additional information, refer to Clutch in this section.
P287B	Shift fork calibration not learned	Transmission control module adaptive learning failure	Defaults to neutral until a transmission control module adaptive learning completes successfully	Verify TCM calibration. For additional information, refer to Transmission Adaptive Learning in this section.
U0028	Vehicle communication bus A	non- MIL sister code to U0073	• Holds current gear until the vehicle speed is too low, then defaults to neutral.	Refer to Section 418-00 .
U0073	Control module communication bus A off	Complete Controller Area Network (CAN) failure	• Holds current gear until the vehicle speed is too low, then defaults to NEUTRAL. • Will turn on MIL .	Refer to Section 418-00 .
U0100	Lost communication with Engine Control Module (ECM)/ PCM A	Lost communication with the PCM .	• Holds current gear until the vehicle speed is too low, then defaults to neutral. • Will turn on	Refer to Section 418-00 .

			MIL .	
U0115	Lost Communication With ECM / PCM B	Lost communication with the PCM .	FMEM mode.	Refer to Section 418-00 .
U0121	Lost communication with ABS control module	Lost communication with ABS	Provide failure mode substitutions for missing brake pressure and wheel speeds	Refer to Section 418-00 .
U0129	Lost communication with ABS control module	Lost communication with ABS control module	Provide failure mode substitutions for missing brake pressure and wheel speeds	Refer to Section 418-00 .
U0140	Lost communication with Body Control Module (BCM)	—	—	Refer to Section 418-00 .
U0141	Lost communication with BCM A	—	—	Refer to Section 418-00 .
U0155	Lost communication with Instrument Panel Cluster (IPC) control module	Lost communication with the IPC control module	—	Refer to Section 418-00 .
U0294	Lost communication with PCM	Lost communication with PCM	Holds current gear until speed is too low then defaults to neutral.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0401	Invalid data received from ECM / PCM A	Receiving CAN messages from PCM , but PCM is indicating failures of certain key signals	Holds current gear until speed is too low then defaults to neutral.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0415	Invalid data received from ABS control module	Receiving CAN messages from ABS , but ABS is indicating failures of certain key signals	—	Refer to Section 206-09 .

[a] Clutch A = Clutch 1

[b] Clutch B = Clutch 2

Pinpoint Tests

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Any time an electrical connector is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new as necessary.

Pinpoint Tests

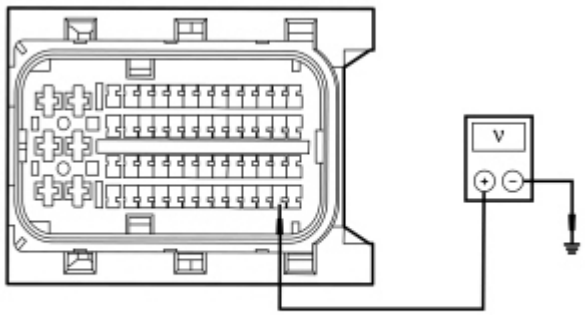
Refer to Wiring Diagrams Cell 29 for schematic and connector information.

PINPOINT TEST A: CLUTCH MOTORS

NOTE: Refer to the transaxle connector illustrations Transaxle Connector Layouts in this section.

Test Step	Result / Action to Take
A1 TEST BJB FUSE 2 (50A)	
• Check fuse: Battery Junction Box (BJB) fuse 2 (50A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A2. **No** REPAIR circuit SBB02 (YE/RD) for a short to ground. INSTALL a new fuse. TEST the system for normal operation. Refer to clutch test in Transmission Adaptive Learning.
A2 TEST BJB FUSE 27 (7.5A)	
• Check fuse: BJB fuse 27 (7.5A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A3.

	No REPAIR circuit SBB27 (BU/RD) for a short to ground. INSTALL a new fuse. TEST the system for normal operation.
A3 TEST CJB FUSE 23 (10A) • Check fuse: Central Junction Box (CJB) fuse 23 (10A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR circuit CBP23 (BN/YE) for a short to ground. INSTALL a new fuse. TEST the system for normal operation.
A4 CHECK FOR VOLTAGE AT THE TCM CONNECTOR • Ignition OFF. • Disconnect: Transmission Control Module (TCM) C1750A. • Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Measure the voltage between TCM C1750A-1, circuit SBB02 (YE/RD) harness side and ground.  N0125641 • Measure the voltage between TCM C1750A-2, circuit SBB02 (YE/RD) harness side and ground.  N0125642 • **Is the voltage greater than 10 volts?**	**Yes** GO to A5 . **No** REPAIR circuit SBB02 (YE/RD) for an open. RECONNECT all components. TEST the system for normal operation.
A5 CHECK FOR KAM VOLTAGE AT THE TCM CONNECTOR • Measure the voltage between TCM C1750A-18, circuit SBB27 (BU/RD) harness side and ground.	**Yes** GO to A6 .



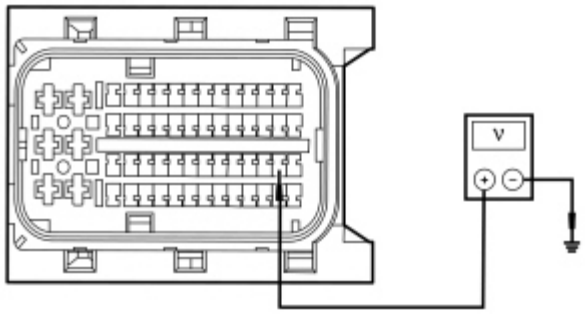
N0125643

- **Is the voltage greater than 10 volts?**

No
REPAIR circuit SBB27 (BU/RD) for an open. RECONNECT all components. TEST the system for normal operation.

A6 CHECK FOR IGNITION POWER AT THE TCM CONNECTOR

- Ignition ON.
- Measure the voltage between TCM C1750A-31, circuit CBP23 (BN/YE) harness side and ground.



N0125644

- **Is the voltage greater than 10 volts?**

Yes
GO to A7.

No
REPAIR circuit CBP23 (BN/YE) for an open. RECONNECT all components. TEST the system for normal operation.

A7 CHECK THE TRANSAXLE WIRING HARNESS FOR AN OPEN CIRCUIT

- Ignition OFF.
- Disconnect: TCM C1750B.
- Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Disconnect: Clutch Motor 1 C1633.
- Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Disconnect: Clutch Motor 2 C1634.
- Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- If diagnosing a clutch motor 1 concern, measure the resistance between TCM C1750B, harness side and clutch motor 1 C1633, using the following chart.

TCM	Clutch Motor 1
C1750B-58	C1633-1
C1750B-19	C1633-2
C1750B-45	C1633-3
C1750B-32	C1633-4
C1750B-57	C1633-5

Yes
GO to A8.

No
REPAIR the circuit(s) for an open. RECONNECT all components. TEST the system for normal operation.

C1750B-6	C1633-6
C1750B-4	C1633-7
C1750B-5	C1633-8

- If diagnosing a clutch motor 2 concern, measure the resistance between TCM C1750B, harness side and clutch motor 2 C1634, using the following chart.

TCM	Clutch Motor 2
C1750B-55	C1634-1
C1750B-42	C1634-2
C1750B-44	C1634-3
C1750B-43	C1634-4
C1750B-56	C1634-5
C1750B-2	C1634-6
C1750B-1	C1634-7
C1750B-3	C1634-8

- **Is the resistance less than 5 ohms?**

A8 CHECK THE TRANSAXLE WIRING HARNESS FOR A SHORT TO GROUND

- If diagnosing a clutch motor 1 concern, measure the resistance between TCM C1750B, harness side and ground using the following chart.

TCM	Ground
C1750B-58	Ground
C1750B-19	Ground
C1750B-45	Ground
C1750B-32	Ground
C1750B-57	Ground
C1750B-6	Ground
C1750B-4	Ground
C1750B-5	Ground

- If diagnosing a clutch motor 2 concern, measure the resistance between TCM C1750B, harness side and ground using the following chart.

TCM	Ground
C1750B-55	Ground
C1750B-42	Ground
C1750B-44	Ground
C1750B-43	Ground
C1750B-56	Ground
C1750B-2	Ground

Yes
Inspect the transaxle wiring harness for signs of physical damage and repair or install a new transaxle wiring harness as necessary. TEST the system for normal operation. If the transaxle wiring harness is not damaged, GO to A9 .

No
REPAIR the circuit(s) for a short to ground. RECONNECT all components. TEST the system for normal operation.

C1750B-1	Ground
C1750B-3	Ground

- **Is the resistance greater than 10,000 ohms?**

A9 CHECK THE CLUTCH MOTOR	
• Remove both clutch motors. Install clutch motor 1 in the original clutch motor 2 location and install clutch motor 2 in the original clutch motor 1 location. RECONNECT all components. Clear the DTC's and TEST the system for normal operation. • **Does the TCM set the same DTC?**	**Yes** INSTALL a new TCM . **No** INSTALL a new clutch motor. TEST the system for normal operation.

PINPOINT TEST B: SHIFT MOTORS

NOTE: Refer to the transaxle connector illustrations Transaxle Connector Layouts in this section.

Test Step	Result / Action to Take
B1 TEST BJB FUSE 2 (50A)	
• Check fuse: Battery Junction Box (BJB) fuse 2 (50A). • **Is the resistance less than 5 ohms?**	**Yes** GO to B2 . **No** REPAIR circuit SBB02 (YE/RD) for a short to ground. INSTALL a new fuse. TEST the system for normal operation.
B2 TEST BJB FUSE 27 (7.5A)	
• Check fuse: BJB fuse 27 (7.5A). • **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR circuit SBB27 (BU/RD) for a short to ground. INSTALL a new fuse. TEST the system for normal operation. Refer to Shift Drum Test in Transmission Adaptive Learning .
B3 TEST CJB FUSE 23 (7.5A)	
• Check fuse: CJB fuse 23 (7.5A). • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR circuit CBP23 (BN/YE) for a short to ground. INSTALL a new fuse. TEST the system for normal operation.
B4 CHECK FOR VOLTAGE AT THE TCM CONNECTOR	
• Ignition OFF. • Disconnect: Transmission Control Module (TCM) C1750A. • Inspect both ends of the connector for damage or pushed-	**Yes** GO to B5 .

out pins, corrosion, loose wires and missing or damaged seals. • Measure the voltage between TCM C1750A-1, circuit SBB02 (YE/RD) harness side and ground.  N0125641 • Measure the voltage between TCM C1750A-2, circuit SBB02 (YE/RD) harness side and ground.  N0125642 • **Is the voltage greater than 10 volts?**	**No** REPAIR circuit SBB02 (YE/RD) for an open. RECONNECT all components. TEST the system for normal operation.
B5 CHECK FOR KAM VOLTAGE AT THE TCM CONNECTOR	
• Measure the voltage between TCM C1750A-18, circuit SBB27 (BU/RD) harness side and ground.  N0125643 • **Is the voltage greater than 10 volts?**	**Yes** GO to B6 . **No** REPAIR circuit SBB27 (BU/RD) for an open. RECONNECT all components. TEST the system for normal operation.
B6 CHECK FOR IGNITION POWER AT THE TCM CONNECTOR	
• Ignition ON. • Measure the voltage between TCM C1750A-31, circuit CBP23 (BN/YE) harness side and ground.	**Yes** INSTALL a new TCM . **No**

 N0125644 • **Is the voltage greater than 10 volts?**	REPAIR circuit CBP23 (BN/YE) for an open. RECONNECT all components. TEST the system for normal operation.

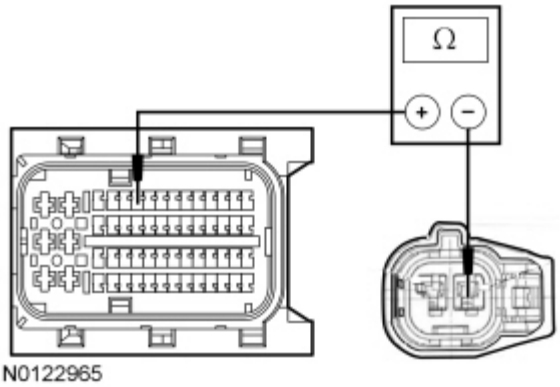
PINPOINT TEST C: SPEED SENSORS

NOTE: Perform speed sensor test prior to beginning speed sensor pinpoint tests. For additional information, refer to Transmission Adaptive Learning in this section.

NOTE: Refer to the transaxle connector illustrations Transaxle Connector Layouts in this section.

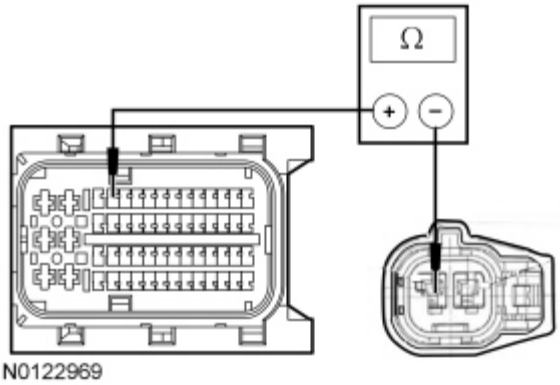
Test Step	Result / Action to Take
C1 CHECK THE TRANSAXLE WIRING HARNESS FOR AN OPEN CIRCUIT	
• Ignition OFF. • Disconnect: Transmission Control Module (TCM) C1750B. • Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Disconnect: Input Shaft Speed Sensor 1 C143. • Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Disconnect: Input Shaft Speed Sensor 2 C164. • Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Disconnect: Output Shaft Speed (OSS) sensor C193. • Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • If diagnosing an input shaft speed sensor 1 concern, measure the resistance between TCM C1750B-21, harness side and input shaft speed sensor 1 C143-2.  N0122964 • If diagnosing an input shaft speed sensor 1 concern, measure the resistance between TCM C1750B-10, harness side and	**Yes** GO to C2 . **No** REPAIR the circuit(s) for an open. RECONNECT all components. TEST the system for normal operation.

input shaft speed sensor 1 C143-1.



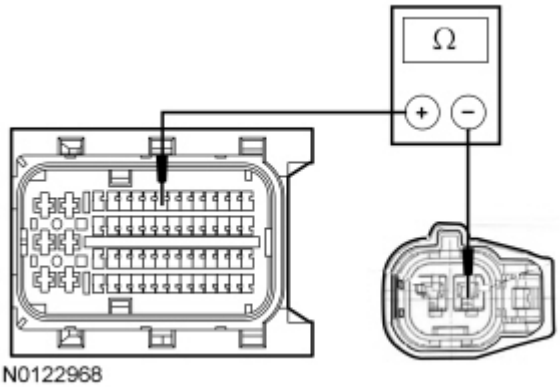
N0122965

- If diagnosing an input shaft speed sensor 2 concern, measure the resistance between TCM C1750B-8, harness side and input shaft speed sensor 2 C164-2.



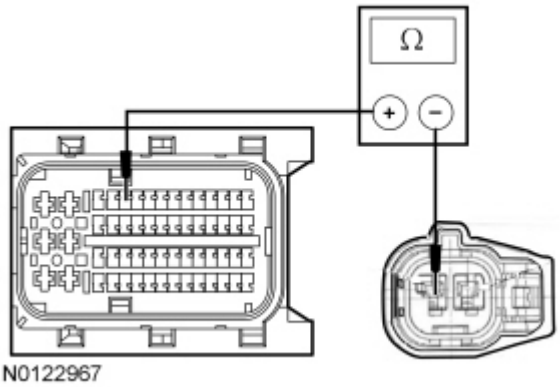
N0122969

- If diagnosing an input shaft speed sensor 2 concern, measure the resistance between TCM C1750B-12, harness side and input shaft speed sensor 2 C164-1.



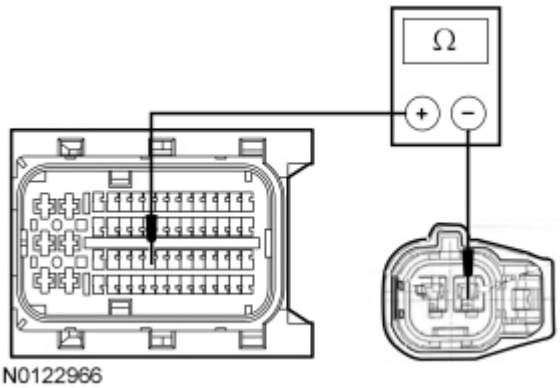
N0122968

- If diagnosing an OSS sensor concern, measure the resistance between TCM C1750B-9, harness side and OSS sensor C193-2.



N0122967

- If diagnosing an OSS sensor concern, measure the resistance between TCM C1750B-37, harness side and OSS sensor C193-1.



N0122966

- **Is the resistance less than 5 ohms?**

C2 CHECK THE TRANSAXLE WIRING HARNESS FOR A SHORT TO GROUND

- If diagnosing an input shaft speed sensor 1 concern, measure the resistance between TCM C1750B, harness side and ground using the following chart.

TCM	Ground
C1750B-21	Ground
C1750B-10	Ground

- If diagnosing an input shaft speed sensor 2 concern, measure the resistance between TCM C1750B, harness side and ground using the following chart.

TCM	Ground
C1750B-12	Ground
C1750B-8	Ground

- If diagnosing an OSS sensor concern, measure the resistance between TCM C1750B, harness side and ground using the following chart.

TCM	Ground
C1750B-37	Ground

Yes
Inspect the transaxle wiring harness for signs of physical damage and repair or install a new transaxle wiring harness as necessary. TEST the system for normal operation. If the transaxle wiring harness is not damaged, GO to C3 .

No
REPAIR the circuit(s) for a short to ground. RECONNECT all components. TEST the system for normal operation.

C1750B-9 | Ground • **Is the resistance greater than 10,000 ohms?**	
C3 CHECK THE TCM • Connect: TCM C1750B. • Ignition ON. • If diagnosing an input shaft speed sensor 1 concern, measure the voltage between input shaft speed sensor 1 C143-2, harness side and ground.  N0122981 • If diagnosing an input shaft speed sensor 2 concern, measure the voltage between input shaft speed sensor 2 C164-2, harness side and ground.  N0122981 • If diagnosing an OSS sensor concern, measure the voltage between OSS sensor C193-1, harness side and ground.  N0122982 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new speed sensor. RECONNECT all components. TEST the system for normal operation. Refer to ISS or OSS Test in Transmission Adaptive Learning . **No** INSTALL a new TCM . RECONNECT all components. TEST the system for normal operation.

PINPOINT TEST D: TR SENSOR

NOTE: Prior to beginning TR sensor pinpoint test, verify TR sensor adaptive learning. For additional information, refer to Transmission Adaptive Learning in this section.

NOTE: Refer to the transaxle connector illustrations Transaxle Connector Layouts in this section.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>D1 VERIFY SELECTOR LEVER CABLE/LINKAGE ADJUSTMENT</td><td rowspan="2">Yes
GO to D2.

No
ADJUST the selector lever cable/linkage. REFER to Section 307-05.</td></tr>
<tr><td>• Verify that the selector lever cable/linkage is correctly adjusted. Refer to Section 307-05.
• Is the selector lever cable/linkage correctly adjusted?</td></tr>
<tr><td>D2 CHECK THE TRANSAXLE WIRING HARNESS FOR AN OPEN CIRCUIT</td><td rowspan="2">Yes
GO to D3.

No
REPAIR the circuit(s) for an open. RECONNECT all components. TEST the system for normal operation. Refer to TR Sensor Adaptive Learning in Transmission Adaptive Learning.</td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Transmission Control Module (TCM) C1750B.
• Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
• Disconnect: Transmission Range (TR) sensor C167.
• Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
• Measure the resistance between TCM C1750B, harness side and TR sensor C167, using the following chart.
<table><tr><th>TCM</th><th>Transmission Range Sensor</th></tr><tr><td>C1750B-24</td><td>C167-4</td></tr><tr><td>C1750B-25</td><td>C167-1</td></tr><tr><td>C1750B-34</td><td>C167-3</td></tr><tr><td>C1750B-35</td><td>C167-2</td></tr></table>• Is the resistance less than 5 ohms?</td></tr>
<tr><td>D3 CHECK THE TRANSAXLE WIRING HARNESS FOR A SHORT TO GROUND</td><td rowspan="2">Yes
Inspect the transaxle wiring harness for signs of physical damage and repair or install a new transaxle wiring harness as necessary. TEST the system for normal operation. If the transaxle wiring harness is not damaged, GO to D4.

No
REPAIR the circuit(s) for a short to ground. RECONNECT all components. TEST the system for normal operation.</td></tr>
<tr><td>• Measure the resistance between TCM C1750B, harness side and ground using the following chart.
<table><tr><th>TCM</th><th>Ground</th></tr><tr><td>C1750B-24</td><td>Ground</td></tr><tr><td>C1750B-25</td><td>Ground</td></tr><tr><td>C1750B-34</td><td>Ground</td></tr><tr><td>C1750B-35</td><td>Ground</td></tr></table>• Is the resistance greater than 10,000 ohms?</td></tr>
<tr><td></td><td></td></tr>
</table>

D4 CHECK THE TCM	
• Connect: Transmission Control Module (TCM) C1750B. • Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Ignition ON. • Measure the voltage between TR sensor C167-3, harness side and TR sensor C167-2, harness side.  N0122984 • **Is the voltage between 4.5 and 5.5 volts?**	**Yes** INSTALL a new TR sensor. RECONNECT all components. TEST the system for normal operation. **No** INSTALL a new TCM . RECONNECT all components. TEST the system for normal operation. Refer to TR Sensor Adaptive Learning in Transmission Adaptive Learning .

Leakage Inspection

Material

Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

NOTICE: **Do not try to stop the transmission fluid leak by increasing the torque beyond specification. This may cause damage to the case threads.**

If leakage is found at the Transmission Range (TR) manual control lever, install a new seal. Refer to Manual Control Lever Shaft Seal in this section.

If leakage is found at the TCM, install a new O-rings. Refer to Transmission Control Module (TCM) in this section.

Check the fill plug and drain plug. If leakage is present refer to Transmission Draining and Filling in this section.

Check all the speed sensors for leakage. Refer to Input Shaft Speed Sensor — No. 1, Input Shaft Speed Sensor — No. 2 or Output Shaft Speed (OSS) Sensor in this section.

Check the RH and LH halfshaft seals. Refer to Halfshaft Seal — RH and Halfshaft Seal — LH in this section.

The transaxle has the following parts to prevent external transmission fluid leakage:

- Sealer
- O-ring seals

Diagnosis By Symptom

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Symptom Chart — Transaxle Operation

Symptom Chart — Transaxle Operation

Condition	Possible Sources	Action
• No forward or reverse, stuck in neutral.	• Brake pressure sensor	• Go to Section 206-09 .
• Harsh or Soft/delayed engagement or shifts	• Clutch Adaptive Learn • Clutch	• Go to Transmission Adaptive Learning in this section and verify the clutch adaptive learning. • Go to Clutch .
• NVH in 1st, 3rd, and/or 5th	• Clutch 1 • Input Shaft 1	• Go to Clutch . • Go to Transaxle .
• NVH in Park, Neutral, R, 2nd, 4th, and/or 6th	• Clutch 2 • Input Shaft 2	• Go to Clutch . • Go to Transaxle .
• NVH in 1st, 2nd, 5th and/or 6th	• Output shaft 1	• Go to Transaxle .
• NVH in 3rd and/or 4th and/or Reverse	• Output shaft 2	• Go to Transaxle .
• NVH in all gears	• Differential	• Go to Transaxle .
• No PARK / Stuck in PARK	• Selector lever cable adjustment • Park components • TCM software wrong level • TCM B+ too high • Wiring harness • TCM can command PRNDL to stay in PARK	• Go to Section 307-05 . • Go to Transaxle . • Go to Clutch Adaptive Learning in Transmission Adaptive Learning .

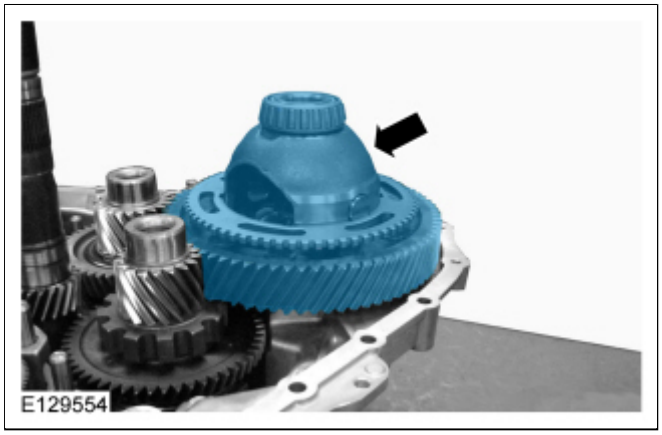
Differential Shim Selection

Special Tool(s)

ST3257-A	Differential Bearing Preload Tool DPS6 307-681 (includes 307-681/1 and 307-681/2)
ST2486-A	Shim Selection Set 308-164

NOTE: If the differential, differential bearings, clutch housing or transaxle case have been replaced this procedure must be performed.

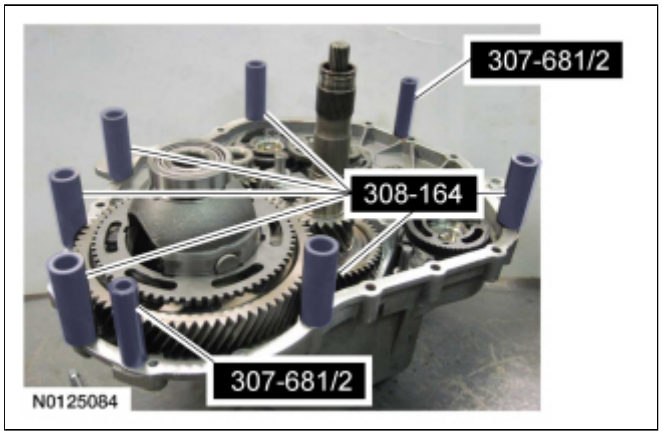
1. Install the differential.



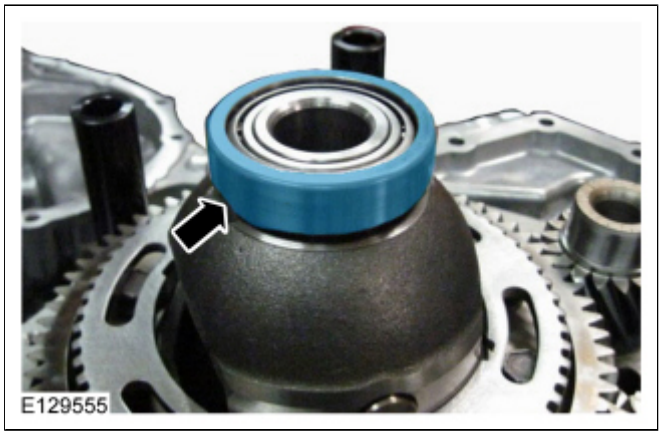
2. **NOTE:** Install the alignment standoffs at the transaxle dowel locations.

   NOTE: Place the special tools around the differential area as shown.

   Install the special tools.

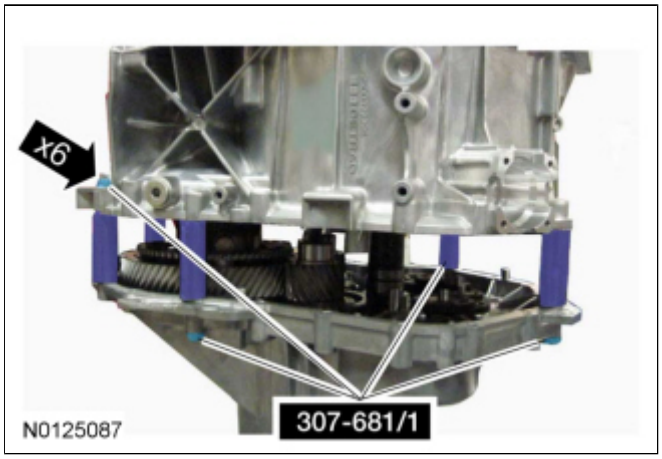


3. Position the differential bearing race on the differential. For removal of the differential bearing race from the clutch housing refer to Differential Shim in this section.



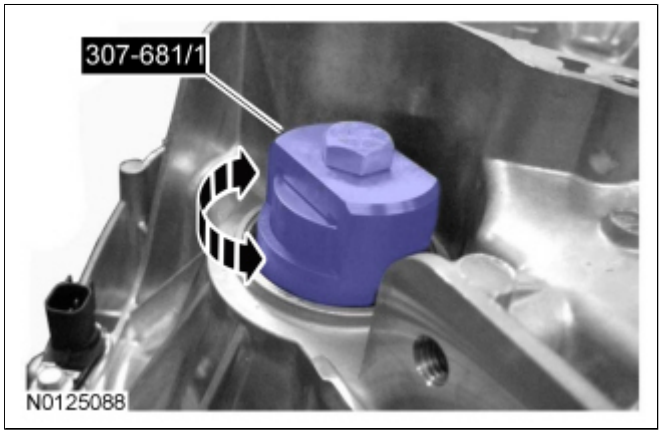
4. Install the special tool on the differential.

5. Position the clutch housing on the special tools and install the 6 special tool bolts, 4 shown.
   - Tighten to 18 Nm (13 lb-ft).

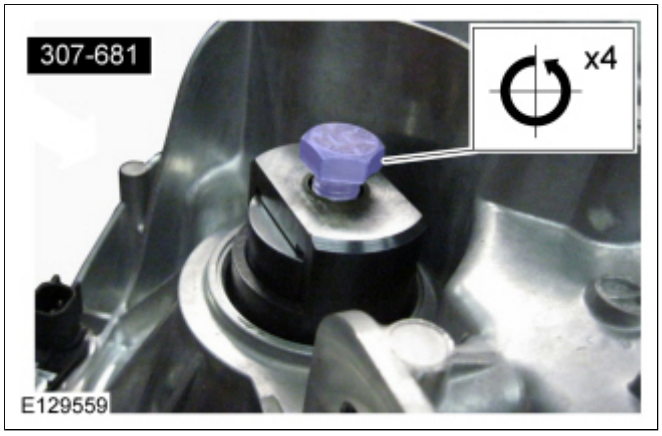


6. Turn the differential several times clockwise and counter-clockwise to make sure the differential turns freely and that the bearing is seated.

7. Turn the differential pre-load tool as shown.

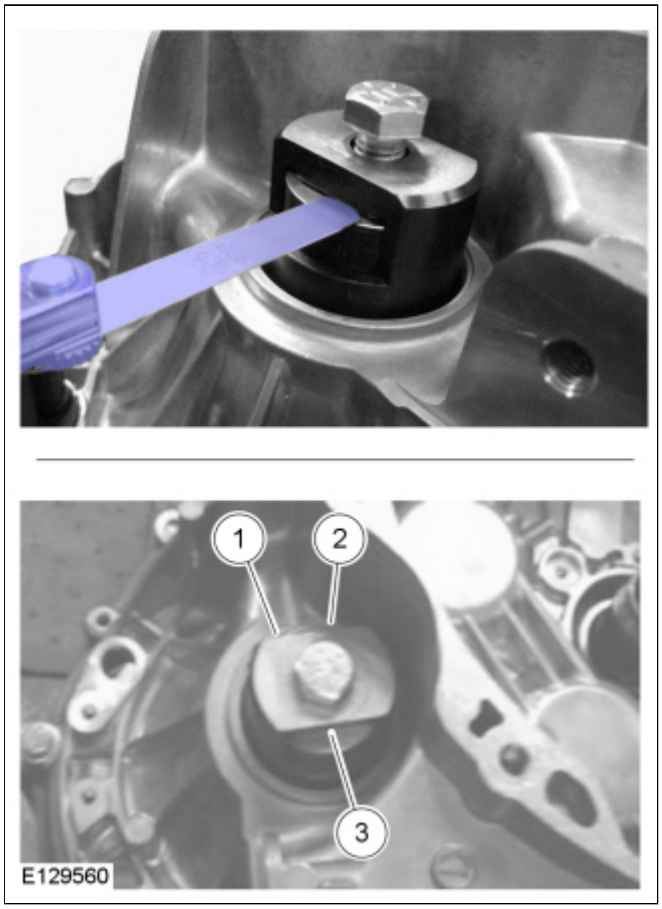


8. Loosen the differential pre-load tool bolt.



9. **NOTE:** The shim size should be the average of the 3 measurements.

   Using a feeler gauge measure the clearance at points 1, 2 and 3 and record. Using the average of the recorded measurements, select the appropriate shim from the shim selection chart in the specifications section.



10. Remove the special tools.

11. Install the selected shim into the clutch housing and install the differential bearing race. For additional information, refer to Differential Shim in this section.

Transmission Adaptive Learning

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

1. The adaptive learning procedures and self-tests should be done with the Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS).

2. **NOTE:** The VCM LED prove-out confirms power and ground from the Data Link Connector (DLC) to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to, Section 418-00 to diagnose no power to the scan tool.

3. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the RUN position.
   - verify scan tool operation with a known good vehicle.
   - refer to, Section 418-00 to diagnose no response from the scan tool.

4. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00
   - If the network test passes, continue with the transmission adaptive learning procedures.

5. Verify that the calibration file is present on the scan tool. If the file is present, go to Step 10. If the file is not present, continue with this procedure.

6. Update the PCM/Transmission Control Module (TCM) calibration. Calibration files maybe obtained at Professional Technician Society (PTS) website. Independent Technicians refer to www.motorcraft.com.
   The scan tool checks to see if the file is present on the scan tool. If the calibration file is present, the technician may proceed with downloading the file to the PCM/ TCM. If the file is not present, the scan tool will need to be connected to the server to download the file onto the scan tool.

7. Connect the scan tool to the PTS server.

8. Follow the instructions on the network to download the strategy file to the scan tool.

9. If the scan tool cannot connect to the PTS server, download the file from www.motorcraft.com. If the scan tool cannot download a strategy from the web site, a partial strategy will automatically be downloaded.

10. Reconnect the scan tool to the vehicle.

TCM Reprogramming

1. Using the scan tool, navigate to the Module Reprogramming sub menu.
    1. Module Programming
    2. Module Reprogramming
    3. TCM

2. Follow the instructions displayed on the scan tool.

TCM Programming

1. Using the scan tool, navigate to the Module Reprogramming sub menu.
    1. Module Programming
    2. Programmable Module Installation
    3. TCM

2. Follow the instructions displayed on the scan tool.

Transmission Range (TR) Sensor Adaptive Learning

1. Using the scan tool, navigate to the TCM Adaptive Learning sub menu.
    1. PCM
    2. TCM
    3. TCM Adaptive Learning

2. Select TR sensor.

3. Select Perform Adaptive Learning.

4. Follow the instructions displayed on the scan tool.

Shift Drum Adaptive Learning

1. Using the scan tool, navigate to the TCM Adaptive Learning sub menu.
    1. PCM
    2. Transmission
    3. TCM Adaptive Learning

2. Select Shift Drum.

3. Follow the instructions displayed on the scan tool.

Clutch Adaptive Learning

1. Using the scan tool, navigate to the TCM Adaptive Learning sub menu.
    1. PCM
    2. Transmission
    3. TCM Adaptive Learning

2. Follow the instructions displayed on the scan tool.

Clutch System Test

1. Using the scan tool, navigate to the TCM Adaptive Learning sub menu.
    1. PCM
    2. Transmission
    3. Clutch System Test

2. Follow the instructions displayed on the scan tool.

Speed Sensor Test

1. Using the scan tool, navigate to the TCM Adaptive Learning sub menu.
    1. PCM
    2. Transmission
    3. Speed Sensor Test

2. Select the desired speed sensor.

3. Follow the instructions displayed on the scan tool.

Drive Cycle

NOTICE: **If a drive cycle is not completed, the customer may feel erratic shifts and driveability concerns.**

NOTE: To perform drive cycle, drive the vehicle on a level road surface.

1. Depress vehicle brake pedal (do not use parking brake).

2. Shift to Drive.

3. Wait 15 seconds.

4. Shift to Reverse.

5. Wait 2 seconds.

6. Repeat (1-5) ten (10) times.

7. Accelerate from a stop with light throttle to 15 mph (24 km/h).

8. Brake gently to a complete stop (allow at least 6 seconds).

9. Repeat steps (7-8) five (5) times in dealership parking lot or similar setting.

10. Accelerate from a stop with light throttle performing 1-2, 2-3, 3-4 shifts maintaining 1700-2000 rpm.

11. Accelerate to a speed between 50 mph (80 km/h) and 65 mph (104 km/h), achieve 6th gear, keep throttle steady with engine below 3000 rpm for a minimum of two (2) minutes.

12. Repeat step 11 two (2) times.
13. Test drive the vehicle.

Transmission Draining and Filling

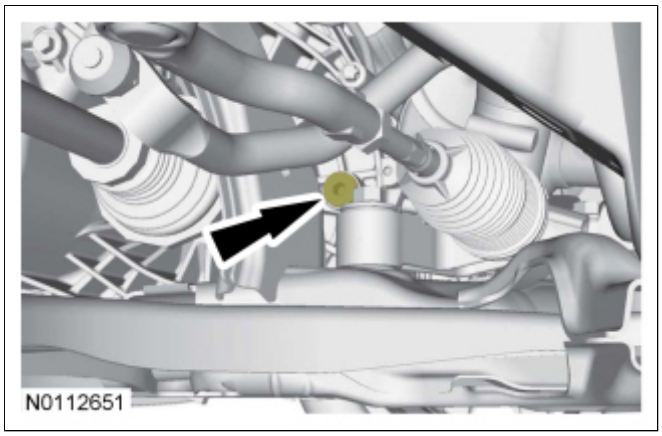
Material

Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

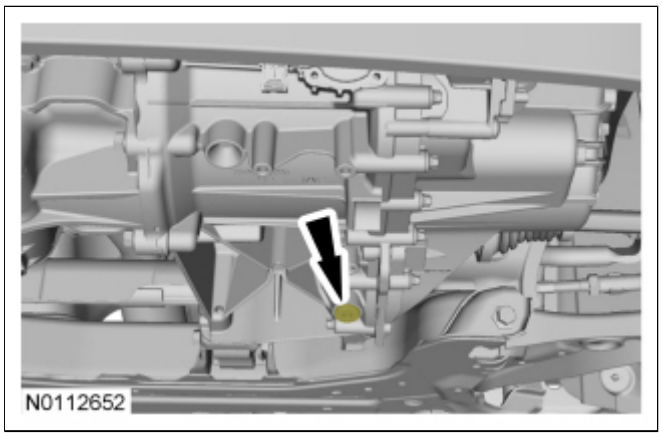
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Prior to removal, clean the area surrounding the fill plug.

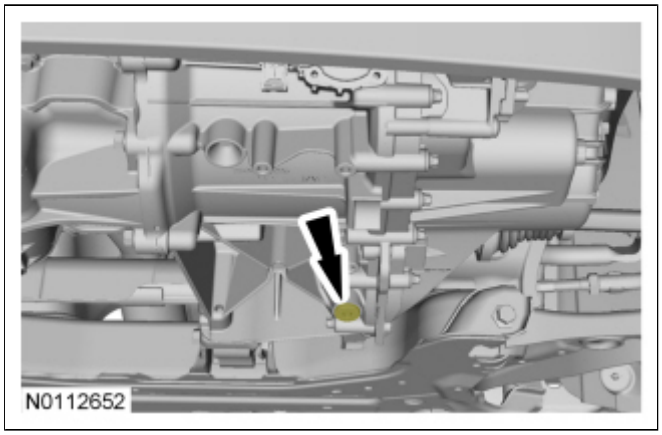
   Remove the fill plug.



3. Remove the drain plug and drain the fluid.

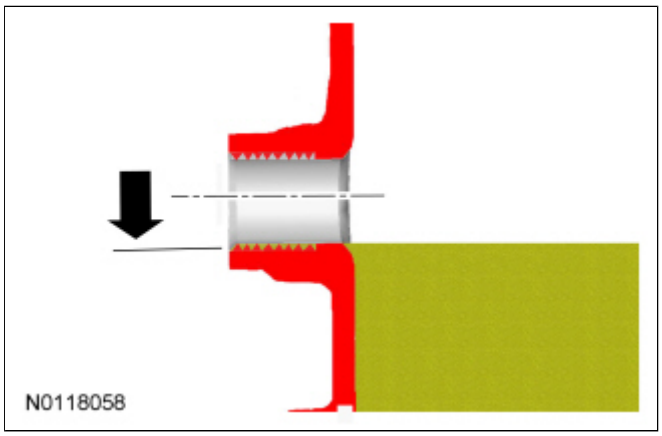


4. Install the drain plug.
   - Tighten to 43 Nm (32 lb-ft).



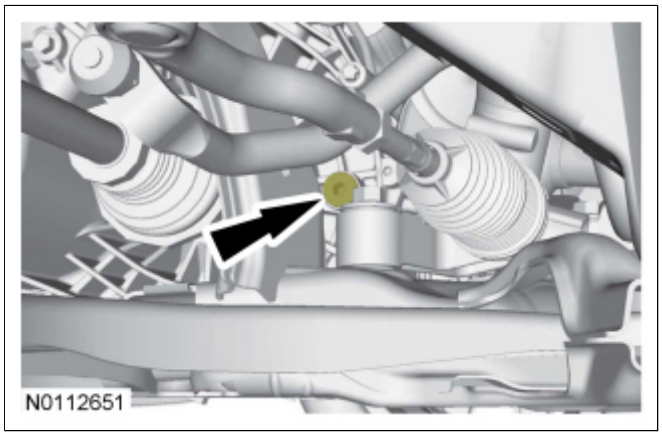
5. **NOTE:** Do not overfill the transaxle. This will cause transaxle fluid to be forced out of the case.

   Using a suitable oil suction gun, fill the transaxle to the correct level with the specified fluid. Add transmission fluid until the oil runs out of the fill port in a continuous stream. The transaxle is full when the oil flow from the fill port has slowed to a broken stream or dripping.



6. **NOTE:** Use a ball head hex socket to torque to specifications.

   Install the fill plug.
   - Tighten to 43 Nm (32 lb-ft).



Transmission Fluid Level Check

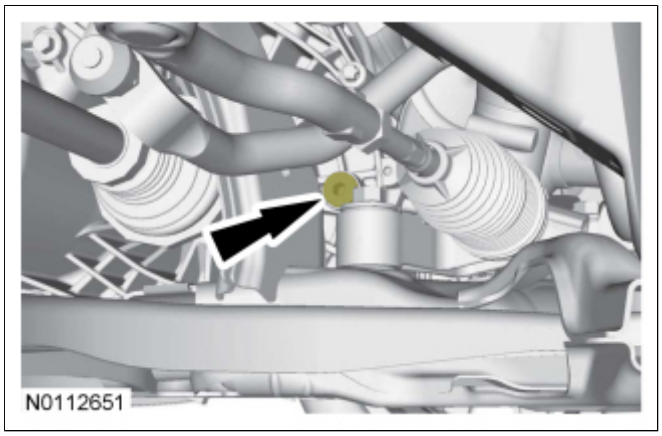
Material

Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

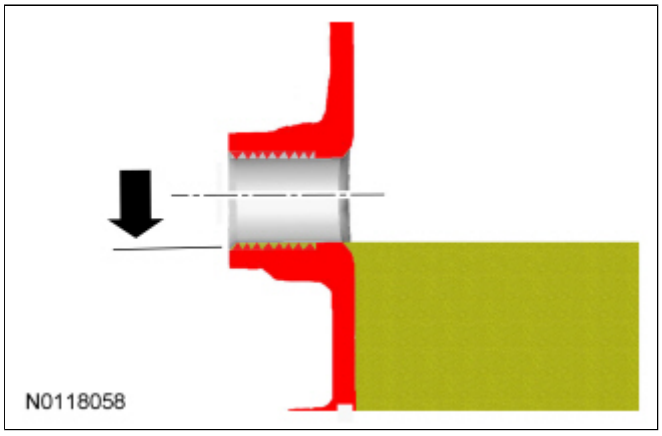
2. **NOTE:** Prior to removal, clean the area around the fill plug.

   Remove the fill plug.



3. **NOTE:** Do not overfill the transaxle. This causes transmission fluid to be forced out of the case.

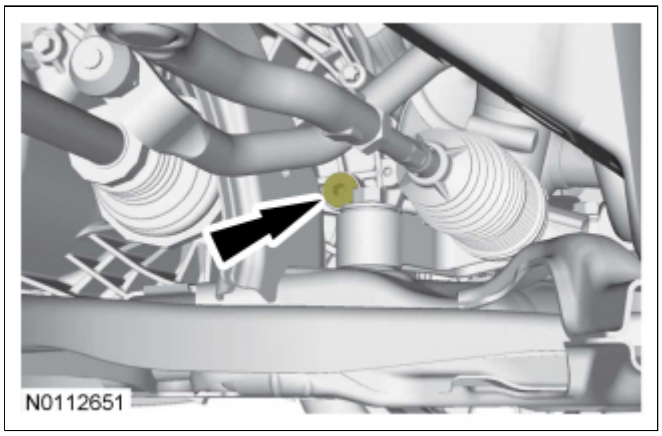
   Using a suitable oil suction gun, fill the transaxle to the correct level with the specified fluid. Add transmission fluid until the oil runs out of the fill port in a continuous stream. The transaxle is full when the oil flow from the fill port has slowed to a broken stream or dripping.



4. **NOTE:** Use a ball head hex socket to tighten the transaxle fill plug.

Install the fill plug.

- Tighten to 43 Nm (32 lb-ft).



Clutch

Special Tool(s)

 ST3224-A	Actuator Reset, Spline Socket 307-677
 ST3223-A	Clutch Reset 307-676 (includes 307-676/1, 307-676/2, 307-676/3, 307-676/4, 307-676/5 and 307-676/6)
 ST3222-A	Fixture, Clutch Remover/Installer 307-675 (includes 307-675/1, 307-675/2, 307-675/3 and 307-675/4)

High Temperature Nickel Anti-Seize Lubricant XL-2	—
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

Removal

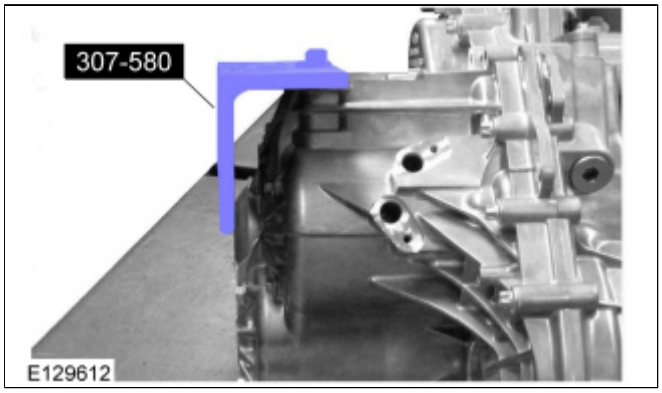
WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions

may result in serious personal injury.

NOTICE: **After installation of the transaxle be sure to perform the Clutch Adaptive Learning procedure or transaxle damage can occur. For additional information, refer to Transmission Adaptive Learning in this section.**

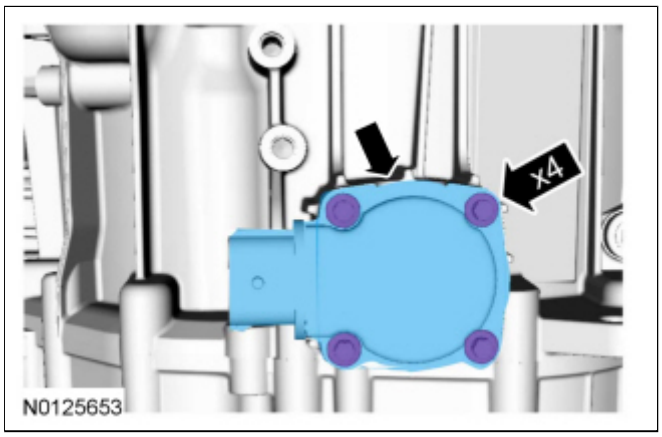
1. Remove the transaxle from the vehicle. For additional information, refer to Transaxle in this section.

2. Install the special tools.

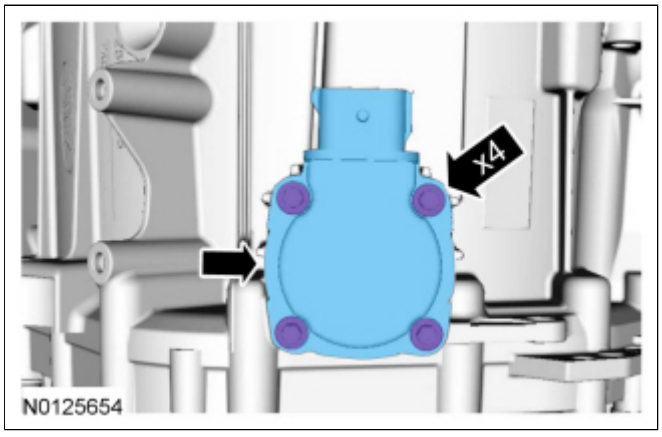


3. Stand the transaxle on its back.

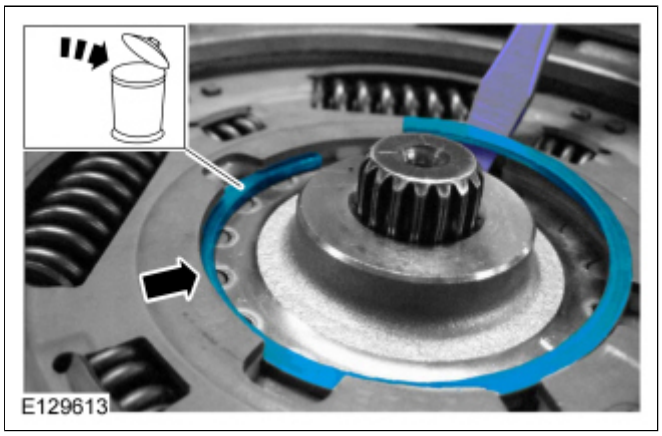
4. Remove the 4 clutch motor 1 bolts and remove clutch motor 1.



5. Remove the 4 clutch motor 2 bolts and remove clutch motor 2.

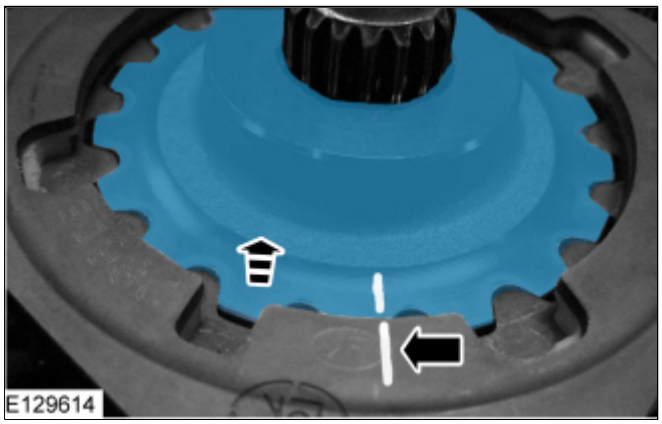


6. Remove and discard the clutch hub snap ring.

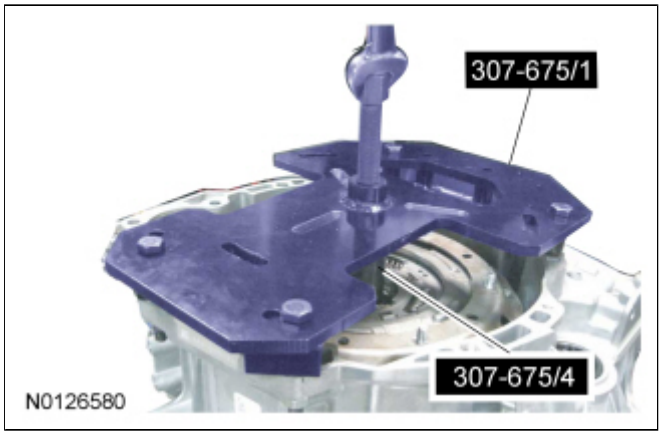


7. **NOTE:** Index mark the clutch hub and clutch for installation.

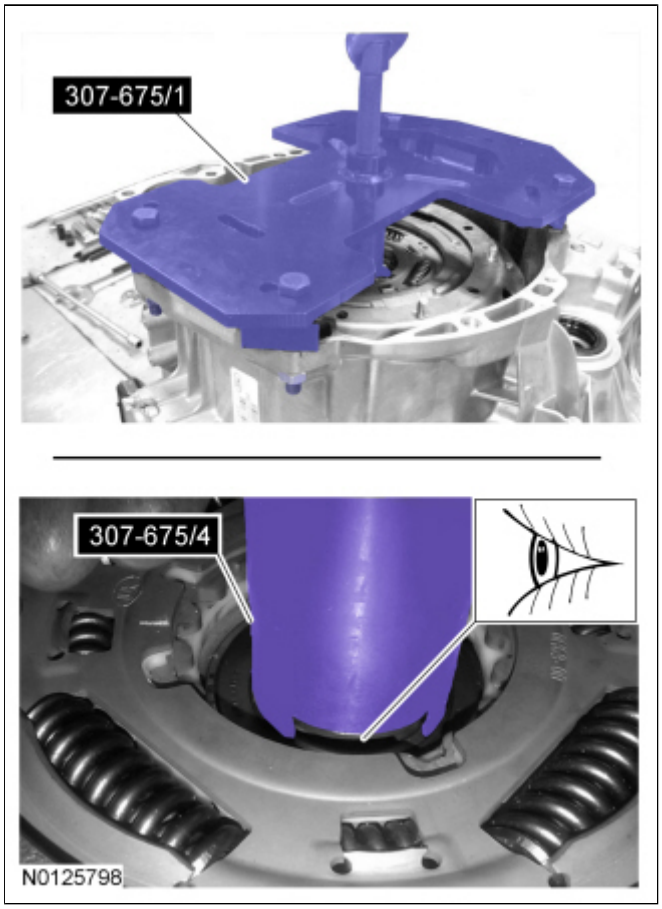
   Remove the clutch hub.



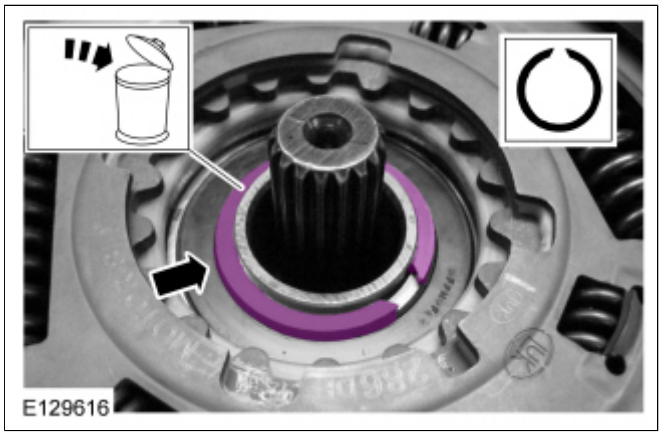
8. Install the special tools.



9. Using the special tools, turn the center bolt of the special tool with a maximum of 5 Nm (44 lb-in) of torque to push the clutch down to release the pressure from the hollow input shaft snap ring.



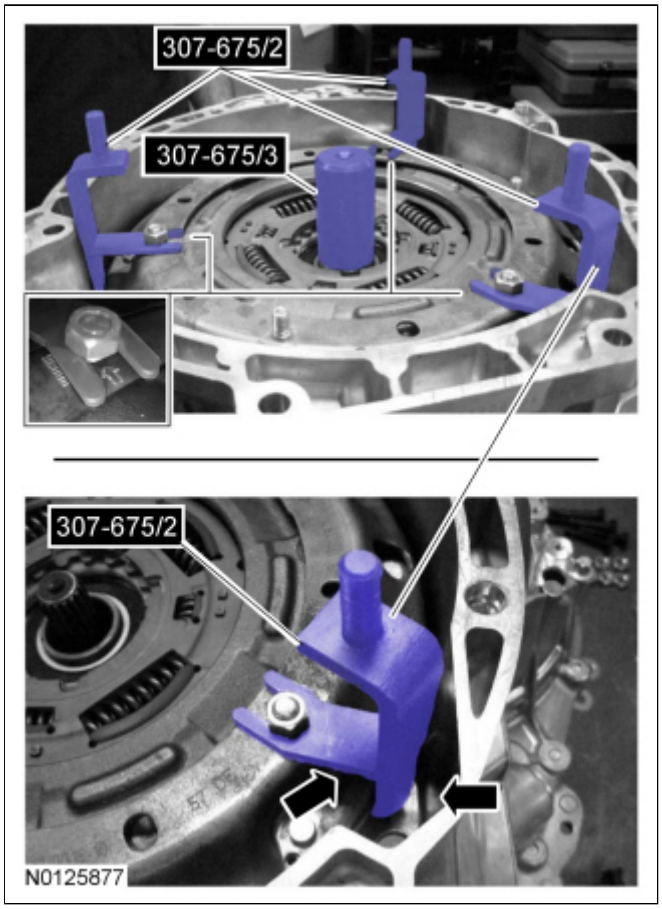
10. Remove and discard the hollow input shaft snap ring.



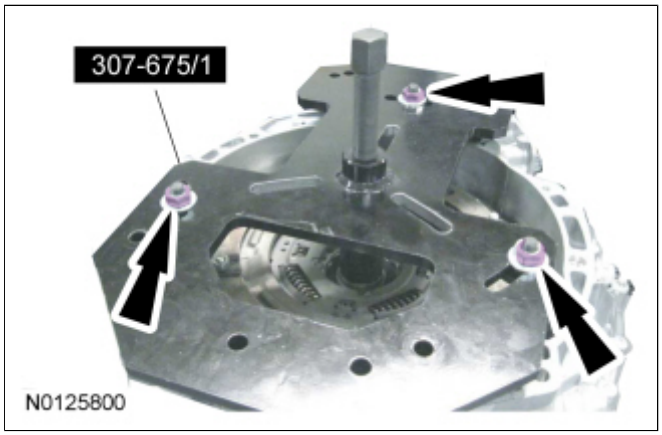
11. **NOTE:** Make sure the lifting legs are installed on the 3 clutch studs marked with the manufacturing mark as shown.

    NOTE: Make sure the lifting leg with the angle is in the location shown.

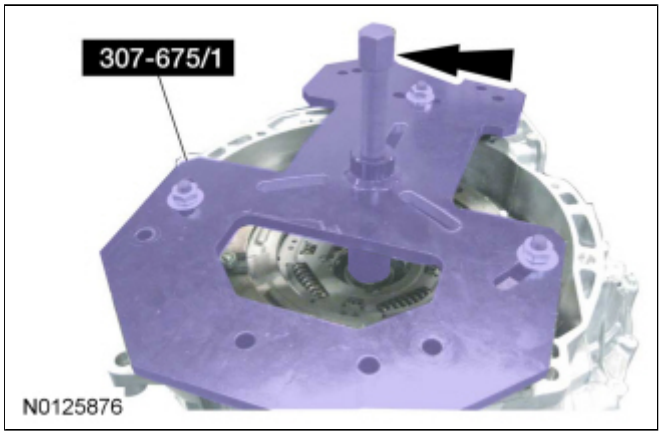
    Install the special tools.



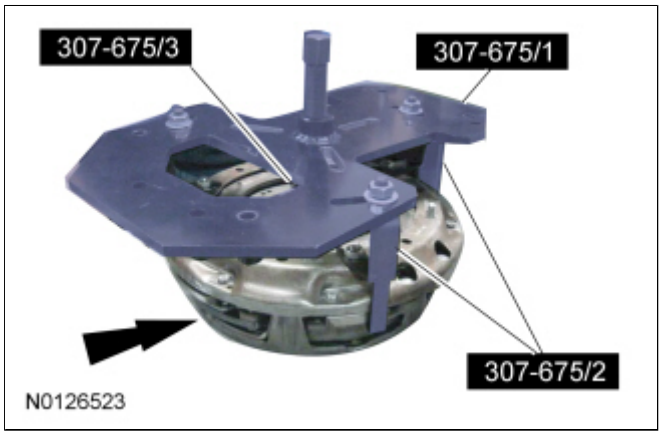
12. Install the special tools.



13. Turn the center bolt of the special tool with approximately 5 Nm (44 lb-in) of torque until the clutch is free of the input shaft.



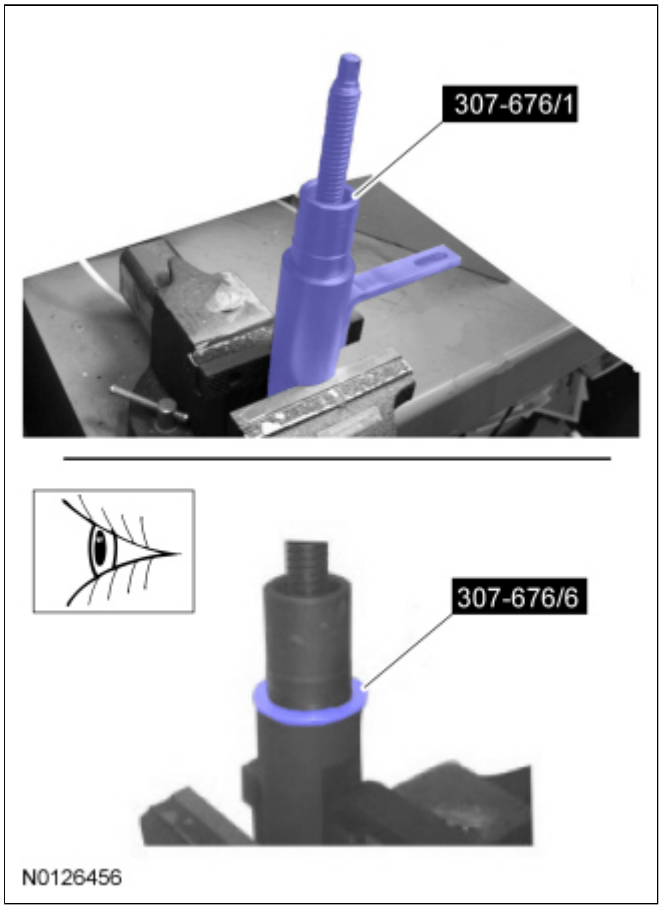
14. Using the special tools, remove the clutch as an assembly from the transaxle.



Installation

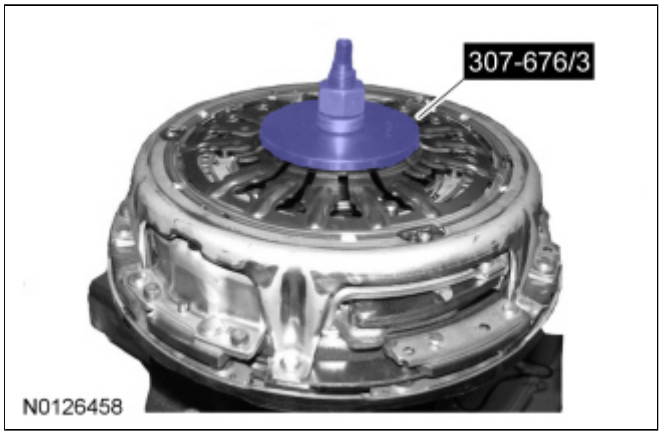
1. If installing a new clutch go to step 19.
2. **NOTE:** Make sure the special tool washer is also installed.

   Install the special tool in a vise.

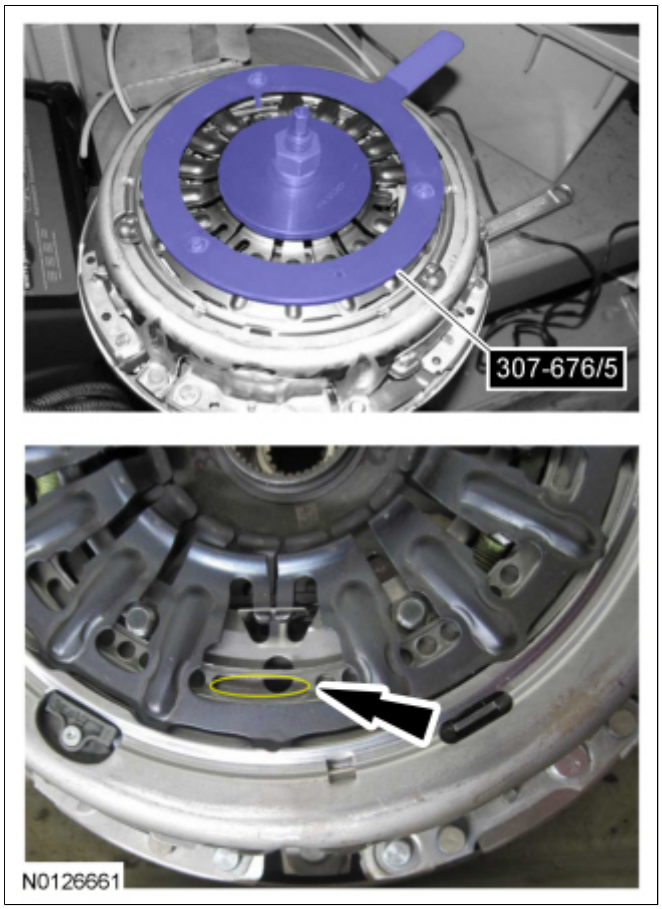


3. Place the clutch on the special tool and align one clutch stud with the slotted hole on the special tool.

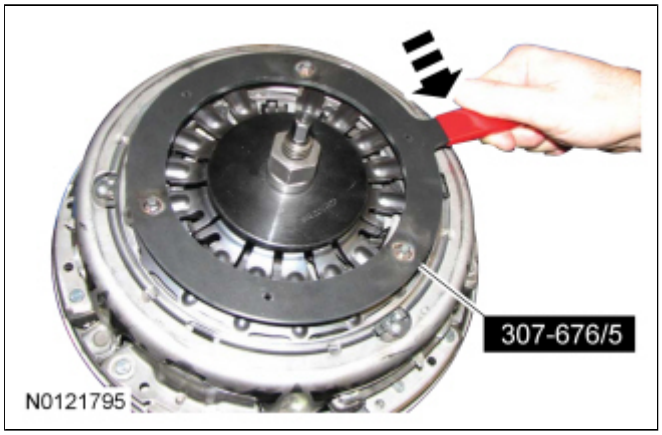
4. Install the special tool loosely on the clutch.



5. Install the special tool on the clutch making sure the legs are inserted in the slots.

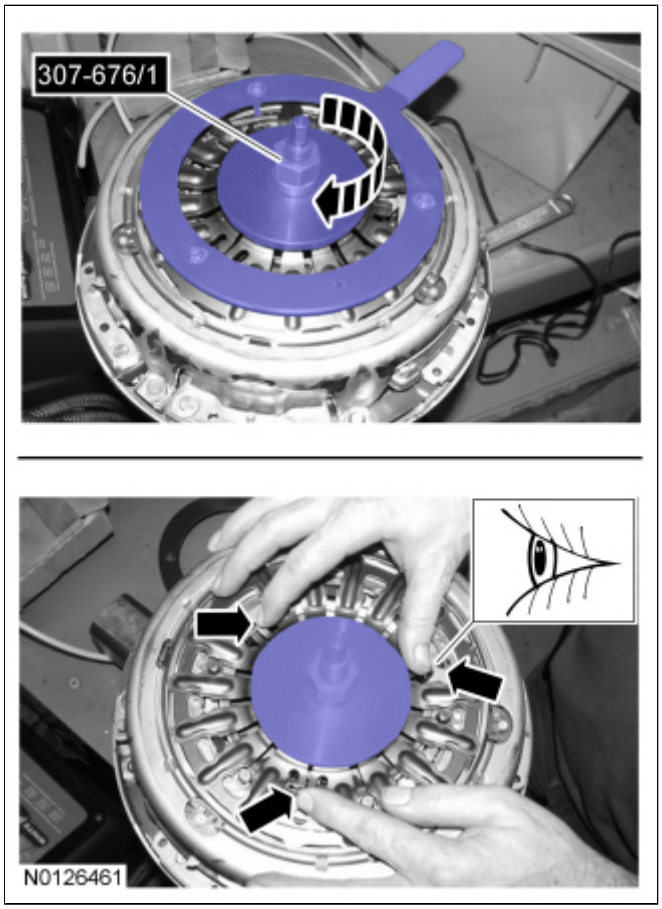


6. Turn the special tool clockwise to the stops and hold.

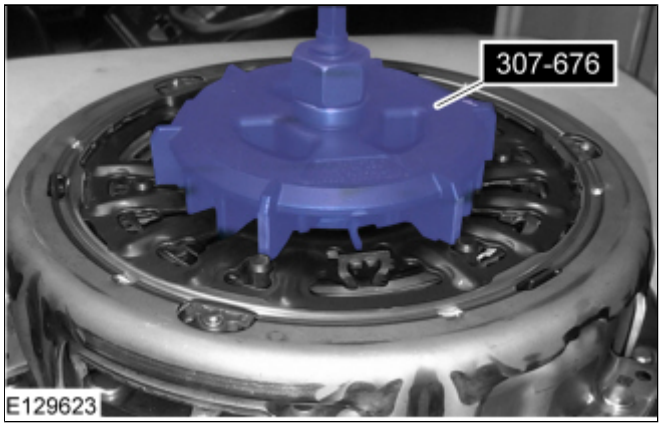


7. ***NOTICE:*** **Failure to rotate the self-adjuster to the stops before compressing the clutch, causes damage to the clutch.**

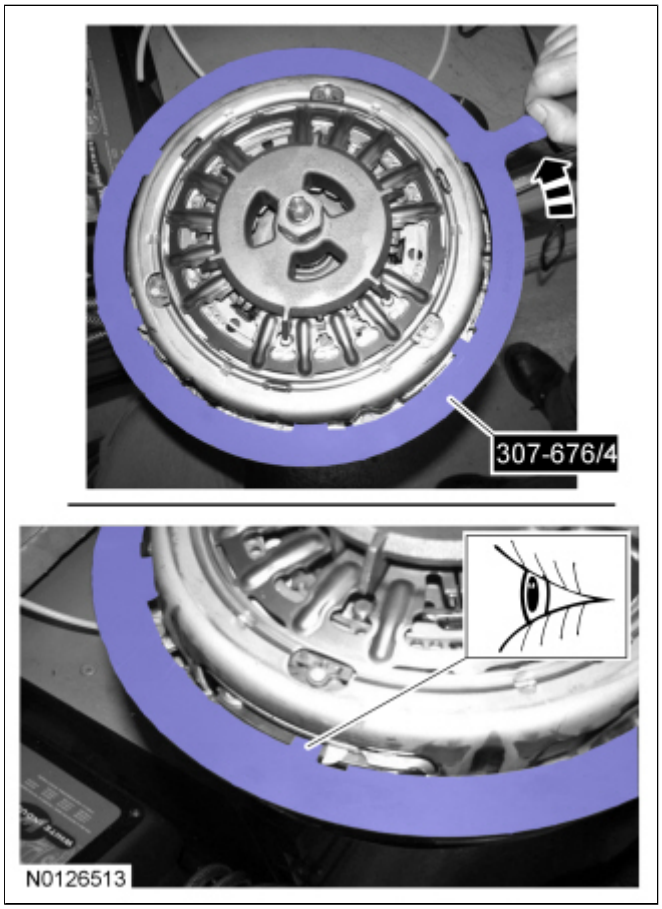
   Tighten the special tool until the 3 clutch 1 locks can be locked in place by hand.



8. Install the special tool loosely on the clutch.



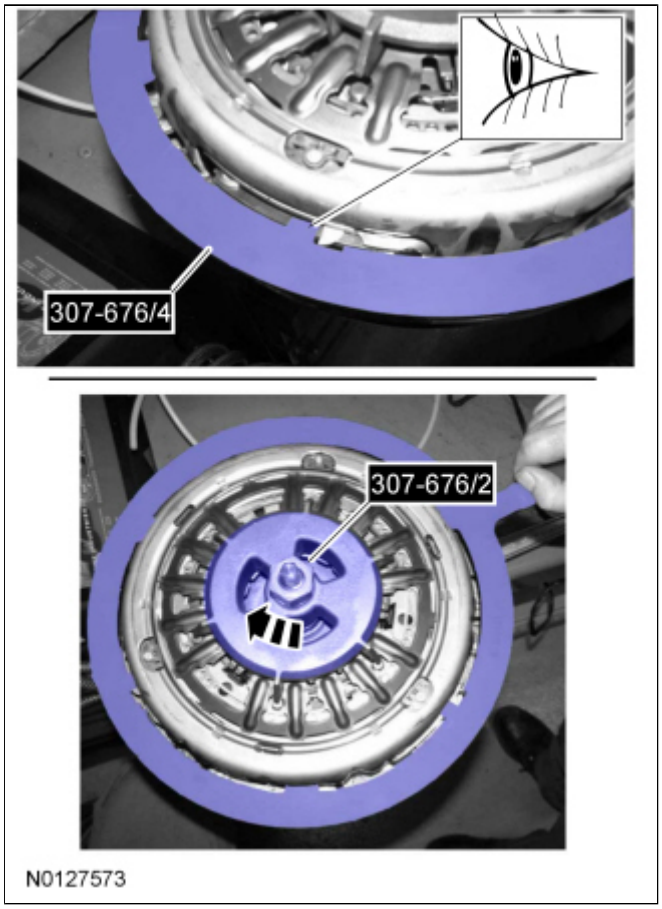
9. Using the special tool, move the clutch self-adjuster counterclockwise to the stop and hold.



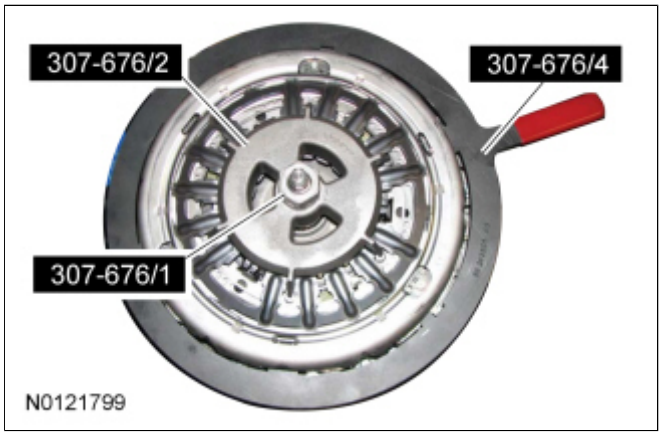
10. ***NOTICE:*** **Make sure the clutch self-adjuster is held to the stops before compressing the clutch or damage will occur to the clutch.**

    NOTE: An audible click can be heard when the clutch locks lock.

    While holding the clutch self-adjuster to the stops, use the special tool and compress the clutch to the stops on the clutch. The locks on clutch 2 lock at this time.

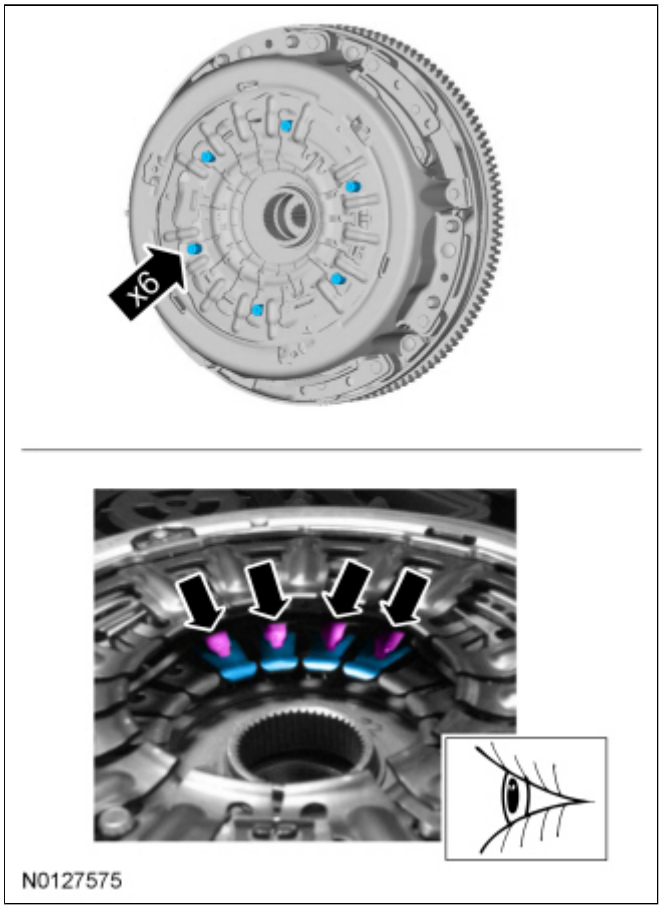


11. Remove the special tools.



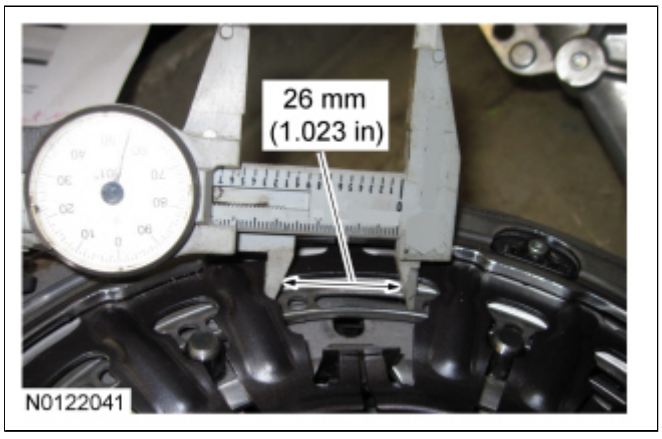
12. **NOTE:** The minimum number of engaged clutch locks is 6. Make sure the 6 locked clutch fingers align with the clutch studs as shown. If not, reset the clutch 2 locks as necessary.

    Visually check the locks to make sure they have locked. 4 locks shown, 12 total.

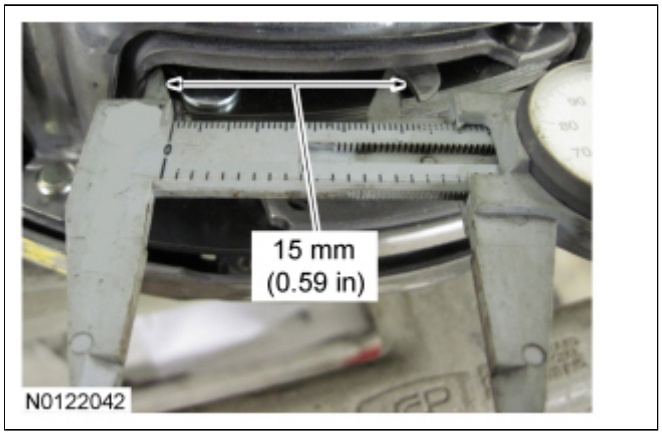


13. If installing a used clutch, verify the clutch is not worn or damaged. Perform the next 2 steps to check for clutch wear.

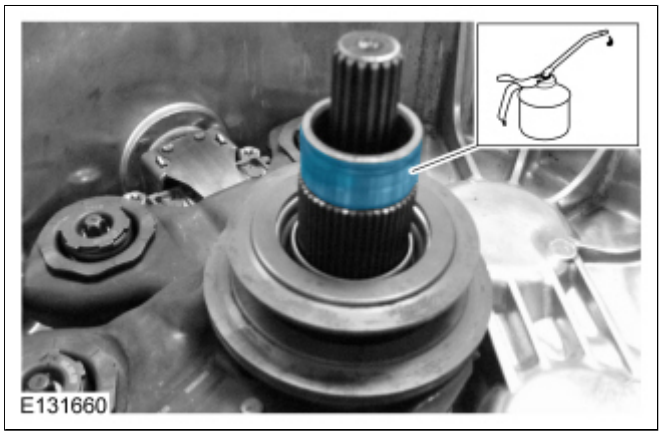
14. Check clutch 1 for wear by measuring the distance between the adjuster ring 1 long hole and lever 1 spring. Replace the clutch assembly if the measurement is 26 mm (1.023 in) or less.



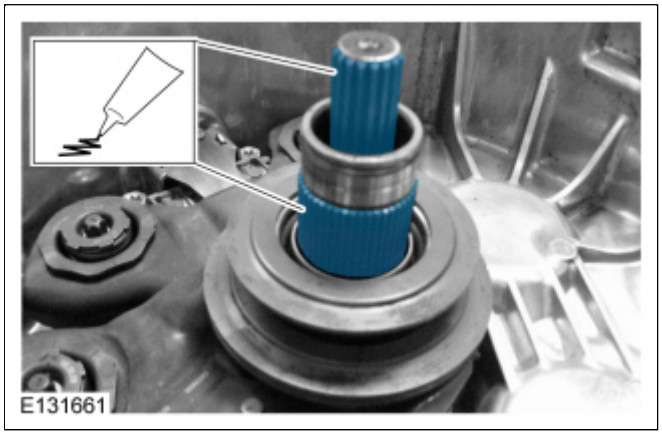
15. Check clutch 2 for wear by measuring the distance between adjuster ring 2 and the cover. Replace the clutch assembly if the measurement is 15 mm (0.59 in) or less.



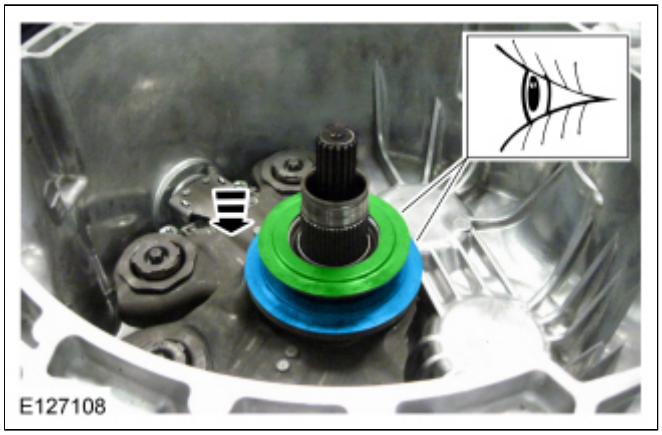
16. Apply a small amount of transmission fluid on the input shaft bearing surface.



17. Apply a small amount of DPS6 Grease on both input shaft splines.



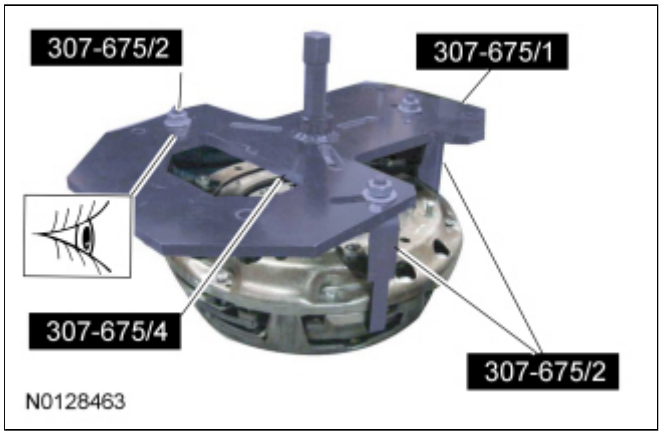
18. Verify the Z-washers are installed correctly.



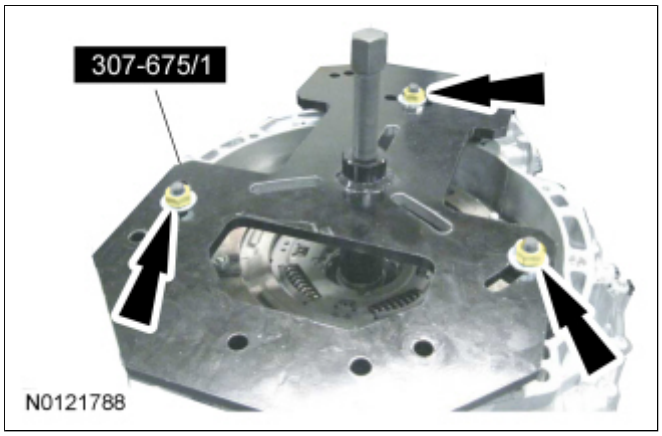
19. ***NOTICE:*** **Verify the clutch locks are locked prior to installation or the transaxle may not operate correctly and damage can occur. If the clutch locks are not locked go to step 2 within this procedure.**

    NOTE: Make sure the angled lifting leg is installed in the location shown.

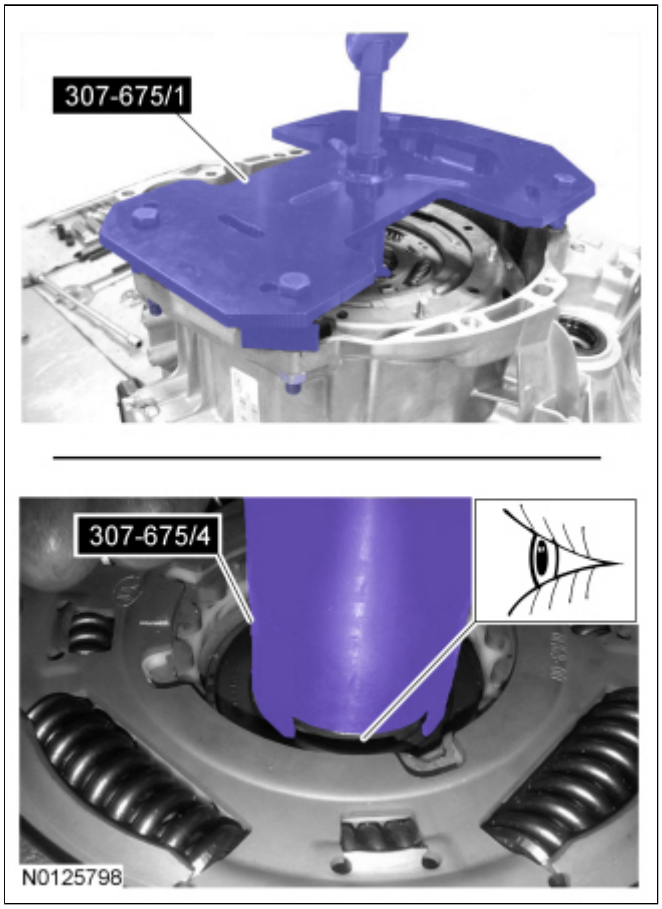
    Using the special tools, install the clutch in the transaxle.



20. Remove all the special tools.

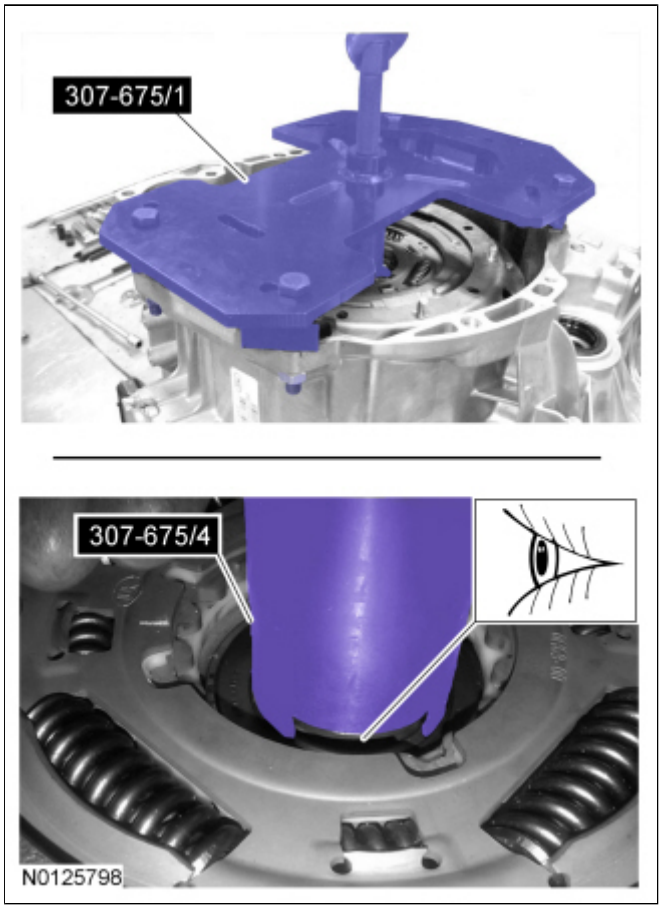


21. Install the special tools onto the transaxle case.



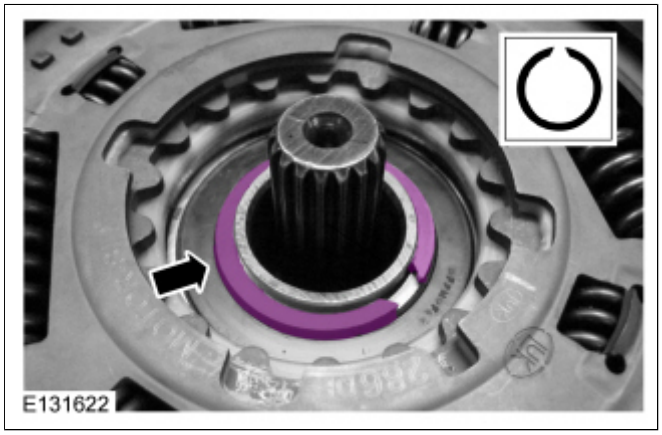
22. ***NOTICE:*** **Do not overtighten the special tool or damage can occur.**

    Using the special tools, push the clutch down with approximately 5 Nm (44 lb-in) of torque until seated on the input shaft bearing and the snap ring groove is visible.



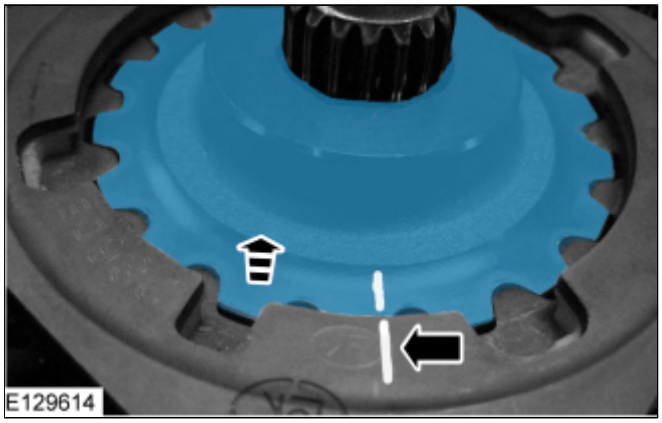
23. **NOTE:** Make sure the hollow input shaft snap ring is fully seated.

    Install the new hollow input shaft snap ring.

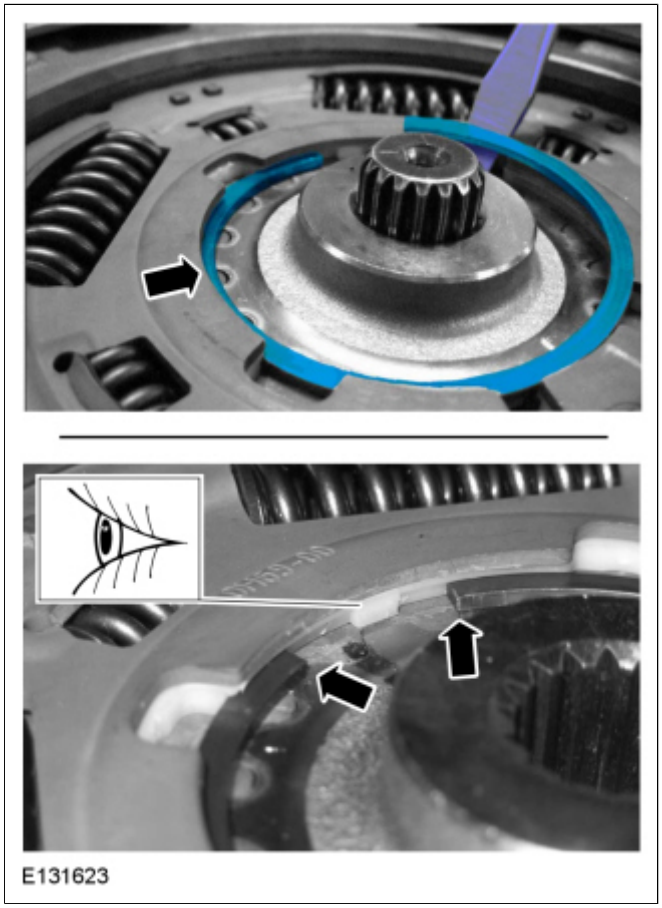


24. **NOTE:** Align the index marks on the clutch hub and clutch.

    Install the clutch hub.

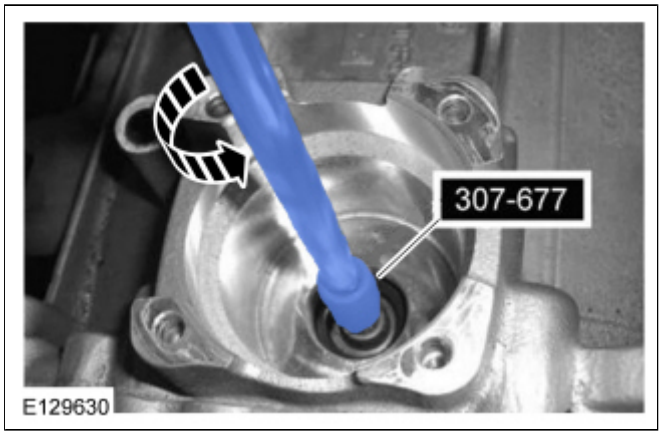


25. Install the new clutch hub snap ring in the position shown.

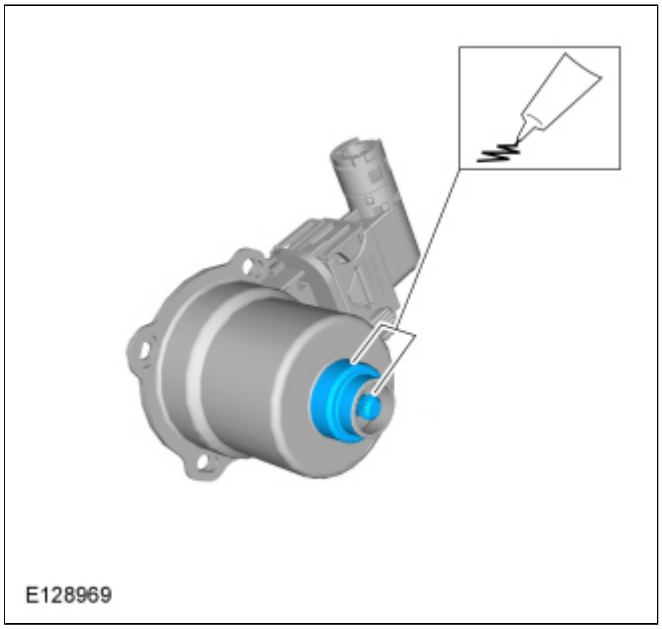


26. ***NOTICE:*** **Do not turn the special tool more than 12 turns or damage to the clutch actuator engagement lever can occur.**

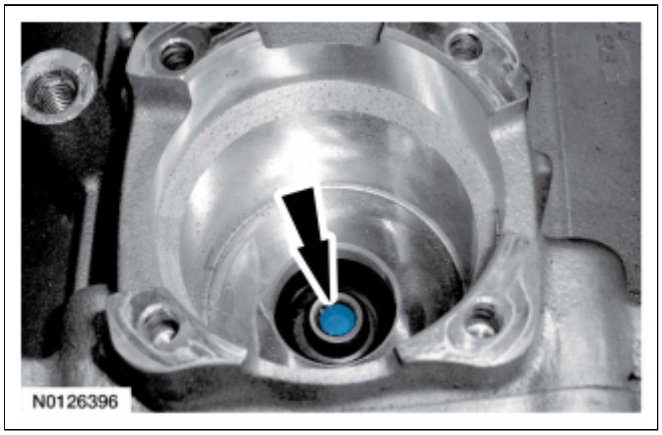
    Using the special tool, release the clutch 1 locks and then the clutch 2 locks by slowly turning the special tool counterclockwise. An audible click will be heard when the clutch locks are released.



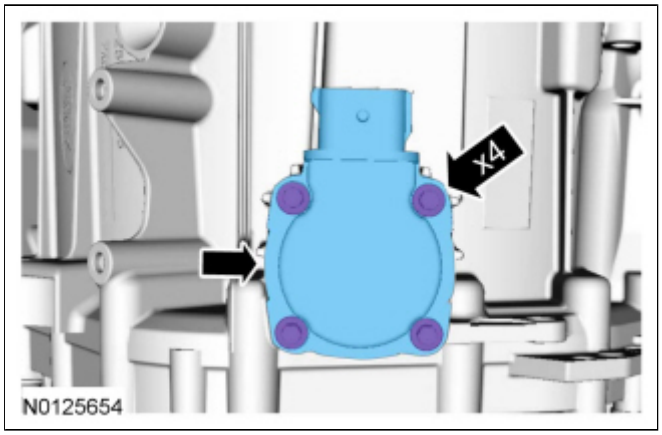
27. Apply High Temperature Nickel Anti-Seize Lubricant to both clutch motor surfaces where indicated.



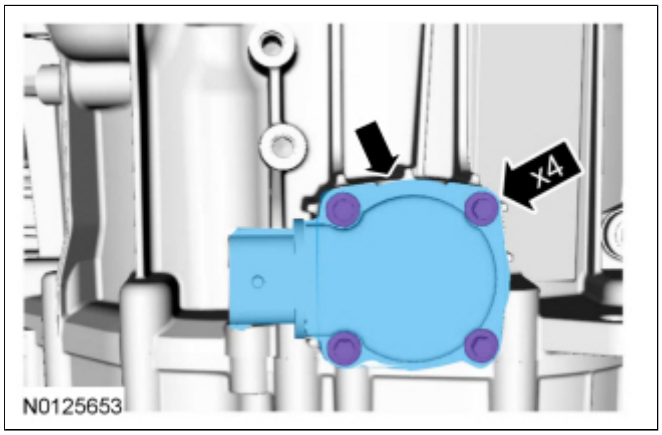
28. Apply High Temperature Nickel Anti-Seize Lubricant to the clutch actuator lever splines as shown.



29. Install the clutch motor 2 and the 4 clutch motor 2 bolts.
    - Tighten to 5 Nm (44 lb-in).



30. Install the clutch motor 1 and the 4 clutch motor 1 bolts.
    - Tighten to 5 Nm (44 lb-in).



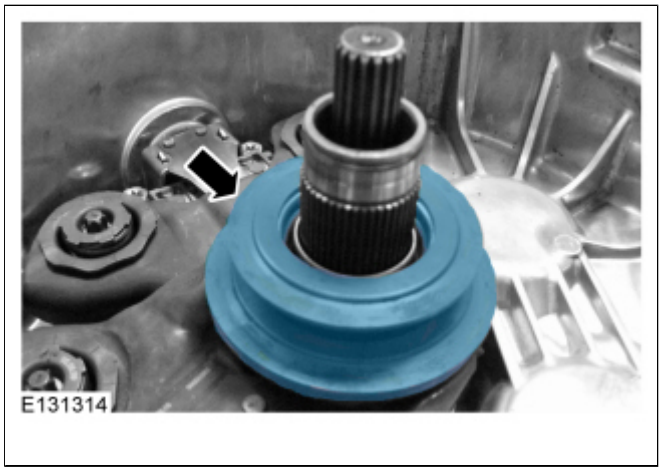
31. ***NOTICE:*** **After installation of the transaxle be sure to perform the Clutch Adaptive Learning procedure or transaxle damage can occur. For additional information, refer to Transmission Adaptive Learning in this section.**

    Install the transaxle in the vehicle. For additional information, refer to Transaxle in this section.

Clutch Engagement System

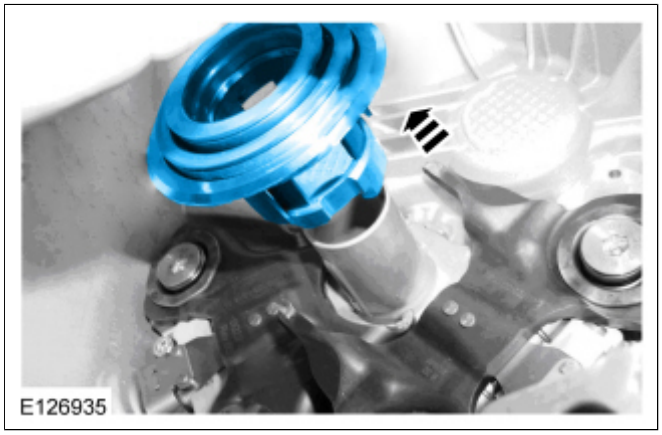
Removal

1. Remove the clutch. For additional information, refer to Clutch in this section.
2. Remove the Z-washers from the engagement system bearing unit.



3. **NOTE:** The engagement system bearing unit should be removed easily.

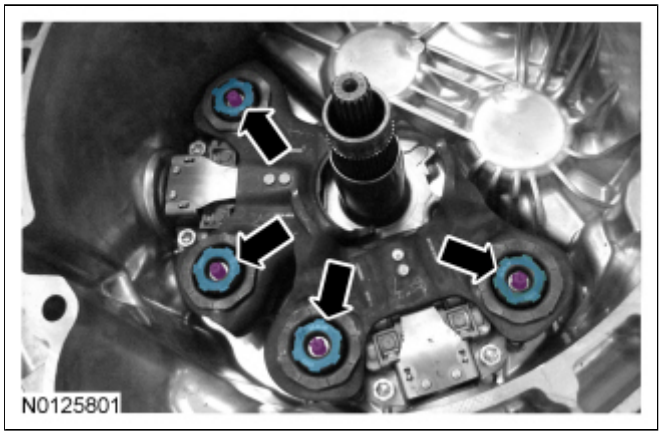
   Remove the engagement system bearing unit. Inspect for wear or damage. Replace as neccessary. Refer to Transaxle in this section.



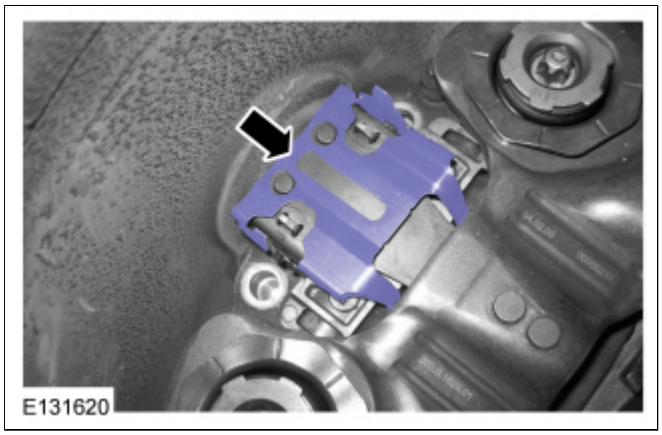
4. ***NOTICE:*** **Remove the spring retainer bolts by loosening them slightly in an alternating pattern or damage can occur to the clutch actuator levers.**

   NOTE: The spring retainers and actuator levers are matched sets with corresponding serial numbers. If the spring retainers and actuator levers are being reused, mark on each spring retainer and actuator lever for assembly.

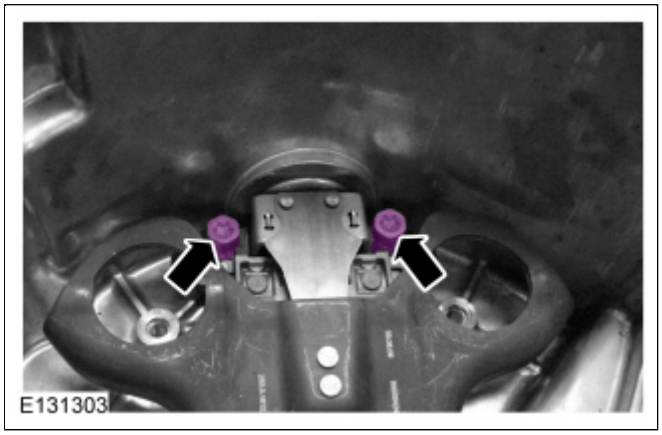
   Remove the 4 spring retainer bolts from the spring retainers and remove the spring retainers.



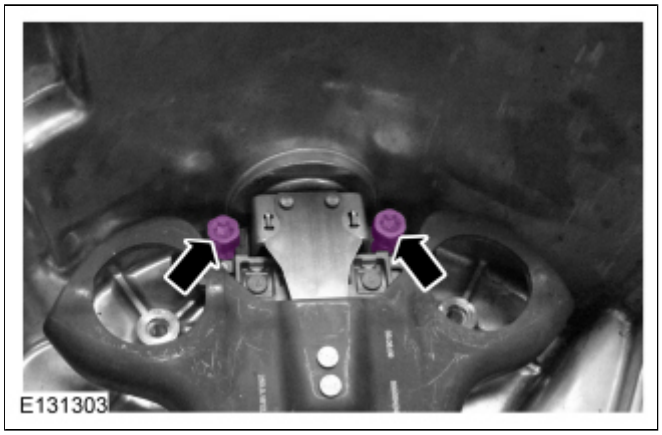
5. Install clutch actuator lever locks as shown if available.



6. Remove the 2 bolts from the clutch actuator lever 1.

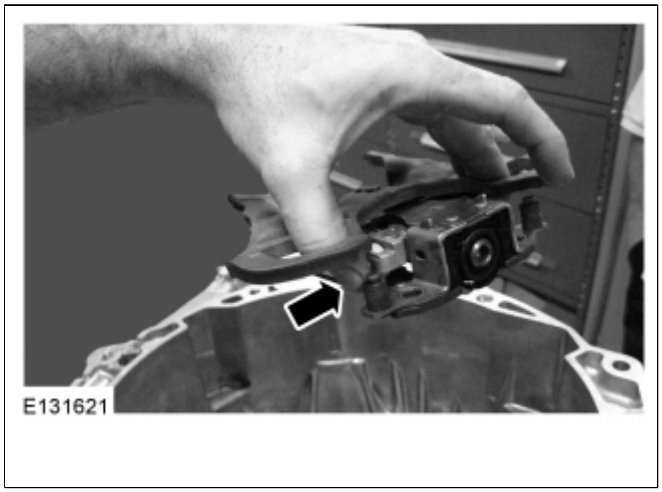


7. Remove the 2 bolts from the clutch actuator lever 2.



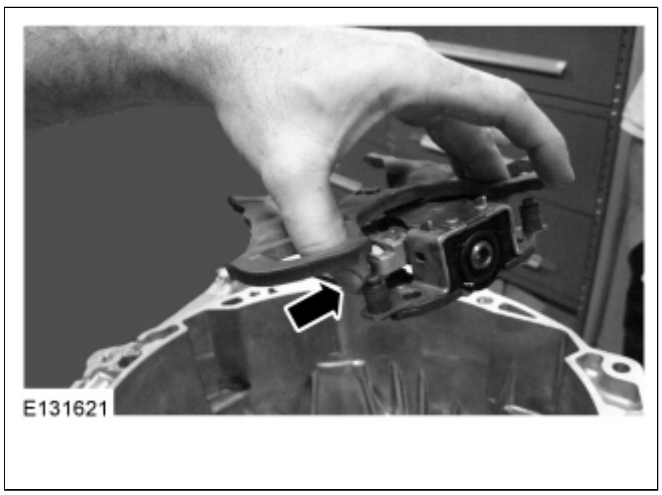
8. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

   Remove the clutch actuator lever 1.



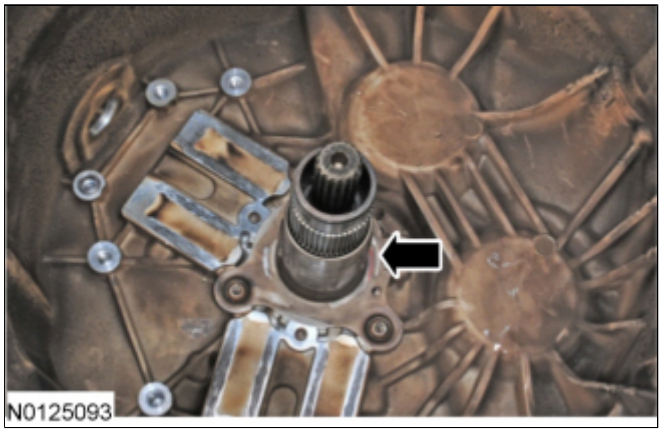
9. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

   Remove the clutch actuator lever 2.



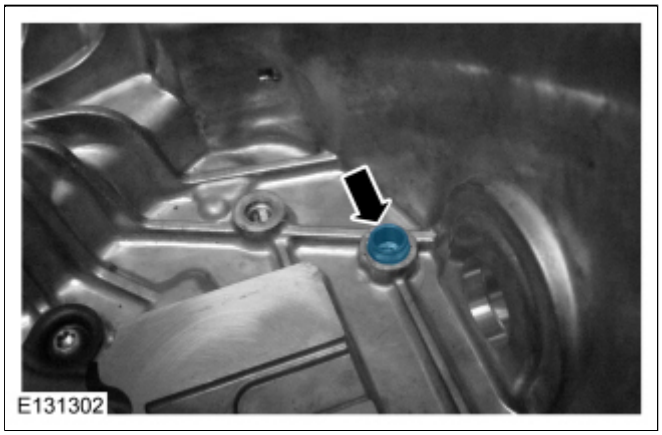
Installation

1. Inspect the guide tube for wear or damage. For additional information, refer to Transaxle in this section.



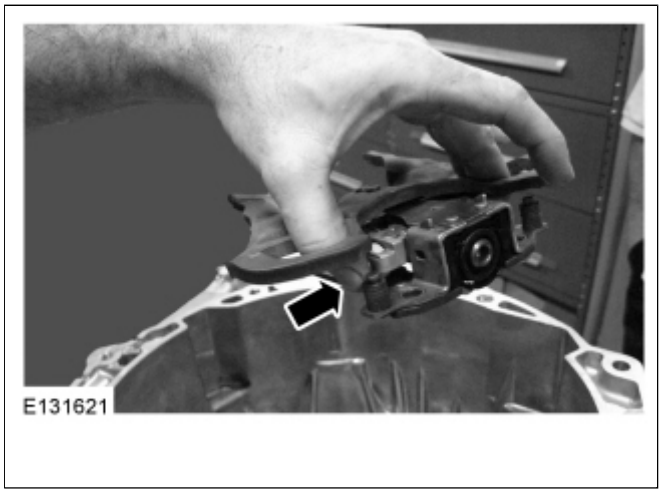
2. **NOTE:** One clutch actuator lever bushing shown, one per clutch actuator lever.

   Install the clutch actuator lever bushings.



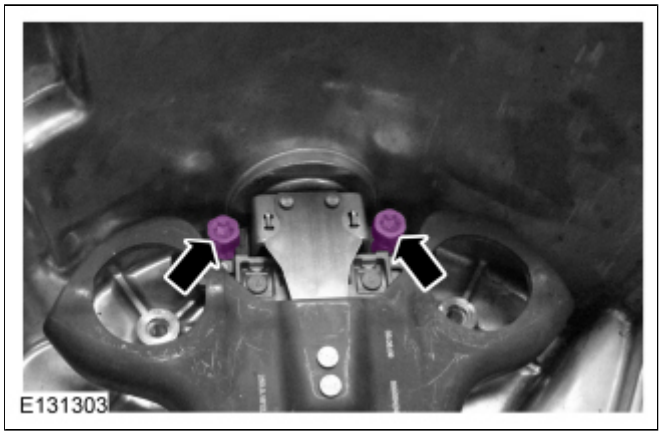
3. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

   Install the clutch actuator lever 2.



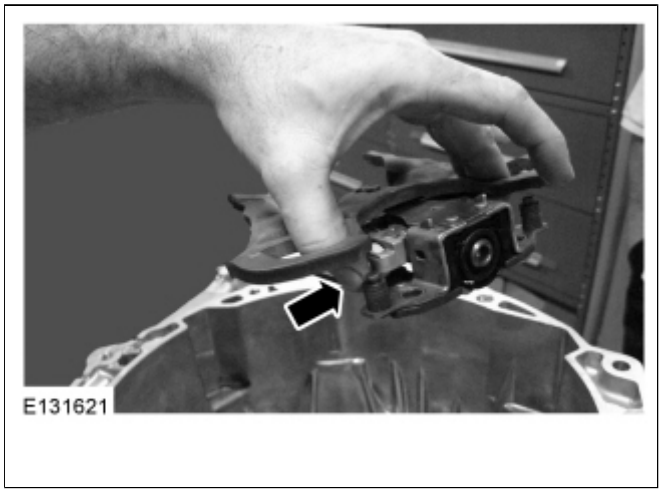
4. Install clutch motor 2 without the bolts to aide in the alignment of the clutch actuator lever.

5. Install the 2 clutch actuator lever 2 bolts.
   - Tighten to 19 Nm (168 lb-in).



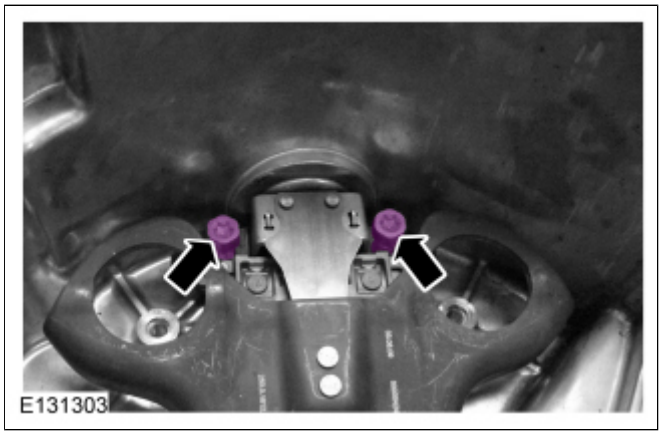
6. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

   Install the clutch actuator lever 1.



7. Install clutch motor 1 without the bolts to aide in the alignment of the clutch actuator lever.

8. Install the 2 clutch actuator lever 1 bolts.
   - Tighten to 19 Nm (168 lb-in).



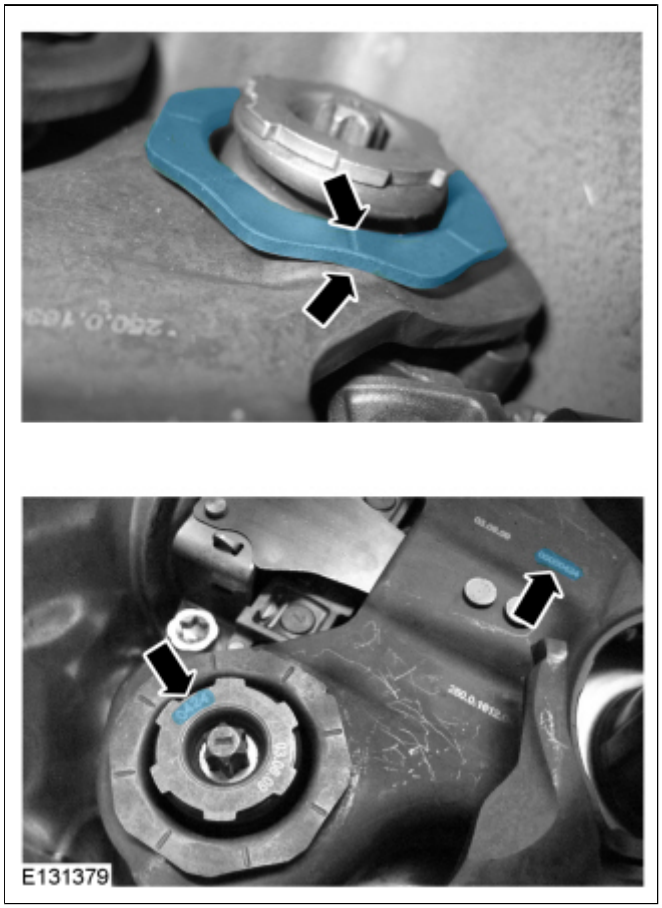
9. ***NOTICE:*** **Tighten the spring retainer bolts by tightening them slightly in an alternating pattern or damage can occur to the clutch actuator levers.**

   NOTE: Make sure the spring retainer contour aligns with the actuator lever contour as shown.

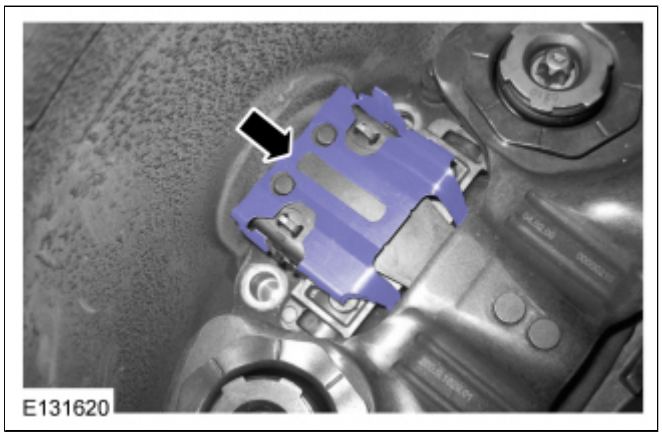
NOTE: Make sure the serial number on the spring retainer matches the serial number on the actuator lever. If reusing the spring retainers and actuator levers use the marks made during removal for assembly.

Install the spring retainers and spring retainer bolts.

- Tighten to 26 Nm (19 lb-ft).

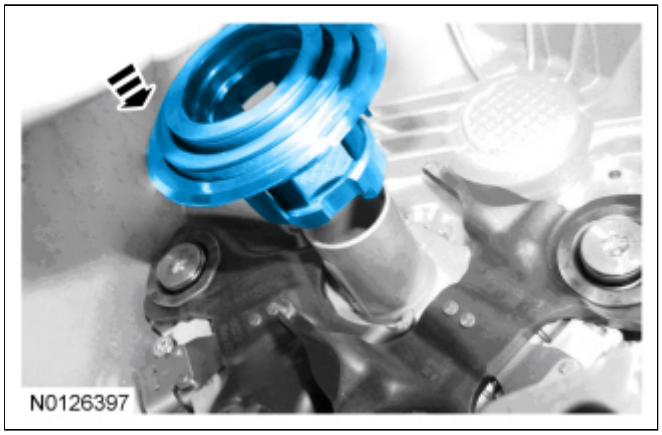


10. Remove the clutch actuator lever locks if installed.



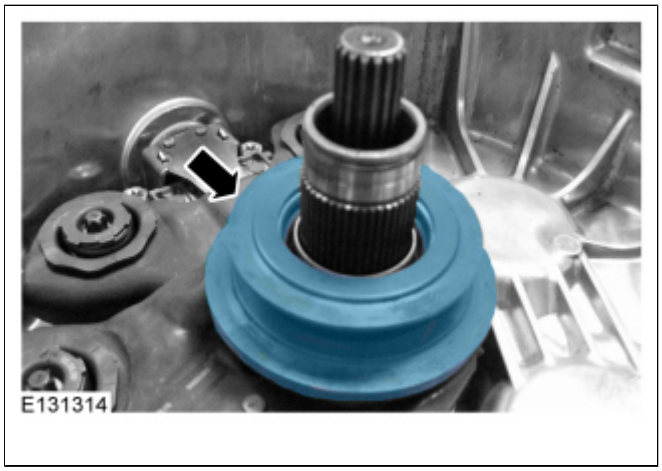
11. **NOTE:** The engagement system bearing unit should be installed easily.

    Install the engagement system bearing unit.



12. ***NOTICE:*** **Do not tilt transaxle after the Z-washers are installed, they may come off center and damage can occur.**

    Install the Z-washers onto the engagement system bearing unit and center them correctly.



13. Install the clutch. For additional information, refer to Clutch in this section.

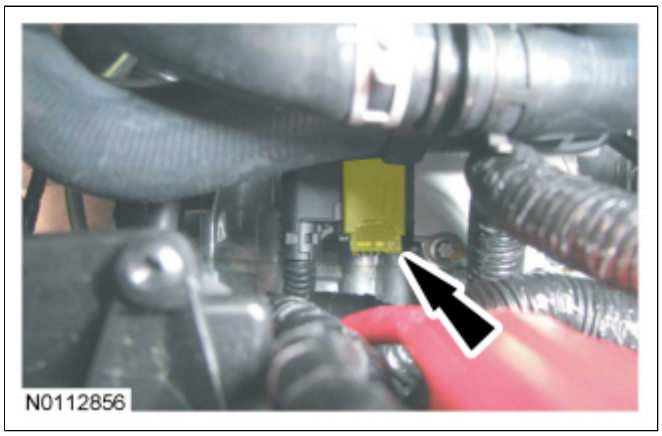
Clutch Motor — No. 1

Material

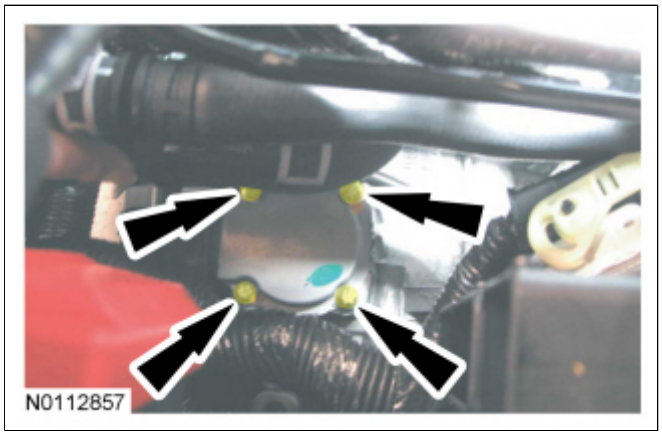
Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	—

Removal

1. Clean the area around the clutch motor to ensure no debris gets into the clutch motor pocket.
2. Disconnect the clutch motor electrical connector.

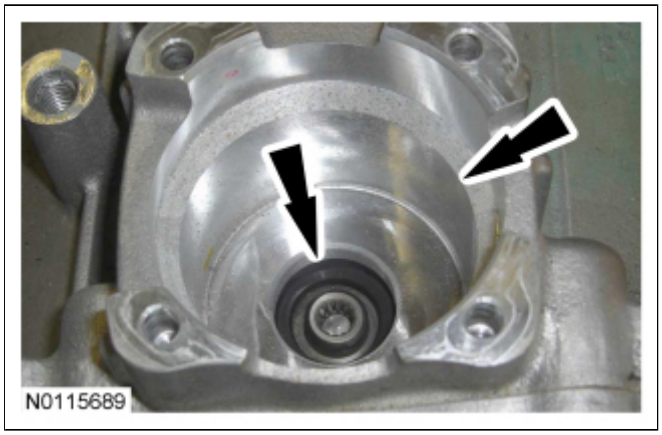


3. Remove the 4 clutch motor bolts and the clutch motor.

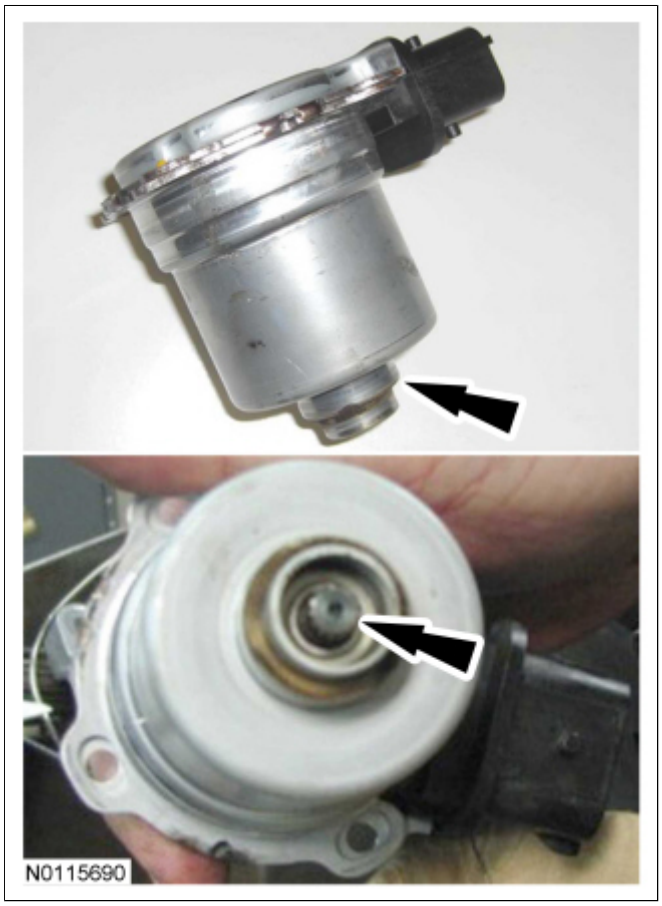


Installation

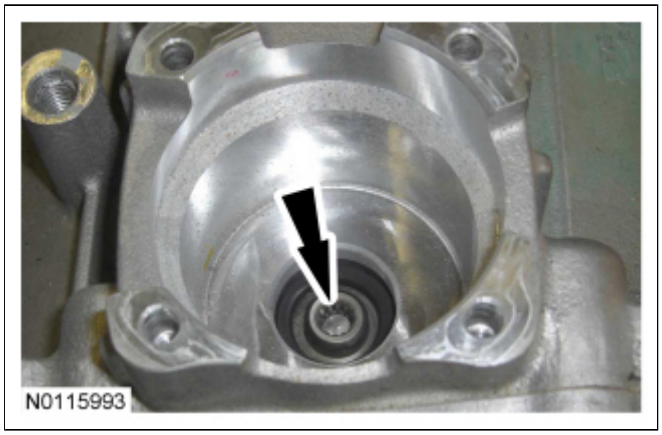
1. Inspect the clutch motor pocket for damage or debris. Clean or repair as needed.



2. Apply anti-seize to the clutch motor surfaces where indicated.

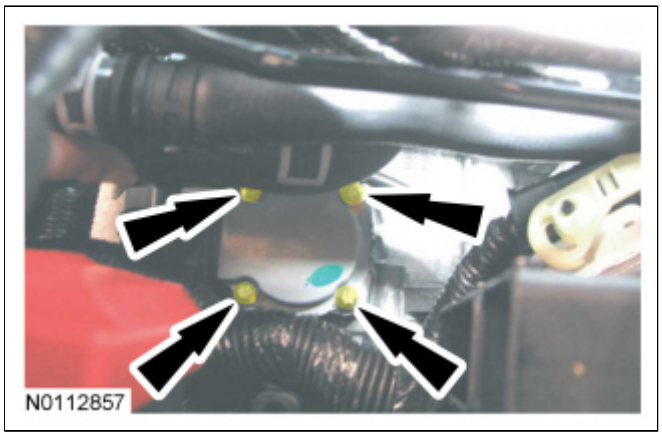


3. Apply anti-seize to the clutch actuator lever splines as shown.

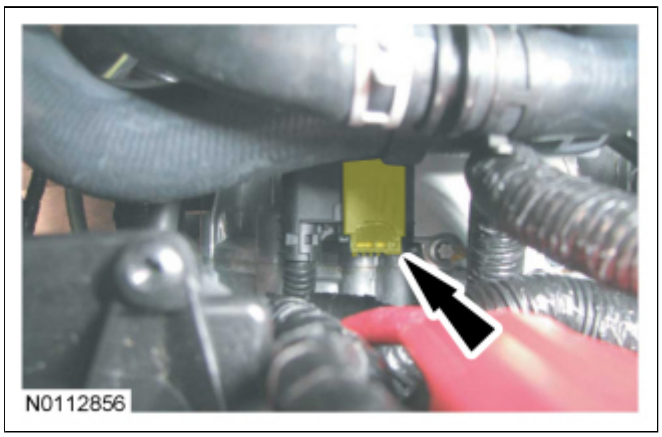


4. **NOTE:** Clutch motor splines may need to be turned to ease installation.

   Install the clutch motor and the 4 clutch motor bolts.
   - Tighten to 5 Nm (44 lb-in).



5. Connect the clutch motor electrical connector.



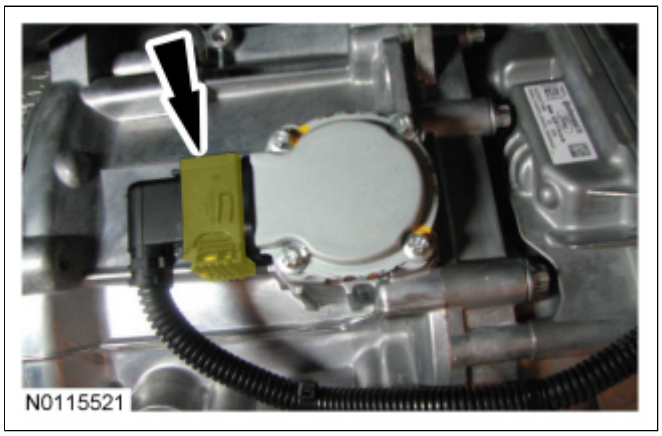
Clutch Motor — No. 2

Material

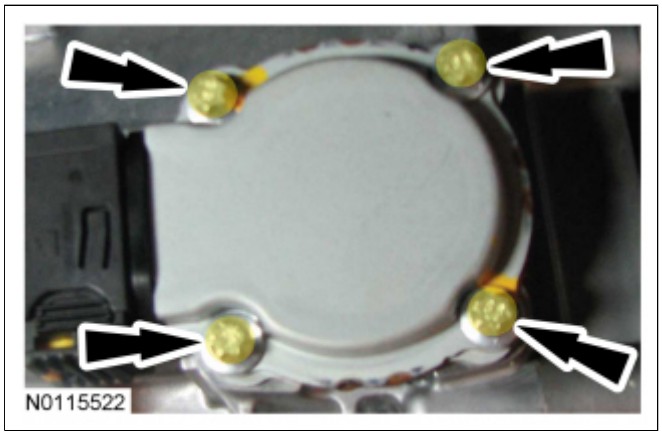
Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	—

Removal

1. Clean the area around the clutch motor to ensure no debris gets into the clutch motor pocket.
2. Disconnect the clutch motor electrical connector.

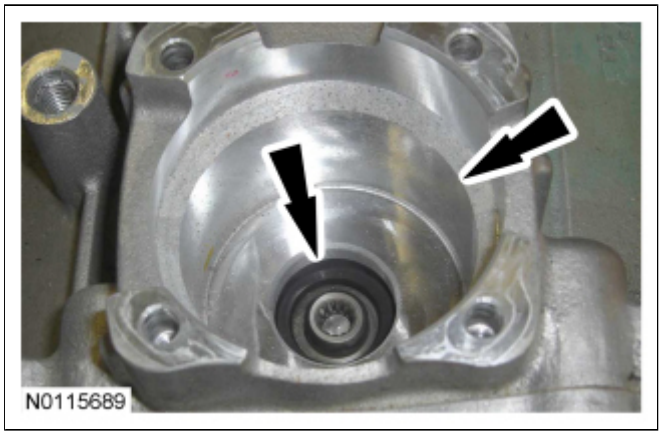


3. Remove the 4 clutch motor bolts and the clutch motor.

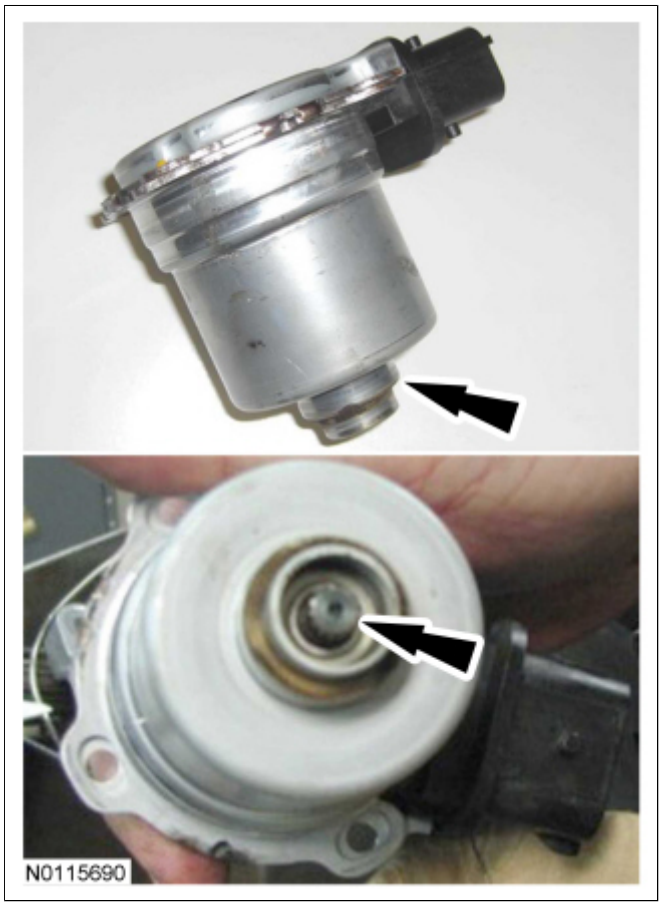


Installation

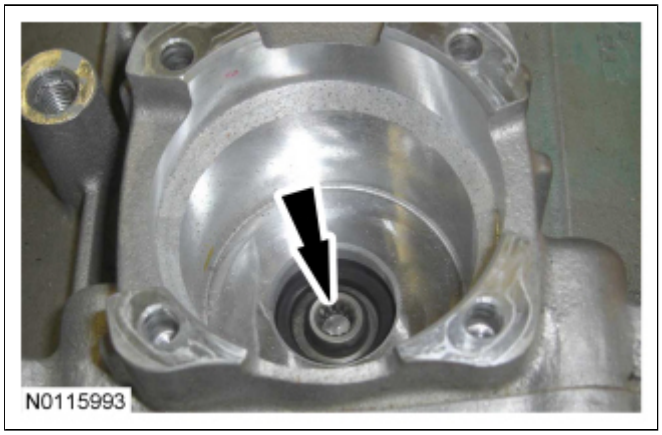
1. Inspect the clutch motor pocket for damage or debris. Clean or repair as needed.



2. Apply anti-seize to the clutch motor surfaces as shown.

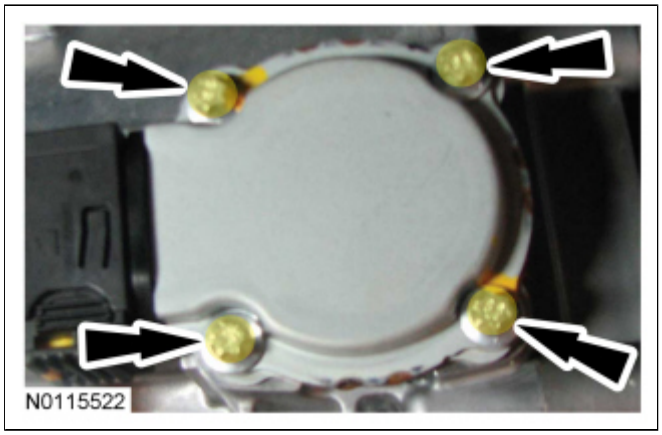


3. Apply anti-seize to the clutch actuator lever splines as shown.

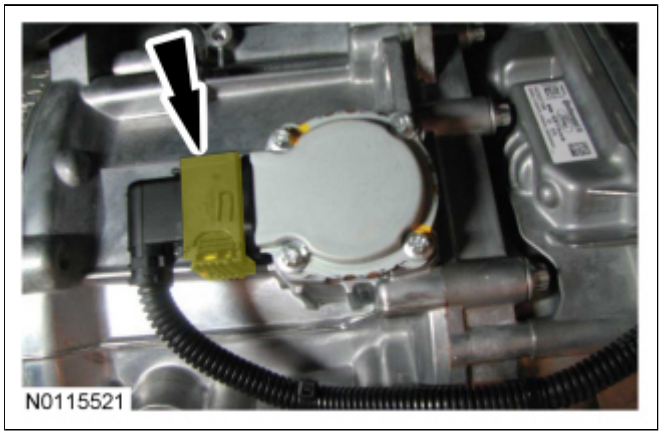


4. **NOTE:** Clutch motor splines may need to be turned to ease installation.

   Install the clutch motor and the 4 clutch motor bolts.
   - Tighten to 5 Nm (44 lb-in).



5. Connect the clutch motor electrical connector.



Transaxle

Special Tool(s)

 ST2378-A	Adapter for 303-290A 303-290-01
 ST2379-A	Adapter for 303-290A (Support Leg) 303-290-03A
ST1255-A	Handle 205-153
ST3218-A	Installer, Axle Seal 307-671
ST1582-A	Remover, Halfshaft 205-241 (T86P-3514-A)
ST2038-A	Remover, Halfshaft (Plate) 205-290 (T89P-3415-B)
ST2789-A	Slide Hammer 100-001 (T50T-100-A)
	Support Bar, Engine 303-290A

 ST2363-A	
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Transmission Control Module (TCM) Programming does not need to be performed if the transmission is being removed for flexplate or rear main seal service.

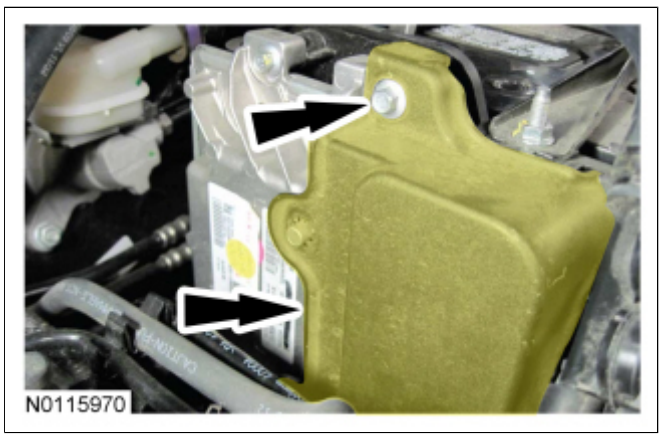
   Using the scan tool, recover all module information before removing the transaxle. For additional information, refer to Transmission Adaptive Learning in this section.

3. Remove the battery. For additional information, refer to Section 414-01 .

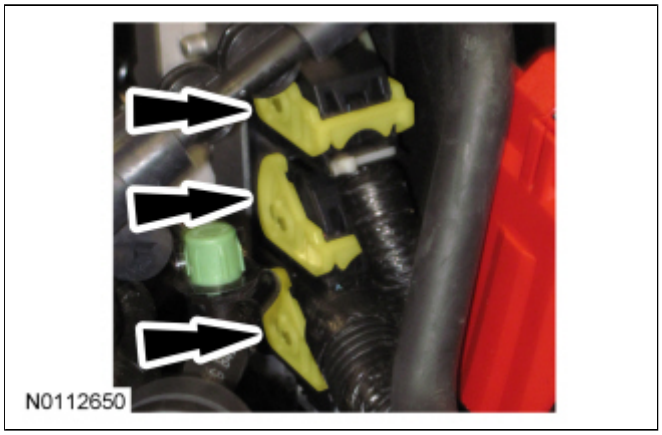
4. Remove the cowl assembly. For additional information, refer to Section 501-02 .

5. Remove the Air Cleaner (ACL) assembly and outlet pipe. For additional information, refer to Section 303-12 .

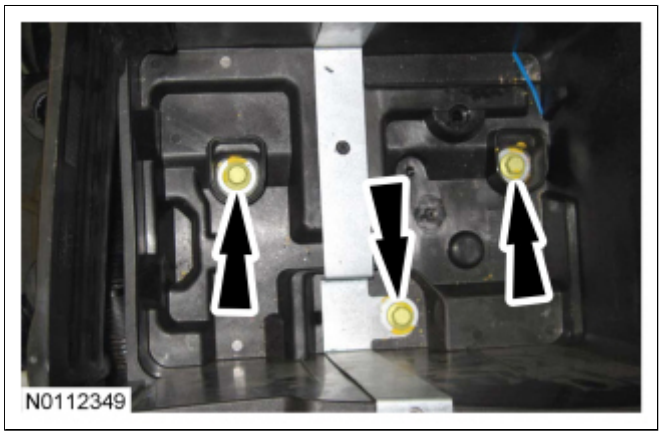
6. Remove the bolt and the PCM cover.



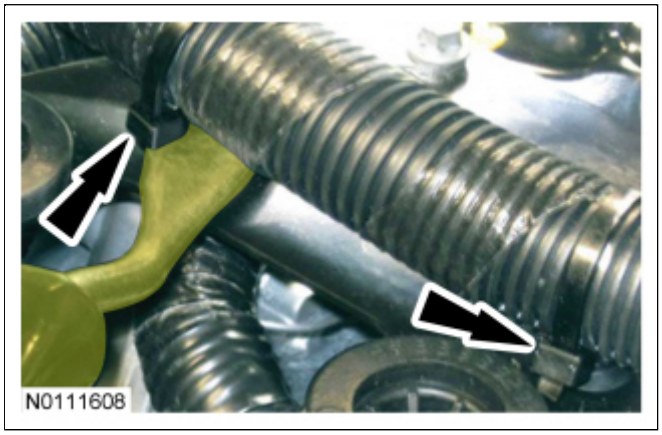
7. Disconnect the 3 PCM electrical connectors.



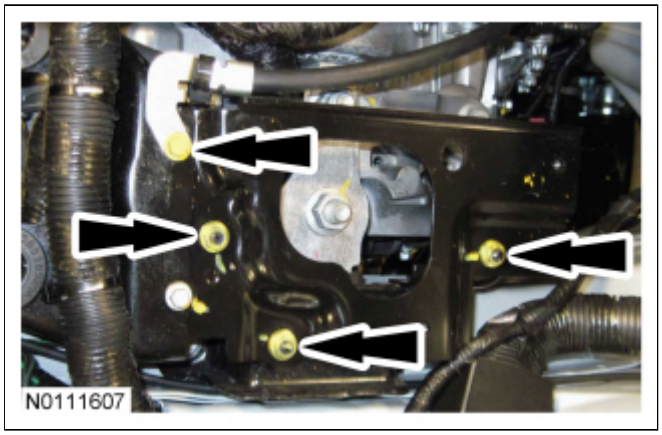
8. Remove the 3 battery tray bolts and the battery tray.



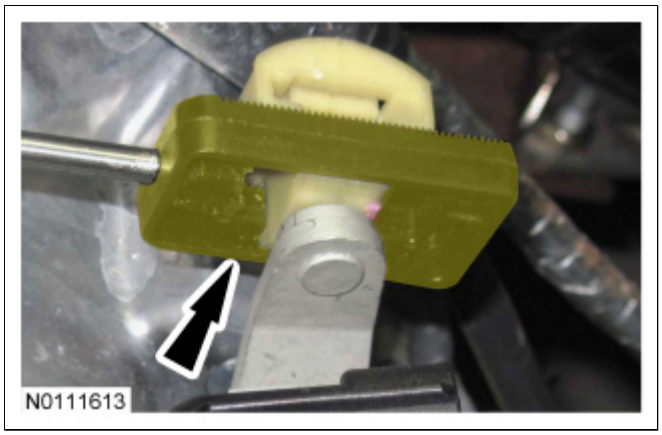
9. Using a suitable tool, detach the wiring harness from the battery tray bracket.



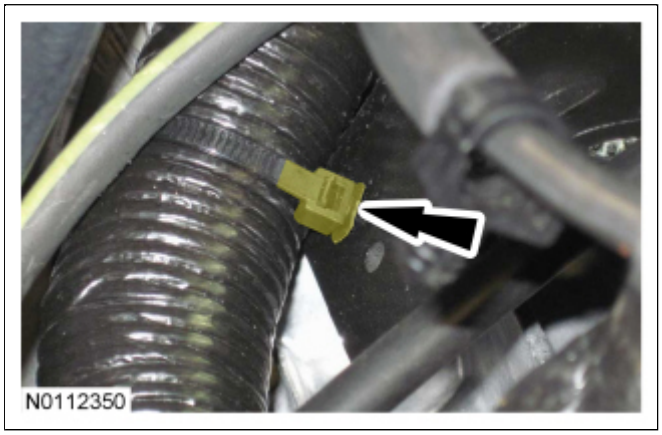
10. Remove the selector lever cable bracket bolt, the battery tray bracket nuts and remove the battery tray bracket.



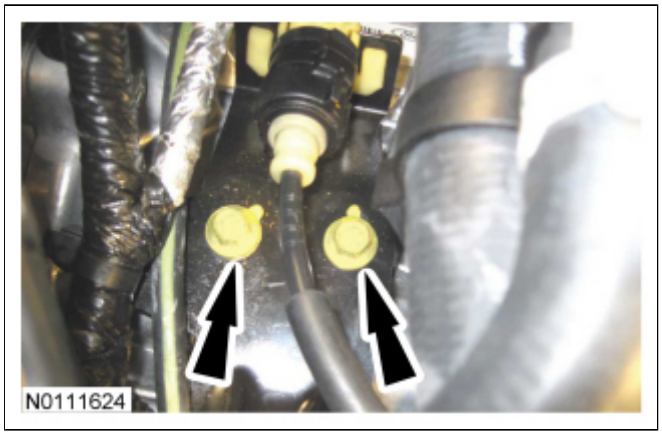
11. Disconnect the selector lever cable from the manual control lever.



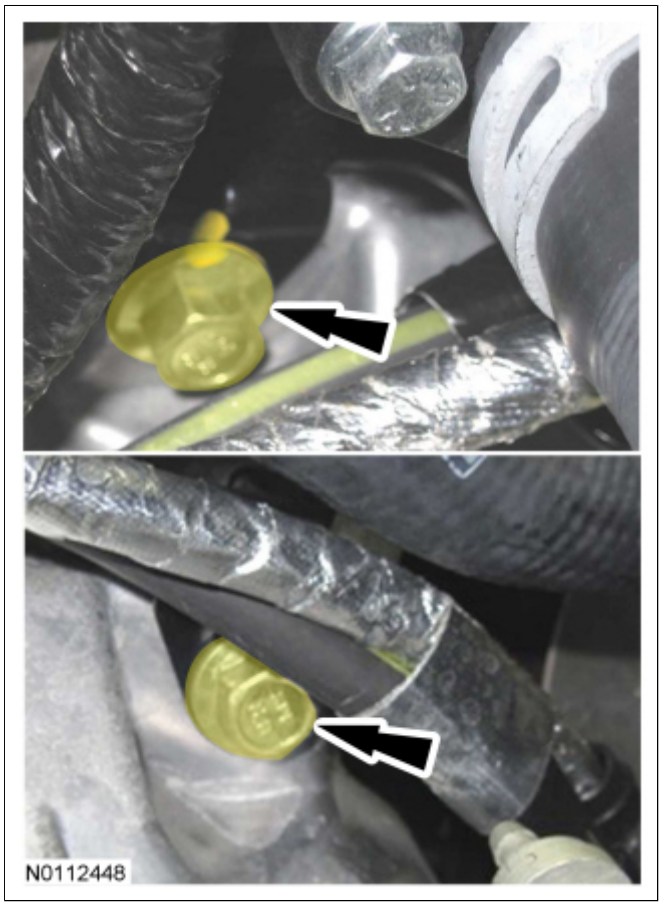
12. Remove the wiring harness from the selector lever cable bracket.



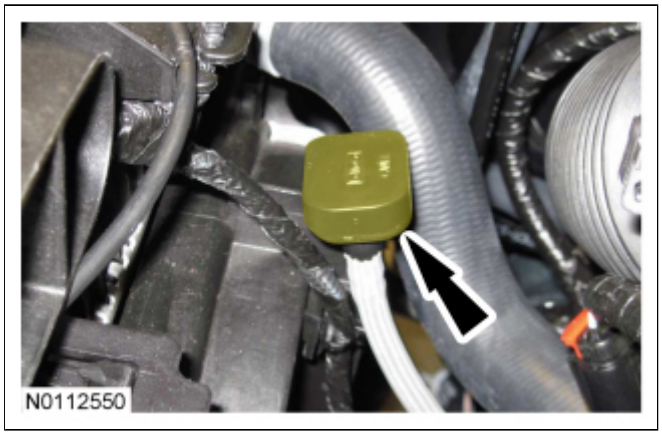
13. Remove the 2 selector lever cable bracket bolts from the transaxle and position the selector lever cable and bracket aside.



14. Remove the 2 upper clutch housing-to-engine bolts.

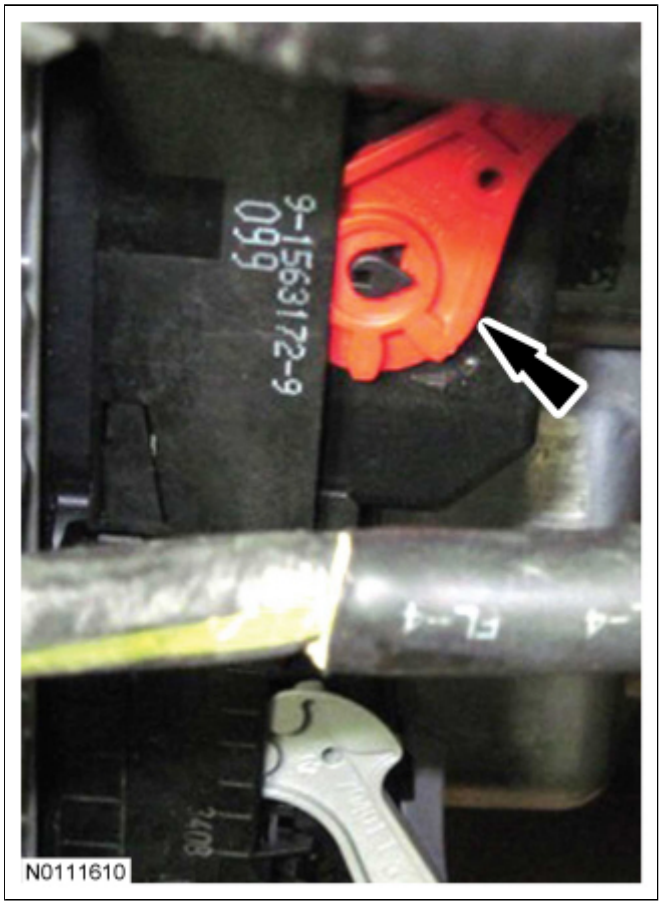


15. Remove the transaxle vent hose from the cooling fan housing and position aside.

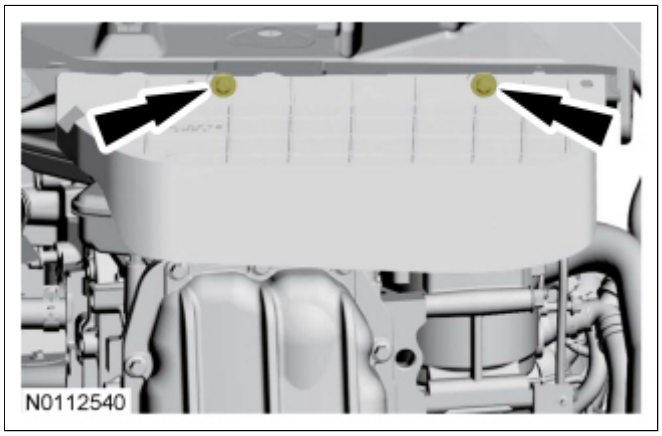


16. Remove the ground wire bolt and the ground wire from the transaxle.

17. Disconnect the engine harness electrical connector from the Transmission Control Module (TCM).

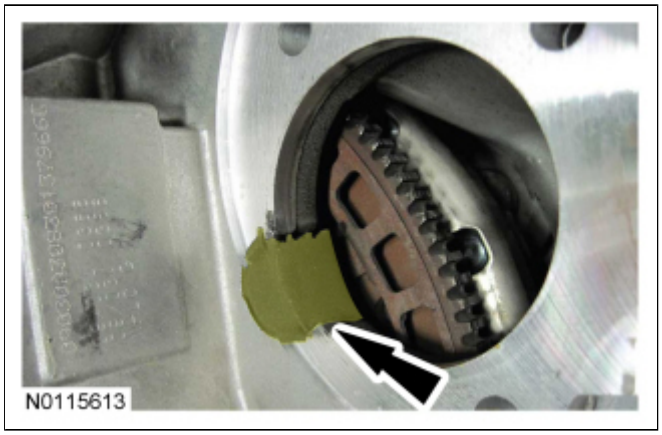


18. If equipped, remove the engine splash shield.



19. Remove the starter motor. For additional information, refer to Section 303-06 .

20. Remove the flexplate-to-clutch nut access cover.

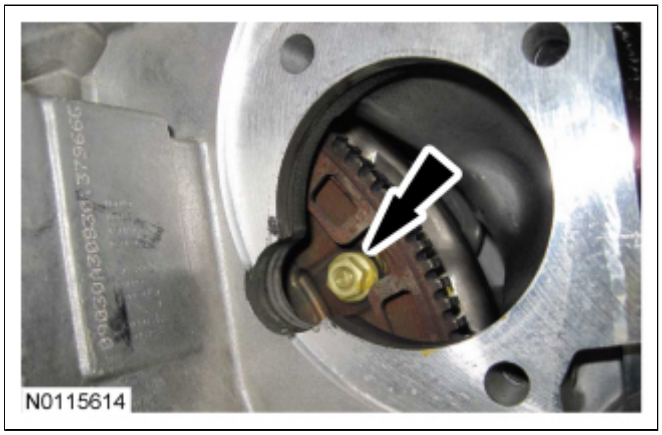


21. ***NOTICE:*** **Rotate the engine in a clockwise direction only or engine damage will occur.**

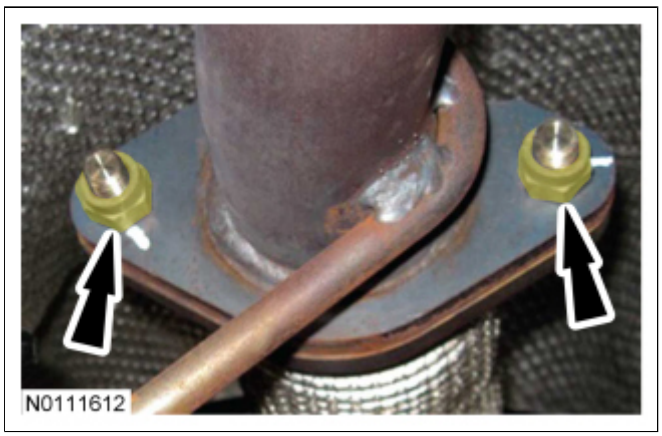
    NOTICE: **To prevent the flexplate-to-clutch nuts from falling into the clutch housing and causing damage, use a magnetic socket to remove the 6 flexplate-to-clutch nuts.**

    NOTE: Index mark one clutch stud and the flexplate for installation reference.

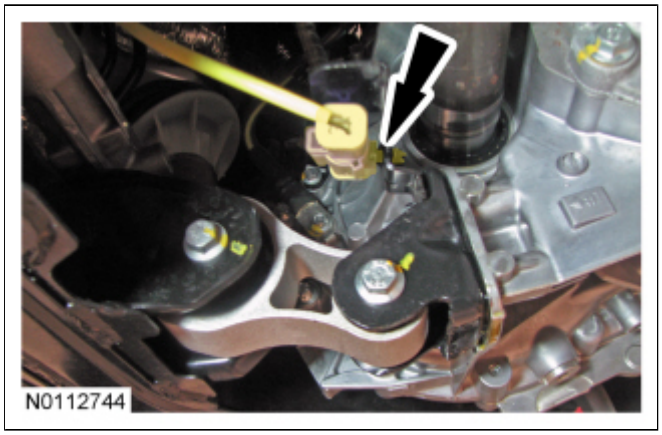
    Rotate the crankshaft in a clockwise direction to gain access to the flexplate-to-clutch nuts. Remove and discard the 6 flexplate-to-clutch nuts.



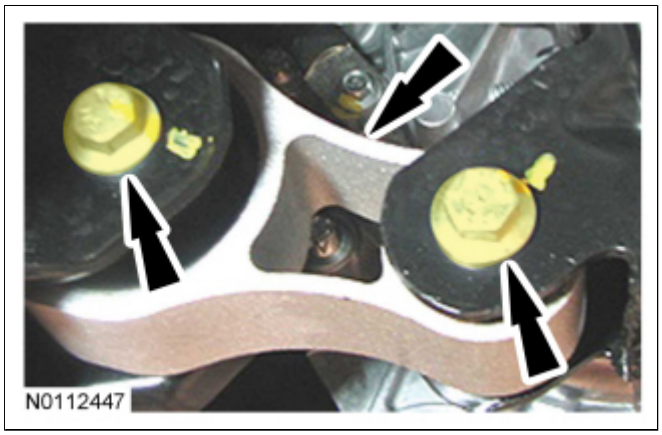
22. Remove and discard the exhaust flange nuts and exhaust flange gasket. Disconnect the exhaust flange.



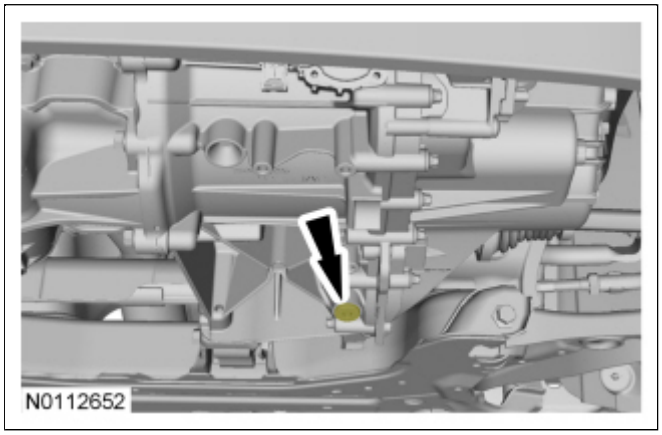
23. Detach the Heated Oxygen Sensor (HO2S) electrical connector from the HO2S bracket.



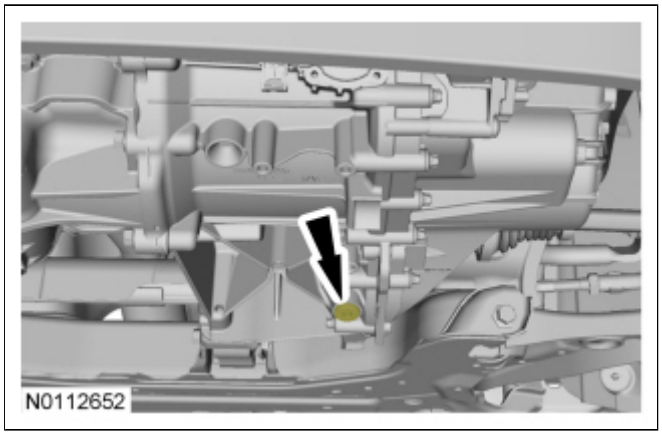
24. Remove the transaxle roll restrictor bolts and the transaxle roll restrictor.



25. Remove the drain plug and drain the transmission fluid.

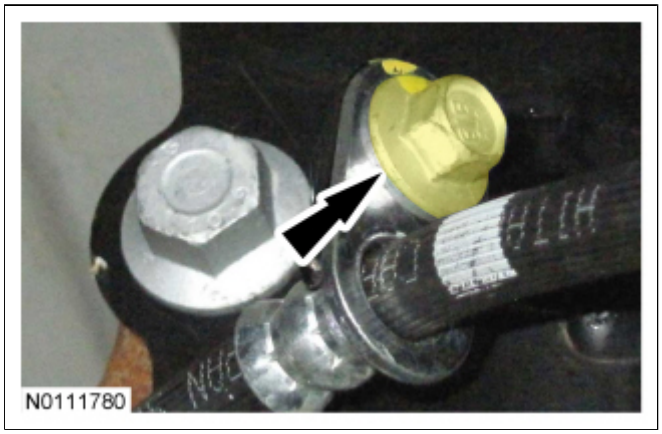


26. Install the drain plug.
    - Tighten to 43 Nm (32 lb-ft).

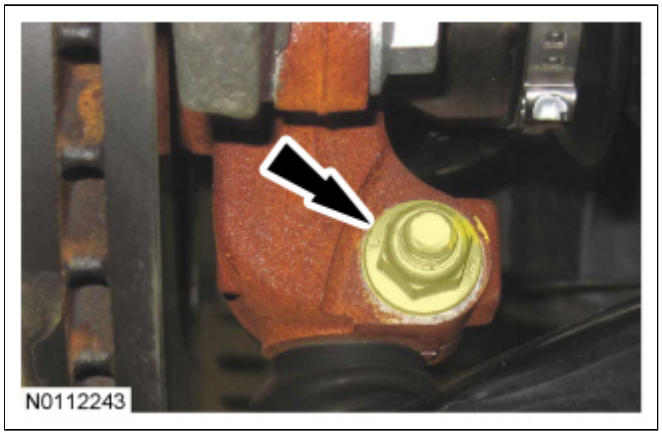


27. Remove the front wheels. For additional information, refer to Section 204-04 .

28. Remove the brake hose retainer bolt and the brake hose retainer from the RH strut.

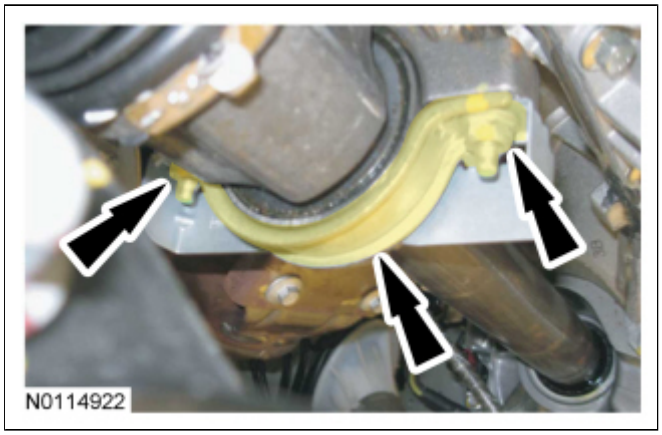


29. Remove and discard the RH ball joint nut and bolt.



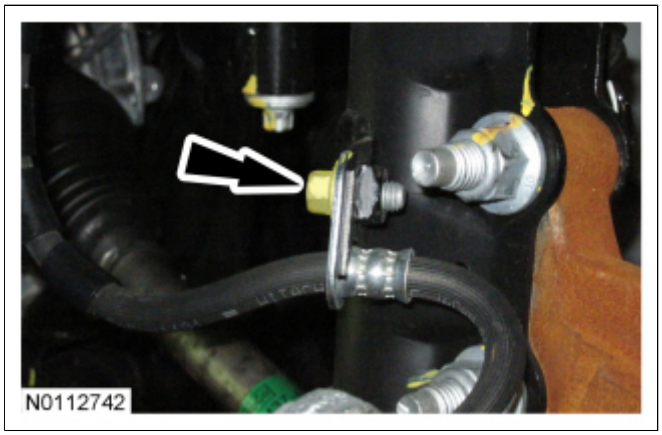
30. Separate the RH ball joint from the knuckle.

31. Remove and discard the bearing retainer strap nuts, shield and the bearing retainer strap.

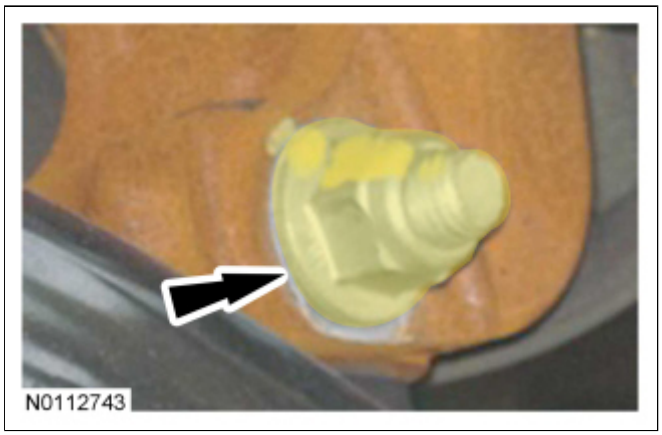


32. Remove the RH intermediate shaft assembly from the transaxle and position aside. Support the intermediate shaft assembly.

33. Remove the brake hose retainer bolt and the brake hose retainer from the LH strut.

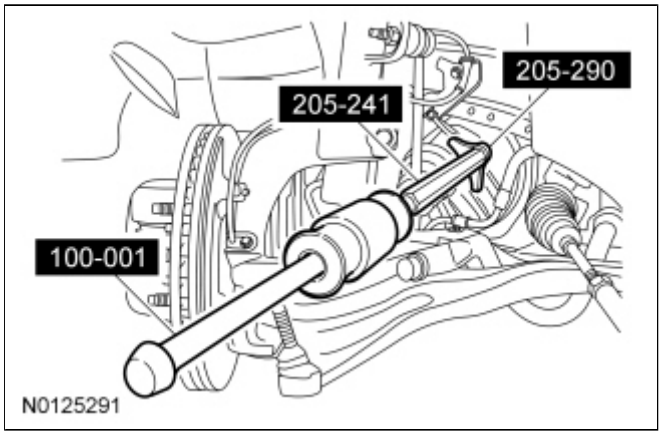


34. Remove and discard the LH ball joint nut and bolt.

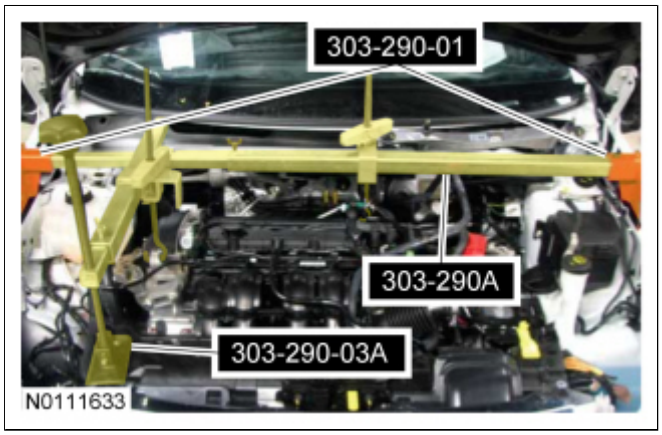


35. Separate the LH ball joint from the knuckle.

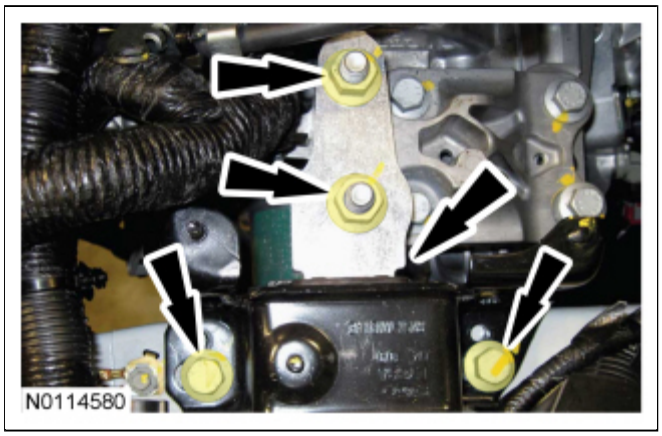
36. Using the special tools, remove the LH halfshaft assembly from the transaxle and position aside. Support the LH halfshaft assembly.



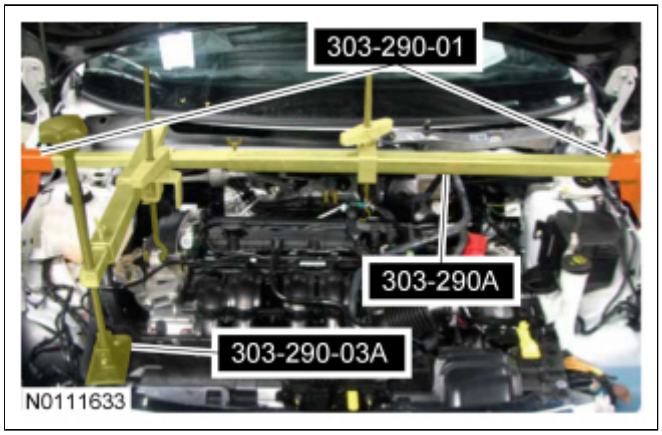
37. Install the special tools and support the engine.



38. Remove the 2 transaxle support insulator bolts and nuts and remove the transaxle support insulator.

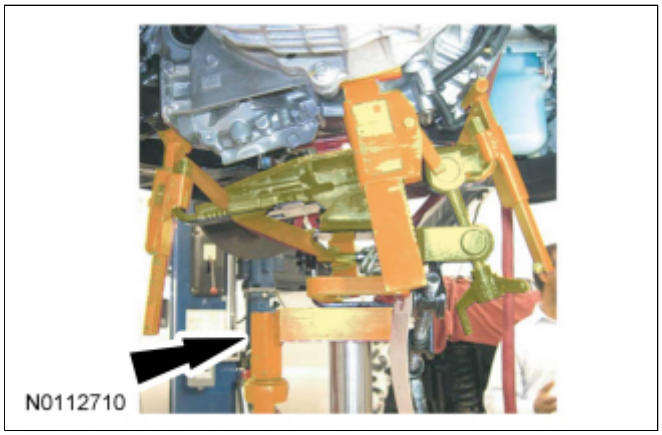


39. Using the special tools, lower the transaxle.

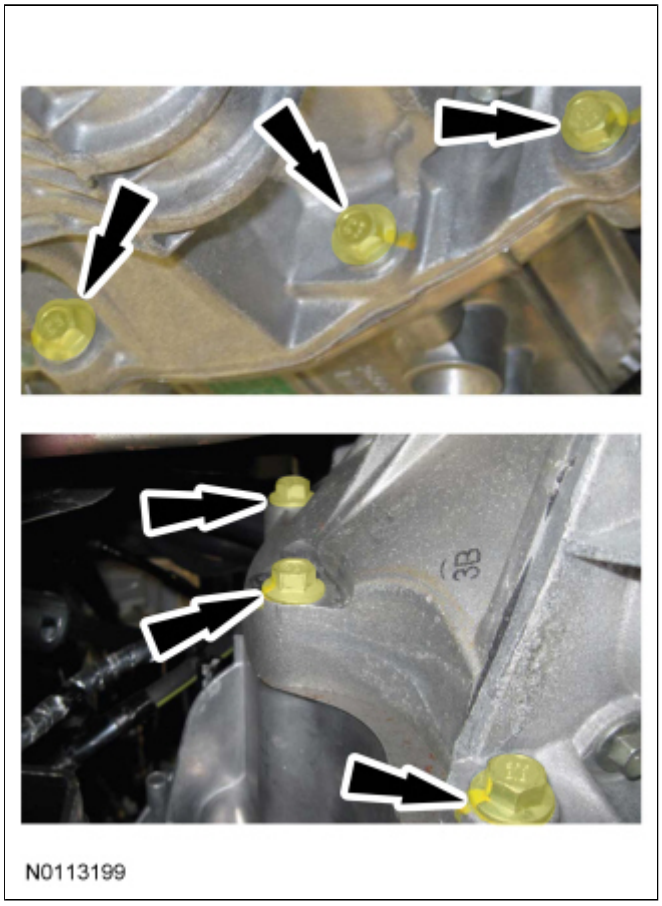


40. ***NOTICE:*** **Use caution not to damage the transaxle wiring harness or sensors.**

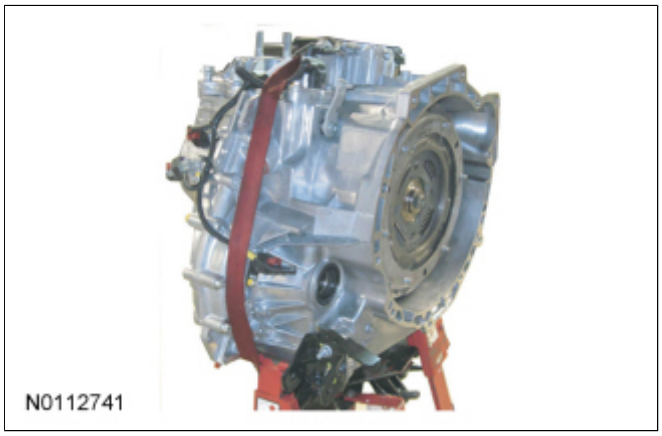
    Position a suitable high-lift transmission jack under the transaxle and secure the transaxle to the high-lift transmission jack.



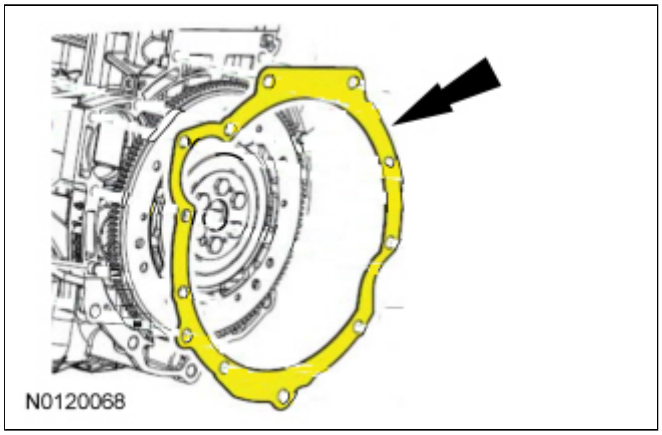
41. Remove the 6 lower clutch housing-to-engine bolts.



42. Remove the transaxle.



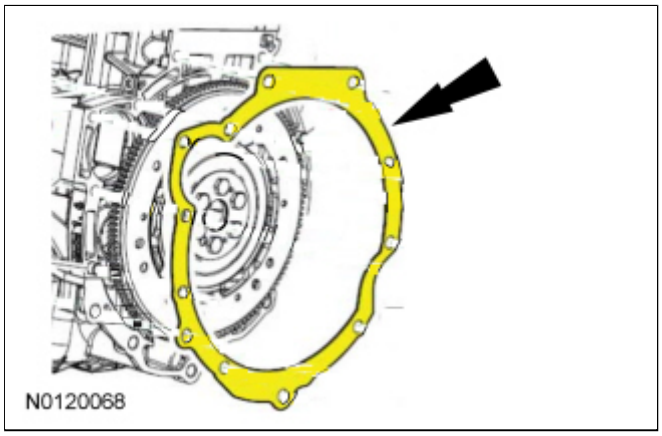
43. Remove and discard the engine-to-transaxle separator plate.



Installation

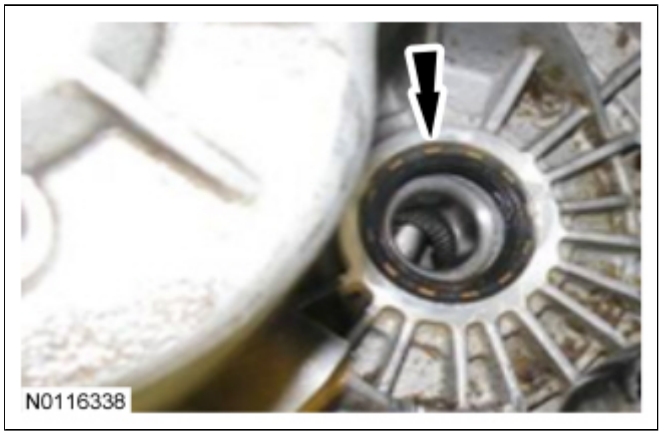
1. ***NOTICE:*** **Use caution not to damage the engine-to-transaxle separator plate or damage can occur.**

   Install the new engine-to-transaxle separator plate.

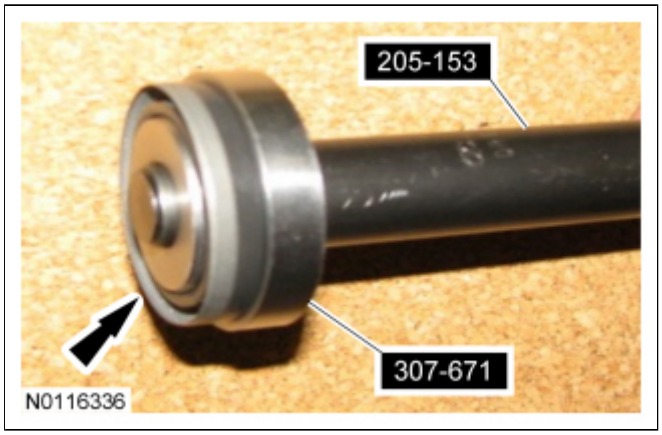


2. ***NOTICE:*** **If installing the existing transaxle, the halfshaft seals must be replaced or damage to the transaxle can occur.**

   Using a suitable tool, remove and discard the LH halfshaft seal.

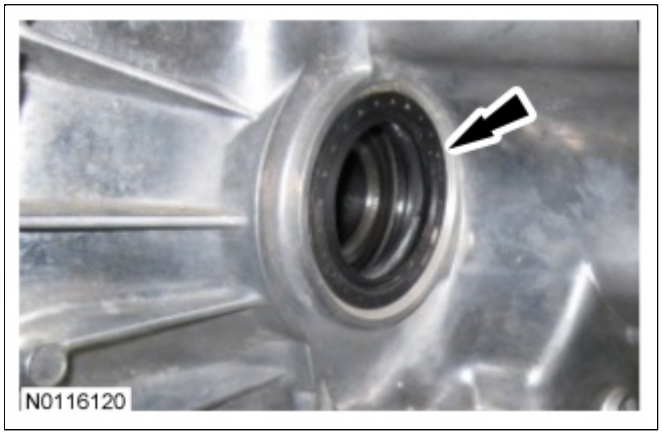


3. Install the new LH halfshaft seal onto the special tool.

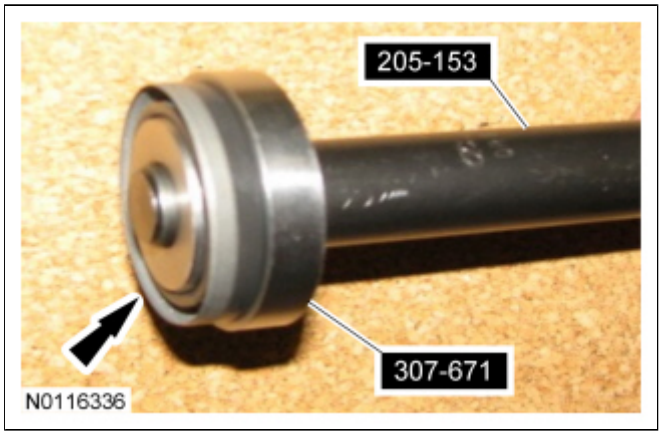


4. Using the special tools, install the new LH halfshaft seal.

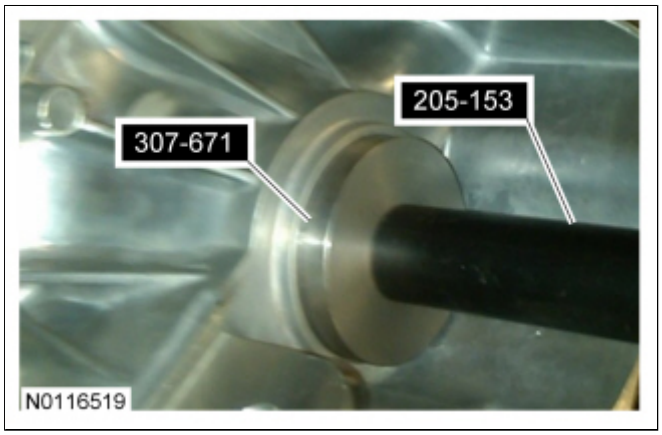
5. Using a suitable tool, remove and discard the RH halfshaft seal.



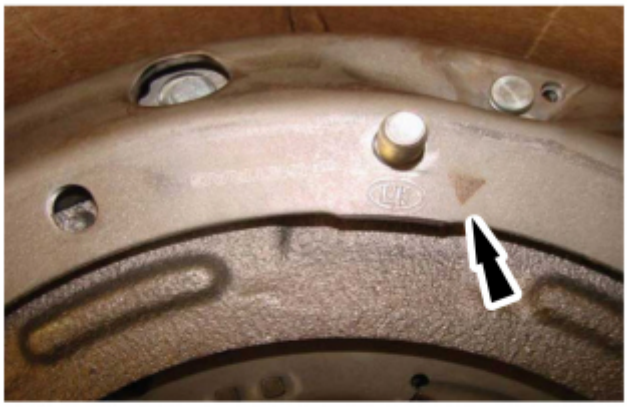
6. Install the new RH halfshaft seal onto the special tool.



7. Using the special tools, install the new RH halfshaft seal.



8. If using a new clutch assembly, make sure the clutch-to-flexplate alignment marks are aligned.



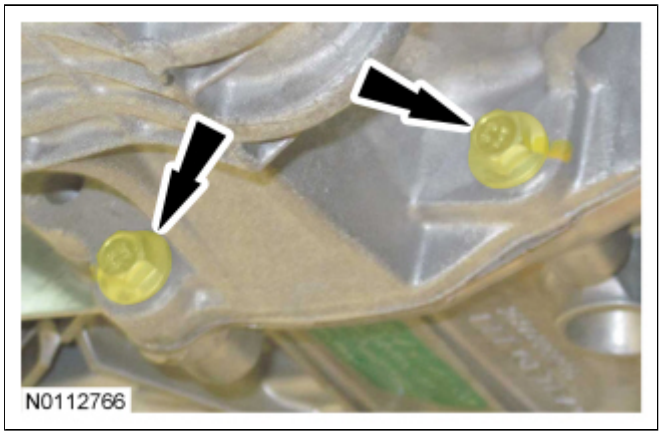
N0115979

9. **NOTE:** If using the existing clutch assembly, align the index marks on the flexplate and the clutch stud made during removal.

   Install the transaxle.

N0112710

10. Install 2 lower clutch housing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

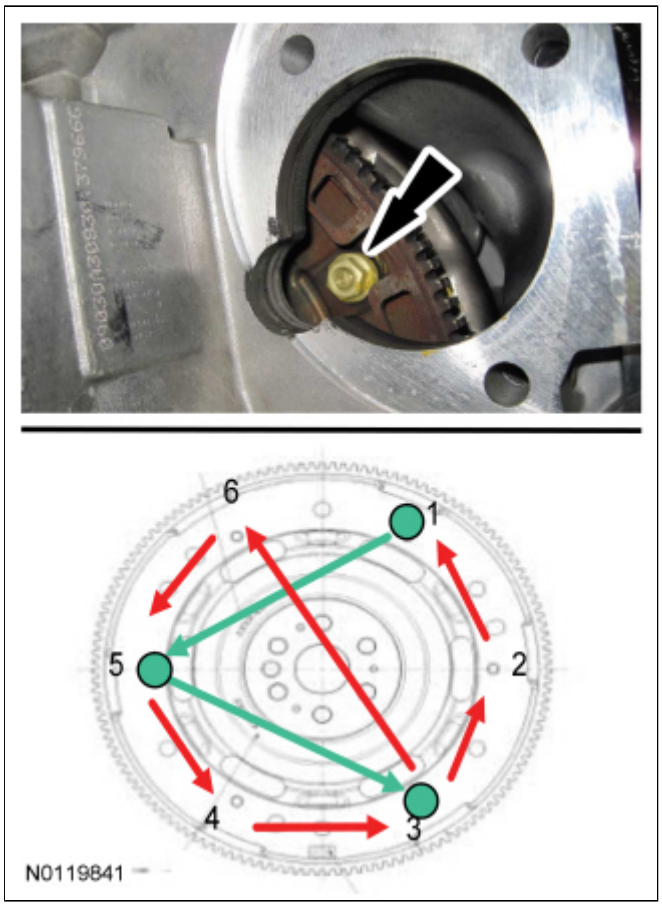


11. ***NOTICE:*** **Rotate the engine in a clockwise direction only or engine damage will occur.**

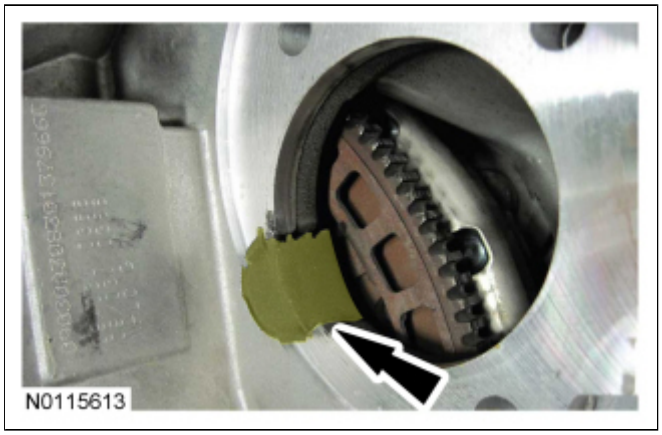
    NOTICE: **Tighten the flexplate-to-clutch nuts in a star pattern or transaxle damage can occur.**

    NOTE: Using a magnetic socket will help ease the installation of new flexplate-to-clutch nuts. If the flexplate-to-clutch nuts fall into the clutch housing, the transaxle will have to be removed to retrieve them.

    Install the 6 new flexplate-to-clutch nuts. Tighten the nuts in a star pattern in 2 stages.
    - Stage 1: Tighten nuts 1, 5 and 3 to 12 Nm (106 lb-in).
    - Stage 2: Tighten all nuts to 25 Nm (18 lb-ft).

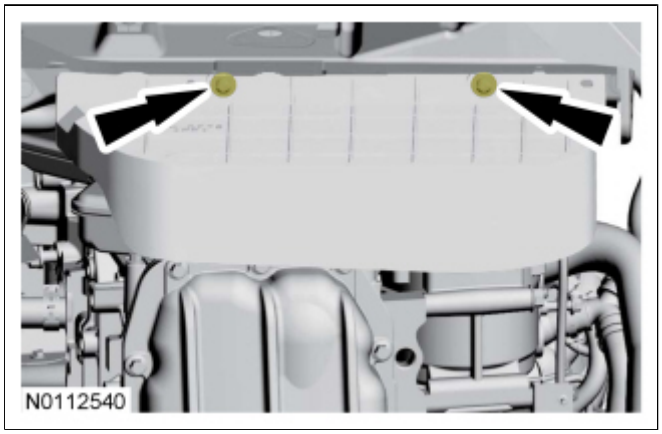


12. Install the flexplate-to-clutch nut access cover.

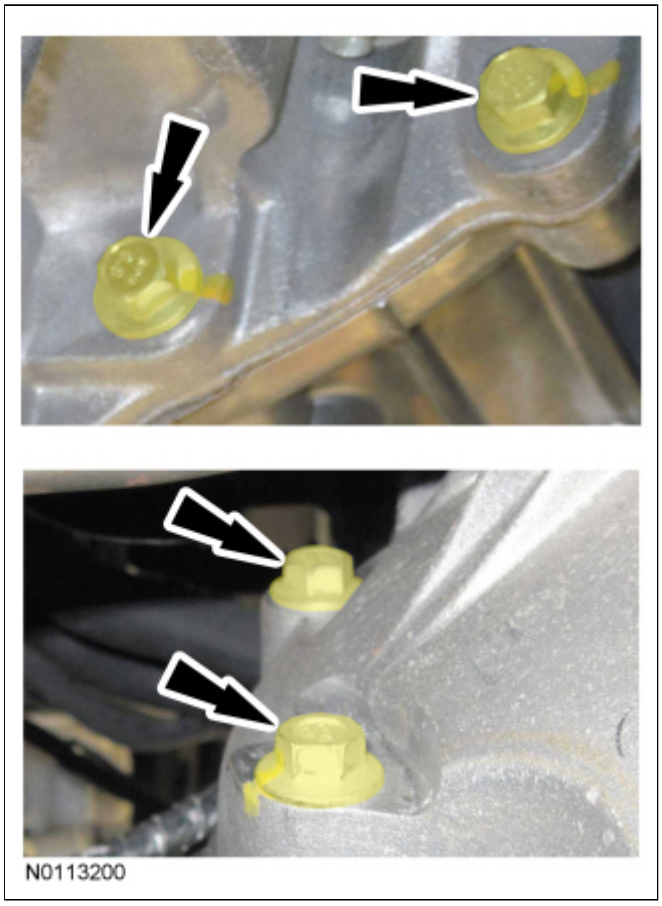


13. Install the starter motor. For additional information, refer to Section 303-06 .

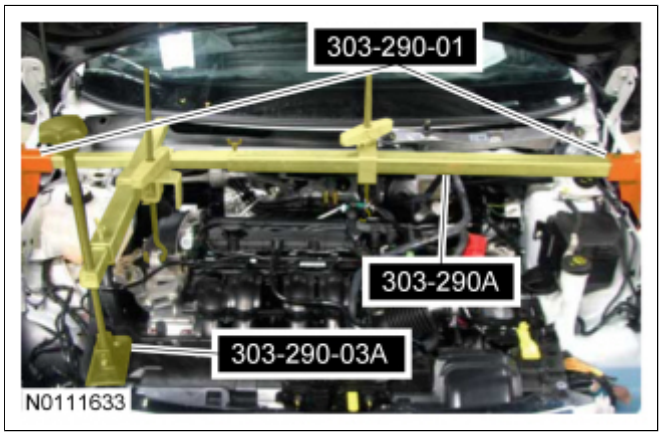
14. If equipped, install the engine splash shield.



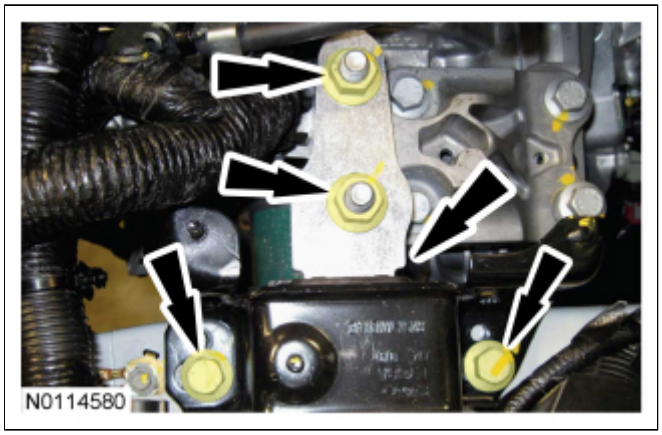
15. Install the 4 lower clutch housing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



16. Using the special tools, raise the transaxle.

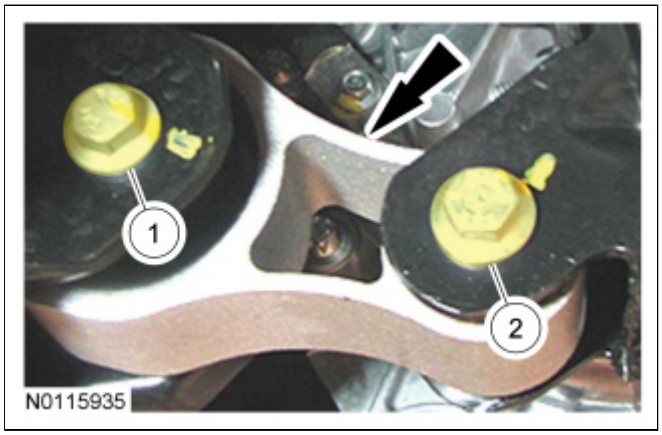


17. Install the transaxle support insulator and install the 2 transaxle support insulator bolts and the 2 nuts.
    - Tighten the 2 bolts to 90 Nm (66 lb-ft).
    - Tighten the 2 nuts to 125 Nm (92 lb-ft).

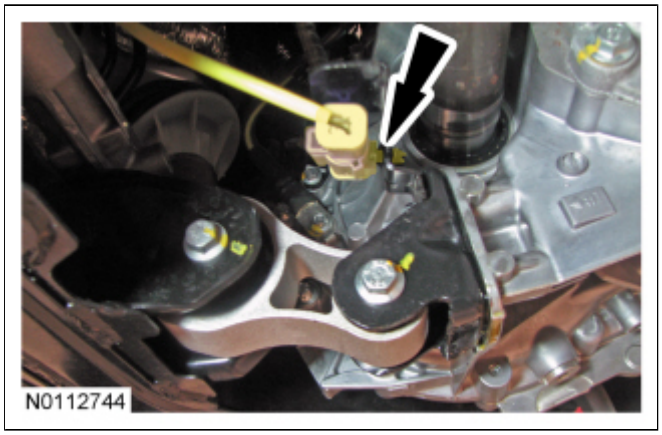


18. Install the ground wire and bolt onto the transaxle.
    - Tighten to 25 Nm (18 lb-ft).

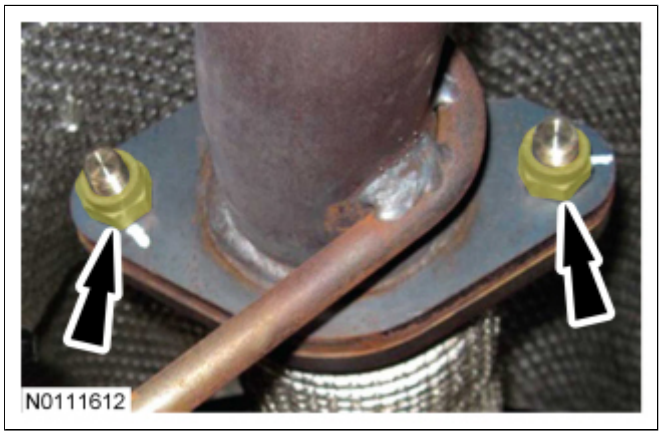
19. Install the transaxle roll restrictor and the 2 roll restrictor bolts. Tighten the bolts in the sequence shown.
    1. Tighten to 70 Nm (52 lb-ft).
    2. Tighten to 70 Nm (52 lb-ft).



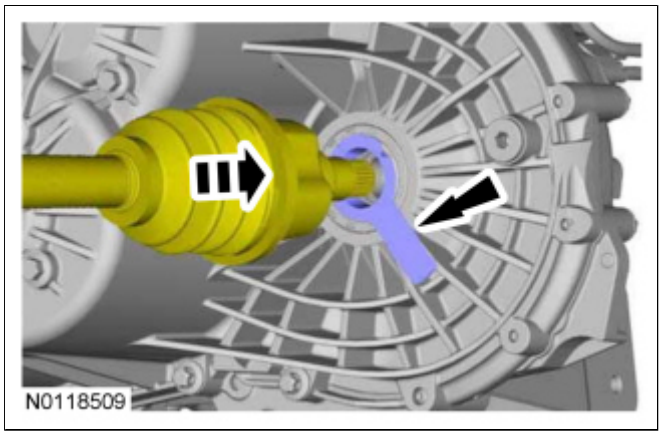
20. Attach the HO2S electrical connector to the HO2S bracket.



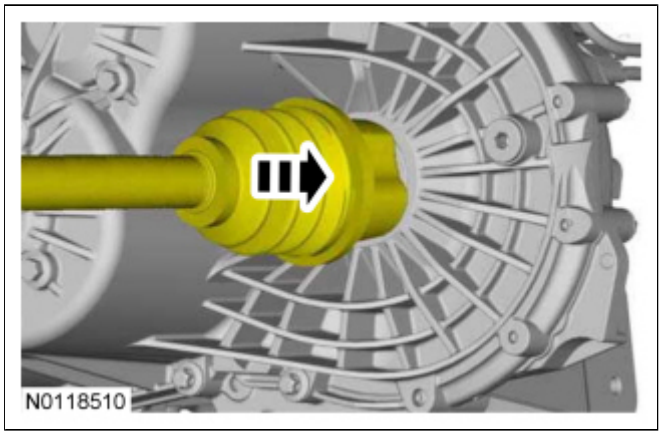
21. Using a new exhaust flange gasket and nuts, connect the exhaust flange to the exhaust.
    - Tighten to 48 Nm (35 lb-ft).



22. Using the LH halfshaft seal protector provided with the new LH halfshaft seal, install the LH halfshaft partially into the transaxle.

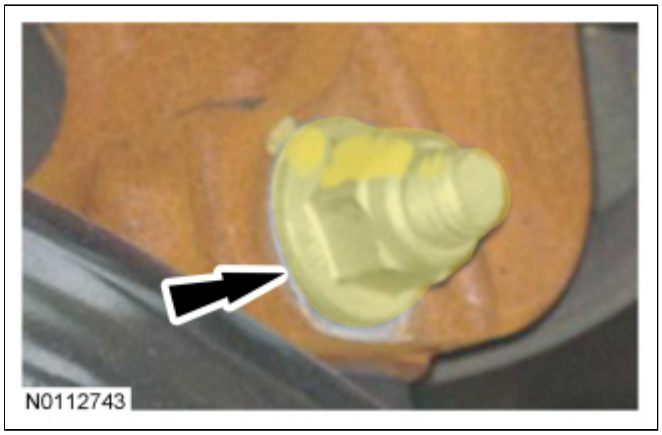


23. Remove the LH halfshaft seal protector and install the LH halfshaft into the transaxle.

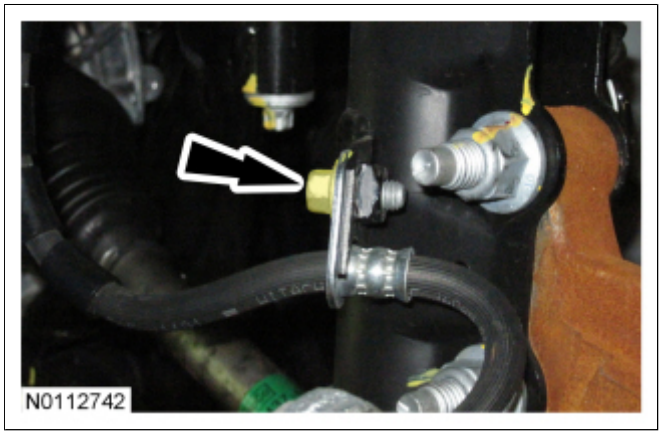


24. Install the LH ball joint into the knuckle.

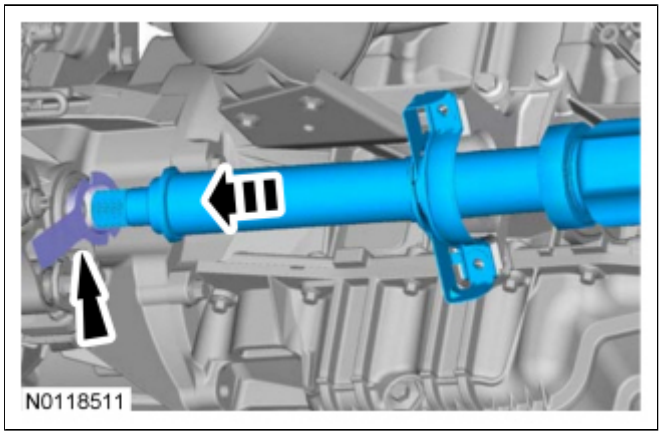
25. Install the new LH ball joint bolt and nut.
    - Tighten to 48 Nm (35 lb-ft).



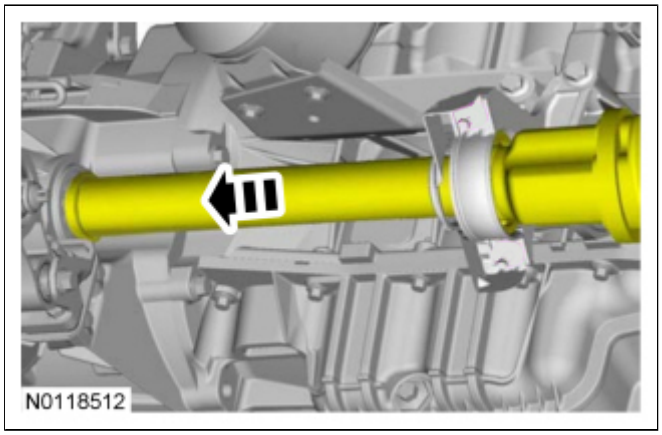
26. Install the brake hose retainer and bolt on the LH strut.
    - Tighten to 25 Nm (18 lb-ft).



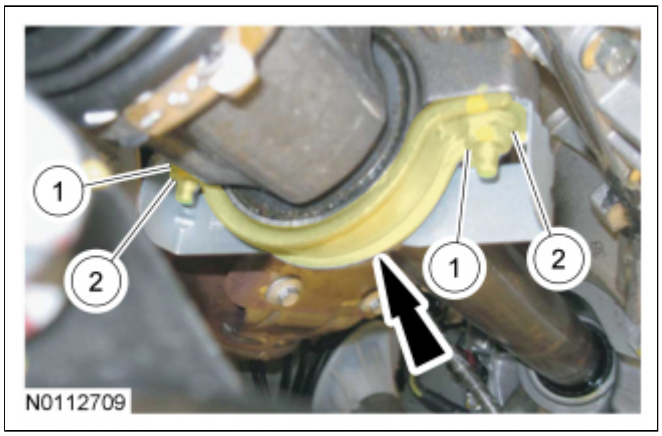
27. Using the RH halfshaft seal protector provided with the new RH halfshaft seal, install the RH intermediate shaft assembly partially into the transaxle.



28. Remove the RH halfshaft seal protector and install the RH intermediate shaft assembly into the transaxle.

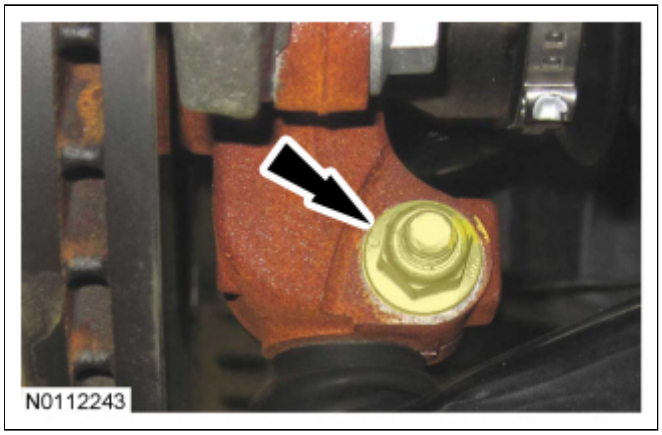


29. Install the new bearing retainer strap, shield and bearing retainer strap nuts. Tighten the nuts in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

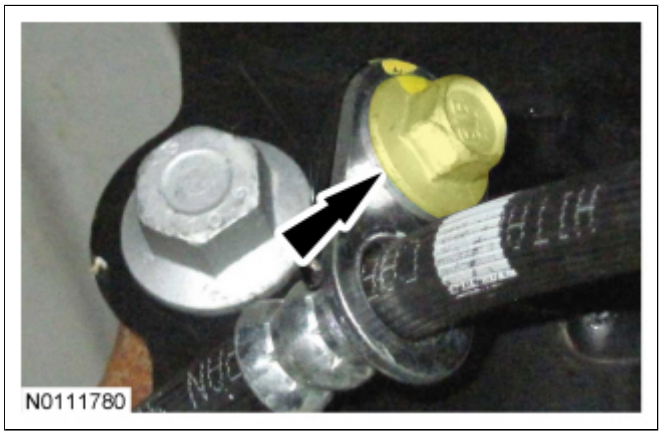


30. Install the RH ball joint into the knuckle.

31. Install the new RH ball joint bolt and nut.
    - Tighten to 48 Nm (35 lb-ft).

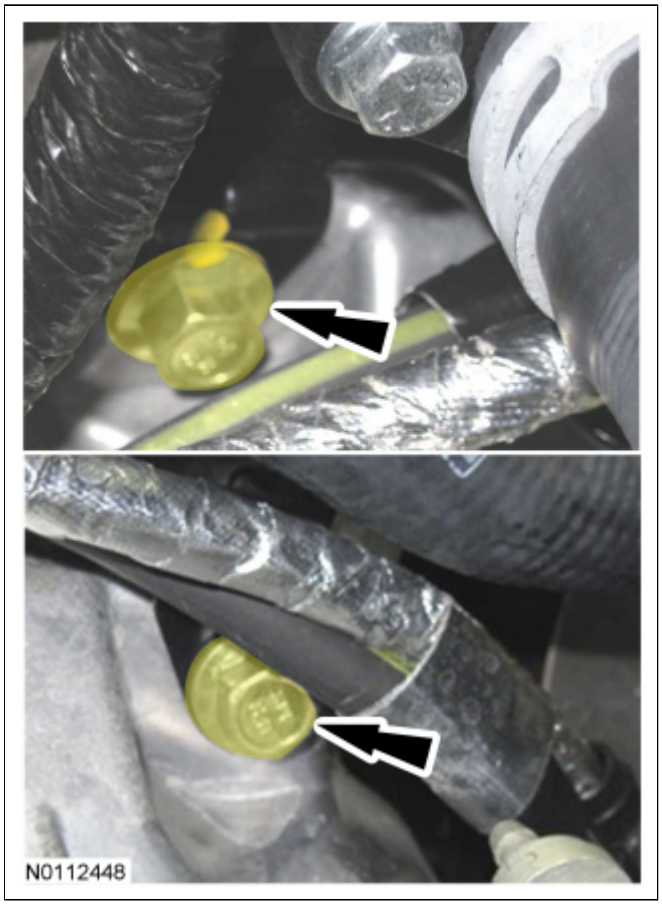


32. Install the brake hose retainer and bolt on the RH strut.
    - Tighten to 25 Nm (18 lb-ft).

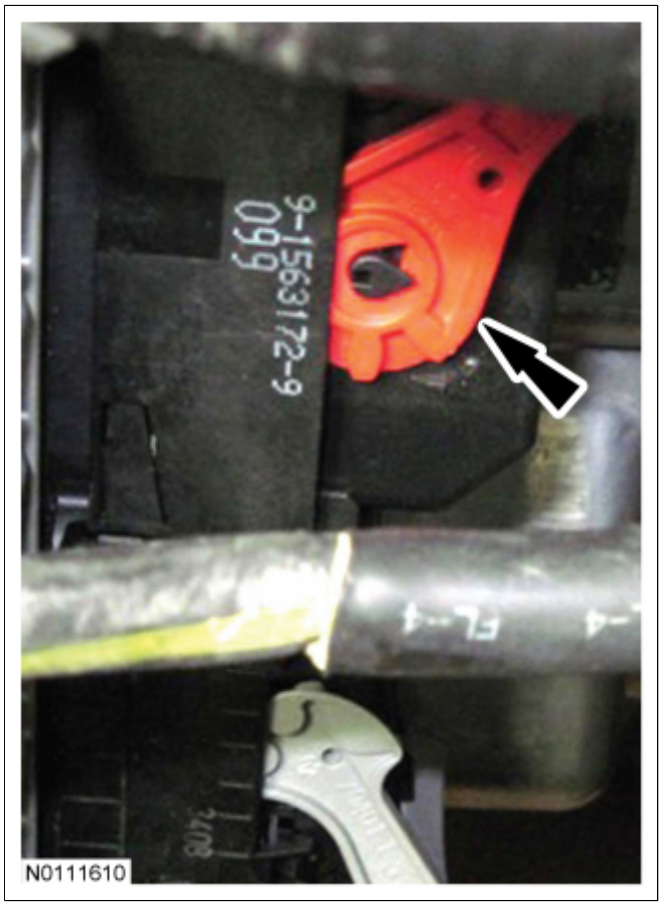


33. Install the front wheels. For additional information, refer to Section 204-04 .

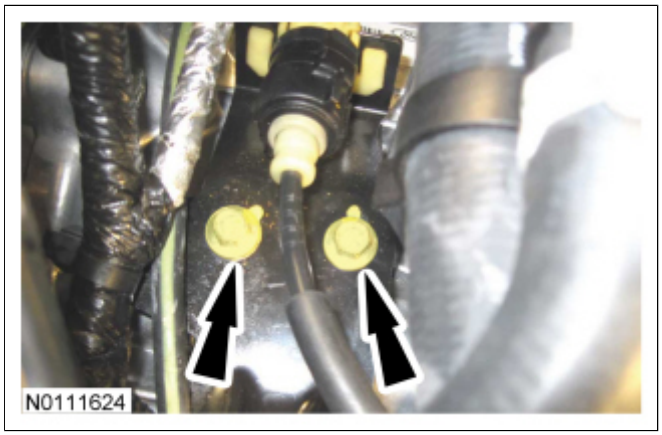
34. Install the 2 upper clutch housing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



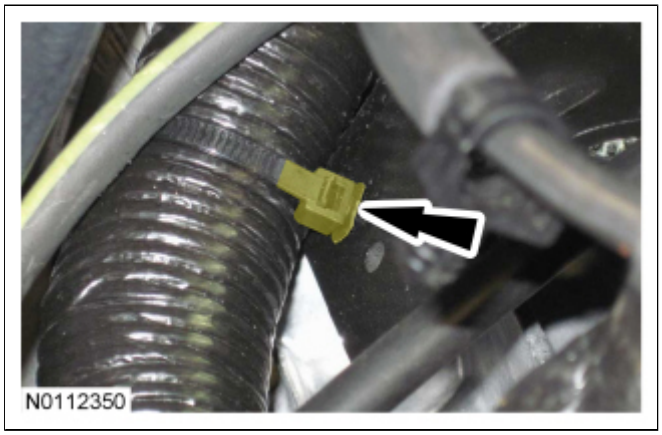
35. Connect the engine harness electrical connector to the TCM .



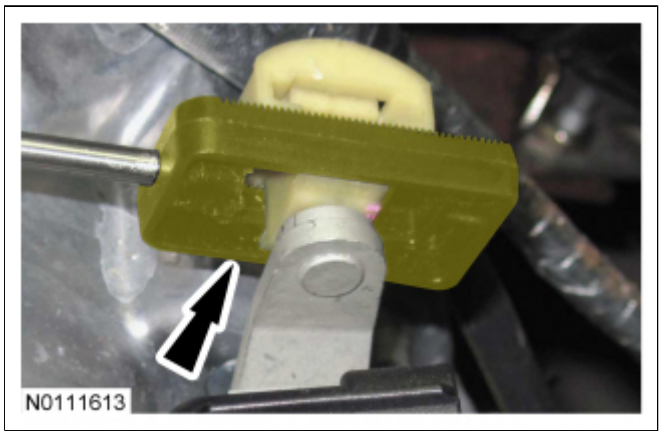
36. Install the selector lever cable bracket and the 2 selector lever cable bracket bolts on the transaxle.
    - Tighten to 25 Nm (18 lb-ft).



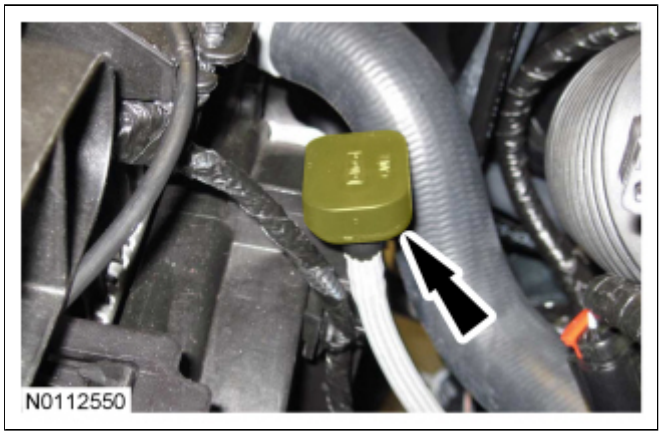
37. Attach the wiring harness to the selector lever cable bracket.



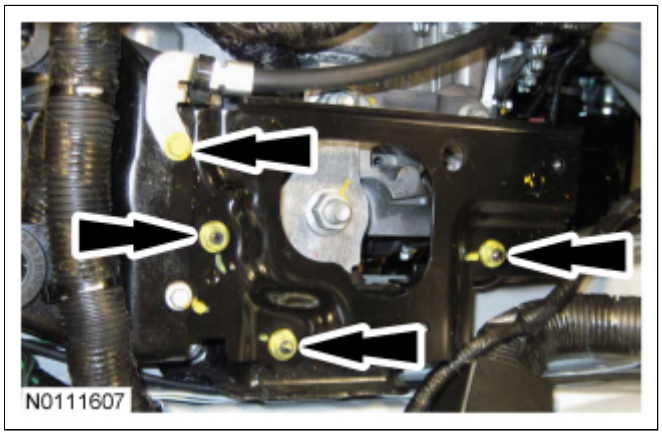
38. Connect the selector lever cable to the manual control lever.



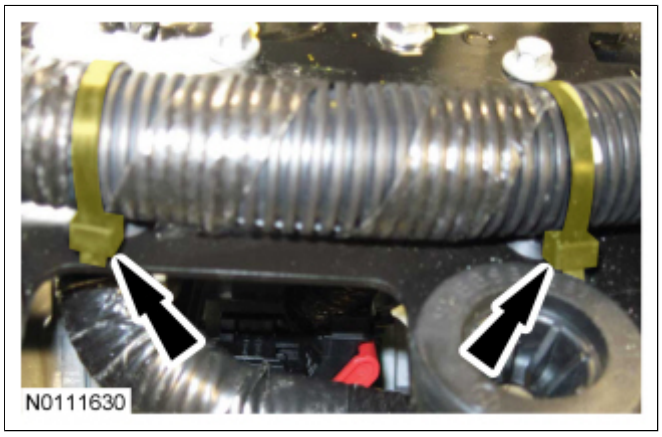
39. Attach the transaxle vent hose to the cooling fan housing.



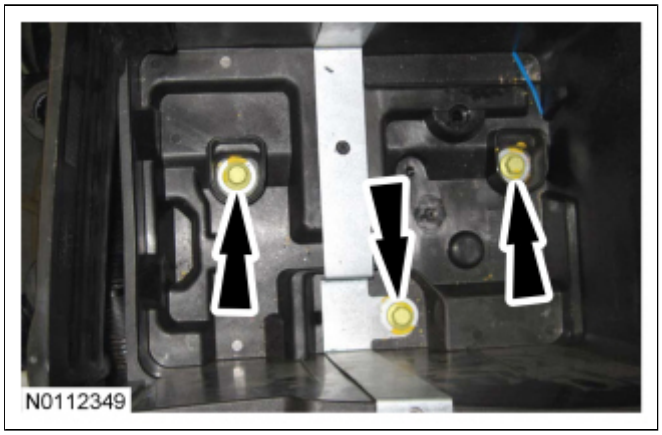
40. Install the battery tray bracket, battery tray bracket nuts and the selector lever cable bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



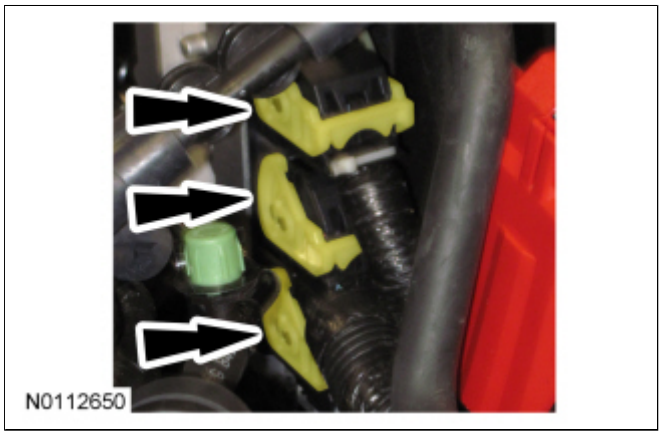
41. Attach the wiring harness to the battery tray bracket.



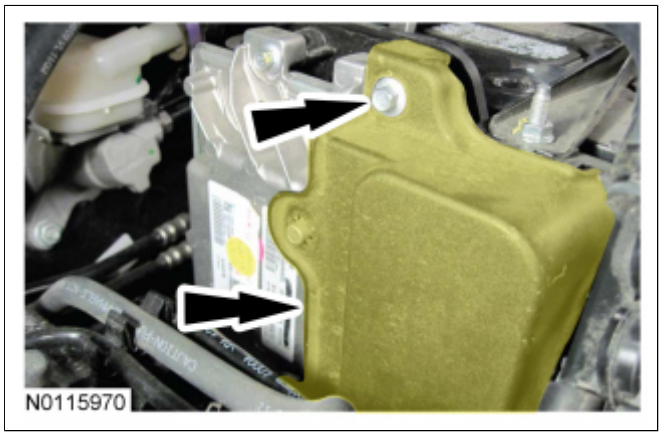
42. Install the battery tray and the 3 battery tray bolts.
    - Tighten to 10 Nm (89 lb-in).



43. Connect the 3 PCM electrical connectors.



44. Install the PCM cover and bolt.
    - Tighten to 5.4 Nm (47.8 lb-in).



45. Install the ACL assembly and outlet pipe. For additional information, refer to Section 303-12 .

46. Install the battery. For additional information, refer to Section 414-01 .

47. Install the cowl assembly. For additional information, refer to Section 501-02 .

48. Fill the transaxle with transmission fluid. For additional information, refer to Transmission Draining and Filling .

49. Adjust the selector lever cable. For additional information, refer to Section 307-05 .

50. Using the scan tool, install all recovered module information after installing the transaxle. For additional information, refer to Transmission Adaptive Learning in this section.

Halfshaft Seal — LH

Special Tool(s)

ST1255-A	Handle 205-153 (T80T-4000-W)

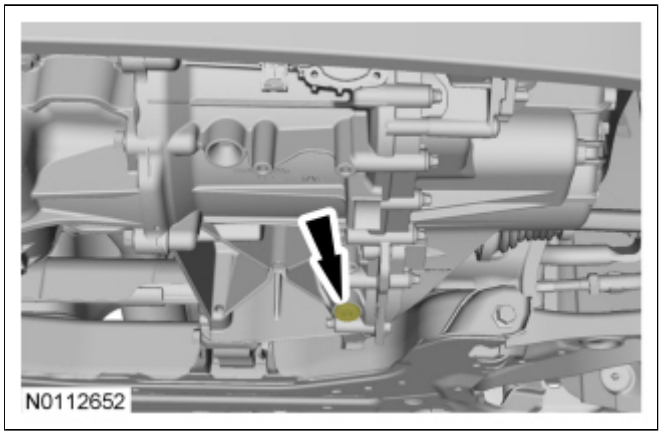
Material

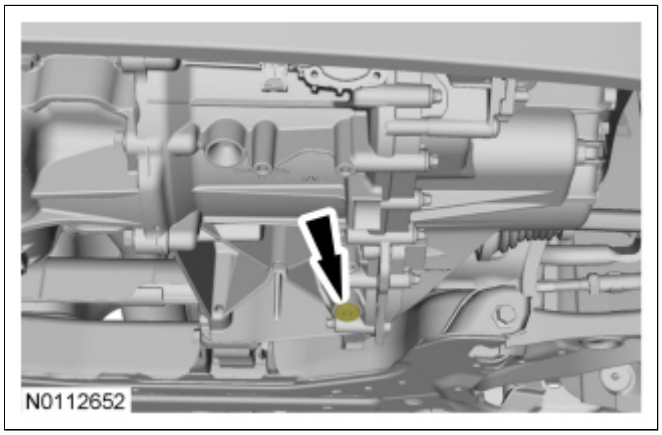
Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

Removal

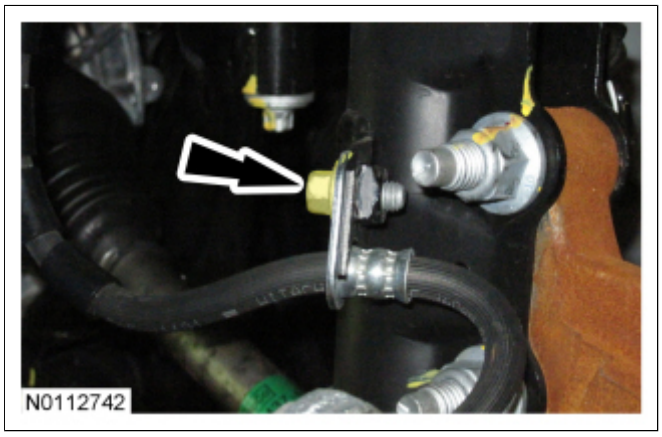
1. Remove the front wheel and tire. For additional information, refer to Section 204-04 .
2. Remove the drain plug and drain the transmission fluid.



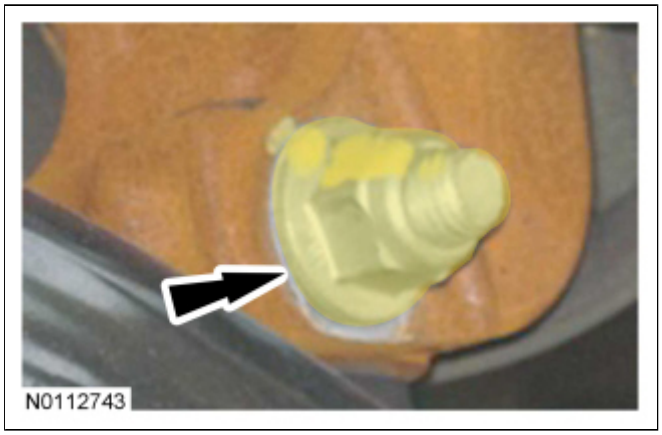
3. Install the drain plug.
    - Tighten to 43 Nm (32 lb-ft).



4. Remove the brake hose retainer bolt and the brake hose retainer from the LH strut.

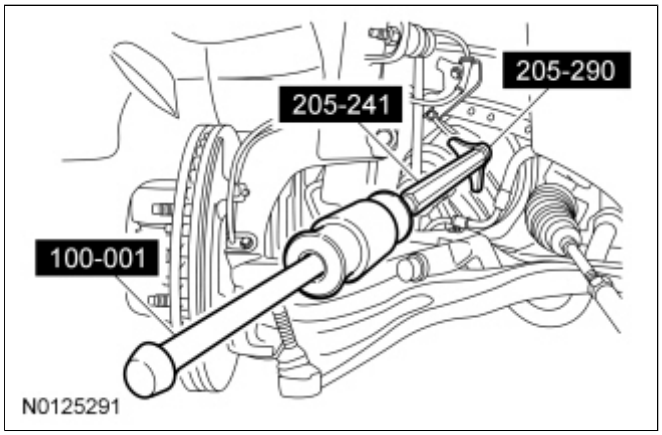


5. Remove and discard the LH ball joint bolt and nut.

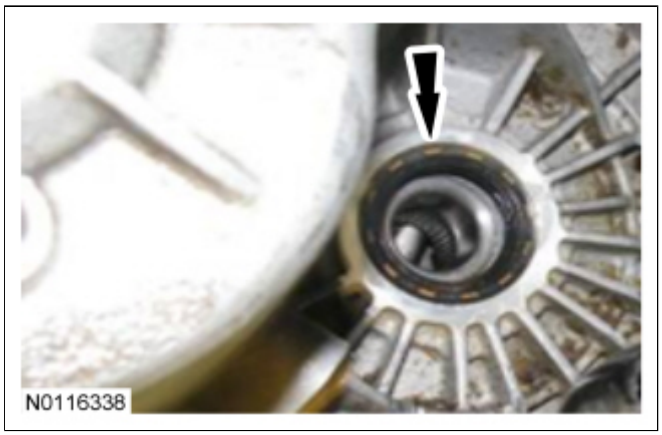


6. Separate the LH ball joint from the knuckle.

7. Using the special tools, remove the LH halfshaft assembly from the transaxle and position aside. Support the LH halfshaft assembly.

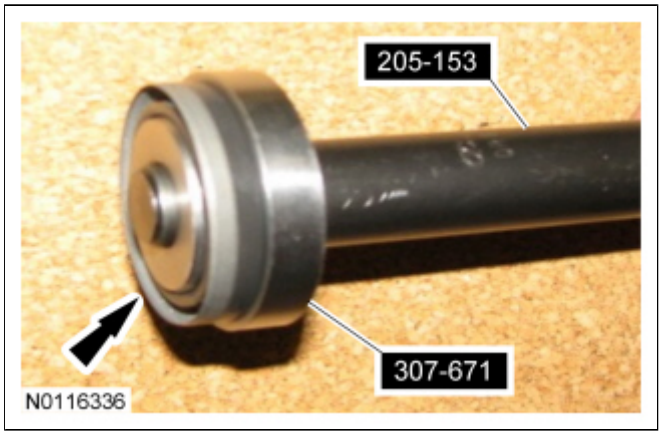


8. Using a suitable tool, remove and discard the LH halfshaft seal.



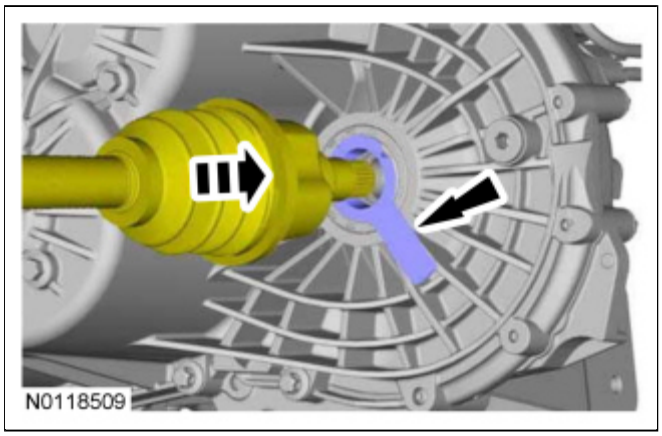
Installation

1. Install the LH halfshaft seal onto the special tool.

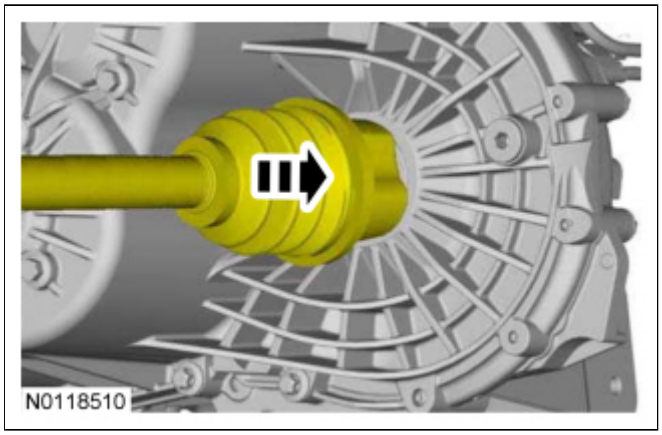


2. Using the special tools, install the LH halfshaft seal.

3. Using the LH halfshaft seal protector provided with the new LH halfshaft seal, install the LH halfshaft partially into the transaxle.

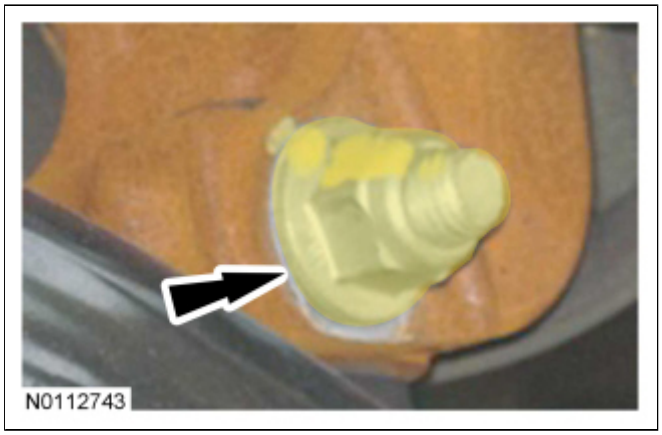


4. Remove the LH halfshaft seal protector and install the LH halfshaft into the transaxle.

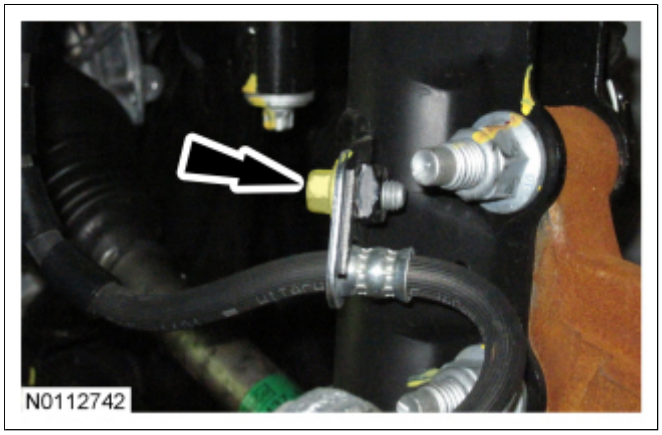


5. Install the LH ball joint into the knuckle.

6. Install the new LH ball joint bolt and nut.
   - Tighten to 48 Nm (35 lb-ft).



7. Install the brake hose retainer and bolt on the LH strut.
   - Tighten to 25 Nm (18 lb-ft).



8. Install the front wheel and tire. For additional information, refer to Section 204-04 .

9. Fill the transaxle with transmission fluid. For additional information, refer to Transmission Draining and Filling in this section.

Halfshaft Seal — RH

Special Tool(s)

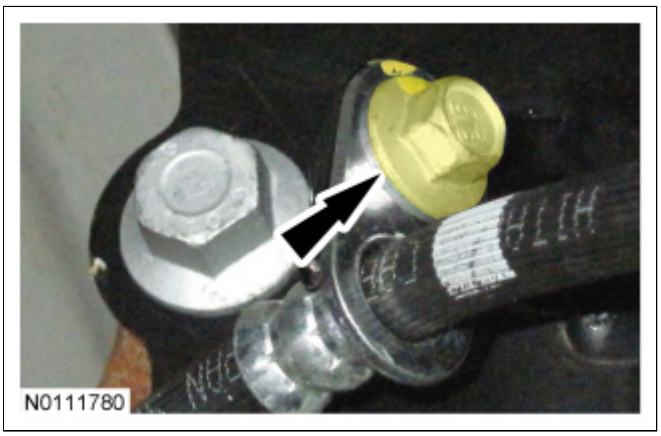
ST1255-A	Handle 205-153
ST3218-A	Installer, Output Shaft Seal 307-671

Material

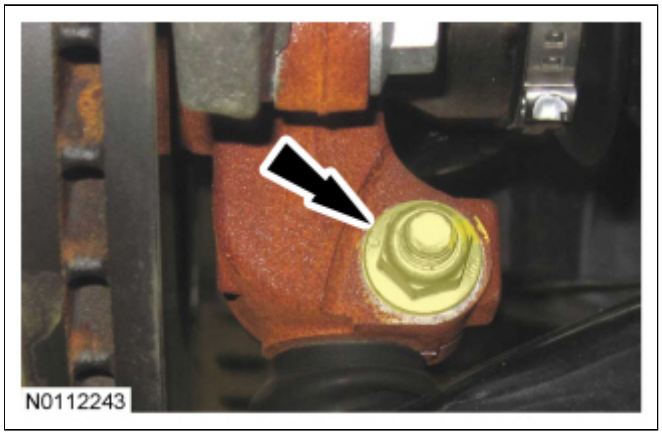
Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

Removal

1. Remove the RH front wheel and tire. For additional information, refer to Section 204-04 .
2. Remove the brake hose retainer bolt and the brake hose retainer from the RH strut.

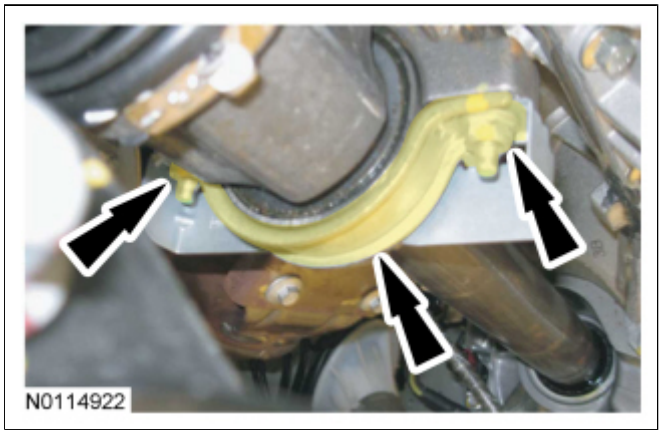


3. Remove and discard the RH ball joint bolt and nut.



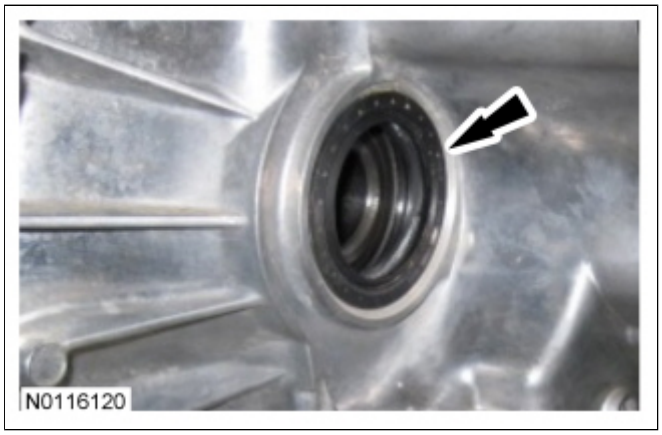
4. Separate the RH ball joint from the knuckle.

5. Remove and discard the bearing retainer strap nuts, shield and the bearing retainer strap.



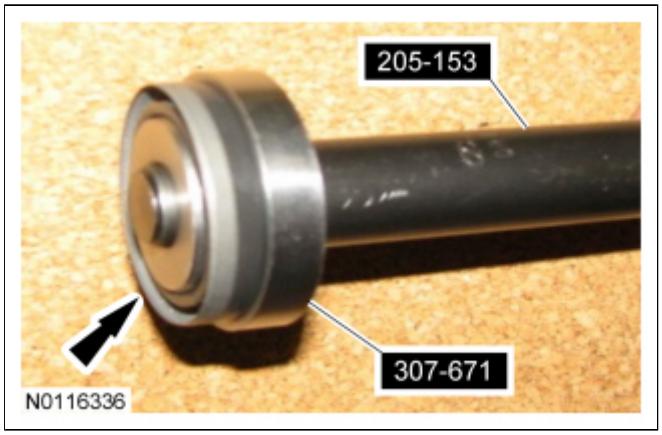
6. Detach the RH intermediate shaft assembly from the transaxle and position aside. Support the RH intermediate shaft assembly.

7. Using a suitable tool. remove and discard the RH halfshaft seal.

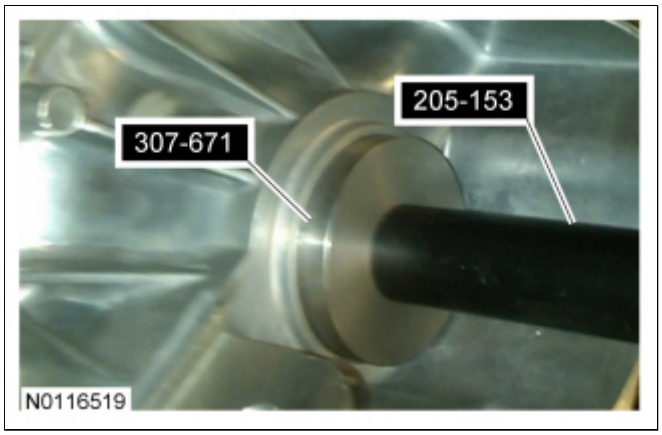


Installation

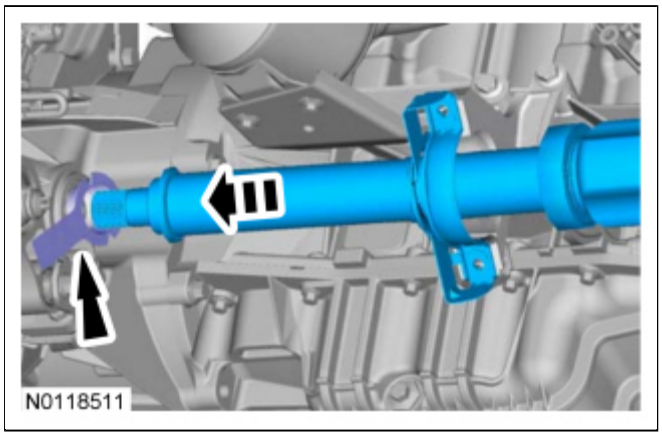
1. Install the RH halfshaft seal onto the special tool.



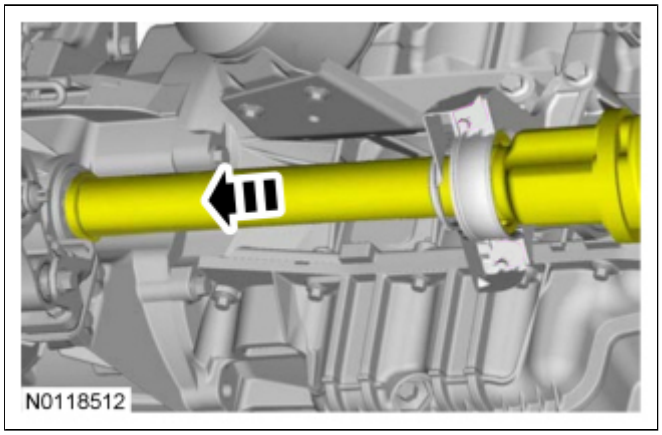
2. Using the special tools, install the RH halfshaft seal.



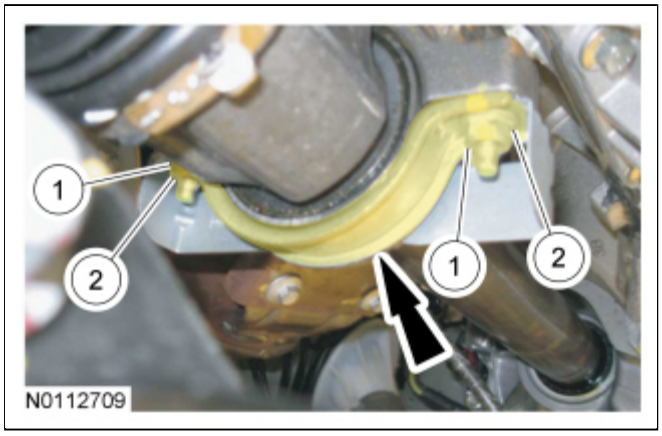
3. Using the RH halfshaft seal protector provided with the new RH halfshaft seal, install the RH intermediate shaft assembly partially into the transaxle.



4. Remove the RH halfshaft seal protector and install the RH intermediate shaft assembly into the transaxle.

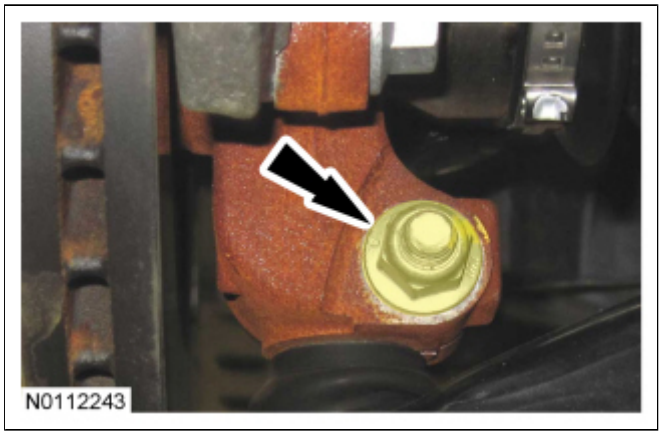


5. Install the new bearing retainer strap, shield and bearing retainer strap nuts. Tighten the nuts in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

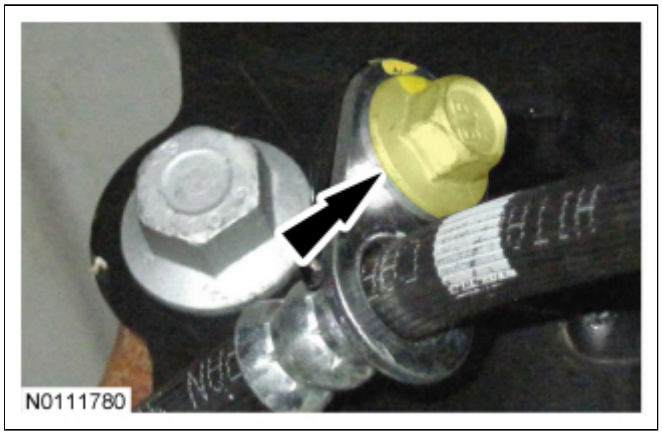


6. Install the RH ball joint into the knuckle.

7. Install the new RH ball join bolt and nut.
    - Tighten to 48 Nm (35 lb-ft).



8. Install the brake hose retainer and bolt on the RH strut.
    - Tighten to 25 Nm (18 lb-ft).



9. Install the RH front wheel and tire. For additional information, refer to Section 204-04 .

10. Fill the transmission fluid. For additional information, refer to Transmission Draining and Filling in this section.

Inner Input Shaft Seal

Special Tool(s)

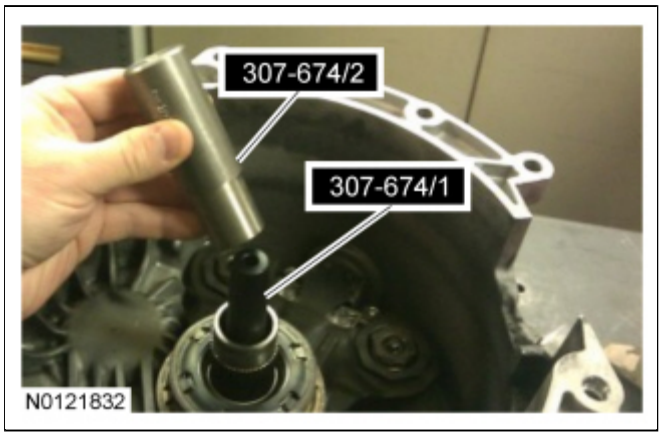
 ST3220-A	Remover, Outer Input Shaft Seal 307-673
 ST3221-A	Installer, Outer Input Seal 307-674 (includes 307-674/1 and 307-674/2)

Removal

1. Remove the transaxle. For additional information, refer to Transaxle .
2. Remove the clutch. For additional information, refer to Clutch .
3. Using the special tools, remove and discard the inner input shaft seal.

Installation

1. Using the special tools, install the new inner input shaft seal.



2. Install the clutch. For additional information, refer to Clutch .
3. Install the transaxle into the vehicle. For additional information, refer to Transaxle .

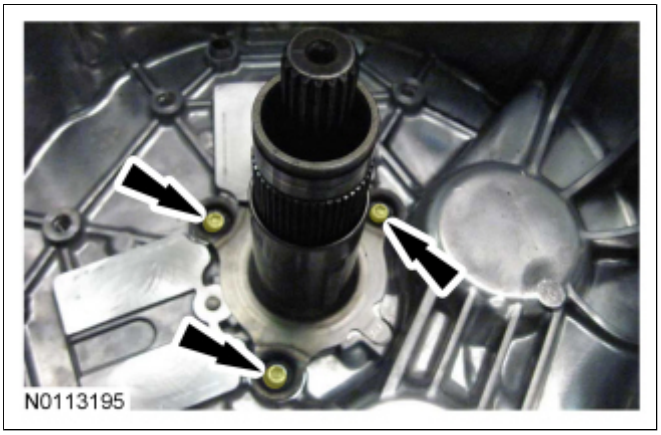
Outer Input Shaft Case Seal

Special Tool(s)

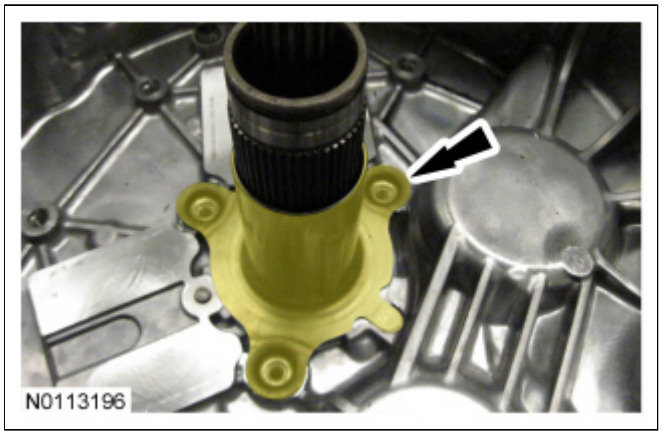
ST3219-A	Installer, Input Guide and Seal 307-672 (includes 307-672/1 and 307-672/2)
ST2417-A	Remover, Input Shaft Oil Seal 308-375
ST1185-A	Slide Hammer 100-001

Removal

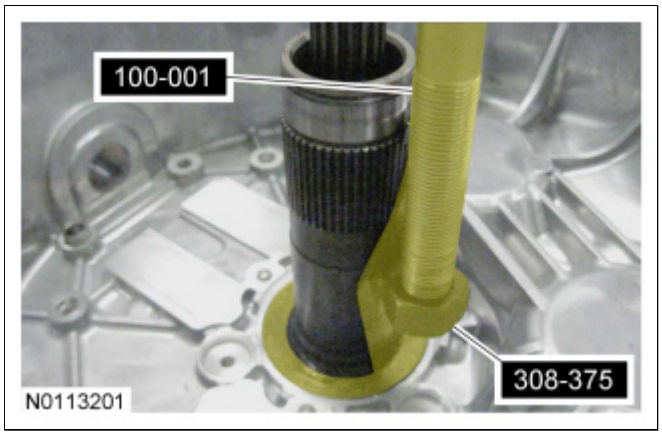
1. Remove the clutch engagement system. For additional information, refer to Clutch Engagement System in this section.
2. Remove the guide tube bolts.



3. Remove the guide tube.

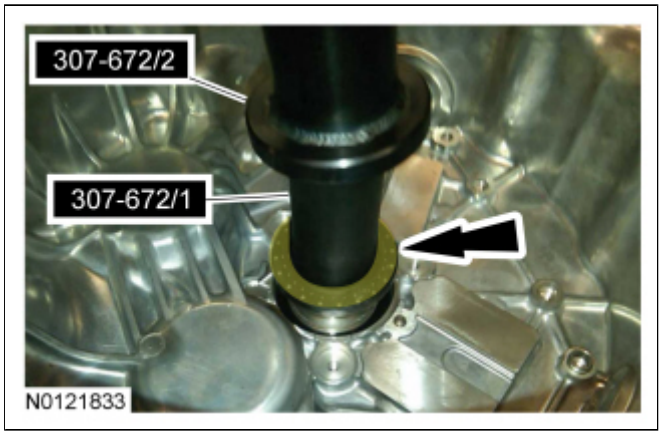


4. Using the special tools, remove and discard the outer input shaft case seal.

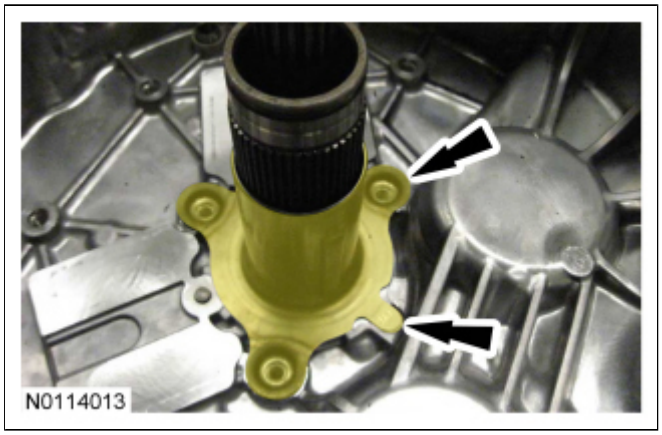


Installation

1. Using the special tools, install the new outer input shaft case seal.

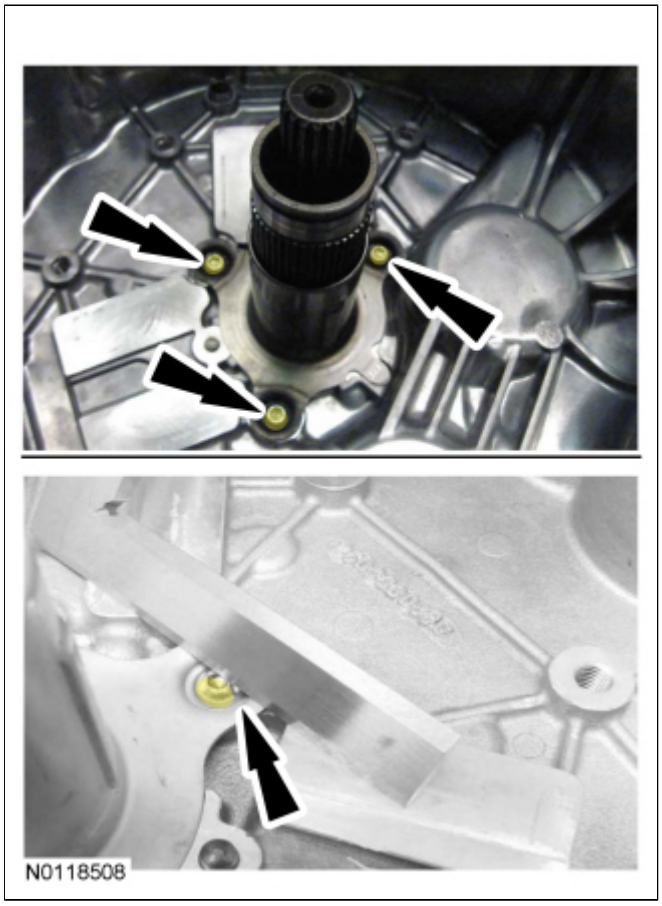


2. Using the locating tab on the guide tube, install the guide tube.



3. **NOTE:** The guide tube bolts must not project beyond the mounting surface of the clutch engagement levers.

   Install the guide tube bolts.
   - Tighten to 8 Nm (71 lb-in).



4. Install the clutch engagement system. For additional information, refer to Clutch Engagement System in this section.

5. Install the clutch. For additional information, refer to Clutch in this section.

6. Install the transaxle into the vehicle. For additional information, refer to Transaxle in this section.

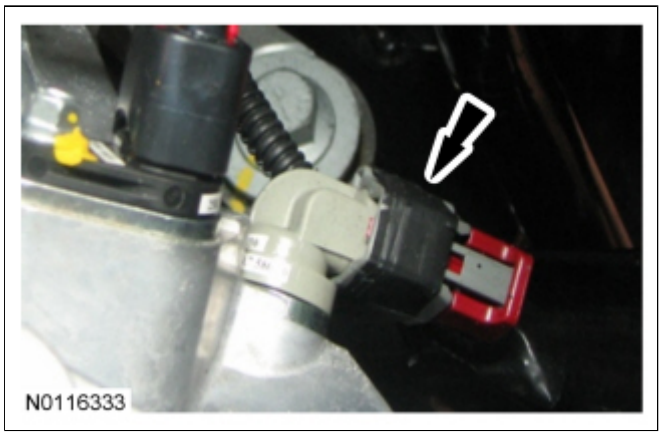
Input Shaft Speed Sensor — No. 1

Material

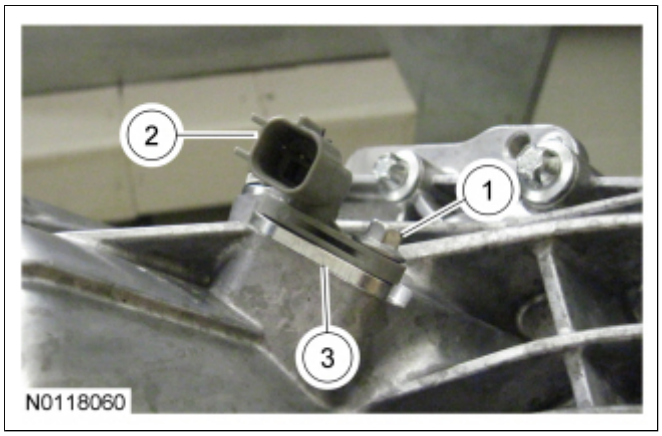
Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

Removal

1. Disconnect the input shaft speed sensor 1 electrical connector.

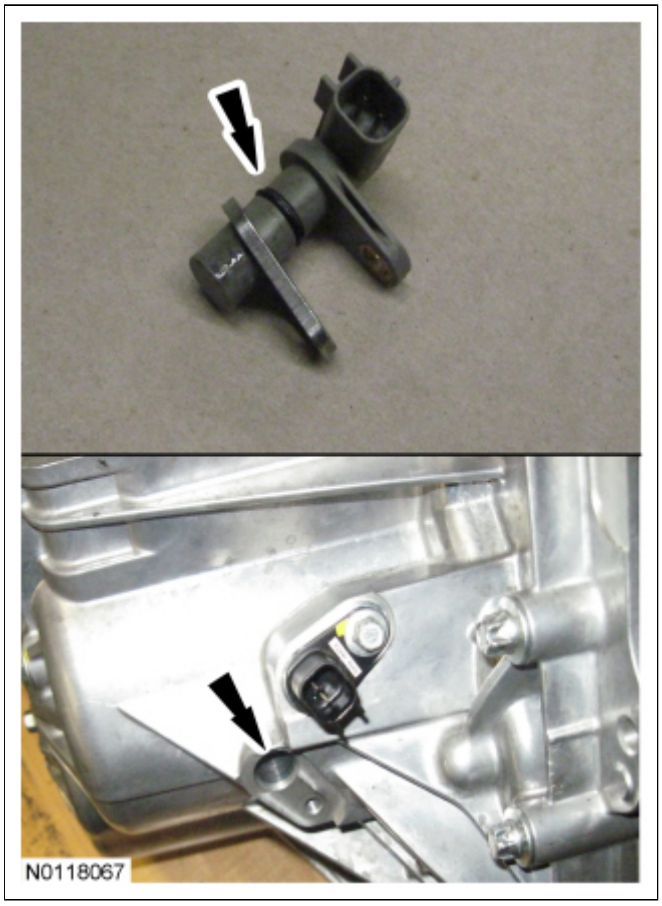


2. Remove the input shaft speed sensor 1.
    1. Remove the input shaft speed sensor 1 bolt.
    2. Remove the input shaft speed sensor 1.
    3. Remove the input shaft speed sensor 1 shim.



Installation

1. Inspect the input shaft speed sensor 1 and transaxle bore for debris or damage. Clean, repair and/or replace as needed.

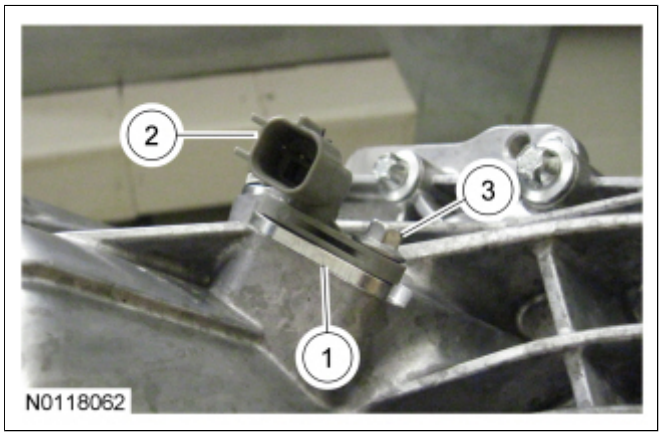


2. ***NOTICE:*** **Be sure to use the 3.5 mm (0.137 in) input shaft speed sensor 1 shim on input shaft speed sensor 1 or damage can occur to the transaxle.**

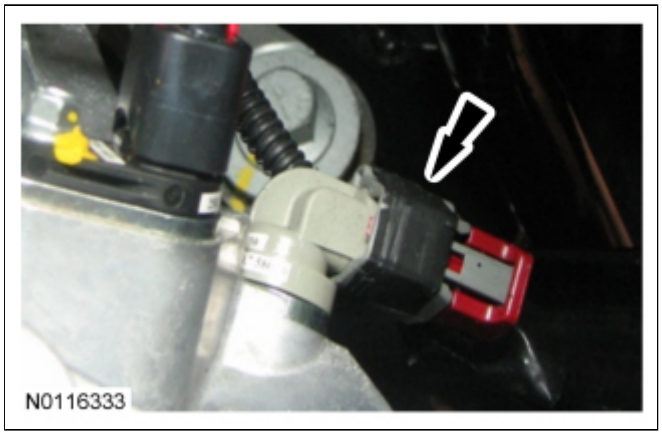
   NOTE: Install a new O-ring if installing the existing input shaft speed sensor 1.

   NOTE: Use a small amount of transmission fluid on the input shaft speed sensor 1 O-ring for installation.

   Install the input shaft speed sensor 1.
   1. Install the input shaft speed sensor 1 shim.
   2. Install the input shaft speed sensor 1.
   3. Install the input shaft speed sensor 1 bolt.
      - Tighten to 10 Nm (89 lb-in).



3. Connect the input shaft speed sensor 1 electrical connector.



N0116333

Input Shaft Speed Sensor — No. 2

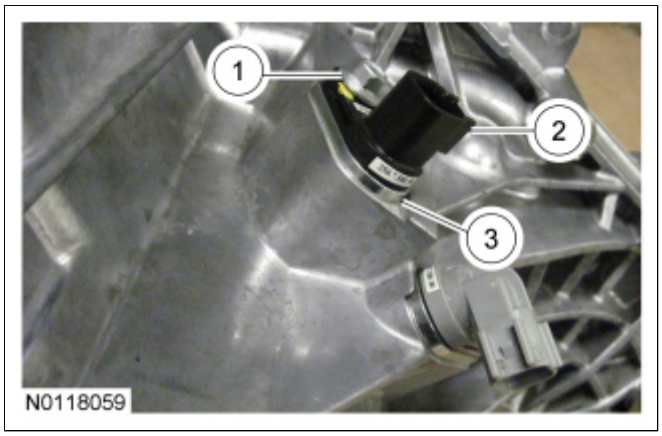
Material

Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

Removal

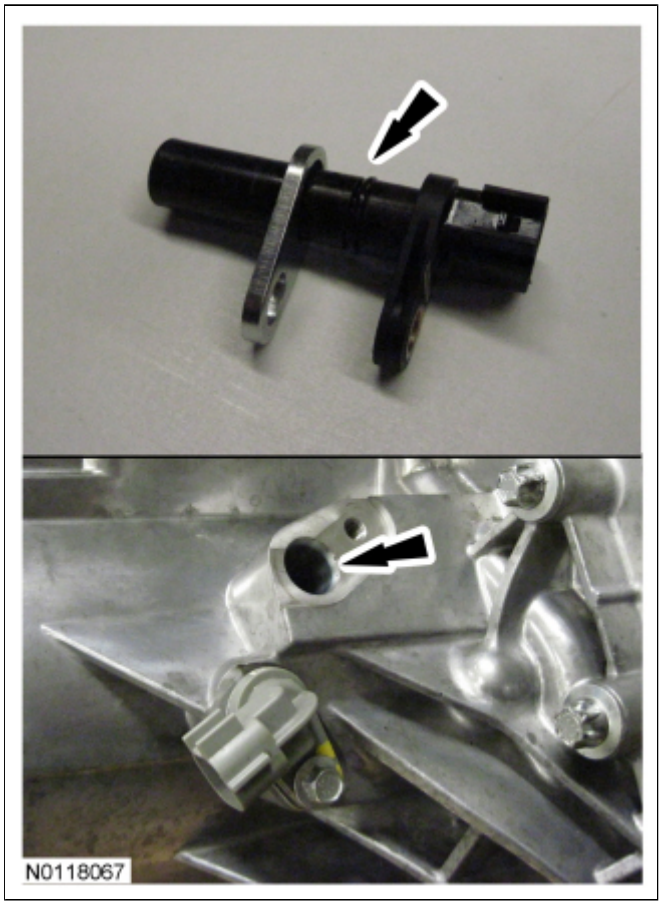
1. Disconnect the input shaft speed sensor 2 electrical connector.

2. Remove the input shaft speed sensor 2.
    1. Remove the input shaft speed sensor 2 bolt.
    2. Remove the input shaft speed sensor 2.
    3. Remove the input shaft speed sensor 2 shim.



Installation

1. Inspect the input shaft speed sensor 2 and transaxle bore for debris or damage. Clean, repair and/or replace as needed.

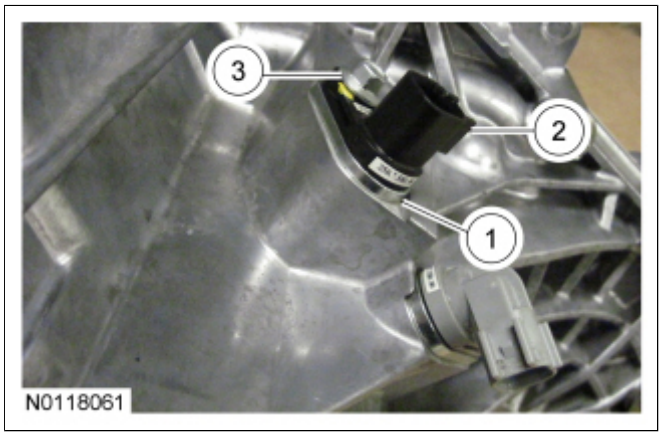


2. ***NOTICE:*** **Be sure to use the 3.2 mm (0.125 in) input shaft speed sensor 2 shim or damage can occur to the transaxle.**

   NOTE: Install a new O-ring if installing the existing input shaft speed sensor 2.

   NOTE: Use a small amount of transmission fluid on the input shaft speed sensor 2 O-ring for installation.

   Install the input shaft speed sensor 2.
   1. Install the input shaft speed sensor 2 shim.
   2. Install the input shaft speed sensor 2.
   3. Install the input shaft speed sensor 2 bolt.
      - Tighten to 10 Nm (89 lb-in).



3. Connect the input shaft speed sensor 2 electrical connector.

N0116332

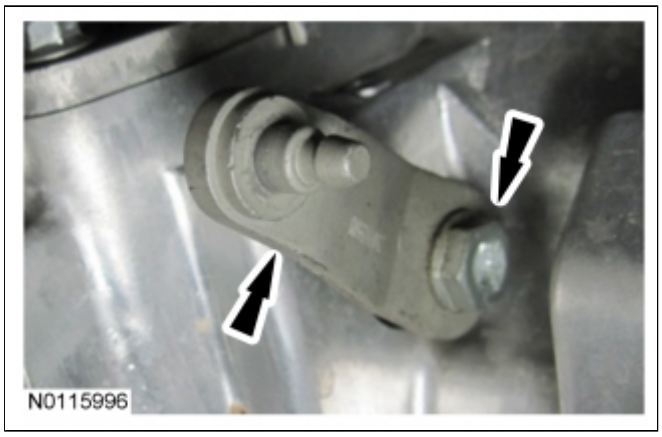
Manual Control Lever Shaft Seal

Special Tool(s)

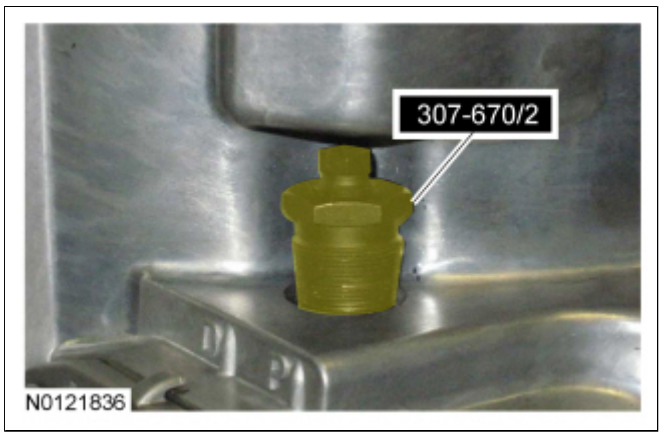
 ST3217-A	Remover/Installer, Manual Lever Seal 307-670 (includes 307-670/1 and 307-670/2)

Removal

1. Remove the transaxle. For additional information, refer to Transaxle in this section.
2. Remove and discard the manual control lever bolt and remove the manual control lever.

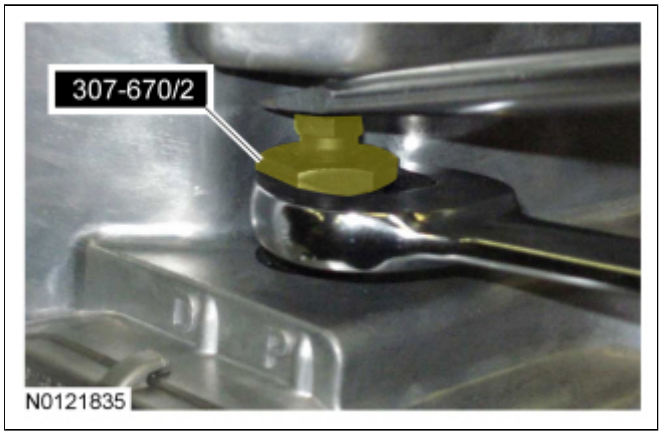


3. Install the special tool.



4. **NOTE:** Use care to prevent clutch housing cup plug from being dislodged.

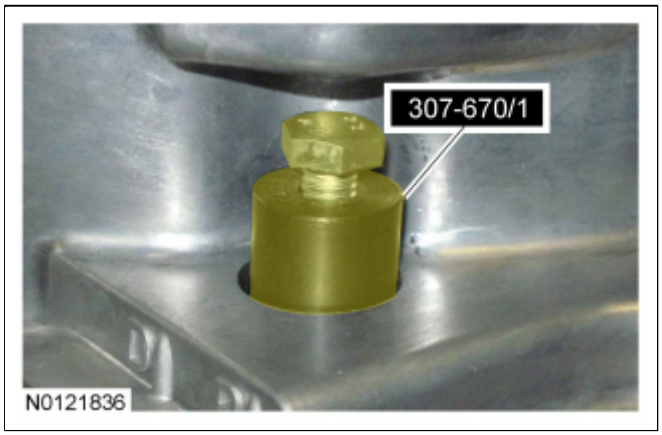
   Using the special tool and a suitable tool, apply slight pressure to the special tool, remove and discard the manual control lever seal.



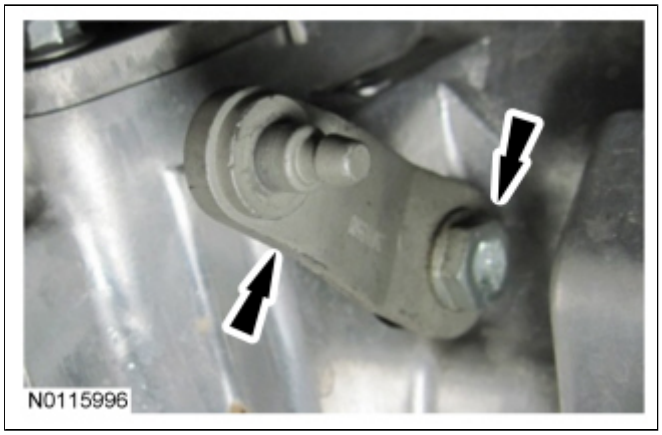
5. Inspect the transaxle case bore for debris or damage. Clean and/or repair as needed.

Installation

1. Using the special tools, install the new manual control lever shaft seal.



2. Install the manual control lever and the new manual control lever bolt.
   - Tighten to 26 Nm (19 lb-ft).



3. Install the transaxle. For additional information, refer to Transaxle in this section.

Output Shaft Speed (OSS) Sensor

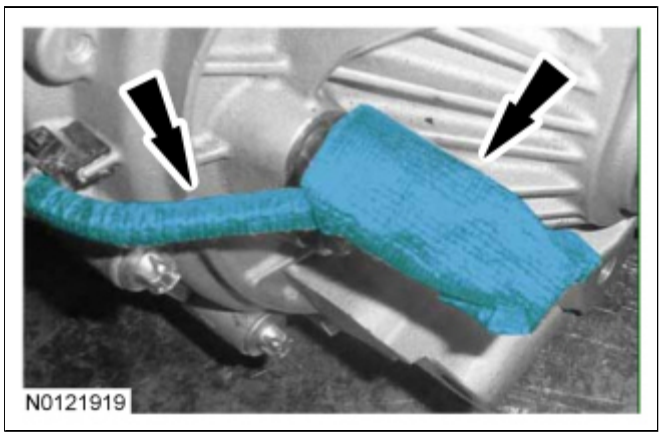
Material

Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

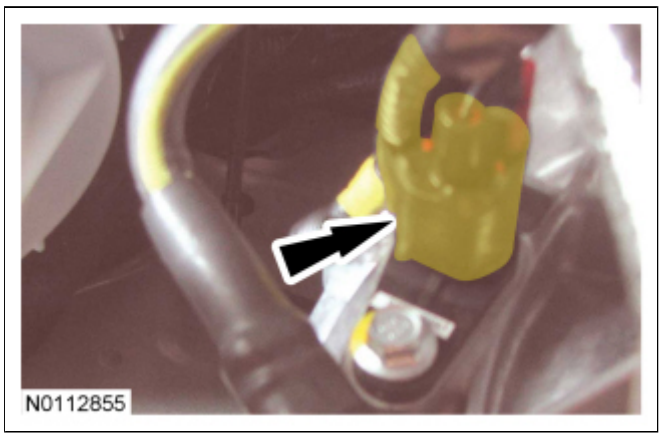
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

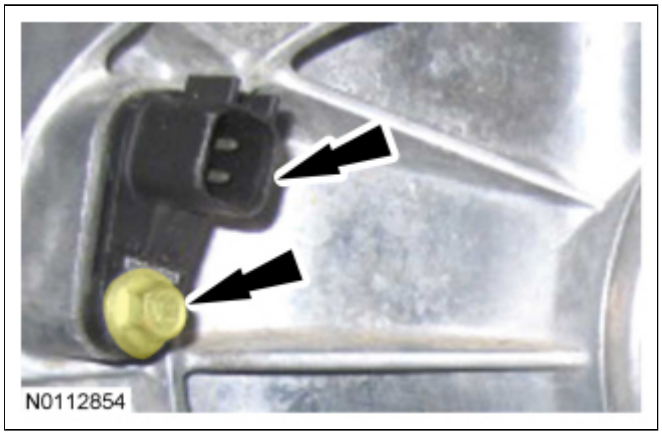
2. Remove and discard the heat tape from the Output Shaft Speed (OSS) sensor and electrical connector.



3. Disconnect the OSS sensor electrical connector.



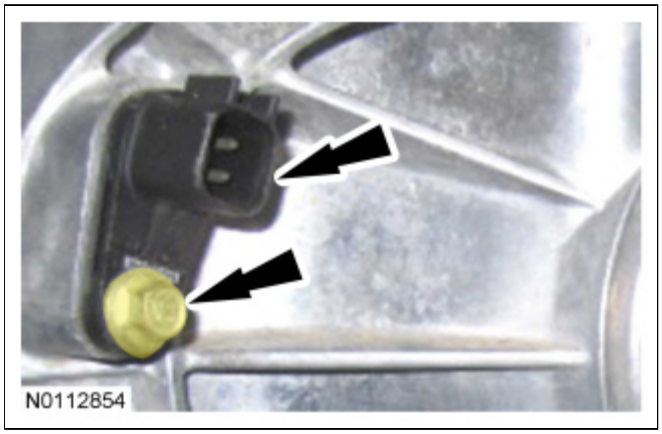
4. Remove the OSS sensor bolt and OSS sensor.



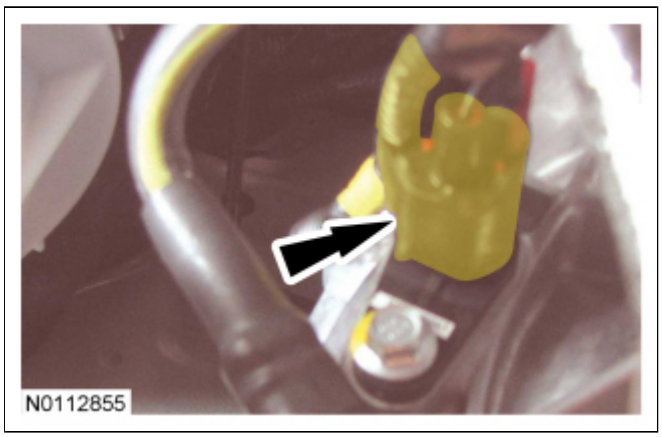
Installation

1. Inspect the transaxle case bore. Clean and/or repair as needed.
2. Inspect the OSS sensor for debris or damage. Clean or replace the OSS as needed.
3. **NOTE:** If installing the old OSS sensor, install a new O-ring.

   Apply a small amount of transmission fluid to the O-ring and install the OSS sensor and the OSS sensor bolt.
   - Tighten to 10 Nm (89 lb-in).



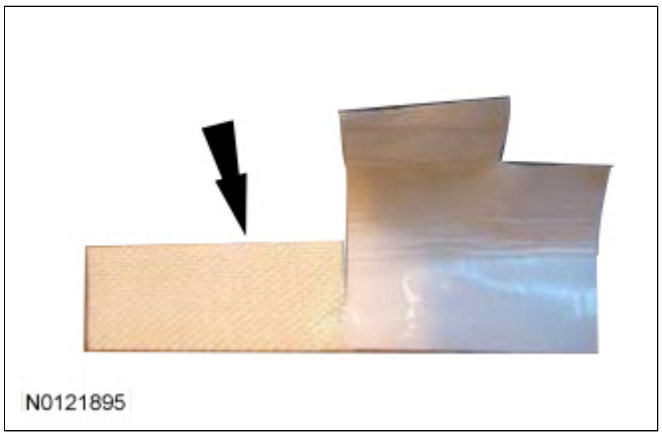
4. Connect the OSS sensor electrical connector.



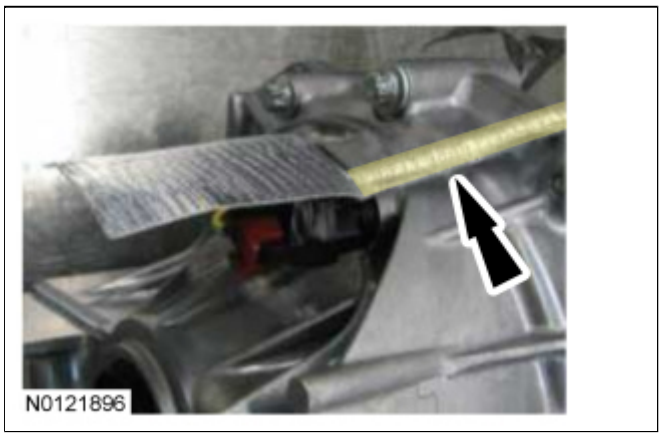
5. Thoroughly clean the OSS sensor, electrical connector and wire.

6. Install new heat tape on the OSS sensor as shown in the preceding steps.

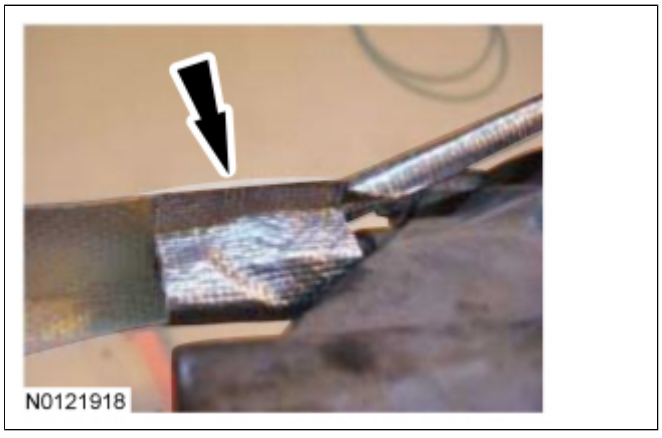
7. Remove the heat tape backing only from this location first.



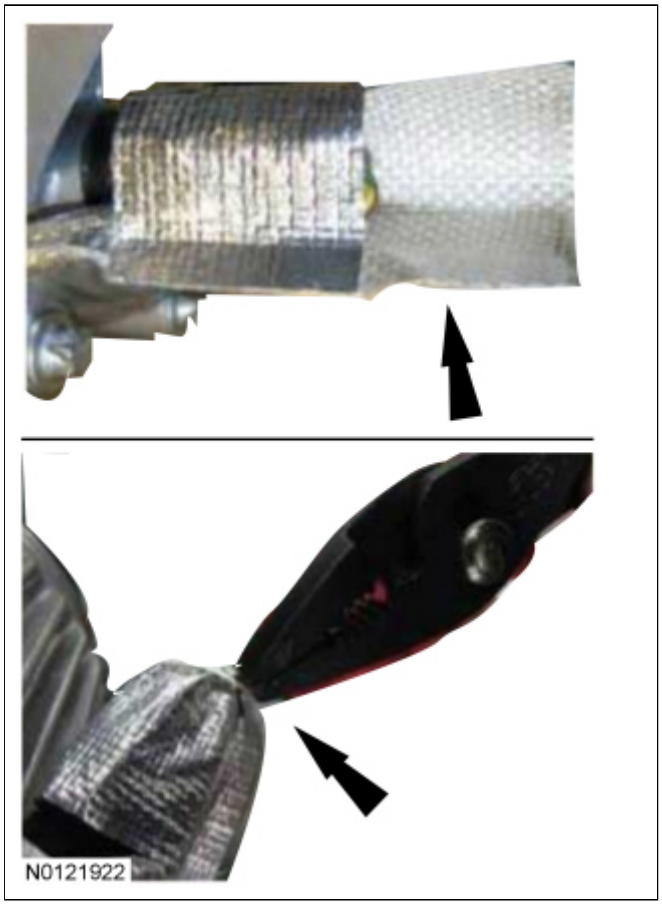
8. Wrap the heat tape around the OSS sensor wiring harness.



9. Remove the heat tape backing from the rest of the heat tape and wrap it around the OSS sensor and sticking the ends together.



10. Fold the remaining portion of the heat tape and crimp around the edge starting from the sensor portion moving around.



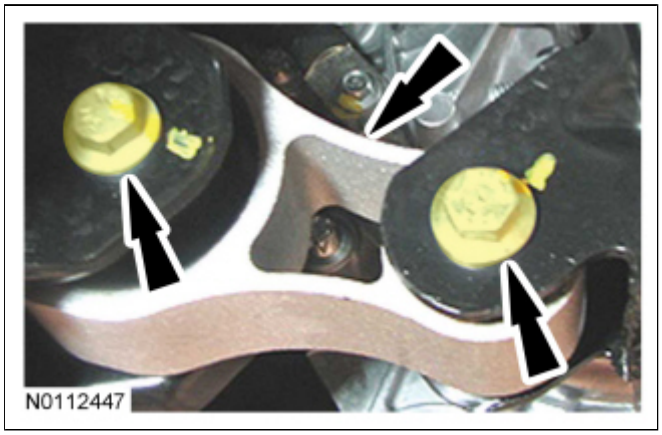
N0121922

Roll Restrictor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

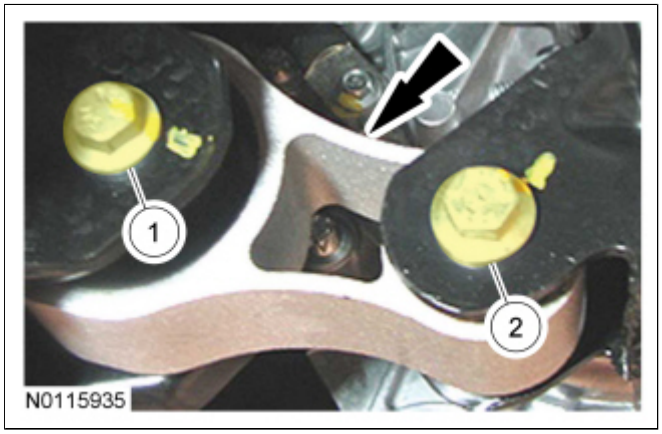
2. Remove the roll restrictor bolts and the roll restrictor.



Installation

1. **NOTE:** The bolts are different lengths, make sure the bolts are in the correct location using the marks made during removal.

   Install the roll restrictor and the roll restrictor bolts.
   1. Tighten to 70 Nm (52 lb-ft).
   2. Tighten to 48 Nm (35 lb-ft).



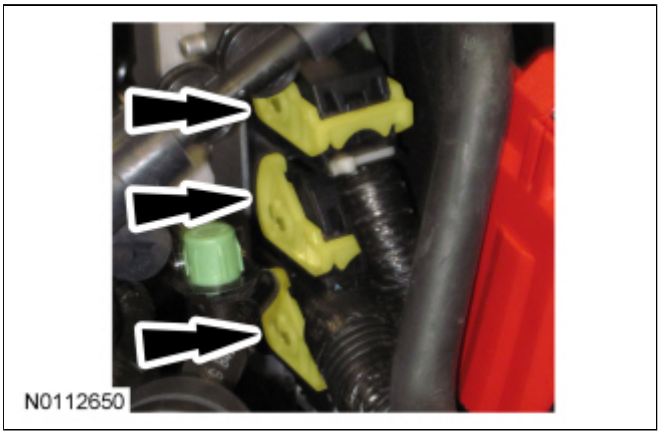
Transaxle Support Insulator

Special Tool(s)

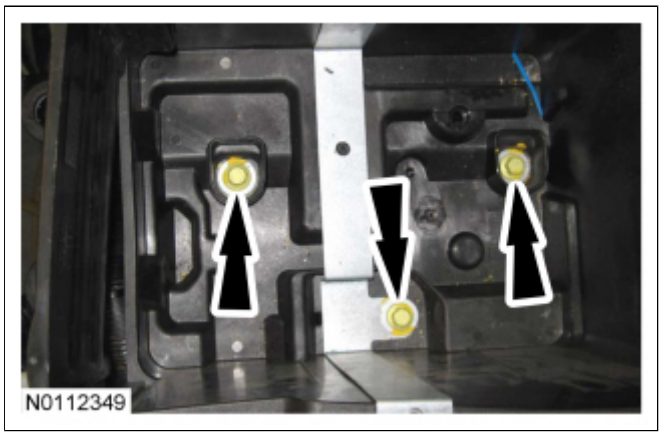
ST2378-A	Adapter for 303-290 303-290-01
 ST2379-A	Adapter for 303-290A (Support Leg) 303-290A-03A
 ST2363-A	Support Bar, Engine 303-290A

Removal

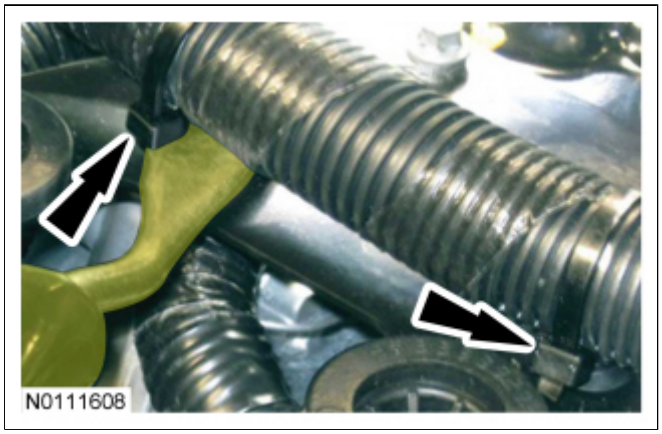
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the battery. For additional information, refer to Section 414-01 .
3. Remove the cowl assembly. For additional information, refer to Section 501-02 .
4. Remove the Air Cleaner (ACL) assembly and outlet pipe. For additional information, refer to Section 303-12 .
5. Disconnect the 3 PCM electrical connectors.



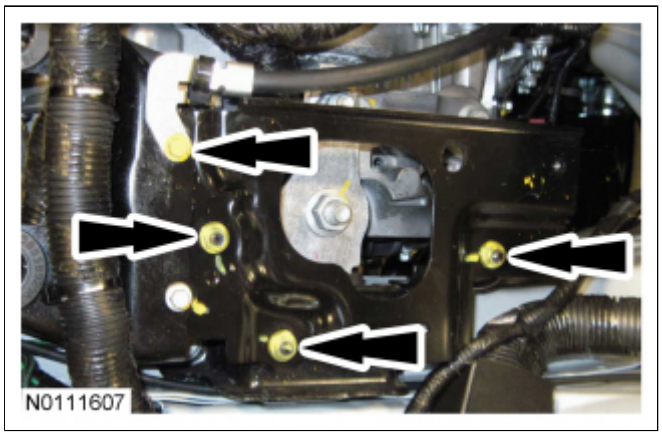
6. Remove the 3 battery tray bolts and the battery tray.



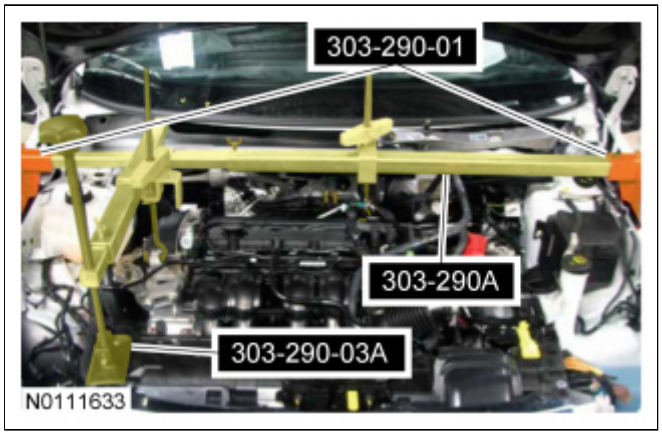
7. Using a suitable tool, detach the wiring harness from the battery tray bracket.



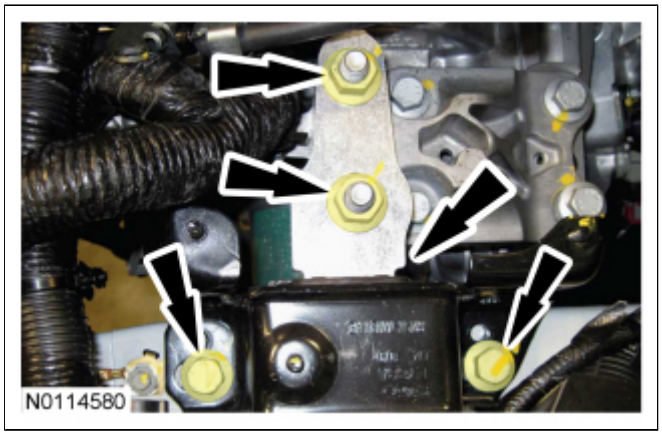
8. Remove the selector lever cable bracket bolt, the battery tray bracket nuts and remove the battery tray bracket.



9. Install the special tools and support the engine.

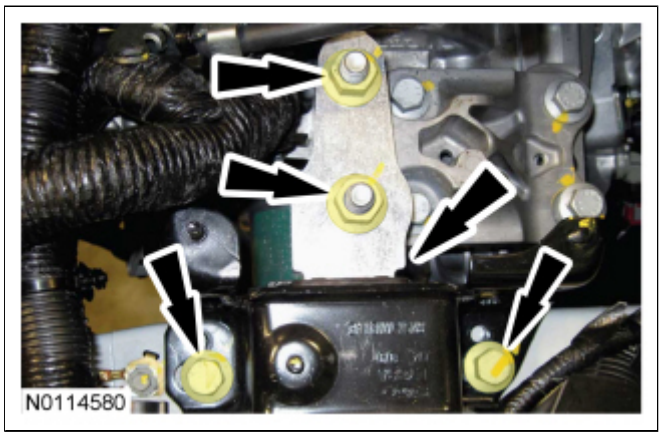


10. Remove the 2 transaxle support insulator bolts and nuts and remove the transaxle support insulator.

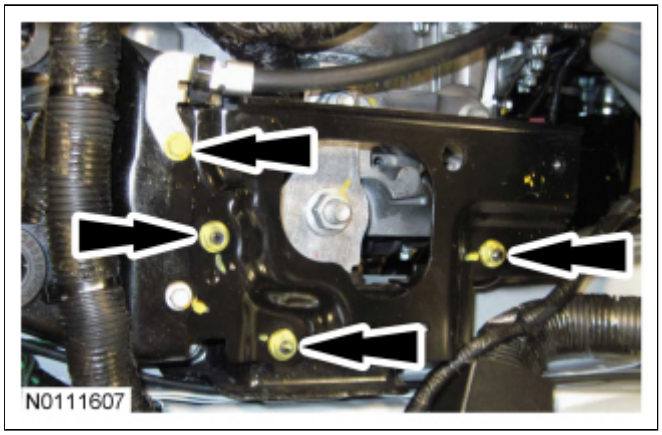


Installation

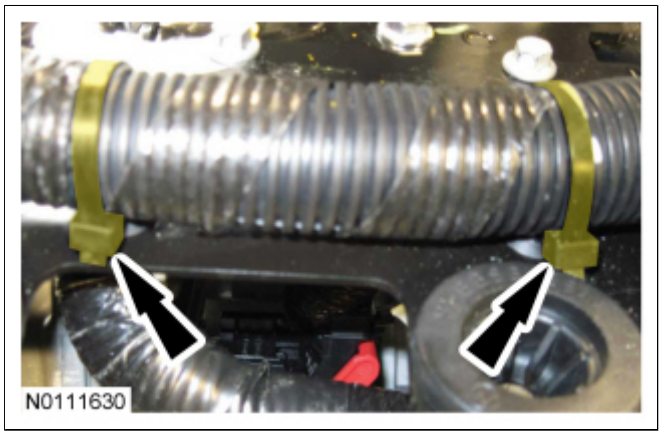
1. Install the transaxle support insulator and install the 2 transaxle support insulator bolts and the 2 nuts.
    - Tighten the 2 bolts to 90 Nm (66 lb-ft).
    - Tighten the 2 nuts to 125 Nm (92 lb-ft).



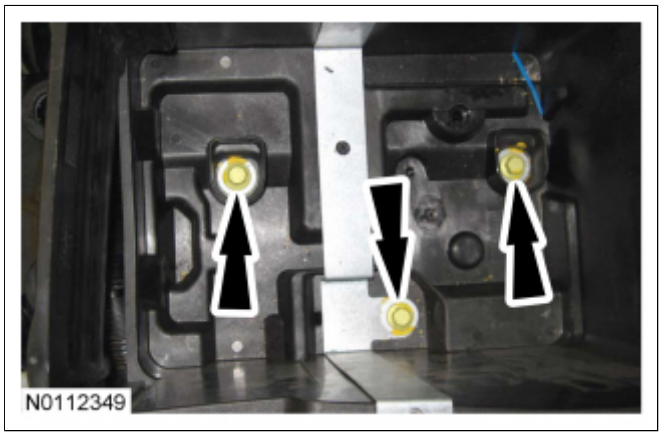
2. Install the battery tray bracket, battery tray bracket nuts and the selector lever cable bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



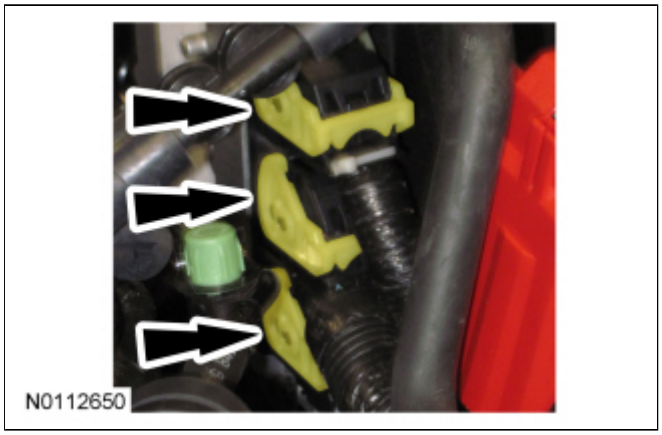
3. Attach the wiring harness to the battery tray bracket.



4. Install the battery tray and 3 battery tray bolts.
    - Tighten to 10 Nm (89 lb-in).

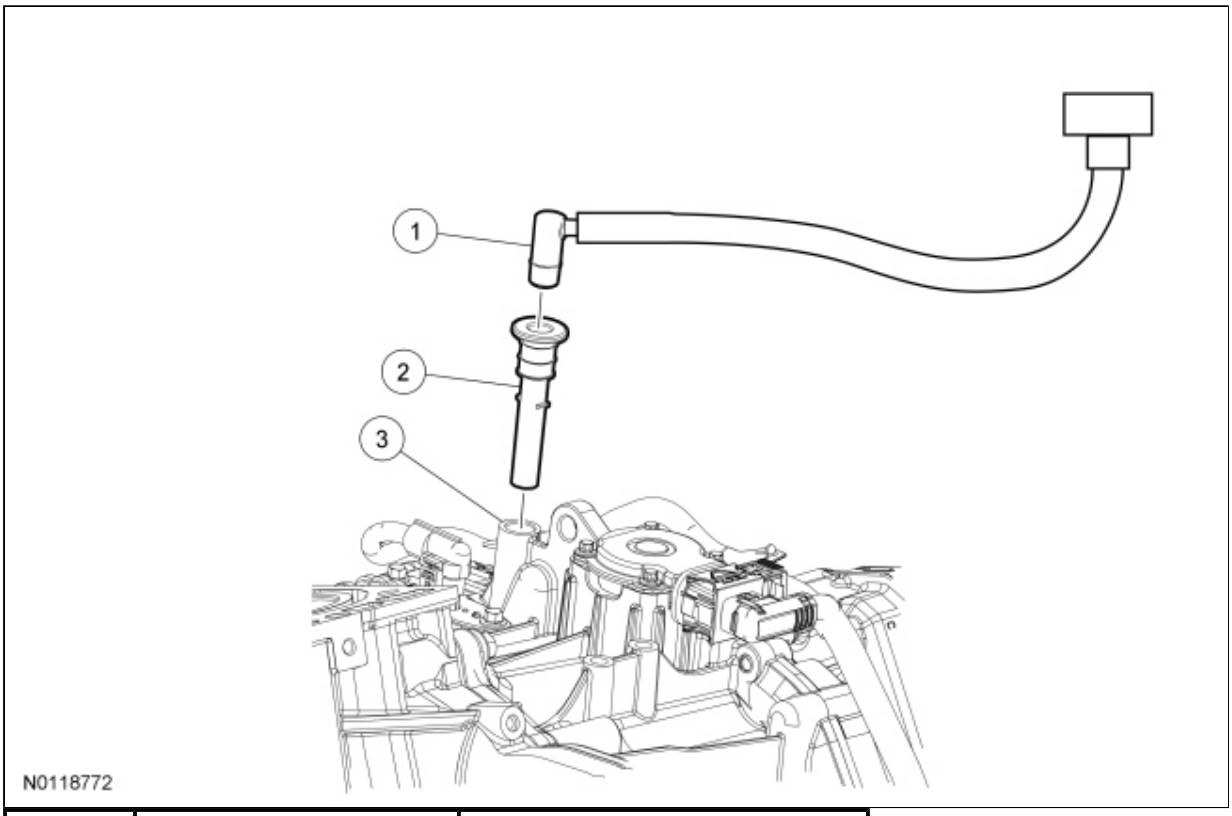


5. Connect the 3 PCM electrical connectors.



6. Install the ACL and the outlet pipe. For additional information, refer to Section 303-12 .
7. Install the cowl assembly. For additional information, refer to Section 501-02 .
8. Install the battery. For additional information, refer to Section 414-01 .

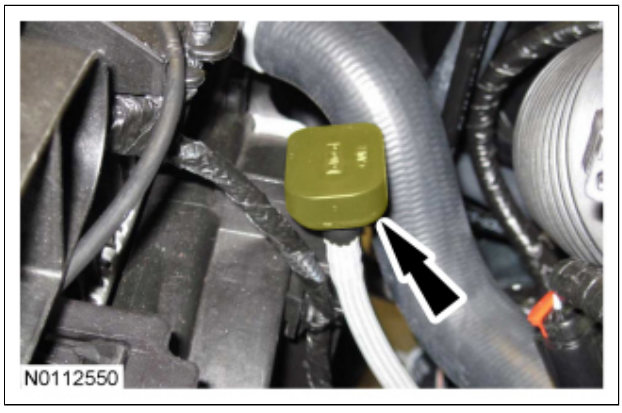
Transaxle Vent



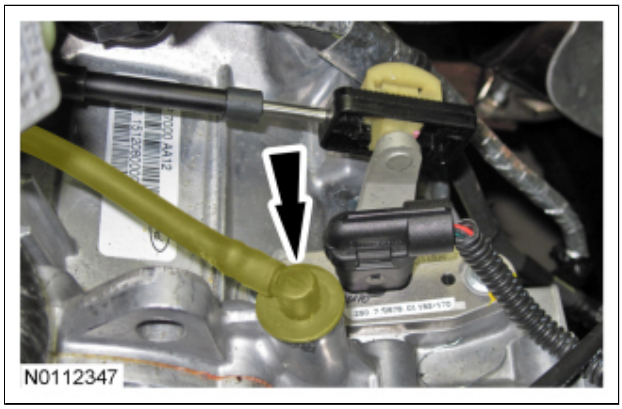
Item	Part Number	Description
1	—	Vent cap housing
2	—	Vent base
3	—	Transaxle

Removal

1. Remove the battery and battery tray. For additional Information, refer to Section 414-01 .
2. Remove the Air Cleaner (ACL) assembly and the outlet pipe. For additional Information, refer to Section 303-12 .
3. Remove the vent assembly end from the cooling fan housing and position it aside.

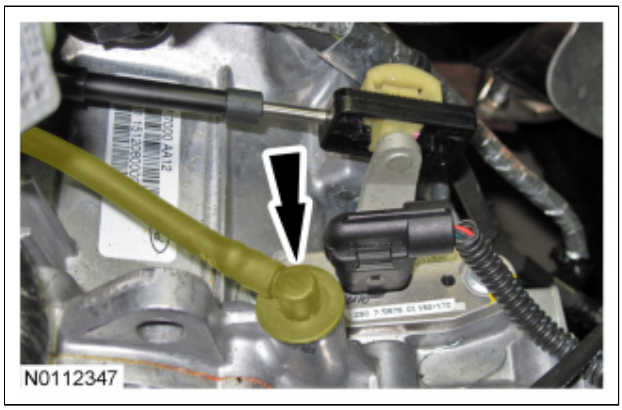


4. Remove the vent assembly from the transaxle.



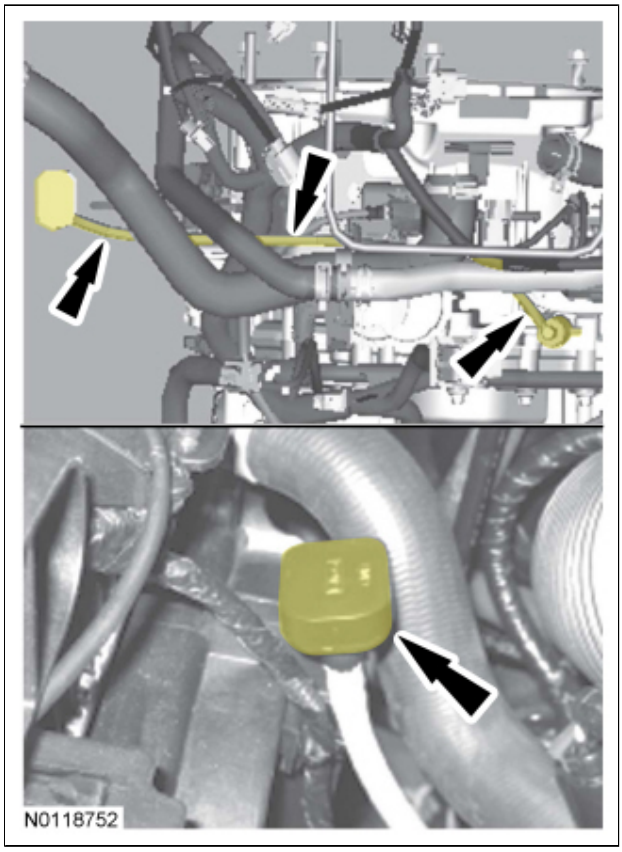
Installation

1. Inspect the vent transaxle bore for damage or debris. Clean or repair as needed.
2. Install the vent assembly in the transaxle bore.



3. ***NOTICE:*** **Make sure the transaxle vent hose is properly routed or damage can occur.**

   Install the vent assembly end onto the cooling fan housing.



4. Install the ACL assembly and outlet pipe. For additional Information, refer to Section 303-12 .
5. Install the battery tray and battery. For additional Information, refer to Section 414-01 .

Transmission Control Module (TCM)

Special Tool(s)

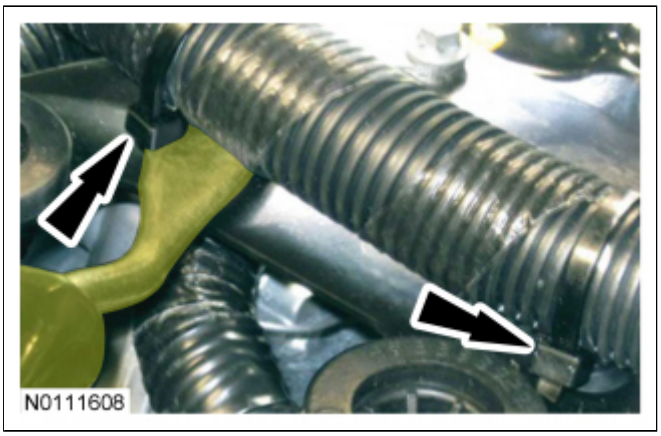
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

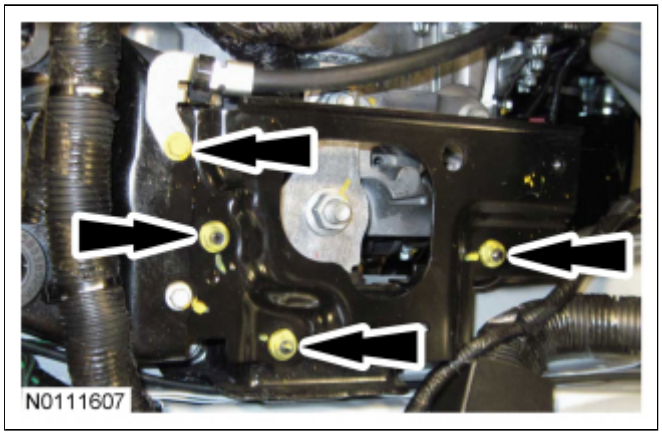
Removal

1. Using the scan tool, recover all module information before removing the Transmission Control Module (TCM). For additional information, refer to Transmission Adaptive Learning in this section.
2. Remove the battery and battery tray. For additional information, refer to Section 414-01 .
3. Remove the Air Cleaner (ACL) assembly and the outlet pipe. For additional information, refer to Section 303-12 .
4. Using a suitable tool, detach the wiring harness from the battery tray bracket.

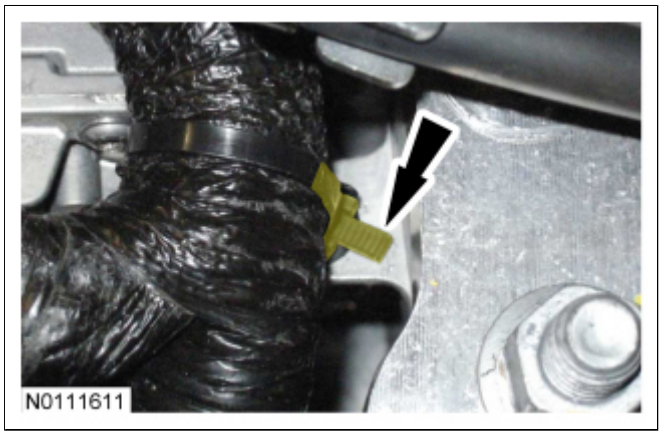


N0111608

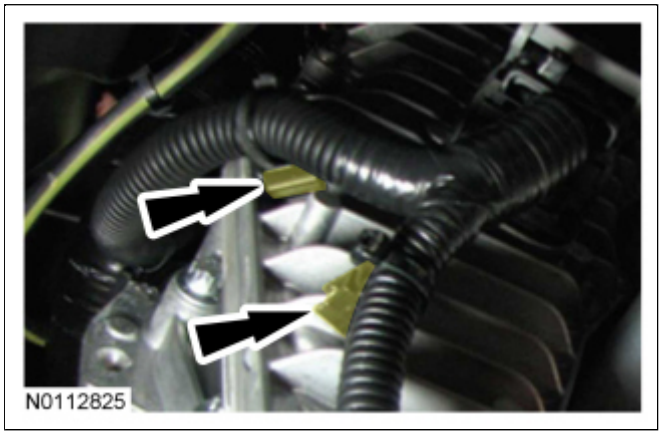
5. Remove the selector lever cable bracket bolt, the battery tray bracket nuts and the battery tray bracket.



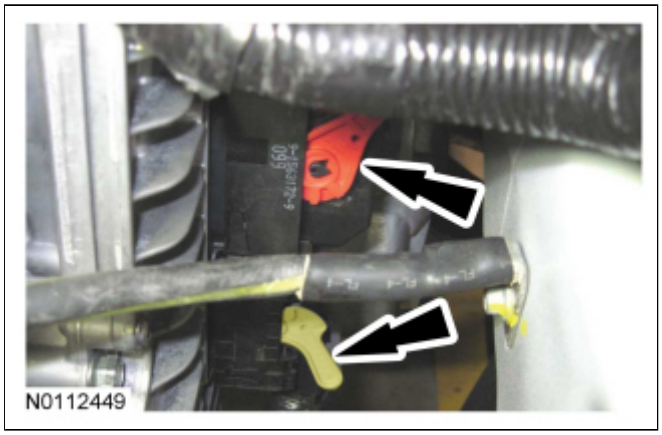
6. Remove the wiring harness from the transaxle housing.



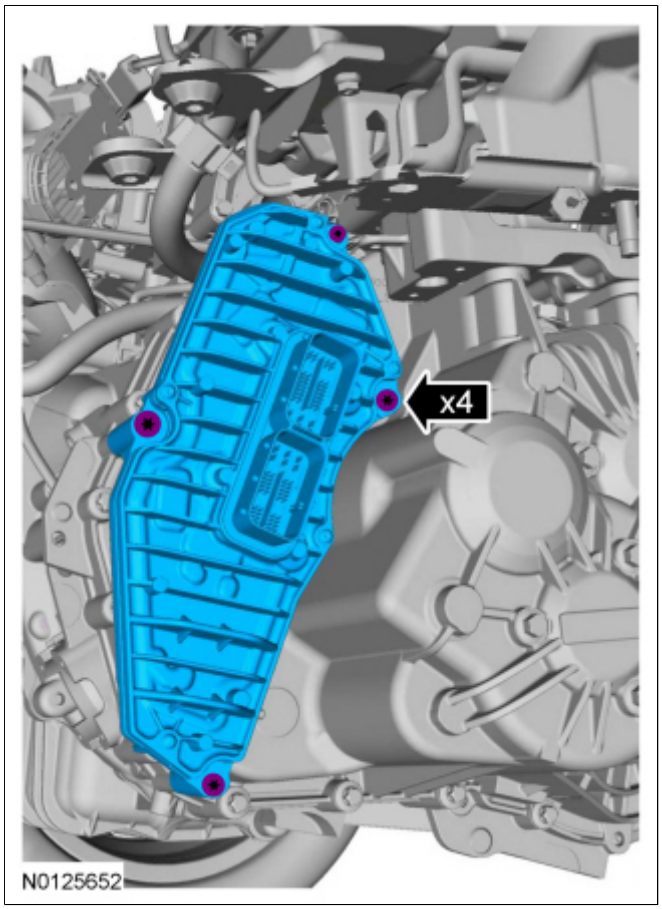
7. Detach the wiring harness clips from the Transmission Control Module (TCM) housing.



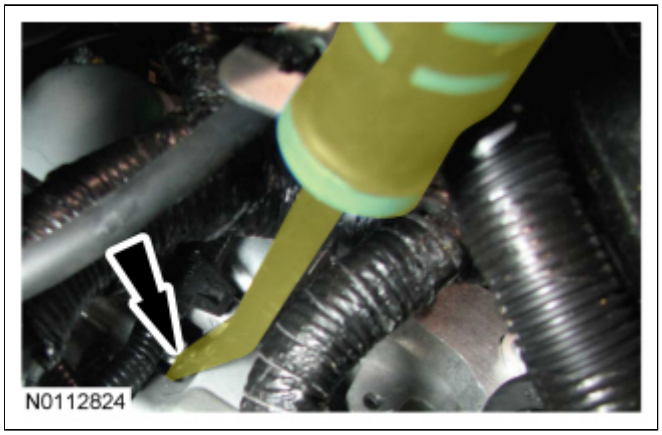
8. Disconnect the 2 TCM electrical connectors.



9. Remove the 4 TCM bolts.



10. Using a suitable flat blade screwdriver, carefully pry the TCM from the transaxle, at the location shown, and remove the TCM , discard the O-rings.

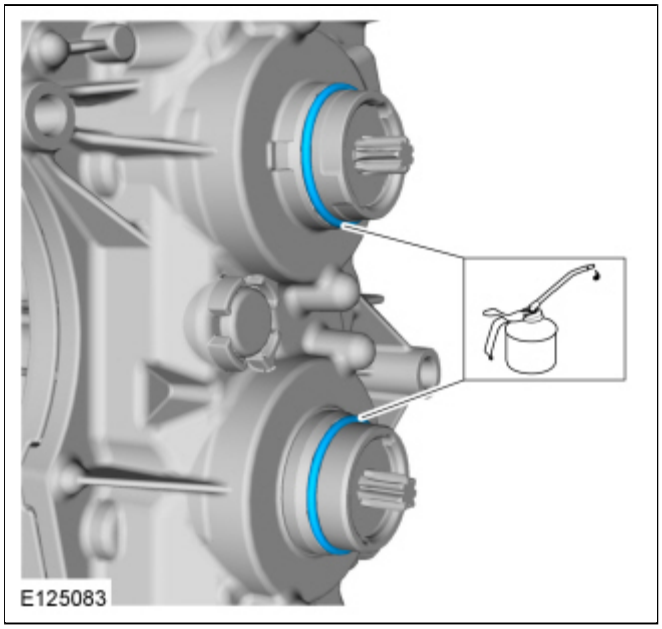


Installation

1. Carefully inspect the TCM and the transaxle bore for debris or damage. Clean and/or repair as needed.

2. **NOTE:** Use a small amount of transmission fluid on the new O-rings prior to installation.

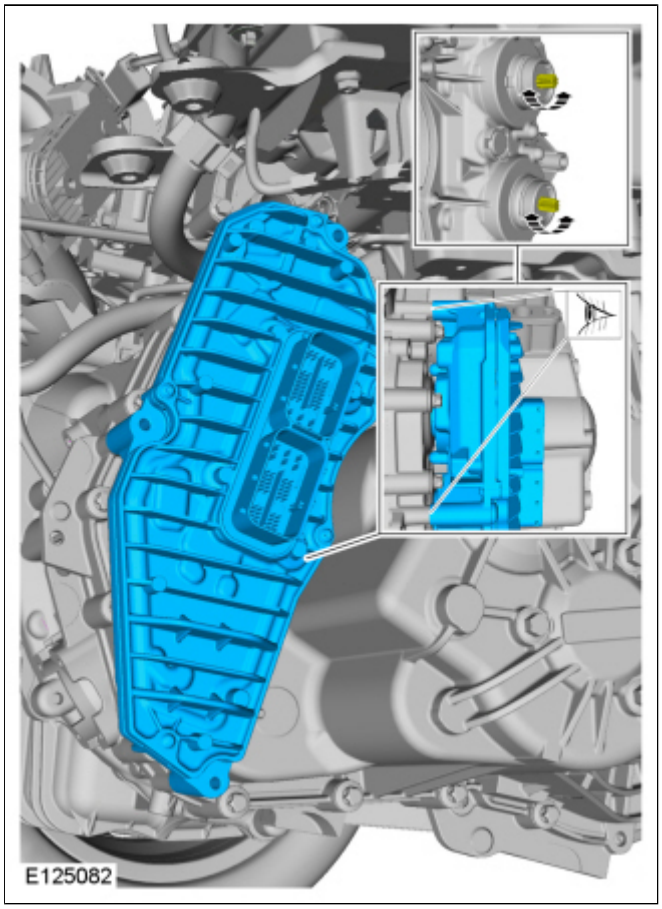
   Install new O-rings if the TCM is being reused.



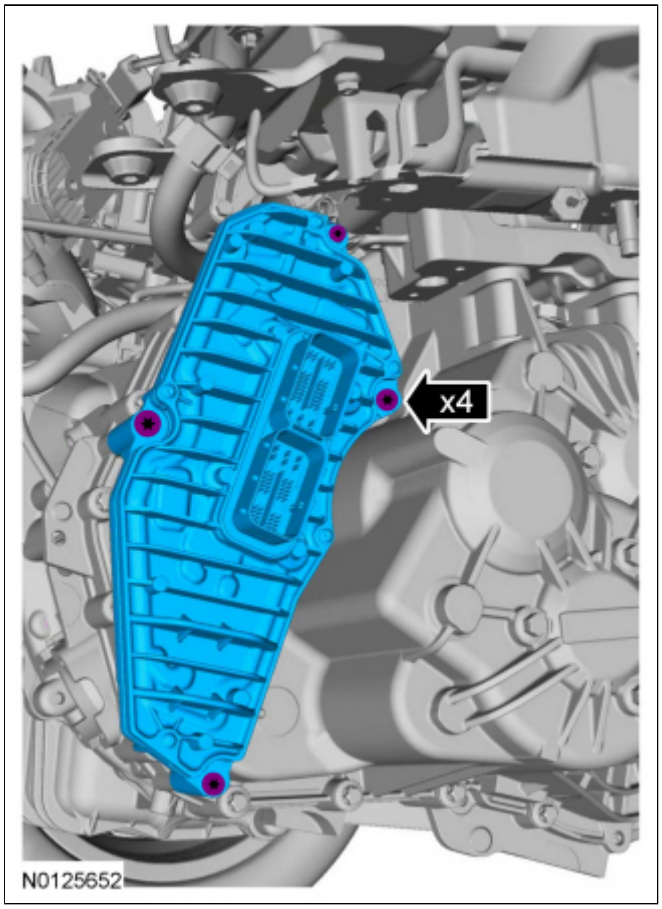
3. ***NOTICE:*** **Do not force the TCM onto the transaxle or damage may occur.**

   NOTICE: **Make sure the TCM sits flush on the transaxle or damage can occur.**

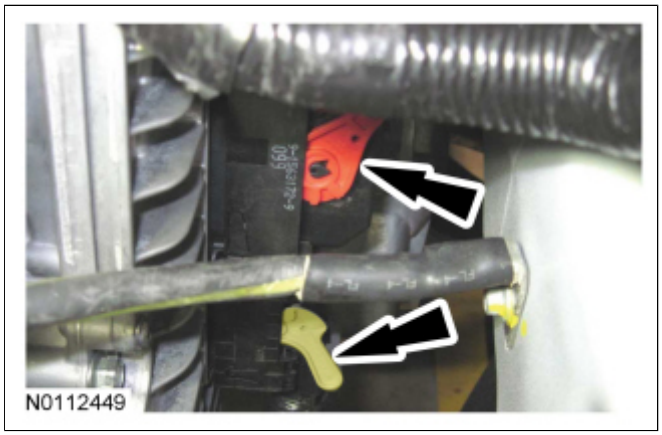
   Install the TCM on the transaxle. Apply light pressure to seat the O-rings. If the TCM does not push in place with light pressure, remove the TCM and slightly turn the TCM gears and retry installing the TCM on the transaxle.



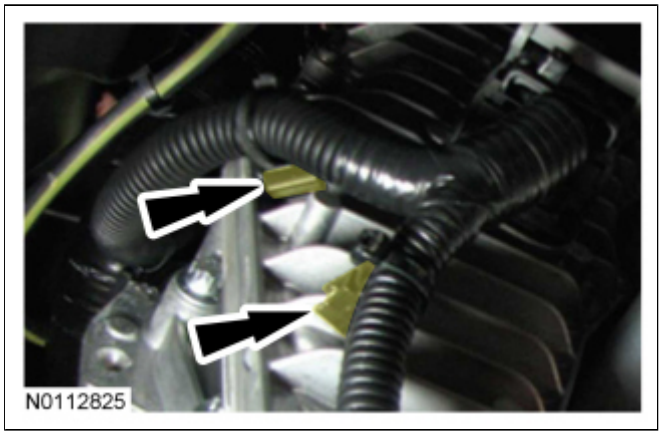
4. Install the 4 TCM bolts.
    - Tighten to 27 Nm (20 lb-ft).



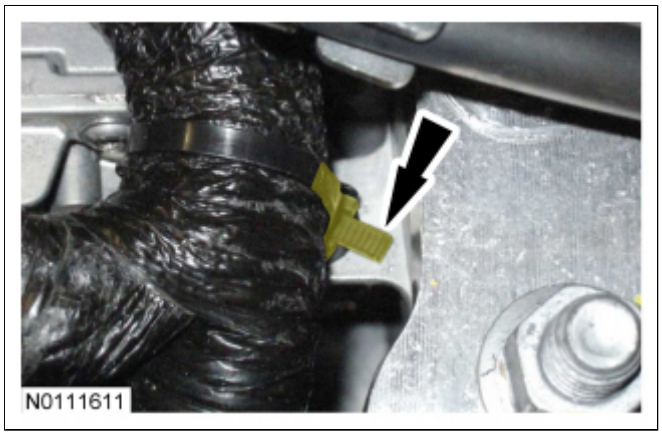
5. Connect the 2 TCM electrical connectors.



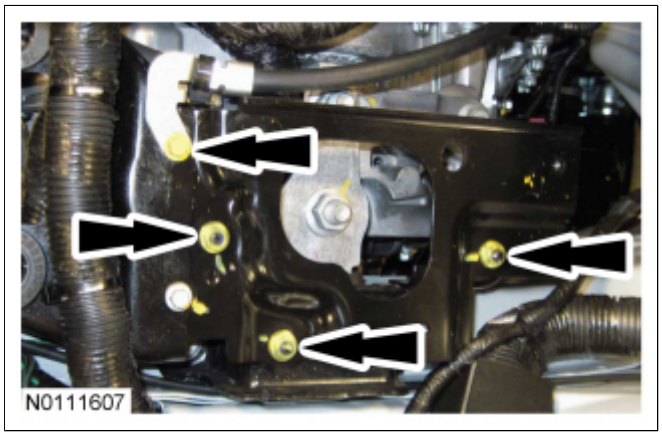
6. Install the wiring harness clips on the TCM housing.



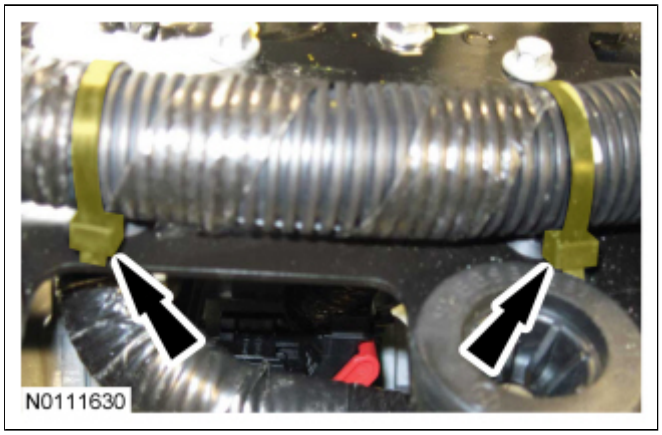
7. Install the wiring harness on the transaxle housing.



8. Install the battery tray bracket, battery tray bracket nuts and selector lever cable bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



9. Install the wiring harness onto the battery tray bracket.



10. Install the ACL assembly and outlet pipe. For additional information, refer to Section 303-12 .
11. Install the battery tray and battery. For additional information, refer to Section 414-01 .
12. If a new TCM was installed, it will need to be reprogrammed to the latest calibration level available. For additional Information, refer to Transmission Adaptive Learning in this section.

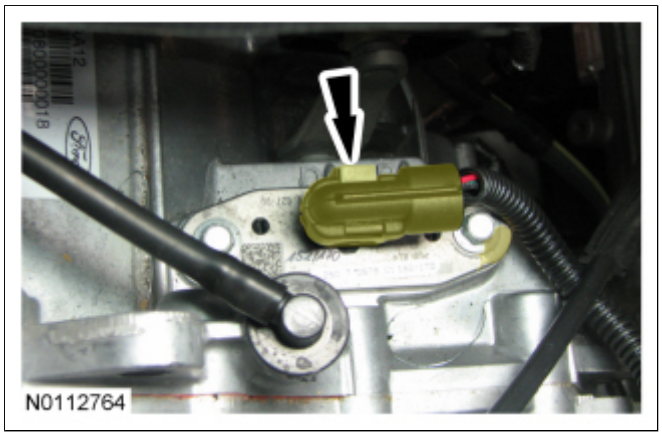
Transmission Range (TR) Sensor

Special Tool(s)

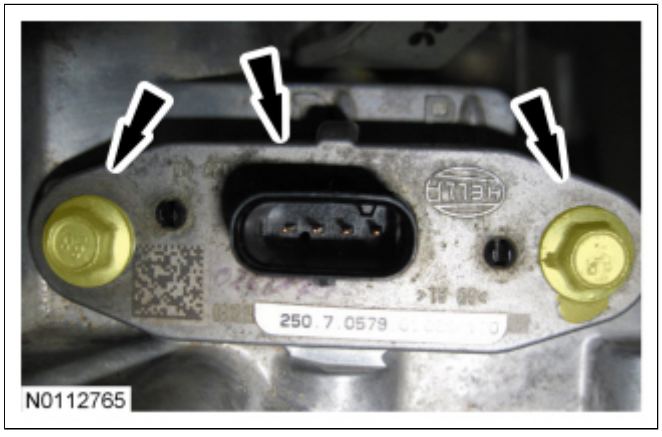
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Removal

1. Disconnect the Transmission Range (TR) sensor electrical connector.

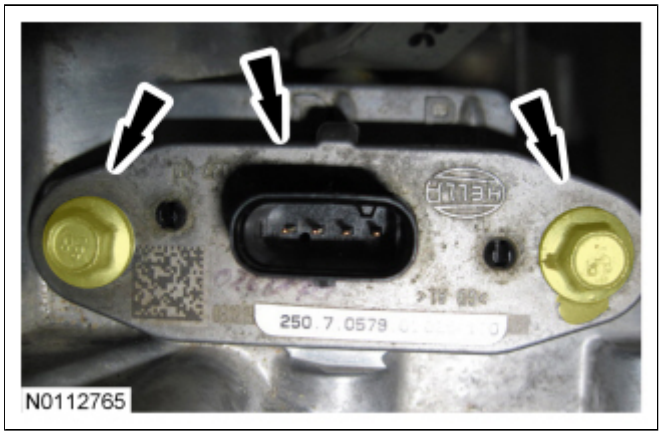


2. Remove the 2 TR sensor bolts and the TR sensor.

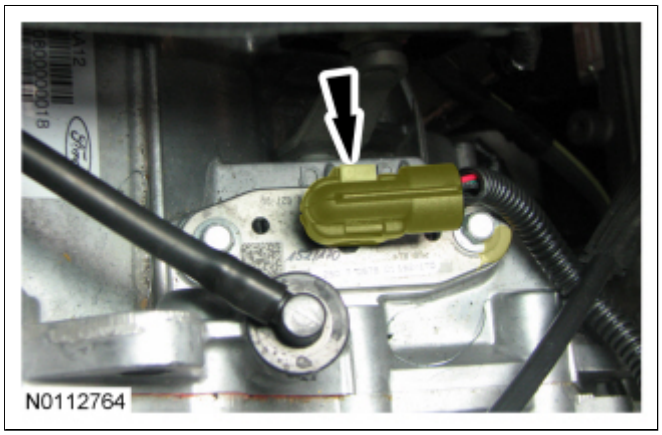


Installation

1. Install the TR sensor and the 2 TR sensor bolts.
   - Tighten to 10 Nm (89 lb-in).



2. Connect the TR sensor electrical connector.



3. Adjust the selector lever cable. For additional information, refer to Section 307-05 .

4. Re-calibrate the TR sensor. For additional information, refer to Transmission Adaptive Learning in this section.

5. Verify the vehicle starts in PARK and NEUTRAL only.

Transaxle

Special Tool(s)

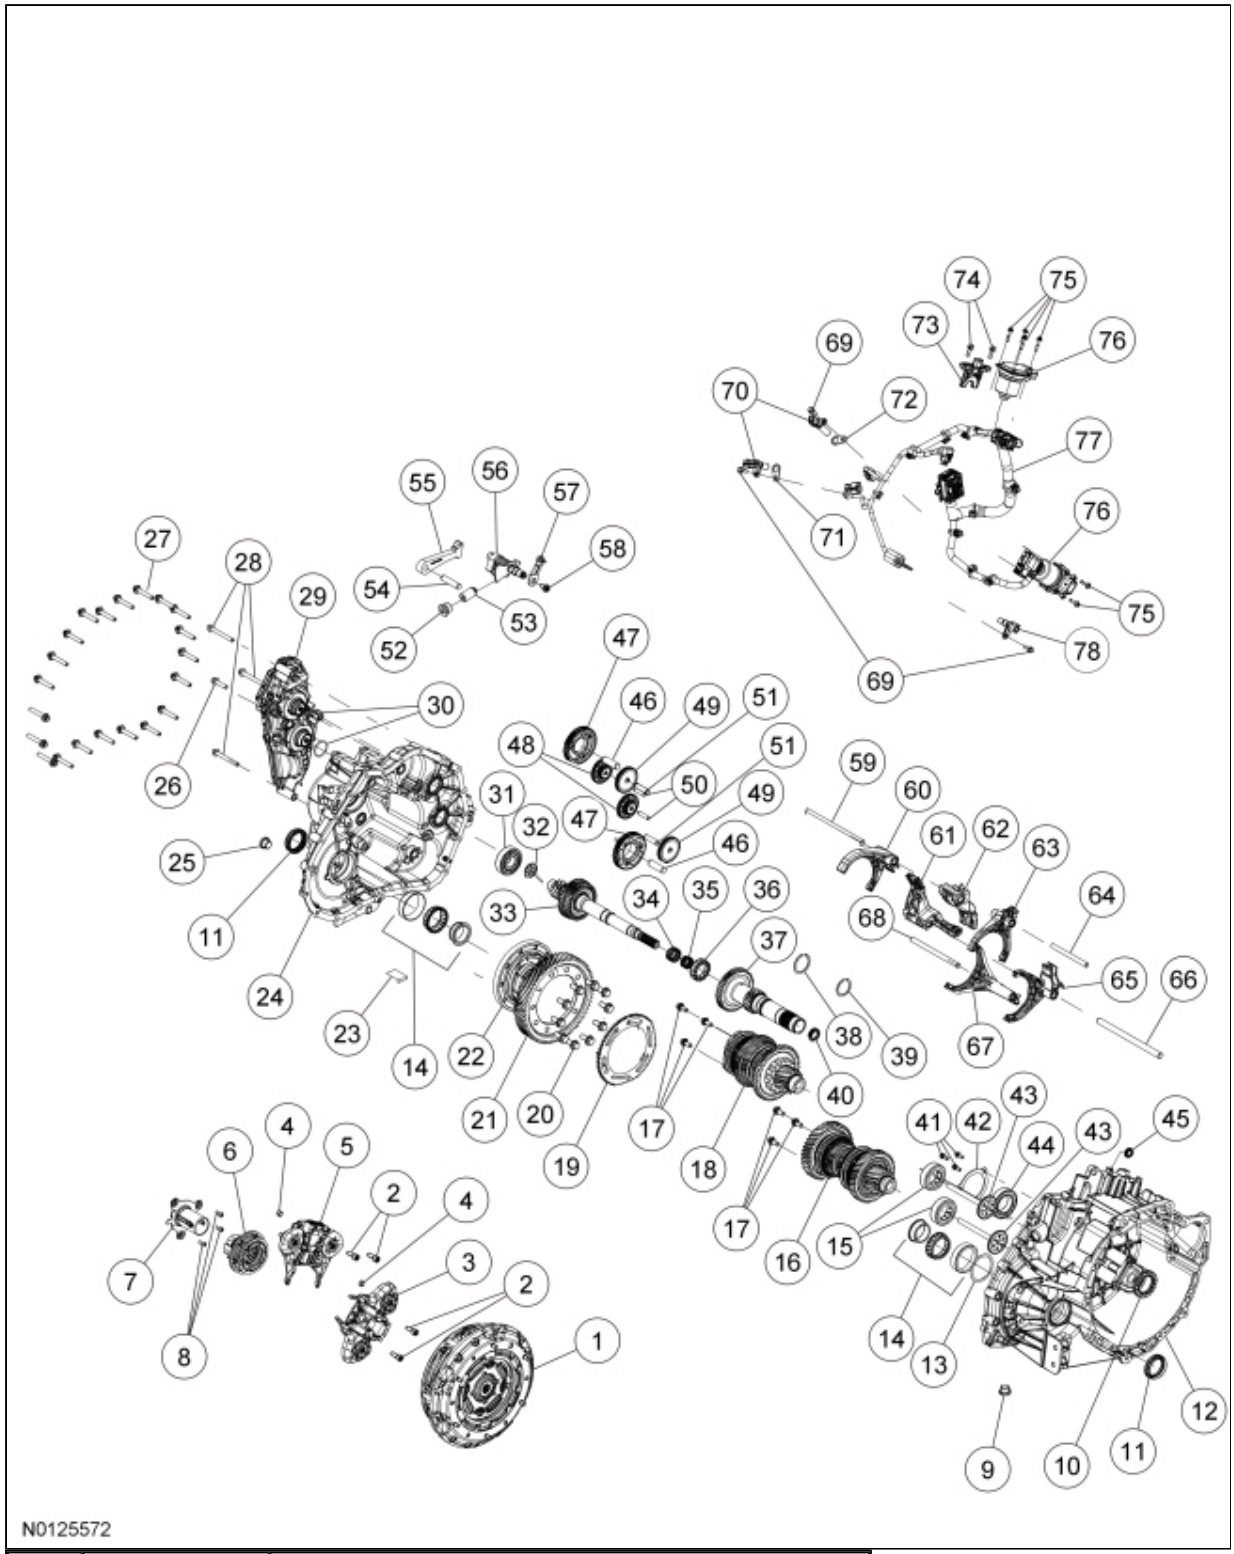
 ST1185-A	Slide Hammer 100-001
 ST2986-A	Holding Fixture 307-580
 ST3219-A	Installer, Input Guide and Seal 307-672 (includes 307-672/1 and 307-672/2)
 ST3222-A	Fixture, Clutch Remover/Installer 307-675 (includes 307-675/1, 307-675/2, 307-675/3 and 307-675/4)
 ST3258-A	Table, Assembly (DPS6) 307-680 (includes 307-680/1, 307-680/2, 307-680/3, 307-680/4 and 307-680/5)
ST2417-A	Remover, Input Shaft Oil Seal 308-375

Material

Item	Specification
DPS6 Grease 9U7Z-19A506-BA	WSS-M1C270-A
Gasket Maker TA-16	WSK-M2G348-A5
High Temperature Nickel Anti-Seize Lubricant XL-2	—
Motorcraft® Dual Clutch Transmission Fluid	WSS-M2C200-D2

XT-11-QDC	

Transaxle Exploded View



Item	Part Number	Description
1	7B546	Clutch assembly (part of 7C601 kit)
2	W790187	Actuator lever bolts (4 required)

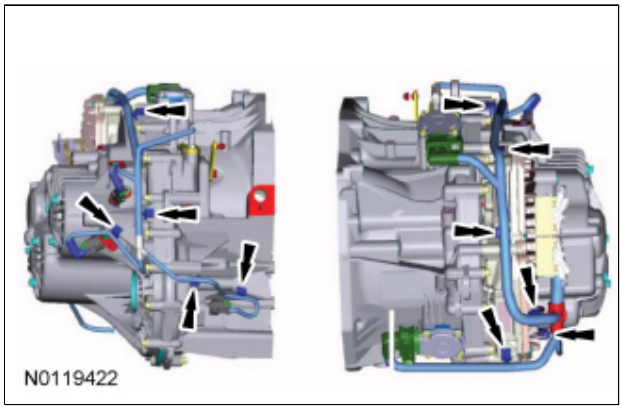
3	7515	Actuator lever 1 (part of 7C601 kit)
4	7N080	Actuator lever dowels (2 required)
5	7515	Actuator lever 2 (part of 7C601 kit)
6	7A508	Engagement bearing (part of 7C603 kit)
7	7A564	Guide tube
8	W790185	Guide tube bolts (3 required)
9	7L013	Drain plug
10	7048	Input shaft case seal
11	1177	Halfshaft seals (2 required)
12	7505	Clutch housing
13	4067	Differential shim (part of kit)
14	4220	Differential bearings (2 required)
15	7M037	Output shaft bearings (2 required)
16	7060	Output shaft assembly
17	W790208	Output shaft bearing retainer bolts (6 required)
18	7060	Output shaft assembly
19	7H150	Differential impulse ring
20	W790237	Differential ring gear bolts (10 required)
21	7D392	Differential ring gear
22	4026	Differential case
23	7L027	Magnet
24	7005	Transaxle case
25	7C013	Fill plug
26	W790189	Transmission Control Module (TCM) bolt
27	W790209	Clutch housing-to-case bolts (21 required)
28	W790188	TCM bolt
29	7Z369	TCM
30	7B498	TCM O-ring seal
31	7118	Input shaft bearing
32	7D000	Oil spout
33	7017	Inner input shaft
34	7M037	Needle bearing
35	7M037	Needle bearing
36	7118	Bearing
37	7017	Hollow input shaft
38	7064	Snap ring
39	7917	Snap ring
40	7052	Hollow input shaft seal
41	W790236	Bolts (3 required)
42	7049	Bearing retainer
43	7D000	Lube feed tubes (2 required)
44	7118	Input shaft bearing
45	7052	Manual control lever shaft seal
46	—	Shift drum pin (2 required) (part of 7J047)
47		

	7J047	Shift drum (2 required)
48	7J048	Small clock gear (2 required)
49	7J048	Large clock gear (2 required)
50	6397	Clock gear pin (2 required)
51	6397	Clock gear pin (2 required)
52	7L013	Park plunger plug
53	7233	Park plunger
54	6397	Park pawl rod
55	7A248	Park pawl
56	7H296	Park pawl actuation shaft assembly
57	7A256	Manual control lever
58	W790198	Manual control lever bolt
59	7240	Shift fork rod
60	7230	2nd/6th gear shift fork
61	7B081	3rd gear shift fork linkage
62	7B081	2nd/6th gear shift fork linkage
63	7230	4th/reverse gear shift fork
64	7240	Shift fork rod
65	7230	3rd gear shift fork
66	7240	Shift fork rod
67	7230	1st/5th gear shift fork
68	7240	Shift fork rod
69	W790186	Bolt
70	7M101	Input shaft speed sensor
71	7Z101	Input shaft speed sensor shim
72	7Z101	Input shaft speed sensor shim
73	7F293	Transmission Range (TR) sensor
74	W790186	Bolts (2 required)
75	W790175	Bolts (8 required)
76	7C604	Clutch motor (2 required)
77	7G276	Transmission wiring harness
78	7H103	Output Shaft Speed (OSS) sensor

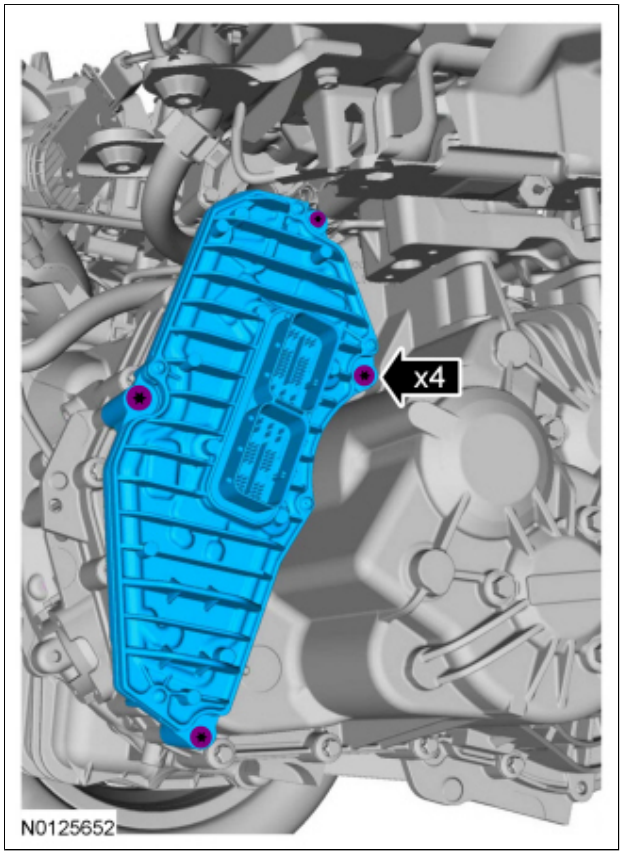
Disassembly

1. **NOTE:** Take note of the transaxle wiring harness clip locations for installation.

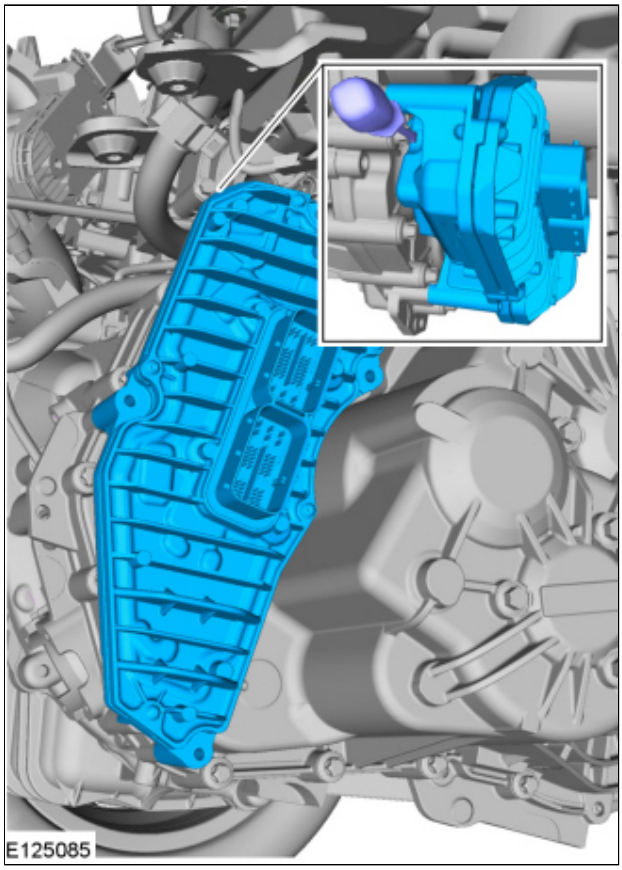
   Remove the transaxle wiring harness.



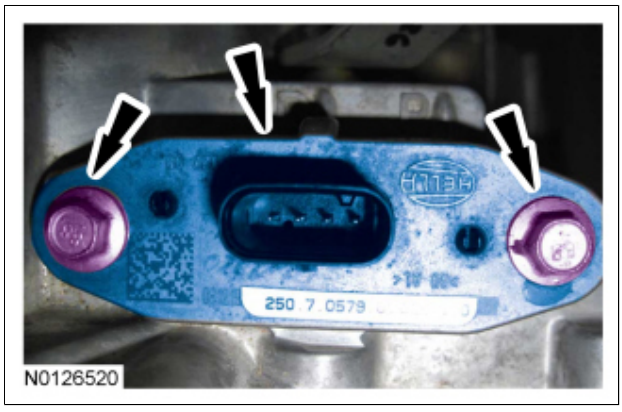
2. Remove the 4 Transmission Control Module (TCM) bolts.



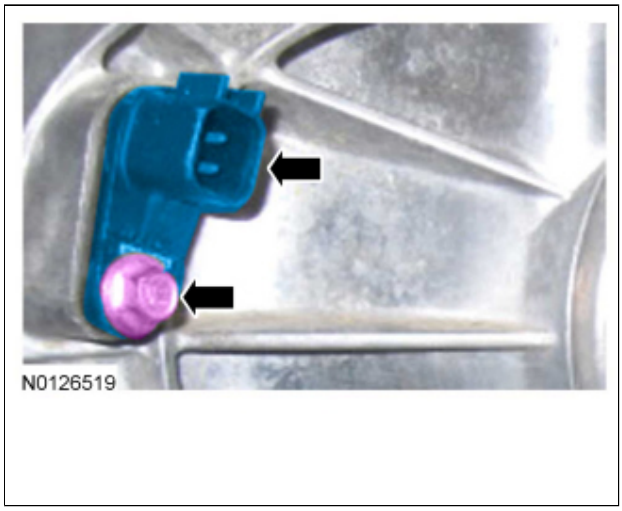
3. Using a flat blade screwdriver, carefully pry the TCM from the transaxle, at the location shown, and remove the TCM, discard the O-rings.



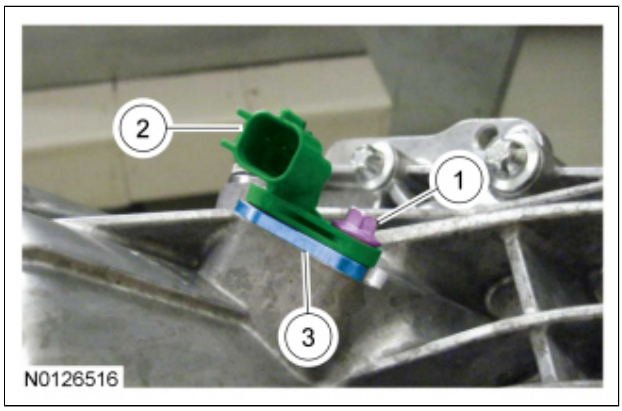
4. Remove the 2 Transmission Range (TR) sensor bolts and the TR sensor.



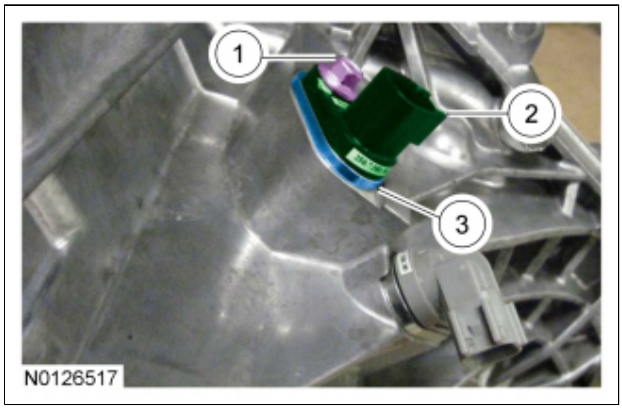
5. Remove the Output Shaft Speed (OSS) sensor bolt and OSS sensor.



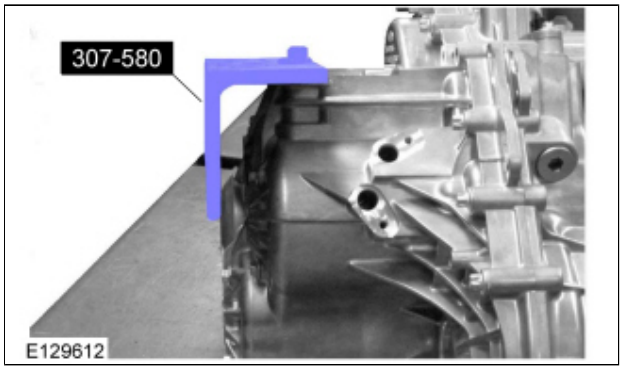
6. Remove the input shaft speed sensor 1.
    1. Remove the input shaft speed sensor 1 bolt.
    2. Remove the input shaft speed sensor 1.
    3. Remove the input shaft speed sensor 1 shim.



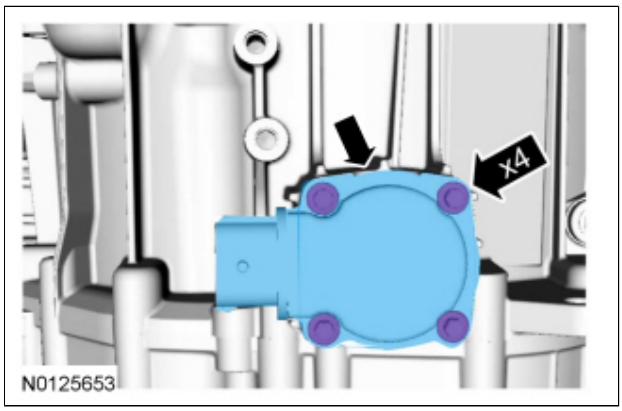
7. Remove the input shaft speed sensor 2.
    1. Remove the input shaft speed sensor 2 bolt.
    2. Remove the input shaft speed sensor 2.
    3. Remove the input shaft speed sensor 2 shim.



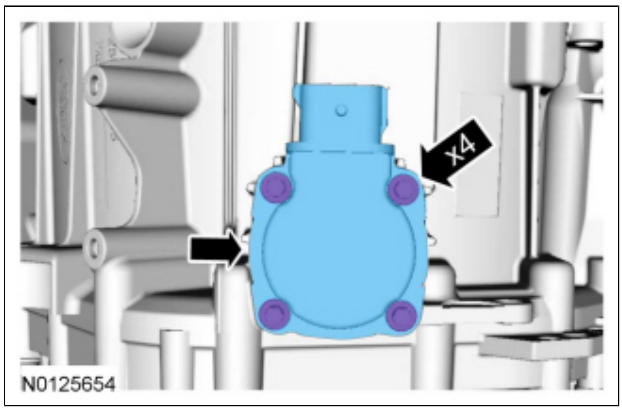
8. Install the special tools.



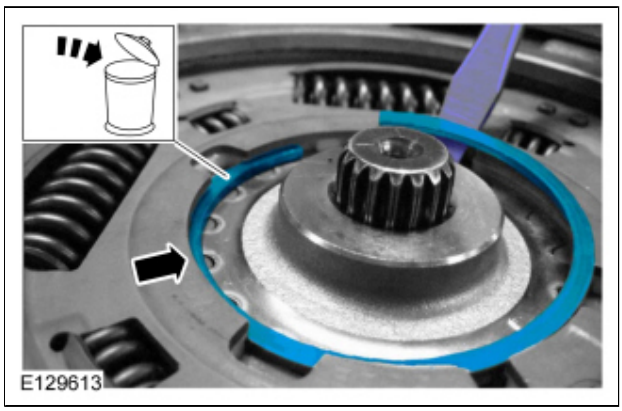
9. Stand the transaxle on its back.
10. Remove the 4 clutch motor 1 bolts and remove clutch motor 1.



11. Remove the 4 clutch motor 2 bolts and remove clutch motor 2.

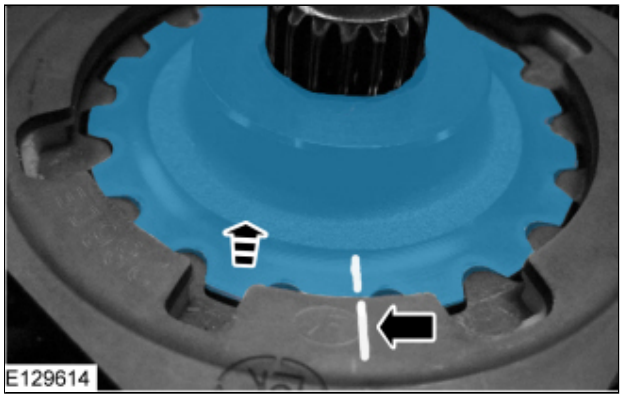


12. Remove and discard the clutch hub snap ring.

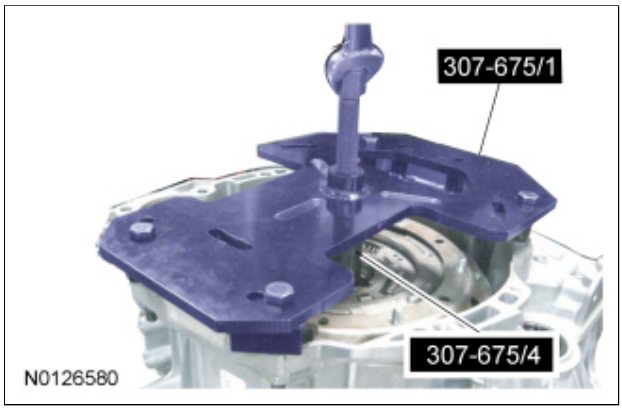


13. **NOTE:** Index mark the clutch hub and clutch for installation.

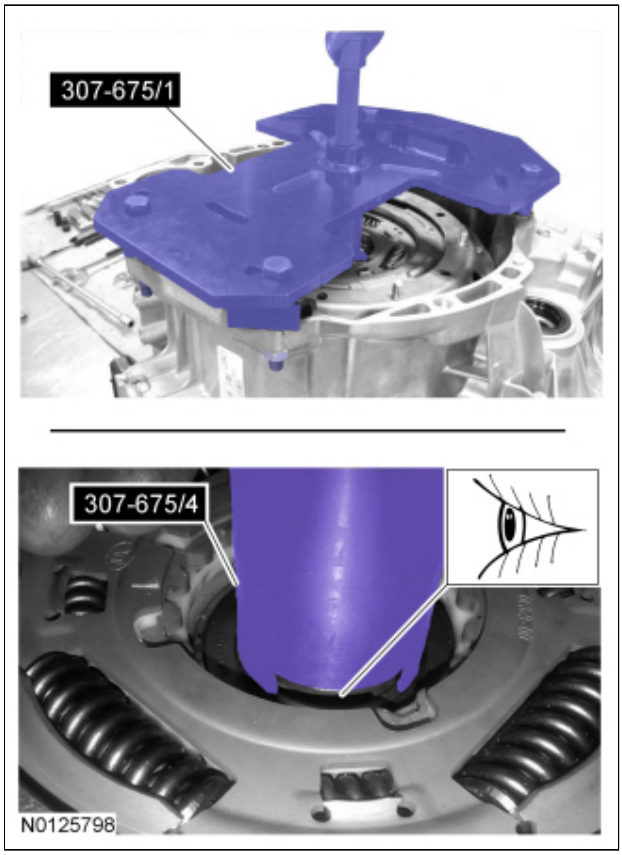
    Remove the clutch hub.



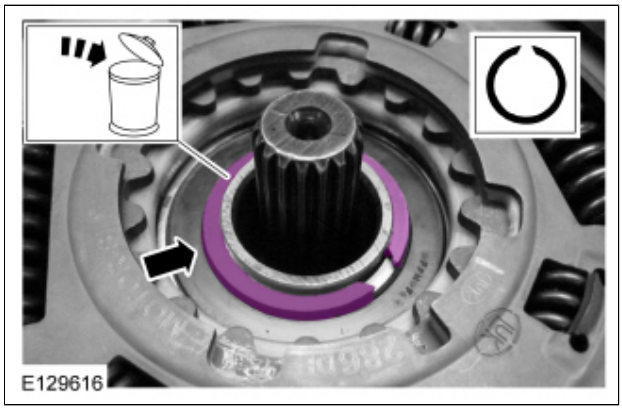
14. Install the special tools.



15. Using the special tools, turn the center bolt of the special tool with a maximum of 5 Nm (44 lb-in) of torque to push the clutch down to release the pressure from the hollow input shaft snap ring.



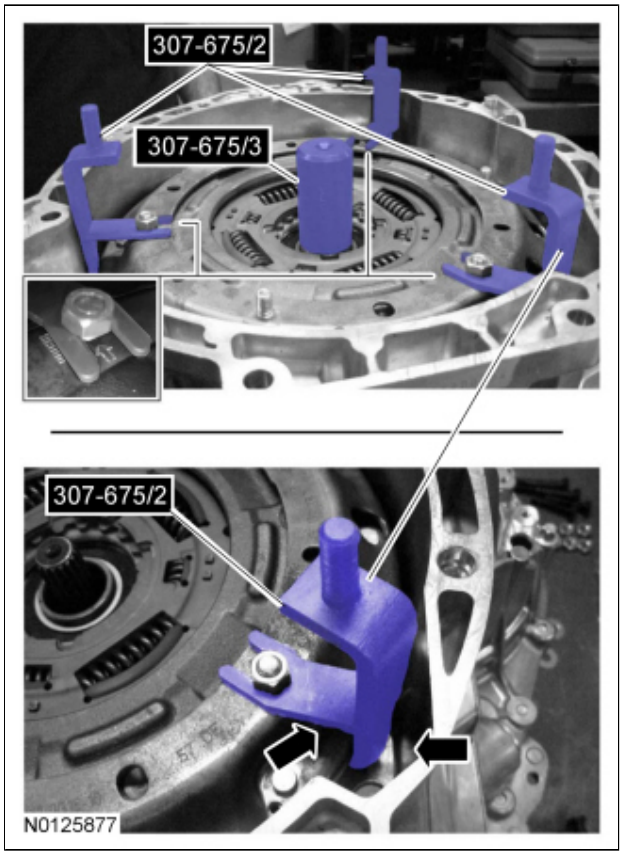
16. Remove and discard the hollow input shaft snap ring.



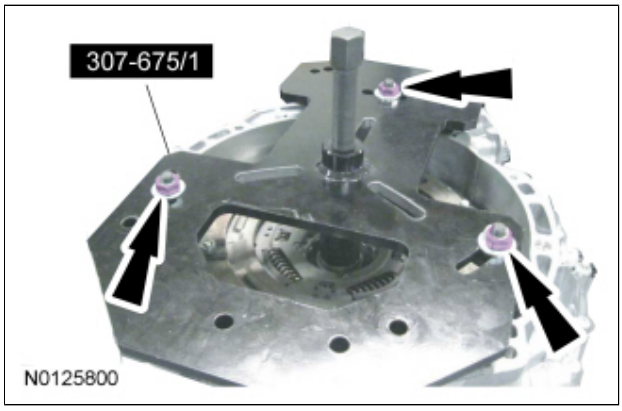
17. **NOTE:** Make sure the lifting legs are installed on the 3 clutch studs marked with the manufacturing mark as shown.

    NOTE: Make sure the lifting leg with the angle is in the location shown.

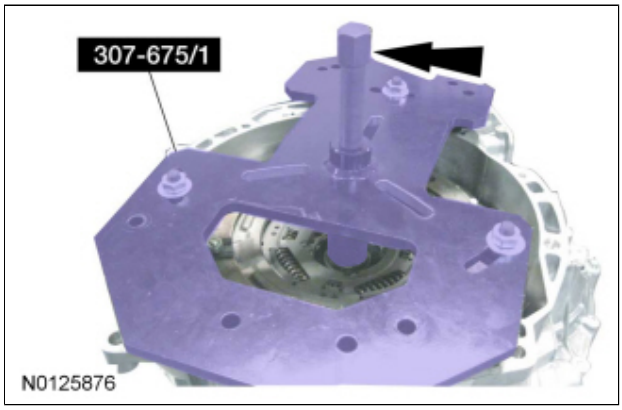
    Install the special tools.



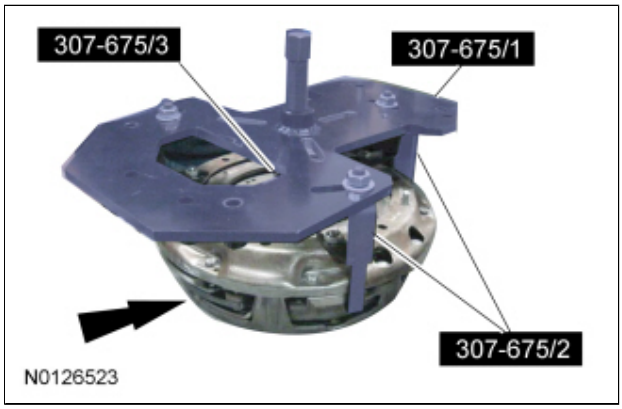
18. Install the special tools.



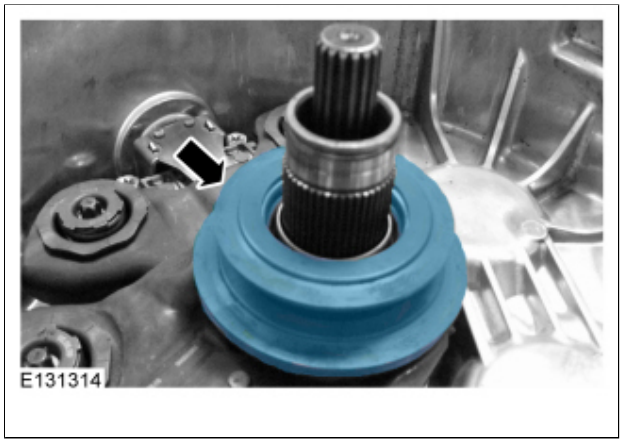
19. Turn the center bolt of the special tool with approximately 5 Nm (44 lb-in) of torque until the clutch is free of the input shaft.



20. Using the special tools, remove the clutch as an assembly from the transaxle.

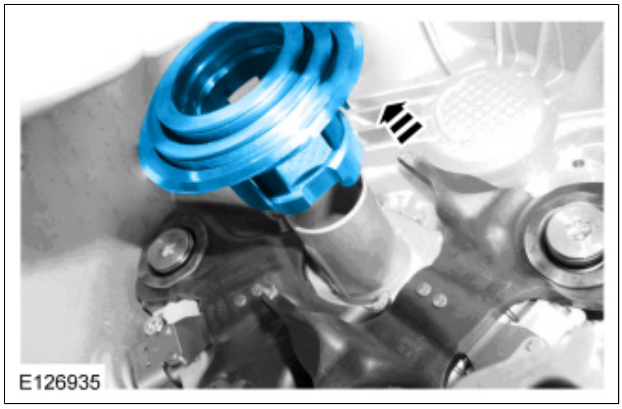


21. Remove the Z-washers from the engagement system bearing unit.



22. **NOTE:** The engagement system bearing unit should be removed easily.

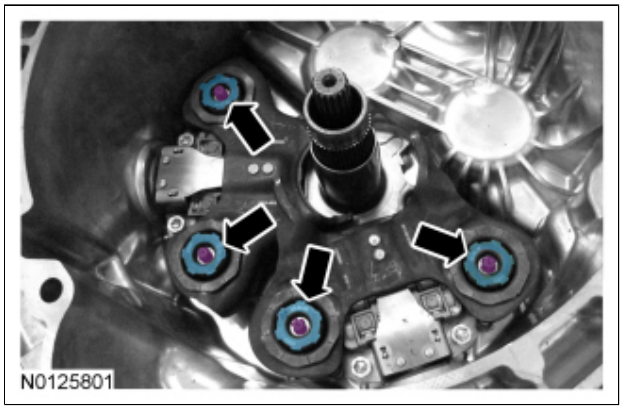
    Remove the engagement system bearing unit. Inspect for wear or damage. Replace as necessary. Refer to Transaxle in this section.



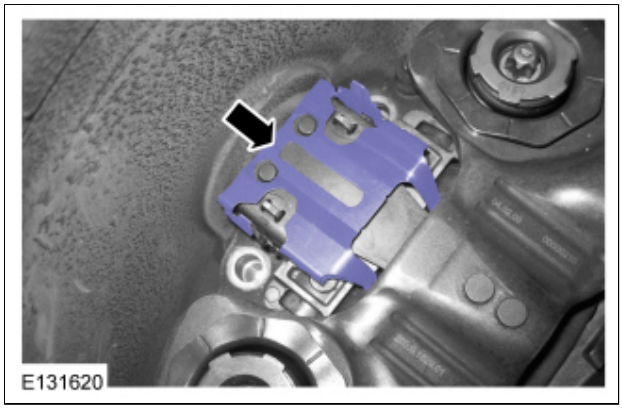
23. ***NOTICE:*** **Remove the spring retainer bolts by loosening them slightly in an alternating pattern or damage can occur to the clutch actuator levers.**

    NOTE: The spring retainers and actuator levers are matched sets with corresponding serial numbers. If the spring retainers and actuator levers are being reused, mark on each spring retainer and actuator lever for assembly.

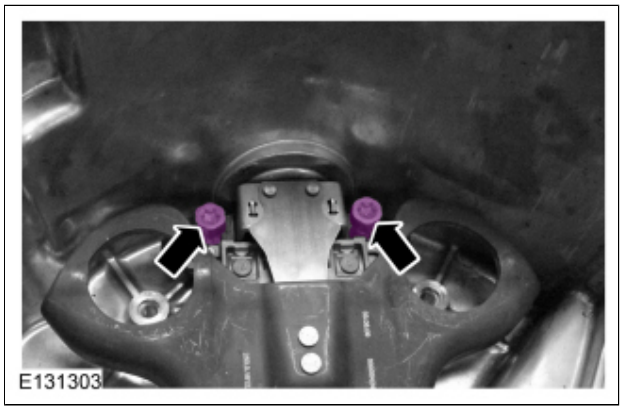
    Remove the 4 spring retainer bolts from the spring retainers and remove the spring retainers.



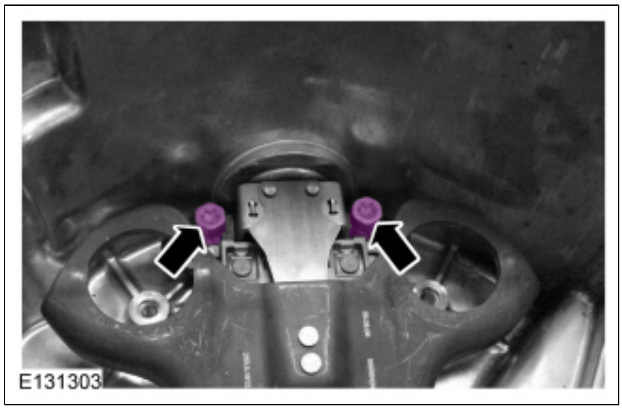
24. Install clutch actuator lever locks as shown if available.



25. Remove the 2 bolts from the clutch actuator lever 1.

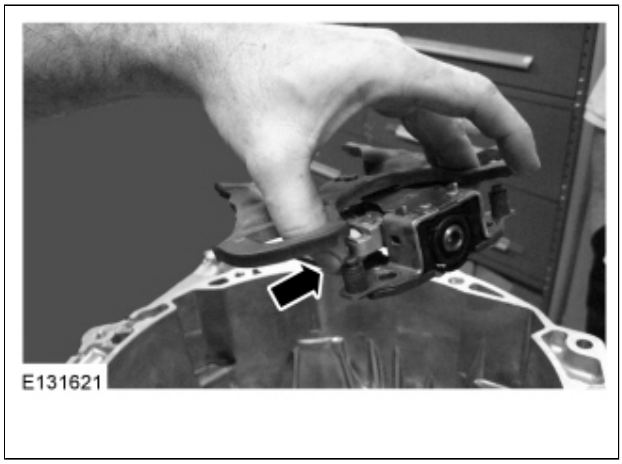


26. Remove the 2 bolts from the clutch actuator lever 2.



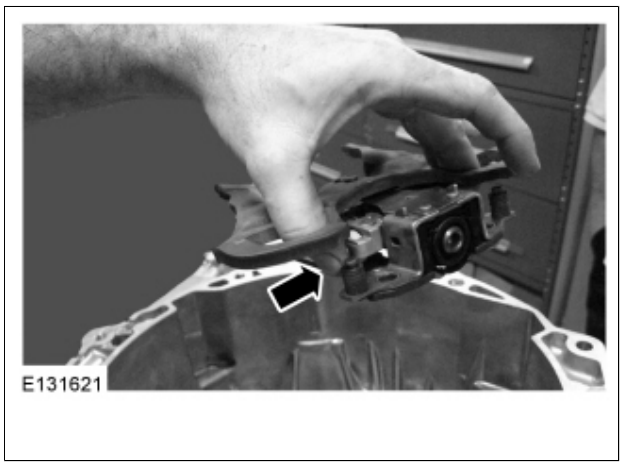
27. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

    Remove the clutch actuator lever 1.

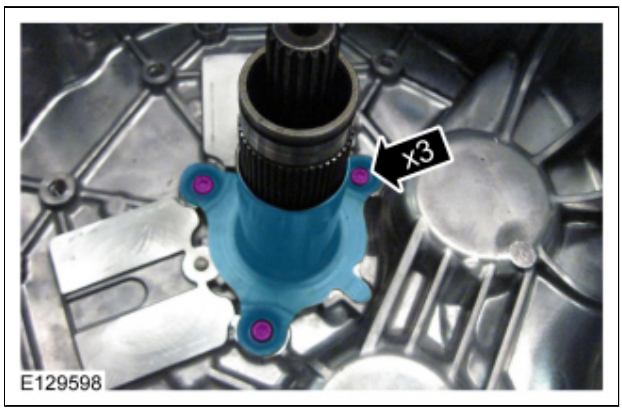


28. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

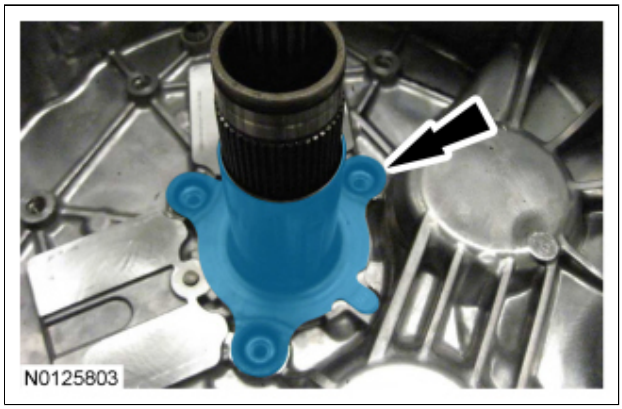
    Remove the clutch actuator lever 2.



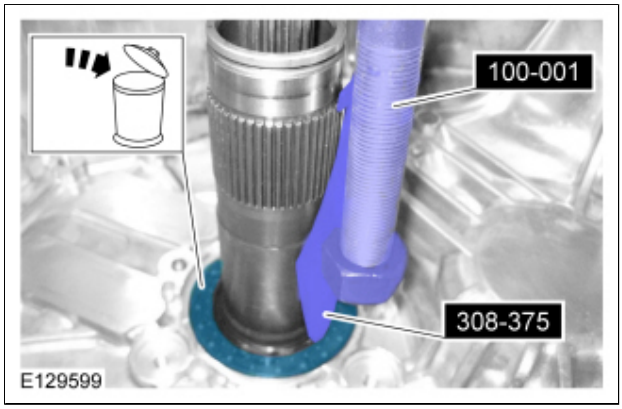
29. Remove the guide tube bolts.



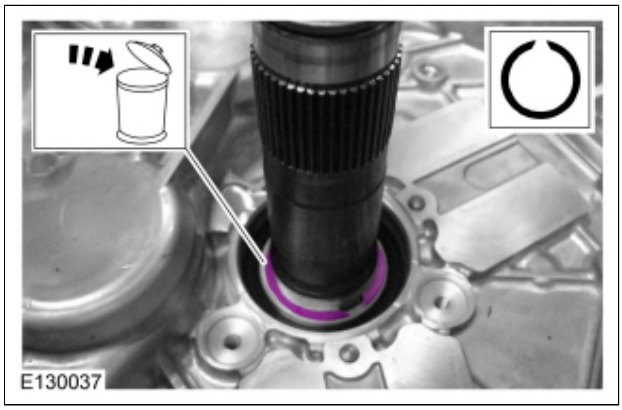
30. Remove the guide tube.



31. Using the special tools, remove and discard the input shaft case seal.

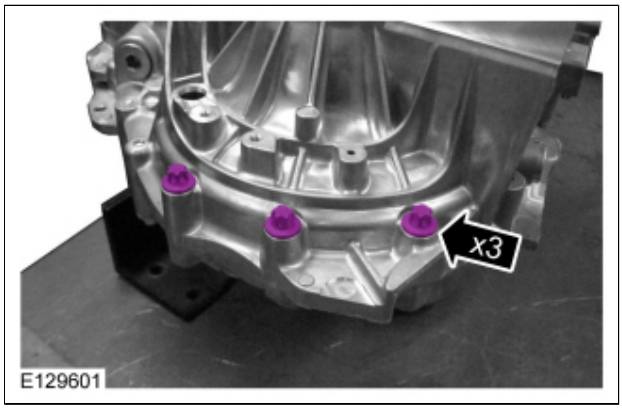


32. Remove and discard the input shaft snap ring.

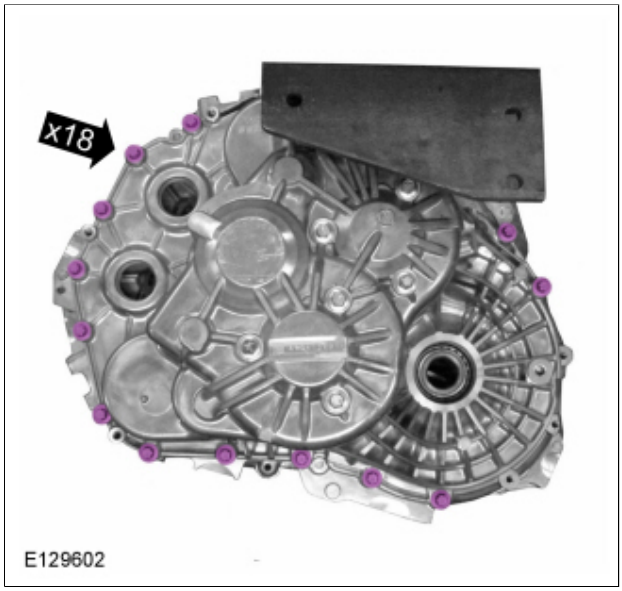


33. Remove discard the manual control lever bolt and remove the manual control lever.

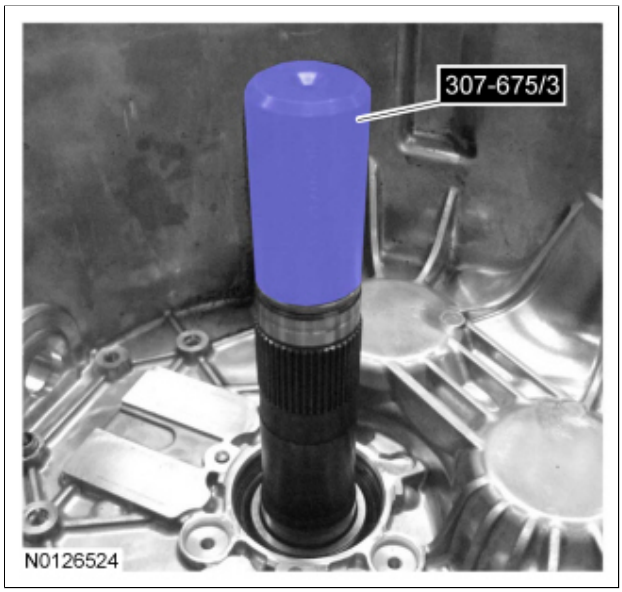
34. Remove the top 3 clutch housing-to-case bolts.



35. Remove the bottom 18 clutch housing-to-case bolts (13 shown).



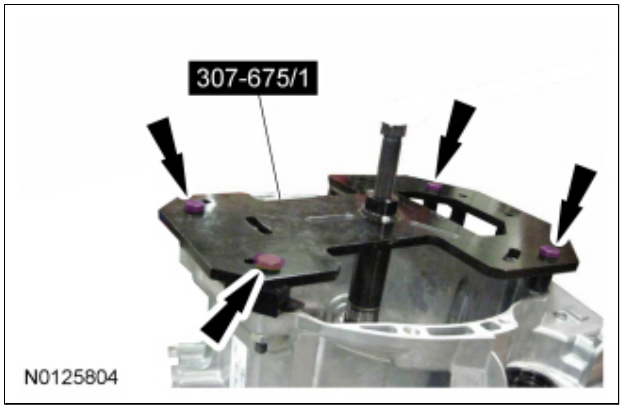
36. Install the special tool.



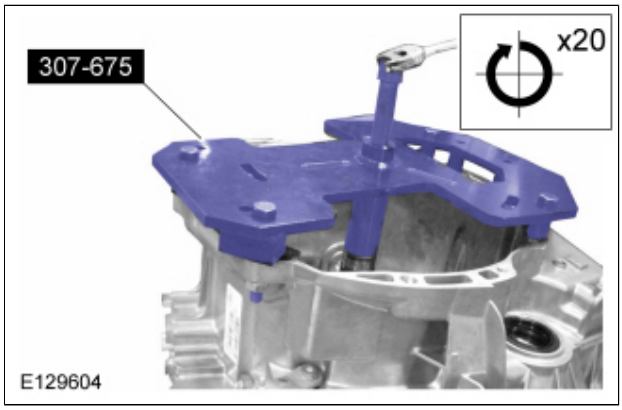
37. **NOTE:** Install the special tools in the position shown.

Install the special tools and special tools bolts.

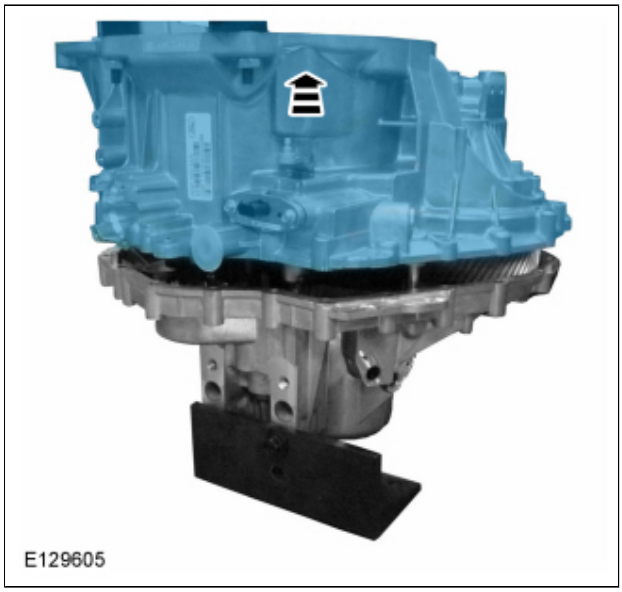
- Tighten to 18 Nm (159 lb-in).



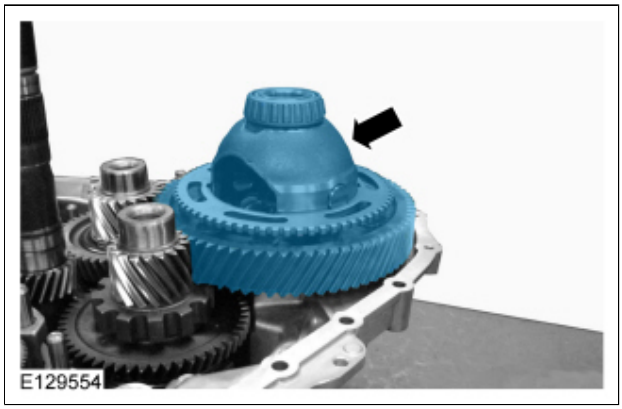
38. Turn the special tool bolt approximately 20 turns to separate the clutch housing from the transaxle case.



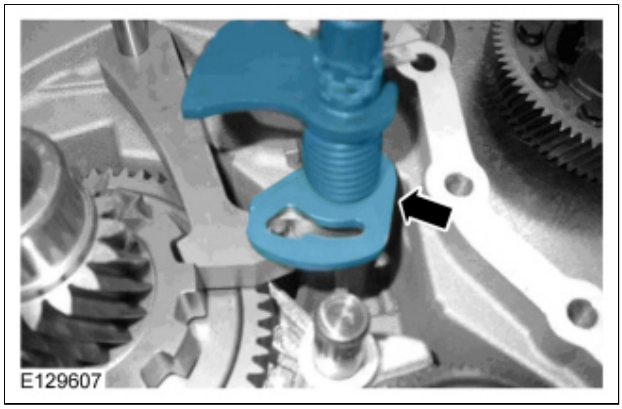
39. Lift the clutch housing off the transaxle case.



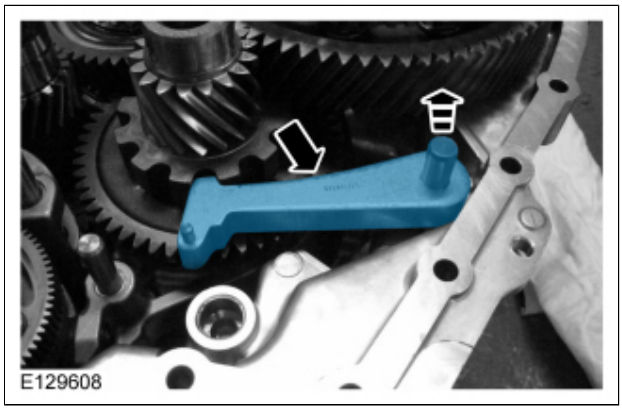
40. Remove the differential.



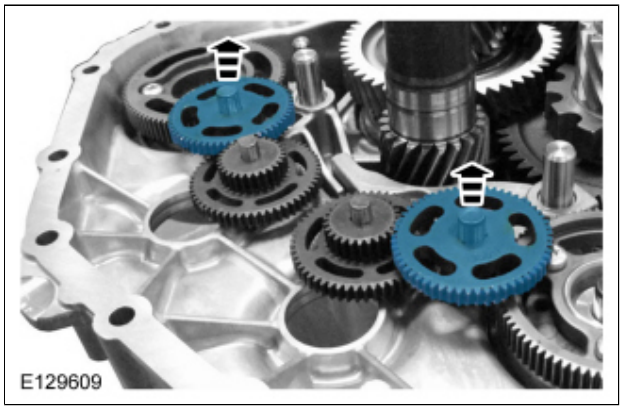
41. Remove the park pawl actuation shaft assembly.



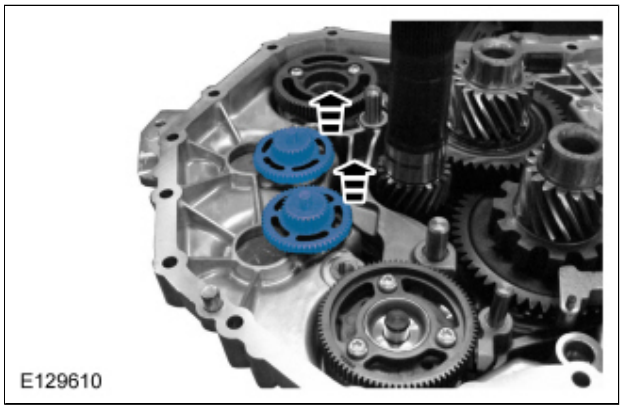
42. Remove the park pawl rod and park pawl.



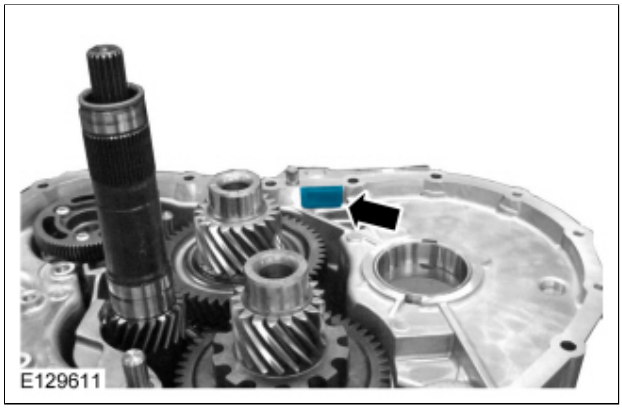
43. Remove the large clock gears and clock gear pins.



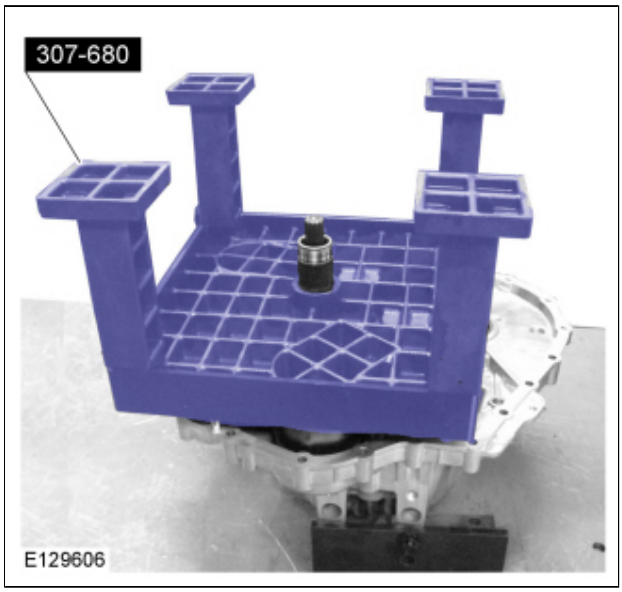
44. Remove the small clock gears and clock gear pins.



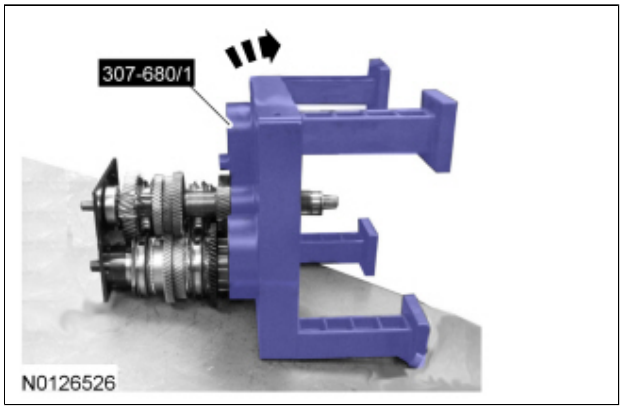
45. Remove the magnet.



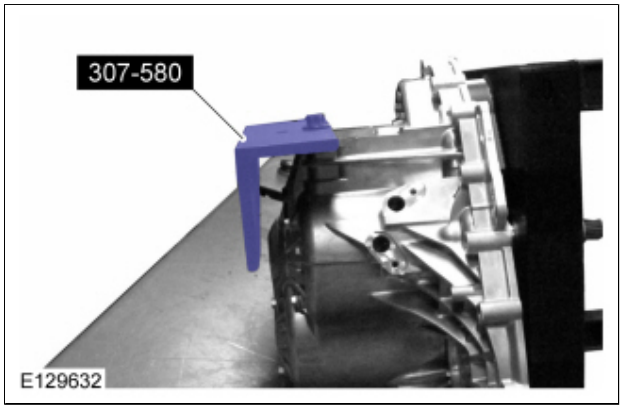
46. Install the special tool on the transansaxle case and gear set assembly.



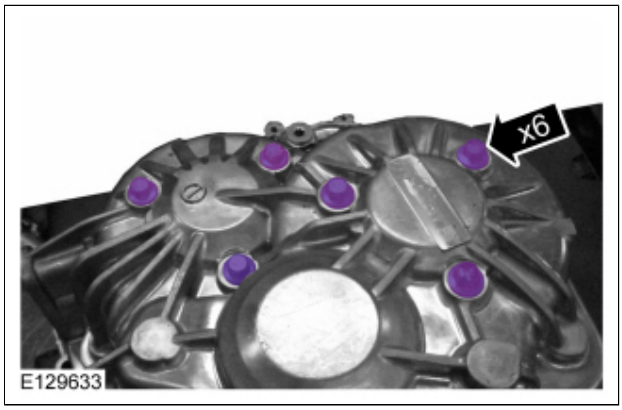
47. Turn the transaxle case and gear set assembly over on the special tool.



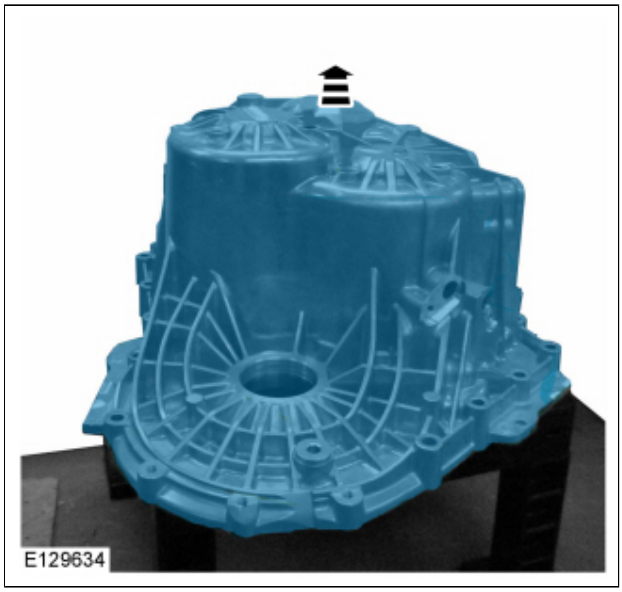
48. Remove the special tool from the transaxle case.



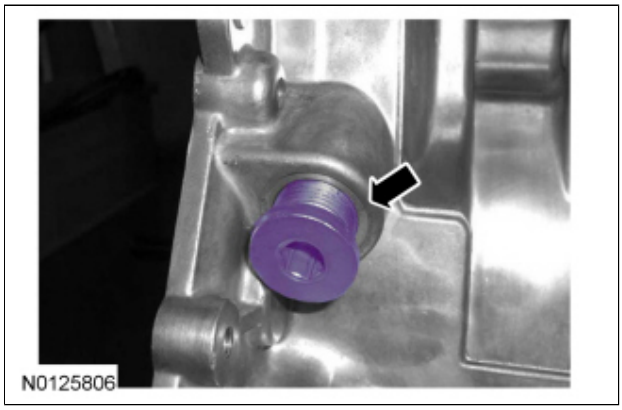
49. Remove and discard the 6 output shaft bearing retainer bolts.



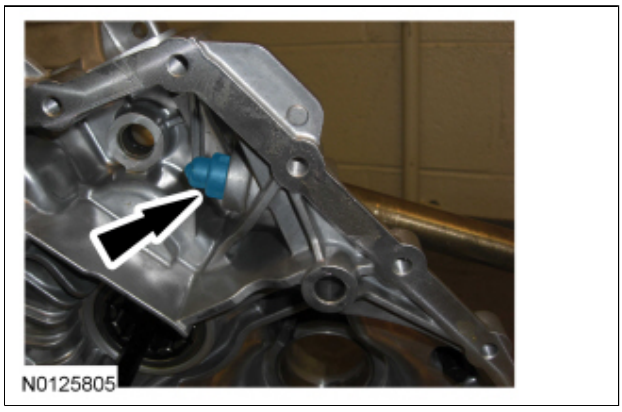
50. Lift the transaxle case off the gearset assemblies.



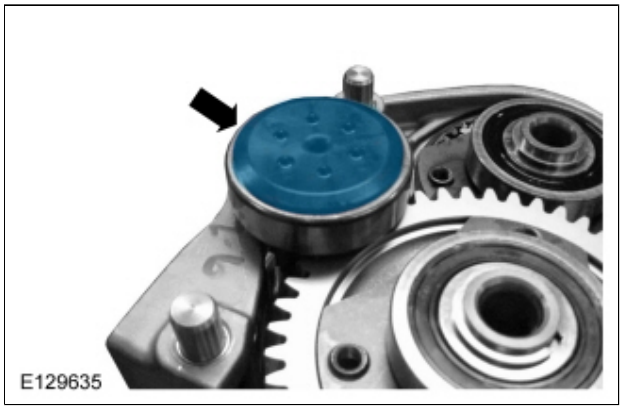
51. Remove the park plunger plug.



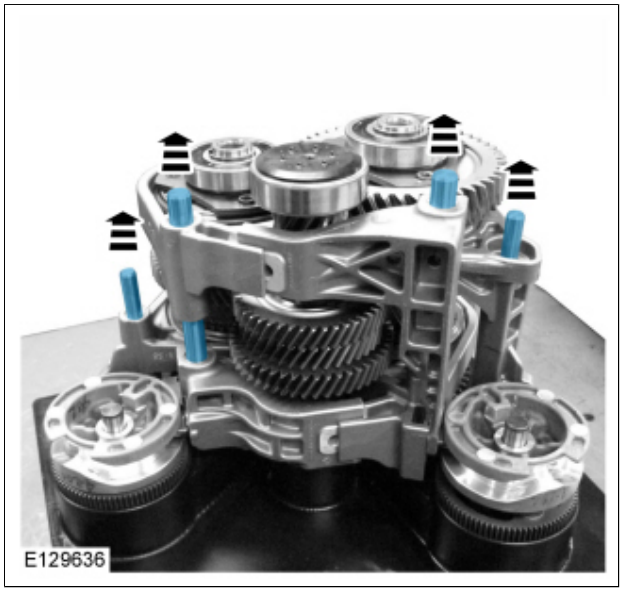
52. Remove the park plunger.



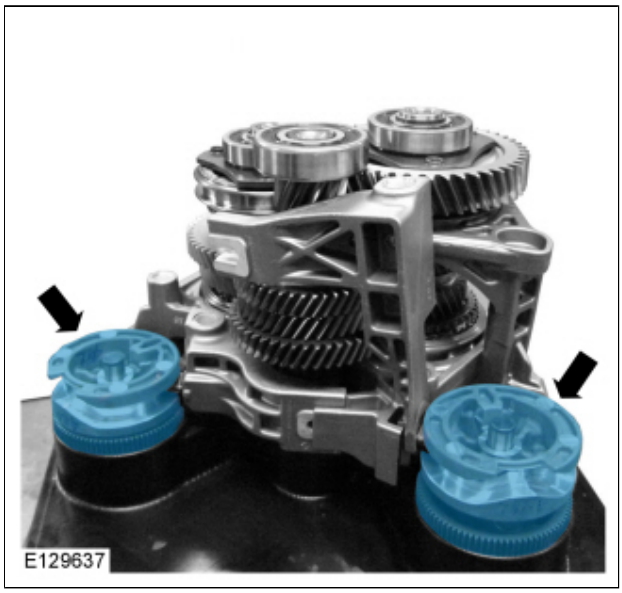
53. Remove the oil spout.



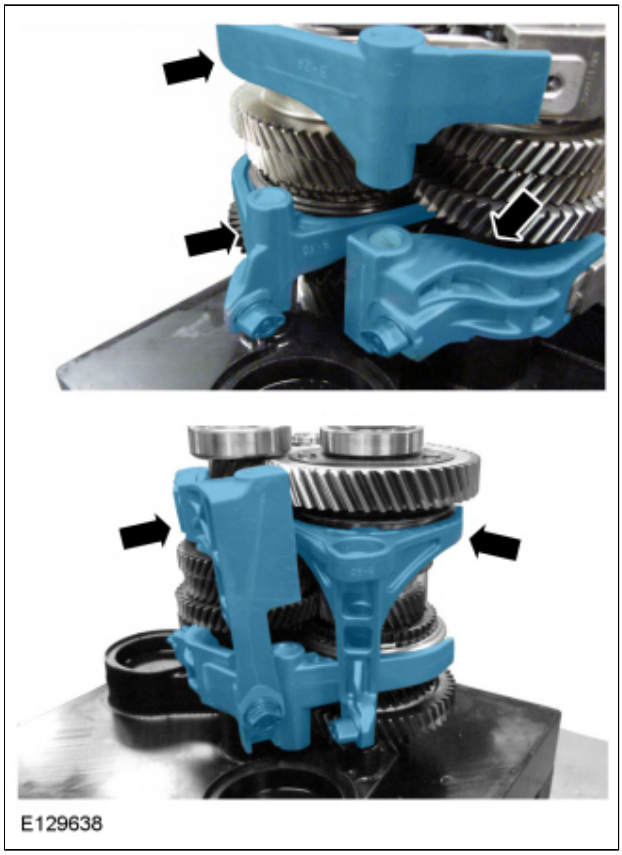
54. Remove the 4 shift fork rods.



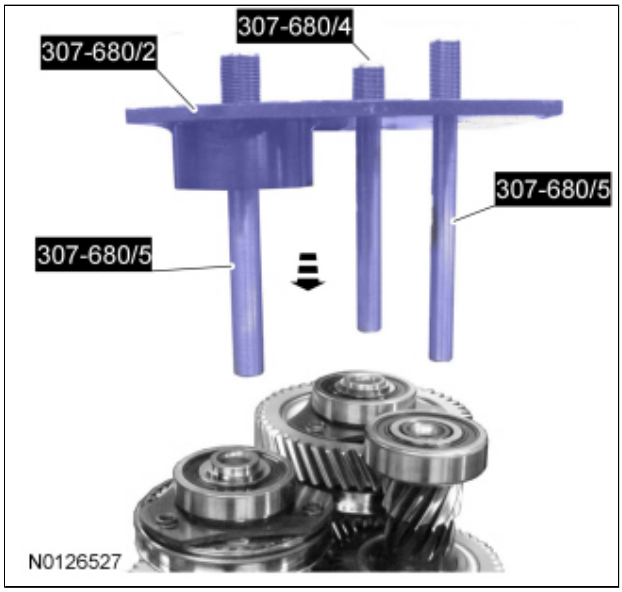
55. Remove the 2 shift drums.



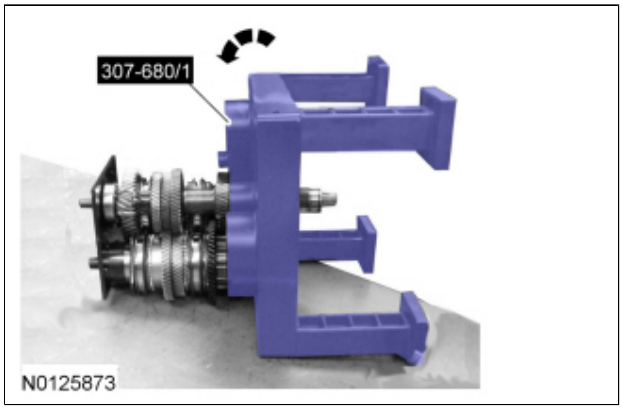
56. Remove the shift forks and linkages.



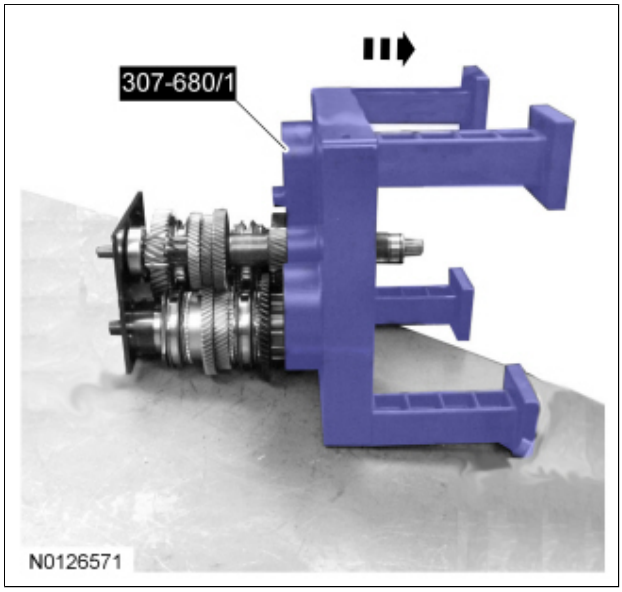
57. Install the special tool.



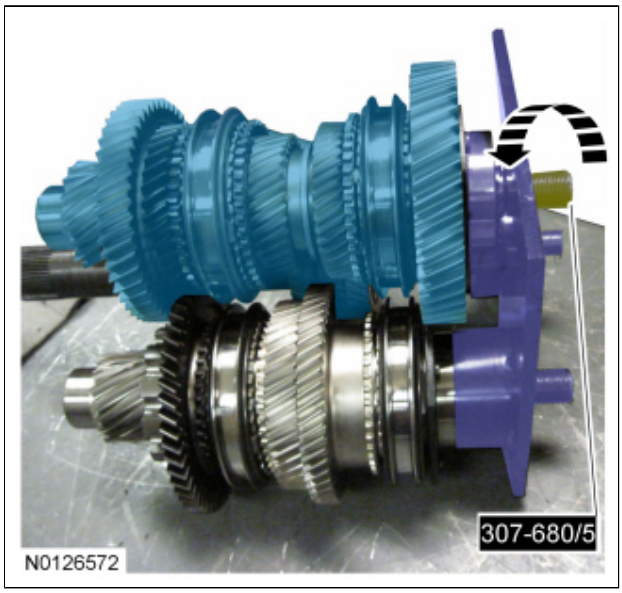
58. Turn the gearset assembly over on its side.



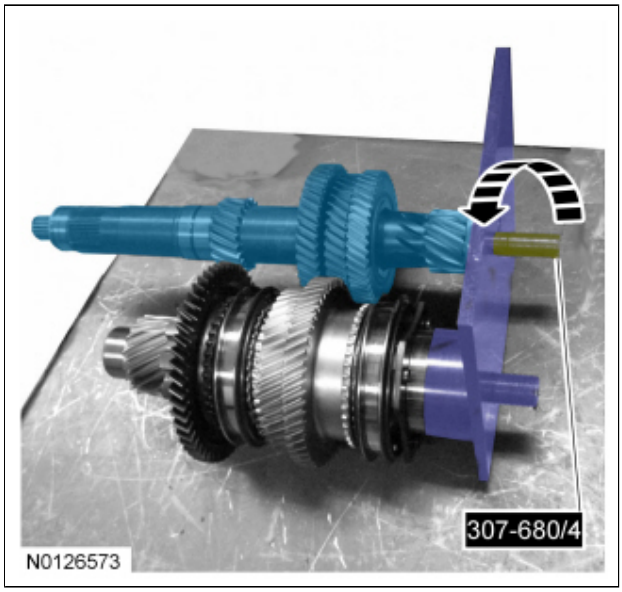
59. Remove the special tool.



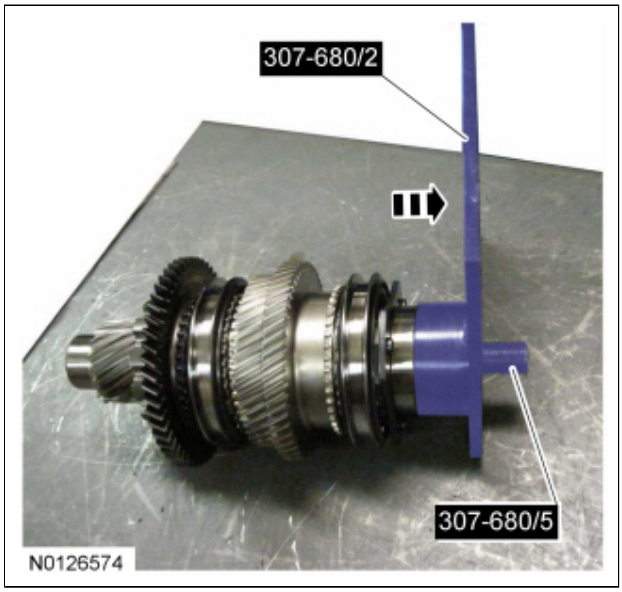
60. Remove output shaft 1 assembly by removing the special tool.



61. Remove the input shaft assembly by removing the special tool.



62. Remove the special tool from output shaft 2 assembly.



63. Remove the hollow input shaft from the solid input shaft.

Assembly

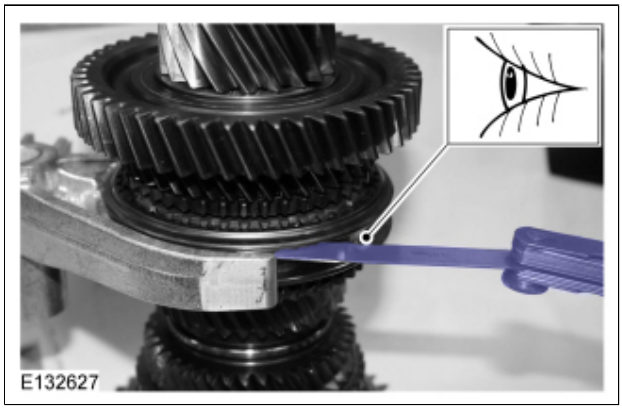
1. ***NOTICE:*** **Do not to damage the inner input shaft seal or bearing when installing the hollow input shaft onto the inner input shaft.**

   Install the hollow input shaft onto the inner input shaft.

2. **NOTE:** Apply pressure on the synchronizer ring while taking the measurements.

   NOTE: If the clearance is less than the minimum measurement stated in the specifications section, install a new output shaft assembly.

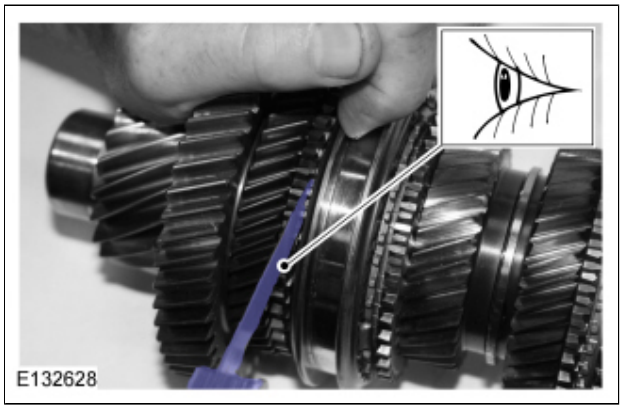
   Using a suitable feeler gauge, measure the clearance between the synchronizer ring and gear in various places around the circumference.



3. **NOTE:** Apply pressure on the synchronizer ring while taking the measurements.

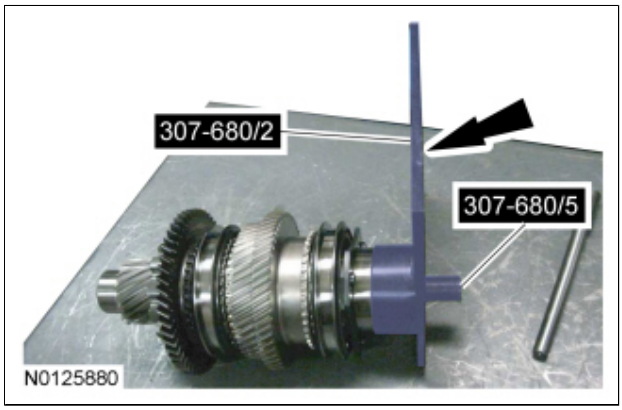
   NOTE: If the clearance is less than the minimum measurement stated in the specifications section, install a new output shaft assembly.

   Using a suitable feeler gauge, measure the clearance between the synchronizer ring and gear in various places around the circumference.

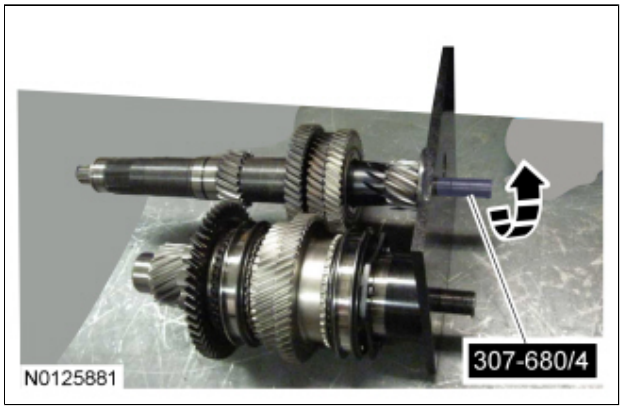


4. **NOTE:** Make sure the synchronizers are in the neutral position.

   Install output shaft 2 assembly on the special tool.

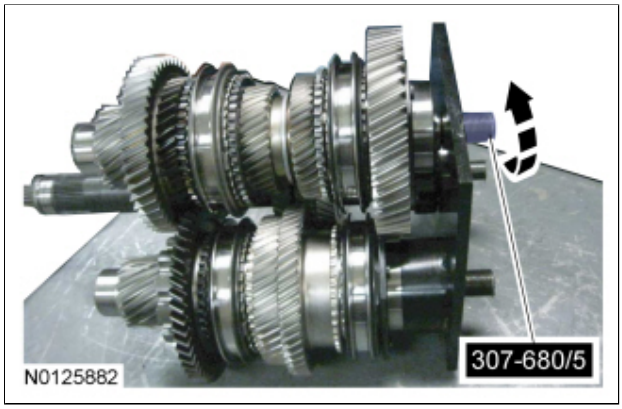


5. Install the input shaft assembly on the special tool.

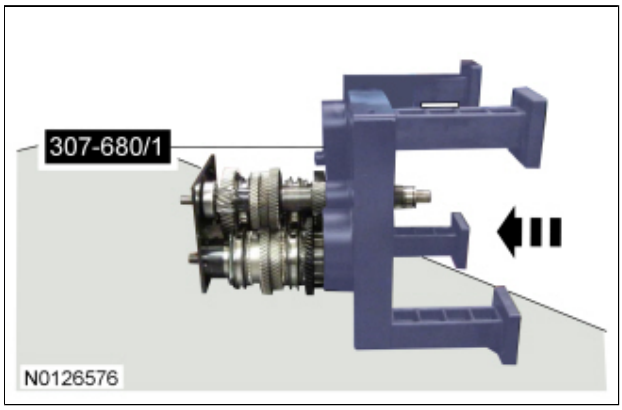


6. **NOTE:** Make sure the synchronizers are in the neutral position.

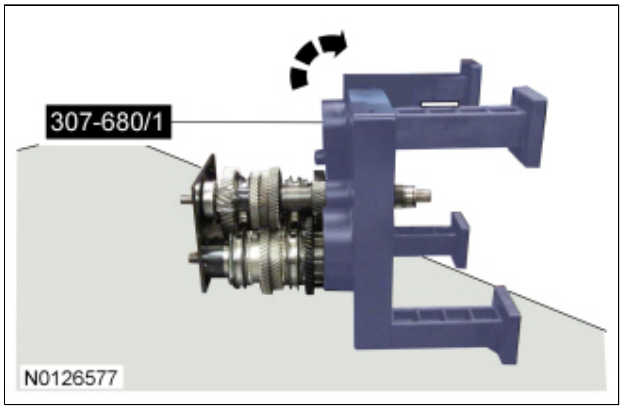
   Install output shaft 1 assembly on the special tool.



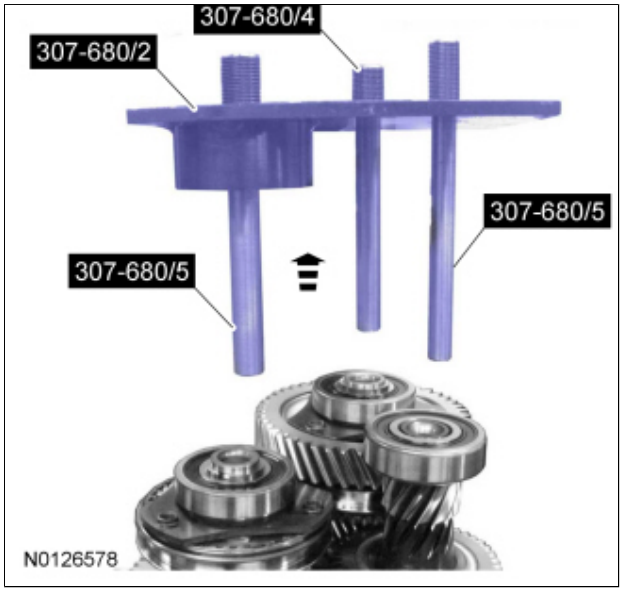
7. Install the special tool.



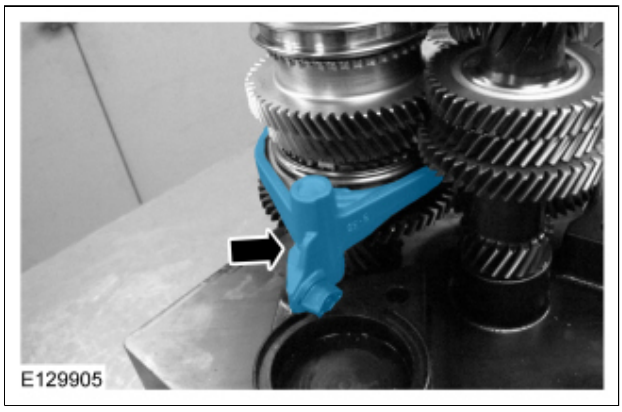
8. Turn the gearset assembly over onto the special tool.



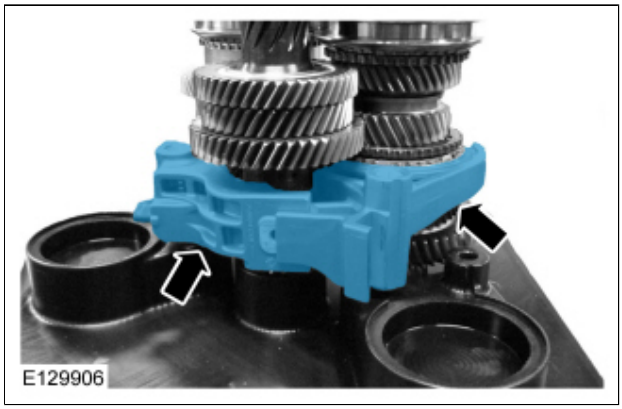
9. Remove the special tool.



10. Install the 4th/reverse gear shift fork.

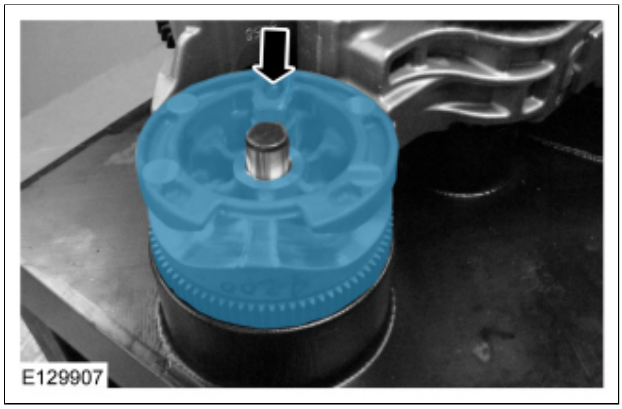


11. Install the 2nd/6th gear shift fork and linkage.



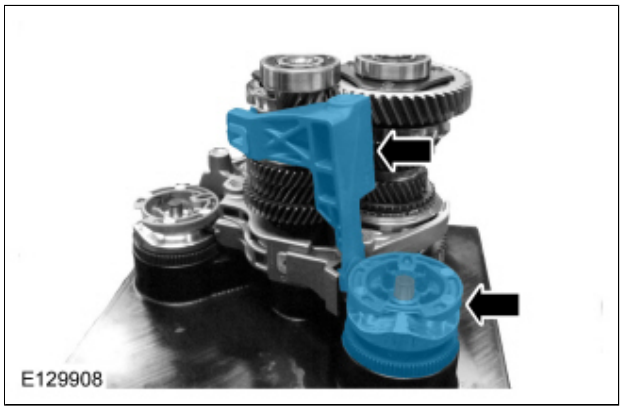
12. **NOTE:** Make sure shift drum 1 is in the neutral position as shown.

    Install shift drum 1.



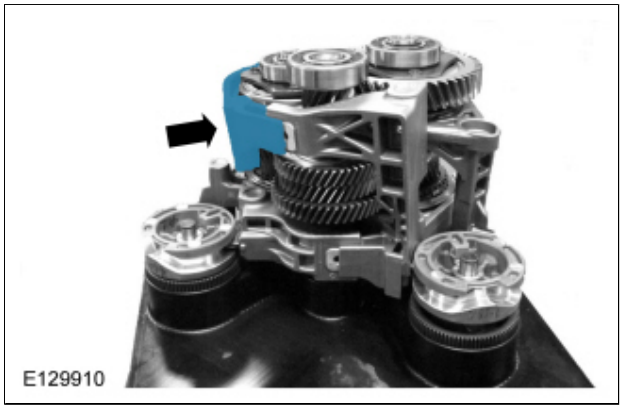
13. **NOTE:** Make sure shift drum 2 is in the neutral position as shown.

    Install the 3rd gear linkage and shift drum 2.

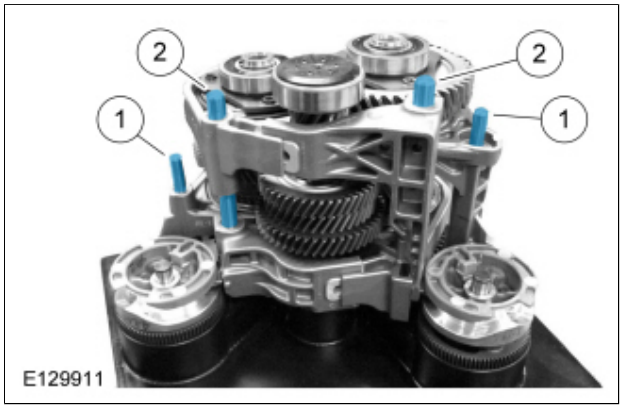


14. Install the 1st/5th gear shift fork.

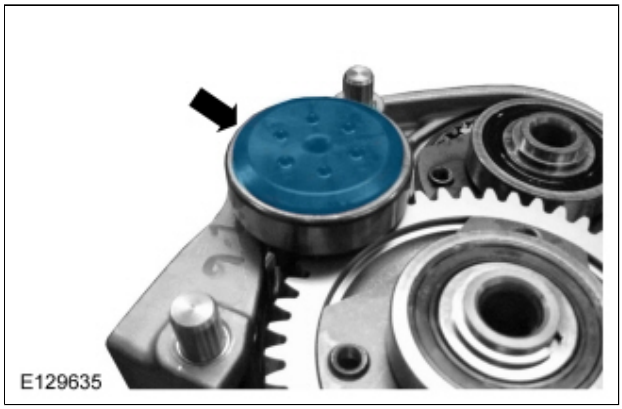
15. Install the 3rd gear shift fork.



16. Install the 4 shift fork rods.
    1. Install the small shift fork rods.
    2. Install the large shift fork rods.



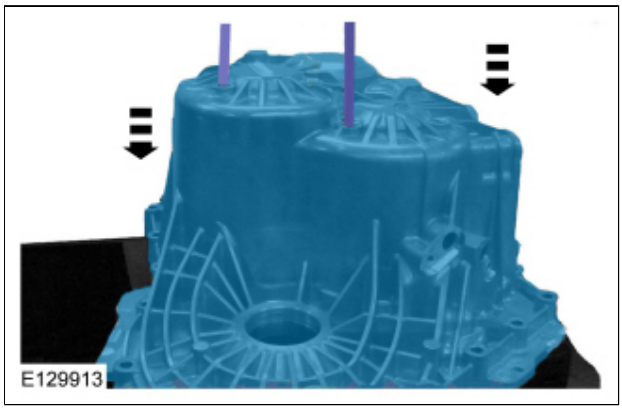
17. Install the oil spout.



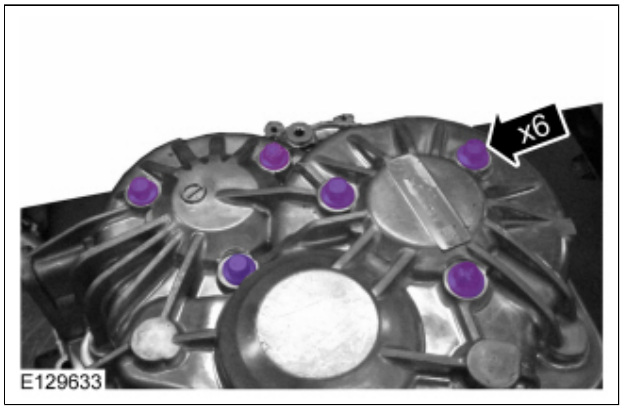
18. **NOTE:** Make sure the output shaft bearing retainer brackets are positioned as shown.

    Install the special tools on the output shafts assemblies.

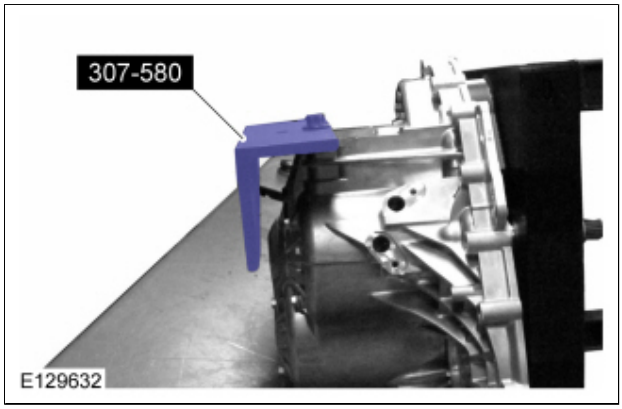
19. Install the transaxle case onto the gearset assemblies.



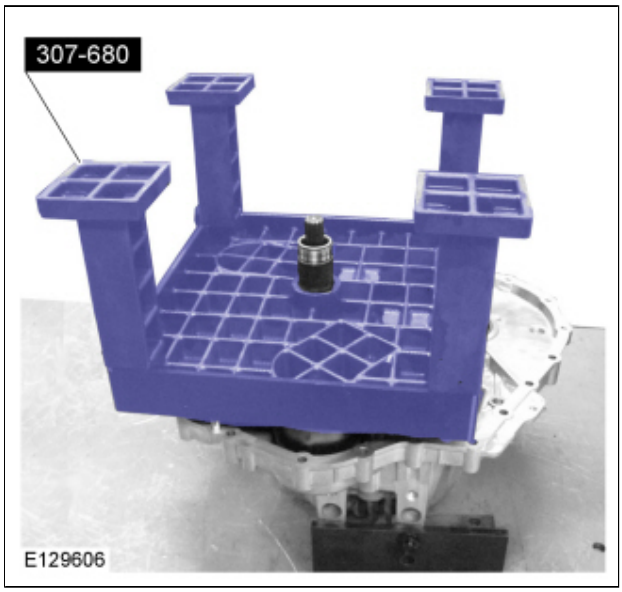
20. Install the 6 new output shaft bearing retainer bolts. Tighten in 2 stages.
    - Stage 1: tighten to 10 Nm (89 lb-in).
    - Stage 2: tighten to 32 Nm (24 lb-ft).



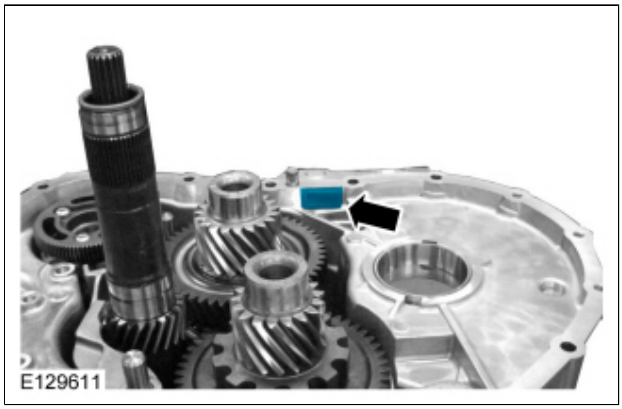
21. Install the special tool on the transaxle case.



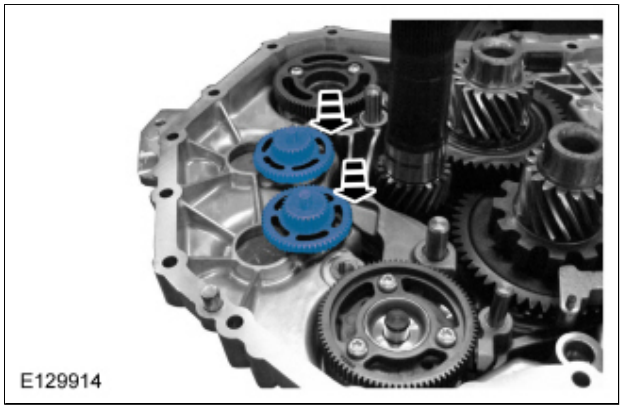
22. Turn the transaxle case and gearset assembly over onto the special tool.
23. Remove the special tool.



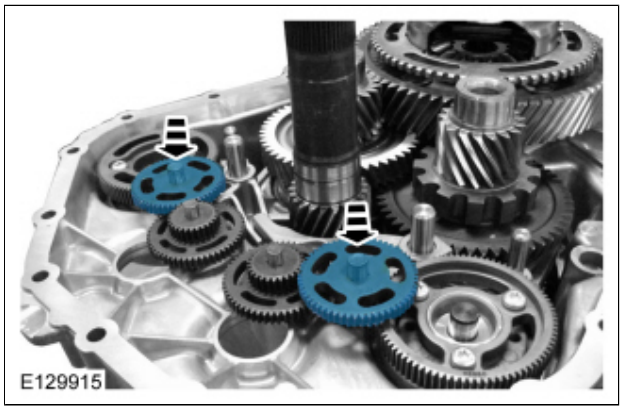
24. Install the magnet.



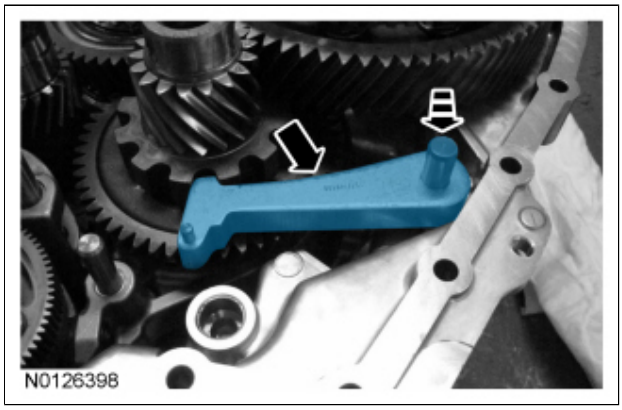
25. Install the small clock gears and clock gear pins.



26. Install the large clock gears and clock gear pins.

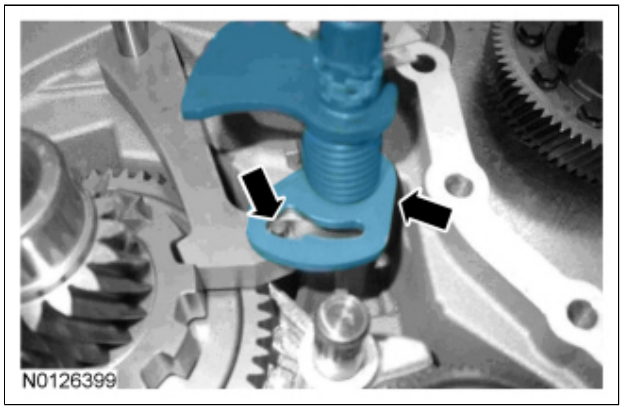


27. Install the park pawl and park pawl rod.



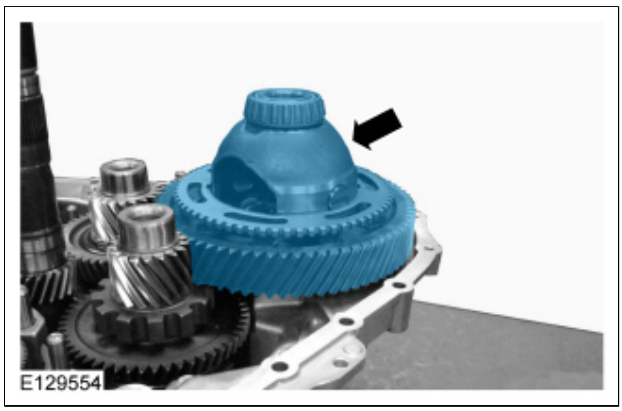
28. **NOTE:** Make sure the pin is installed as shown.

    Install the park pawl actuation shaft assembly.



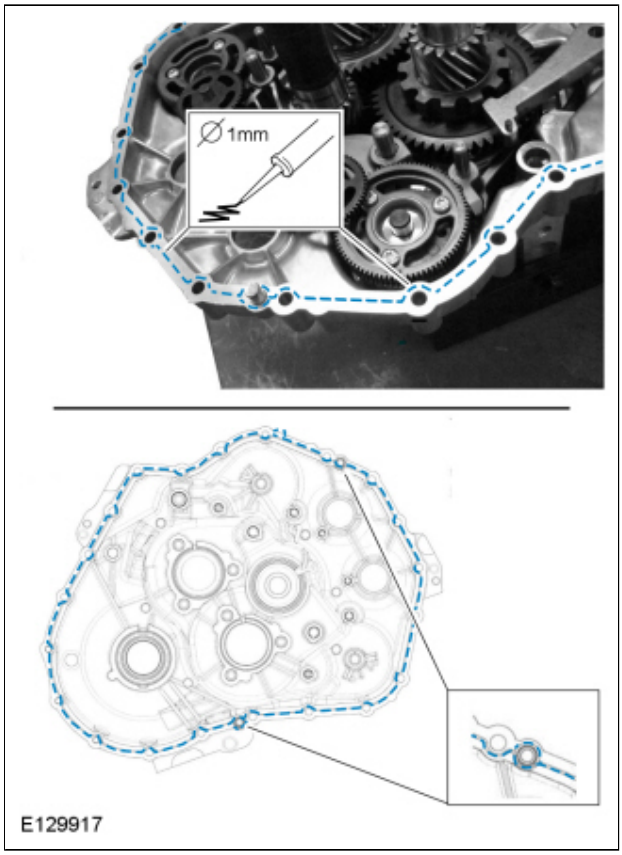
29. **NOTE:** If the differential bearings, differential, clutch housing and/or transaxle case are replaced refer to Differential Shim Selection in this section.

    Install the differential.



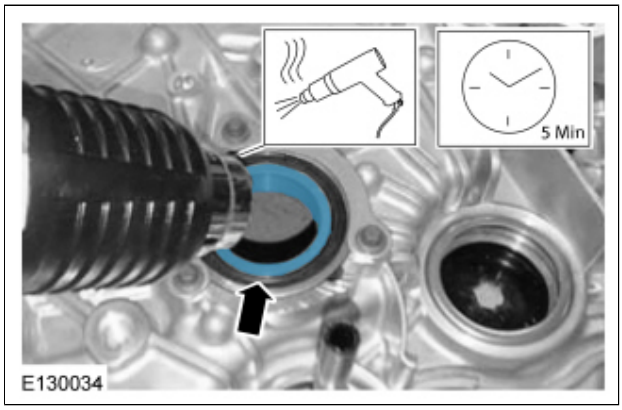
30. ***NOTICE:*** **Make sure the transaxle case and the clutch housing are clean and no old sealant is present or transmission fluid leaks can occur and cause transaxle damage.**

    Apply a 1 mm (0.039 in) bead of Gasket Maker around the inside of the bolt holes on the case side and completely around each dowel.

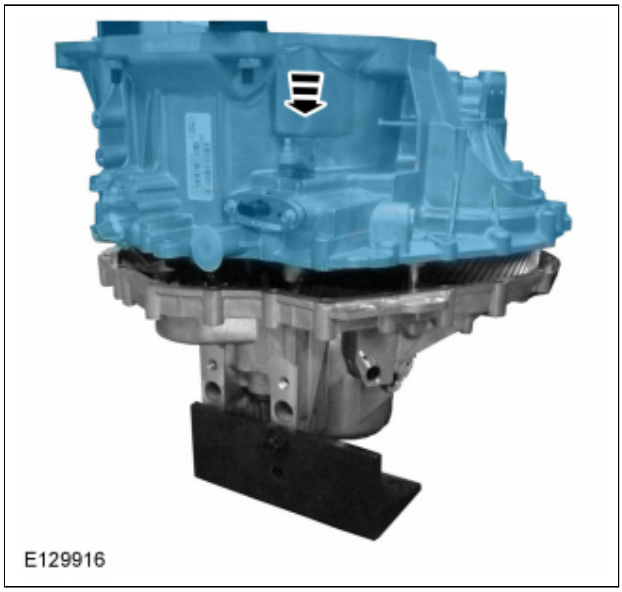


31. ***NOTICE:*** **Do not overheat the bearing or damage to the bearing may occur.**

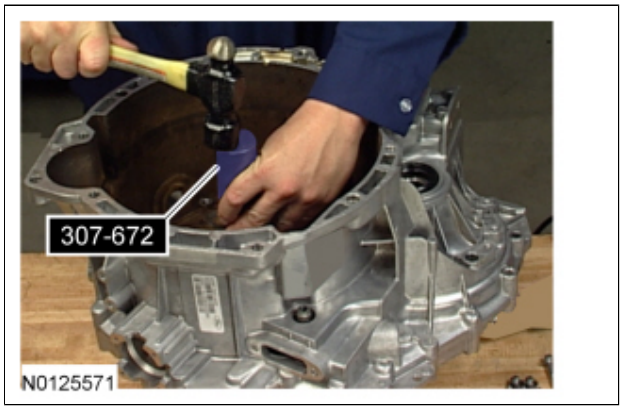
    Using a 1500W heat gun, or equivalent, heat the input shaft bearing in the clutch housing for approximately 5 minutes.



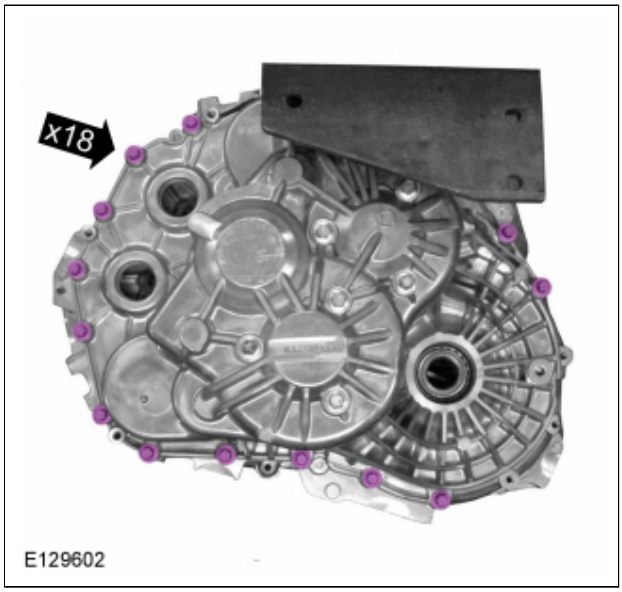
32. Install the clutch housing onto the transaxle case.



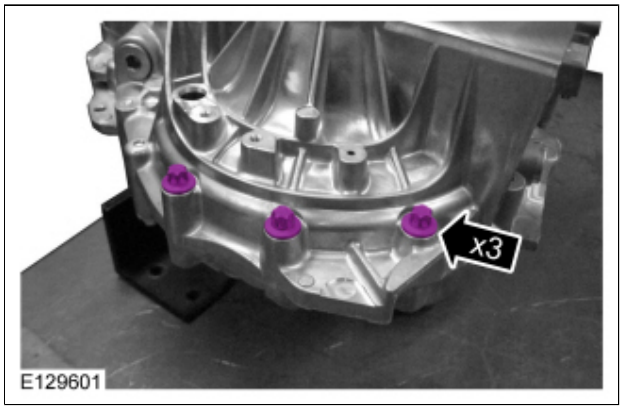
33. Using the special tool and a hammer, tap the clutch housing down onto the transaxle case.



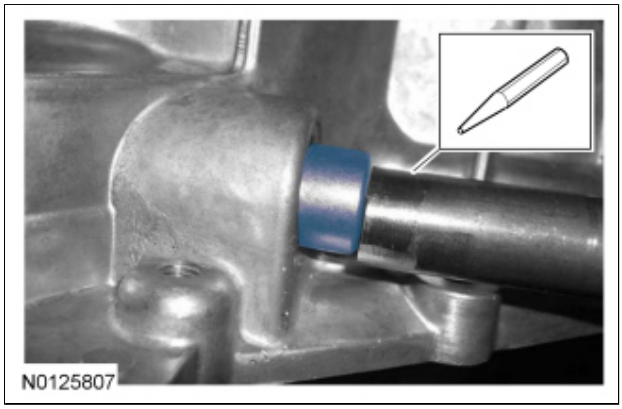
34. Install the 18 bottom clutch housing-to-case bolts (13 shown).
    - Tighten to 27 Nm (20 lb-ft).



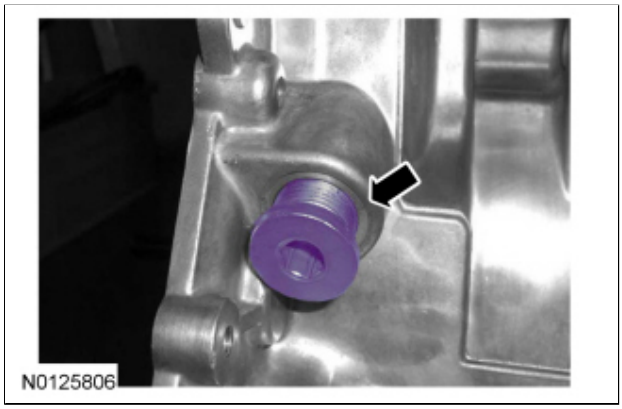
35. Install the 3 top clutch housing-to-case bolts.
    - Tighten to 27 Nm (20 lb-ft).



36. Install the park plunger.

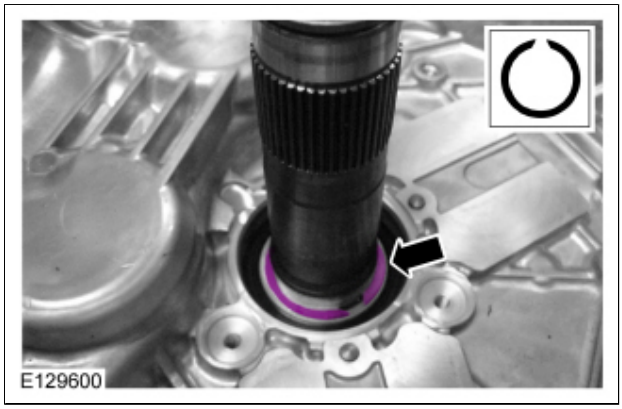


37. Install the park plunger plug.
    - Tighten to 43 Nm (32 lb-ft).

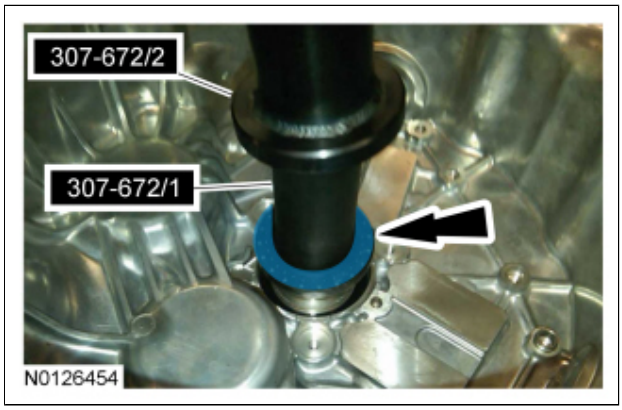


38. Install the manual control lever and the new manual control lever bolt.
    - Tighten to 26 Nm (19 lb-ft).

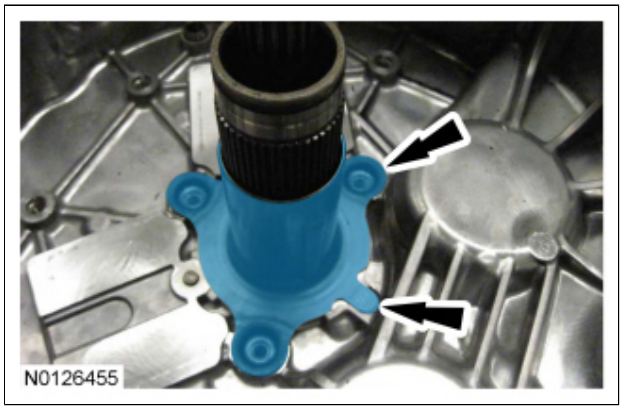
39. Install a new input shaft snap ring.



40. Using the special tools, install a new input shaft case seal.

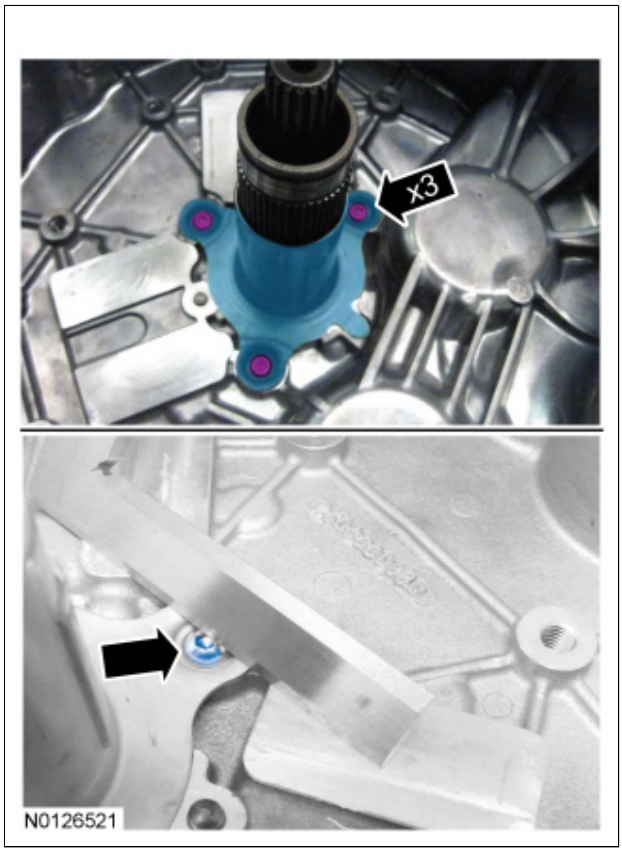


41. Using the locating flange on the guide tube, install the guide tube.

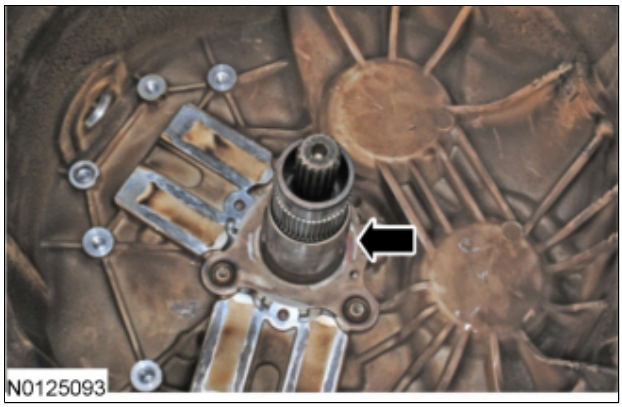


42. **NOTE:** The guide tube bolts must not project beyond the mounting surface of the clutch engagement levers.

    Install the 3 guide tube bolts.
    - Tighten to 8 Nm (71 lb-in).

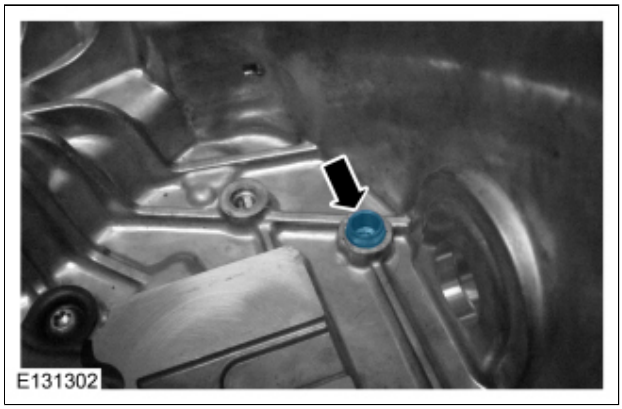


43. Inspect the guide tube for wear or damage. Replace as necessary.



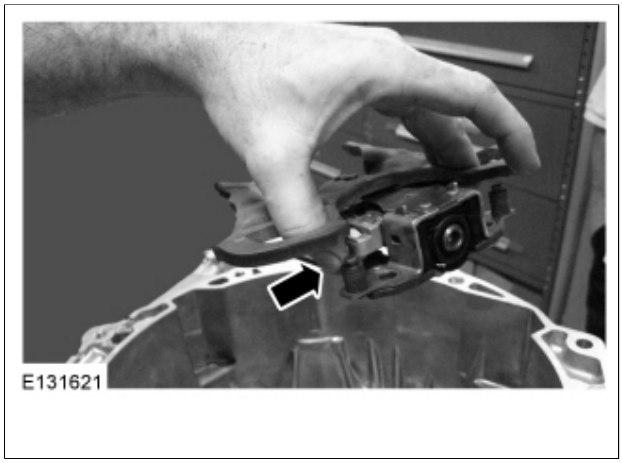
44. **NOTE:** One clutch actuator lever bushing shown, one per clutch actuator lever.

    Install the clutch actuator lever bushings.



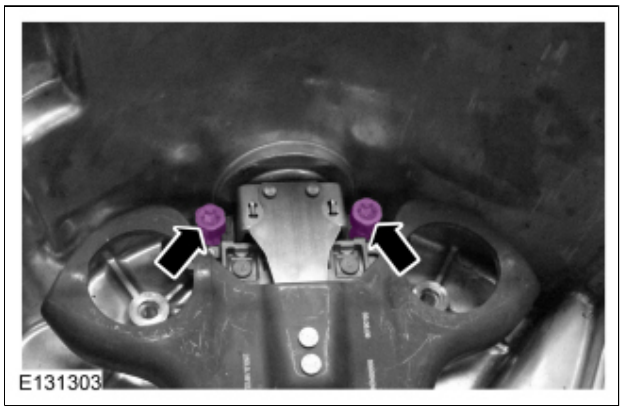
45. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

    Install the clutch actuator lever 2.



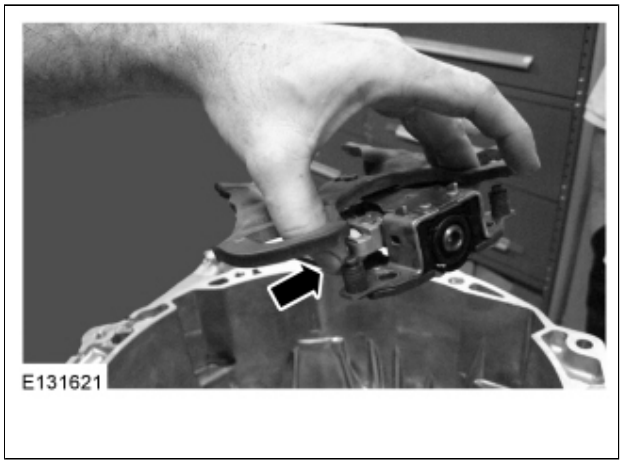
46. Install clutch motor 2 without the bolts to aide in the alignment of the clutch actuator lever.

47. Install the 2 clutch actuator lever 2 bolts.
    - Tighten to 19 Nm (168 lb-in).



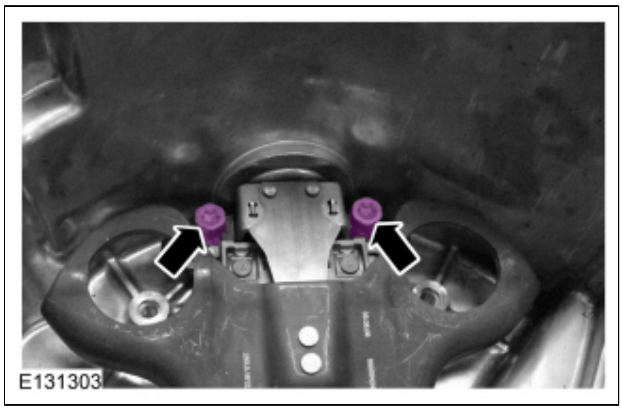
48. ***NOTICE:*** **Be sure to properly handle the actuator lever as shown or damage may occur.**

    Install the clutch actuator lever 1.



49. Install clutch motor 1 without the bolts to aide in the alignment of the clutch actuator lever.

50. Install the 2 clutch actuator lever 1 bolts.
    - Tighten to 19 Nm (168 lb-in).

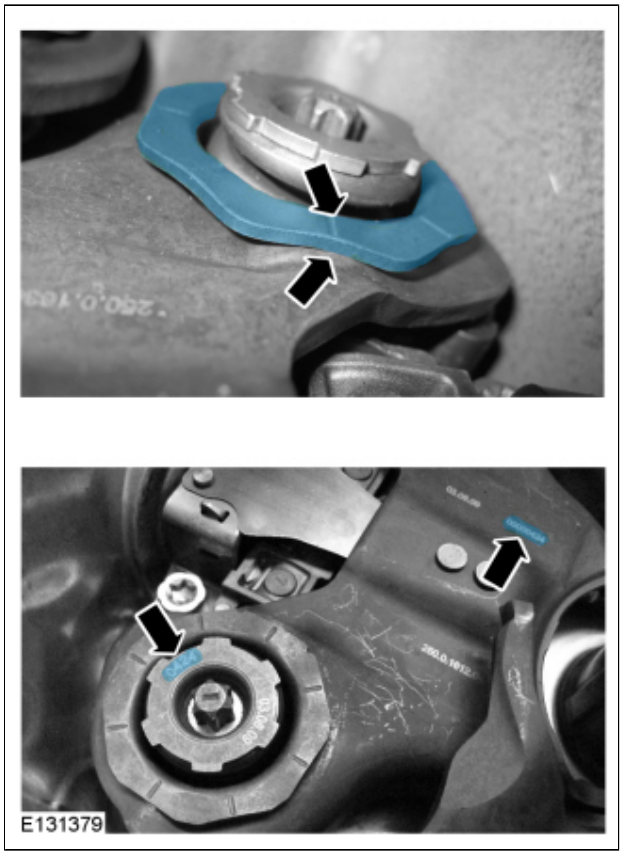


51. ***NOTICE:*** **Tighten the spring retainer bolts by tightening them slightly in an alternating pattern or damage can occur to the clutch actuator levers.**

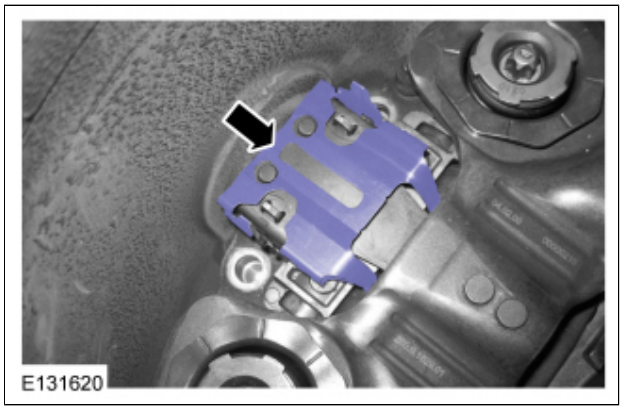
    NOTE: Make sure the spring retainer contour aligns with the actuator lever contour as shown.

    NOTE: Make sure the serial number on the spring retainer matches the serial number on the actuator lever. If reusing the spring retainers and actuator levers use the marks made during removal for assembly.

    Install the spring retainers and spring retainer bolts.
    - Tighten to 26 Nm (19 lb-ft).



52. Remove the clutch actuator lever locks if installed.

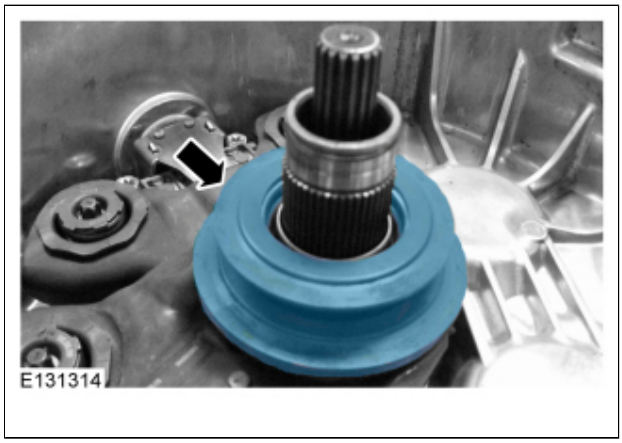


53. **NOTE:** The engagement system bearing unit should be installed easily.

    Install the engagement system bearing unit.

54. ***NOTICE:*** **Do not tilt transaxle after the Z-washers are installed, they may come off center and damage can occur.**

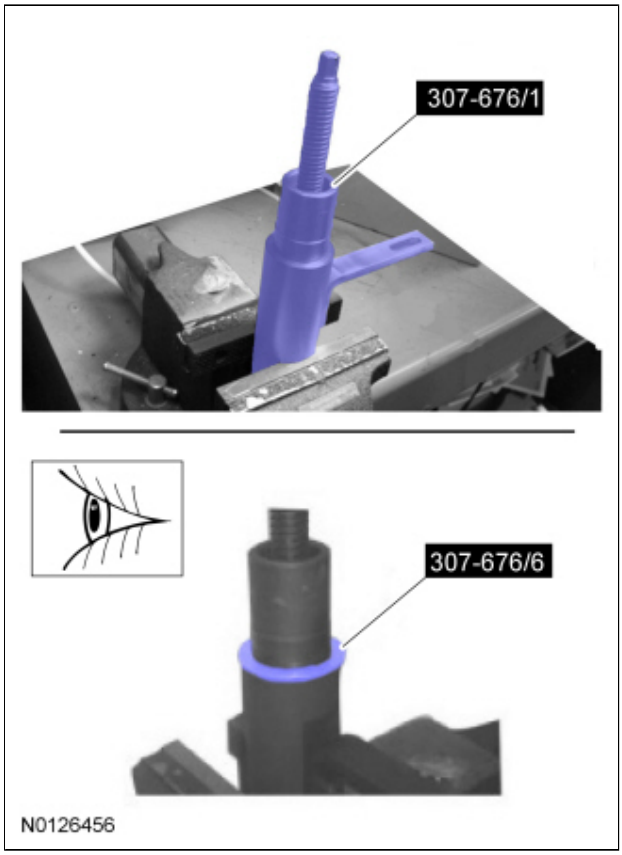
    Install the Z-washers onto the engagement system bearing unit and center them correctly.



55. If installing a new clutch go to step 19.

56. **NOTE:** Make sure the special tool washer is also installed.

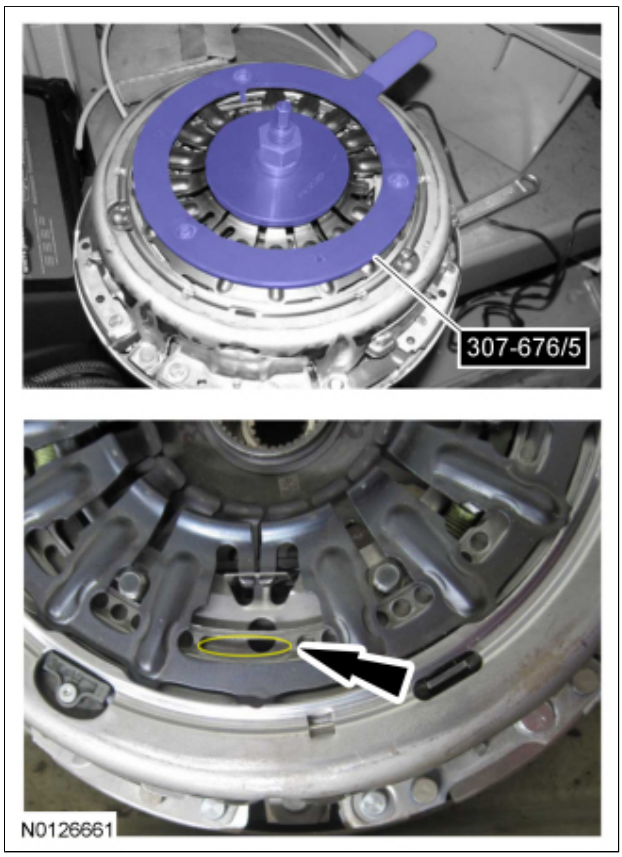
    Install the special tool in a vise.



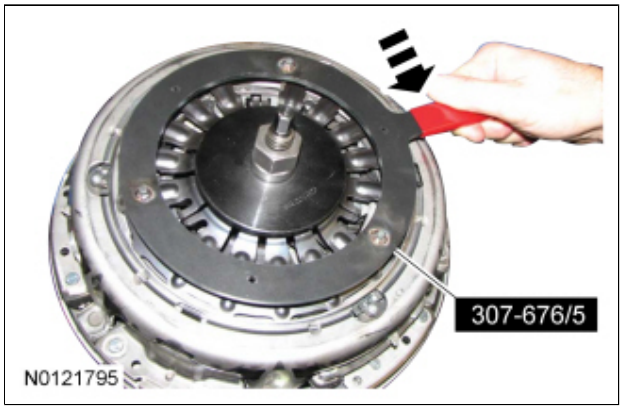
57. Place the clutch on the special tool and align one clutch stud with the slotted hole on the special tool.

58. Install the special tool loosely on the clutch.

59. Install the special tool on the clutch making sure the legs are inserted in the slots.

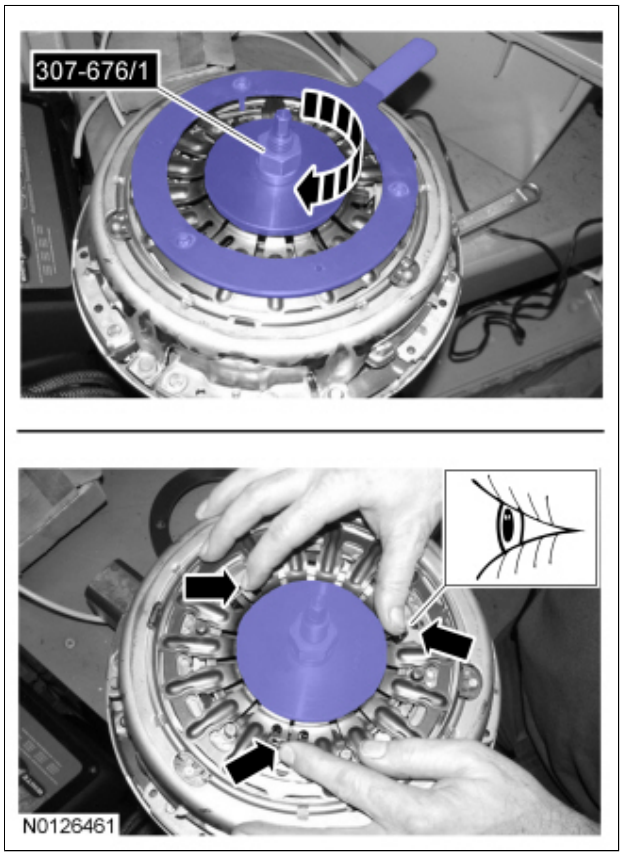


60. Turn the special tool clockwise to the stops and hold.

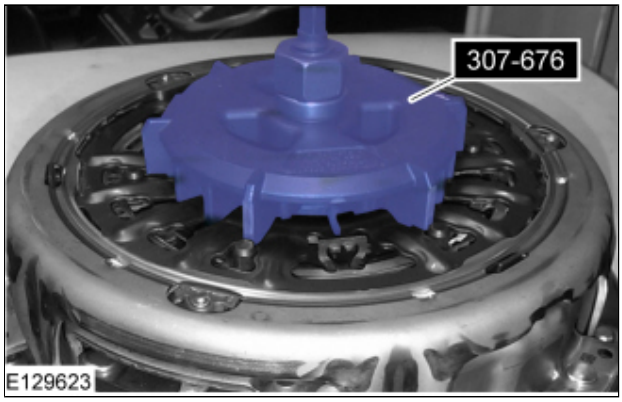


61. ***NOTICE:*** **Failure to rotate the self-adjuster to the stops before compressing the clutch, causes damage to the clutch.**

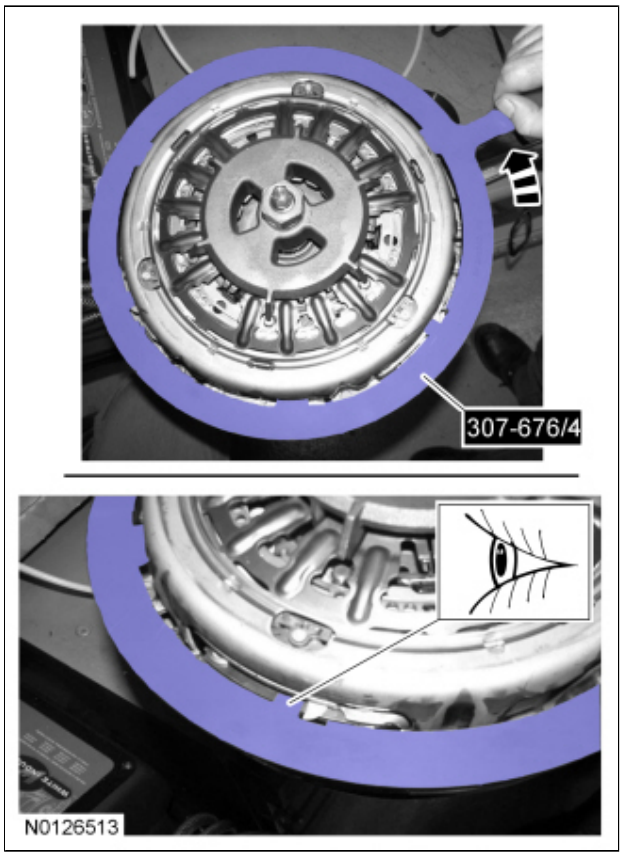
    Tighten the special tool until the 3 clutch 1 locks can be locked in place by hand.



62. Install the special tool loosely on the clutch.



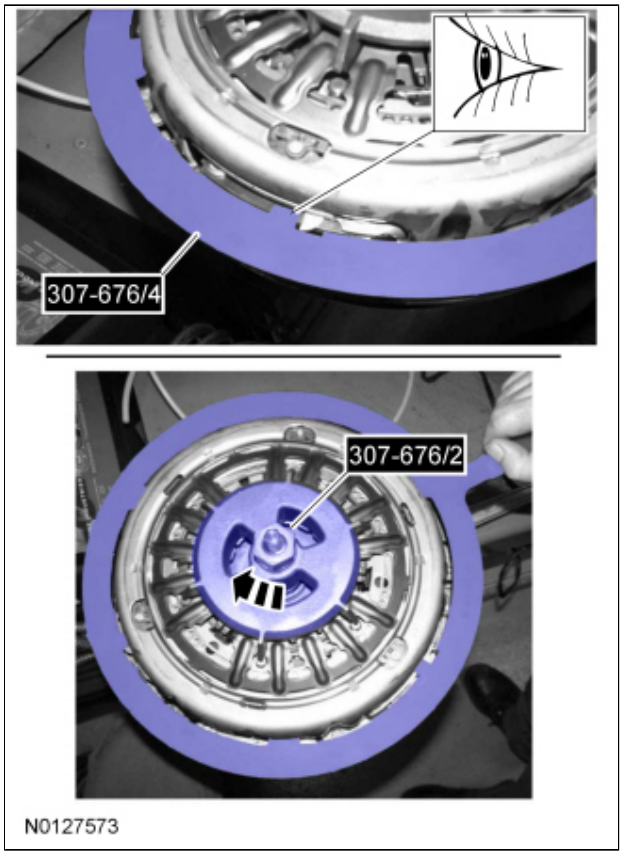
63. Using the special tool, move the clutch self-adjuster counterclockwise to the stop and hold.



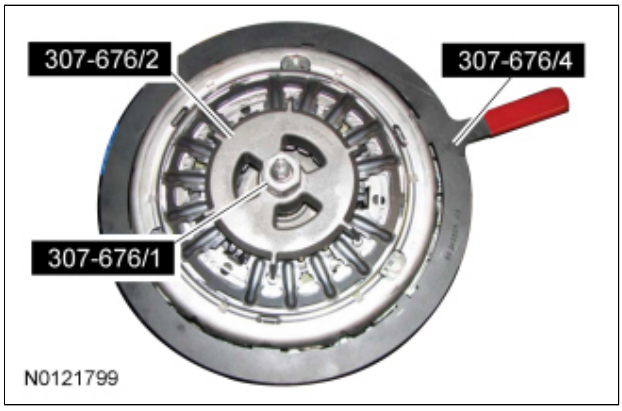
64. ***NOTICE:*** **Make sure the clutch self-adjuster is held to the stops before compressing the clutch or damage will occur to the clutch.**

    NOTE: An audible click can be heard when the clutch locks lock.

    While holding the clutch self-adjuster to the stops, use the special tool and compress the clutch to the stops on the clutch. The locks on clutch 2 lock at this time.

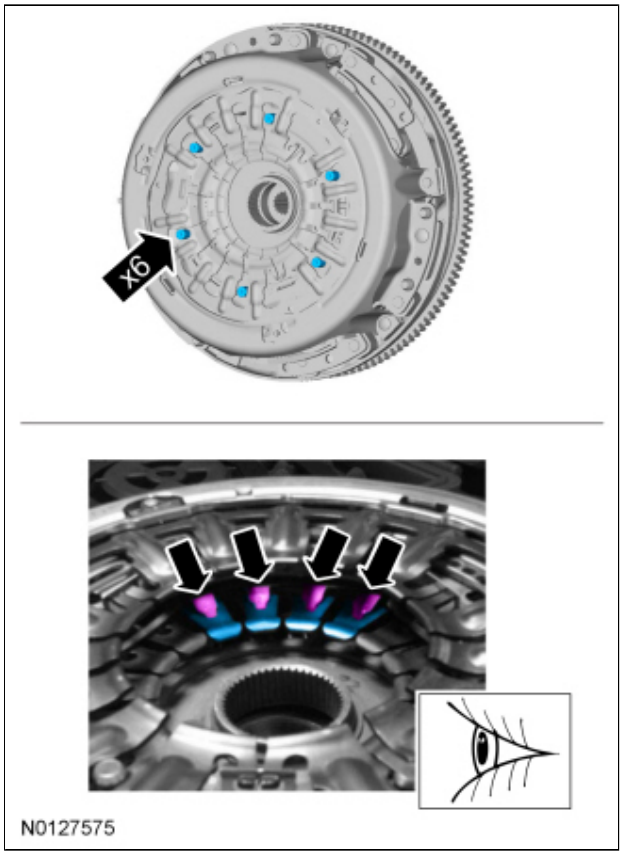


65. Remove the special tools.



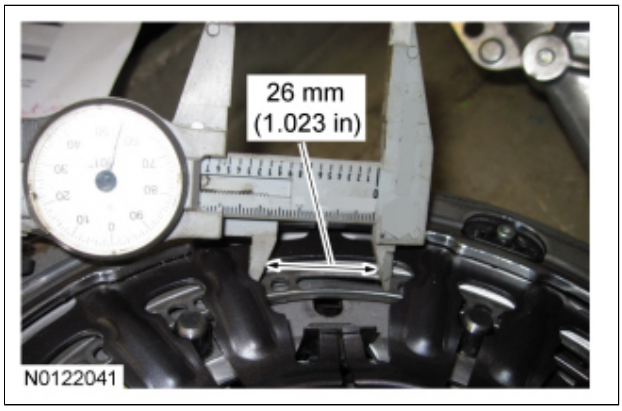
66. **NOTE:** The minimum number of engaged clutch locks is 6. Make sure the 6 locked clutch fingers align with the clutch studs as shown. If not, reset the clutch 2 locks as necessary.

    Visually check the locks to make sure they have locked. 4 locks shown, 12 total.

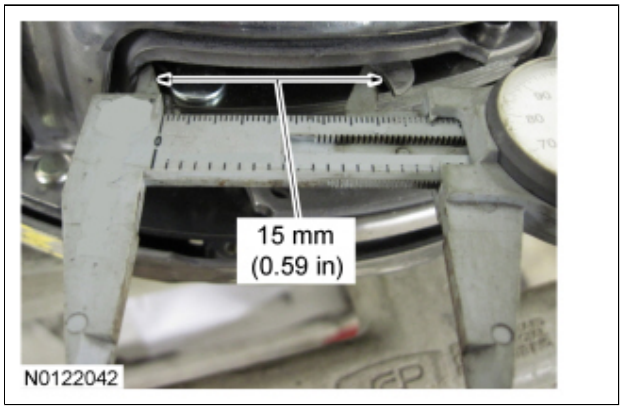


67. If installing a used clutch, verify the clutch is not worn or damaged. Perform the next 2 steps to check for clutch wear.

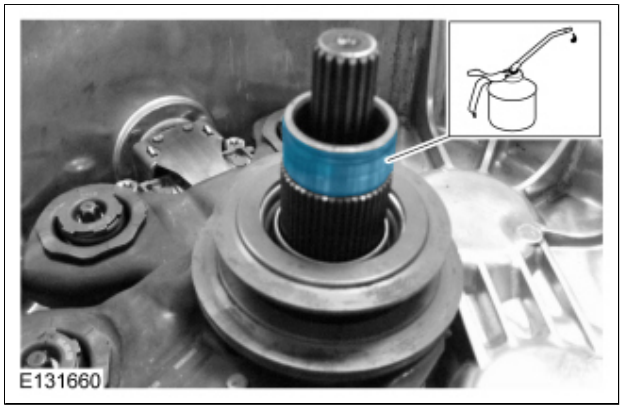
68. Check clutch 1 for wear by measuring the distance between the adjuster ring 1 long hole and lever 1 spring. Replace the clutch assembly if the measurement is 26 mm (1.023 in) or less.



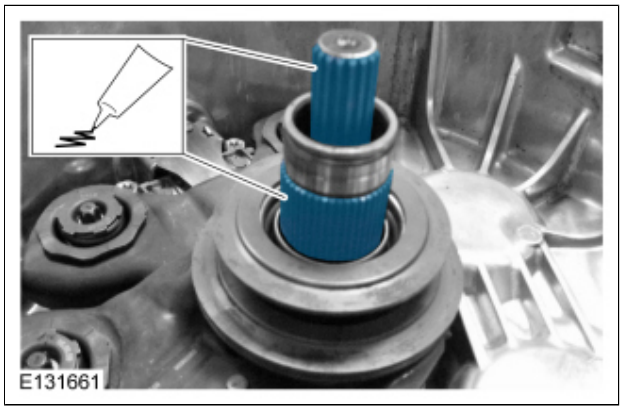
69. Check clutch 2 for wear by measuring the distance between adjuster ring 2 and the cover. Replace the clutch assembly if the measurement is 15 mm (0.59 in) or less.



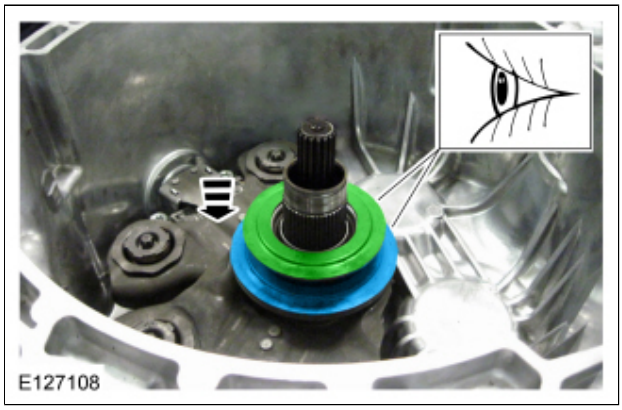
70. Apply a small amount of transmission fluid on the input shaft bearing surface.



71. Apply a small amount of DPS6 Grease on both input shaft splines.



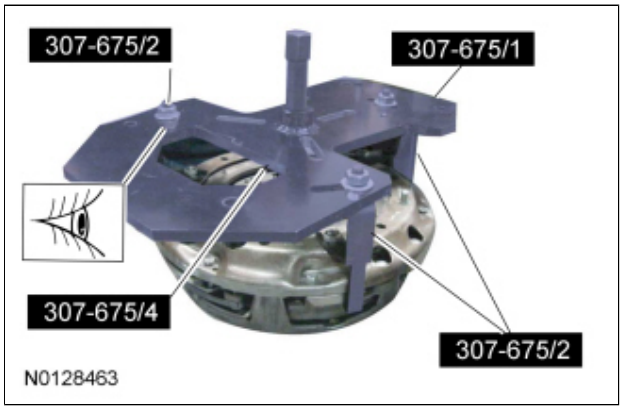
72. Verify the Z-washers are installed correctly.



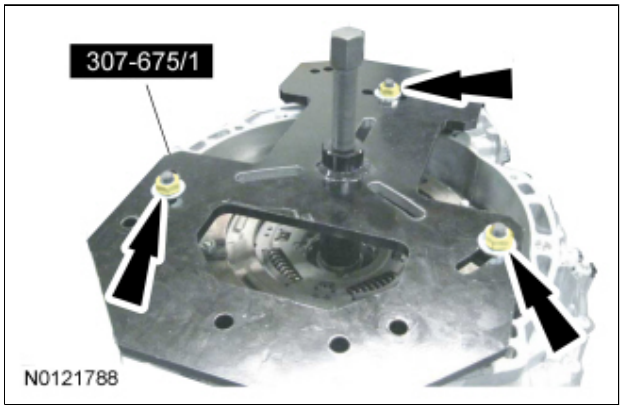
73. ***NOTICE:*** **Verify the clutch locks are locked prior to installation or the transaxle may not operate correctly and damage can occur. If the clutch locks are not locked go to step 2 within this procedure.**

    NOTE: Make sure the angled lifting leg is installed in the location shown.

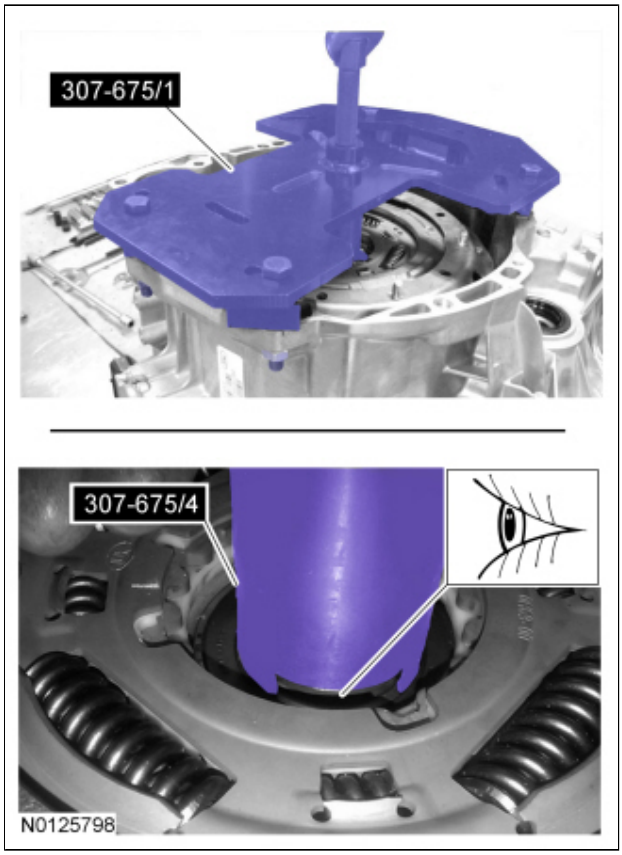
    Using the special tools, install the clutch in the transaxle.



74. Remove all the special tools.

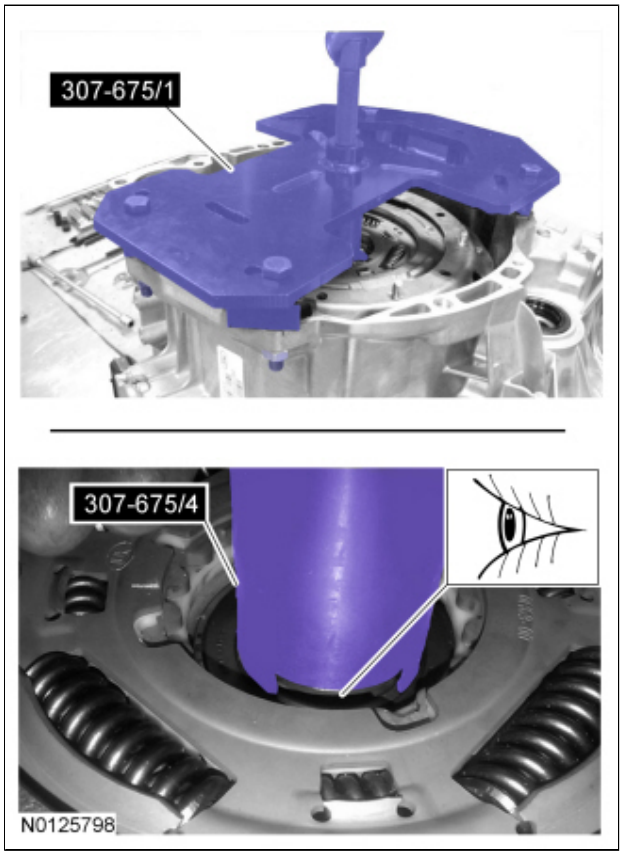


75. Install the special tools onto the transaxle case.



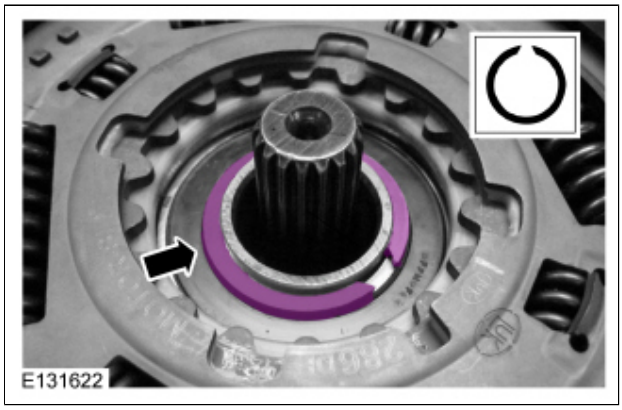
76. ***NOTICE:*** **Do not overtighten the special tool or damage can occur.**

Using the special tools, push the clutch down with approximately 5 Nm (44 lb-in) of torque until seated on the input shaft bearing and the snap ring groove is visible.



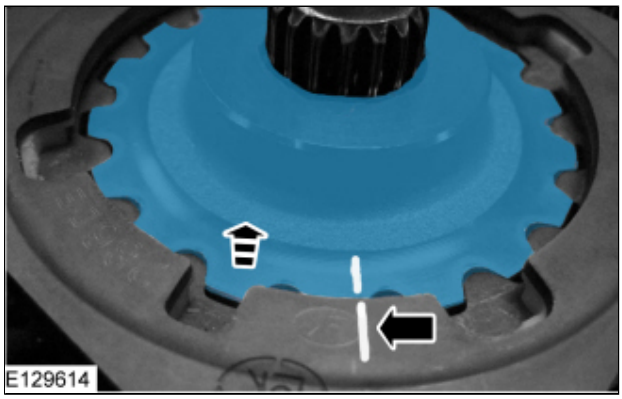
77. **NOTE:** Make sure the hollow input shaft snap ring is fully seated.

    Install the new hollow input shaft snap ring.

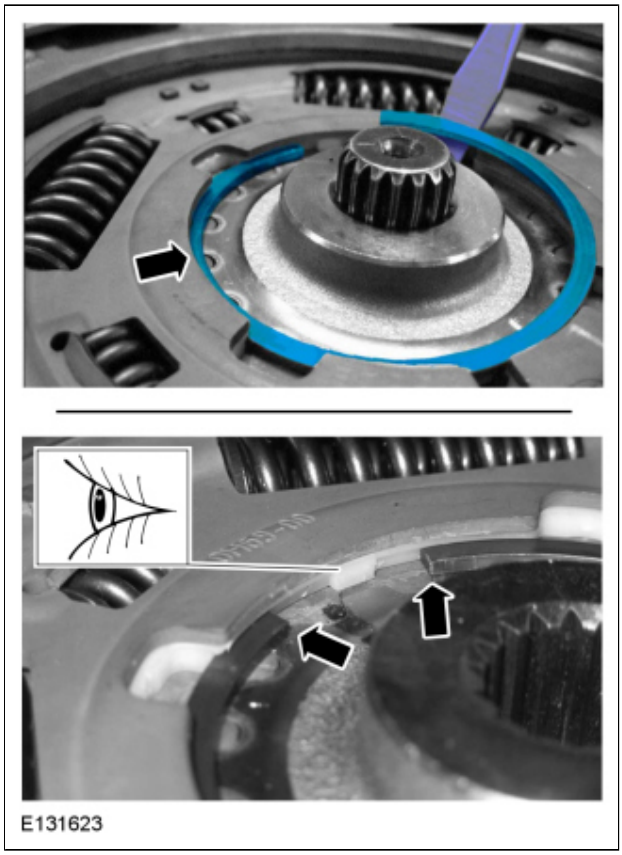


78. **NOTE:** Align the index marks on the clutch hub and clutch.

    Install the clutch hub.

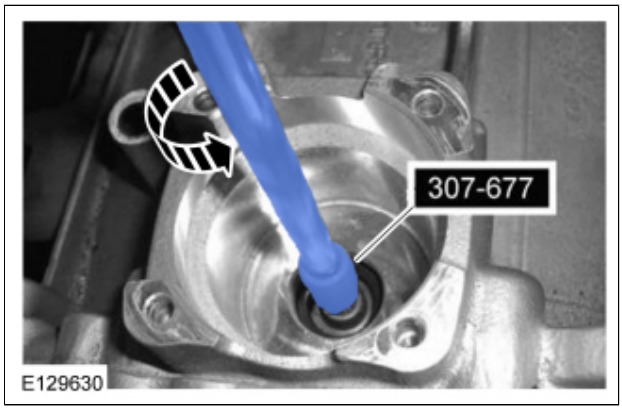


79. Install the new clutch hub snap ring in the position shown.

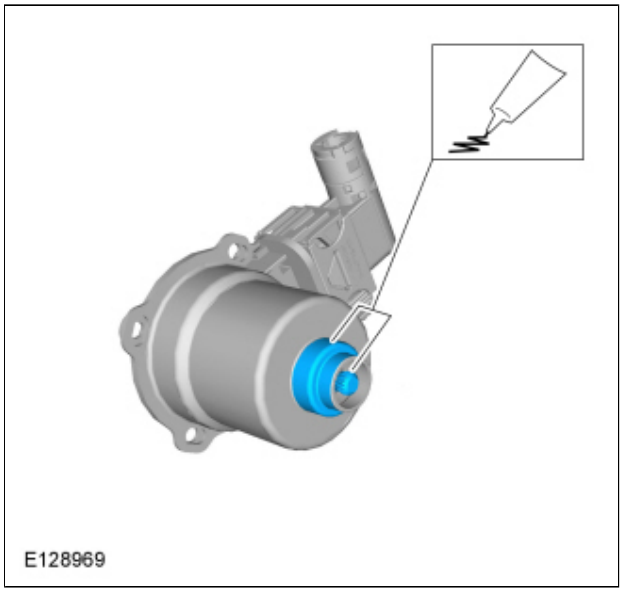


80. ***NOTICE:*** **Do not turn the special tool more than 12 turns or damage to the clutch actuator engagement lever can occur.**

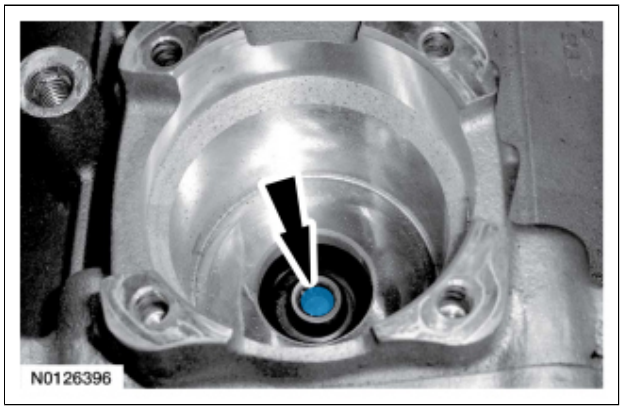
    Using the special tool, release the clutch 1 locks and then the clutch 2 locks by slowly turning the special tool counterclockwise. An audible click will be heard when the clutch locks are released.



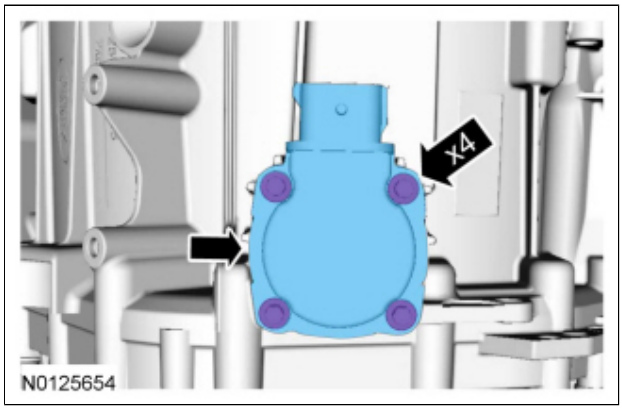
81. Apply High Temperature Nickel Anti-Seize Lubricant to both clutch motor surfaces where indicated.



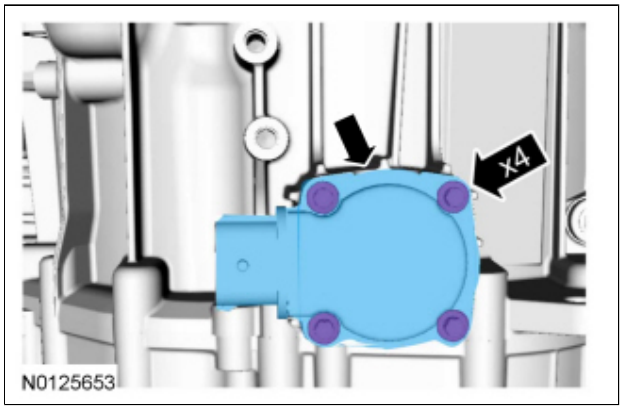
82. Apply High Temperature Nickel Anti-Seize Lubricant to the clutch actuator lever splines as shown.



83. Install the clutch motor 2 and the 4 clutch motor 2 bolts.
    - Tighten to 5 Nm (44 lb-in).



84. Install the clutch motor 1 and the 4 clutch motor 1 bolts.
    - Tighten to 5 Nm (44 lb-in).

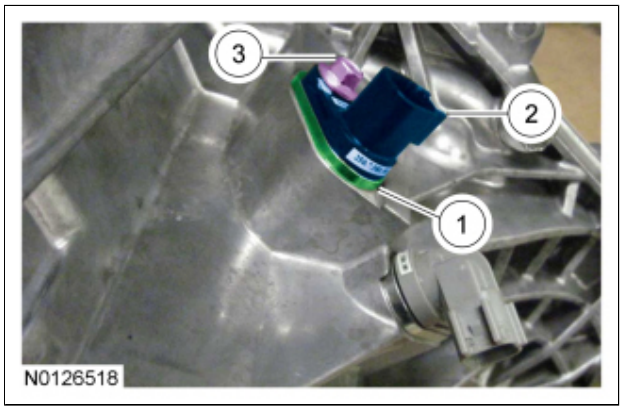


85. ***NOTICE:*** **Be sure to use the 3.2 mm (0.125 in) input shaft speed sensor 2 shim or damage can occur to the transaxle.**

NOTE: Install a new O-ring if installing the existing input shaft speed sensor 2.

NOTE: Use a small amount of transmission fluid on the input shaft speed sensor 2 O-ring for installation.

Install the input shaft speed sensor 2.
1. Install the input shaft speed sensor 2 shim.
2. Install the input shaft speed sensor 2.
3. Install the input shaft speed sensor 2 bolt.
    - Tighten to 10 Nm (89 lb-in).

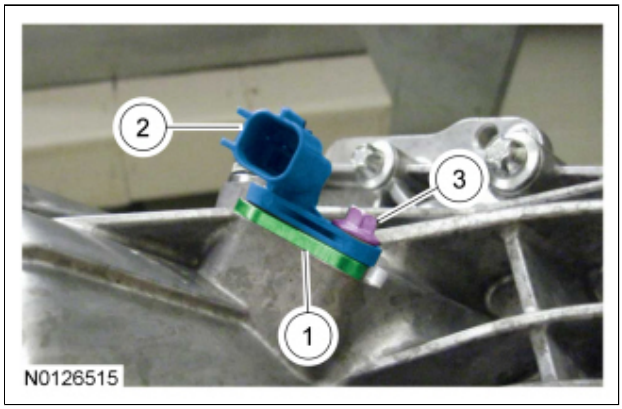


86. ***NOTICE:*** **Be sure to use the 3.5 mm (0.137 in) input shaft speed sensor 1 shim on input shaft speed sensor 1 or damage can occur to the transaxle.**

NOTE: Install a new O-ring if installing the existing input shaft speed sensor 1.

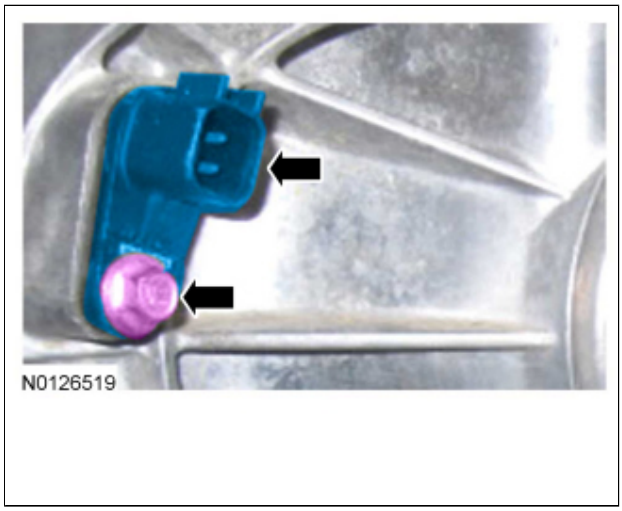
NOTE: Use a small amount of transmission fluid on the input shaft speed sensor 1 O-ring for installation.

Install the input shaft speed sensor 1.
1. Install the input shaft speed sensor 1 shim.
2. Install the input shaft speed sensor 1.
3. Install the input shaft speed sensor 1 bolt.
    - Tighten to 10 Nm (89 lb-in).

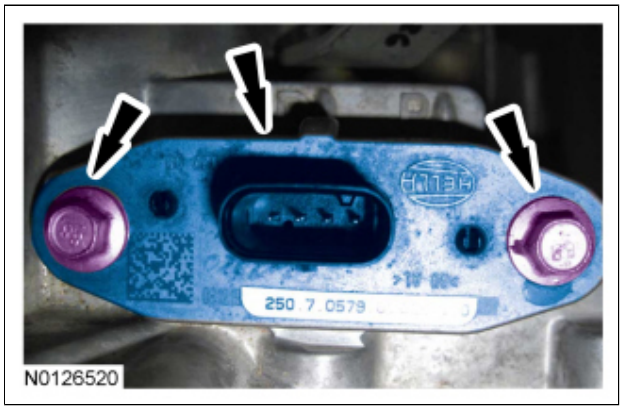


87. **NOTE:** If installing the old OSS sensor, install a new O-ring.

    Install the OSS sensor and the OSS sensor bolt.
    - Tighten to 10 Nm (89 lb-in).



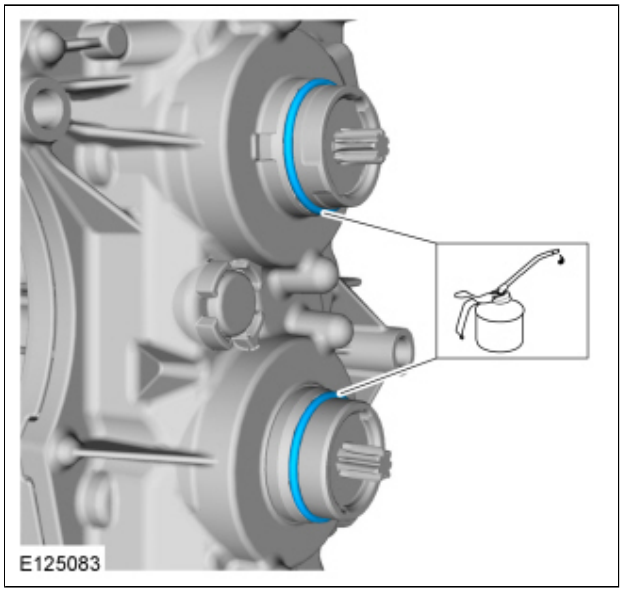
88. Install the TR sensor and the 2 TR sensor bolts.
    - Tighten to 10 Nm (89 lb-in).



89. Carefully inspect the TCM and the transaxle bore for debris or damage. Clean and/or repair as needed.

90. **NOTE:** Use a small amount of transmission fluid on the new O-rings prior to installation.

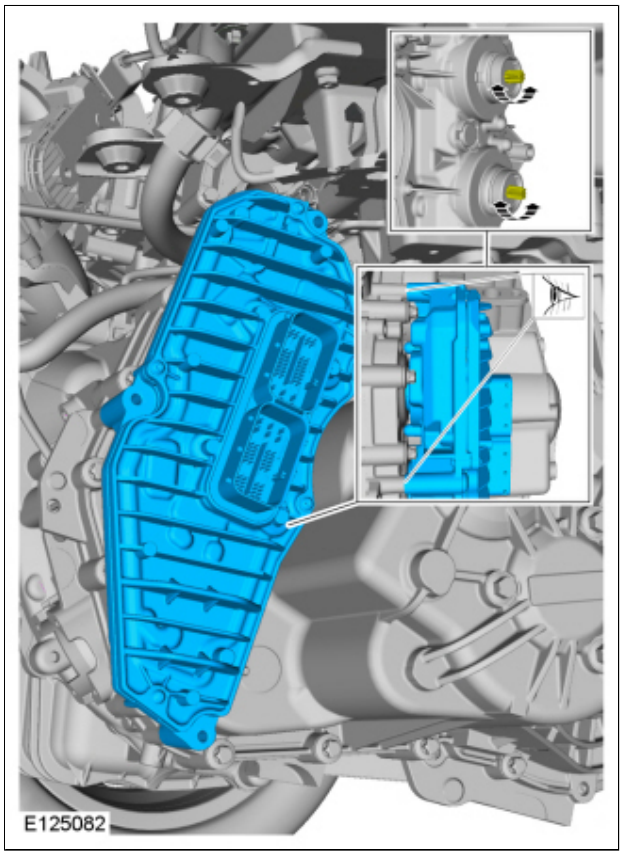
    Install new O-rings if the TCM is being reused.



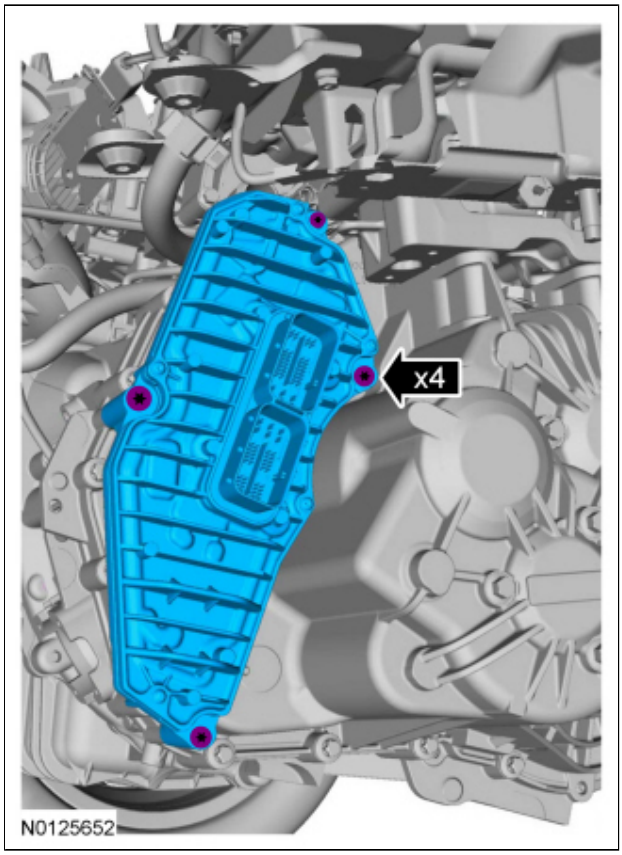
91. ***NOTICE:*** **Do not force the TCM onto the transaxle or damage may occur.**

    NOTICE: **Make sure the TCM sits flush on the transaxle or damage can occur.**

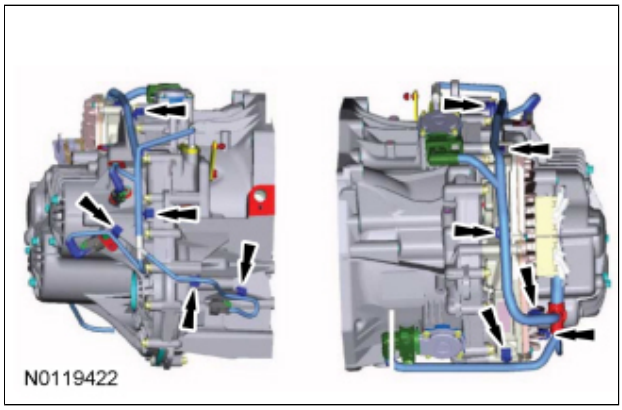
    Install the TCM on the transaxle. Apply light pressure to seat the O-rings. If the TCM does not push in place with light pressure, remove the TCM and slightly turn the TCM gears and retry installing the TCM on the transaxle.



92. Install the 4 TCM bolts.
    - Tighten to 27 Nm (20 lb-ft).



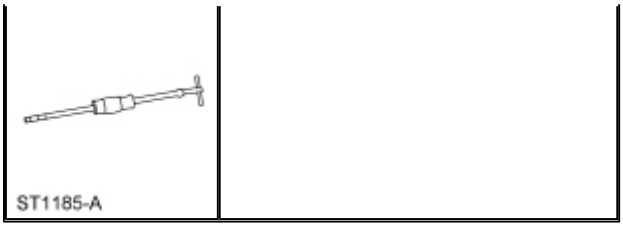
93. Install the transaxle wiring harness.



Clutch Housing

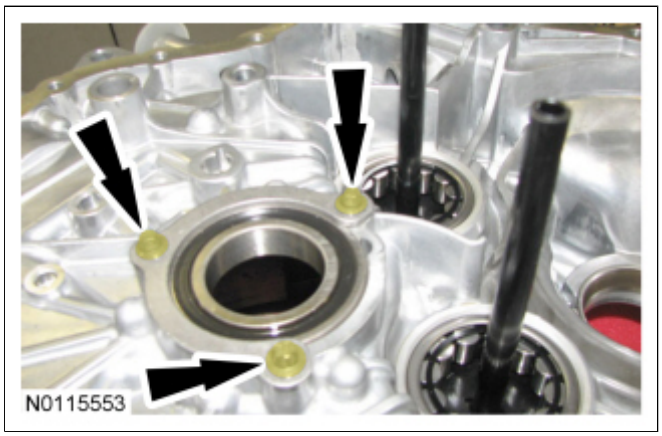
Special Tool(s)

 ST1608-A	Collet, 1 1/4" to 1 1/2" 303-D022
ST3214-A	Forcing Screw 204-594
ST1255-A	Handle 205-153
 ST3226-A	Installer, Countershaft Needle Bearing 307-679
ST2350-A	Installer, Differential Bearing Cup 205-118
ST3218-A	Installer, Output Shaft Seal 307-671
ST3225-A	Remover, Differential Bearing Cup 307-678
	Slide Hammer 100-001



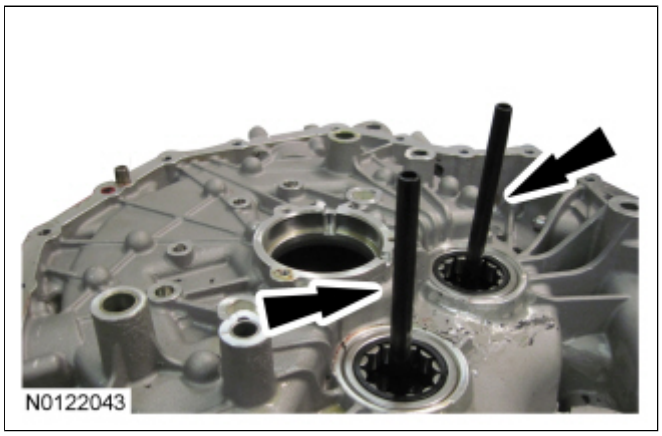
Disassembly

1. Remove and discard the clutch housing input shaft bearing retainer bolts and remove clutch housing input shaft bearing retainer.



2. By lightly tapping, remove and discard the clutch housing input shaft bearing.

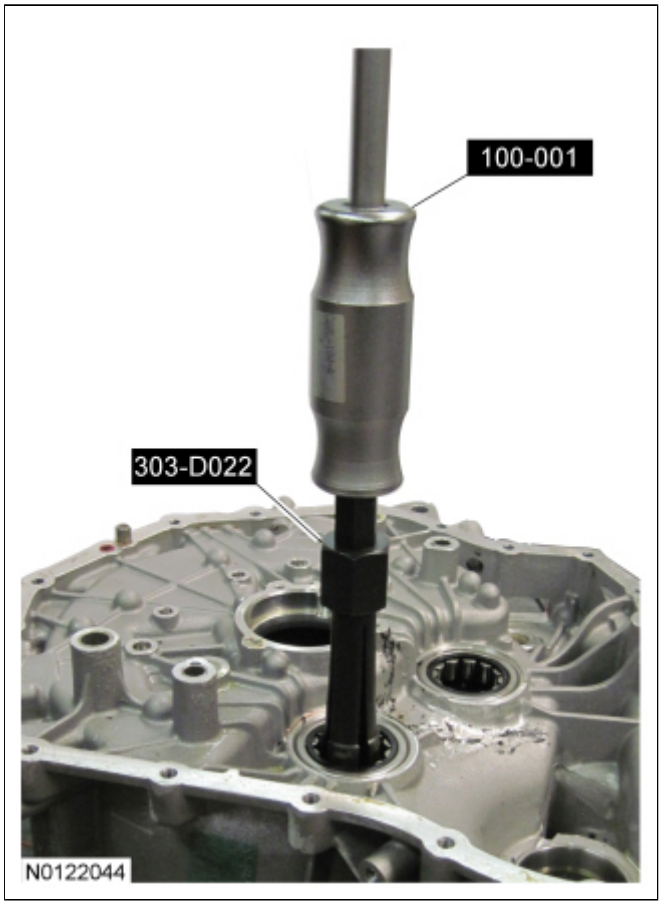
3. Break the lube feed tubes off the clutch housing output shaft bearings and discard.



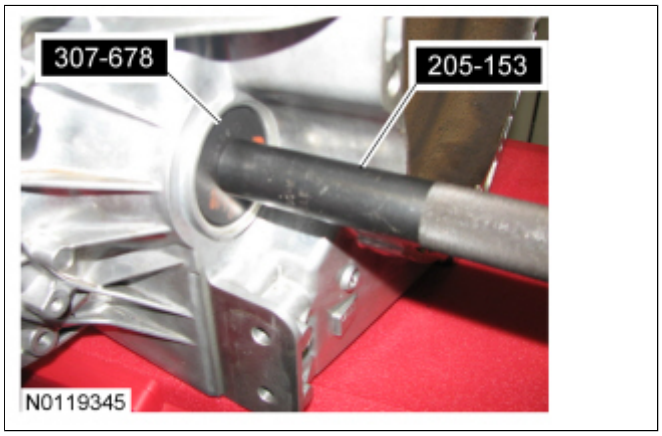
4. **NOTE:** If the clutch housing output shaft bearing is broken, use the next size larger special tool.

   NOTE: The clutch housing output shaft bearing 1 is shown, the clutch housing output shaft bearing 2 is similar.

   Using the special tool, remove the 2 clutch housing output shaft bearings.



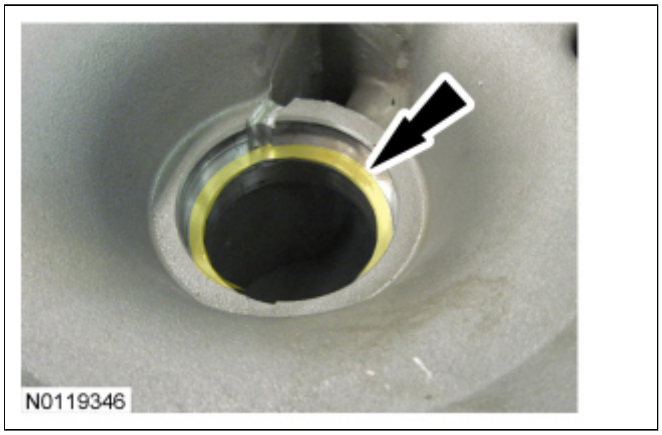
5. Using the special tools, remove the clutch housing differential bearing race and shim.



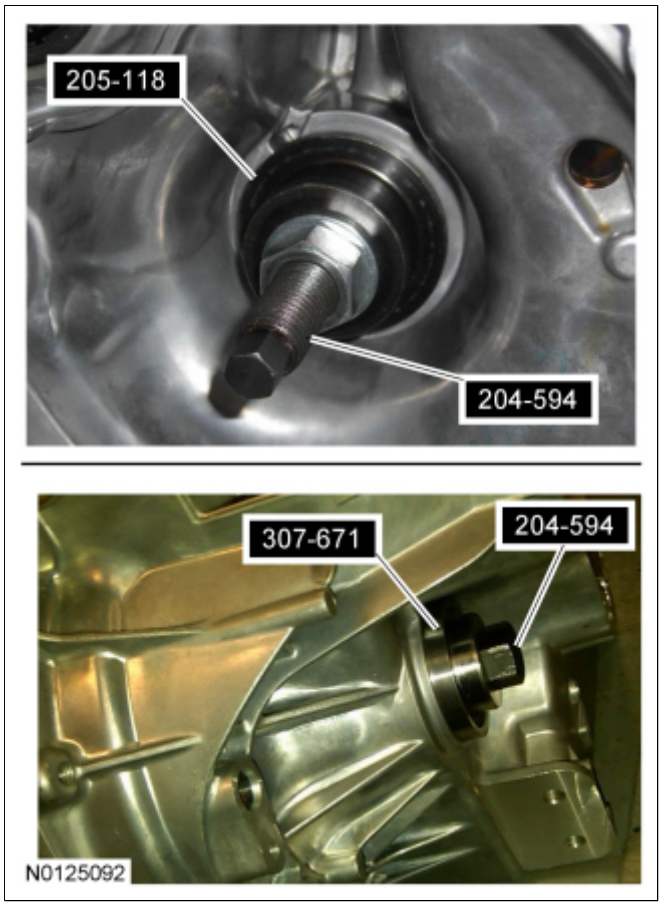
Assembly

1. **NOTE:** If new differential bearings, differential, clutch housing or transaxle case are installed refer to the Differential Shim Selection in this section.

   Install the clutch housing differential bearing shim.

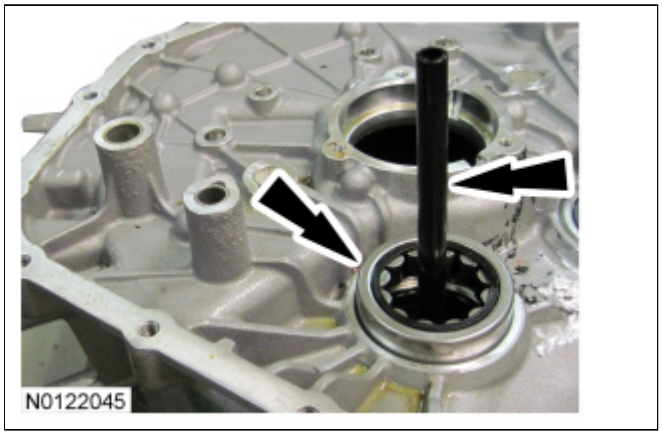


2. Using the special tools, install the clutch housing differential bearing race.



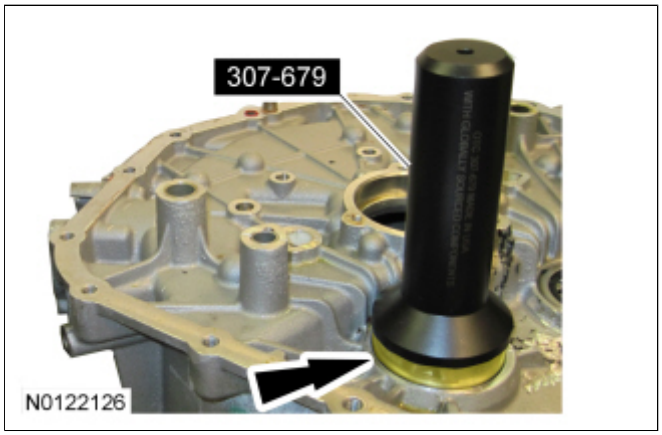
3. **NOTE:** The clutch housing output shaft bearing 1 is shown, the clutch housing output shaft bearing 2 is similar.

   Install the new lube feed tubes and position the clutch housing output shaft bearings into the clutch housing.

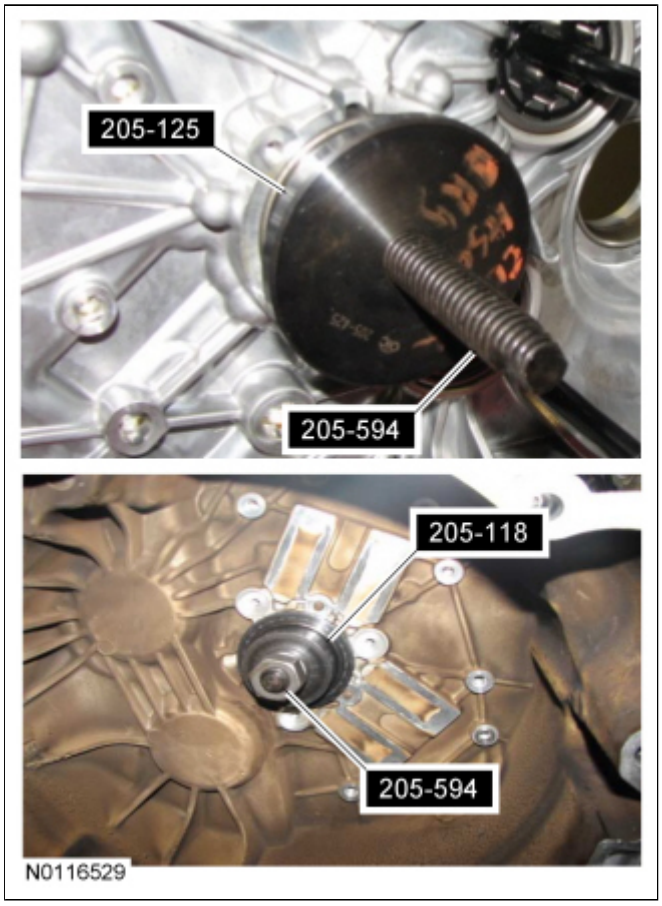


4. **NOTE:** The clutch housing output shaft bearing 1 is shown, the clutch housing output shaft bearing 2 is similar.

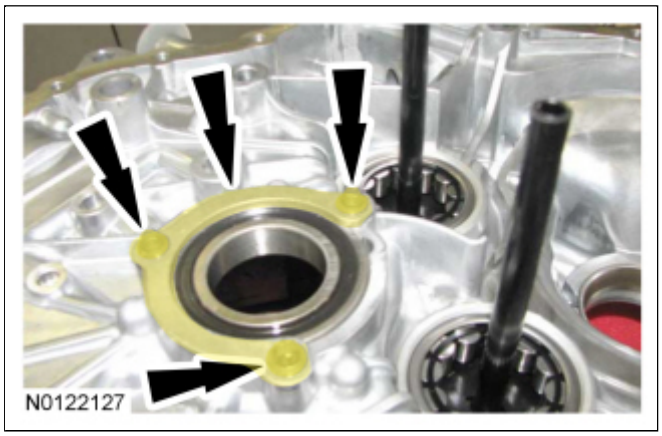
   Using the special tool, install the 2 clutch housing output shaft bearings.



5. Using the special tools, install the new clutch housing input shaft bearing.



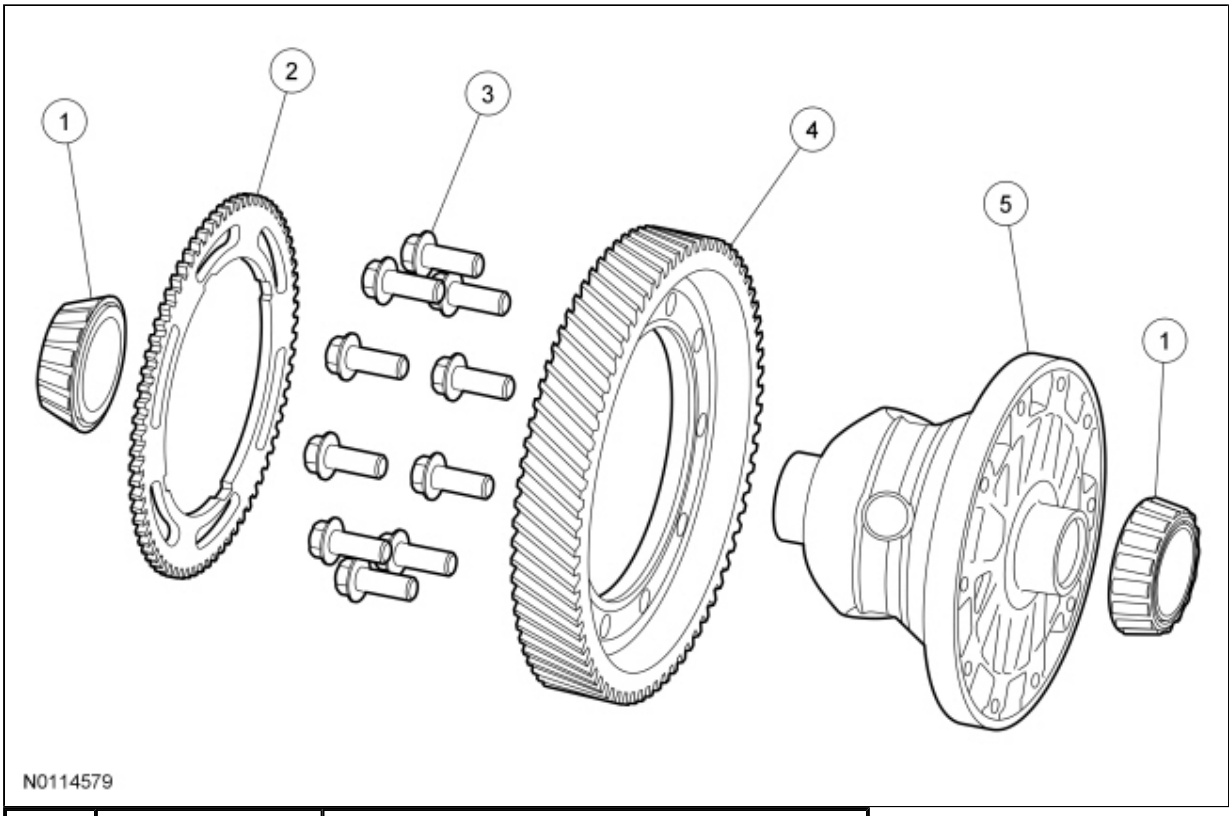
6. Install the clutch housing input shaft bearing retainer and the new clutch housing input shaft bearing retainer bolts.
    - Tighten to 11 Nm (97 lb-in).



Differential

Special Tool(s)

ST1653-A	Handle 205-153
ST3242-A	Installer, Differential Bearing 205-206
 ST2785-A	Puller, Bearing 205-D064
ST2770-A	Remover/Installer, Front Wheel Hub 204-069
 ST1935-A	Step Plate 205-D014

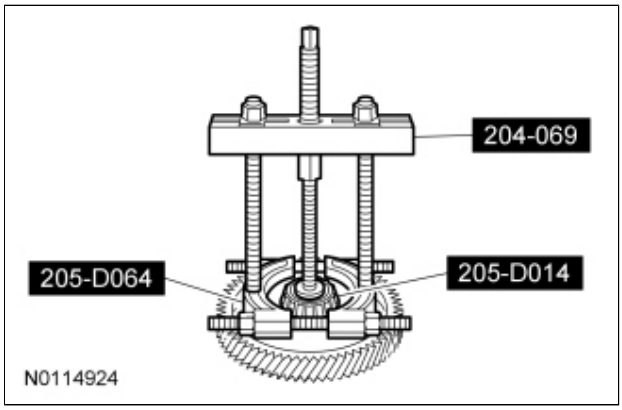


Item	Part Number	Description
1	4220	Differential bearings
2	7H150	Differential impulse ring
3	W790237	Differential ring gear bolts
4	—	Differential ring gear (part of 4026)
5	—	Differential case (part of 4026)

Disassembly

1. ***NOTICE:*** **Take care not to damage the differential impulse ring.**

   Using the special tools, remove and discard the differential bearings.



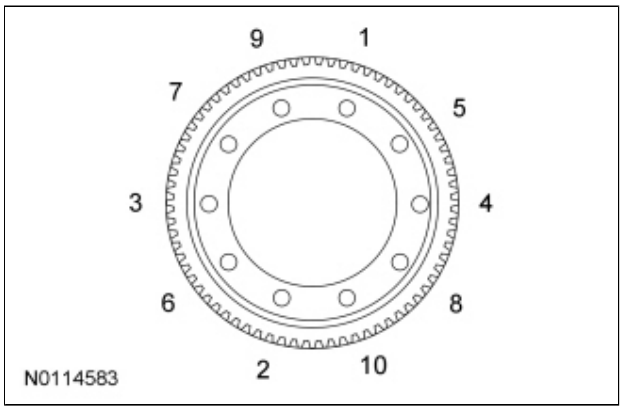
2. Using a 1500W heat gun, slightly heat the impulse ring. Remove the impulse ring.
3. Remove and discard the differential ring gear bolts. Lightly tap the ring gear to separate it from the differential case.
4. Clean all parts in clean solvent and dry with compressed air.

Assembly

1. Inspect differential parts for damage or wear. Repair or replace as needed.

2. Install the differential ring gear onto the differential case.

3. Install the new differential ring gear bolts.
   - Using the illustration, tighten to 85 Nm (63 lb-ft) in a star pattern.

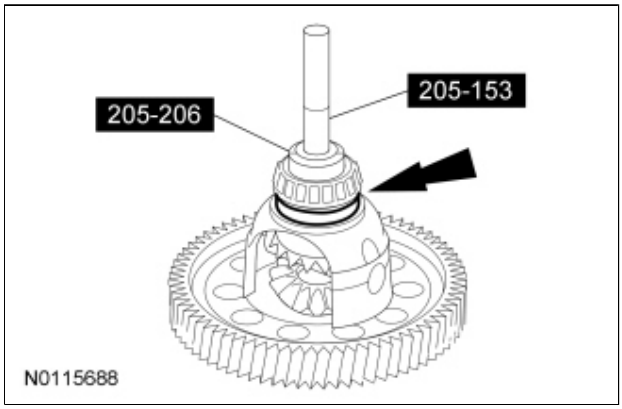


4. **NOTE:** Make sure the differential impulse ring is fully seated and flush on the differential.

   Using a 1500W heat gun, slightly heat the differential impulse ring. Install it onto the differential assembly.

5. ***NOTICE:*** **Take care not to damage the differential impulse ring.**

   Using the special tools, install the new differential bearings.



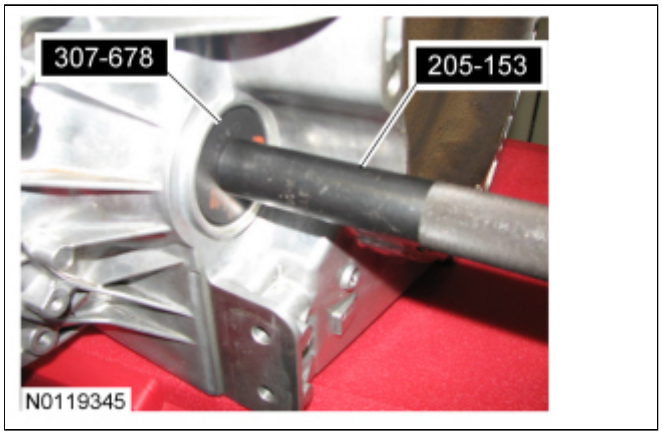
Differential Shim

Special Tool(s)

ST3214-A	Forcing Screw 204-594
ST2350-A	Installer, Differential Bearing Cup 205-118
ST1255-A	Handle 205-153
ST3218-A	Installer, Axle Seal 307-671
ST3225-A	Remover, Differential Bearing Cup 307-678

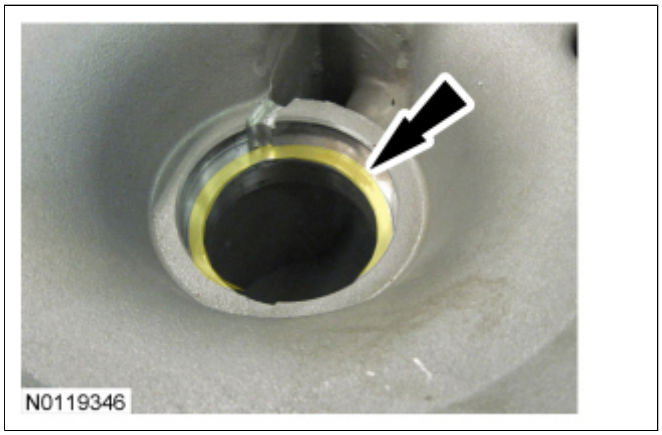
Disassembly

1. Using the special tools, remove the clutch housing differential bearing race and shim.

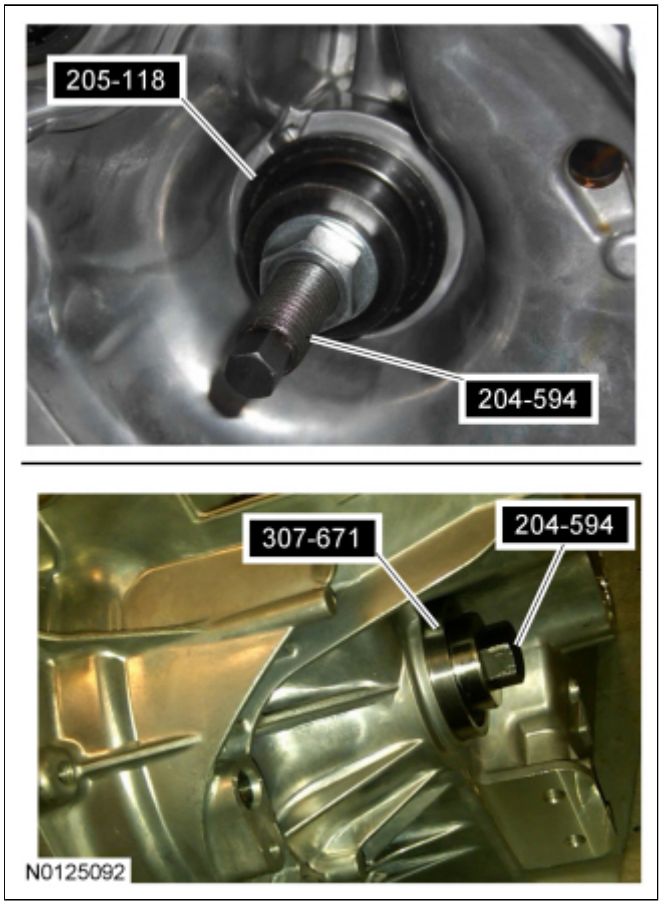


Assembly

1. Install the selected differential bearing shim. If the differential bearings, differential, clutch housing or transaxle case were replaced, refer to Differential Shim Selection in this section.



2. Using the special tools, install the differential bearing race.



205-118
204-594
307-671
204-594

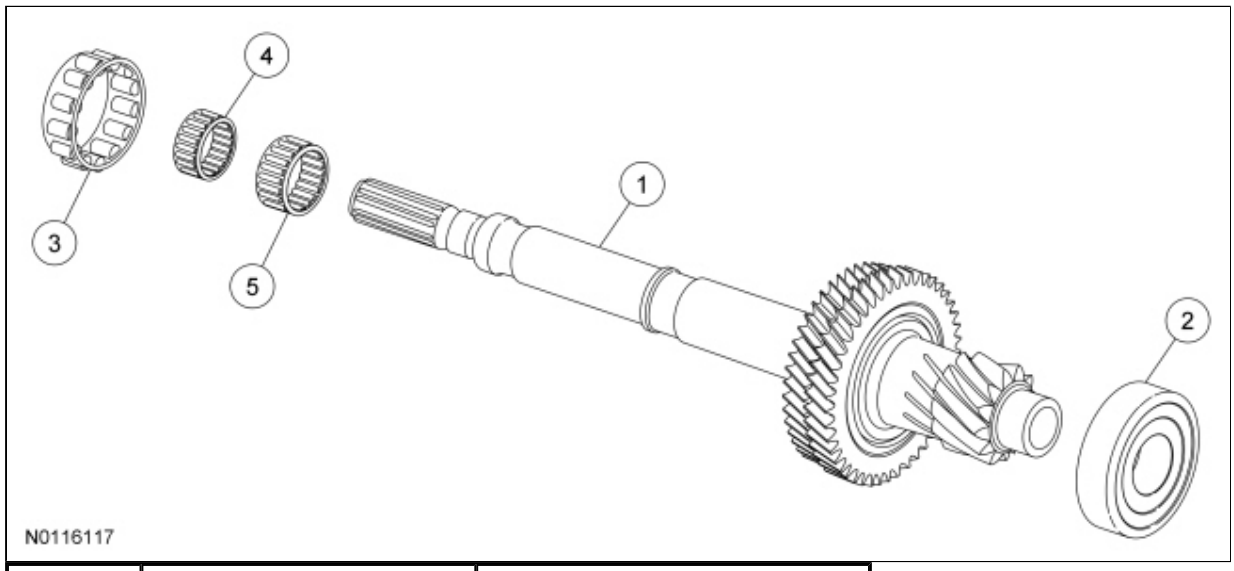
Input Shaft — Inner

Special Tool(s)

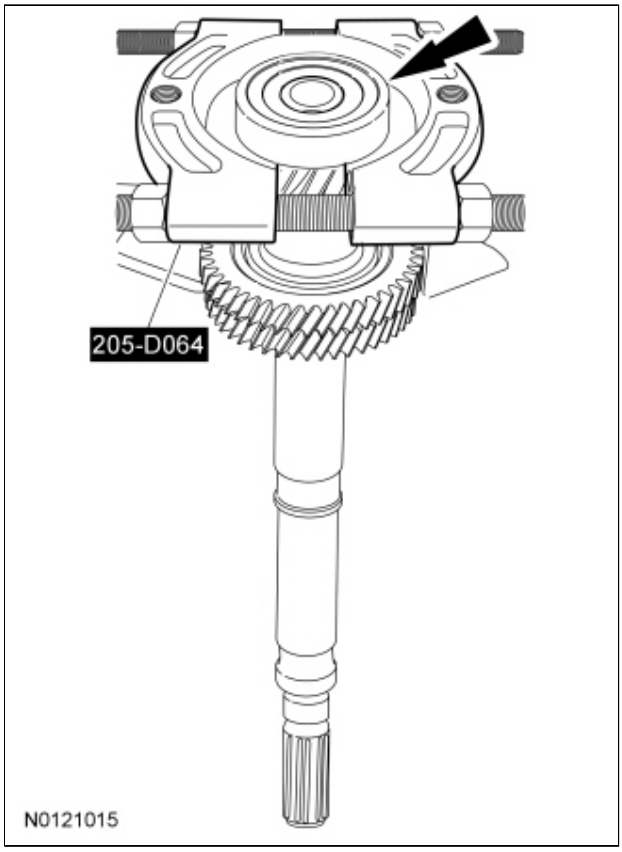
 ST1368-A	Puller, Bearing 205-D064



Item	Part Number	Description
1	7717	Inner input shaft
2	7B412	Radial bearing
3	7B412	Roller bearing
4	7M150	Needle bearing
5	7M150	Needle bearing

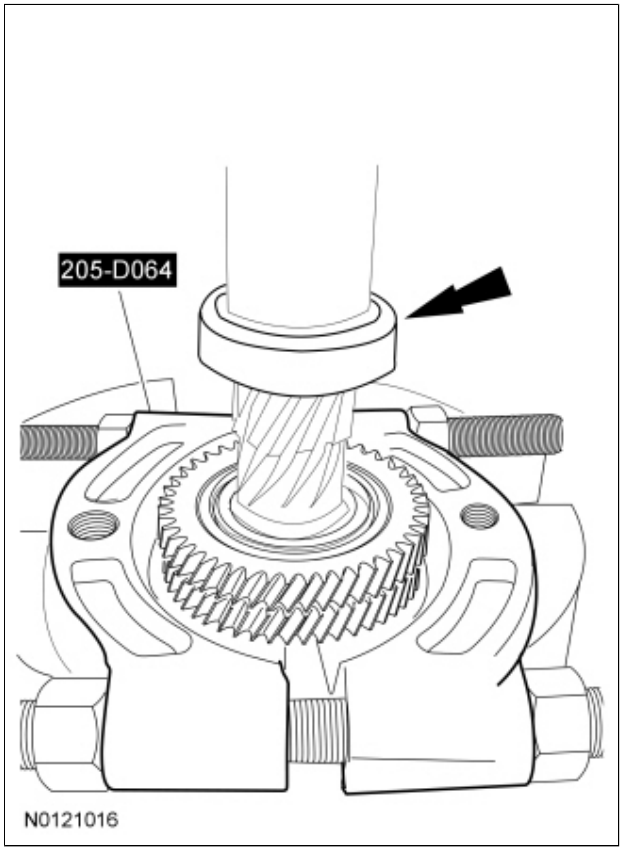
Disassembly

1. Remove the inner input shaft needle bearing.
2. Remove the inner input shaft needle bearing.
3. Remove the inner input shaft roller bearing.
4. Using the special tools and a press, remove the inner input shaft radial bearing.



Assembly

1. Inspect the inner input shaft for wear or damage, replace as needed.
2. Using the special tools and a press, install the inner input shaft radial bearing.



3. Install the inner input shaft roller bearing.
4. Install the inner input shaft needle bearing.
5. Install the inner input shaft needle bearing.

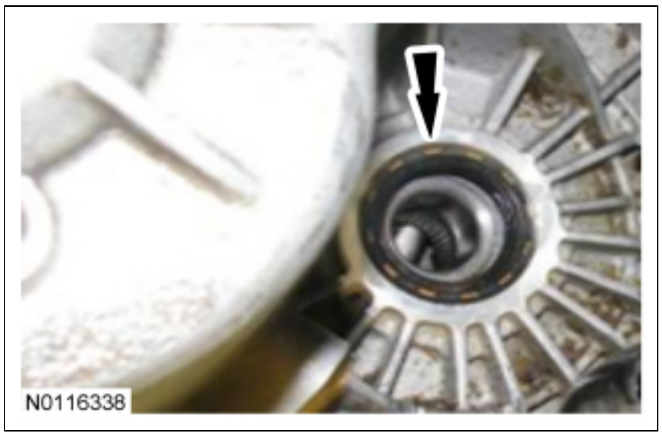
Transaxle Case

Special Tool(s)

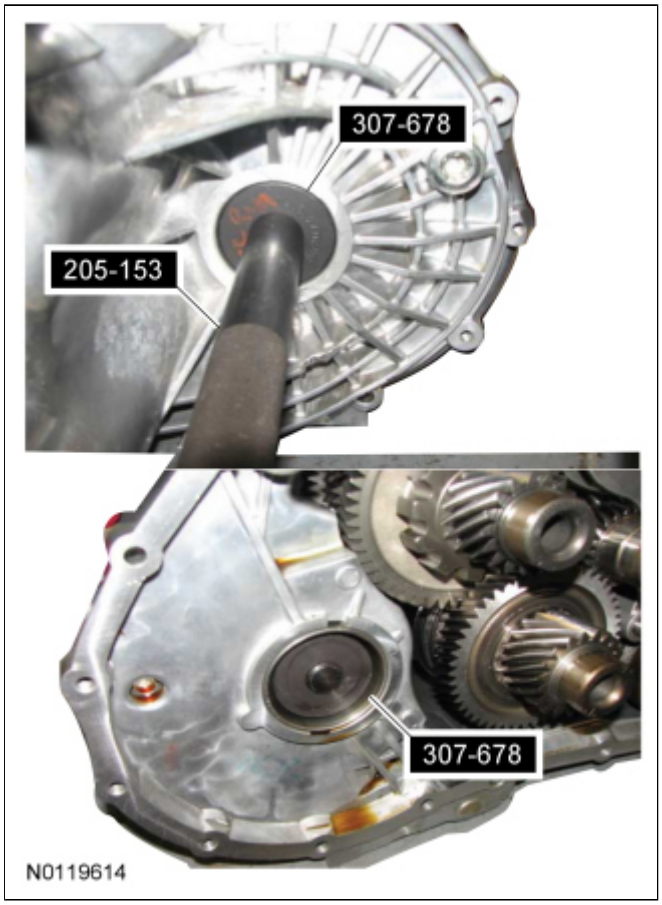
ST3214-A	Forcing Screw 204-594
ST1255-A	Handle 205-153
ST3218-A	Installer, Output Shaft Seal 307-671
ST3225-A	Remover, Differential Bearing Cup 307-678

Disassembly

1. Remove and discard the halfshaft seal.



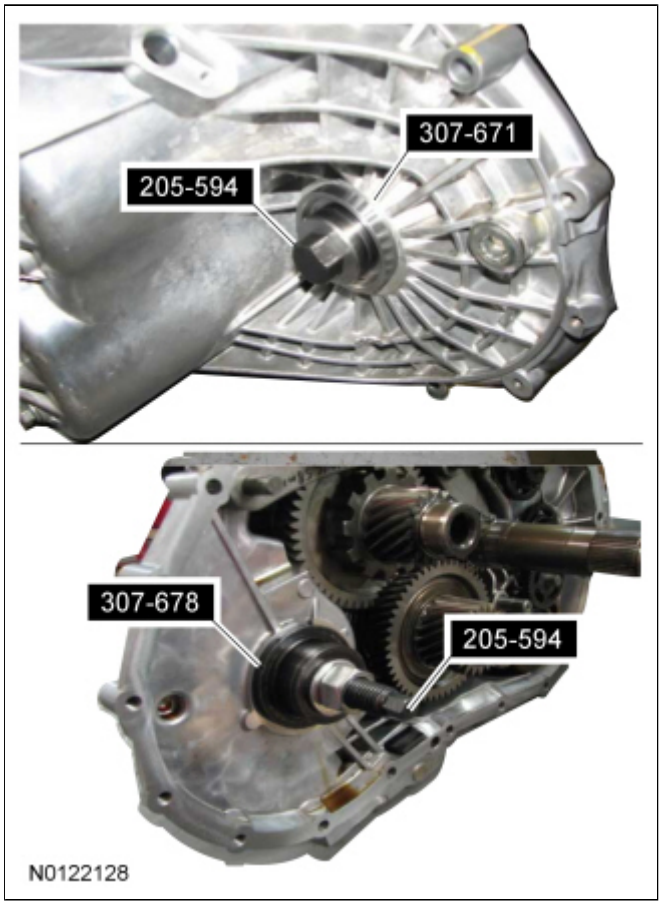
2. Using the special tools, remove the differential case bearing cup.



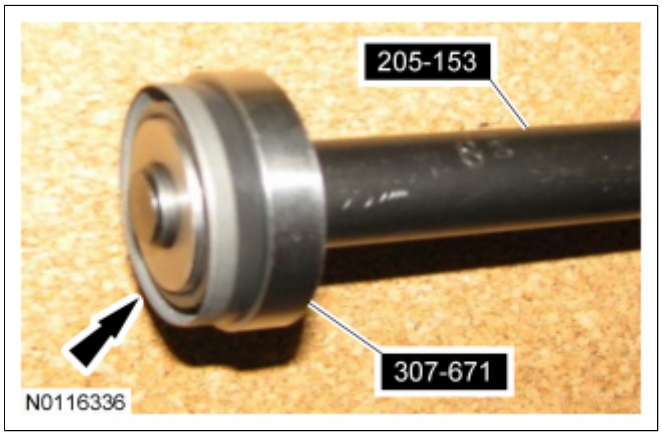
Assembly

1. **NOTE:** If a new differential gear bearing, transmission case, differential or clutch housing are installed, measure the differential shim for the correct size. For additional information, refer to Differential Shim Selection .

   Using the special tools, install the differential gear bearing cup.



2. Install the new halfshaft seal on the special tools.



3. Using the special tools, install the new halfshaft seal.

205-153
307-671
N0116337

Material

Item	Specification	Fill Capacity
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C	2.1L (2.2 qt)
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	—

Gear Ratios

4th	0.95
5th	0.76
Reverse	3.62
Final Drive	4.07

Manual Transaxle and Clutch

The IB5 manual transaxle and clutch system consists of the following:

- Five-speed manual transaxle
- Clutch disc
- Clutch pressure plate
- Clutch release hub and bearing
- Clutch hydraulic system
- Clutch pedal
- Flywheel

The function of the transaxle is to move the vehicle from a rest position to motion. The transaxle uses gears to adapt the torque to the demands of load and road conditions. It matches engine power to vehicle needs. This power is delivered from the engine flywheel to the transaxle. The power is transmitted through a driver-operated clutch, which allows for engagement and disengagement of the engine to the transaxle.

The transaxle input shaft receives the power when the clutch is engaged. The transaxle then uses a system of gears to change the speed and torque relationship between the engine crankshaft and the transaxle differential.

The purpose of the clutch is to connect and disconnect a manually operated transaxle and the halfshafts from the engine. This allows starting and stopping the vehicle, shifting and changing speeds that correspond to the engine speed through gear changes.

Manual Transaxle and Clutch

Special Tool(s)

 ST1840-A	Holding Tool, Flywheel 303-103 (T74P-6375-A)
 ST1897-A	Dial Indicator Gauge With Holding Fixture 100-002 (TOOL-4201-C)

Material

Item	Specification
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Inspection and Verification

NOTICE: **If transaxle noise is reported, check the fluid level first. Do not drive the vehicle if the fluid level is low or damage can occur.**

NOTE: If any evaluation or inspection reveals an obvious concern, repair the vehicle.

NOTE: Before attempting to repair any concerns, road test the vehicle to determine in which system the concern falls.

The technician should have a thorough knowledge of transaxle/clutch operation and accepted general transaxle/clutch guidelines to detect any problems.

A gear driven unit produces a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions. Certain conditions, such as road and weather, amplify normal vehicle noise.

Use the following to diagnose and repair a transaxle/clutch concern:

Verify the Customer Concern

NOTICE: **If transaxle noise is reported, first check the fluid level. The vehicle should not be driven if the fluid level is low or damage can occur.**

1. Verify and document the customer concern.
    1. When was it first noticed?
    2. Did it appear suddenly or gradually?
    3. Did anything unusual occur that would coincide with it or precede it?
    4. Identify when the condition occurs.
        - Hot or cold vehicle operating conditions
        - Type of terrain
        - City or highway driving
        - Driving at a particular speed
            - coasting
            - hard acceleration
        - Shifting
            - upshifts
            - downshifts
            - in a particular gear
            - in all gears
        - Hot or cold ambient temperatures
    5. Check TSBs and On-Line Automotive Service Information System (OASIS) messages.

2. Visually inspect for obvious signs of mechanical damage.

Check Fluid Level and Condition

NOTICE: **Do not drive the vehicle if the fluid level is low or damage can occur.**

An incorrect fluid level may affect transaxle operation and can result in transaxle damage. To correctly check and add fluid to the transaxle, refer to transaxle draining and filling in Section 308-03 .

Low fluid level can result in poor transaxle shifting, engagement or damage. It can also indicate a leak in one of the transaxle seals or gaskets.

1. Check the fluid condition.
    - Observe the color and the odor of the fluid. Allow the fluid to drip onto a white cloth and examine the stain. Check the fluid for contamination or metal particles.
        - Fluid should appear nearly clear, similar to clean engine oil.

Evaluation of Clutch Hydraulic System

1. Verify the clutch hydraulic fluid reservoir is filled to the correct level.
    - If the fluid level is low, add fluid as necessary. Check the clutch hydraulic system for leaks and repair as necessary. Refer to Section 308-02 .

Evaluation Of The Clutch

1. Slowly press and release the clutch pedal to see if the pedal is binding. Make sure the clutch pedal can be fully pressed and is not restricted by the floor mat. Verify the pedal return spring is present and is functioning correctly.

2. Measure the clutch reserve. GO to Pinpoint Test A .

3. With the engine idling, the parking brake on and the clutch pedal up, gently move the gearshift lever into a forward or reverse gear, until gear clash can be heard. Slowly press the clutch pedal.
    - If the gears cease to clash (full disengage at 25-38 mm [1-1.5 in] from the floor), hold the pedal at the point of disengagement and increase engine to 4,000 rpm. If the clutch remains disengaged, it is functioning correctly.
    - Any concerns indicate a worn or damaged clutch. Repair as necessary. Refer to Section 308-01 .

4. With the engine idling, move the gearshift lever into 4th gear. Increase the engine to 2,000 rpm and slowly release the clutch pedal.
    - If the engine stalls, the clutch is OK.
    - If the engine does not stall, the clutch is slipping. Repair as necessary.

5. Compare the road test results with the symptom chart. The chart is a list of conditions that are typical faults. GO to Symptom Chart - Clutch .

Inspect The Gearshift Components

1. Inspect the gearshift cables for:
    - signs of damage
    - broken locks
    - binding
    - cables not fully seated or in hold-down brackets
    - correct routing
    - correct adjustment
        - If the concern is a gear(s) cannot be selected, jumps out of gear or gear clashes, adjust the gearshift cables. Refer to Section 303-06 .

2. Inspect the gearshift lever for free play.
    - If the gearshift lever free play is more than 15 mm (0.59 in), check the gearshift cables and repair as necessary.
    - If the gearshift lever free play is 15 mm (0.59 in), adjust the gearshift cables. Refer to Section 308-06 .

Road Test the Vehicle

1. During the road test, use the following driving methods to diagnose the problem.
    - Start the engine.
    - Evaluate the noise in NEUTRAL while the vehicle is parked.
        - Check whether the noise is present with the clutch fully disengaged (pedal fully pressed). Check to see if the pedal pulsates abnormally (for clutch diaphragm finger run out).
        - Check whether the noise is present with the gearshift in the NEUTRAL position and the clutch fully engaged (foot off pedal). With the parking brake engaged, move the gearshift towards the 1st gear position. Apply very slight pressure and note if the gear noise level is reduced (for gear rollover noise).
        - With the clutch fully engaged (foot off pedal) check whether the noise is present as the engine rpm increases. If the noise reduces, note the engine rpm at which this occurs.
    - Listen for any change in noise while pressing and releasing the clutch pedal.
    - Listen for any change in noise while changing the engine rpm.

- Drive the vehicle and shift through all of the gear ranges, including reverse. Listen for any change in noise in a particular gear.
- Drive the vehicle in the gear in which the noise is most noticeable. Press the clutch pedal and leave the gear engaged. Listen for any change in noise.
- Drive the vehicle in the gear in which the noise is most noticeable. Press the clutch pedal and shift the transaxle into NEUTRAL. Release the clutch pedal and allow the vehicle to coast.

2. Compare the road test results with the symptom charts. The charts are a list of conditions that are typical faults.GO to Symptom Chart - Clutch , GO to Symptom Chart - Transaxle or GO to Symptom Chart - NVH in this section.

Symptom Chart — Clutch

Condition	Possible Sources	Action
• Clutch slippage	• Clutch pedal reserve • Worn or damaged pressure plate • Clutch disc facing • Hardened or oiled clutch disc facing surface • Flywheel	• GO to Pinpoint Test A .
• Clutch chatter, rattle or shudder	• Loose or damaged engine or transaxle mounts • Oil on clutch disc facing • Worn pressure plate • Clutch disc facing • Loose or damaged flywheel • Worn clutch disc	• GO to Pinpoint Test B .
• Clutch drag	• Insufficient clutch hydraulic fluid • Air in hydraulic system • Clutch pedal reserve • Diaphragm springs • Clutch disc • Clutch disc splines • Oil on clutch disc facing	• GO to Pinpoint Test C .
• Clutch pedal pulsation	• Clutch and brake pedal pivot shaft not correctly lubricated • Flywheel • Worn pressure plate springs	• GO to Pinpoint Test D .
• Clutch related vibrations	• Engine component grounding against frame • Accessory drive belt • Flywheel bolts loose • Flywheel • Imbalanced clutch pressure plate	• GO to Pinpoint Test E .
• Hard shifting	• Insufficient clutch hydraulic fluid • Clutch pedal reserve • Transaxle concern	• GO to Pinpoint Test F .
• Excessive noise	• Clutch pedal reserve • Clutch slave cylinder • Excessive crankshaft endplay	• GO to Pinpoint Test G .
• Clutch system leakage	• Clutch master cylinder • Clutch slave cylinder • Clutch hydraulic tubes	• GO to Pinpoint Test H .

Symptom Chart — Transaxle

Symptom Chart — Transaxle

Condition	Possible Sources	Action
• Gears clash when shifting from one forward gear to another	• Gear teeth/synchronizer damaged	• INSPECT and REPAIR as necessary. REFER to Section 308-03 .
• Transaxle jumps out of gear	• Bolts retaining transaxle to engine loose	• TIGHTEN the bolts to specification. REFER to Section 308-03 .
	• Preload incorrect • Internal components damaged	• CHECK preload. INSPECT the synchronizer for free movement on their hubs. INSPECT the synchronizer blocking rings for widened index slots, rounded clutch teeth and smooth internal surface. CHECK the countershaft cluster gear for excessive end play. INSPECT the shift forks for wear. CHECK for loose shift forks on the shift rails. INSPECT the synchronizer sliding sleeve and the gear clutch teeth for wear and damage. REPAIR as necessary. REFER to Section 308-03 .
	• Gear teeth worn/damaged	• INSPECT and REPAIR as necessary. REFER to Section 308-03 .
• Transaxle will not shift into one gear — all others OK	• Internal components	• For the gear in question, INSPECT the shift rail and fork, the synchronizer, and the gear clutch teeth for restricted travel. REPAIR as necessary. REFER to Section 308-03 .
• Transaxle is locked in one gear and will not shift out of that gear	• Internal components	• INSPECT the gears, the shift rails, the forks and the synchronizer for wear or damage. REPAIR as necessary. REFER to Section 308-03 .
• Fluid leaks	• Transmission fluid	• CHECK the transmission fluid level and type. • REMOVE all traces of fluid on the exposed transaxle surfaces. CHECK the vent for free breathing. OPERATE the transaxle. INSPECT for new leakage. REFER to Section 308-03 .
	• Other components leaking	• REMOVE all traces of fluid on exposed transaxle surfaces. CHECK the vent for free breathing. OPERATE the transaxle and INSPECT for new leakage. IDENTIFY the leaking fluid as engine, power steering or transmission fluid. REPAIR as

		necessary.
	• Halfshaft seals	• INSPECT and INSTALL new seals as necessary. REFER to Section 308-03 .
	• Input shaft seal	• INSPECT, and REPAIR as necessary. REFER to Section 308-03 .
	• Fill and drain plugs	• INSPECT the plug, O-ring, and the threads in the case. REPAIR as necessary. TIGHTEN the plug to specification. REFER to Section 308-03 .
• Significant effort required when downshifting	• Gear synchronization is inadequate. Gear teeth/synchronizer damaged	• INSPECT the transaxle. INSTALL a new synchronizer assembly with synchronizer rings. INSTALL two new gears belonging to the synchronizer assembly. REFER to Section 308-03 .
• Stiff gearshift	• Transmission fluid • Damaged synchronizer rings or inner selector mechanism	• CHECK that the transaxle is filled with the specified transmission fluid and, if necessary, FILL and ADD transmission fluid as necessary. • CHECK the internal components for wear or damage, REPAIR as necessary. REFER to Section 308-03 .
• One of the gears cannot be selected	• Fault between the gearshift lever and gearshift lever housing	• INSPECT the gearshift lever. REFER to Section 308-06 .
• Reverse gear cannot be selected	• Gearshift lever • Internal components	• CHECK the gearshift lever for damage. REPAIR as necessary, remove the gearshift lever to see whether reverse gear can be selected. • CHECK the reverse idler gear and the appropriate selector fork, shift rail and synchronizer unit. REPAIR as necessary. REFER to Section 308-03 .
• Grinding or clashing noises when shifting into 3rd gear	• Deflected lubrication condition causing early 3rd gear wear	• INSTALL a new 3rd gear, 3rd/4th gear shift fork, outer synchronizer ring, inner synchronizer ring, 3rd gear synchronizer cone, 3rd/4th gear synchronizer assembly. REFER to Section 308-03 .

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Noisy in forward gears — noise described as rattle or a knock	• Transmission fluid level low/incorrect type	• ADD or REFILL with the specified transmission fluid. REFER to Specifications in this section.
	• Components grounding out on transaxle	• CHECK for screws and bolts of chassis components grounding out. REPAIR as necessary.
	• Bearings/gears worn/damaged	• INSPECT the bearings, the gears, and the gear teeth for wear and damage. REPAIR as necessary. REFER to Section 308-03 .
	• Bolts retaining transaxle to engine loose	• VERIFY the bolts are tightened to specification. REFER to Section 308-03 .
• Noise in NEUTRAL occurs after hot soak or under load	• Neutral rollover noise	• A slight rollover gear noise is an acceptable condition. INSTALL a new clutch disc. REFER to Section 308-01 .
	• Transaxle	• INSPECT and REPAIR as necessary. REFER to Section 308-03 .
• Slight buzzing, rattling or metallic scraping noise from the transaxle at 2,500 to 3,500 rpm when coasting or driving without load (particularly in 2nd and 3rd gear)	• Rotational vibration from the engine not sufficiently damped by the clutch	• These noises do not affect the operation and durability of the transaxle.
• Brief scratching noise during gear shifting	• Inadequate gear synchronization	• INSPECT the transaxle for wear or damage. REPAIR as necessary. INSTALL a complete synchronizer assembly with synchronizer rings. INSTALL two new gears belonging to the synchronizer assembly. REFER to Section 308-03 .
• Gear growl — to occur, lug the engine in 1st or 2nd gears, press the throttle to floor and the noise will be heard	• Reduced preload on the input shaft	• Acceptable noise under these conditions.
• Gear whistle — occurs in 2nd, 3rd and 4th gear by pressing the throttle to the floor and letting the vehicle	• Driven gears on the output shaft	• Acceptable noise under these conditions.

accelerate, hard acceleration to Wide Open Throttle (WOT), a very light whistle noise can be heard		
• Clicking noises in reverse gear	• Reverse gear	• INSPECT the gears for wear or damage. INSTALL new gears as necessary. REFER to Section 308-03 .

Pinpoint Tests

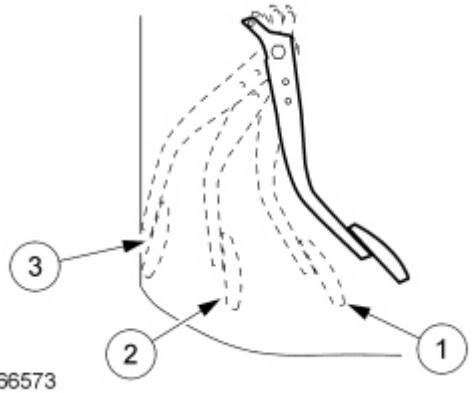
PINPOINT TEST A: CLUTCH SLIPPAGE

Test Step	Result / Action to Take
A1 TEST CLUTCH SLIPPAGE	
• Apply the parking brake. • Start engine and engage 4th gear. • Run the engine at approximately 2,000 rpm. • Slowly release clutch pedal. • **Does the engine stall when the clutch pedal is fully released?**	**Yes** Clutch is OK. **No** GO to A2 .
A2 MEASURE THE CLUTCH RESERVE	
NOTE: Remove the floor mat, if equipped, to allow the clutch pedal to travel to the downstop. • Install a cable tie to the lower clutch pedal, than attach a tape measure to the cable tie.  A0066569 • Pull the tape measure up to the steering wheel. Position it through the steering wheel opening. Put a piece of masking tape on the wheel, index mark the tape.	**Yes** Clutch pedal reserve is OK. VERIFY customer concern. GO to Symptom Chart - Clutch . **No** INSTALL a new pressure plate and clutch disc. REFER to Section 308-01 .

A0085779

- Press the clutch fully and start the vehicle.
- Shift the transaxle into reverse gear, then move the gearshift lever forward to the position in between reverse gear and neutral. Slowly release the clutch pedal (if the vehicle creeps rearward, move the gearshift lever forward a little more). The transaxle will work as if in neutral, but the reverse gear synchronizer will be bypassed.
- With the clutch pedal released, gently pull the gearshift lever toward the reverse gear position. Gear clash can now be heard.
- Slowly press the clutch pedal. Using the mark on the tape as a reference, note the measurement when the gear clash stops or the gearshift lever slides into reverse gear. Press the clutch pedal to the downstop. The difference between the measurement taken when the gear clash stopped and the measurement taken at the downstop is the clutch reserve.

Item	Pedal Position
1	Gear clash begins
2	Gear clash ends
3	Clutch pedal downstop



A0066573

- **Is the clutch reserve between 25-38 mm (1 to 1.5 in)?**

PINPOINT TEST B: CLUTCH CHATTER, RATTLE OR SHUDDER

Test Step	Result / Action to Take
B1 CHECK THE ENGINE OR TRANSAXLE MOUNTS	
• Inspect all the engine and transaxle mounts for looseness or damage.	**Yes** TIGHTEN or INSTALL new engine or transaxle

• **Are any of the engine or transaxle mounts loose or damaged?**	mounts. TEST the system for normal operation. **No** GO to B2.
B2 INSPECT THE PRESSURE PLATE BOLTS	
• Inspect the pressure plate-to-flywheel bolts. • **Are any of the pressure plate-to-flywheel bolts loose?**	**Yes** TIGHTEN or INSTALL new bolts. REFER to Section 308-01. **No** GO to B3.
B3 INSPECT THE PRESSURE PLATE	
• Remove the clutch pressure plate. • Inspect the clutch pressure plate for wear or damage. • **Are any signs of damage present on the clutch pressure plate?**	**Yes** INSTALL a new clutch pressure plate. REFER to Section 308-01. TEST the system for normal operation. **No** GO to B4.
B4 CHECK THE CLUTCH DISC	
NOTE: If the internal damper of the clutch disc is damaged or contaminated with grease or oil, it will sound similar to a "transaxle rattle". • Check the clutch disc for wear or damage. • **Is the clutch disc OK?**	**Yes** GO to B5. **No** INSTALL a new clutch disc. REFER to Section 308-01. TEST the system for normal operation.
B5 INSPECT THE FLYWHEEL	
• Inspect the flywheel for wear or damage. • **Is the flywheel OK?**	**Yes** GO to B6. **No** REPAIR or INSTALL a new flywheel as necessary. REFER to Section 308-01. TEST the system for normal operation.
B6 INSPECT THE INPUT SHAFT	
• Inspect the input shaft for signs of wear, damage or corrosion. • **Are any signs of wear damage, or corrosion present on the input shaft?**	**Yes** If wear or damage is found, INSTALL a new input shaft. REFER to Section 308-03. If corrosion is found on the splines of the input shaft, apply a small amount of grease to the splines of the input shaft. **No** VERIFY the customer concern. GO to Symptom Chart - Clutch, GO to Symptom Chart - Transaxle, GO to Symptom Chart - NVH if necessary.

PINPOINT TEST C: CLUTCH DRAG

Test Step	Result / Action to Take
C1 CHECK CLUTCH FLUID LEVEL	
	Yes

• Check clutch fluid level. • **Is the clutch fluid level between the MAX and MIN marks on the brake fluid reservoir?**	GO to C2 . **No** FILL reservoir to specification, CHECK the brake and clutch systems for leaks. TEST clutch system for normal operation.
C2 TEST CLUTCH PEDAL FREE TRAVEL	
• Manually operate the clutch pedal to the point of resistance and release. • Measure pedal travel. • **Is the measured dimension within 10 mm (0.393 in)?**	**Yes** GO to C3 . **No** GO to Pinpoint Test B .
C3 CHECK THE BELLEVILLE SPRING WASHER OF THE CLUTCH PRESSURE PLATE	
• Remove transaxle. • **Does the clutch pressure plate or the Belleville spring washer of the clutch pressure plate show signs of wear or damage?**	**Yes** INSTALL a new clutch pressure plate. TEST the system for normal operation. **No** VERIFY the customer concern. GO to Symptom Chart - Clutch .

PINPOINT TEST D: CLUTCH PEDAL PULSATION

Test Step	Result / Action to Take
D1 CHECK THE CLUTCH PEDAL PULSATION	
• Start engine. • With the transaxle in neutral, slowly press the clutch pedal. • **Does the clutch pedal pulsate while being pressed?**	**Yes** GO to D2 . **No** VERIFY the customer concern. GO to Symptom Chart - Clutch if necessary.
D2 INSPECT THE PRESSURE PLATE BOLTS	
• Inspect the pressure plate-to-flywheel bolts. • **Are any of the pressure plate-to-flywheel bolts loose?**	**Yes** TIGHTEN or INSTALL new bolts. REFER to Section 308-01 . TEST the system for normal operation. **No** GO to D3 .
D3 INSPECT THE CLUTCH PRESSURE PLATE	
• Remove the clutch pressure plate. REFER to Section 308-01 . • Inspect the clutch pressure plate for wear or damage. • **Are there any signs of damage present on the clutch pressure plate?**	**Yes** INSTALL a new clutch pressure plate. REFER to Section 308-01 . TEST the system for normal operation. **No** GO to D4 .
D4 INSPECT THE CLUTCH DISC	
• Check the clutch disc for wear or damage. • **Is the clutch disc OK?**	**Yes** GO to D5 .

	No INSTALL a new clutch disc. REFER to Section 308-01 . TEST the system for normal operation.
D5 INSPECT THE FLYWHEEL • Inspect the flywheel for wear or damage. • **Is flywheel OK?**	**Yes** VERIFY the customer concern. GO to Symptom Chart - Clutch , GO to Symptom Chart - Transaxle , GO to Symptom Chart - NVH if necessary. **No** TIGHTEN, RESURFACE or INSTALL a new flywheel as necessary. REFER to Section 308-01 . TEST the system for normal operation.

PINPOINT TEST E: CLUTCH RELATED VIBRATIONS

Test Step	Result / Action to Take
E1 CHECK FOR ENGINE COMPONENT GROUNDING • Raise and support the vehicle. • Check the engine mount interlocks for grounding on the body or frame. • Check the exhaust manifold or other engine component grounding on the body or frame. • **Is there evidence of grounding on body or frame?**	**Yes** REPAIR any components as necessary. TEST the system for normal operation. **No** GO to E2 .
E2 CHECK FOR ACCESSORY DRIVE VIBRATIONS • Feel accessory vibration at clutch engage/disengage when engine torque changes. • Disconnect the accessory drive belt and check for vibration. • **Does the vibration stop when the drive belt is removed from the engine?**	**Yes** REPAIR or INSTALL new accessory drive belt components. REFER to Section 303-05 . **No** GO to E3 .
E3 CHECK FOR RELEASE BEARING NOISE • Start engine. • Press and hold clutch pedal. • **Is a whirring, grating or grinding noise present?**	**Yes** INSTALL a new clutch slave cylinder. REFER to Section 308-02 . TEST the system for normal operation. **No** GO to E4 .
E4 INSPECT THE FLYWHEEL • Remove the transaxle. REFER to Section 308-03 . • Inspect for loose flywheel bolts. • Carry out flywheel runout check. REFER to Section 303-00 . • **Is the flywheel OK?**	**Yes** DIAGNOSE engine vibration concern. REFER to Section 308-00 . **No** TIGHTEN the flywheel bolts or INSTALL a new flywheel. REFER to Section 303-01 . TEST the system for normal operation.

PINPOINT TEST F: HARD SHIFTING

Test Step	Result / Action to Take
F1 CHECK THE FLUID LEVEL	
NOTE: The hydraulic clutch fluid is supplied from the brake master cylinder. • Ignition OFF. • Inspect the fluid level in the brake master cylinder reservoir. • **Is the fluid within the MAX and MIN level marks?**	**Yes** GO to F2 . **No** ADD brake fluid and CHECK for leaks in the clutch and brake system. TEST the system for normal operation.
F2 CHECK THE CLUTCH PEDAL FREE PLAY	
• Press the clutch pedal lightly by hand. • Measure the distance the clutch pedal travels. • **Is the clutch pedal free play within 1-3 mm (0.04-0.12 in)?**	**Yes** DIAGNOSE hard shifting concern. REFER to Section 308-03 . **No** INSPECT the clutch pressure plate for wear or damage. REPAIR as necessary. REFER to Section 308-01 . TEST the system for normal operation.

PINPOINT TEST G: EXCESSIVE NOISE

Test Step	Result / Action to Take
G1 CHECK THE TRANSAXLE NEUTRAL POSITION	
• Start engine and run it in neutral. • Press clutch pedal fully. • **Are there noises when the clutch is operated?**	**Yes** GO to G2 . **No** There is a problem with the transaxle. GO to Symptom Chart - Transaxle if necessary.
G2 TEST THE CLUTCH PEDAL FREE TRAVEL	
• Manually press the clutch pedal down until resistance is felt, then release. • Measure pedal travel. • **Is the travel within 10 mm (0.393 in)?**	**Yes** GO to G3 . **No** REFER to Section 308-02 .
G3 TEST THE CLUTCH SLAVE CYLINDER WITH RELEASE BEARING	
• Remove the transaxle. • Check the clutch slave cylinder bolts. • Check the release bearing for wear and rust. • **Are the bolts loose or are there signs of wear or rust?**	**Yes** TIGHTEN the bolts or INSTALL a new clutch slave cylinder with the release bearing. REFER to Section 308-02 . TEST the system for normal operation. **No** GO to G4 .
G4 TEST THE CLUTCH FRICTION DISC TORSION SPRINGS	

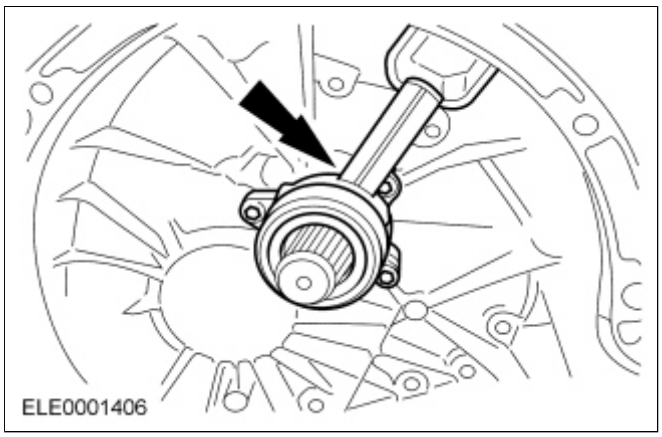
• Check torsion springs for wear or damage. • **Do the torsion springs have signs of wear or damage?**	**Yes** INSTALL a new clutch disc. REFER to Section 308-01 . TEST the system for normal operation. **No** CHECK the crankshaft end play. REFER to Section 303-00 .

PINPOINT TEST H: CLUTCH SYSTEM LEAKAGE

Test Step	Result / Action to Take
H1 INSPECT THE CLUTCH MASTER CYLINDER	
• Inspect clutch master cylinder for leakage. • **Is the clutch master cylinder OK?**	**Yes** GO to H2 . **No** REPAIR or INSTALL a new clutch master cylinder as necessary. REFER to Section 308-02 .
H2 INSPECT THE CLUTCH SLAVE CYLINDER	
• Inspect clutch slave cylinder for leaks. • **Is the clutch slave cylinder OK?**	**Yes** GO to H3 . **No** REPAIR or INSTALL a new clutch slave cylinder as necessary. REFER to Section 308-02 .
H3 INSPECT THE SYSTEM HYDRAULIC TUBES	
• Inspect clutch hydraulic tubes for loose or damaged fittings causing leakage. • **Are the clutch hydraulic tubes OK?**	**Yes** CARRY OUT a road test to VERIFY customer complaint. **No** REPAIR or INSTALL new components as necessary. REFER to Section 308-02 . TEST the clutch system for normal operation.

Clutch Slave Cylinder Check

1. Check the clutch slave cylinder with release bearing for:
    - leaks.
    - transmission fluid.
    - brake fluid.
    - damage or rust.



Clutch System Bleeding

Special Tool(s)

23036A	Vacuum Pump Kit 416-D002 (D95L-7559-A)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

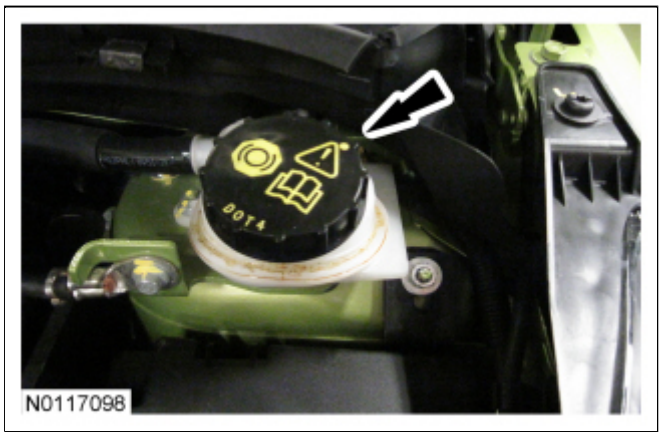
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **If brake fluid is spilled on the paint, immediately wash the affected area with cold water or damage can occur.**

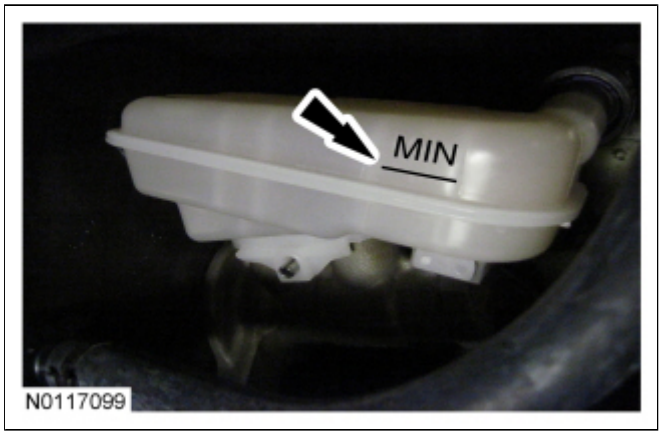
NOTE: Do not reuse brake fluid.

1. Remove the Air Cleaner (ACL) assembly and outlet pipe. For additional information, refer to Section 303-12 .

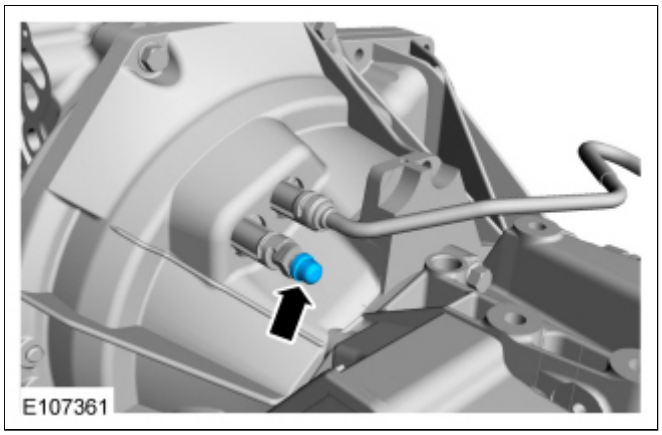
2. Remove the brake fluid reservoir cap.



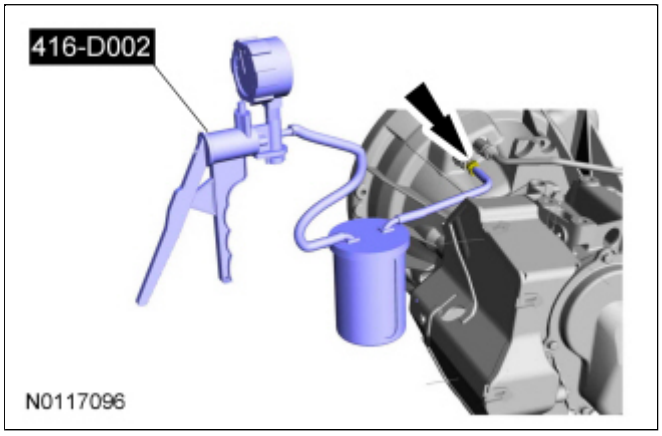
3. Drain the brake fluid reservoir to the MIN mark.



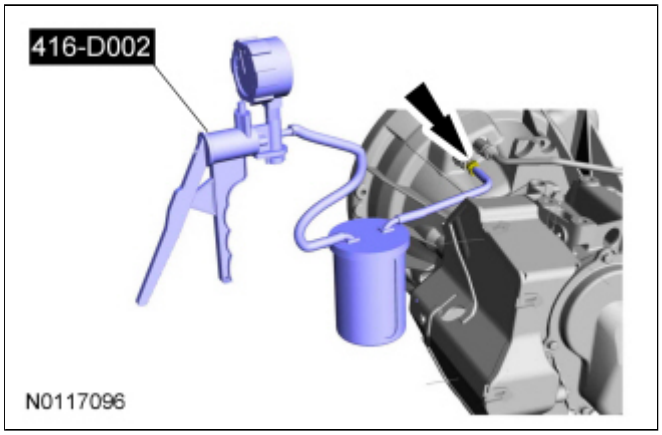
4. Remove the clutch slave cylinder bleed fitting dust cap.



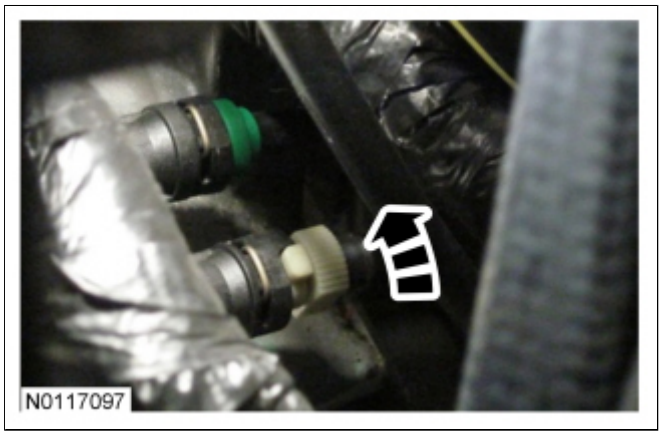
5. Install the special tool and loosen the clutch slave cylinder bleed fitting.



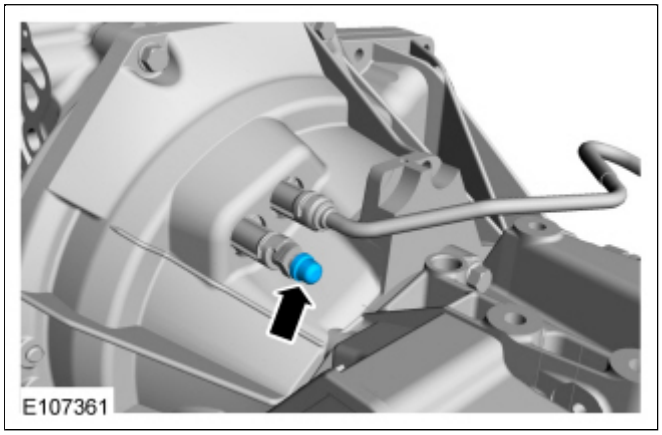
6. Using the special tool, bleed the clutch system.
    1. Fill the reservoir of the special tool with approximately 120 ml (4.06 oz) of brake fluid.
    2. Loosen the clutch slave cylinder bleed fitting.
    3. Pump approximately 100 ml (3.38 oz) of brake fluid into the clutch system.



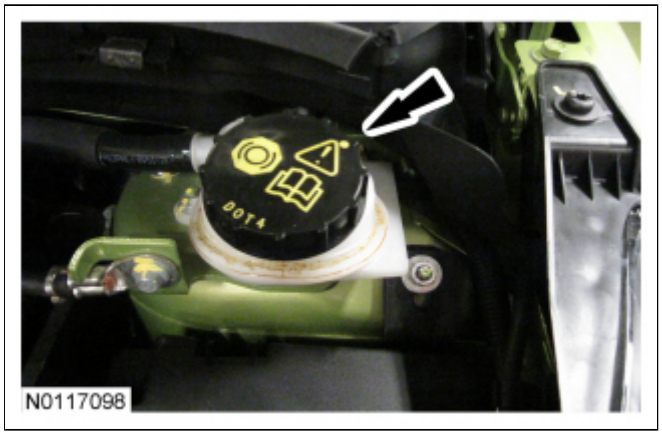
7. Tighten the clutch slave cylinder bleed fitting.



8. Install the clutch slave cylinder bleed fitting dust cap.



9. Install the brake fluid reservoir cap.



10. Check the fluid level in the brake fluid reservoir and add as necessary.

11. **NOTE:** Carefully move the gearshift lever into REVERSE.

    Test the operation of the clutch control system.
    - Start the engine, after 2 seconds press the clutch pedal and carefully move the gearshift lever into REVERSE. If there are abnormal noises, automatically bleed the clutch control system by pressing the clutch pedal 4 or 5 times. During bleeding, full travel of the clutch pedal must be reached.
    - Test the operation of the clutch control system again after 30 seconds. If there are still abnormal noises perform steps 2 to 10 again.

12. Install the ACL assembly and outlet pipe assembly. For additional information, refer to Section 303-12 .

Flywheel Runout Check

NOTICE: **Do not clean the dual mass flywheel with any kind of fluid. Use a dry cloth only or damage to the dual mass flywheel may occur.**

NOTICE: **Do not clean the gap between the primary and secondary mass. Only clean the bolt connection surface and the clutch surface or damage to the flywheel may occur.**

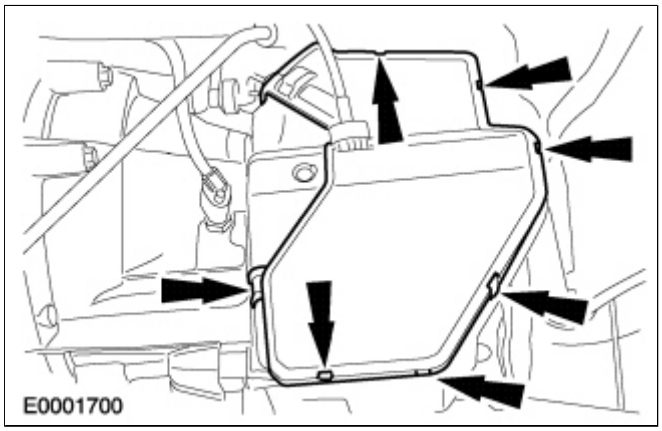
1. Check the transmission fluid level and fill to the correct level as necessary.

2. With the engine operating at idle and the transaxle in NEUTRAL, listen and check for unacceptable noise. Determine if any unacceptable noise is reduced when the clutch pedal is pressed. For additional information, refer to the Flywheel Inspection procedure in Section 303-00 .

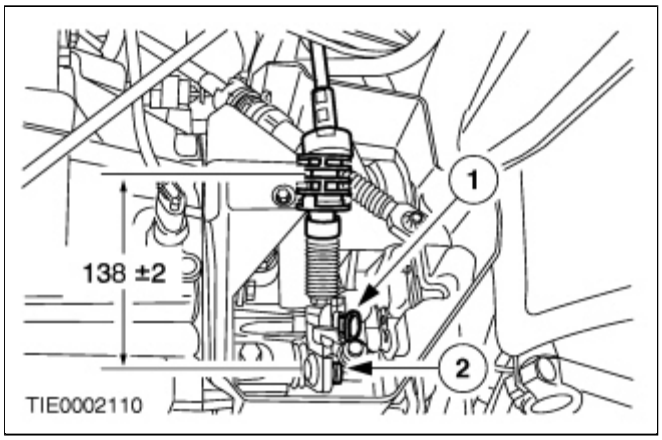
Gearshift Cable Adjustment

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

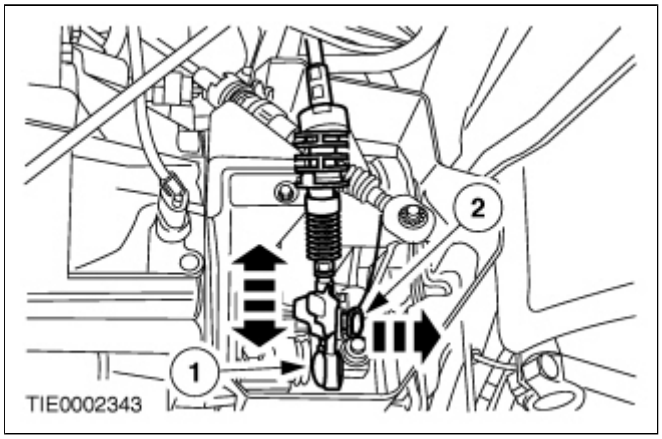
2. Remove the gearshift cables cover.



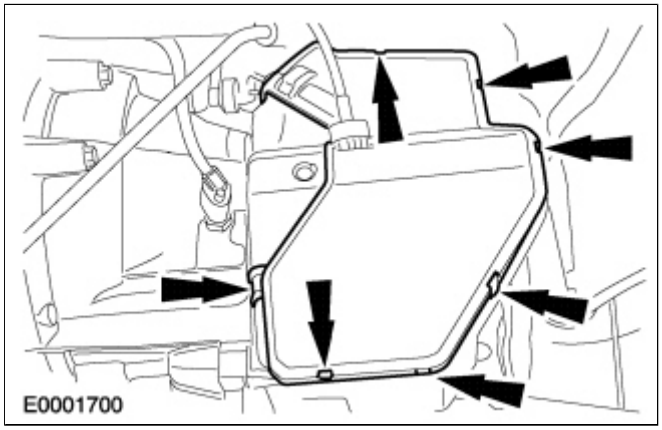
3. Adjust the selector cable.
    1. Unlock the selector cable (press colored insert).
    2. Move the selector lever to its center position.



4. Adjust the selector cable.
    1. Select 3rd or 4th gear (move the gearshift lever to its RH or LH stop position).
    2. Lock the selector cable.



5. Install the gearshift cables cover.



6. Check system for normal operation.

General Specifications

Item	Specification
Clutch	
Type	Single-plate dry clutch
Operation	Hydraulic
External diameter of clutch disc	220 mm (8.661 in)
Pedal travel (not adjustable)	132-138 mm (5.197-5.433 in)

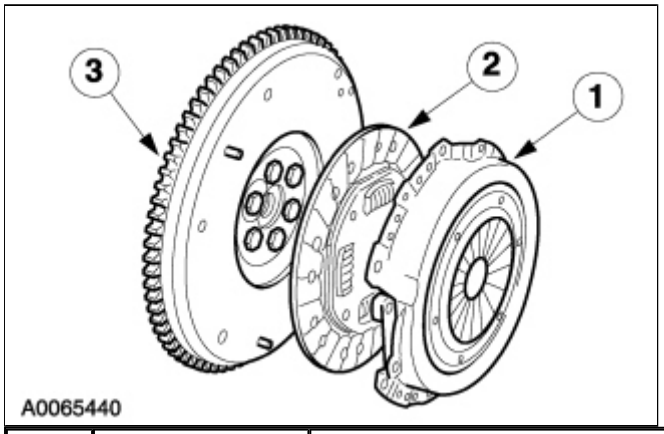
Torque Specifications

Description	Nm	lb-ft
Clutch pressure plate-to-flywheel [a]	—	—

[a] Refer to the procedure in this section.

Clutch

Clutch Components



Item	Part Number	Description
1	7563	Clutch pressure plate (part of 7B546)
2	7550	Clutch friction disc (part of 7B546)
3	6375	Flywheel

The clutch transmits the engine torque to the transaxle.

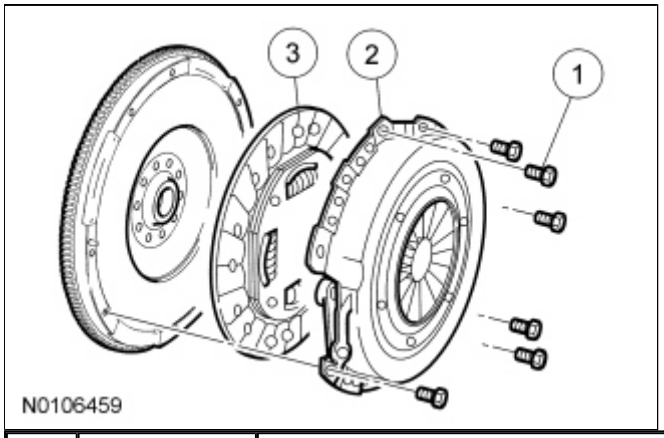
The clutch is a single-plate, dry-friction disc with a diaphragm-style spring clutch pressure plate. The clutch disc has a hub which is splined to the transmission input shaft. The clutch disc has friction material where it contacts the flywheel and the clutch pressure plate. The clutch pressure plate applies pressure to the clutch disc, holding it tightly against the surface of the flywheel. In the engaged position, the diaphragm spring holds the clutch pressure plate against the clutch disc, so that engine torque is transmitted to the input shaft.

When the clutch pedal is applied, the release bearing pushes the diaphragm spring center of the clutch pressure plate toward the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. The clutch slave cylinder assists in the effort it takes to relieve the load on the clutch pressure plate. Steel spring straps riveted to the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transaxle.

Clutch

For additional information, refer to Section 308-00 .

Clutch Disc and Pressure Plate



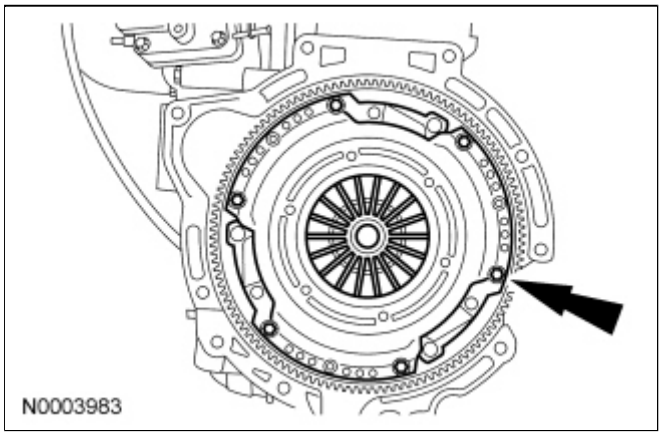
Item	Part Number	Description
1	W702426	Clutch pressure plate-to-flywheel bolt (6 required)
2	7563	Clutch pressure plate (part of 7B546)
3	7550	Clutch disc (part of 7B546)

Removal

1. Remove the transaxle. For additional information, refer to Section 308-03 .

2. ***NOTICE:*** **Loosen the clutch pressure plate retaining bolts evenly, by two turns at a time.**

   Remove and discard the 6 clutch pressure plate retaining bolts, remove the clutch disc and pressure plate.

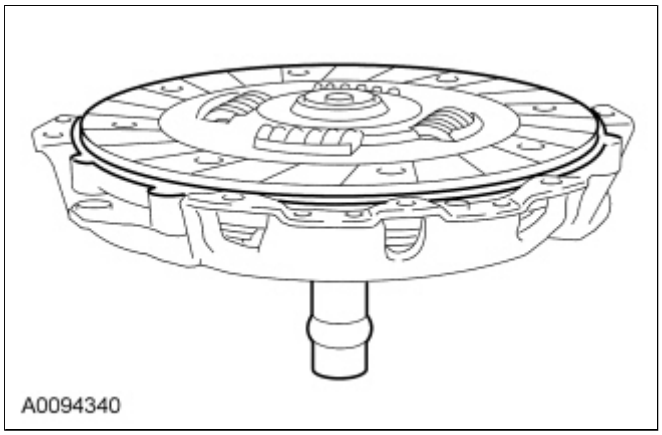


Installation

1. ***NOTICE:*** **Be sure the clutch is installed correctly in the pressure plate. The side of the clutch marked gearbox side faces the pressure plate fingers. Failure to install the clutch plate will damage the clutch assembly during installation on the flywheel.**

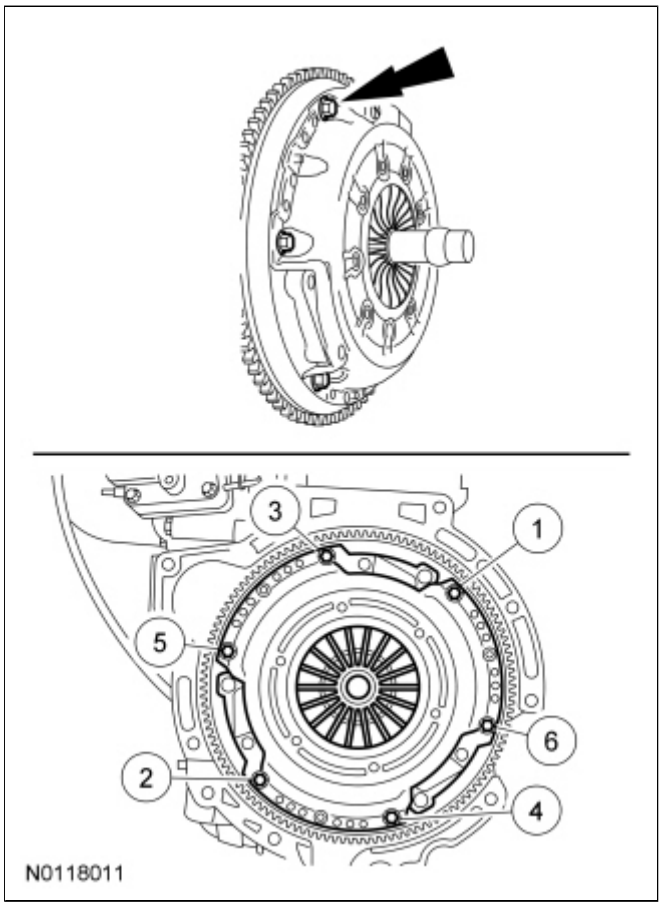
   NOTICE: **Do not use cleaners with a petroleum base and do not immerse the clutch pressure plate in solvent or damage may occur.**

Position the clutch disc on the clutch pressure plate with the side of the clutch marked gearbox side facing the pressure plate fingers. Using a suitable clutch aligner, centralize the clutch disc to the clutch pressure plate.



2. **NOTE:** Tighten the clutch pressure plate-to-flywheel bolts finger tight and then evenly by two turns at a time to the specified torque.

   Using a suitable clutch aligner, position the clutch disc and clutch pressure plate on the flywheel. Install the 6 new clutch pressure plate-to-flywheel bolts.
   - Tighten the bolts evenly two turns at a time in the pattern shown.
   - Tighten to 29 Nm (21 lb-ft).



3. Install the transaxle. For additional information, refer to Section 308-03 .

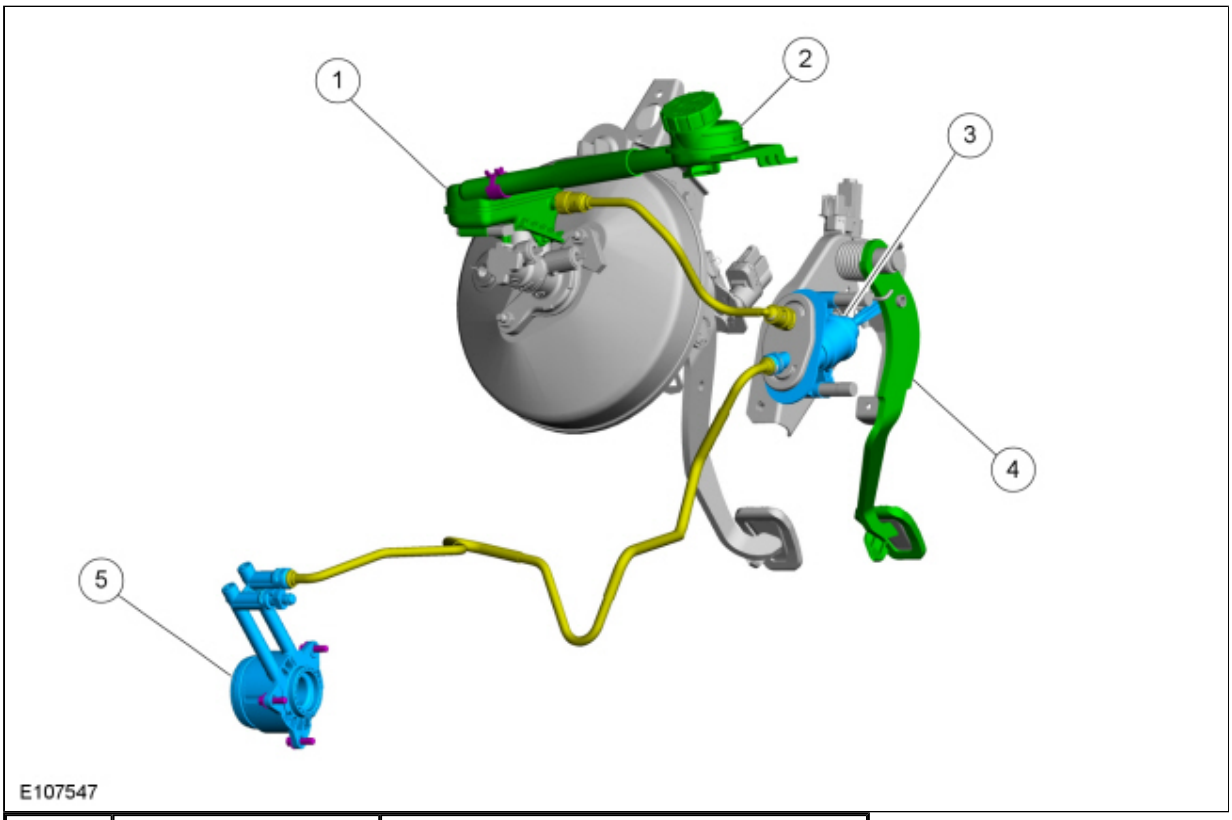
Clutch Controls

Components — Clutch Control



Item	Part Number	Description
1	—	Brake fluid reservoir
2	—	Brake fluid filling reservoir
3	—	Clutch master cylinder
4	—	Clutch pedal
5	—	Clutch slave cylinder

The clutch control system is a hydraulic/mechanical clutch system. The clutch control system disengages the clutch when the clutch pedal is pressed and engages the clutch when the clutch pedal is released. When the clutch pedal is pressed, pressure builds up in the clutch master cylinder and the release bearing in the clutch slave cylinder is actuated.

The advantages of a hydraulic clutch system are:

- Automatic adjustment
- Low operating effort
- Minimal wear

A self-adjusting clutch system eliminates the need for maintenance adjustments. It provides for consistent pedal height throughout the service life of the clutch.

Brake Fluid Reservoir

The brake fluid reservoir supplies brake fluid to the hydraulic clutch system and the brake system. The hydraulic clutch system and brake system are arranged separately inside the brake fluid reservoir. If a leak

occurs in the hydraulic clutch system, the brake system continues to operate unrestricted.

Brake Fluid Filling Reservoir

The brake fluid filling reservoir is remotely attached to the brake fluid reservoir. Due to the brake fluid reservoirs location the brake fluid filling reservoir allows the technician to easily fill the brake fluid reservoir.

Clutch Master Cylinder

The clutch master cylinder generates the system pressure required to actuate the clutch. When the clutch pedal is depressed, the piston rod moves the clutch master cylinder piston. The hydraulic fluid in the clutch master cylinder is forced through the high-pressure tube to the clutch slave cylinder.

Clutch Pedal

When the clutch pedal is pressed, the clutch master cylinder transmits hydraulic fluid pressure to the clutch slave cylinder. The clutch slave cylinder and the clutch release fork transfer the clutch pedal motion to the clutch release bearing. The release bearing presses against the pressure plate diaphragm spring, releasing the clutch disc. Once the clutch pedal is released, the diaphragm spring pushes the piston in the clutch slave cylinder back to its initial position. The non-positive connection between the clutch disc and the flywheel is re-established.

Clutch Slave Cylinder

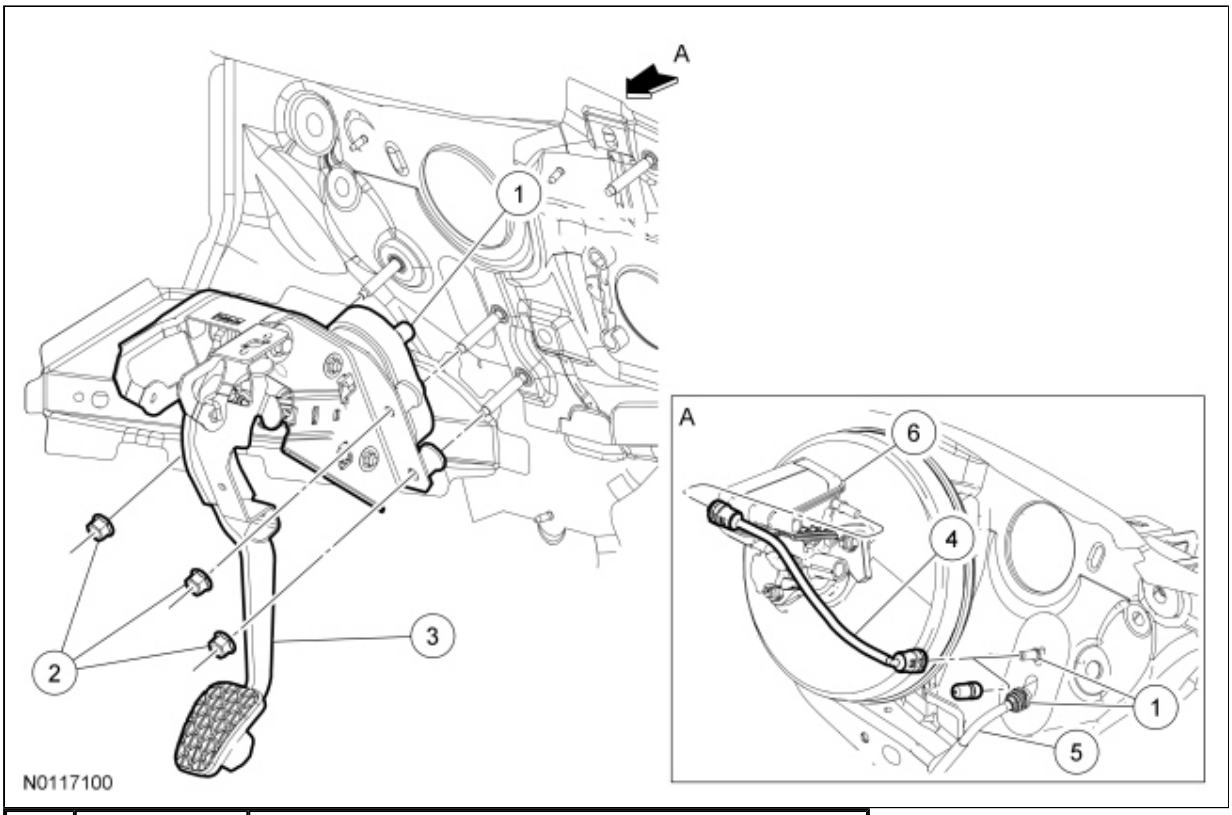
The central clutch slave cylinder is equipped with a release bearing and is attached to the clutch bell housing with three bolts. The release bearing is an interference installed in the clutch slave cylinder and is not serviced separately.

The hydraulic fluid forced from the piston in the clutch master cylinder moves the piston in the clutch slave cylinder which, moves the release bearing in an axial direction. The release bearing inner ring presses onto the diaphragm spring. The non-positive connection between the clutch disc and the flywheel is interrupted.

Clutch Master Cylinder

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1



Item	Part Number	Description
1	—	Clutch master cylinder (part of 7519)
2	W706840	Clutch pedal nut (3 required)
3	7519	Clutch pedal assembly
4	7K502	Brake master cylinder to clutch master cylinder tube
5	7K592	Clutch master cylinder to slave cylinder tube
6	2140	Brake master cylinder assembly

Removal

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification.

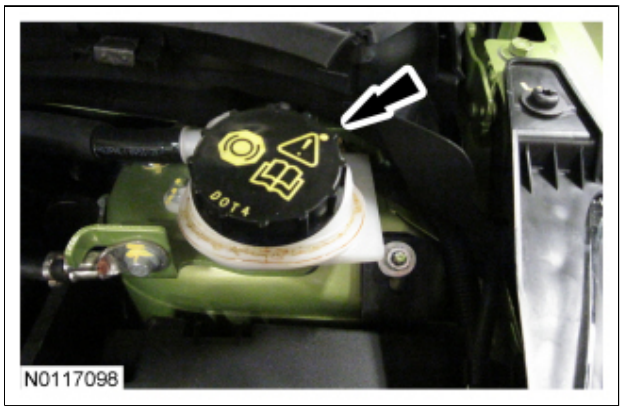
Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

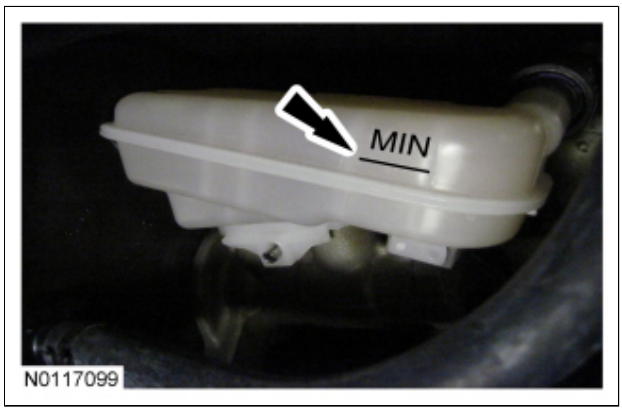
NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

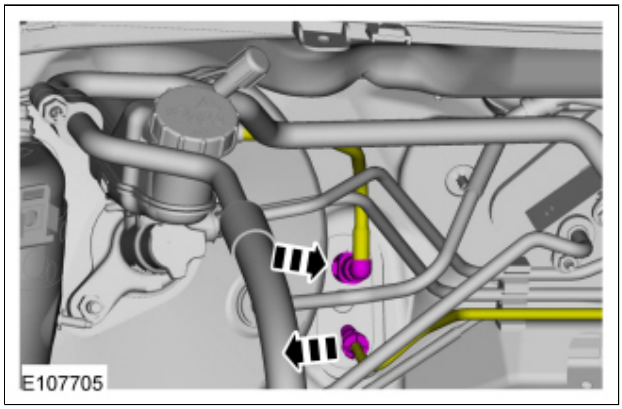
1. Remove the brake fluid reservoir cap.



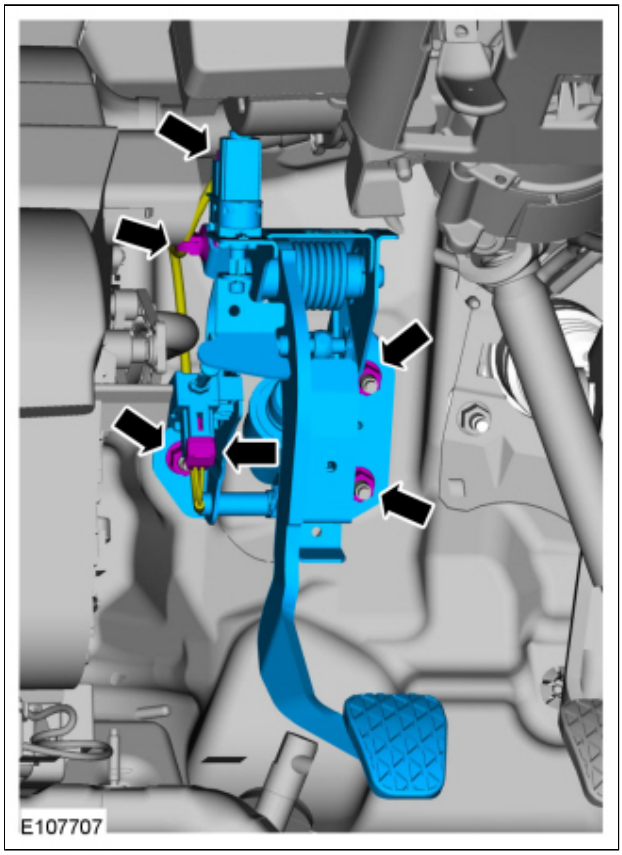
2. Drain the brake fluid into a suitable container until the brake fluid level reaches the MIN mark.



3. Disconnect the clutch master cylinder tubes.



4. Disconnect the clutch pedal position switch, starter inhibitor switch electrical connectors and remove the 3 clutch pedal assembly nuts.

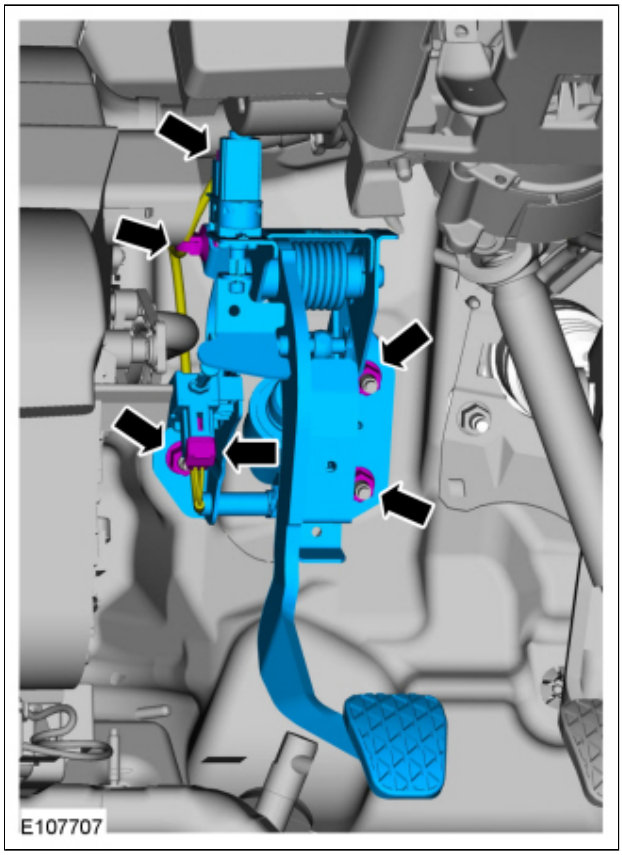


5. Remove the clutch pedal/master cylinder assembly.

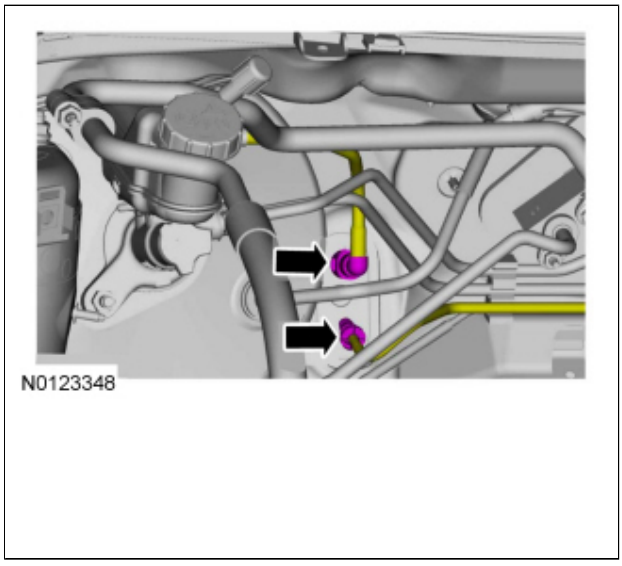
Installation

1. Install the clutch pedal/ master cylinder assembly

2. Install the 3 clutch pedal assembly nuts, connect the starter inhibitor switch and clutch pedal position switch electrical connectors.
   - Tighten to 25 Nm (18 lb-ft).



3. Connect the clutch master cylinder tubes.



4. Bleed the clutch hydraulic system. For additional information, refer to Section 308-00 .

Clutch Slave Cylinder

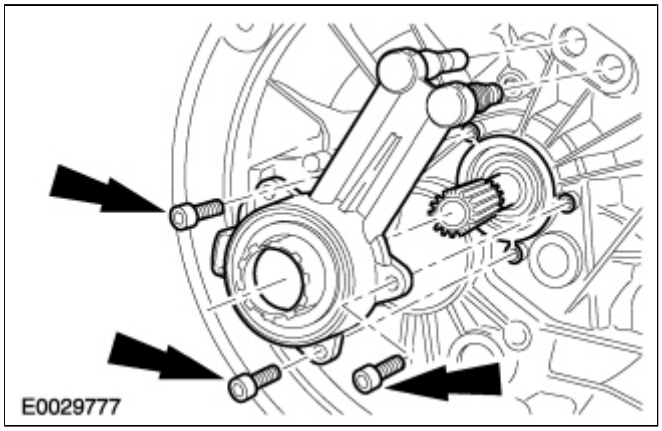
Removal

1. Remove the transaxle. For additional information, refer to Section 308-03 .

2. ***NOTICE:*** **If brake fluid is spilled on the paint work, the affected area must be immediately washed down with cold water.**

   NOTE: Any oily or greasy deposits witnessed on the slave cylinder release bearing surface should be wiped off with a suitable de-greasing agent or cleaner. Do not use detergent or other corrosive agents.

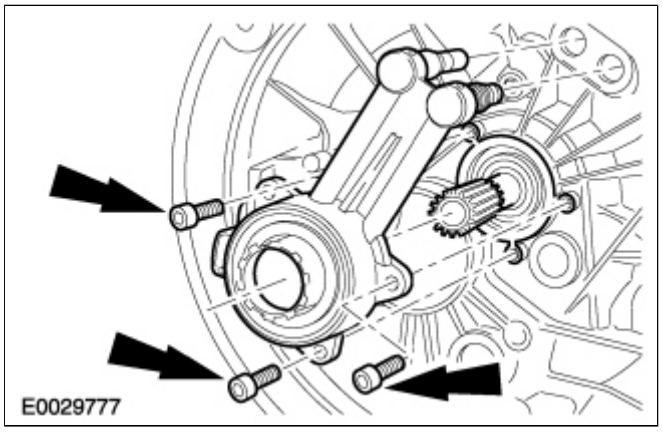
   Remove the 3 clutch slave cylinder bolts and remove the clutch slave cylinder.



Installation

1. ***NOTICE:*** **If brake fluid is spilled on the paint work, the affected area must be immediately washed down with cold water.**

   Install the clutch slave cylinder and the 3 clutch slave cylinder bolts.
   - Tighten to 11 Nm (97 lb-in.).



2. Install the transaxle. For additional information, refer to Section 308-03 .

3. Fill and bleed the clutch system. For additional information, refer to Section 308-00 .

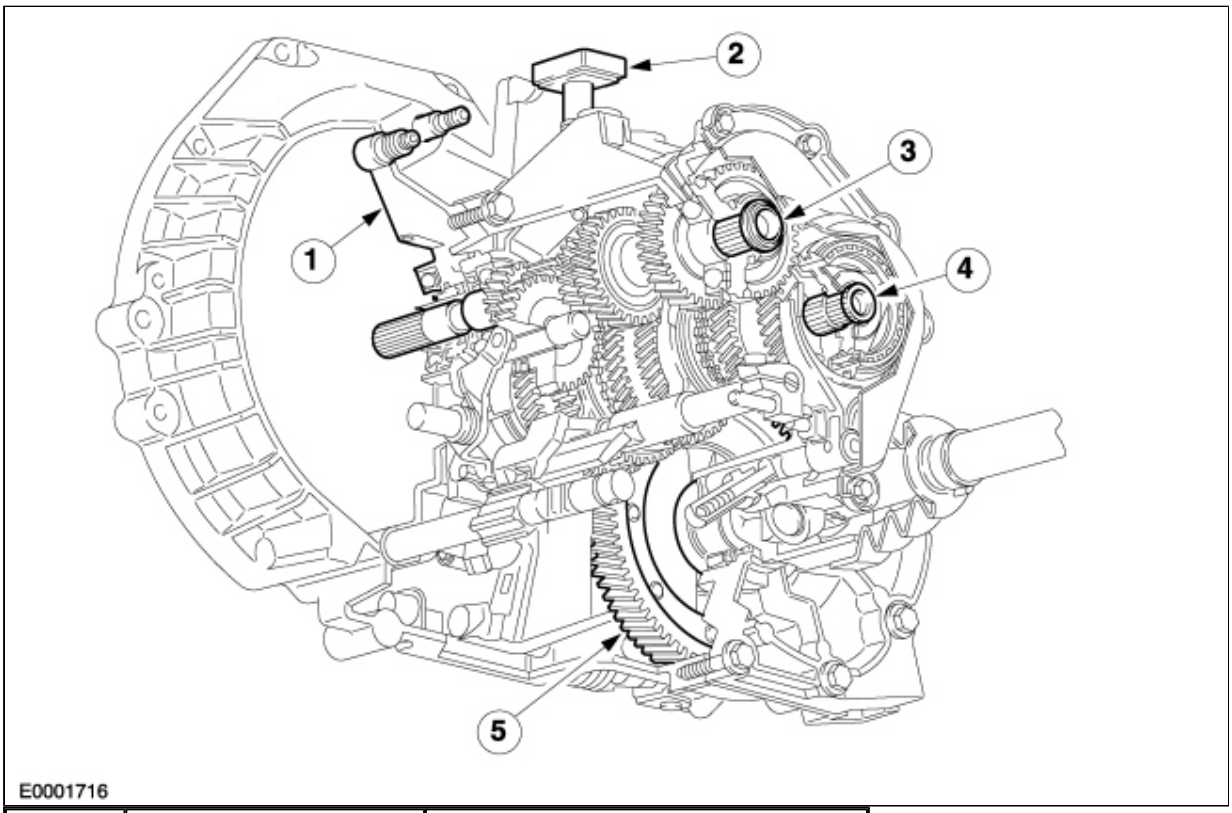
Manual Transaxle

General View



E0001716

Item	Part Number	Description
1	7A564	Clutch slave cylinder
2	7D494	Transaxle vent
3	7L226	Input shaft
4	7061	Output shaft
5	4026	Differential

The IB5 transaxle has an aluminum transaxle housing which comprises of two sections. Its rigidity has been improved with the inclusion of reinforcement ribbing in the design. The transaxle housing sections come in pairs and cannot be obtained separately. The clutch is hydraulically actuated.

All the gears are constant mesh gears (except reverse gear). In each gear, the required transaxle ratio is achieved by means of a pair of gears.

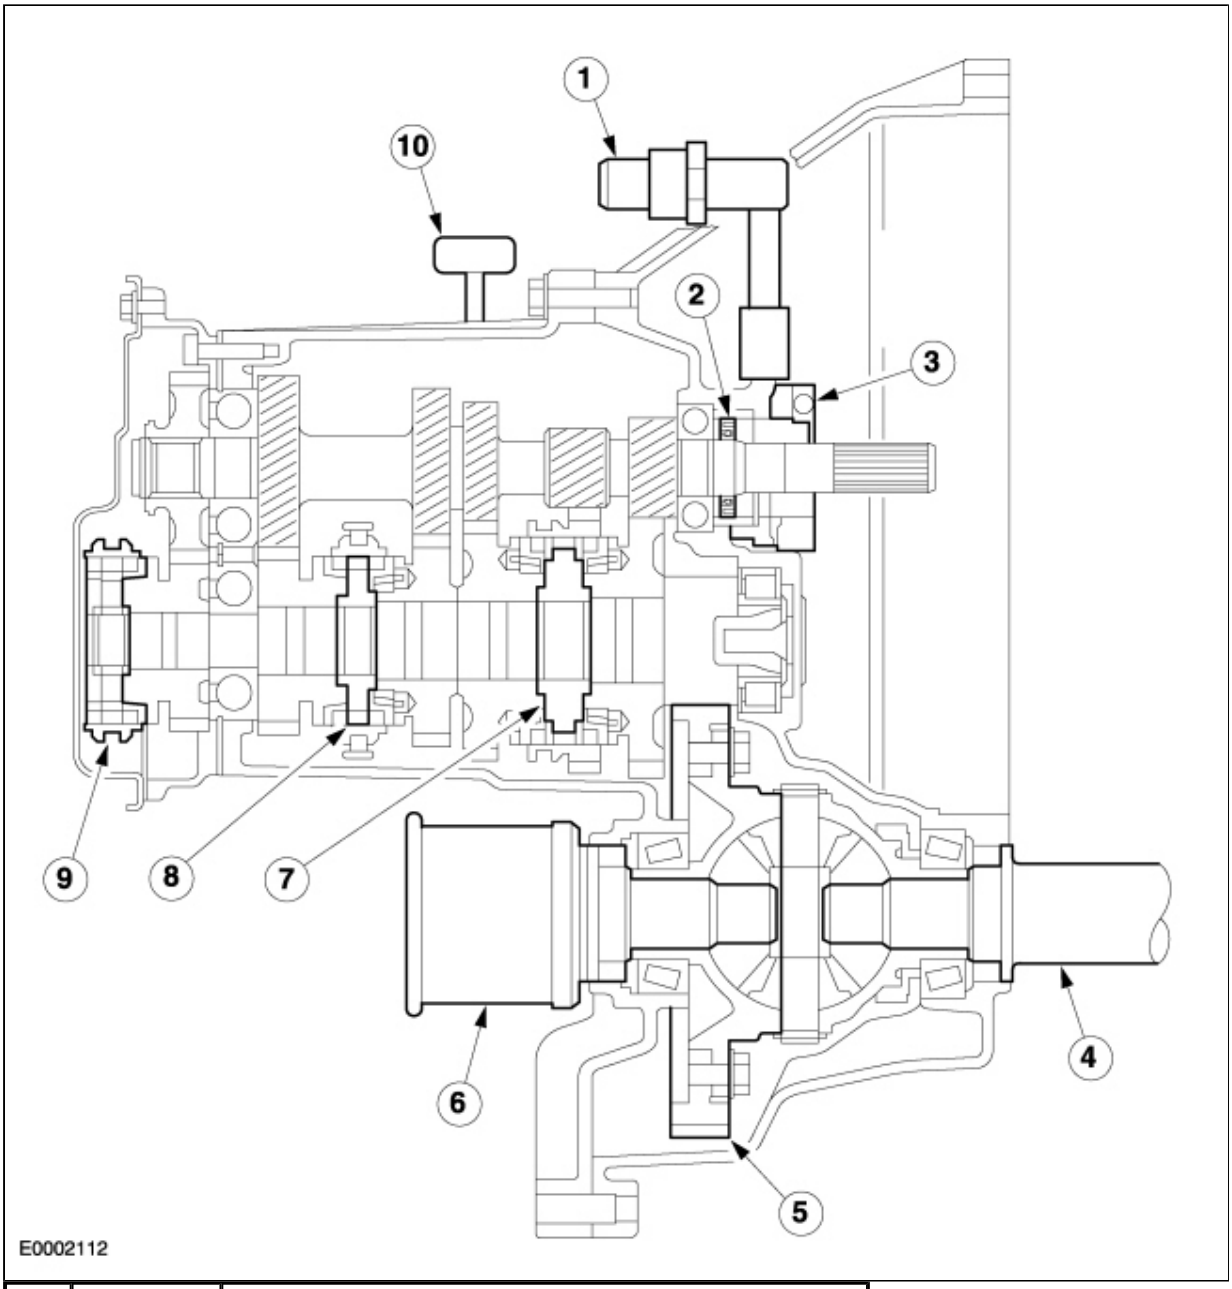
When reverse gear is selected, the direction of rotation of the output shaft is changed by an idler gear.

The gears are all helical gears (except reverse gear). They all have synchronizers (except reverse gear) and run on plain bearings.

First and second gears have dual synchronizers.

IB5 Manual Transaxle Components

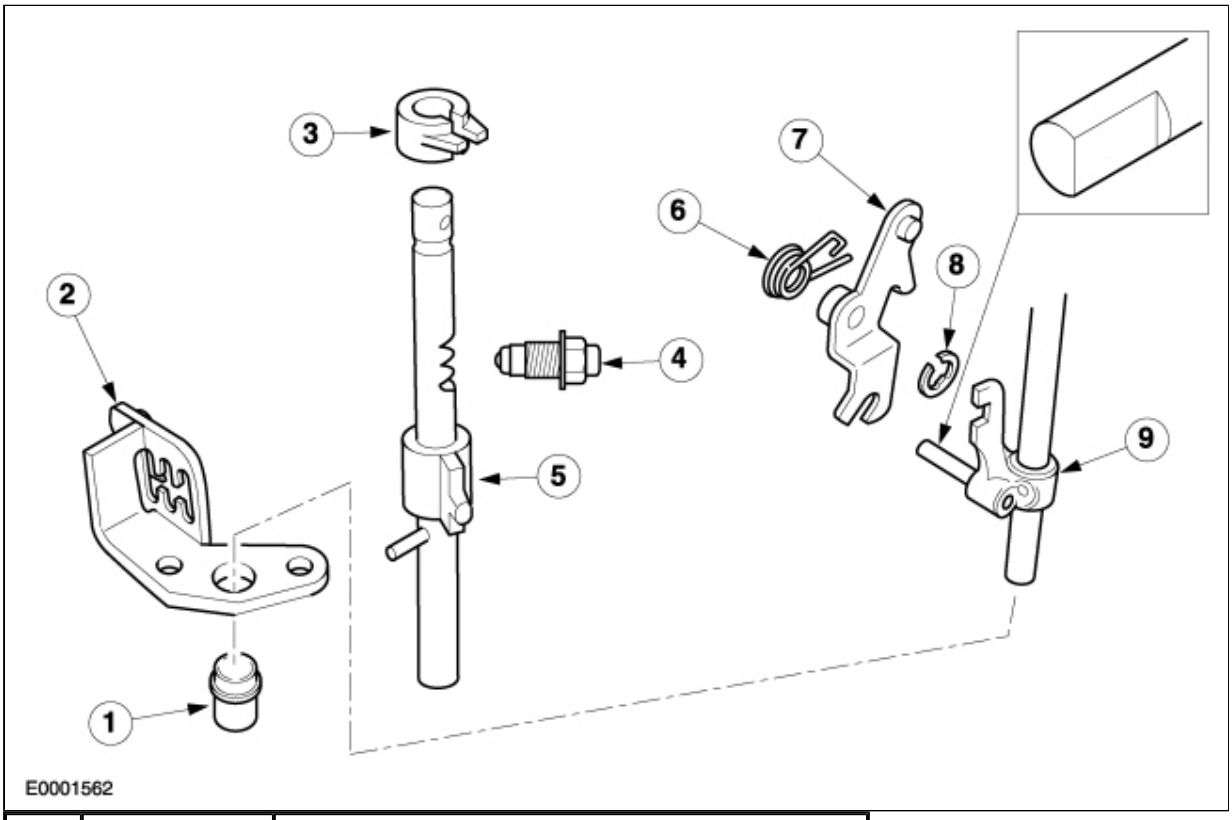
General View



Item	Part Number	Description
1	—	Quick-release coupling
2	7052	Oil seal (accessible from outside)
3	7A564	Clutch slave cylinder with release bearing (cannot be serviced separately)
4	3B436	RH intermediate shaft
5	7F343	Differential ring gear
6	3B437	LH halfshaft
7	7124	Gear synchronizer — 1st/2nd gear
8	7124	Gear synchronizer — 3rd/4th gear
9	7107	Gear synchronizer — 5th gear
10	7D494	Transaxle vent

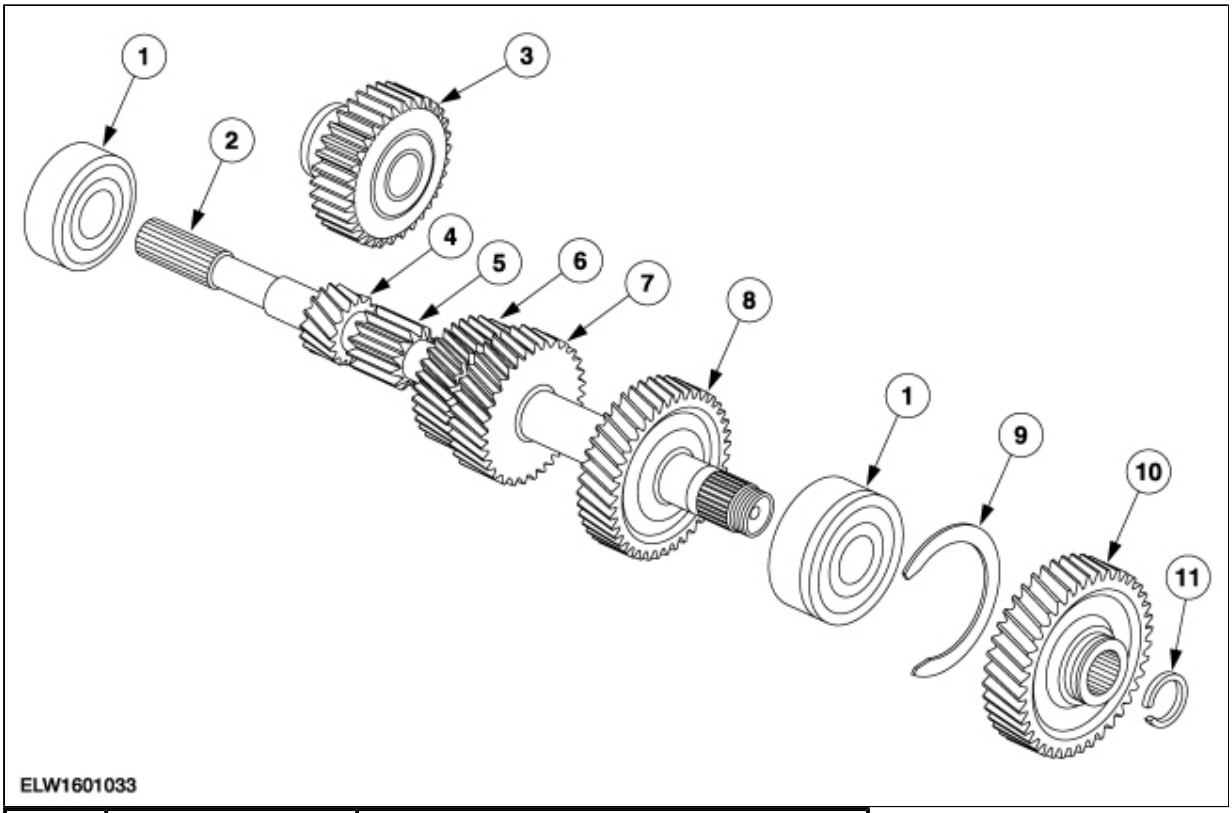
In neutral, no gear is connected to the output shaft via the gear synchronizers. No input torque is transmitted to the differential.

Selector Mechanism



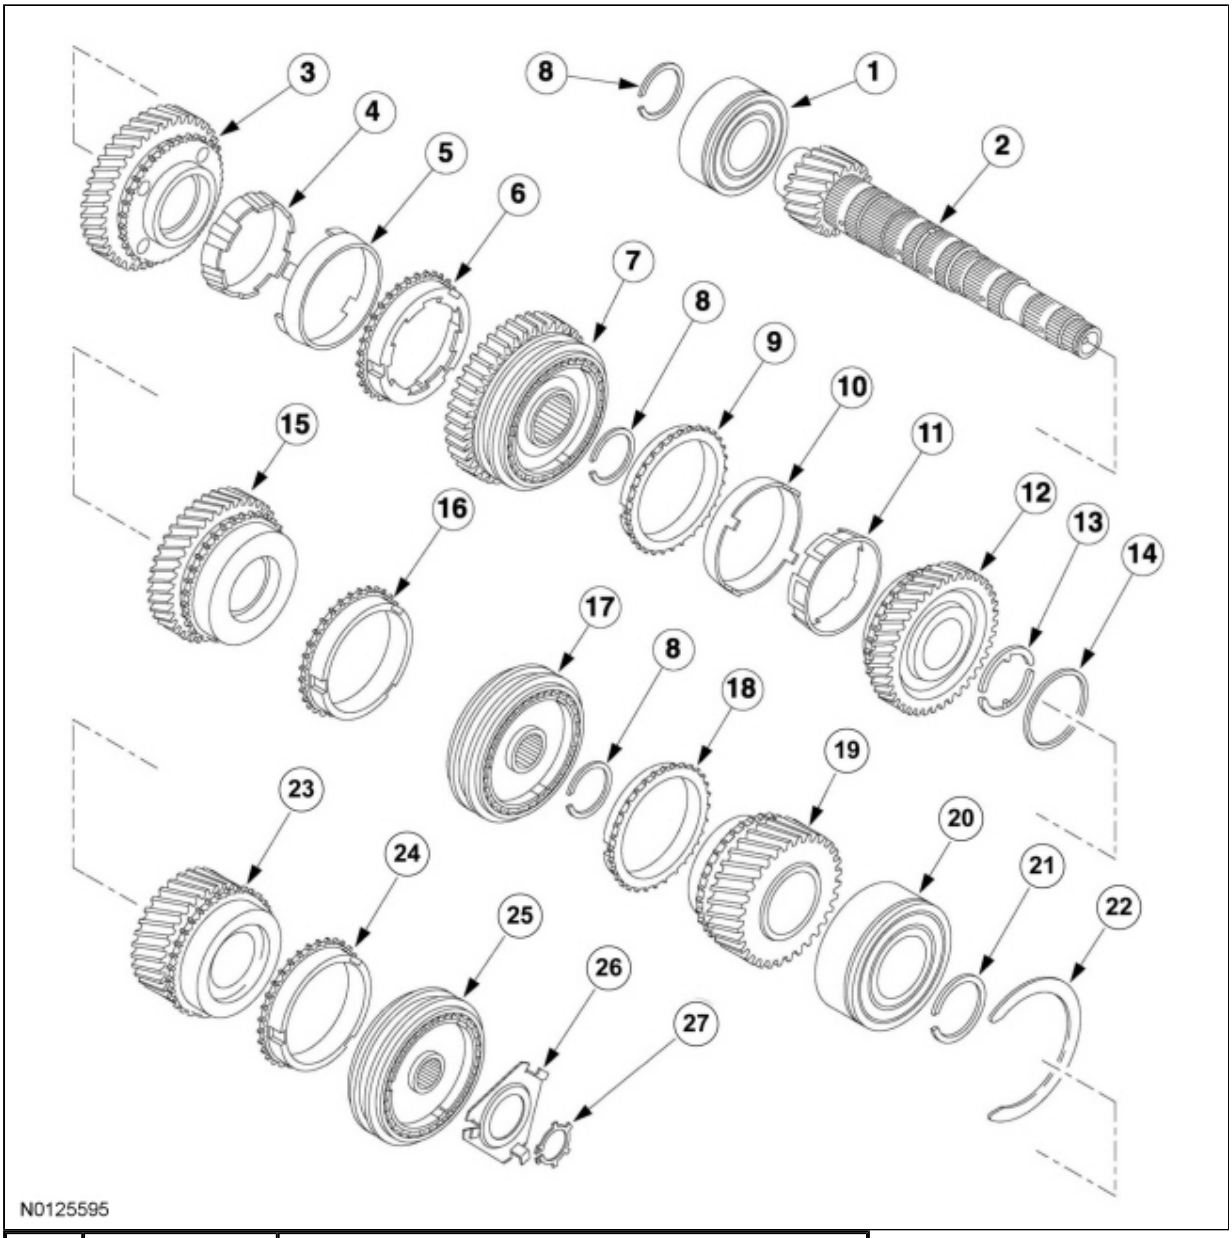
Item	Part Number	Description
1	7K024	Selector rod guide sleeve, 5th/reverse gear
2	7M038	Selector gate
3	7K201	Select interlock plate
4	7M131	Selector shaft interlock mechanism
5	7C031	Selector shift shaft
6	7K205	Return spring for selector lever, reverse gear
7	7K001	Selector lever, reverse gear
8	W527007	Snap-ring
9	7302	Selector fork, 5th/reverse gear

Input Shaft



Item	Part Number	Description
1	7025	Bearing
2	7L226	Input shaft
3	7141	Reverse idler gear
4	—	1st gear (part of 7L226)
5	—	Reverse gear (part of 7L226)
6	—	2nd gear (part of 7L226)
7	—	3rd gear (part of 7L226)
8	—	4th gear (part of 7L226)
9	7026	Retaining ring
10	—	5th gear (part of 7L226)
11	E860332	Snap-ring

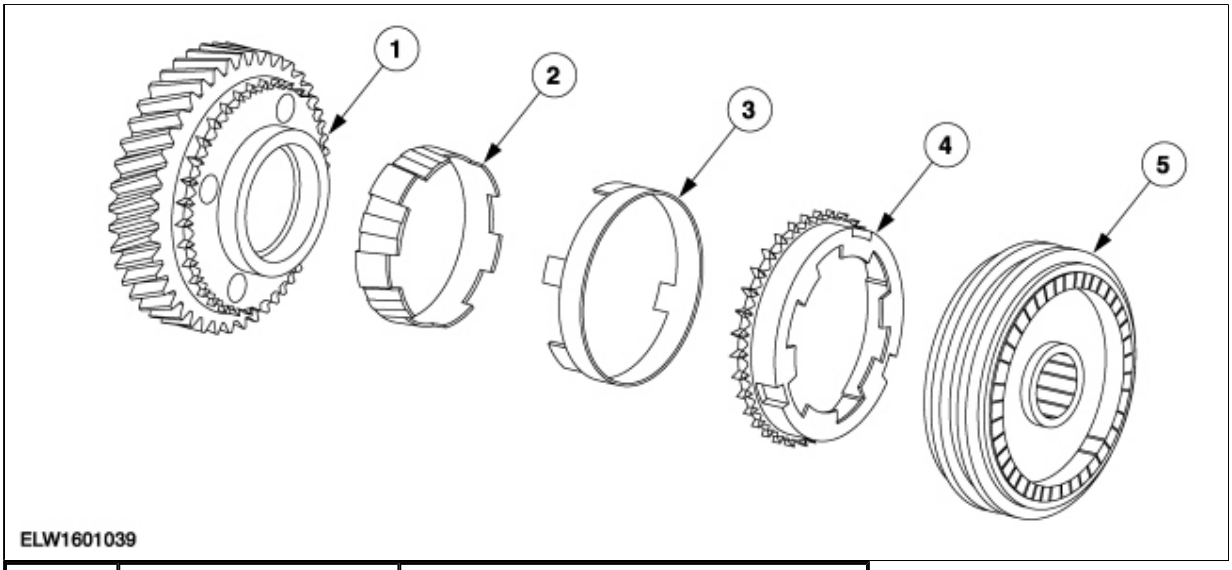
Output Shaft



Item	Part Number	Description
1	7A043	Bearing
2	7061	Output shaft
3	7100	1st gear
4	7107	Inner synchronizer ring
5	7M000	Synchronizer cone
6	7107	Outer synchronizer ring
7	7124	1st/2nd gear synchronizer with reverse gear
8	E860141	Snap-ring
9	—	Outer synchronizer ring (part of 7124)
10	7M000	Synchronizer cone
11	7107	Inner synchronizer ring
12	7102	2nd gear
13	7A385	Half moon washer (2 required)
14	7A046	Snap-ring
15	7B340	3rd gear

16	7107	Synchronizer ring, 3rd gear
17	7124	Gear synchronizer, 3rd/4th gear
18	7107	Synchronizer ring, 4th gear
19	7110	4th gear
20	7065	Bearing
21	E860303	Circlip
22	7026	Retaining ring
23	7K136	5th gear
24	7107	Synchronizer ring, 5th gear
25	7L053	Gear synchronizer, 5th gear
26	7L049	Retaining plate
27	W702295	Circlip

Dual Synchronizer



Item	Part Number	Description
1	7100	Gear
2	7107	Inner synchronizer ring
3	7M000	Synchronizer cone
4	7107	Outer synchronizer ring
5	7124	Synchronizer assembly

Dual Synchronizer

First and second gear have dual synchronizers. The use of a second synchronizer ring means that the effective synchronization area is increased approximate. 100% in relation to single synchronizers. Dual synchronization gives considerable improvement in gearshift quality.

The dual synchronizers consist of inner synchronizer ring, cone ring, outer synchronizer ring and synchronizer assembly.

The conical surface on the gear wheel is discontinued. Synchronization occurs through both synchronizer rings and the cone ring which is positively fitted to the gear wheel.

Differential

Major components of the differential include:

- Differential ring gear
- Differential housing with two taper roller bearings
- Differential pinion gears
- Input shaft pinion gears

The transaxle and differential are housed in a two-section aluminum housing and flange-mounted to the engine.

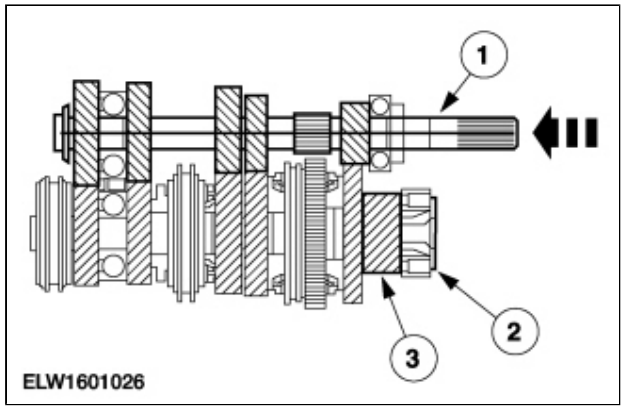
The input torque is transmitted to the differential via a ring gear which is bolted to the differential case.

The differential case contains the differential pinions mounted on one pin as well as the front halfshaft pinions connected to the front drive shafts through the splines.

If the front wheels are travelling at different speeds (when cornering), the front halfshaft pinions can move on the differential pinions.

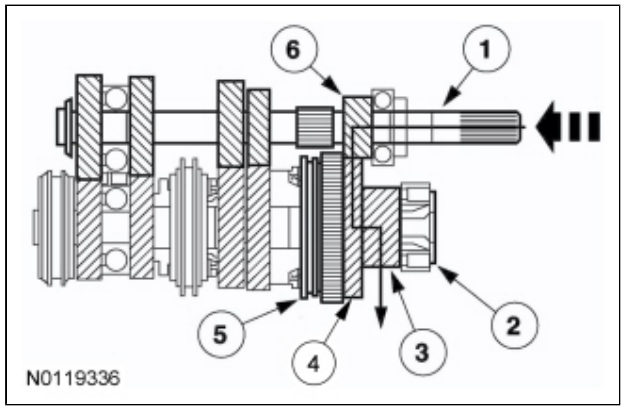
Power Flow

Neutral



1	Input shaft
2	Output shaft
3	Output pinion

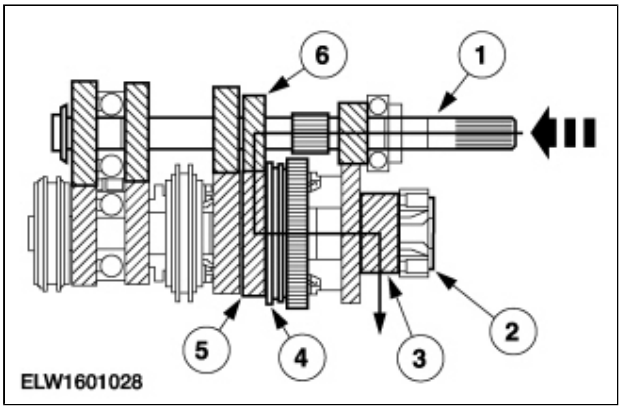
First Gear



1	Input shaft
2	Output shaft
3	Output pinion

4	1st gear
5	Gear synchronizer, 1st/2nd gear
6	Gearing, 1st gear

Second Gear



1	Input shaft
2	Output shaft
3	Output pinion
4	Gear synchronizer, 1st/2nd gear
5	2nd gear
6	Gearing, 2nd gear

Third Gear

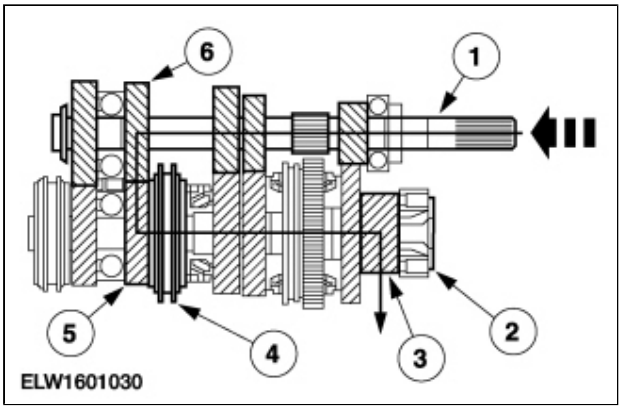
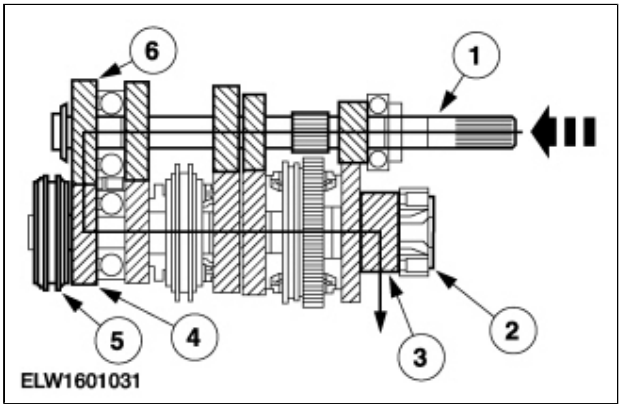
2	Output shaft
3	Output pinion
4	Gearing, 3rd gear
5	Gear synchronizer, 3rd/4th gear
6	3rd gear

Fourth Gear



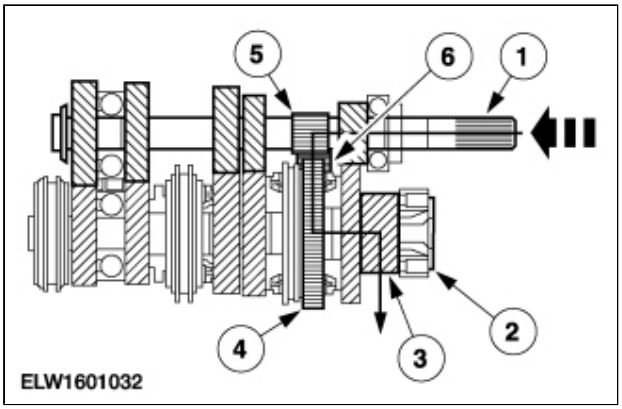
1	Input shaft
2	Output shaft
3	Output pinion
4	Gear synchronizer, 3rd/4th gear
5	Gearing, 4th gear
6	4th gear

Fifth Gear



1	Input shaft
2	Output shaft
3	Output pinion
4	Gearing, 5th gear
5	Gear synchronizer, 5th gear
6	5th gear

Reverse Gear



1	Input shaft
2	Output shaft
3	Output pinion
4	Reverse gear wheel
5	Gearing, reverse gear
6	Reverse idler gear

The reverse idler gear is driven off the input shaft. Its purpose is to change the direction of rotation of the output shaft when reverse gear is selected.

The reverse idler gear runs in a plain bearing on the idler gear shaft and a bearing block.

The selector interlock mechanism and the selector finger are mounted on a sleeve in the transaxle housing. They hold the selected gear by means of a spring-loaded ball until a different gear is selected.

The selector interlock mechanism has three different positions.

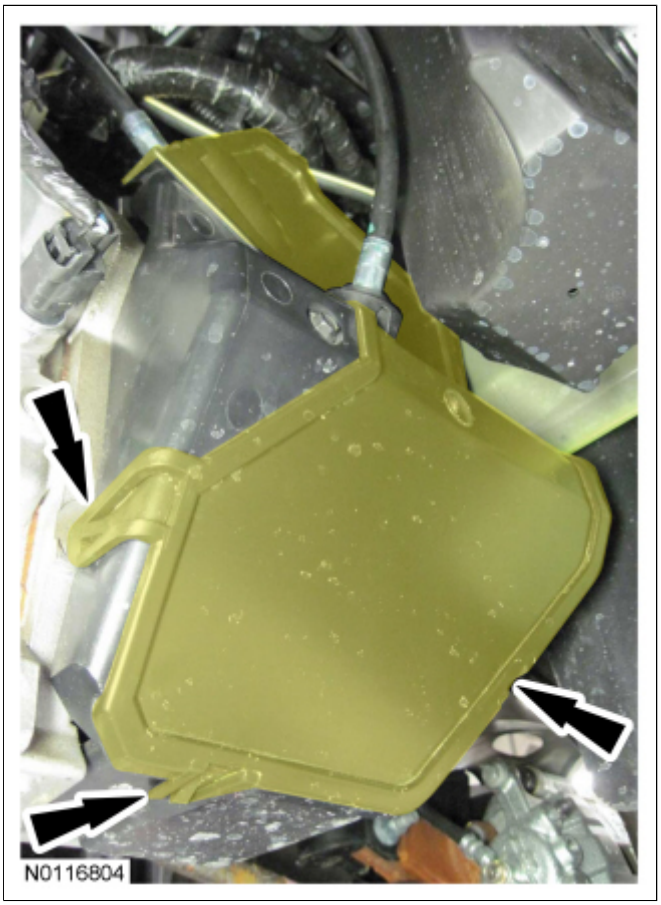
Transaxle Draining and Filling

Material

Item	Specification
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C

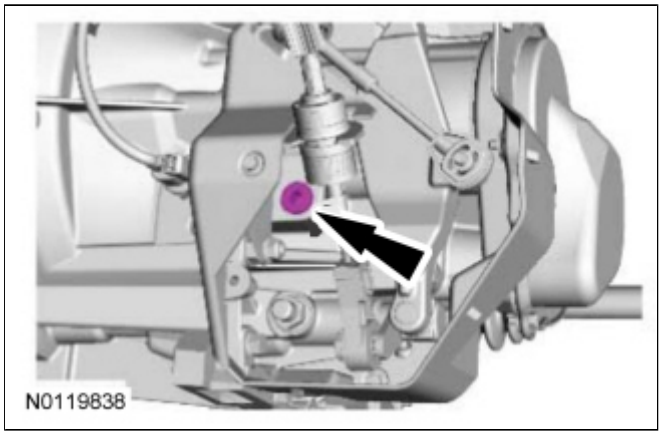
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the 7 retainers (2 shown) and remove the shift cable cover.

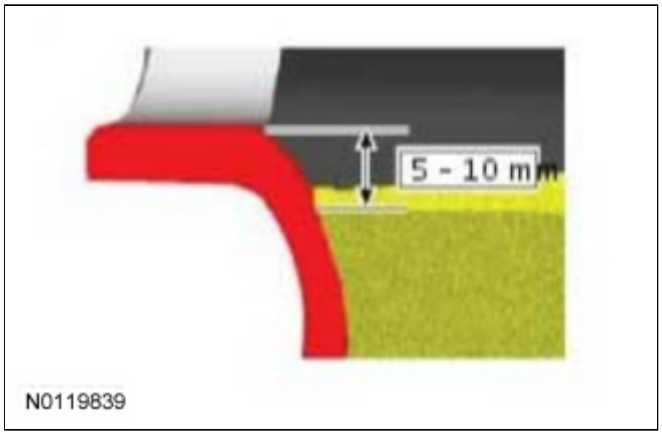


3. **NOTE:** Before removing, clean the area around the filler plug.

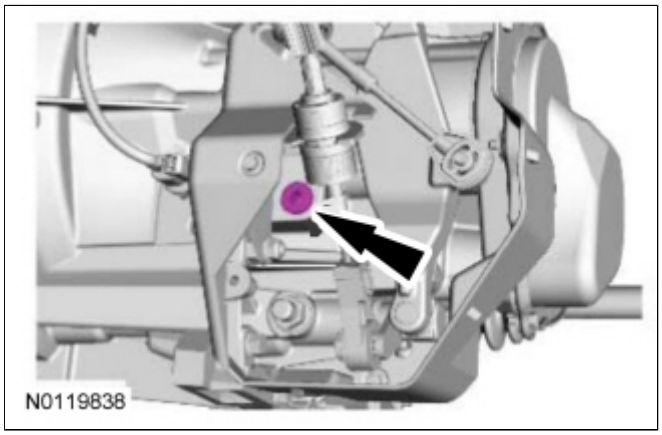
   Remove the fill plug.



4. Using a suitable oil suction gun, fill the transaxle to the correct level with the specified fluid.
    - Transaxle fluid level: 5-10 mm (0.196-0.393 in.) below the lower edge of the filler plug bore.



5. Install the fill plug.
    - Tighten to 35 Nm (26 lb-ft).



6. Install the shift cables cover.

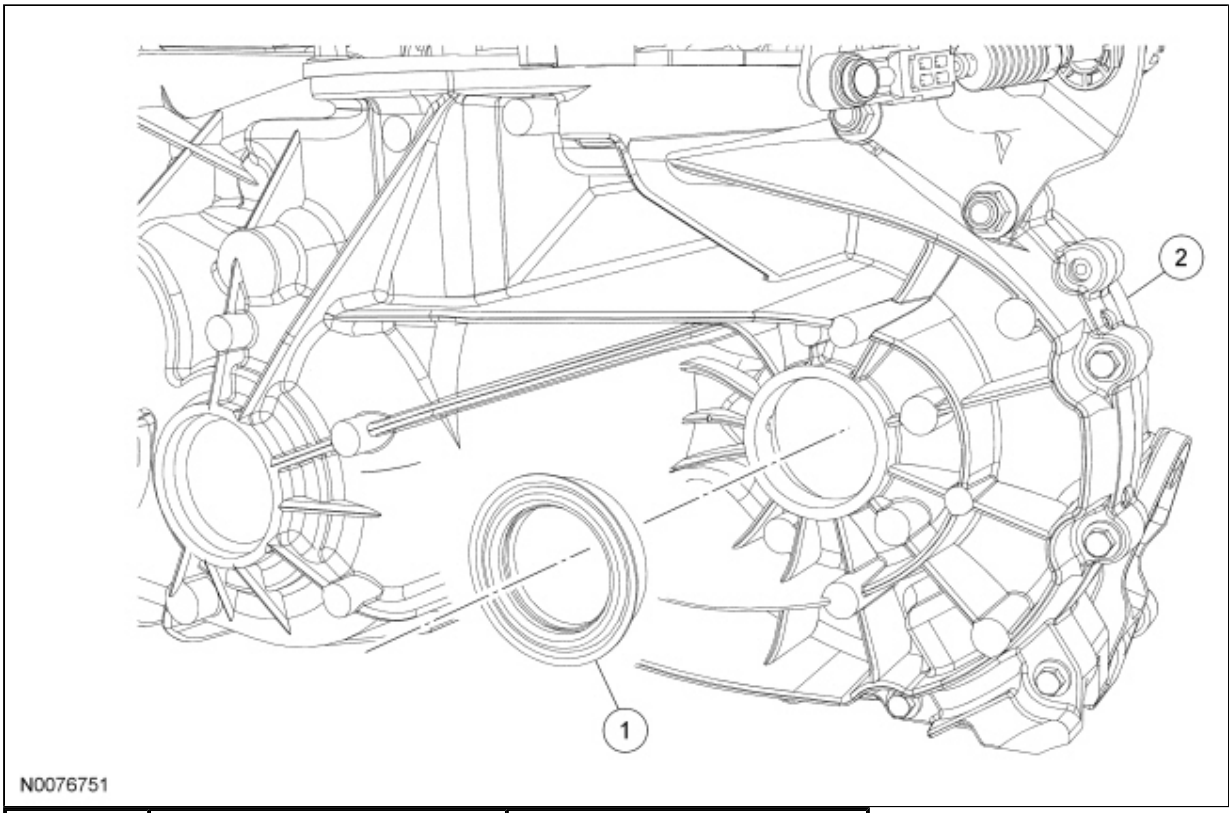
Halfshaft Seal — LH

Special Tool(s)

 16018	Installer, Halfshaft Oil Seal 308-039
 ST1556-A	Remover, Halfshaft Oil Seal 307-163 (T86P-70043-A)
ST2791-A	Remover, Pilot Bearing 308-001 (T58L-101-B)

Material

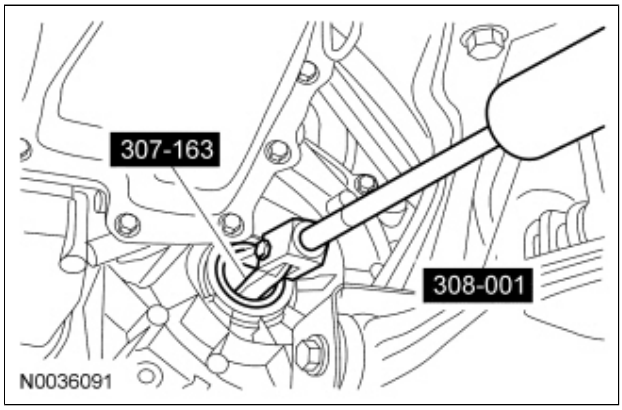
Item	Specification
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C



Item	Part Number	Description
1	3K169	Halfshaft seal
2	7003	Transaxle

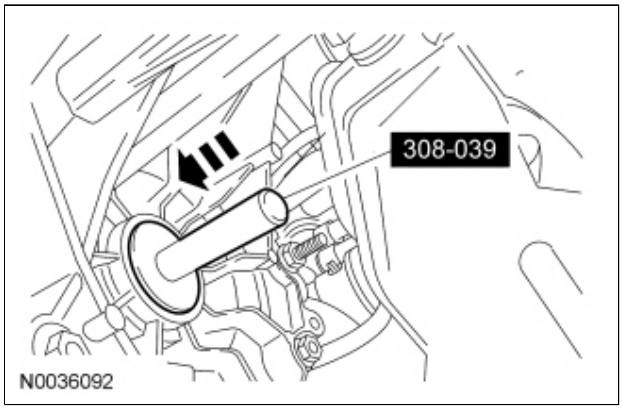
Removal

1. Remove the LH halfshaft. For additional information, refer to Section 205-04 .
2. Using the Pilot Bearing Remover with the Halfshaft Oil Seal Remover, remove and discard the halfshaft oil seal.



Installation

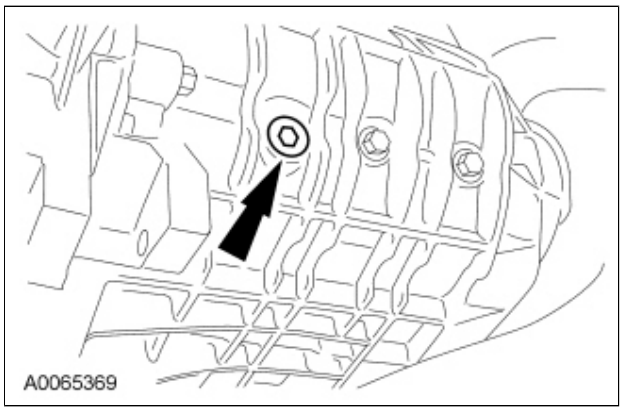
1. Using the Halfshaft Oil Seal Installer, install the new halfshaft oil seal.



2. Install the halfshaft. For additional information, refer to Section 205-04 .

3. **NOTE:** The fill height is 0.0-0.5 mm (0.0-0.2 in) below the lower edge of the filler hole.

   Remove the transaxle fluid filler plug. Check the transaxle fluid level and fill with manual transmission fluid as necessary.
   - Tighten to 35 Nm (26 lb-ft).



Halfshaft Seal — RH

Special Tool(s)

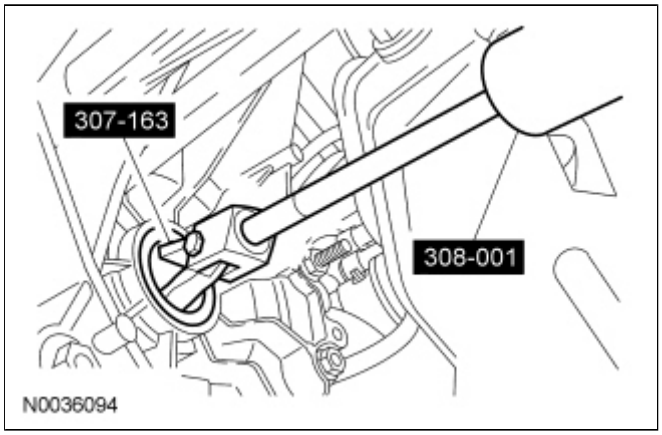
 16018	Installer, Halfshaft Oil Seal 308-039
 ST1556-A	Remover, Halfshaft Oil Seal 307-163 (T86P-70043-A)
ST2791-A	Remover, Pilot Bearing 308-001 (T58L-101-B)

Material

Item	Specification
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C

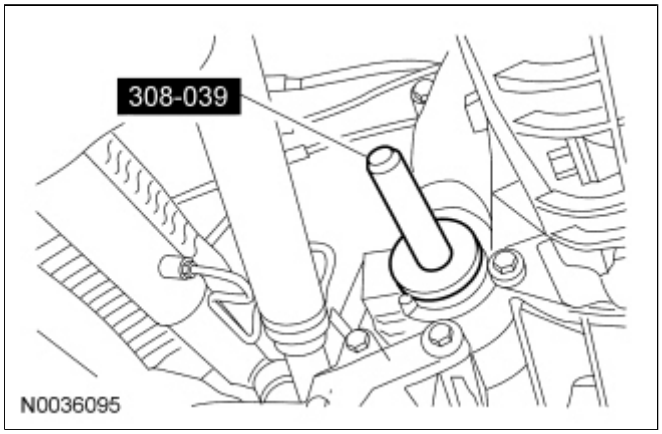
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the RH halfshaft and intermediate shaft assembly. For additional information, refer to Section 205-04 .
3. Using the Pilot Bearing Remover with the Halfshaft Oil Seal Remover, remove and discard the halfshaft oil seal.



Installation

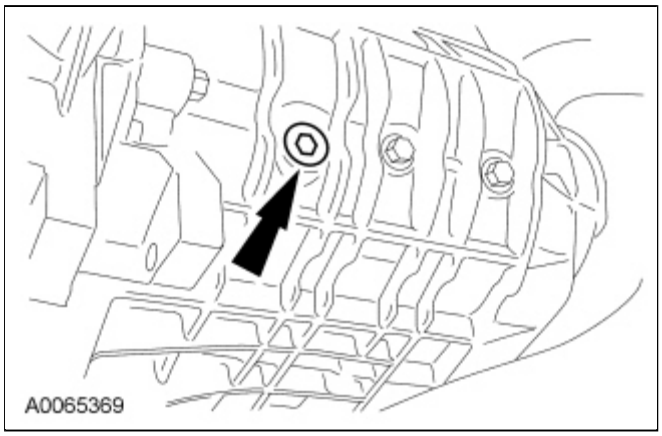
1. Using the Halfshaft Oil Seal Installer, install the new halfshaft oil seal.



2. Install the RH halfshaft and intermediate shaft assembly. For additional information, refer to Section 205-04 .

3. **NOTE:** The fill height is 0.0-5.0 mm (0.0-0.2 in) below the lower edge of the filler hole.

   Remove the transaxle fluid filler plug. Check the transaxle fluid level and fill with manual transmission fluid as necessary.
   - Tighten to 35 Nm (26 lb-ft).



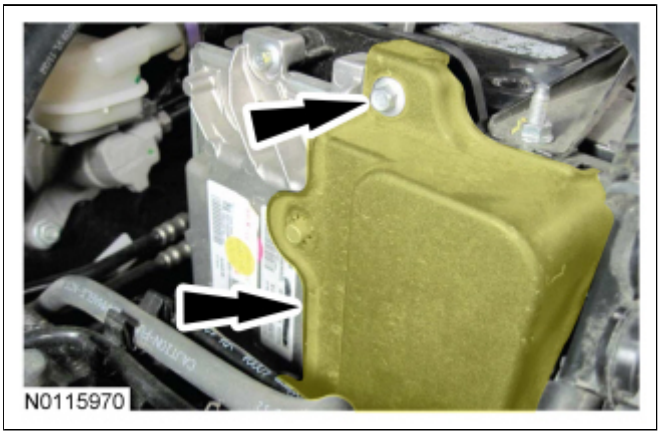
Transaxle Support Insulator

Special Tool(s)

ST2759A	Adapter for 303-290A 303-290-01
 ST2379-A	Adapter for 303-290A (Support Leg) 303-290-03A
ST2761A	Support Bar, Engine 303-290A

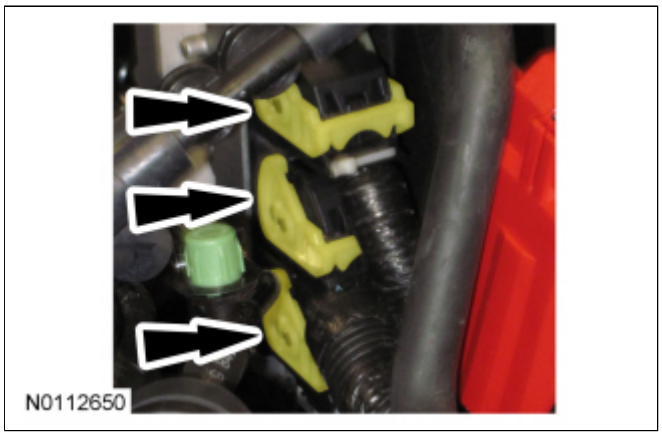
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the battery. For additional information, refer to Section 414-01 .
3. Remove the cowl assembly. For additional information, refer to Section 501-02 .
4. Remove the Air Cleaner (ACL) assembly and outlet pipe. For additional information, refer to Section 303-12 .
5. Remove the PCM cover bolt and the PCM cover.

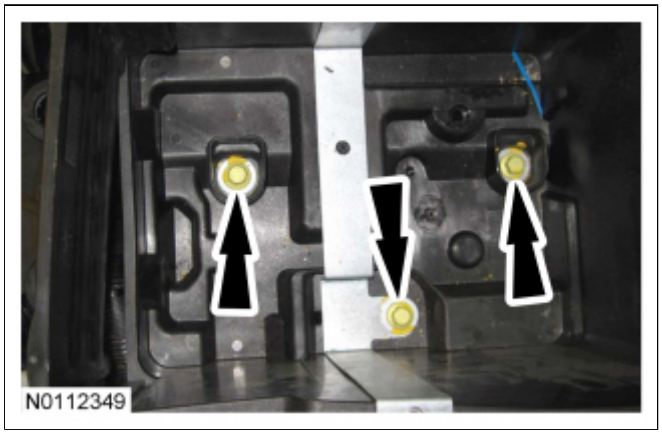


N0115970

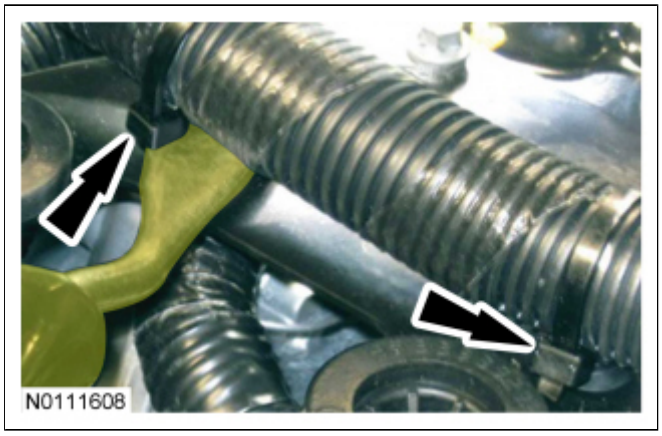
6. Disconnect the 3 PCM electrical connectors.



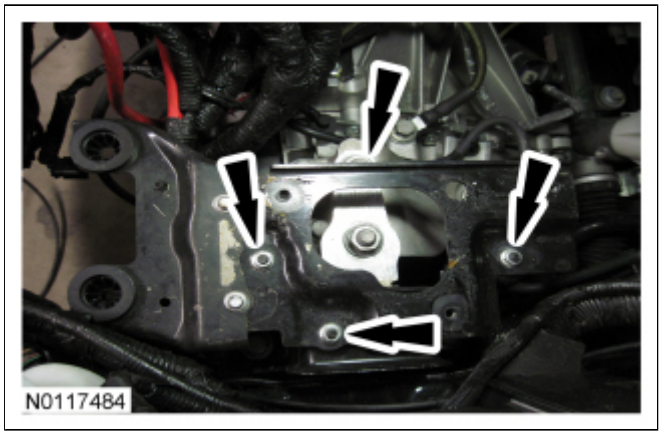
7. Remove the 3 battery tray bolts and the battery tray.



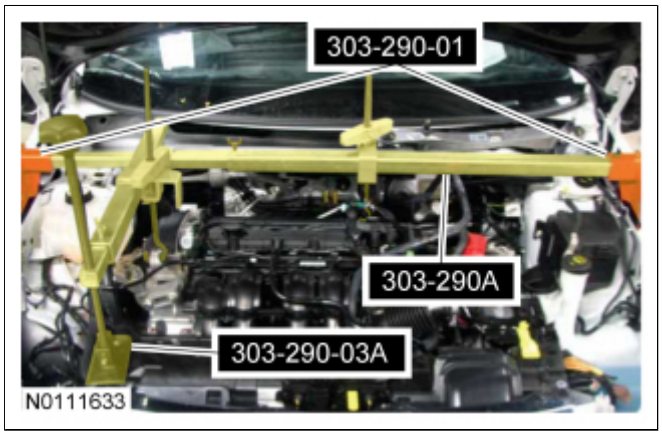
8. Using a suitable tool, detach the wiring harness from the battery tray bracket.



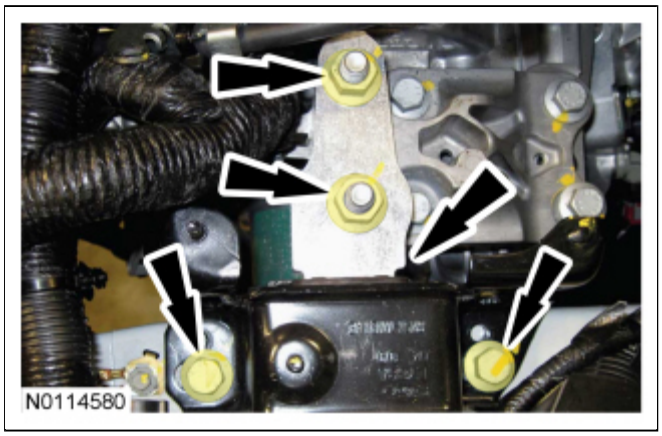
9. Remove the 3 battery tray bracket nuts and remove the battery tray bracket.



10. Install the special tools and support the engine.

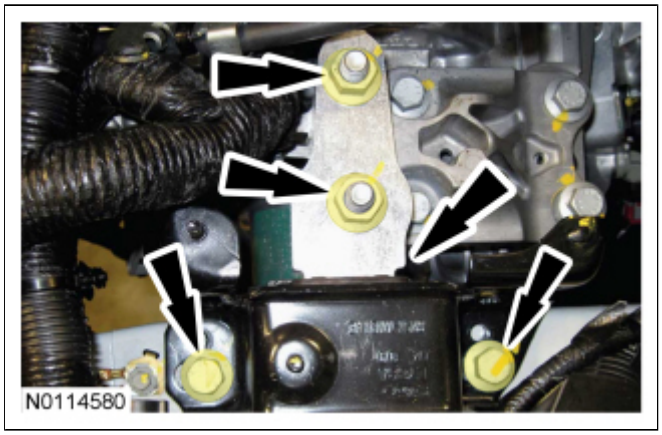


11. Remove the 2 transaxle support insulator bolts and nuts and remove the transaxle support insulator.

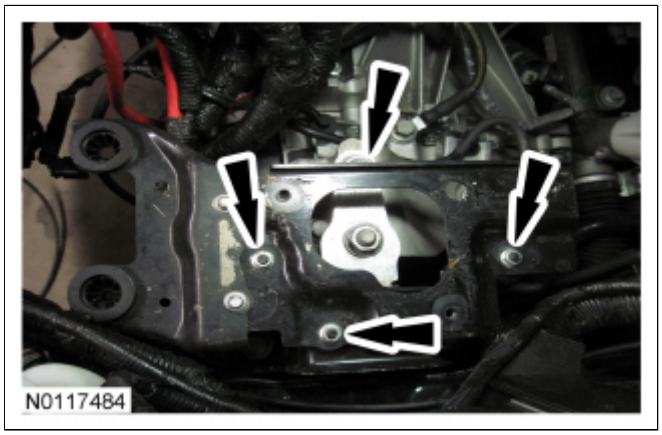


Installation

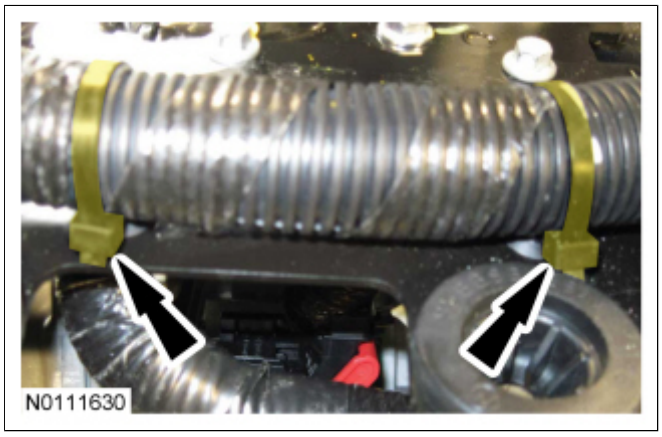
1. Install the transaxle support insulator and install the 2 transaxle support insulator bolts and the 2 nuts.
    - Tighten the 2 bolts to 90 Nm (66 lb-ft).
    - Tighten the 2 nuts to 125 Nm (92 lb-ft).



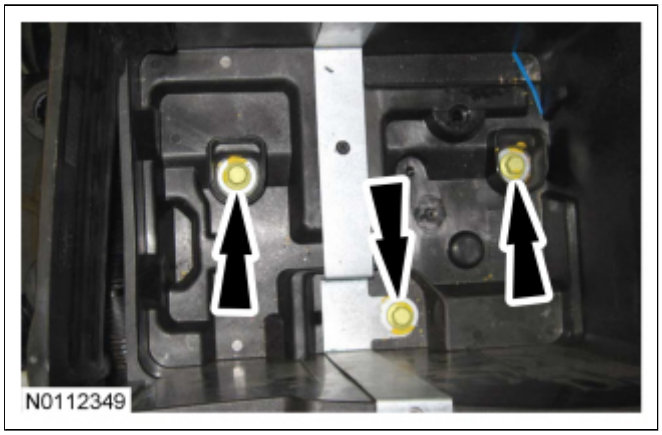
2. Install the battery tray bracket and the 3 battery tray bracket nuts.
    - Tighten to 25 Nm (18 lb-ft).



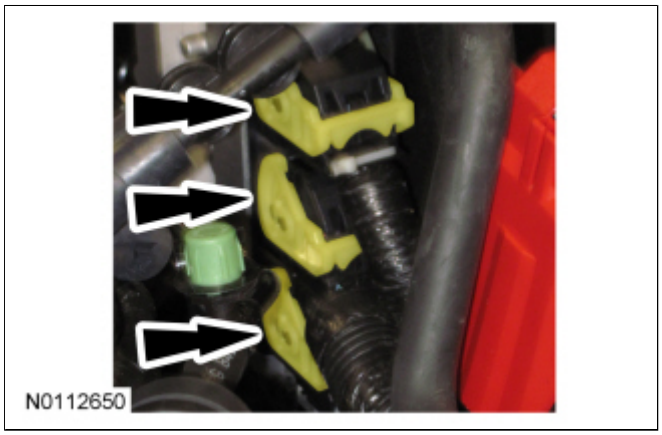
3. Attach the wiring harness to the battery tray bracket.



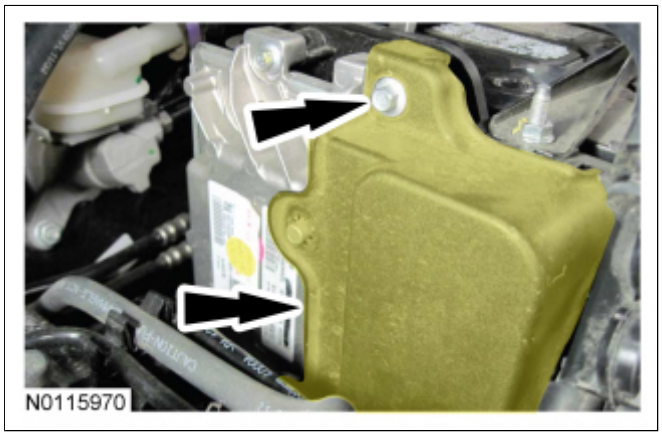
4. Install the battery tray and 3 battery tray bolts.
    - Tighten to 10 Nm (89 lb-in).



5. Connect the 3 PCM electrical connectors.



6. Install the PCM cover and the PCM cover bolt.
   - Tighten to 6 Nm (53 lb-in).



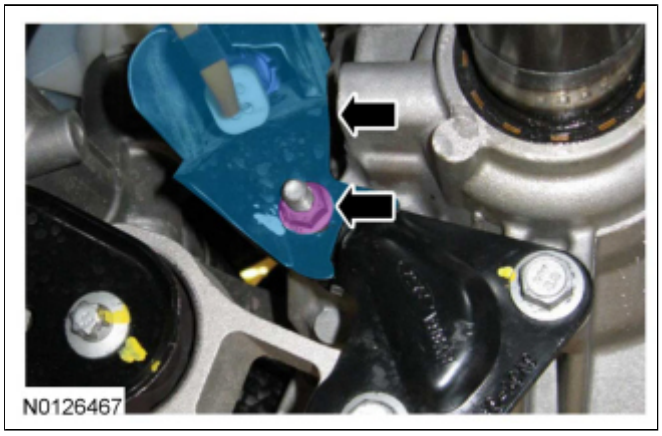
7. Install the ACL and the outlet pipe. For additional information, refer to Section 303-12 .
8. Install the cowl assembly. For additional information, refer to Section 501-02 .
9. Install the battery. For additional information, refer to Section 414-01 .

Roll Restrictor

Removal

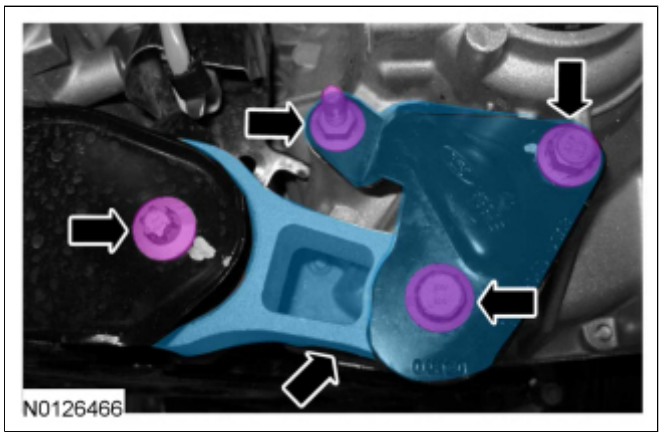
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the Heated Oxygen Sensor (HO2S) electrical connector bracket nut and the HO2S electrical connector bracket from the roll restrictor bracket.



3. **NOTE:** The roll restrictor bolts are different types, make note of their location prior to removal.

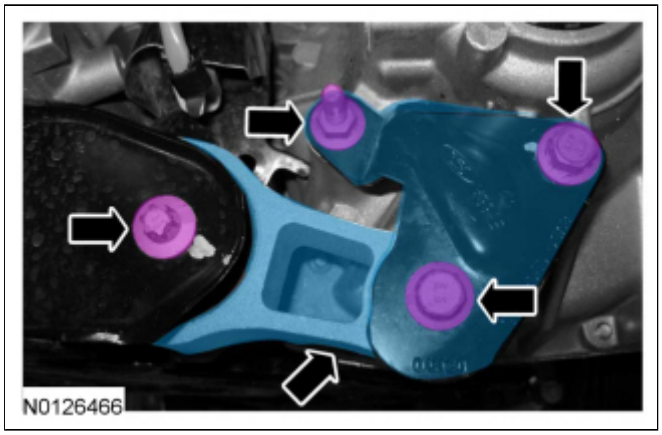
   Remove the roll restrictor bolts, roll restrictor bracket bolts and the roll restrictor with roll restrictor bracket.



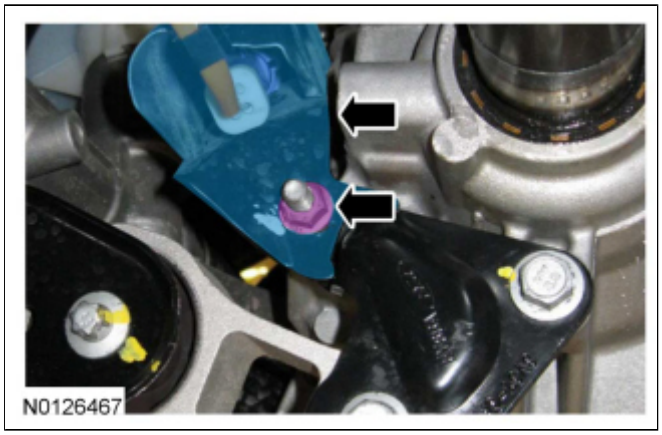
Installation

1. **NOTE:** The bolts are different types, make sure the bolts are in the correct location.

   Install the roll restrictor with roll restrictor bracket, roll restrictor bolts and the roll restrictor bracket bolts.
   1. Tighten to 70 Nm (52 lb-ft).



2. Install the HO2S electrical connector bracket to the roll restrictor bracket and install the HO2S electrical connector bracket nut.
    - Tighten to 25 Nm (18 lb-ft).



Transaxle

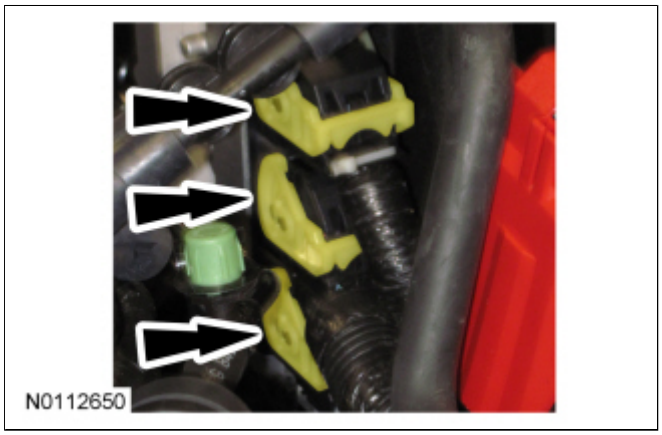
Special Tool(s)

 ST2378-A	Adapter for 303-290A 303-290-01
 ST2379-A	Adapter for 303-290A (Support Leg) 303-290-03A
 ST2363-A	Support Bar, Engine 303-290A
16089	Remover, Halfshaft 308-256

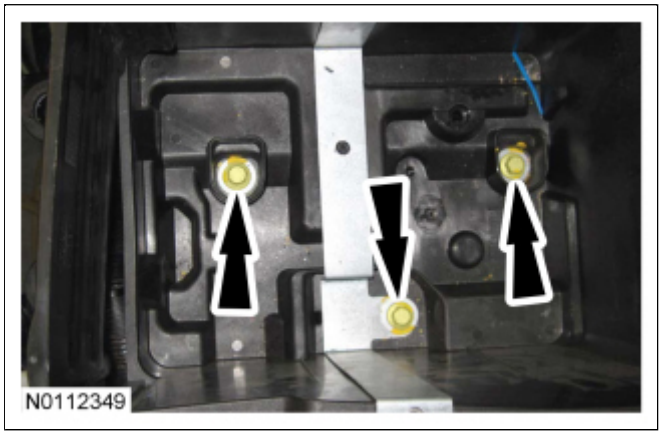
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the battery. For additional information, refer to Section 414-01 .
3. Remove the cowl assembly. For additional information, refer to Section 501-02 .
4. Remove the Air Cleaner (ACL) assembly and outlet pipe. For additional information, refer to Section 303-12 .
5. Remove the PCM cover bolt and the PCM cover.

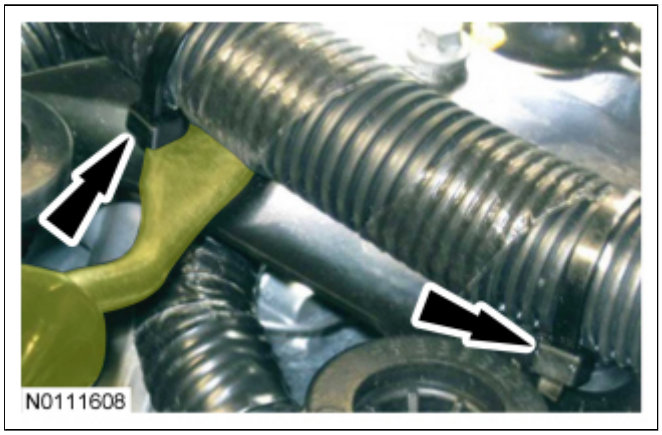
6. Disconnect the 3 PCM electrical connectors.



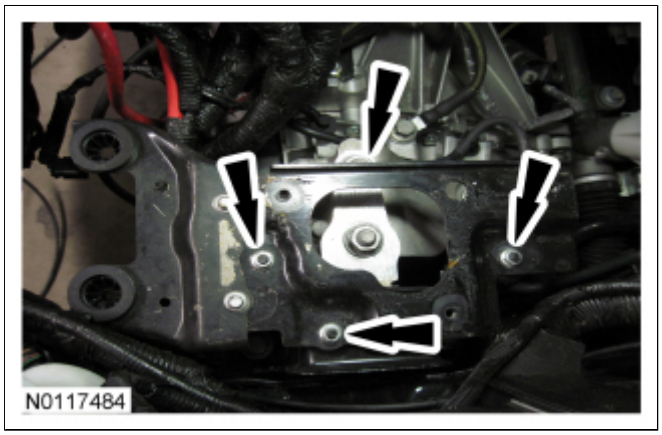
7. Remove the 3 battery tray bolts and the battery tray.



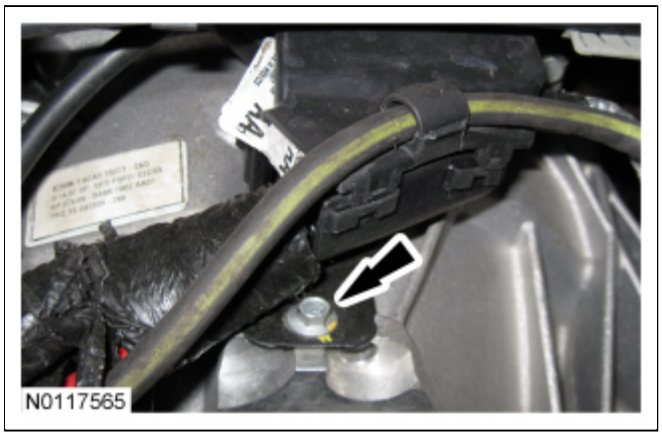
8. Using a suitable tool, detach the wiring harness from the battery tray bracket.



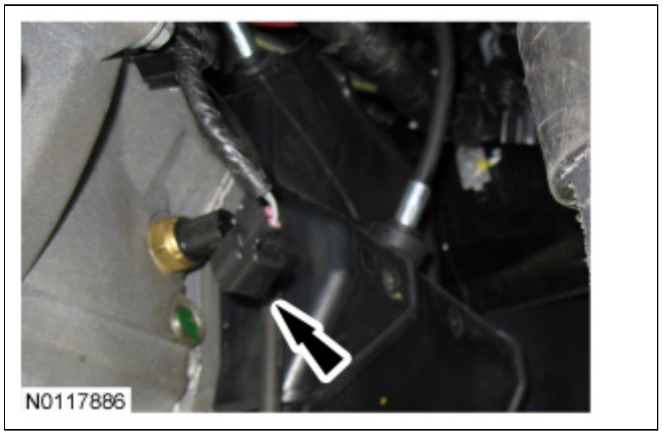
9. Remove the 3 battery tray bracket nuts and remove the battery tray bracket.



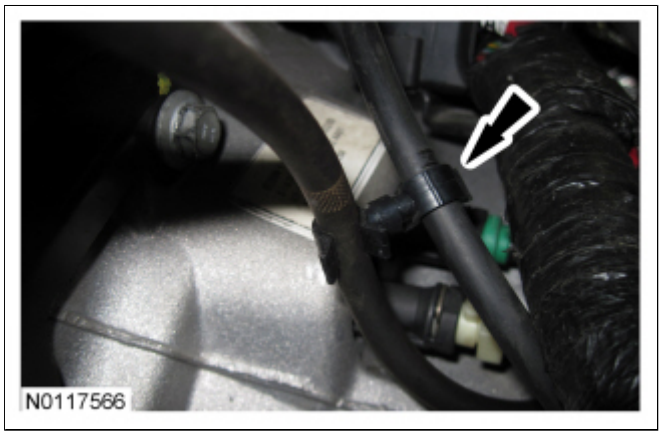
10. Remove the wiring harness bracket bolt from the transaxle and position the wiring harness bracket aside.



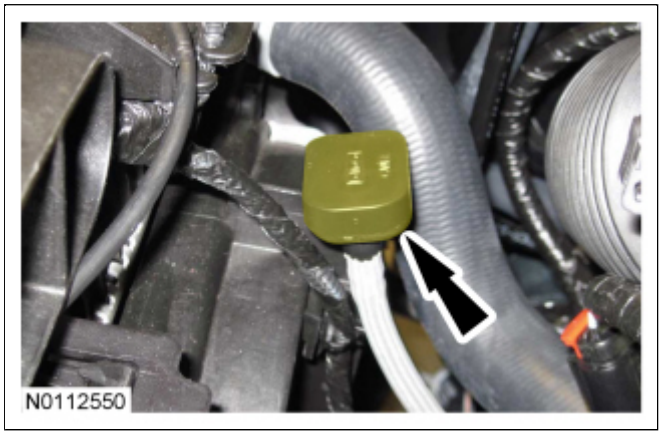
11. Disconnect the reverse light switch electrical connector.



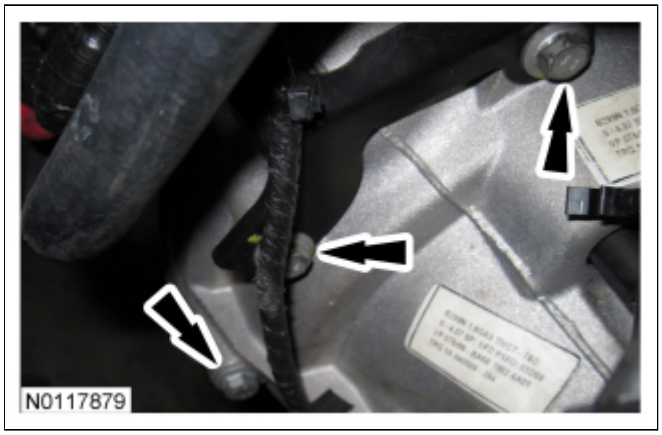
12. Remove the transaxle vent hose from the hose retainer.



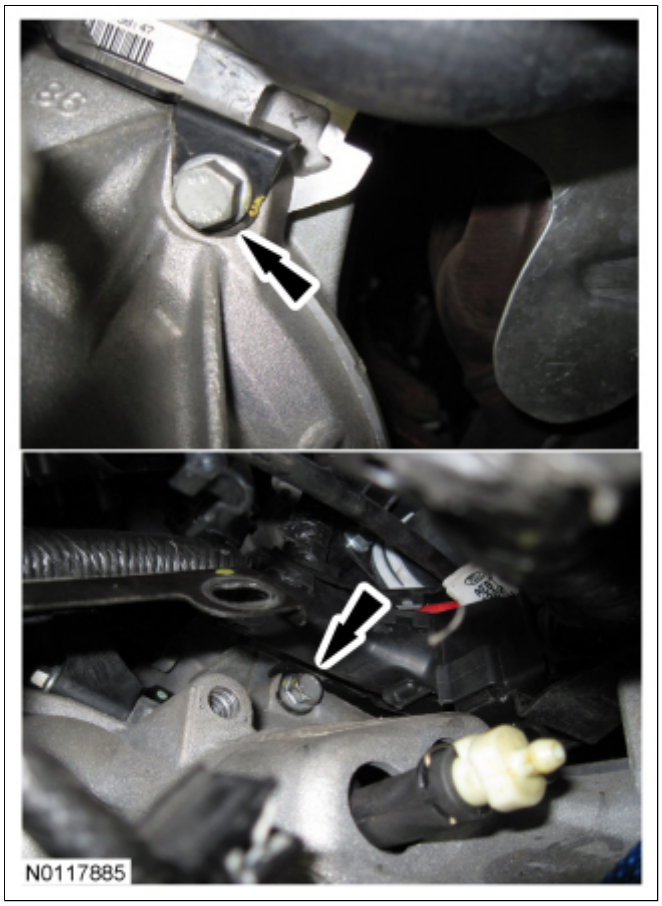
13. Remove the transaxle vent hose from the cooling fan housing and position aside.



14. Remove the 4 clutch housing-to-engine bolts (3 shown).

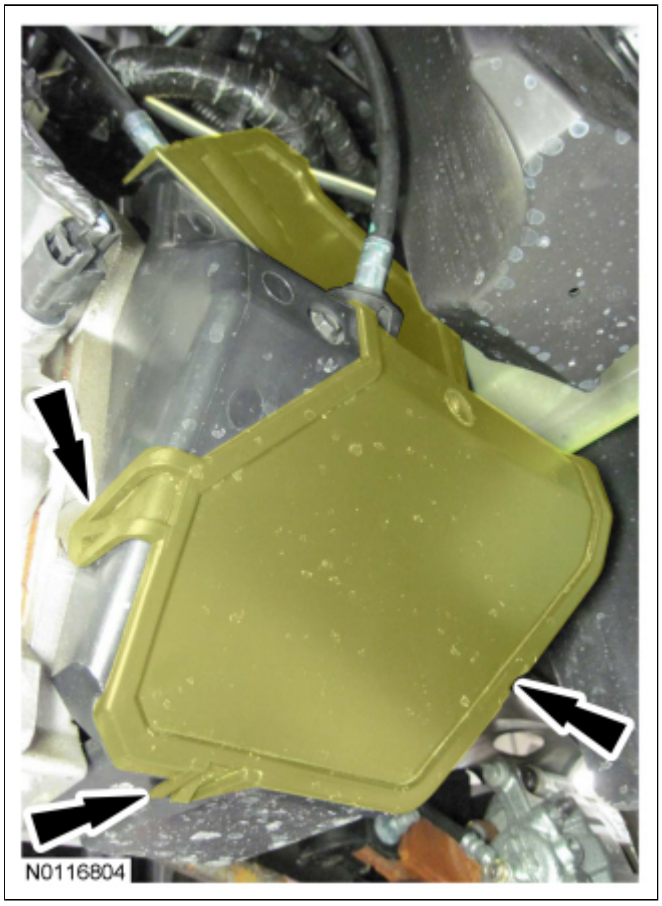


15. Remove the 2 top clutch housing-to-engine bolts.

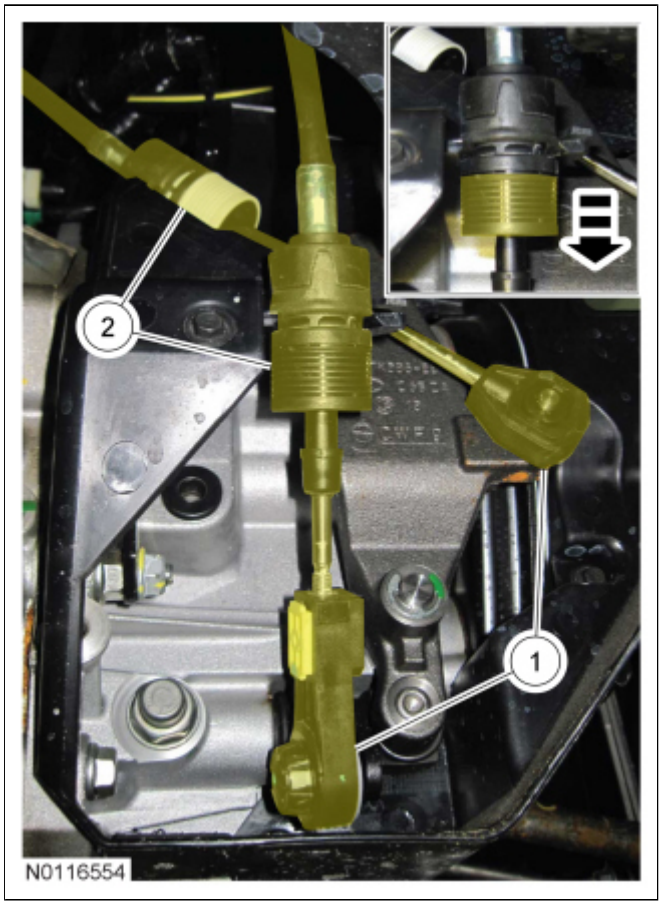


16. Remove the front wheels. For additional information, refer to Section 204-04 .

17. Release the 7 shift cables cover retainers (2 shown) and remove the shift cables cover.

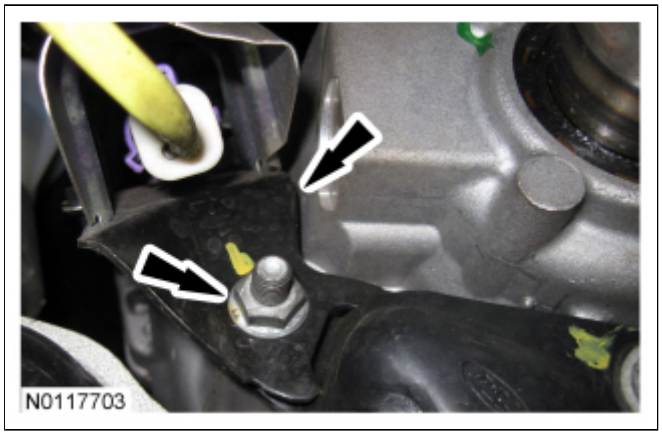


18. Remove the gearshift cables from the transaxle.
    1. Using a suitable tool, gently pry the shift and selector cables off the transaxle shift control levers.
    2. Remove the shift and selector cables by pulling the lower part of abutment down and removing from the brackets.



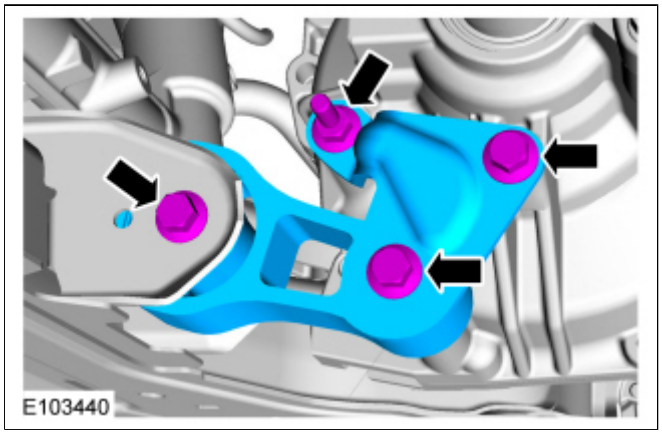
19. Remove and discard the exhaust flange nuts and exhaust flange gasket. Disconnect the exhaust flange.

20. Remove the Heated Oxygen Sensor (HO2S) bracket nut and position the HO2S bracket aside.

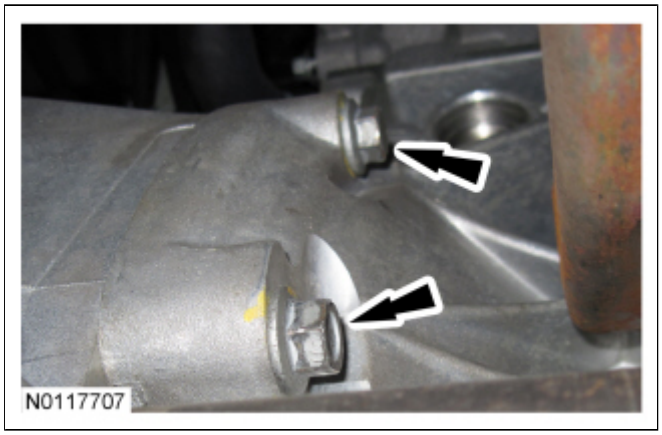


21. **NOTE:** The roll restrictor bolts are different lengths, mark the roll restrictor bolts for installation.

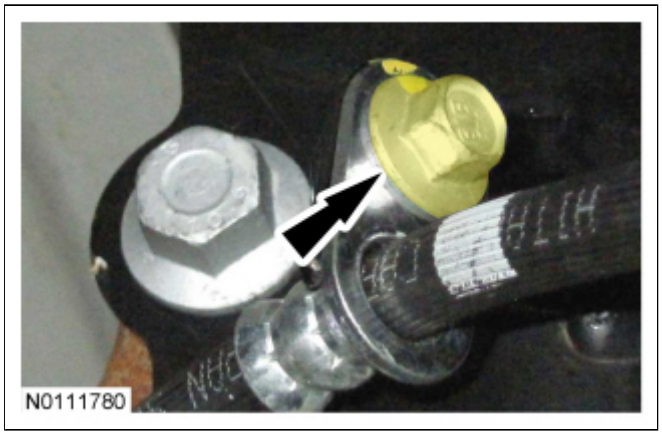
    Remove the roll restrictor bolts, bracket and the roll restrictor.



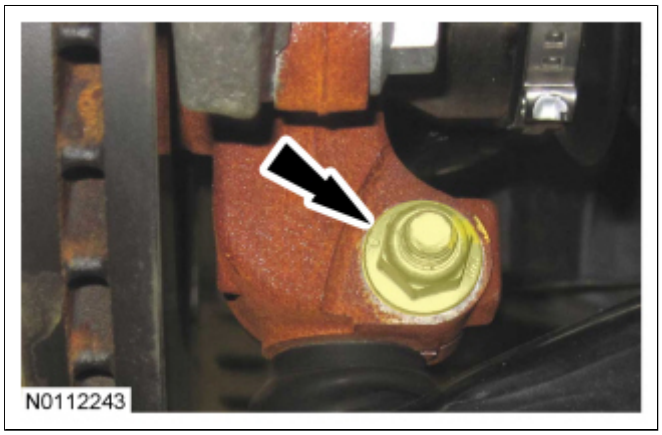
22. Remove the 2 LH clutch housing-to-engine bolts.



23. Remove the brake hose retainer bolt and the brake hose retainer from the RH strut.

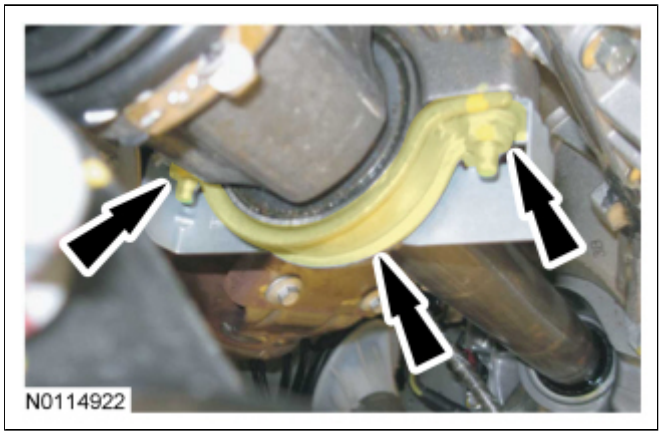


24. Remove and discard the RH ball joint nut and bolt.



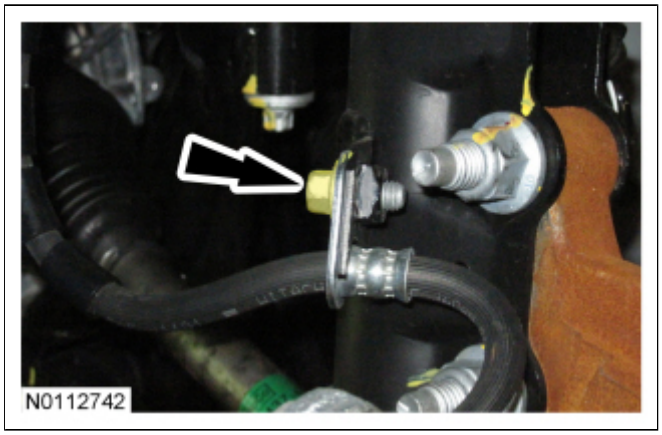
25. Separate the RH ball joint from the knuckle.

26. Remove and discard the bearing retainer strap nuts, shield and bearing retainer strap.

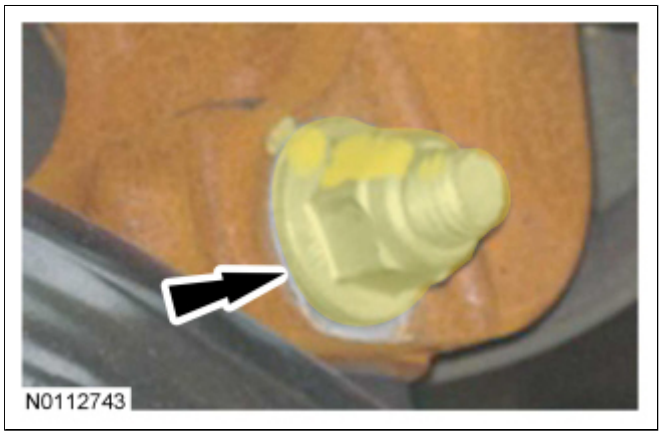


27. Remove the RH intermediate shaft assembly from the transaxle and position aside. Support the intermediate shaft assembly.

28. Remove the brake hose retainer bolt and the brake hose retainer from the LH strut.

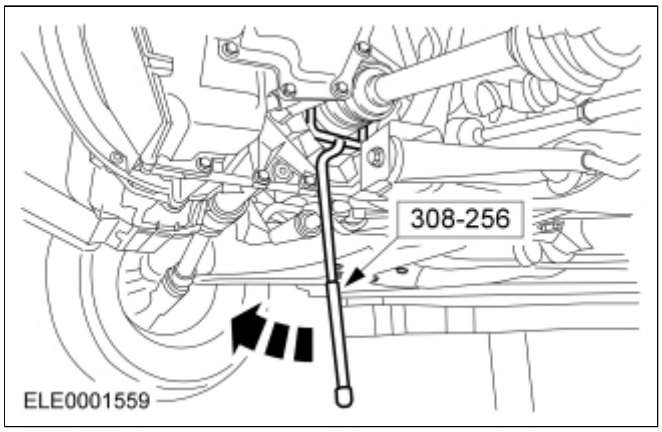


29. Remove and discard the LH ball joint nut and bolt.

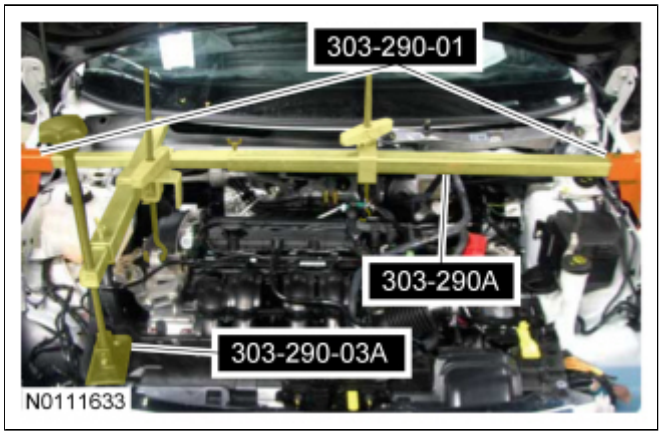


30. Separate the LH ball joint from the knuckle.

31. Using the special tools, remove the LH halfshaft assembly from the transaxle and position aside. Support the LH halfshaft assembly.



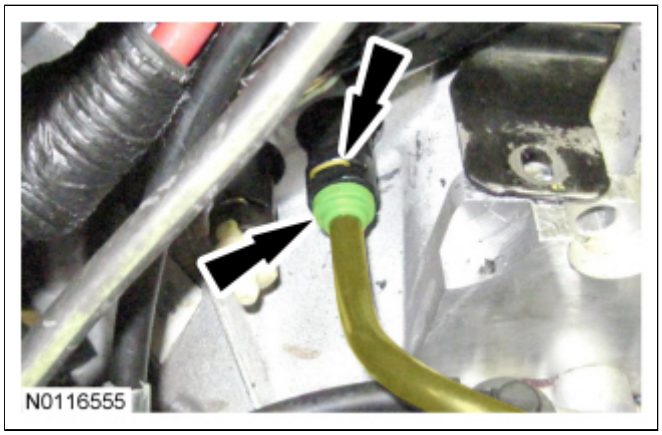
32. Install the special tools and support the engine.



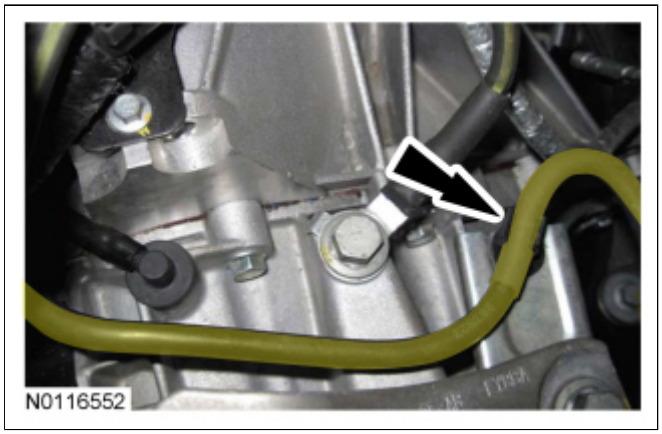
33. **WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

    NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

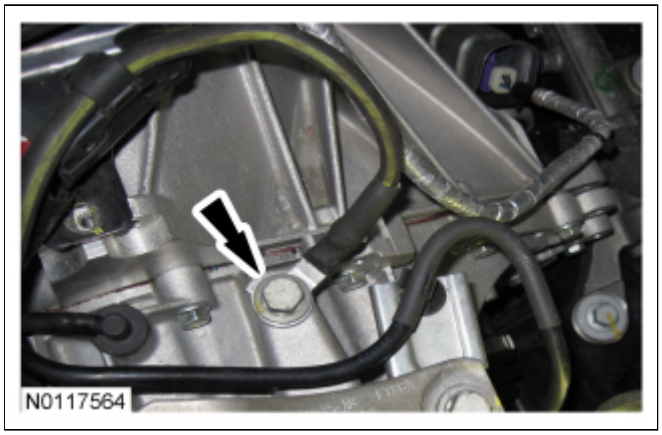
    Remove the clip and disconnect the clutch hydraulic hose.



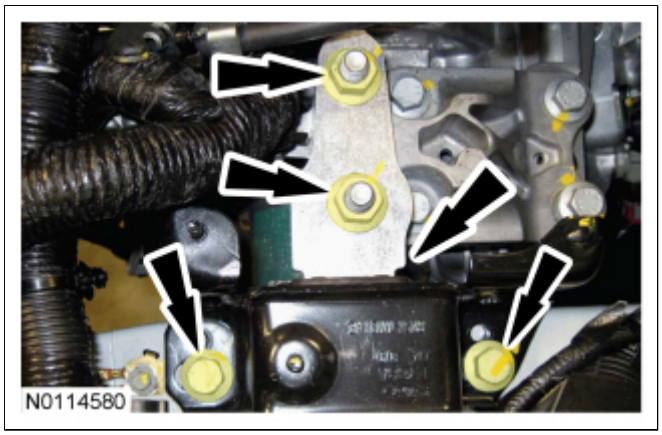
34. Remove the clutch hydraulic hose from the transaxle retainer.



35. Remove the ground wire bolt and position the ground wire aside.

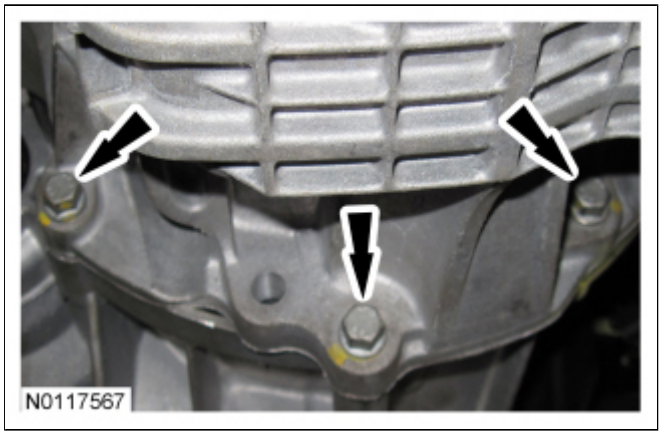


36. Remove the 2 bolts, 2 nuts and the transaxle support insulator.



37. Position a suitable high-lift transmission jack under the transaxle and secure the transaxle to the high-lift transmission jack.

38. Remove the 4 lower clutch housing-to-engine bolts (3 shown).



39. Remove the transaxle.

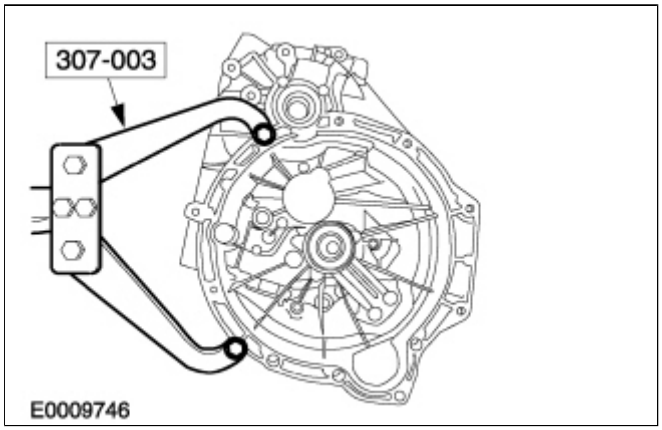
Material

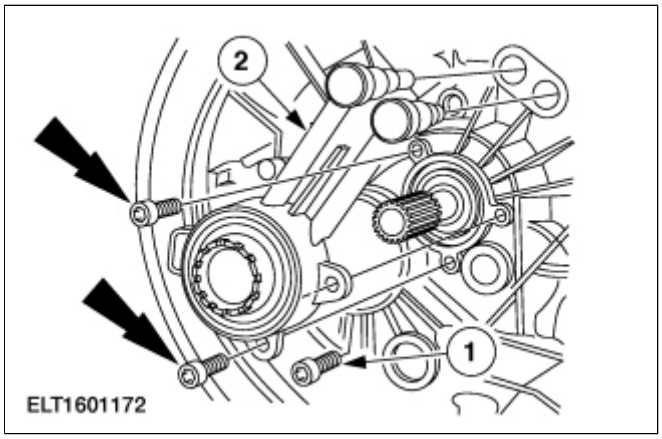
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—

Disassembly

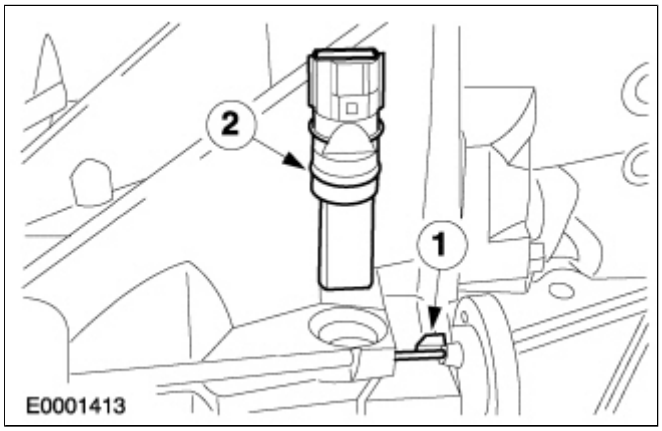
1. Using the special tool, install the transaxle.



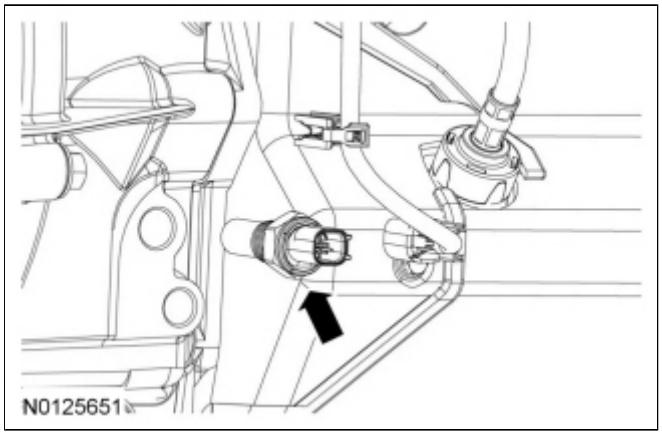
2. Remove the clutch slave cylinder.
    1. Remove the 3 clutch slave cylinder bolts.
    2. Remove the clutch slave cylinder.



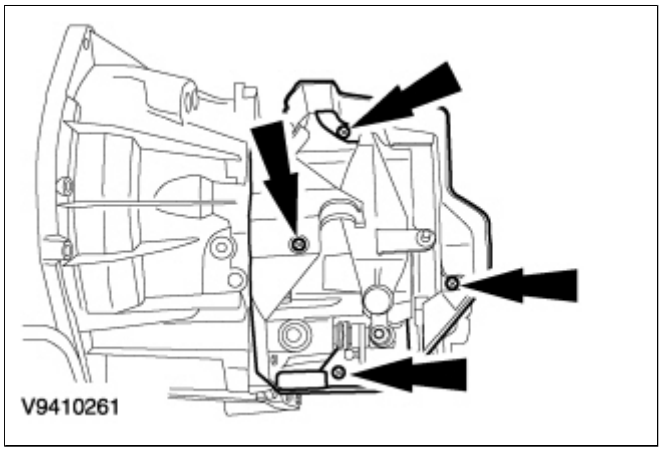
3. Remove the Vehicle Speed Sensor (VSS).
    1. Remove the retaining pin.
    2. Remove the VSS .



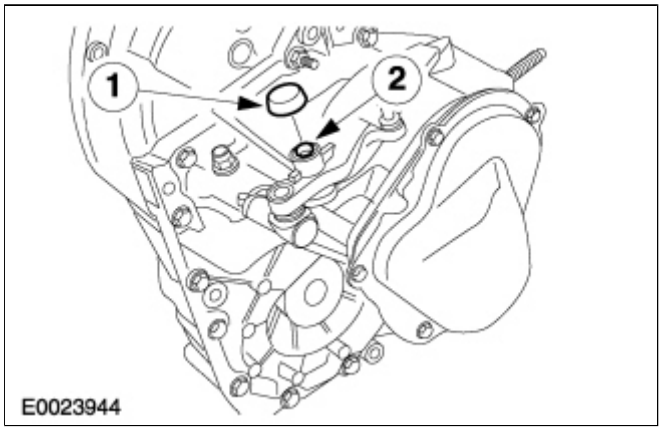
4. Remove the reversing lamp switch.



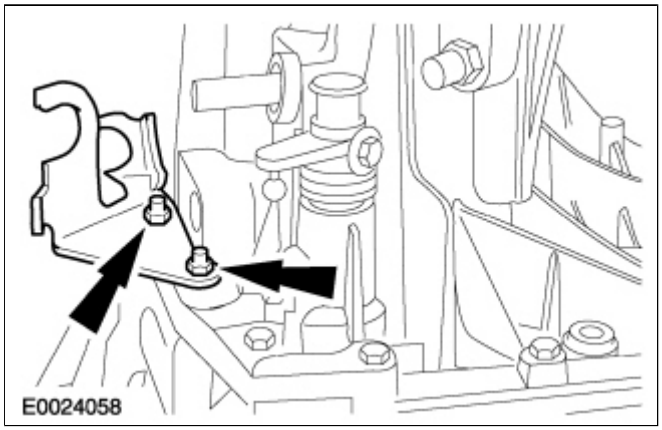
5. Remove the gearshift cables shroud retainers and the gearshift cables shroud.



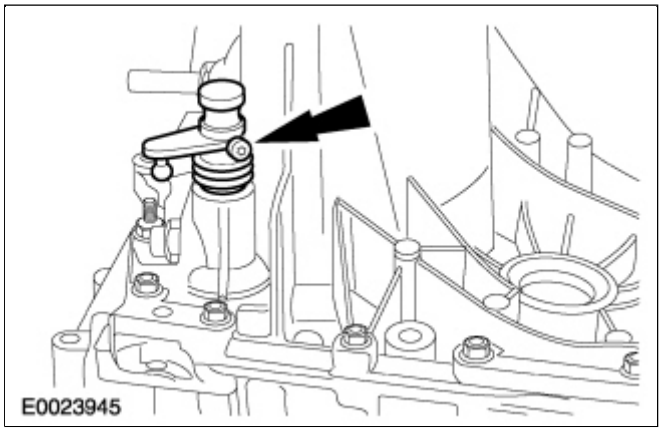
6. Remove the selector lever.
    1. Remove the protective cap.
    2. Remove and discard the snap-ring and remove the selector lever.



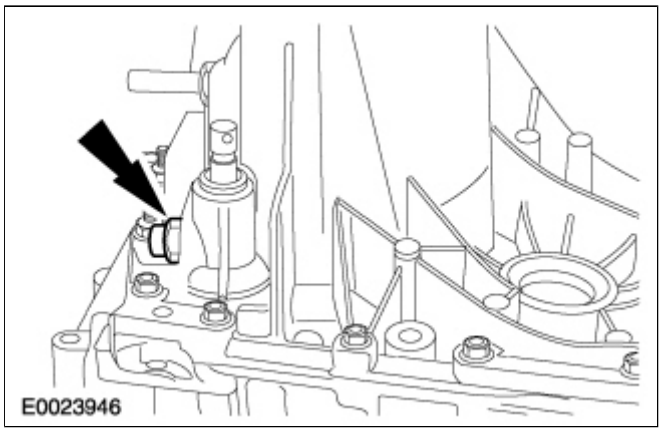
7. Remove the 2 gearshift cables bracket nuts and remove the gearshift cables bracket.



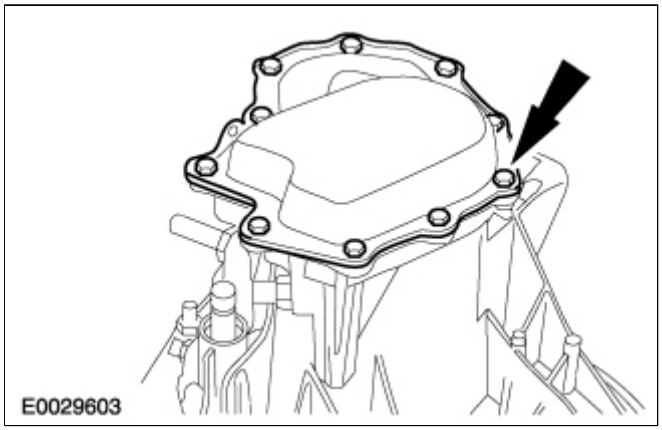
8. Remove the shift lever snap ring and remove the shift lever.



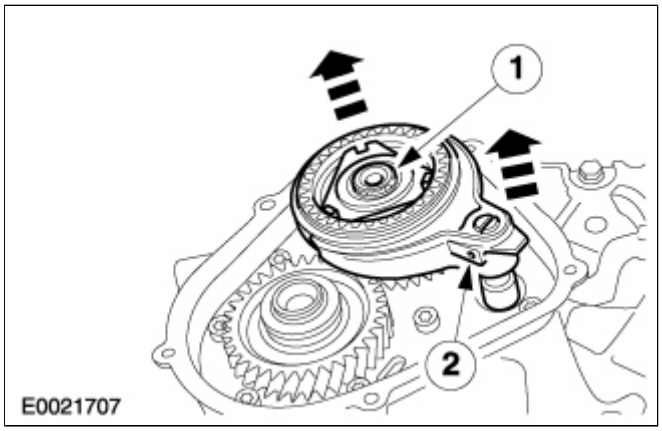
9. Remove the selector shaft interlock mechanism.



10. Remove the 5th gear cover bolts and remove the 5th gear cover.

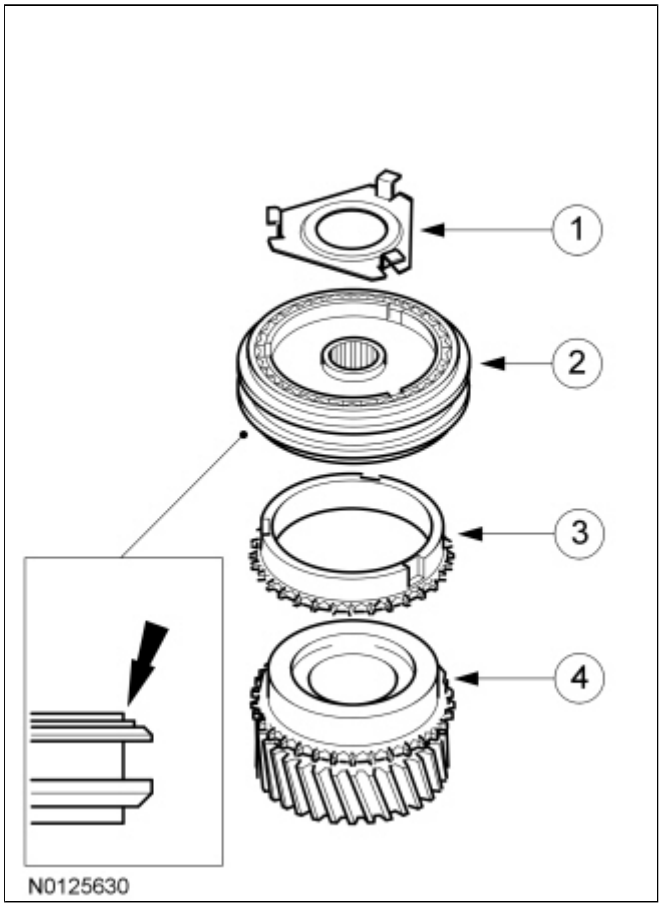


11. Remove the 5th gear synchronizer unit and the selector fork.
    1. Remove and discard the 5th gear synchronizer unit circlip.
    2. Remove and discard the selector fork roll pin.

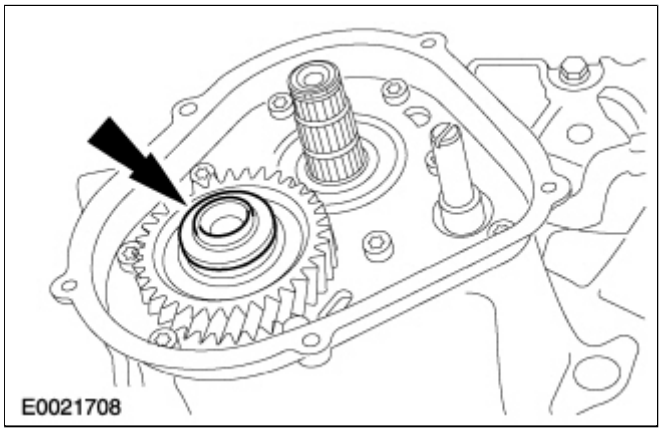


12. **NOTE:** Mark the installation position of the gear synchronizer before disassembling.

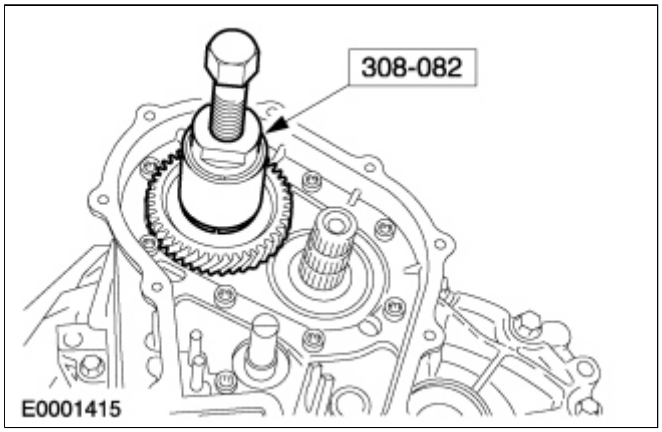
    Disassemble the 5th gear synchronizer unit.
    1. Remove the retaining plate
    2. Remove the 5th gear synchronizer
    3. Remove the synchronizer ring
    4. Remove the 5th gear



13. Remove and discard the 5th gear retaining ring.

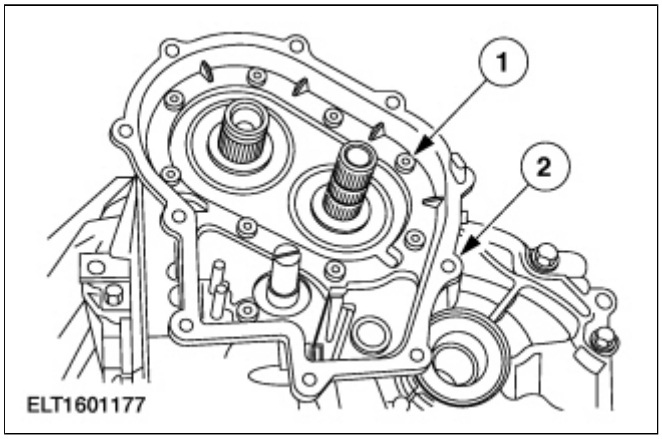


14. Using the special tool, remove the 5th gear.

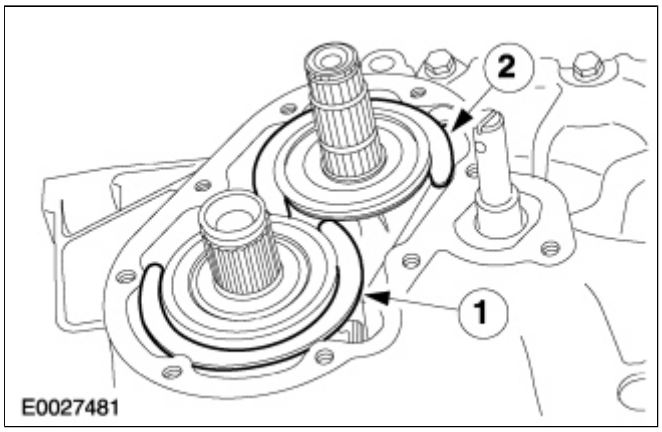


15. ***NOTICE:*** **Do not strike directly on the gear housing mating surfaces or damage can occur.**

    Remove the 5th gear housing.
    1. Remove and discard the 9 bolts and carefully separate the 5th gear housing sections by tapping lightly.
    2. Using Motorcraft® Metal Surface Prep, clean the 5th gear housing mating surfaces.



16. Remove the input shaft and output shaft retaining rings.
    1. Remove and discard the input shaft retaining ring.
    2. Remove and discard the output shaft retaining ring.



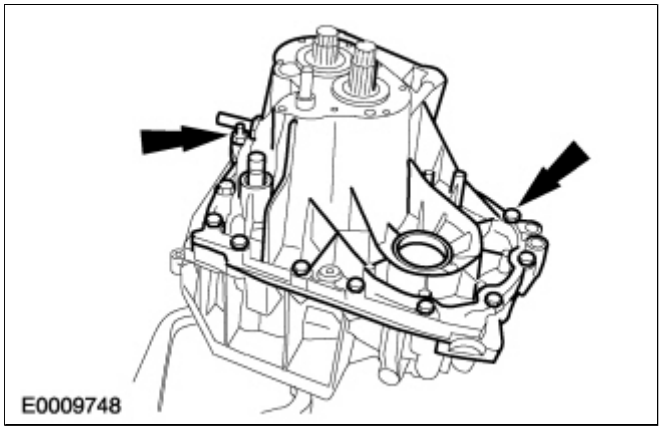
17. Remove the LH and RH halfshaft seals.

18. ***NOTICE:*** **Do not use metal scrapers to clean the transaxle gear housing surfaces or damage can occur.**

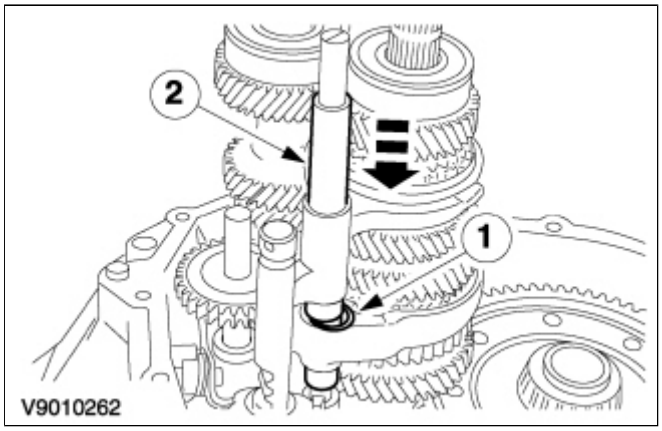
NOTE: Slightly turn the transaxle housing to raise it.

Separate the transaxle housing from the clutch housing.

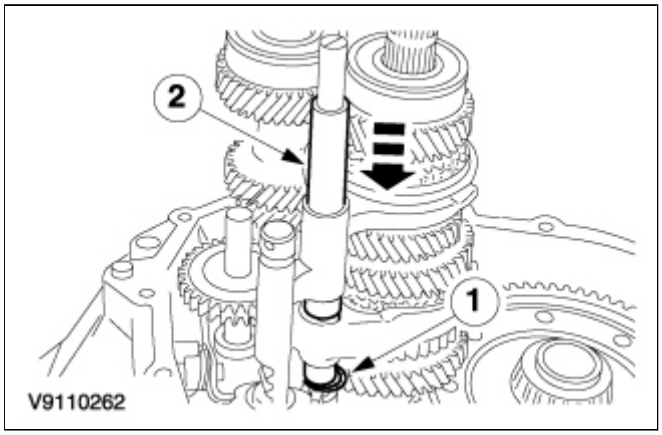
- Using Motorcraft® Metal Surface Prep, clean the transaxle housing and clutch housing mating surfaces.



19. Remove the upper snap-ring from the selector rod guide sleeve.
    1. Remove and discard the upper snap-ring.
    2. Push the selector rod guide sleeve downwards.

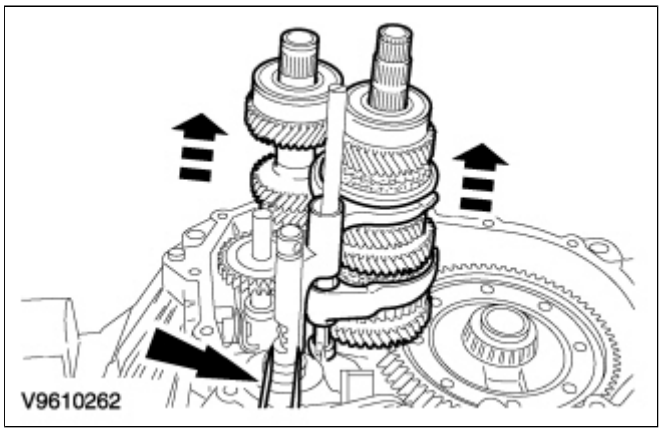


20. Remove the selector rod guide sleeve.
    1. Remove and discard the lower snap-ring from the guide sleeve.
    2. Pull off the selector rod guide sleeve.

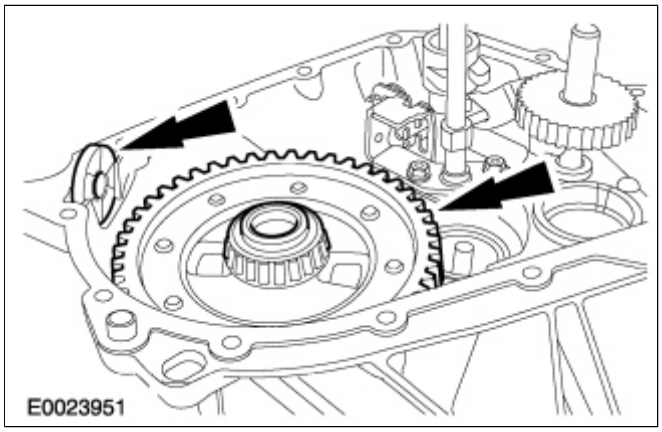


21. **NOTE:** Install a rubber belt to the auxiliary selector shaft to aid disassembly.

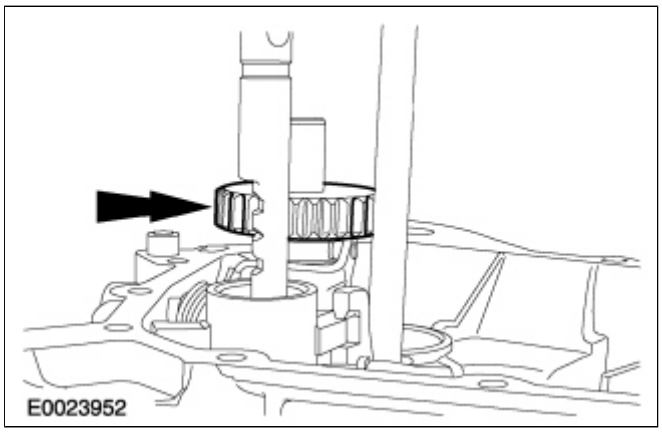
Remove the input and output shaft with the shift forks.



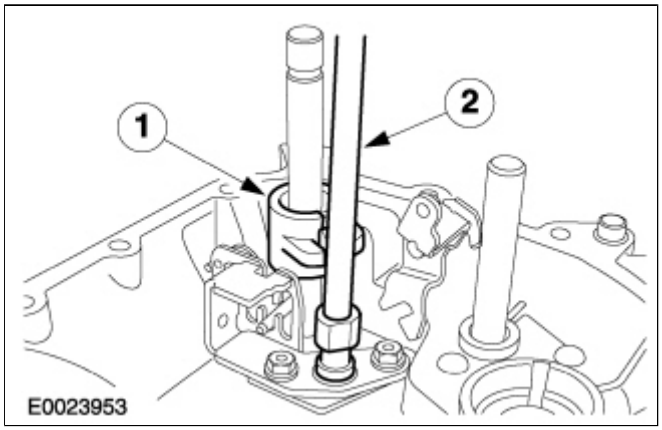
22. Remove the differential and the magnet.



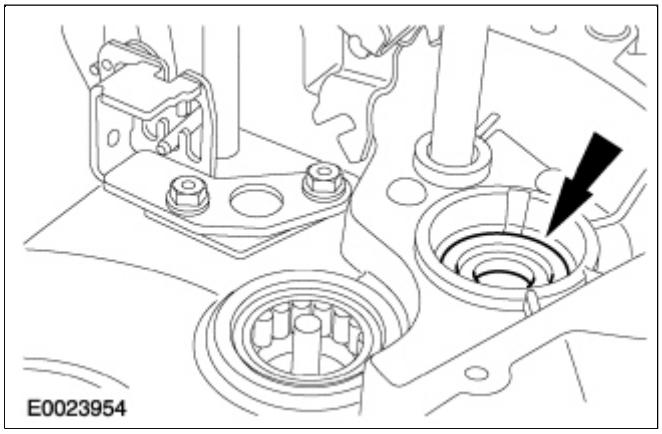
23. Remove the reverse idle gear.



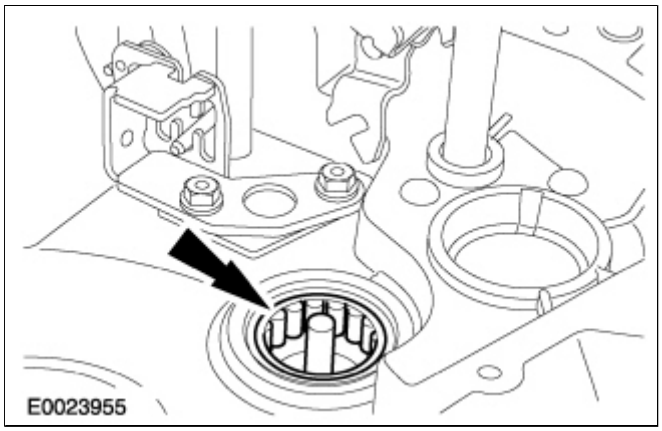
24. Remove the selector rod and locking plate.
    1. Remove the selector interlock plate.
    2. Remove the 5th/reverse gear selector rod.



25. Remove and discard the input shaft oil seal.

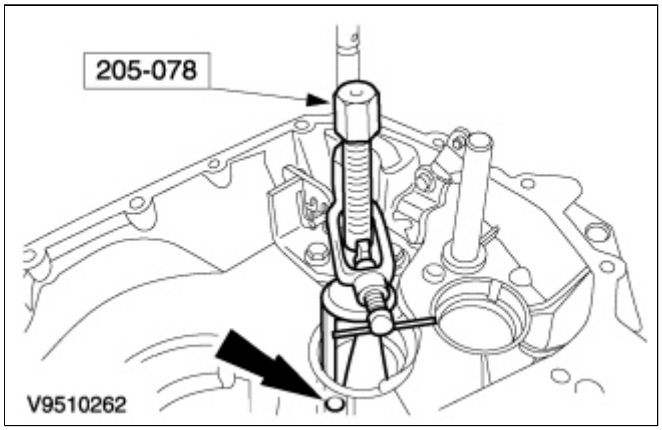


26. Remove output shaft roller bearing.
    - Press out the track rollers from the bearing cage.
    - Remove the bearing cage.

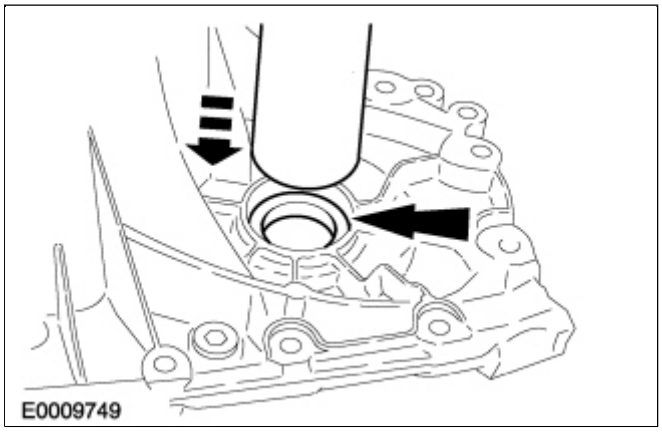


27. ***NOTICE:*** **Only use the special tool in the position indicated, otherwise the blanking plug will be forced out of the housing.**

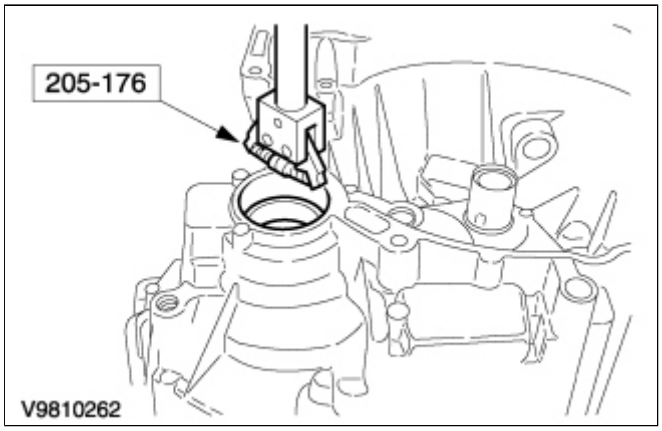
    Using the special tool, remove the output shaft bearing cone.
    - Remove the oil thrower.



28. Remove the bearing cone.

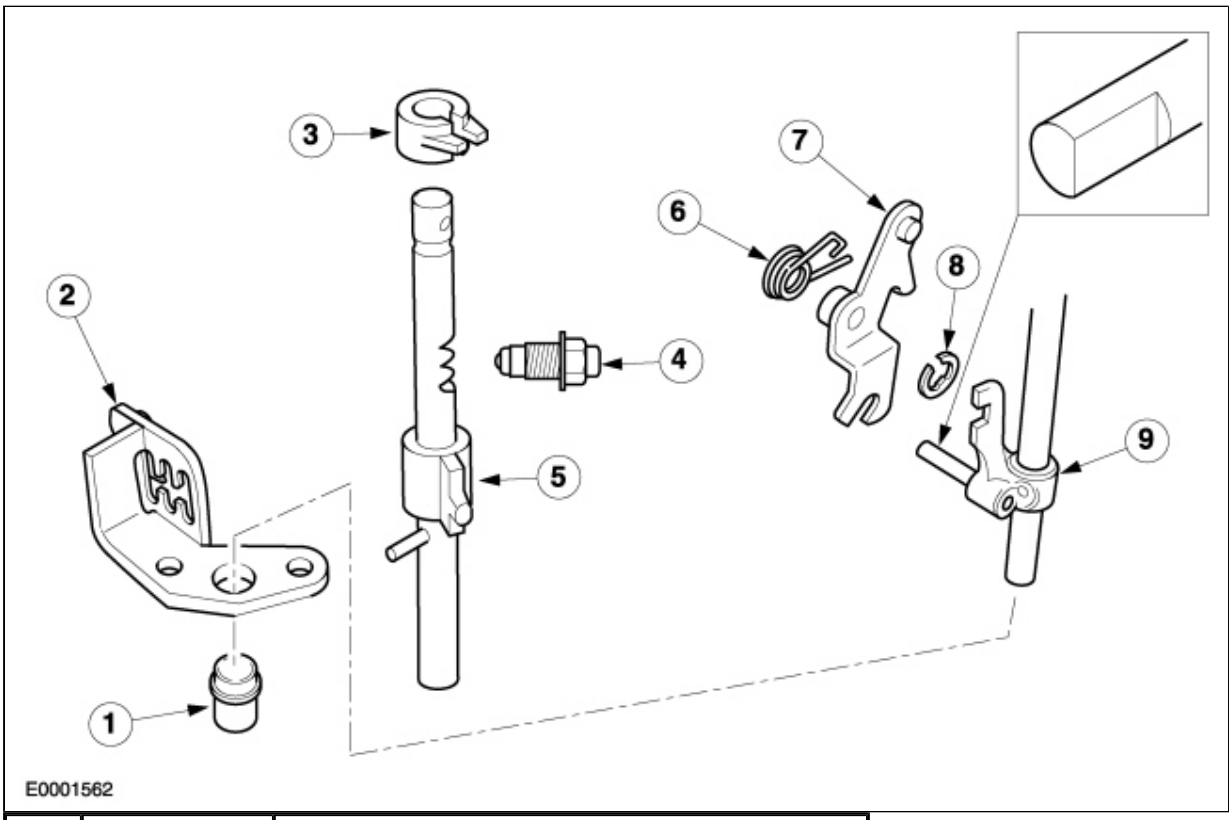


29. Using the special tool, remove the differential bearing cone.



Selector Plate

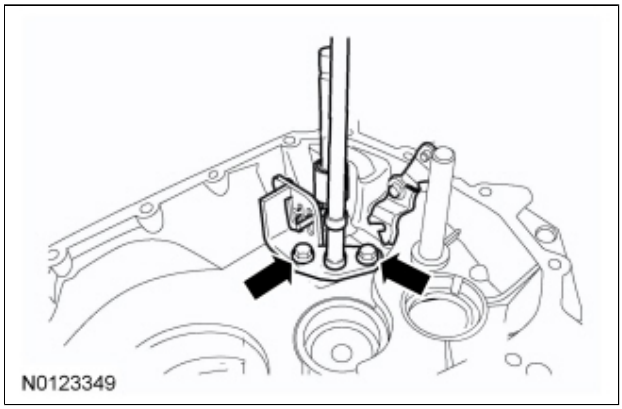
Selector Mechanism



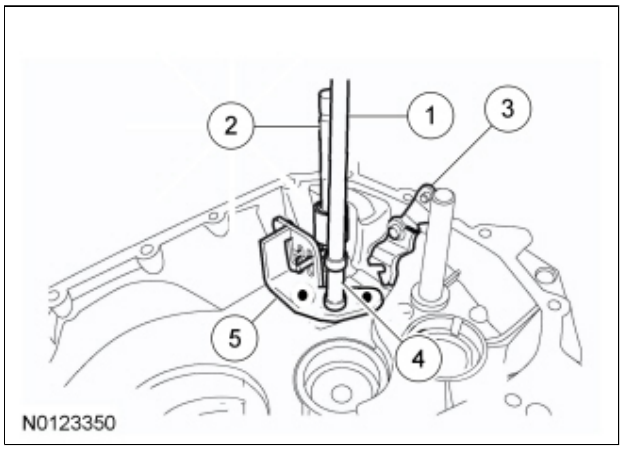
Item	Part Number	Description
1	—	Selector rod guide sleeve, 5th/reverse gear
2	7M038	Selector plate
3	7K201	Selector gate
4	7M131	Selector shaft interlock mechanism
5	7C031	Selector shift shaft
6	7K205	Return spring for selector lever, reverse gear
7	7K001	Selector lever, reverse gear
8	W527007	Snap-ring
9	—	Fifth and reverse gear selector rod

Disassembly

1. Remove the 2 selector plate bolts.

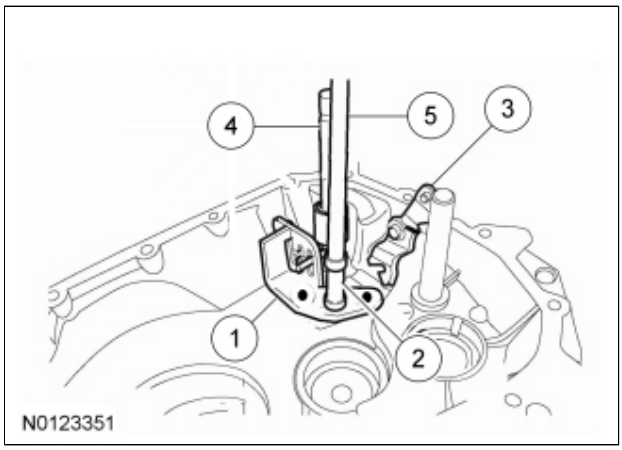


2. Remove the selector mechanism.
    1. Fifth and reverse gear selector rod.
    2. Selector shift shaft.
    3. Reverse gear selector lever.
    4. Fifth and reverse gear selector rod guide sleeve.
    5. Selector plate.



Assembly

1. Install the selector mechanism.
    1. Selector plate.
    2. Fifth and reverse gear selector rod guide sleeve.
    3. Reverse gear selector lever.
    4. Selector shift shaft.
    5. Fifth and reverse gear selector rod.



2. Install the 2 selector plate bolts.
    - Tighten to 22 Nm (16 lb-ft).

Disassembly

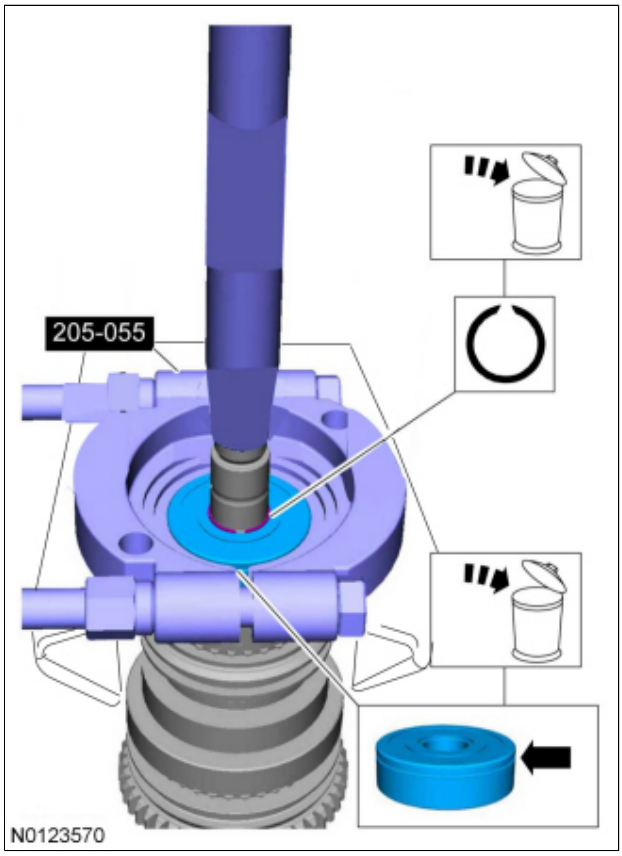
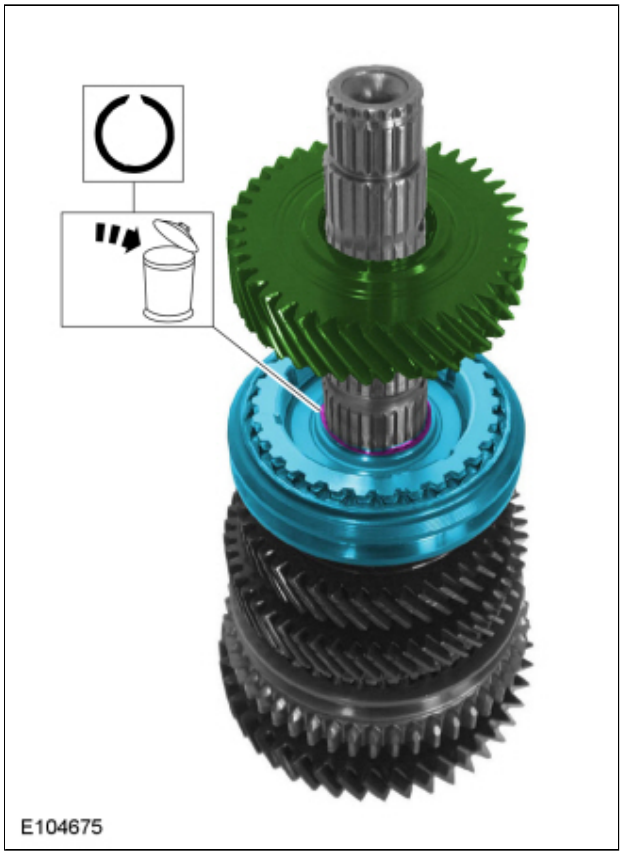
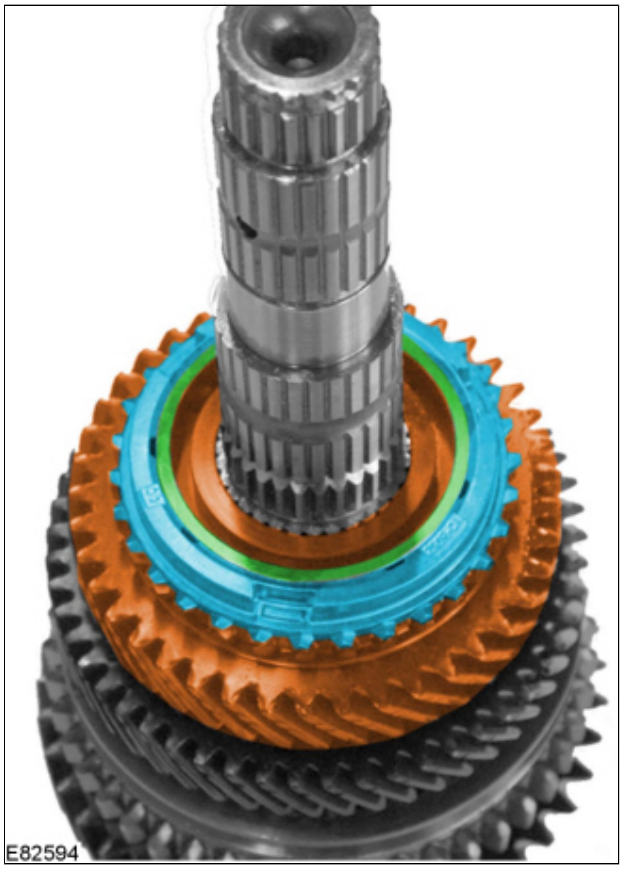
1. Remove the bearing.
    - Remove and discard the circlip.
    - Using the special tools, remove and discard the bearing.



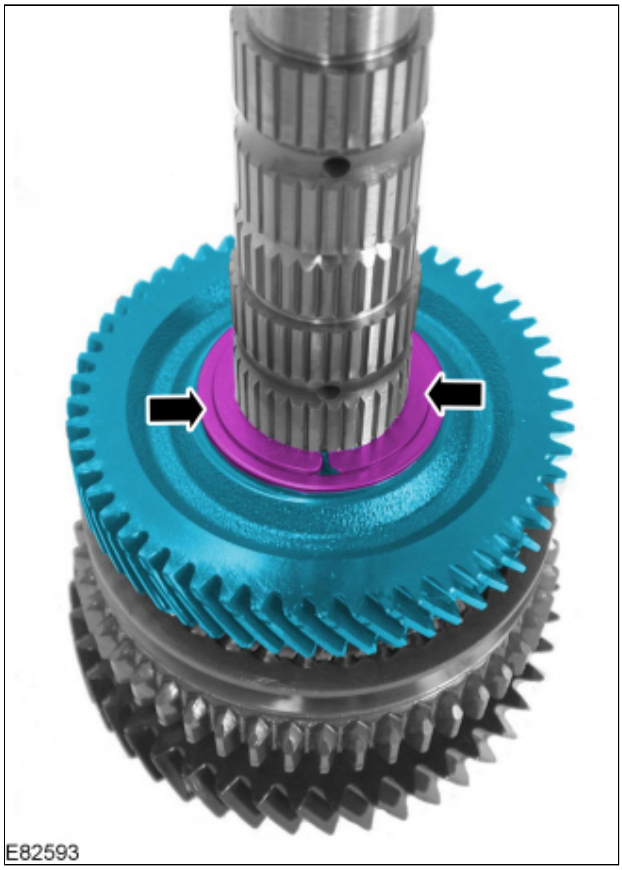
2. Remove 4th gear, remove and discard the snap-ring and remove the 3rd/4th gear synchronizer.



3. Remove the 3rd gear synchronizer ring and 3rd gear.

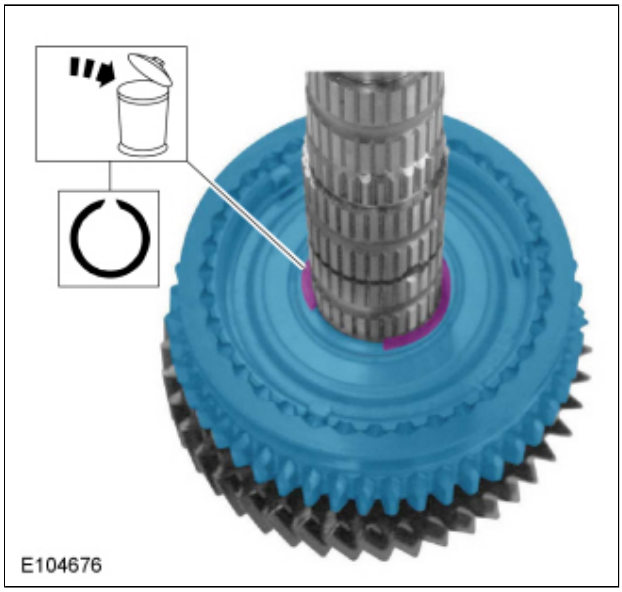


4. Remove the 2 half moon washers and 2nd gear.

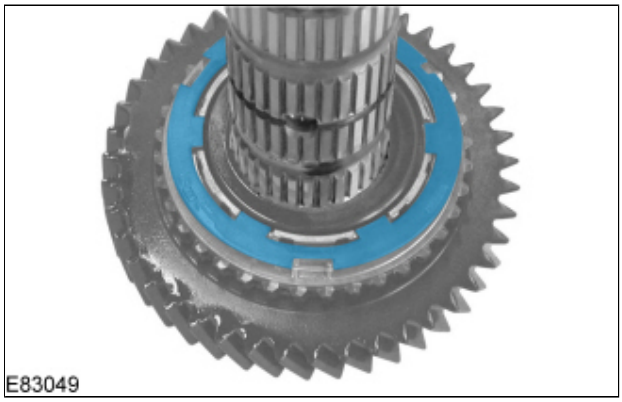


5. Remove the inner and outer synchronizer rings and the synchronizer cone.

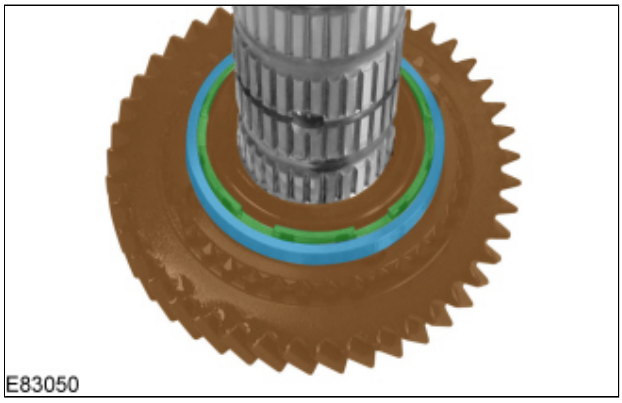
6. Remove and discard the snap-ring and remove the 1st/2nd gear synchronizer with reverse gear.



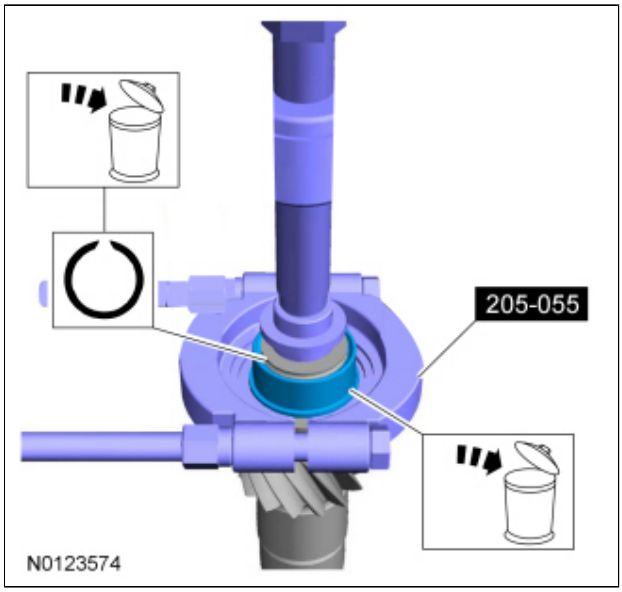
7. Remove the outer synchronizer ring.



8. Remove the synchronizer cone, inner synchronizer ring and the 1st gear.

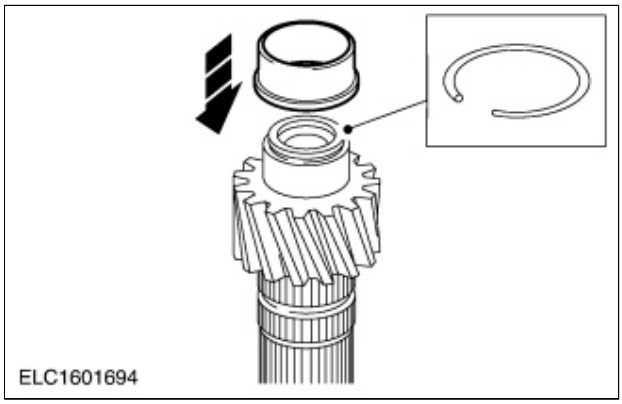


9. Remove the bearing cone.
    - Remove and discard the snap-ring.
    - Using the special tools, remove and discard the bearing cone.

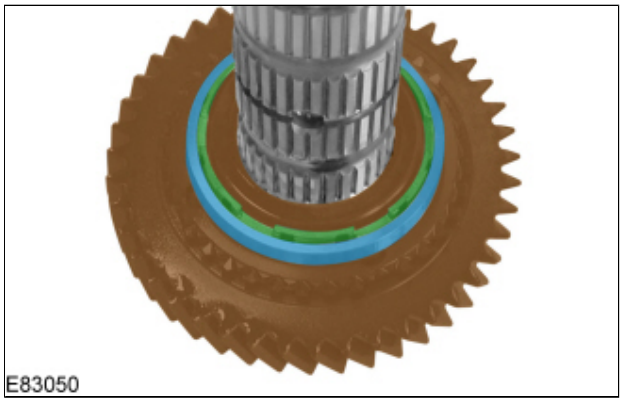


Assembly

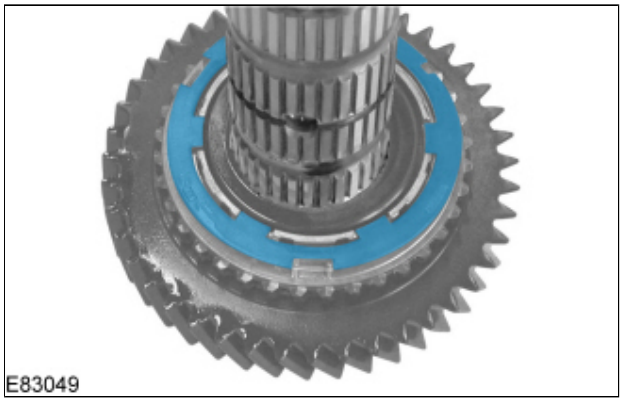
1. Install the new bearing cone and new snap-ring.
    1. Evenly heat the new bearing cone to approximately 176°F (80°C) and slide it onto the output shaft.
    2. Install the new snap-ring.



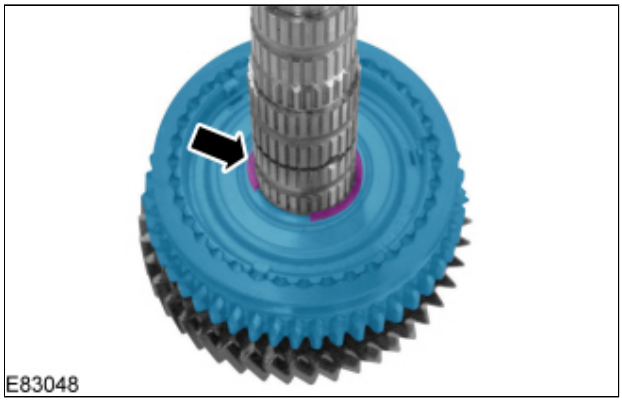
2. Install the 1st gear, inner synchronizer ring and the synchronizer cone.



3. Install the outer synchronizer ring.

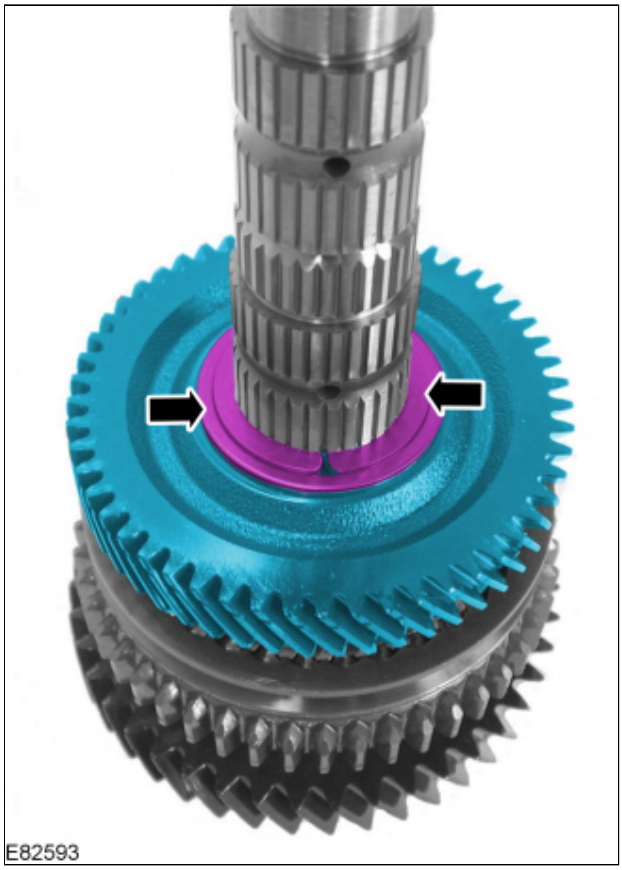


4. Install the new snap-ring.

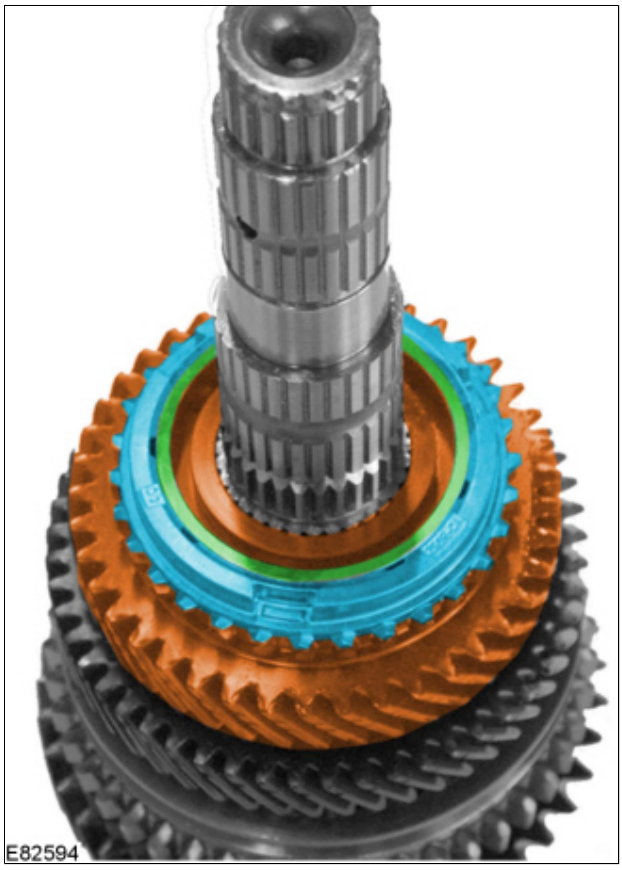


5. Install the synchronizer cone and the outer and inner synchronizer rings.

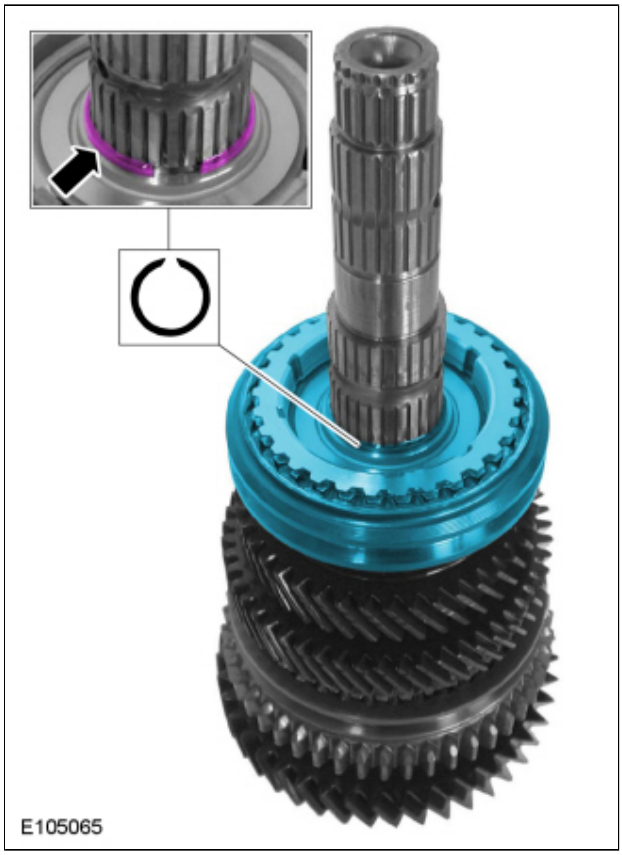
6. Install the 2nd gear and the 2 half moon washers.



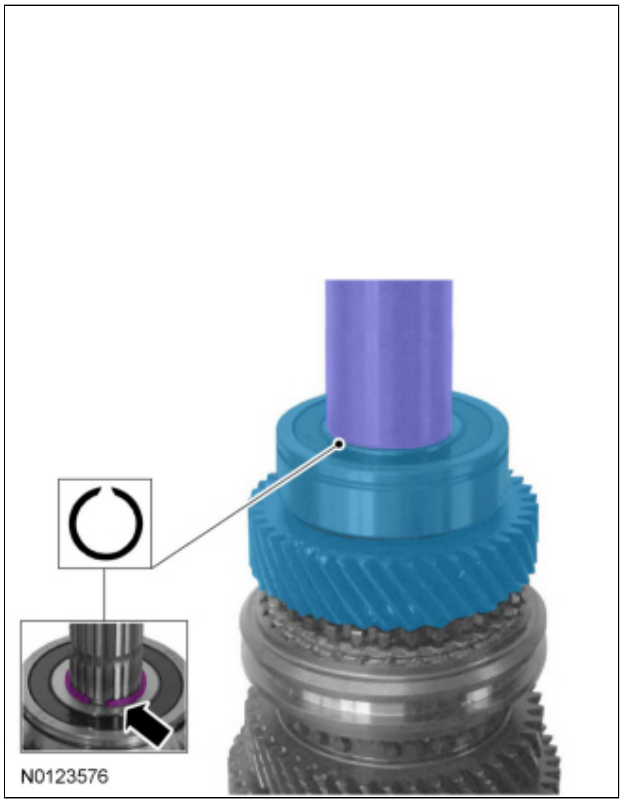
7. Install the 3rd gear and 3rd gear synchronizer ring.



8. Install the 3rd/4th gear synchronizer and new snap-ring.



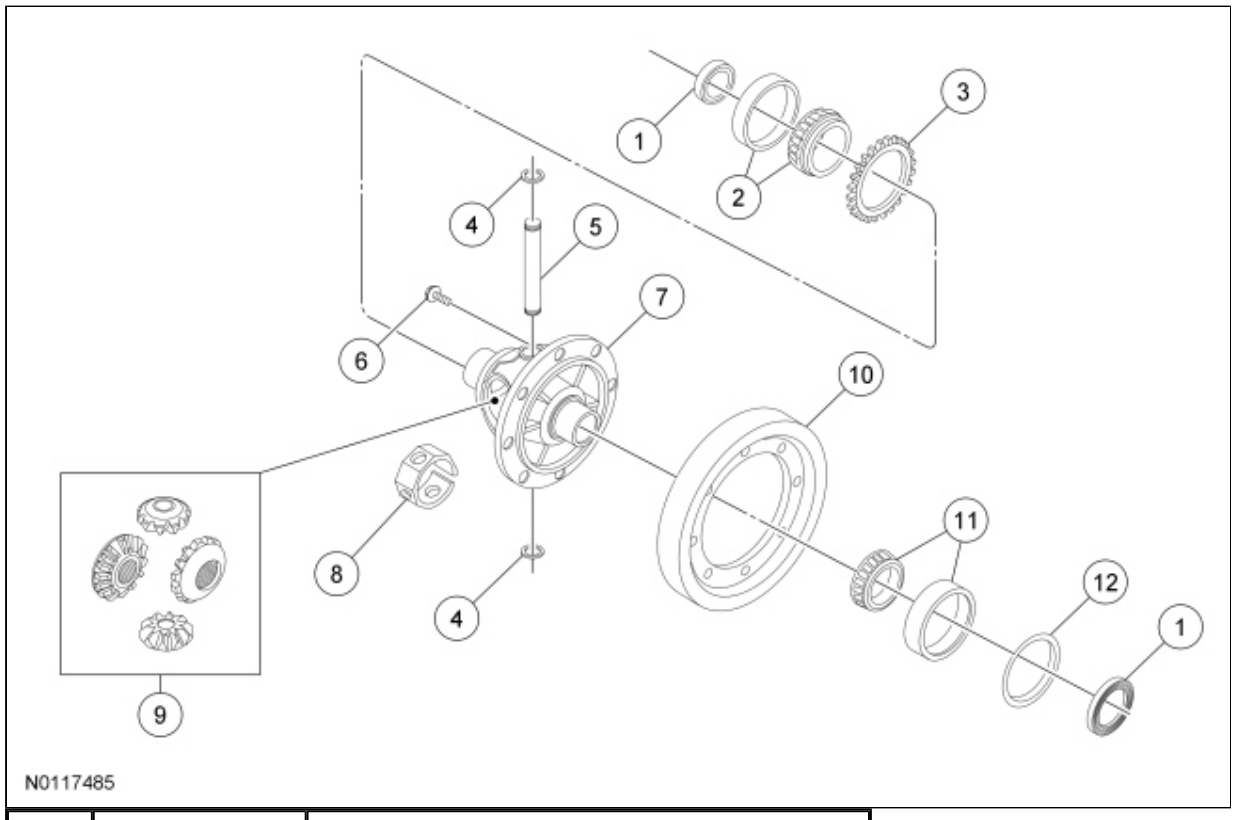
9. Install 4th gear and using a suitable tube, install the new bearing and new circlip.



Differential

Special Tool(s)

	Remover, Wheel Knuckle 205-253 (T87C-1104-A)
 ST2784-A	Puller, Drive Pinion/Differential Carrier 205-D036 (D81L-4220-A)
 ST2769-A	Handle 205-153 (T80T-4000-W)
	Installer, Differential Bearing Cup 308-162 (T88C-77000-C)



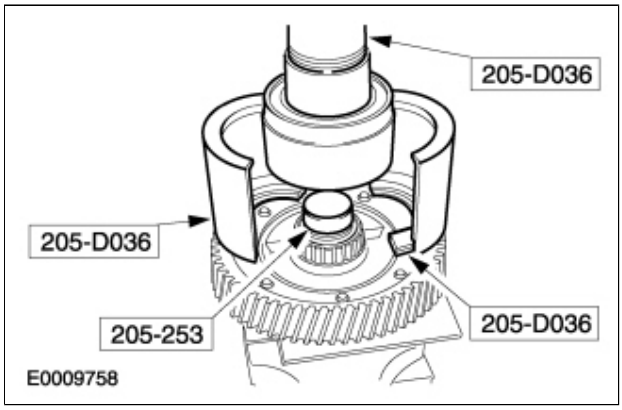
Item	Part Number	Description
1	1177	Differential seal
2	4221	Differential bearing

3	17285	Speed sensor trigger wheel
4	E860187	Retainer
5	4211	Differential pinion shaft
6	W700427	Differential bolt
7	4205	Differential case
8	4K322	Differential case lining
9	—	Differential pinion gears (part of 4026)
10	7F343	Differential ring gear
11	4220	Differential bearing
12	4228	Differential cup

Disassembly

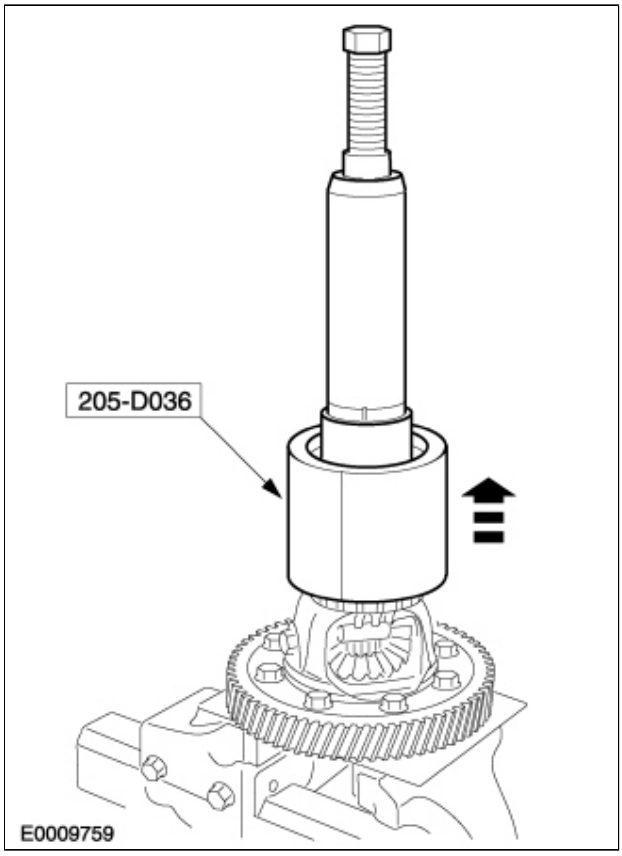
1. **NOTE:** Clutch side shown, transaxle side similar.

   Install the special tools.

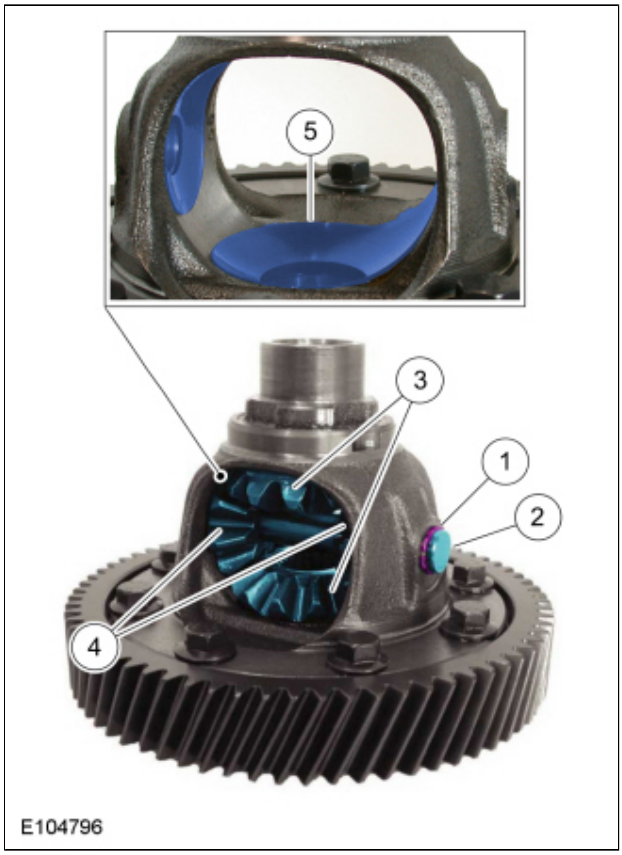


2. **NOTE:** Transaxle side shown, clutch side similar.

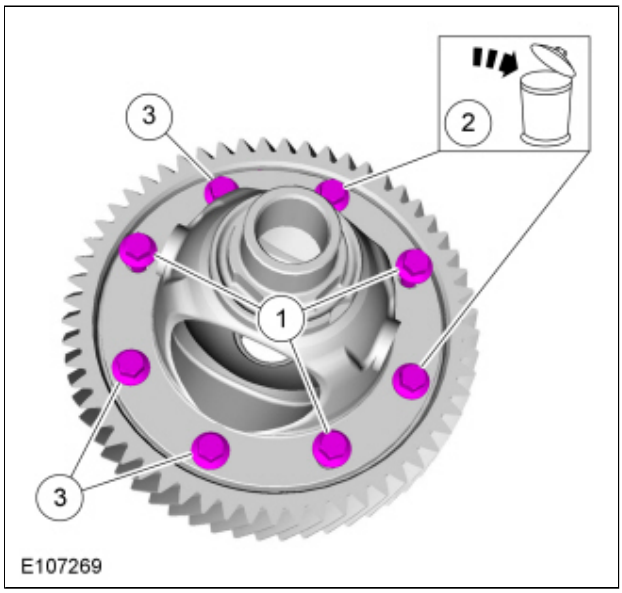
   Using the special tools, remove the differential bearings from the differential assembly.



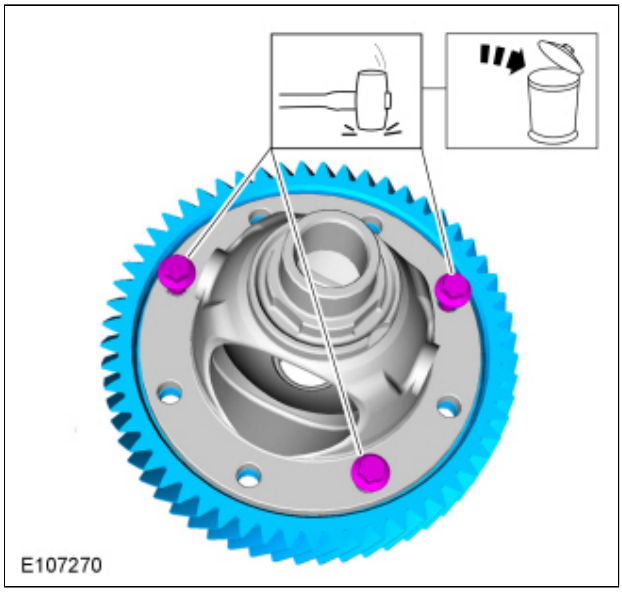
3. Remove the differential pinions.
    1. Remove the differential pinion shaft snap ring.
    2. Remove the differential pinion shaft.
    3. Rotate and remove the differential pinion gears.
    4. Rotate and remove the differential pinion gears.
    5. Remove the differential pinion gear case lining.



4. Remove the differential ring gear bolts as follows:
    1. Loosen the 3 differential bolts four turns.
    2. Remove and discard the 2 differential bolts.
    3. Remove and save the 3 differential bolts.

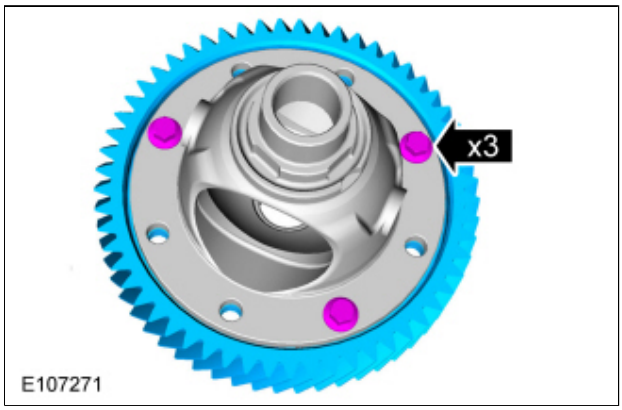


5. Using a hammer, hit the 3 remaining differential bolts, remove and discard the differential bolts and remove the differential ring gear.

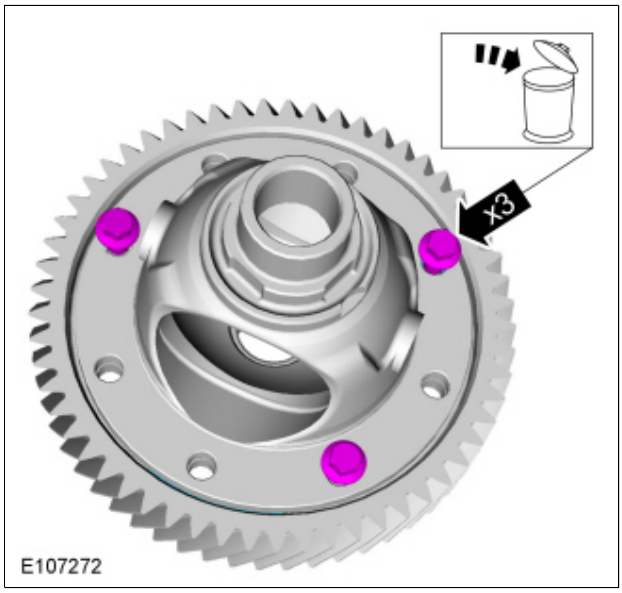


Assembly

1. Install the differential ring gear and the 3 bolts saved during disassembly.
    - Tighten to 105 Nm (77 lb-ft).

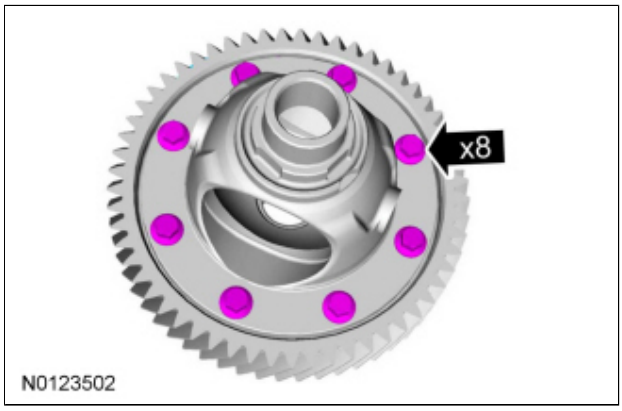


2. Remove and discard the 3 bolts.

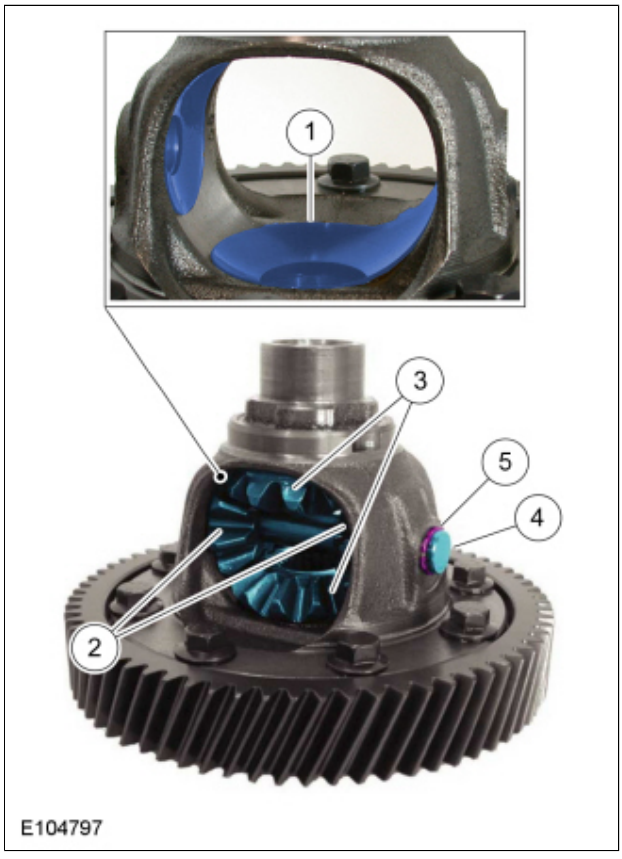


3. Install 8 new differential ring gear bolts.

- Tighten to 105 Nm (77 lb-ft).



4. Install the differential pinion gears.
    1. Install the differential pinion gear case lining.
    2. Install the differential pinion gears.
    3. Install the differential pinion gears.
    4. Install the differential pinion shaft.
    5. Install the differential pinion shaft snap ring.



5. **NOTE:** Transaxle side shown, clutch side similar.

    Using the special tools, install the differential bearings.

	Blanking Plugs, Transaxle Housing 308-152 (T88C-7025-AH)

Material

Item	Specification
Gasket Maker TA-16	WSK-M2G348-A5

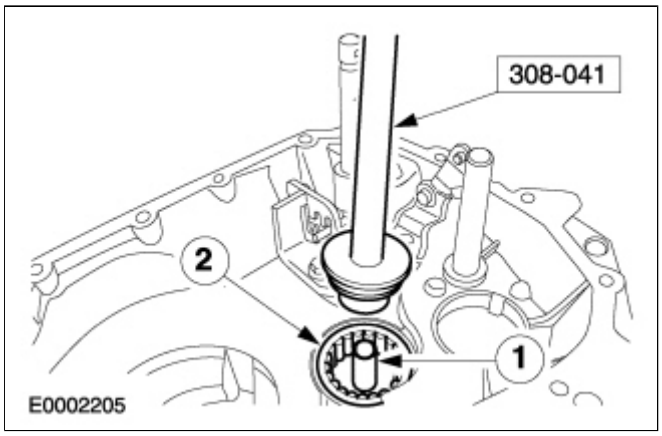
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Threadlock and Sealer TA-25	WSK-M2G351-A5

Assembly

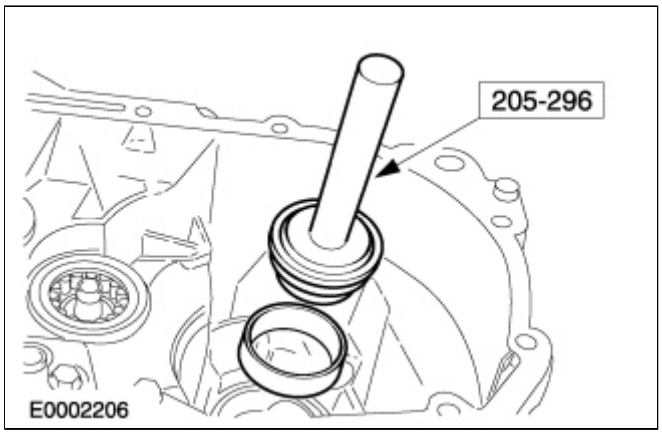
1. **NOTE:** Apply transmission fluid to all rotating surfaces.

   Clean and check all parts carefully before reassembly.

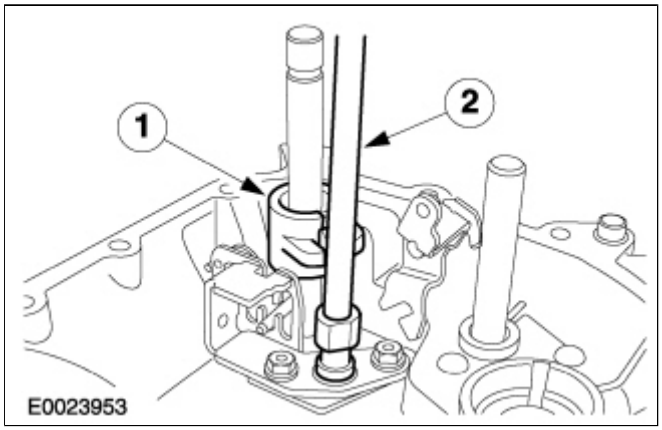
2. Using the special tool, install the output shaft roller bearing and bearing cone.
   1. Install the oil thrower.
   2. Install the bearing as far as stop.



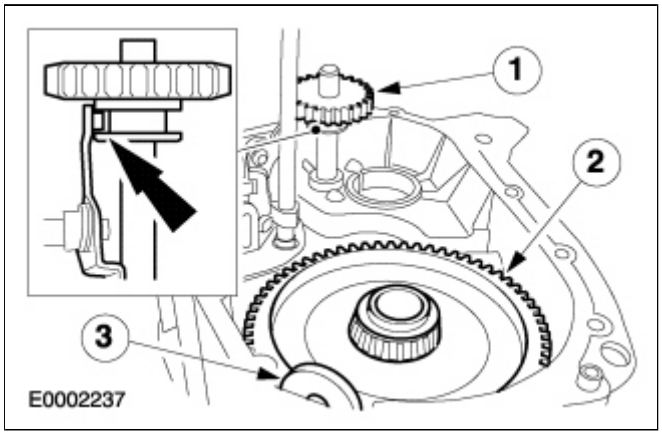
3. Using the special tool, install the differential bearing cone.



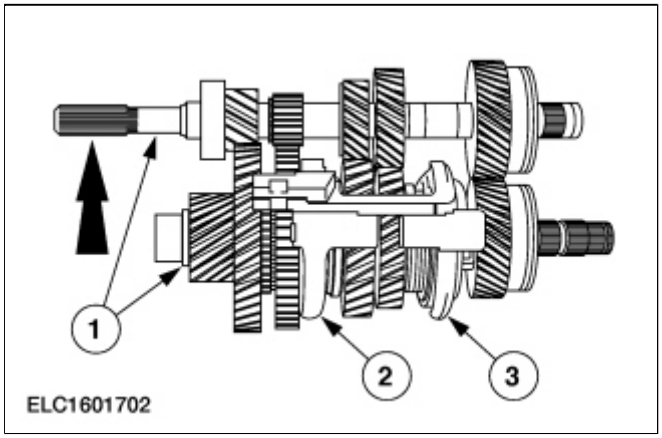
4. Install the shift selector interlock plate and the selector rod.
   1. Install the shift selector interlock plate.
   2. Install the 5th/reverse gear selector rod.



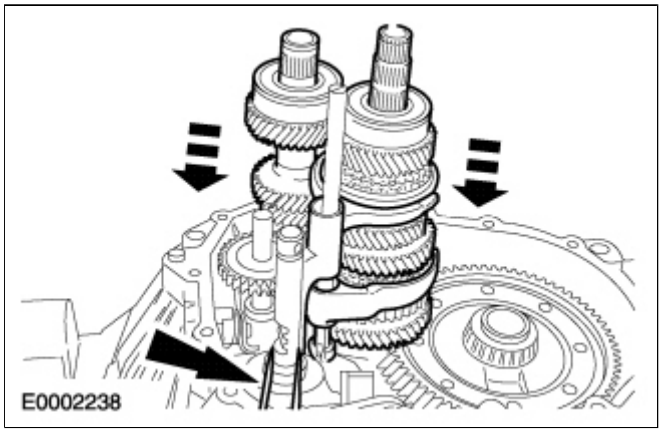
5. Install the reverse gear idler (as shown), the differential and the magnet.
    1. Reverse gear idler.
    2. Differential.
    3. Magnet.



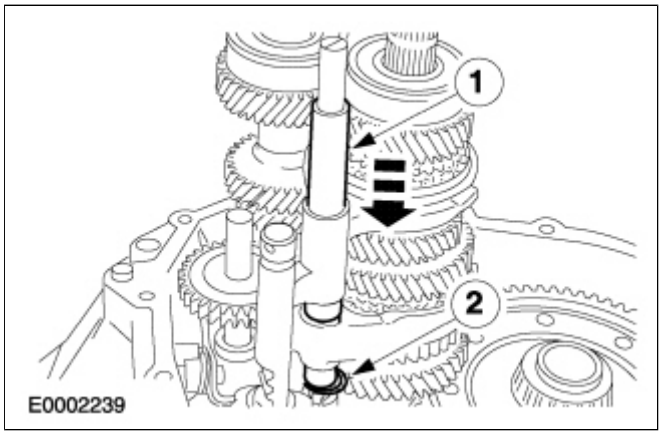
6. Prepare the input and the output shaft for installation.
    1. Position the input shaft and the output shaft together.
    2. Position the 1st and 2nd gear selector fork on the shaft assemblies.
    3. Position the 3rd and 4th gear selector fork on the shaft assemblies.



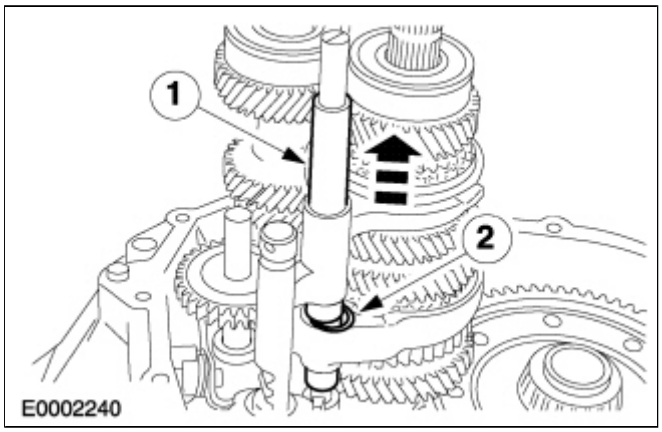
7. Install the input shaft, output shaft and selector fork assemblies into the transaxle case.
    - Install a rubber band to the selector shaft to aid assembly.
    - Insert the input shaft to a depth of approximately 50 mm (1.968 in) and swivel it slightly to the side.
    - Insert the output shaft to the level of the input shaft and engage the gears.
    - Install the input shaft and the output shaft.



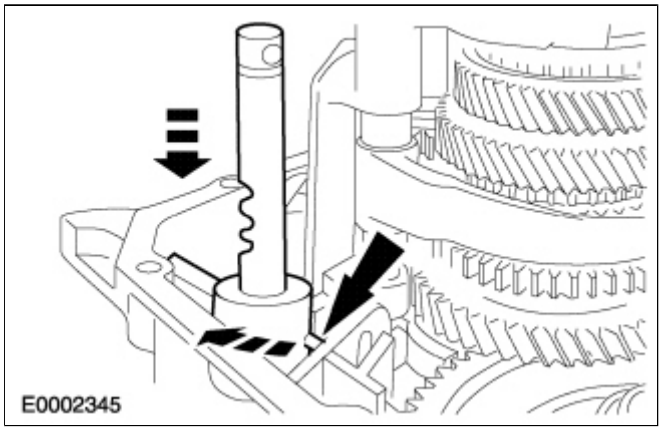
8. Install the selector shaft guide sleeve and new lower snap ring.
    1. Push in the selector shaft guide sleeve.
    2. Install the new lower snap ring.



9. Install the selector shaft guide sleeve new upper snap ring.
    1. Pull up the selector shaft guide sleeve.
    2. Install the new upper snap ring.

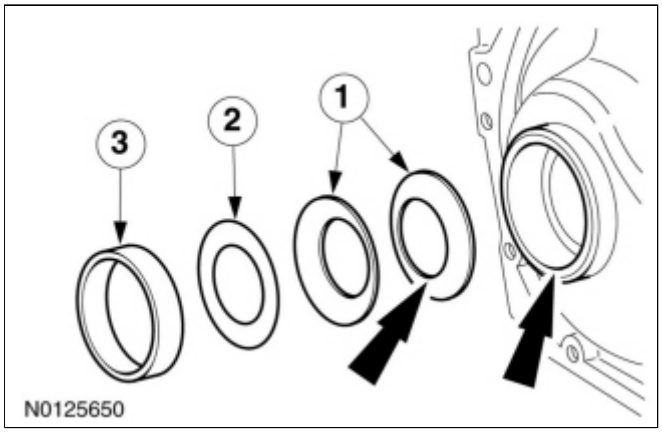


10. Move the inner gearshift linkage to 5th gear.
    - Turn the selector shaft clockwise until the reverse and 5th gear passage is reached, then press downwards.

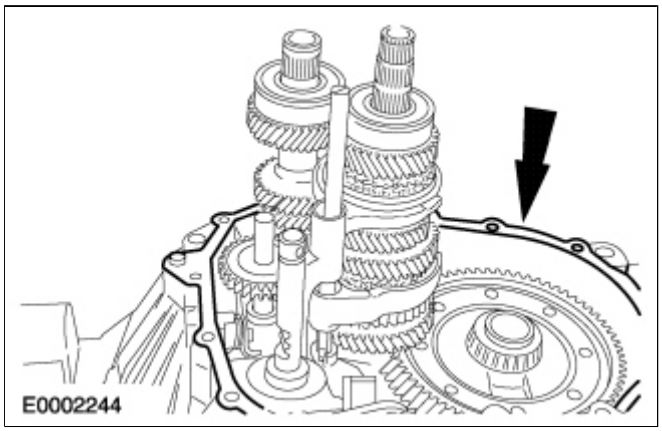


11. **NOTE:** The inner diameters of the Belleville washers are touching.

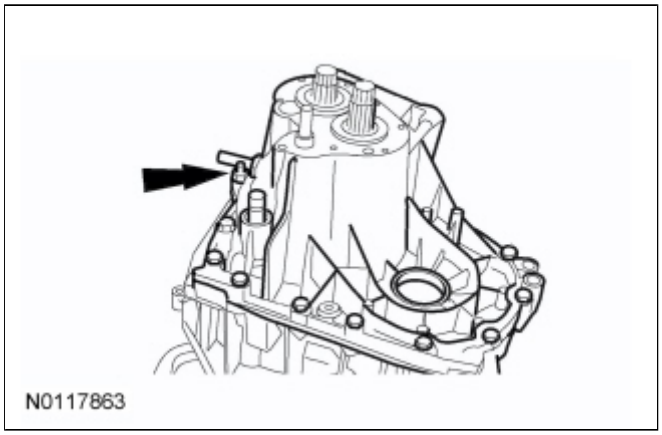
    Install the shim and secure it by staking the edge of the housing.
    1. Belleville washers.
    2. Shim.
    3. Install the bearing cone and secure it by staking the edge of the housing.



12. Apply Gasket Maker to the transaxle housing.

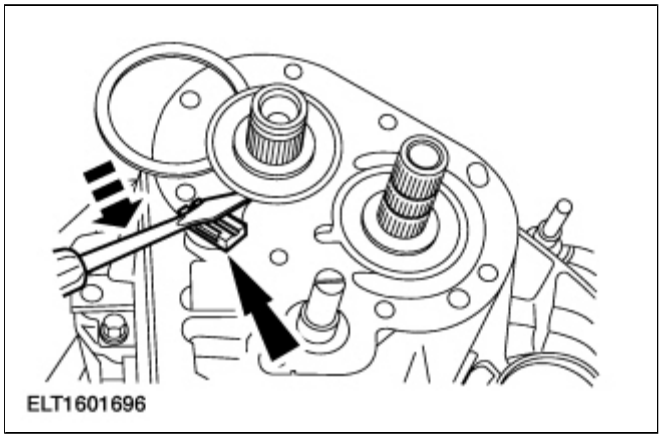


13. Install the transaxle housing bolts and evenly tighten.
    - Tighten to 33 Nm (24 lb-ft).



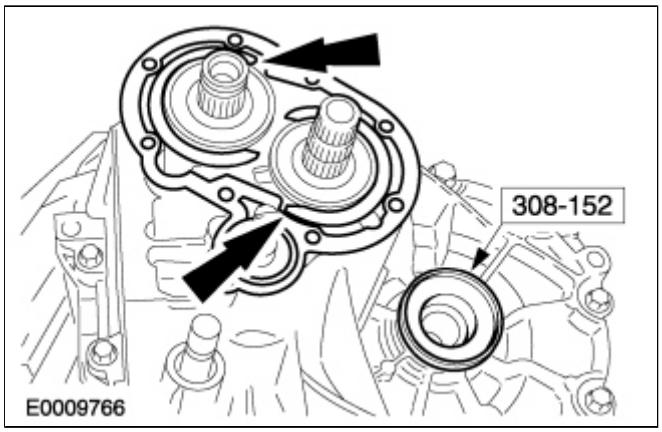
14. **NOTE:** Use a wooden block.

    Install the new input shaft and output shaft retaining rings.

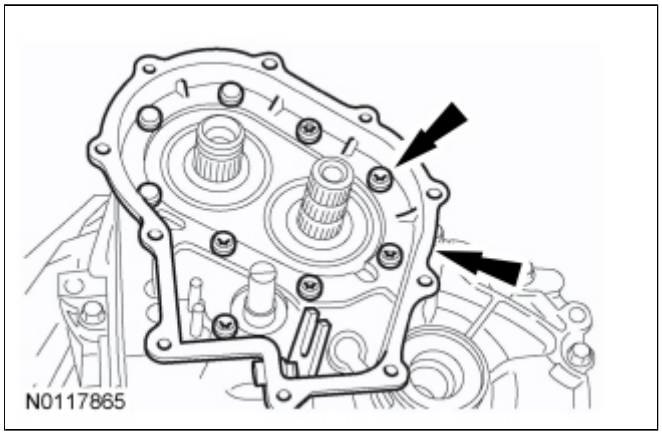


15. **NOTE:** Turn the retaining rings so that they are located in the cut-outs in the gasket.

    Install the special tools.



16. Install the new 5th gear housing gasket, 5th gear housing and the 9 new 5th gear housing bolts.
    - Tighten to 17 Nm (150 lb-in).

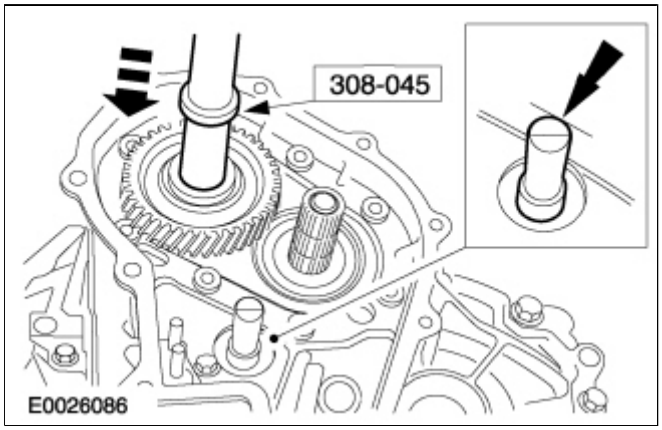


17. **NOTE:** Remove the transaxle from the special tool and carry out the following step on a press.

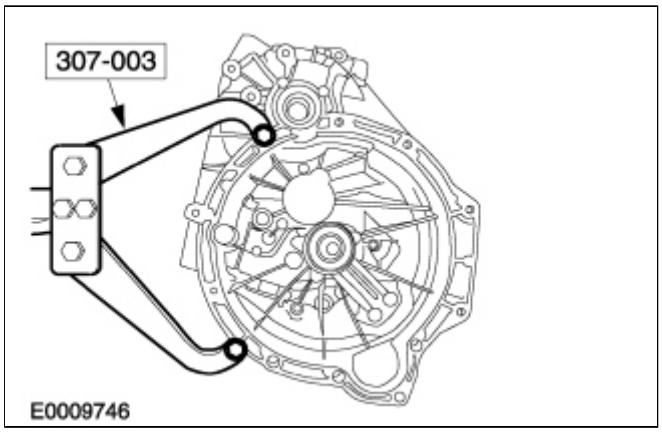
    NOTE: Install an anti twist stop for the selector rod.

    NOTE: The transaxle housing must not rest on the press table. Support the input shaft clutch splines on the press.

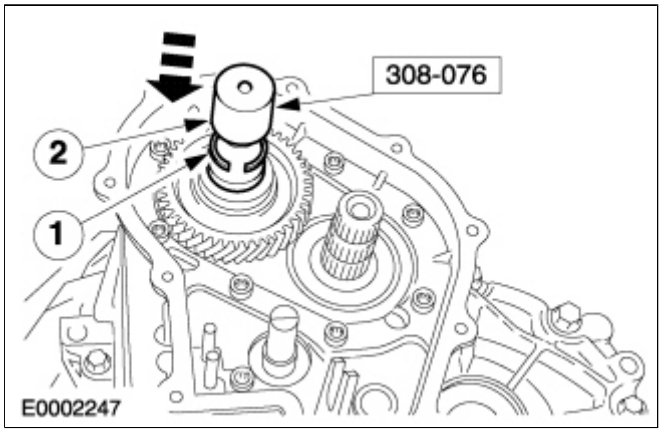
    Using the special tool and a press, install the 5th gear wheel onto the input shaft.



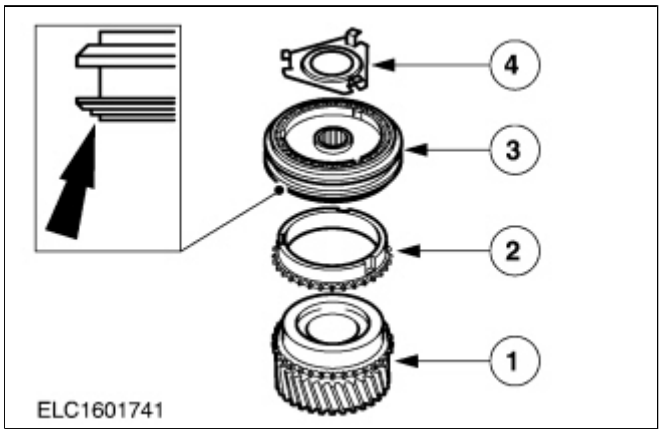
18. Install the special tool onto the transaxle.



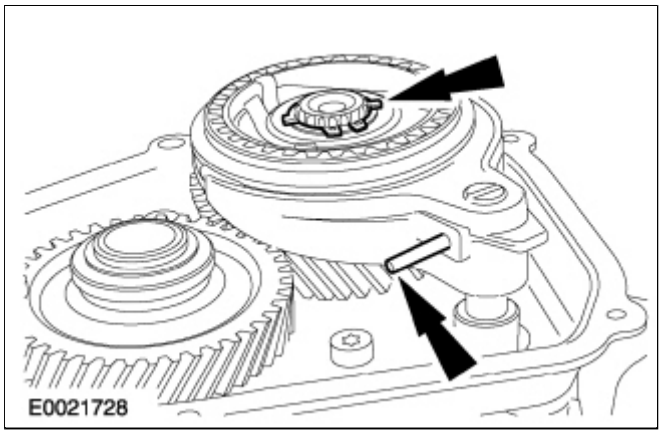
19. Using the special tool, install the new 5th gear snap ring.
    1. Install the new snap ring onto the special tool.
    2. Install the special tool and push on the new snap ring.



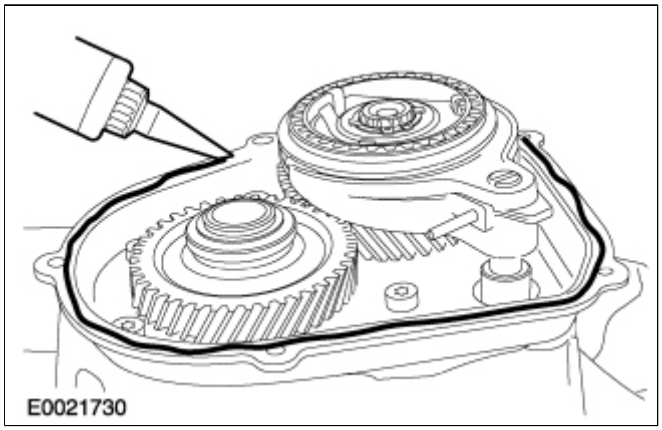
20. Assemble the 5th gear synchronizer unit.
    1. 5th gear.
    2. Synchronizer ring.
    3. Synchronizer (as shown).
    4. Retaining plate.



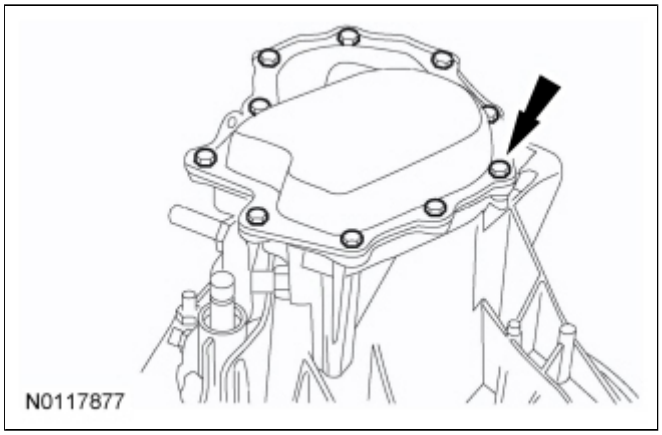
21. Install the 5th gear synchronizer unit with selector fork on the transaxle.
    - Install the new roll pin.
    - Install the new circlip.



22. Apply Silicone Gasket and Sealant evenly to the end cap.

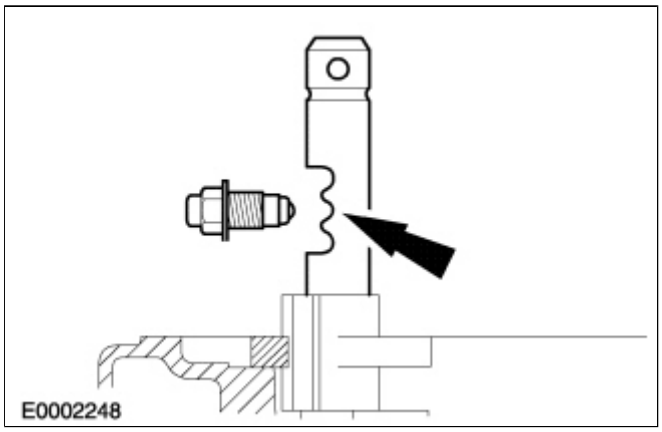


23. Install the 5th gear cover and the 5th gear cover bolts.
    - Tighten to 12 Nm (106 lb-in).



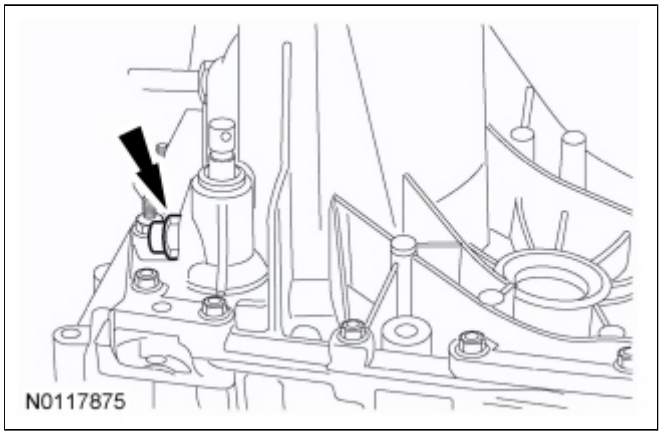
24. **NOTE:** Install the selector shaft interlock in the neutral position.

    Install the selector shaft interlock as shown.

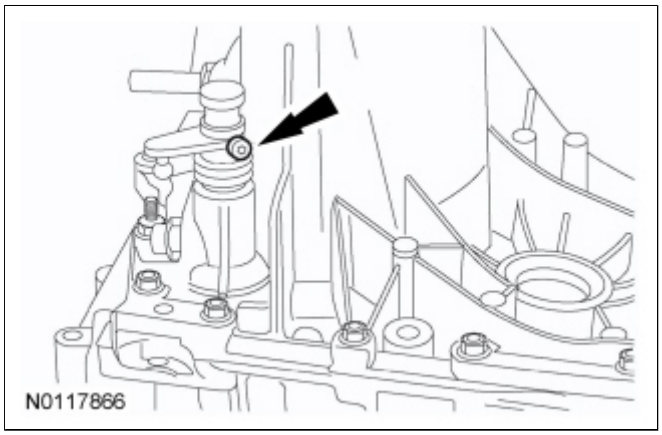


25. **NOTE:** Make sure the selector shaft interlock in the neutral position.

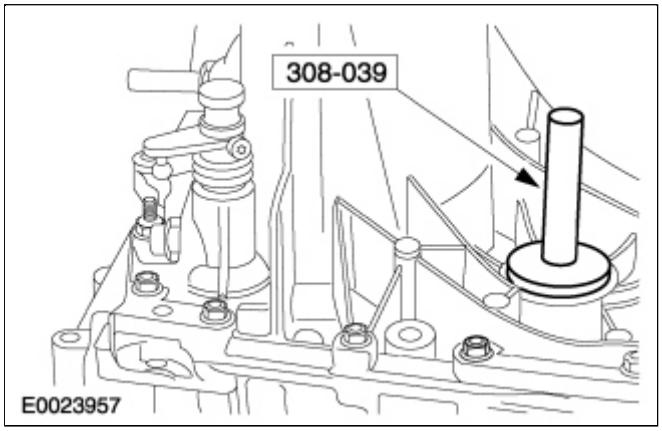
    Apply Threadlock and Sealer to the selector interlock mechanism and install.
    - Tighten to 25 Nm (18 lb-ft).



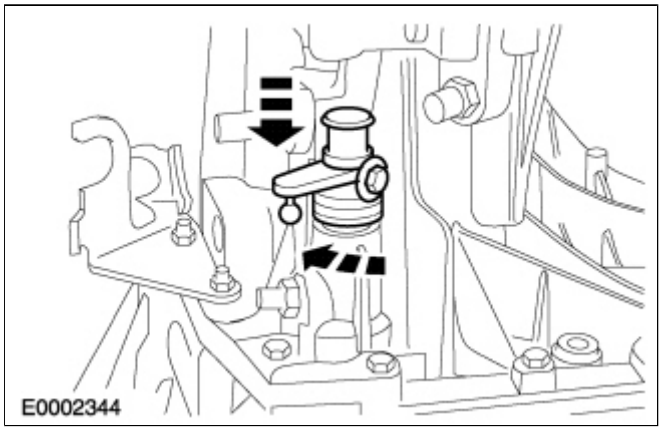
26. Install the shift lever.



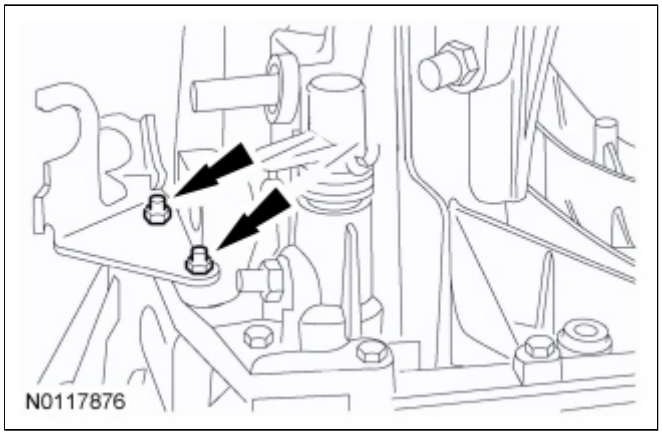
27. Using the special tool, install the halfshaft seal until it engages audibly.



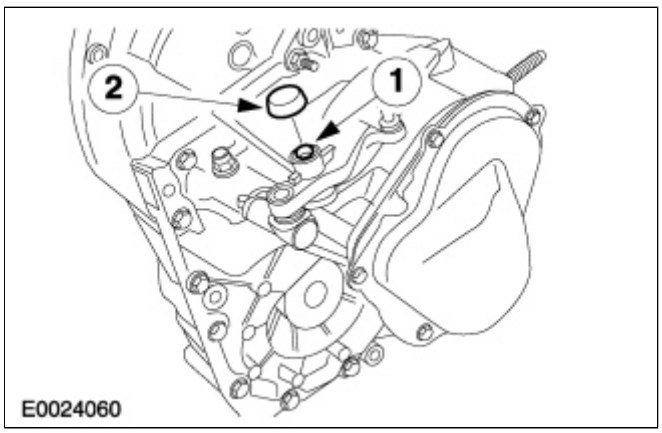
28. Engage 5th gear.
    - Turn the selector shaft clockwise as far as possible and press it in.



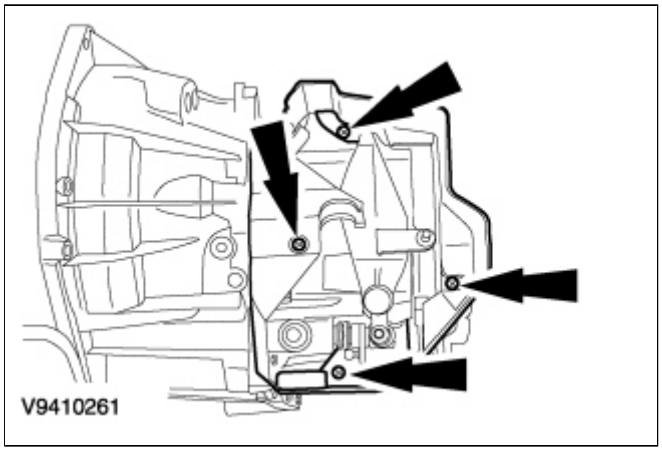
29. Install the gearshift cables bracket and the gearshift cables bracket nuts.
    - Tighten to 20 Nm (177 lb-in).



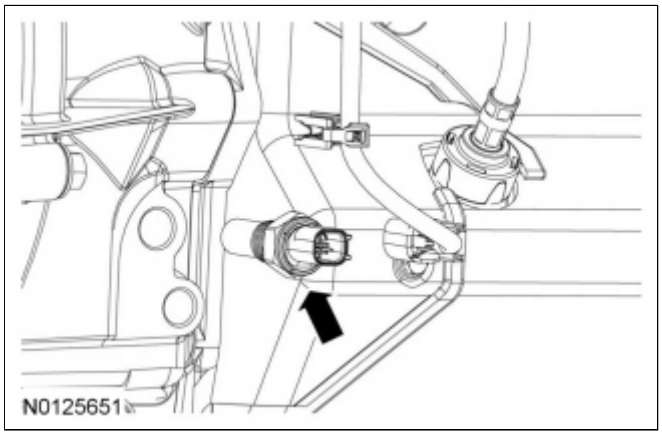
30. Install the selector lever.
    1. Install the new snap ring.
    2. Install the protective cap.



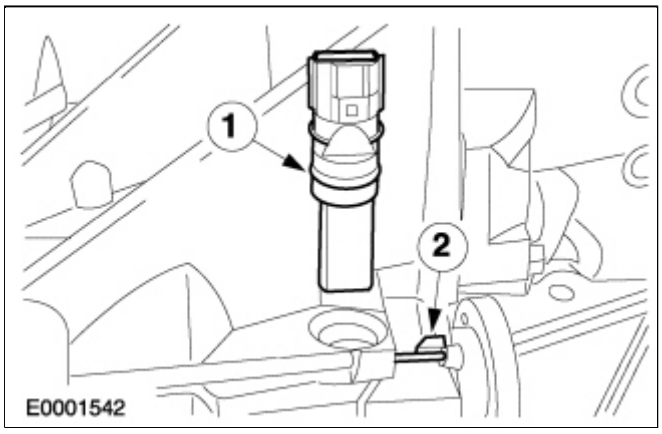
31. Install the gearshift cables shroud and gearshift cables shroud fasteners.



32. Install the reversing lamp switch.
    - Tighten to 14 Nm (124 lb-in).

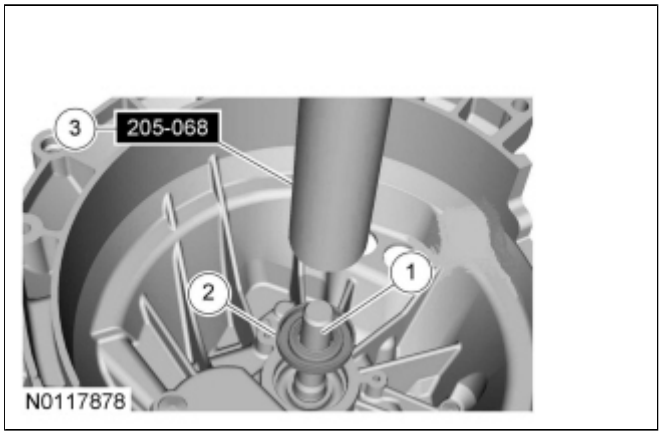


33. Install the Vehicle Speed Sensor (VSS).
    1. Connect the VSS .
    2. Install the retaining pin.

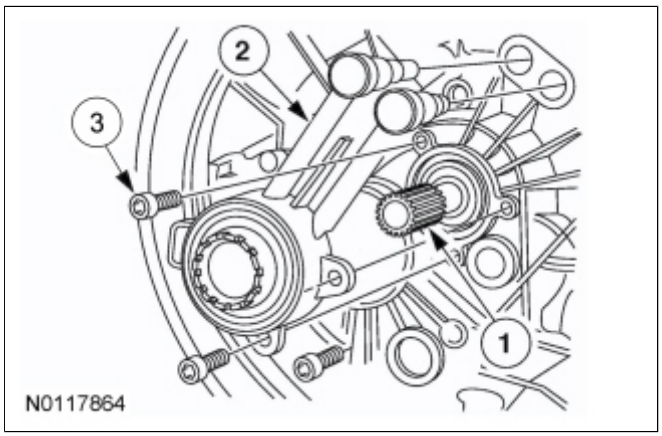


34. ***NOTICE:*** **Apply adhesive tape to cover the input shaft splines to prevent damage to the input shaft seal.**

    Using the special tools, install the new input shaft seal.
    1. Apply a small amount of adhesive tape to the input shaft.
    2. Put the input shaft seal on the input shaft.
    3. Using the special tool, install the new input shaft seal.



35. Install the clutch slave cylinder and the clutch slave cylinder bolts.
    1. Apply a small amount of grease to the input shaft.
    2. Install the clutch slave cylinder.
    3. Install the 3 clutch slave cylinder bolts.
        - Tighten evenly to 11 Nm (97 lb-in).



Transaxle

Special Tool(s)

ST2378-A	Adapter for 303-290A 303-290-01
 ST2379-A	Adapter for 303-290A (Support Leg) 303-290-03A
 ST2363-A	Support Bar, Engine 303-290A

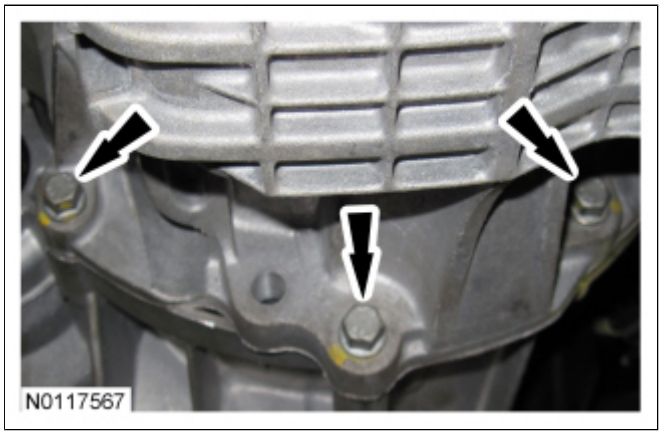
Material

Item	Specification
Motorcraft® Full Synthetic Manual Transmission Fluid XT-M5-QS	WSD-M2C200-C

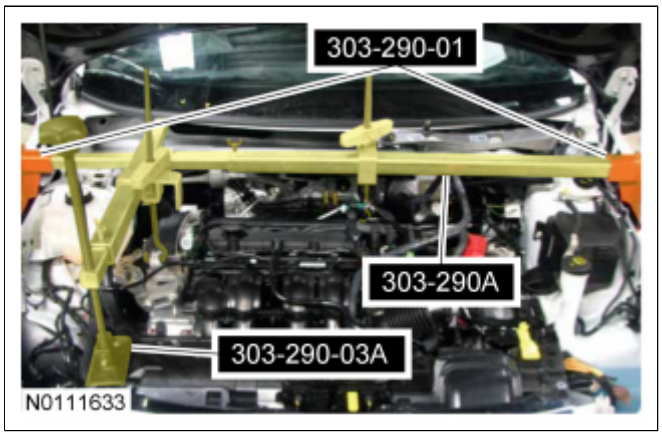
Installation

1. Install the transaxle.

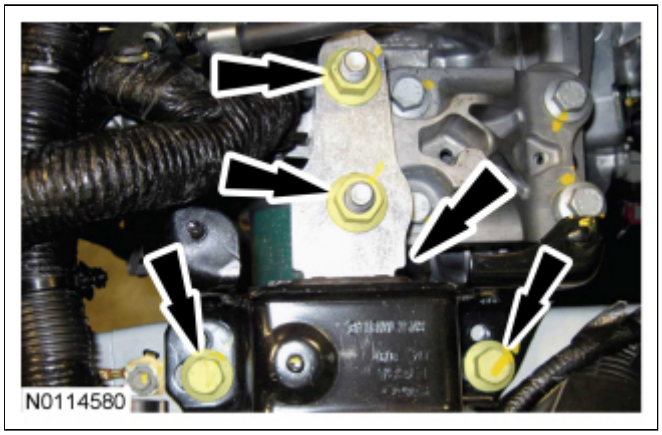
2. Install the 4 lower clutch housing-to-engine bolts (3 shown).
   - Tighten to 48 Nm (35 lb-ft).



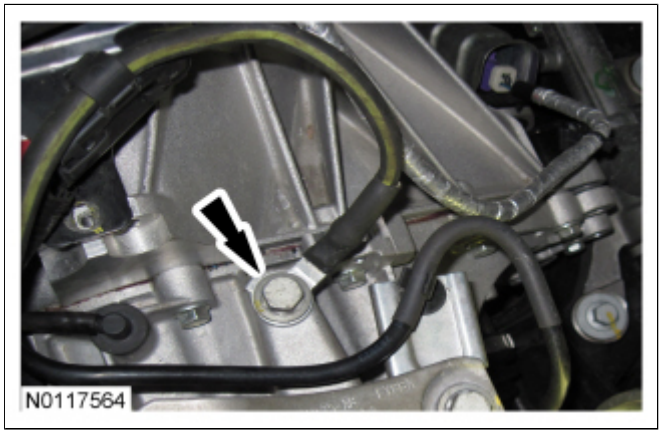
3. Using the special tools, lower the transaxle.



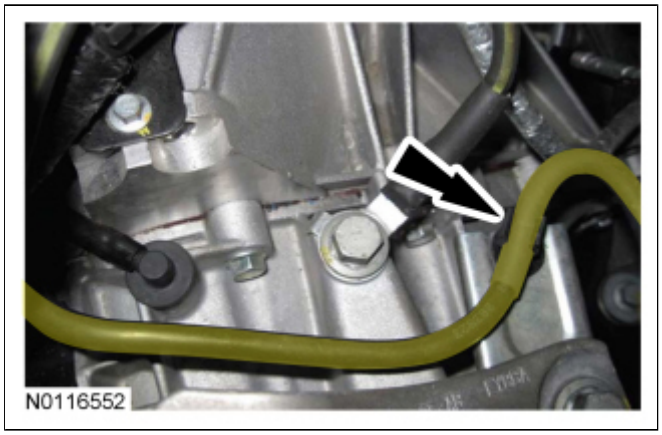
4. Install the transaxle support insulator, the 2 transaxle support insulator bolts and the 2 nuts.
    - Tighten the 2 bolts to 90 Nm (66 lb-ft).
    - Tighten the 2 nuts to 125 Nm (92 lb-ft).



5. Install the ground wire and bolt onto the transaxle.
    - Tighten to 25 Nm (18 lb-ft).



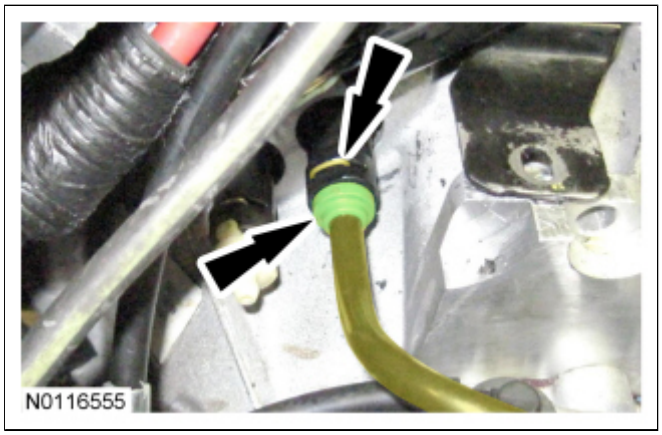
6. Attach the clutch hydraulic hose to the transaxle retainer.



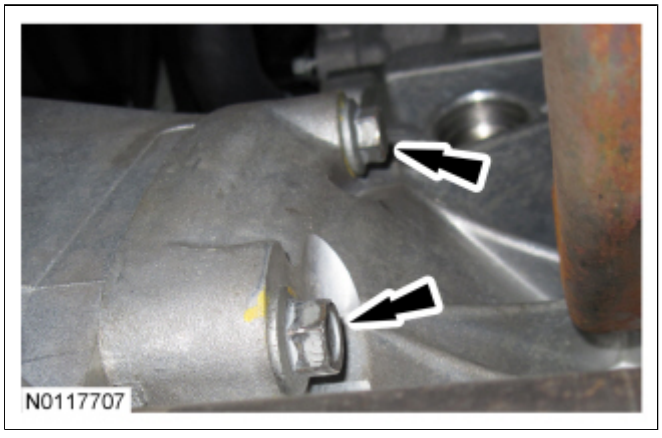
7. **WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

   NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

   Install the clutch hydraulic hose onto the transaxle and install the clip.

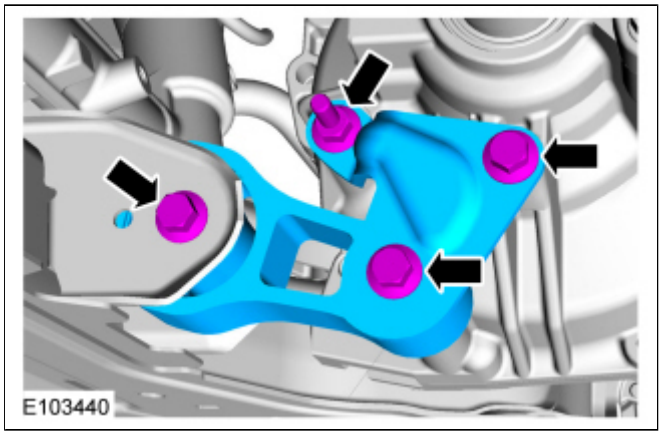


8. Install the 2 LH clutch housing-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

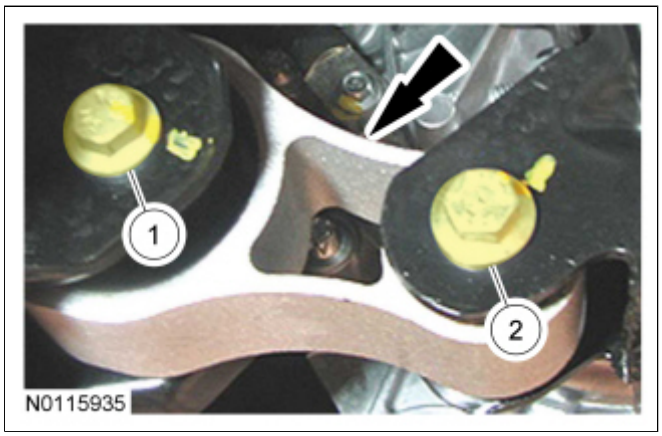


9. **NOTE:** The roll restrictor bolts are different lengths, make sure the roll restrictor bolts are in the correct location using the marks made during removal.

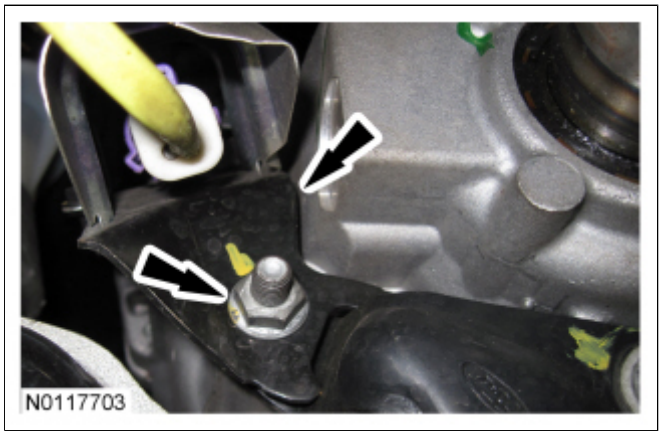
   Install the roll restrictor bracket, roll restrictor and the roll restrictor bolts.
   Loosely install the 2 roll restrictor bolts and the 2 roll restrictor bracket bolts at this time.
   - Only tighten the top 2 roll restrictor bracket bolts.
     - Tighten the to 48 Nm (35 lb-ft).



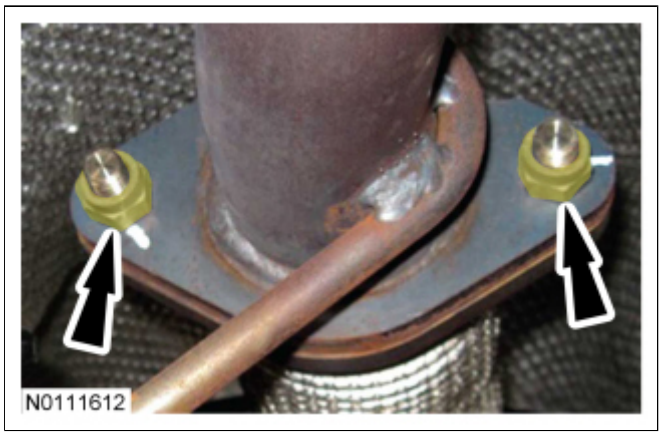
10. Tighten the roll restrictor bolts.
    1. Tighten the roll restrictor bolt to 70 Nm (52 lb-ft).
    2. Tighten the roll restrictor-to-transaxle bracket bolt to 70 Nm (52 lb-ft).



11. Attach the Heated Oxygen Sensor (HO2S) bracket to the transaxle and install the HO2S bracket nut.
    - Tighten to 25 Nm (18 lb-ft).



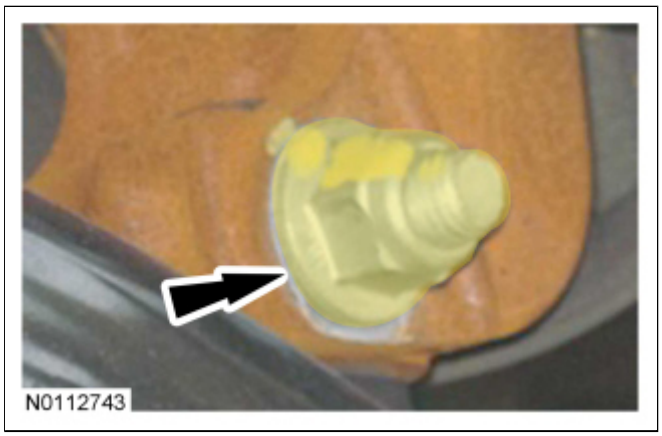
12. Using a new exhaust flange gasket and nuts, connect the exhaust flange to the exhaust.
    - Tighten to 48 Nm (35 lb-ft).



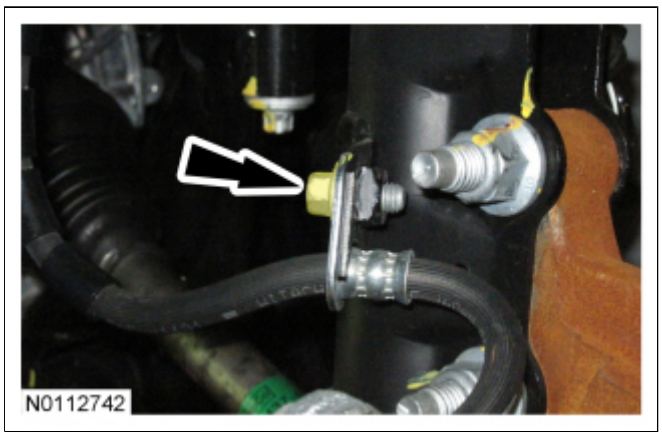
13. Install the LH halfshaft into the transaxle.

14. Install the LH ball joint into the knuckle.

15. Install the new LH ball joint bolt and nut.
    - Tighten to 48 Nm (35 lb-ft).

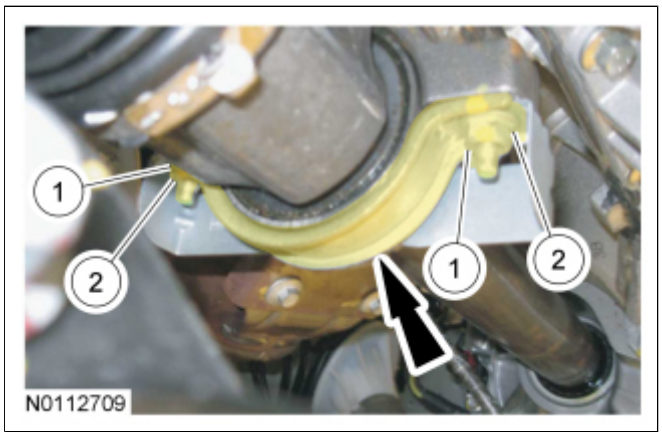


16. Install the brake hose retainer and bolt on the LH strut.
    - Tighten to 25 Nm (18 lb-ft).



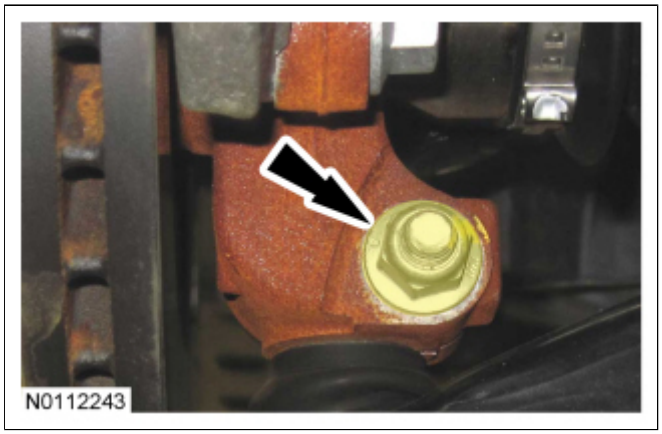
17. Install the RH intermediate shaft assembly into the transaxle.

18. Install the new bearing retainer strap, shield and bearing retainer strap nuts. Tighten the nuts in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

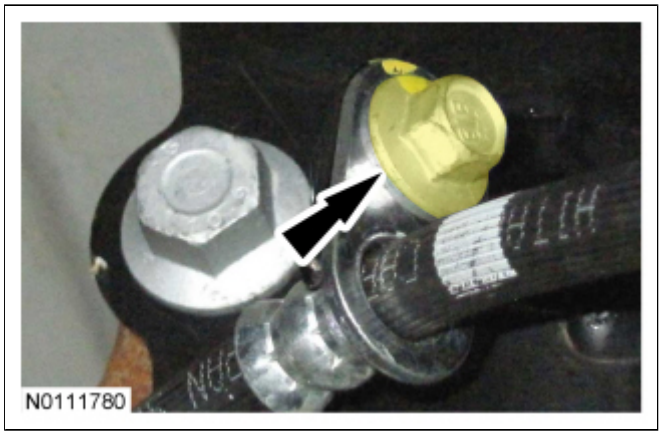


19. Install the RH ball joint into the knuckle.

20. Install the new RH ball joint bolt and nut.
    - Tighten to 48 Nm (35 lb-ft).

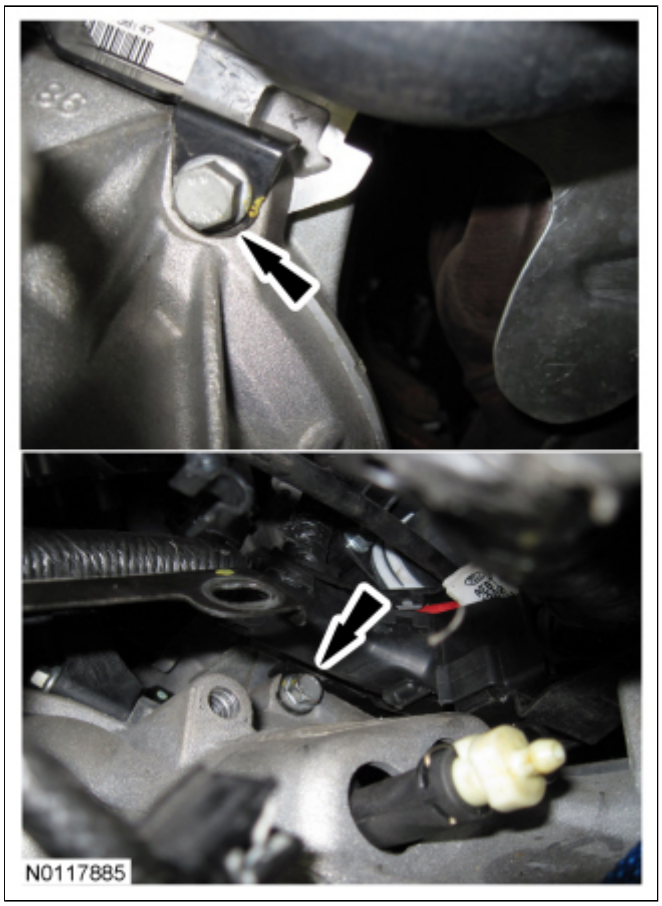


21. Install the brake hose retainer and bolt on the RH strut.
    - Tighten to 25 Nm (18 lb-ft).

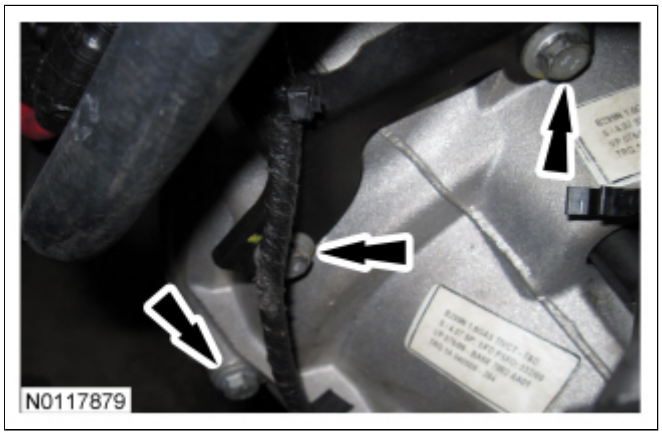


22. Install the front wheels. For additional information, refer to Section 204-04 .

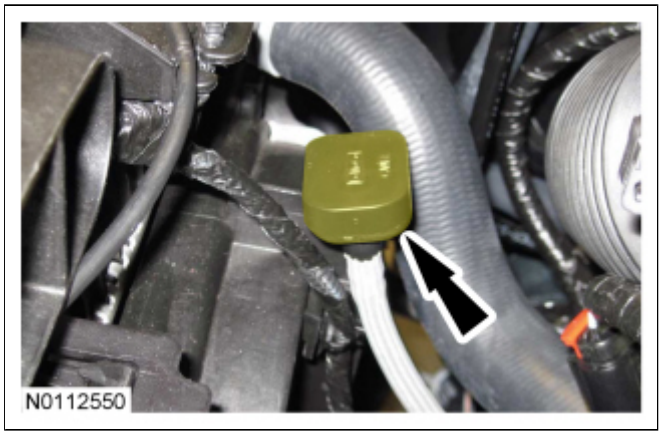
23. Install the 2 top clutch housing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



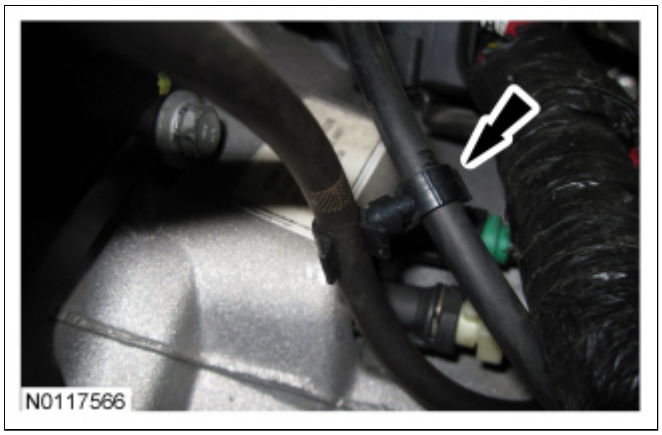
24. Install the 4 clutch housing-to-engine bolts (3 shown).
    - Tighten to 48 Nm (35 lb-ft).



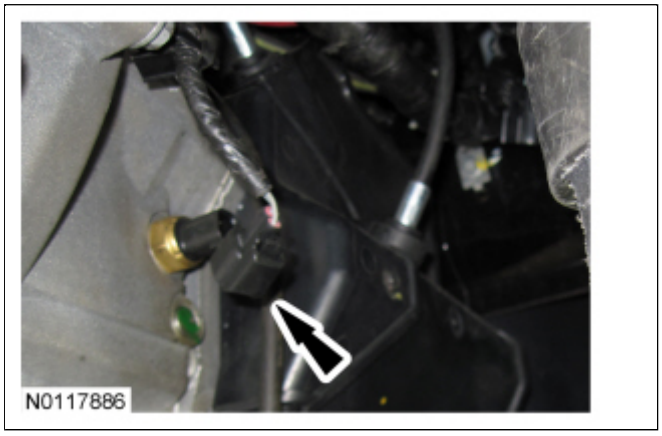
25. Install the transaxle vent hose on the cooling fan housing.



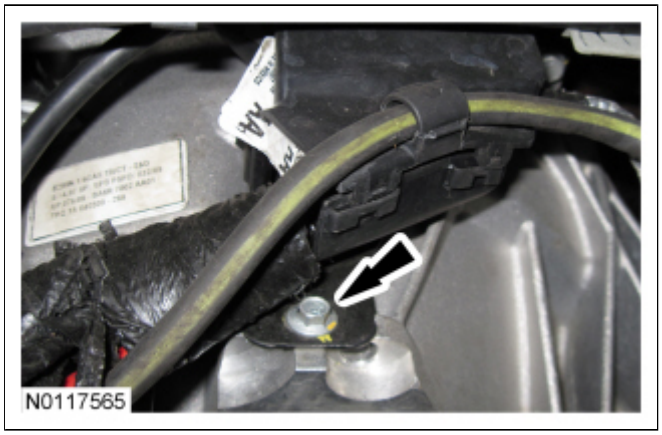
26. Attach the transaxle vent hose to the hose retainer.



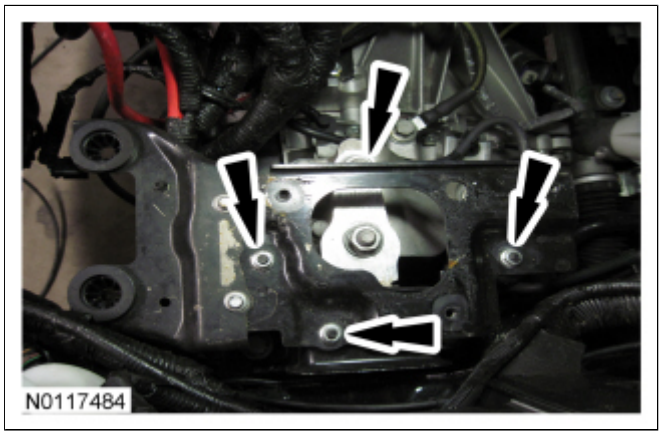
27. Connect the reverse light switch electrical connector.



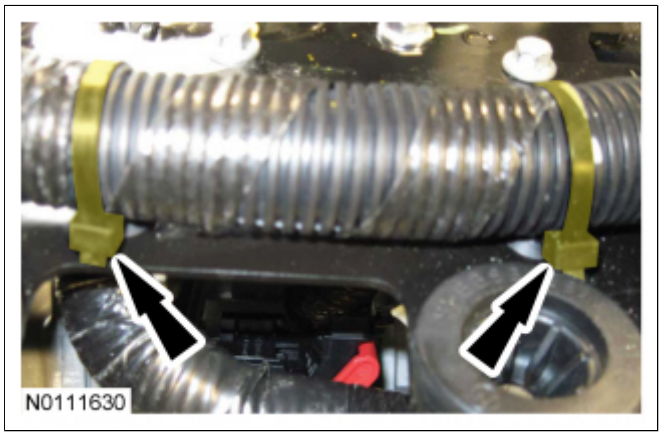
28. Install the wiring harness bracket and wiring harness bracket bolt to the transaxle.
    - Tighten to 25 Nm (18 lb-ft).



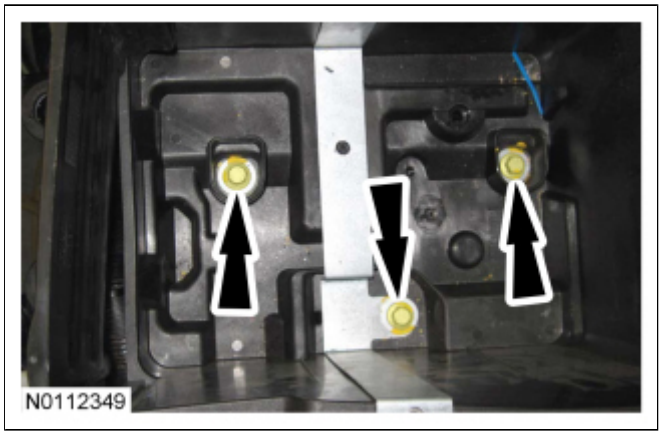
29. Install the battery tray bracket and the 3 battery tray bracket nuts.
    - Tighten to 25 Nm (18 lb-ft).



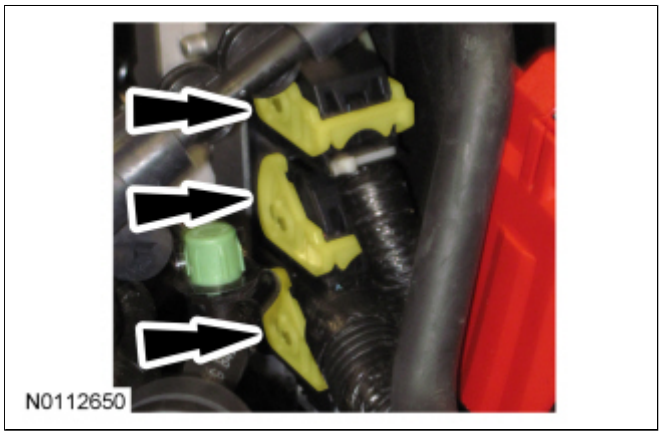
30. Attach the wiring harness to the battery tray bracket.



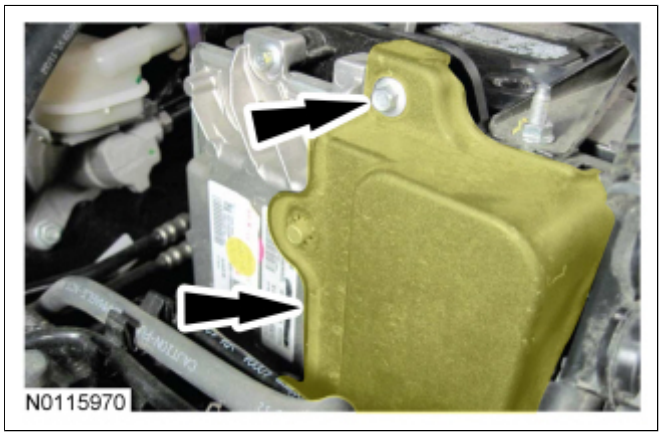
31. Install the battery tray and 3 battery tray bolts.
    - Tighten to 10 Nm (89 lb-in).



32. Connect the 3 PCM electrical connectors.



33. Install the PCM cover and the PCM cover bolt.
    - Tighten to 6 Nm (53 lb-in).



34. Install the cowl assembly. For additional information, refer to Section 501-02 .

35. Install the battery. For additional information, refer to Section 414-01 .

36. Fill the transaxle with transmission fluid. For additional information, refer to Transaxle Draining and Filling in this section.

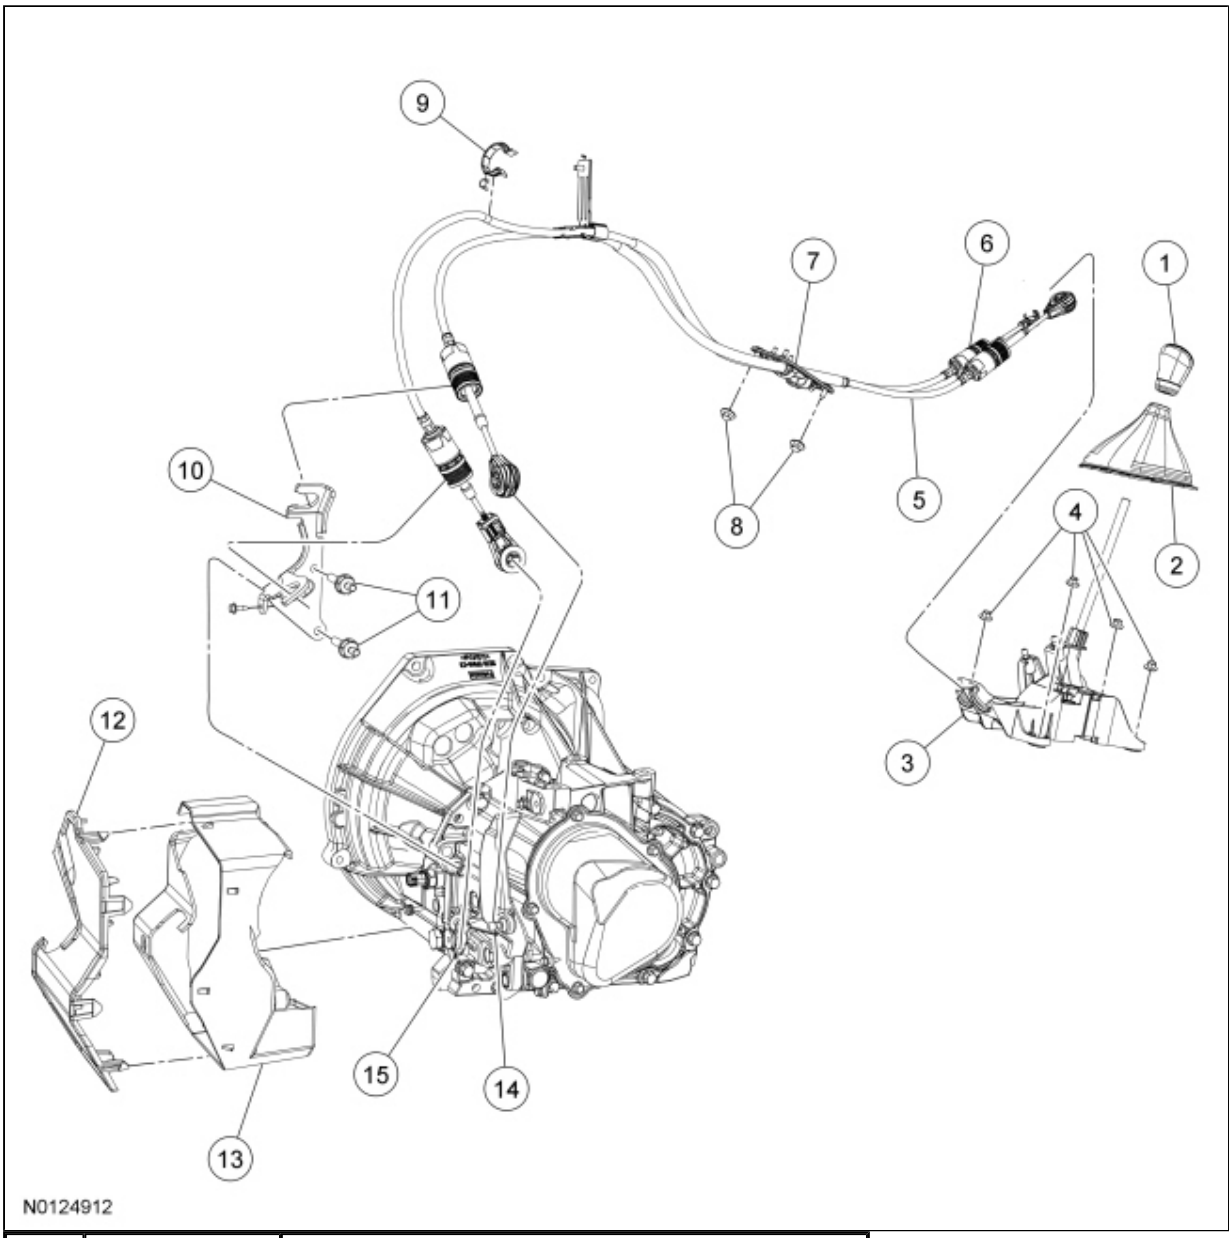
37. Bleed the clutch hydraulic system. For additional information, refer to Section 308-00 .

38. Adjust the gearshift cables. For additional information, refer to Section 308-00 .

Torque Specifications

Description	Nm	lb-ft	lb-in
Exhaust flange bolts	47	35	—
Gearshift lever nuts	9	—	80
Shift and selector cable grommet nuts.	9	—	80

External Controls



Item	Part Number	Description

2	—	Gearshift boot (part of 7213)
3	—	Gearshift lever base (part of 7210)
4	W706131	Gearshift nuts
5	—	Shift cable (part of 7E395)
6	—	Selector cable (part of 7E395)
7	—	Gearshift cables grommet (part of 7E395)
8	W706131	Gearshift cables grommet nuts (2 required)
9	W709047	Gearshift cable clip
10	7474	Gearshift cables bracket

11	W703125	Gearshift cables bracket studs
12	7222	Gearshift cables cover
13	7220	Gearshift cables shroud
14	7210	Transaxle selector lever
15	7F116	Transaxle shift lever

The IB5 manual transaxle external controls consists of the following:

- Gearshift cables
  - shift cable
  - selector cable
- Gearshift lever
- Gearshift lever knob and boot
- Transaxle shift lever
- Transaxle selector lever

The manual transaxle is controlled by a floor-mounted gearshift lever located in the floor console. Connection between the floor-mounted gearshift lever and the transaxle shift lever and selector lever is made through 2 gearshift cables. When the operator moves the floor mounted gearshift lever, that movement is transmitted through 2 gearshift cables routed through the floor to the transaxle. The 2 gearshift cables are attached to the transaxle at the shift lever and selector lever. The shift and selector levers transfer the movement of the gearshift cables to the shift rods and shift forks located inside the transaxle. Removal and installation of the gearshift cables require specific adjustments for correct shifting of the transaxle. For information regarding gearshift cable adjustments, refer to Section 308-00 .

The shift cable has white ends and the selector cable has black ends. The selector cable (black) does not have an adjustment.

External Controls

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not evident, verify the symptom. GO to Symptom Chart.

Symptom Chart

Symptom Chart

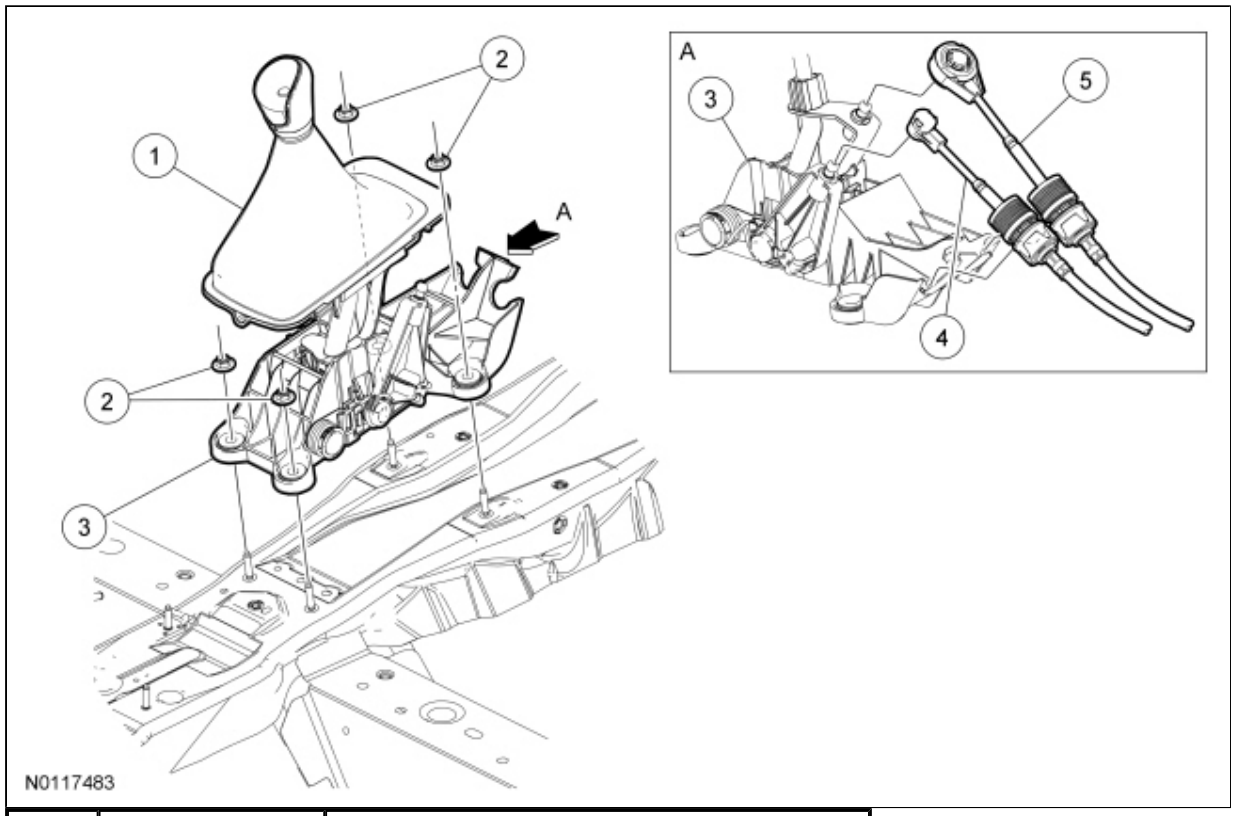
Condition	Possible Sources	Action
• Gearshift Cables Do Not Operate Freely	• Gearshift cables incorrectly adjusted	• ADJUST gearshift cables. REFER to Section 308-00.
• Gearshift Cables Do Not Operate Freely	• Gearshift lever • Gearshift cables	• GO to Pinpoint Test A.

Pinpoint Test

PINPOINT TEST A: GEARSHIFT CABLES DO NOT OPERATE FREELY

Test Step	Result / Action to Take
A1 CHECK GEARSHIFT LEVER	
• Disconnect the gearshift cables from the gearshift lever. • **Is the gearshift lever difficult to operate?**	**Yes** INSTALL a new gearshift lever. REFER to Gearshift Lever in this section. **No** GO to A2.
A2 CHECK THE GEARSHIFT CABLES.	
• Attach the gearshift cables to the gearshift lever. • Disconnect the gearshift cables from the transaxle. • **Is the gearshift lever difficult to operate?**	**Yes** INSTALL a new gearshift cable assembly. REFER to Gearshift Cables in this section. **No** There is a problem with the transaxle. REFER to Section 308-03.

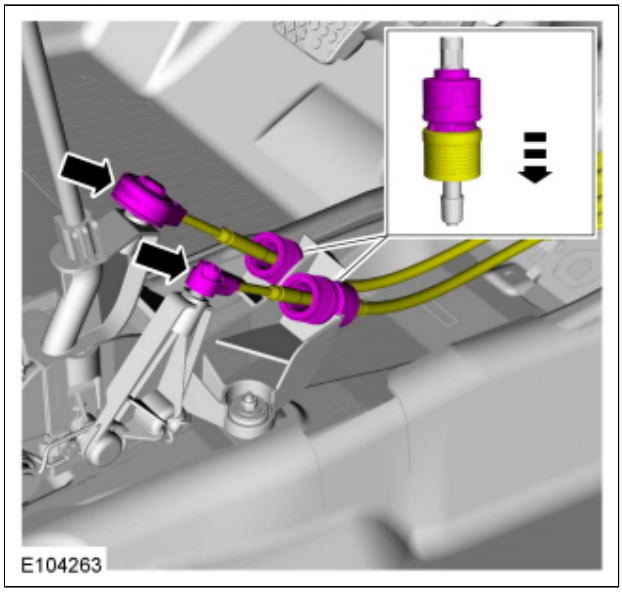
Gearshift Lever



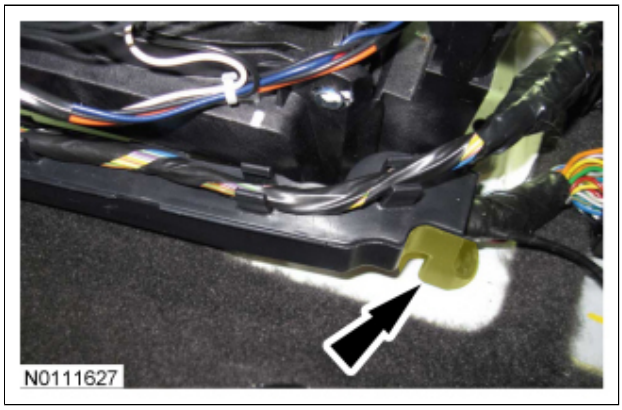
Item	Part Number	Description
1	7213	Gearshift lever
3	W706131	Gearshift lever nuts (4 required)
3	—	Gearshift lever base (part of 7210)
4	—	Shift cable (part of 7E395)
5	—	Selector cable (part of 7E395)

Removal

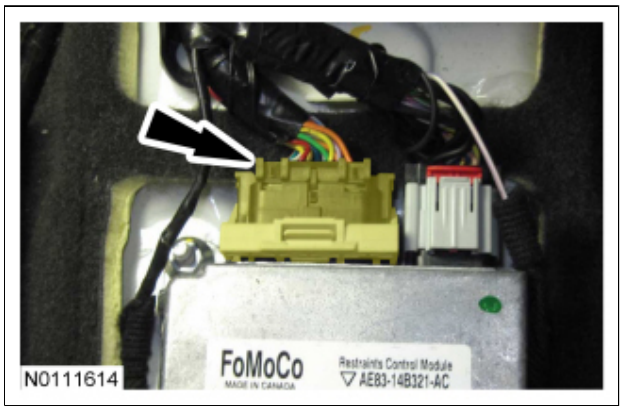
1. Remove the floor console. For additional information, refer to Section 501-12 .
2. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .
3. Remove the gearshift cables.



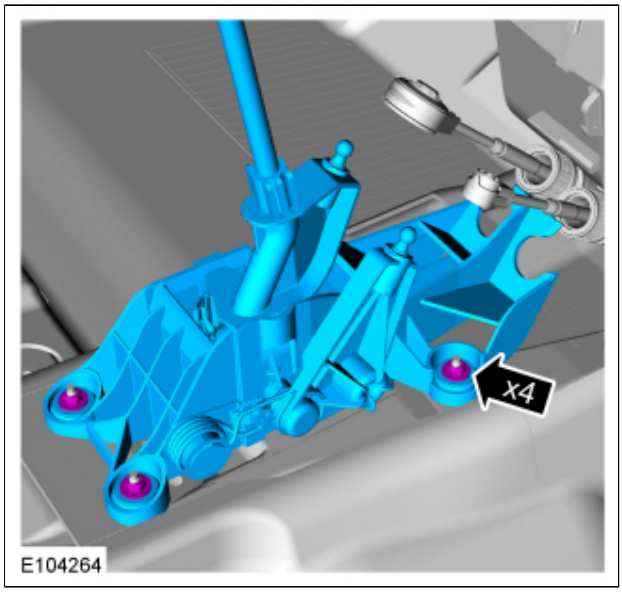
4. Using a suitable tool, remove the wiring harness from the gearshift lever base.



5. Disconnect the RCM electrical connector.

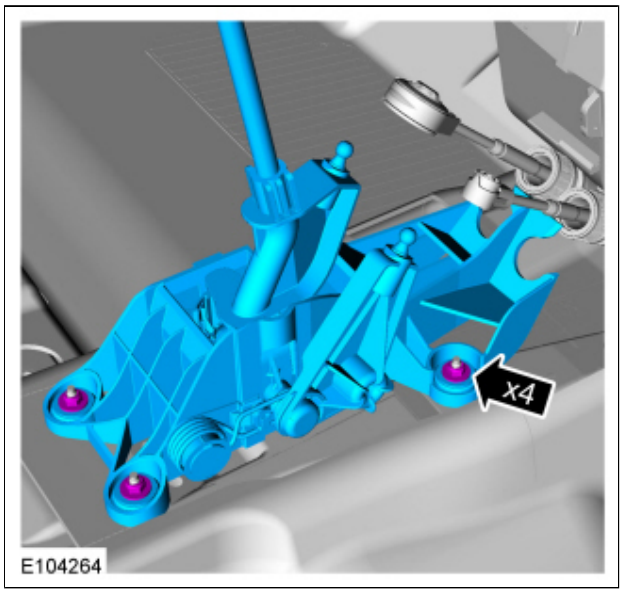


6. Remove the 4 gearshift lever nuts and remove the gearshift lever.

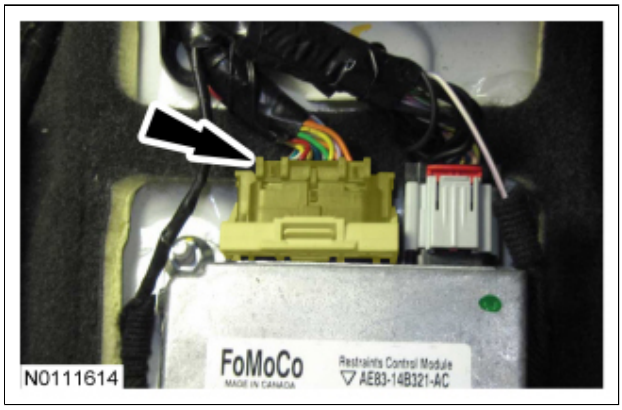


Installation

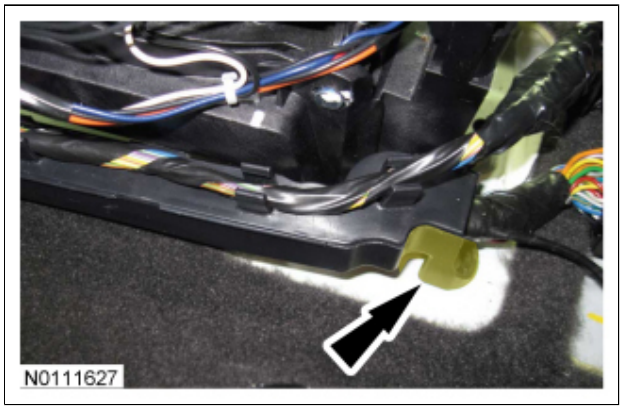
1. Install the gearshift lever and the 4 gearshift lever nuts.
   - Tighten to 9 Nm (80 lb-in).



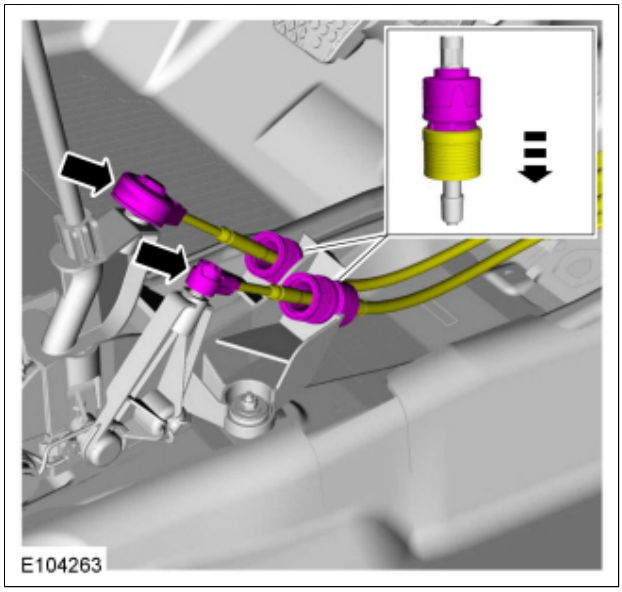
2. Connect the RCM electrical connector.



3. Install the wiring harness to the gearshift lever base.

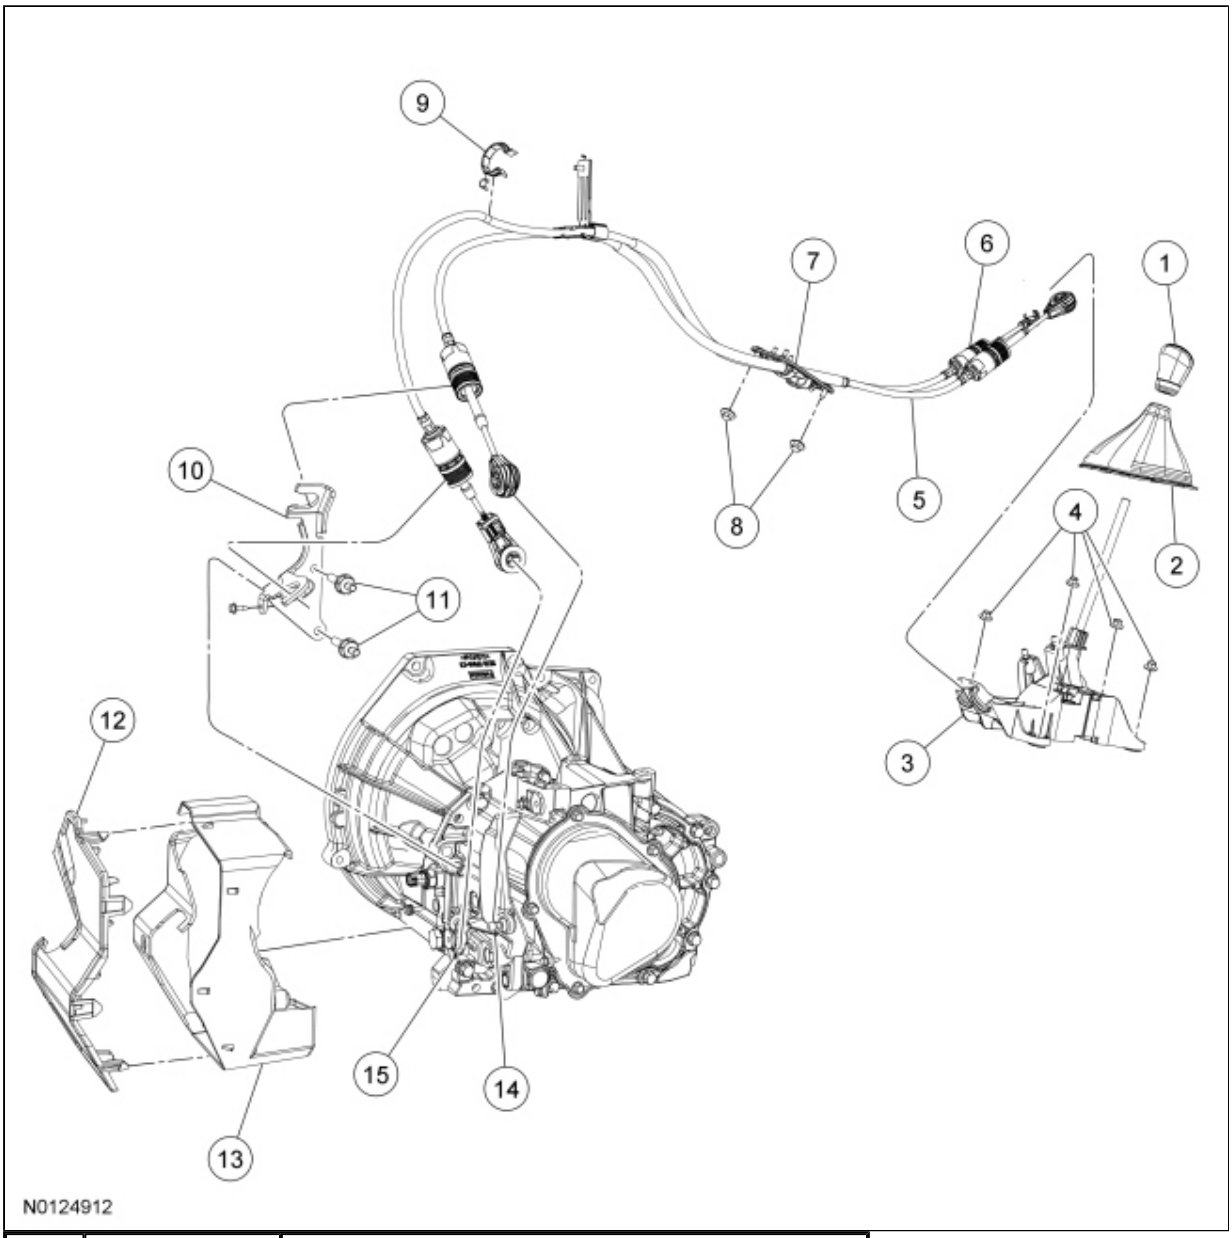


4. Install the gearshift cables.



5. Install the floor console. For additional information, refer to Section 501-12 .
6. Repower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .
7. Adjust the gearshift mechanism. For additional information, refer to Section 308-00 .

Gearshift Cables

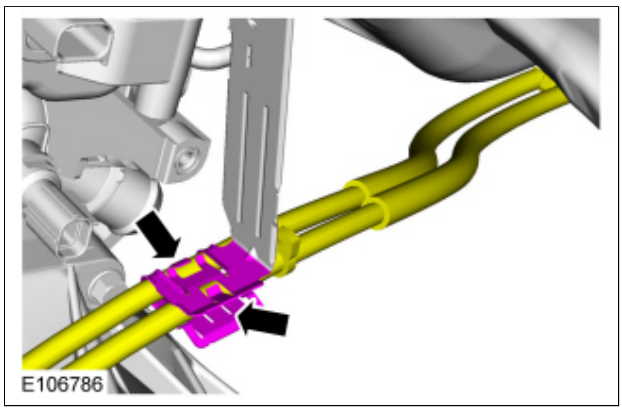


Item	Part Number	Description
1	—	Gearshift knob (part of 7213)
2	—	Gearshift boot (part of 7213)
3	—	Gearshift lever base (part of 7210)
4	W706131	Gearshift nuts
5	—	Shift cable (part of 7E395)
6	—	Selector cable (part of 7E395)
7	—	Gearshift cables grommet (part of 7E395)
8	W706131	Gearshift cables grommet nuts (2 required)
9	W709047	Gearshift cable clip
10	7474	Gearshift cables bracket

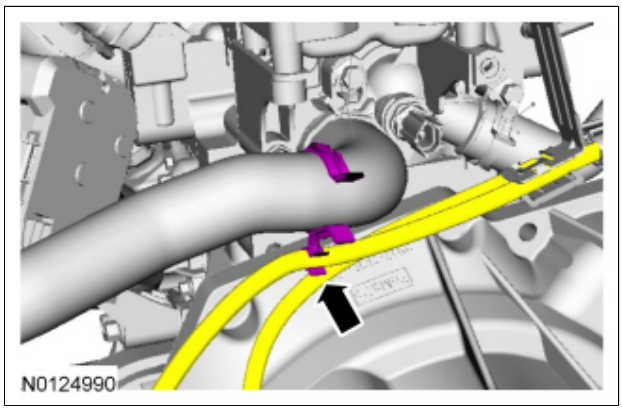
11	W703125	Gearshift cables bracket studs
12	7222	Gearshift cables cover
13	7220	Gearshift cables shroud
14	7210	Transaxle selector lever
15	7F116	Transaxle shift lever

Removal

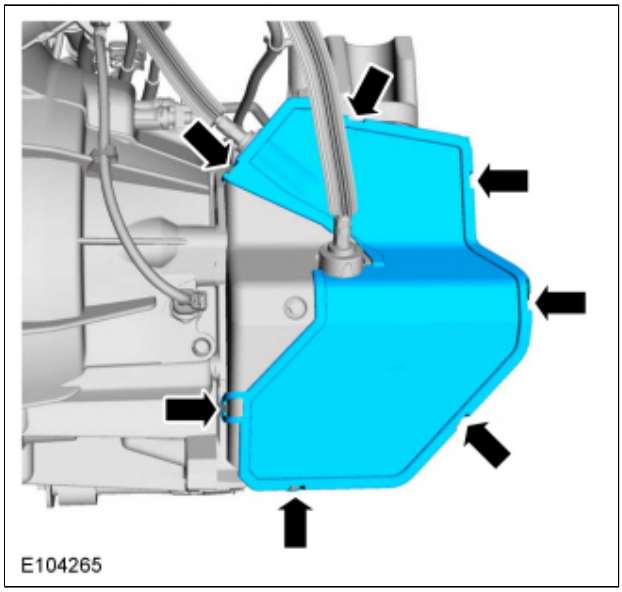
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the battery tray. For additional information, refer to Section 414-01 .
3. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12 .
4. Remove the gearshift cables from the gearshift cables bracket.



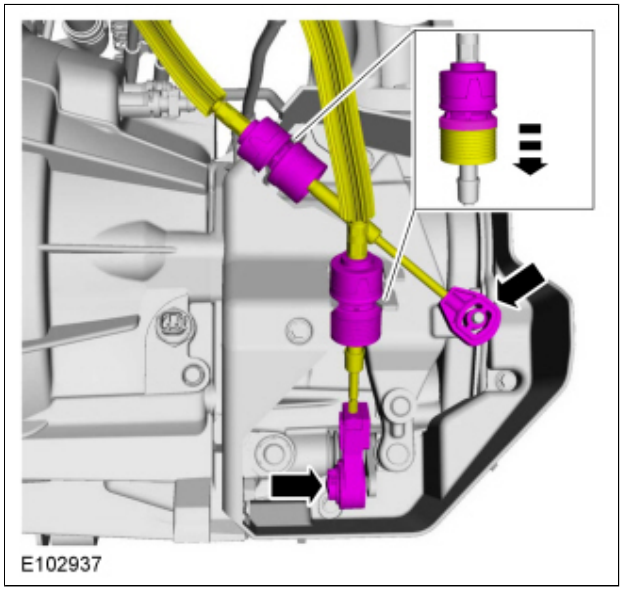
5. Remove the gearshift cable from the gearshift cable clip.



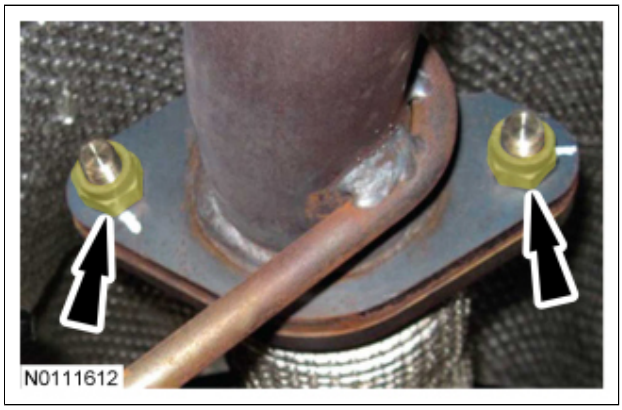
6. Release the 7 retainers and remove the gearshift cables cover.



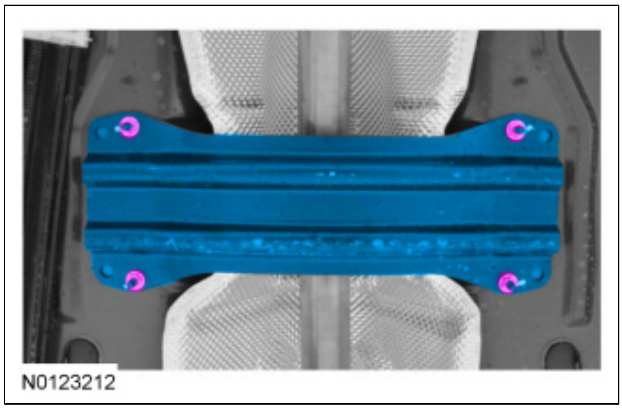
7. Remove the gearshift cables.
    - Using a suitable tool, gently pry the gearshift cables off the transaxle shift control levers.
    - Remove the gearshift cables by pulling the lower part of the abutment down and removing from the gearshift cables bracket.



8. Remove and discard the 2 exhaust flange nuts and the exhaust flange gasket. Disconnect the exhaust flange.

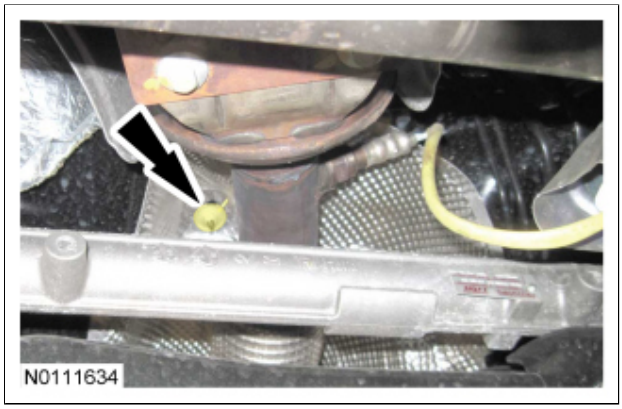


9. Remove the 4 cross brace nuts and remove the cross brace.

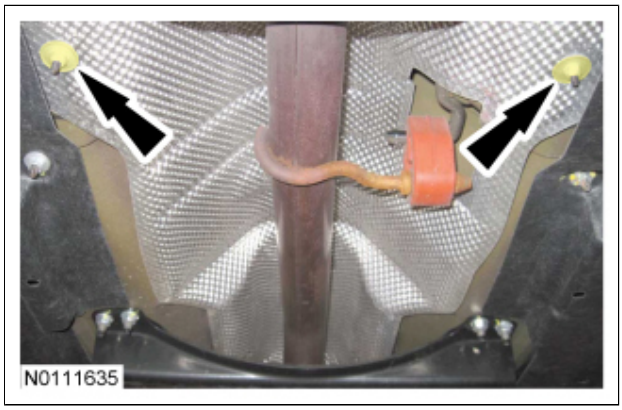


N0123212

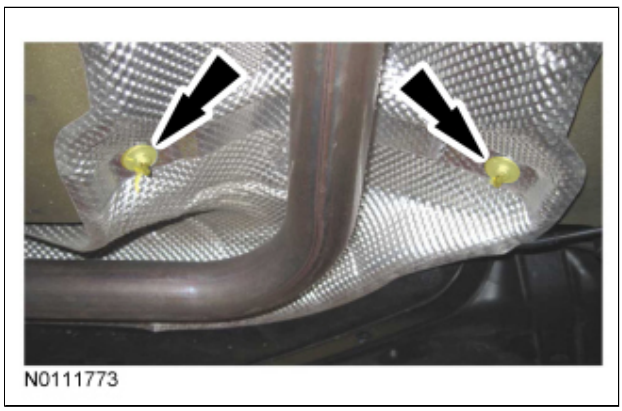
10. Remove the 6 exhaust heat shield fasteners (5 shown).



N0111634

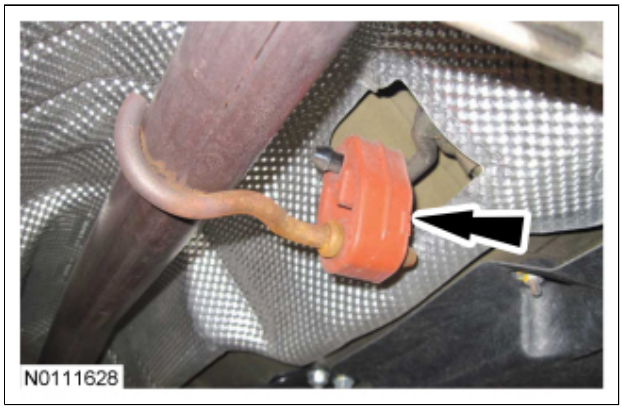


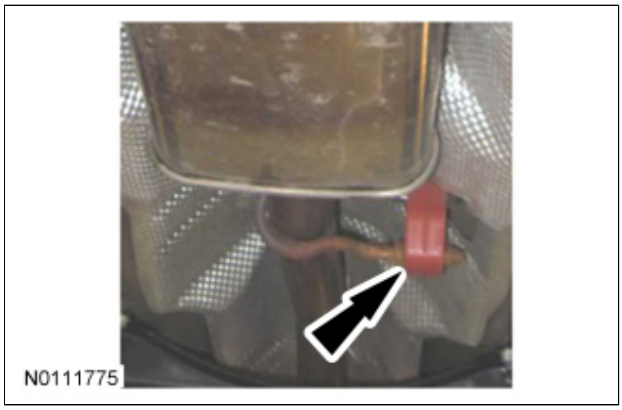
N0111635



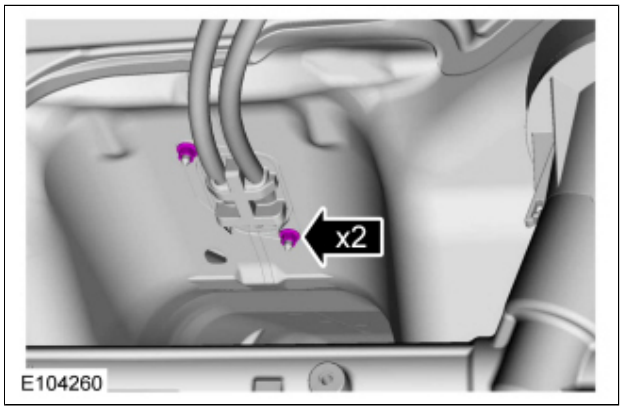
N0111773

11. Disconnect the exhaust hangers and support the exhaust with wire.

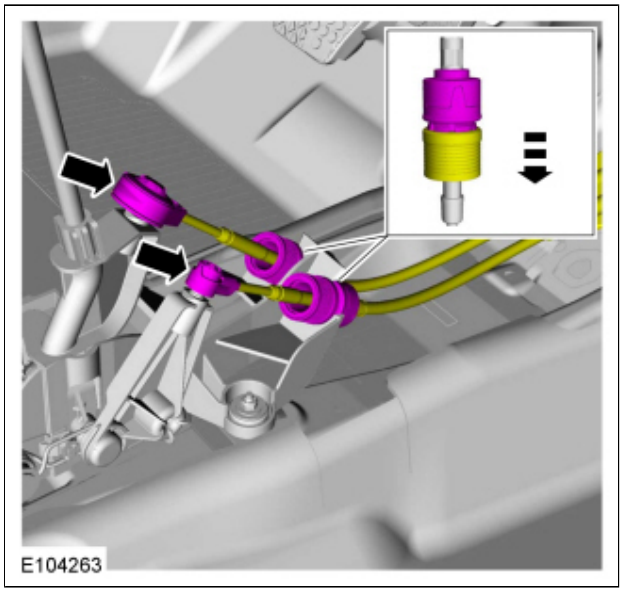




12. Remove the exhaust heat shield.
13. Remove the 2 gearshift cables grommet nuts.

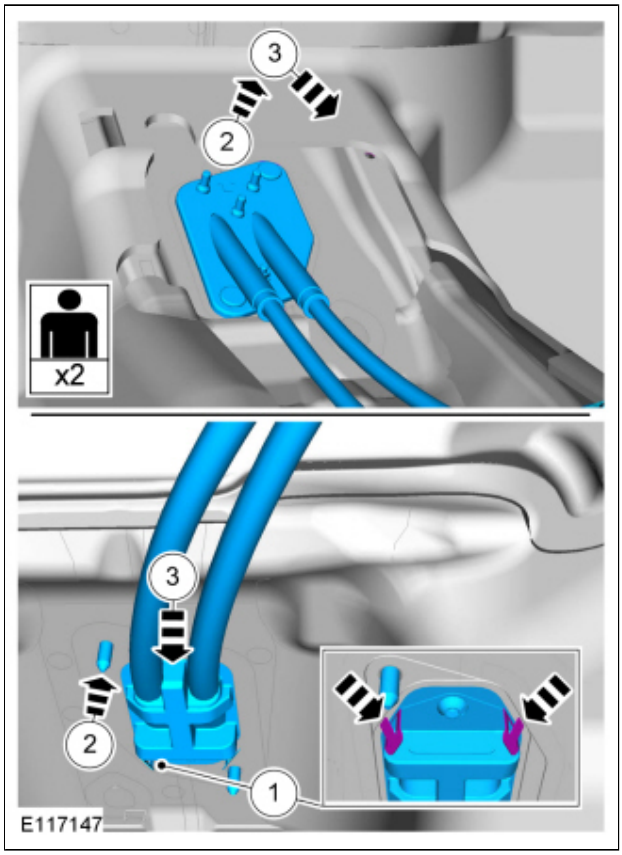


14. Remove the floor console. For additional information, refer to Section 501-12 .
15. Detach the gearshift cables from the gearshift lever.



16. **NOTE:** Heater core and evaporator core housing not shown.

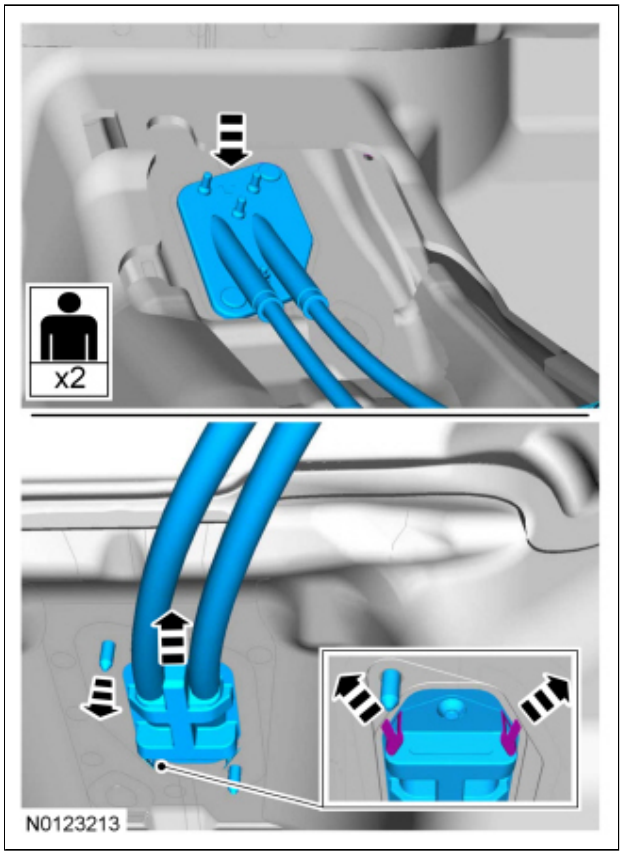
    Remove the gearshift cables.
    1. Release the clips.
    2. Push the studs through the floor pan.
    3. Push the gearshift cables grommet through the floor pan and remove the gearshift cables through to the vehicle interior.



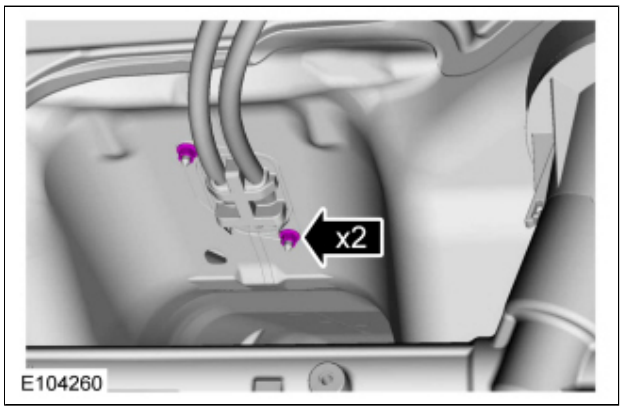
Installation

1. **NOTE:** Heater core and evaporator core housing not shown.

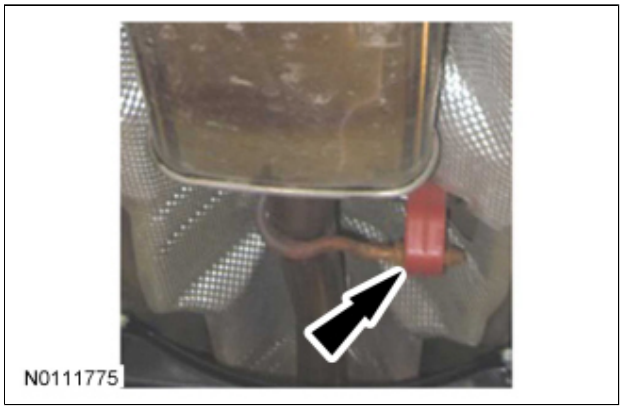
   Position the gearshift cables and gearshift cables grommet in place.

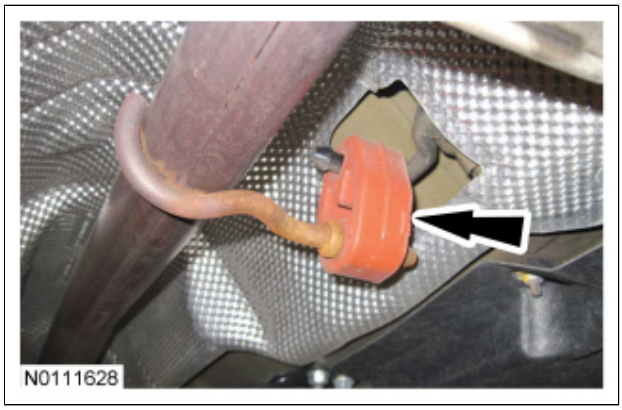


2. Install the 2 gearshift cables grommet nuts.
    - Tighten to 9 Nm (80 lb-in).

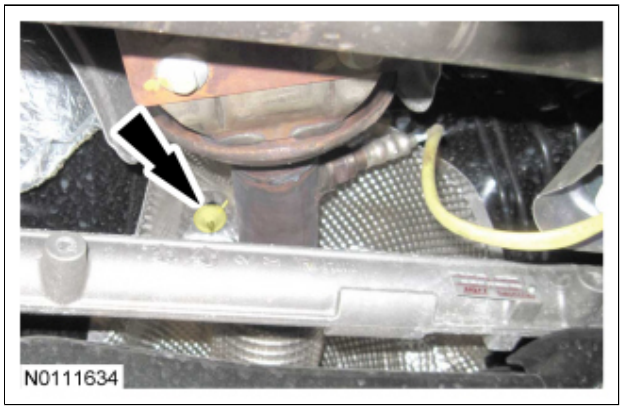


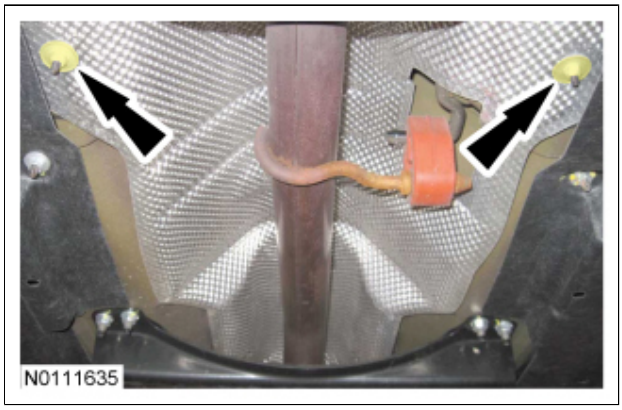
3. Install the exhaust heat shield.
4. Connect the exhaust hangers.

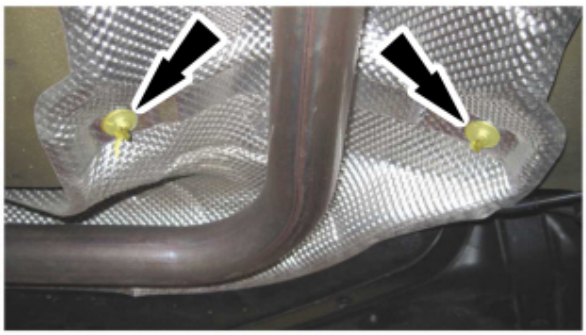




5. Install the 6 exhaust heat shield fasteners (5 shown).

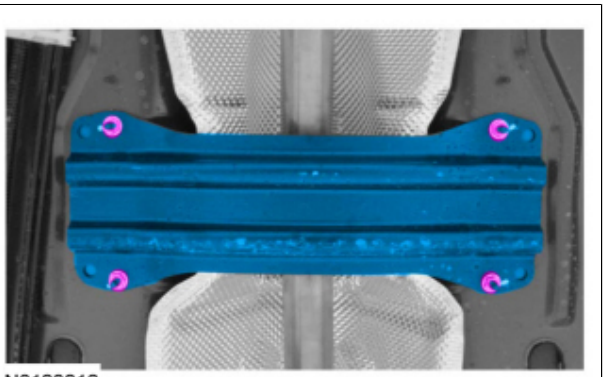






N0111773

6. Install the cross brace and the 4 cross brace nuts.
    - Tighten to 40 Nm (30 lb-ft).

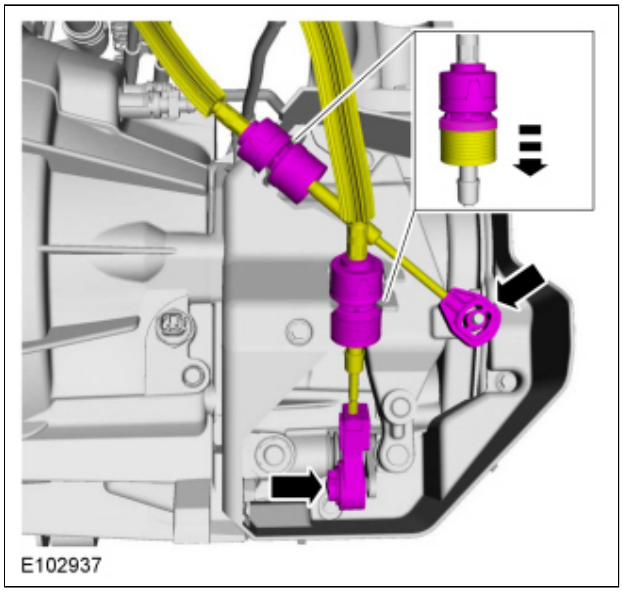


N0123212

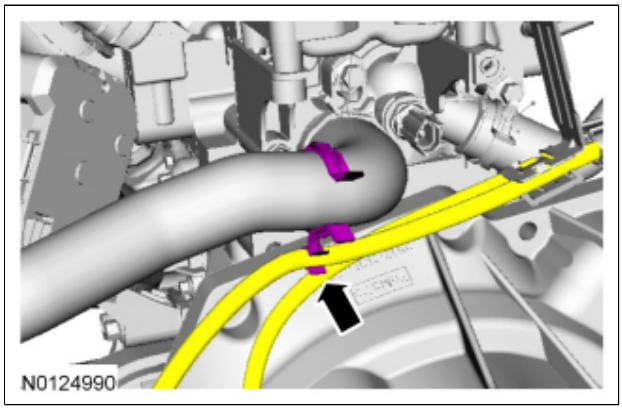
7. Using a new exhaust flange gasket and 2 new exhaust flange nuts, connect the exhaust flange.
    - Tighten to 47 Nm (35 lb-ft).

N0111612

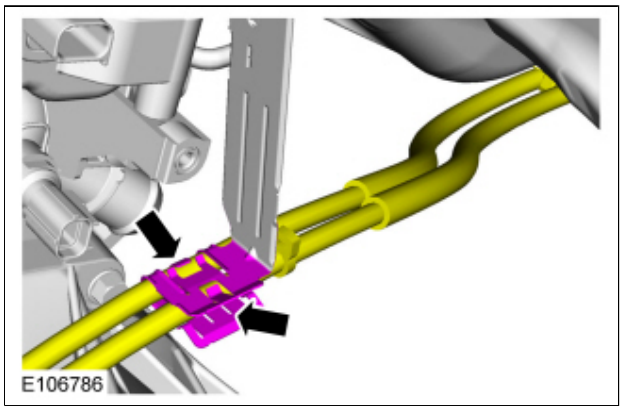
8. Install the gearshift cables.
    - Install the gearshift cables by pulling the lower part of the abutment down and installing the gearshift cables onto the gearshift cables bracket.
    - Push the gearshift cables onto the transaxle shift control levers.



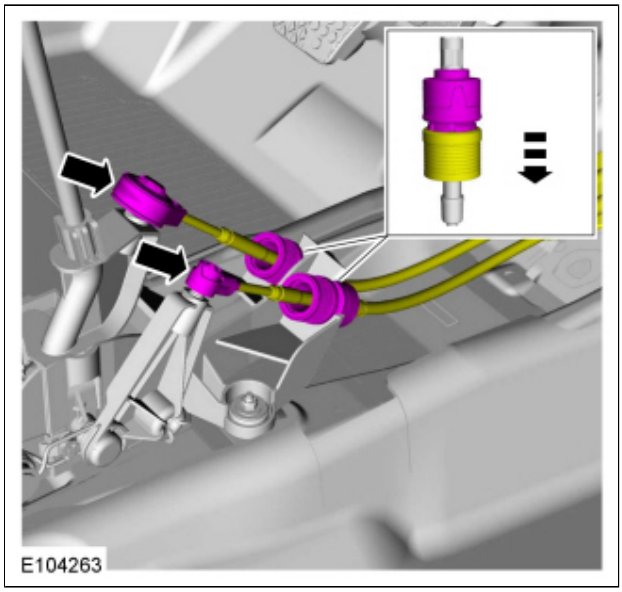
9. Install the gearshift cable on the gearshift cable clip.



10. Install the gearshift cables on the gearshift cables bracket.



11. Attach the gearshift cables to the gearshift lever.



12. Install the floor console. For additional information, refer to Section 501-12 .
13. Install the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12
14. Install the battery tray. For additional information, refer to Section 414-01
15. Adjust the shift and selector cables. For additional information, refer to Section 308-00 .

Torque Specifications

Description	Nm	lb-ft	lb-in
Catalytic converter bracket-to-engine bolts	50	37	—
Catalytic converter manifold studs	17	—	150
Catalytic converter manifold-to-cylinder head bolt and nuts [a]	—	—	—
Catalytic converter-to-catalytic converter bracket bolts	25	18	—
Catalytic converter-to-muffler and tailpipe assembly nuts	48	35	—
Heat shield bolts	10	—	89
RH halfshaft support bracket upper bolt	48	35	—
RH halfshaft support bracket lower bolts	24	18	—
Worm gear clamp	7	—	62

[a] See the procedure for specification.

Exhaust System

The exhaust system consists of:

- a one-piece catalytic converter manifold with exhaust flexible pipe.
- a resonator.
- a muffler and tailpipe assembly with isolators.

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converter, a muffler and tailpipe assembly and resonator. Rubber exhaust hanger isolators attach the exhaust system to the mounting hooks on the body.

Catalytic Converter

The catalytic converter plays a major role in the emission control system by functioning as a gas reactor. The catalytic converter speeds up the heat producing chemical reaction between the components of the exhaust gases to reduce air pollutants. Due to the high temperatures at which the catalytic converter operates, the vehicle body areas around the catalytic converter are protected by heat shields. The catalytic converter controls Hydrocarbon (HC), Carbon Monoxide (CO) and Nitrogen Oxides (NOx) emissions.

Exhaust System

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the components of the exhaust system and related controls that may affect exhaust gas quality or loss of power.
3. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Exhaust pipe pinched or crushed • Damaged muffler • Broken or damaged exhaust hanger brackets • Damaged catalytic converter • Cracked exhaust manifold • Loose or damaged heat shields

4. Verify that the exhaust system is installed correctly, with clamps correctly located and tightened to specification.
5. If the fault is not visually evident, determine the symptom. GO to Symptom Chart - Exhaust System or GO to Symptom Chart - NVH .

Symptom Chart — Exhaust System

Symptom Chart — Exhaust System

Condition	Possible Sources	Action
• Vehicle has low or no power — vehicle performance complaint	• Exhaust pipe pinched or crushed • Damaged catalytic converter • Loose obstruction in exhaust	• INSPECT the exhaust components for damage. REPAIR or INSTALL new components as necessary. TEST the system for normal operation. If the concern is still present, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Restricted exhaust (possible frozen condensate in muffler)	• CHECK drain holes for foreign material. PARK the vehicle inside to thaw. TEST the vehicle for normal operation. If the concern is still present, REFER to the Powertrain

		Control/Emissions Diagnosis (PC/ED) manual.
• Burning smell — usually occurs at idle, with possible traces of smoke	• Foreign material caught in exhaust system • Missing heat shields	• Visually INSPECT the exhaust system for foreign material or missing heat shields. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Odor — described as a sulfur or rotten egg smell	• Catalytic converter • Excessive sulfur content in fuel	• At times, a slight sulfur smell is normal for catalytic converters. The cause is the sulfur content in the gasoline being used. ADVISE the customer no repair is required.
	• Rich fuel conditions • Misfire conditions	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Visible rust on surface of exhaust pipes	• Catalytic converter/exhaust system	• Surface rust is a characteristic of materials used on exhaust systems. Exposure to heat or road salt may result in surface rust. INSPECT for perforations. If there are no perforations, the condition is normal.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Rattle, squeaks or buzz type noise — from the bottom of the vehicle	• Loose or damaged heat shield	• INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and tighten to 7 Nm (62 lb-in). If the heat shields are missing, INSTALL new heat shields or exhaust system components as necessary. If a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged	• VERIFY that the exhaust

	exhaust isolators	isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Damaged exhaust isolator hanger bracket	• INSPECT the exhaust system components for damaged or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets or fasteners. TIGHTEN the bolts to specification or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged catalytic converter or muffler	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler, then the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Drone or clunk type noise — from the bottom of the vehicle	• Loose or damaged exhaust isolators	• INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Whistles, boom, hum or ticking type noise — noise tends to change as the engine warms. The noises are often accompanied by exhaust fumes	• Exhaust system leak	• INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, gaskets, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which indicates exhaust leakage at that point. To magnify a small leak, have an assistant hold a rag over the

		tailpipe outlet while listening for a leak. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Catalytic converter	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust muffler/resonator drain hole enlarged due to corrosion	• CONFIRM the drain holes are the noise source. INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Hissing or rushing noise — high frequency sound. Vehicle performance is unaffected	• Exhaust system. Exhaust flow through pipes	• CHECK the exhaust system for leaks. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
• Pinging noise — occurs when exhaust system is hot, engine turned off	• Catalytic converter/exhaust system	• Cool down pinging is a result of the exhaust system expanding and contracting during heating and cooling. This is a normal condition.
• Vibration — occurs at idle and at low speeds. Also accompanied by a clunk or buzz type noise	• Loose or damaged exhaust isolator	• INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged exhaust isolator hanger brackets	• INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary. TEST the system for normal operation after the repair.

	• Damper broken or out of position	• CHECK for the correct damper orientation in this section. RELOCATE to the correct position and tighten the nuts to specification. INSPECT for missing or damaged damper. INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Exhaust system grounded to chassis	• CARRY OUT the Exhaust System Alignment in this section.
• Engine drumming noise — normally accompanied by vibration	• Damaged or misaligned exhaust system	• INSPECT the exhaust system for loose or damaged fasteners, Torca® clamps, or isolators. CARRY OUT the Exhaust System Alignment in this section.
• Sputter type noise — noise worse when cold, lessens or disappears when the vehicle is at operating temperature	• Damaged or worn exhaust system	• INSPECT the exhaust system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
• Thumping noise — from the bottom of the vehicle, worse during acceleration	• Misaligned exhaust system	• CHECK the exhaust system to chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary. TEST the system for normal operation after the repair.
• Engine vibration — is felt with increases and decreases in engine rpm.	• Strain on exhaust system isolators	• CARRY OUT the Exhaust System Alignment in this section. REPAIR as necessary. TEST the system for normal operation after the repair.
• Drumming noise — occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	• Exhaust system vibration excites the body resonances inducing interior noise	• GO to Pinpoint Test A .

Pinpoint Test

PINPOINT TEST A: DRUMMING NOISE

Test Step	Result / Action to Take

A1 CHECK THE EXHAUST SYSTEM	
• Key in RUN position. • Increase the engine rpm until the noise is the loudest. Note the engine rpm. • Ignition OFF. • Add approximately 9 kg (20 lb) of weight to the exhaust system. First place the weight at the tailpipe and test, then at the front pipe.  DF1768-A • Key in RUN position. • Increase the engine rpm and listen for the drumming noise. Note the engine rpm if the noise occurs. • Ignition OFF. • Remove the weight from the exhaust system. • **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different rpm?**	**Yes** REFER to Exhaust System Alignment in this section. TEST the system for normal operation. **No** CONDUCT a diagnosis on other suspect systems. REFER to Section 100-04 .

Exhaust System Alignment

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen all fasteners joining the exhaust system components.
3. Beginning at the front of the vehicle, align the exhaust system to establish the maximum clearance. Make sure all fit pipes are pushed all the way into the preceding pipe and the notches are correctly lined up with the tabs.
4. Beginning at the front of the vehicle, tighten all fasteners and clamps to specification. For additional information, refer to Specifications in this section.
5. Start the engine and check the exhaust system for leaks.

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

Catalytic Converter

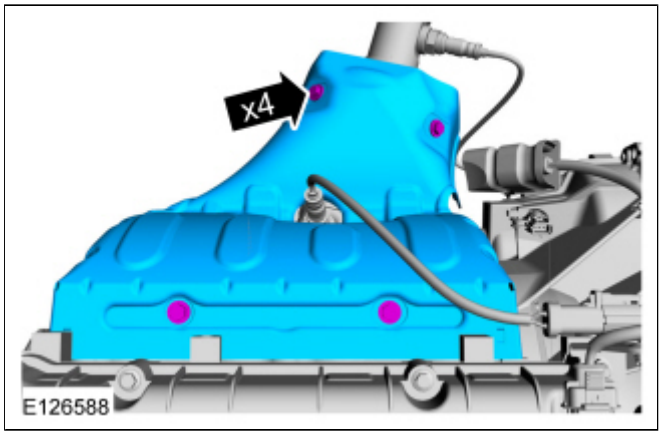
General Equipment

Cable Ties

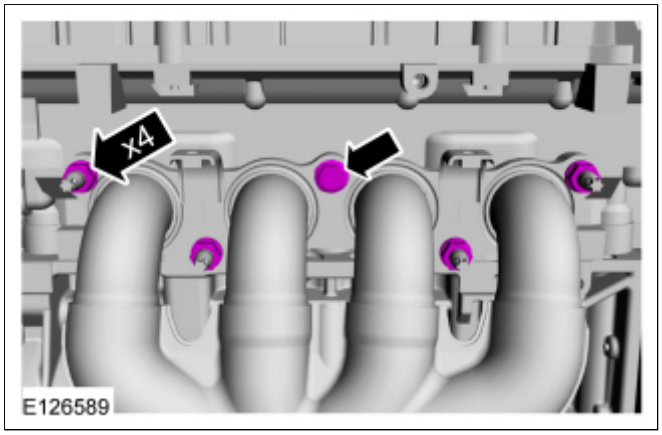
Removal and Installation

NOTE: Exhaust fasteners are of a torque prevailing design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the Heated Oxygen Sensor (HO2S). For additional information, refer to Section 303-14 .
3. Remove the 4 bolts and position aside the heat shield.

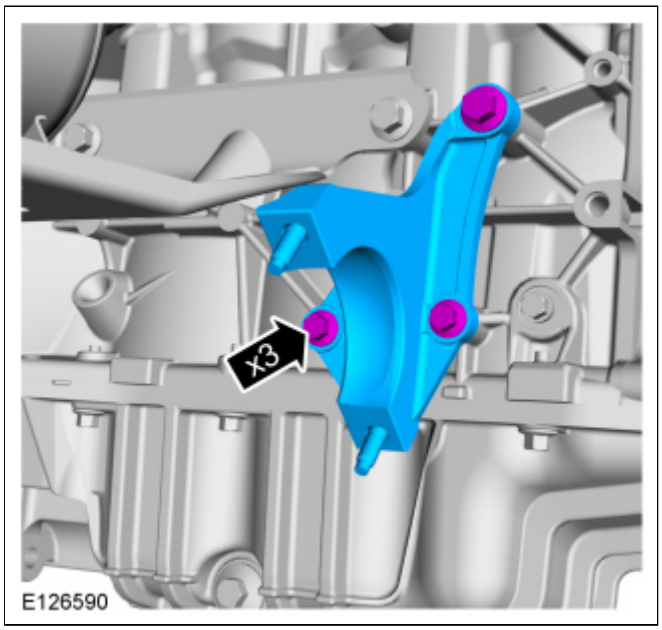


4. Remove and discard the 4 nuts and 1 bolt.

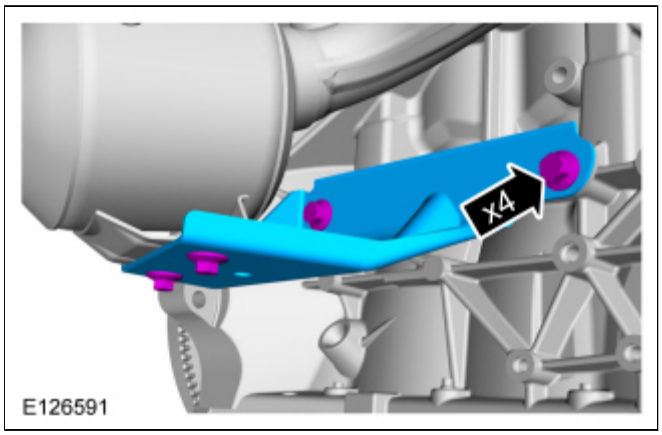


5. Remove the RH halfshaft. For additional information, refer to Front Drive Halfshafts, Halfshaft — Exploded View in Section 205-04 .
6. Remove the Catalyst Monitor Sensor (CMS). For additional information, refer to Section 303-14 .

7. Remove the 3 bolts and the halfshaft support bracket.

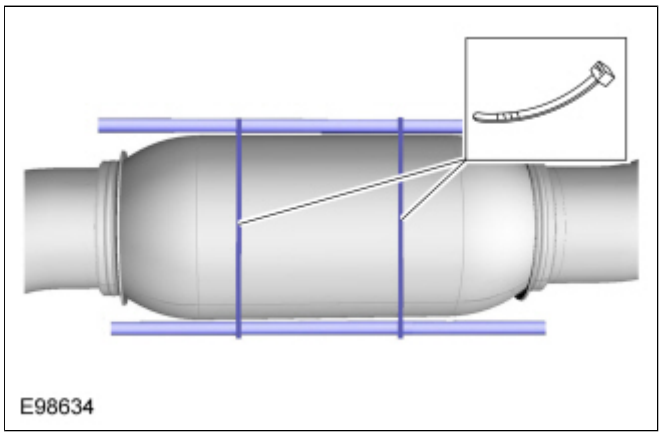


8. Remove the 4 bolts and the catalytic converter bracket.



9. ***NOTICE:*** **Do not forcibly bend or twist the exhaust flexible pipe. Failure to follow these instructions may cause damage to the flexible pipe.**

   Using cable ties, support the exhaust flexible pipe with a support wrap or suitable splint.

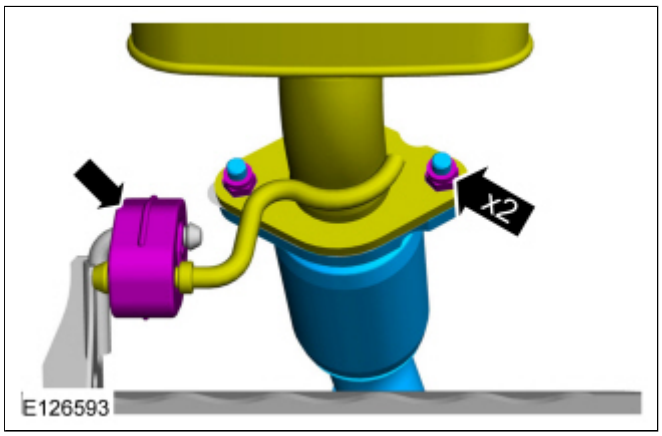


10. ***NOTICE:*** **Do not forcibly bend or twist the exhaust flexible pipe. Failure to follow these**

instructions may cause damage to the flexible pipe.

Detach the muffler and tailpipe assembly isolator and remove the 2 catalytic converter-to-muffler and tailpipe assembly nuts.

- Remove the catalytic converter assembly.
- Discard the 2 nuts and gaskets.

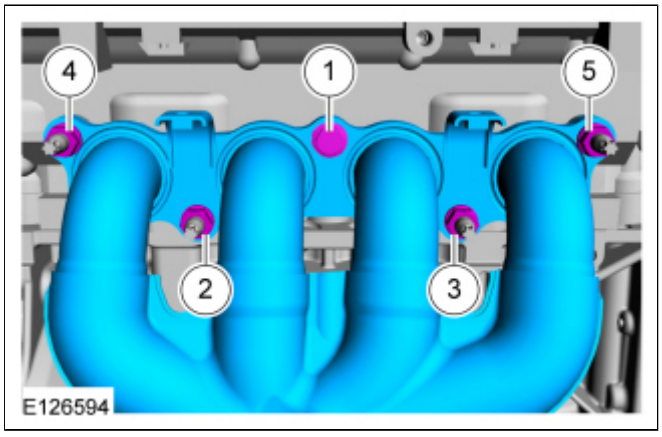


Installation

1. ***NOTICE:*** **Failure to tighten the catalytic converter manifold fasteners in 20 Nm increments until reaching final torque of 55 Nm will cause the converter to develop an exhaust leak.**

   Install a new gasket, catalytic converter assembly and new fasteners. Tighten the bolt and 4 nuts in the sequence shown, in 3 stages.

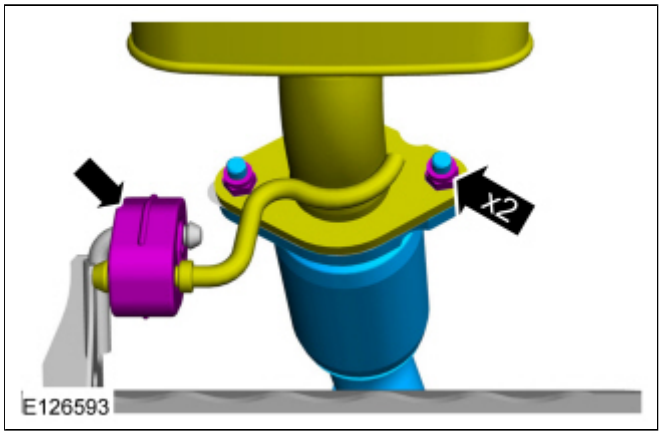
   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten to 40 Nm (30 lb-ft).
   - Stage 3: Tighten to 55 Nm (41 lb-ft).



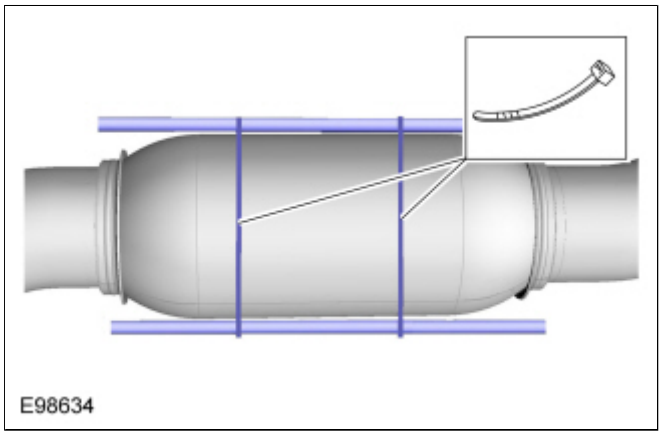
2. ***NOTICE:*** **Do not forcibly bend or twist the exhaust flexible pipe. Failure to follow these instructions may cause damage to the flexible pipe.**

   Install a new gasket and 2 new catalytic converter-to-muffler and tailpipe assembly nuts.

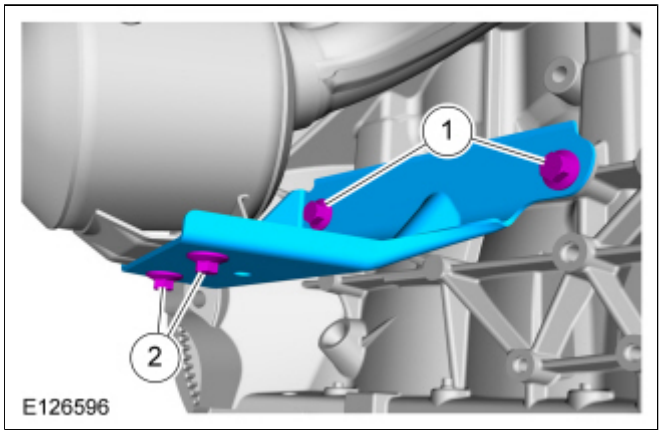
   - Attach the muffler and tailpipe assembly isolator.
   - Tighten to 48 Nm (35 lb-ft).



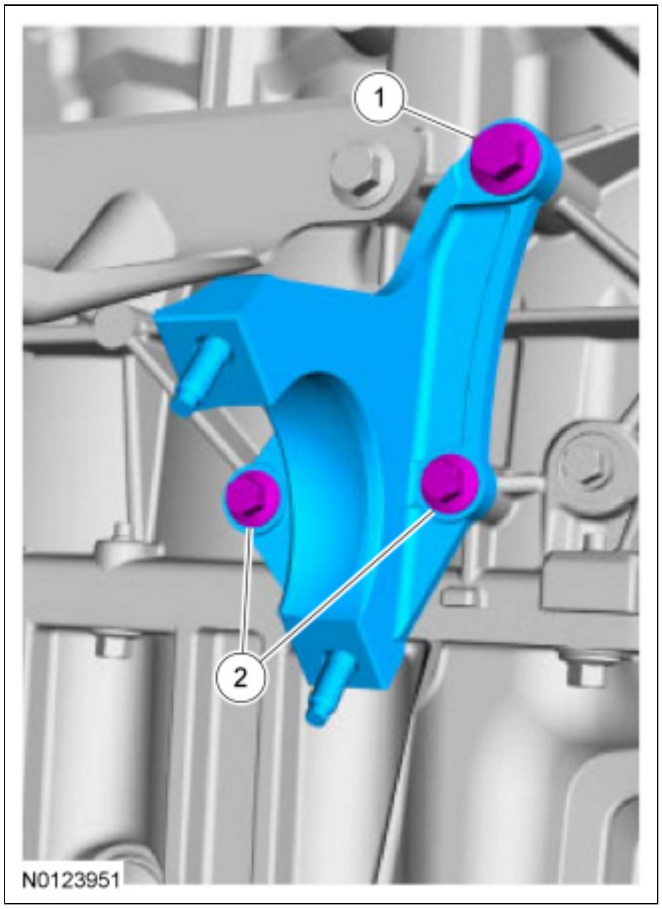
3. Remove the cable ties, support wrap or suitable splint from the exhaust flexible pipe.



4. Install the catalytic converter bracket and the 4 bolts.
    1. Tighten the 2 catalytic converter bracket-to-engine block bolts to 50 Nm (37 lb-ft).
    2. Tighten the 2 catalytic converter bracket-to-catalytic converter bolts to 25 Nm (18 lb-ft).



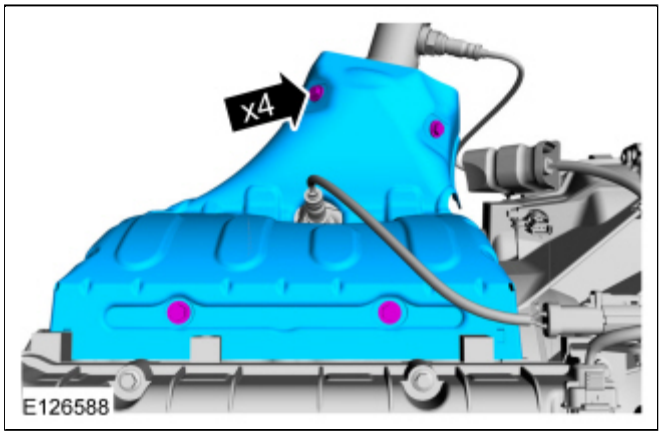
5. Install the halfshaft support bracket and the 3 bolts.
    1. Tighten the upper bolt to 48 Nm (35 lb-ft).
    2. Tighten the 2 lower bolts to 24 Nm (18 lb-ft).



6. Install the RH halfshaft. For additional information, refer to Front Drive Halfshafts, Halfshaft — Exploded View in Section 205-04 .

7. Install the Catalyst Monitor Sensor (CMS). For additional information, refer to Section 303-14 .

8. Install the 4 bolts and the heat shield.
   - Tighten to 10 Nm (89 lb-in).



9. Install the Heated Oxygen Sensor (HO2S). For additional information, refer to Section 303-14 .

10. Fill the transmission/transaxle to the correct fluid level. For Automatic Transmission/Transaxle, refer to Transmission Fluid Level Check in Section 307-11 . For Manual Transmission/Transaxle, refer to Transaxle Draining and Refilling in Section 308-03 .

Muffler and Tailpipe

General Equipment

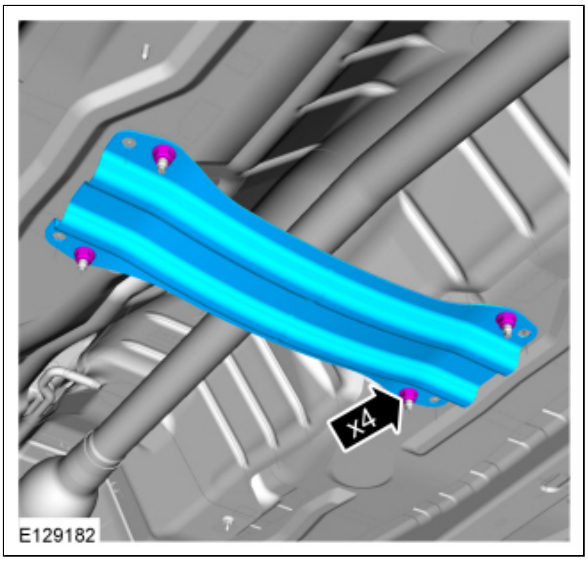
Air Body Saw
Cable Ties

Removal and Installation

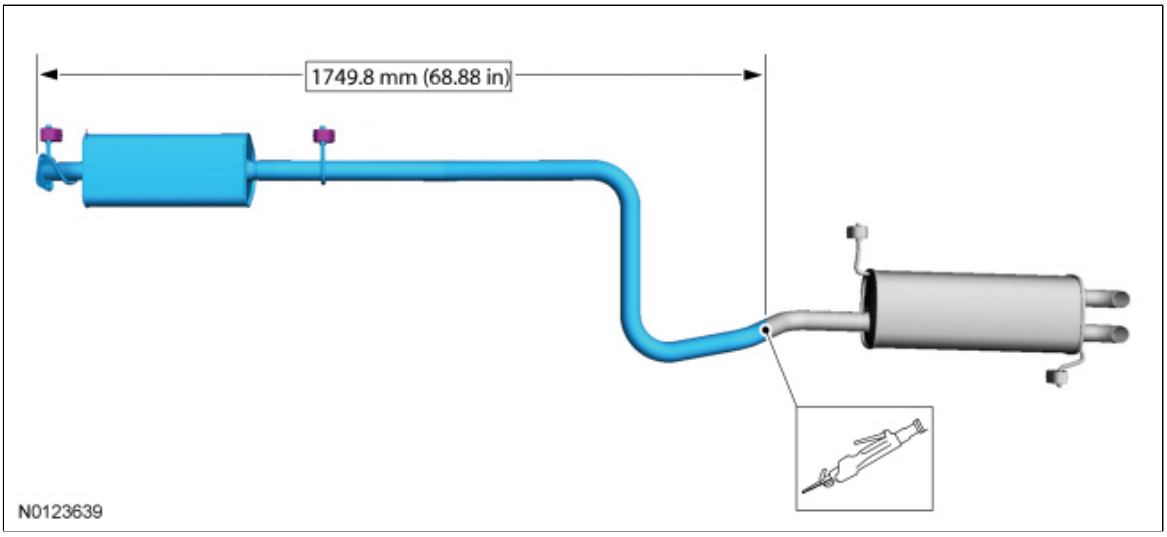
NOTE: Exhaust fasteners are of a torque prevailing design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

NOTE: Check the exhaust hanger isolators for damage and fatigue. Install new exhaust hanger isolators as required.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the 4 nuts and the brace.

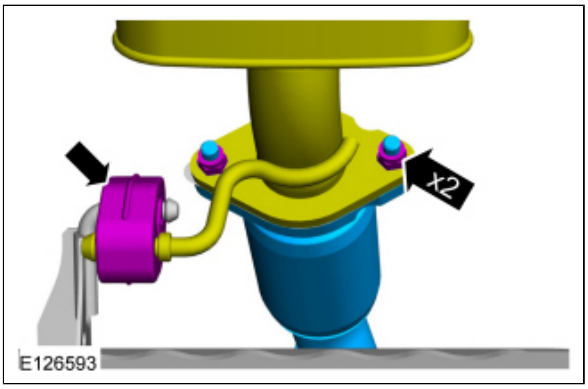


3. Cut the pipe where shown.



4. ***NOTICE:*** **Do not forcibly bend or twist the exhaust flexible pipe. Failure to follow these instructions may cause damage to the flexible pipe.**

   Detach the front muffler and tailpipe assembly isolators and remove the 2 catalytic converter-to-muffler and tailpipe assembly nuts.
   - Remove the front muffler and tailpipe section.
   - Discard the 2 nuts and gasket.



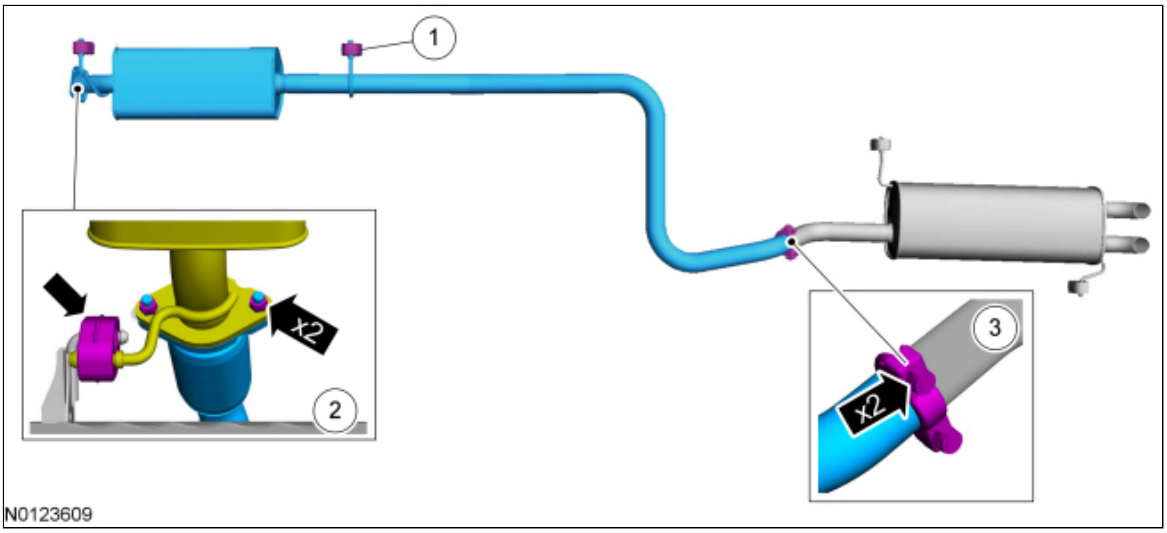
5. Detach the 2 isolators and remove the rear muffler and tailpipe section.

Installation

1. Install the rear muffler and tailpipe section and attach the 2 isolators.

2. **NOTE:** If the rear muffler and tailpipe section is being serviced, the rear muffler service part is sized to overlap the front muffler and tailpipe section (shown). If the front muffler and tailpipe section is being serviced, install the service sleeve and clamp.

   Install the front muffler and tailpipe section.
   1. Attach the front muffler and tailpipe assembly isolator.
   2. Install a new gasket and 2 new catalytic converter-to-muffler and tailpipe assembly nuts.
      - Attach the front muffler and tailpipe assembly isolator.
      - Tighten to 48 Nm (35 lb-ft).
   3. Install the service clamp.
      - Tighten to 45 Nm (33 lb-ft).



3. Install the 4 nuts and the brace.
   - Tighten to 40 Nm (30 lb-ft).

Item	Specification	Fill Capacity
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	—

General Specifications

Item	Specification
Fuel Pressure	
Key ON Engine Running (KOER)	379 kPa (55 psi)
Fuel Tank Capacity	
Fuel tank capacity	47 L (12.5 gal)

Fuel System

The fuel system consists of:

- a Multi-Port Fuel Injection (MFI) system.
- a 2-speed Mechanical Returnless Fuel System (MRFS).
- Easy Fuel TM (capless) fuel tank filler pipe assembly.
- a fuel tank filler pipe containing:
  - a recirculation tube.
  - a fresh air hose.
  - a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- a fuel tank.
- a Fuel Pump (FP) module containing:
  - an electric FP , which provides pressurized fuel to the fuel rail.
  - a lifetime fuel filter serviced as part of the FP module.
  - a serviceable fuel level sender.
  - a check valve, which maintains system pressure after the FP is shut off.
  - a pressure relief valve for overpressure protection in the event of restricted fuel flow.
- fuel, vapor and brake tubes in an integrated bundle assembly attached to the underside of the vehicle by retaining clips.
- a fuel rail.
- fuel injectors.
- fuel pump control module.

The fuel tank filler pipe cannot be modified in any way.

The vehicle is equipped with electronic Multi-Port Fuel Injection (MFI) that is supplied by a 2-speed Mechanical Returnless Fuel System (MRFS) . The PCM is able to maintain constant fuel pressure by varying the FP output. This is accomplished by increasing or decreasing voltage supplied by the fuel pump control module to the FP based on the duty cycle request from the PCM. The returnless fuel system offers improved economy, lower fuel temperatures and decreased fuel vapor in the fuel tank.

Fuel Pump (FP) Shut-off Feature

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump (FP) shut-off feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the Restraints Control Module (RCM) to the FP control module. Signal communication between the RCM and the FP control module allows the PCM to shut-off the FP .

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition switch to the OFF position and then turn the ignition switch to the ON position. In some instances the vehicle may not start the first time and may take one additional key cycle.

Fuel System

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The following procedure diagnoses a slow to fill concern only. For all other concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

The fuel tank filler pipe assembly is used to refuel the vehicle. The fuel tank inlet check valve prevents spitback of fuel during and after refueling. The fuel tank stores the fuel. The fuel tank contains a Fuel Pump (FP) module. The FP module consists of a fuel level sender and a FP . The fuel level sender sends a signal to the fuel gauge informing the driver of how much fuel is in the fuel tank. The FP provides fuel to the fuel tubes, which supply the fuel rail.

During refueling, the fuel tank vents to the atmosphere through the vent and filler pipes, on vehicles without On-Board Refueling Vapor Recovery (ORVR) systems. In vehicles equipped with ORVR , the fuel tank and filler pipe are designed so that when the vehicle is being refueled, fuel vapors in the fuel tank travel to the Evaporative Emission (EVAP) canister, which absorbs the fuel vapors and vents the pressure from the fuel tank during refueling.

Inspection and Verification

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Verify the customer's concern by refueling the vehicle and observe the fuel fill rate.

2. Inspect to determine if any of the following mechanical concerns apply.

Visual Inspection Chart

Mechanical
• Bent, kinked or damaged fuel tank filler pipe • Bent, kinked or damaged fuel tank filler pipe fresh air hose or recirculation tube (if equipped) • Incorrect routing of the fuel tank filler pipe • Incorrect routing of the fuel tank filler pipe fresh air hose or recirculation tube (if equipped) • Incorrect position of fuel tank filler pipe clamps • Incorrect position of fuel tank filler pipe fresh air hose or recirculation tube clamps (if equipped) • Fuel tank mounted vapor tubes bent or damaged • Evaporative Emission (EVAP) system tubes or hoses bent or damaged • Accident damage to the fuel tank • Accident damage to the vehicle effecting the fuel tank filler pipe-to-body connection • Unauthorized modifications and/or alterations to the vehicle • EVAP fresh air hose or recirculation tube plugged (dirt, spider webbing)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory DTCs.

8. Clear the continuous memory DTCs and carry out the self-test diagnostics for the EVAP system.

9. If the DTCs retrieved are related to the concern, go to Evaporative Emission (EVAP) System DTC Chart. For PCM related DTCs, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Evaporative Emission (EVAP) System DTC Chart

DTC	Description	Action
P0446	Evaporative Emission System Vent Control Circuit	GO to Pinpoint Test A.
P0451	Evaporative Emission System Pressure Sensor/Switch Range/Performance	GO to Pinpoint Test A.
P0452	Evaporative Emission System Pressure Sensor/Switch Low	GO to Pinpoint Test A.
P0453	Evaporative Emission System Pressure Sensor/Switch High	GO to Pinpoint Test A.
P0454	Evaporative Emission System Pressure Sensor/Switch Intermittent	GO to Pinpoint Test A.
P1450	Unable to Bleed up Fuel Tank Vacuum	GO to Pinpoint Test A.
P1451	Evaporative Emission System Vent Control Circuit	GO to Pinpoint Test A.
P260F	Emission System Monitoring Processor Performance	GO to Pinpoint Test A.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Slow to fill	• Fuel tank filler pipe • Fuel tank filler pipe fresh air hose or recirculation tube, if equipped • Evaporative Emission (EVAP) system • Fuel tank inlet check valve (part of the fuel tank) • Fuel level vent valve (part of the fuel tank)	• GO to Pinpoint Test A.
• All other fuel system concerns	• Fuel system components	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Pinpoint Test

Pinpoint Test A: Slow to Fill

Normal Operation

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank, air is vented through the filler pipe or the On-Board Refueling Vapor

Recovery (ORVR) system.

This pinpoint test is intended to diagnose the following:

- Fuel tank filler pipe fresh air hose or recirculation tube, if equipped
- Fuel tank filler pipe
- Evaporative Emission (EVAP) system
- Fuel tank inlet check valve (part of the fuel tank)
- Fuel level vent valve (part of the fuel tank)

PINPOINT TEST A: SLOW TO FILL

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION • Carry out inspection and verification. • **Was the cause of the concern found?**	**Yes** REPAIR or INSTALL new components to correct the concern. **No** GO to A2.
A2 CHECK THE SYSTEM FOR ANY EVAP DTCs • Connect the scan tool. • Check the system for any of the following EVAP DTCs: P0446, P0451, P0452, P0453, P0454, P1450, P1451 and P260F. • **Are any of these DTCs present?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnosis the EVAP system. **No** GO to A3.
A3 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION • Remove the fuel tank filler pipe assembly. Refer to Section 310-01. • Inspect the fuel tank filler pipe and fuel tank filler pipe fresh air hose or recirculation tube (if equipped) for a blockage or restriction. • **Is the fuel tank filler pipe or fuel tank filler pipe fresh air hose or recirculation tube (if equipped) blocked or restricted?**	**Yes** If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe. REFER to Section 310-01. **No** GO to A4.
A4 CHECK THE FUEL TANK INLET CHECK VALVE • Inspect the fuel tank inlet check valve for restriction or sticking. • **Is the fuel tank inlet check valve restricted or sticking?**	**Yes** If possible, REPAIR the restriction. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to Section 310-01. **No** INSTALL a new fuel tank. REFER to Section 310-01.

Fuel System Pressure Release

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

1. **NOTE:** The Fuel Pump (FP) module fuse is located in the Battery Junction Box (BJB), location F8.

   Remove the FP module fuse.

2. **NOTE:** The engine will crank and not start.

   Crank the engine for approximately 20 seconds.

3. Crank the engine an additional 20 seconds to make sure the fuel system pressure has been released.

4. Turn the ignition switch to the OFF position.

5. When fuel system service is complete, install the FP module fuse.

6. **NOTE:** It may take more than one key cycle to pressurize the fuel system. Cycle the ignition key and wait 3 seconds to pressurize the fuel system.

   Check for leaks prior to starting the engine.

7. Start the vehicle and check the fuel system for leaks.

Fuel System Pressure Test

Special Tool(s)

ST3038-A	Fuel Pressure Test Kit 310-D009 or equivalent
ST3283-A	Fuel Pressure T-Adapter 5/16" 310-D251 or equivalent

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

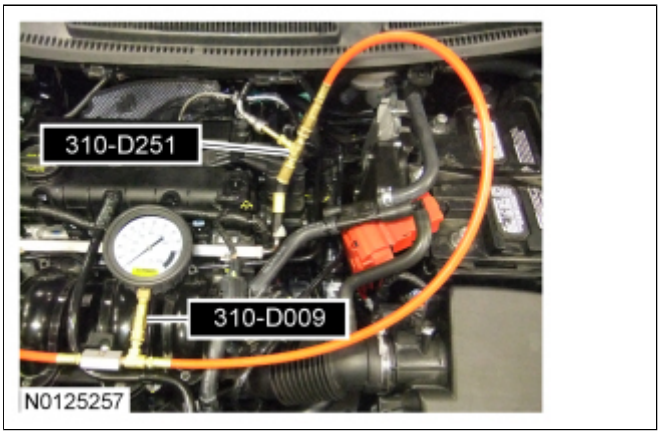
WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the fuel supply tube-to-fuel rail spring lock coupling. For additional information, refer to Spring Lock Couplings in this section.
4. Install the Fuel Pressure T-Adapter 5/16" and Fuel Pressure Test Kit in line between the fuel

supply line and fuel rail.



5. **NOTE:** The Fuel Pump (FP) module fuse was removed previously in the Fuel System Pressure Release.

   Install the FP module fuse.

6. Connect the battery ground cable. For additional information, refer to Section 414-01 .

7. **NOTE:** Carry out a Key ON Engine OFF (KOEO) visual inspection for fuel leaks prior to completing the Fuel System Pressure Test.

   NOTE: After completion of the fuel system pressure test, open the drain valve on the Fuel Pressure Test Kit and release any residual fuel into a suitable container prior to removing the Fuel Pressure Test Kit.

   Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to Specifications in this section.

Fuel Tank Draining

Special Tool(s)

ST1134A	Fuel Storage Tanker 164-R3202 or equivalent

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

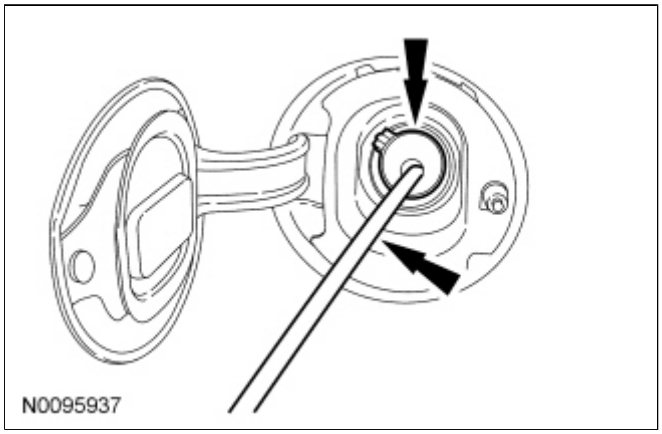
WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

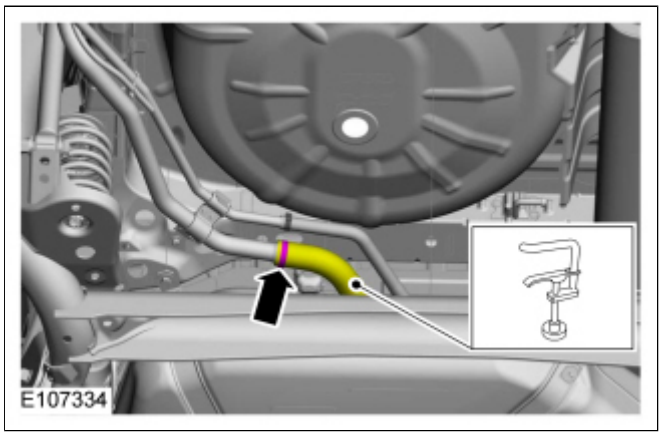
   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe.



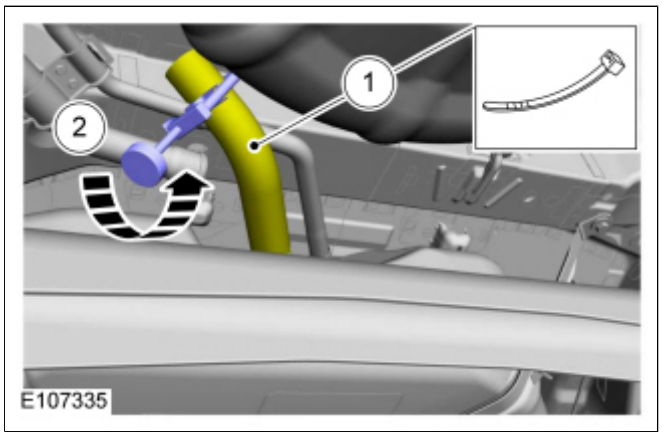
3. Attach the Fuel Storage Tanker to the fuel drain tube and drain as much fuel as possible from the Easy Fuel ^{TM} (capless) fuel tank filler pipe, lowering the fuel level below the fuel tank inlet spout.

4. **NOTE:** Some residual fuel may remain in the fuel tank filler pipe. Carefully drain into a suitable container.

   Release the clamp and position the fuel tank filler pipe hose aside.
   - To install, tighten to 4 Nm (35 lb-in).



5. Secure the fuel tank filler pipe hose above the fuel level.



6. Insert the fuel drain tube into the fuel tank filler pipe hose, attach the Fuel Storage Tanker and drain as much fuel as possible from the fuel tank.

Spring Lock Couplings

Special Tool(s)

ST2590-A	Disconnect Tool, Spring Lock Coupling 310-040 or equivalent

Disconnect

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

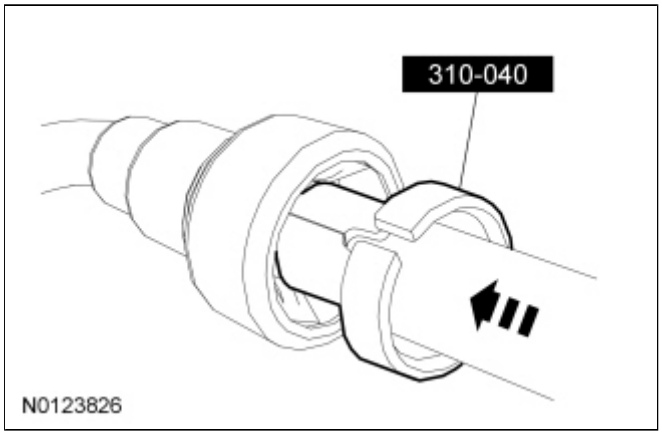
WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

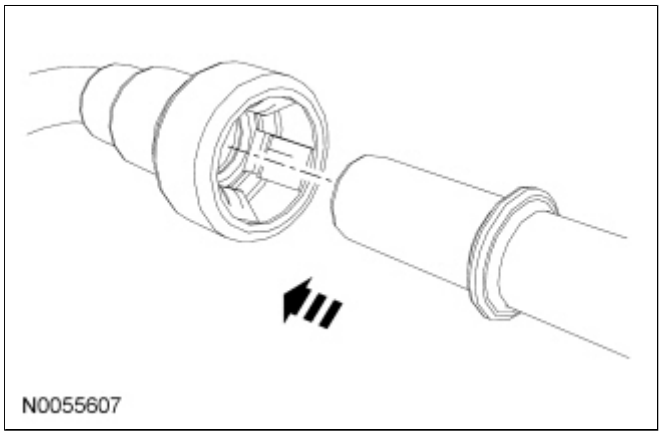
***NOTICE:* When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur.**

***NOTICE:* Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Install the Spring Lock Coupling Disconnect Tool on the tube and push into the spring lock coupling to release.

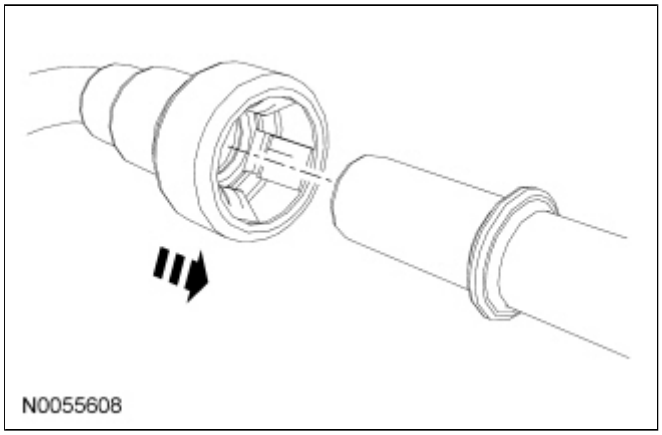


4. Separate the spring lock coupling from the tube.



Connect

1. Align and push the spring lock coupling onto the tube until a click is heard.



2. Pull on the coupling to make sure it is fully engaged.
3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Quick Connect Coupling

Disconnect — Type I

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

***NOTICE:* When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur.**

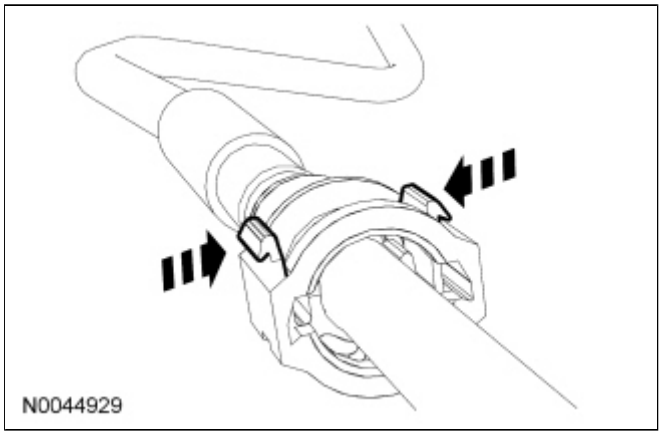
***NOTICE:* Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

***NOTICE:* Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

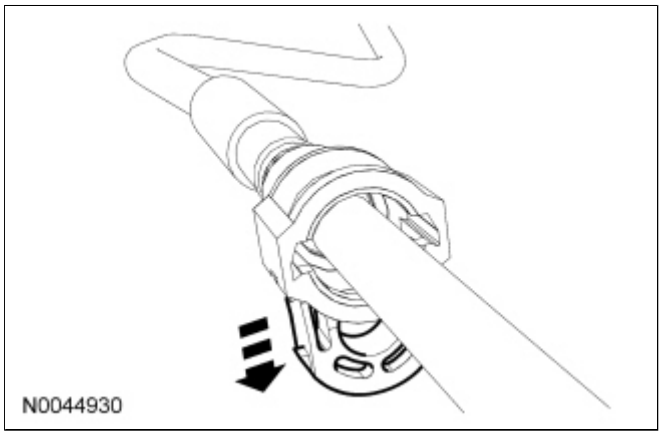
1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01.

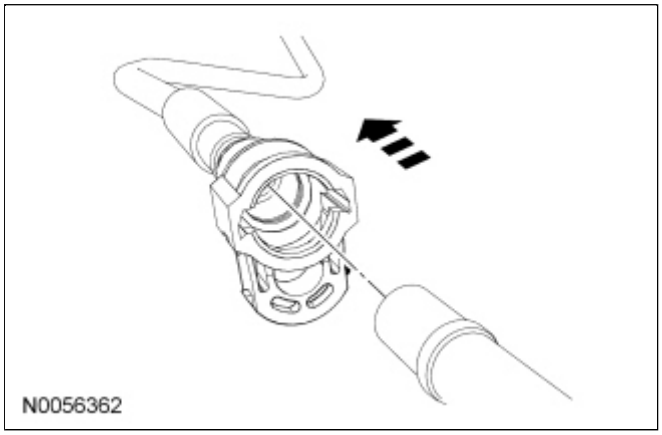
3. Squeeze the quick connect coupling retainer clip tabs to release the locking mechanism.



4. Push the locking mechanism outward to release the tube.

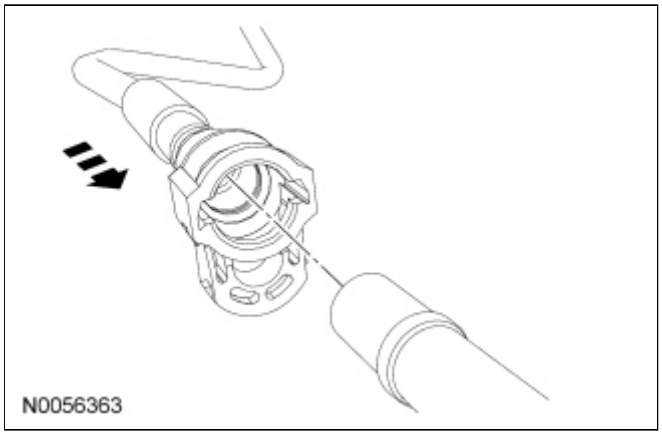


5. Remove the quick connect coupling from the tube.

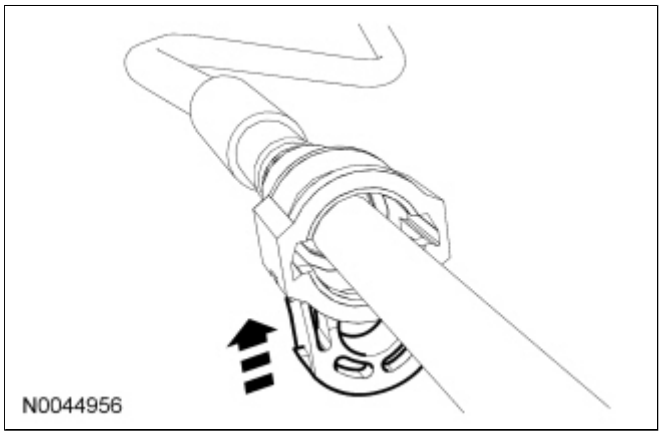


Connect — Type I

1. Install the quick connect coupling onto the tube.

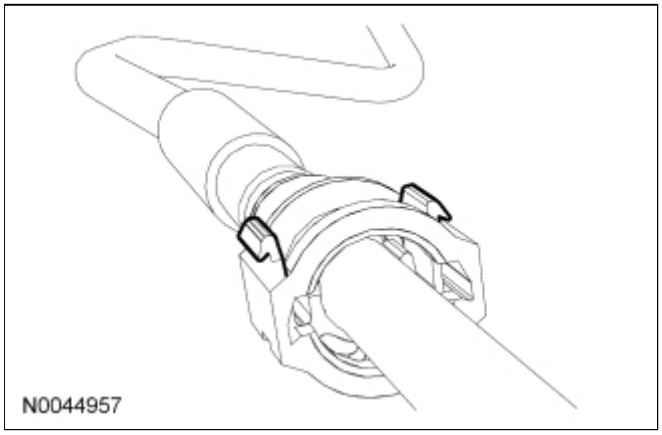


2. Depress the quick connect coupling locking mechanism into the locked position.



3. **NOTE:** Make sure the coupling is completely seated and locked onto the tube by pulling on the quick connect coupling.

   Visually inspect and verify that the locking mechanism is flush with the quick connect coupling housing and that the tabs are locked in place.



4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect — Type II

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

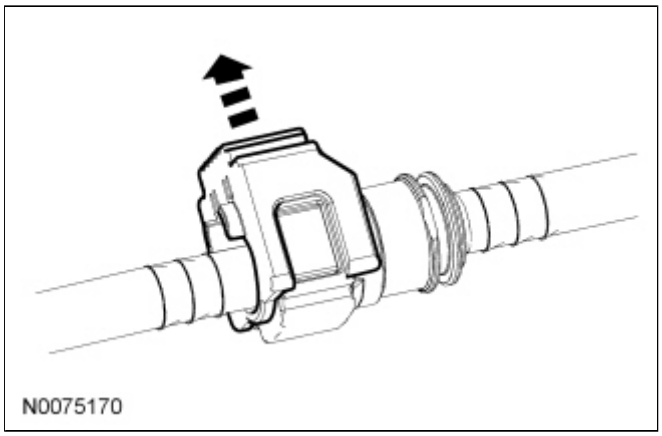
WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur.**

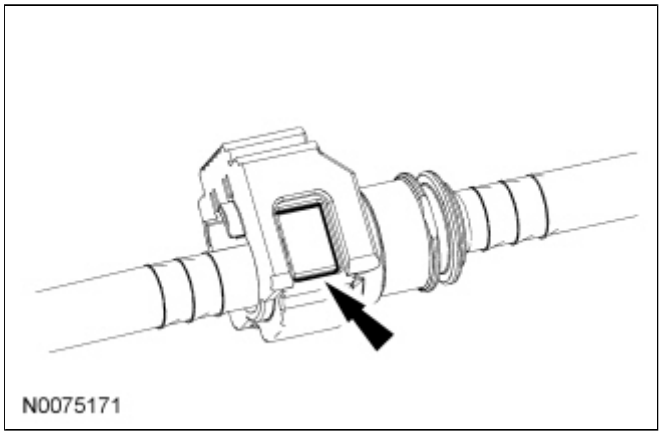
NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

NOTICE: **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

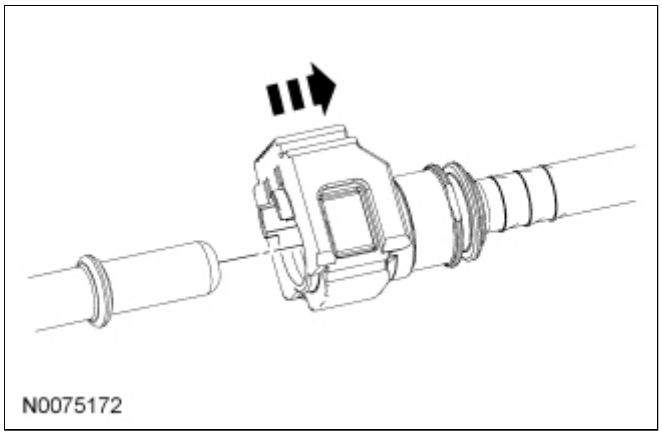
1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Position the secondary latch outward.



4. Squeeze both of the release tabs.

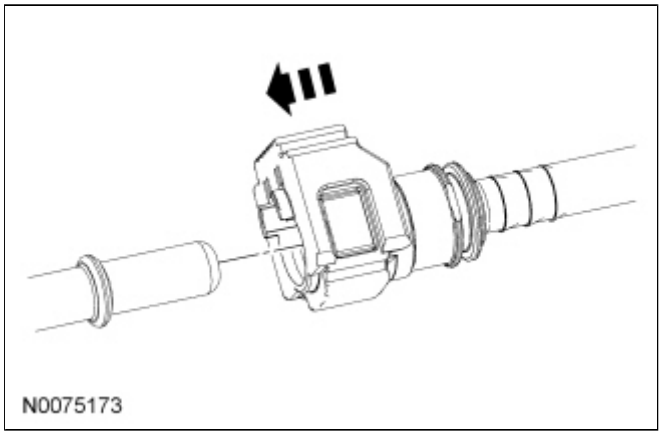


5. Remove the quick connect coupling from the tube.



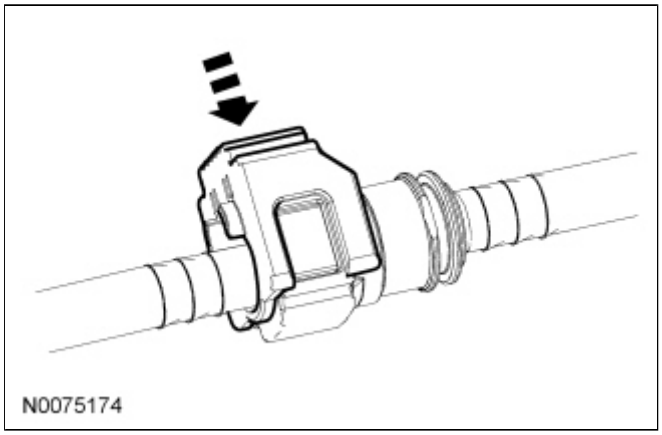
Connect — Type II

1. Install the quick connect coupling onto the tube until completely seated.



2. **NOTE:** Make sure the coupling is completely seated and locked onto the tube by pulling on the quick connect coupling.

   Apply the secondary latch into the locked position.



3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Material

Item	Specification	Fill Capacity
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A	—

General Specifications

Item	Specification
Fuel tank capacity	47 L (12.5 gal)

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake tube fittings	17	—	150
Fuel tank filler pipe bracket bolt	11	—	97
Fuel tank filler pipe hose clamp	4	—	35
Fuel tank strap bolt	25	18	—

Fuel Tank and Lines

The fuel system consists of:

- a Multi-Port Fuel Injection (MFI) system.
- a 2-speed Mechanical Returnless Fuel System (MRFS).
- Easy Fuel TM (capless) fuel tank filler pipe assembly.
- a fuel tank filler pipe containing:
  - a recirculation tube.
  - a fresh air hose.
  - a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- a fuel tank.
- a Fuel Pump (FP) module containing:
  - an electric FP , which provides pressurized fuel to the fuel rail.
  - a lifetime fuel filter serviced as part of the FP module.
  - a serviceable fuel level sender.
  - a check valve, which maintains system pressure after the FP is shut off.
  - a pressure relief valve for overpressure protection in the event of restricted fuel flow.
- fuel, vapor and brake tubes in an integrated bundle assembly attached to the underside of the vehicle by retaining clips.
- a fuel rail.
- fuel injectors.
- fuel pump control module.

The fuel tank filler pipe cannot be modified in any way.

The vehicle is equipped with electronic Multi-Port Fuel Injection (MFI) that is supplied by a 2-speed Mechanical Returnless Fuel System (MRFS) . The PCM is able to maintain constant fuel pressure by varying the FP output. This is accomplished by increasing or decreasing voltage supplied by the fuel pump control module to the FP based on the duty cycle request from the PCM. The returnless fuel system offers improved economy, lower fuel temperatures and decreased fuel vapor in the fuel tank.

Fuel Pump (FP) Shut-off Feature

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump (FP) shut-off feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the Restraints Control Module (RCM) to the FP control module. Signal communication between the RCM and the FP control module allows the PCM to shut-off the FP .

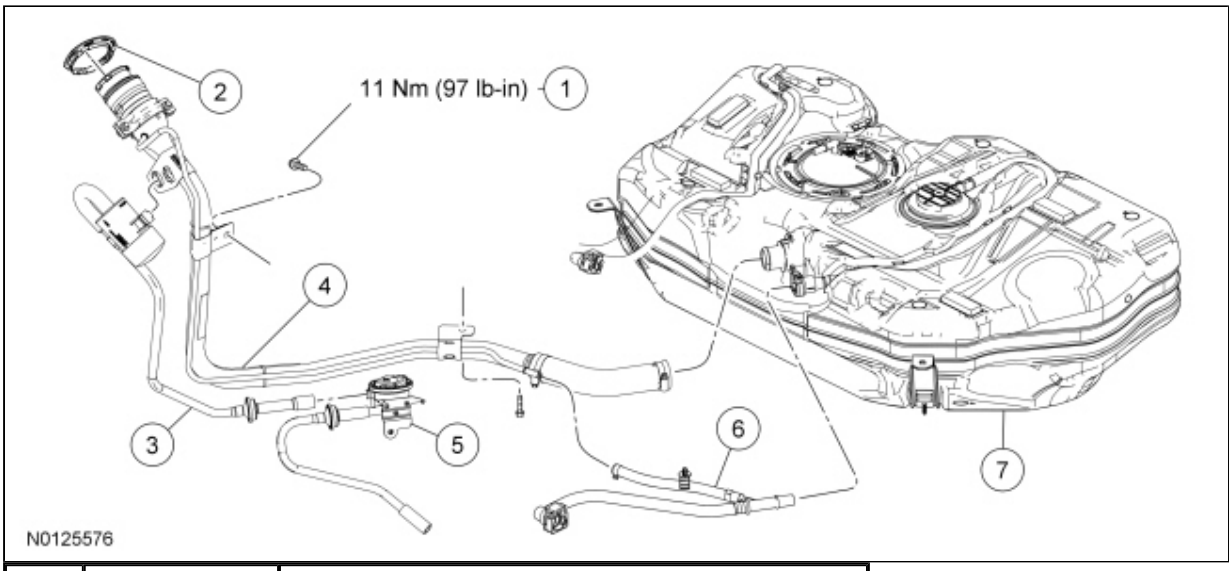
Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition switch to the OFF position and then turn the ignition switch to the ON position. In some instances the vehicle may not start the first time and may take one additional key cycle.

Fuel Tank and Lines

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Fuel Tank and Filler Pipe — Exploded View

Fuel Tank Filler Pipe Assembly



Item	Part Number	Description
1	W700228	Fuel tank filler pipe bracket bolt (2 required)
2	9K072	Fuel tank filler pipe information bezel
3	—	Fresh air hose (part of 9J279)
4	9034	Fuel tank filler pipe
5	9J279	Natural vacuum leak detection valve

Fuel Tank

Special Tool(s)

ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

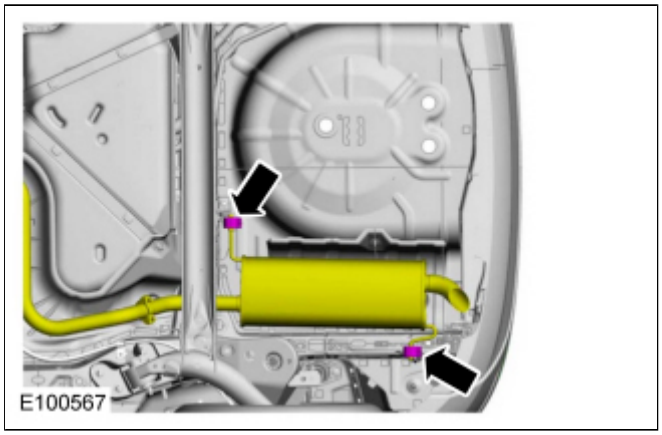
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

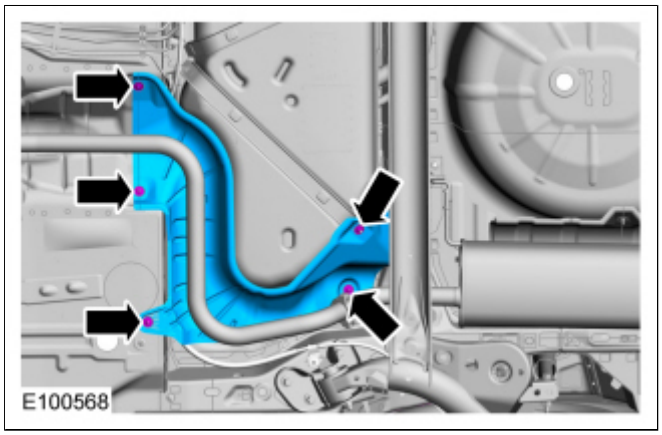
WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Drain the fuel tank. For additional information, refer to Section 310-00 .
5. Disconnect the muffler and tailpipe assembly from the insulators.



6. Remove the 5 nuts and fuel tank heat shield.



7. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to Section 310-00 .

8. Loosen the hose clamp and disconnect the fuel tank filler pipe from the fuel tank.

9. Position the Powertrain Lift under the fuel tank.

10. **NOTE:** Some residual fuel may remain in the fuel tank filler pipe after draining the fuel tank. Carefully drain any residual fuel into a suitable container.

    Release the clamp and disconnect the fuel tank filler pipe from the fuel tank.
    - To install, tighten clamp to 4Nm (35 lb-in).

11. Position the Powertrain Lift under the fuel tank.

12. Remove the 3 fuel tank strap bolts.
    - To install, tighten to 25 Nm (18 lb-ft).

13. Partially lower the fuel tank for access.

14. Disconnect the fuel supply tube-to-Fuel Pump (FP) module quick connect coupling. For additional information, refer to Section 310-00 .

15. Disconnect the FP module electrical connector.

16. Lower the fuel tank.

17. To install, reverse the removal procedure.

Fuel Tank Filler Pipe

Special Tool(s)

ST1134A	Fuel Storage Tanker 164-R3202 or equivalent

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

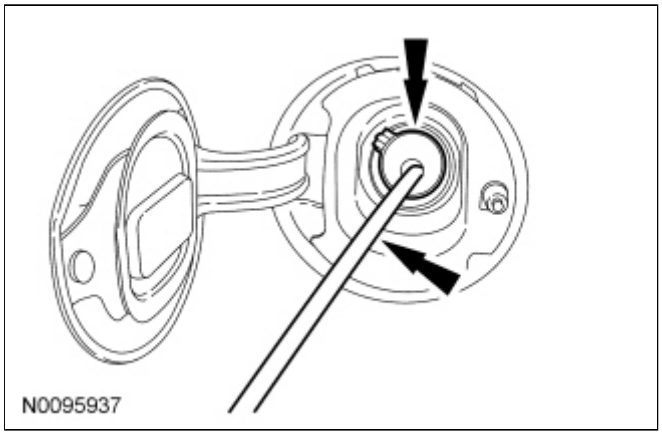
WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe.



4. **NOTE:** If the fuel tank is completely full, this step will lower the fuel level to the fuel tank Inlet.

   Attach the Fuel Storage Tanker to the fuel drain tube and drain the fuel from the fuel tank filler pipe.

5. Remove the information bezel.

6. Remove the LR wheel and tire. For additional information, refer to Section 204-04 .

7. Remove the 3 retainers, 2 pin-type retainers and position LR splash shield aside.

8. Release the fresh air hose from the fuel tank filler pipe bracket and disconnect the fresh air hose retainer from the fuel tank filler pipe.

9. Disconnect the fuel vapor tube-to-Evaporative Emission (EVAP) canister quick connect coupling. For additional information, refer to Section 310-00 .

10. Release the clamp and disconnect the fuel tank filler pipe recirculation tube.

11. **NOTE:** The fuel tank filler pipe may have some residual fuel remaining in it after draining. Upon disconnecting the fuel tank filler pipe, carefully drain the residual fuel into a suitable container.

    Release the clamp and disconnect the fuel tank filler pipe from the fuel tank.
    - To install, tighten to 4 Nm (35 lb-in).

12. Remove the 2 fuel tank filler pipe bracket bolts.
    - To install, tighten to 11 Nm (97 lb-in).

13. Remove the fuel tank filler pipe from the vehicle.

14. To install, reverse the removal procedure.

Fuel Pump Module

Special Tool(s)

ST2803-A	Lock Ring Wrench 310-123

Material

Item	Specification

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: The Fuel Pump (FP) module has a serviceable fuel level sender. For additional information, refer to Fuel Level Sender in this section.

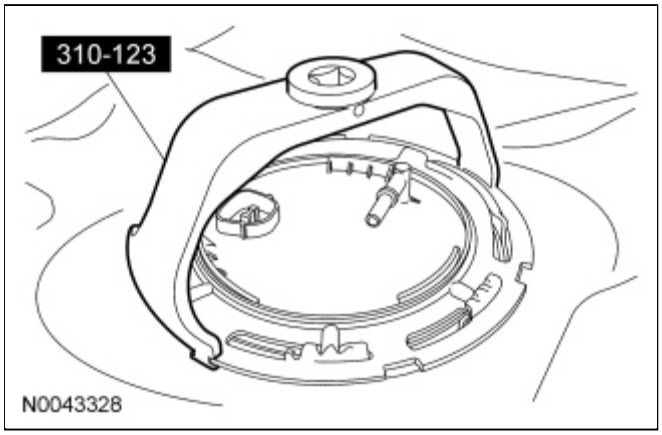
1. **NOTE:** To avoid introducing contamination into the fuel tank use water to clean the FP module

connections, couplings, flange surface and the immediate surrounding area of any dirt or foreign material. Blow dry thoroughly with shop air after cleaning.

Remove the fuel tank. For additional information, refer to Section 310-01 .

2. ***NOTICE:*** **Carefully install the lock ring wrench to avoid damaging the Fuel Pump (FP) module when removing the lock ring**

   Using the lock ring wrench, rotate the lock ring counterclockwise and remove the FP module lock ring.



3. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

   NOTE: The FP module will have residual fuel remaining internally, drain into a suitable container.

   Remove the FP module from the fuel tank.

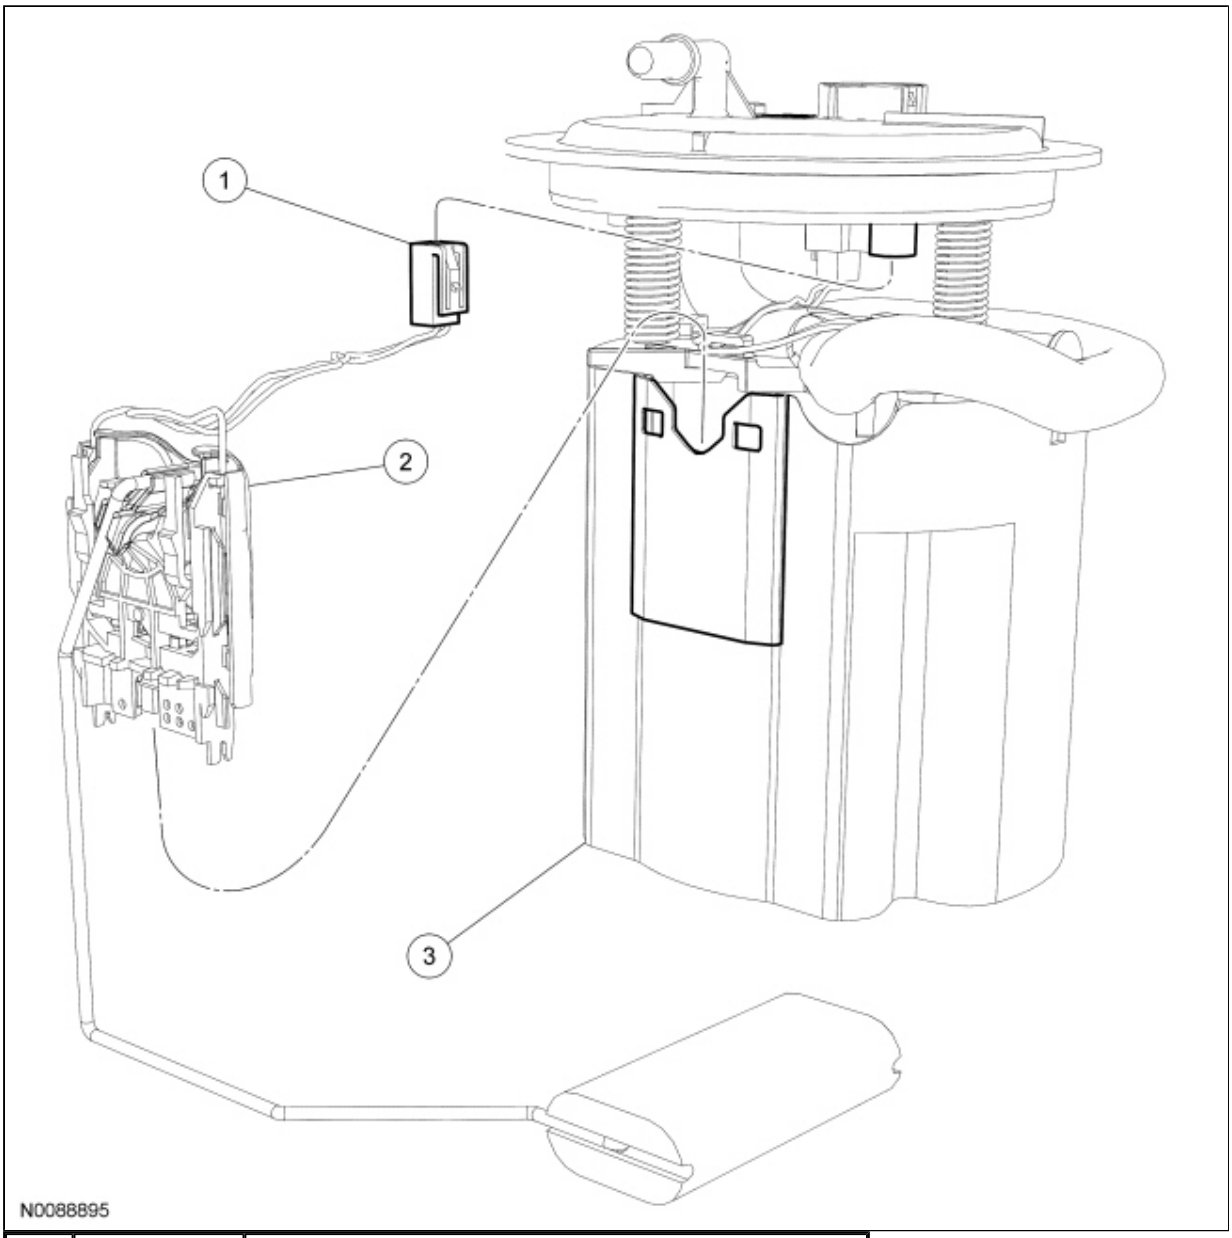
4. **NOTE:** Inspect the mating surfaces of the FP module flange and the fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new FP module or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

   NOTE: To install, apply clean engine oil to the new O-ring seal.

   Remove and discard the FP module O-ring seal.

5. To install, reverse the removal procedure.
   - Install a new FP module O-ring seal.

Fuel Level Sender



Item	Part Number	Description
1	—	Fuel level sender electrical connector (part of 9A299)
2	9A299	Fuel level sender
3	9H307	Fuel Pump (FP) module

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

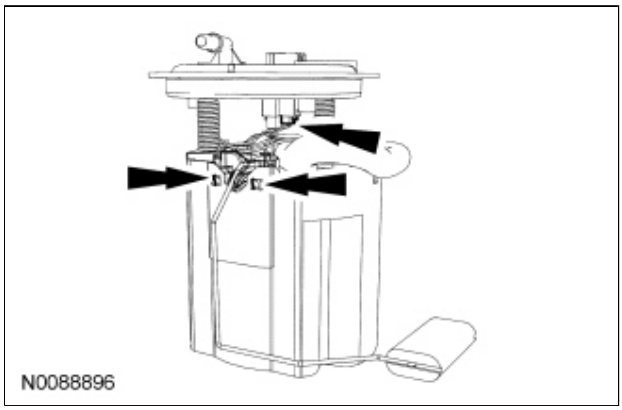
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio

equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the Fuel Pump (FP) module. For additional information, refer to Fuel Pump Module in this section.
2. Disconnect the fuel level sender electrical connector.
3. Depress the lock tabs and slide the fuel level sender upwards.
   - Remove the sender from the FP module.



4. To install, reverse the removal procedure.

Fuel Lines

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

4. Remove the fuel tank. For additional information, refer to Fuel Tank in this section.

5. Disconnect the fuel tube-to-fuel rail spring lock coupling.

6. Disconnect the Evaporative Emission (EVAP) canister purge valve-to-fuel vapor tube assembly quick connect coupling.

7. **NOTE:** Cap the brake tube connections to prevent fluid loss or dirt contamination.

   Disconnect the 2 Hydraulic Control Unit (HCU) brake tube inline fittings-to-fuel bundle assembly and postion aside.
   - To install, tighten to 17 Nm (150 b-in).

8. Disconnect the 2 rear brake tube fittings-to-fuel bundle assembly.
   - To install, tighten to 17 Nm (150 b-in).

9. Disconnect the 5 fuel tube bundle retainers and remove fuel tube bundle assembly.

10. To install, reverse the removal procedure.
    - Bleed the brake system. For additional information, refer to Section 206-00 .

Torque Specifications

Description	Nm	lb-ft
Accelerator pedal and sensor assembly nuts	22	16

Acceleration Control

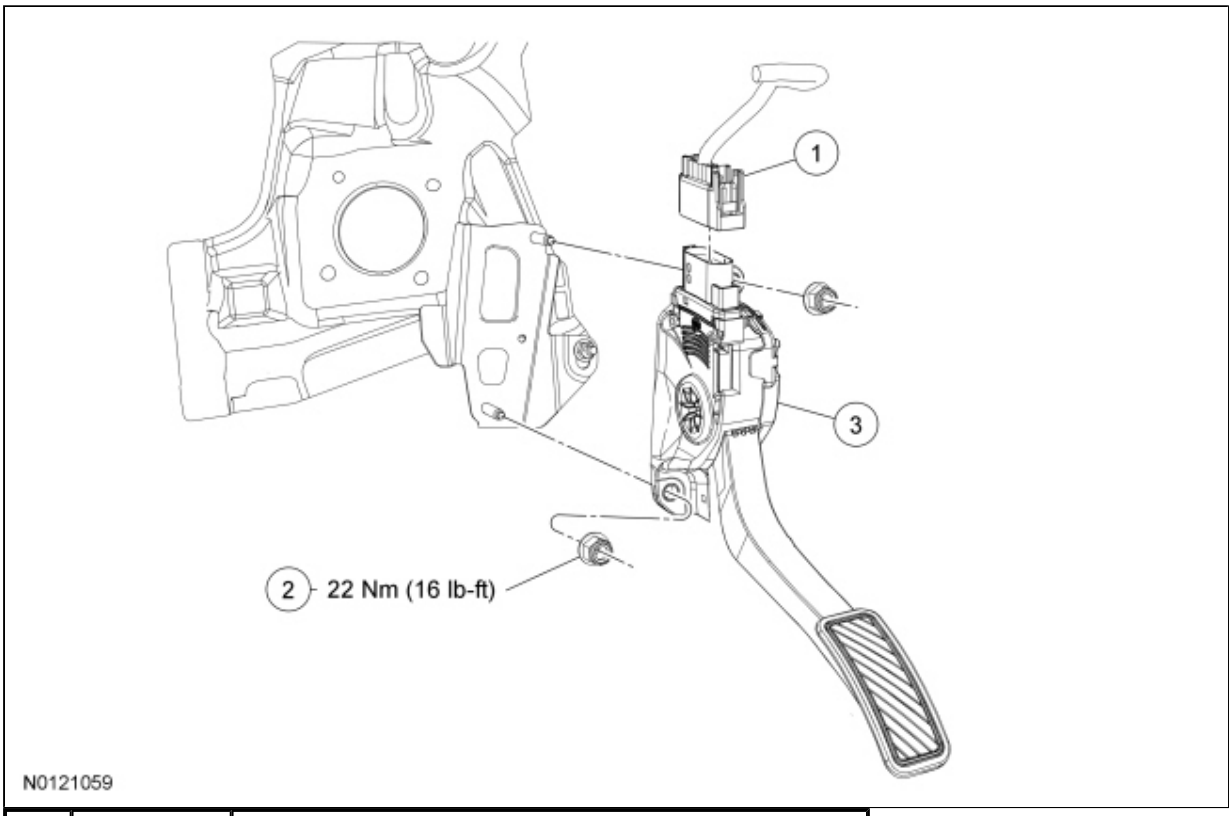
The acceleration controls consist of the accelerator pedal and sensor assembly.

The engine management system electronically operates the throttle of the engine in response to accelerator pedal movements initiated by the driver. In the event of a system failure, the engine management system provides a limp home mode which allows the car to be driven with limited performance.

Acceleration Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Accelerator Pedal



Item	Part Number	Description
1	—	Accelerator pedal sensor electrical connector (part of 14K733)
2	W706840	Accelerator pedal and sensor assembly nut (2 required)
3	9F836	Accelerator pedal and sensor assembly

Removal and Installation

1. **NOTE:** To prevent setting DTCs, make sure the ignition switch is in the OFF position prior to disconnecting the accelerator pedal electrical connectors.

   Disconnect the accelerator pedal sensor electrical connector.

2. Remove the 2 nuts and the accelerator pedal and sensor assembly.
   - To install, tighten to 22 Nm (16 lb-ft).

3. To install, reverse the removal procedure.

Steering System

Electronic Power Assist Steering (EPAS) System

NOTICE: **The steering sensor contains a clockspring that will be damaged if the steering column is not handled correctly. To prevent damage to the steering sensor, use the service bolt (HB1) to lock the steering column in the straight ahead position before disconnecting the steering column from the steering gear. Damage caused to the steering sensor by failing to lock the steering when disconnecting the column from the steering gear leads to a complete failure of the Electronic Power Assist Steering (EPAS) system and requires a new EPAS column to be installed.**

The Electronic Power Assist Steering (EPAS) system consists of the following components:

- Power Steering Control Module (PSCM) — the PSCM controls the functions of the EPAS system and communicates with other modules on the High Speed Controller Area Network (HS-CAN). The PSCM is attached to the EPAS column assembly and cannot be serviced separately.
- Motor — the EPAS column uses a 12-volt brushless, reversible motor, a worm gear and a reduction gear to control the steering effort. The motor is attached to the EPAS column assembly and cannot be serviced separately.
- Steering sensor — the PSCM uses the steering sensor to determine force applied to, speed and direction of the steering wheel. This information is transmitted to other modules along the HS-CAN. The sensor is attached to the EPAS column assembly and cannot be serviced separately.
- Steering column shaft — the steering column shaft connects the EPAS column assembly to the steering gear and can be serviced separately. For additional information, refer to Section 211-04.
- Steering gear — the steering gear is a rack and pinion type gear, which is serviced as an assembly and contained within a one-piece aluminum housing. The steering gear uses tie-rod ends to connect the gear to the wheel knuckles. The steering gear can be serviced separately from the EPAS column assembly. For additional information, refer to Section 211-02.
- Tie-rod ends — one inner and outer tie rod is located at each end of the steering gear and can be serviced separately. For additional information, refer to Section 211-02.

The EPAS system provides power steering assist to the driver by replacing the conventional hydraulic valve system with an electric motor coupled to the steering shaft. The motor is controlled by the PSCM which senses the steering effort using sensors mounted between the steering column shaft and the steering gear. Steering assist is provided in proportion to the steering input effort and vehicle speed.

Steering System

Special Tool(s)

ST2574-A	Flex Probe Kit NUD150-R025D or equivalent
ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Electronic Power Assist Steering (EPAS)

The Electronic Power Assist Steering (EPAS) system provides power steering assist to the driver by replacing the conventional hydraulic valve system with an electric motor coupled to the steering shaft. The motor is controlled by the Power Steering Control Module (PSCM) that senses the steering effort using a torque sensor mounted internally to the steering column assembly. Steering assist is provided in proportion to the steering input effort and vehicle speed.

The EPAS system requires a 12-volt, hot at all times feed for system operation. The PSCM is activated when power is applied to the hardwired ignition/run input. After activation, the PSCM monitors the High Speed Controller Area Network (HS-CAN) to determine if the vehicle is operating in a manner capable of supporting the EPAS system.

The PSCM recieves vehicle speed from the PCM over the HS-CAN and steering shaft speed, direction and position from the steering shaft sensor to determine the amount or level of power steering assist provided by the EPAS system.

The level of steering assist is primarily based on vehicle speed. As vehicle speed increases, the amount of assist decreases to improve and enhance road feel at the steering wheel. As vehicle speed decreases the amount of assist increases to ease vehicle maneuvering. If the vehicle speed is missing or out of range, the PSCM defaults to a safe level of assist for all driving conditions. If the vehicle speed returns to the correct in-range values, the PSCM adjusts the level of assist accordingly. Steering wheel/shaft speed, torque and direction information allows the PSCM to determine how much assist is needed to turn the wheels right and left.

The PSCM continually monitors and adjusts steering efforts based on the sensor inputs to enhance the feel of the steering. Compensation is made to reduce the effect of pull or drift that may be experienced when driving on roads with a high degree of camber. Active nibble control is also employed by the PSCM to reduce the vibrating movement felt at the steering wheel that can be caused by driving on rough surfaces or out of balance wheels.

The PSCM is self-monitoring and is capable of setting and storing DTCs. Depending on the DTC set, the control module enters into a safe mode of manual steering. In addition, the PSCM may send a request to the Instrument Panel Cluster (IPC) module over the HS-CAN to display a message in the message center, part of the Front Controls Interface Module (FCIM) alerting the driver of a potential EPAS concern.

Low battery and/or charging system voltage or a charging system DTC being present may cause the PSCM to enter into a limited operation mode resulting in uneven steering assist or a lack of steering assist. This limited operation mode feature is built into the PSCM to allow the safe, continued operation of the vehicle in the event of an EPAS concern. A DTC may or may not be present when the PSCM is operating in limited operation mode. Additionally, overheating the steering system may cause the PSCM to go into the limited operation mode, to protect the electronic components from overheating.

The PSCM is an integral part of the EPAS column assembly and cannot be serviced separately.

Power Steering Control Module (PSCM) Power Down

The internal circuitry of the PSCM enables the PSCM to remain powered for 90 seconds after the igniton state has been switched to OFF. When carrying out diagnostic procedures that require DTCs to be cleared and a new ignition cycle to be started, make sure the ignition state remains OFF for a minimum of 90 seconds before switching to ON. This allows the PSCM to shut down completely and a new ignition cycle to be entered.

Power Steering Motor

The EPAS system uses a 12-volt brushless reversible motor to control the steering effort. The motor is

connected to the steering shaft through a worm gear and a reduction gear on the steering column. The motor is part of the steering column assembly and is not serviced separately.

Steering Sensor

NOTICE: **The steering sensor contains a clockspring that will be damaged if the steering column is not handled correctly. To prevent damage to the steering sensor, use the service bolt (HB1) to lock the steering column in the straight ahead position before disconnecting the steering column from the steering gear. Damage caused to the steering sensor by failing to lock the steering when disconnecting the column from the steering gear leads to a complete failure of the EPAS system and requires a new EPAS column to be installed.**

The steering sensor provides the PSCM with information on the direction, speed and amount of force being applied to the steering wheel. The steering sensor is a split sensor that monitors the steering inputs from the driver and the output side of the EPAS assembly. The PSCM uses the inputs from the sensor to determine the amount of steering assist required and adjusts steering efforts based on the sensor inputs. The sensor is a 5-volt dual analog sensor with an output voltage range of 0.25 volt to 4.75 volts. When the steering wheel is turned to the left, the left signal increases while the right signal decreases, likewise when the steering wheel is turned to the right, the right signal increases while the left signal decreases.

Interactive Diagnostics

For diagnosing and testing please refer to the on-line Workshop Manual. If you do not have an on-line subscription, go to www.motorcraftservice.com.

Torque Specifications

Description	Nm	lb-ft
Engine roll restrictor bolt	50	37
Forward subframe bolts	60	44
Outer tie-rod end nuts	53	39
Rearward subframe bolts [a]	—	—
Stabilizer bar link-to-strut nuts	48	35
Steering column shaft-to-steering gear bolt	32	24
Steering gear bolts	90	66
Subfame brace-to-body bolts	50	37
Tie-rod end jam nuts	63	46

[a] Refer to the procedure in this section.

Power Steering

The rack and pinion steering gear that is used with the Electronic Power Assist Steering (EPAS) system is a manual (non-hydraulic) steering gear that is contained within a 1-piece die cast aluminum housing. The power assist is provided by a 12-volt, 65 amp brush-less motor, mounted to the steering column. The steering column and motor/module are serviced as an assembly. For information on steering column service, refer to Section 211-04 . A new steering gear includes inner tie rods, however, the inner and outer tie rods can also be serviced separately. For information on tie-rod service, refer to Section 211-03 .

Steering Gear

Special Tool(s)

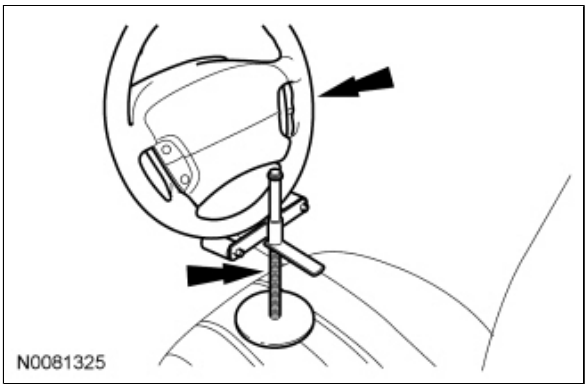
ST2783-A	Remover, Tie Rod End 211-001 (Tool-3290-D)

General Equipment

Transmission Jack

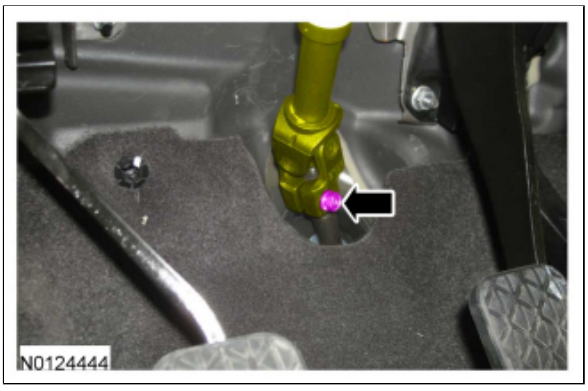
Removal

1. Using a suitable holding device, hold the steering wheel in the straight-ahead position.



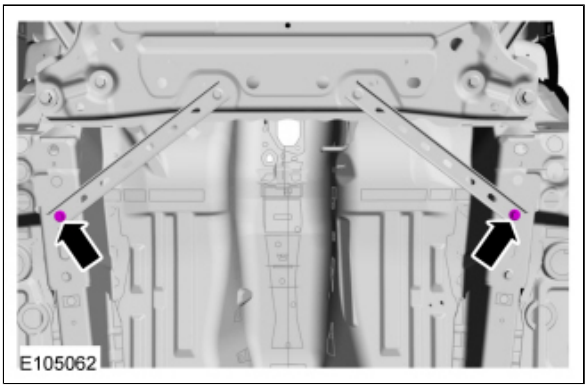
2. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the steering column shaft has rotated, remove and recenter the clockspring. For additional information, refer to Section 501-20B .**

   Remove and discard the steering column shaft-to-steering gear bolt and disconnect the steering column shaft from the steering gear.

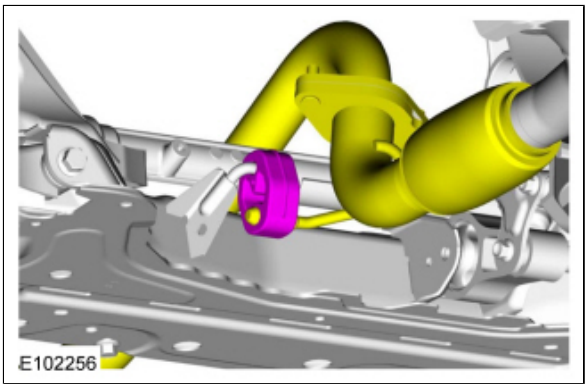


3. Remove the front wheels and tires. For additional information, refer to Section 100-04 .
4. Remove and discard the 2 outer tie rod nuts.
5. Using the Tie Rod End Remover, separate the outer tie rods from the wheel knuckles.

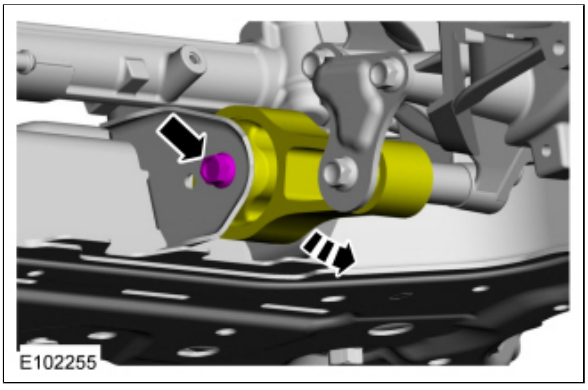
6. Remove and discard the 2 stabilizer bar link-to-strut nuts and disconnect the stabilizer bar links from the struts.
7. Remove the 2 subframe brace-to-body bolts.



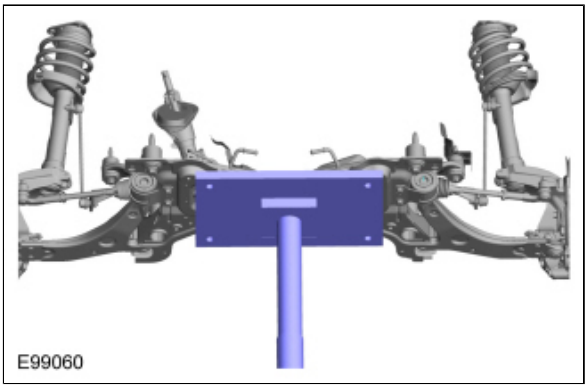
8. Disconnect the exhaust isolator.



9. Remove the engine roll restrictor bolt.

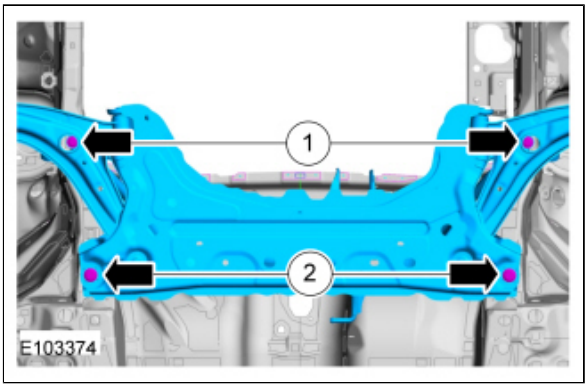


10. Support the front subframe using a suitable transmission jack.

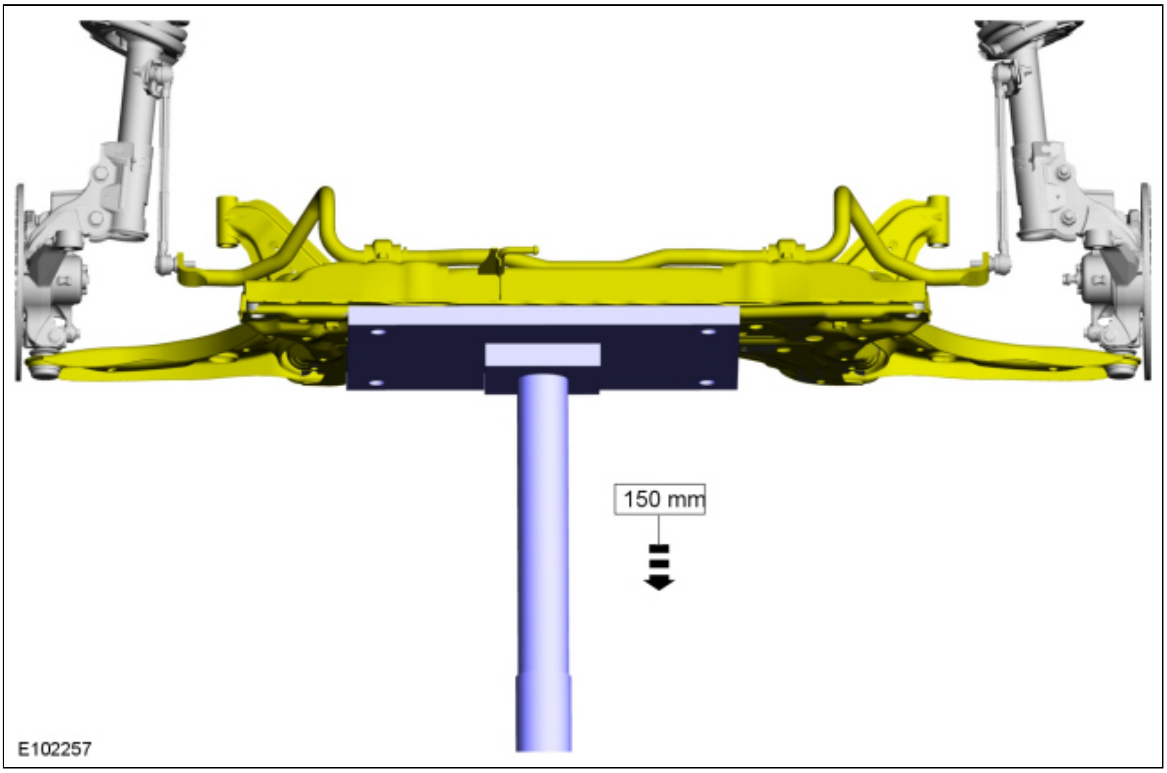


11. Mark the position of the subframe-to-frame mounting location at each mounting point on the vehicle frame rails to aide in installation.

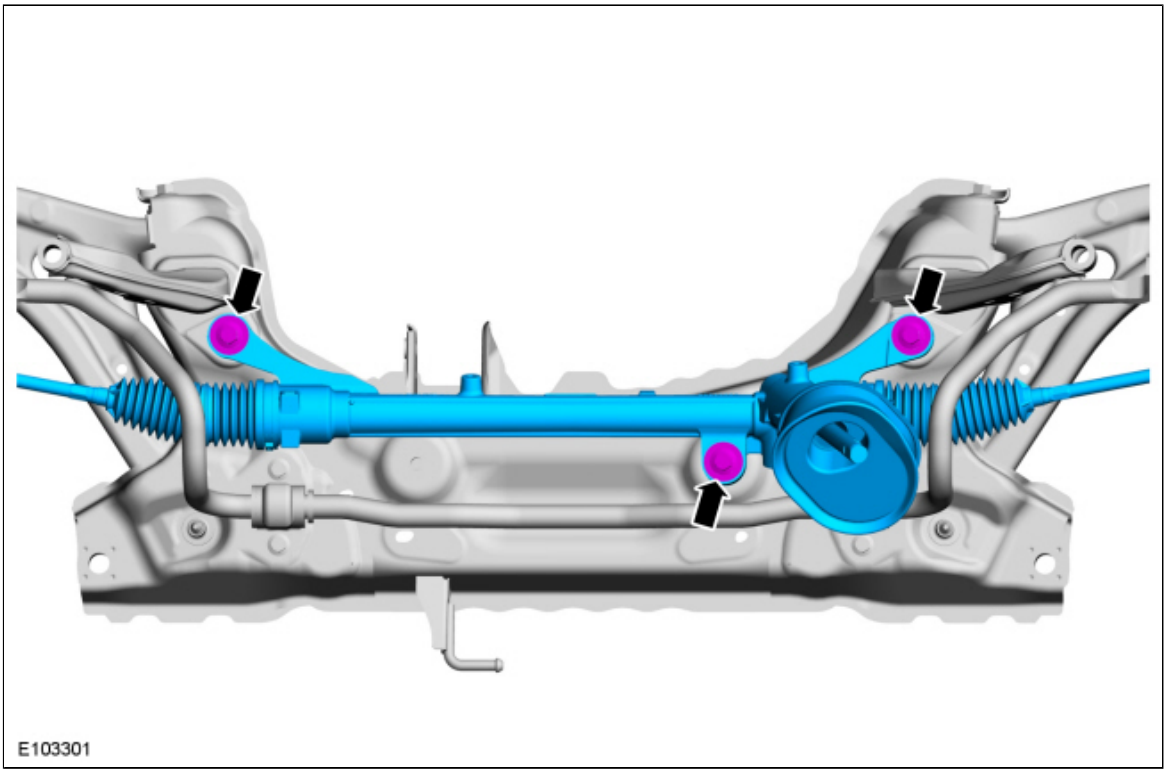
12. Remove the 4 subframe bolts and discard the 2 rearward bolts.



13. Lower the front subframe approximately 155 mm (6.102 in).



14. Remove the 3 steering gear bolts and the steering gear.



Installation

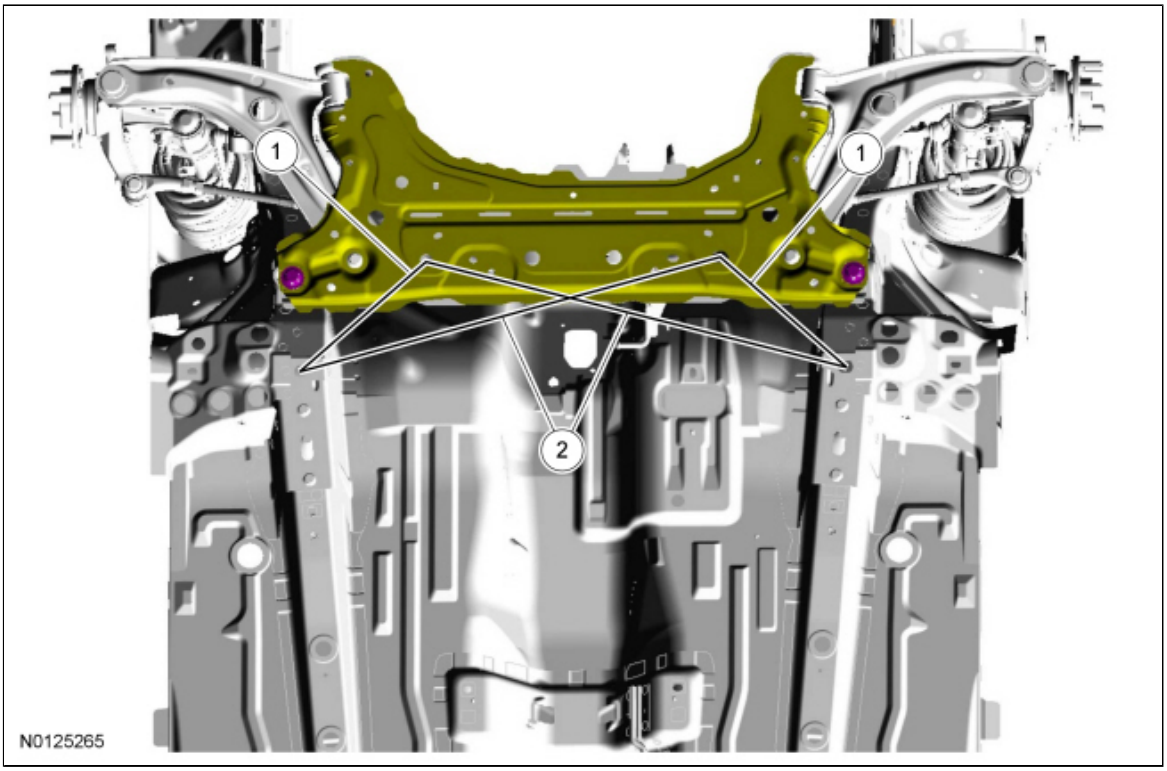
1. Position the steering gear and install the 3 bolts.
   - Tighten to 90 Nm (66 lb-ft).

2. Raise the subframe and loosely install the 4 subframe bolts.

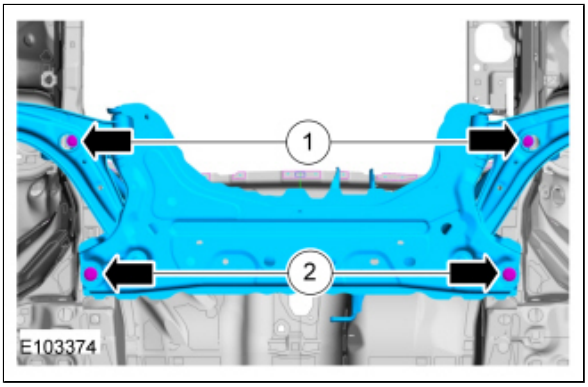
3. Align the subframe to the locating marks made during removal.

4. **NOTE:** RH and LH dimensions are identical. All measurements on center.

   Measure for correct positioning of the subframe to vehicle underbody.
   1. Location 1 — 260 mm (10.236 in)
   2. Location 2 — 666 mm (26.22 in)

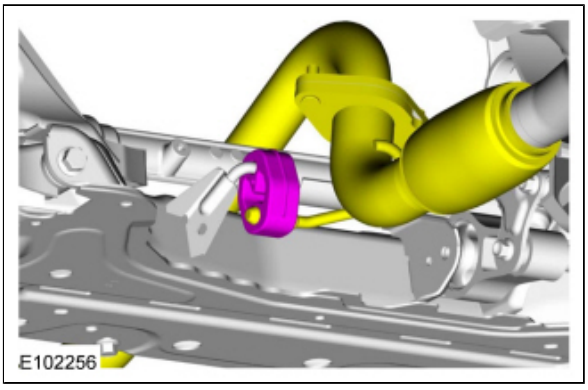


5. Tighten the subframe bolts.
    1. Tighten the forward bolts to 60 Nm (44 lb-ft).
    2. Tighten the new rearward bolts to 100 Nm (74 lb-ft).
        - Tighten the rearward bolts an additional 240°.

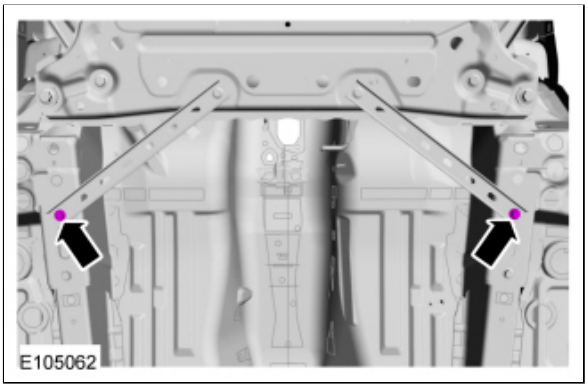


6. Position the engine roll restrictor and install the engine roll restrictor bolt.
    - Tighten to 50 Nm (37 lb-ft).

7. Connect the exhaust isolator.



8. Install the 2 subframe brace-to-body bolts.
    - Tighten to 50 Nm (37 lb-ft).

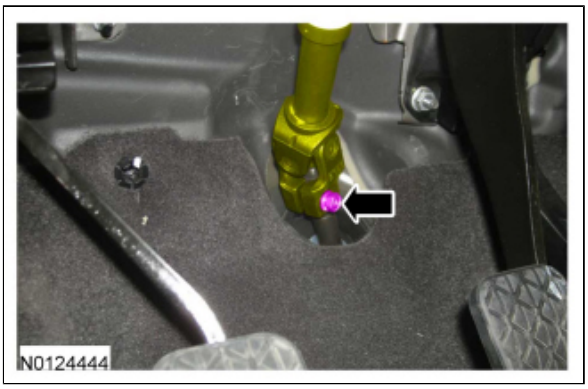


9. Position the stabilizer bar links and install the 2 new stabilizer bar link-to-strut nuts.
    - Tighten to 48 Nm (35 lb-ft).

10. Position the outer tie rods and install the new 2 outer tie rod nuts.
    - Tighten to 53 Nm (39 lb-ft).

11. **WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

    Connect the steering column shaft and install a new steering column shaft-to-steering gear bolt.
    - Tighten to 32 Nm (24 lb-ft).



12. Check and, if necessary, adjust the front toe. For additional information, refer to Section 204-00 .

Material

Item	Specification	Fill Capacity
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B	—

Torque Specifications

Description	Nm	lb-ft
Inner tie-rod end	83	61
Outer tie-rod end nut	53	39
Tie-rod end jam nut	63	46

Steering Linkage

The steering linkage consists of the following components:

- Inner tie-rod end
- Steering gear
- Outer tie-rod end
- Steering gear boot

The inner and outer tie rods connect the steering gear to the wheel knuckles. The tie rods are lubricated for life and do not contain grease fittings. The steering linkage is adjustable at the 2 tie-rod ends.

Tie Rod — Inner

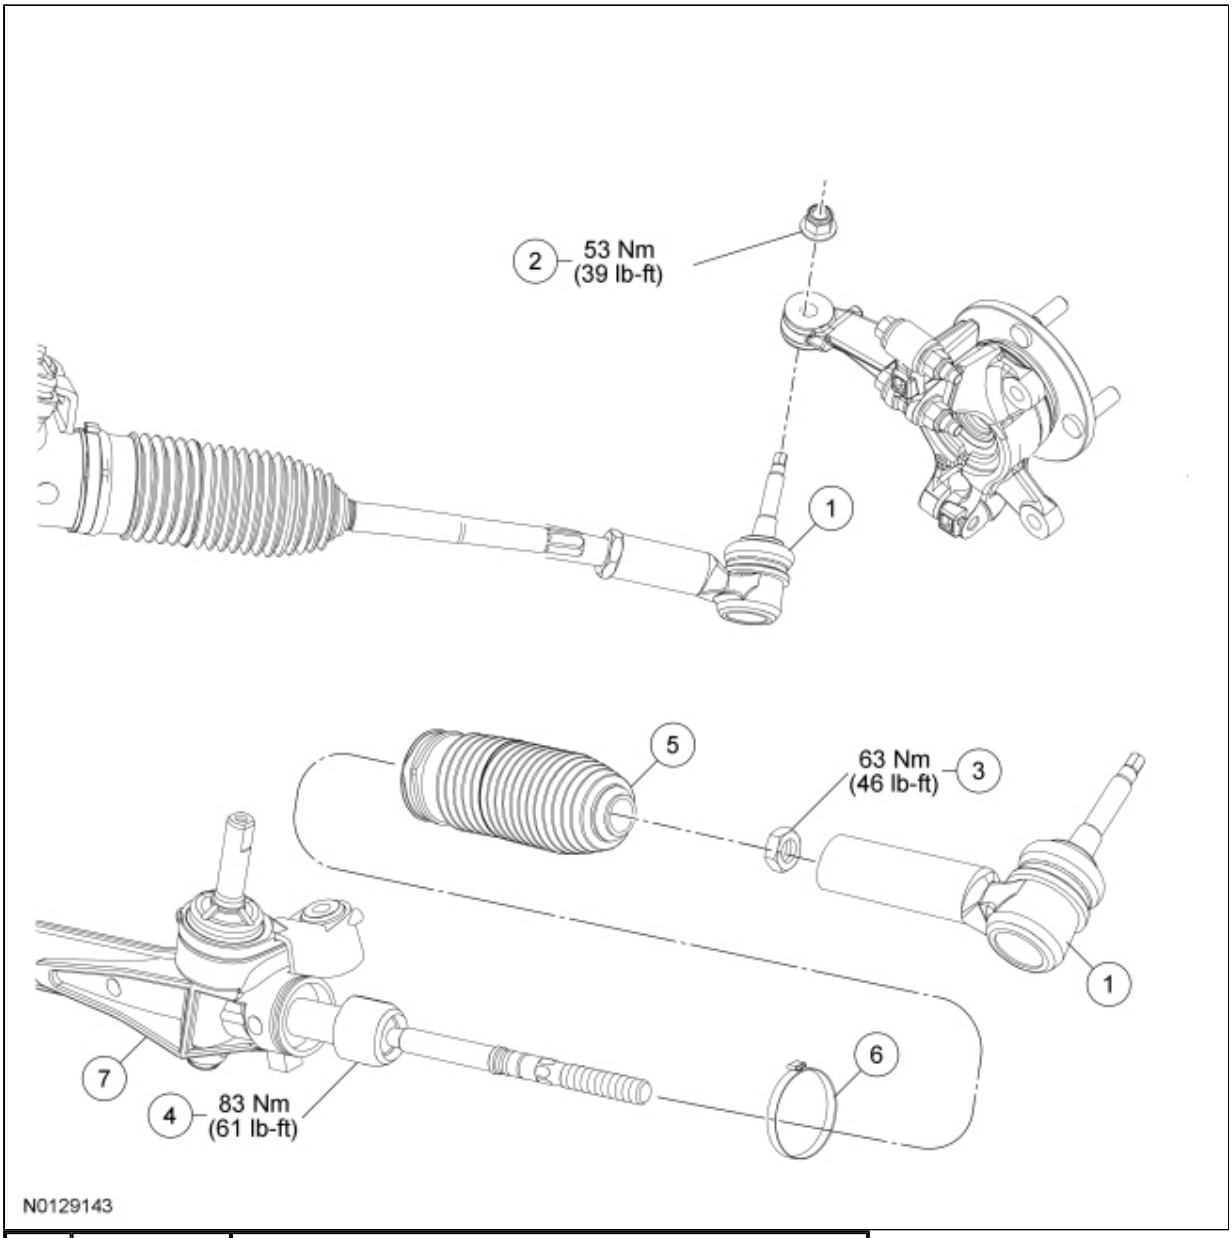
Special Tool(s)

ST2783-A	Remover, Tie Rod End 211-001

Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

Removal



Item	Part Number	Description
1	3A130	Outer tie-rod end
2	W520204	Outer tie-rod nut
3	W303694	Tie-rod end jam nut
4	3280	Inner tie-rod end
5	—	Steering gear bellows boot kit (part of 3332A boot kit)
6	—	Steering gear bellows boot clamp, inner (part of 3332A boot kit)
7	3504	Steering gear

NOTICE: **The steering gear bellows boots and clamps are designed to produce an airtight seal and protect the internal components of the steering gear. If the seal is not airtight, the vacuum generated during turning will draw water and contamination into the gear, causing damage. Zip ties do not provide an airtight seal and must not be used.**

NOTICE: **The inner tie-rod ball joint grease is not compatible with water. Water trapped in the grease will damage the joint.**

NOTE: If the RH inner tie rod is being serviced, remove the LH outer tie-rod end and bellows boot to access and hold the steering gear rack when loosening and tightening the inner tie rod. An assistant will be needed to hold the steering gear rack on the LH side when servicing the RH inner tie rod.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Loosen the tie-rod jam nut.

3. Remove and discard the outer tie rod nut.

4. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle can result.**

   Use the Tie-Rod End Remover to separate the outer tie-rod end from the wheel knuckle.

5. **NOTE:** Count and record the number of turns required to remove the outer tie-rod end for reference during installation.

   Remove the outer tie-rod end.

6. Remove the tie-rod jam nut.

7. Remove and discard the inner bellows boot clamp.

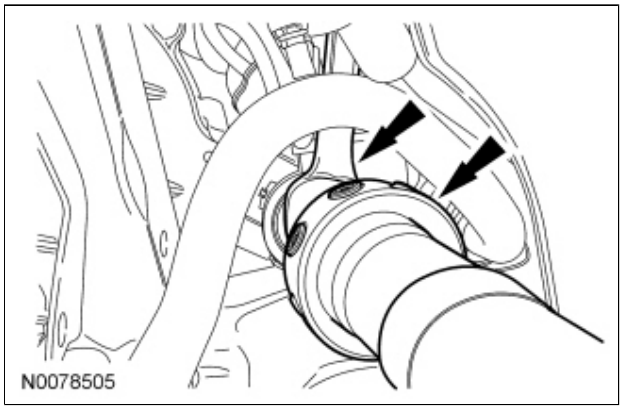
8. Remove and discard the steering gear bellows boot.

9. ***NOTICE:*** **Use an appropriate-sized wrench on the flat of the rack gear to resist rotation and to prevent damage during the removal of the inner tie rod.**

   NOTE: An assistant will be needed to hold the steering gear rack on the LH side when servicing the RH inner tie rod.

   NOTE: Set screw style inner tie rod tool shown.

   While holding the steering gear rack, use a set screw style inner tie rod tool (such as Matco® stock # TRT48) to remove the inner tie rod.



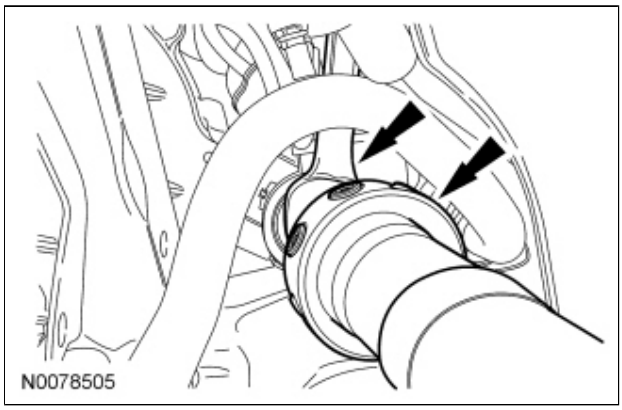
Installation

1. ***NOTICE:*** **Thoroughly remove any abrasive material. This material is extremely harmful to the steering gear.**

   Thoroughly clean the bellows boot-to-steering gear housing mating surface and install the O-ring supplied with the new bellows boot.

2. ***NOTICE:*** **Use an appropriate-sized wrench on the flat of the rack gear to resist rotation and to prevent damage during the installation of the inner tie rod.**

   While holding the steering gear rack, use a set screw style inner tie rod tool (such as Matco® stock # TRT48) to install the inner tie rod.
   - Tighten to 83 Nm (61 lb-ft).



3. Apply the specified grease to the bellows boot-to-steering gear mating surfaces and bellows boot grooves in the inner tie-rod casting.

4. **NOTE:** Make sure the bellows boot is positioned correctly over the steering gear housing bead and the groove in the inner tie rod.

   Install the steering gear bellows boot.

5. Using bellows boot clamp pliers, install a new inner bellows boot clamp.

6. Install the tie-rod jam nut onto the inner tie rod.

7. **NOTE:** Install the outer tie rod end(s) the same number of turns recorded during removal.

   Install the outer tie-rod end.

8. Connect the outer tie-rod end to the wheel knuckle and install the outer tie-rod end nut.
   - Tighten to 53 Nm (39 lb-ft).

9. Tighten the tie-rod jam nut to 63 Nm (46 lb-ft).
10. Install the wheel and tire. For additional information, refer to Section 204-04 .
11. Check and if necessary, adjust the front toe. For additional information, refer to Section 204-00 .

Material

Steering wheel bolt	40	30	—

Steering Column

The steering column is the mechanical linkage between the steering wheel and the steering gear. However, the steering column housing also contains the Power Steering Control Module (PSCM), motor and steering sensor, which are used to provide the power assist. The programmable module uses inputs from the sensor to determine when and how much assist is needed. The 12-volt brushless, reversible motor uses a worm gear and a reduction gear to apply the power assist to the steering column shaft. The steering column, module, motor and sensor are serviced as an assembly. For information on Electronic Power Assist Steering (EPAS) diagnosis, refer to Section 211-00 .

The steering wheel is mounted to a shaft which passes through the center of the steering column. The shaft is centered by roller ball bearings within the steering column. The steering column shaft then connects the steering column to the steering gear. The upper and lower steering column shaft connections utilize U-joint type couplings. The tilt function of the steering column is controlled by a mechanical lever on the underside of the steering column which uses a cam to lock and unlock the steering column. When the tilt lever is unlocked, the steering column can then be adjusted to various positions through a pin-type pivot. The steering column switches (multifunction and ignition) are mounted to the steering column. These switches are covered by the upper and lower steering column shrouds. For information on steering column switches, refer to Section 211-05 .

Steering Wheel Wrap Bonding

Material

Item	Specification
Instant Gel Adhesive TA-19	WSK-M2G402-A4

1. **NOTE:** If re-adhering leather to the front side of the steering wheel only, it will not be necessary to remove the steering wheel. Steering wheel removal is necessary only when repairing loose leather on the backside of the steering wheel.

   If necessary remove the steering wheel. For additional information, refer to Steering Wheel in this section.

2. Position the loose leather out of the way.

3. Apply the specificed adhesive evenly over the wheel spoke.

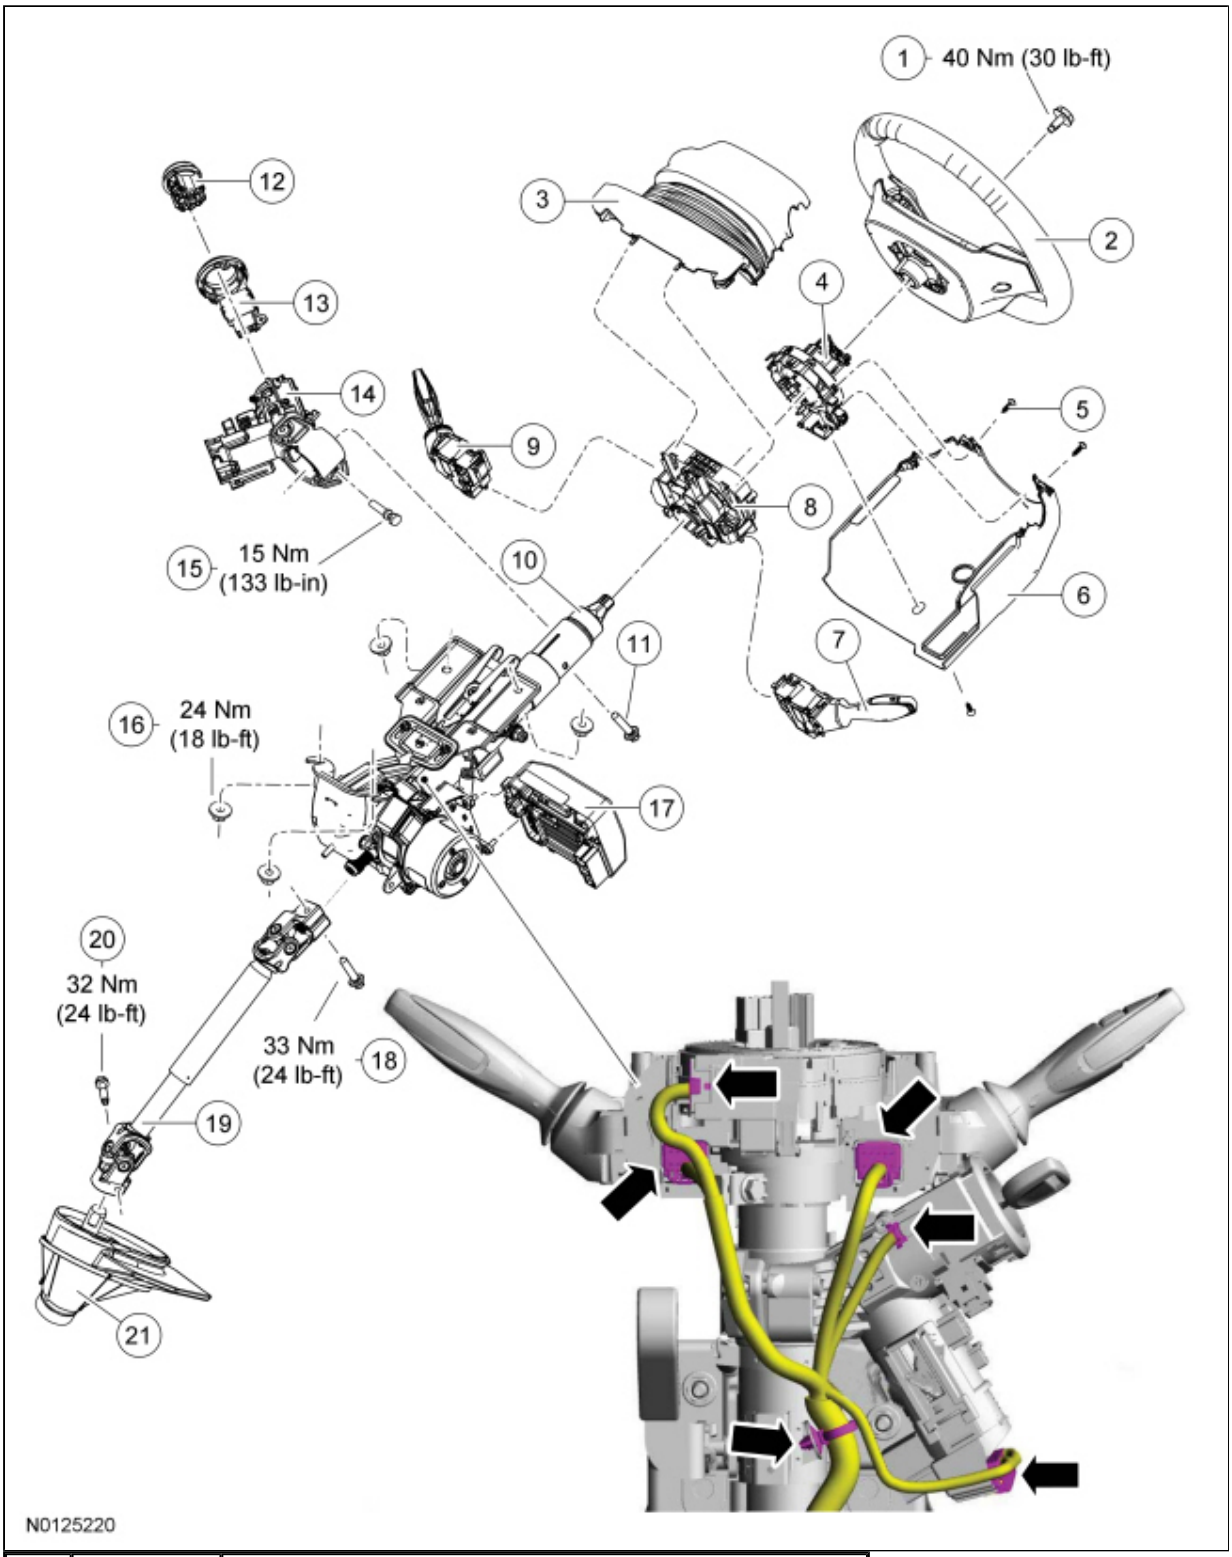
4. Position the loose leather back into the original position.

5. **NOTE:** The adhesive should be completely set after 5 minutes. Do not pull on the repair area.

   Smooth the leather and tuck in for neat appearance.
   - Apply pressure (for at least 30 seconds) until the leather is bonded to the wheel spoke.

6. If removed, Install the steering wheel. For additional information, refer to Steering Wheel in this section.

Steering Column — Exploded View



Item	Part Number	Description
1	W750985	Steering wheel bolt
2	3600	Steering wheel

3	3530A	Upper steering column shroud
4	14A664	Clockspring
5	W714630	Lower steering column shroud screw (3 required)
6	3530B	Lower steering column shroud
7	13341	Steering column multifunction switch
8	3F791	Steering column switch carrier
9	17A553	Wiper/washer switch
10	3C529	Steering column
11	—	Steering column anti-rotation bolt (M6 x 1 x 30)
12	11582	Ignition lock cylinder
13	15607	Passive Anti-Theft System (PATS) transceiver electrical connector (part of 14401)
14	3F527	Ignition switch/lock cylinder housing (push button start and key start)
15	W709942	Ignition switch/lock cylinder housing shear bolt (or part of 3F790)
16	W520102	Steering column nut (4 required)
17	—	Steering column module (part of 3C529)
18	3R827A	Steering column shaft-to-steering column bolt
19	3A525	Steering column shaft (or part of 3C529)
20	3R827B	Steering column shaft-to-steering gear bolt
21	3D677	Dash seal

1. Refer to the procedures in this section.

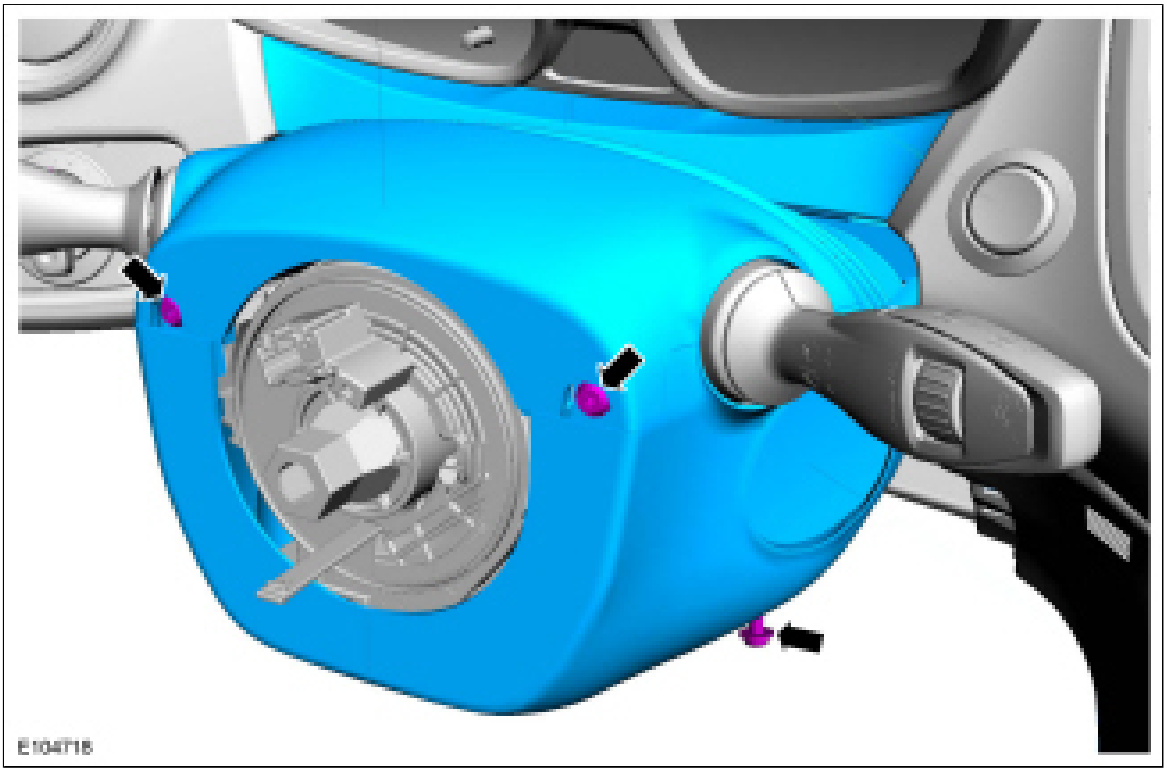
Steering Column

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

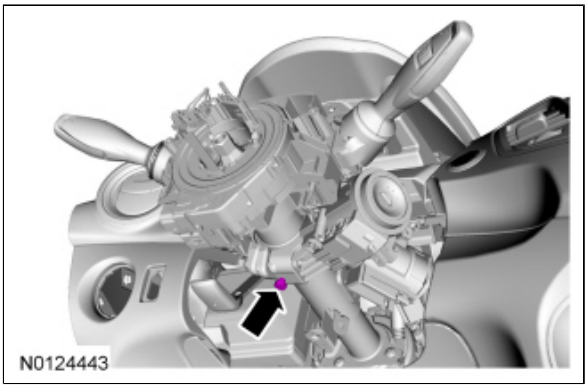
Removal and Installation

1. Remove the steering wheel. For additional information, refer to Steering Wheel in this section.
2. Remove the knee airbag module. For additional information, refer to Section 501-20B .
3. Remove the 3 screws and the upper and lower steering column shroud.
   - To install, tighten to 1 Nm (9 lb-in).

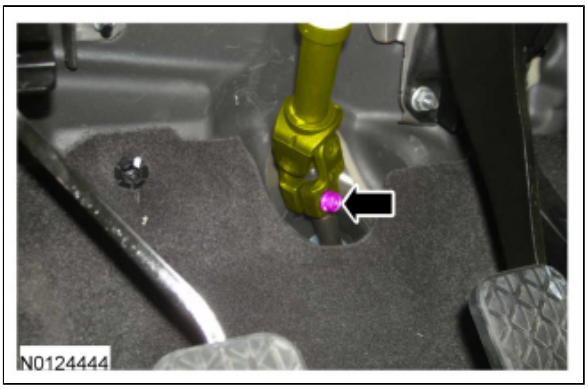


4. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the steering column internal sensor may result.**

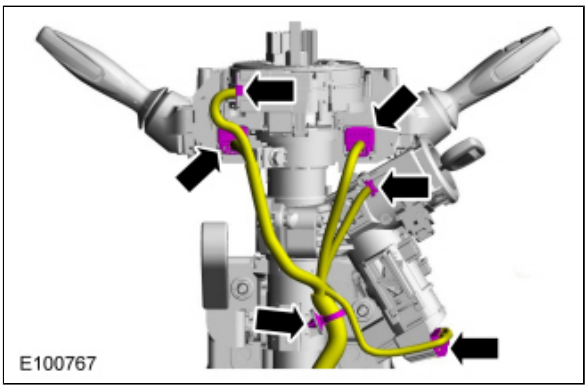
   To prevent steering column rotation, install a M6 x 1 x 30 bolt into the steering column and tighten hand tight.



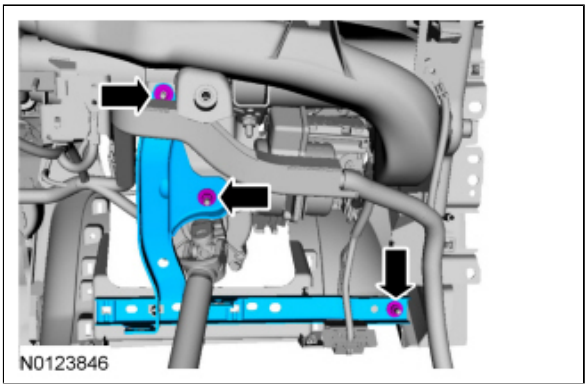
5. Remove and discard the steering column shaft-to-steering gear bolt and disconnect the steering column shaft from the steering gear.
    - To install, tighten the new bolt to 32 Nm (24 lb-ft).



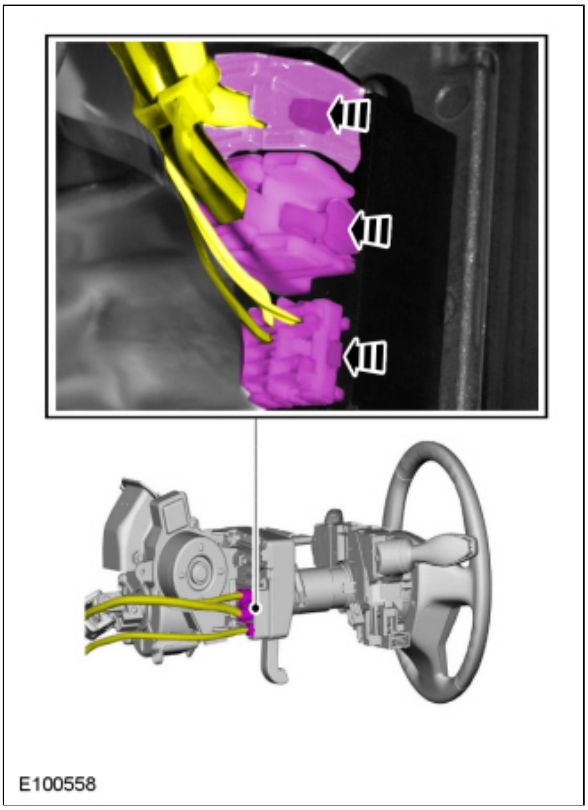
6. Disconnect the electrical connectors, detach the wiring harness retainers and position the wiring harness aside.



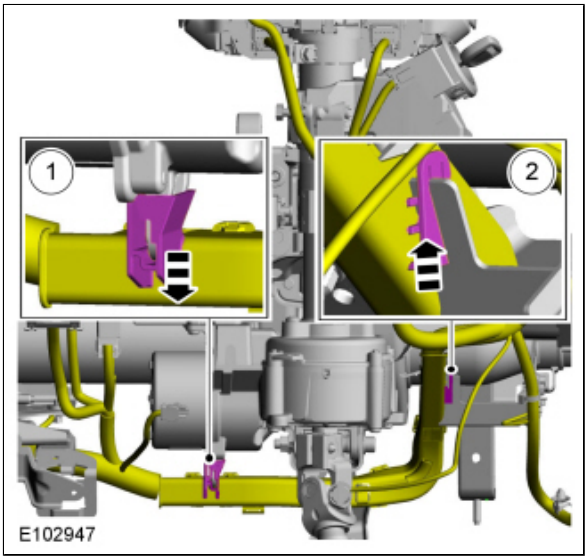
7. Remove the 3 nuts and the knee airbag brace.
    - To install, tighten to 8 Nm (71 lb-in).



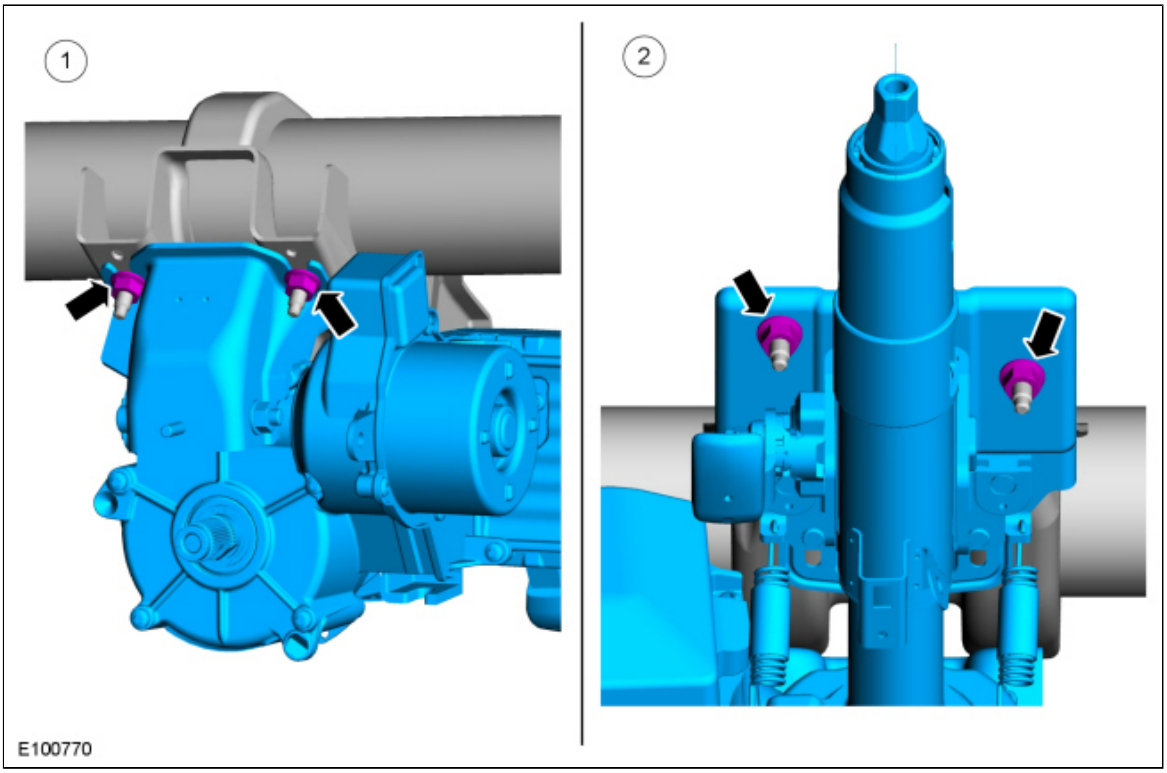
8. Disconnect the 3 steering column electrical connectors.



9. Unclip the wiring harness shield from the steering column in the order shown.



10. Remove and discard the 4 steering column nuts in the order shown.
    - To install, tighten the new nuts to 24 Nm (18 lb-ft).



11. Remove the steering column and steering column shaft as an assembly.

12. ***NOTICE:*** **Leave the anti-rotation cap on the new column until the steering column shaft has been connected and the steering column shaft-to-steering gear bolt has been installed or damage to the steering column may occur. Once the anti-rotation cap has been removed from the new column it must be installed on the old steering column and the anti-rotation bolt can be removed.**

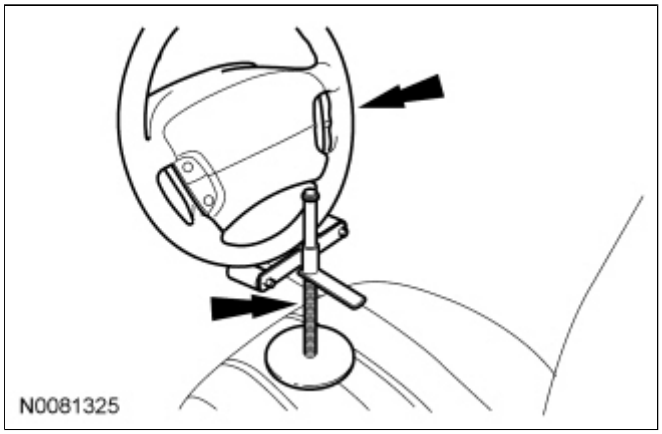
    NOTE: If a new column is being installed, a new ignition switch/lock cylinder housing shear bolt (W709942) will be required to transfer the ignition switch/lock cylinder housing to the new column. For additional information, refer to Ignition Lock Cylinder Housing in Section 501-14 .

    To install, reverse the removal procedure.

13. Calibrate the steering wheel position sensor if a new steering column has been installed.
    - Using the scan tool, select programable parameters/steering wheel position sensor calibration and follow the scan tool instructions.

Steering Column Shaft

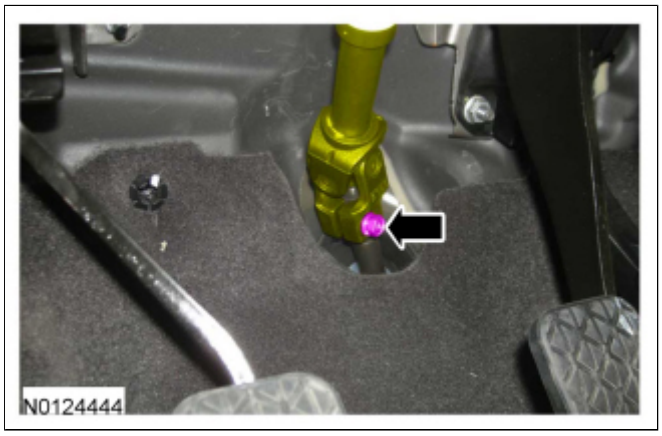
1. Turn the steering wheel 45 degrees to the right and using a suitable holding device, secure the steering wheel.



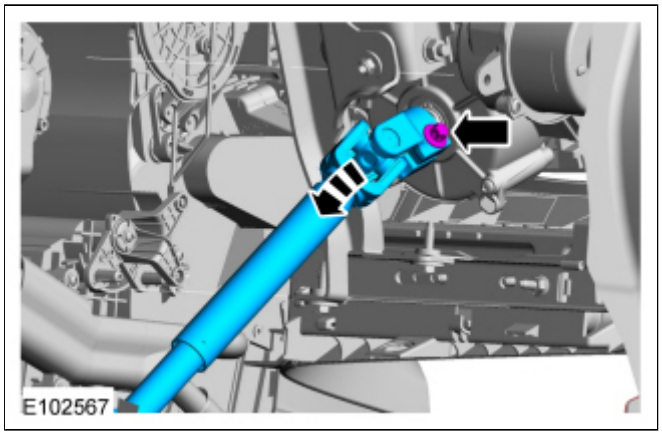
2. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the steering column has rotated, remove and recenter the clockspring. For additional information, refer to Section 501-20B .**

   NOTICE: **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the steering column internal sensor may result.**

   Remove and discard the steering column shaft-to-steering gear bolt and disconnect the steering column shaft from the steering gear.
   - To install, tighten a new bolt to 32 Nm (24 lb-ft).



3. Remove and discard the steering column shaft-to-steering column bolt and remove the steering column shaft.
   - To install, tighten a new bolt to 33 Nm (24 lb-ft).

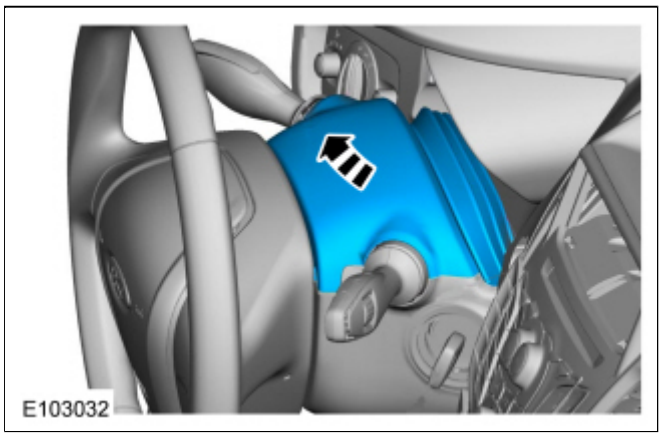


4. To install, reverse the removal procedure.

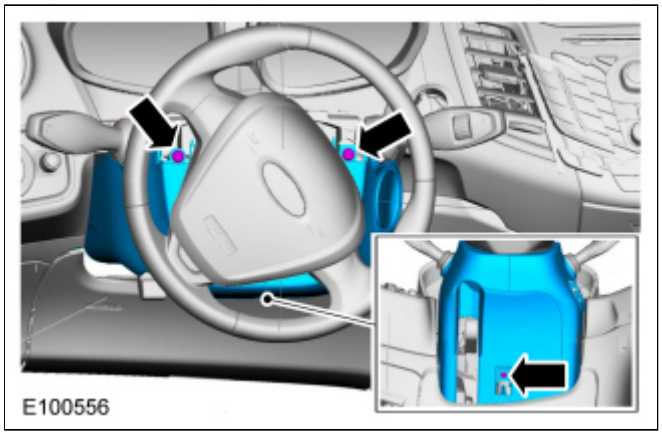
Steering Column Shroud

Removal and Installation

1. Pulling upward, detach the upper steering column shroud from the lower steering column shroud.
   - Slide the upper steering column shroud out of the Instrument Cluster (IC) trim panel and remove the shroud.



2. Remove the 3 screws and the lower steering column shroud.
   - To install, tighten to 1 Nm (9 lb-in).

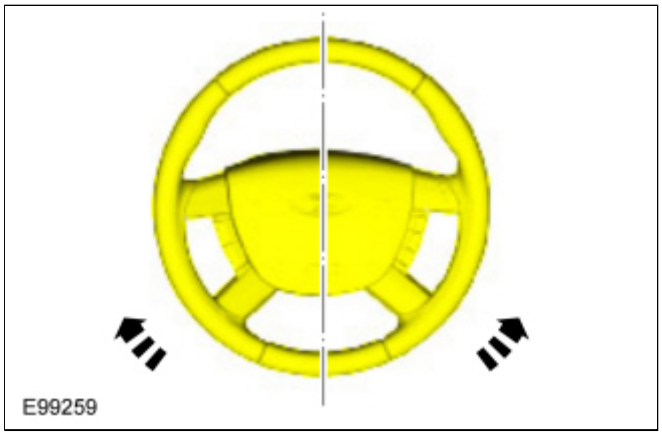


3. To install, reverse the removal procedure.

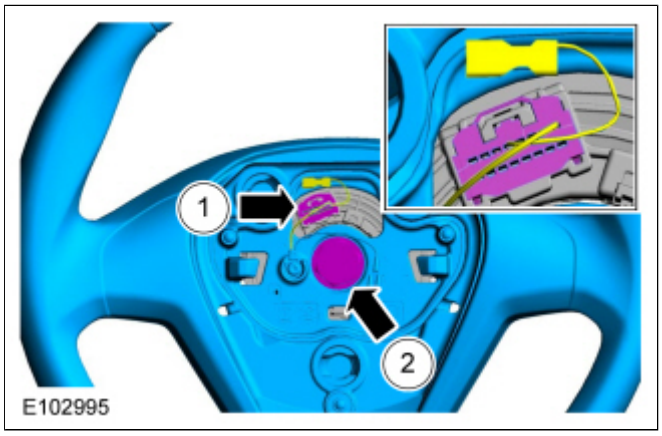
Steering Wheel

Removal and Installation

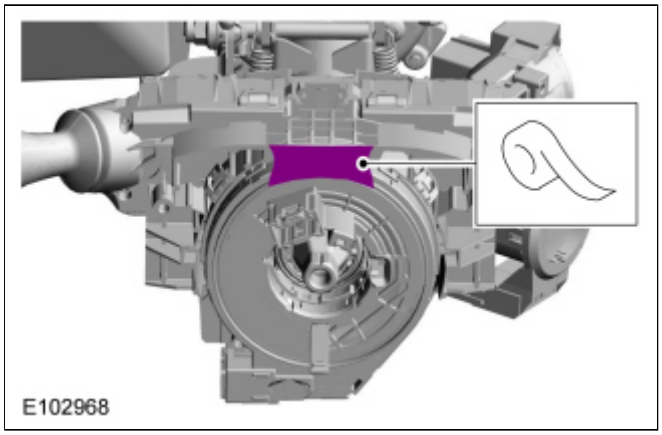
1. Remove the driver air bag module. For additional information, refer to Section 501-20B .
2. Turn the steering wheel to the straight-ahead position.



3. Remove the steering wheel as shown.
    1. Disconnect the electrical connector.
    2. Remove the bolt and the steering wheel.
        - To install, tighten the steering wheel bolt to 40 Nm (30 lb-ft).



4. Tape the clockspring center rotor to the outer housing to keep it from rotating.



5. To install, reverse the removal procedure.

Steering Column Switches

The steering column switches consist of the following components:

- LH multifunction switch – controls the turn signals, headlamp low/high beam, headlamp flash-to-pass and the trip computer display (if equipped). The LH multifunction switch can be serviced separately. For additional information on exterior lighting, refer to Section 417-01 . For additional information on the trip computer, refer to Section 413-01 .
- RH multifunction switch – controls the front windshield wipers and the rear window wiper (if equipped). The RH multifunction switch can be serviced separately. For additional information on the wiper/washer system, refer to Section 501-16 .
- Ignition switch – used in conjunction with the ignition lock cylinder and ignition key to achieve the various ignition modes.
- Start/stop switch – available only on vehicles equipped with a push button start system. Located in the instrument panel just to the right of the steering column, the start/stop switch is used instead of a conventional ignition switch to achieve the various ignition modes.

Push Button Start System Ignition Modes

The push button start system has 3 ignition modes:

- OFF
- ON (engine off)
- START

The start/stop button is used in conjunction Intelligent Access (IA) key and the brake pedal (automatic transaxle) or clutch pedal (manual transaxle) to achieve the different ignition modes as indicated in the table below. For additional information on the IA key, refer to Section 419-01B .

Push Button Start Ignition Modes

Ignition Entry Condition	Desired Ignition Modes	Action
Ignition off	ON (engine off)	Press the start/stop switch without pressing the brake or clutch pedal.
Any ignition mode	START	Press and hold the brake or clutch pedal and then push the start/stop switch.
On (engine off)	OFF	Push the start/stop switch.
On (engine running)	OFF	Press and hold the start/stop switch.

OFF Mode

If the vehicle is in motion, a momentary press of the start/stop switch will not shut the engine off. If the vehicle is moving, the start/stop switch must be pressed and held for longer than one second to achieve OFF mode.

ON Mode

When the vehicle enters ON mode, multiple indicators in the IPC will prove out (just like a vehicle equipped with an ignition key cylinder), the indicator in the start/stop switch will illuminate and the IPC will display the vehicle mileage and current transmission gear selection.

Steering Column Switches

Special Tool(s)

ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Ignition Switch

The ignition switch is controlled by the ignition lock cylinder with a key. When the ignition lock cylinder is turned, a mechanical connection positions the ignition switch to the selected position. The available ignition switch positions are:

- OFF
- ACC
- ON
- START

The ignition switch supplies battery voltage to the Central Junction Box (CJB) which then distributes this voltage to multiple circuits and modules throughout the vehicle, based on ignition switch position.

Push Button Start System

The Remote Function Actuator (RFA) module applies battery voltage to the same circuits that a conventional ignition switch uses to achieve 3 of the 4 standard ignition states (OFF, ON and START). Unlike a conventional ignition switch system, this push button start system does not have a driver accessible ACC mode. The RFA module automatically cycles through the ACC mode when the driver cycles the vehicle to the ON mode. The RFA module receives input from the following:

- Clutch Pedal Position (CPP) switch (manual transaxle)
- Cruise control deactivator switch (automatic transaxle)
- Intelligent Access (IA) key (wireless input)
- Park detect switch (automatic transaxle)
- Start/stop switch

The RFA module uses input from the IA key to authorize use of the vehicle. The RFA module uses input from the start/stop switch, the park detect switch (automatic transaxle), the cruise control deactivator switch (automatic transaxle) and/or the CPP switch (manual transaxle) to transition between ignition modes.

Intelligent Access (IA) Key

To achieve any ignition state other than OFF, the IA key must be present inside the vehicle. The driver need not perform any actions with the IA key to operate the push button start system. It is sufficient that the IA key is located inside the vehicle when the start/stop switch is pressed. Pressing the start/stop switch triggers radio frequency communication between the IA key and the RFA module.

Backup Antenna

If the battery inside the IA key is weak, if the IA key is damaged or if excessive ambient Radio Frequency Interference (RFI) prevents communication between the RFA module and the IA key, the backup antenna located on the RH side of the steering column (where a conventional ignition lock cylinder would be located) provides a secondary means for the RFA module to validate the IA key and authorize use of the vehicle. The backup antenna uses passive radio frequency identification to exchange signals with the IA key, similar to the way a typical encoded Passive Anti-Theft System (PATS) key and transceiver operate. For additional information on the IA key and backup antenna, refer to Section 419-01B.

Push Button Start System Front Control/Display Interface Module (FCDIM) Messages

The FCDIM provides instruction for operating the push button start system. The FCDIM can also display warnings that could indicate a potential issue with the push button start system. The following FCDIM messages pertain to the push button start system:

- **TO START PRESS BRAKE** — Momentarily displays when the start/stop switch is pressed without the brake pedal being applied (vehicles equipped with an automatic transaxle).
- **TO START PRESS CLUTCH** — Momentarily displays when the start/stop switch is pressed without the clutch pedal being applied (vehicles equipped with a manual transaxle).
- **TO START SELECT N OR P** — Displays when attempting to start the vehicle and the transaxle is not in NEUTRAL or PARK (vehicles equipped with an automatic transaxle).
- **VEHICLE NOT IN PARK SELECT P** — Displays when the start/stop switch is pressed to shut off the engine with the transaxle selector lever in any position other than PARK (vehicles equipped with an automatic transaxle).
- **KEY OUTSIDE CAR** — Whenever a door is opened and then closed while the engine is running, the RFA module searches for the IA key. This message displays if the key is not detected by the module.
- **KEY NOT DETECTED** — Displays if the IA key is not detected by the RFA module when attempting to enter ON mode or attempting to start the vehicle. If this message is observed with the IA key located inside the vehicle, go to Section 419-01B to diagnose the IA key.

Remote Function Actuator (RFA) Module Programming

If it is necessary to replace the RFA module, the replacement module must be programmed. Carry out the following scan tool functions if an RFA module is installed new:

NOTE: All of the following scan tool functions must be completed before the vehicle will start.

- Programmable Module Installation (PMI) — This process configures the new module with specific vehicle information. Refer to Programmable Module Installation (PMI) in Section 418-01 .
- PATS Parameter Reset — This process initiates an exchange of information between the RFA module and the PCM specific to the anti-theft/engine immobilizer feature. Carry out a PATS parameter reset when either the RFA module or the PCM is installed new. For additional information, refer to Passive Anti-Theft System (PATS) Parameter Reset-Intelligent Access (IA) in Section 419-01B .
- IA Key Programming — This process programs the IA keys to the RFA module. If the RFA module is installed new, 2 IA keys will have to be programmed before the vehicle will start. For additional information, refer to Key Programming Using Diagnostic Equipment-Intelligent Access (IA) in Section 419-01B .

Multifunction Switches

The multifunction switches control the various components (high beam headlamps, flash-to-pass, turn signal, trip computer display and windshield wiper/washer) by grounding certain Body Control Module (BCM) or Instrument Panel Cluster (IPC) circuits. When the BCM or IPC detects the ground signal, voltage is sent to activate the appropriate component. The BCM controls the high beam headlamps, flash-to-pass, turn signals and windshield wipers/washers. The IPC controls the trip computer display.

For multifunction switch concerns, refer to one of the following sections:

- For high beam headlamps, flash-to-pass and turn signal concerns, refer to Section 417-01 .
- For wiper and washer concerns, refer to Section 501-16 .
- For trip computer concerns, refer to Section 413-01 .

Inspection and Verification

NOTE: Make sure the vehicle battery is fully charged and in good condition before diagnosing any ignition switch concerns.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• CPP switch (if equipped with a manual transaxle) • Cruise control deactivator switch (if equipped with an automatic transaxle) • Ignition lock cylinder (if equipped with an ignition key) • Ignition key (if equipped with an ignition switch) • Ignition switch (if equipped) • Intelligent Access (IA) key (if equipped with a push button start system) • Multifunction switches • Start/stop switch (if equipped with a push	• Battery Junction Box (BJB) fuse(s): ▪ 5 (60A) ▪ 7 (60A) • Wiring, terminals or connectors • Central Junction Box (CJB) fuse(s): ▪ 1 (15A) ▪ 19 (7.5A) ▪ 20 (10A) ▪ 21 (10A) ▪ 22 (7.5A) ▪ 23 (10A) ▪ 26 (7.5A) ▪ 34 (30A)

button start system) • Steering column shrouds	• Ignition switch (if equipped) • Start/stop switch (if equipped with a push button start system) • Remote Function Actuator (RFA) module (if equipped with a push button start system)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - Refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the VCM.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out confirms ignition ON (other indicators may NOT prove ignition is ON). If ignition does not turn ON, GO to Symptom Chart.
   - refer to Section 418-00 Inspection and Verification to establish a scan tool session.
   - verify the scan tool operation with a known good vehicle.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. If equipped with a start/stop switch, carry out the self-test diagnostics for the RFA module.

9. If the DTCs retrieved are related to the concern, refer to the Remote Function Actuator (RFA) Module DTC Chart. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Remote Function Actuator (RFA) Module DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens or shorts to ground. CMDTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B108B:23	Start Button Circuit "A": Signal Stuck Low	GO to Pinpoint Test E.
B108B:29	Start Button Circuit "A": Signal Invalid	GO to Pinpoint Test E.
B108C:23	Start Button Circuit "B": Signal Stuck Low	GO to Pinpoint Test E.

B10E7:11	Ignition On Relay: Circuit Short to Ground	GO to Pinpoint Test F .
B10E7:12	Ignition On Relay: Circuit Short to Battery	GO to Pinpoint Test F .
B10E7:16	Ignition On Relay: Circuit Voltage Below Threshold	GO to Pinpoint Test F .
B10E7:17	Ignition On Relay: Circuit Voltage Above Threshold	GO to Pinpoint Test F .
U3004:11	Accessory Power Relay: Circuit Short to Ground	GO to Pinpoint Test G .
U3004:12	Accessory Power Relay: Circuit Short to Battery	GO to Pinpoint Test G .
U300E:62	Ignition Input On: Signal Compare Failure	GO to Pinpoint Test I .
U300F:62	Ignition Input Accessory: Signal Compare Failure	GO to Pinpoint Test I .
U3010:62	Ignition Input Start: Signal Compare Failure	GO to Pinpoint Test I .
U3011:62	Ignition Input Off: Signal Compare Failure	GO to Pinpoint Test I .
—	All Other Remote Function Actuator (RFA) Module DTCs	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the Remote Function Actuator (RFA) module	• Wiring, terminals or connectors • RFA module	• REFER to Section 418-00 to diagnose the no communication concern.
• No power in all ignition switch positions — vehicles with an ignition switch	• Battery Junction Box (BJB) fuse • Central Junction Box (CJB) fuse • Wiring, terminals or connectors • Ignition switch	• GO to Pinpoint Test A .
• No power in ACC — vehicles with an ignition switch	• Wiring, terminals or connectors • Ignition switch • CJB fuse(s)	• GO to Pinpoint Test B .
• No power in ON — vehicles with an ignition switch	• Wiring, terminals or connectors • Ignition switch • CJB fuse(s)	• GO to Pinpoint Test C .
• No power in ON — vehicles with a push button start system	• Wiring, terminals or connectors • CJB fuse(s) • Start/stop switch • Smart keyless	• GO to Pinpoint Test H .

	entry accessory relay • Smart keyless entry ignition relay • Ignition relay • Cruise control deactivation switch • Clutch Pedal Position (CPP) switch • RFA module	
• No power in START — vehicles with an ignition switch	• Wiring, terminals or connectors • Starting system • Ignition switch	• GO to Pinpoint Test D .
• No power in START — vehicles with a push button start system	• Wiring, terminals or connectors • Start/stop switch • CJB fuse(s) • Smart keyless entry accessory relay • Smart keyless entry ignition relay • Cruise control deactivation switch • Clutch Pedal Position (CPP) switch • Starting system • Passive Anti-Theft System (PATS) • RFA module	• GO to Pinpoint Test H .
• KEY NOT DETECTED is displayed in the Front Control/Display Interface Module (FCDIM)	• Wiring, terminals or connectors • Intelligent Access (IA) key • RFA module antennas • RFA module	• REFER to Section 419-01B to diagnose the IA key concern.
• The ignition key cannot be returned to the OFF position	• Wiring, terminals or connectors • Ignition lock cylinder • Key removal inhibit solenoid (part of the ignition switch) • Park detect switch (part of the selector lever) • Instrument Panel Cluster (IPC)	• GO to Pinpoint Test J .
• The ignition key can be turned to the OFF position when the selector lever is not in PARK	• Wiring, terminals or connectors • Key release interlock actuator (part of the ignition switch) • Park detect switch (part of the selector lever)	• GO to Pinpoint Test K .

• The ignition key is hard to turn	• Ignition lock cylinder • Ignition key • Ignition switch	• GO to the Ignition Switch — Mechanical Component Test in this section.
• The multifunction switch does not operate correctly	• Multifunction switch	• REFER to Section 417-01 to diagnose an exterior lighting concern. • REFER to Section 501-16 to diagnose a wiper or washer concern. • REFER to Section 413-01 to diagnose a trip computer concern.

Pinpoint Tests

Pinpoint Test A: No Power in All Ignition Switch Positions — Vehicles With an Ignition Switch

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Normal Operation

The ignition switch receives fused battery voltage from Central Junction Box (CJB) fuse 1 (15A). The ignition switch distributes this voltage to the PCM and/or the CJB depending on the ignition switch position.

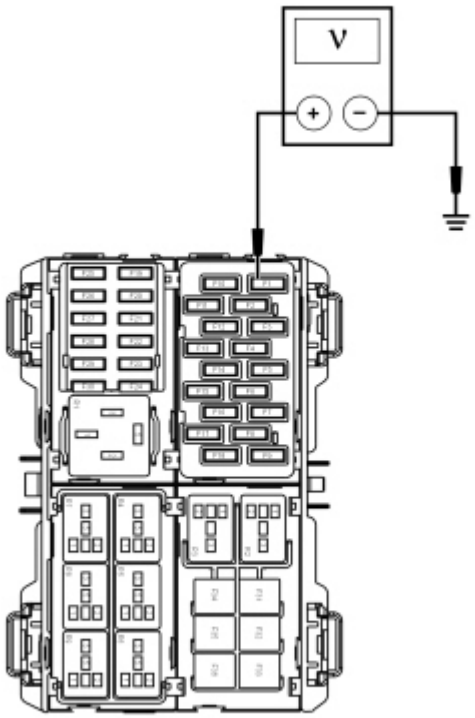
This pinpoint test is intended to diagnose the following:

- CJB fuse
- Battery Junction Box (BJB) fuse
- Wiring, terminals or connectors
- Ignition switch

PINPOINT TEST A: NO POWER IN ALL IGNITION SWITCH POSITIONS — VEHICLES WITH AN IGNITION SWITCH

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

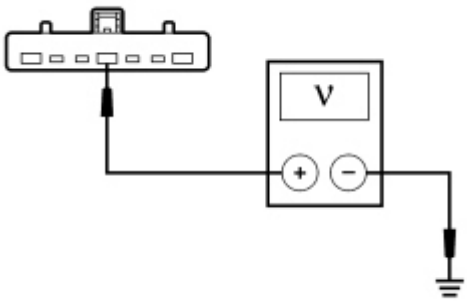
Test Step	Result / Action to Take
A1 CHECK FOR POWER TO CJB FUSE 1 (15A)	
• Disconnect: CJB Fuse 1 (15A). • Measure the voltage between CJB fuse 1 (15A), circuit SBP01 (RD), input side and ground.	**Yes** GO to A2 . **No** VERIFY BJB fuse 5 (60A) is OK. If OK, REPAIR circuit SBB05 (GY/RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. TEST the system for normal operation.



N0117019

- **Is the voltage greater than 10 volts?**

A2 CHECK CJB FUSE 1 (15A) • Check fuse: CJB fuse 1 (15A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A3 . **No** REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. TEST the system for normal operation.
A3 CHECK FOR POWER TO THE IGNITION SWITCH • Connect: CJB Fuse 1 (15A). • Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250-4, circuit SBP01 (RD), harness side and ground.	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** VERIFY in-line connector C212 is OK. If not OK, REPAIR as necessary. If OK, REPAIR circuit SBP01 (RD). TEST the system for normal operation.



A0089808

- **Is the voltage greater than 10 volts?**

Pinpoint Test B: No Power in ACC — Vehicles With an Ignition Switch

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Normal Operation

When the ignition switch is in the ACC position, voltage is provided to Central Junction Box (CJB) fuses 19 (7.5A) and 26 (7.5A).

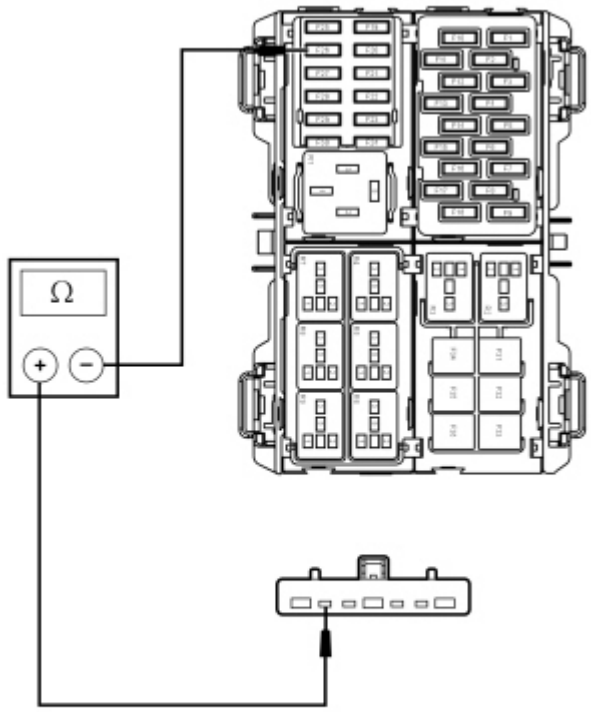
This pinpoint test is intended to diagnose the following:

- CJB fuse(s)
- Wiring, terminals or connectors
- Ignition switch

PINPOINT TEST B: NO POWER IN ACC — VEHICLES WITH AN IGNITION SWITCH

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
B1 CHECK THE IGNITION ACC CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Ignition Switch C250. • Disconnect: CJB Fuse 26 (7.5A). • Measure the resistance between CJB fuse 26 (7.5A), circuit CDC33 (VT/GN), input cavity and ignition switch C250-6, circuit CDC33 (VT/GN), harness side.	**Yes** VERIFY CJB fuses 19 (7.5A) and 26 (7.5A) are OK. If OK, INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. TEST the system for normal operation. **No** REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation.



N0118076

- **Is the resistance less than 5 ohms?**

Pinpoint Test C: No Power in ON — Vehicles With an Ignition Switch

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Normal Operation

The switch side of the ignition relay receives fused battery voltage from Battery Junction Box (BJB) fuse 7 (60A). When the ignition switch is in the ON position, voltage is provided to Central Junction Box (CJB) fuses 19 (7.5A), 20 (10A), 21 (10A), 22 (7.5A), 23 (10A), 26 (7.5A) and the coil side of the ignition relay.

This pinpoint test is intended to diagnose the following:

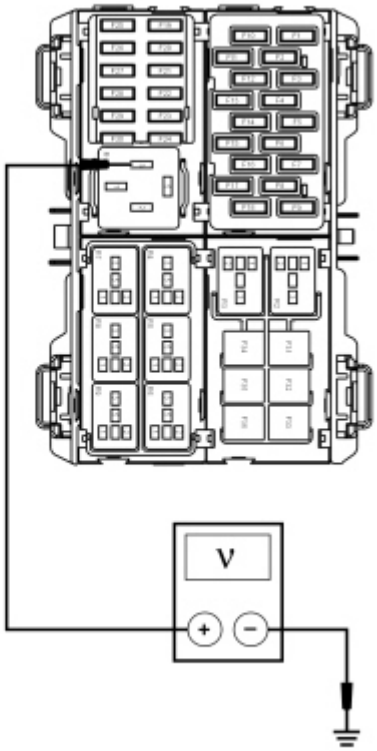
- CJB fuse(s)
- Wiring, terminals or connectors
- Ignition switch

PINPOINT TEST C: NO POWER IN ON — VEHICLES WITH AN IGNITION SWITCH

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
C1 CHECK FOR POWER TO CJB FUSE 19 (7.5A)	
• Disconnect: CJB Fuse 19 (7.5A). • Ignition ON.	**Yes** GO to C2 .

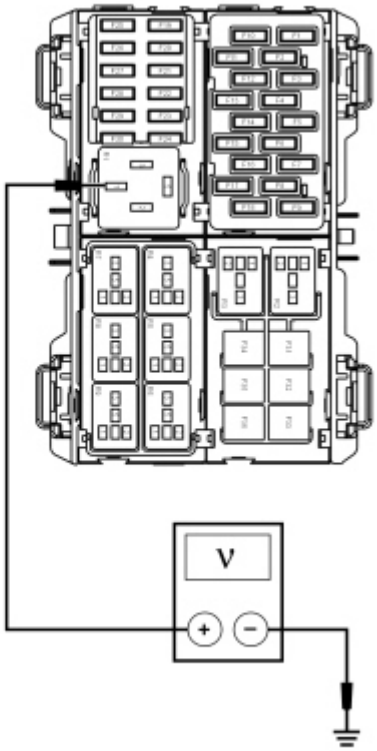
• Measure the voltage between CJB fuse 19 (7.5A), circuit CDC33 (VT/GN), input cavity and ground.  N0118068 • **Is the voltage greater than 10 volts?**	**No** GO to Pinpoint Test B .
C2 CHECK FOR POWER TO THE SWITCH SIDE OF THE IGNITION RELAY	
• Disconnect: Ignition Relay. • Measure the voltage between ignition relay cavity 3, circuit SBB07 (WH/RD), and ground.	**Yes** GO to C3 . **No** VERIFY BJB fuse 7 (60A) is OK. If OK, REPAIR circuit SBB07 (WH/RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR as necessary. TEST the system for normal operation.



N0117042

- **Is the voltage greater than 10 volts?**

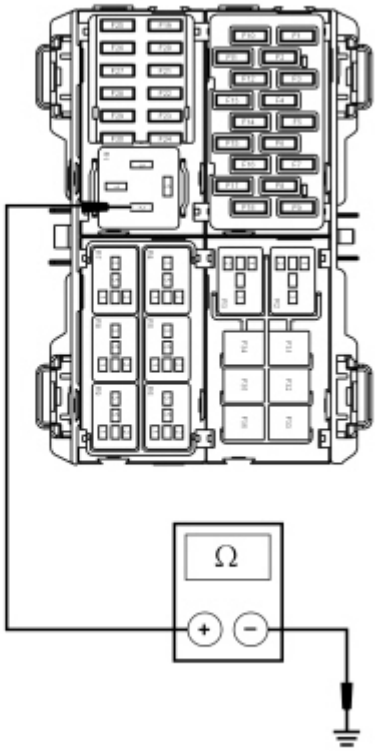
C3 CHECK FOR POWER AT THE COIL SIDE OF THE IGNITION RELAY	
• Measure the voltage between ignition relay cavity 1, circuit CDC32 (BN/YE), and ground.	**Yes** GO to C4 . **No** GO to C5 .



N0118073

- **Is the voltage greater than 10 volts?**

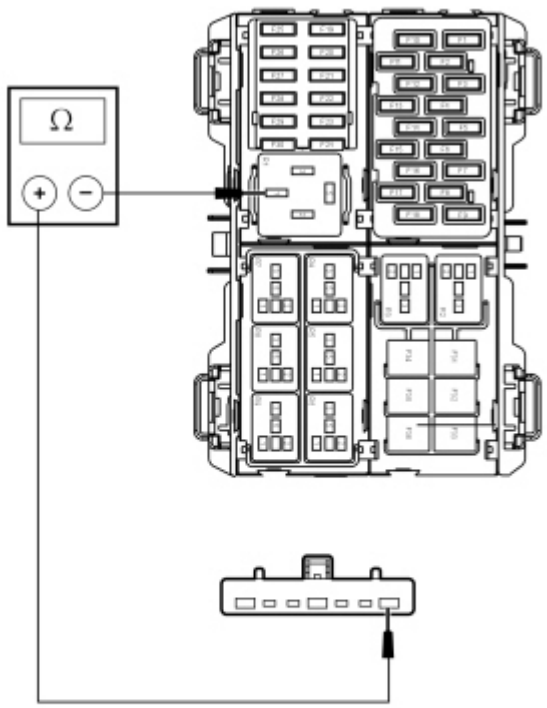
C4 CHECK THE IGNITION RELAY COIL GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between ignition relay cavity 2, circuit GD145 (BK/BU), and ground.	**Yes** INSTALL a new ignition relay. TEST the system for normal operation. **No** REPAIR circuit GD145 (BK/BU). TEST the system for normal operation.



N0119754

- **Is the resistance less than 5 ohms?**

C5 CHECK THE IGNITION ON CIRCUIT FOR AN OPEN	
• Measure the resistance between ignition switch C250-1, circuit CDC32 (BN/YE), harness side and ignition relay cavity 1, circuit CDC32 (BN/YE).	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CDC32 (BN/YE). TEST the system for normal operation.



N0118074

- **Is the resistance greater than 10,000 ohms?**

Pinpoint Test D: No Power in START — Vehicles With an Ignition Switch

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

When the ignition switch is in the START position, voltage is sent to the PCM.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch

PINPOINT TEST D: NO POWER IN START — VEHICLES WITH AN IGNITION SWITCH

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
D1 CHECK THE IGNITION START CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Ignition Switch C250.	**Yes** GO to D2 .

• Disconnect: PCM C175B. • Measure the resistance between ignition switch C250-7, circuit CDC35 (BU/WH), harness side and PCM C175B-9, circuit CDC35 (BU/WH), harness side.  N0118075 • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.
D2 ISOLATE THE IGNITION SWITCH • Carry out the ignition switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the ignition switch OK?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REFER to Section 303-06 to continue diagnosing the starting system.

Pinpoint Test E: DTCs B108B:23, 29 and B108C:23

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

The start stop/switch is a momentary, dual-contact, normally-open switch. This means that the 2 internal contacts will only remain closed for as long as the switch is pressed. As soon as the switch is released, the contacts will open. The start/stop switch is connected to the Remote Function Actuator (RFA)

module by 2 circuits. When the switch is pressed, both contacts close and connect to a ground circuit. The RFA module detects this ground signal and enters into 1 of the 3 ignition modes, depending on other RFA module inputs. The start/stop switch uses 2 sets of contacts and 2 circuits for redundancy; if there is a concern in one of the 2 circuits/contacts, the other can still provide a ground signal to the RFA module. Also, if there is a concern in one of the 2 circuits/contacts, the RFA module sets one or more DTCs.

- DTC B108B:23 (Start Button Circuit "A": Signal Stuck Low) — Pressing the start/stop switch starts a 120 second timer in the RFA module. This DTC sets if the signal from circuit "A" is still present when the timer expires. Pressing and holding the start/stop switch for more than 120 seconds also causes this DTC to set. This DTC only sets during normal operation and not during a module self-test.
- DTC B108B:29 (Start Button Circuit "A": Signal Invalid) — Pressing and releasing the start/stop switch causes both internal contacts to change state (open to closed and then closed to open) at the same time. The RFA module detects this change in state and increases an internal counter by 1 if the change does not happen at the same time or if only one of the contacts changes state. When the internal counter reaches 5, the RFA module sets this DTC. This DTC only sets during normal operation and not during a module self-test.
- DTC B108C:23 (Start Button Circuit "B": Signal Stuck Low) — Pressing the start/stop switch starts a 120 second timer in the RFA module. This DTC sets if the signal from circuit "B" is still present when the timer expires. Pressing and holding the start/stop switch for more than 120 seconds also causes this DTC to set. This DTC only sets during normal operation and not during a module self-test.

This pinpoint test is intended to diagnose the following:

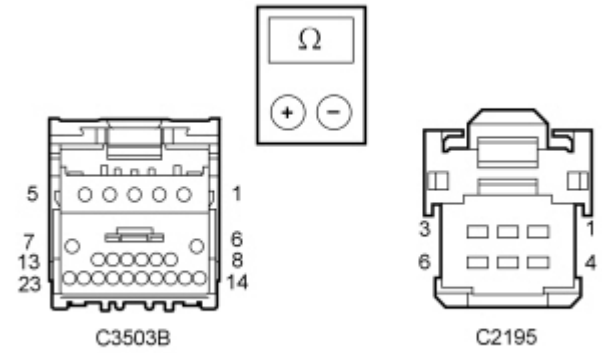
- Start/stop switch
- Wiring, terminals or connectors
- RFA module

PINPOINT TEST E: B108B:23, 29 AND B108C:23

Test Step	Result / Action to Take
E1 CHECK THE START/STOP SWITCH	
• Ignition OFF. • Disconnect: Start/Stop Switch C2195. • Carry out the start/stop switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Does the start/stop switch pass the test?**	**Yes** GO to E2. **No** INSTALL a new start/stop switch. CLEAR the DTCs. TEST the system for normal operation.
E2 ISOLATE THE DTC	
• Review the RFA module DTCs recorded during Inspection and Verification. • **Is DTC B108B:29 the only DTC present?**	**Yes** GO to E3. **No** If DTC B108B:23 is also present, GO to E5. If DTC B108C:23 is also present, GO to E6.
E3 CHECK THE RFA MODULE START/STOP SWITCH INPUT CIRCUITS FOR AN OPEN	
• Disconnect: RFA Module C3503B. • Measure resistance between RFA module C3503B, harness side and start/stop switch C2195, harness side using the	**Yes** GO to E4.

following chart:

RFA Module	Circuit	Start/Stop Switch
C3503B-23	CPK35 (YE/OG)	C2195-4
C3503B-22	CPK34 (BN/VT)	C2195-3



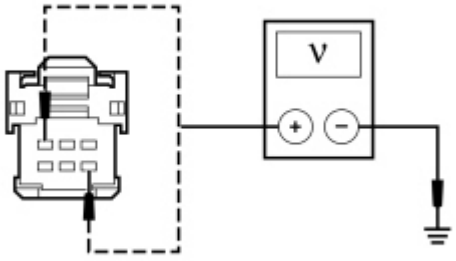
N0118077

- **Are the resistances less than 5 ohms?**

No
REPAIR the affected circuit (s). CLEAR the DTC. TEST the system for normal operation.

E4 CHECK THE RFA MODULE START/STOP SWITCH INPUT CIRCUITS FOR A SHORT TO VOLTAGE

- Connect: RFA Module C3503B.
- Connect: Start/Stop Switch C2195.
- Ignition ON.
- Disconnect: Start/Stop Switch C2195.
- Measure the voltage between ground and:
  - start/stop switch C2195-3, circuit CPK34 (BN/VT), harness side.
  - start/stop switch C2195-4, circuit CPK35 (YE/OG), harness side.



N0118078

- **Are the voltages greater than 5 volts?**

Yes
REPAIR the affected circuit (s). CLEAR the DTC. TEST the system for normal operation.

No
GO to E7 .

E5 CHECK START/STOP SWITCH CIRCUIT A FOR A SHORT TO GROUND

- Disconnect: RFA Module C3503B.
- Measure the resistance between start/stop switch C2195-3, circuit CPK34 (BN/VT), harness side and ground.

Yes
GO to E7 .

No
REPAIR circuit CPK34 (BN/VT). CLEAR the DTCs.

 N0117029 • **Is the resistance greater than 10,000 ohms?**	TEST the system for normal operation.
E6 CHECK START/STOP SWITCH CIRCUIT B FOR A SHORT TO GROUND • Disconnect: RFA Module C3503B. • Measure the resistance between start/stop switch C2195-4, circuit CPK35 (YE/OG), harness side and ground.  N0087657 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E7 . **No** REPAIR circuit CPK35 (YE/OG). CLEAR the DTCs. TEST the system for normal operation.

E7 CHECK FOR CORRECT RFA MODULE OPERATION
• Disconnect all RFA module electrical connectors.
• Check connectors for:
  ▪ corrosion
  ▪ pushed-out pins
  ▪ bent pins
  ▪ spread terminals
• Connect all RFA module electrical connectors and make sure they are seated correctly.
• Connect: Start/Stop Switch C2195.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10 .
	
	CONFIGURE the new RFA module. REFER to Programmable Module Installation (PMI) in Section 418-01 .
	
	CARRY OUT a Passive Anti-Theft System (PATS) Parameter Reset. REFER to Passive Anti-Theft System (PATS) Parameter Reset-Intelligent Access (IA) in Section 419-01B .
	
	PROGRAM 2 Intelligent Access (IA) keys. REFER to Key Programming Using Diagnostic Equipment-Intelligent Access (IA) in

	Section 419-01B . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: DTCs B10E7:11, 12, 16 and 17

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Normal Operation

The Remote Function Actuator (RFA) module controls and monitors the coil side of the smart keyless entry ignition relay. When the RFA module enters ON mode, it activates the relay. When energized, the relay sends power to the Central Junction Box (CJB), the main ignition relay and back to the RFA module. The RFA module uses this voltage input for diagnostic purposes.

- DTC B10E7:11 (Ignition On Relay: Circuit Short To Ground) — The RFA module monitors the output to the coil side of the smart keyless entry ignition relay. This DTC sets if the module detects a short to ground on this circuit during normal operation or during an RFA module on-demand self test.
- DTC B10E7:12 (Ignition On Relay: Circuit Short To Battery) — The RFA module monitors the output to the coil side of the smart keyless entry ignition relay. This DTC sets if the module detects a short to battery voltage on this circuit during normal operation or during an RFA module on-demand self test.
- DTC B10E7:16 (Ignition On Relay: Circuit Voltage Below Threshold) — The RFA module monitors the smart keyless entry ignition relay coil input circuit and the relay switch output. This DTC sets if the RFA module activates the relay but does not receive input voltage from the relay due to a short to ground or an open on the relay switch output circuit, an open in the relay coil input circuit or a relay fault. This DTC sets only if DTC B10E7:11 is not set and sets during normal operation or during an RFA module on-demand self test.
- DTC B10E7:17 (Ignition On Relay: Circuit Voltage Above Threshold) — The RFA module monitors the input from the smart keyless entry ignition relay. This DTC sets if the RFA module receives an input voltage from the relay but has not activated the relay. This DTC sets only if DTC B10E7:12 is not set and sets during normal operation or during an RFA module on-demand self test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Smart keyless entry ignition relay
- RFA module

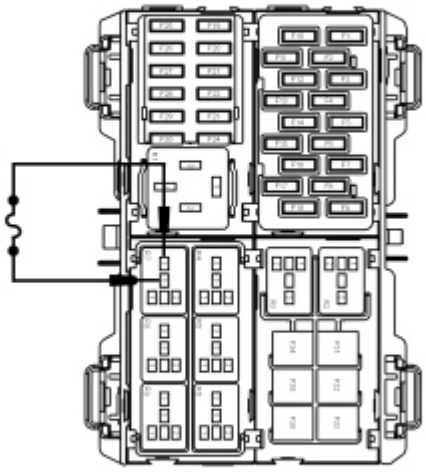
PINPOINT TEST F: DTCs B10E7:11, 12, 16 and 17

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take

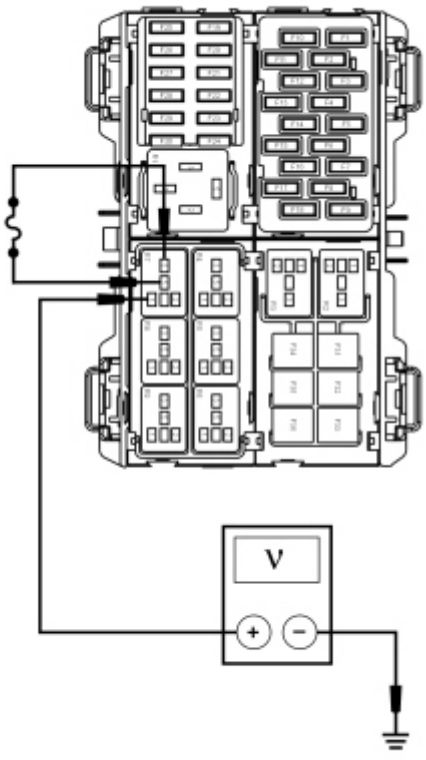
F1 REVIEW THE RFA MODULE DTCs • Review the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC B10E7:11, 12, 16 or 17 present?**	**Yes** For B10E7:11, GO to F2. For B10E7:12, GO to F4. For B10E7:16, GO to F5. For B10E7:17, GO to F9. **No** For all other RFA module DTCs, REFER to the Remote Function Actuator (RFA) Module DTC Chart in this section.
F2 CHECK THE SMART KEYLESS ENTRY IGNITION RELAY CONTROL CIRCUIT AND RFA MODULE FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: Smart Keyless Entry Ignition Relay. • Measure the resistance between smart keyless entry ignition relay cavity 1, circuit ZA102 (OG/YE), and ground.  N0117031 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new smart keyless entry ignition relay. CLEAR the DTC. REPEAT the self-test. **No** GO to F3.
F3 ISOLATE THE SMART KEYLESS ENTRY IGNITION RELAY CONTROL CIRCUIT AND CHECK FOR A SHORT TO GROUND • Disconnect: RFA Module C3503B. • Measure the resistance between smart keyless entry ignition relay cavity 1, circuit ZA102 (OG/YE), and ground.	**Yes** GO to F14. **No**

 N0117031 • **Is the resistance greater than 10,000 ohms?**	REPAIR circuit ZA102 (OG/YE). CLEAR the DTCs. REPEAT the self-test.
F4 CHECK THE SMART KEYLESS ENTRY IGNITION RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: Smart Keyless Entry Ignition Relay. • Disconnect: RFA Module C3503B. • Connect a fused jumper wire between smart keyless entry ignition relay cavity 3, circuit SBP01 (RD) and smart keyless entry ignition relay cavity 5, circuit CDC32 (BN/YE).	**Yes** REPAIR circuit ZA102 (OG/YE). CLEAR the DTCs. REPEAT the self-test. **No** GO to F14 .



N0117032

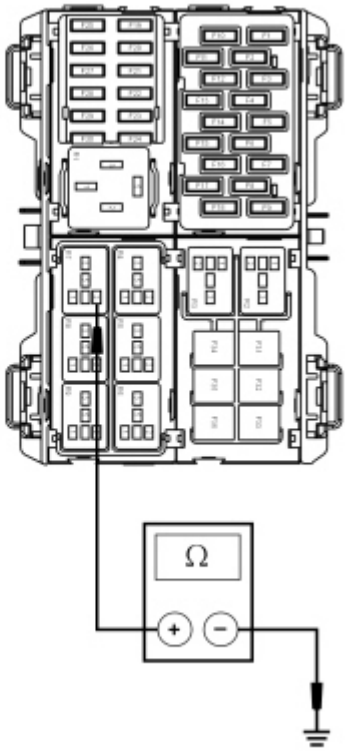
- Measure the voltage between smart keyless entry ignition relay cavity 1, circuit ZA102 (OG/YE), and ground.



N0117033

- **Is any voltage present?**

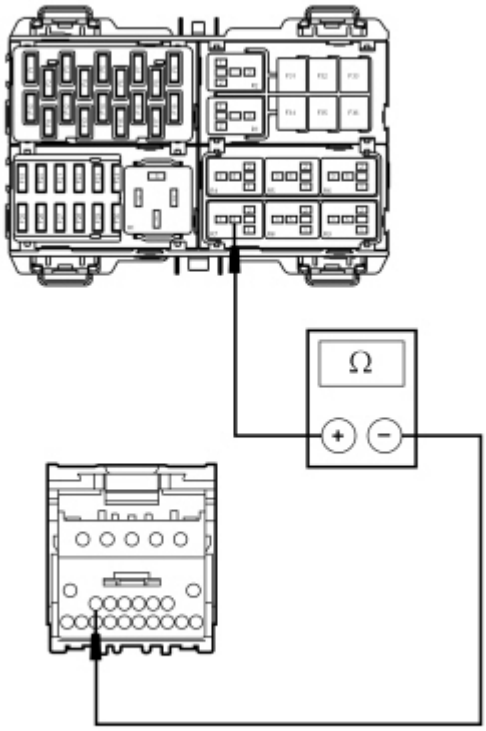
CONTROL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Smart Keyless Entry Ignition Relay. • Disconnect: RFA Module C3503B. • Measure the resistance between smart keyless entry ignition relay cavity 1, circuit ZA102 (OG/YE), and RFA module C3503B-18, circuit ZA102 (OG/YE), harness side.  N0117035 • **Is the resistance less than 5 ohms?**	**Yes** GO to F6 . **No** REPAIR circuit ZA102 (OG/YE). CLEAR the DTC. REPEAT the self-test.
F6 CHECK THE RELAY CONTROL GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between smart keyless entry ignition relay cavity 2, circuit GD145 (BK/BU), and ground.	**Yes** GO to F7 . **No** REPAIR circuit GD145 (BK/BU). CLEAR the DTC. REPEAT the self-test.



N0117036

- **Is the resistance less than 5 ohms?**

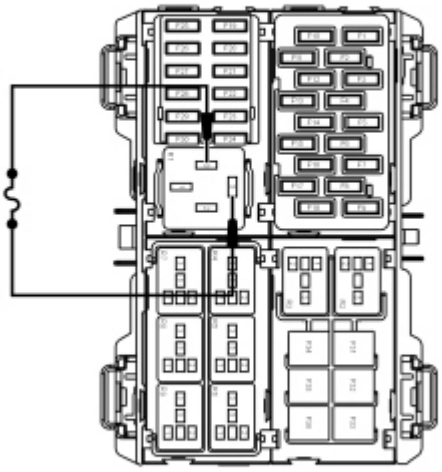
F7 CHECK THE RELAY OUTPUT CIRCUIT FOR AN OPEN	
• Measure the resistance between smart keyless entry ignition relay cavity 5, circuit CDC32 (BN/YE), and RFA module C3503B-13, circuit CDC32 (BN/YE), harness side.	**Yes** GO to F8 . **No** REPAIR circuit CDC32 (BN/YE). CLEAR the DTC. REPEAT the self-test.



N0117037

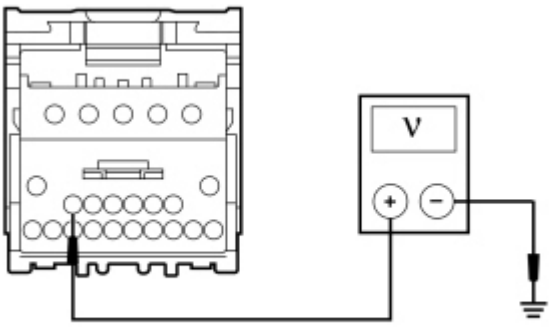
- **Is the resistance less than 5 ohms?**

F8 CHECK THE SMART KEYLESS ENTRY IGNITION RELAY OPERATION	
• Carry out the micro ISO relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Does the relay pass the test?**	**Yes** GO to F14 . **No** INSTALL a new smart keyless entry ignition relay. CLEAR the DTC. REPEAT the self-test.
F9 CHECK THE SMART KEYLESS ENTRY IGNITION RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: RFA Module C3503B. • Disconnect: Ignition Relay. • **NOTE:** This step may cause one or more DTCs to set in the RFA module. • Connect a fused jumper wire between ignition relay cavity 3, circuit SBB07 (WH/RD) and ignition relay cavity 5, circuit CDC21 (GY/BN).	**Yes** GO to F10 . **No** INSTALL a new smart keyless entry ignition relay. CLEAR the DTC. REPEAT the self-test.



N0118107

- Measure the voltage between RFA module C3503B-13, circuit CDC32 (BN/YE), harness side and ground.



N0118109

- **Is any voltage present?**

F10 ISOLATE CJB FUSE 20 (10A) OUTPUT CIRCUIT AND RECHECK THE RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: CJB Fuse 20 (10A). • Measure the voltage between RFA module C3503B-13, circuit CDC32 (BN/YE), harness side and ground.	**Yes** GO to F11 . **No** REFER to the Wiring Diagrams manual to identify possible causes of the short on circuit CBP20 (YE/VT). REPAIR as necessary.

 N0118109 • **Is any voltage present?**	CLEAR the DTC. REPEAT the self-test.
F11 ISOLATE CJB FUSE 21 (10A) OUTPUT CIRCUIT AND RECHECK THE RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: CJB Fuse 21 (10A). • Measure the voltage between RFA module C3503B-13, circuit CDC32 (BN/YE), harness side and ground.  N0118109 • **Is any voltage present?**	**Yes** GO to F12 . **No** REFER to the Wiring Diagrams manual to identify the cause of the short on circuit CBP21 (BU/GY). REPAIR as necessary. CLEAR the DTC. REPEAT the self-test.
F12 ISOLATE CJB FUSE 22 (7.5A) OUTPUT CIRCUIT AND RECHECK THE RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: CJB Fuse 22 (7.5A). • Measure the voltage between RFA module C3503B-13, circuit CDC32 (BN/YE), harness side and ground.  N0118109 • **Is any voltage present?**	**Yes** GO to F13 . **No** REFER to the Wiring Diagrams manual to identify the cause of the short on circuit CBP22 (GN/OG). REPAIR as necessary. CLEAR the DTC. REPEAT the self-test.
F13 ISOLATE CJB FUSE 23 (10A) OUTPUT CIRCUIT AND	

RECHECK THE RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: CJB Fuse 23 (10A). • Measure the voltage between RFA module C3503B-13, circuit CDC32 (BN/YE), harness side and ground.  N0118109 • **Is any voltage present?**	**Yes** GO to F14. **No** REFER to the Wiring Diagrams manual to identify the cause of the short on circuit CBP23 (BN/YE). REPAIR as necessary. CLEAR the DTC. REPEAT the self-test.
F14 CHECK FOR CORRECT RFA MODULE OPERATION	

• Disconnect all RFA module electrical connectors.
• Check connectors for:
  ▪ corrosion
  ▪ pushed-out pins
  ▪ bent pins
  ▪ spread terminals
• Connect all RFA module electrical connectors and make sure they are seated correctly.
• Connect: Smart Keyless Entry Ignition Relay.
• Connect: Ignition Relay (if previously disconnected).
• Connect: CJB Fuse 20 (10A) (if previously disconnected).
• Connect: CJB Fuse 21 (10A) (if previously disconnected).
• Connect: CJB Fuse 22 (7.5A) (if previously disconnected).
• Connect: CJB Fuse 23 (10A) (if previously disconnected).
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10.
	
	CONFIGURE the new RFA module. REFER to Programmable Module Installation (PMI) in Section 418-01.
	
	CARRY OUT a Passive Anti-Theft System (PATS) Parameter Reset. REFER to Passive Anti-Theft System (PATS) Parameter Reset-Intelligent Access (IA) in Section 419-01B.
	
	PROGRAM 2 Intelligent Access (IA) keys. REFER to Key Programming Using Diagnostic Equipment-Intelligent Access (IA) in Section 419-01B.
	
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test G: DTCs U3004:11 and 12

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Normal Operation

The Remote Function Actuator (RFA) module controls and monitors the coil side of the smart keyless entry accessory relay. When the RFA module enters ACC mode, it activates the relay. When energized, the relay sends power to the Audio Control Module (ACM) and the Instrument Panel Cluster (IPC) through Central Junction Box (CJB) fuse 19 (7.5A); and to the Tire Pressure Monitoring System (TPMS)/Vehicle Security Module (VSM) through CJB fuse 26 (7.5A).

- DTC U3004:11 (Accessory Power Relay: Circuit Short To Ground) — The RFA module monitors the output to the coil side of the smart keyless entry accessory relay. This DTC sets if the module detects a short to ground on this circuit. This DTC only sets during normal operation.
- DTC U3004:12 (Accessory Power Relay: Circuit Short To Battery) — The RFA module monitors the output to the coil side of the smart keyless entry accessory relay. This DTC sets if the module detects a short to battery voltage on this circuit. This DTC only sets during normal operation.

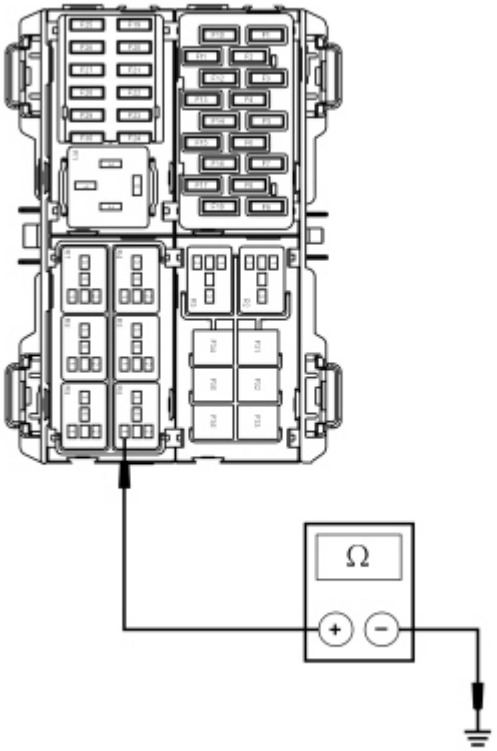
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Smart keyless entry accessory relay
- RFA module

PINPOINT TEST G: DTCs U3004:11 AND 12

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

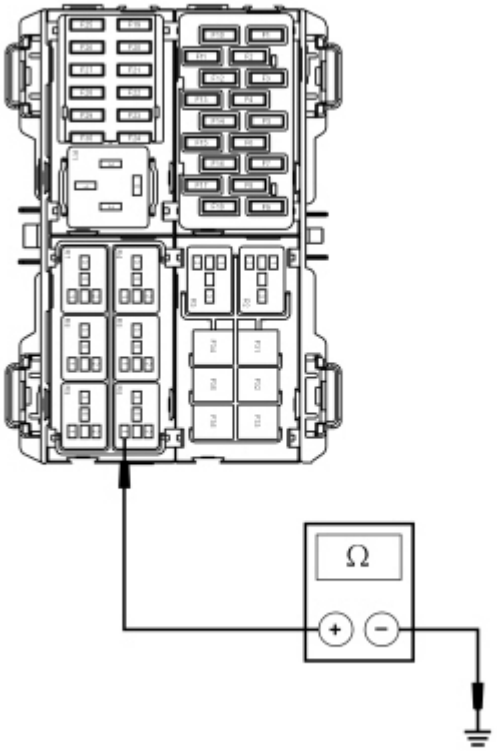
Test Step	Result / Action to Take
G1 REVIEW THE RFA MODULE DTCs • Review the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC U3004:11 or U3004:12 present?**	**Yes** For U3004:11, GO to G2 . For U3004:12, GO to G4 . **No** For all other RFA module DTCs, REFER to the Remote Function Actuator (RFA) Module DTC Chart in this section.
G2 CHECK THE SMART KEYLESS ENTRY ACCESSORY RELAY CONTROL FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: Smart Keyless Entry Accessory Relay. • Measure the resistance between smart keyless entry accessory relay cavity 1, circuit ZA101 (OG), and ground.	**Yes** INSTALL a new smart keyless entry accessory relay. CLEAR the DTC. TEST the system for normal operation. **No** GO to G3 .



N0117040

- **Is the resistance greater than 10,000 ohms?**

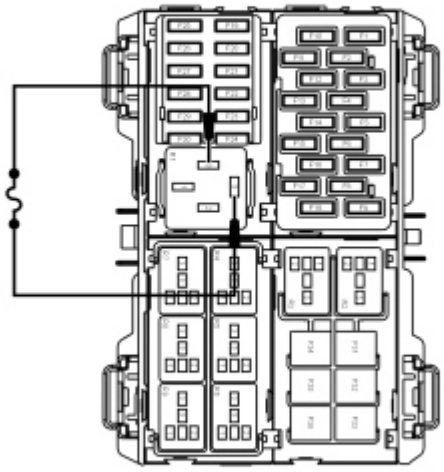
G3 ISOLATE THE SMART KEYLESS ENTRY ACCESSORY RELAY CONTROL CIRCUIT AND RECHECK FOR A SHORT TO GROUND	
• Disconnect: RFA Module C3503C. • Measure the resistance between smart keyless entry accessory relay cavity 1, circuit ZA101 (OG), and ground.	**Yes** GO to G5 . **No** REPAIR circuit ZA101 (OG). CLEAR the DTC. TEST the system for normal operation.



N0117040

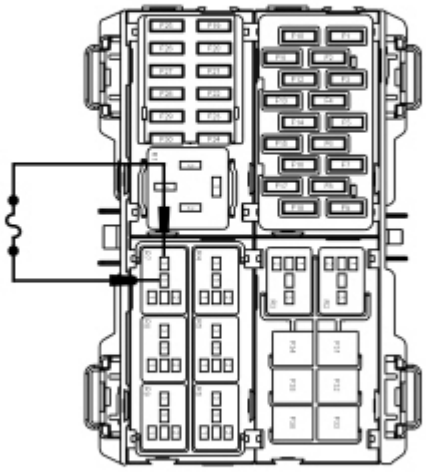
- **Is the resistance greater than 10,000 ohms?**

G4 CHECK THE SMART KEYLESS ENTRY ACCESSORY RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: RFA Module C3503C. • Disconnect: Ignition Relay. • Disconnect: Smart Keyless Entry Ignition Relay. • Disconnect: Smart Keyless Entry Accessory Relay. • **NOTE:** This step may cause one or more DTCs to set in the RFA module. • Connect a fused jumper wire between ignition relay cavity 3, circuit SBB07 (WH/RD) and ignition relay cavity 5, circuit CDC21 (GY/BN).	**Yes** REPAIR circuit ZA101 (OG). CLEAR the DTC. TEST the system for normal operation. **No** GO to G5 .



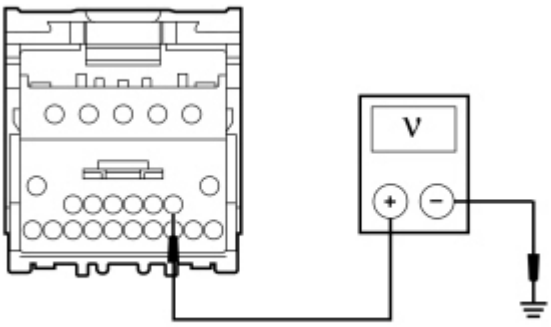
N0118107

- **NOTE:** This step may cause one or more DTCs to set in the RFA module.
- Connect a fused jumper wire between smart keyless entry ignition relay cavity 3, circuit SBP01 (RD) and smart keyless entry ignition relay cavity 5, circuit CDC32 (BN/YE).



N0117032

- Measure the voltage between RFA module C3503C-8, circuit ZA101 (OG), and ground.



N0118111

- **Is any voltage present?**

G5 CHECK FOR CORRECT RFA MODULE OPERATION
- Disconnect all RFA module electrical connectors.
- Check connectors for:
  - corrosion
  - pushed-out pins
  - bent pins
  - spread terminals
- Connect all RFA module electrical connectors and make sure they are seated correctly.
- Connect: Ignition Relay.
- Connect: Smart Keyless Entry Accessory Relay.
- Connect: Smart Keyless Entry Ignition Relay.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10 .
	
	CONFIGURE the new RFA module. REFER to Programmable Module Installation (PMI) in Section 418-01 .
	
	CARRY OUT a Passive Anti-Theft System (PATS)

	Parameter Reset. REFER to Passive Anti-Theft System (PATS) Parameter Reset-Intelligent Access (IA) in Section 419-01B . PROGRAM 2 Intelligent Access (IA) keys. REFER to Key Programming Using Diagnostic Equipment-Intelligent Access (IA) in Section 419-01B . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test H: No Power in ON/No Power in START — Vehicles With a Push Button Start System

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

Normal Operation

To place the vehicle in ON mode, place the Intelligent Access (IA) key inside the vehicle and press the start/stop switch for at least one second without applying the brake pedal (or clutch pedal if equipped with a manual transmission). When in ON mode, the Remote Function Actuator (RFA) module applies battery voltage to the coil side of the smart keyless entry ignition relay and the smart keyless entry accessory relay. When activated, the smart keyless entry ignition relay provides battery voltage to the main ignition relay and several fuses in the Central Junction Box (CJB). The main ignition relay provides power to various vehicle systems. When activated, the smart keyless entry accessory relay provides battery voltage to CJB fuses 19 (7.5A) and 26 (7.5A).

To start the engine; place the IA key inside the vehicle, shift the transaxle into PARK (automatic transaxle) or NEUTRAL (automatic or manual transaxle), place the vehicle in either OFF mode or ON mode, press and hold the brake pedal (automatic transaxle) or clutch pedal (manual transaxle), then press the start/stop switch.

At that time, the RFA module sends a voltage signal to the input side of the starter inhibit relay coil. If the Passive Anti-Theft System (PATS) authorizes the system to start the engine, the PCM supplies a ground to the coil of the starter inhibit relay, closing the relay and engaging the starter motor.

In the event the vehicle will not enter ON or START mode, the Front Control/Display Interface Module (FCDIM) displays messages that may indicate possible causes.

This pinpoint test is intended to diagnose the following:

- Fuses

- Wiring, terminals or connectors
- Start/stop switch
- Smart keyless entry ignition relay
- Smart keyless entry accessory relay
- Ignition relay
- Cruise control deactivation switch
- Clutch Pedal Position (CPP) switch
- Starting system
- PATS
- RFA module

PINPOINT TEST H: NO POWER IN ON/NO POWER IN START — VEHICLES WITH A PUSH BUTTON START SYSTEM

Test Step	Result / Action to Take
H1 CONFIRM THE IA KEY ALLOWS VEHICLE ENTRY • **NOTE:** Do not place the IA key inside the vehicle during this test step. • With the driver door unlocked and the IA key within 1 meter (3 feet) of the driver door, press the button on the driver door handle; the driver door should lock. • **Did the driver door lock?**	**Yes** GO to H3. **No** GO to H2.
H2 CHECK VEHICLE BATTERY • Carry out the Battery Condition Test. Refer to Section 414-01. • **Is the battery OK?**	**Yes** REFER to Section 501-14 to diagnose the Remote Keyless Entry (RKE) system. **No** CORRECT the battery condition. TEST the system for normal operation.
H3 ATTEMPT VEHICLE START WHILE MONITORING THE FCDIM • With the vehicle in PARK (automatic transaxle) or NEUTRAL (automatic or manual transaxle) and the IA key in the vehicle, press the brake pedal (automatic transaxle) or clutch pedal (manual transaxle) and then press the start/stop switch while monitoring FCDIM messages. • **Did the engine crank?**	**Yes** CARRY OUT Key ON Engine OFF (KOEO) self-test. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the no start concern. **No** If NO KEY DETECTED is displayed in the FCDIM, REFER to Section 419-01B to diagnose the RFA module and interior antenna concern. If TO START PRESS BRAKE is displayed in the FCDIM, GO to H19.

	If TO START SELECT N OR P is displayed in the FCDIM, GO to H24. If TO START PRESS CLUTCH is displayed in the FCDIM, GO to H29. If there is no message displayed in the FCDIM, GO to H4.
H4 CHECK FOR IGNITION ON MODE • **NOTE:** The air bag warning indicator in the Instrument Panel Cluster (IPC) only illuminates and proves out when the vehicle successfully enters ON mode. • Monitor the air bag warning indicator while attempting to enter ON mode. • **Did the air bag warning indicator illuminate for approximately 6 seconds and then go out?**	**Yes** GO to H11. **No** GO to H5.
H5 CARRY OUT A NETWORK TEST **NOTE:** Entering the vehicle with the IA key will cause the RFA module to "wake up". While the RFA module is awake, it is able to report DTCs from a Network Test. Other modules may not be able to pass the Network Test with the ignition in the OFF mode. • Enter the following diagnostic mode on the scan tool: Network Test. • **Did the RFA module pass the Network Test?**	**Yes** GO to H6. **No** REFER to Section 418-00 to diagnose no communication with the RFA module.

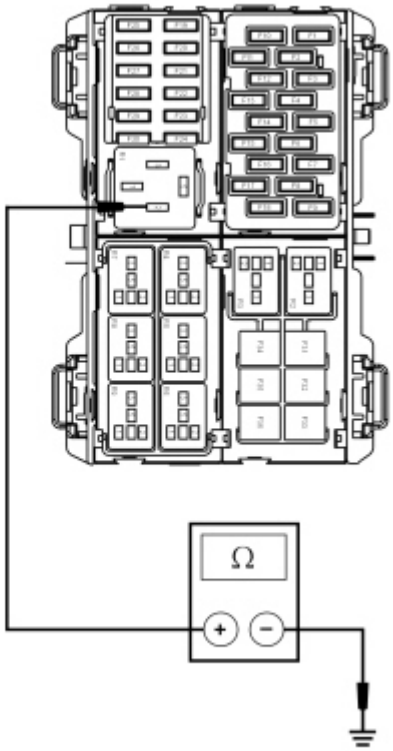
H6 CHECK THE START/STOP SWITCH PIDs
NOTE: The RFA module is able to provide DataLogger information with the ignition in the OFF mode. When the scan tool indicates "Turn the Ignition ON", ignore this command and press or click the "continue" button.
• Enter the following diagnostic mode on the scan tool: DataLogger — RFA Module.
• Monitor the following RFA module PIDs while pressing and releasing the start/stop switch:
  ▪ Start Button Circuit A (START_SW_1)
  ▪ Start Button Circuit B (START_SW_2)
• **Do both PIDs display ON when the switch is pressed and OFF when the switch is released?**
	Yes
	GO to H12.
	
	No
	GO to H7.

H7 CHECK THE START/STOP SWITCH • Ignition OFF. • Disconnect: Start/Stop Switch C2195. • Carry out the start/stop switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Does the start/stop switch pass the test?**	**Yes** GO to H8. **No** INSTALL a new start/stop switch. CLEAR the DTCs. TEST the system for normal operation.
H8 CHECK THE START/STOP SWITCH GROUND CIRCUIT FOR AN OPEN • Measure the resistance between start/stop switch C2195-1, circuit GD115 (BK/GY), and ground.	**Yes** GO to H9. **No**

 N0119326 • **Is the resistance less than 5 ohms?**	REPAIR circuit GD115 (BK/GY). TEST the system for normal operation.
H9 CHECK THE RFA MODULE START/STOP SWITCH INPUT CIRCUITS FOR AN OPEN • Disconnect: RFA Module C3503B. • Measure resistance between RFA module C3503B, harness side and start/stop switch C2195, harness side using the following chart: **RFA Module** / **Circuit** / **Start/Stop Switch** C3503B-23 / CPK35 (YE/OG) / C2195-4 C3503B-22 / CPK34 (BN/VT) / C2195-3  N0118077 • **Are the resistances less than 5 ohms?**	**Yes** GO to H10 . **No** REPAIR the affected circuit (s). CLEAR the DTC. TEST the system for normal operation.
H10 CHECK THE RFA MODULE START/STOP SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND • Measure the resistance between ground and: ▪ start/stop switch C2195-3, circuit CPK34 (BN/VT), harness side. ▪ start/stop switch C2195-4, circuit CPK35 (YE/OG), harness side.	**Yes** GO to H34 . **No** REPAIR the affected circuit (s). CLEAR the DTC. TEST the system for normal operation.

 N0118112 • **Are the resistances greater than 10,000 ohms?**	
H11 CARRY OUT AN RFA MODULE SELF-TEST • Enter the following diagnostic mode on the scan tool: Self Test — RFA Module. • Review the results of the self-test. • **Are any RFA module DTCs present?**	**Yes** For DTCs B108B:23, B108B:29 and B108C:23, GO to Pinpoint Test E. For DTCs B10E7:11, B10E7:12, B10E7:16 and B10E7:17, GO to Pinpoint Test F. For DTCs U3004:11 and U3004:12, GO to Pinpoint Test G. For DTCs U300E:62, U300F:62, U3010:62 and U3011:62, GO to Pinpoint Test I. For all other RFA module DTCs, REFER to the Remote Function Actuator (RFA) Module DTC Chart in this section. **No** REFER to Section 303-06 to diagnose the starting system.
H12 ISOLATE THE IGNITION RELAY • Ignition OFF. • Disconnect: Ignition Relay. • Carry out the appropriate relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the relay OK?**	**Yes** GO to H13. **No** INSTALL a new ignition relay. CLEAR the DTCs. TEST the system for normal operation.
H13 CHECK FOR POWER TO THE IGNITION RELAY • Disconnect: Ignition Relay. • Measure the voltage between ignition relay cavity 3, circuit SBB07 (WH/RD), and ground.	**Yes** GO to H14. **No** VERIFY Battery Junction Box (BJB) fuse 7 (60A) is OK. If OK, REPAIR circuit SBB07 (WH/RD).

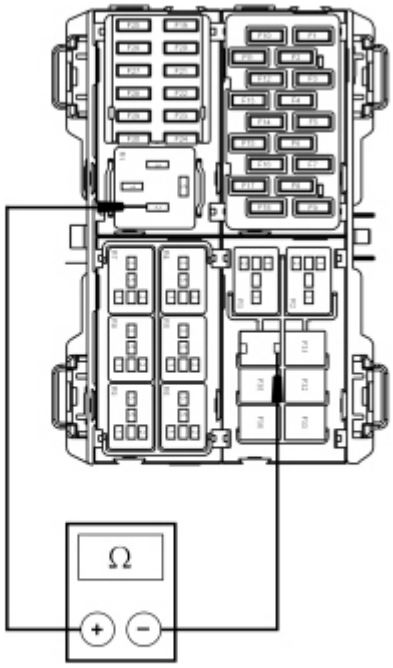
 N0117042 • **Is the voltage greater than 10 volts?**	If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. REPAIR as necessary. TEST the system for normal operation.
H14 CHECK THE IGNITION RELAY GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between ignition relay cavity 2, circuit GD145 (BK/BU), and ground.	**Yes** GO to H15 . **No** REPAIR circuit GD145 (BK/BU). TEST the system for normal operation.



N0117043

- **Is the resistance less than 5 ohms?**

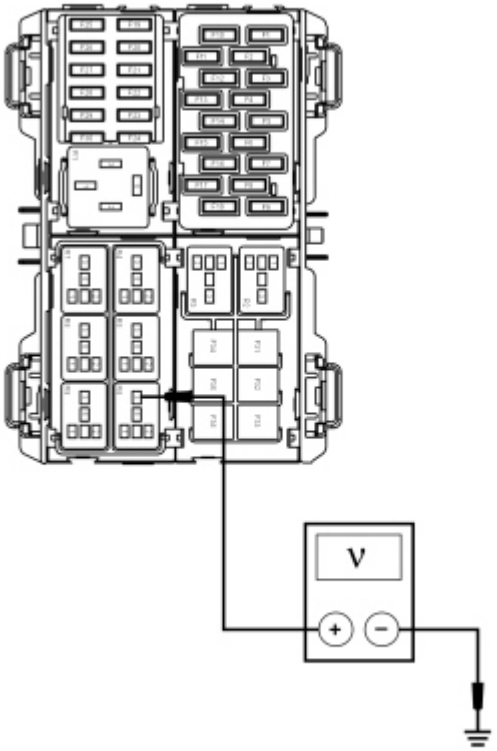
H15 CHECK THE IGNITION RELAY OUTPUT CIRCUIT FOR AN OPEN	
• Disconnect: CJB Fuse 34 (30A). • Measure the resistance between ignition relay pin 5, circuit CDC21 (GY/BN), and CJB fuse 34 (30A), circuit CDC21 (GY/BN), input side.	**Yes** GO to H16 . **No** REPAIR circuit CDC21 (GY/BN). TEST the system for normal operation.



N0117044

- **Is the resistance less than 5 ohms?**

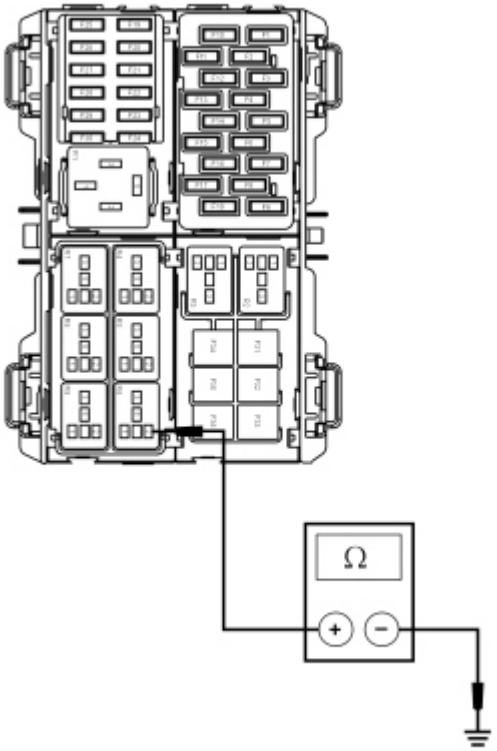
H16 CHECK FOR POWER TO THE SMART KEYLESS ENTRY ACCESSORY RELAY	
• Ignition OFF. • Disconnect: Smart Keyless Entry Accessory Relay. • Measure the voltage between smart keyless entry accessory relay cavity 3, circuit SBP01 (RD), and ground.	**Yes** GO to H17 . **No** VERIFY CJB fuse 1 (15A) is OK. If OK, REPAIR circuit SBP01 (RD). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. REPAIR as necessary. TEST the system for normal operation.



N0117045

- **Is the voltage greater than 10 volts?**

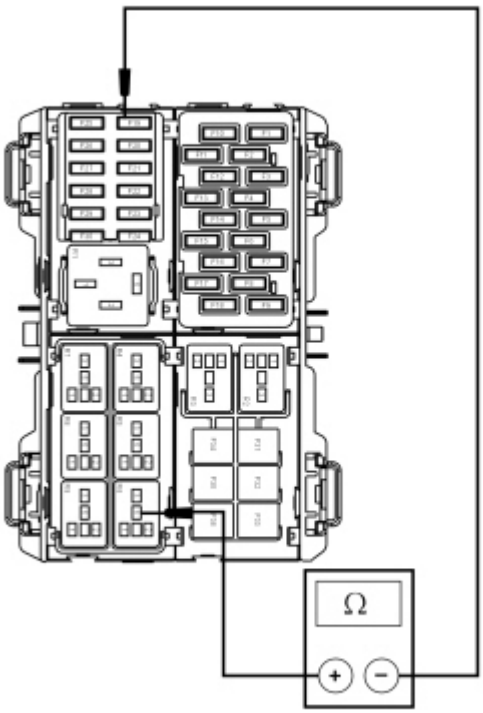
H17 CHECK THE SMART KEYLESS ENTRY ACCESSORY RELAY GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between smart keyless entry accessory relay cavity 2, circuit GD145 (BK/BU), and ground.	**Yes** GO to H18 . **No** REPAIR circuit GD145 (BK/BU). TEST the system for normal operation.



N0117046

- **Is the resistance less than 5 ohms?**

H18 CHECK THE SMART KEYLESS ENTRY ACCESSORY RELAY OUTPUT CIRCUIT FOR AN OPEN	
• Measure the resistance between smart keyless entry accessory relay cavity 5, circuit CDC33 (VT/GN), and CJB fuse 19 (7.5A), circuit CDC33 (VT/GN), input side.	**Yes** INSTALL a new smart keyless entry accessory relay. TEST the system for normal operation. **No** REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation.



N0117047

- **Is the resistance less than 5 ohms?**

H19 CHECK THE RFA MODULE BRAKE SWITCH (BRAKE_SW) PID	
NOTE: The RFA module is able to provide DataLogger information with the ignition in the OFF mode. When the scan tool indicates "Turn the Ignition ON", ignore this command and press or click the "continue" button. • Enter the following diagnostic mode on the scan tool: DataLogger — RFA Module. • Monitor the BRAKE_SW PID while applying the brake pedal. • **Does the PID change from NO to YES when the brake pedal is applied?**	**Yes** GO to H34 . **No** GO to H20 .
H20 CHECK THE RFA MODULE CRUISE CONTROL DEACTIVATOR SWITCH INPUT	
• Disconnect: RFA Module C3503B. • While pressing and releasing the brake pedal, measure the resistance between RFA module C3503B-21, circuit CCA29 (GN/BU), harness side and ground.	**Yes** GO to H34 . **No** GO to H21 .

 N0117048 • **Is the resistance less than 5 ohms with the brake pedal released and greater than 10,000 ohms with the brake pedal applied?**	
H21 CHECK THE RFA MODULE CRUISE CONTROL DEACTIVATOR SWITCH INPUT CIRCUIT FOR AN OPEN • Disconnect: Cruise Control Deactivator Switch C278. • Measure the resistance between RFA module C3503B-21, circuit CCA29 (GN/BU), harness side and cruise control deactivator switch C278-2, circuit CCA29 (GN/BU), harness side.  N0117049 • **Is the resistance less than 5 ohms?**	**Yes** GO to H22 . **No** REPAIR circuit CCA29 (GN/BU). TEST the system for normal operation.
H22 CHECK THE RFA MODULE CRUISE CONTROL DEACTIVATOR SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND • Measure the resistance between RFA module C3503B-21, circuit CCA29 (GN/BU), harness side and ground.  N0117048 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H23 . **No** REPAIR circuit CCA29 (GN/BU). TEST the system for normal operation.

H23 CHECK THE RFA MODULE CRUISE CONTROL DEACTIVATOR SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between cruise control deactivator switch C278-1, circuit GD187 (BK/GN), harness side.  N0117050 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new cruise control deactivator switch. REFER to Section 419-03. TEST the system for normal operation. **No** REPAIR circuit GD187 (BK/GN). TEST the system for normal operation.
H24 CHECK THE RFA MODULE CRANK FACTOR PARK (CRK_FACT_PK) PID	
NOTE: The RFA module is able to provide DataLogger information with the ignition in the OFF mode. When the scan tool indicates "Turn the Ignition ON", ignore this command and press or click the "continue" button. • Enter the following diagnostic mode on the scan tool: DataLogger — RFA Module. • Monitor the Crk_Fact_Pk PID while shifting the transaxle into and out of PARK and NEUTRAL. • **Does the PID display YES with the transaxle in PARK/NEUTRAL and NO with the transaxle out of PARK/NEUTRAL?**	**Yes** GO to H34. **No** GO to H25.
H25 CHECK THE RFA MODULE PARK POSITION SWITCH INPUT	
• Select PARK. • Disconnect: RFA Module C3503C. • Measure the resistance between RFA module C3503C-14, circuit CDC41 (WH/BN), harness side and ground.  N0117051 • **Is the resistance less than 5 ohms with the transaxle in PARK?**	**Yes** GO to H34. **No** GO to H26.
H26 CHECK THE RFA MODULE PARK POSITION SWITCH INPUT CIRCUIT FOR AN OPEN	
• Disconnect: Floor Shifter C3245.	**Yes**

• Measure the resistance between RFA module C3503C-14, circuit CDC41 (WH/BN), harness side and floor shifter C3245-2, circuit CDC41 (WH/BN), harness side.  N0117052 • **Is the resistance less than 5 ohms?**	GO to H27 . **No** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation.
H27 CHECK THE RFA MODULE PARK POSITION SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between RFA module C3503C-14, circuit CDC41 (WH/BN), harness side and ground.  N0117051 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H28 . **No** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation.
H28 CHECK THE RFA MODULE PARK POSITION SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between floor shifter C3245-5, circuit GD115 (BK/GY), harness side and ground.  N0117053 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new transaxle selector lever (floor shifter). REFER to Section 307-05 . TEST the system for normal operation. **No** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation.
H29 CHECK THE RFA CLUTCH SWITCH (CLUTCH_SW) PID	

NOTE: The RFA module is able to provide DataLogger information with the ignition in the OFF mode. When the scan tool indicates "Turn the Ignition ON", ignore this command and press or click the "continue" button. • Enter the following diagnostic mode on the scan tool: DataLogger — RFA Module. • Monitor the CLUTCH_SW PID while pressing and releasing the clutch pedal. • **Does the PID display YES with the clutch pedal fully applied and NO with the clutch pedal released?**	**Yes** GO to H34 . **No** GO to H30 .
H30 CHECK THE RFA MODULE CPP SWITCH INPUT • Disconnect: RFA Module C3503B. • While pressing and releasing the clutch pedal, measure the resistance between RFA module C3503B-17, circuit CE903 (BU/OG), harness side and ground.  N0117054 • **Is the resistance less than 5 ohms with the clutch pedal fully applied and greater than 10,000 ohms with the clutch pedal released?**	**Yes** GO to H34 . **No** GO to H31 .
H31 CHECK THE RFA MODULE CPP SWITCH INPUT CIRCUIT FOR AN OPEN • Disconnect: CPP Switch C257. • Measure the resistance between RFA module C3503B-17, circuit CE903 (BU/OG), harness side and CPP switch C257-1, circuit CE903 (BU/OG), harness side.  N0119755 • **Is the resistance less than 5 ohms?**	**Yes** GO to H32 . **No** REPAIR circuit CE903 (BU/OG). TEST the system for normal operation.
H32 CHECK THE RFA MODULE CPP SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND • Measure the resistance between RFA module C3503B-17, circuit CE903 (BU/OG), harness side and ground.	**Yes** GO to H33 .

 N0117054 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR circuit CE903 (BU/OG). TEST the system for normal operation.
H33 CHECK THE RFA MODULE CPP SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between CPP switch C257-2, circuit GD187 (BK/GN), harness side.  N0119756 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new CPP switch. TEST the system for normal operation. **No** REPAIR circuit GD187 (BK/GN). TEST the system for normal operation.
H34 CHECK FOR CORRECT RFA MODULE OPERATION	

• Disconnect all RFA module electrical connectors.
• Check connectors for:
  ▪ corrosion
  ▪ pushed-out pins
  ▪ bent pins
  ▪ spread terminals
• Connect all RFA module electrical connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10 .
	
	CONFIGURE the new RFA module. REFER to Programmable Module Installation (PMI) in Section 418-01 .
	
	CARRY OUT a Passive Anti-Theft System (PATS) Parameter Reset. REFER to Passive Anti-Theft System (PATS) Parameter Reset-Intelligent Access (IA) in Section 419-01B .
	
	PROGRAM 2 Intelligent Access (IA) keys. REFER to Key Programming Using Diagnostic Equipment-Intelligent Access (IA) in

	Section 419-01B . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test I: DTCs U300E:62, U300F:62, U3010:62 and U3011:62

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

The Remote Function Actuator (RFA) module receives a direct input from the start/stop switch. After receiving this input, the RFA module activates the smart keyless entry ignition relay, the smart keyless entry accessory relay and the main ignition relay. The Instrument Panel Cluster (IPC) receives power from the 2 smart keyless entry relays and sends an ignition status message to the RFA module over the Controller Area Network (CAN), the RFA module uses this status message as a way to self-test.

DTC Description	Fault Trigger Condition
• U300E:62 — Ignition Input On: Signal Compare Failure • U300F:62 — Ignition Input Accessory: Signal Compare Failure • U3010:62 — Ignition Input Start: Signal Compare Failure • U3011:62 — Ignition Input Off: Signal Compare Failure	One or more of these DTCs are set if the IPC ignition status message received by the RFA module does not match the start/stop switch input to the RFA module. This can be caused by a communication issue between the IPC and the RFA module, a wiring concern in the CAN , a wiring concern in the ignition input to the RFA module, a wiring concern in the relay inputs to the IPC , a failure of the start/stop switch or a failure in either module. The input from the start/stop switch to the RFA module supersedes the input message from the IPC .

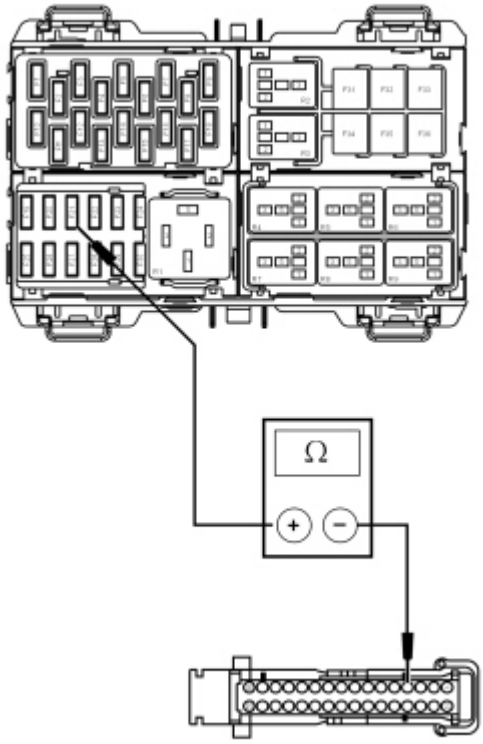
This pinpoint test is intended to diagnose the following:

- Fuses
- Wiring, terminals or connectors
- Smart keyless entry accessory relay
- Start/stop switch
- IPC
- RFA module

PINPOINT TEST I: DTCs U300E:62, U300F:62, U3010:62 AND U3011:62

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

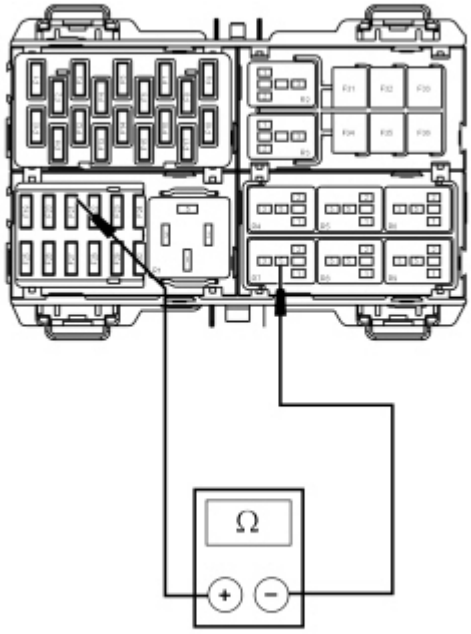
Test Step	Result / Action to Take
I1 CARRY OUT THE IPC SELF-TEST	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — IPC . • **Did the IPC communicate with the scan tool?**	**Yes** GO to I9 . **No** GO to I2 .
I2 CHECK THE IGNITION AND ACCESSORY INPUTS TO THE IPC	
NOTE: Record the results for this pinpoint test step, they will be referred to later in this pinpoint test. • Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between ground and: ▪ IPC C220-4, circuit CBP21 (BU/GY), harness side. ▪ IPC C220-15, circuit CBP19 (BN/WH), harness side.  N0117057 • **Are the voltages greater than 10 volts?**	**Yes** REFER to Section 418-00 to diagnose no communication with the IPC . **No** If the voltage on **both** CBP21 (BU/GY) **and** CBP19 (BN/WH) are less than 10 volts, GO to I3 . If only the voltage on CBP19 (BN/WH) is less than 10 volts, GO to I5 . If only the voltage on CBP21 (BU/GY) is less than 10 volts, GO to I7 .
I3 CHECK THE IPC SMART KEYLESS ENTRY IGNITION RELAY INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: CJB Fuse 21 (10A). • Measure the resistance between IPC C220-4, circuit CBP21 (BU/GY), harness side and CJB fuse 21 (10A), circuit CBP21 (BU/GY), output side.	**Yes** VERIFY CJB fuse 21 (10A) is OK. If OK, GO to I4 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. **No** REPAIR circuit CBP21 (BU/GY). CLEAR the DTCs. REPEAT the self-test.



N0117058

- **Is the resistance less than 5 ohms?**

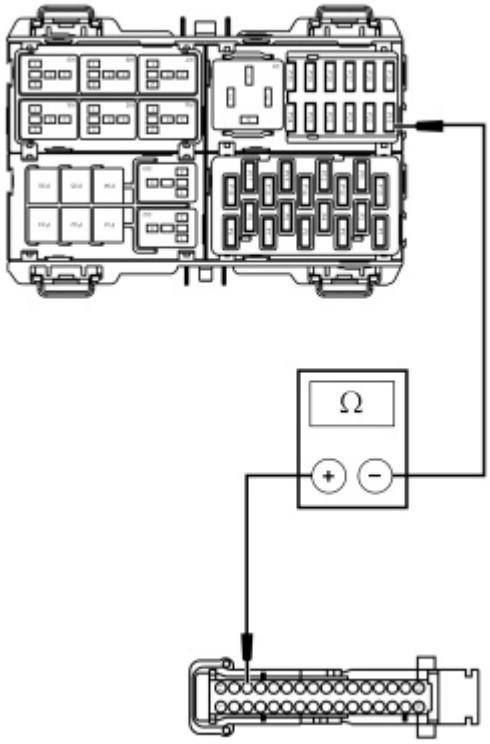
I4 CHECK THE SMART KEYLESS ENTRY IGNITION RELAY OUTPUT TO CJB FUSE 21 (10A)	
• Disconnect: Smart Keyless Entry Ignition Relay. • Measure the resistance between smart keyless entry ignition relay cavity 5, circuit CDC32 (BN/YE), and CJB fuse 21 (10A), circuit CDC32 (BN/YE), input side.	**Yes** If the voltage measured on CBP19 (BN/WH) in Step I2 was also less than 10 volts, GO to I5 . If the voltage measured on CBP19 (BN/WH) in Step I2 was greater than 10 volts, GO to I10 . **No** REPAIR circuit CDC32 (BN/YE). CLEAR the DTCs. REPEAT the self-test.



N0117059

- **Is the resistance less than 5 ohms?**

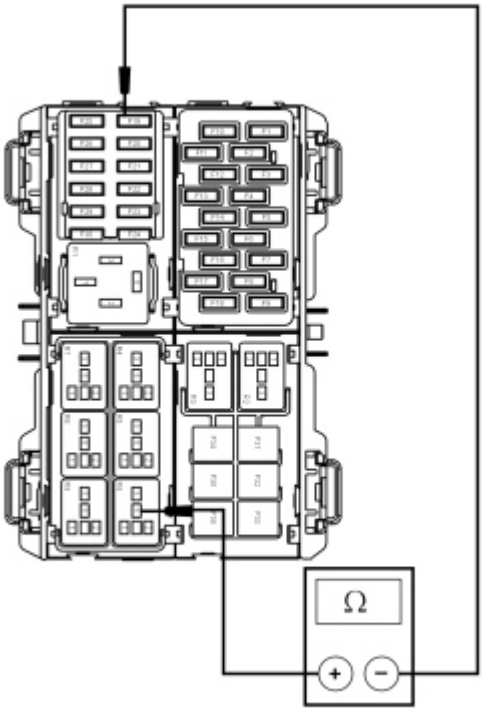
I5 CHECK THE IPC SMART KEYLESS ENTRY ACCESSORY RELAY INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: CJB Fuse 19 (7.5A). • Measure the resistance between IPC C220-15, circuit CBP19 (BN/WH), harness side and CJB fuse 19 (7.5A), circuit CBP19 (BN/WH), output side.	**Yes** VERIFY CJB fuse 19 (7.5A) is OK. If OK, GO to I6 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. **No** REPAIR circuit CBP19 (BN/WH). CLEAR the DTCs. REPEAT the self-test.



N0117060

- **Is the resistance less than 5 ohms?**

I6 CHECK THE SMART KEYLESS ENTRY ACCESSORY RELAY OUTPUT TO CJB FUSE 19 (7.5A)	
• Disconnect: Smart Keyless Entry Accessory Relay. • Measure the resistance between smart keyless entry accessory relay cavity 5, circuit CDC33 (VT/GN), and CJB fuse 19 (7.5A), circuit CDC33 (VT/GN), input side.	**Yes** GO to I7 . **No** REPAIR circuit CDC33 (VT/GN). CLEAR the DTCs. REPEAT the self-test.



N0117047

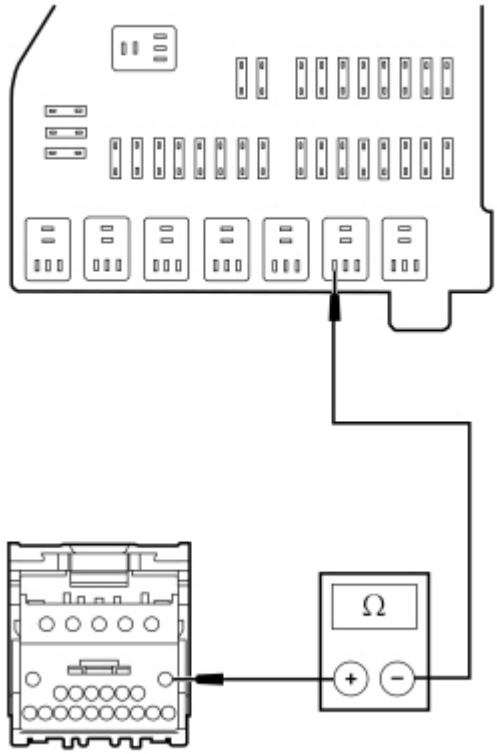
- **Is the resistance less than 5 ohms?**

I7 CHECK THE SMART KEYLESS ENTRY ACCESSORY RELAY GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between smart keyless entry accessory relay cavity 2, circuit GD145 (BK/BU), and ground.	**Yes** GO to I8 . **No** REPAIR circuit GD145 (BK/BU). CLEAR the DTCs. REPEAT the self-test.

 N0117046 • **Is the resistance less than 5 ohms?**	
I8 ISOLATE THE SMART KEYLESS ENTRY ACCESSORY RELAY	
• Carry out the appropriate relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the relay OK?**	**Yes** GO to I10 . **No** INSTALL a new smart keyless entry accessory relay. CLEAR the DTCs. TEST the system for normal operation.
I9 ACT ON IPC DTCs	
• Refer to the results of the IPC self-test. • **Were any IPC DTCs present?**	**Yes** REFER to the Instrument Panel Cluster (IPC) DTC Chart in Section 413-01 . **No** GO to I10 .
I10 REVIEW THE RFA MODULE DTCs	
• Review the RFA module DTCs retrieved during Inspection and Verification. • **Are any DTCs other than U300E:62, U300F:62, U3010:62 and/or U3011:62 present?**	**Yes** DIAGNOSE all other RFA module DTCs before diagnosing U300E:62, U300F:62, U3010:62 and U3011:62. For DTCs B108B:23, B108B:29 and B108C:23, GO to Pinpoint Test E . For DTCs B10E7:11, B10E7:12, B10E7:16 and

	B10E7:17, GO to Pinpoint Test F. For DTCs U3004:11 and U3004:12, GO to Pinpoint Test G. For all other RFA module DTCs, REFER to the Remote Function Actuator (RFA) Module DTC Chart in this section. **No** For DTCs U300E:62, U300F:62 and/or U3011:62, GO to I11. For DTC U3010:62, GO to I12.
I11 CHECK THE STARTER MOTOR CONTROL SENSE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: RFA Module C3503C. • Disconnect: IPC C220. • Disconnect: Starter Inhibit Relay. • Disconnect: ACM C240A (Vehicles Built After 1/14/2011). • Ignition ON. • Measure the voltage between starter inhibit relay, cavity 1, circuit CDC54 (WH/GN), harness side and ground.  N0117061 • **Is any voltage present?**	**Yes** REPAIR circuit CDC54 (WH/GN). CLEAR the DTCs. REPEAT the self-test. **No** GO to I12.
I12 CHECK THE IPC ACCESSORY INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220 (if not previously disconnected). • Connect: CJB Fuse 19 (7.5A) (if previously disconnected).	**Yes** GO to I13.

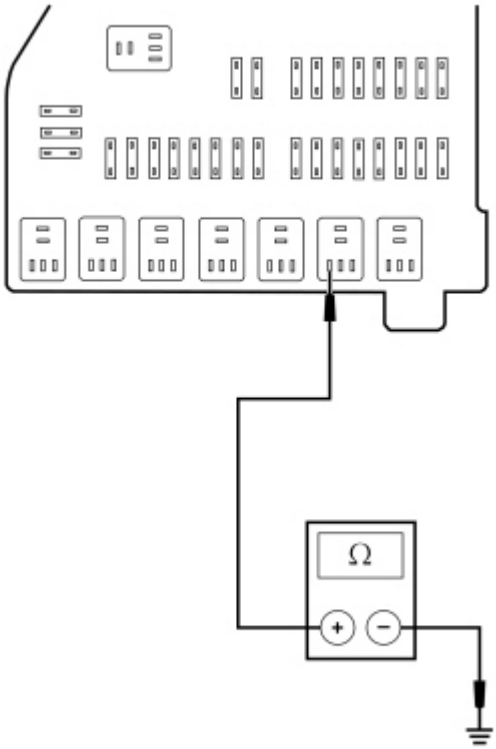
• Connect: Smart Keyless Entry Accessory Relay (if previously disconnected). • Ignition ON. • Measure the voltage between IPC C220-15, circuit CBP19 (BN/WH), harness side and ground.  N0117062 • **Is any voltage present?**	**No** GO to I14 .
I13 ISOLATE THE SMART KEYLESS ENTRY ACCESSORY RELAY AND CHECK THE IPC ACCESSORY INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Smart Keyless Entry Accessory Relay. • Measure the voltage between IPC C220-15, circuit CBP19 (BN/WH), harness side and ground.  N0117062 • **Is any voltage present?**	**Yes** REPAIR circuit CBP19 (BN/WH). CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new smart keyless entry accessory relay. CLEAR the DTCs. REPEAT the self-test.
I14 CHECK THE STARTER MOTOR CONTROL SENSE CIRCUIT FOR AN OPEN CIRCUIT	
• Ignition OFF. • Measure the resistance between starter inhibit relay cavity 1, circuit CDC54 (WH/GN), and RFA module C3503C-6, circuit CDC54 (WH/GN), harness side.	**Yes** GO to I15 . **No** REPAIR circuit CDC54 (WH/GN). CLEAR the DTCs. REPEAT the self-test.



N0117063

- **Is the resistance less than 5 ohms?**

I15 CHECK THE STARTER MOTOR CONTROL SENSE CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between starter inhibit relay cavity 1, circuit CDC54 (WH/GN), and ground.	**Yes** GO to I16 . **No** REPAIR circuit CDC54 (WH/GN). CLEAR the DTCs. REPEAT the self-test.



N0117064

- **Is the resistance greater than 10,000 ohms?**

I16 CHECK FOR CORRECT RFA MODULE OPERATION
• Disconnect all RFA module electrical connectors.
• Check connectors for:
  ▪ corrosion
  ▪ pushed-out pins
  ▪ bent pins
  ▪ spread terminals
• Connect all RFA module electrical connectors and make sure they are seated correctly.
• Connect all other disconnected module connectors, relays and/or fuses.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RFA module. REFER to Section 419-10 .
	
	CONFIGURE the new RFA module. REFER to Programmable Module Installation (PMI) in Section 418-01 .
	
	CARRY OUT a Passive Anti-Theft System (PATS) Parameter Reset. REFER to Passive Anti-Theft System (PATS) Parameter Reset-Intelligent Access (IA) in Section 419-01B .
	
	PROGRAM 2 Intelligent Access (IA) keys. REFER to Key Programming Using Diagnostic Equipment-Intelligent Access (IA) in Section 419-01B .
	
	TEST the system for normal operation.
	
	No
	The system is operating

	correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test J: The Ignition Key Cannot Be Returned to the OFF Position

Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

Normal Operation

The key removal inhibit solenoid (part of the ignition switch) receives battery voltage from Central Junction Box (CJB) fuse 1 (15A). Moving the selector lever out of the PARK position closes the park detect switch (part of the selector lever) and provides a ground path for the key removal inhibit solenoid. The ground path activates the solenoid and prevents the ignition lock cylinder from being turned to the OFF position, which prevents the ignition key from being removed. The Instrument Panel Cluster (IPC) also receives input from the park detect switch along the same circuit as the key removal inhibit solenoid.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key removal inhibit solenoid (part of the ignition switch)
- Ignition lock cylinder
- Park detect switch (part of the selector lever)
- IPC

PINPOINT TEST J: THE IGNITION KEY CANNOT BE RETURNED TO THE OFF POSITION

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
J1 CHECK FOR AN ENERGIZED KEY REMOVAL INHIBIT SOLENOID	
• Remove CJB fuse 1 (15A). • Attempt to turn the ignition lock cylinder to the RUN position and then back to the OFF position and remove the key. • **Does the ignition lock cylinder turn to the OFF position and can the key be removed?**	**Yes** GO to J3 . **No** GO to J2 .
J2 CHECK THE IGNITION SWITCH FOR MECHANICAL DAMAGE	
• Remove the ignition switch. Refer to Ignition Switch in this section. • Attempt to turn the ignition lock cylinder to the OFF position and remove the ignition key. • **Does the ignition lock cylinder turn to the OFF position and can the key be removed?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REFER to Section 501-14 to continue diagnosis of the ignition lock cylinder.
J3 CHECK THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT	

FOR A SHORT TO GROUND	
• Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** GO to J4.
J4 ISOLATE THE IPC	
• Disconnect: IPC C220. • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J6. **No** GO to J5.
J5 ISOLATE THE SHORT TO GROUND IN THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT	
• Disconnect: Floor Shifter C3245. • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.  N0065439	**Yes** INSTALL a new selector lever. REFER to Section 307-05. TEST the system for normal operation. **No** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation.

• **Is the resistance greater than 10,000 ohms?**	
J6 CHECK FOR CORRECT IPC OPERATION	

• Check IPC C220 for:
  ▪ corrosion
  ▪ pushed-out pins
  ▪ bent pins
  ▪ spread terminals
• Connect: IPC C220.
• Connect: Ignition Switch C250.
• Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC .
	REFER to Section 413-01 .
	
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test K: The Ignition Key Can Be Turned to the OFF Position When the Selector Lever is Not In PARK

Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

Normal Operation

The key removal inhibit solenoid (part of the ignition switch) receives battery voltage from Central Junction Box (CJB) fuse 1 (15A). Moving the selector lever out of the PARK position closes the park detect switch (part of the selector lever) and provides a ground path for the key removal inhibit solenoid. The ground path activates the solenoid and prevents the ignition lock cylinder from being turned to the OFF position, which prevents the ignition key from being removed. The Instrument Panel Cluster (IPC) also receives input from the park detect switch along the same circuit as the key removal inhibit solenoid.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key removal inhibit solenoid (part of the ignition switch)
- Park detect switch (part of the selector lever)

PINPOINT TEST K: THE IGNITION KEY CAN BE TURNED TO THE OFF POSITION WHEN THE SELECTOR LEVER IS NOT IN PARK

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
K1 CHECK THE KEY INHIBIT SOLENOID CIRCUIT FOR GROUND	
• Select NEUTRAL. • Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.

 N0105910 • **Is the resistance less than 5 ohms?**	**No** GO to K2 .
K2 CHECK THE KEY INHIBIT SOLENOID CIRCUIT FOR AN OPEN	
• Disconnect: Floor Shifter C3245. • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and floor shifter C3245-2, circuit CDC41 (WH/BN), harness side.  N0117065 • **Is the resistance less than 5 ohms?**	**Yes** GO to K3 . **No** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation.
K3 CHECK THE FLOOR SHIFTER GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between floor shifter C3245-5, circuit GD115 (BK/GY), harness side and ground.  N0117066 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new selector lever (floor shifter). REFER to Section 307-05 . TEST the system for normal operation. **No** REPAIR circuit GD115 (BK/GY). TEST the system for normal operation.

Component Tests

Ignition Switch — Mechanical

The following conditions can cause difficulty in operating the ignition switch and lock cylinder:

- burrs on the lock cylinder key
- insufficient lube on the lock cylinder
- binding lock cylinder
- burrs or foreign material around the rack-and-pinion actuator in the lock cylinder housing
- insufficient lube on the actuator (do not apply lubricant to the inside of the ignition switch.)
- binding ignition switch

Carry out the following test to determine if the ignition switch and lock cylinder are operating correctly.

1. Inspect the ignition key for any burrs, damage or incorrect cut. Have a new ignition key made as necessary.

2. Turn the key to the ACC position and then the ON position.
   - If the ignition key turns to the ACC and ON position, continue with Step 3.
   - If the ignition key will not turn to the ACC and ON position, continue with Step 4.

3. **NOTE:** The ignition switch and lock cylinder should return from the START position back to the ON position without assistance.

   Turn the ignition key to the START position and release the key.
   - If the ignition switch and lock cylinder return from the START position back to the ON position without assistance, the ignition switch is operating correctly at this time.
   - If the ignition switch and lock cylinder do not return from the START position back to the ON position without assistance, continue with Step 4.

4. Remove the ignition lock cylinder. Refer to Section 501-14 .

5. Rotate the ignition lock cylinder through all of the switch positions.
   - If the lock cylinder operates correctly, install a new ignition switch. Refer to Ignition Switch in this section.
   - If the lock cylinder does not operate correctly, install a new ignition lock cylinder. Refer to Section 501-14 .

Ignition Switch — Electrical

Refer to Wiring Diagrams Cell 149 for component testing.

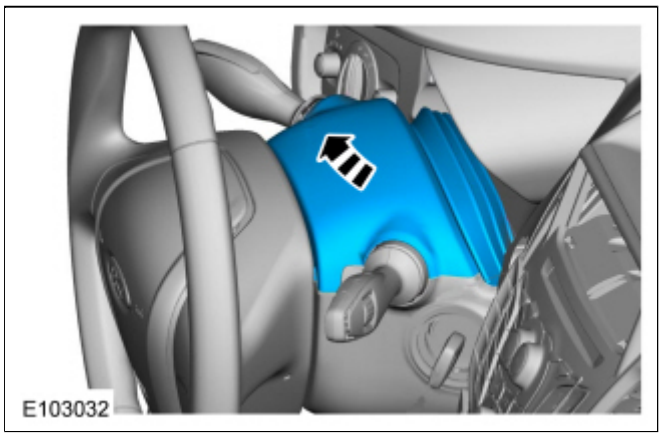
Multifunction Switch — Electrical

Refer to Wiring Diagrams Cell 149 for component testing.

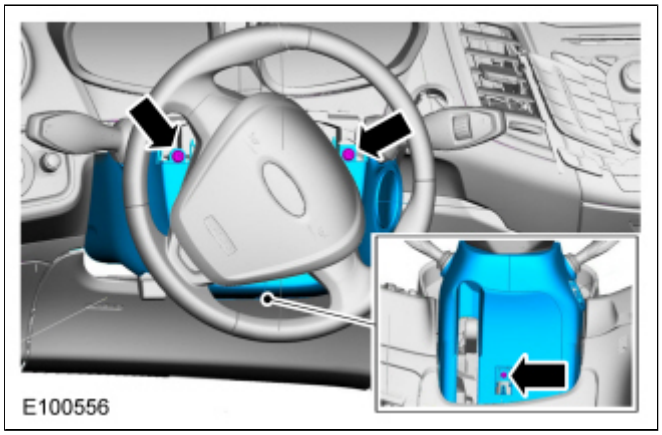
Ignition Switch

Removal and Installation

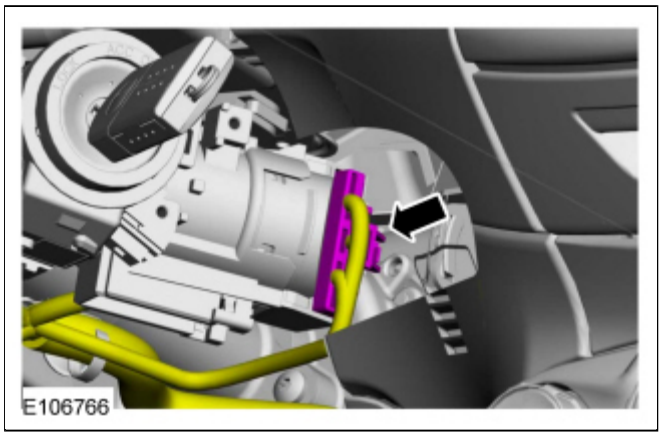
1. Pulling upward, detach the upper steering column shroud from the lower steering column shroud.
   - Slide the upper steering column shroud out of the Instrument Cluster (IC) trim panel and remove the shroud.



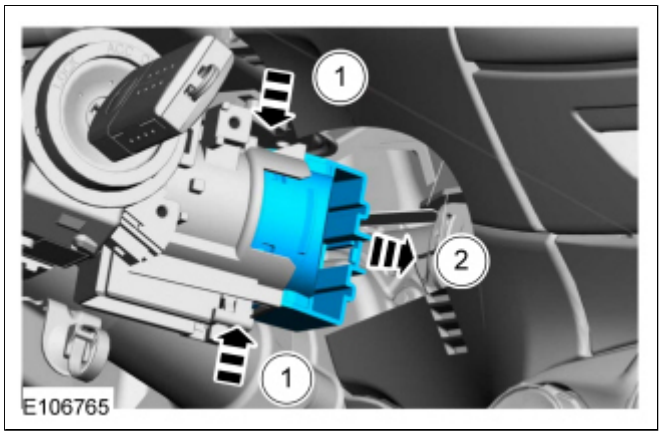
2. Remove the 3 screws and the lower steering column shroud.



3. Disconnect the ignition switch electrical connector.



4. Remove the ignition switch in the sequence shown.
    1. Press the 2 retaining tabs.
    2. Remove the ignition switch.

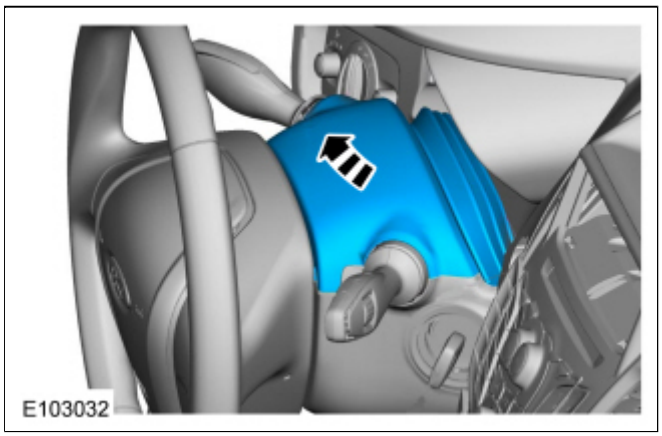


5. To install, reverse the removal procedure.

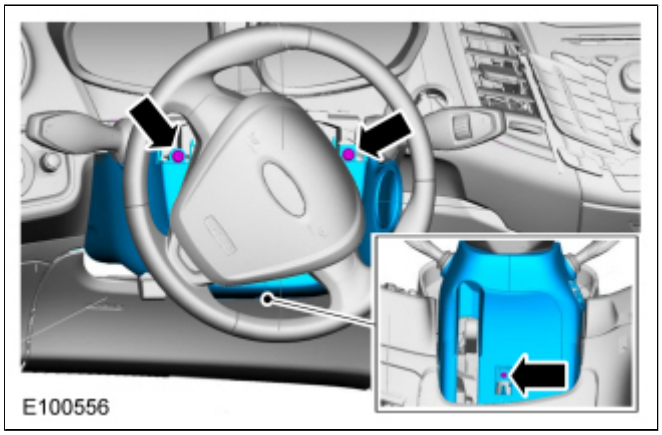
Steering Column Multifunction Switch

Removal and Installation

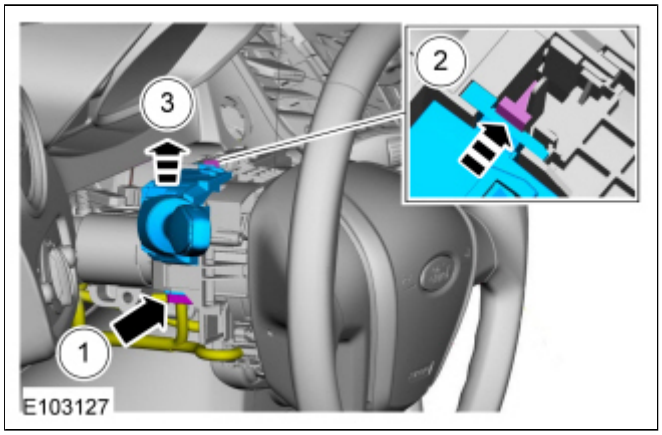
1. Pulling upward, detach the upper steering column shroud from the lower steering column shroud.
    - Slide the upper steering column shroud out of the Instrument Cluster (IC) trim panel and remove the shroud.



2. Remove the 3 screws and the lower steering column shroud.

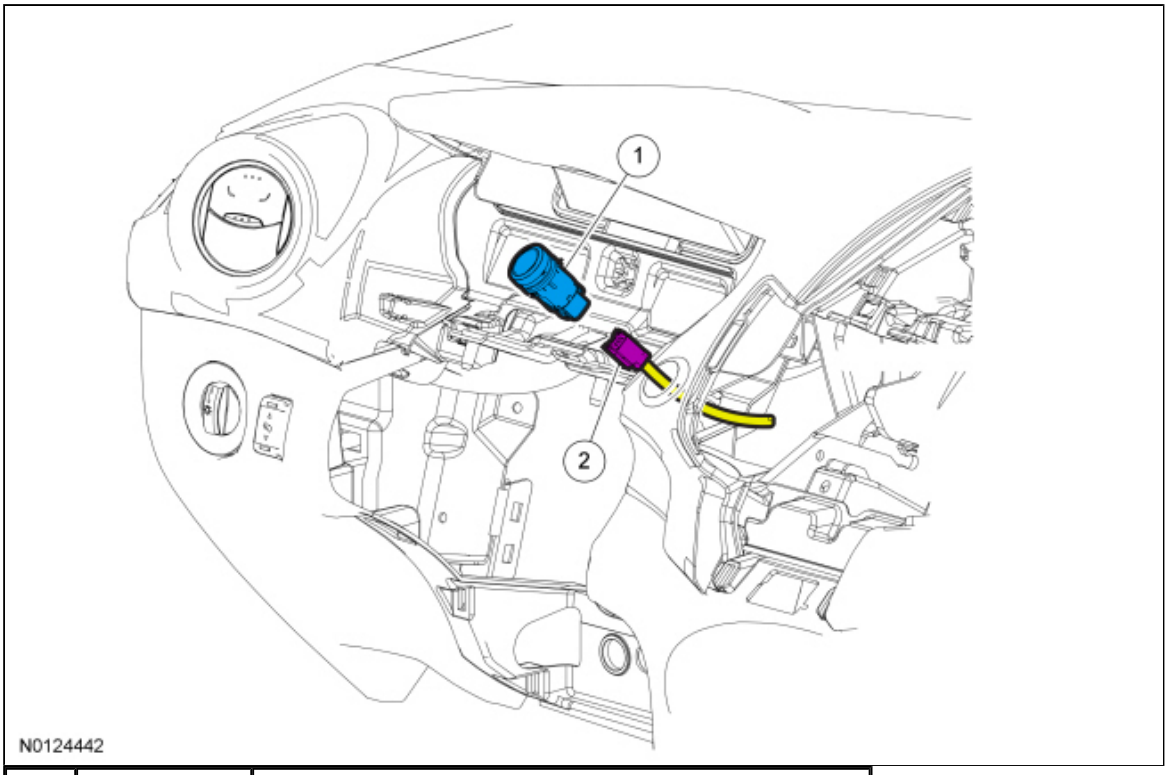


3. Remove the multifunction switch in the sequence shown.
    1. Disconnect the electrical connector.
    2. Push inward to release the locking clip.
    3. Slide the multifunction switch upward on the carrier and remove the multifunction switch.



4. To install, reverse the removal procedure.

Start/Stop Switch

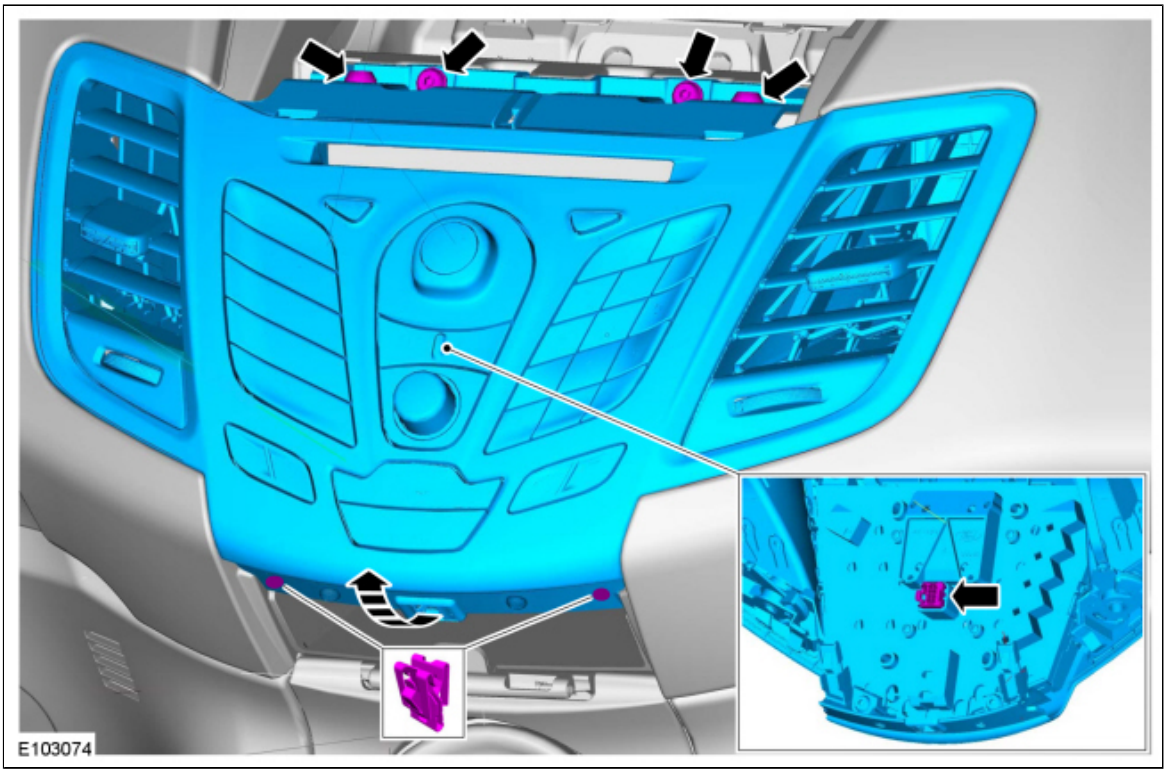


Item	Part Number	Description
1	11572	Start/stop switch
2	—	Start/stop switch electrical connector (part 14K024)

Removal and Installation

1. Remove the upper instrument panel finish panel. For additional information, refer to Section 501-12 .

2. Position aside the Front Controls Interface Module (FCIM) finish panel in the following order.
    1. Remove the 4 upper screws.
    2. Pull outward to detach the 2 lower clips.
    3. Disconnect the FCIM electrical connector and position the FCIM finish panel aside.



3. Release the 2 start/stop switch tabs (upper and lower) and detach the start/stop switch from the instrument panel.

4. Disconnect the start/stop switch electrical connector and remove the start/stop switch.

5. To install, reverse the removal procedure.

General Specifications

Item	Specification
A/C Compressor Magnetic Clutch	
Air gap between pulley and hub	0.3-0.6 mm (0.012-0.024 in)
A/C Pressure Relief Valve	
Open	3,682 kPa (534 psi) minimum
A/C Evaporator Discharge Air Temperature Sensor	
Cut-in/cut-out	2.2°C (36°F)/0.6°C (33°F)

Material

Item	Specification	Fill Capacity
Motorcraft® A/C Cooling Coil Coating YN-29	—	—
Motorcraft® A/C System Flushing Solvent YN-23	—	—
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B	100 ml (3.4 fl oz)
Motorcraft® R-134a Refrigerant YN-19 (US); CYN-16-R (Canada)	WSH-M17B19-A	0.54 kg (19 oz) (1.19 lb)
Stay-Brite® R-134a Leak Detection Dye 164-R6060 (Rotunda)	—	—

Climate Control System

Climate Control System Operation

WARNING: Take the following precautions when repairing an air conditioning system containing R-134a:

- **Always wear safety goggles.**
- **Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13° F) under atmospheric pressure and will freeze skin tissue.**
- **Never allow refrigerant R-134a gas to escape in quantity in an occupied space. It will displace the oxygen needed to support life.**
- **Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but it decomposes when exposed to high temperatures such as a torch flame. During decomposition it releases irritating and toxic gasses (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.**

Failure to follow these instructions may result in serious personal injury.

NOTICE: **To avoid damaging the vehicle or Air Conditioning (A/C) components, observe the following precautions.**

- **Identify and analyze the A/C refrigerant of all vehicles prior to refrigerant charging. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.**
- **Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These 2 types of refrigerant must never be mixed. Doing so can damage the A/C system.**
- **Charge the A/C system with R-134a refrigerant gas while the engine is running only at the low-pressure side to prevent refrigerant slugging from damaging the A/C compressor.**
- **Use only R-134a refrigerant. Due to environmental concerns, when the A/C system is drained, collect the refrigerant using refrigerant recovery/recycling equipment. Federal, State/Provincial and/or local laws REQUIRE that R-134a be recovered into appropriate recovery equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as ASE or Mobile Air Conditioning Society (MACS). Use of a recovery machine dedicated to R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the A/C system.**
- **R-134a Refrigerant must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.**
- **A number of manufacturers are producing refrigerant products described as direct substitutes for R-134a. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled R-134a refrigerant.**

NOTICE: **To avoid contamination of the Air Conditioning (A/C) system, observe the following precautions.**

- **Never open or loosen a connection before recovering the refrigerant.**

- **When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.**
- **Evacuate a system that has been opened to install a new component or one that has discharged through leakage before charging.**
- **Seal open fittings with a cap or plug immediately after disconnecting a component from the system.**
- **Clean the outside of the fittings thoroughly before disconnecting a component from the system.**
- **Do not remove the sealing caps from a new component until ready to install.**
- **Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use and install the cap immediately after using. Store the oil in a clean, moisture-free container.**
- **Install a new O-ring seal before connecting an open fitting. Coat the fitting and O-ring seal with PAG oil before connecting.**
- **When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.**
- **Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system will not tolerate overtightening.**
- **When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.**
- **Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.**

The climate control system, **not equipped with A/C** , consists of the following components:

- Heater core and evaporator core housing
- HVAC module
- Instrument Panel Cluster (IPC)
- Temperature blend door actuator
- Floor/defrost/panel mode door actuator
- Air inlet mode door actuator
- Blower motor resistor
- Blower motor

The climate control system, **equipped with A/C** , consists of the following components:

- A/C compressor
- A/C compressor clutch assembly
- A/C condenser core
- A/C evaporator core
- Receiver/drier
- Connecting refrigerant lines
- Thermostatic Expansion Valve (TXV)
- Heater core and evaporator core housing
- HVAC module
- Instrument Panel Cluster (IPC)
- Temperature blend door actuator
- Floor/defrost/panel mode door actuator
- Air inlet mode door actuator
- Blower motor resistor
- Blower motor
- Evaporator discharge air temperature sensor

HVAC System Operation

The Electronic Manual Temperature Control (EMTC) system heats or cools the vehicle depending on the HVAC control panel selection.

- The control panel selection determines heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the air outlet temperature.
- The blower motor switch varies the blower motor speed.
- During A/C operation (if equipped), the system reduces the relative humidity of the air inside the vehicle.

HVAC System Airflow and Mode Description

Max A/C (if equipped)

When MAX A/C is selected:

- the air inlet door closes off outside air and admits only recirculated air.
- the RECIRC button is disabled and the indicator is illuminated. (RECIRC forced on)
- the defrost/panel/floor door directs airflow to the instrument panel registers.
- blended air temperature is available.
- the A/C request button disabled and the indicator is illuminated.
- the A/C compressor operates if the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

PANEL

When PANEL is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door admits only outside air into the passenger compartment.
- the defrost/panel/floor door directs airflow to the instrument panel registers.
- blended air temperature is available. Only when A/C compressor operation (if equipped) has been selected by pressing the A/C request button (indicator on), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button (if equipped) is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door admits only outside air into the passenger compartment.
- the defrost/panel/floor door directs airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters and defrost duct is present.
- blended air temperature is available. Only when A/C compressor operation (if equipped) has been selected by pressing the A/C request button (indicator on), can the airflow temperature be cooled

below the outside air temperature.
- the A/C request button (if equipped) is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

OFF

When OFF is selected:

- the RECIRC request button is disabled.
- the air inlet door closes off outside air and admits only recirculated air.
- the A/C request button (if equipped) is disabled.
- the blower motor is off.

FLOOR

When FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door admits only outside air into the passenger compartment. When RECIRC is selected, the air inlet mode door remains in recirculated air mode for 5 minutes. After 5 minutes, the RECIRC indicator turns off and the air inlet mode door changes to fresh air mode.
- the defrost/panel/floor door directs airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters is present.
- blended air temperature is available. Only when A/C compressor operation (if equipped) has been selected by pressing the A/C request button (indicator on), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor operates and the indicator illuminates if the A/C request button is selected and the outside temperature is above approximately 0°C (32° F).
- the blower motor is on.

FLOOR/DEFROST

When the FLOOR/DEFROST is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator on), the air inlet door closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator off), the air inlet door admits only outside air into the passenger compartment. When RECIRC is selected, the air inlet mode door remains in recirculated air mode for 5 minutes. After 5 minutes, the RECIRC indicator turns off and the air inlet mode door changes to fresh air mode.
- the defrost/panel/floor door actuator directs airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button (if equipped) indicates the last status and the indicator can be toggled. To reduce fogging, the A/C compressor operates automatically, regardless of indicator status, if the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

DEFROST

When DEFROST is selected:

- the RECIRC request button is disabled. The air inlet door opens, admitting only outside air into

the passenger compartment.

- the defrost/panel/floor door directs airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct is present.
- blended air temperature is available.
- the A/C request button (if equipped) will indicate the last status and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 0°C (32°F).
- the blower motor is on.

Principles of Operation

The Refrigerant Cycle

During stabilized conditions (A/C system shutdown), the refrigerant pressures are equal throughout the system. When the A/C compressor is in operation, it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the A/C condenser core.

The A/C condenser, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser and enters the inlet side of the A/C receiver/drier. The receiver/drier is designed to remove moisture from the refrigerant.

The outlet of the receiver/drier is connected to the Thermostatic Expansion Valve (TXV). The TXV provides the orifice which is the restriction in the refrigerant system and separates the high and low pressure sides of the A/C system. As the liquid refrigerant passes across this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator, it absorbs heat from the airflow passing over the plate/fin sections of the A/C evaporator. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

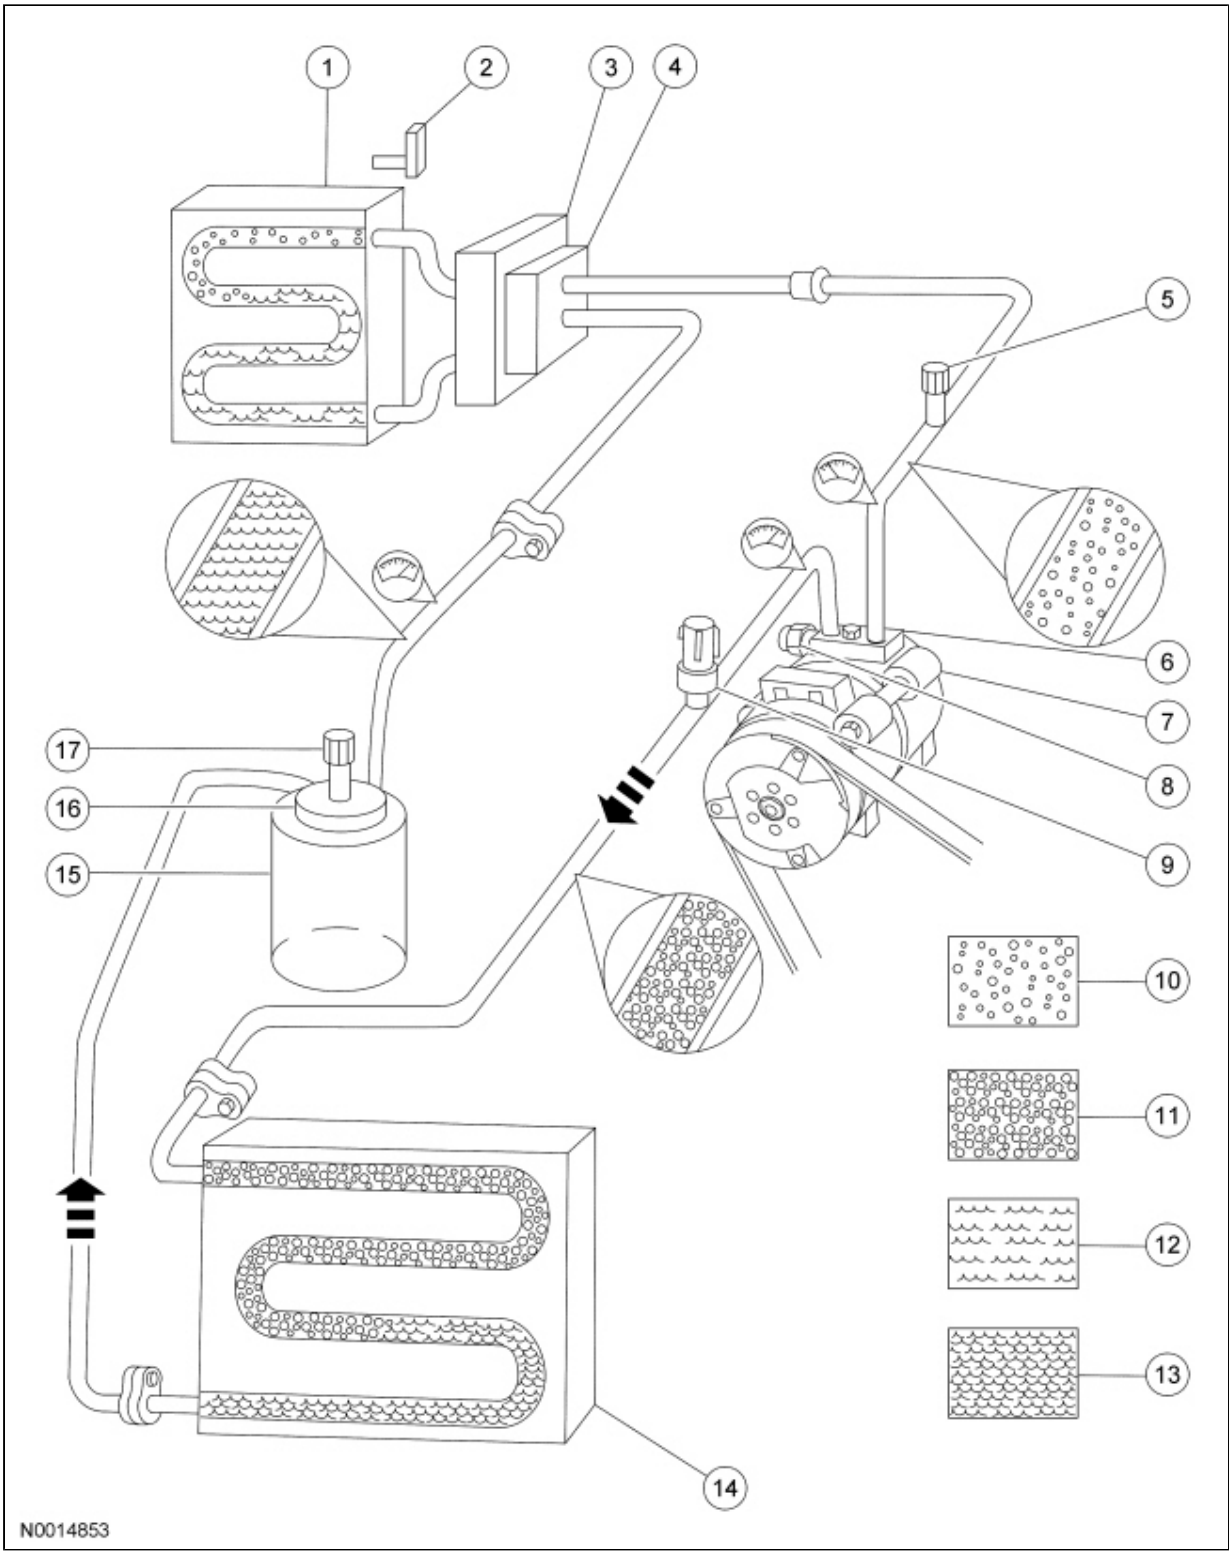
The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.

The evaporator discharge air temperature sensor monitors the temperature of the evaporator core controls A/C clutch cycling. If the temperature of the evaporator core is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the PCM.

The high-side line pressure is monitored by the A/C pressure transducer so that A/C compressor operation is interrupted if the system pressure becomes too high or is determined to be too low (low charge condition).

The A/C compressor relief valve opens and vents refrigerant to relieve unusually high system pressure.

Thermostatic Expansion Valve (TXV) Type Refrigerant System



Item	Description
1	A/C evaporator core
2	A/C evaporator core temperature sensor
3	Thermostatic Expansion Valve (TXV)
4	Manifold and tube assembly — TXV
5	A/C charge valve port (low side)
6	Manifold and tube assembly — A/C compressor

7	A/C compressor
8	A/C pressure relief valve
9	A/C pressure transducer
10	Low-pressure vapor
11	High-pressure vapor
12	Low-pressure liquid
13	High-pressure liquid
14	A/C condenser core
15	A/C receiver/drier
16	Manifold and tube assembly — receiver/drier
17	A/C charge valve port (high side)

Inspection and Verification

1. Verify the customer concern by operating the climate control system to duplicate the condition.
2. Visually inspect for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical

• Loose, missing or damaged A/C compressor drive belt
• Loose or disconnected A/C clutch
• Broken or leaking refrigerant lines
	• Battery Junction Box (BJB) fuse (s):
	  ▪ 4 (40A)
	  ▪ 29 (10A)
	• Central Junction Box (CJB) fuse (s):
	  ▪ 2 (10A)
	  ▪ 7 (7.5A)
	  ▪ 21 (10A)
	• Blower motor inoperative
	• A/C compressor inoperative
	• Circuitry open/shorted
	• Disconnected electrical connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms voltage and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no voltage to the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
    - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics from the Instrument Panel Cluster (IPC) and PCM.

9. **NOTE:** Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

   If the PCM DTCs retrieved are related to the concern, go to the PCM DTC Chart. If the IPC DTCs retrieved are related to the concern, go to the Instrument Panel Cluster (IPC) DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Climate Control Systems or GO to Symptom Chart - NVH .

Self-Test — Retrieving And Clearing HVAC Module DTCs

To retrieve HVAC module DTCs, Carry out the following steps:

1. With the ignition on, select any mode except OFF on the HVAC controls.

2. While pressing the RECIRC mode button, select OFF on the HVAC controls.

3. Continue holding the RECIRC mode button for 5 seconds after OFF is selected.

The recirc mode indicator flashes at the rate of 1 flash per second for the first digit of the DTC, pause for 2 seconds, then resumes flashing at 1 flash per second for the second digit of the DTC. There is a 5 second pause between DTCs. DTC 1-1 indicates no faults present.

To exit **without clearing DTCs** , select any mode **except** FLOOR or PANEL/FLOOR or turning the ignition off after retrieving HVAC module DTCs.

To exit and **clear HVAC DTCs** , select FLOOR after retrieving HVAC module DTCs. The recirc mode indicator flashes 5 times a second for 2 seconds, then resumes flashing to indicate any DTCs. DTC 1-1 indicates no faults present.

Calibrating the HVAC Actuators

NOTE: The HVAC module will initialize and calibrate the actuators. The purpose of the HVAC module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points.

To calibrate HVAC actuators, Carry out the following steps:

1. With the ignition on, select any mode except OFF on the HVAC controls.

2. While pressing the RECIRC mode button, select OFF on the HVAC controls.

3. Continue holding the RECIRC mode button for 5 seconds after OFF is selected.

4. Select PANEL/FLOOR mode on the HVAC controls.

The recirc mode indicator flashes at the rate of 1 flash per second for the duration of the actuator calibration. After the calibration is complete, the recirc mode indicator resumes flashing to indicate any DTCs. DTC 1-1 indicates no faults present.

DTC Charts

PCM DTC Chart

DTC	Description	Action to Take
P0531:2F	A/C Refrigerant Pressure Sensor A Circuit Range/Performance: Signal Erratic	INSPECT the refrigerant system for leaks. REFER to Electronic Leak Detection or Fluorescent Dye Leak Detection . If refrigerant system leaks or is low, RECHARGE the refrigerant system. REFER to Specifications in this section. If the refrigerant system does not leak and is properly charged, INSTALL a new A/C pressure transducer. CLEAR the DTCs and REPEAT the self-test. TEST the system for normal operation.
P0532:16	A/C Refrigerant Pressure Sensor A Circuit Low: Circuit Voltage Below Threshold	GO to Pinpoint Test a .
P0533:17	A/C Refrigerant Pressure Sensor A Circuit High: Circuit Voltage Above Threshold	GO to Pinpoint Test a .
P0645:13	A/C Clutch Relay Control Circuit: Circuit Open	GO to Pinpoint Test b .
P0646:11	A/C Clutch Relay Control Circuit Low: Circuit Short To Ground	GO to Pinpoint Test B .
P0647:12	A/C Clutch Relay Control Circuit High: Circuit Short To Battery	GO to Pinpoint Test B .
All Other DTCs	—	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Instrument Panel Cluster (IPC) DTC Chart

DTC	Description	Action to Take
B101E:01	Air Conditioning Mode Switch: General Electrical Failure	PLACE the HVAC selector in the OFF position, CLEAR the DTCs and REPEAT the self-test. If the DTC does not return, ignore the DTC and continue diagnosing other DTCs or symptoms. If the DTC returns and HVAC DTC 5-2 **is** also set, GO to Pinpoint Test I and diagnose HVAC DTC 5-2. If the DTC returns and HVAC DTC 5-2 is **not** also set, INSTALL a new Instrument Panel Cluster (IPC). REFER to Section 413-01 .
B1B71:11	Evaporator Temperature Sensor: Circuit Short to Ground	GO to Pinpoint Test C .
B1B71:13	Evaporator Temperature Sensor: Circuit Open	GO to Pinpoint Test C .
All Other DTCs	—	REFER to Section 413-01 .

HVAC Module DTC Chart

NOTE: Some PCM and Instrument Panel Cluster (IPC) DTCs may inhibit A/C operation. If any PCM or IPC DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart or the Instrument Panel Cluster (IPC) DTC Chart.

DTC	Description	Action to Take
1-0	Recirculation Button Performance	If the RECIRC button is held for more than 2 minutes, this DTC sets. ATTEMPT to clean buttons. CLEAR the DTCs. REPEAT the self-test. If DTC returns, INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
1-1	Diagnostics Mode Entered — No DTC Set	This DTC indicates that no HVAC faults are present at this time.
1-2	A/C Button Performance	If the A/C button is held for more than 2 minutes, this DTC sets. ATTEMPT to clean buttons. CLEAR the DTCs. REPEAT the self-test. If code returns, INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
2-1	Blend Feedback Circuit/Performance	GO to Pinpoint Test m .
2-2	Blend Motor Driver Circuit/Performance	GO to Pinpoint Test m .
2-3	Blend Actuator Calibration Performance	GO to Pinpoint Test m .
3-1	Mode Feedback Circuit/Performance	GO to Pinpoint Test h .
3-2	Mode Motor Driver Circuit/Performance	GO to Pinpoint Test h .
3-3	Mode Actuator Calibration Performance	GO to Pinpoint Test h .
4-2	Recirculation Motor Driver Circuit/Performance	GO to Pinpoint Test g .
4-4	Feedback Reference Circuit/Performance	GO to Pinpoint Test d .
5-1	Blower Relay Driver Circuit/Performance	If the blower motor is inoperative, GO to Pinpoint Test n . If the blower motor is always on, GO to Pinpoint Test o .
5-2	A/C Select Drive Circuit/Performance	If the A/C is inoperative, GO to Pinpoint Test j . If the A/C is always commanded on, GO to Pinpoint Test l .
5-3	Battery Voltage Low	GO to Pinpoint Test e .
5-4	Battery Voltage High	GO to Pinpoint Test e .

Symptom Chart — Climate Control System

Symptom Chart — Climate Control System

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

Condition	Possible Sources	Action
• All HVAC functions inoperative	• Fuse • Wiring, terminals or connectors • HVAC module	• GO to Pinpoint Test P .

• Unable to duplicate the customer concern and no DTCs present	• Incorrect functioning of the HVAC system and/or related components	• GO to Pinpoint Test F .
• Reduced outlet airflow	• Wiring, terminals or connectors • A/C compressor clutch air gap • A/C pressure transducer • Evaporator discharge air temperature sensor • A/C clutch relay • Blower motor • Blower motor resistor • HVAC module • PCM	• If the vehicle is not equipped with A/C, GO to Pinpoint Test O • If the A/C compressor is engaged and does not cycle, GO to Pinpoint Test K . • If the A/C compressor cycles normally, GO to Pinpoint Test O .
• The air inlet door is inoperative	• Wiring, terminals or connectors • Air inlet mode door actuator • Air inlet mode door binding or stuck • HVAC module	• GO to Pinpoint Test G .
• Incorrect/erratic direction of airflow from outlets	• Wiring, terminals or connectors • Defrost/panel/floor mode door actuator • Defrost/panel/floor mode door binding or stuck • HVAC module	• GO to Pinpoint Test H .
• Insufficient, erratic or no heat	• Low engine coolant level • Plugged or partially plugged heater core • Temperature blend door binding or stuck • Temperature blend door actuator	• GO to Pinpoint Test I .
• The air conditioning (A/C) is inoperative	• Fuse(s) • Wiring, terminals or connectors • A/C system discharged/low charge • PCM • HVAC module • A/C clutch relay • A/C compressor clutch air gap • A/C pressure transducer • Evaporator discharge air temperature sensor • A/C compressor clutch field coil	• GO to Pinpoint Test J .
• The air conditioning (A/C) is always on — A/C compressor does not cycle	• Wiring, terminals or connectors • PCM • A/C clutch relay • A/C compressor	• GO to Pinpoint Test K .

	clutch air gap • Evaporator discharge air temperature sensor	
• The A/C is always on — A/C mode always commanded ON	• Wiring, terminals or connectors • HVAC module • PCM	• GO to Pinpoint Test L .
• Temperature control is inoperative/does not operate correctly	• Wiring, terminals or connectors • HVAC module • Temperature blend door is binding or stuck • Temperature blend door actuator	• GO to Pinpoint Test M .
• The blower motor is inoperative	• Fuse(s) • Wiring, terminals or connectors • HVAC module • Blower motor relay • Blower motor	• GO to Pinpoint Test N .
• The blower motor does not operate correctly	• Wiring, terminals or connectors • A/C blower motor resistor • HVAC module	• GO to Pinpoint Test O .
• A/C pressure relief valve discharging	• High system pressure • A/C pressure relief valve	• CHECK the high side system pressure. If the pressure is below the A/C pressure relief valve open pressure, REPLACE the A/C pressure relief valve. If the system pressure is above the A/C pressure relief valve open pressure, REPAIR the system for a restriction.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms will be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Noisy A/C compressor	• A/C compressor clutch air gap out of specification	• CHECK and ADJUST the A/C compressor clutch gap if necessary. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. • If the A/C compressor clutch gap is OK, INSTALL an A/C compressor clutch. REFER to Section 412-01 . TEST the system for normal operation.
	• A/C compressor pulley bearing	• INSPECT the A/C compressor pulley bearing for roughness. If bearing

	worn	roughness is found, INSTALL an A/C compressor pulley. REFER to Section 412-01. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: DTC P0532:16 or P0533:17

Refer to Wiring Diagrams Cell 23, Electronic Engine Controls for schematic and connector information.

Refer to Wiring Diagrams Cell 54, Manual Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the A/C pressure transducer receives a ground from the PCM. A 5-volt reference voltage is supplied to the A/C pressure transducer from the PCM. The A/C pressure transducer then sends a voltage to the PCM to indicate the A/C pressure.

- DTC P0532:16 (A/C Refrigerant Pressure Sensor A Circuit Low: Circuit Voltage Below Threshold) — The A/C pressure transducer inputs a feedback voltage to the PCM. This DTC sets if the feedback voltage is less than 0.26 volts for at least 2 seconds and the ambient air temperature is greater than 0°C (32°F).
- DTC P0533:17 (A/C Refrigerant Pressure Sensor A Circuit High: Circuit Voltage Above Threshold) — The A/C pressure transducer inputs a feedback voltage to the PCM. This DTC sets if the feedback voltage is greater than 4.95 volts for at least 2 seconds and the ambient air temperature is greater than 0°C (32°F).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- A/C pressure transducer
- PCM

PINPOINT TEST A: DTC P0532:16 OR P0533:17

Test Step	Result / Action to Take
A1 CHECK THE PCM OUTPUT VOLTAGE	
• Ignition OFF. • Disconnect: A/C Pressure Transducer C1260. • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1260-2, circuit LH108 (GY/BN), harness side.  N0082573 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to A4. **No** If the voltage is less than 4.7 volts, GO to A2. If the voltage is greater than 5.1 volts REPAIR circuit LH108 (GY/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A2 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between ground and A/C pressure transducer C1260-2, circuit LH108 (GY/BN), harness side.  N0115312 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A3 . **No** REPAIR circuit LH108 (GY/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A3 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the resistance between A/C pressure transducer C1260-2, circuit LH108 (GY/BN), harness side and PCM C175B-16, circuit LH108 (GY/BN), harness side.  N0116059 • **Is the resistance less than 5 ohms?**	**Yes** GO to A15 . **No** REPAIR circuit LH108 (GY/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A4 CHECK THE PCM SENSOR GROUND	
• Measure the voltage between A/C pressure transducer C1260-1, circuit RH108 (BN), harness side and A/C pressure transducer C1260-2, circuit LH108 (GY/BN), harness side.  A0047632 • **Is the voltage greater than 4.7 volts?**	**Yes** If diagnosing **DTC P0532** , GO to A8 . If diagnosing **DTC P0533** , GO to A11 . **No** GO to A5 .
A5 CHECK THE SIGNAL RETURN CIRCUIT FOR VOLTAGE	

• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1260-1, circuit RH108 (BN), harness side.  N0115314 • **Is any voltage present?**	**Yes** REPAIR circuit RH108 (BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A6 .
A6 CHECK THE SIGNAL RETURN CIRCUIT FOR A SHORT TO THE REFERENCE VOLTAGE CIRCUIT	
• Measure the resistance between A/C pressure transducer C1260-1, circuit RH108 (BN), harness side and A/C pressure transducer C1260-2, circuit LH108 (GY/BN), harness side.  N0116056 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A7 . **No** REPAIR circuit RH108 (BN) for a short to circuit LH108 (GY/BN). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A7 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between A/C pressure transducer C1260-1, circuit RH108 (BN), harness side and PCM C175B-40, circuit RH108 (BN), harness side.  N0117780 • **Is the resistance less than 5 ohms?**	**Yes** GO to A15 . **No** REPAIR circuit RH108 (BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A8 CHECK THE A/C PRESSURE TRANSDUCER	

• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Observe the A/C Pressure Sensor (ACP_V) PCM PID voltage. • **Does the ACP_V PCM PID voltage read greater than 4.7 volts?**	**Yes** INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A9.
A9 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN CIRCUIT	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between A/C pressure transducer C1260-3, circuit VH442 (GN/BN), harness side and A/C pressure transducer C1260-1, circuit RH108 (BN), harness side.  N0082575 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A10. **No** REPAIR circuit VH442 (GN/BN) for a short to circuit RH108 (BN). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A10 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between ground and A/C pressure transducer C1260-3, circuit VH442 (GN/BN), harness side.  A0047688 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A15. **No** REPAIR circuit VH442 (GN/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A11 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1260-3, circuit VH442 (GN/BN), harness side.	**Yes** REPAIR circuit VH442 (GN/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No**

 A0047689 • **Is any voltage present?**	GO to A12 .
A12 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR A SHORT THE REFERENCE VOLTAGE CIRCUIT	
• Measure the resistance between A/C pressure transducer C1260-3, circuit VH442 (GN/BN), harness side and A/C pressure transducer C1260-2, circuit LH108 (GY/BN), harness side.  N0082576 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A13 . **No** REPAIR circuit VH442 (GN/BN) for a short to circuit LH108 (GY/BN). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A13 CHECK THE A/C PRESSURE TRANSDUCER FEEDBACK CIRCUIT FOR AN OPEN	
• Measure the resistance between A/C pressure transducer C1260-3, circuit VH442 (GN/BN), harness side and PCM C175B-28, circuit VH442 (GN/BN), harness side.  N0117781 • **Is the resistance less than 5 ohms?**	**Yes** GO to A14 . **No** REPAIR circuit VH442 (GN/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A14 CHECK THE A/C PRESSURE SENSOR (ACP_V) PCM PID WITH THE A/C PRESSURE TRANSDUCER SHORTED	
NOTE: If the jumper fuse opens while carrying out this test step, repair circuit VH442 (GN/BN) for a short to ground. • Ignition OFF. • Connect: PCM C175B.	**Yes** INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test.

• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • While observing the ACP_V PCM PID, connect a fused jumper between A/C pressure transducer C1260-1, circuit RH108 (BN), harness side and A/C pressure transducer C1260-3, circuit VH442 (GN/BN), harness side.  A0008127 • **Does the ACP_V PCM PID voltage read 0 volts?**	TEST the system for normal operation. **No** GO to A15 .
A15 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the PCM connectors for: ▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • Connect and correctly seat all the PCM connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC P0645:13, P0646:11 or P0647:12

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

Voltage is provided to the A/C clutch relay coil. When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay.

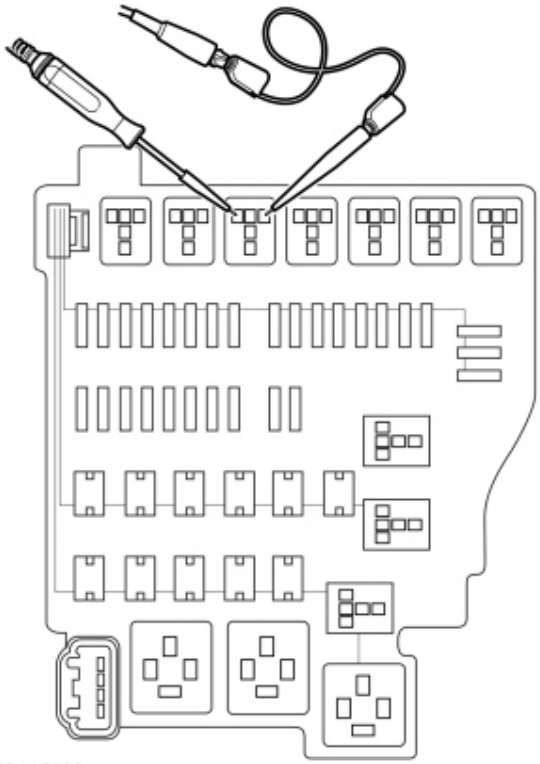
- DTC P0645:13 (A/C Clutch Relay Control Circuit: Circuit Open) — This DTC sets when the relay circuit is OFF and no voltage is detected on the relay circuit. The PCM expects to detect voltage coming through the relay coil to the relay circuit when it is not grounding it.
- DTC P0646:11 (A/C Clutch Relay Control Circuit Low: Circuit Short To Ground) — This DTC sets when the relay circuit is OFF and ground is detected on the relay circuit. The PCM expects to detect voltage coming through the relay coil to the relay circuit when it is not grounding it.
- DTC P0647:12 (A/C Clutch Relay Control Circuit High: Circuit Short To Battery) — This DTC sets when the PCM grounds the relay circuit and excessive current draw (short to voltage) is detected on the relay circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- A/C clutch relay
- PCM

PINPOINT TEST B: DTC P0645:13, P0646:11 OR P0647:12

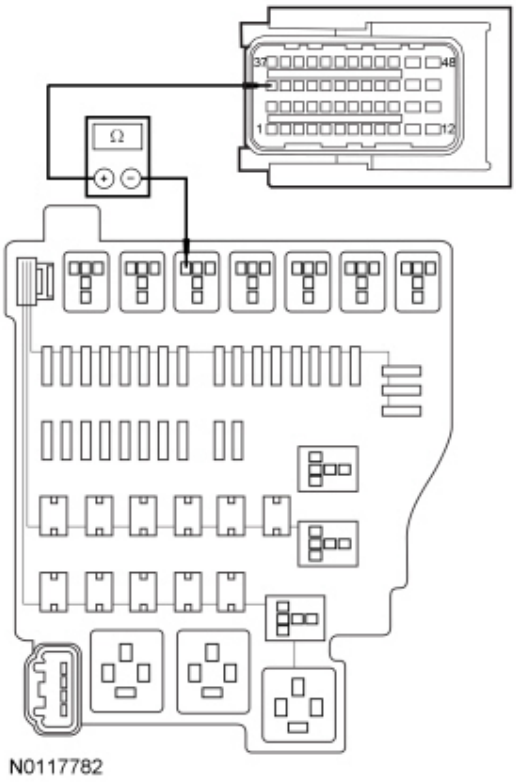
Test Step	Result / Action to Take
B1 CHECK PCM DTCS	
• Ignition ON. • Check the PCM DTCs retrieved during the self-test. • **Is DTC P0645:13 present?**	**Yes** GO to B2 . **No** **For DTC P0646:11** , GO to B5 . **For DTC P0647:12** , GO to B6 .
B2 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY COIL	
• Ignition OFF. • Disconnect: A/C Clutch Relay. • Ignition ON. • Measure the voltage between ground and the A/C clutch relay socket pin 1, circuit CBP02 (GN).  N0114473 • **Is the voltage greater than 10 volts?**	**Yes** GO to B3 . **No** VERIFY Central Junction Box (CJB) fuse 2 (10A) is OK. If OK, REPAIR circuit CBP02 (GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
B3 CHECK THE A/C CLUTCH RELAY	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Start the engine. • Select PANEL and press the A/C button (indicator on) on the HVAC controls. • With the engine running, connect a 12-volt test light between A/C clutch relay socket pin 1, circuit CBP02 (GN) and A/C clutch relay socket pin 2, circuit CH302 (WH/BN).	**Yes** INSTALL a new A/C clutch relay. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B4 .



N0115303

- **Does the test light illuminate?**

B4 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between A/C clutch relay socket pin 2, circuit CH302 (WH/BN) and PCM C175B-25, circuit CH302 (WH/BN), harness side.	**Yes** GO to B7 . **No** REPAIR circuit CH302 (WH/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



N0117782

- **Is the resistance less than 5 ohms?**

B5 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: A/C Clutch Relay. • Disconnect: PCM C175B. • Measure the resistance between ground and PCM C175B-25, circuit CH302 (WH/BN), harness side.  N0117783 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B7 . **No** REPAIR circuit CH302 (WH/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B6 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: A/C Clutch Relay. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and PCM C175B-25, circuit CH302 (WH/BN), harness side.	**Yes** REPAIR circuit CH302 (WH/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No**

 N0117784 • **Is any voltage present?**	CARRY OUT the A/C clutch relay component test. Refer to Refer to Wiring Diagrams Cell 149 for component testing. If the relay tests OK, GO to B7 .
B7 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the PCM connectors for: ▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • Connect and correctly seat all the PCM connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: DTC B1B71:11 or B1B71:13

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

The evaporator discharge air temperature sensor receives a ground from the Instrument Panel Cluster (IPC). The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. The IPC measures this resistance on the feedback circuit to determine the temperature at the sensor. The sensor value is sent from the IPC to the PCM through the High Speed Controller Area Network (HS-CAN).

The evaporator discharge air temperature sensor is used for A/C compressor cycling. An accurate evaporator discharge air temperature is critical to prevent evaporator icing. The PCM uses the temperature measurement to turn off the A/C compressor before the evaporator temperature is cold enough to freeze the condensation. This prevents ice blockage of airflow over the evaporator core.

- DTC B1B71:11 (Evaporator Discharge Air Temperature Sensor: Circuit Short to Ground) — The module senses lower than expected voltage on the sensor feedback circuit, indicating a short to ground.
- DTC B1B71:13 (Evaporator Discharge Air Temperature Sensor: Circuit Open) — The module senses greater than expected voltage on the sensor feedback circuit, indicating an open circuit or sensor.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Evaporator discharge air temperature sensor
- IPC

PINPOINT TEST C: DTC B1B71:11 OR B1B71:13

Test Step	Result / Action to Take

C1 CHECK THE SENSOR RESISTANCE

- Ignition OFF.
- Disconnect: Evaporator Discharge Air Temperature Sensor C296.
- Allow enough time for the evaporator to stabilize to the ambient temperature.
- Measure the resistance between evaporator discharge air temperature sensor C296 terminals and compare to the table below.

Ambient Temperature	Resistance
0-10°C (32-50°F)	5,892-9,893 ohms
10-20°C (50-68°F)	3,689-6,048 ohms
20-25°C (68-77°F)	2,950-3,805 ohms
25-30°C (77-86°F)	2,374-3,050 ohms
30-35°C (86-95°F)	1,923-2,460 ohms
35-40°C (95-104°F)	1,566-1,996 ohms
40-50°C (104-122°F)	1,057-1,630 ohms

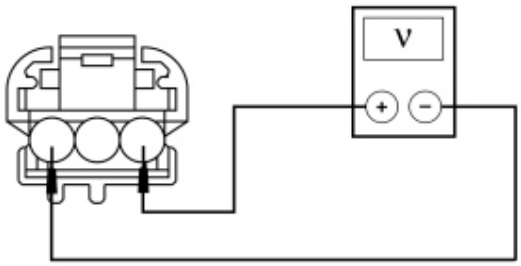
- **Is the resistance within the specified values for the temperatures?**

Yes
GO to C2 .

No
INSTALL a new evaporator discharge air temperature sensor. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C2 CHECK THE IPC SENSOR OUTPUT VOLTAGE

- Ignition ON.
- Select PANEL and press the A/C button (indicator on) on the HVAC controls.
- Measure the voltage between evaporator discharge air temperature sensor C296-1, circuit VH406 (VT/BN), harness side and C296-3, circuit RH119 (YE/VT), harness side.



N0114477

- **Is the voltage between 4.7 and 5.1 volts?**

Yes
INSTALL a new evaporator discharge air temperature sensor. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the DTC returns, GO to C7 .

No
If diagnosing DTC B1B71:13 , GO to C3 .

If diagnosing DTC B1B71:11 , GO to C5 .

C3 CHECK THE EVAPORATOR TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR AN OPEN

- Ignition OFF.
- Disconnect: Instrument Panel Cluster (IPC) C220.
- Measure the resistance between IPC C220-26, circuit VH406 (VT/BN), harness side and evaporator discharge air temperature sensor C296-1, circuit VH406 (VT/BN), harness side.

Yes
GO to C4 .

No
REPAIR circuit VH406 (VT/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0114478 • **Is the resistance less than 5 ohms?**	
C4 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between IPC C220-24, circuit RH119 (YE/VT), harness side and evaporator discharge air temperature sensor C296-3, circuit RH119 (YE/VT), harness side.  N0114479 • **Is the resistance less than 5 ohms?**	**Yes** GO to C7 . **No** REPAIR circuit RH119 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C5 CHECK THE EVAPORATOR TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN CIRCUIT	
• Ignition OFF. • Disconnect: IPC C220. • Measure the resistance between evaporator discharge air temperature sensor C296-1, circuit VH406 (VT/BN), harness side and C296-3, circuit RH119 (YE/VT), harness side.  N0114480 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C6 . **No** REPAIR circuits VH406 (VT/BN) and RH119 (YE/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C6 CHECK THE EVAPORATOR TEMPERATURE SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between IPC C220-26, circuit VH406 (VT/BN), harness side and ground.	**Yes** GO to C7 .

 N0114481 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR circuit VH406 (VT/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C7 CHECK THE IPC CONNECTION	

• Disconnect all the IPC connectors.
• Inspect the IPC connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the IPC connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Section 413-01. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test D: DTC 4-4

Refer to Wiring Diagrams Cell 54, Manual Climate Control System for schematic and connector information.

Normal Operation

A 5-volt reference voltage is supplied to the sensors and actuators from the HVAC module.

- DTC 4-4 (Feedback Reference Circuit/Performance) — The module senses less than expected voltage on the reference voltage circuit, indicating a short directly to ground or the module senses greater than expected voltage on the sensor reference voltage circuit, indicating an open or a short directly to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module

PINPOINT TEST D: DTC 4-4

Test Step	Result / Action to Take
D1 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module C228A. • Measure the resistance between ground and HVAC module C228A-12, circuit CH232 (WH/BN), harness side.	**Yes** GO to D2. **No** REPAIR circuit CH232 (WH/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0114482 • **Is the resistance greater than 10,000 ohms?**	
D2 CHECK THE REFERENCE VOLTAGE CIRCUIT AND THE SIGNAL RETURN CIRCUIT FOR A SHORT TOGETHER	
• Measure the resistance between HVAC module C228A-12, circuit CH232 (WH/BN), harness side and HVAC module C228A-2, circuit CH233 (VT/BN), harness side.  N0114483 • **Is the resistance greater than 100 ohms?**	**Yes** GO to D4 . **No** GO to D3 .
D3 CHECK THE ACTUATORS	

• Measure the resistance between HVAC module C228A-2, circuit CH233 (VT/BN), harness side and HVAC module C228A-12, circuit CH232 (WH/BN), harness side.
 N0114483
• While measuring the resistance, disconnect the following components one at a time, in order. Stop disconnecting components if the measured resistance rises above 100 ohms.
  • Defrost/panel/floor door actuator C236
  • Temperature blend door actuator C2092
• **Did the resistance rise above 100 ohms?**
	Yes
	INSTALL a new actuator (the last one to be disconnected). REFER to Section 412-01 . CONNECT the actuator electrical connector before the HVAC module connector(s). This allows the actuator to be calibrated when the HVAC module is reconnected. TEST the system for normal operation.
	
	No
	REPAIR circuits CH233 (VT/BN) and CH232 (WH/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D4 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON.	**Yes**

• Measure the voltage between ground and HVAC module C228A-12, circuit CH232 (WH/BN), harness side  N0114484 • **Is any voltage present?**	REPAIR circuit CH232 (WH/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D5 .
D5 CHECK THE RETURN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and HVAC module C228A-2, circuit CH233 (VT/BN), harness side  N0114484 • **Is any voltage present?**	**Yes** REPAIR circuit CH233 (VT/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D6 .
D6 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Temperature Blend Door Actuator C2092. • Measure the resistance between ground and HVAC module C228A-12, circuit CH232 (WH/BN), harness side and temperature blend door actuator C2092-2, circuit CH232 (WH/BN).  N0114485 • **Is the resistance less than 5 ohms?**	**Yes** GO to D7 . **No** REPAIR circuit CH232 (WH/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D7 CHECK THE HVAC MODULE CONNECTION	
• Disconnect all the HVAC module connectors. • Inspect the HVAC module connectors for:	**Yes** INSTALL a new HVAC module.

▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test E: DTCs 5-3 and 5-4

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

NOTE: DTCs 5-3 and 5-4 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Normal Operation

The HVAC module receives a ground. The HVAC module is supplied constant battery voltage and ignition voltage.

- DTC 53 (Battery Voltage Low) — The module senses when battery voltage is less than 8 volts for more than 2 seconds.
- DTC 54 (Battery Voltage High) — The module senses when battery voltage is greater than 16 volts for more than 2 seconds.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- HVAC module
- Battery
- Charging system concern

PINPOINT TEST E: DTCs 5-3 AND 5-4

Test Step	Result / Action to Take
E1 RETRIEVE ALL CMDTCs IN ALL MODULES • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Are any charging system DTCs present in the PCM??**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to E2 .
E2 CHECK BATTERY CONDITION • Ignition OFF. • Refer to Section 414-01 and carry out the Battery — Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all

	Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to E3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
E3 CHECK THE CHARGING SYSTEM VOLTAGE **NOTE:** Do not allow the engine rpm to exceed above 2,000 rpm while performing this step or the generator may self-excite and result in default charging system output voltage. If engine rpm has exceeded 2,000 rpm, shut the vehicle off and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery: ▪ **For DTC 54** , turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes. ▪ **For DTC 53** , turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes.  AJ0210-A • **Is the battery voltage between 13 and 15.2 volts?**	**Yes** **If diagnosing DTC 5-3** , GO to E4 . **If diagnosing DTC 5-4** , INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR all CMDTCs . REPEAT the self-test. **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.
E4 CHECK THE HVAC MODULE VOLTAGE SUPPLY CIRCUITS • Ignition OFF. • Disconnect: HVAC Module C228A. • Ignition ON. • With the engine running, measure the voltage between ground and: ▪ HVAC module C228A-10, circuit SBP07 (WH/RD), harness side. ▪ HVAC module C228A-14, circuit CBP21 (BU/GY), harness side.	**Yes** GO to E5 . **No** REPAIR circuit SBP07 (WH/RD) or CBP21 (BU/GY) for high resistance. CLEAR all CMDTCs . REPEAT the self-test.

 N0114486 • **Are the voltages greater than 10 volts?**	
E5 CHECK THE HVAC MODULE GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between ground and HVAC module C228A-13, circuit GD115 (BK/GY), harness side.  N0114487 • **Is the resistance less than 5 ohms?**	**Yes** GO to E6 . **No** REPAIR circuit GD115 (BK/GY) for high resistance. CLEAR all CMDTCs . REPEAT the self-test. TEST the system for normal operation.
E6 CHECK THE HVAC MODULE CONNECTION	
• Disconnect all the HVAC module connectors. • Inspect the HVAC module connectors for: ▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: Unable to Duplicate the Customer Concern and No DTCs Present

Normal Operation

This pinpoint test tests the functions of the HVAC system and identifies the correct HVAC symptom pinpoint test.

This pinpoint test is intended to diagnose the following:

- Incorrect functioning of the HVAC system and/or related components

PINPOINT TEST F: UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DTCS PRESENT

Test Step	Result / Action to Take
F1 CHECK THE BLOWER MOTOR OPERATION • Ignition ON. • Select PANEL mode. • Observe blower motor operation and select each blower motor speed. • **Does the blower motor operate in all selections and change speed in each?**	**Yes** GO to F2. **No** If the blower motor does not operate in any setting, GO to Pinpoint Test N. If the blower motor does not properly change speeds or shut off, GO to Pinpoint Test O.
F2 CHECK AIRFLOW OPERATION • Select the highest blower motor setting. • **NOTE:** Refer to Description and Operation in this section for proper airflow descriptions. • While observing the airflow, select each of the airflow positions (PANEL, PANEL/FLOOR, FLOOR, FLOOR/DEFROST, DEFROST). • **Is the airflow directed to the proper outlets?**	**Yes** GO to F3. **No** GO to Pinpoint Test H.
F3 VERIFY TEMPERATURE CONTROL OPERATION • Start the vehicle and allow it to reach normal operating temperature. • Select PANEL and press the A/C button (indicator on) (if equipped) on the HVAC controls. • Change the temperature setting from the coldest to the warmest and back to the coldest. • **Does the temperature change between very warm to cool?**	**Yes** If the vehicle **is equipped** with A/C, GO to F4. If the vehicle **is not equipped** with A/C, GO to F6. **No** If the temperature does not get very warm, GO to Pinpoint Test I. If the temperature does not change at all, GO to Pinpoint Test M.
F4 VERIFY THE A/C CLUTCH DOES NOT ENGAGE WITH A/C OFF • Start the engine. • Select PANEL and press the A/C button (indicator off) on the HVAC controls. • Select the coldest temperature setting. • **Is the outlet temperature close to ambient temperature?**	**Yes** GO to F5. **No** If the temperature is warmer than ambient temperature, GO to Pinpoint Test M and diagnose for inoperative blend door. If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch cycles normally, GO to Pinpoint Test L. If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch is engaged and does not cycle, GO to Pinpoint Test K.
F5 VERIFY A/C CLUTCH ENGAGEMENT IN THE A/C MODE • Make sure the ambient air temperature is above 0°C (32°F). • Select PANEL mode on the HVAC controls. • Press the A/C button (indicator on). • **Does the A/C clutch engage when the PANEL and A/C button (indicator on) is**	**Yes** GO to F6. **No** GO to Pinpoint Test J.

pressed?	
F6 CHECK THE RECIRC OPERATION	
• With the engine running, press the RECIRC button (indicator off). • Select PANEL mode. • Select the highest blower motor setting. • Observe airflow noise. • Press the RECIRC button (indicator on). • **Does the airflow noise increase when the RECIRC mode is selected (indicator on)?**	**Yes** The system is operating normally. **No** GO to Pinpoint Test G .

Pinpoint Test G: The Air Inlet Door is Inoperative

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

The HVAC module supplies voltage and ground to the air inlet mode door actuator through the actuator motor circuits to rotate the air inlet mode door actuator. To reverse the air inlet mode door actuator rotation, the HVAC module reverses voltage and ground on the circuits.

When the HVAC is in FLOOR/DEFROST or FLOOR mode, RECIRC is a timed function. When RECIRC is selected, the air inlet mode door remains in recirculated air mode for 5 minutes. After 5 minutes, the RECIRC indicator turns off and the air inlet mode door changes to fresh air mode.

- DTC 4-2 (Recirculation Motor Driver Circuit/Performance) — This DTC sets when either of the following occurs:
  - The module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground.
  - The module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Air inlet mode door actuator
- HVAC module
- Air inlet mode door binding or stuck

PINPOINT TEST G: THE AIR INLET DOOR IS INOPERATIVE

Test Step	Result / Action to Take
G1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • CARRY OUT the HVAC module self-test. • Check for HVAC DTCs retrieved during the self-test. • **Is DTC 4-2 present?**	**Yes** GO to G2 . **No** GO to G6 .
G2 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF.
• Disconnect: HVAC Module C228A.
• Ignition ON.
• Measure the voltage between ground and:
  ▪ HVAC module C228A-9, circuit CH206 (YE/VT), harness side.
  ▪ HVAC module C228A-18, circuit CH208 (GN/OG), harness side.
	Yes
	REPAIR circuit CH206 (YE/VT) or CH208 (GN/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0114488 • **Are any voltages present?**	**No** GO to G3 .
G3 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and: ▪ HVAC module C228A-9, circuit CH206 (YE/VT), harness side. ▪ HVAC module C228A-18, circuit CH208 (GN/OG), harness side.  N0114489 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit CH206 (YE/VT) or CH208 (GN/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G4 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR RESISTANCE	
• Measure the resistance between HVAC module C228A-9, circuit CH206 (YE/VT), harness side and HVAC module C228A-18, circuit CH208 (GN/OG), harness side.  N0114490 • **Is the resistance greater than 30 ohms?**	**Yes** GO to G8 . **No** GO to G5 .
G5 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR	

CIRCUITS FOR A SHORT TOGETHER	
• Disconnect: Air Inlet Mode Door Actuator C289. • Measure the resistance between HVAC module C228A-9, circuit CH206 (YE/VT), harness side and HVAC module C228A-18, circuit CH208 (GN/OG), harness side.  N0114490 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new air inlet actuator. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuits CH208 (GN/OG) and CH206 (YE/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G6 CHECK THE AIR INLET MODE DOOR ACTUATOR MOTOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module C228A. • Disconnect: Air Inlet Mode Door Actuator C289. • Measure the resistance between HVAC module C228A-18, circuit CH208 (GN/OG), harness side and air inlet mode door actuator C289-1, circuit CH208 (GN/OG), harness side.  N0114491 • Measure the resistance between HVAC module C228A-9, circuit CH206 (YE/VT), harness side and air inlet mode door actuator C289-6, circuit CH206 (YE/VT), harness side.  N0114492 • **Are the resistances less than 5 ohms?**	**Yes** GO to G7 . **No** REPAIR circuit CH206 (YE/VT) or CH208 (GN/OG) for an open. TEST the system for normal operation.
G7 CHECK THE AIR INLET MODE DOOR AND LINKAGE	
	Yes

• Disconnect: Air Inlet Mode Door Actuator C289. • REMOVE the air inlet mode mode door actuator. REFER to Section 412-01 . • INSPECT the air inlet mode mode door and linkage for a broken, loose or binding condition. • **Is any binding condition found during inspection?**	REPAIR the air inlet mode mode door or linkage TEST the system for normal operation. **No** GO to G8 .
G8 CHECK THE AIR INLET MODE DOOR ACTUATOR CONNECTION	

• Disconnect the air inlet mode door actuator connector.
• Inspect the air inlet door actuator connector for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat the actuator connector.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	CARRY OUT the Air Inlet Mode Door Actuator component test in this section. INSTALL a new air inlet mode door if necessary. REFER to Section 412-01 . If the actuator tests OK, GO to G9 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

G9 CHECK THE HVAC MODULE CONNECTION	

• Disconnect all the HVAC module connectors.
• Inspect the HVAC module connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the HVAC module connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test H: Incorrect/Erratic Direction of Airflow From Outlets

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

The HVAC module supplies voltage and ground to the defrost/panel/floor mode door actuator motor through the actuator motor circuits to rotate the defrost/panel/floor mode door actuator. To reverse the defrost/panel/floor mode door actuator rotation, the HVAC module reverses voltage and ground on the circuits.

The defrost/panel/floor mode door actuator feedback resistor is supplied a 5-volt reference voltage and ground from the HVAC module. The HVAC module measures the resistance on the defrost/panel/floor mode door actuator feedback circuit to determine the defrost/panel/floor mode door actuator position by the position of the actuator feedback resistor wiper arm.

During an actuator calibration cycle, the HVAC module drives the defrost/panel/floor mode door until the door reaches both internal stops in the HVAC case. If the defrost/panel/floor mode door is temporarily obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to its end of travel, the airflow may not be from the expected outlets.

- DTC 3-1 (Mode Feedback Circuit/Performance) — The module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates an open actuator motor, an open or shorted feedback circuit, an open feedback resistor reference voltage circuit, or an internal electrical or mechanical failure.
- DTC 3-2 (Mode Motor Driver Circuit/Performance) — The module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor. This indicates a short to ground or the module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
- DTC 3-3 (Mode Actuator Calibration Performance) — The module senses the actuator has moved outside its travel limits during calibration. This indicates broken/disconnected linkage or door or an internal mechanical failure.

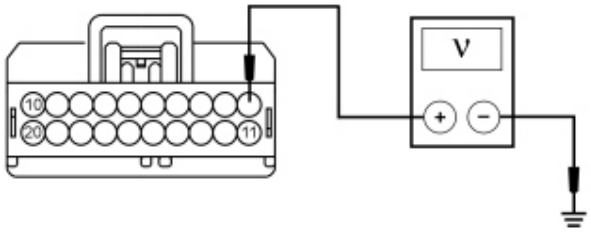
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Defrost/panel/floor mode door actuator
- HVAC module
- Defrost/panel/floor mode door binding or stuck

PINPOINT TEST H: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS

Test Step	Result / Action to Take
H1 CHECK THE HVAC MODULE FOR DTCs **NOTE:** If HVAC DTC 4-4 is present, GO to Pinpoint Test D and diagnose that DTC first. • Ignition ON. • CARRY OUT the HVAC module self-test. • Check for HVAC DTCs retrieved during the self-test. • **Are HVAC DTCs present?**	**Yes** **For DTC 3-1** , GO to H2 . **For DTC 3-2** , GO to H9 . **For DTC 3-3** , GO to H8 . **No** GO to H7 .
H2 CHECK THE ACTUATOR MOTOR AND CIRCUITS • Ignition OFF. • Disconnect: HVAC Module C228A. • Measure the resistance between HVAC module C228A-7, circuit CH202 (BU/GN), harness side and HVAC module C228A-8, circuit CH203 (GN/BN), harness side.  N0114493 • **Is the resistance less than 40 ohms?**	**Yes** GO to H4 . **No** GO to H3 .
H3 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR • Ignition OFF. • Disconnect: Defrost/Panel/Floor Mode Door Actuator C236. • CARRY OUT the Defrost/Panel/Floor Mode Door Actuator component test in this section. • **Did the defrost/panel/floor mode door actuator test OK?**	**Yes** REPAIR circuit CH202 (BU/GN) or CH203 (GN/BN) for an open or high resistance. REPEAT the self-test. TEST the system for normal

	operation. **No** GO to H13 .
H4 CHECK THE POTENTIOMETER LOW- AND HIGH-SIDE RESISTANCE • Measure the **high-side** resistance between HVAC module C228A-12, circuit CH232 (WH/BN), harness side and HVAC module C228A-1, circuit CH204 (GY/OG), harness side.  N0114494 • Measure the **low-side** resistance between HVAC module C228A-2, circuit CH233 (VT/BN), harness side and HVAC module C228A-1, circuit CH204 (GY/OG), harness side.  N0115268 • **Are the resistances between 215 and 4,375 ohms?**	**Yes** GO to H5 . **No** CARRY OUT the Defrost/Panel/Floor Mode Door Actuator component test in this section. INSTALL a new defrost/panel/floor mode door actuator if necessary. REFER to Section 412-01 . If the actuator tests OK and: If the **high-side** resistance only is greater than 4,375 ohms, REPAIR circuit CH232 (WH/BN) for an open. If the **high-side** resistance only is less than 215 ohms, REPAIR circuits CH204 (GY/OG) and CH232 (WH/BN) for a short together. If the **low-side** resistance only is greater than 4,375 ohms, REPAIR circuit CH233 (VT/BN) for an open. If the **low-side** resistance only is less than 215 ohms, REPAIR circuits CH204 (GY/OG) and CH233 (VT/BN) for a short together. If both the **high-side and low-side** resistance is greater than 4,375 ohms, REPAIR circuit CH204 (GY/OG) for an open. Once the repair is complete, CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section. TEST the system for normal operation.
H5 CHECK THE ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE • Ignition ON. • Measure the voltage between ground and HVAC module C228A-1, circuit CH204 (GY/OG), harness side.	**Yes** REPAIR circuit CH204 (GY/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to H6 .



N0117785

- **Is any voltage present?**

H6 CHECK THE ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and HVAC module C228A-1, circuit CH204 (GY/OG), harness side.  N0117786 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to H7 . **No** REPAIR circuit CH204 (GY/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H7 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR OPERATION	
• Ignition OFF. • Disconnect: HVAC Module C228A (If not previously disconnected). • Measure the resistance between HVAC module C228A-2, circuit CH233 (VT/BN), harness side and HVAC module C228A-1, circuit CH204 (GY/OG), harness side.  N0115268 • Connect a fused jumper wire between: ▪ HVAC module C228A-10, circuit SBP07 (WH/RD), harness side and HVAC module C228A-7, circuit CH202 (BU/GN), harness side. ▪ HVAC module C228A-13, circuit GD115 (BK/GY), harness side and HVAC module C228A-8, circuit	**Yes** GO to H14 . **No** GO to H8 .

CH203 (GN/BN), harness side.  N0116057 • Remove the fused jumpers. • Connect a fused jumper wire between: ▪ HVAC module C228A-13, circuit GD115 (BK/GY), harness side and HVAC module C228A-7, circuit CH202 (BU/GN), harness side. ▪ HVAC module C228A-10, circuit SBP07 (WH/RD), harness side and HVAC module C228A-8, circuit CH203 (GN/BN), harness side.  N0116058 • **Does the resistance smoothly increase to approximately 3,500 ohms and/or decrease to approximately 290 ohms when the jumpers are connected?**	
H8 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR AND LINKAGE	
• Disconnect: Defrost/Panel/Floor Mode Door Actuator C236. • REMOVE the defrost/panel/floor mode door actuator. REFER to Section 412-01 . • INSPECT the defrost/panel/floor mode door and linkage for a broken, loose or binding condition. • **Is any condition found during inspection?**	**Yes** REPAIR the defrost/panel/floor mode door or linkage REINSTALL the defrost/panel/floor mode door actuator. CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section. TEST the system for normal operation. **No** GO to H13 .
H9 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module C228A. • Ignition ON. • Measure the voltage between ground and: ▪ HVAC module C228A-7, circuit CH202 (BU/GN),	**Yes** REPAIR circuit CH202 (BU/GN) or CH203 (GN/BN) for a short to voltage. TEST the system for normal operation.

harness side. ■ HVAC module C228A-8, circuit CH203 (GN/BN), harness side.  N0115271 • **Are any voltages present?**	**No** GO to H10 .
H10 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and: ■ HVAC module C228A-7, circuit CH202 (BU/GN), harness side. ■ HVAC module C228A-8, circuit CH203 (GN/BN), harness side.  N0115272 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to H11 . **No** REPAIR circuit CH202 (BU/GN) or CH203 (GN/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H11 CHECK THE ACTUATOR MOTOR AND CIRCUIT RESISTANCE	
• Measure the resistance between HVAC module C228A-7, circuit CH202 (BU/GN), harness side and HVAC module C228A-8, circuit CH203 (GN/BN), harness side.  N0114493	**Yes** GO to H14 . **No** GO to H12 .

• **Is the resistance greater than 30 ohms?**	
H12 CHECK THE ACTUATOR MOTOR CIRCUITS FOR A SHORT TOGETHER	
• Disconnect: Defrost/Panel/Floor Mode Door Actuator C236. • Measure the resistance between HVAC module C228A-7, circuit CH202 (BU/GN), harness side and HVAC module C228A-8, circuit CH203 (GN/BN), harness side.  N0114493 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H13 . **No** REPAIR circuits CH202 (BU/GN) and CH203 (GN/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H13 CHECK THE DEFROST/PANEL/FLOOR MODE DOOR ACTUATOR CONNECTION	

• Disconnect the defrost/panel/floor mode door actuator connector.
• Inspect the defrost/panel/floor mode door actuator connector for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• REINSTALL the defrost/panel/floor mode door actuator, If removed.
• Connect and correctly seat the defrost/panel/floor mode door actuator connector.
• CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new defrost/panel/floor mode door actuator. REFER to Section 412-01 . CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

H14 CHECK THE HVAC MODULE CONNECTION	

• Disconnect all the HVAC module connectors.
• Inspect the HVAC module connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the HVAC module connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
	
	No
	The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

Pinpoint Test I: Insufficient, Erratic or No Heat

Normal Operation

Coolant flows from the engine through the heater core and back to the engine. Proper coolant temperatures are critical for good heater performance.

This pinpoint test is intended to diagnose the following:

- Plugged or partially plugged heater core
- Low engine coolant level
- Temperature blend door actuator
- Temperature blend door binding or stuck

PINPOINT TEST I: INSUFFICIENT, ERRATIC OR NO HEAT

Test Step	Result / Action to Take
I1 CHECK FOR CORRECT ENGINE COOLANT LEVEL	
• Ignition OFF. • Check the engine coolant level. • **Is the engine coolant at the correct level as indicated on the engine coolant recovery reservoir?**	**Yes** GO to I3. **No** GO to I2.
I2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS	
• Pressure test the cooling system for leaks. Refer to Section 303-03. • **Does the engine cooling system leak?**	**Yes** REPAIR the engine coolant leak. TEST the system for normal operation. **No** FILL and BLEED the cooling system. REFER to Section 303-03. After filling and bleeding the cooling system, GO to I3.
I3 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
• Run the engine until it reaches normal operation temperature. Select the FLOOR position on the control assembly. Set the temperature control to full warm and the blower to the lowest setting. • Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot. • **Is the heater core inlet hose temperature above 65.5°C (150°F)?**	**Yes** GO to I4. **No** REFER to Section 303-03 to diagnose the engine not reaching normal operating temperature.
I4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE	
• Using a suitable temperature measuring device, measure the heater core outlet hose temperature. • **Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17° C [10-30°F])?**	**Yes** GO to Pinpoint Test M. **No** INSTALL a new heater core. REFER to Section 412-01. TEST the system for normal operation.

Pinpoint Test J: The Air Conditioning (A/C) is Inoperative

Refer to Wiring Diagrams Cell 54, Manual Climate Control System for schematic and connector information.

Normal Operation

When A/C is requested the HVAC module grounds a circuit to the Instrument Panel Cluster (IPC). The IPC then sends an A/C request through the High Speed Controller Area Network (HS-CAN) to the PCM.

Voltage is provided to the A/C clutch relay coil and switch contacts. When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay. When the PCM energizes the relay, voltage is supplied to the A/C clutch from the relay. Ground is supplied for the A/C clutch.

The evaporator discharge air temperature sensor is used for A/C compressor cycling. An accurate evaporator temperature is critical for compressor engagement. The PCM uses the temperature measurement to turn the A/C compressor off before the evaporator temperature is cold enough to freeze the condensation on the evaporator core.

When an A/C request is received by the PCM, the A/C compressor clutch only engages the A/C clutch relay if all of the following conditions are met:

- The A/C pressure transducer does not indicate excessively low or high refrigerant pressure. Refer to Specifications in this section.
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below 0°C (32°F).
- The PCM has not detected a Wide Open Throttle (WOT) condition.
- The HVAC module does not detect an evaporator discharge air temperature below 0.6°C (33°F).

- DTC 52 (A/C Select Drive Circuit/Performance) — This DTC sets when any of the following occur during a self-test:
  - The module senses ground on the A/C request circuit when the circuit is not grounded by the HVAC module, indicating a short directly to ground.
  - The module senses voltage on the A/C request circuit when the circuit is grounded by the HVAC module, indicating a short directly to voltage.
  - The module senses no voltage on the A/C request circuit when the relay is not grounded by the HVAC module, indicating an open.

This pinpoint test is intended to diagnose the following:

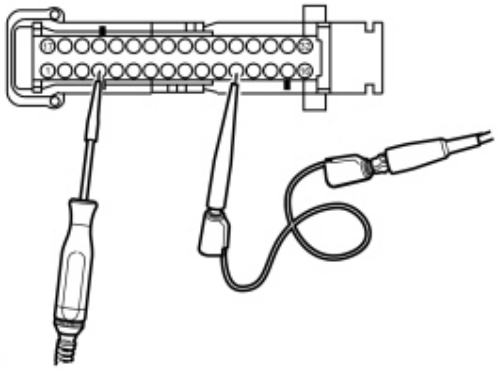
- Fuse(s)
- Wiring, terminals or connectors
- A/C system discharged/low charge
- PCM
- HVAC module
- IPC
- Evaporator discharge air temperature sensor
- A/C pressure transducer
- A/C compressor clutch field coil
- A/C clutch relay
- A/C compressor clutch air gap

PINPOINT TEST J: THE AIR CONDITIONING (A/C) IS INOPERATIVE

NOTE: Some PCM and Instrument Panel Cluster (IPC) DTCs may inhibit A/C operation. If any PCM or IPC DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart or the Instrument Panel Cluster (IPC) DTC Chart.

Test Step	Result / Action to Take
J1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • CARRY OUT the HVAC module self-test. • Check for HVAC DTCs retrieved during the self-test. • **IS DTC 52 present?**	**Yes** GO to J19 . **No** GO to J2 .
J2 CHECK THE A/C SYSTEM PRESSURE	
• Ignition OFF.	**Yes**

• With the R-134a manifold gauge set connected, check the A/C system pressure. • **Is the A/C system pressure above 290 kPa (42 psi) ?**	GO to J3 . **No** CHECK the A/C system for leaks. REFER to Fluorescent Dye Leak Detection or Electronic Leak Detection in this section. RECHARGE the A/C system. REFER to Air Conditioning (A/C) System Recovery, Evacuation and Charging . TEST the system for normal operation.
J3 CHECK THE A/C PRESSURE SENSOR (ACP_PRESS) PCM PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • With the R-134a manifold gauge set connected, compare the pressure readings of the manifold gauge set and the ACP_PRESS PCM PID. • **Are the pressure values of the manifold gauge set and the ACP_PRESS PCM PID similar?**	**Yes** GO to J4 . **No** INSTALL a new A/C pressure transducer. TEST the system for normal operation.
J4 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) INSTRUMENT PANEL CLUSTER (IPC) PID	
• Allow the vehicle exterior and interior to stabilize to the ambient temperature. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Monitor the EVAP_TEMP IPC PID • **Does the EVAP_TEMP IPC PID read similar to the ambient temperature?**	**Yes** GO to J5 . **No** GO to J21
J5 CHECK THE AIR CONDITIONING SWITCH (A/C_SWITCH) IPC PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Monitor the A/C_SWITCH IPC PID • Select PANEL and press the A/C button (indicator on) on the HVAC controls. • **Does the A/C_SWITCH IPC PID read ACTIVE?**	**Yes** GO to J7 . **No** GO to J6 .
J6 CHECK THE A/C REQUEST TO THE IPC	
***NOTICE:* The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Instrument Panel Cluster (IPC) C220. • Ignition ON. • Connect a 12-volt test light between IPC C220-4, circuit CBP21 (BU/GY), harness side and IPC C220-12, circuit CH434 (GY/YE), harness side.	**Yes** GO to J24 . **No** GO to J22 .

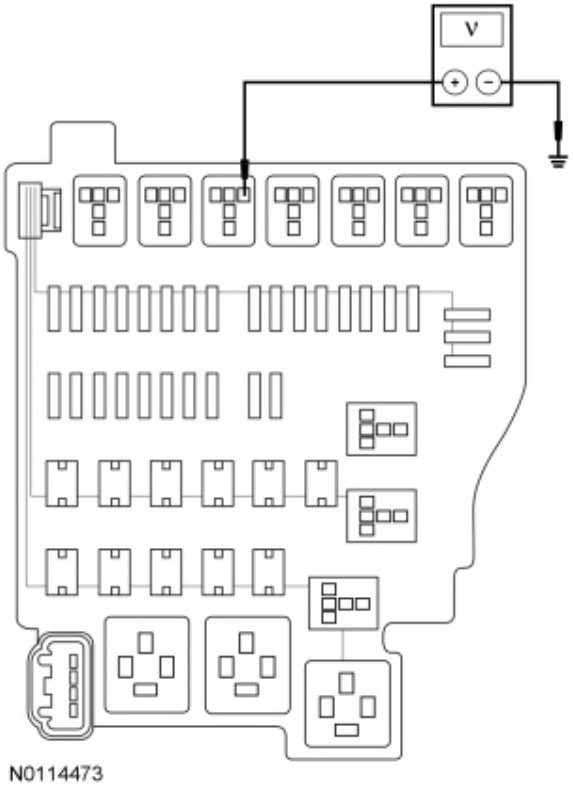


N0115317

- Select PANEL and press the A/C button (indicator on) on the HVAC controls.
- **Does the test light illuminate?**

J7 CHECK THE AIR CONDITIONING REQUEST SIGNAL (AC_REQ) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select PANEL and press the A/C button (indicator on) on the HVAC controls. • Monitor the AC_REQ PCM PID • **Does the AC_REQ PCM PID read YES?**	**Yes** GO to J8 . **No** GO to J24 .
J8 CHECK THE AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select PANEL and press the A/C button (indicator on) on the HVAC controls. • Monitor the ACC_CMD PCM PID • **Does the ACC_CMD PCM PID read ON?**	**Yes** GO to J9 . **No** GO to J23 .
J9 CHECK THE VOLTAGE AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Disconnect: A/C Compressor Clutch Field Coil C100. • Start the engine. • Select MAX A/C on the HVAC module. • Measure the voltage between ground and A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH), harness side.  A0048576 • **Is the voltage greater than 10 volts?**	**Yes** GO to J10 . **No** GO to J13 .
J10 CHECK THE GROUND AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Measure the resistance between ground and A/C compressor clutch field coil C100-2, circuit GD120 (BK/GN), harness side.	**Yes** GO to J11 . **No**

 N0003086 • **Is the resistance less than 5 ohms?**	REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
J11 CHECK THE A/C COMPRESSOR CLUTCH FIELD COIL • Measure the resistance between the A/C compressor clutch field coil C100 terminals, component side. • **Is the resistance between 2 and 5 ohms?**	**Yes** GO to J12 . **No** INSTALL a new A/C compressor clutch field coil. REFER to Section 412-01 . TEST the system for normal operation.
J12 CHECK THE A/C COMPRESSOR CLUTCH FIELD COIL FOR A SHORT TO GROUND • Measure the resistance between the A/C compressor clutch field coil C100 terminals, component side and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. REFER to Section 412-01 . TEST the system for normal operation.
J13 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY COIL • Ignition OFF. • Disconnect: A/C Clutch Relay. • Start the engine. • Measure the voltage between A/C clutch relay socket pin 1, circuit CBP02 (GN) and ground.	**Yes** GO to J14 . **No** VERIFY Central Junction Box (CJB) fuse 2 (10A) is OK. If OK, REPAIR circuit CBP02 (GN) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.



- **Is the voltage greater than 10 volts?**

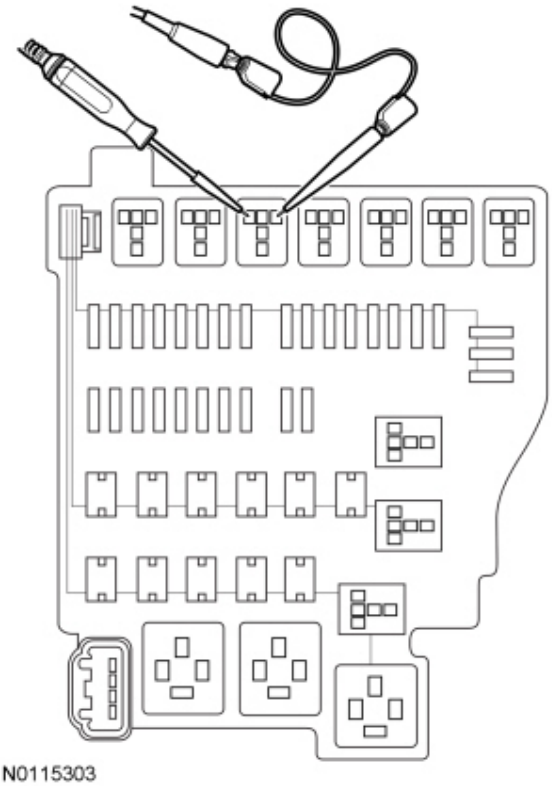
J14 CHECK THE A/C CLUTCH RELAY

NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.**

- Start the engine.
- Select PANEL and press the A/C button (indicator on) on the HVAC controls.
- With the engine running, connect a 12-volt test light between A/C clutch relay socket pin 1, circuit CBP02 (GN) and A/C clutch relay socket pin 2, circuit CH302 (WH/BN).

Yes
GO to J17 .

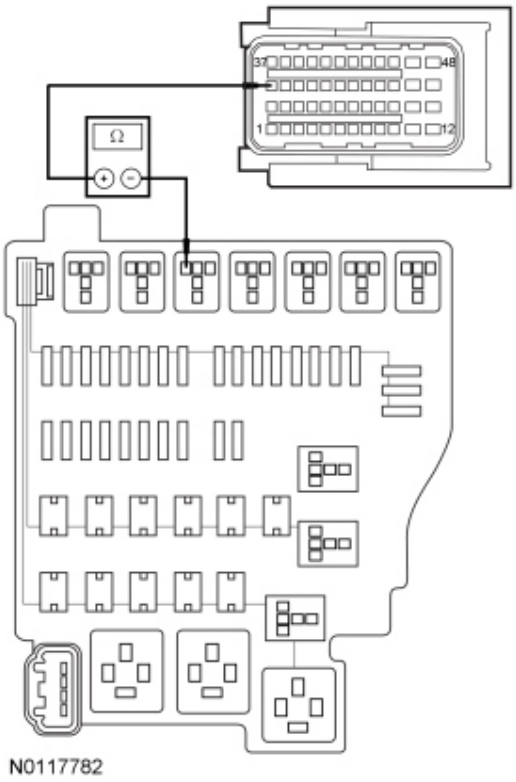
No
GO to J15 .



N0115303

- **Does the test light illuminate?**

J15 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and PCM C175B-25, circuit CH302 (WH/BN), harness side.  N0117784 • **Is any voltage present?**	**Yes** REPAIR circuit CH302 (WH/BN) for a short to voltage. TEST the system for normal operation. **No** GO to J16.
J16 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between A/C clutch relay socket pin 2, circuit CH302 (WH/BN) and PCM C175B-25, circuit CH302 (WH/BN), harness side.	**Yes** GO to J23. **No** REPAIR circuit CH302 (WH/BN) for an open. TEST the system for normal operation.

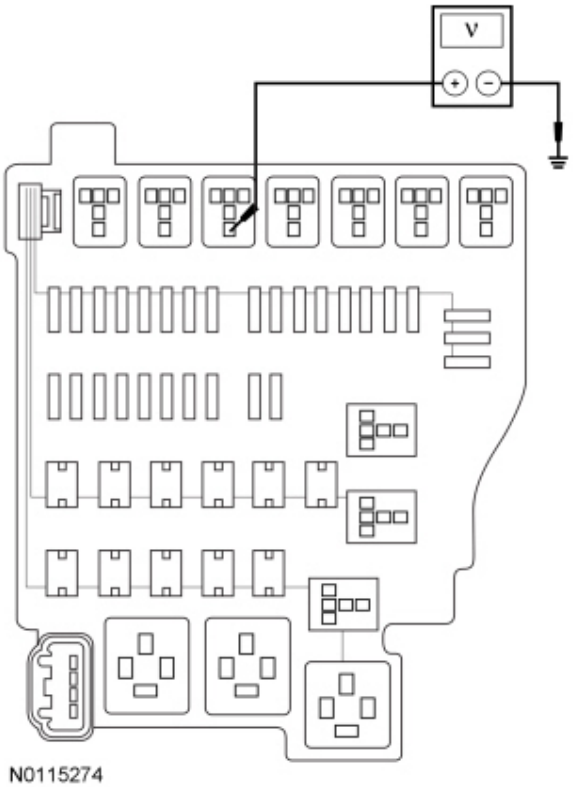


N0117782

- **Is the resistance less than 5 ohms?**

J17 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY SWITCH CONTACTS

- Measure the voltage between ground and the A/C clutch relay socket pin 3, circuit SBB29 (GY/RD).



N0115274

- **Is the voltage greater than 10 volts?**

Yes
GO to J18 .

No
VERIFY Battery Junction Box (BJB) fuse 29 (10A) is OK. If OK, REPAIR circuit SBB29 (GY/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

J18 CHECK THE A/C COMPRESSOR CLUTCH FIELD COIL VOLTAGE CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between A/C clutch relay socket pin 5, circuit CH401 (VT/WH) and A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH), harness side.  N0115275 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new A/C clutch relay. TEST the system for normal operation. **No** REPAIR circuit CH401 (VT/WH) for an open. TEST the system for normal operation.
J19 CHECK THE A/C REQUEST CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module C228A. • Disconnect: Instrument Panel Cluster (IPC) C220. • Ignition ON. • Measure the voltage between ground and HVAC module C228A-4, circuit CH434 (GY/YE), harness side.  N0115276 • **Is any voltage present?**	**Yes** REPAIR circuit CH434 (GY/YE) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to J20.
J20 CHECK THE A/C REQUEST CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between HVAC module C228A-4, circuit CH434 (GY/YE), harness side and IPC C220-12, circuit CH434	**Yes** GO to J22.

(GY/YE), harness side.  • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit CH434 (GY/YE) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J21 CHECK THE EVAPORATOR TEMPERATURE AIR TEMPERATURE SENSOR	
• Ignition OFF. • Disconnect: Evaporator Discharge Air Temperature Sensor C296. • CARRY OUT the Evaporator Discharge Air Temperature Sensor component test in this section. • **Did the evaporator discharge air temperature sensor test OK?**	**Yes** GO to J24 . **No** INSTALL a new evaporator discharge air temperature sensor. REFER to Section 412-01 . TEST the system for normal operation.
J22 CHECK THE HVAC MODULE CONNECTION	

• Disconnect all the HVAC module connectors.
• Inspect the HVAC module connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the HVAC module connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

J23 CHECK THE PCM CONNECTION	

• Disconnect all the PCM connectors.
• Inspect the PCM connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the PCM connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

J24 CHECK THE IPC CONNECTION	
• Disconnect all the IPC connectors. • Inspect the IPC connectors for:	**Yes** INSTALL a new IPC .

■ corrosion. ■ pushed-out terminals. ■ damaged terminals. • Connect and correctly seat all the IPC connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	REFER to Section 413-01. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test K: The Air Conditioning (A/C) is Always On — A/C Compressor Does Not Cycle

Refer to Wiring Diagrams Cell 54, Manual Climate Control System for schematic and connector information.

Normal Operation

When A/C is requested the HVAC module grounds a circuit to the Instrument Panel Cluster (IPC). The IPC then sends an A/C request through the High Speed Controller Area Network (HS-CAN) to the PCM.

Voltage is provided to the A/C clutch relay coil and switch contacts. When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay. When the PCM energizes the relay, voltage is supplied to the A/C clutch from the relay. Ground is supplied for the A/C clutch.

The evaporator discharge air temperature sensor is used for A/C compressor cycling. An accurate evaporator temperature is critical for compressor engagement. The PCM uses the temperature measurement to turn the A/C compressor off before the evaporator temperature is cold enough to freeze the condensation on the evaporator core.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- IPC
- Evaporator discharge air temperature sensor
- A/C clutch relay
- A/C compressor clutch air gap

PINPOINT TEST K: THE AIR CONDITIONING (A/C) IS ALWAYS ON — A/C COMPRESSOR DOES NOT CYCLE

Test Step	Result / Action to Take
K1 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) INSTRUMENT PANEL CLUSTER (IPC) PID	
• Ignition ON. • Allow the vehicle exterior and interior to stabilize to the ambient temperature. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Monitor the EVAP_TEMP IPC PID • **Does the EVAP_TEMP IPC PID read similar to the ambient temperature?**	**Yes** GO to K2. **No** GO to K8.
K2 CHECK AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C OFF	

• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select PANEL and press the A/C button (indicator off) on the HVAC controls. • Monitor the ACC_CMD PCM PID • **Does the ACC_CMD PCM PID read OFF?**	**Yes** GO to K3 . **No** GO to K10 .
K3 CHECK THE A/C RELAY	
• Ignition OFF. • Disconnect: A/C Clutch Relay. • Start the engine. • OBSERVE A/C compressor clutch operation. • **Does the A/C compressor clutch disengage?**	**Yes** GO to K4 . **No** GO to K6 .
K4 CHECK THE A/C CLUTCH RELAY	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Connect a 12-volt test light between A/C clutch relay socket pin 1, circuit CBP02 (GN) and A/C clutch relay socket pin 2, circuit CH302 (WH/BN).  N0115303 • **Does the test light illuminate?**	**Yes** GO to K5 . **No** INSTALL a new A/C clutch relay. TEST the system for normal operation.
K5 CHECK THE A/C CLUTCH RELAY COIL SWITCHED GROUND CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between ground and PCM C175B-25, circuit CH302 (WH/BN), harness side.	**Yes** GO to K10 . **No** REPAIR circuit CH302 (WH/BN) for a short to ground. TEST the system for normal operation.

 N0117783 • **Is the resistance greater than 10,000 ohms?**	
K6 CHECK FOR VOLTAGE TO THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Disconnect: A/C Compressor Clutch Field Coil C100. • Ignition ON. • Measure the voltage between A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH), harness side and ground.  A0048576 • **Is any voltage present?**	**Yes** REPAIR circuit CH401 (VT/WH) for a short to voltage. TEST the system for normal operation. **No** GO to K7 .
K7 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP	
• Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley.  N0069468 • **Is the A/C compressor clutch air gap average less than 0.3 mm (0.012 in)?**	**Yes** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch. REFER to Section 412-01 . TEST the system for normal operation.
K8 CHECK THE EVAPORATOR TEMPERATURE AIR TEMPERATURE SENSOR	
• Ignition OFF. • Disconnect: Evaporator Discharge Air Temperature Sensor C296. • CARRY OUT the Evaporator Discharge Air Temperature Sensor component test in this section.	**Yes** GO to K9 . **No**

• **Did the evaporator discharge air temperature sensor test OK?**	INSTALL a new evaporator discharge air temperature sensor. REFER to Section 412-01 . TEST the system for normal operation.
K9 CHECK THE IPC CONNECTION	

• Disconnect all the IPC connectors.
• Inspect the IPC connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the IPC connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

K10 CHECK THE PCM CONNECTION	

• Disconnect all the PCM connectors.
• Inspect the PCM connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the PCM connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Air Conditioning (A/C) is Always On — A/C Mode Always Commanded ON

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, when A/C is requested the HVAC module grounds a circuit to the Instrument Panel Cluster (IPC). The IPC then sends an A/C request through the High Speed Controller Area Network (HS-CAN) to the PCM.

- DTC 52 (A/C Select Drive Circuit/Performance) — This DTC sets when any of the following occur during a self-test:
  - The module senses ground on the A/C request circuit when the circuit is not grounded by the HVAC module, indicating a short directly to ground.
  - The module senses voltage on the A/C request circuit when the circuit is grounded by the HVAC module, indicating a short directly to voltage.
  - The module senses no voltage on the A/C request circuit when the relay is not grounded by the HVAC module, indicating an open.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- HVAC module

PINPOINT TEST L: THE AIR CONDITIONING (A/C) IS ALWAYS ON — A/C MODE ALWAYS COMMANDED ON

NOTE: Some PCM and Instrument Panel Cluster (IPC) DTCs may inhibit A/C operation. If any PCM or IPC DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart or the Instrument Panel Cluster (IPC) DTC Chart.

Test Step	Result / Action to Take
L1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Select OFF on the HVAC controls. • CARRY OUT the HVAC module self-test. • Check for HVAC DTCs retrieved during the self-test. • **Is DTC 52 present?**	**Yes** GO to L2. **No** GO to L3.
L2 CHECK THE A/C REQUEST CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module C228A. • Disconnect: Instrument Panel Cluster (IPC) C220. • Ignition ON. • Measure the resistance between ground and HVAC module C228A-4, circuit CH434 (GY/YE), harness side.  N0117791 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L8. **No** REPAIR circuit CH434 (GY/YE) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
L3 CHECK THE AIR CONDITIONING SWITCH (A/C_SWITCH) IPC PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Monitor the A/C_SWITCH IPC PID • Select PANEL and press the A/C button (indicator off) on the HVAC controls. • **Does the A/C_SWITCH IPC PID read INACTIVE?**	**Yes** GO to L4. **No** GO to L6.
L4 CHECK THE AIR CONDITIONING REQUEST SIGNAL (AC_REQ) PCM PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select PANEL and press the A/C button (indicator off) on the HVAC controls. • Monitor the AC_REQ PCM PID • **Does the AC_REQ PCM PID read NO?**	**Yes** GO to L5. **No** GO to L7.
L5 CHECK AIR CONDITIONING COMPRESSOR COMMANDED	

STATE (ACC_CMD) PCM PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select PANEL and press the A/C button (indicator off) on the HVAC controls. • Monitor the ACC_CMD PCM PID • **Does the ACC_CMD PCM PID read OFF?**	**Yes** GO to L6 . **No** GO to L7 .
L6 CHECK THE HVAC MODULE CONNECTION	

• Disconnect all the HVAC module connectors.
• Inspect the HVAC module connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the HVAC module connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

L7 CHECK THE PCM CONNECTION	

• Disconnect all the PCM connectors.
• Inspect the PCM connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the PCM connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

L8 CHECK THE IPC CONNECTION	

• Disconnect all the IPC connectors.
• Inspect the IPC connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the IPC connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test M: Temperature Control is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

The HVAC module supplies voltage and ground to the temperature blend door actuator motor through the actuator motor circuits to rotate the temperature blend door actuator. To reverse the temperature blend door actuator rotation, the HVAC module reverses the voltage and ground on the circuits.

The temperature blend door actuator feedback resistor is supplied a 5-volt reference voltage and ground from the HVAC module. The HVAC module measures the resistance on the temperature blend door actuator feedback circuit to determine the temperature blend door actuator position by the position of the actuator feedback resistor wiper arm.

During an actuator calibration cycle, the HVAC module drives the temperature blend door until the door reaches both internal stops in the HVAC case. If the temperature blend door is temporarily obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to its end of travel, the airflow may not be the expected temperature.

- DTC 2-1 (Blend Feedback Circuit/Performance) — The module senses no changes in the feedback circuit when motor movement is commanded and no motor electrical DTCs are present. This indicates an open actuator motor, an open or shorted feedback circuit, an open feedback resistor reference voltage circuit, or an internal electrical or mechanical failure.
- DTC 2-2 (Blend Motor Driver Circuit/Performance) — The module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor. This indicates a short to ground or the module senses greater than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage.
- DTC 2-3 (Blend Actuator Calibration Performance) — The module senses the actuator has moved outside its travel limits during calibration. This indicates broken/disconnected linkage or door or an internal mechanical failure.

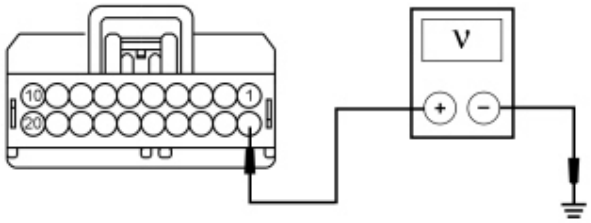
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Temperature blend door actuator
- HVAC module
- Temperature blend door is binding or stuck

PINPOINT TEST M: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
M1 CHECK THE HVAC MODULE FOR DTCs **NOTE:** If HVAC DTC 4-4 is present, GO to Pinpoint Test D and diagnose that DTC first. • Ignition ON. • CARRY OUT the HVAC module self-test. • Check for HVAC DTCs retrieved during the self-test. • **Are HVAC DTCs present?**	**Yes** **For DTC 2-1** , GO to M2 . **For DTC 2-2** , GO to M9 . **For DTC 2-3** , GO to M8 . **No** GO to M7 .
M2 CHECK THE ACTUATOR MOTOR AND CIRCUITS • Ignition OFF. • Disconnect: HVAC Module C228A. • Measure the resistance between HVAC module C228A-17, circuit CH235 (BU), harness side and HVAC module C228A-19, circuit CH236 (WH), harness side.  N0115278 • **Is the resistance less than 40 ohms?**	**Yes** GO to M4 . **No** GO to M3 .
M3 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR	

• Ignition OFF. • Disconnect: Temperature Blend Door Actuator C2092. • CARRY OUT the Temperature Blend Door Actuator component test in this section. • **Did the temperature blend door actuator test OK?**	**Yes** REPAIR circuit CH235 (BU) or CH236 (WH) for an open or high resistance. REPEAT the self-test. TEST the system for normal operation. **No** GO to M13.
M4 CHECK THE POTENTIOMETER LOW- AND HIGH-SIDE RESISTANCE	
• Measure the **high-side** resistance between HVAC module C228A-12, circuit CH232 (WH/BN), harness side and HVAC module C228A-11, circuit CH206 (YE/VT), harness side.  N0115279 • Measure the **low-side** resistance between HVAC module C228A-2, circuit CH233 (VT/BN), harness side and HVAC module C228A-11, circuit CH206 (YE/VT), harness side.  N0115280 • **Are the resistances between 215 and 4,375 ohms?**	**Yes** GO to M5. **No** CARRY OUT the Temperature Blend Door Actuator component test in this section. INSTALL a new defrost/panel/floor mode door actuator if necessary. REFER to Section 412-01. If the actuator tests OK and: If the **high-side** resistance only is greater than 4,375 ohms, REPAIR circuit CH232 (WH/BN) for an open. If the **high-side** resistance only is less than 215 ohms, REPAIR circuits CH206 (YE/VT) and CH232 (WH/BN) for a short together. If the **low-side** resistance only is greater than 4,375 ohms, REPAIR circuit CH233 (VT/BN) for an open. If the **low-side** resistance only is less than 215 ohms, REPAIR circuits CH206 (YE/VT) and CH233 (VT/BN) for a short together. If both the **high-side and low-side** resistance is greater than 4,375 ohms, REPAIR circuit CH206 (YE/VT) for an open. Once the repair is complete, CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section. TEST the system for normal operation.
M5 CHECK THE ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and HVAC module C228A-11, circuit CH206 (YE/VT), harness side.	**Yes** REPAIR circuit CH206 (YE/VT) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to M6.



N0117787

- **Is any voltage present?**

M6 CHECK THE ACTUATOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and HVAC module C228A-11, circuit CH206 (YE/VT), harness side.  N0117788 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M7 . **No** REPAIR circuit CH206 (YE/VT) or CH233 (VT/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M7 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR OPERATION	
• Ignition OFF. • Disconnect: HVAC Module C228A (If not previously disconnected). • Measure the resistance between HVAC module C228A-2, circuit CH233 (VT/BN), harness side and HVAC module C228A-11, circuit CH206 (YE/VT), harness side.  N0115280 • Connect a fused jumper wire between: ▪ HVAC module C228A-10, circuit SBP07 (WH/RD), harness side and HVAC module C228A-17, circuit CH235 (BU), harness side. ▪ HVAC module C228A-13, circuit GD115 (BK/GY), harness side and HVAC module C228A-19, circuit	**Yes** GO to M14 . **No** GO to M8 .

CH236 (WH), harness side.  N0117789 • Remove the fused jumpers. • Connect a fused jumper wire between: ▪ HVAC module C228A-13, circuit GD115 (BK/GY), harness side and HVAC module C228A-17, circuit CH235 (BU), harness side. ▪ HVAC module C228A-10, circuit SBP07 (WH/RD), harness side and HVAC module C228A-19, circuit CH236 (WH), harness side.  N0117790 • **Does the resistance smoothly increase to approximately 3,500 ohms and/or decrease to approximately 290 ohms when the jumpers are connected?**	
M8 CHECK THE TEMPERATURE BLEND DOOR AND LINKAGE	
• Disconnect: Temperature Blend Door Actuator C2092. • REMOVE the temperature blend door actuator. REFER to Section 412-01 . • INSPECT the temperature blend door and linkage for a broken, loose or binding condition. • **Is any condition found during inspection?**	**Yes** REPAIR the temperature blend door or linkage REINSTALL the temperature blend door actuator. CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section. TEST the system for normal operation. **No** GO to M13 .
M9 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module C228A. • Ignition ON. • Measure the voltage between ground and: ▪ HVAC module C228A-17, circuit CH235 (BU), harness side. ▪ HVAC module C228A-19, circuit CH236 (WH),	**Yes** REPAIR circuit CH235 (BU) or CH236 (WH) for a short to voltage. TEST the system for normal operation. **No**

harness side.  N0115283 • **Are any voltages present?**	GO to M10.
M10 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and: ▪ HVAC module C228A-17, circuit CH235 (BU), harness side. ▪ HVAC module C228A-19, circuit CH236 (WH), harness side.  N0115284 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M11. **No** REPAIR circuit CH235 (BU) or CH236 (WH) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M11 CHECK THE ACTUATOR MOTOR AND CIRCUIT RESISTANCE	
• Measure the resistance between HVAC module C228A-17, circuit CH235 (BU), harness side and HVAC module C228A-19, circuit CH236 (WH), harness side.  N0115278 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M14. **No** GO to M12.

M12 CHECK THE ACTUATOR MOTOR CIRCUITS FOR A SHORT TOGETHER	
• Disconnect: Temperature Blend Door Actuator C2092. • Measure the resistance between HVAC module C228A-17, circuit CH235 (BU), harness side and HVAC module C228A-19, circuit CH236 (WH), harness side.  N0115278 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M13 . **No** REPAIR circuits CH235 (BU) and CH236 (WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M13 CHECK THE ACTUATOR CONNECTION	
• Disconnect the temperature blend door actuator connector. • Inspect the temperature blend door actuator connector for: ▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • REINSTALL the temperature blend door actuator, If removed. • Connect and correctly seat the temperature blend door actuator connector. • CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new temperature blend door actuator. REFER to Section 412-01 . CALIBRATE the actuators. REFER to Calibrating the HVAC Actuators in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
M14 CHECK THE HVAC MODULE CONNECTION	
• Disconnect all the HVAC module connectors. • Inspect the HVAC module connectors for: ▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

Pinpoint Test N: The Blower Motor is Inoperative

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

The blower motor relay coil and relay switch contacts receive voltage. The blower motor relay is energized when the coil receives ground from the HVAC module, if the HVAC power is on. When the relay coil is energized, voltage is delivered to the blower motor. Ground for the blower motor is provided from the blower resistor or the blower switch (HI). The blower resistor is grounded through the blower motor switch. The blower motor switch is grounded. The blower motor switch is part of the HVAC module and can not be replaced separately.

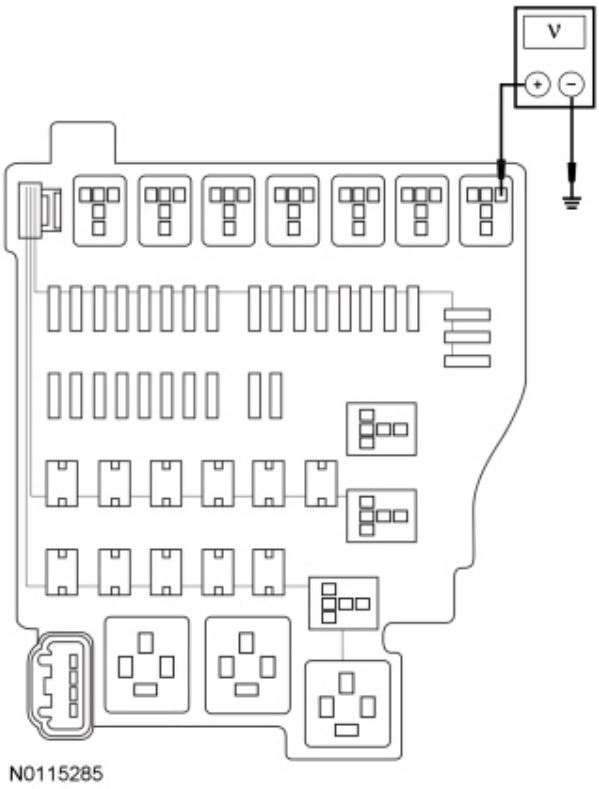
- DTC 51 (Blower Relay Driver Circuit/Performance) — This DTC sets when any of the following occur:
  - The module senses ground on the relay coil ground circuit when the relay is not grounded by the HVAC module, indicating a short directly to ground.
  - The module senses voltage on the relay coil ground circuit when the relay is grounded by the HVAC module, indicating a short directly to voltage.
  - The module senses no voltage on the relay coil ground circuit when the relay is not grounded by the HVAC module, indicating an open.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Blower motor
- Blower motor relay
- HVAC module

PINPOINT TEST N: THE BLOWER MOTOR IS INOPERATIVE

Test Step	Result / Action to Take
N1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • CARRY OUT the HVAC module self-test. • Check for HVAC DTCs retrieved during the self-test. • **Is DTC 51 present?**	**Yes** GO to N2 . **No** GO to N6 .
N2 CHECK THE BLOWER MOTOR RELAY COIL SUPPLY VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay. • Ignition ON. • Measure the voltage between blower motor relay socket pin 1, circuit CBP21 (BU/GY) and ground.	**Yes** GO to N3 . **No** REPAIR circuit CBP21 (BU/GY) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



- **Is the voltage greater than 10 volts?**

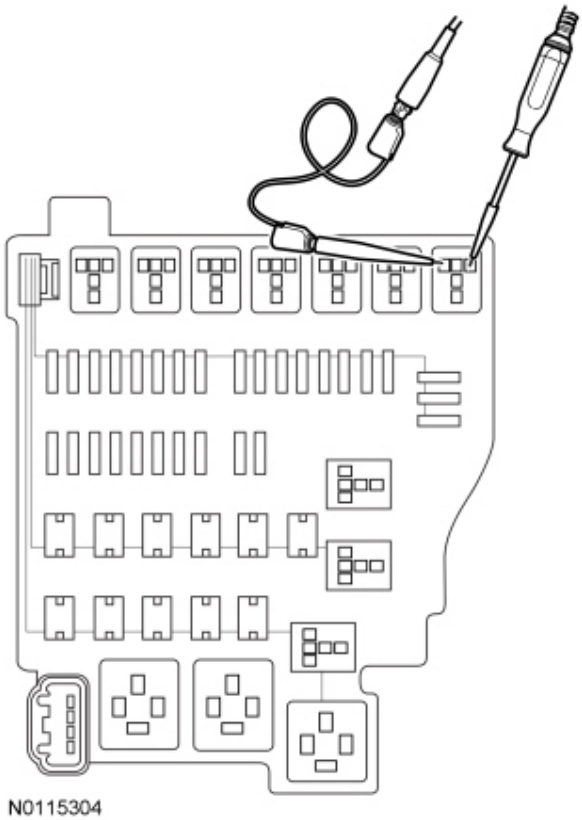
N3 CHECK THE BLOWER MOTOR RELAY COIL

NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.**

- Select PANEL on the HVAC controls.
- Connect a 12-volt test light between blower motor relay socket pin 1, circuit CBP21 (BU/GY) and blower motor relay socket pin 2, circuit CH123 (VT/GN).

Yes
INSTALL a new blower motor relay. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

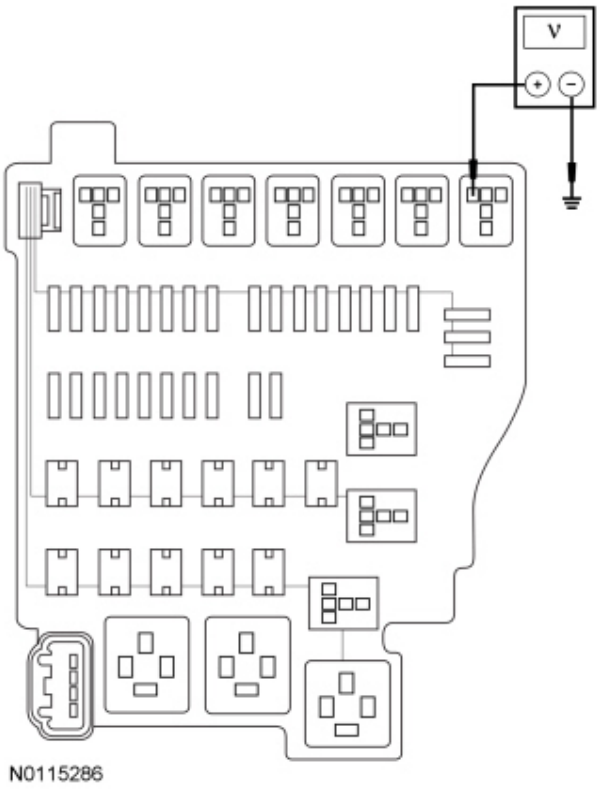
No
GO to N4 .



N0115304

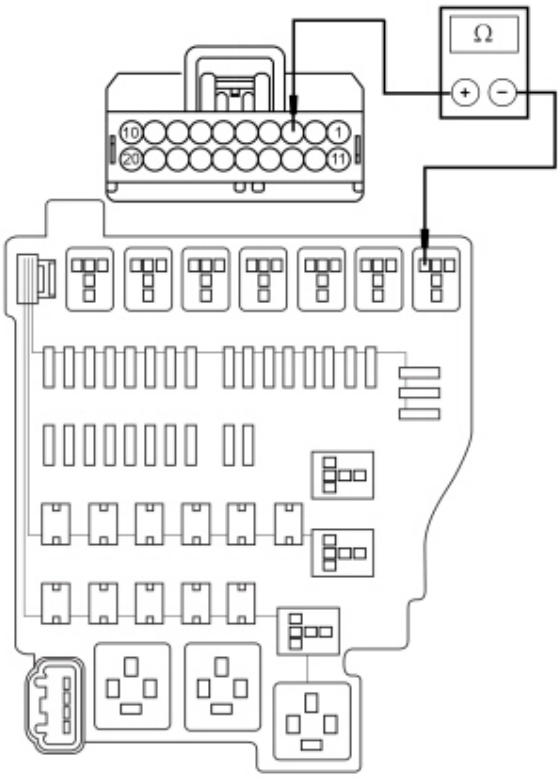
- **Does the test light illuminate?**

N4 CHECK THE BLOWER MOTOR RELAY COIL GROUND CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module C228A. • Ignition ON. • Measure the voltage between blower motor relay socket pin 2, circuit CH123 (VT/GN) and ground.	**Yes** REPAIR circuit CH123 (VT/GN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to N5 .



- **Is any voltage present?**

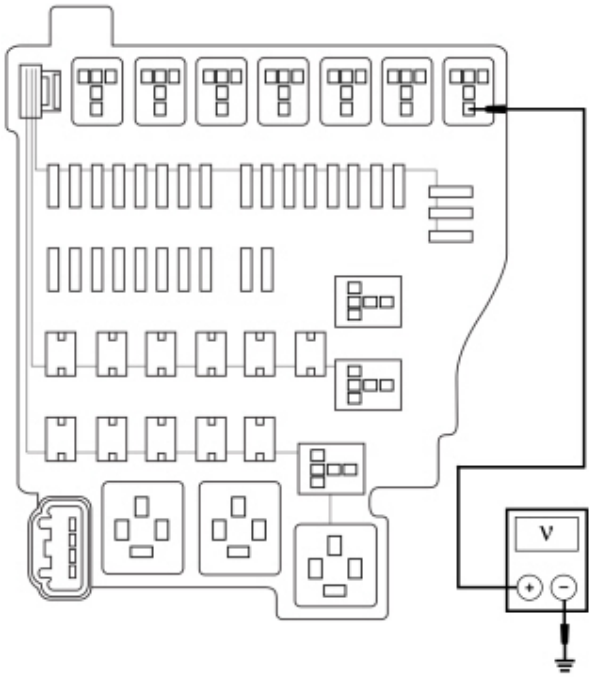
N5 CHECK THE BLOWER MOTOR RELAY COIL GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between blower motor relay socket pin 2, circuit CH123 (VT/GN) and HVAC module C228A-3, circuit CH123 (VT/GN), harness side.	**Yes** GO to N12 . **No** REPAIR circuit CH123 (VT/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



N0115287

- **Is the resistance less than 5 ohms?**

N6 CHECK THE BLOWER MOTOR RELAY SWITCH CONTACTS SUPPLY VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay. • Ignition ON. • Measure the voltage between blower motor relay socket pin 3, circuit SBB04 (GN/RD) and ground.	**Yes** GO to N7 . **No** VERIFY Battery Junction Box (BJB) fuse 4 (40A) is OK. If OK, REPAIR circuit SBB04 (GN/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

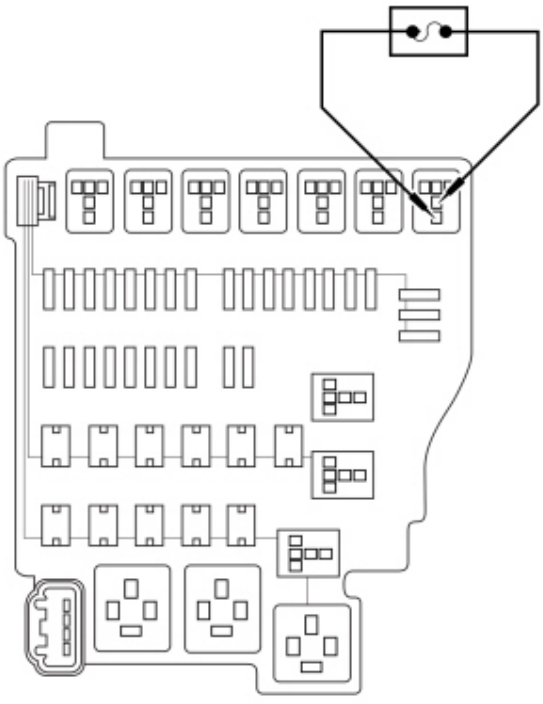


N0115305

- **Is the voltage greater than 10 volts?**

N7 CHECK THE BLOWER MOTOR RELAY

- Select the highest blower motor speed on HVAC controls.
- Connect a fused jumper lead between blower motor relay socket pin 3, circuit SBB04 (GN/RD) and blower motor relay socket pin 5, circuit CH402 (YE/GN).



N0115293

Yes
INSTALL a new blower motor relay. TEST the system for normal operation.

No
GO to N8 .

• **Does the blower motor operate?**	
N8 CHECK THE BLOWER MOTOR GROUND CIRCUIT	
• Ignition OFF. • Disconnect: Blower Motor C2004. • Turn the blower motor switch to the HI position. • Measure the resistance between blower motor connector C2004-2, circuit CH430 (VT/OG), harness side and ground.  N0115288 • **Is the resistance less than 5 ohms?**	**Yes** GO to N9 . **No** GO to N10 .
N9 CHECK THE BLOWER MOTOR VOLTAGE CIRCUIT FOR AN OPEN	
• Measure the resistance between blower motor relay socket pin 5, circuit CH402 (YE/GN) and blower motor C2004-1, circuit CH402 (YE/GN), harness side.  N0115292 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor. TEST the system for normal operation. **No** REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.
N10 CHECK THE BLOWER MOTOR GROUND CIRCUIT FOR AN OPEN	
• Disconnect: HVAC Module C228B. • Measure the resistance between HVAC module C228B-6, circuit CH430 (VT/OG), harness side and blower motor C2004-2, circuit CH430 (VT/OG), harness side.	**Yes** GO to N11 . **No**

 N0115289 • **Is the resistance less than 5 ohms?**	REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.
N11 CHECK THE BLOWER MOTOR SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between HVAC module C228B-3, circuit GD115 (BK/GY), harness side and ground.  N0115290 • **Is the resistance less than 5 ohms?**	**Yes** GO to N12 . **No** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
N12 CHECK THE HVAC MODULE CONNECTION	
• Disconnect all the HVAC module connectors. • Inspect the HVAC module connectors for: ▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test O: The Blower Motor Does Not Operate Correctly

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor is provided a ground through part of the blower resistor in LO, MED-

LO and MED-HI blower setting. The blower motor resistor is grounded through the blower motor switch in any setting except HI. In HI, the blower motor is grounded directly through the blower motor switch. The blower switch is provided a ground. The blower motor switch is part of the HVAC module and can not be replaced separately.

- DTC 51 (Blower Relay Driver Circuit/Performance) — This DTC sets when any of the following occur:
  - The module senses ground on the relay coil ground circuit when the relay is not grounded by the HVAC module, indicating a short directly to ground.
  - The module senses voltage on the relay coil ground circuit when the relay is grounded by the HVAC module, indicating a short directly to voltage.
  - The module senses no voltage on the relay coil ground circuit when the relay is not grounded by the HVAC module, indicating an open.

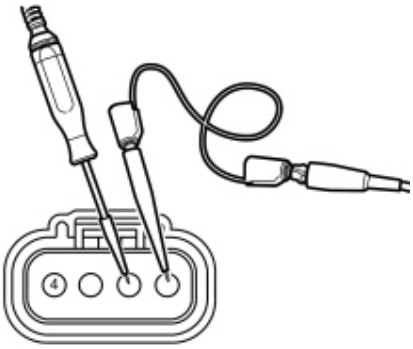
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Blower motor resistor
- HVAC module

PINPOINT TEST O: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
O1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • CARRY OUT the HVAC module self-test. • Check for HVAC DTCs retrieved during the self-test. • **Is DTC 51 present?**	**Yes** REPAIR circuit CH123 (VT/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to O2.
O2 CHECK THE BLOWER MOTOR OPERATION	
• Turn the function selector switch to the FLOOR position. • Select all blower speed positions. • **Does the blower motor operate in any position?**	**Yes** If the blower motor will not turn off, REPAIR circuit CH402 (YE/GN) for a short to voltage. TEST the system for normal operation. If the blower motor does not operate in HI setting only, GO to O3. If the blower motor does not operate in LO, MED-LO or MED-HI setting only, GO to O4. If the blower motor operates in HI setting only, GO to O6. For all other symptoms, GO to O7.

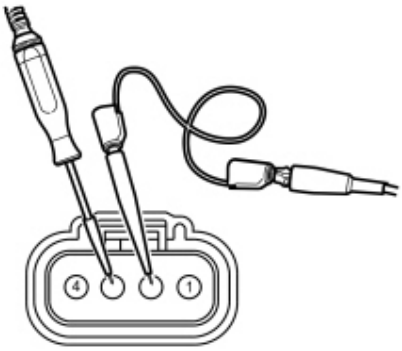
	No GO to Pinpoint Test N.
O3 CHECK THE BLOWER MOTOR GROUND CIRCUIT TO THE BLOWER MOTOR SWITCH FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module C228B. • Disconnect: Blower Motor C2004. • Measure the resistance between HVAC module C228B-6, circuit CH430 (VT/OG), harness side and blower motor C2004-2, circuit CH430 (VT/OG), harness side.  N0115289 • **Is the resistance less than 5 ohms?**	**Yes** GO to O9. **No** REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.
O4 CHECK THE BLOWER MOTOR RESISTOR	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Blower Motor Resistor C293. • Ignition ON. • Turn the function selector switch to the FLOOR position. **For LO inoperative**  N0116010 • **For LO inoperative** : With the blower motor switch in the LO speed position, connect a 12-volt test light between blower motor resistor C293-2, circuit CH430 (VT/OG), harness side and blower motor resistor C293-4, circuit CH427 (BN), harness side. **For MED-LO inoperative**	**Yes** INSTALL a new blower motor resistor. REFER to Section 412-01. TEST the system for normal operation. **No** GO to O5.



N0116011

- **For MED-LO inoperative** : With the blower motor switch in the MED-LO speed position, connect a 12-volt test light between blower motor resistor C293-2, circuit CH430 (VT/OG), harness side and blower motor resistor C293-1, circuit CH428 (GN/WH), harness side.

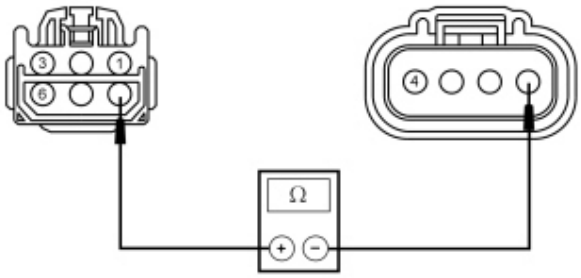
  For MED-HI inoperative



N0116012

- **For MED-HI inoperative** : With the blower motor switch in the MED-HI speed position, connect a 12-volt test light between blower motor resistor C293-2, circuit CH430 (VT/OG), harness side and blower motor resistor C293-3, circuit CH429 (GY/BN), harness side.
- **Does the test light illuminate?**

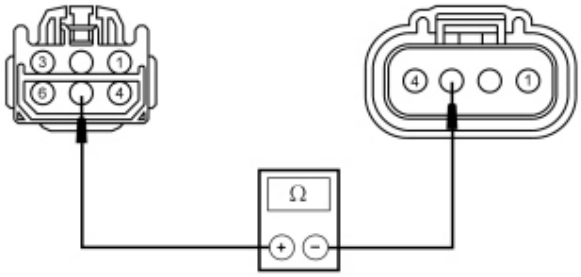
O5 CHECK THE BLOWER MOTOR RESISTOR TO BLOWER MOTOR SWITCH CIRCUITS	
• Disconnect: HVAC Module C228B. **For LO inoperative**  N0115297 • **For LO inoperative** , measure the resistance between HVAC module C228B-1, circuit CH427 (BN), harness side and blower motor resistor C293-4, circuit CH427 (BN), harness side. **For MED-LO inoperative**	**Yes** GO to O9 . **No** REPAIR circuit CH427 (BN), CH428 (GN/WH) or CH429 (GY/BN) for an open. TEST the system for normal operation.



N0115298

- **For MED-LO inoperative** , measure the resistance between HVAC module C228B-4, circuit CH428 (GN/WH), harness side and blower motor resistor C293-1, circuit CH428 (GN/WH), harness side.

  For MED-HI inoperative

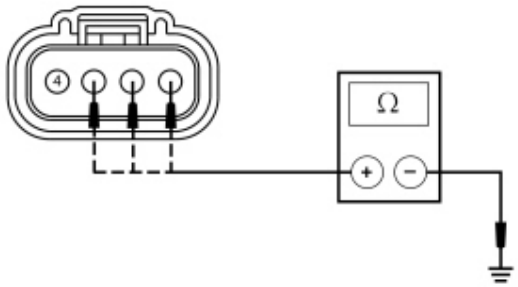


N0115299

- **For MED-HI inoperative** , measure the resistance between HVAC module C228B-5, circuit CH429 (GY/BN), harness side and blower motor resistor C293-3, circuit CH429 (GY/BN), harness side.
- **Is the resistance less than 5 ohms?**

O6 CHECK THE BLOWER MOTOR GROUND CIRCUIT TO THE BLOWER MOTOR RESISTOR FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor C2004. • Disconnect: Blower Motor Resistor C293. • Measure the resistance between blower motor resistor C293-2, circuit CH430 (VT/OG), harness side and blower motor C2004-2, circuit CH430 (VT/OG), harness side.  N0116013 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor resistor. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.
O7 CHECK THE BLOWER MOTOR RESISTOR CIRCUITS FOR A SHORT TO GROUND	

- Ignition OFF.
- Disconnect: Blower Motor C2004.
- Disconnect: Blower Motor Resistor C293.
- Disconnect: HVAC Module C228B.
- Measure the resistance between ground and blower motor resistor:
  - C293-1, circuit CH428 (GN/WH), harness side.
  - C293-3, circuit CH429 (GY/BN), harness side.
  - C293-2, circuit CH430 (VT/OG), harness side.



N0115301

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to O8.

No
REPAIR the affected circuit for a short to ground. TEST the system for normal operation.

O8 CHECK THE BLOWER MOTOR RESISTOR CIRCUITS FOR SHORTS TOGETHER

- Measure the resistance between blower motor resistor C293, harness side using the following chart:

Blower Motor Resistor	Circuit	Blower Motor Resistor	Circuit
C293-1	CH428 (GN/WH)	C293-2	CH430 (VT/OG)
C293-1	CH428 (GN/WH)	C293-3	CH429 (GY/BN)
C293-1	CH428 (GN/WH)	C293-4	CH427 (BN)

C293

N0115302

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to O9.

No
REPAIR the affected circuits. TEST the system for normal operation.

O9 CHECK THE HVAC MODULE CONNECTION	

• Disconnect all the HVAC module connectors.
• Inspect the HVAC module connectors for:
  ▪ corrosion.
  ▪ pushed-out terminals.
  ▪ damaged terminals.
• Connect and correctly seat all the HVAC module connectors.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test P: All HVAC Functions Inoperative

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

The HVAC module receives a ground. The HVAC module is supplied constant battery voltage and ignition voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module
- Battery
- Charging system concern

PINPOINT TEST P: ALL HVAC FUNCTIONS INOPERATIVE

Test Step	Result / Action to Take
P1 CHECK THE HVAC MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	

• Ignition OFF.
• Disconnect: HVAC Module C228A.
• Ignition ON.
• With the engine running, measure the voltage between ground and:
  ▪ HVAC module C228A-10, circuit SBP07 (WH/RD), harness side.
  ▪ HVAC module C228A-14, circuit CBP21 (BU/GY), harness side.
	Yes
	GO to P2 .
	
	No
	REPAIR circuit SBP07 (WH/RD) or CBP21 (BU/GY) for high resistance. CLEAR all CMDTCs . REPEAT the self-test.

 N0114486 • **Are the voltages greater than 10 volts?**	
P2 CHECK THE HVAC MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ground and HVAC module C228A-13, circuit GD115 (BK/GY), harness side.  N0114487 • **Is the resistance less than 5 ohms?**	**Yes** GO to P3 . **No** REPAIR circuit GD115 (BK/GY) for high resistance. CLEAR all CMDTCs . REPEAT the self-test. TEST the system for normal operation.
P3 CHECK THE HVAC MODULE CONNECTION	
• Disconnect all the HVAC module connectors. • Inspect the HVAC module connectors for: ▪ corrosion. ▪ pushed-out terminals. ▪ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

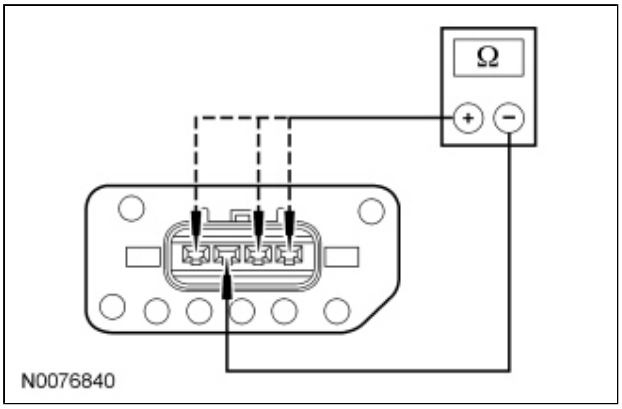
Component Tests

Evaporator Discharge Air Temperature Sensor

Ambient Temperature	Resistance
0-10°C (32-50°F)	5,892-9,893 ohms
10-20°C (50-68°F)	3,689-6,048 ohms
20-25°C (68-77°F)	2,950-3,805 ohms
25-30°C (77-86°F)	2,374-3,050 ohms
30-35°C (86-95°F)	1,923-2,460 ohms
35-40°C (95-104°F)	1,566-1,996 ohms

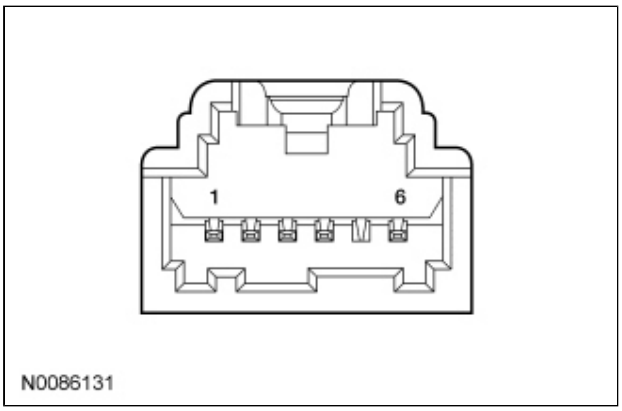
40-50°C (104-122°F)	1,057-1,630 ohms

Blower Motor Resistor



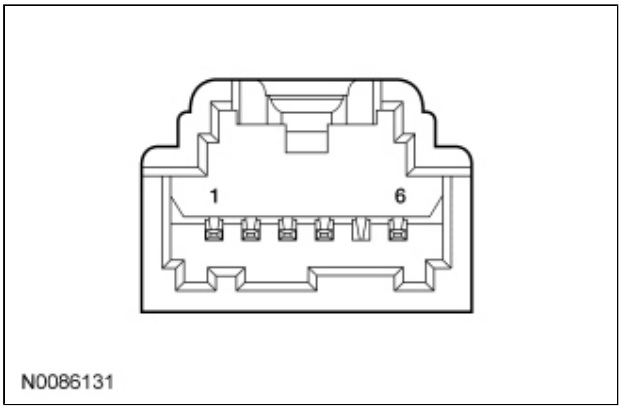
Blower Motor Resistor Pins	Resistance
4 and 2	2.0-2.6 ohms
2 and 3	0.2-0.4 ohms
2 and 1	0.8-1.1 ohms

Defrost/Panel/Floor Mode Door Actuator



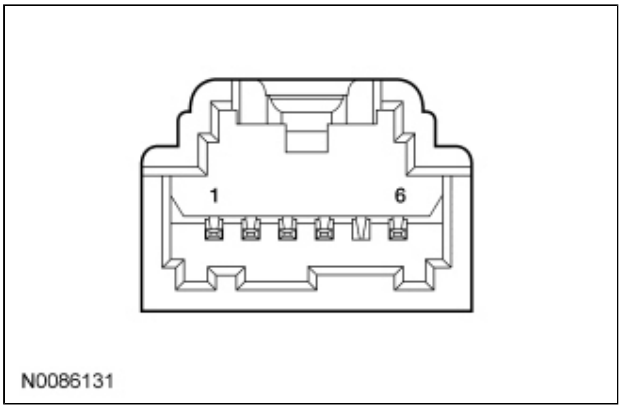
Actuator Pins	Approx. Resistance
1 and 6	30-40 ohms
2 and 4	215-4,375 ohms
3 and 4	215-4,375 ohms
2 and 3	2,800-4,200 ohms

Temperature Blend Door Actuator



Actuator Pins	Approx. Resistance
1 and 6	30-40 ohms
2 and 4	215-4,375 ohms
3 and 4	215-4,375 ohms
2 and 3	2,800-4,200 ohms

Air Inlet Mode Door Actuator



Actuator Pins	Approx. Resistance
1 and 6	30-40 ohms

Heater Core

1. **NOTE:** If a heater core leak is suspected, test he heater core by following the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly.

   Inspect for evidence of coolant leakage at the heater hose to heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

2. **NOTE:** Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the heater hose connection and damage the heater core.

   Check the integrity of the heater hose clamps.

Heater Core — Plugged

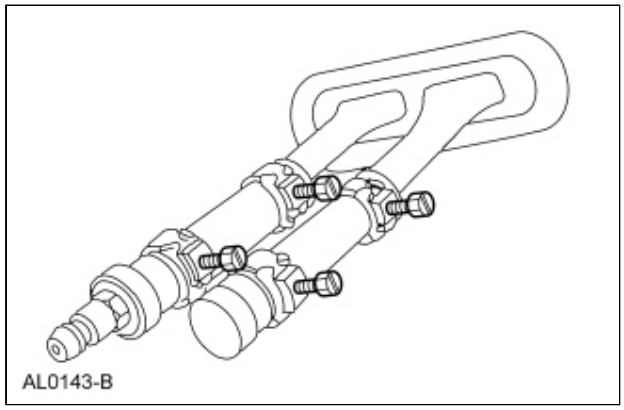
1. Verify that the engine coolant is at the correct level.
2. Start the engine and turn on the heater.
3. When the engine coolant reaches operating temperature, check the heater core inlet and outlet hoses to see if they are hot.
4. If the outlet only is not hot the heater core may have an air pocket or may be plugged.
5. If the inlet only is not hot the thermostat may not be working correctly.

Heater Core — Pressure Test

Use the Pressure Test Kit to carry out the pressure test.

1. **NOTE:** Due to space limitations, a bench test may be necessary for pressure testing.

   Drain the coolant from the cooling system.
2. Disconnect the heater hoses from the heater core.
3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube.
4. Fill the heater core and heater hoses with water and install the plug BT-7422-B and the adapter BT-7422-A from the Pressure Test Kit. Secure the heater hoses, plug and adapter with hose clamps.



5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter.
6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core.
7. Observe the pressure gauge for a minimum of 3 minutes.
8. If the pressure drops, check the heater hose connections to the heater core tubes for leaks. If the heater hoses do not leak, remove the heater core from the vehicle and carry out the bench test.

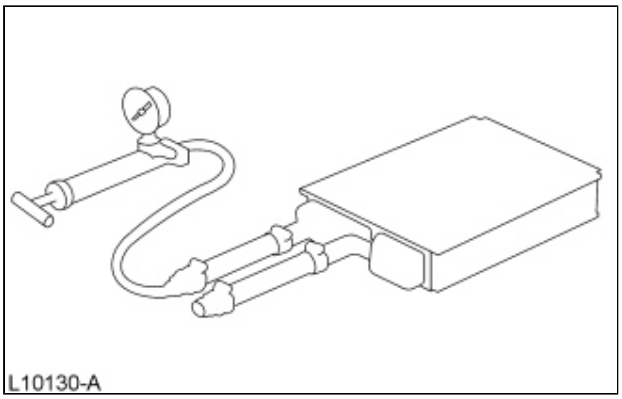
Heater Core — Bench Test

1. Remove the heater core from the vehicle.
2. Drain all of the coolant from the heater core.

3. Connect the 101 mm (4 in) test heater hoses with plug and adapter to the heater core tubes. Then connect the Pressure Test Kit to the adapter.

4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water.

5. If a leak is observed, install a new heater core.



Evaporator/Condenser Core — On-Vehicle Leak Test

1. Discharge and recover the refrigerant. Refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the suspect evaporator core or condenser core from the A/C system.

3. Clean the manifold fittings.

4. Connect the appropriate test fittings from the A/C Flush Adapter Kit to the condenser or evaporator core tube connections.

5. **NOTE:** The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter that will activate the valve. The test is not valid if the shut-off valve does not open.

   Attach the correct adapters from the Adapters/O-rings for Filter kit to the test fittings and connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the evaporator core or condenser core. Connect the yellow hose to a known good vacuum pump.

6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low pressure gauge indicates 101 kPa (30 in-Hg). The 45 minute evacuation is necessary to remove any refrigerant from oil left in the evaporator core or condenser core. If the refrigerant is not completely removed from the oil, outgassing degrades the vacuum and appears as a refrigerant leak.

7. If the low pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before installing a new evaporator core or condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
   - If the low pressure gauge reading rises 34 kPa (10 in-Hg) or more of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
   - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
   - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the evaporator core or condenser core. Then recheck for loss of vacuum.
   - If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check

for vacuum loss.

9. If the evaporator core or condenser core leaks, as verified by the above procedure, install a new evaporator core or condenser core.

A/C Compressor — External Leak Test

1. Install the adapter from the A/C Flush Adapter Kit on the port of the A/C compressor, using the existing manifold retaining bolt.

2. Connect the high and low pressure lines of a manifold gauge set or a refrigerant recovery/recycling station to the corresponding fittings on the adapter.

3. Attach the center hose of a manifold gauge set to a refrigerant container standing in an upright position.

4. Open the low pressure gauge valve, the high pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.

5. Using the Refrigerant Leak Detector, check for leaks at the compressor shaft.

6. If an external leak is found, install a new A/C compressor.

7. When the leak test is complete, recover the refrigerant from the compressor.

Refrigerant System Tests

Special Tool(s)

ST1928-A	R-134a Manifold Gauge Set 023-00047 or equivalent
ST3079A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 023-00181 or equivalent
ST3081-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 199-00067 or equivalent
ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 265-00012 or equivalent

Procedure 1 — Ambient Temperature at or Below 38°C (100°F)

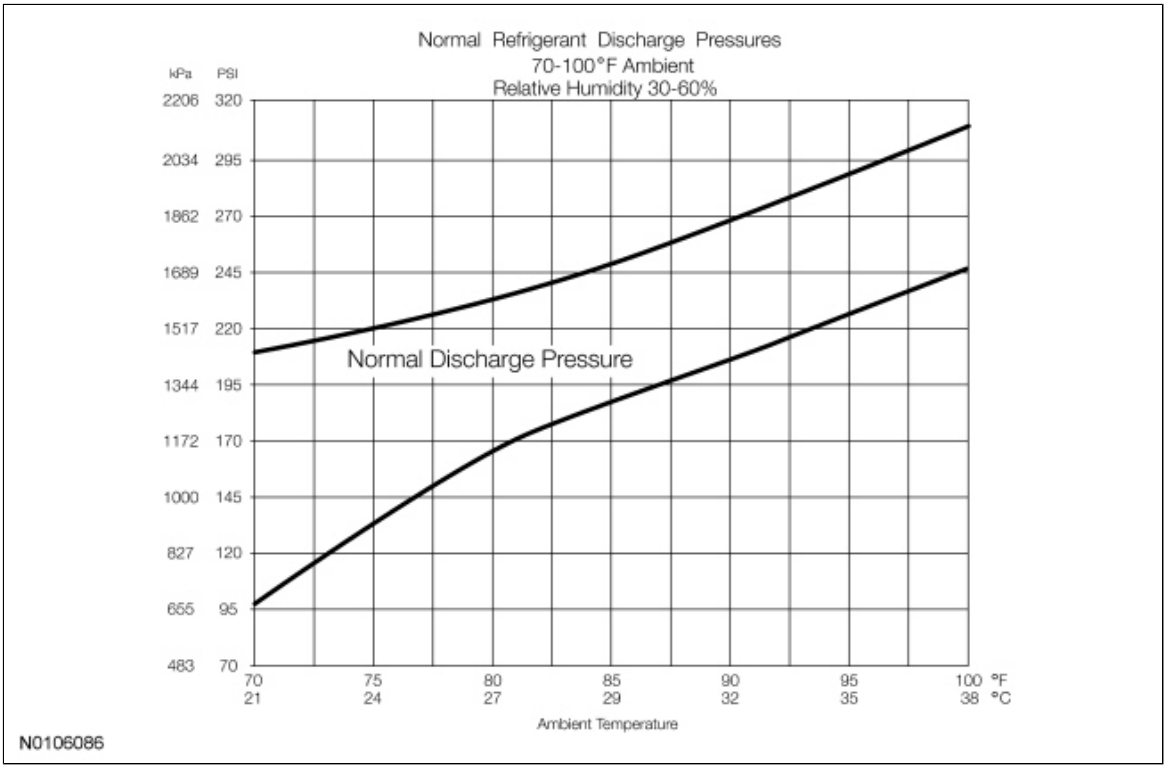
NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100° F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

NOTE: If the A/C compressor cycles at any time during this test, refer to the diagnostic table.

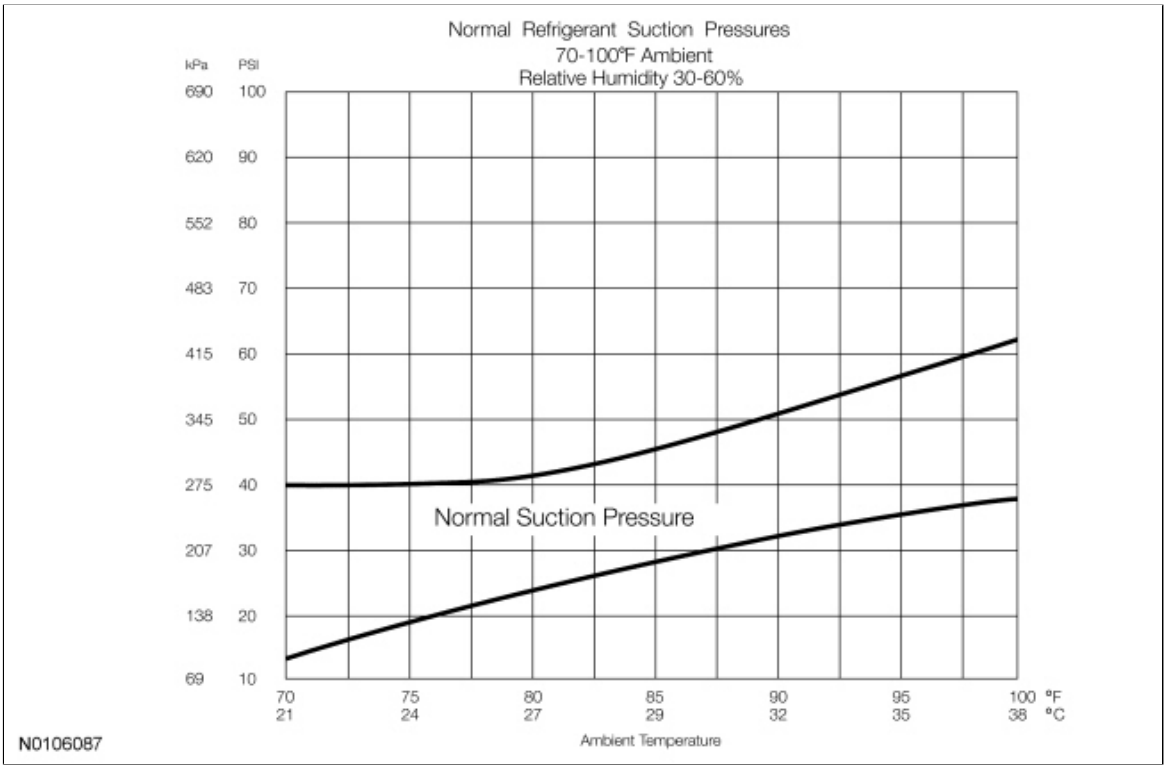
1. Drive the vehicle or run the engine until it reaches normal operating temperature.
2. Connect an R-134a Manifold Gauge Set or R-134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.
3. Set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, HI blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
4. Open all vehicle windows and leave the hood open for the test. Open the rear doors.
5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.
6. Record the ambient (shop) temperature.
7. Record the discharge pressure. If the pressure is fluctuating, record the average value.

8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.



9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.



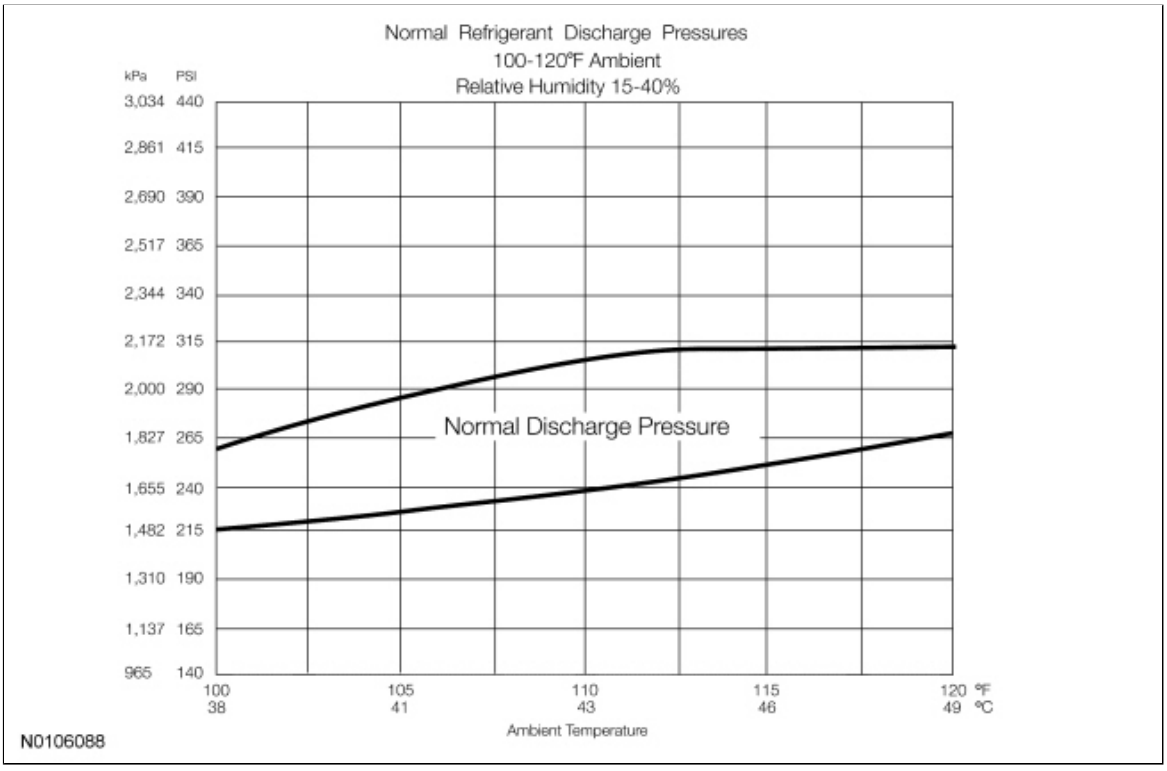
11. Proceed to the Diagnostic Table.

Procedure 2 — Ambient Temperature Above 38°C (100°F)

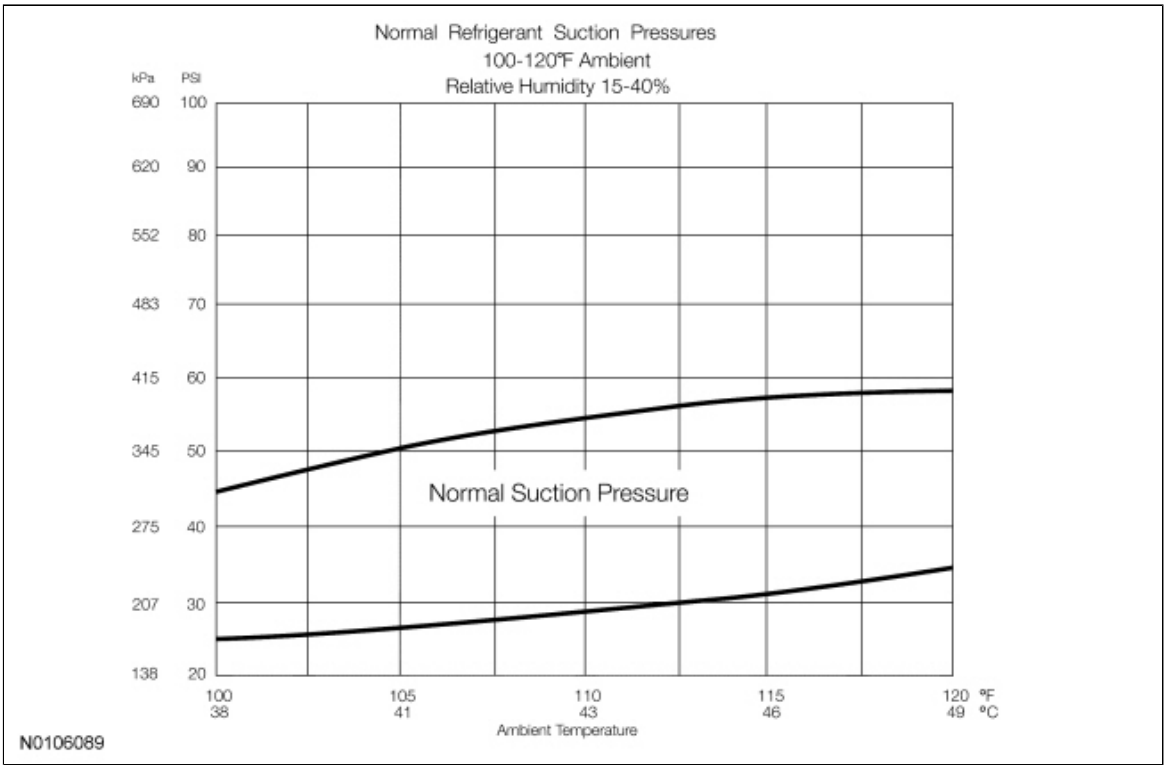
NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100° F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.
2. Connect an R-134a Manifold Gauge Set or R-134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.
3. Set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, MED LO blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).
5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.
6. Record the ambient (shop) temperature.
7. Record the discharge pressure. If the pressure is fluctuating, record the average value.
8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.



9. Record the suction pressure. If the pressure is fluctuating, record the average value.
10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.



11. Proceed to the Diagnostic Table.

Diagnostic Table

1. **NOTE:** The following table is used to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

   Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component — Causes
High or Clutch Cycling	High	Condenser — inadequate airflow.
High	Normal to High	Engine — overheating.
Normal to High	Normal	Refrigerant overcharge — air in refrigerant.
Normal to Low	Normal to High	A/C suction line — partially restricted or plugged. [a]
Normal to Low	Low or Clutch Cycling	Low refrigerant charge, A/C suction line — partially restricted or plugged. [b]
Erratic Operation or Compressor Not Running		Evaporator discharge air temperature sensor or A/C pressure transducer — poor connection at A/C clutch connector. A/C electrical circuit erratic — see A/C Electrical Circuit Wiring Diagram.
Normal to Low	High	Compressor — low performance.
Additional Possible Cause Components Associated With Inadequate Compressor Operation		
• Compressor Drive Belt — loose • Compressor Clutch — slipping • Clutch Coil Open — shorted, or loose mounting • HVAC Module • Clutch Wiring Circuit — high resistance, open or blown fuse • Compressor Operation Interrupted by PCM		
Additional Possible Cause Components Associated With a Damaged Compressor		
• Incorrect Clutch Air-gap • Refrigerant Leaks		

[a] Low pressure reading will be normal to high if restriction is downstream of service access valve.
[b] Low pressure reading will be low restriction is upstream of service access valve.

Air Conditioning (A/C) Odor Treatment

Special Tool(s)

ST2940-A	Flexible Applicator Tool 258-00005

Material

Item	Specification
Motorcraft® A/C Cooling Coil Coating YN-29	—

WARNING: Carry out this procedure in a well-ventilated area with all vehicle windows and doors opened. Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION, seek medical advice. On Ford/Motorcraft products in the USA or Canada call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS), if available. Failure to follow these instructions may result in serious personal injury.

NOTE: There are typically 4 types of objectionable odors found in a vehicle:

- Chemical odors
- Environmental odors
- Human and other interior-generated odors
- Microbiological odors

Before determining that A/C odor treatment is required, the source and the circumstances under which the odor occurs must be determined.

NOTE: Chemical odors are usually constant regardless of the climate control system setting although they may be enhanced by A/C operation. Most chemical odors are caused by fluid leaks or incorrectly cured adhesives. Chemical odors can be eliminated by repairing the leaking component and removing any residue.

NOTE: Environmental odors usually occur for a short time and diminish after the vehicle passes through the affected area. These odors are typically only detected when the vehicle windows are open, or when the climate control system is operating in a mode that allows for fresh air. Environmental odors cannot be eliminated because they are external in source, but they may be minimized by switching to a climate control setting that uses recirculated air.

NOTE: Human and other interior-generated odors occur while the source is present and may linger for a short time after. These odors may be more noticeable during A/C operation. Human odors may be eliminated by removing the source and cleaning the affected area.

NOTE: Microbiological odors, if in the A/C system, usually last for about 30 seconds after the system is

turned on. They will be detected while the A/C is turned on and using either outside or recirculated air. Microbiological odors that occur in areas other than the A/C system (for example, water in doors or wet carpeting) may last indefinitely and will be more intense when recirculated air is used. Microbiological odors will not be present at temperatures at or below 10°C (50°F).

Microbiological odors can be eliminated by removing the source and treating the affected area. Standing water must be allowed to drain and dry out. A/C systems may be treated by using A/C cooling coil coating as described in the service procedure below.

Microbiological odors result from microbial growth supported by warm temperatures and moisture. Microbiological odors are described as musty/mildew type smells and may occur on/in:

- foam seals.
- rubber seals.
- adhesives.
- standing water.
- water soaked carpet/trim.

1. Identify the type of odor present in the vehicle. Do not proceed with A/C odor treatment if the odor source is found to be outside of the A/C system. Refer to the following chart for examples.

Odor Source	Odor Description
Chemical Odors	
Coolant	Sweet smell
Fuel	Gasoline or diesel fuel smell
Oil	Oil type or burning smell
Power Steering Fluid	Oil type or burning smell
Transmission Fluid	Oil type or burning smell
Washer Fluid	Alcohol type smell
Gear Lube	Garlic/sulfur smell
Refrigerant Oil	Ether type smell
Carpet/trim Adhesives	Fishy, urine or sweet smell
Evaporator Core Coating	Wet cement type smell
Environmental Odors	
Exhaust	Exhaust, fuel or burning type smell
Industrial Pollutants	Various smells
Dust	Musty, mildew or wet cement type smell
Pollen	Sweet smell
Tobacco	Burning, tar smell
Human and Other Interior Generated Odors	
Body Secretions	Body odor
Perfuming Agents	Sweet or fragrance smell
Clothing	Musty, mildew or body odors
Food/Beverage	Sweet, musty, mildew or fishy smell
Microbiological Odors	
Microbiological Odors Occurring Inside of A/C System	Musty, mildew smell lasting about 30 seconds after A/C is turned on
Microbiological Odors Occurring	Musty, mildew smell lasting indefinitely and possibly more

Outside of A/C System	pronounced when using recirculated air

2. Identify the source of the odor.
   - Check the evaporator core drain tube for restriction.
   - Check the passenger and driver side carpet for moisture. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
   - Check the blower motor and blower motor cover (if equipped) for moisture resulting from water bypassing the cowl baffling system. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
   - Check the cowl top panel and air inlet screen for standing water or foreign material. If possible, remove any standing water and clean the air inlet screen using a wet/dry vacuum.

3. Open all vehicle windows and doors.

4. Make sure that the A/C is off.

5. Set the following.
   - Select PANEL mode (A/C off).
   - Adjust the temperature setting to full warm.
   - Adjust the blower motor speed to HI.

6. Run the engine for 25 minutes to dry out the A/C system.

7. Turn the ignition OFF.

8. Remove the blower motor.

9. **NOTE:** Blower motor speed controls that are mounted outside of the evaporator core housing and not exposed to the blower motor airflow do not need to be removed.

   Remove the blower motor resistor (if equipped) or blower motor speed control (if equipped and exposed to the inside of the evaporator core housing).

10. ***NOTICE:*** **To avoid damage to the vehicle interior, do not spill or spray this product on any interior surface.**

    Add one full bottle of A/C cooling coil coating to the Flexible Applicator Tool.

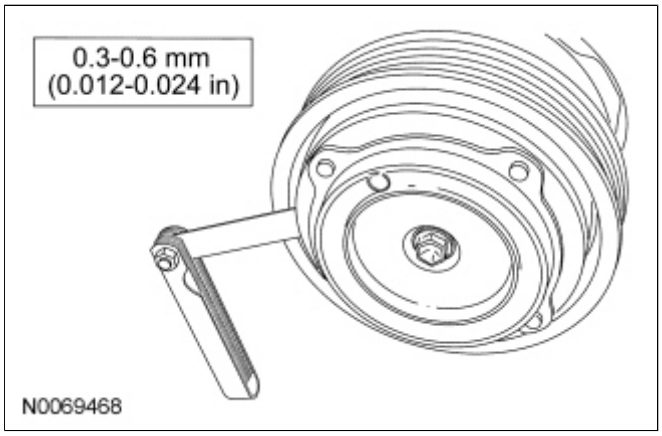
11. Insert the nozzle into the evaporator housing and direct the spray toward the evaporator core face. Spray the entire evaporator core face until empty.

12. Install the blower motor and blower motor resistor (if equipped) or blower motor speed control (if equipped).

13. Repeat Steps 4 through 6 to cure the evaporator core coating.

Air Conditioning (A/C) Clutch Air Gap Adjustment

1. Check the A/C clutch air gap at 3 equally spaced places between the clutch plate and the A/C clutch pulley.



2. If the A/C clutch air gap is out of range, remove the clutch plate. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification.

Electronic Leak Detection

Special Tool(s)

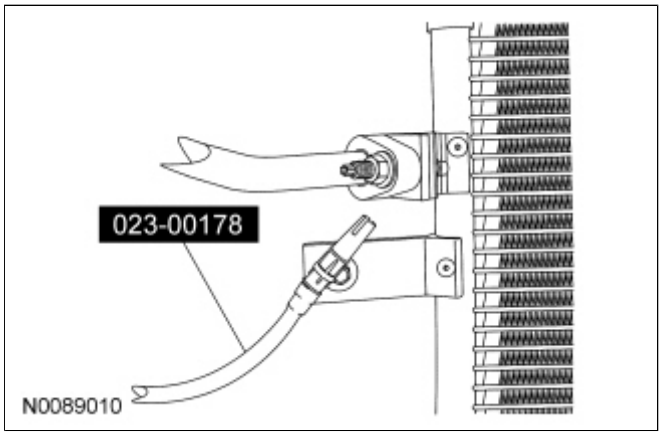
ST3072-A	Heated Pentode Halogen Leak Detector 023-00178 or equivalent

NOTE: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the Heated Pentode Halogen Leak Detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

NOTE: R-134a is heavier than air, and will tend to move downward from the source of the leak if present. It is possible that a leak may not be detected if the leak detector tip is held above the leaking fitting, line or component. Always be sure to thoroughly leak test below the fitting, line or component for the presence of R-134a as well as leak testing above and around.

1. **NOTE:** The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off and cool. The pressure reading may be higher if the engine is hot.

   Leak test the refrigerant system using the Heated Pentode Halogen Leak Detector. Follow the instructions included with the Heated Pentode Halogen Leak Detector for handling and operation techniques.



Fluorescent Dye Leak Detection

Special Tool(s)

ST3073-A	Cordless/Rechargeable True UV LED Light ES 023-00182 or equivalent
ST3057-A	R-134a Loop/Add On Injector Kit-Set 219-00069 or equivalent
ST1928-A	R-134a Manifold Gauge Set 300-R0B40134AE or equivalent
ST3079A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 300-R0B34788-PROE or equivalent
ST3081-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 199-00067 or equivalent
ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 265-00012 or equivalent

Material

Item	Specification
Stay-Brite® R-134a Leak Detection Dye 164-R6060 (Rotunda)	—

Fluorescent Dye Injection Using a R-134a Refrigerant Management Machine and Dye Injector — Vehicles Requiring R-134a Addition

NOTE: This method of fluorescent dye injection requires the addition of R-134a from a R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set hooked to an external tank to charge the dye into the refrigerant system. If adding fluorescent dye to a refrigerant system that is already fully charged, the R-134a Loop/Add On Injector Kit-Set method should be used.

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

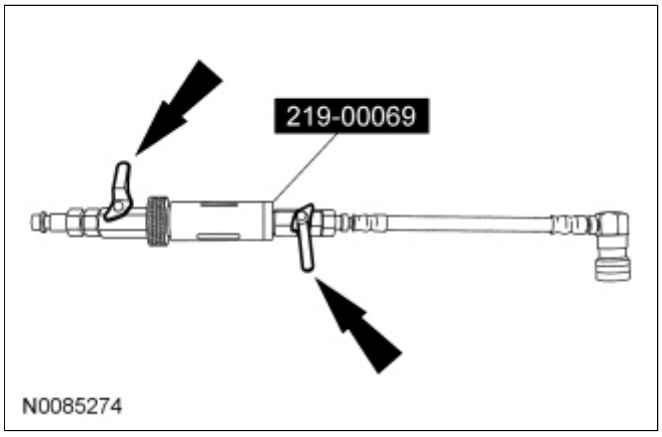
NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the manufacturer's instructions on evacuation of any non-condensable gases from the hoses.

NOTE: Only connect the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set when fluorescent dye is to be injected. The dye/lubricant injector has a one-way check valve that will prevent refrigerant system recovery and evacuation.

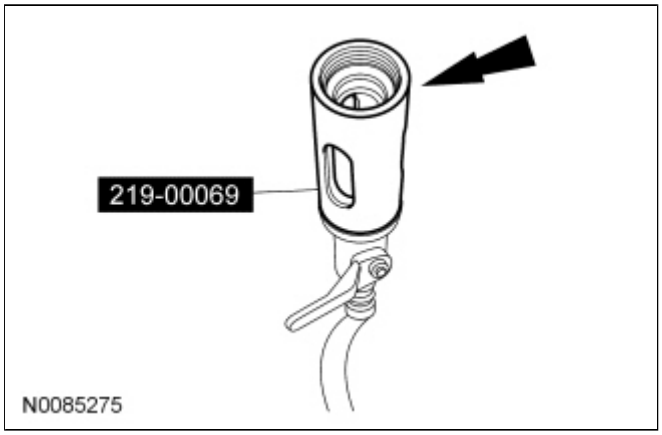
1. **NOTE:** If no R-134a pressure is present in the refrigerant system, the system should be evacuated before carrying out the injection procedure. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

   Connect a R-134a Refrigerant Management Machine or a R-134a Manifold Gauge Set to the refrigerant system service port valves.

2. Verify that the valves on the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set are closed.



3. Fill the R-134a fluorescent dye injector reservoir with 7 ml (0.25 oz) of fluorescent dye.



4. Install the dye/lubricant injector between the low-pressure service gauge port valve and the R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set.

5. **NOTE:** Following fluorescent dye injection, the refrigerant system should be fully charged to make sure of correct movement of the dye.

   Open all valves and inject the fluorescent dye into the refrigerant system by charging the refrigerant system with the required amount of R-134a.

6. When fluorescent dye injection is complete, close all valves.

7. Recover the refrigerant from the dye/lubricant injector.

8. Remove the dye/lubricant injector from the low-pressure service gauge port valve and the R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set.

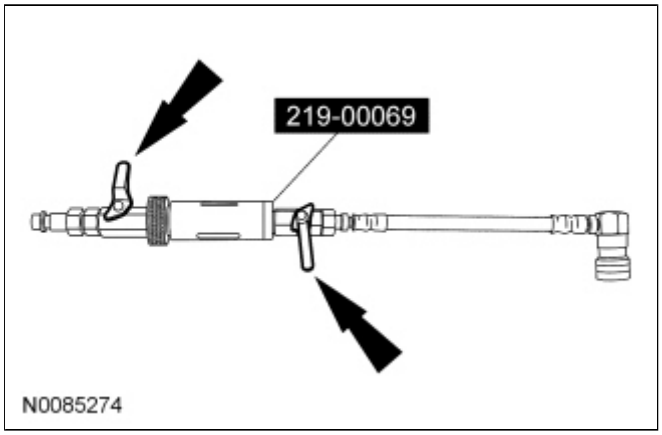
Fluorescent Dye Injection Using a R-134a Loop/Add On Injector Kit-Set — Vehicles Not Requiring R-134a Addition

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

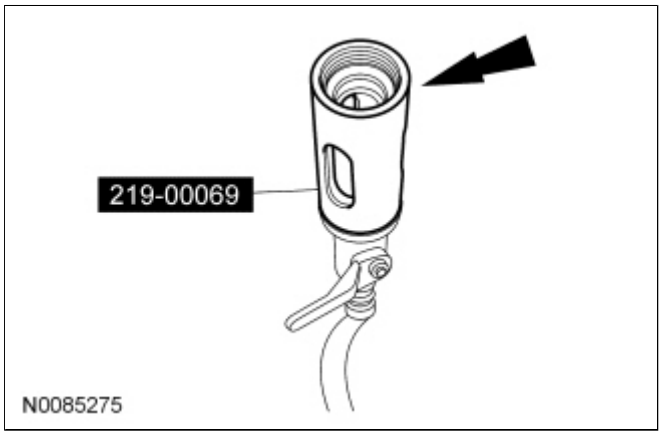
NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off and cool.

1. Verify that the valves on the R-134a Loop/Add On Injector Kit-Set are closed.



2. Fill the R-134a Loop/Add On Injector Kit-Set reservoir with 7 ml (0.25 oz) of fluorescent dye.



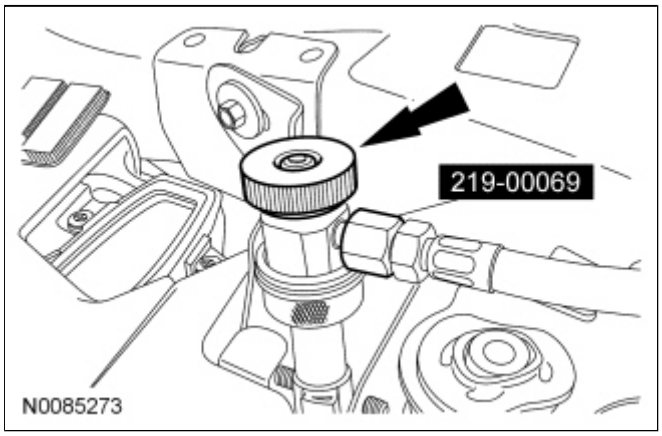
3. Install the R-134a Loop/Add On Injector Kit-Set between the high-pressure and low-pressure service gauge port valves.

4. ***NOTICE:*** **Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine. Failure to keep tools and hoses clear from the engine cooling fan and drive belt will result in damage to the tools and/or vehicle.**

   With the A/C off, start the engine. Allow engine speed to stabilize below 1,000 rpm.

5. Set the A/C to the ON position.

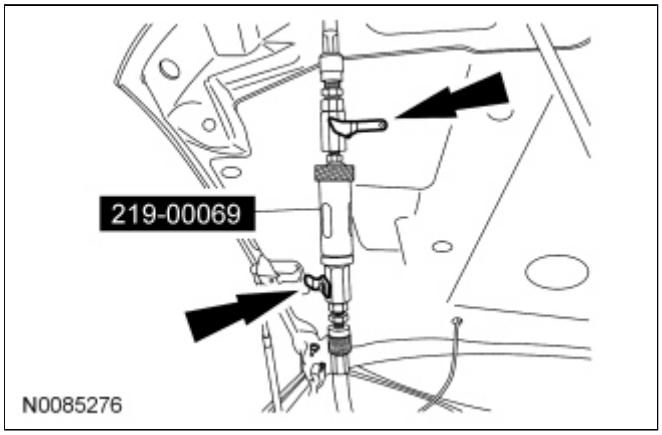
6. Open the high-pressure service valve.



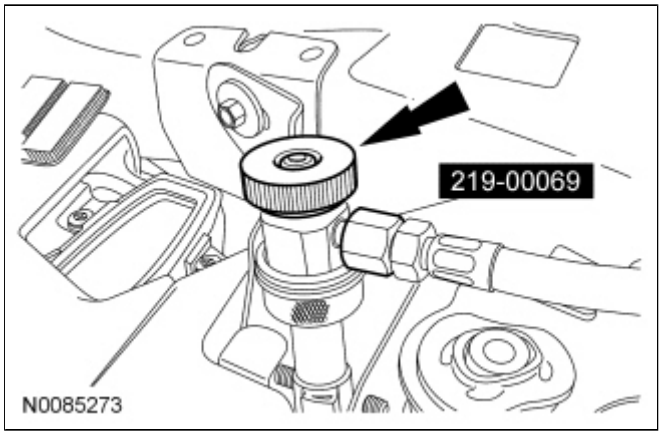
7. **NOTE:** To prevent pressure spike/liquid slug, crack the R-134a Loop/Add On Injector Kit-Set

valves and slowly open to inject the fluorescent dye into the refrigerant system.

Open the R-134a Loop/Add On Injector Kit-Set valves and inject the fluorescent dye into the refrigerant system.

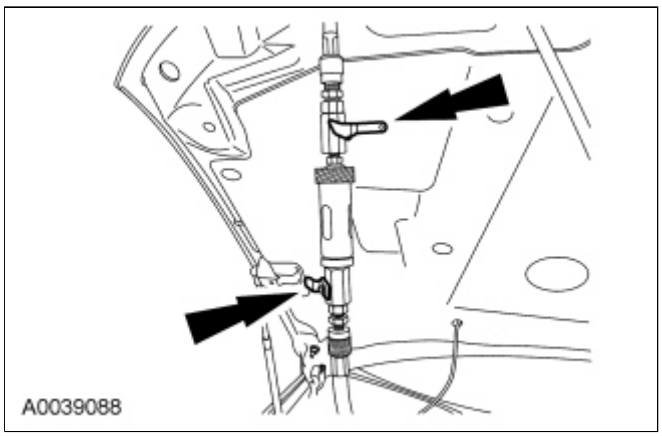


8. Close the high-pressure service valve to allow the pressure inside the R-134a Loop/Add On Injector Kit-Set to equalize with the suction side of the refrigerant system.



9. **NOTE:** Close the valves on the R-134a Loop/Add On Injector Kit-Set while the A/C compressor is operating.

   Close the valves on the R-134a Loop/Add On Injector Kit-Set.



10. **NOTE:** Leave all valves on the R-134a Loop/Add On Injector Kit-Set closed when not in use.

    Disconnect the high-pressure and low-pressure service valves and remove the R-134a Loop/Add

On Injector Kit-Set from the vehicle.

Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line and fitting in the refrigerant system for a leak.

NOTE: Use of dye-enhancing glasses or goggles greatly improves the detection of the dye under the UV lamp.

NOTE: Not all UV lamps will fluoresce the dye used in Ford vehicles. All Rotunda UV lamps are optimized to fluoresce the dye.

1. Check for leaks using a Rotunda-approved UV lamp and dye enhancing glasses.
    - Inspect all components, lines and fittings of the refrigerant system.

2. After the leak(s) is repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

3. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp.

Air Conditioning (A/C) System Flushing

Special Tool(s)

ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent
ST2466-A	A/C Flush and Purge Machine 219-00022 (part of 219-00023) or equivalent
 ST3046A	Connector, Refrigerant Flushing Equipment 412-145

Material

Item	Specification
Motorcraft® A/C System Flushing Solvent YN-23	—
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants as outlined on refrigerant tank and on recovery and charging equipment. Failure to follow these instructions may result in serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle A/C refrigerant. Failure to do so puts the shop bulk refrigerant at risk of contamination. If the vehicle A/C refrigerant is contaminated, refer the customer to the repair facility that carried out the last A/C repair. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTICE: **The Thermostatic Expansion Valve (TXV) and hoses with mufflers, should be removed when flushing the Air Conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material.**

NOTE: Prior to using the A/C Flush and Purge Machine 219-00022 for the first time, review the operating instructions.

NOTE: Only the A/C Flush and Purge Machine kit, which includes A/C Flush and Purge Machine, A/C Flush and Purge Fitting Kit and the A/C Systems Flushing Solvent, is approved for use. No other flushing device or solvent is approved for flushing heat exchangers (A/C condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-Chlorofluorocarbons (CFC) method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed while installed in their normal in-vehicle location. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a 2-step procedure that involves the use of an A/C Flush and Purge Machine to:

- circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
- remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and evaporate any remaining flush solvent from the heat exchanger.

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the refrigerant lines from the heat exchanger(s) to be flushed.

3. Connect the A/C Flush and Purge Machine to the heat exchanger to be flushed using the Refrigerant Flushing Equipment Connector or the correct adapters from the A/C Flush Adapter Kit. Do not flush through the evaporator core orifice or hoses. The internal plumbing and material make-up of these components make it impossible to correctly remove foreign material or residual flushing solvent.

4. **NOTE:** Flush the heat exchanger for a minimum of 15 minutes. The flush solvent may be used for one or both heat exchangers in the A/C system. However, the flush solvent and the flushing unit filter is intended for one vehicle only.

   Flush the heat exchanger for a minimum of 15 minutes.

5. Apply 621-862 kPa (90-125 psi) of pressurized air to the component for a minimum of 30 minutes. The 30-minute purge time is required to force and evaporate all residual solvent from the A/C system component. Failure to successfully remove all residual solvent within the component can result in system damage when reconnected and operated. Dispose of the used flush solvent and filter in accordance with local, state and federal regulations.

6. **NOTE:** A/C system filtering as described in this section is optional if system flushing is carried out. However, the filter kit use is recommended after flushing if the A/C system contamination is extensive.

   Install a new Thermostatic Expansion Valve (TXV) in any vehicle being repaired for an internal A/C compressor or desiccant failure.

7. Install new refrigerant hoses if clogged with foreign material.

8. Install a new receiver/drier in any vehicle being repaired for an internal A/C compressor or desiccant failure.

9. Reconnect the heat exchanger being repaired.

10. If a new A/C compressor is not to be installed, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

11. If a new A/C compressor is not to be installed, evacuate, leak test, and charge the A/C system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Air Conditioning (A/C) System Recovery, Evacuation and Charging

Special Tool(s)

 ST1686-A	6.0 CFM Vacuum Pump 300-R0B15600E or equivalent

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Refrigerant System Recovery

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTE: Ford Motor Company recommends the use of R-134a refrigerant management equipment that meets the requirements of the SAE J2788 standard.

1. Prior to recovering, the purity of the refrigerant must be verified. For additional information, refer to Refrigerant Identification Testing in this section.

2. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer. Note the amount of oil removed during the refrigerant recovery (if any). Add that same amount back into the system once repairs are complete.

4. Once the R-134a Refrigerant Management Machine has recovered the refrigerant, switch OFF the power supply.

5. Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.

6. If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.

7. Carry out the required repairs.

Refrigerant System Evacuation Using a R-134a Refrigerant Management Machine

1. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.

3. Turn OFF the Vacuum Pump. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held.

Refrigerant System Evacuation Using a R-134a Manifold Gauge Set and Vacuum Pump

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect the R-134a Manifold Gauge Set to the low-side and high-side service gauge port valves.

2. Connect the center (yellow) hose from the R-134a Manifold Gauge Set to the suction port on the Vacuum Pump.

3. Open all valves on the R-134a Manifold Gauge Set and both service gauge port valves.

4. Turn on the Vacuum Pump and evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.

5. Close the high-side and low-side valves on the R-134a Manifold Gauge Set (not the service gauge port valves) and turn OFF the Vacuum Pump.

6. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Charging Using a R-134a Refrigerant Management Machine

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

2. Connect a R-134a Refrigerant Management Machine to the low-side and high-side service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Set the refrigerant charge amount, and charge the refrigerant system following the instructions provided by the equipment manufacturer.

Refrigerant System Charging Using a R-134a Manifold Gauge Set and Automatic Refrigerant Charging Meter

NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out charging of the refrigerant system. If a R-134a Refrigerant Management Machine is not available, refrigerant system charging may be accomplished using a separate Automatic Refrigerant Charging Meter and R-134a Manifold Gauge Set.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

2. Assemble the R-134a Manifold Gauge Set, Automatic Refrigerant Charging Meter and R-134a supply tank following the Automatic Refrigerant Charging Meter operating instructions.

3. Charge the refrigerant system following the Automatic Refrigerant Charging Meter operating instructions.

4. If the refrigerant flow stops before the refrigerant charge is complete, start the engine, select MAX A/C operation and allow the refrigerant charge to complete.

Refrigerant System Filtering Following Air Conditioning (A/C) Compressor Installation

Special Tool(s)

ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 or equivalent

Material

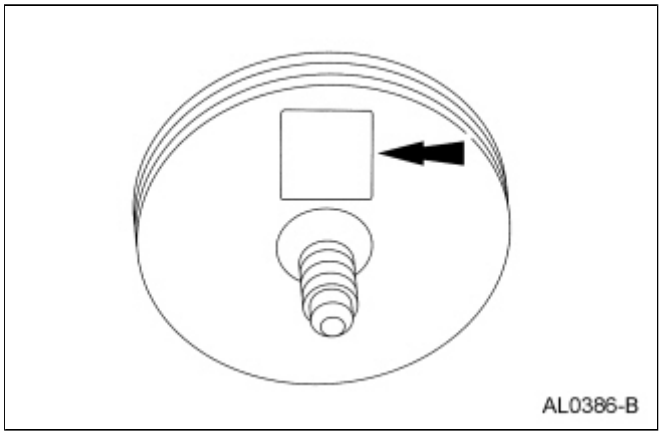
Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer's procedures and instructions.**

NOTICE: **On vehicles being serviced for an internal compressor or desiccant failure, a new suction accumulator or receiver/drier, Thermostatic Expansion Valve (TXV) or evaporator core orifice and any hoses containing mufflers must be installed prior to filtering the Air Conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any foreign material. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The filter is intended for use on one vehicle only.**

1. **NOTE:** The filter inlet is marked with a label on one side of the filter body.

   Orient the filter inlet toward the A/C condenser core.



2. ***NOTICE:*** **The flexible extension adapters included in the A/C Flush Adapter Kit are designed for low-pressure flushing and are not designed for use with a charged refrigerant system. Do not make the condenser fitting connections using the flexible extension adapters or damage to the adapters and loss of refrigerant will occur.**

   NOTE: The F8VZ-19E773-AB pancake filter is not permanently installed and will be removed at the end of this procedure.

   Disconnect the condenser outlet fitting and temporarily install the pancake filter between the 2 halves of the fitting.
   - Use flexible R-134a service hoses of 17,238 kPa (2,500 psi) burst rating.
   - Make the connections using the correct adapters from the A/C Flush Adapter Kit and/or A/C Flush and Purge Fitting Kit.

3. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. Check all refrigerant system hoses, lines and the position of the newly installed filters to be sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

6. Provide adequate airflow to the front of the vehicle (with a fan, if necessary). Select A/C operation and set the blower motor speed to maximum. Start the engine and let it idle briefly. Make sure the A/C system is operating correctly.

7. Using a scan tool, command the idle to gradually bring the engine up to 1,200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1,000 rpm). Set the engine at 1,200 rpm and run it for one hour with the A/C system operating.

8. Stop the engine.

9. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

10. Remove the adapters, flexible hoses and pancake filter from between the condenser and the condenser to evaporator tube.

11. Discard the pancake filter. It can be used one time only.

12. Reconnect the condenser outlet fitting.

13. Evacuate, charge and leak-test the refrigerant system. For additional information, refer to Air

Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Oil Adding

Special Tool(s)

ST3057-A	R-134a Loop/Add On Injector Kit-Set 219-00069 or equivalent

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Refrigerant Oil Adding

NOTE: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the PAG oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

1. Refer to the chart below for refrigerant oil adding amounts and methods of installation.

Component	PAG Oil Amount	Method of Adding
A/C Compressor	Refer to Adding Refrigerant Oil After A/C Compressor Replacement	Add or remove directly through A/C compressor low-side port before installation.
Suction Accumulator or Receiver/Drier	Refer to Adding Refrigerant Oil After New Suction Accumulator or Receiver/Drier Replacement	Add directly to suction accumulator inlet port or inject to low-side service port during system charging.
Evaporator Core	45 ml (1.5 fl oz) added to the amount collected during refrigerant recovery	Add directly to evaporator core inlet tube or inject to low-side service port during system charging.
Condenser Core	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Add directly to condenser core inlet or inject to low-side service port during system charging.
Evaporator Core Orifice or Thermostatic Expansion Valve (TXV)	The amount collected during refrigerant recovery	Inject to low-side service port during system charging.
A/C Pressure Relief Valve	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging.

Refrigerant Hose/Line	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [a]	Inject to low-side service port during system charging.
O-ring Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [b]	Inject to low-side service port during system charging.
Service Port Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging.

[a] If an excessive amount of PAG oil is lost due to a hose rupture/separation or other damage, the total system PAG oil capacity must be added.
[b] The amount specified may be used for one or multiple O-ring leak repairs. Do not multiply the PAG oil amount by the number of O-ring leaks being repaired.

Adding Refrigerant Oil After A/C Compressor Replacement

Service A/C compressors shipped without clutch and pulley

1. Rotate the old A/C compressor shaft 6 to 8 revolutions while collecting oil in a clean measuring device.
    - If the amount of oil drained from the old A/C compressor is between 85-142 ml (3-5 oz), pour the same amount plus 30 ml (1 oz) of clean PAG Refrigerant Compressor Oil (R-134a Systems) (YN-12-D) WSH M1C231-B or equivalent into the new A/C compressor.
    - If the amount of oil that was removed from the old A/C compressor is greater than 142 ml (5 oz), pour the same amount drained of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent into the new A/C compressor.
    - If the amount of oil that was removed from the old A/C compressor is less than 85 ml (3 oz), pour 85 ml (3 oz) of clean A/C Refrigerant Compressor Oil (R-134a Systems) or equivalent into the new A/C compressor.

Service A/C compressors shipped with clutch and pulley

2. Rotate the old A/C compressor shaft 6 to 8 revolutions while collecting oil in a clean measuring device.
    - If the amount of oil drained from the old A/C compressor is less than 89 ml (3 oz), remove 118 ml (4 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is 89 ml (3 oz), remove 89 ml (3 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is 118 ml (4 oz), remove 59 ml (2 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is 148 ml (5 oz), remove 29 ml (1 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is greater than 148 ml (5 oz), remove 0 ml (0 oz) from the new A/C compressor.

Adding Refrigerant Oil After New Suction Accumulator or Receiver/Drier Replacement

NOTE: This refrigerant oil adding method is to be used when a new suction accumulator or receiver drier only has been installed. If a new A/C compressor and evaporator core orifice or Thermostatic Expansion Valve (TXV) have also been installed due to system contamination, refer to the appropriate heading.

1. Drill one 12.7 mm (1/2 in) hole in the old suction accumulator or receiver/drier cylinder and drain the oil into a clean measuring cup.

2. Add the same quantity of new PAG oil, plus the amount collected during refrigerant recovery and 60 ml (2 fl oz).

Adding Refrigerant Oil After Multiple Component Replacement After A/C System Contamination

NOTE: This refrigerant oil adding method is to be used when a new A/C compressor, suction accumulator or receiver drier and evaporator core orifice or TXV have been installed due to system contamination and the A/C system has been flushed.

1. If the new A/C compressor is shipped with a new clutch and pulley already installed, remove the shipping caps and rotate the new A/C compressor shaft 6 to 8 revolutions while collecting the oil in a clean measuring cup.

2. Add 60 ml (2 fl oz) directly to the new A/C compressor suction port.

3. Inject the total vehicle PAG oil capacity minus 60 ml (2 fl oz) to the low-side service port during system charging. For the total PAG oil capacity specification, refer to the Specifications table in this section.

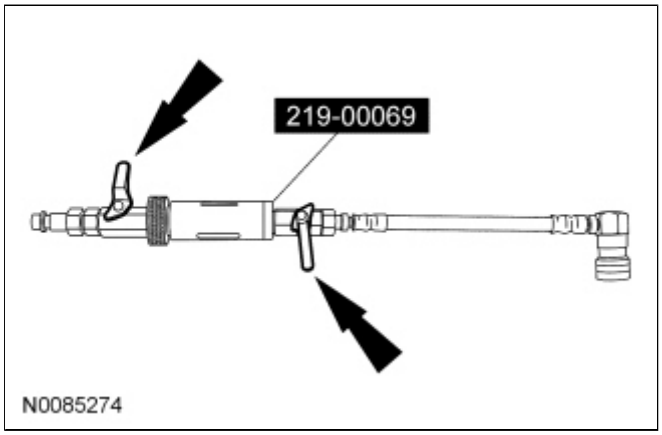
Oil Injection Using a Dye/Lubricant Injector

NOTE: If fluorescent leak detection dye is also to be added during A/C charging, the dye may be added to the dye/lubricant injector, from the R-134a Loop/Add On Injector Kit-Set, along with the PAG oil.

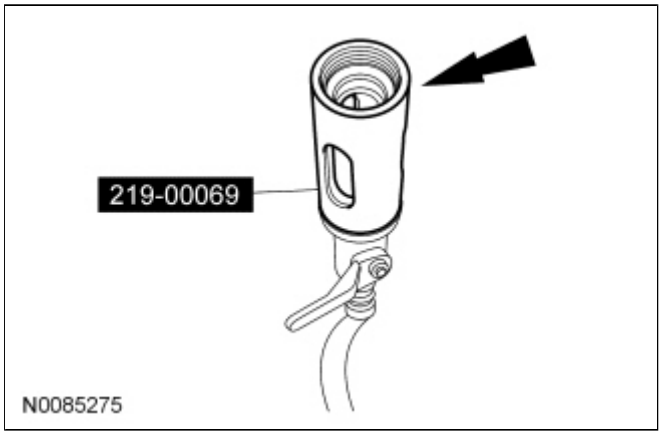
1. Evacuate the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Assemble the dye/lubricant injector and the correct adapters from the R-134a Loop/Add On Injector Kit-Set to match the amount of refrigerant compressor oil to be injected.

3. Verify that all the valves on the dye/lubricant injector are closed.



4. Fill the dye/lubricant injector with the correct amount of clean, new PAG oil.



5. Install the dye/lubricant injector between the low-side service gauge port valve and the refrigerant service station or manifold gauge set.

6. Open all valves and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Identification Testing

Special Tool(s)

ST3090-A	Refrigerant Blend Identifier with Printer 198-00012 or equivalent

Refrigerant Identification

1. **NOTE:** A Refrigerant Blend Identifier with Printer must be used to identify gas samples taken directly from the refrigeration system or storage containers prior to recovering or charging the refrigerant system.

   Follow the instructions included with the Refrigerant Blend Identifier with Printer to obtain the sample for testing.

2. The Refrigerant Blend Identifier with Printer will display one of the following:
   - If the purity level of R-134a is 98% or greater by weight, the green PASS LED will light. The weight concentrations of R-134a, R-12, R-22, hydrocarbons and air will be displayed on the digital display.
   - If refrigerant R-134a does not meet the 98% purity level, the red FAIL LED will light and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will be displayed on the digital display.
   - If hydrocarbon concentrations are 2% or greater by weight, the red FAIL LED will light, "Hydrocarbon High" will be displayed on the digital display, and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will also be displayed on the digital display.

3. The percentage of air contained in the sample will be displayed if the R-134a content is 98% or greater. The Refrigerant Blend Identifier with Printer eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the Refrigerant Blend Identifier with Printer has determined that a refrigerant source is pure (R-134a is 98% or greater by weight) and air concentration levels are 2% or greater by weight, it will prompt the user if an air purge is desired.

4. If contaminated refrigerant is detected, repeat the refrigerant identification test to verify that the refrigerant is indeed contaminated.

Contaminated Refrigerant Handling

NOTICE: **If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a recovery/recycling equipment. Recovery of contaminated refrigerant will contaminate the recovered refrigerant supply and may damage the recovery/recycling equipment.**

NOTE: A new suction accumulator or receiver/drier must be installed as directed by the A/C system

flushing procedure.

1. Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant only.
    - If this equipment is not available, contact an A/C service facility in the area with the correct equipment to carry out this service.

2. Determine and correct the cause of the customer's initial concern.

3. Flush the A/C system.

4. Dispose of the contaminated refrigerant in accordance with all federal, state and local regulations.

TXV fitting nuts (high-pressure and low-pressure)	10	—	89

Air Conditioning

The refrigerant system components include the following:

- A/C compressor and clutch assembly
- A/C condenser core
- A/C evaporator core
- Receiver/drier
- Connecting refrigerant lines
- Thermostatic Expansion Valve (TXV)

The A/C compressor contains a pressure relief valve to protect the refrigerant system against excessively high refrigerant pressures.

A/C Compressor and Clutch Assembly

NOTE: Internal A/C compressor components are not serviced separately. The A/C compressor is serviced as an assembly. A new A/C pressure relief valve is included with replacement A/C compressors, but the valve is also available as a separate component and can be independently replaced if needed. The A/C compressor clutch, A/C compressor pulley and A/C clutch field coil can be serviced separately.

The A/C compressor has the following characteristics:

- A non-serviceable shaft seal.
- Uses PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D. This oil contains special additives required for the A/C compressor.
- The A/C compressor oil may darken over time while maintaining normal oil viscosity. This is normal because of break-in wear.
- Use the refrigerant oil adding procedure specified for this vehicle when installing a new A/C compressor or any other A/C component. Refer to the Refrigerant Oil Adding procedure in Section 412-00.

When battery voltage is applied to the A/C compressor clutch field coil, the clutch disc and hub assembly is drawn toward the A/C compressor pulley. The magnetic force locks the clutch disc and hub assembly and the A/C compressor pulley together as one unit, causing the compressor shaft to rotate with the engine. When battery voltage is removed from the A/C compressor clutch field coil, springs in the clutch disc and hub assembly move the clutch disc away from the A/C compressor pulley.

A/C Pressure Relief Valve

NOTE: If the A/C compressor is operating within limits and the A/C pressure relief valve is venting or leaking around the threads, install a new A/C pressure relief valve and O-ring. If the new A/C pressure relief valve still vents after it is installed, diagnose the refrigerant system for a restriction.

An A/C pressure relief valve is incorporated in the A/C compressor to prevent damage to the A/C compressor and other system components by relieving unusually high system discharge pressure buildups. For specifications regarding operating pressure(s), refer to Section 412-00.

The A/C pressure relief valve can be serviced separately from the A/C compressor. It is necessary to

recover the refrigerant before removing the A/C pressure relief valve.

A/C Condenser Core

The condenser core is an aluminum fin-and-tube design heat exchanger located in front of the vehicle radiator. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat, and condenses gas to liquid refrigerant as it is cooled.

A/C Evaporator Core

The evaporator core is an aluminum plate/fin type and is located in the heater core and evaporator core housing. A mixture of liquid refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and continues out of the evaporator core through the evaporator core outlet tube as a vapor. During A/C compressor operation, air flow from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Thermostatic Expansion Valve (TXV)

The Thermostatic Expansion Valve (TXV) is located at the evaporator core inlet and outlet tubes at the center rear of the engine compartment. The TXV provides a restriction to the flow of refrigerant from the high-pressure side of the refrigerant system and separates the low-pressure and high-pressure sides of the refrigerant system. Refrigerant entering and exiting the evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Receiver/Drier

NOTE: Installation of a new receiver/drier is not required when repairing the A/C system, unless there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier. Damage to the receiver/drier includes leaks, physical damage to the receiver/drier shell or desiccant, or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, a new receiver/drier should not be installed.

The receiver/drier is mounted to the RH side of the condenser core above the condenser outlet fitting. It stores high-pressure liquid after it leaves the condenser core. A desiccant cartridge mounted inside the receiver/drier removes moisture from the refrigerant.

Evaporator Discharge Air Temperature Sensor

The evaporator discharge air temperature sensor contains a thermistor. The resistance of this thermistor varies by a specific amount based on the evaporator discharge air temperature. The PCM measures a voltage ratio between the reference voltage it supplies to the sensor and the sensor voltage to determine this resistance and the associated evaporator discharge air temperature.

As the evaporator core removes heat and moisture from the air flow moving through the evaporator core

fins, the removed moisture condensates on the exterior of the evaporator core. The PCM uses input from the evaporator discharge air temperature sensor to prevent this moisture from freezing on the exterior of the evaporator core, and inhibiting air flow through the evaporator core fins. When the evaporator core temperature drops to a temperature near the freezing point of water, the PCM switches off the A/C compressor. The A/C compressor is switched back on when the evaporator core temperature rises to an acceptable level.

The evaporator discharge air temperature sensor is located below the glove compartment outside of the heater core and evaporator core housing.

A/C Pressure Transducer

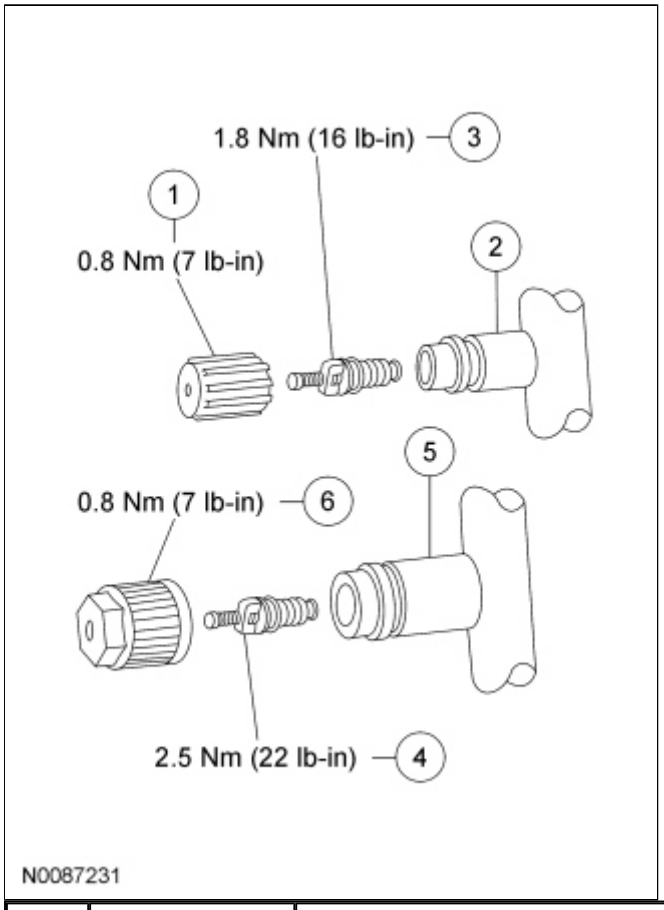
The A/C pressure transducer monitors the compressor discharge pressure and communicates with the PCM. The PCM interrupts A/C compressor operation in the event the A/C pressure transducer indicates high system discharge pressures. It also to senses low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the PCM will not allow the clutch to engage.

The A/C pressure transducer is located at the lower RH corner of the condenser core near the condenser outlet fitting. It is not necessary to recover the refrigerant before removing the A/C pressure transducer.

Service Gauge Port Valves

The high-pressure service gauge port valve is located on the compressor-to-condenser discharge line near the condenser inlet fitting.

The low-pressure service gauge port valve is located on the A/C compressor suction line near the RH shock tower.



Item	Part Number	Description
1	19D702	A/C charging valve cap
2	—	Low-pressure service gauge port valve
3	19D701	Low-pressure Schrader-type valve core
4	19D701	High-pressure Schrader-type valve core
5	—	High-pressure service gauge port valve
6	19D702	A/C charging valve cap

The service gauge port valve is an integral part of the refrigerant system line or component.

- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage is always detectable around the Schrader-type valve with the service gauge port valve cap removed, and is considered normal. If the seal leaks excessively, install a new Schrader-type valve core.
- The service gauge port valve caps each include an O-ring seal used as a primary seal in the refrigerant system to prevent any leakage through the Schrader-type valves from reaching the atmosphere. Check the service gauge port valve cap O-ring seals when checking the refrigerant system for leaks and install a new cap if necessary. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.

Refrigerant System Dye

Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis when using a Rotunda-approved ultraviolet black light. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement receiver/driers are shipped with

a fluorescent dye "wafer" included in the desiccant bag, which dissolves after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new receiver/drier is installed as part of the flushing or filtering procedure. Only add additional refrigerant system dye if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation or hose rupture. Refer to Section 412-00 .

Air Distribution and Filtering

Air Distribution and Filtering

NOTE: The air distribution system is equipped with a factory installed cabin air filter.

There are 2 sources of air available to the air distribution system:

- Fresh (outside) air
- Recirculated air

Recirculated air is always used when the HVAC module is set to the MAX A/C mode and can be selected in any mode except DEFROST or FLOOR/DEFROST.

Air distribution within the vehicle is determined by the air flow mode selected. Electric mode door actuator-positioned airflow mode control doors direct airflow within the heater core and evaporator core housing.

Air enters the passenger compartment from the following outlets:

- Instrument panel registers
- Floor duct outlets
- Windshield defroster
- Side window demisters
- Rear footwell duct

Passenger compartment air is exhausted from the vehicle through open windows or body air vents.

Cabin Air Filter

The cabin air filter is located in the heater core and evaporator core housing. For cabin air filter maintenance intervals, refer to Section 100-03.

Control Components

Electronic Manual Temperature Control (EMTC)

The HVAC module allows the vehicle occupants to select the following:

- Air inlet source (outside or recirculated)
- Blower motor speed
- Discharge air temperature (temperature blend)
- Discharge air location (defrost, panel, floor, panel/floor, defrost/floor)
- A/C compressor operation
- Rear window defroster operation

Control System Inputs

The blower motor speed switch is mounted in the HVAC module and controls blower motor speed by adding or bypassing resistors in the blower motor resistor in all modes except OFF. The blower motor speed switch is serviced only as an assembly with the HVAC module.

The temperature control switch adjusts the discharge air temperature. Movement of the temperature knob from COOL (blue) to WARM (red) causes a corresponding movement of the temperature blend door. The position of the temperature blend door determines the discharge air temperature that the air distribution system will maintain. The temperature control selector is an integral part of the HVAC module and cannot be serviced separately.

The airflow mode setting adjusts the discharge air outlet location. Movement of the airflow mode selector causes a corresponding movement of the airflow mode doors and determines the discharge air outlet location. The airflow mode selector is an integral part of the HVAC module and cannot be serviced separately.

The A/C request button determines A/C compressor operation, except when the airflow mode selector is in the OFF, MAX A/C, DEFROST or FLOOR/DEFROST mode. The A/C request button is an integral part of the HVAC module and cannot be serviced separately.

The recirculated air request button can select recirculated air in any mode except DEFROST, and fresh air in any mode except MAX A/C or OFF. The recirculated air request button is an integral part of the HVAC module and cannot be serviced separately.

The rear defog button signals activation of the heated backlight. Under certain conditions, the heated backlight may be activated automatically by the PCM and Body Control Module (BCM). The rear defog button indicator may remain off during this time. The rear defog button is an integral part of the HVAC module and cannot be serviced separately.

Control System Outputs

The Electronic Manual Temperature Control (EMTC) system has 4 system outputs.

Blower Motor Speed

The HVAC module blower motor speed selector varies the blower motor ground circuit resistance by adding or bypassing series resistance in the blower motor resistor. Increased resistance lowers the blower motor speed, and lowered resistance increases blower motor speed. When the blower motor is in the HI (4) position, the blower motor resistor is bypassed.

The blower motor resistor is located on the heater core and evaporator core housing below the glove compartment.

Temperature Blend Door Position

The temperature blend door actuator moves the temperature blend door on command from the HVAC module.

The temperature blend door actuator contains a reversible electric motor and a potentiometer. The potentiometer circuit reports the position of the temperature blend door to the HVAC module. The HVAC module drives the temperature blend door actuator motor in whichever direction is necessary to move the temperature blend door to the position set by the vehicle occupants.

The temperature blend door actuator is mounted to the RH side of the heater core and evaporator core housing and can be serviced separately.

Airflow Mode Door Position

The airflow mode door actuator controls the airflow mode door actuating assembly to position the airflow mode doors on command from the HVAC module.

The airflow mode door actuator contains a reversible electric motor and potentiometer. The potentiometer circuit reports the position of the airflow mode doors to the HVAC module. The HVAC module drives the actuator motor in whichever direction is necessary to move the airflow mode doors to the position set by the vehicle occupants. The airflow mode door actuating assembly contains a cam and gear arrangement which transfers the rotation of the airflow mode door actuator to the individual airflow mode doors.

The airflow mode door actuating assembly is mounted to the LH side of the heater core and evaporator core housing and can be serviced separately. The airflow mode door actuator is mounted to the airflow mode door actuating assembly and can be serviced separately.

Air Inlet Mode Door Position

The air inlet mode door actuator moves the air inlet door between the fresh and RECIRC positions on command from the HVAC module. The air inlet mode door actuator is driven to, and will automatically stop at, the full RECIRC or full fresh air inlet position and does not require a potentiometer circuit to monitor its position. The airflow mode door does not stop at any point between the RECIRC or fresh air inlet position. When the air inlet mode is switched, the airflow mode door actuator is driven by the HVAC module for 9 seconds, and will stall at the end of travel until the 9 second timer has expired.

The air inlet mode door actuator is mounted to the air inlet duct and can be accessed through the glove compartment. The air inlet mode door actuator can be serviced separately.

Heating and Ventilation

The heating and ventilation system has the following features:

- Controls the temperature and, during A/C operation, reduces the relative humidity of the air inside the vehicle
- Delivers heated or cooled air to maintain the vehicle interior temperature and comfort level
- Cooling or heating can be adjusted to maintain the desired temperature

The heating and ventilation system includes the following components:

- Blower motor
- Heater core and evaporator core housing
- Heater core

Blower Motor

The blower motor draws air from the air inlet and forces it into the heater core and evaporator core housing where it is mixed and distributed. The blower motor receives battery voltage at all times when the ignition is in the RUN position, and is grounded by the HVAC module blower motor switch.

The blower motor is mounted to the LH side of the heater core and evaporator core housing to the right of the pedal assembly.

Heater Core and Evaporator Core Housing

The heater core and evaporator core housing directs air flow from the blower motor through the evaporator core (if equipped) and heater core. All air flow from the blower motor passes through the evaporator core. The air flow is then directed through or around the heater core by an electric motor actuated temperature blend door. After passing through or around the heater core, the air flow is distributed to the selected outlet. The air flow mode doors are actuated by a single electric motor using a cam and gear setup.

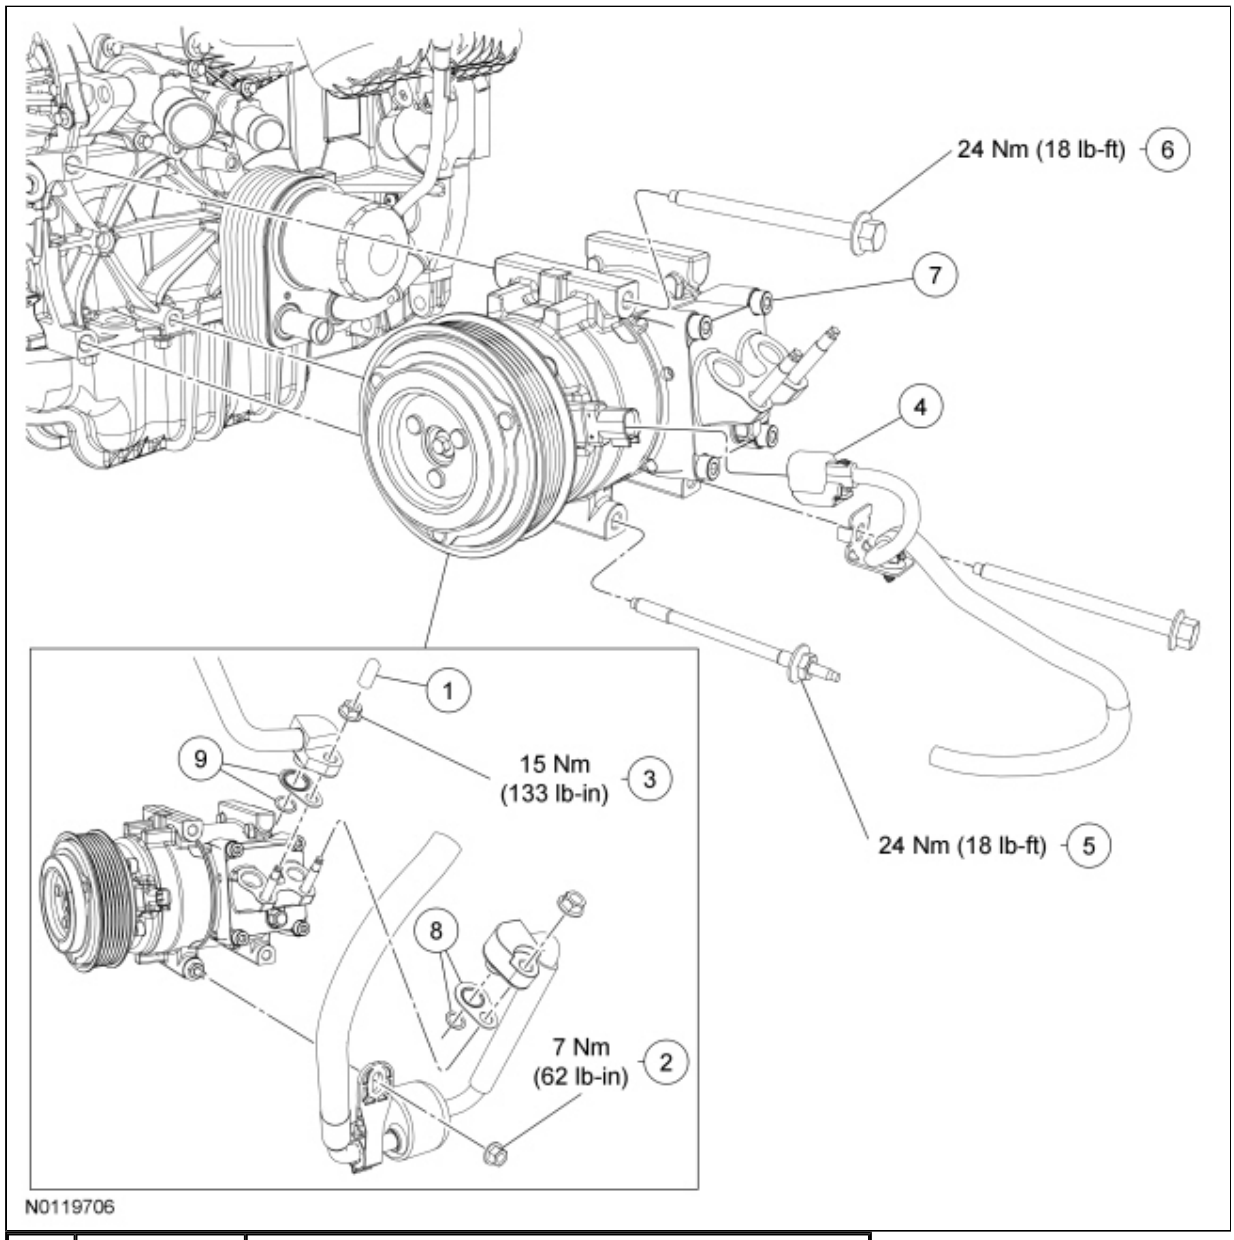
Heater Core

The heater core receives a flow of coolant from the engine cooling system through the heater core inlet. The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer it to air passing through the heater core. The engine coolant is then returned to the engine cooling system through the heater core outlet.

The heater core is located in the heater core and evaporator core housing.

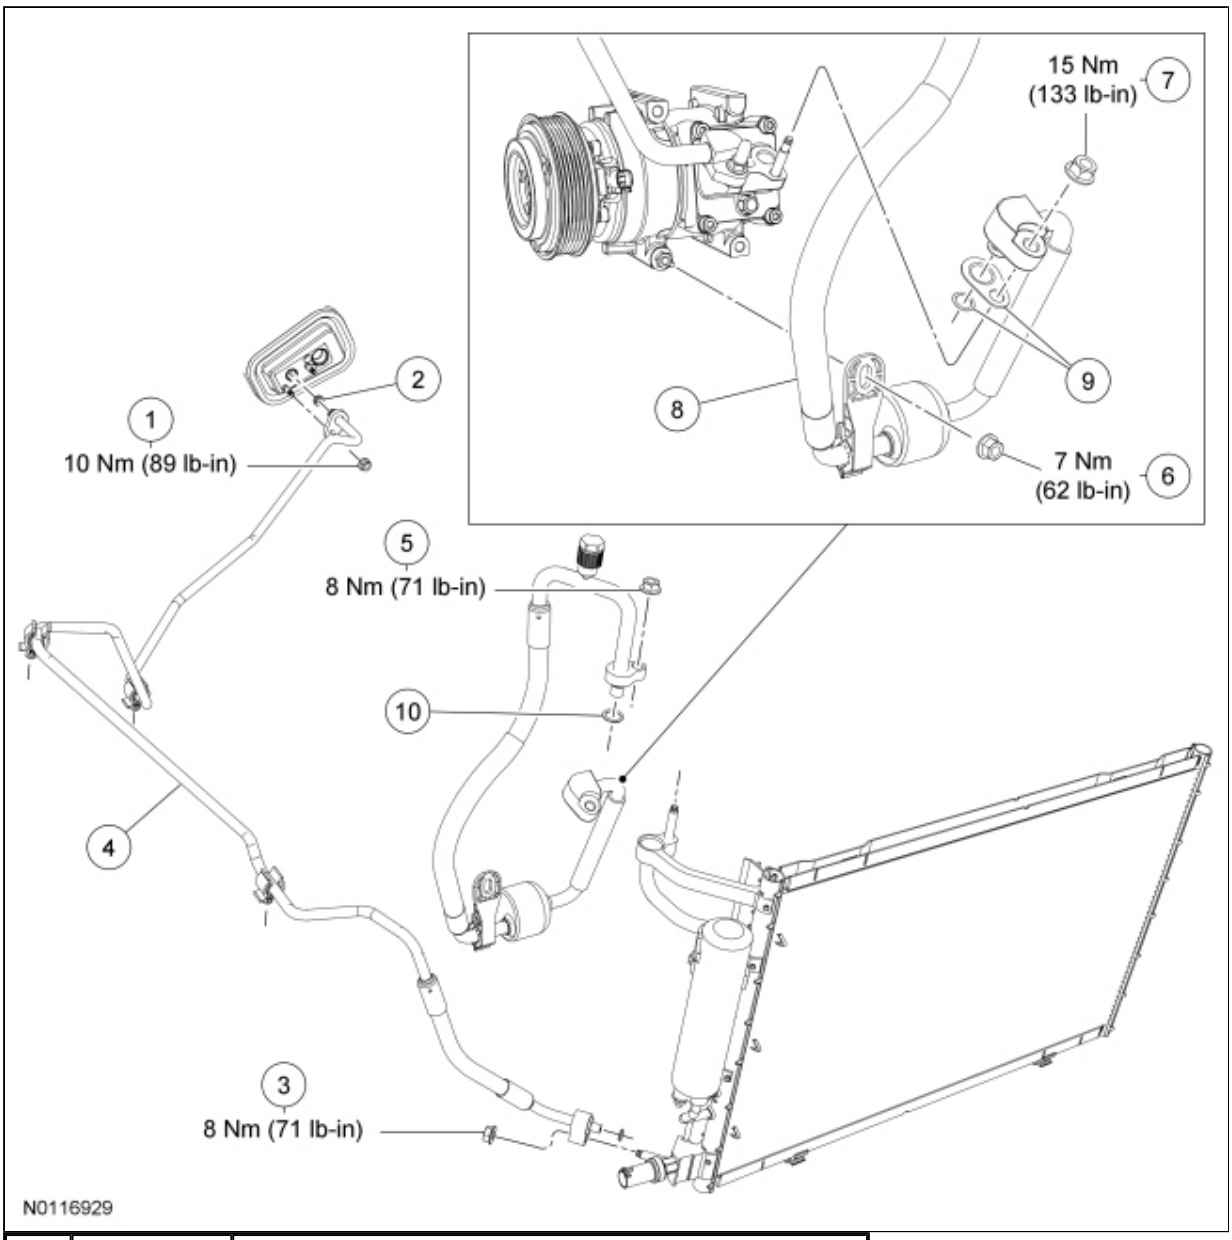
Air Conditioning — Exploded View

A/C Compressor



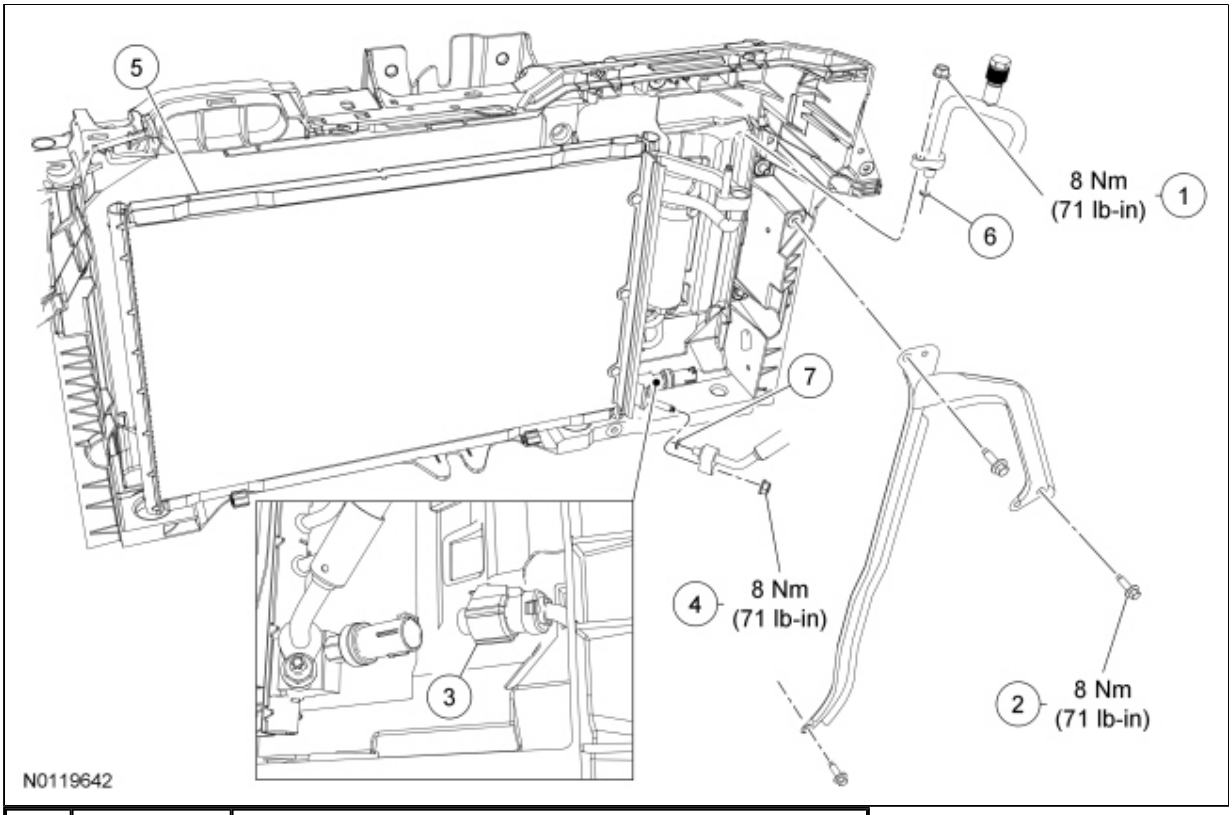
Item	Part Number	Description
1	386802-S	Rubber cap
2	W520111	Compressor-to-condenser discharge line bracket nut
3	W520413	A/C compressor fitting nut (2 required)
4	—	A/C compressor electrical connector (part of 12A522)
5	W714403	A/C compressor stud-bolt
6	W701331	A/C compressor bolt (2 required)
7	19703	A/C compressor
8	19B596	O-ring seal and gasket seal kit
9	19B596	O-ring seal and gasket seal kit

A/C High-Pressure Lines



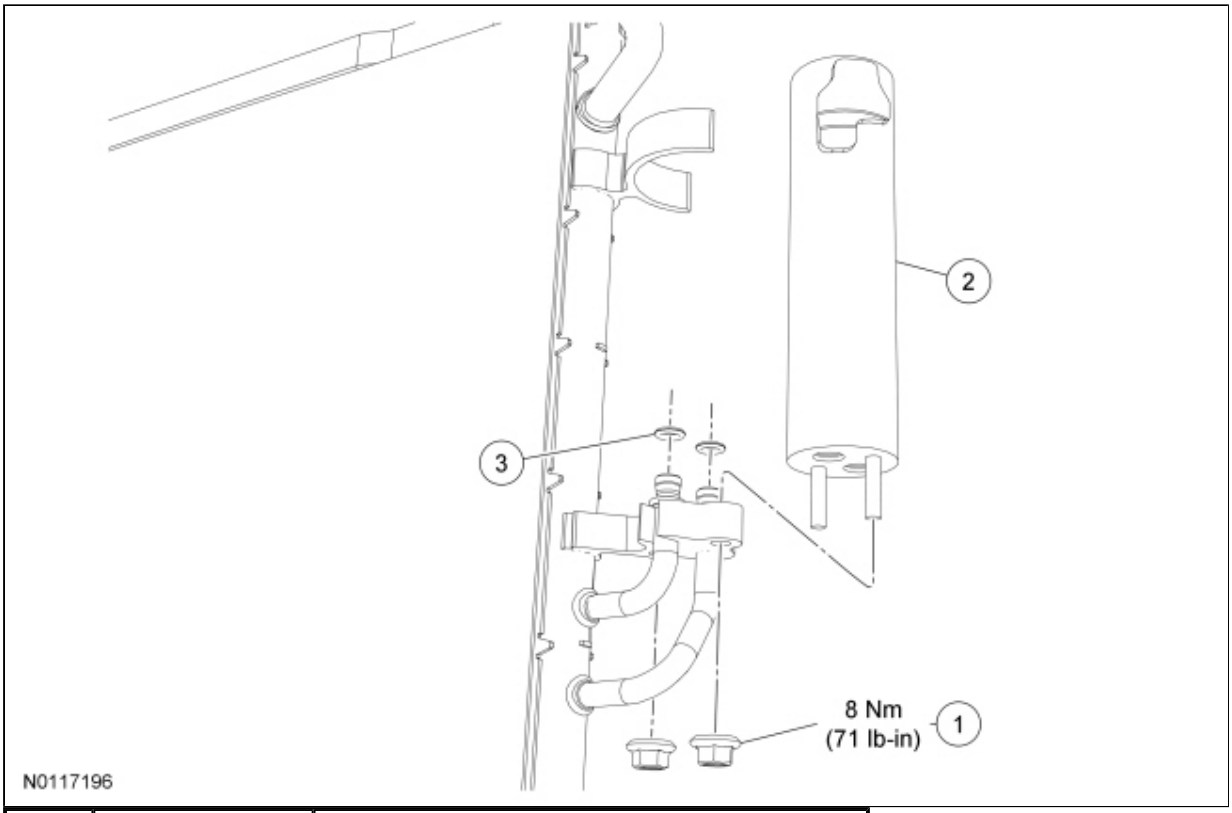
Item	Part Number	Description
1	W520412	Thermostatic Expansion Valve (TXV) high-pressure fitting nut
2	19E889	O-ring seal (2 required)
3	W520413	Condenser outlet fitting nut
4	19835	Condenser-to-evaporator line
5	W520413	Condenser inlet fitting nut
6	W520111	Compressor-to-condenser discharge line bracket nut
7	W520413	A/C compressor discharge fitting nut
8	19972	Compressor-to-condenser discharge line
9	19B596	O-ring seal and gasket seal kit
10	19E889	O-ring seal

A/C Condenser Core



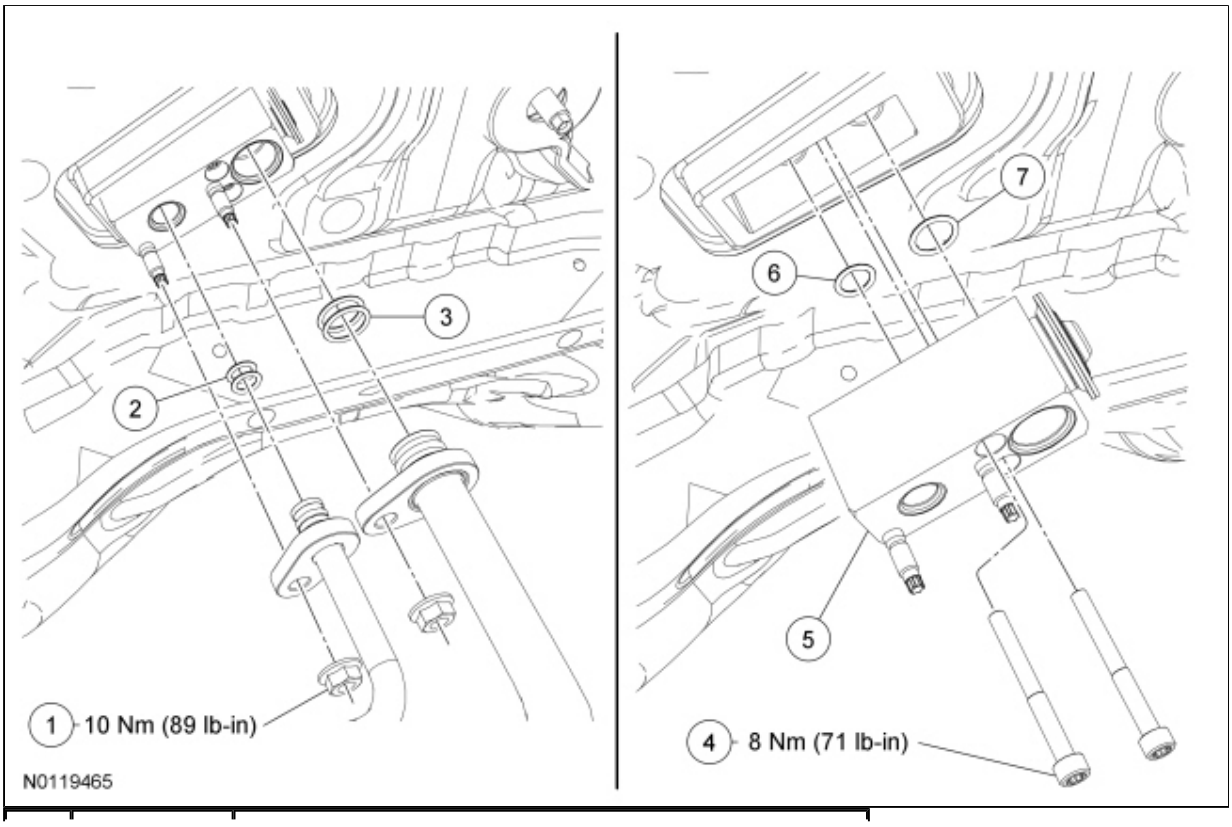
Item	Part Number	Description
1	W520413	Condenser inlet fitting nut
2	W500213	Radiator support reinforcement bolt (3 required)
3	—	A/C pressure transducer electrical connector (part of 12A522)
4	W520413	Condenser outlet fitting nut
5	19712	Condenser core
6	19E889	O-ring seal
7	19E889	O-ring seal

Receiver/Drier



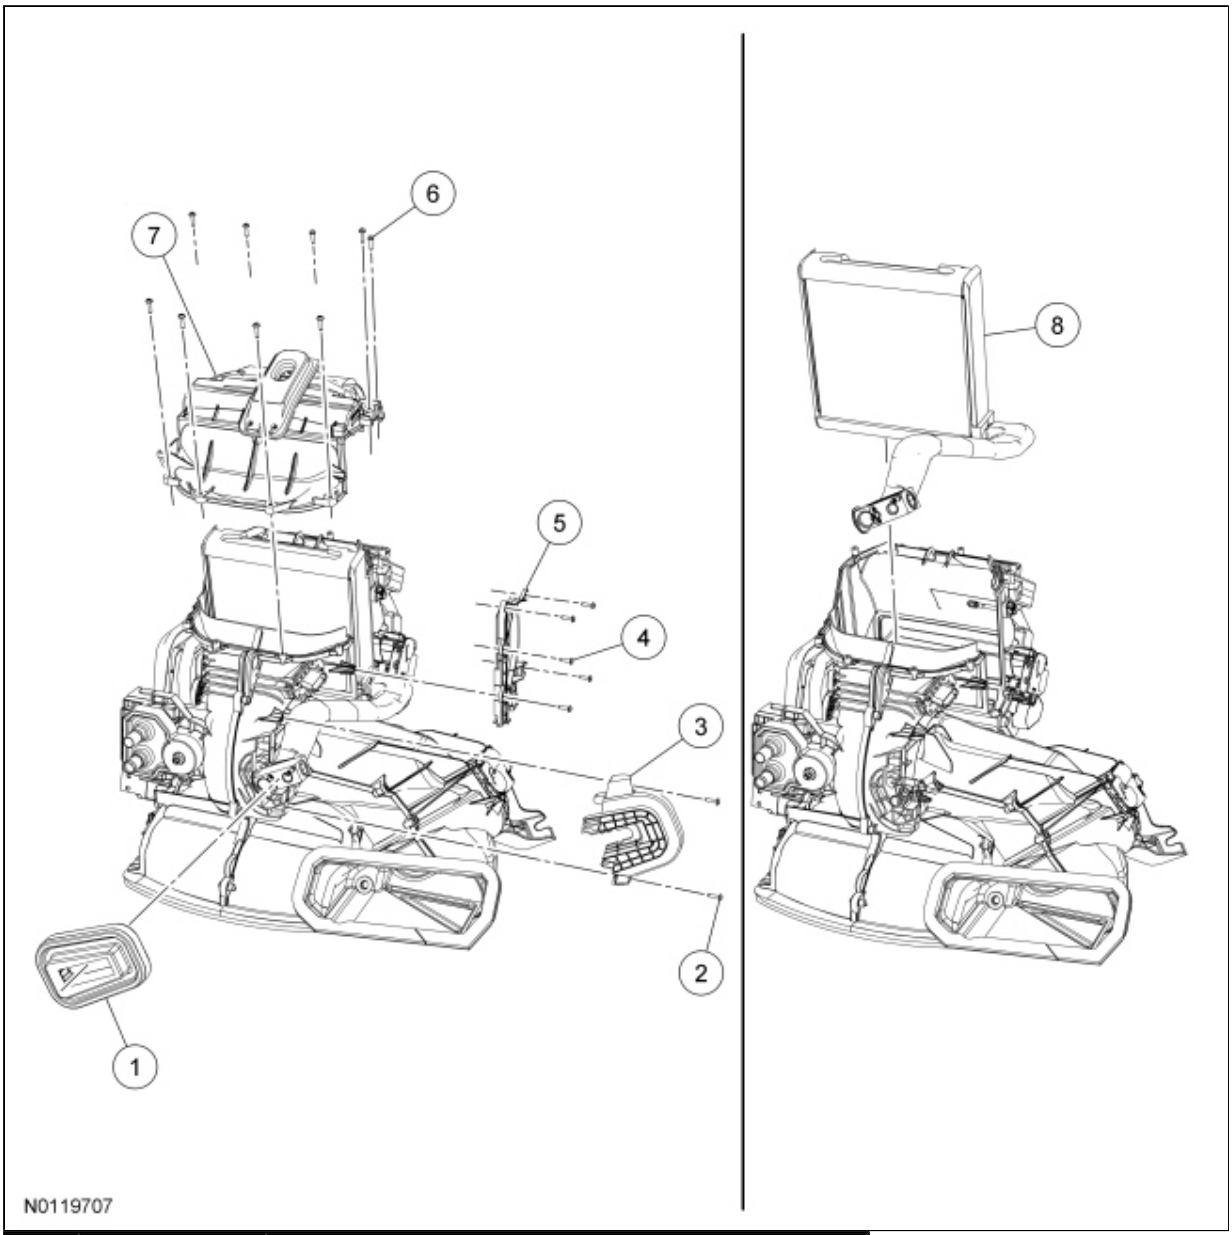
Item	Part Number	Description
1	W705460	Receiver/drier fitting nut (2 required)
2	19959	Receiver/drier
3	19E889	O-ring seal (2 required)

Thermostatic Expansion Valve (TXV)



Item	Part Number	Description
1	W520412	Thermostatic Expansion Valve (TXV) fitting nut (2 required)
2	19E889	O-ring seal (2 required)
3	19E889	O-ring seal (2 required)
4	—	TXV bolt (2 required) (part of 19849)
5	19849	TXV
6	19E889	O-ring seal
7	19E889	O-ring seal

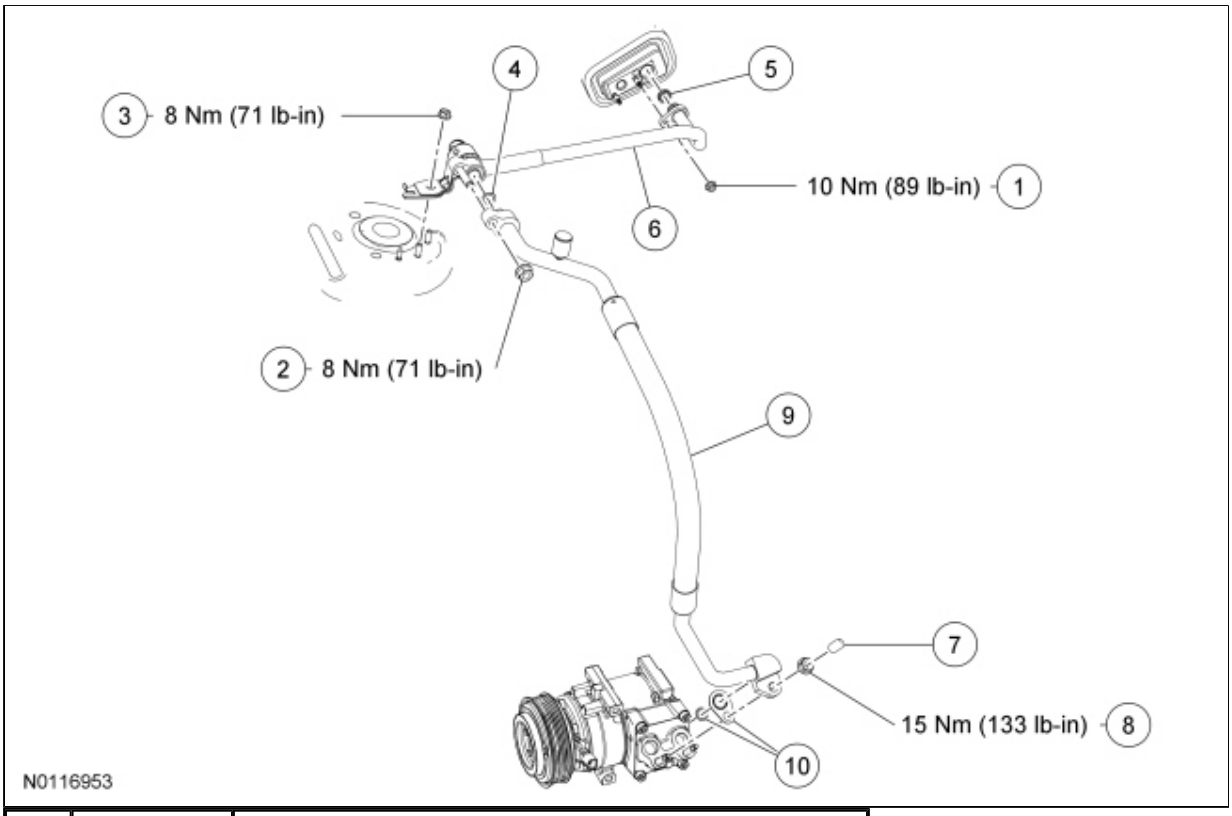
Evaporator Core



Item	Part Number	Description
1	19B588	Dash panel seal
2	W506945	Evaporator tube bracket screw (2 required)

3	—	Evaporator tube bracket (part of 19850)
4	W506945	Cabin air filter access cover screw (5 required)
5	19D672	Cabin air filter access cover
6	W506945	Evaporator core cover screw (9 required)
7	—	Evaporator core cover (part of 19850)
8	19860	Evaporator core

A/C Low-Pressure Lines



Item	Part Number	Description
1	W520412	Thermostatic Expansion Valve (TXV) low-pressure fitting nut
2	W520413	Evaporator outlet line fitting nut
3	W520412	Evaporator outlet line bracket nut
4	19E889	O-ring seal
5	19E889	O-ring seal (2 required)
6	19867	Evaporator outlet line
7	386802	Rubber cap
8	W520413	A/C compressor suction fitting
9	19D734	Evaporator-to-compressor suction line
10	19D596	O-ring seal and gasket seal kit

8	19703	A/C compressor
9	19B596	O-ring seal and gasket seal kit
10	19B596	O-ring seal and gasket seal kit

Removal and Installation

NOTICE: **If installing a new Air Conditioning (A/C) compressor due to an internal failure of the old unit, the following procedures must be carried out to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.**

- **If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to Section 412-00 .**
- **If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to Section 412-00 .**
- **Install a new Thermostatic Expansion Valve (TXV), as directed by the A/C flushing or filtering procedure.**
- **Install a new receiver/drier as directed by the A/C flushing or filtering procedure.**

NOTE: Installation of a new receiver/drier is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier. Damage to the receiver/drier includes leaks in the receiver/drier, physical damage to the receiver/drier shell or desiccant, or moisture contamination. Moisture contamination results only from a complete loss of refrigerant and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the system before repairs are carried out, the receiver/drier should not be replaced.

NOTE: A new A/C compressor may come equipped with an A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil already installed. If these components are not pre-installed, it will be necessary to transfer these parts from the old A/C compressor to the new compressor prior to installation of the A/C compressor if suitable for reuse.

1. If flushing of the refrigerant system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the compressor-to-condenser discharge line bracket nut.
   - To install, tighten to 7 Nm (62 lb-in).

3. Remove the 2 A/C compressor fitting nuts and disconnect the fitting.
   - Discard the O-ring seals and gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

4. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

5. Disconnect the A/C clutch field coil electrical connector.

6. Detach the wire harness from the A/C compressor wire harness bracket.

7. Remove the 2 A/C compressor bolts, the A/C compressor stud bolt and the A/C compressor wire harness bracket.
   - To install, tighten to 24 Nm (18 lb-ft).

8. Remove the A/C compressor.

9. To install, reverse the removal procedure.
   - Install new O-ring seals and gasket seals.

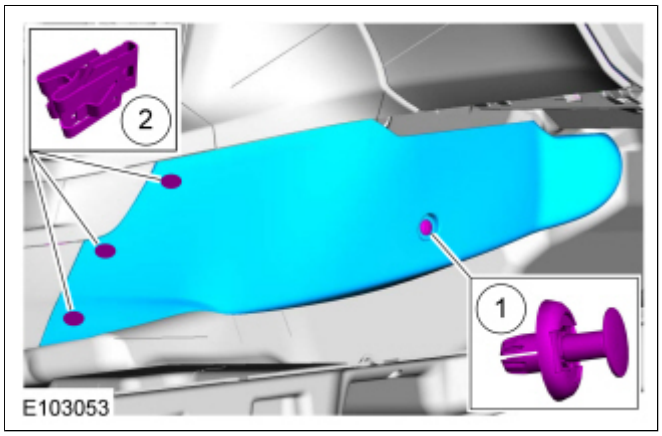
- If filtering of the refrigerant system is not to be carried out, add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

10. If filtering of the refrigerant system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

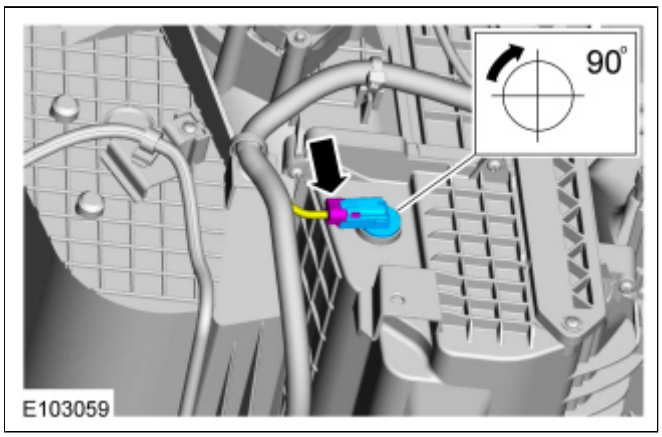
Air Conditioning (A/C) Evaporator Discharge Air Temperature Sensor

Removal and Installation

1. Remove the RH floor console trim panel.
    1. Remove the pin-type retainer.
    2. Detach the 3 clips and remove the trim panel.



2. Disconnect the evaporator discharge air temperature sensor electrical connector and rotate the sensor clockwise to remove.



3. To install, reverse the removal procedure.

Air Conditioning (A/C) Pressure Relief Valve

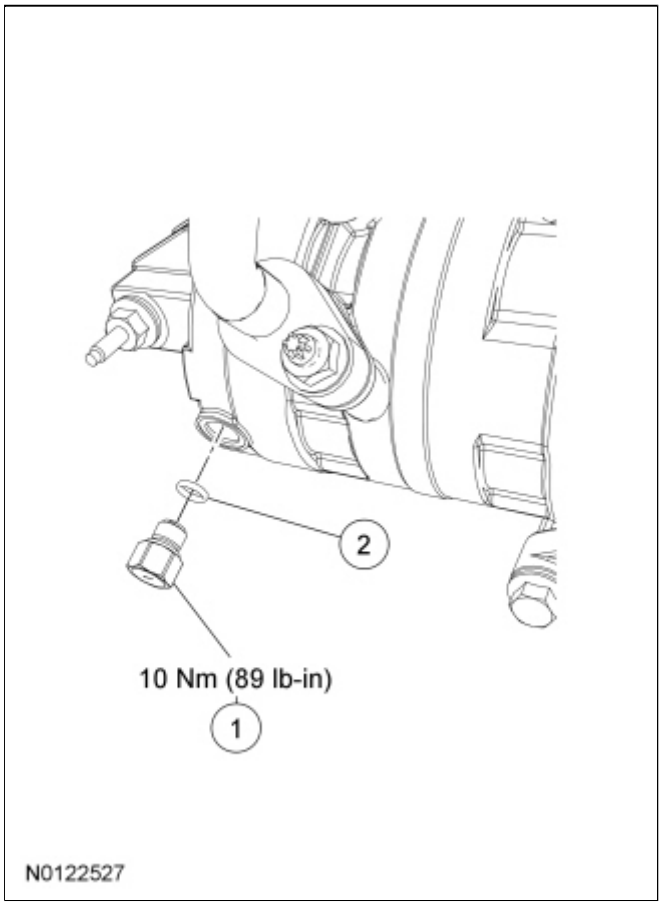
Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the A/C compressor pressure relief valve and O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).



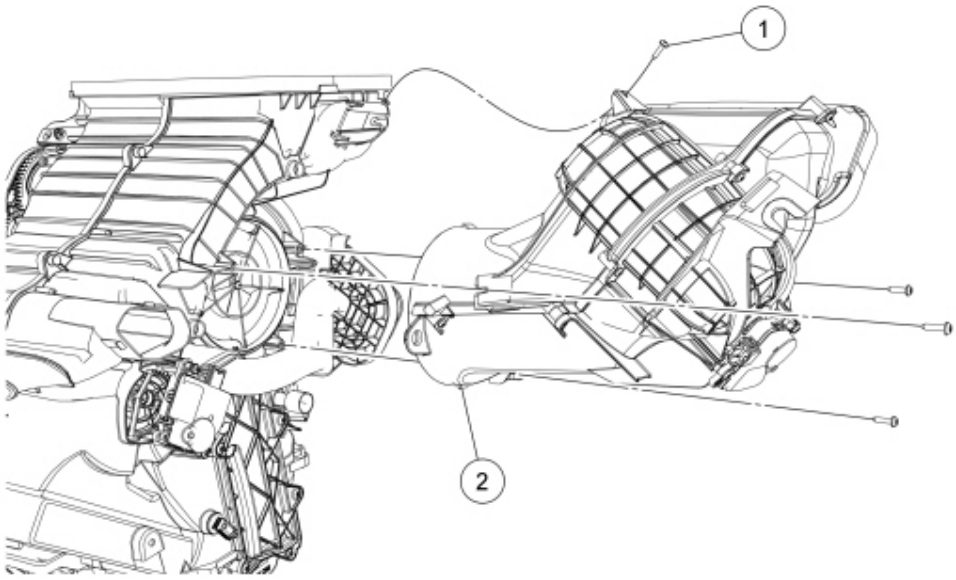
3. **NOTE:** A new O-ring seal will already be installed on the new A/C compressor pressure relief valve service part.

   To install, reverse the removal procedure.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

4. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section

412-00 .

Air Inlet Duct



N0123602

Item	Part Number	Description
1	W506945	Air inlet duct screw (4 required)
2	19A618	Air inlet duct

Removal and Installation

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Remove the 4 air inlet duct screws.
3. Remove the air inlet duct.
4. To install, reverse the removal procedure.

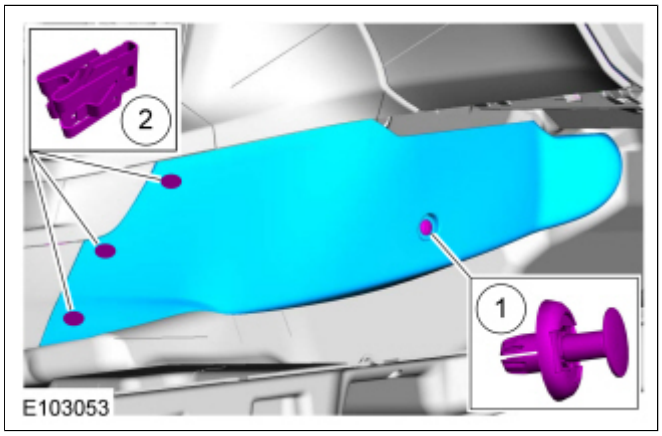
Blower Motor

Removal and Installation

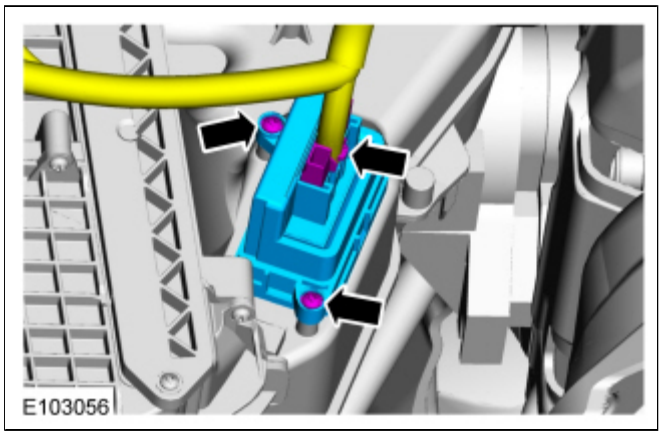
1. With the ignition in the ON position , select the PANEL climate control mode. Switch the ignition to the OFF position.
2. Remove the brake pedal and bracket assembly. For additional information, refer to Section 206-06 .
3. Disconnect the blower motor electrical connector.
4. Remove the 3 blower motor screws.
5. Remove the blower motor.
6. To install, reverse the removal procedure.

Blower Motor Resistor

1. Remove the RH floor console side panel.
    1. Remove the side panel pin-type retainer.
    2. Detach the clips and remove the RH floor console side panel.



2. Remove the blower motor resistor.
    - Disconnect the blower motor resistor electrical connector.
    - Remove the 2 blower motor resistor screws and the blower motor resistor.

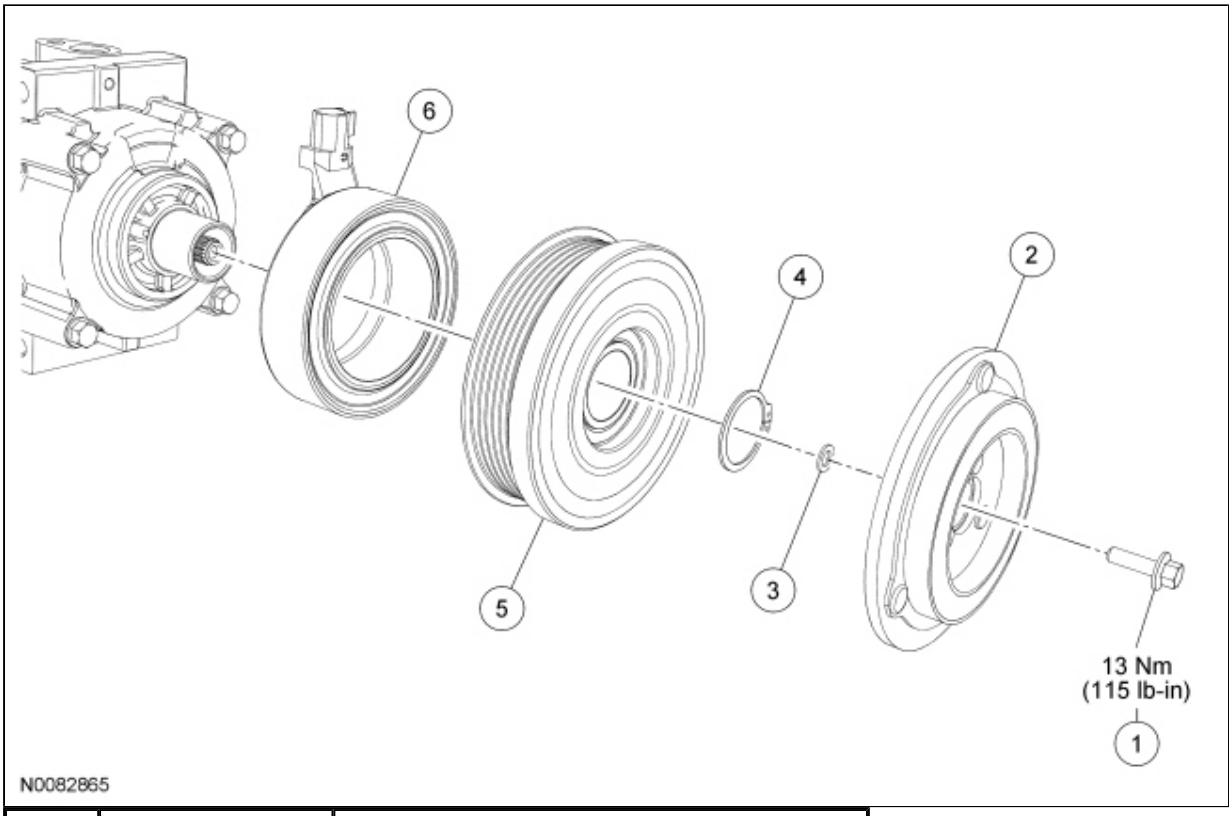


3. To install, reverse the removal procedure.

Clutch and Clutch Field Coil

Special Tool(s)

ST2946-A	Holding Tool, Compressor Clutch 412-134
 ST1232-A	Installer, A/C Compressor Coil 412-065 (T89P-19623-EH)
ST1234-A	Installer, A/C Compressor Field Coil 412-078 (T91L-19623-CH)
ST1233-A	Remover, A/C Compressor Field Coil 412-067 (T89P-19623-FH)
ST2382-A	Remover, Compressor Pulley 412-001 (T71P-19703-B)

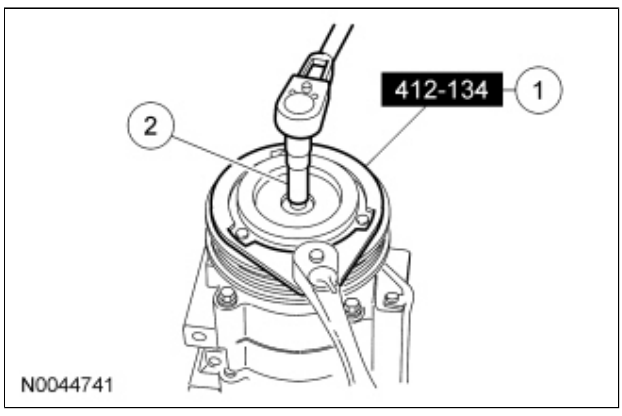


Item	Part Number	Description
1	W711877	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19D648	A/C clutch disc and hub spacer
4	N805338	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	19D798	A/C clutch field coil

Removal

1. Remove the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

2. Remove the A/C clutch disc and hub bolt.
    1. Using the Compressor Clutch Holding Tool, hold the A/C clutch disc and hub.
    2. Remove the A/C clutch disc and hub bolt.



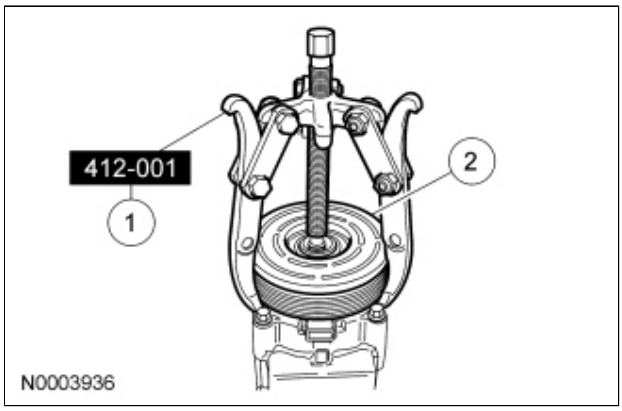
3. Remove the A/C clutch disc and hub.

4. Remove the A/C clutch disc and hub spacer(s).

5. Remove the A/C compressor pulley snap ring.

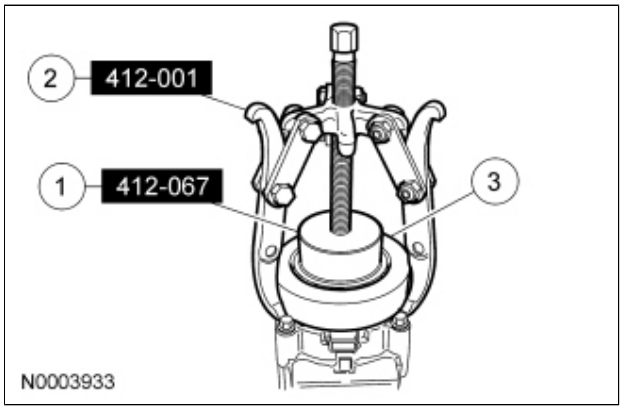
6. ***NOTICE:*** **Do not use air tools. Damage to the Air Conditioning (A/C) compressor pulley or A/C compressor may result.**

   Remove the A/C compressor pulley.
   1. Install the Compressor Pulley Remover.
   2. Remove the A/C compressor pulley.



7. ***NOTICE:*** **Do not use air tools. Damage to the Air Conditioning (A/C) clutch field coil or A/C compressor may result.**

   Remove the A/C clutch field coil.
   1. Install the A/C Compressor Field Coil Remover.
   2. Install the Compressor Pulley Remover.
   3. Remove the A/C clutch field coil.

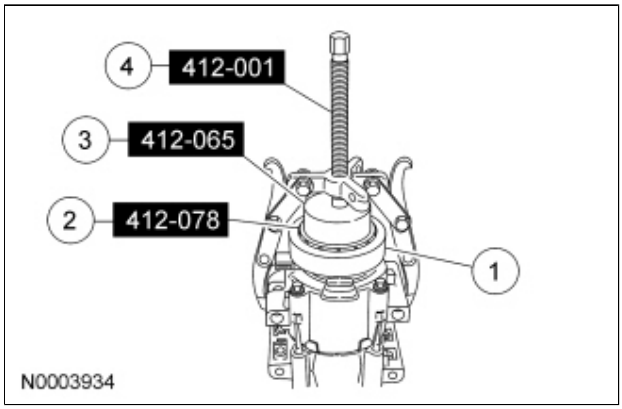


Installation

1. Clean the A/C clutch field coil and pulley mounting surfaces.

2. ***NOTICE:*** **Do not use air tools. Damage to the Air Conditioning (A/C) clutch field coil or A/C compressor may result.**

   Install the A/C clutch field coil.
   1. Place the A/C clutch field coil on the A/C compressor with the A/C clutch field coil electrical connector correctly positioned.
   2. Place the A/C Compressor Field Coil Installer on the A/C clutch field coil.
   3. Place the A/C Compressor Coil Installer on the A/C Compressor Field Coil Installer.
   4. Use the Compressor Pulley Remover to install the A/C clutch field coil.

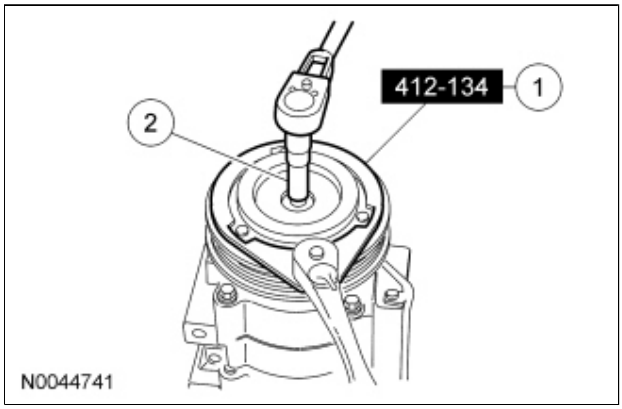


3. Install the A/C compressor pulley.

4. Install the A/C compressor pulley snap ring.

5. Install the A/C clutch disc and hub spacer(s) and the A/C clutch disc and hub.

6. Install the A/C clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the Compressor Clutch Holding Tool.
    2. Tighten to 13 Nm (115 lb-in).



7. Measure and adjust the clutch air gap by adding or removing A/C clutch disc and hub spacers. For additional information, refer to the A/C clutch air gap procedure in Section 412-00 .

8. Install the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

Compressor to Condenser Discharge Line

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the condenser inlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal.
   - To install, tighten to 8 Nm (71 lb-in).

4. Remove the compressor-to-condenser discharge line bracket nut.
   - To install, tighten to 7 Nm (62 lb-in).

5. Remove the compressor discharge fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

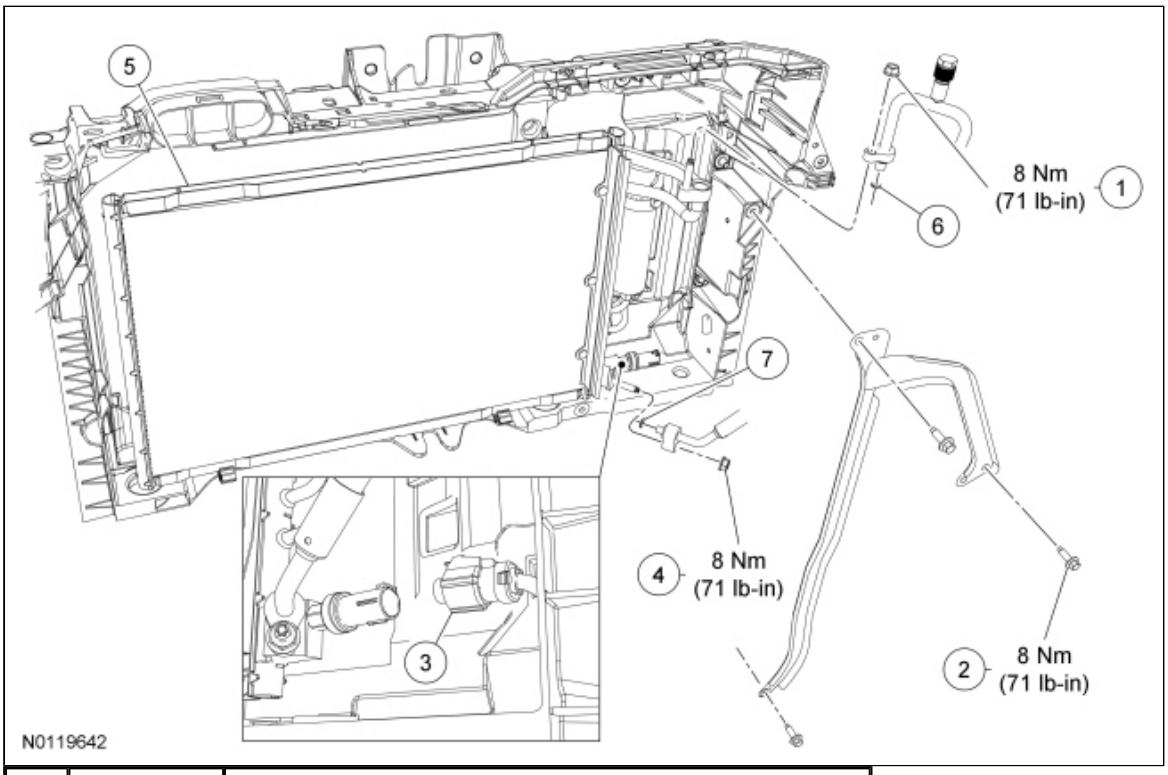
6. To install, reverse the removal procedure.
   - Install new O-ring seals and a new gasket seal.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to Section 412-00 .

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Condenser Core

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B



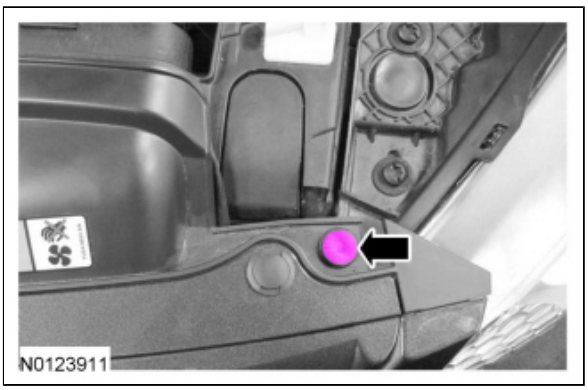
Item	Part Number	Description
1	W520413	Condenser inlet fitting nut
2	W500213	Radiator support reinforcement bolt (3 required)
3	—	A/C pressure transducer electrical connector (part of 12A522)
4	W520413	Condenser outlet fitting nut
5	19712	Condenser core
6	19E889	O-ring seal
7	19E889	O-ring seal

Removal and Installation

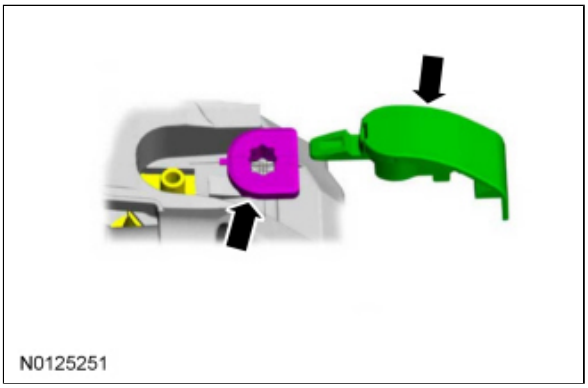
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Recover the refrigerant. For additional information, refer to Section 412-00 .
3. Remove the cooling fan motor and shroud. For additional information, refer to Section 303-03 .
4. Remove the condenser inlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal.

- To install, tighten to 8 Nm (71 lb-in).

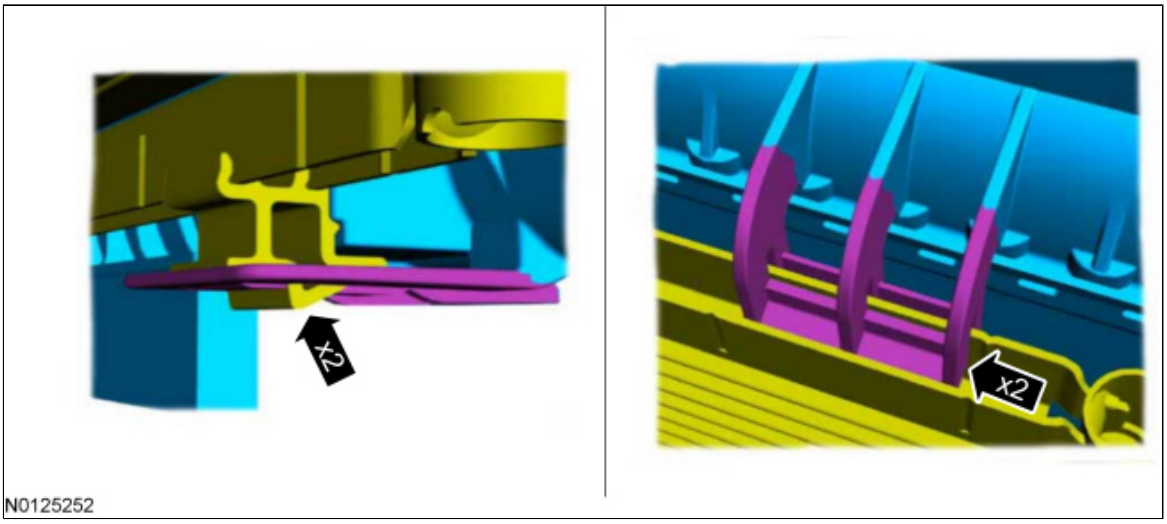
5. Remove the LH radiator grille pin-type retainer.



6. Release the LH and RH upper radiator bracket tabs and remove the LH and RH upper radiator insulators.



7. Remove the 3 radiator support reinforcement bolts and the radiator support reinforcement.
8. Disconnect the A/C pressure transducer electrical connector.
9. Remove the condenser outlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal.
   - To install, tighten to 8 Nm (71 lb-in).
10. Lift the radiator out of the lower insulator bushings and position it rearward.
11. Release the tabs and detach the condenser core from the radiator.



12. Remove the condenser core.

13. To install, reverse the removal procedure.
    - Install new O-ring seals and a new gasket seal.
    - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

14. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

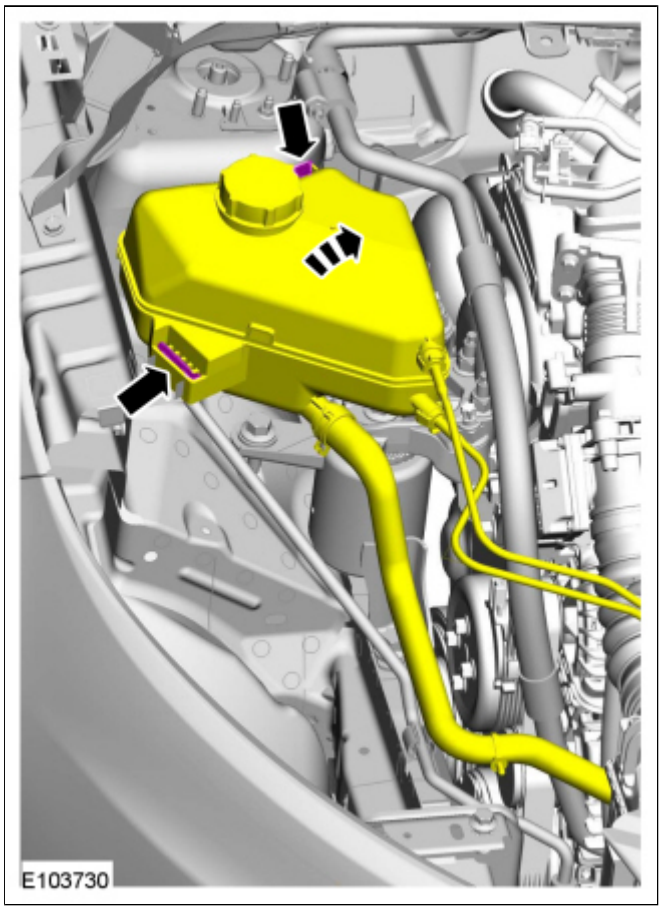
Condenser to Evaporator Line

Material

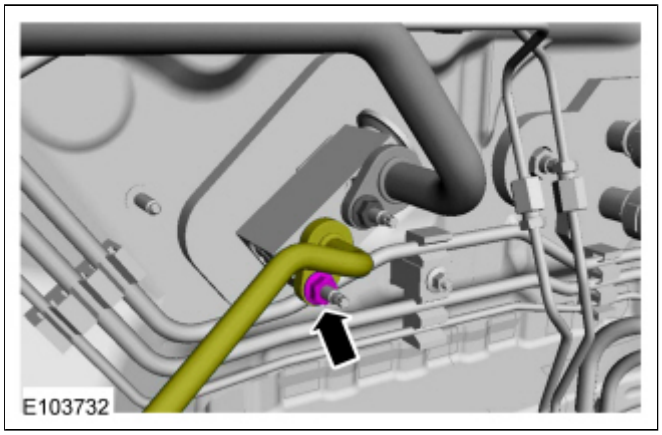
Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

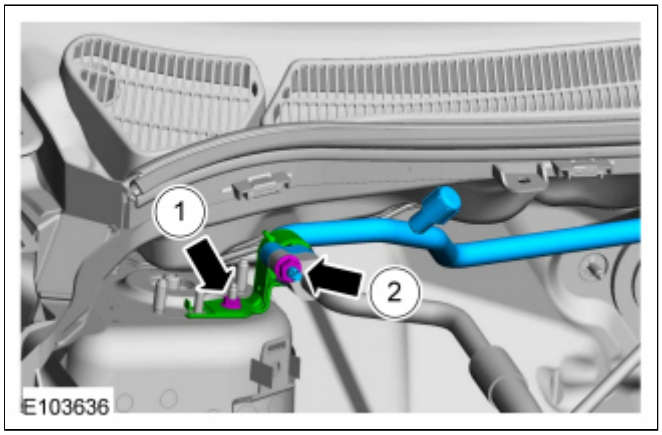
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Recover the refrigerant. For additional information, refer to Section 412-00 .
3. Release the clips and position the coolant bottle aside.



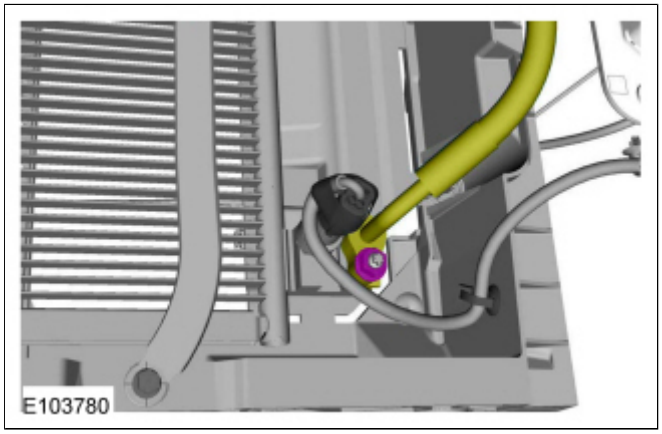
4. Remove the Thermostatic Expansion Valve (TXV) inlet fitting nut and disconnect the fitting.
   - Discard the O-ring seals.
   - To install, tighten to 10 Nm (80 lb-in).



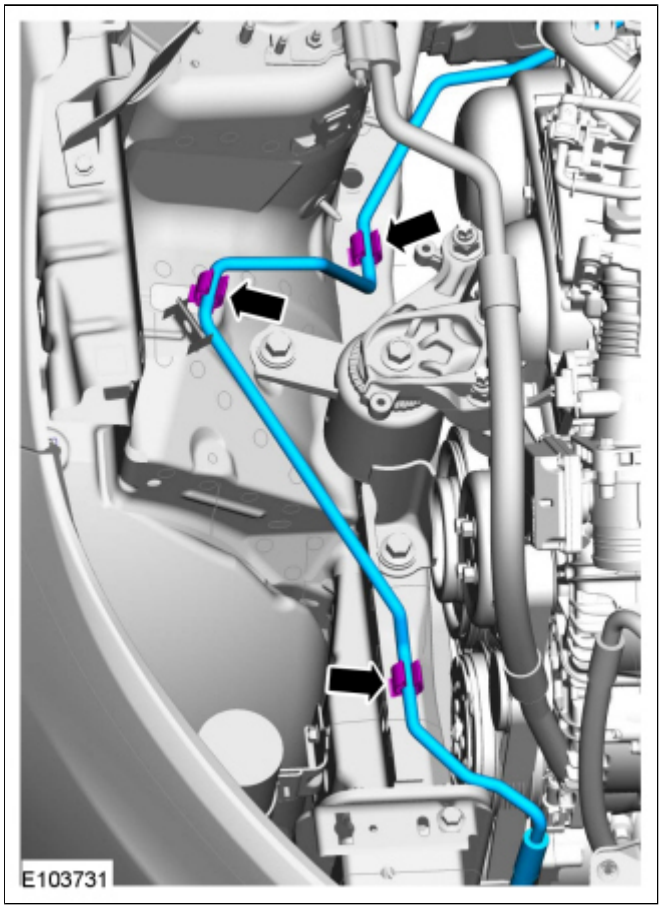
5. Disconnect the evaporator outlet line fitting.
    1. Remove the evaporator outlet line bracket nut.
    2. Remove the evaporator outlet line fitting nut and disconnect the fitting.
    - Discard the O-ring seal.
    - To install, tighten the evaporator outlet line fitting nut to 8 Nm (71 lb-in).
    - To install, tighten the evaporator outlet line bracket nut to 8 Nm (71 lb-in).



6. Remove the condenser outlet fitting nut and disconnect the fitting.
    - Discard the O-ring seal.
    - To install, tighten to 8 Nm (71 lb-in).



7. Detach the condenser-to-evaporator line from the clips.



8. Remove the condenser-to-evaporator line.

9. To install, reverse the removal procedure.
   - Install new O-ring seals.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .

10. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Evaporator Outlet Line

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the Thermostatic Expansion Valve (TXV) outlet fitting nut and disconnect the fitting.
   - Discard the O-ring seals.
   - To install, tighten to 10 Nm (89 lb-in).
3. Remove the evaporator outlet line bracket nut.
   - To install, tighten to 8 Nm (71 lb-in).
4. Remove the A/C compressor suction fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).
5. Remove the evaporator outlet line.
6. To install, reverse the removal procedure.
   - Install new O-ring seals, and a new gasket seal.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00 .
7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Evaporator to Compressor Suction Line

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

1. Recover the refrigerant. For additional information, refer to Section 412-01 .
2. Remove the evaporator outlet line fitting nut.
   - Discard the O-ring seal.
   - To install, tighten to 8 Nm (71 lb-in).
3. Remove the rubber cap from the A/C compressor suction fitting stud.
4. Remove the A/C compressor suction fitting nut.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).
5. To install, reverse the removal procedure.
   - Install a new gasket seal and new O-ring seals.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to Section 412-00 .
6. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Footwell Duct — Rear

Removal and Installation

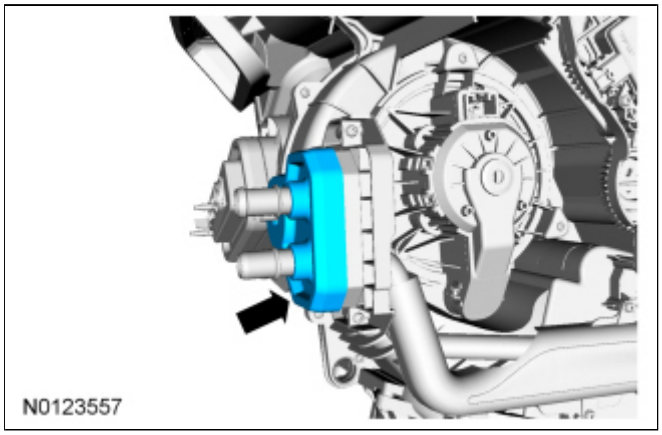
1. Remove the front seats. For additional information, refer to Section 501-10 .
2. Remove the LH and RH front scuff plates, and the RH and LH cowl side trim panels. For additional information, refer to Section 501-05 .
3. Remove the 2 LH rear footwell duct pin-type retainers and the LH rear footwell duct.
4. Remove the 2 RH rear footwell duct pin-type retainers and the RH rear footwell duct.
5. To install, reverse the removal procedure.

Heater Core

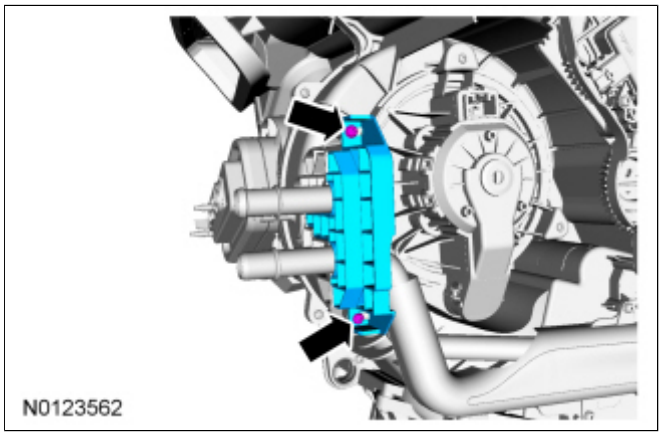
Removal and Installation

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.

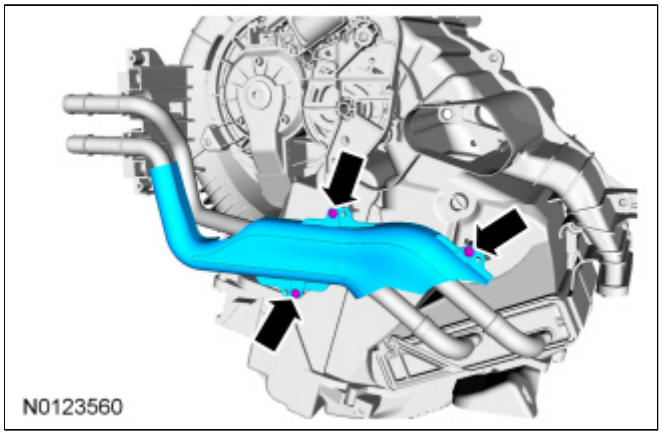
2. Remove the dash panel seal.



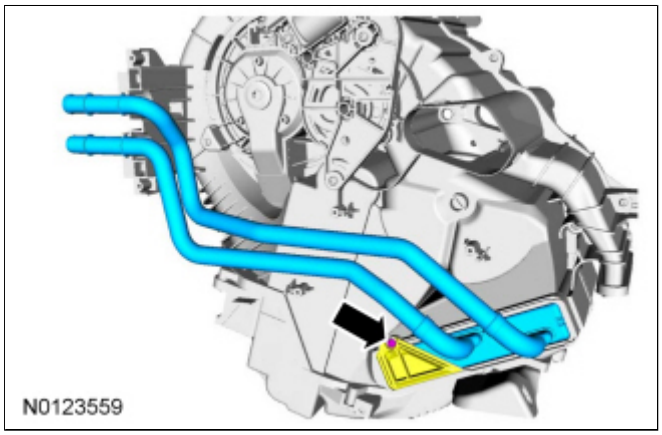
3. Remove the 2 heater core tube bracket screws and remove the bracket.



4. Remove the 3 heater tube cover screws and remove the heater tube cover

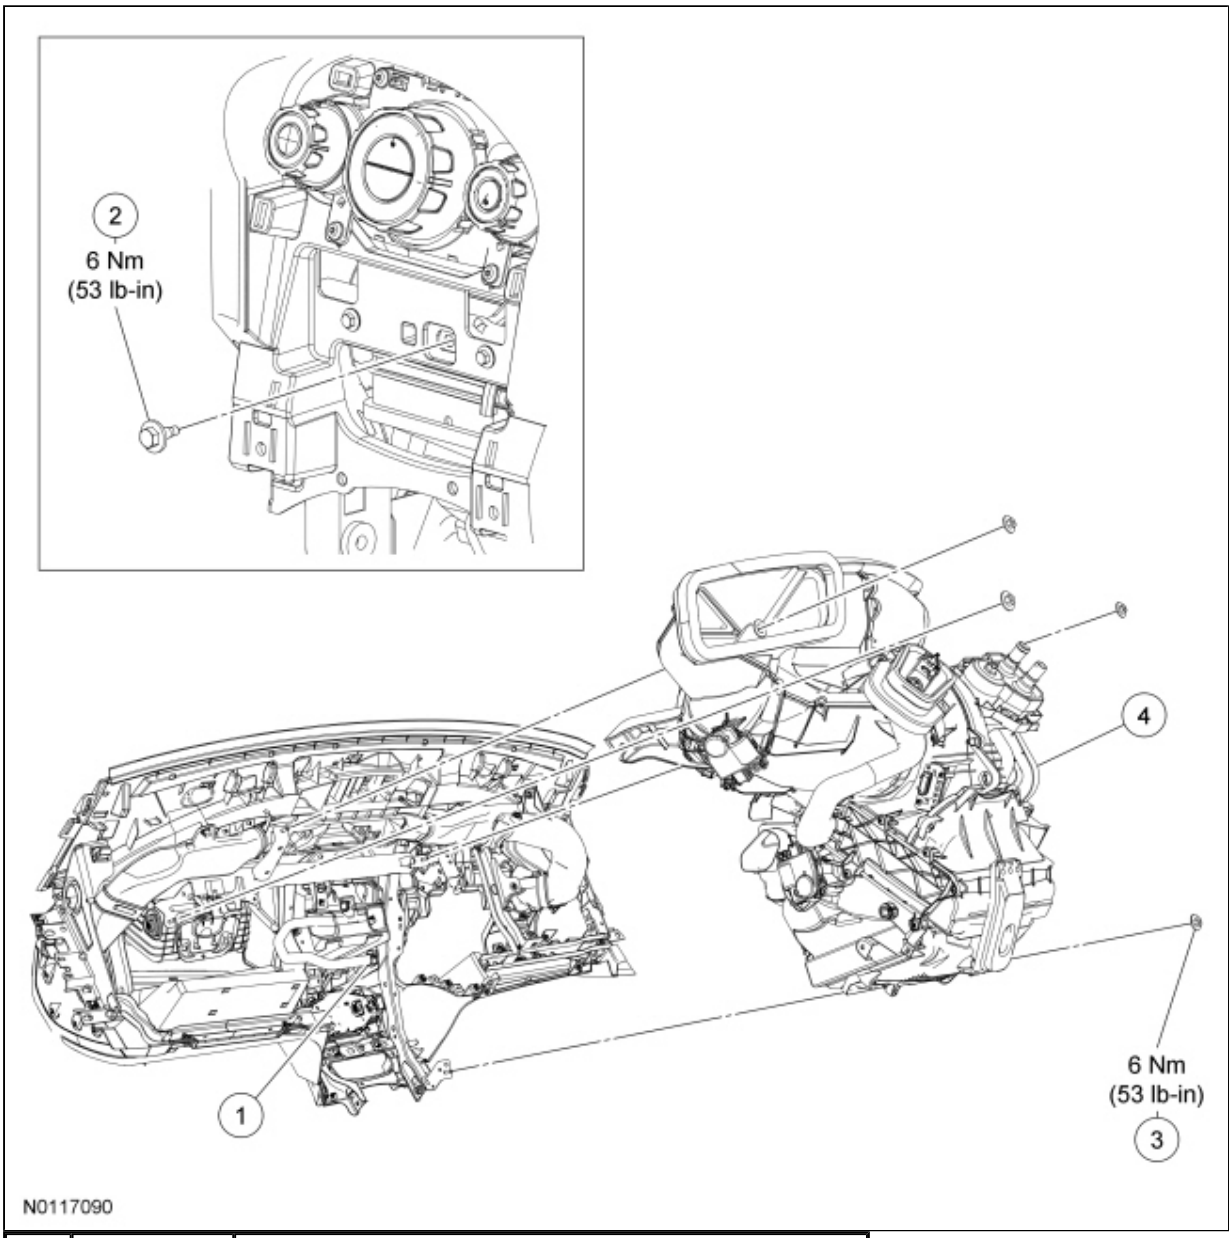


5. Remove the heater core retainer screw and position the retainer aside.



6. Remove the heater core.
7. To install, reverse the removal procedure.

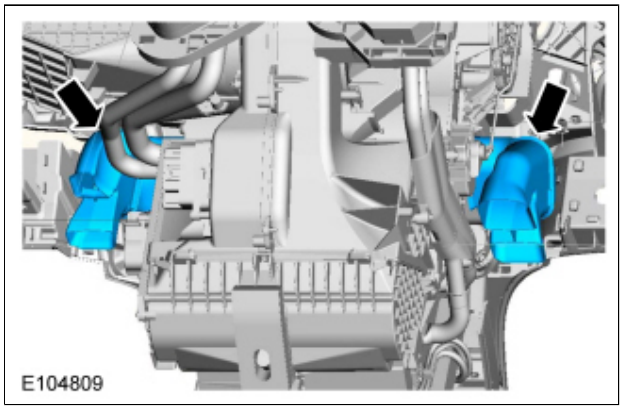
Heater Core And Evaporator Core Housing



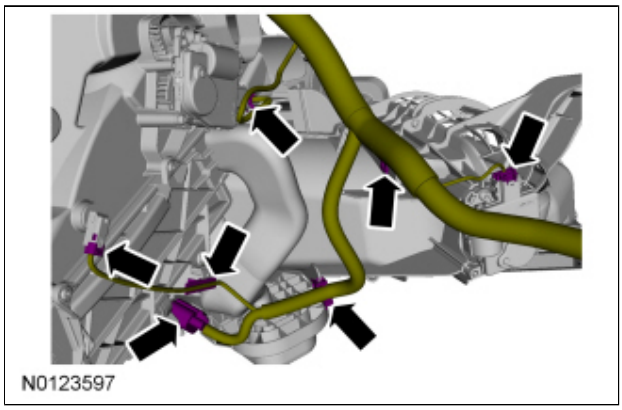
Item	Part Number	Description
1	19D888	Audio unit vent tube
2	W505422	Heater core and evaporator core housing bolt
3	W700430	Heater core and evaporator core housing nuts (4 required)
4	19850	Heater core and evaporator core housing

Removal and Installation

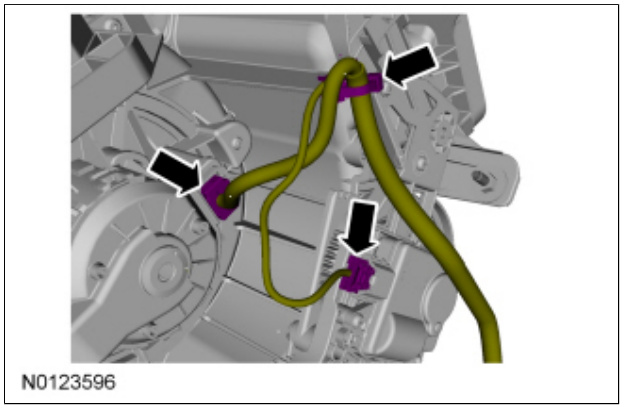
1. Remove the instrument panel. For additional information, refer to Section 501-12 .
2. Remove the 2 floor ducts.



3. Disconnect the electrical connectors and detach the wire harness clips from the RH side of the heater core and evaporator core housing.



4. Disconnect the electrical connectors and detach the wire harness retainer from the LH side of the heater core and evaporator core housing.

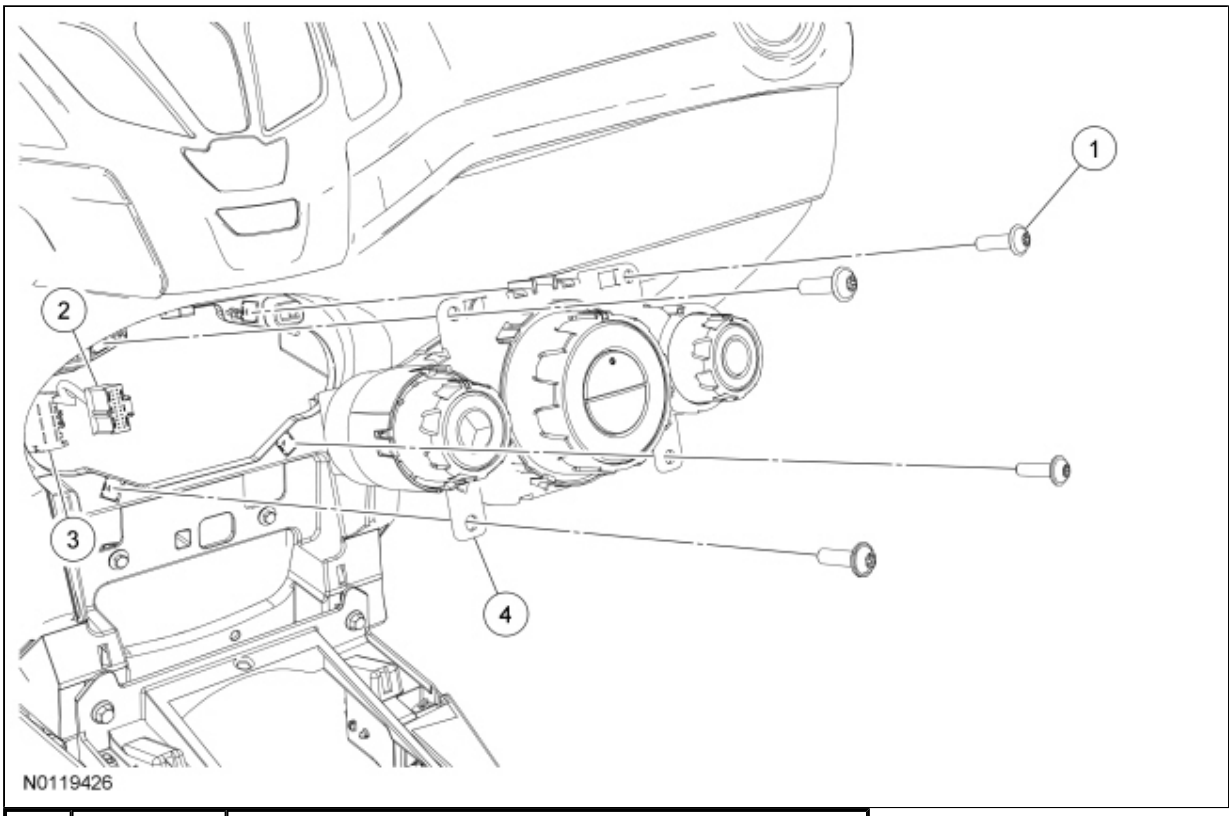


5. Release the clamp and detach the audio unit vent tube from the heater core and evaporator core housing.

6. Remove the 4 heater core and evaporator core housing nuts, and the heater core and evaporator core housing bolt.
   - To install, tighten to 6 Nm (53 lb-in).

7. To install, reverse the removal procedure.

Heating Ventilation Air Conditioning (HVAC) Module



Item	Part Number	Description
1	W707628	HVAC module screw (4 required)
2	—	HVAC module electrical connector (part of 14401)
3	—	HVAC module blower motor switch electrical connector (part of 14401)
4	18549	HVAC module (vehicles not equipped with A/C)
4	19980	HVAC module (vehicles equipped with A/C)

Removal and Installation

1. Remove the lower instrument panel finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 HVAC module screws.
3. Disconnect the 2 HVAC module electrical connectors.
4. Remove the HVAC module.
5. To install, reverse the removal procedure.

Mode Door Actuator — Air Inlet Door

Removal and Installation

1. Lower and remove the glove compartment.
2. Disconnect the air inlet mode door actuator electrical connector.
3. Remove the 2 air inlet mode door actuator screws.
4. Remove the air inlet mode door actuator.
5. To install, reverse the removal procedure.

Mode Door Actuator — Defrost/Panel/Floor Door

Removal and Installation

1. If replacing the defrost/panel/floor mode door actuator motor only, remove the knee air bag module and the lower steering column shroud. For additional information, refer to Section 501-20B and Section 211-04 .

2. If replacing the airflow mode door actuating assembly, remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.

3. Disconnect the defrost/panel/floor mode door actuator electrical connector.

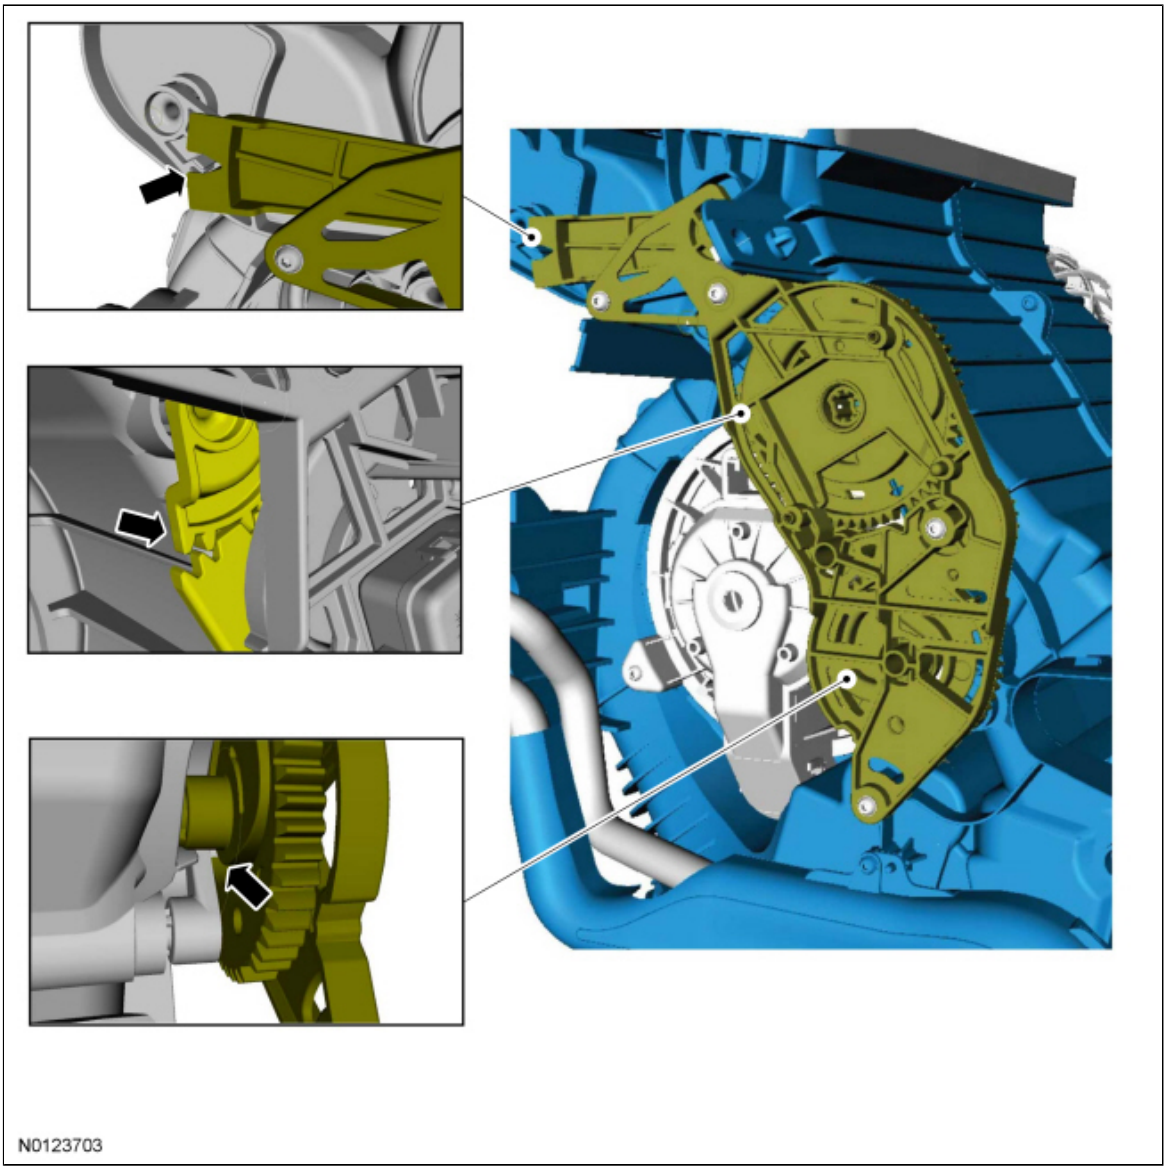
4. Remove the 2 defrost/panel/floor mode door actuator screws and the defrost/panel/floor door mode door actuator.

5. Remove the defrost/panel/floor mode door actuator.

6. If removing the airflow mode door actuating assembly, remove the 5 airflow mode door actuating assembly screws and the actuating assembly.

7. **NOTE:** When installing the airflow mode door actuating assembly, make sure that each airflow mode door gear or lever is correctly aligned with the actuating assembly.

   To install, reverse the removal procedure.

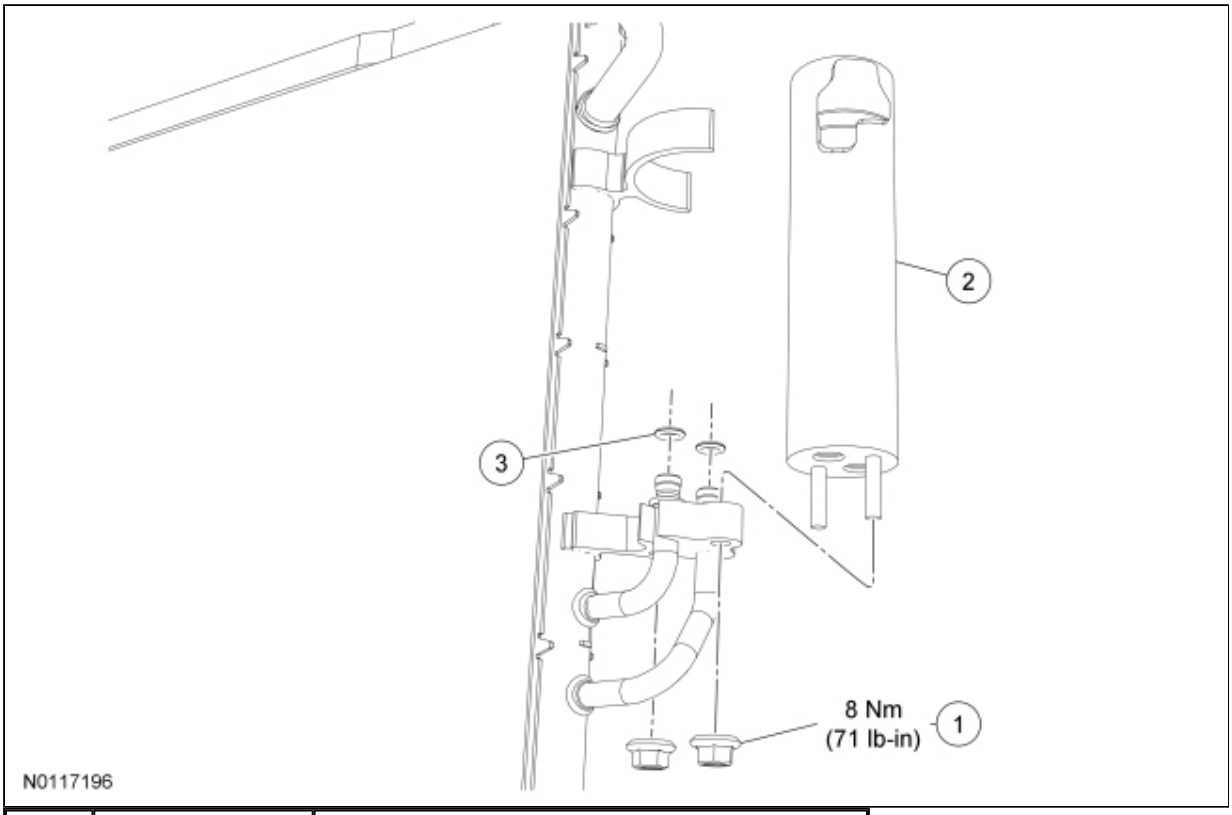


N0123703

Receiver Drier

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W705460	Receiver/drier fitting nut (2 required)
2	19959	Receiver/drier
3	19E889	O-ring seal (2 required)

Removal and Installation

NOTE: Installation of a new receiver/drier is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier. Damage to the receiver/drier includes leaks in the receiver/drier, physical damage to the receiver/drier shell or desiccant, or moisture contamination. Moisture contamination results only from a complete loss of refrigerant and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the system before repairs are carried out, the receiver/drier should not be replaced.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Recover the refrigerant. For additional information, refer to Section 412-00 .
3. Remove the 2 receiver/drier fitting nuts.

- To install, tighten to 8 Nm (71 lb-in).

4. Remove the receiver/drier.
   - Discard the O-ring seals.

5. To install, reverse the removal procedure.
   - Install new O-ring seals.
   - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to Section 412-00 .

6. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Register

Removal and Installation

Outer registers

1. With a non-metallic trim-type tool, gently pry out on the outer rim of the register to release and remove the register.

Center registers

2. Remove the FCIM finish panel. For additional information, refer to Section 501-12 .
3. Remove the center register screws.
4. Release the center register clips and remove the center registers.

All registers

5. To install, reverse the removal procedure.

Temperature Blend Door Actuator

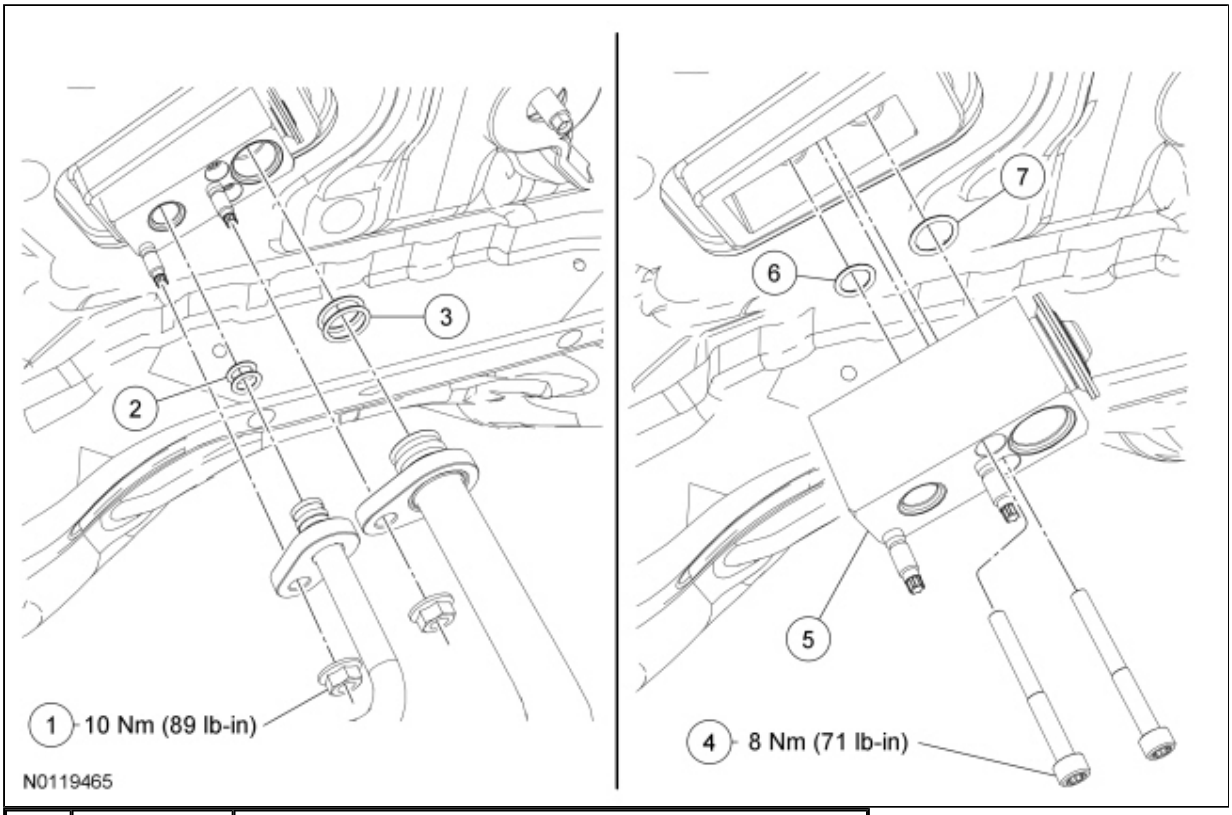
1. Remove the instrument panel. For additional information, refer to Section 501-12 .
2. Disconnect the temperature blend door actuator electrical connector.
3. Remove the 2 temperature blend door actuator screws.
4. Remove the temperature blend door actuator.
5. **NOTE:** When installing the temperature blend door actuator, be sure that the actuator gear, and the blend door gear are aligned so that the center (keyed) portion of each gear mates with the center (keyed) portion of the opposite gear as the gears are rotated.

   To install, reverse the removal procedure.

Thermostatic Expansion Valve

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W520412	Thermostatic Expansion Valve (TXV) fitting nut (2 required)
2	19E889	O-ring seal (2 required)
3	19E889	O-ring seal (2 required)
4	—	TXV bolt (2 required) (part of 19849 kit)
5	19849	TXV
6	19E889	O-ring seal
7	19E889	O-ring seal

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the 2 Thermostatic Expansion Valve (TXV) fitting nuts and disconnect the fittings.
   - Discard the O-ring seals.
   - To install, tighten to 10 Nm (89 lb-in).

3. Remove the 2 TXV bolts.
    - To install, tighten to 8 Nm (71 lb-in).

4. Remove the TXV .
    - Discard the O-ring seals.

5. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to Section 412-00 .

6. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Instrument Cluster and Panel Illumination

Overview

The backlighting system consist of dimmable components and non-dimmable components.

Dimmable Components

The functional dimmable components are:

- Driver heated seat switch
- Floor shifter
- Instrument panel dimmer switch
- Front Controls Interface Module (FCIM)
- Headlamp switch
- HVAC module
- Passenger heated seat/ambient lighting switch
- Start/stop switch
- Steering wheel switches
- Instrument Panel Cluster (IPC) (via network message)
- Front Control/Display Interface Module (FCDIM) (via network message)
- Body Control Module (BCM)

The dimmable backlighting is controlled by the BCM . The dimmable switches and components are illuminated when the parking lamps are on. The instrument panel dimmer switch is a single detent rocker switch used to control all dimmable interior illuminated components. The up detent increases dimmable backlighting intensity and the down detent decreases dimmable backlighting intensity. When the parking lamps are off, the Instrument Panel Cluster (IPC) is illuminated to full brightness.

Non-Dimmable Components

The functional non-dimmable components are:

- Window control switches

The non-dimmable illumination provides backlighting to the window switches when the ignition relay is energized.

Instrument Cluster and Panel Illumination

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

Dimmable Backlighting

When the parking lamps are on, the Body Control Module (BCM) monitors the input from the instrument panel dimmer switch. The BCM sends voltage to the dimmable components based on input received from the instrument panel dimmer switch.

If a fault is detected by the BCM on the dimmable illumination output circuit, the BCM sets a DTC and disables the circuit function until the fault is cleared and an ignition cycle takes place.

The BCM also sends a message over the network to the Front Control/Display Interface Module (FCDIM) and the Instrument Panel Cluster (IPC) to control the backlighting intensity level.

If the receiving module does not receive the backlighting status message from the BCM , or if the data received is deemed invalid for more than 5 seconds, the receiving module sets a missing message related DTC in continuous memory and defaults the backlighting to full nighttime intensity.

Non-Dimmable Backlighting

When the ignition relay (located in the Central Junction Box (CJB)) is energized, switched voltage is supplied to the window control switches.

Field-Effect Transistor (FET) Protection

Field-Effect Transistor (FET) is a type of transistor that when used with module software, monitors and controls current flow on module outputs. The FET protection strategy prevents module damage in the event of excessive current flow.

The BCM utilizes an FET protective circuit strategy for many of its outputs, for example a backlighting illumination output circuit. Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down when a fault event is detected. A short circuit DTC sets when the fault occurs.

The FET protection continues to shut off the circuit so long as the fault exists. When the fault is corrected and the ignition state is cycled off and then back on, the module resets the FET protection and allows the circuit to function.

The FET protected circuit for the dimmable backlighting system is the dimmable backlighting illumination circuit.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch • Instrument panel dimmer switch	• Illuminated components

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool release software.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the BCM.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B134E:23	Switch Illumination Adjustment Control: Signal Stuck low	GO to Pinpoint Test A.
U2010:11	Switch Illumination: Circuit Short To Ground	GO to Pinpoint Test B.
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• All dimmable illumination does not increase/decrease brightness	• Wiring, terminals or connectors • Instrument panel dimmer switch • Body Control Module (BCM)	• GO to Pinpoint Test A.
• All dimmable non-networked illumination is inoperative	• Wiring, terminals or connectors • BCM	• GO to Pinpoint Test B.
• All dimmable non-networked illumination is always on	• Wiring, terminals or connectors • BCM	• GO to Pinpoint Test C.
• The steering wheel switch illumination is inoperative	• Wiring, terminals or connectors • Steering wheel switch (es) • Steering wheel harness • Clockspring	• GO to Pinpoint Test D.
• One or more switch illumination is inoperative	• Wiring, terminals or connectors • Illuminated switch	• GO to Pinpoint Test E.
• The window control switch illumination is inoperative	• Window control switch	• CHECK the operation of the power windows. ▪ If the power windows

		operate correctly, INSTALL a new window control switch. REFER to Section 501-11. TEST the system for normal operation. ■ If the power windows do not operate correctly, REFER to Section 501-11.
• All network controlled illumination does not dim	• Medium Speed Controller Area Network (MS-CAN) • BCM	• CARRY OUT the network test. ■ If the scan tool responds with no communication to any module on the MS-CAN, REFER to Section 418-00. ■ If the scan tool communicates with the modules on the MS-CAN, INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
• The Instrument Panel Cluster (IPC) illumination is inoperative	• MS-CAN • IPC	• CARRY OUT the network test. ■ If the scan tool responds with no communication with the IPC, REFER to Section 418-00. ■ If the scan tool communicates with the IPC, INSTALL a new IPC. REFER to Section 413-01. TEST the system for normal operation.
• The Front Control/Display Interface Module (FCDIM) illumination operate correctly	• MS-CAN • FCDIM	• REFER to Section 415-00.

Pinpoint Tests

Pinpoint Test A: All Dimmable Illumination Does Not Increase/Decrease Brightness

Refer to Wiring Diagrams Cell 71, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The instrument panel dimmer switch is a rocker style switch with 2 inputs to the Body Control Module (BCM) to increase or decrease the backlighting illumination. When the instrument panel dimmer switch is pressed up or down, a ground signal is routed to the BCM.

Based on the ground signal input from the instrument panel dimmer switch, the BCM sends a message

over the network to the modules with backlighting output indicating the backlighting intensity level, and provides voltage to the hard-wired dimmable illumination sources.

- DTC B134E:23 (Switch Illumination Adjustment Control: Signal Stuck low) — a continuous and on-demand DTC that sets when the BCM detects the instrument panel dimmer switch is stuck or held low for more than 2 minutes or the increase or decrease control circuits are shorted to ground. If the instrument panel dimmer switch is stuck low the BCM defaults the backlighting illumination to full backlighting intensity.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Instrument panel dimmer switch
- BCM

PINPOINT TEST A: ALL DIMMABLE ILLUMINATION DOES NOT INCREASE/DECREASE BRIGHTNESS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE RECORDED RESULTS FROM THE BCM ON-DEMAND SELF-TEST	
• Ignition OFF. • Review the recorded results from the BCM on-demand self-test. • **Is DTC B134E:23 present?**	**Yes** GO to A2. **No** GO to A4.
A2 CHECK THE INSTRUMENT PANEL DIMMER SWITCH FOR A SHORT TO GROUND	
• Disconnect: Instrument Panel Dimmer Switch C2298. • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM Self-Test. • Clear the DTCs and repeat the BCM self-test. • **Is on-demand DTC B134E:23 still present?**	**Yes** GO to A3. **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.
A3 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: BCM C2280E. • Measure the resistance between the instrument panel dimmer switch C2298-3, circuit CLN56 (BN/VT), harness side and ground; and between the instrument panel dimmer switch C2298-7, circuit CLN55 (YE/VT), harness side and ground.	**Yes** GO to A7. **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-

 N0115751 • **Are the resistances greater than 10,000 ohms?**	test.
A4 CHECK THE INSTRUMENT PANEL DIMMER SWITCH • Disconnect: Instrument Panel Dimmer Switch C2298. • **NOTE:** For this step, the PID should indicate "DIMMER" each time the fused jumper wire is connected. • For the illumination decrease function, while monitoring the BCM PID IP_DIMMER_SW, connect and disconnect a fused jumper wire between the instrument panel dimmer switch C2298-3, circuit CLN56 (BN/VT), harness side and the instrument panel dimmer switch C2298-4, circuit GD115 (BK/GY), harness side.  N0115795 • **NOTE:** For this step, the PID should indicate "BRIGHTER" each time the fused jumper wire is connected. • For the illumination increase function, while monitoring the BCM PID IP_DIMMER_SW, connect and disconnect a fused jumper wire between the instrument panel dimmer switch C2298-7, circuit CLN55 (YE/VT), harness side and the instrument panel dimmer switch C2298-4, circuit GD115 (BK/GY), harness side.  N0115752 • **Does the PID indication agree with the fused jumper wire**	**Yes** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation. **No** GO to A5.

position?	
A5 CHECK THE INSTRUMENT PANEL DIMMER SWITCH GROUND CIRCUIT • **NOTE:** For this step, the PID should indicate "DIMMER" each time the fused jumper wire is connected to C2298-3, and "BRIGHTER" each time the fused jumper wire is connected to C2298-7. • While monitoring the BCM PID IP_DIMMER_SW, connect and disconnect a fused jumper wire between the instrument panel dimmer switch C2298-3, circuit CLN56 (BN/VT), harness side and ground; and between the instrument panel dimmer switch C2298-7, circuit CLN55 (YE/VT), harness side and ground.  N0115753 • **Does the PID indication agree with the fused jumper wire position?**	**Yes** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation. **No** GO to A6.
A6 CHECK THE INSTRUMENT PANEL DIMMER SWITCH DIM UP AND DIM DOWN CIRCUITS FOR AN OPEN • Ignition OFF. • Disconnect: BCM C2280E. • Measure the resistance between the instrument panel dimmer switch C2298-3, circuit CLN56 (BN/VT), harness side and the BCM C2280E-11, circuit CLN56 (BN/VT), harness side.  N0115754 • Measure the resistance between the instrument panel dimmer switch C2298-7, circuit CLN55 (YE/VT), harness side and the BCM C2280E-12, circuit CLN55 (YE/VT), harness side.	**Yes** GO to A7. **No** REPAIR the circuit in question for an open. TEST the system for normal operation.

 N0115755 • **Are the resistances less than 5 ohms?**	

A7 CHECK FOR CORRECT BCM OPERATION
• Connect all disconnected connectors.
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: All Dimmable Non-Networked Illumination Is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the parking lamps are on, the Body Control Module (BCM) provides voltage to the hard-wired dimmable illumination sources based on the hard-wired inputs from the instrument panel dimmer switch to the BCM .

- DTC U2010:11 (Switch Illumination: Circuit Short To Ground) — A continuous and on-demand DTC that sets when the BCM has temporarily shut down the output driver. The module has temporarily disabled the backlighting output because an excessive current draw exists (such as a short to ground). The BCM cannot enable the backlighting output until the cause of the short is corrected, the DTCs have been cleared and an ignition cycle takes place.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- BCM

PINPOINT TEST B: ALL DIMMABLE NON-NETWORKED ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE INSTRUMENT PANEL DIMMER SWITCH • While observing the Instrument Panel Cluster (IPC), press the instrument panel dimmer switch up and down. • **Does the backlighting in the IPC increase and decrease intensity?**	**Yes** GO to B2. **No** GO to Pinpoint Test A.
B2 BYPASS THE BCM • Ignition OFF. • Disconnect: BCM C2280E. • **NOTE:** If the jumper wire fails, refer to the Wiring Diagrams manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, test the system for normal operation. If DTCs are present, clear the DTCs and repeat the self-test. Test the system for normal operation. • Connect a fused jumper wire between the BCM C2280E-20, circuit CLN04 (BU/BN) and battery positive.  N0115756 • **Do the backlighting components illuminate?**	**Yes** REMOVE the jumper wire. GO to B3. **No** REMOVE the jumper wire. REPAIR circuit CLN04 (BU/BN) for an open. TEST the system for normal operation.

B3 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: All Dimmable Non-Networked Illumination Is Always On

Refer to Wiring Diagrams Cell 71, Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the parking lamps are on, the Body Control Module (BCM) provides voltage to the hard-wired dimmable illumination sources based on the hard-wired inputs from the instrument panel dimmer switch to the BCM .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- BCM

PINPOINT TEST C: ALL DIMMABLE NON-NETWORKED ILLUMINATION IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE EXTERIOR LIGHTING • Place the headlamp switch in the OFF position. • Observe the parking lights. • **Are the parking lights illuminated?**	**Yes** REFER to Section 417-01 . **No** GO to C2 .
C2 CHECK THE BCM BACKLIGHTING OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: BCM C2280E. • Ignition ON. • **Do the dimmable backlighted components continue to illuminate?**	**Yes** REPAIR circuit CLN04 (BU/BN) for a short to voltage. TEST the system for normal operation. **No** GO to C3 .

C3 CHECK FOR CORRECT BCM OPERATION
• Ignition OFF.
• Disconnect all the BCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The Steering Wheel Switch Illumination Is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage to the steering wheel switches. The voltage passes

through the clockspring to the steering wheel harness and on to the steering wheel switches.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Steering wheel switch(es)
- Steering wheel harness
- Clockspring

PINPOINT TEST D: THE STEERING WHEEL SWITCH ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE OTHER DIMMABLE LIGHTING SWITCHES • Ignition OFF. • Place the headlamp switch in the PARKING LAMPS ON position. • Press and hold the instrument panel dimmer switch up to the full illumination position and observe other dimmable switches. • **Are all the dimmable switches inoperative?**	**Yes** GO to Pinpoint Test B. **No** GO to D2.
D2 CHECK THE HORN OPERATION • Press the driver air bag module against the steering wheel. • **Does the horn sound?**	**Yes** GO to D3. **No** REFER to Section 413-06 to diagnose the horn is inoperative.
D3 CHECK FOR VOLTAGE TO THE CLOCKSPRING • Place the headlamp switch in the OFF position. • Disconnect: Clockspring C218B. • Place the headlamp switch in the PARKING LAMPS ON position. • Press and hold the instrument panel dimmer switch up to the full illumination position. • Measure the voltage between the clockspring C218B-13, circuit CLN04 (BU/BN), harness side and ground.  N0115757 • **Is the voltage greater than 10 volts?**	**Yes** GO to D4. **No** REPAIR circuit CLN04 (BU/BN) for an open. TEST the system for normal operation.

D4 CHECK THE GROUND CIRCUIT TO THE CLOCKSPRING FOR CONTINUITY	
• Measure the voltage between the clockspring C218B-13, circuit CLN04 (BU/BN), harness side and the clockspring C218B-15, circuit GD115 (BK/GY), harness side.  N0115758 • **Is the voltage greater than 10 volts?**	**Yes** GO to D5 . **No** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
D5 CHECK FOR VOLTAGE TO THE STEERING WHEEL SWITCH	
• Connect: Clockspring C218B. • Place the headlamp switch in the OFF position. • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Inoperative Steering Wheel Switch. • Place the headlamp switch in the PARKING LAMPS ON position. • For the cruise control switch, measure the voltage between the cruise control switch C2999-3, harness side and the cruise control switch C2999-1, harness side. • For the steering wheel controls switch, measure the voltage between the steering wheel controls switch C2998-3, harness side and the steering wheel controls switch C2998-1, harness side.  N0115850 • **Is the voltage greater than 10 volts?**	**Yes** REPLACE the inoperative steering wheel switch. For the cruise control switch, REFER to Section 419-03 . For the steering wheel controls switch, REFER to Section 415-00 TEST the system for normal operation. **No** GO to D6 .
D6 CHECK FOR VOLTAGE TO THE UPPER CLOCKSPRING	
• Disconnect: Clockspring C218C . • Measure the voltage between the clockspring C218C-6, component side and the clockspring C218C-8, component side.	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation. **No** INSTALL a new

 N0115760 • **Is the voltage greater than 10 volts?**	clockspring. REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test E: One Or More Switch Illumination is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Body Control Module (BCM) sends voltage to the dimmable components.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Illuminated switch

PINPOINT TEST E: ONE OR MORE SWITCH ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE VOLTAGE TO THE SINGLE ILLUMINATION	
NOTE: If the instrument panel dimmer switch illumination is the inoperative source, increase the backlighting brightness to the highest setting before disconnect the instrument panel dimmer switch connector. • Ignition OFF. • Disconnect: Inoperative Illumination Source. • Ignition ON. • **NOTE:** If the headlamp switch illumination is the inoperative source, unplugging the headlamp switch connector causes the BCM to turn the exterior lights on by default, so there is no need to turn the parking lamps on. • Place the headlamp switch to the PARKING LAMPS ON position. • Increase the backlighting brightness to the highest setting. • Measure the voltage between the inoperative illumination source, harness side and ground as follows:	**Yes** GO to E2 . **No** REPAIR circuit CLN04 (BU/BN) for an open. TEST the system for normal operation.

Component	Connector-Pin	Circuit
Instrument panel dimmer switch	C2298-2	CLN04 (BU/BN)
Headlamp switch	C205-1	CLN04 (BU/BN)
Front Controls Interface Module (FCIM)	C2402-3	CLN04 (BU/BN)
HVAC module	C228A-6	CLN04 (BU/BN)
Floor shifter	C3245-4	CLN04 (BU/BN)
Driver heated seat switch	C2400-5	CLN04 (BU/BN)
Passenger heated seat/ambient lighting switch	C2401-5	CLN04 (BU/BN)
Start/stop switch	C2195-6	CLN04 (BU/BN)

- **Is the voltage greater than 10 volts?**

E2 CHECK THE GROUND CIRCUIT TO THE ILLUMINATION SOURCE FOR CONTINUITY

- Measure the voltage between the inoperative illumination source pins, harness side as follows:

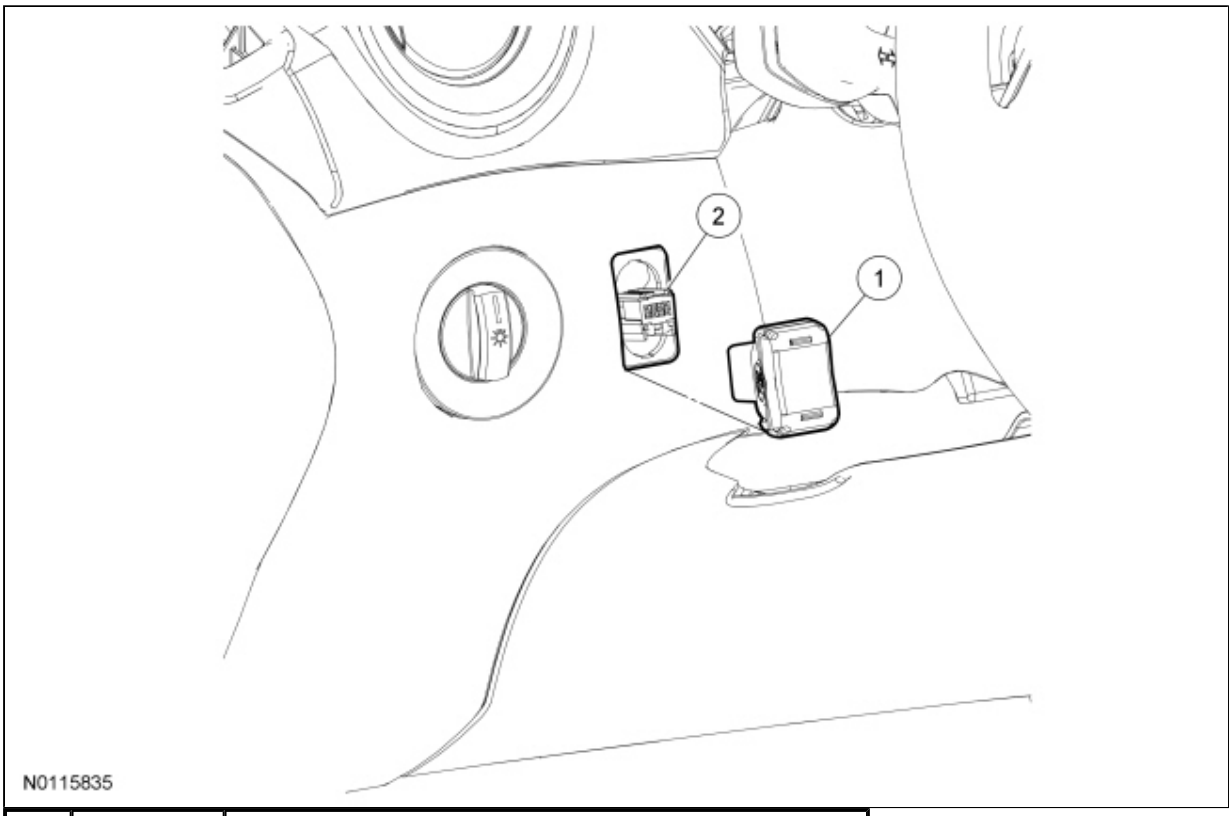
Component	Connector-Pin/ Circuit	Connector-Pin/ Circuit
Instrument panel dimmer switch	C2298-2 CLN04 (BU/BN)	C2298-1 GD115 (BK/GY)
Headlamp switch	C205-1 CLN04 (BU/BN)	C205-8 GD115 (BK/GY)
Front Controls Interface Module (FCIM)	C2402-3 CLN04 (BU/BN)	C2402-5 GD115 (BK/GY)
HVAC module	C228A-6 CLN04 (BU/BN)	C228A-13 GD115 (BK/GY)
Floor shifter	C3245-4 CLN04 (BU/BN)	C3245-5 GD115 (BK/GY)
Driver heated seat switch	C2400-5 CLN04 (BU/BN)	C2400-4 GD115 (BK/GY)
Passenger heated seat/ambient lighting switch	C2401-5 CLN04 (BU/BN)	C2401-4 GD115 (BK/GY)
Start/stop switch	C2195-6 CLN04 (BU/BN)	C2195-1 GD115 (BK/GY)

Yes
INSTALL a new component in question. TEST the system for normal operation.

No
REPAIR the ground circuit in question for an open. TEST the system for normal operation.

• **Is the voltage greater than 10 volts?**	

Instrument Panel Dimmer Switch



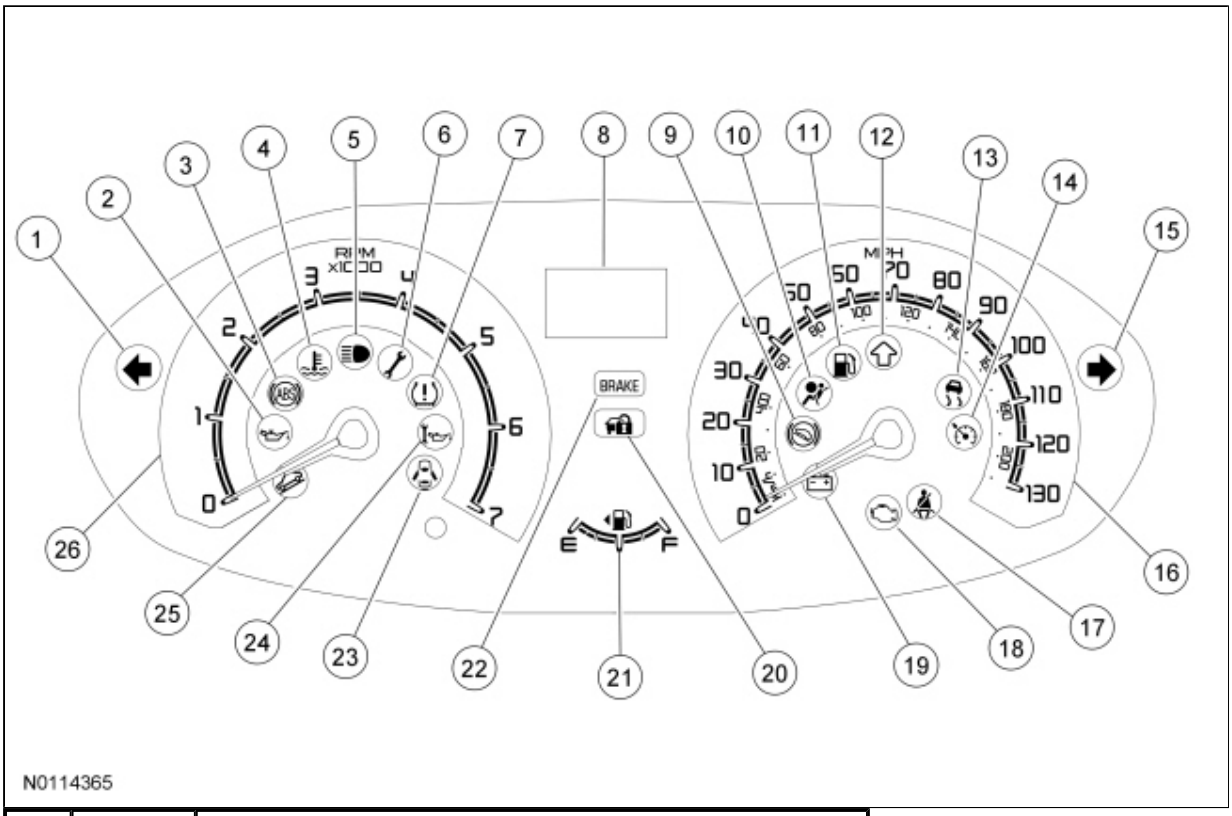
Item	Part Number	Description
1	11691	Instrument panel dimmer switch
2	—	Instrument panel dimmer switch electrical connector (part of 14K024)

Removal and Installation

1. Using a suitable non-marring tool, pry the dimmer switch from the instrument panel.
    - Disconnect the electrical connector.

2. To install, reverse the removal procedure.

Instrument Panel Cluster (IPC)



N0114365

Item	Part Number	Description
1	—	LH turn indicator
2	—	Low engine oil pressure warning indicator
3	—	ABS warning indicator
4	—	Engine over-temperature warning indicator
5	—	High beam indicator
6	—	Powertrain malfunction (wrench) warning indicator
7	—	Tire Pressure Monitoring System (TPMS) warning indicator (Note that the TPMS warning indicator is the only indication on this vehicle. There are no additional warnings for low tire pressure.)
8	—	Odometer display area
9	—	Hill start assist indicator
10	—	Air bag warning indicator
11	—	Low fuel warning indicator
12	—	Upshift indicator
13	—	Traction control indicator
14	—	Cruise control indicator
15	—	RH turn indicator
16	—	Speedometer
17	—	Safety belt warning indicator

18	—	Malfunction Indicator Lamp (MIL)
19	—	Charging system warning indicator
20	—	Anti-theft indicator
21	—	Fuel gauge
22	—	Brake warning indicator
23	—	Door ajar warning indicator
24	—	Oil change minder
25	—	Overdrive off
26	—	Tachometer

The Instrument Panel Cluster (IPC) contains gauges, informational indicators, warning indicators and an integrated circuit display designed to provide the driver with system status and to alert the driver when certain conditions exist in the vehicle.

The integrated circuit display, located in the top center of the IPC , uses a 3-line Liquid Crystal Display (LCD) of basic informational items such as the odometer, trip odometer, gear position display, Distance To Empty (DTE), average fuel economy and outside air temperature.

Gauges

Gauges inform the driver of the status of systems. The systems that use gauges are as follows:

- Engine rpm
- Fuel level
- Vehicle speed

Transport Mode

The vehicle is placed in a transport mode at the completion of production to reduce the drain on the battery. Various systems may be altered in how they operate or are disabled when in the transport mode. The vehicle automatically reverts to normal operation after 80 km (50 miles). To disable or turn off the transport mode, carry out the following within 10 seconds:

- Verify the battery is fully charged.
- With ignition in RUN, press brake pedal 5 times.
- Press hazard switch 4 times (on, off, on, off).

Informational Indicators/Warning Indicators

Informational indicators inform the driver of vehicle conditions. Warning indicators inform the driver of conditions that could potentially cause personal injury or alter vehicle performance.

Hardwired Inputs

The hardwired inputs are provided from the following systems or components:

- Accelerator Pedal Position (APP) sensor
- A/C request switch
- Ambient temperature sensor
- Brake fluid level switch
- Evaporator temperature sensor
- Clutch pedal switch
- Cruise control switch
- Fuel pump module
- Message center switch (located in the multifunction switch)
- Network communications High Speed Controller Area Network (HS-CAN) and Medium Speed Controller Area Network (MS-CAN)

- Park detect switch
- Parking brake switch
- Passive Anti-Theft System (PATS) transceiver

Network Messaged Inputs

Module messaging has increased over time and has become the standard for sending and receiving information required to operate the IPC . For a complete list of module messages with the message origination sources, refer to Section 418-00 .

The following is a partial list of status and information messages the IPC requires from other vehicle inputs:

- ABS
  - ABS braking
  - Stability/traction control
- Chassis
  - Electronic Power Assist Steering (EPAS)
  - Tire Pressure Monitoring System (TPMS)
- Lighting system
  - LH/RH turn
  - High beam
- Powertrain
  - Charging system
  - Cruise control system
  - Engine emission system
  - Engine oil pressure
  - Engine rpm
  - Engine temperature
  - Overdrive status
  - Hill start assist status
  - Oil life
  - Tow haul status
  - Transaxle range
  - Transaxle upshift (manual transaxle)
  - Transaxle fault
  - Vehicle speed
- Security/safety
  - Door ajar
- Supplemental Restraint System (SRS)
  - Air bag
  - Safety belt/Belt-Minder®

Information And Message Center

The message center consists of the following:

- Instrument Panel Cluster (IPC)
- Front Control/Display Interface Module (FCDIM)

The message center is integrated into the FCDIM , which displays message center warning messages, message center warning indicators and audio information. The message center displays are controlled by the IPC through messages sent to the FCDIM over the High Speed Controller Area Network (HS-CAN) communication bus. The message center constantly monitors different vehicle systems and displays all warnings and message center functions in the FCDIM . The message center notifies the driver of potential vehicle concerns by displaying a warning message pertaining to the system in which a fault has been detected.

Oil Change Minder

The message center provides an oil change minder to inform the driver that an oil change is required. The calculated interval between oil changes is based on mileage and time. The interval for the oil change minder is 16,093 km (10,000 miles) or 1 year. The oil change minder can be reset by the driver. Refer to Message Center Configuration in this section.

Message Center Indicators

The FCDIM displays message center indicators along with warning messages. Many of the message center indicators use the same or similar iconic representations that are used in the IPC as informational or warning indicators. For example: the door ajar message center warning indicator is represented by the same door ajar symbol used in the IPC . The message center indicators are displayed along with warning messages and may also be accompanied by a warning chime.

System Warning Messages

The system warning messages alert the operator to possible concerns or malfunctions in the vehicle operating systems. The warning messages that are displayed in the message center are as follows:

Body

- AIR BAG MALFUNCTION SERVICE NOW
- ALARM SYSTEM MALFUNCTION NEXT SERVICE
- ALARM TRIGGERED CHECK VEHICLE
- DRIVER DOOR OPEN
- DRIVER'S REAR DOOR OPEN
- HOOD OPEN
- PASSENGER DOOR OPEN
- PASSENGER REAR DOOR OPEN
- TRUNK OPEN

Chassis

- ABS MALFUNCTION SERVICE NOW
- BRAKE FLUID LEVEL LOW SERVICE NOW
- BRAKE SYSTEM MALFUNCTION STOP SAFELY
- STEERING ASSIST FAULT SERVICE NOW

- TCS OFF

Intelligent Access (IA)

- KEY BATTERY LOW REPLACE BATTERY
- KEY NOT DETECTED
- TURN IGNITION OFF USE POWER BUTTON
- KEY OUTSIDE CAR
- TO START PRESS BRAKE
- CLOSE TRUNK OR USE SPARE KEY
- TO START PRESS CLUTCH
- IMMOBILIZER MALFUNCTION SERVICE NOW
- TO START PRESS BRAKE
- VEHICLE NOT IN PARK SELECT P
- TO START SELECT N
- TO START SELECT N OR P

Powertrain

- DOOR OPEN APPLY BRAKE
- ENGINE OIL CHANGE NEXT SERVICE
- ENGINE OIL PRESSURE LOW STOP SAFELY
- ENGINE MALFUNCTION SERVICE NOW
- TRANSMISSION HOT STOP OR SPEED UP
- TRANSMISSION HOT STOP SAFELY
- TRANSMISSION MALFUNCTION SERVICE NOW
- TRANSMISSION HOT WAIT 1 MINUTE
- TRANSMISSION HOT WAIT XX MINUTES
- TRANSMISSION HOT WAIT...
- TRANSMISSION READY
- USE BRAKE TO STOP SAFELY

Warning Chimes

The warning chimes provide the driver with an audible warning that acts as a supplemental alert to the Instrument Panel Cluster (IPC) indication and message center warnings. The IPC controls all warning chimes based on messages received from external modules.

The warning chime system consists of the following:

- IPC
- Safety belt warning indicator switch(es)
- Door ajar switch(es)
- Headlamp switch
- Key-in-ignition warning switch (without Intelligent Access (IA))
- Parking brake warning indicator switch
- Body Control Module (BCM)

The following chimes are controlled by the IPC :

- Belt-Minder®
- Door ajar
- Headlamps on
- Key-in-ignition
- Parking brake applied
- Safety belt warning
- Turn signal/hazard

Instrumentation, Message Center and Warning Chimes

Special Tool(s)

ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST1388-A	Instrument Gauge System Tester 014-R1063 or equivalent
ST2834-A	Vehicle Security Module (VSM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: Whenever a network message is suspected as missing or confirmed by a missing message DTC (U-code), it is important to look for other conditions that may also be present in the Instrument Panel Cluster (IPC) and throughout the vehicle. Once a DTC sets in the IPC, it may be helpful to review the complete message list available in Section 418-00 to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.

The IPC uses input messages from other modules to control the gauges, informational indicators, warning indicators, message center and warning chimes over the communication networks. If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last known good message. For example, if the brake status message is missing for less than 5 seconds and the brake warning indicator was illuminated, the indicator remains in the on state until the next good message is received. If the message remains missing or invalid for more than 5 seconds, the IPC sets a U-code DTC and the output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer to the normal operation descriptions located before each individual pinpoint test for further description of the default action specific to each indicator or gauge. If the messaged input to the IPC returns at any time, the normal function of the gauge or indicator resumes.

It is very important to understand:

- where the input originates.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- whether the module which received the input controls the output of the feature, or whether it outputs a message over the communication network to another module.
- which module controls the output of the feature.

Instrument Panel Cluster (IPC)

The IPC utilizes a microprocessor to control the gauge and indicator functions. Data is sent to the IPC over the Medium Speed Controller Area Network (MS-CAN) and the High Speed Controller Area Network (HS-CAN) bus lines and through hardwired circuitry from individual components. The IPC uses each input to output an action to the gauges or indicators.

IPC Gateway Function

The IPC acts as a gateway module by receiving information in one format and transmitting it to other modules using another format. For example, the IPC receives the vehicle speed data from the PCM over the HS-CAN , converts the data into an MS-CAN message and sends (gateways) the message to other network modules such as the Body Control Module (BCM). This enables network communication between modules that do not communicate using the same network (HS-CAN or MS-CAN).

IPC Configuration

The IPC contains items that are configurable. Configurable items include customer preference items, which can be set with a scan tool. The remaining items can be set only through the Programmable Module Installation (PMI) procedure using As-Built data. Refer to Section 418-01 .

NOTE: When installing a new IPC , it is necessary to upload the module configuration to the scan tool. Following installation of the IPC download the module configuration from the scan tool into the new IPC . It is also necessary to carry out key programming and parameter reset whenever a new IPC or PCM is installed. Refer to Section 419-01B .

IPC Configuration Parameters

Customer Preference	As-Built Parameter
—	Air bag driver side
—	Alarm
—	Alternator
—	Climate control unit
—	Cruise control
—	Emission standard
—	Engine type
—	Front center mounted display
—	Fuel
—	Gearbox
—	Gearbox type
—	Hill start assist

—	Integrated vehicle dynamic control
—	KVM (Intelligent Access (IA))
—	Power steering type
—	Shift indication
—	Speedometer display
—	Speed warning device
—	Steering wheel position
—	Transmission driveline
—	Tire pressure mode system
—	Trip computer
—	Vehicle type

IPC Prove-Out

The IPC and other vehicle modules carry out a display prove-out to verify that all module controlled informational and warning indicators and monitored systems are functioning correctly within the IPC . When the ignition is transitioned to the ON state with the engine off, the indicators illuminate to prove-out according to the following table:

Indicator	Indicator Type	Prove-Out Duration
ABS	Warning	3 seconds
Air bag	Warning	6 seconds
Anti-theft indicator	Informational	3 seconds
Brake	Warning	3 seconds
Charge	Informational	Engine start up
Cruise control	Informational	3 seconds
Door ajar	Informational	No prove-out
Engine over-temperature	Warning	3 seconds
High beam	Informational	No prove-out
Low engine oil pressure	Warning	Engine start up
Low fuel	Informational	3 seconds
Malfunction Indicator Lamp (MIL)	Warning	Engine start up
Overdrive off	Informational	No prove-out
RH/LH turn signals	Informational	No prove-out
Safety belt	Warning	60 seconds if the safety belt is unbuckled, turns off when the safety belt is buckled (controlled by the Restraints Control Module (RCM))
Tire Pressure Monitoring System (TPMS)	Warning	3 seconds
Traction control	Informational	3 seconds (controlled by the ABS module)
Upshift	Informational	3 seconds

Information and Message Center

The message center is integrated into the Front Control/Display Interface Module (FCDIM). The message center is controlled by the IPC and acts upon much of the same information that is input and used to operate the IPC gauges, informational indicators, and warning indicators. The FCDIM receives the message center display information from the IPC over the MS-CAN communication bus.

Whenever conditions are present that require a warning message, the message center replaces the last selected display with the new warning message. Once the message is reset or cleared, the message center returns to the last selected display. If multiple warnings are present, the message center displays each warning for approximately 4 seconds. Warning messages are also generally associated with other observable IPC indications. For example, when the LH front door is opened, the message center displays the message DRIVER DOOR AJAR along with the door ajar warning indicator. This allows the message center to be a more informative supplement to the IPC gauges and indicators.

Warning Chimes

The IPC uses inputs that are both hardwired to individual components and messages that are sent from other modules over the HS-CAN or MS-CAN to control the warning chime functions.

Warning Chime Characteristics

Each warning chime has unique characteristics that help identify and differentiate one warning chime from another. The warning chimes use volume, chime frequency, length of time the chime sounds and the number of chime tones to identify which chime is sounding. The IPC prioritizes the chimes according to a preset hierarchy programmed into the IPC software. Generally, when more than one chime request is received by the IPC , the most important chime sounds. If a lower priority chime is currently sounding, the higher priority request takes over and replaces the lower priority chime.

There are 3 different chimes as listed below:

- Repetitive
- Single tone
- Tick-tock

The following table provides a summary of the chime characteristics including the chime priority:

IPC Chime Characteristics

Chime Name	Chime Type	Condition Description
Belt-Minder® A and B	Repetitive	Belt-Minder® A is a repetitive on/off chime tone sequence that sounds for as long as the IPC receives the Belt-Minder® chime request. Belt-Minder® B is a repetitive on/off chime tone sequence that increases the tone frequency and duration of the tone. On for as long as the IPC receives the Belt-Minder® chime request.
Door ajar	Single tone	A single on/off chime tone that sounds whenever the IPC receives a door ajar message.
Headlamps on	Repetitive	A repetitive on/off chime tone sequence that sounds for as long as the headlamps are on and the IPC receives the chime on command.

Key-in-ignition	Repetitive	A repetitive on/off chime tone sequence that sounds for as long as the key is in the ignition (without Intelligent Access (IA)) or with the ignition in the off state and the transaxle range selector out of park (with IA) with the door ajar and IPC receives the chime on command.
Parking brake on	Repetitive	A repetitive on/off chime tone sequence that sounds for as long as the parking brake is applied and the IPC receives the chime on command.
Safety belt	Repetitive	A series of 4 on/off chime tone sequences that sound when the safety belt is unbuckled and the IPC receives the chime on command.
Turn signal/hazard	Tick-tock	Repetitive tick-tock sound for as long as the RH or LH turn signal, or hazard lamps are on and the IPC receives the chime on command.

Belt-Minder®

The Belt-Minder® is configurable. To configure the Belt-Minder®, refer to Belt-Minder® Deactivating/Activating in this section.

The Belt-Minder® feature supplements the current safety belt warning function and is enabled after the current safety belt warning is complete. The Belt-Minder® informs the driver that the driver or front passenger safety belt is unbuckled by intermittently and simultaneously sounding a chime and illuminating the safety belt warning indicator in the IPC once the vehicle speed has exceeded 9.7 km/h (6 mph). The Belt-Minder® remains active for 5 minutes from the time it is started. While activated, the Belt-Minder® chime provides a series of 6 chimes/safety belt warning indicator flash sequences, which consist of a 1-second chime tone and safety belt warning indicator on/off state. The Belt-Minder® chime and the safety belt warning indicator sound and flash for 6 seconds, then the chime stops and the safety belt warning indicator remains on for 30 seconds. The IPC repeats the chime cycle for 5 minutes.

If the vehicle speed drops below 4.8 km/h (3 mph) once the Belt-Minder® chime has activated, the chime turns off and the safety belt warning indicator remains on. When the vehicle speed exceeds 9.7 km/h (6 mph) again, the Belt-Minder® chime resumes.

The Belt-Minder® warning chime inputs are the:

- Ignition state.
- Safety belt warning request communicated by the RCM to the IPC through the HS-CAN .
- Belt-Minder® chime request communicated by the RCM to the IPC through the HS-CAN .

Safety Belt Warning Chime

The safety belt warning chime warns that the driver safety belt is not fastened and sounds when the driver safety belt is not fastened, the ignition is transitioned from the OFF/LOCK or ACC state to the RUN or START state.

The safety belt warning chime stops sounding when the safety belt is fastened, the ignition is transitioned from the RUN or START state to the OFF/LOCK or ACC state, or the chime has sounded for approximately 6 seconds.

The safety belt warning chime inputs are the:

- Ignition state.
- Driver safety belt warning request communicated by the RCM to the IPC through the HS-CAN .
- Driver safety belt warning chime request communicated by the RCM to the IPC through the HS-CAN .

Door Ajar Warning Chime

The door ajar warning chime warns that a door is open or not fully closed. The chime sounds when any door, or the luggage compartment lid becomes ajar while the ignition is in the RUN state.

The door ajar warning chime stops sounding and resets when all of the doors and the luggage compartment lid are closed, or the ignition is placed in the OFF/LOCK or ACC state.

The door ajar warning chime inputs are the:

- Ignition state.
- Door ajar data communicated by the BCM to the IPC through the MS-CAN .

Headlamps On Warning Chime

The headlamps on warning chime sounds if the driver door is ajar, the headlamp switch is in the PARK or HEADLAMP position, and the ignition is in the OFF/LOCK state with the key removed (IA only).

The headlamps on warning chime stops sounding when any one of the above conditions are removed or the battery saver has expired.

The headlamps on warning chime inputs are the:

- Ignition state.
- Door ajar input from the driver door ajar switch to the BCM .
- Headlamp switch input to the BCM .
- Headlamps on chime request communicated by the BCM to the IPC through the MS-CAN .

Key-In-Ignition Warning Chime

On vehicles without IA , the key-in-ignition warning chime warns that the key is still in the ignition when the driver door is ajar. On vehicles with IA , the key-in-ignition warning chime sounds when the ignition is in the ON state with the door ajar.

On vehicles with IA and a automatic transaxle, the key-in-ignition warning chime is also used when the ignition is in the OFF mode with the transaxle range selector out of park. The message center displays a warning message and the chime sounds.

The key-in-ignition warning chime inputs are:

- Ignition state.
- Key-in-ignition chime request to the IPC from the BCM over the MS-CAN (without IA).
- Key-in-ignition chime request to the IPC from the Remote Function Actuator (RFA) module over the MS-CAN (with IA).
- Door ajar input to the BCM .

Parking Brake Warning Chime

The parking brake warning chime warns that the parking brake is engaged when the vehicle is in motion. The parking brake warning chime sounds if the ignition is in the ON state, the parking brake is engaged, and the vehicle speed is greater than 4.8 km/h (3 mph).

The parking brake warning chime stops sounding and resets if the parking brake is released, the ignition is not in the ON state, if the vehicle speed is less than 4.8 km/h (3 mph), or after 90 seconds from the time the chime is activated.

The parking brake warning chime inputs are:

- Ignition state.
- Parking brake switch status to the IPC .
- Vehicle speed data communicated by the PCM to the IPC through the HS-CAN .

Turn/Hazard On Tone

The IPC provides a tick-tock tone along with the visual turn signal indicators to indicate that the RH/LH TURN or HAZARD indicators are on.

The turn/hazard on tone inputs are:

- Left turn indicator signal from the BCM to the IPC through the HS-CAN .
- Right turn indicator signal from the BCM to the IPC through the HS-CAN .

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Accessory drive belt
• Brake fluid level
• Door adjustment
• Engine oil level
• Engine coolant level
• Fuel evaporative system
• Fuel tank
• Tire pressure
• Tire size
	• Central Junction Box (CJB) fuse(s):
	  ▪ 3 (7.5A)
	  ▪ 19 (7.5A)
	  ▪ 21 (10A)
	• Wiring, terminals or connectors
	• Message center switch
	• Instrument Panel Cluster (IPC)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON state.
     - The air bag indicator (other indicators may not prove ignition on) confirms ignition ON. If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
- If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the IPC , Body Control Module (BCM), PCM, ABS module and Restraints Control Module (RCM).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Instrument Panel Cluster (IPC) , GO to Symptom Chart - Information And Message Center or GO to Symptom Chart - Warning Chimes .

DTC Charts

Instrument Panel Cluster (IPC) DTC Chart

DTC	Description	Action
B101E:01	Air Conditioning Mode Switch: General Electrical Failure	REFER to Section 412-00 .
B1029:11	Accelerator Pedal Sensor: Circuit Short To Ground	FOLLOW the PCM diagnostics in section 3, Powertrain Control Module (PCM) Quick Test, of the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B1029:13	Accelerator Pedal Sensor: Circuit Open	FOLLOW the PCM diagnostics in section 3, Powertrain Control Module (PCM) Quick Test, of the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B1048:01	Brake Fluid Level Switch: General Electrical Failure	GO to Pinpoint Test M .
B1053:11	Fuel Tank Level Sensor: Circuit Short To Ground	GO to Pinpoint Test B .
B1053:13	Fuel Tank Level Sensor: Circuit Open	GO to Pinpoint Test B .
B10BD:01	Multifunctional Switch: General Electrical Failure	GO to Pinpoint Test AE .
B10D5:94	PATS Antenna: Unexpected Operation	REFER to Section 419-01B .
B10D7:05	PATS Key: System Programming Failure	REFER to Section 419-01B .
B10D7:51	PATS Key: Not Programmed	REFER to Section 419-01B .
B10D7:81	PATS Key: Invalid Data Signal Received	REFER to Section 419-01B .
B10D7:87	PATS Key: Missing Message	REFER to Section 419-01B .
B10D7:94	PATS Key: Unexpected Operation	REFER to Section 419-01B .
B10D8:00	PATS Key Less Than Minimum Programmed: No Sub Type Information	REFER to Section 419-01B .
B10DA:51	PATS PCM Identifier: Not Programmed	REFER to Section 419-01B .

B10DA:62	PATS PCM Identifier: Signal Compare Failure	REFER to Section 419-01B .
B1A14:11	RCM Warning Lamp: Circuit Short To Ground	CLEAR the DTC. REPEAT the self-test. If DTC B1A14:11 returns, INSTALL a new Instrument Panel Cluster (IPC). REFER to Instrument Panel Cluster (IPC) . TEST the system for normal operation.
B1A14:13	RCM Warning Lamp: Circuit Open	CLEAR the DTC. REPEAT the self-test. If DTC B1A14:13 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) . TEST the system for normal operation.
B1A68:11	Ambient Temperature Sensor: Circuit Short To Ground	GO to Pinpoint Test AD .
B1A68:13	Ambient Temperature Sensor: Circuit Open	GO to Pinpoint Test AD .
B1A84:41	Car Configuration Data: General Checksum Failure	CARRY OUT Programmable Module Installation (PMI) (when the original module is not available). REFER to Section 418-01 . TEST the system for normal operation.
B1A84:51	Car Configuration Data: Not Programmed	CARRY OUT PMI (when the original module is not available). REFER to Section 418-01 . TEST the system for normal operation.
B1B71:11	Evaporator Temperature Sensor: Circuit Short To Ground	REFER to Section 412-00 .
B1B71:13	Evaporator Temperature Sensor: Circuit Open	REFER to Section 412-00 .
P0565:01	Cruise Control ON Signal: General Electrical Failure	REFER to Section 419-03 .
P0566:01	Cruise Control OFF Signal: General Electrical Failure	REFER to Section 419-03 .
P0567:01	Cruise Control RESUME Signal: General Electrical Failure	REFER to Section 419-03 .
P0568:01	Cruise Control SET Signal: General Electrical Failure	REFER to Section 419-03 .
P0569:01	Cruise Control COAST Signal: General Electrical Failure	REFER to Section 419-03 .
P0579:01	Cruise Control Multi-Function Input A Circuit Range/Performance: General Electrical Failure	REFER to Section 419-03 .
P0581:13	Cruise Control Multi-Function Input A Circuit High: Circuit Open	REFER to Section 419-03 .
P0704:01	Clutch Switch Input Circuit: General Electrical Failure	REFER to Section 419-03 .
P081C:01	Park Input Circuit: General Electrical Failure	GO to Pinpoint Test AG .
P1536:01	Parking Brake Switch Circuit: General Electrical Failure	GO to Pinpoint Test M .
P1572:01	Brake Pedal Switch Circuit: General Electrical Failure	REFER to Section 419-03 .
P1607:81	MIL Output Circuit: Invalid	DTC P1607:81 sets when the IPC receives invalid

	Serial Data Received	network data from the PCM. RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for navigation of all DTCs. TEST the system for normal operation.
P1607:87	MIL Output Circuit: Missing Message	GO to Pinpoint Test AM .
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	GO to Pinpoint Test AM .
U0101:00	Lost Communication With TCM : No Sub Type Information	GO to Pinpoint Test AN .
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	GO to Pinpoint Test AO .
U0131:00	Lost Communication With Power Steering Control Module: No Sub Type Information	GO to Pinpoint Test AP .
U0140:00	Lost Communication With Body Control Module: No Sub Type Information	GO to Pinpoint Test AQ .
U0151:00	Lost Communication With Restraints Control Module: No Sub Type Information	GO to Pinpoint Test AR .
U0214:00	Lost Communication With Remote Function Actuation: No Sub Type Information	GO to Pinpoint Test AS .
U0257:00	Lost Communication With Front Controls / Display Interface Module: No Sub Type Information	GO to Pinpoint Test AT .
U0401:68	Invalid Data Received From ECM/PCM "A": Event Information	DTC U0401:68 sets when the IPC receives invalid network data from the PCM for the vehicle speed, engine rpm, engine temperature or odometer count input. RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for navigation of all DTCs. TEST the system for normal operation.
U2023 (this may display as DTC U0427:68)	Fault Received From External Node (this may display Invalid Data Received From Vehicle Security Module: Event Information)	DTC U2023 (U0427:68) sets when the IPC receives invalid network data from the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) for the Tire Pressure Monitoring System (TPMS) input. RETRIEVE and REPAIR all non-network DTCs in the TPM / VSM and other modules on the network. REFER to Section 204-04 for navigation of all DTCs. TEST the system for normal operation.
U2101:00	Control Module Configuration Incompatible: No Sub Type Information	DTC U2101:00 sets when the IPC configuration does not match the configuration of the other vehicle modules. DETERMINE which module was recently installed and CARRY OUT Programmable Module Installation (PMI)

		(when the original module is not available) for that specific module. REFER to Section 418-01 . TEST the system for normal operation.
U2104:01	Trip Meter Reset Button: General Electrical Failure	CLEAR the DTC. REPEAT the self-test. If DTC U2104:01 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) . TEST the system for normal operation.
U3000:00	Control Module: No Sub Type Information	CLEAR the DTC. REPEAT the self-test. If DTC U3000:00 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) . TEST the system for normal operation.
U3006:16	Control Module Input Power "A": Circuit Voltage Below Threshold	GO to Pinpoint Test AU .
U3006:17	Control Module Input Power "A": Circuit Voltage Above Threshold	GO to Pinpoint Test AV .
U3010:01	Ignition Input Start: General Electrical Failure	GO to Pinpoint Test AW .

PCM DTC Chart

DTC	Description	Action
P0460	Fuel Level Sensor A Circuit	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
P0461	Fuel Level Sensor A Circuit Range/Performance	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
P0462	Fuel Level Sensor A Circuit Low	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
P0463	Fuel Level Sensor A Circuit High	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
All other DTCs	—	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B10F1:23	Key In Switch: Signal Stuck Low	GO to Pinpoint Test AI .

All other DTCs	—	REFER to Section 419-10 .

Instrument Panel Cluster (IPC) Dealer Test Mode

To enter the IPC dealer test mode, begin with the ignition in the OFF mode. Press and hold the IPC TRIP/RESET button. Place the ignition in the RUN mode and hold the TRIP/RESET button until the display indicates tESt, usually within 3 to 5 seconds. Press the TRIP/RESET button once to advance through each stage of the self-test. To exit the IPC dealer test mode, turn the ignition to the OFF position.

NOTE: The displays listed in the table below use xxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display. For example, DTC xxxx xxxx xxxx may display DTC C0100. Note that there were 12 x's in the display description but only 4 digits in the actual display.

IPC Display	Description
Test	Initial entry display into the dealer test mode.
Gauge	Carries out the gauge sweep of all gauges, then displays the present gauge values.
LED	Illuminates all the microprocessor controlled lamps and LEDs.
Read-Only Memory (ROM) level	Displays the hexadecimal ROM level. For a ROM checksum fault, FAIL displays on the bottom line
Non-Volatile Memory (NVM) target ROM	Displays the hexadecimal ROM level and type as stored in NVM . For an NVM checksum fault is detected, FAIL displays on the bottom line
NVM Electrically Erasable Programmable Read-Only Memory (EEPROM) level	Displays the hexadecimal value for the EEPROM level. For an NVM checksum fault, FAIL displays on the bottom line
Manufacturing date	Displays the hexadecimal coding of the final manufacturing test date.
DTC	Displays DTCs detected in continuous operation not during self-test.
Speed mph	Displays the English speed value being inputs in tenths of mph to the IPC , the speedometer indicates the present filtered speed.
Speed km/h	Displays the metric speed value being inputs in tenths of km/h to the IPC , the speedometer indicates the present filtered speed.
Speedometer	Displays corresponding speedometer gauge driver counts output for present filtered speed.
Engine rpm	Displays the tachometer value being input in rpm to the IPC , tachometer indicates the present filtered rpm.
Tachometer	Displays corresponding tachometer driver counts output for present filtered engine rpm.
Odometer	Displays the odometer rolling count input to the IPC .
Fuel analog/digital input	Displays the present fuel level analog/digital input in decimal. The IPC indicates the present fuel level.
Fuel gauge	Displays corresponding fuel gauge driver counts output for present filtered fuel level.
Fuel flow	Displays the present filtered fuel flow status in decimal (used for Distance To Empty (DTE) calculation).
Fuel percent	Displays the present fuel level percent status in decimal.

Engine temperature	Displays the last temperature gauge input value from the High Speed Controller Area Network (HS-CAN) in degrees C, temperature gauge indicates the present filtered temperature.
Temperature gauge	Displays corresponding temperature gauge driver counts output for present filtered temperature value.
Battery voltage	Displays the present battery monitor reading in volts.
Analog/digital input	Displays hexadecimal value of the analog/digital port input reads.
Personality input	Displays the vehicle configuration for the personality settings.
Port input	Displays hexadecimal value of the digital port reads.
DTE	Displays the calculated DTE .
Average fuel economy	Displays the running average fuel economy in decimal.
Passive Anti-Theft System (PATS)	Displays the current PATS settings.
Manufacturing start date	Displays the hexadecimal manufacturing start date.

Symptom Charts

Symptom Chart — Instrument Panel Cluster (IPC)

Condition	Possible Sources	Action
• No communication with the Instrument Panel Cluster (IPC)	• Fuse(s) • Wiring, terminals or connectors • IPC	• REFER to Section 418-00 to diagnose The IPC Does Not Respond to The Scan Tool.
• The Instrument Panel Cluster (IPC) is inoperative	• Fuse(s) • Wiring, terminals or connectors • IPC	• GO to Pinpoint Test A .
• Incorrect fuel gauge indication	• Wiring, terminals or connectors • Fuel pump module • Fuel level sender (float and card) • Fuel tank • IPC	• GO to Pinpoint Test B .
• The tachometer is inoperative	• PCM • IPC	• GO to Pinpoint Test C .
• Incorrect tachometer indication	• PCM concern • IPC	• GO to Pinpoint Test D .
• The speedometer is inoperative	• PCM • IPC	• GO to Pinpoint Test E .
• Incorrect speedometer indication	• Tire size configuration • PCM concern • IPC	• GO to Pinpoint Test F .
• The odometer is inoperative	• PCM concern • IPC	• GO to Pinpoint Test G .
• The low oil pressure warning indicator is never/always on	• Wiring, terminals or connectors • Engine oil	• GO to Pinpoint Test H .

	pressure switch • Base engine oil pressure concern • PCM • IPC	
• The engine over-temperature warning indicator is never/always on	• PCM • IPC	• GO to Pinpoint Test I.
• The low fuel warning indicator is never on	• IPC	• GO to Pinpoint Test J.
• The low fuel warning indicator is always on	• IPC	• VERIFY that the fuel gauge is operating correctly and that the Distance To Empty (DTE) is less than 80 km (50 miles). ▪ If the DTE is less than 80 km (50 miles), the system is operating correctly at this time. ▪ If the DTE is not less than 80 km (50 miles), INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC). TEST the system for normal operation.
• The charging system warning indicator is never/always on	• Charging system concern • PCM • IPC	• GO to Pinpoint Test K.
• The brake warning indicator is never on	• Wiring, terminals or connectors • Parking brake warning indicator switch • Brake fluid level switch • IPC	• GO to Pinpoint Test L.
• The brake warning indicator is always on	• Wiring, terminals or connectors • Parking brake warning indicator switch • Brake fluid level switch • ABS concern • IPC	• GO to Pinpoint Test M.
• The ABS warning indicator is never/always on	• ABS module • IPC	• GO to Pinpoint Test N.
• The stability/traction control indicator is never/always on	• Traction control concern • ABS module • IPC	• GO to Pinpoint Test O.
• The Malfunction Indicator Lamp (MIL) is never/always on	• PCM • IPC	• GO to Pinpoint Test P.

• The powertrain malfunction (wrench) warning indicator is never/always on	• Electronic Throttle Control (ETC) concern • Transmission concern • IPC	• GO to Pinpoint Test Q .
• The hill start assist indicator is never/always on	• Hill start assist function concern • ABS module • IPC	• GO to Pinpoint Test R .
• The overdrive off indicator is never/always on	• Overdrive function concern • Transmission Control Module (TCM) • IPC	• GO to Pinpoint Test S .
• The upshift indicator is never/always on	• PCM • IPC	• GO to Pinpoint Test T .
• The cruise control indicator is never/always on	• PCM • IPC	• GO to Pinpoint Test U .
• The oil change minder indicator is never/always on	• PCM • IPC	• GO to Pinpoint Test V .
• The door ajar warning indicator is never/always on	• Interior lamps concern • Hood ajar concern • Decklid ajar concern • Wiring, terminals or connectors • Body Control Module (BCM) • IPC	• GO to Pinpoint Test W .
• The LH/RH turn or high beam indicator is never/always on	• Turn signal concern • High beam concern • BCM • IPC	• GO to Pinpoint Test X .
• The Tire Pressure Monitoring System (TPMS) warning indicator is never/always on	• Tire pressure • TPMS concern • Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) • IPC	• GO to Pinpoint Test Y .
• The safety belt warning indicator is never/always on	• Restraints Control Module (RCM) • IPC	• GO to Pinpoint Test Z .
• The air bag warning indicator is never/always on	• RCM • IPC	• GO to Pinpoint Test AA .
• The anti-theft indicator is never/always on	• Passive Anti-Theft System (PATS) concern	• GO to Pinpoint Test AB .

	• IPC	
• The transaxle range display is never on	• TCM concern • IPC	• GO to Pinpoint Test AC .
• The outside air temperature display does not operate correctly	• Wiring, terminals or connectors • Ambient Air Temperature (AAT) sensor • IPC	• GO to Pinpoint Test AD
• The integrated circuit display is inoperative	• Fuse(s) • Wiring, terminals or connectors • IPC	• GO to Pinpoint Test A .
• The trip computer switch is inoperative	• Wiring, terminals or connectors • Message center switch • IPC	• GO to Pinpoint Test AE .
• Not all integrated circuit display segments illuminate	• IPC	• INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Symptom Chart — Information And Message Center

Condition	Possible Sources	Action
• The Front Control/Display Interface Module (FCDIM) does not display warning messages or message center warning indicators	• Communication concern • FCDIM	• GO to Pinpoint Test AF .
• The FCDIM display is blank	• Fuse • Wiring, terminals or connectors • FCDIM	• REFER to Section 415-00 .
• An Intelligent Access (IA) warning is never/always on	• IA system concern	• REFER to Section 419-01B .
• The VEHICLE NOT IN PARK SELECT P warning is inoperative/always on	• Wiring, terminals or connectors • Park detect switch • IPC	• GO to Pinpoint Test AG .
• The DRIVER, PASSENGER, REAR LEFT, REAR RIGHT DOOR or TRUNK AJAR warning is never/always on	• Door ajar warning indication concern	• GO to Pinpoint Test W .
• The BRAKE SYSTEM MALFUNCTION STOP SAFELY or BRAKE FLUID LEVEL LOW SERVICE NOW warning is never/always on	• Brake warning indication concern	• GO to Pinpoint Test L (never on) or GO to Pinpoint Test M (always on).
• The ABS MALFUNCTION SERVICE NOW warning is never/always on	• ABS warning indication concern	• GO to Pinpoint Test N .
• The TCS MALFUNCTION NEXT SERVICE (base	• Traction control warning indication	• GO to Pinpoint Test O .

message center) or ESP MALFUNCTION NEXT SERVICE (optional message center) warning is never/always on	concern	
• The AIR BAG MALFUNCTION SERVICE NOW warning is never/always on	• Air bag warning indication concern	• GO to Pinpoint Test AA .
• The POWER STEERING MALFUNCTION SERVICE NOW warning is always on	• Electronic Power Assist Steering (EPAS) concern	• Section 211-00 .
• The ENGINE OIL PRESSURE LOW STOP SAFELY warning is never/always on	• Base engine oil pressure concern • Low oil pressure warning indication concern	• GO to Pinpoint Test H .
• The TRANSPORT MODE CONTACT DEALER message is always on	• Vehicle still in transport mode	• REFER to Transport Mode in Instrument Panel Cluster (IPC) and CARRY OUT the procedure to place the vehicle in normal operation mode.
• A transmission warning is never/always on	• Transaxle concern	• Section 307-11 .

Symptom Chart — Warning Chimes

Condition	Possible Sources	Action
• All the chimes are inoperative	• Instrument Panel Cluster (IPC)	• INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The chime sounds when the driver door is ajar (no key in ignition and headlamps off)	• Wiring, terminals or connectors • Key-in-ignition warning switch (without Intelligent Access (IA)) • Body Control Module (BCM)	• GO to Pinpoint Test AH .
• The key-in-ignition warning chime is inoperative	• Wiring, terminals or connectors • Key-in-ignition warning switch (without IA) • BCM • IPC	• GO to Pinpoint Test AI .
• The headlamps on warning chime is inoperative	• Door ajar indication • BCM • IPC	• GO to Pinpoint Test AJ .
• The door ajar warning chime is inoperative	• Wiring, terminals or connectors • BCM	• OPEN the driver door and OBSERVE the door ajar warning indicator.

	• IPC	▪ If the door ajar warning indicator does not operate correctly, GO to Pinpoint Test W. ▪ If the door ajar warning indicator operates correctly, INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• The safety belt warning chime is inoperative	• Safety belt warning indication concern • Speedometer concern • IPC	• GO to Pinpoint Test AK.
• The Belt-Minder® feature does not operate	• Belt-Minder® deactivated • Safety belt warning indication concern • Speedometer concern • IPC	• GO to Pinpoint Test AK.
• The parking brake warning chime is inoperative	• Brake warning indication concern • IPC	• GO to Pinpoint Test AL.
• The turn signal/hazard on tone is inoperative	• Turn signal indication concern • IPC	• VERIFY that the turn signal indicator operates correctly. ▪ If the turn signal indicator does not operate correctly, GO to Pinpoint Test X. ▪ If the turn signal indicator operates correctly, INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC). TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: The Instrument Panel Cluster (IPC) Is Inoperative

Refer to Wiring Diagrams Cell 60, Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) receives the ignition RUN state input from Central Junction Box (CJB) fuse 21 (10A). The IPC receives the ignition ACC state input from CJB fuse 19 (7.5A). The IPC

receives hot at all times B+ voltage from CJB fuse 22 (7.5A). The IPC is grounded through a single hardwired ground circuit.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- IPC

PINPOINT TEST A: THE IPC IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded IPC DTCs from the self-test. • **Is DTC U3010:01 recorded?**	**Yes** GO to Pinpoint Test AW . **No** GO to A2 .
A2 CHECK THE IPC B+ VOLTAGE SUPPLY • Ignition OFF. • Disconnect: IPC C220. • Measure the voltage between the IPC C220-32, circuit SBP03 (BU/RD), harness side and ground.  N0115640 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** VERIFY the CJB fuse 3 (7.5A) is OK. If OK, REPAIR circuit SBP03 (BU/RD) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
A3 CHECK THE IPC RUN VOLTAGE SUPPLY • Ignition ON. • Measure the voltage between the IPC C220-4, circuit CBP21 (BU/GY), harness side and ground.	**Yes** GO to A4 . **No** VERIFY the CJB fuse 21 (10A) is OK. If OK, REPAIR circuit CBP21 (BU/GY) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the

 N0115641 • **Is the voltage greater than 10 volts?**	system for normal operation.
A4 CHECK THE IPC ACC VOLTAGE SUPPLY	
• Ignition In ACC. • Measure the voltage between the IPC C220-15, circuit CBP19 (BN/WH), harness side and ground.  N0115642 • **Is the voltage greater than 10 volts?**	**Yes** GO to A5 . **No** VERIFY the CJB fuse 19 (7.5A) is OK. If OK, REPAIR circuit CBP19 (BN/WH) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
A5 CHECK THE IPC START VOLTAGE SUPPLY	
• Place the ignition in the START position. • Measure the voltage between the IPC C220-9, circuit CDC54 (WH/GN), harness side and ground.  N0115643 • **Is the voltage greater than 10 volts?**	**Yes** GO to A6 . **No** REPAIR circuit CDC54 (WH/GN) for an open. TEST the system for normal operation.
A6 CHECK THE IPC GROUND CIRCUIT FOR AN OPEN	
• Ignition ON. • Measure the voltage between the IPC C220-32, circuit SBP03 (BU/RD), harness side and the IPC C220-6, circuit GD115 (BK/GY), harness side.	**Yes** GO to A7 . **No**

 N0115644 • **Is the voltage greater than 10 volts?**	REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.

A7 CHECK FOR CORRECT IPC OPERATION
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC .
	REFER to Instrument Panel Cluster (IPC) in this section.
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: Incorrect Fuel Gauge Indication

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The fuel pump module is hardwired to the Instrument Panel Cluster (IPC) between the fuel level signal circuit and the fuel level signal return circuit. The fuel level sender (float and card) is a variable resistor attached to the fuel pump module that ranges from 180 ohms ± 4 ohms at empty (E) and 10 ohms ± 2 ohms at full (F). The IPC provides a reference voltage to the fuel pump module on the fuel level input circuit. As the fuel level changes, a float actuates a variable resistor on the fuel level sensor card and raises or lowers the fuel level signal voltage depending on the resistance of the fuel level sensor. The IPC monitors the changes in voltage and commands the fuel gauge with a corresponding movement of the pointer. If the IPC detects a fault on the fuel level input circuit, fuel level return circuit or the fuel pump module, the IPC defaults the fuel gauge to the empty (E) position and illuminates the low fuel warning indicator.

IPC DTCs

DTC Description	Fault Trigger Conditions
• B1053:11 — Fuel Tank Level Sensor: Circuit Short to Ground	A continuous and on-demand DTC that sets after 33 seconds if the IPC detects that the fuel sender is out of range on the fuel level input circuit with a short to ground. The IPC defaults the fuel gauge to empty (E) once the IPC detects a fault and sets DTC B1053:11.
• B1053:13 — Fuel Tank Level Sensor:	A continuous and on-demand DTC that sets after 33 seconds if the IPC detects that the fuel sender is out of range on the fuel level input circuit

Circuit Open	with an open or short to voltage. The IPC defaults the fuel gauge to empty (E) once the IPC detects a fault and sets DTC B1053:13.

PCM DTCs

DTC Description	Fault Trigger Conditions
• P0460 — Fuel Level Sensor A Circuit	Sets when the PCM determines the value of the fuel level input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
• P0461 — Fuel Level Sensor A Circuit Range/Performance	Sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
• P0462 — Fuel Level Sensor A Circuit Low	Sets when the PCM detects a short to ground on the fuel pump module signal circuit based on the messaged input received from the IPC .
• P0463 — Fuel Level Sensor A Circuit High	Sets when the PCM detects an open or a short to voltage on the fuel pump module signal circuit based on the messaged input received from the IPC .

This pinpoint test is intended to diagnose the following:

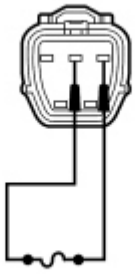
- Wiring, terminals or connectors
- Fuel pump module
- Fuel level sender (float and card)
- Fuel tank
- IPC

PINPOINT TEST B: INCORRECT FUEL GAUGE INDICATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC B1053:11, GO to B2 . For DTC B1053:13, GO to B5 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to B9 .
B2 CHECK THE FUEL PUMP MODULE FOR A SHORT TO GROUND	
• Disconnect: Fuel Pump Module C463.	**Yes**

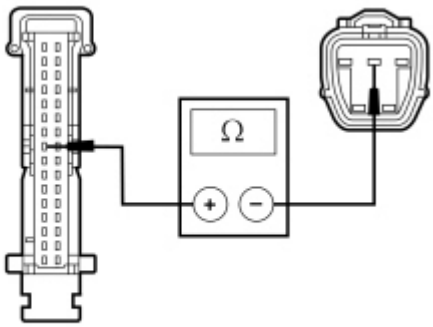
• Ignition ON. • Wait one minute. • Enter the following diagnostic mode on the scan tool: IPC Self-Test. • **NOTE:** DTC B1053:13 may also be present when carrying out this step and should be ignored at this time. • Repeat the IPC self-test. • Retrieve the IPC continuous DTCs. • **Is DTC B1053:13 retrieved?**	GO to B13 . **No** GO to B3 .
B3 CHECK THE FUEL LEVEL SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Disconnect: IPC C220. • Ignition OFF. • Measure the resistance between the IPC C220-8, circuit VE724 (GY), harness side and the IPC C220-7, circuit VE721 (WH/OG), harness side.  N0115648 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuits for a short together. CLEAR the DTCs. REPEAT the self-test.
B4 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between the IPC C220-8, circuit VE724 (GY), harness side and ground.  N0115649 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B15 . **No** REPAIR circuit VE724 (GY) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
B5 CHECK THE FUEL PUMP MODULE FOR AN OPEN	
• Ignition OFF. • Disconnect: Fuel Pump Module C463. • Connect a fused jumper wire between the fuel pump module C463-1, circuit VE721 (WH/OG), harness side and the fuel pump module C463-2, circuit VE724 (GY), harness side.	**Yes** REMOVE the jumper wire. GO to B13 . **No** REMOVE the jumper wire. GO to B6 .



N0053609

- Ignition ON.
- Wait one minute.
- Enter the following diagnostic mode on the scan tool: IPC Self-Test.
- **NOTE:** DTC B1053:13 may also be present when carrying out this step and should be ignored at this time.
- Repeat the IPC self-test.
- Retrieve the IPC continuous DTCs.
- **Is DTC B1053:11 retrieved?**

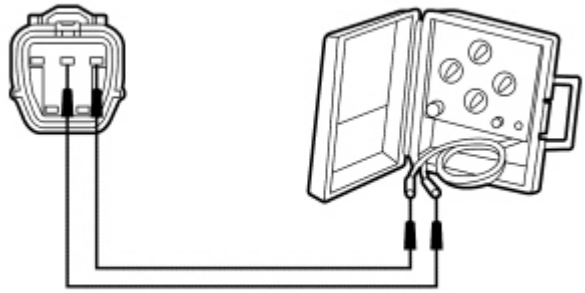
B6 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the IPC C220-8, circuit VE724 (GY), harness side and ground.  N0115645 • **Is any voltage present?**	**Yes** REPAIR circuit VE724 (GY) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to B7.
B7 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the IPC C220-8, circuit VE724 (GY), harness side and the fuel pump module assembly C463-2, circuit VE724 (GY), harness side.	**Yes** GO to B8. **No** REPAIR circuit VE724 (GY) for an open. CLEAR the DTCs. REPEAT the self-test.



N0115646

- **Is the resistance less than 5 ohms?**

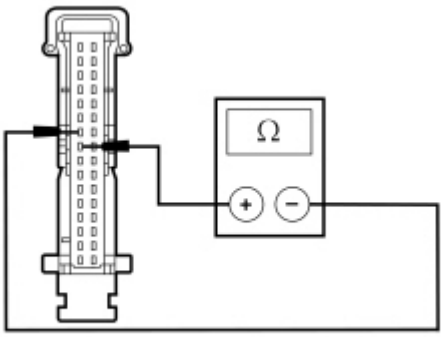
B8 CHECK THE FUEL LEVEL RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between the IPC C220-7, circuit VE721 (WH/OG), harness side and the fuel pump module assembly C463-1, circuit VE721 (WH/OG), harness side.  N0115647 • **Is the resistance less than 5 ohms?**	**Yes** GO to B15 . **No** REPAIR circuit VE721 (WH/OG) for an open. CLEAR the DTCs. REPEAT the self-test.
B9 CARRY OUT THE IPC FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC fuel gauge (FUELLEVEL) active command. Command the fuel gauge from 0% to 20%, 50%, 70% and 100% while observing the fuel gauge. • **Does the fuel gauge begin at (E) empty, move to approximately 1/4, 1/2, 3/4 and F (full)?**	**Yes** GO to B10 . **No** GO to B15 .
B10 CHECK THE FUEL LEVEL INPUT TO THE IPC	
NOTE: Since the IPC may be in anti-slosh fuel indication mode, the self-test and tester values may not match the fuel gauge readings. Disregard the actual gauge indication during this test step. • Ignition OFF. • Disconnect: Fuel Pump Module C463. • Connect one lead of the instrument gauge system tester to the fuel pump module C463-2, circuit VE724 (GY), harness side and the other lead to the fuel pump module assembly C463-1, circuit VE721 (WH/OG), harness side.	**Yes** DISCONNECT the instrument gauge system tester. GO to B12 . **No** DISCONNECT the instrument gauge system tester. GO to B11 .



N0026539

- Ignition ON.
- Enter the following diagnostic mode on the scan tool: IPC DataLogger.
- **NOTE:** It is extremely important to confirm the gauge tester settings with an ohmmeter to make sure that the gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results.
- Monitor the IPC fuel level (FUELLEVEL) PID with the gauge tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms and 10 ohms.
- **Does the PID begin at approximately 0%, move to 25%, 50%, 75% then 100%?**

B11 CHECK THE FUEL LEVEL SIGNAL AND RETURN CIRCUITS FOR HIGH RESISTANCE	
- Ignition OFF. - Disconnect: IPC C220. - Connect a fused jumper wire between the fuel pump module C463-1, circuit VE721 (WH/OG), harness side and the fuel pump module C463-2, circuit VE724 (GY), harness side.  N0053609 - Measure the resistance between the IPC C220-8, circuit VE724 (GY), harness side and the IPC C220-7, circuit VE721 (WH/OG), harness side.	**Yes** REMOVE the jumper wire. GO to B15 . **No** REPAIR the circuits for high resistance. TEST the system for normal operation.



N0115648

- **Is the resistance less than 5 ohms?**

B12 CHECK THE FUEL TANK	
• Check the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to B13 . **No** VERIFY the fuel level sensor and fuel pump module are OK. INSTALL a new fuel tank. REFER to Section 310-01 . TEST the system for normal operation.
B13 CHECK THE FUEL PUMP MODULE	
NOTE: The fuel pump module resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position. • Remove the fuel pump module. Refer to Section 310-01 . • Measure the resistance between the fuel pump module pin 1, component side, and the fuel pump module pin 2, component side, while moving the float arm from the lower stop position to the upper stop position.  N0115698 • **Does the resistance slowly decrease from approximately 180 ohms to 10 ohms?**	**Yes** CHECK the fuel pump module connector for corrosion, damaged or pushed out pins and REPAIR as necessary. TEST the system for normal operation. **No** GO to B14 .
B14 CHECK THE FUEL LEVEL SENDER (FLOAT AND CARD)	
NOTE: The fuel level sender (float and card) resistance measures between 180 ohms ± 4 ohms at the lower stop position and 10 ohms ± 2 ohms at the upper stop position. • Disconnect the fuel level sender (float and card) input wire from the	**Yes** INSTALL a new fuel pump module. REFER to Section 310-01 .

fuel pump module. • Measure the resistance between the fuel level sender (float and card) input wire pin 1, harness side, and the fuel level sender (float and card) return wire pin 2, harness side, while slowly moving the float arm from the lower stop position to the upper stop position.  N0115651 • **Does the resistance slowly decrease from approximately 180 ohms at the lower stop to 10 ohms at the upper stop?**	CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new fuel level sender (float and card). REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test.
B15 CHECK FOR CORRECT IPC OPERATION	

• Disconnect the IPC connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Tachometer Is Inoperative

Normal Operation

The PCM uses the Crankshaft Position (CKP) sensor to measure the engine rpm. The PCM sends the data to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) communication bus to command the tachometer according to the data.

If the engine rpm data is invalid for 5 seconds or less or if the IPC does not receive the engine rpm data for 5 seconds or less, the IPC defaults the tachometer to the last setting, based upon the last known good rpm message.

If the IPC does not receive the engine rpm data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the tachometer to 0 rpm. If the engine rpm data received is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the tachometer to 0 rpm.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST C: THE TACHOMETER IS INOPERATIVE

Test Step	Result / Action to Take
C1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST • Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to C2.
C2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM. For all other DTCs, REFER to DTC Charts in this section. **No** GO to C3.
C3 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC tachometer (TACH_IND) active command. Command the tachometer on then off while monitoring the tachometer. • **Does the tachometer begin at 0 rpm, increase to 7,000 rpm then return to 0 rpm?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. TEST the system for normal operation. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test D: Incorrect Tachometer Indication

Normal Operation

If the engine rpm data is invalid for 5 seconds or less or if the IPC does not receive the engine rpm data for 5 seconds or less, the IPC defaults the tachometer to the last setting, based upon the last known good rpm message.

If the IPC does not receive the engine rpm data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the tachometer to 0 rpm. If the engine rpm data received is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the tachometer to 0 rpm.

NOTE: If DTC U0100:00 sets in the IPC, other observable symptoms may be an inoperative speedometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM concern
- IPC

PINPOINT TEST D: INCORRECT TACHOMETER INDICATION

Test Step	Result / Action to Take
D1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to D2.
D2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM. For all other DTCs, REFER to DTC Charts in this section. **No** GO to D3.
D3 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC tachometer (TACH_IND) active command. Command the tachometer in increments of 10% while monitoring the tachometer. The rpm indicated should increase in increments of approximately 700 rpm for each 10% change. • **Does the tachometer indication increase within specifications?**	**Yes** GO to D4. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
D4 CHECK THE PCM RPM PIDs	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select the PCM engine rpm (RPM) PID and monitor the tachometer while operating the engine at 1,000, 1,500, 2,000 and 2,500 rpm using the PCM PID to set the vehicle speed. • **Does the tachometer indication range between 922-1,078 at 1,000 rpm, 1,422-1,578 rpm at 1,500 rpm, 1,922-2,078 rpm at 2,000 rpm and 2,422-2,578 rpm at 2,500 rpm?**	**Yes** The tachometer is operating correctly at this time. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test E: The Speedometer Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the vehicle speed signal from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. The vehicle speed data originates with the wheel speed sensors. The ABS module provides the wheel speed data to the PCM over the HS-CAN communication bus. The IPC monitors the vehicle speed input from the PCM and commands the speedometer with a corresponding movement of the pointer.

If the IPC receives invalid vehicle speed data from the PCM for 5 seconds or less, the IPC defaults the speedometer to the last setting, based upon the last known good vehicle speed message. If the IPC does not receive the vehicle speed data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the speedometer to 0 km/h (0 mph). If the vehicle speed data received is deemed invalid by the IPC , the IPC sets DTC U0401:68 and defaults the speedometer to 0 km/h (0 mph).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST E: THE SPEEDOMETER IS INOPERATIVE

Test Step	Result / Action to Take
E1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST • Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation. **No** GO to E2 .
E2 CARRY OUT THE SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC speedometer (SPDOMETER) active command. Command the speedometer on and off while monitoring the speedometer. • **Does the speed begin at 0 km/h (0 mph) move to 209 km/h (130 mph) and return to 0 km/h (0 mph)?**	**Yes** GO to E3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
E3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section

	303-14 . TEST the system for normal operation.

Pinpoint Test F: Incorrect Speedometer Indication

Normal Operation

The Instrument Panel Cluster (IPC) receives the vehicle speed signal from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. The vehicle speed data originates with the wheel speed sensors. The ABS module provides the wheel speed data to the PCM over the HS-CAN communication bus. The IPC monitors the vehicle speed input from the PCM and commands the speedometer with a corresponding movement of the pointer.

The IPC provides a tolerance that allows the speed indication to display between 3% below and 7% above the actual vehicle speed. This means that with an actual vehicle speed of 96.6 km/h (60 mph), the speedometer may indicate between 93.7-103.3 km/h (58.2-64.2 mph). Incorrect tire size or tire size configuration could potentially affect the speedometer accuracy.

If the IPC receives invalid vehicle speed data from the PCM for 5 seconds or less, the IPC defaults the speedometer to the last setting, based upon the last known good vehicle speed message. If the IPC does not receive the vehicle speed data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the speedometer to 0 km/h (0 mph). If the vehicle speed data received is deemed invalid by the IPC , the IPC sets DTC U0401:68 and defaults the speedometer to 0 km/h (0 mph).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- Tire size configuration
- PCM concern
- IPC

PINPOINT TEST F: INCORRECT SPEEDOMETER INDICATION

Test Step	Result / Action to Take
F1 CHECK THE TIRE SIZE CONFIGURATION	
• Enter the following diagnostic mode on the scan tool: Module Programming. • **NOTE:** The correct tire size can be found on the vehicle certification label on the LH B-pillar. Refer to Section 100-01 . • Verify that the size of the tires installed on the vehicle matches the certification label. • Verify that the tire size configuration matches the certification label. • **Is the tire size correct and is tire size correctly configured?**	**Yes** GO to F2 . **No** INSTALL the correct size tires or CONFIGURE the correct tire size as required. TEST the system for normal operation.
F2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED)

	manual. TEST the system for normal operation. **No** GO to F3.
F3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM. For all other DTCs, REFER to DTC Charts in this section. **No** GO to F4.
F4 CARRY OUT THE SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC speedometer (SPDOMETER) active command. Command the speedometer according to the following tables: **Early Build Vehicles and All Vehicles With Part Number Suffix xF** **Late Build Vehicles With Part Number Suffix xG and xH**	**Yes** GO to F5. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Early Build Vehicles and All Vehicles With Part Number Suffix xF

Command	Indication Range
21 km/h (13 mph)	20-22 km/h (13-14 mph)
42 km/h (26 mph)	40-45 km/h (25-28 mph)
63 km/h (39 mph)	61-67 km/h (38-42 mph)
84 km/h (52 mph)	81-90 km/h (50-56 mph)
105 km/h (65 mph)	101-112 km/h (63-70 mph)
126 km/h (78 mph)	121-134 km/h (75-83 mph)
146 km/h (91 mph)	141-157 km/h (88-97 mph)
167 km/h (104 mph)	162-179 km/h (100-111 mph)
188 km/h (117 mph)	182-201 km/h (113-125 mph)
209 km/h (130 mph)	202-224 km/h (125-139 mph)

Late Build Vehicles With Part Number Suffix xG and xH

Command	Indication Range
21 km/h (13 mph)	20-22 km/h (13 mph)
42 km/h (26 mph)	40-43 km/h (25-27 mph)
63 km/h (39 mph)	61-65 km/h (38-40 mph)
84 km/h (52 mph)	81-87 km/h (50-54 mph)
105 km/h (65 mph)	101-108 km/h (63-67 mph)
126 km/h (78 mph)	121-130 km/h (75-81 mph)

146 km/h (91 mph)	141-152 km/h (88-94 mph)
167 km/h (104 mph)	162-173 km/h (100-108 mph)
188 km/h (117 mph)	182-195 km/h (113-121 mph)
209 km/h (130 mph)	202-217 km/h (125-135 mph)

- **Does the speed indicated increase within the specified range?**

F5 CHECK THE PCM VSS PIDs	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select the PCM vehicle speed (VSS) PID and monitor the PID while driving the vehicle at 32 km/h (20 mph), 64 km/h (40 mph) and 97 km/h (60 mph). • **Does the speedometer indicate between 31-34 km/h (19-21 mph), 63-69 km/h (39-43 mph) and 93-103 km/h (58-64 mph) at the 3 PCM PID values?**	**Yes** GO to F6 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
F6 OBSERVE THE SPEEDOMETER OPERATION	
• Ignition ON. • Observe the speedometer while driving the vehicle at various speeds and stopping frequently. • **Does the speedometer begin at 0 km/h (0 mph) and fully return to the 0 km/h (0 mph) position when the vehicle is stopped?**	**Yes** The speedometer is operating correctly at this time. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test G: The Odometer Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the odometer rolling count data from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. The IPC monitors the odometer rolling count input from the PCM and commands the odometer with a display in the integrated circuit display area.

If the IPC does not receive the odometer rolling count data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the odometer display to all dashes (-----). If the odometer rolling count data is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the odometer display to all dashes (-----).

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer or tachometer.

This pinpoint test is intended to diagnose the following:

- PCM concern
- IPC

PINPOINT TEST G: THE ODOMETER IS INOPERATIVE

Test Step	Result / Action to Take
G1 RETRIEVE THE RECORDED DTCs FROM THE KOEO PCM SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to G2.
G2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM. For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test H: The Low Oil Pressure Warning Indicator Is Never/Always On

Refer to Wiring Diagrams Cell 60, Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) receives the engine oil pressure status from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. The PCM provides a reference voltage to the engine oil pressure switch when the ignition key is in the RUN position. With the engine running and low or no oil pressure, the engine oil pressure switch closes to ground. The PCM detects the reference voltage pulled low and sends a request to the IPC to illuminate the low oil pressure warning indicator. With the engine running and sufficient oil pressure, the engine oil pressure switch opens. The reference voltage remains unchanged or high and sends a request to the IPC to turn off the low oil pressure warning indicator.

If the IPC fails to receive the oil pressure status from the PCM for 5 seconds or less, the IPC defaults the low oil pressure warning indicator to the last state (on or off), based upon the last known good oil pressure status message. If the IPC fails to receive the oil pressure status from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the low oil pressure warning indicator active (on).

NOTE: If DTC U0100:00 sets in the IPC, other observable symptoms may be an inoperative speedometer, tachometer, or odometer.

This pinpoint test is intended to diagnose the following:

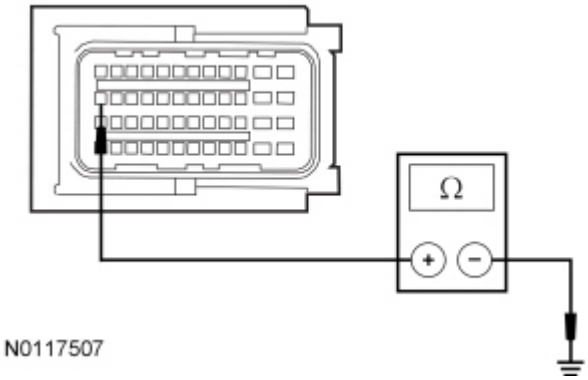
- Wiring, terminals or connectors
- Engine oil pressure switch
- Base engine oil pressure concern
- PCM
- IPC

PINPOINT TEST H: THE LOW OIL PRESSURE WARNING INDICATOR IS NEVER/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
H1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC low oil pressure warning indicator (OIL_P_LOW) active command. Command the low oil pressure warning indicator on and off. Observe the low oil pressure warning indicator. • **Does the low oil pressure warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** If the low oil pressure warning indicator is always on, GO to H2 . If the low oil pressure warning indicator is never on, GO to H5 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
H2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test AM . **No** GO to H3 .
H3 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103. • Ignition ON. • Observe the low oil pressure indicator. • **Does the low oil pressure warning indicator turn off?**	**Yes** INSTALL a new engine oil pressure switch. REFER to Section 303-01 . TEST the system for normal operation. **No** GO to H4 .
H4 CHECK THE OIL PRESSURE INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175E. • Measure the resistance between the PCM C175E-25, circuit CMC24 (GY), harness side and ground.	**Yes** GO to H8 . **No** REPAIR circuit CMC24 (GY) for a short to ground. TEST the system for normal operation.



N0117507

- **Is the resistance greater than 10,000 ohms?**

H5 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103. • **NOTE:** Make sure to use a good clean ground for this test step. • Connect a fused jumper wire between the engine oil pressure switch C103-1, circuit CMC24 (GY), harness side and ground.  N0002760 • Ignition ON. • Observe the low oil pressure warning indicator. • **Does the low oil pressure indicator turn on?**	**Yes** REMOVE the jumper wire. GO to H7 . **No** LEAVE the jumper wire connected. GO to H6 .
H6 CHECK THE ENGINE OIL PRESSURE INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect: C175E. • With the jumper wire in place, measure the resistance between the PCM C175E-25, circuit CMC24 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. GO to H8 . **No** REMOVE the jumper wire. REPAIR circuit CMC24 (GY) for an open. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
H7 CHECK THE OIL PRESSURE	**Yes** INSTALL a new engine oil pressure switch. REFER to Section 303-01 . TEST the system for normal operation. **No** REFER to Section 303-00 to continue diagnosis of the engine oil pressure.
• Carry out the engine oil pressure test. Refer to Section 303-00 . • **Is the oil pressure within specification?**	
H8 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation. **No** GO to H9 .
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	
H9 CHECK FOR CORRECT PCM OPERATION	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Disconnect the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the PCM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**	

Pinpoint Test I: The Engine Over-Temperature Warning Indicator Is Never/Always On

Normal Operation

The PCM uses the Engine Coolant Temperature (ECT) sensor to measure the engine coolant

temperature. The Instrument Panel Cluster (IPC) receives the engine over-temperature request from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. When the PCM detects high engine coolant temperature, the PCM sends a request to the IPC to illuminate the engine over-temperature warning indicator.

If the engine coolant temperature status message is missing for 5 seconds or less or if the IPC receives an invalid engine temperature status message for 5 seconds or less, the IPC defaults the engine over-temperature warning indicator to the last setting (on or off), based upon the last known good request message.

If the IPC does not receive the engine coolant temperature status message from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the engine over-temperature warning indicator on. If the engine coolant temperature status message is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the engine over-temperature warning indicator on.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative tachometer, speedometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST I: THE ENGINE OVER-TEMPERATURE WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
I1 CARRY OUT THE ENGINE OVER-TEMPERATURE WARNING INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC engine over-temperature warning indicator (COOLANT_LMP) active command. Command the engine over-temperature warning indicator on and off while monitoring the engine over-temperature warning indicator. • **Does the engine over-temperature warning indicator turn off when commanded off and turn on when commanded on?**	**Yes** GO to I2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
I2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to I3 .
I3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM .

	For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test J: The Low Fuel Warning Indicator Is Never On

Normal Operation

The low fuel warning indicator illuminates when the Instrument Panel Cluster (IPC) calculation for the Distance To Empty (DTE) reaches 50 miles (80 km) or less. The DTE is calculated internally by the IPC from data received from the PCM and the fuel gauge. If the IPC detects a fault in the fuel input (circuitry or fuel pump module), the IPC defaults the fuel gauge to the empty (E) stop position and illuminates the low fuel warning indicator.

This pinpoint test is intended to diagnose the following:

- IPC

PINPOINT TEST J: THE LOW FUEL WARNING INDICATOR IS NEVER ON

Test Step	Result / Action to Take
J1 CARRY OUT THE IPC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	**Yes** GO to J2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC low fuel (LOFUELL) active command. Command the low fuel warning indicator on and off. Observe the low fuel warning indicator. • **Does the low fuel warning indicator illuminate when commanded on and turn off when commanded off?**	
J2 CHECK THE DTE STATUS	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The low fuel warning message does not appear until the DTE is 80 km (50 miles) or less.
• Access and observe the message center DTE displayed mileage. • **Does the DTE display indicate 80 km (50 miles) or less until empty?**	

Pinpoint Test K: The Charging System Warning Indicator Is Never/Always On

Normal Operation

The charging system indicator is controlled by the Instrument Panel Cluster (IPC) based upon data received from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. When a fault is detected in the charging system, the PCM sends the IPC a request to illuminate the charging system warning indicator.

If the charging system message is missing or invalid for less than 5 seconds, the charging system warning indicator remains in the last indication mode (on or off) based on the last known good message received. If the charging system message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the charging system warning indicator on. If the charging data received is deemed invalid by the IPC for 5 seconds or more, the IPC defaults the charging system warning indicator on.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- PCM
- IPC

PINPOINT TEST K: THE CHARGING SYSTEM WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
K1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC charging system warning indicator (CHARGE_LMP) active command. Command the charging system warning indicator on and off. Observe the charging system warning indicator. • **Does the charging system warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to K2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
K2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any charging system DTCs recorded?**	**Yes** REFER to Section 414-00 . **No** GO to K3 .
K3 CHECK THE CHARGING SYSTEM OPERATION	
• Check the charging system operation. Refer to Section 414-00 . • **Does the charging system operate correctly?**	**Yes** GO to K4 . **No** REFER to Section 414-00 .
K4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-	**Yes**

test. • **Are any DTCs recorded?**	For DTC U0100:00, GO to Pinpoint Test AM . For all other DTCs, REFER to DTC Charts in this section. **No** If the charging system warning indicator is always on, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. If the charging system warning indicator is never on, the system is operating correctly at this time.

Pinpoint Test L: The Brake Warning Indicator is Never On

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) uses 3 basic inputs to control the brake warning indicator. The first 2 are the parking brake warning indicator switch and brake fluid level switch. The third is for the Electronic Brake Distribution (EBD), controlled by the ABS. The parking brake warning indicator switch and brake fluid level switch are hardwired to the IPC through independent signal circuits. The EBD message is sent from the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus.

The IPC provides a reference voltage to both the parking brake warning indicator switch and the brake fluid level switch. When the parking brake is applied, the parking brake warning indicator switch closes to ground, providing a ground to the IPC and pulling the signal circuit low. When a low brake fluid level condition exists, the low brake fluid level switch closes to ground pulling the signal circuit low. The IPC monitors the parking brake and the brake fluid level inputs and illuminates the brake warning indicator when the parking brake is applied or when the brake fluid level is low. When the ABS module detects a base brake system concern, other ABS-related or EBD concerns, the ABS module sends a message to the IPC to illuminate both the ABS warning indicator and the brake warning indicator.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking brake warning indicator switch
- Brake fluid level switch
- IPC

PINPOINT TEST L: THE BRAKE WARNING INDICATOR IS NEVER ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 CHECK THE OPERATION OF THE IPC	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC brake warning indicator (PBA_LMP) active command. Command the brake warning indicator on while observing the brake warning indicator.	**Yes** GO to L2 . **No** INSTALL a new IPC . REFER to Instrument

• **Does the brake warning indicator illuminate?**	Panel Cluster (IPC) in this section. TEST the system for normal operation.
L2 CHECK THE OPERATION OF THE BRAKE WARNING INDICATOR FROM THE PARKING BRAKE SWITCH	
• Apply the parking brake while monitoring the brake warning indicator. • **Does the brake warning indicator illuminate?**	**Yes** GO to L5 . **No** GO to L3 .
L3 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH	
• Ignition OFF. • Disconnect: Parking Brake Warning Indicator Switch C306. • Ignition ON. • Connect a fused jumper wire between the parking brake warning indicator switch C306-1, circuit CMC25 (WH/VT), harness side and ground. N0115699 • **Does the brake warning indicator illuminate?**	**Yes** INSTALL a new parking brake warning indicator switch. TEST the system for normal operation. **No** GO to L4 .
L4 CHECK THE PARKING BRAKE SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: IPC C220. • Measure the resistance between the IPC C220-11, circuit CMC25 (WH/VT), harness side and the parking brake warning indicator switch C306-1, circuit CMC25 (WH/VT), harness side.  N0115654 • **Is the resistance less than 5 ohms?**	**Yes** GO to L8 . **No** REPAIR circuit CMC25 (WH/VT) for an open. TEST the system for normal operation.
L5 CHECK THE BRAKE FLUID LEVEL INPUT TO THE IPC	
NOTE: If the fuse in the jumper wire fails, repair circuit CE908 (BU/BN) for a short to voltage.	**Yes** GO to L6 .

• Ignition OFF. • Disconnect: Brake Fluid Level Switch C124. • Connect a fused jumper wire between the brake fluid level switch C124-2, circuit CE908 (BU/BN), harness side and ground. N0115655 • Ignition ON. • Monitor the brake warning indicator. • **Does the brake warning indicator turn on?**	**No** GO to L7 .
L6 CHECK THE BRAKE FLUID LEVEL INDICATOR SWITCH GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between the brake fluid level switch C124-1, circuit GD187 (BK/GN), harness side and ground.  N0115656 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new brake fluid level switch. TEST the system for normal operation. **No** REPAIR circuit GD187 (BK/GN) for an open. TEST the system for normal operation.
L7 CHECK BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the IPC C220-16, circuit CE908 (BU/BN), harness side and the brake fluid level switch C124-2, circuit CE908 (BU/BN), harness side.	**Yes** GO to L8 . **No** REPAIR circuit CE908 (BU/BN) for an open. TEST the system for normal operation.

 N0115657 • **Is the resistance less than 5 ohms?**	

L8 CHECK FOR CORRECT IPC OPERATION
• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: The Brake Warning Indicator is Always On

Refer to Wiring Diagrams Cell 60, Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) uses 3 basic inputs to control the brake warning indicator. The first 2 are the parking brake warning indicator switch and brake fluid level switch. The third is for the Electronic Brake Distribution (EBD), controlled by the ABS. The parking brake warning indicator switch and brake fluid level switch are hardwired to the IPC through independent signal circuits. The EBD message is sent from the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus.

The IPC provides a reference voltage to both the parking brake warning indicator switch and the brake fluid level switch. When the parking brake is applied, the parking brake warning indicator switch closes to ground, providing a ground to the IPC and pulling the signal circuit low. When a low brake fluid level condition exists, the low brake fluid level switch closes to ground pulling the signal circuit low. The IPC monitors the parking brake and the brake fluid level inputs and illuminates the brake warning indicator when the parking brake is applied or when the brake fluid level is low. When the ABS module detects a base brake system concern, other ABS-related or EBD concerns, the ABS module sends a message to the IPC to illuminate both the ABS warning indicator and the brake warning indicator.

If the EBD message from the ABS module is missing for less than 5 seconds, the brake warning indicator remains in the last indication mode (on or off) based on the last known good message received. If the EBD message from the ABS module is missing or deemed invalid for more than 5 seconds, the IPC sets DTC U0121:00 and defaults the ABS warning indicator on. If the brake warning message received from the ABS module is deemed invalid by the IPC for 5 seconds or more, the EBD defaults the brake warning indicator on.

- DTC B1048:01 (Brake Fluid Level Switch: General Electrical Failure) — an on-demand DTC that sets in the IPC if the IPC detects a short to ground on the brake fluid level input circuit.
- DTC P1536:01 (Parking Brake Switch Circuit: General Electrical Failure) — an on-demand DTC that sets when the IPC detects a short to ground on the parking brake warning indicator switch input circuit during the module self-test.

NOTE: If DTC U0140:00 sets in the IPC, other symptoms may also be present such as Tire Pressure Monitoring System (TPMS), instrument panel backlighting, and door ajar indication.

NOTE: Both the ABS warning indicator and the brake warning indicator illuminate if the input to turn on the brake warning indicator is received from the ABS module.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking brake warning indicator switch
- Brake fluid level switch
- ABS concern
- IPC

PINPOINT TEST M: THE BRAKE WARNING INDICATOR IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCs) FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09. **No** GO to M2.
M2 CHECK THE OPERATION OF THE IPC	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC brake warning indicator active command (PBA_LMP). Command the brake warning indicator on then off while observing the brake warning indicator. • **Does the brake warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to M3. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
M3 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH	
• Ignition OFF. • Disconnect: Parking Brake Warning Indicator Switch C306. • Ignition ON. • Monitor the brake warning indicator with the parking brake switch disconnected. • **Does the brake warning indicator turn off?**	**Yes** INSTALL a new parking brake warning indicator switch. TEST the system for normal operation. **No**

	GO to M4 .
M4 CHECK THE OPERATION OF THE BRAKE FLUID LEVEL SWITCH INPUT TO THE IPC **NOTE:** Verify that a low brake fluid level condition exists or existed prior to beginning the brake fluid level switch diagnostics. • Ignition OFF. • Disconnect: Brake Fluid Level Switch C124. • Ignition ON. • Monitor the brake warning indicator. • **Does the brake warning indicator turn off?**	**Yes** INSTALL a new brake fluid level switch. TEST the system for normal operation. **No** GO to M5 .
M5 CHECK THE PARKING BRAKE SIGNAL CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: IPC C220. • Measure the resistance between the parking brake warning indicator switch C306-1, circuit CMC25 (WH/VT), harness side and ground.  N0115658 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M6 . **No** REPAIR circuit CMC25 (WH/VT) for a short to ground. TEST the system for normal operation.
M6 CHECK THE BRAKE FLUID LEVEL INPUT CIRCUIT FOR A SHORT TO GROUND • Measure the resistance between the brake fluid level switch C124-2, circuit CE908 (BU/BN), harness side and ground.  N0115659 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M7 . **No** REPAIR circuit CE908 (BU/BN) for a short to ground. TEST the system for normal operation.

M7 CHECK FOR CORRECT IPC OPERATION
 	
• Disconnect all IPC connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
	Yes
	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in

▪ pushed-out pins • Connect all IPC connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The ABS Warning Indicator Is Never/Always On

Normal Operation

The ABS module provides the ABS status to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) communication bus. If a fault condition exists in the ABS, the ABS module sends the IPC a command to either flash the ABS warning indicator or to turn it on.

If the ABS status message is missing for less than 5 seconds, the ABS warning indicator remains in the last indication mode (on or off) based on the last known good message received. If the ABS status message is missing for more than 5 seconds, the IPC sets DTC U0121:00 and defaults the ABS warning indicator on. If the ABS data received is deemed invalid by the IPC for 5 seconds or more, the IPC defaults the ABS warning indicator on.

This pinpoint test is intended to diagnose the following:

- ABS module
- IPC

PINPOINT TEST N: THE ABS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
N1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC ABS warning indicator (ABS_LAMP) active command. Command the ABS warning indicator on then off. Observe the ABS warning indicator. • **Does the ABS warning indicator turn off when commanded off?**	**Yes** GO to N2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
N2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0121:00, GO to Pinpoint Test AO . For all other DTCs, REFER to DTC Charts in this section. **No**

	GO to N3 .
N3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** If the ABS warning indicator is always on, INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation. If the ABS warning indicator is never on, the system is operating correctly at this time.

Pinpoint Test O: The Stability/Traction Control Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the stability/traction control data from the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus. The stability/traction control indicator flashes when the vehicle traction control is in active mode or is being controlled by the ABS module. The IPC monitors the stability/traction control message from the ABS module and either flashes the stability/traction control indicator or turns it on steady depending on the condition.

If the stability/traction control message is invalid for 5 seconds or less or if the IPC does not receive the stability/traction control message for 5 seconds or less, the IPC defaults the stability/traction control indicator to the last indication mode (on/off) based upon the last known good message. If the stability/traction control message is missing for more than 5 seconds, the IPC sets DTC U0121:00 in continuous memory and defaults the stability/traction control indicator on.

This pinpoint test is intended to diagnose the following:

- Stability/traction control concern
- ABS module
- IPC

PINPOINT TEST O: THE STABILITY/TRACTION CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
O1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC stability/traction control indicator (TC/IVD/RSCLMP) active command. Command the stability/traction control active indicator on and off while observing the stability/traction control indicator. • **Does the stability/traction control indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to O2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
O2 RETRIEVE THE RECORDED DTCs FROM	

THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0121:00, GO to Pinpoint Test AO . For all other DTCs, REFER to DTC Charts in this section. **No** GO to O3 .
O3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS module self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** If the stability/traction control indicator is never on, the system is operating correctly at this time. If the stability/traction control indicator is always on, INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.

Pinpoint Test P: The Malfunction Indicator Lamp (MIL) Is Never/Always On

Normal Operation

The Malfunction Indicator Lamp (MIL) is controlled by the Instrument Panel Cluster (IPC) using data sent from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus.

If the MIL status message is missing or invalid for less than 5 seconds, the MIL remains in the last indication mode (on or off) based upon the last known good data message. If the MIL status message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the MIL on. If the MIL status message is deemed invalid for more than 5 seconds, the IPC defaults the MIL on.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST P: THE MIL IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
P1 CARRY OUT THE IPC MIL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC MIL (MIL) active command. Command the MIL	**Yes** GO to P2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal

on and off. Observe the MIL . • **Does the MIL illuminate when selected on and turn off when selected off?**	operation.
P2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to P3 .
P3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test AM . **No** If the MIL is never on, the system is operating correctly at this time. If the MIL is always on, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test Q: The Powertrain Malfunction (Wrench) Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the powertrain malfunction data from the PCM and the transmission status from the Transmission Control Module (TCM) over the High Speed Controller Area Network (HS-CAN) communication bus. When a fault condition exists in the PCM, the PCM sends a request to the IPC to illuminate the powertrain malfunction (wrench) warning indicator. When a fault occurs in the transmission, the TCM sends a request to the IPC to illuminate the powertrain malfunction (wrench) warning indicator.

If the powertrain malfunction (wrench) warning indicator request message is missing from the PCM or TCM for 5 seconds or less, the powertrain malfunction (wrench) warning indicator remains in the last indication mode (on or off) based upon the last known good request received. If the powertrain malfunction (wrench) warning indicator request message is missing from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 and defaults the powertrain malfunction (wrench) warning indicator on. If the powertrain malfunction (wrench) warning indicator request message is missing from the TCM for more than 5 seconds, the IPC sets DTC U0101:00 and defaults the powertrain malfunction (wrench) warning indicator on.

NOTE: If U0100:00 sets in the IPC other symptoms may also be present such as an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- ETC concern
- Transmission concern
- IPC

PINPOINT TEST Q: THE POWERTRAIN MALFUNCTION (WRENCH) WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Q1 CARRY OUT THE IPC POWERTRAIN MALFUNCTION (WRENCH) INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC powertrain malfunction (wrench) warning indicator (EMS_FAULT) active command. Command the powertrain malfunction (wrench) warning indicator on and off while observing the powertrain malfunction (wrench) warning indicator. • **Does the powertrain malfunction (wrench) warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to Q2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
Q2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 or DTC U0101:00 recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM . For DTC U0101:00, GO to Pinpoint Test AN . **No** GO to Q3 .
Q3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** REFER to Section 307-11 to diagnose TCM DTCs.

Pinpoint Test R: The Hill Start Assist Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the hill start assist indicator request from the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus. When the hill start assist is active, the ABS module sends a request to the IPC to illuminate the hill start assist indicator.

If the hill start assist request is missing or if the data is deemed invalid for less than 5 seconds, the hill start assist remains in the last indication mode (on or off) based on the last known good request received. If the hill start assist request is missing or if the data is deemed invalid by the IPC for more than 5 seconds, the IPC sets DTC U0121:00 in continuous memory and defaults the hill start assist indicator off.

NOTE: If DTC U0121:00 sets in the IPC , other observable symptoms may be brake, ABS or traction control warning indication concerns.

This pinpoint test is intended to diagnose the following:

- Hill start assist function concern
- ABS module
- IPC

PINPOINT TEST R: THE HILL START ASSIST INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
R1 CHECK THE OPERATION OF THE HILL START ASSIST FUNCTION	
• Verify that the hill start assist function operates correctly. Refer to Hill Start Assist in Section 206-09 . • **Does the hill start assist function operate correctly?**	**Yes** GO to R2 . **No** GO to R4 .
R2 CARRY OUT THE IPC DEALER TEST MODE	
• Ignition ON. • Enter the IPC dealer test mode. Scroll through the displays until LEd is displayed. • **Does the hill start assist indicator illuminate?**	**Yes** GO to R3 **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
R3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0121:00 recorded?**	**Yes** GO to Pinpoint Test AO . **No** GO to R4 .
R4 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.

Pinpoint Test S: The Overdrive Off Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the overdrive off indicator request from the Transmission Control Module (TCM) over the High Speed Controller Area Network (HS-CAN) communication bus. When the overdrive off function is selected, the TCM sends a request to the IPC to illuminate the overdrive off indicator.

If the overdrive off request is missing or if the data is deemed invalid for less than 5 seconds, the overdrive off indicator remains in the last indication mode (on or off) based on the last known good request received. If the overdrive off request is missing or if the data is deemed invalid by the IPC for more than 5 seconds, the IPC sets DTC U0101:00 in continuous memory and defaults the overdrive off indicator off.

This pinpoint test is intended to diagnose the following:

- Overdrive function concern

- TCM
- IPC

PINPOINT TEST S: THE OVERDRIVE OFF INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
S1 CHECK THE OPERATION OF THE OVERDRIVE OFF FUNCTION	**Yes** GO to S2. **No** REFER to Section 307-05.
• Verify that the overdrive off function operates when engaged and turns off when disengaged. Refer to Section 307-05. • **Does the overdrive off function operate correctly?**	
S2 CARRY OUT THE IPC OVERDRIVE OFF INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	**Yes** GO to S3. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC overdrive off indicator (HDC_ACTIVE) active command. Command the overdrive off indicator on and off while observing the overdrive off indicator. • **Does the overdrive off indicator illuminate when commanded on, and turn off when commanded off?**	
S3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	**Yes** GO to Pinpoint Test AM. **No** GO to S4.
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	
S4 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TEST	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** INSTALL a new TCM. REFER to Section 307-11. TEST the system for normal operation.
• Check for recorded TCM DTCs from the self-test. • **Are any DTCs recorded?**	

Pinpoint Test T: The Upshift Indicator Is Never/Always On

Normal Operation

The upshift indicator informs the driver of shift points that provide the highest fuel economy. The upshift indicator is controlled by the Instrument Panel Cluster (IPC) based upon an upshift indicator request sent from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus.

If the upshift indicator request is missing or if the data is deemed invalid for less than 5 seconds, the

upshift indicator remains in the last indication mode (on or off) based on the last known good request received. If the upshift indicator request is missing or if the data is deemed invalid by the IPC for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the upshift indicator off.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST T: THE UPSHIFT INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
T1 CARRY OUT THE IPC UPSHIFT INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC upshift indicator (SHIFT_LAMP) active command. Command the upshift indicator on and off while observing the upshift indicator. • **Does the upshift indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to T2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
T2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test AM. **No** GO to T3.
T3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** INSTALL a new PCM. REFER to Section 303-14. TEST the system for normal operation.

Pinpoint Test U: The Cruise Control Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the cruise control indicator request from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. When the cruise control is engaged, the PCM sends a request to the IPC to illuminate the cruise control indicator.

If the cruise control indicator request is missing or if the data is deemed invalid for less than 5 seconds, the cruise control indicator remains in the last indication mode (on or off) based on the last known good request received. If the cruise control indicator request is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the cruise control indicator off.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST U: THE CRUISE CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
U1 CHECK THE CRUISE CONTROL OPERATION	
• Operate the cruise control. • **Does the cruise control operate correctly?**	**Yes** GO to U2 . **No** REFER to Section 419-03 .
U2 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC cruise control indicator (CRUISE) active command. Command the cruise control indicator on and off. Observe the cruise control indicator. • **Does the cruise control indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to U3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3 RETRIEVE AND RECORD THE DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to U4 .
U4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test V: The Oil Change Minder Indicator Is Never/Always On

Normal Operation

The oil change minder indicator informs the driver that the vehicle requires an oil change. The Instrument Panel Cluster (IPC) receives the oil change minder indicator request from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. When the PCM has determined that the criteria for vehicle mileage or length of time has been met, the PCM sends a request to the IPC to illuminate the oil change minder indicator.

If the oil change minder indicator request is missing or if the data is deemed invalid for less than 5 seconds, the oil change minder indicator remains in the last indication mode (on or off) based on the last known good request received. If the oil change minder indicator request is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the oil change minder indicator off.

NOTE: If DTC U0100:00 sets in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST V: THE OIL CHANGE MINDER INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
V1 CARRY OUT THE IPC DEALER TEST MODE • Ignition ON. • Enter the IPC dealer test mode. Scroll through the displays until LEd is displayed. • **Does the oil change minder indicator illuminate when in the dealer test mode and turn off during normal operation?**	**Yes** GO to V2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
V2 CARRY OUT THE OIL LIFE RESET PROCEDURE • Reset the oil minder. Refer to Message Center Configuration in this section. • **Does the oil change minder indicator turn off?**	**Yes** The system is operating correctly at this time. **No** GO to V3 .
V3 RETRIEVE AND RECORD THE DTCs FROM THE PCM KOEO SELF-TEST • Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to V4 .
V4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM . For all other DTCs, REFER to DTC Charts in this section. **No**

	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test W: The Door Ajar Warning Indicator Is Never/Always On

Normal Operation

The door ajar indicator informs the driver if any of the doors, the luggage compartment lid or the hood is not completely closed. The door ajar information is sent from the Body Control Module (BCM) to the Instrument Panel Cluster (IPC) over the Medium Speed Controller Area Network (MS-CAN) communication bus.

If the door ajar status is missing or if the data is deemed invalid for less than 5 seconds, the door ajar warning indicator remains in the last indication mode (on or off) based on the last known good request received. If the door ajar status is missing for more than 5 seconds, the IPC sets DTC U0140:00 in continuous memory and defaults the door ajar warning indicator off.

This pinpoint test is intended to diagnose the following:

- Interior lamps concern
- Hood ajar concern
- Decklid ajar concern
- Wiring, terminals or connectors
- BCM
- IPC

PINPOINT TEST W: THE DOOR AJAR WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
W1 CHECK THE INTERIOR LIGHTING OPERATION	
• Open and close each door while monitoring the courtesy lamps. • **Do the courtesy lamps operate correctly with each door?**	**Yes** GO to W2 . **No** REFER to Section 417-02 .
W2 CARRY OUT THE IPC DOOR AJAR WARNING INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC door ajar warning indicator (DOOR_AJAR) active command. Command the door ajar warning indicator on and off while observing the door ajar warning indicator. • **Does the door ajar warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to W3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
W3 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test.	**Yes** GO to Pinpoint Test AQ .

• **Is DTC U0140:00 recorded?**	**No** GO to W4 .
W4 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded DTCs from the BCM self-test. • **Are any BCM DTCs recorded?**	**Yes** REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test X: The LH/RH Turn Or High Beam Indicator Is Never/Always On

Normal Operation

When the multifunction switch is in the LH or RH TURN position or if the high beams are on, a message is sent to the Instrument Panel Cluster (IPC) from the Body Control Module (BCM) over the Medium Speed Controller Area Network (MS-CAN) communication bus. The IPC , upon receipt of the LH/RH turn or high beam on message, flashes the LH or RH turn signal indicator on and off or illuminates the high beam indicator.

If the LH/RH TURN or high beam status is missing or if the data is deemed invalid for less than 5 seconds, the LH/RH TURN or high beam indicator remains in the last indication mode (on or off) based on the last known good request received. If the LH/RH TURN or high beam status is missing for more than 5 seconds, the IPC sets DTC U0140:00 in continuous memory and defaults the LH/RH TURN or high beam indicator off.

This pinpoint test is intended to diagnose the following:

- Turn signal concern
- High beam concern
- BCM
- IPC

PINPOINT TEST X: THE LH/RH OR HIGH BEAM TURN INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
X1 DETERMINE THE FAULT CONDITION	
• Place the headlamp switch in the HIGH BEAM position. • Ignition ON. • Observe the high beam indicator. • **Does the high beam indicator illuminate?**	**Yes** GO to X4 . **No** LEAVE the headlamp switch in the HIGH BEAM position. GO to X2 .
X2 CHECK THE HIGH BEAM HEADLAMPS OPERATION	
• Observe the high beam headlamps. • **Do the high beam headlamps operate correctly?**	**Yes** GO to X3 . **No** REFER to Section 417-01 .

X3 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC high beam indicator (HIGH_BEAM). • Command the high beam indicator on and off. Observe the high beam indicator. • **Does the high beam indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to X6 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
X4 CHECK THE LH OR RH TURN SIGNAL LAMPS OPERATION	
• Ignition ON. • Operate the LH or RH turn signal. Observe the exterior LH or RH turn lamps. • **Do the turn signal lamps operate correctly?**	**Yes** GO to X5 . **No** REFER to Section 417-01 .
X5 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC RH or LH turn signal indicator (RH_TURN_L) or (LH_TURN_L) active command. Command the RH or LH turn signal indicator on and off. Observe the LH or RH turn signal indicator. • **Does the LH or RH turn signal indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to X6 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
X6 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to X7 .
X7 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0140:00 recorded?**	**Yes** GO to Pinpoint Test AQ . **No** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test Y: The Tire Pressure Monitoring System (TPMS) Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Tire Pressure Monitoring System (TPMS) messages from the Tire Pressure Monitor (TPM)/Vehicle Security Module (VSM) over the Medium Speed Controller Area Network (MS-CAN) communication bus. If the TPM / VSM determines that the tire pressure has exceeded the low tire pressure limits, a message is sent to the IPC to illuminate the TPMS warning indicator. If a TPMS fault condition exists or if the TPMS is in the tire training mode, the TPM / VSM sends a message to the IPC to flash the TPMS warning indicator.

If the TPMS status message is missing or invalid for less than 5 seconds, the IPC defaults the TPMS warning indicator to the last setting (on or off) based upon the last known good message received. If the TPMS status message is missing for more than 5 seconds, the IPC flashes the TPMS indicator for approximately 75 seconds then turns the indicator on steady. If the TPMS status message is invalid for more than 5 seconds, the IPC sets flashes the TPMS indicator for approximately 75 seconds then turns the indicator on steady.

This pinpoint test is intended to diagnose the following:

- Tire pressure
- TPMS concern
- TPM / VSM
- IPC

PINPOINT TEST Y: THE TPMS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Y1 CHECK THE TIRE PRESSURE • Verify that the tire pressure in all tires meets the recommended tire pressures on the Vehicle Certification (VC) label. Refer to Section 100-01 . • **Do all the tires meet the recommended tire pressures?**	**Yes** GO to Y2 . **No** CORRECT the tire pressures. TEST the system for normal operation.
Y2 CARRY OUT THE IPC DEALER TEST MODE • Ignition ON. • Enter the IPC dealer test mode. Scroll through the displays until LEd is displayed. • **Does the TPMS warning indicator illuminate?**	**Yes** GO to Y3 **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
Y3 RETRIEVE THE RECORDED DTCs FROM IPC SELF-TEST • Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140:00, GO to Pinpoint Test AQ . For all other DTCs, REFER to DTC Charts in this section. **No** GO to Y4
Y4 RETRIEVE THE RECORDED DTCs FROM THE TPM / VSM SELF-TEST • Check for recorded TPM / VSM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Diagnostic Trouble Code (DTC) Chart in Section 204-04 . **No** If the TPMS warning indicator is never on, the system is operating correctly at this time. If the TPMS warning indicator is always on, INSTALL a new TPM module Section 204-04 . TEST the system for normal operation.

Pinpoint Test Z: The Safety Belt Warning Indicator Is Never/Always On

Normal Operation

The Restraints Control Module (RCM) monitors the safety belt position. The RCM provides the safety belt status to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) communication bus.

If the safety belt status is missing or invalid for less than 5 seconds, the IPC defaults the safety belt warning indicator to the last state (on or off) based upon the last known good message received. If the IPC does not receive the safety belt buckle switch status from the RCM for more than 5 seconds, the IPC sets DTC U0151:00 and defaults the safety belt warning indicator off. If the RCM message is deemed invalid by the IPC for more than 5 seconds, the IPC sets defaults the safety belt warning indicator off.

This pinpoint test is intended to diagnose the following:

- RCM
- IPC

PINPOINT TEST Z: THE SAFETY BELT WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Z1 RETRIEVE THE RECORDED RCM DTCs FROM THE SELF-TEST	
• Check for recorded RCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to Z2 .
Z2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0151:00, GO to Pinpoint Test AR . For all other DTCs, REFER to DTC Charts in this section. **No** GO to Z3 .
Z3 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC all warning indicators (SBLT_LAMP) active command. Command all the warning indicators on and off. Observe the safety belt warning indicator. • **Does the safety belt warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** If the safety belt warning indicator is never on, the system is operating correctly at this time. If the safety belt warning indicator is always on, INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AA: The Air Bag Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Supplemental Restraint System (SRS) status from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN) communication bus. If an SRS concern is detected, the RCM sets a DTC and sends a request to the IPC to illuminate the air bag warning indicator.

If the SRS status is missing or invalid for less than 5 seconds, the IPC defaults the air bag warning indicator to the last state (on or off) based upon the last known good message received. If the SRS status message is deemed invalid for more than 5 seconds, the IPC defaults the air bag warning indicator on. If the SRS status message is missing for more than 5 seconds, the IPC sets DTC U0151:00 and defaults the air bag warning indicator on.

This pinpoint test is intended to diagnose the following:

- RCM
- IPC

PINPOINT TEST AA: THE AIR BAG WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AA1 CARRY OUT THE IPC RESTRAINTS OUTPUT CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC all warning indicators (AIRBAG_LMP) active command. Command all the warning indicators on and off. Observe the air bag warning indicator. • **Does the air bag warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to AA2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AA2 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	
• Check for recorded RCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B. **No** GO to AA3.
AA3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0151:00, GO to Pinpoint Test AR. For all other DTCs, REFER to DTC Charts in this section. **No** If the air bag warning indicator is never on, the system is operating correctly at this time. If the air bag warning indicator is always on, INSTALL a new RCM. REFER to Section 501-20B. TEST

	the system for normal operation.

Pinpoint Test AB: The Anti-Theft Indicator Is Never/Always On

Normal Operation

On vehicles not equipped with Intelligent Access (IA), the anti-theft indicator is controlled by the Passive Anti-Theft System (PATS) housed in the Instrument Panel Cluster (IPC). On vehicles equipped with IA, the anti-theft indicator is controlled by the IPC based on a PATS message sent from the Remote Function Actuator (RFA) module.

This pinpoint test is intended to diagnose the following:

- PATS concern
- IPC

PINPOINT TEST AB: THE ANTI-THEFT INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AB1 CARRY OUT THE IPC ANTI-THEFT INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC anti-theft indicator (THEFT_LMP) active command. Command the anti-theft indicator on and off while observing the anti-theft indicator. • **Does the anti-theft indicator illuminate when commanded on and turn off when commanded off?**	**Yes** For vehicles without IA, GO to AB2. For vehicles with IA, GO to AB3. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AB2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Are any PATS -related DTCs recorded?**	**Yes** REFER to Section 419-01B. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AB3 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS RFA MODULE SELF-TEST	
• Check for recorded RFA module DTCs from the continuous self-test. • **Are any PATS -related DTCs recorded?**	**Yes** REFER to Section 419-01B. **No** GO to AB4.
AB4 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Is DTC U0214:00 recorded?**	**Yes** GO to Pinpoint Test AS. **No**

	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AC: The Transaxle Range Display is Never On

Normal Operation

The Instrument Panel Cluster (IPC) receives the transaxle range status from the Transmission Control Module (TCM) over the High Speed Controller Area Network (HS-CAN) communication bus.

If the transaxle range status is missing from the TCM for less than 5 seconds, the transaxle range indicator displays the last selected range based upon the last good known message. If the transaxle range status information is missing from the TCM for 5 seconds or more, the IPC sets DTC U0101:00 and the transaxle range indicator is blank.

This pinpoint test is intended to diagnose the following:

- TCM concern
- IPC

PINPOINT TEST AC: THE TRANSAXLE RANGE DISPLAY IS NEVER ON

Test Step	Result / Action to Take
AC1 VERIFY THE INTEGRATED CIRCUIT DISPLAY FUNCTIONS	
• Ignition ON. • Observe the odometer in the integrated display. • **Does the odometer display illuminate?**	**Yes** GO to AC2 . **No** GO to Pinpoint Test A .
AC2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test AM . For DTC U0101:00, GO to Pinpoint Test AN . **No** GO to AC3 .
AC3 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TEST	
• Check for recorded TCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 307-11 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AD: The Outside Air Temperature Display Does Not Operate Correctly

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The Ambient Air Temperature (AAT) sensor is hardwired to the Instrument Panel Cluster (IPC) through the input and return circuits. The IPC provides a reference voltage to the AAT sensor and monitors the change in voltage resulting from changes in resistance as determined by outside air temperature. The IPC is programmed to update the displayed temperature at different rates depending on several criteria to prevent false temperature displays due to a condition known as heat soaking. Heat soaking is where the outside air temperature is hotter in the location of the AAT sensor than the actual outside air temperature.

The IPC uses the last displayed temperature reading, engine coolant temperature and length of time the engine is off to determine how the display is updated. The IPC stores the last temperature reading at key off and then compares the value against the current temperature reading. When the current temperature reading is below the stored temperature reading, the engine has been off for 2.5 hours or the engine coolant temperature is below 45°C (32°F), the IPC displays the current outside air temperature as measured by the AAT sensor.

If the IPC fails any of the above criteria, the display is updated according to the following table:

Early Build Update Rate

Vehicle Speed	Display Update Rate
Up to 35 km/h (22 mph)	0.1°C (0.18°F) per minute
Between 35 km/h (22 mph) and 120 km/h (75 mph)	0.55°C (0.99°F) per minute
Between 120 km/h (75 mph) and 300 km/h (186 mph)	1.0°C (1.8°F)

Late Build Update Rate

Vehicle Speed	Display Update Rate
Below 25 km/h (16 mph)	Not updated
Between 25 km/h (16 mph) and 35 km/h (22 mph)	0.5°C (0.9°F) per minute
Between 35 km/h (22 mph) and 65 km/h (40 mph)	1.0°C (1.8°F)
Between 65 km/h (40 mph) and 100 km/h (62 mph)	2.0°C (3.6°F)
Above 100 km/h (62 mph)	4.0°C (7.2°F)

- DTC B1A68:11 (Ambient Temperature Sensor: Circuit Short To Ground) — a continuous and on-demand DTC that sets if the IPC detects a short to ground on the AAT sensor input circuit. If the IPC detects a short to ground on the outside air temperature input, the IPC defaults the display to dashes (----).
- DTC B1A68:13 (Ambient Temperature Sensor: Circuit Open) — a continuous and on-demand DTC that sets if the IPC detects an open on the AAT sensor input circuit. If the IPC detects an open on the outside air temperature input, the IPC defaults the display to dashes (----).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- AAT sensor
- IPC

PINPOINT TEST AD: THE OUTSIDE AIR TEMPERATURE DISPLAY DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>AD1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST
• Check for recorded IPC DTCs from the self-test.
• Is IPC DTC B1A68:11 or DTC B1A68:13 recorded?</td><td>Yes
GO to AD4 .

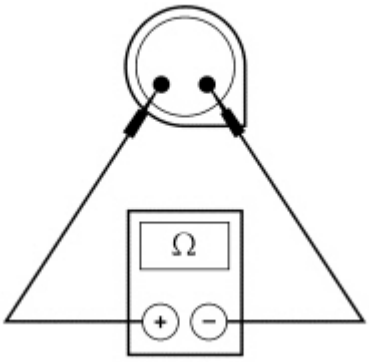
No
VERIFY the vehicle has been driven to eliminate any potential heat soak condition and cool off the sensor.

If the outside air temperature display is still inaccurate, GO to AD2 .</td></tr>
<tr><td>AD2 VERIFY THE SPEEDOMETER OPERATION
• Operate the vehicle and verify the speedometer operation.
• Does the speedometer operate correctly?</td><td>Yes
GO to AD3 .

No
GO to Pinpoint Test E .</td></tr>
<tr><td>AD3 CHECK THE AMBIENT AIR TEMPERATURE SENSOR FUNCTION
• Ignition OFF.
• Disconnect: Ambient Air Temperature Sensor C132.
• Measure the resistance between the ambient air temperature sensor C132 pin 2, component side and the ambient air temperature sensor C132 pin 1, component side according to the following table.

<table><tr><th>Ambient Air Temperature</th><th>Ambient Air Temperature Sensor Resistance</th></tr><tr><td>0-10°C (32-50°F)</td><td>5179-3838 ohms</td></tr><tr><td>10-20°C (50-68°F)</td><td>3838-2792 ohms</td></tr><tr><td>20-30°C (68-86°F)</td><td>2792-1978 ohms</td></tr><tr><td>30-40°C (86-104°F)</td><td>1978-1392 ohms</td></tr></table></td><td>Yes
The system is operating normally at this time. EXPLAIN to the customer the normal operation of the system.

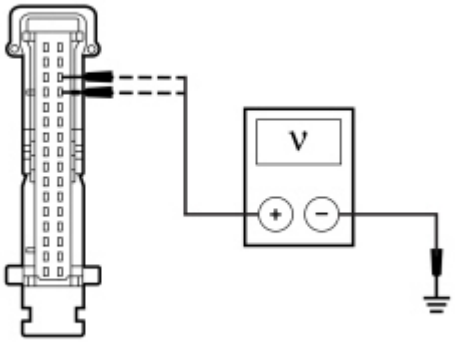
No
CHECK the connector for corrosion or pushed out pins. If the connector is OK, INSTALL a new ambient air temperature sensor. TEST the system for normal operation.</td></tr>
</table>



GK6894-A

- **Does the ambient air temperature sensor resistance match the ambient air temperature according to the table?**

AD4 CLEAR THE DTCs AND RECHECK THE SYSTEM	
• Clear the DTCs and repeat the IPC self-test. • **Is IPC DTC B1A68:11 or DTC B1A68:13 recorded?**	**Yes** GO to AD5 . **No** The system is operating normally at this time.
AD5 CHECK THE AMBIENT AIR TEMPERATURE SENSOR FUNCTION	
• Ignition OFF. • Disconnect: Ambient Air Temperature Sensor C132. • Ignition ON. • Measure the voltage between the ambient air temperature sensor C132-1, circuit VH407 (YE/GN), harness side and the ambient air temperature sensor C132-2, circuit RH107 (GN/BU), harness side.	**Yes** INSTALL a new ambient air temperature sensor. CLEAR the DTCs. REPEAT the self-test. **No** GO to AD6 .
 N0084209 • **Is the voltage approximately 5 volts?**	
AD6 CHECK THE OUTSIDE AIR TEMPERATURE SENSOR INPUT AND RETURN CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the IPC C220-20, circuit VH407 (YE/GN), harness side and ground; and between the IPC C220-19, circuit RH107 (GN/BU), harness side and ground.	**Yes** REPAIR the circuit in question for a short to voltage. REPEAT the self-test. CLEAR the DTCs. **No** GO to AD7 .



N0115662

- **Is any voltage present?**

AD7 CHECK THE OUTSIDE AIR TEMPERATURE INPUT CIRCUIT FOR AN OPEN AND SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the IPC C220-20, circuit VH407 (YE/GN), harness side and the ambient air temperature sensor C132-1, circuit VH407 (YE/GN), harness side; and between the IPC C220-20, circuit VH407 (YE/GN), harness side and ground.  N0117519 • **Is the resistance less than 5 ohms between the IPC and the ambient air temperature sensor, and greater than 10,000 ohms between the IPC and ground?**	**Yes** GO to AD8 . **No** REPAIR circuit VH407 (YE/GN) for an open or for a short to ground. TEST the system for normal operation.
AD8 CHECK THE OUTSIDE AIR TEMPERATURE RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between the IPC C220-19, circuit RH107 (GN/BU), harness side and the ambient air temperature sensor C132-2, circuit RH107 (GN/BU), harness side.  N0117520 • **Is the resistance less than 5 ohms?**	**Yes** GO to AD9 . **No** REPAIR circuit RH107 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test.

AD9 CHECK FOR CORRECT IPC OPERATION	

• Disconnect all the IPC connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the IPC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AE: The Trip Computer Switch Is Inoperative

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The trip computer switch is a redundant switch used to control the functions in the integrated circuit display such as trip computer. The trip computer switch is located in the multifunction switch and hardwired directly to the Instrument Panel Cluster (IPC) through a single signal circuit with a ground provide through a separate circuit. When the driver presses the trip computer button, the switch closes to ground. The IPC detects the change in button state and carries out the chosen function of the integrated display.

- DTC B10BD:01 (Multifunctional Switch: General Electrical Failure) — sets on-demand in the IPC when the IPC detects a short to ground on the trip computer switch signal circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Message center switch
- IPC

PINPOINT TEST AE: THE TRIP COMPUTER SWITCH IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AE1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC B10BD:01, GO to AE6 .

	For all other DTCs, REFER to DTC Charts in this section. **No** GO to AE2.
AE2 CHECK THE TRIP COMPUTER SWITCH OPERATION	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC trip computer switch PID (EXT_TRIP_SW). • Monitor the PID display while pressing the trip computer switch button. • **Does the PID display ON when the button is pressed and OFF when the button is released?**	**Yes** GO to AE3. **No** GO to AE4.
AE3 RETRIEVE THE RECORDED DTCs FROM THE FCDIM SELF-TEST	
• Check for recorded DTCs from the FCDIM self-test. • **Is DTC U0155:00 recorded?**	**Yes** REFER to Section 415-00. **No** INSTALL a new FCDIM. REFER to Section 415-00. TEST the system for normal operation.
AE4 CHECK THE TRIP COMPUTER SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the IPC C220-30, circuit RMC27 (WH/BN), harness side and ground.  N0115665 • **Is any voltage present?**	**Yes** REPAIR circuit RMC27 (WH/BN) for a short to voltage. TEST the system for normal operation. **No** GO to AE5.
AE5 CHECK THE TRIP COMPUTER SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Multifunction Switch C202A. • Measure the resistance between the IPC C220-30, circuit RMC27 (WH/BN), harness side and the multifunction switch C202A-3, circuit RMC27 (WH/BN), harness side.	**Yes** GO to AE7. **No** REPAIR circuit RMC27 (WH/BN) for an open. TEST the system for

 N0115666 • **Is the resistance less than 5 ohms?**	normal operation.
AE6 CHECK THE TRIP COMPUTER SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Multifunction Switch C202A. • Measure the resistance between the IPC C220-30, circuit RMC27 (WH/BN), harness side and ground.  N0115667 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AE7 . **No** REPAIR circuit RMC27 (WH/BN) for a short to ground. TEST the system for normal operation.
AE7 CHECK THE TRIP COMPUTER SWITCH INPUT TO THE IPC	
• Connect: Multifunction Switch C202A. • Disconnect: Negative Battery Cable. • While pressing and releasing the trip computer switch, measure the resistance between the IPC C220-30, circuit RMC27 (WH/BN), harness side and ground.  N0115667 • **Is the resistance less than 5 ohms with the trip computer button pressed and greater then 10,000 ohms with the trip computer button released?**	**Yes** GO to AE8 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTC. REPEAT the self-test.

AE8 CHECK FOR CORRECT IPC OPERATION	

• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AF: The Front Control/Display Interface Module (FCDIM) Does Not Display Warning Messages Or Message Center Warning Indicators

Refer to Wiring Diagrams Cell 60, Instrument Cluster for schematic and connector information.

Normal Operation

The message center display is located in the Front Control/Display Interface Module (FCDIM) and receives the message center data from the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) and Medium Speed Controller Area Network (MS-CAN) communication bus.

This pinpoint test is intended to diagnose the following:

- Communication concern
- FCDIM

PINPOINT TEST AF: THE FCDIM DOES NOT DISPLAY WARNING MESSAGES OR MESSAGE CENTER WARNING INDICATORS

Test Step	Result / Action to Take
AF1 CARRY THE FCDIM DISPLAY OPERATION	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: FCDIM DataLogger. • Select the FCDIM LCD display (LCD_SEG) and message center warnings (WARN_AMBER) and (WARN_RED) active command. Command the LCD display segments, amber and red warning displays on. • Monitor the FCDIM display. • **Do the LCD segments and amber and red warning displays turn on when commanded on?**	**Yes** GO to AF2. **No** INSTALL a new FCDIM. REFER to Section 415-00. TEST the system for normal operation.
AF2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section.

	No GO to AF3 .
AF3 RETRIEVE THE RECORDED DTCs FROM THE FCDIM SELF-TEST	
• Check for recorded DTCs from the FCDIM self-test. • **Is DTC U0155:00 recorded?**	**Yes** REFER to Section 415-00 . **No** INSTALL a new FCDIM . REFER to Section 415-00 . TEST the system for normal operation.

Pinpoint Test AG: The VEHICLE NOT IN PARK SELECT P Message Is Inoperative/Always On (Intelligent Access (IA) Only)

Normal Operation

The park detect switch is hardwired to the Instrument Panel Cluster (IPC) through a single input circuit and grounded through a separate ground circuit. When the vehicle is in PARK (P), the park detect switch opens. When the vehicle is not in PARK (P), the park detect switch closes, providing a ground to the IPC through the park detect input circuit. The IPC receives the driver door ajar data from the Body Control Module (BCM) over the Medium Speed Controller Area Network (MS-CAN) communication bus. When the ignition is placed in the off mode with the floor shifter out of the PARK (P) position and the driver door open, the IPC sends the Front Control/Display Interface Module (FCDIM) a request over the Controller Area Network (CAN) communication bus to display VEHICLE NOT IN PARK SELECT P in the message center.

- DTC P081C:01 (Park Input Circuit: General Electrical Failure) — an on-demand DTC that sets if the IPC detects an open on the park input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Park detect switch
- IPC

PINPOINT TEST AG: THE VEHICLE NOT IN PARK SELECT P MESSAGE IS INOPERATIVE/ALWAYS ON (IA ONLY)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AG1 CHECK THE PARK DETECT INPUT TO THE IPC	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC park detect PID (GEAR_PARK). • Monitor the PID while moving the floor shifter in and out of PARK	**Yes** GO to AG2 . **No** GO to AG3 .

(P). • **Does the PID display TRUE when in PARK (P) and FALSE when out of PARK (P)?**	
AG2 RETRIEVE THE RECORDED DTCs FROM THE FCDIM SELF-TEST	
• Check for recorded DTCs from the FCDIM self-test. • **Is DTC U0155:00 recorded?**	**Yes** REFER to Section 415-00 . **No** INSTALL a new FCDIM . REFER to Section 415-00 . TEST the system for normal operation.
AG3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC P081C:01, GO to AG4 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to AG6 .
AG4 CHECK THE PARK DETECT INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Disconnect: Remote Function Actuator (RFA) Module C3503C. • Ignition ON. • Measure the voltage between the IPC C220-25, circuit CDC41 (WH/BN), harness side and ground.  N0115668 • **Is any voltage present?**	**Yes** REPAIR circuit CDC41 (WH/BN) for a short to voltage. TEST the system for normal operation. **No** GO to AG5 .
AG5 CHECK THE PARK DETECT INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Floor Shifter C3245. • Measure the resistance between the IPC C220-25, circuit CDC41 (WH/BN), harness side and the floor shifter C3245-2, circuit CDC41 (WH/BN), harness side.	**Yes** GO to AG7 . **No** REPAIR circuit CDC41 (WH/BN) for an open. TEST the system for normal operation.

 N0115669 • **Is the resistance less than 5 ohms?**	
AG6 CHECK THE PARK DETECT INPUT CIRCUIT FOR A SHORT TO GROUND	**Yes** GO to AG7 . **No** REPAIR circuit CDC41 (WH/BN) for a short to ground. TEST the system for normal operation.
• Ignition OFF. • Disconnect: Remote Function Actuator (RFA) Module C3503C. • Measure the resistance between the IPC C220-25, circuit CDC41 (WH/BN), harness side and ground.  N0115670 • **Is the resistance greater than 10,000 ohms?**	
AG7 CHECK FOR CORRECT IPC OPERATION	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Disconnect the IPC connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**	

Pinpoint Test AH: The Chime Sounds When The Driver Door Is Ajar (No Key In Ignition And Headlamps Off)

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

On vehicles without Intelligent Access (IA), the key-in-ignition warning switch is hardwired to the Body Control Module (BCM) through the key-in-ignition input circuit. When the key is inserted into the ignition lock cylinder, the key-in-ignition switch opens and removes the ground to the Body Control Module (BCM). When the BCM detects the key-in-ignition input open with the driver door open, the BCM sends the IPC a message over the Medium Speed Controller Area Network (MS-CAN) communication bus to sound the key-in-ignition chime.

On vehicles with IA, the Remote Function Actuator (RFA) module generates an implied key-in-ignition status from the ignition states and the driver door ajar input. If the vehicle is turned off with the selector lever out of PARK (P) and the driver door open, the RFA module sends the IPC a message to sound the key-in-ignition chime.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition warning switch (without IA)
- BCM

PINPOINT TEST AH: THE CHIME SOUNDS WHEN THE DRIVER DOOR IS AJAR (NO KEY IN IGNITION AND HEADLAMPS OFF)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AH1 CHECK THE INSTRUMENT CLUSTER ILLUMINATION	
• Close all doors. • Wait one minute. • Observe the exterior lights. • **Are the headlamps and parking lamps off?**	**Yes** GO to AH2. **No** REFER to Section 417-01.
AH2 CHECK THE INTERIOR LIGHTING OPERATION	
• Open and close the driver door. • Observe the interior lamps. • **Do the interior lamps operate correctly from the driver door?**	**Yes** GO to AH3. **No** REFER to Section 417-02.
AH3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded DTCs from the BCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 for correct navigation of the DTC. **No** GO to AH4.
AH4 CHECK THE KEY-IN-IGNITION SWITCH OPERATION	
• Ignition OFF. • Disconnect: BCM C2280G. • Remove the key from the ignition lock cylinder. • Measure the resistance between the BCM C2280G-9, circuit CDC30 (BU/GY), harness side and ground.	**Yes** GO to AH6. **No** GO to AH5.

 N0115672 • **Is the resistance greater than 10,000 ohms?**	
AH5 CHECK THE KEY-IN-IGNITION INPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Key-In-Ignition Switch C2112. • Measure the resistance between the BCM C2280G-9, circuit CDC30 (BU/GY), harness side and ground.  N0115672 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REPAIR circuit CDC30 (BU/GY) short to ground. TEST the system for normal operation.
AH6 CHECK FOR CORRECT BCM OPERATION	
• Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AI: The Key-In-Ignition Warning Chime Is Inoperative

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) receives the key-in-ignition warning status from the Body Control Module (BCM) over the Medium Speed Controller Area Network (MS-CAN) communication bus.

On vehicles without Intelligent Access (IA), the key-in-ignition warning switch is hardwired to the BCM through the key-in-ignition input circuit. When the key is inserted into the ignition lock cylinder, the key-in-ignition switch opens and removes the ground to the BCM. When the BCM detects the key-in-ignition input open with the driver door open, the BCM sends the IPC a message to sound the key-in-ignition chime.

On vehicles with IA, the Remote Function Actuator (RFA) module receives the door ajar input from the BCM-HVTB over the MS-CAN communication bus. The start/stop button is hardwired to the RFA module. The RFA module generates an implied key-in-ignition status from the start/stop button and the driver door ajar input. When the ignition is placed in the ON mode (engine off) with the driver door open, the RFA module sends the IPC a message to sound the key-in-ignition chime.

- DTC B100A:23 (Fuel Pump Authorization: Signal Stuck Low) — this DTC sets for a key-in-ignition fault and sets on-demand in the BCM when the BCM detects a short to ground on the key-in-ignition output circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition warning switch (without IA)
- BCM (without IA)
- RFA module (with IA)
- IPC

PINPOINT TEST AI: THE KEY-IN-IGNITION WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AI1 CHECK THE SAFETY BELT WARNING CHIME OPERATION	
• Ignition OFF. • Ignition ON. • Monitor the safety belt warning chime when the ignition switch is transitioned from OFF to RUN. • **Does the safety belt warning chime operate for approximately 6 seconds?**	**Yes** GO to AI2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AI2 CHECK THE INTERIOR LAMPS OPERATION	
• Check the operation of the courtesy lamps from the driver door. • **Do the courtesy lamps operate correctly from the driver door?**	**Yes** GO to AI3. **No** REFER to Section 417-02.
AI3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** For vehicles with IA, GO to AI4. For vehicles without IA,

	GO to AI5.
AI4 RETRIEVE THE RECORDED DTCs FROM THE RFA MODULE SELF-TEST	
• Check the recorded DTCs from the RFA module self-test. • **Are any DTCs present?**	**Yes** REFER to Section 419-10. **No** INSTALL a new RFA module. REFER to Section 419-10. TEST the system for normal operation.
AI5 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check the recorded DTCs from the BCM self-test. • **Are any DTCs present?**	**Yes** For all other DTCs, REFER to Section 419-10. For DTC B10F1:23, GO to AI6. **No** GO to AI9.
AI6 CHECK THE KEY-IN-IGNITION INPUT FOR AN OPEN	
• Ignition OFF. • Disconnect: BCM C2280G. • Insert the key into the ignition lock cylinder. • Measure the resistance between the BCM C2280G-9, circuit CDC30 (BU/GY), harness side and ground.  N0115672 • **Is the resistance less than 5 ohms?**	**Yes** GO to AI8. **No** GO to AI7.
AI7 CHECK THE KEY-IN-IGNITION SWITCH OPERATION	
• Disconnect: Key-In-Ignition Switch C2112. • Measure the resistance between the BCM C2280G-9, circuit CDC30 (BU/GY), harness side and the key-in-ignition switch C2112-1, circuit CDC30 (BU/GY), harness side.	**Yes** INSTALL a new ignition switch. REFER to Section 211-05. TEST the system for normal operation. **No** REPAIR circuit CDC30 (BU/GY) for an open. TEST the system for normal

 N0115673 • **Is the resistance less than 5 ohms?**	operation.
AI8 CHECK THE KEY-IN-IGNITION GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between the key-in-ignition switch C2112-2, circuit GD115 (BK/GY), harness side and ground.  N0124632 • **Is the resistance less than 5 ohms?**	**Yes** GO to AI10 . **No** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
AI9 CHECK FOR CORRECT BCM OPERATION	
• Disconnect all the BCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
AI10 CHECK FOR CORRECT KEY-IN-IGNITION SWITCH OPERATION	
• Check the key-in-ignition switch C2112 for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the key-in-ignition switch C2112 and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation. **No** The system is

	operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AJ: The Headlamps On Warning Chime Is Inoperative

Normal Operation

The Body Control Module (BCM) uses hardwired circuitry to receive the headlamp switch status from the headlamp switch and the LH front door ajar status from the LH front door ajar switch. The headlamps on warning chime sounds when the LH front door is opened with the ignition in the OFF state, the key is not in the ignition lock cylinder (without IA), and the headlamp switch in the PARK or HEADLAMP ON position. The BCM communicates the headlamp on chime request to the Instrument Panel Cluster (IPC) based on headlamp or parking lamp and driver door inputs.

This pinpoint test is intended to diagnose the following:

- Door ajar indication
- BCM
- IPC

PINPOINT TEST AJ: THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AJ1 CHECK THE SAFETY BELT WARNING CHIME OPERATION	
• Ignition OFF. • Ignition ON. • Monitor the safety belt warning chime when the ignition switch is transitioned from OFF to RUN. • **Does the safety belt warning chime operate for approximately 6 seconds?**	**Yes** GO to AJ2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AJ2 CHECK THE INTERIOR LAMPS OPERATION	
• On vehicles without IA , remove the key from the ignition lock cylinder. • On vehicles with IA , place the ignition in the OFF state. • Open and close the driver door. • Observe the interior lamps. • **Do the interior lamps operate correctly from the driver door?**	**Yes** GO to AJ3 . **No** REFER to Section 417-02 .
AJ3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140:00, GO to Pinpoint Test AQ . For all other DTCs, REFER to DTC Chart in this section. **No** GO to AJ4 .

AJ4 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST	
• Check for recorded BCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 for correct navigation of the DTC. **No** INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.

Pinpoint Test AK: The Safety Belt Warning Chime Is Inoperative/The Belt-Minder® Feature Does Not Operate

Normal Operation

The Instrument Panel Cluster (IPC) receives the safety belt and Belt-Minder® requests from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN). The safety belt warning chime sounds for approximately 6 seconds when the driver safety belt is not fastened and the ignition is changed from the OFF or ACC state to the RUN or START state.

The Belt-Minder® feature supplements the safety belt warning function and is enabled after the safety belt warning is complete. The Belt-Minder® simultaneously sounds the chime and illuminates the safety belt warning lamp in the IPC once the vehicle speed has exceeded 5 km/h (3 mph), and remains active for 5 minutes from the time it is started.

There are 2 Belt-Minder® strategies used and implemented by the IPC as commanded by the RCM. The 2 strategies are designed to provide an increased intensity level of the chime. Belt-Minder® A provides 6 one-second sequences of 0.5-second on/0.5-second off for the first minute of the Belt-Minder® warning. Belt-Minder® B provides 6 one-second sequences of 0.2-second on/0.2-second off then 0.3-second on/0.3-second off for the remainder of the Belt-Minder® warning.

NOTE: Make sure the safety belt/Belt-Minder® chime operation is verified with the vehicle moving at least 9.7 km/h (6 mph).

This pinpoint test is intended to diagnose the following:

- Belt-Minder® deactivated
- Safety belt warning indication concern
- Speedometer concern
- IPC

PINPOINT TEST AK: THE SAFETY BELT WARNING CHIME IS INOPERATIVE/THE BELT-MINDER® FEATURE DOES NOT OPERATE

Test Step	Result / Action to Take
AK1 CHECK THE HEADLAMPS ON WARNING CHIME OPERATION	
• Ignition OFF. • Place the headlamp switch in the HEADLAMP position. • Open the LH front door and observe the headlamps on warning chime operation. • **Does the headlamps on warning chime operate correctly?**	**Yes** GO to AK2. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

AK2 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: RCM PIDs. • Monitor the RCM driver safety belt buckle PID (SBELT_D_ST) while buckling and unbuckling the driver safety belt. • **Does the PID display BUCKLED with the safety belt buckled and UNBUCKLED with the safety belt unbuckled?**	**Yes** GO to AK3. **No** REFER to Section 501-20B.
AK3 CHECK THE SAFETY BELT WARNING INDICATOR FOR CORRECT OPERATION	
• Ignition ON. • Within one minute, buckle then unbuckle the LH front safety belt. • With the engine running, verify the safety belt warning indicator illuminates with the safety belt unbuckled and turns off when buckled. • **Does the safety belt warning indicator operate correctly?**	**Yes** GO to AK4. **No** GO to Pinpoint Test Z.
AK4 CHECK THE SPEEDOMETER OPERATION	
• Verify the speedometer is operating correctly. • **Does the speedometer operate correctly?**	**Yes** GO to AK5. **No** GO to Pinpoint Test E.
AK5 CHECK THE BELT-MINDER® CONFIGURATION	
• Verify the Belt-Minder® is activated or configured on for the seating position in question. Refer to Belt-Minder® Deactivating/Activating in this section to configure without a scan tool. • **Is the Belt-Minder® activated for the seating position in question?**	**Yes** If the Belt-Minder® is always on above 5 km/h (3 mph) with the safety belt unfastened, the system is operating normally. If the Belt-Minder® is always on with the safety belt fastened or never on with the safety belt unfastened above 9.7 km/h (6 mph), INSTALL a new RCM. REFER to Section 501-20B. TEST the system for normal operation. **No** ACTIVATE the Belt-Minder® for the seating position in question. REFER to Belt-Minder® Deactivating/Activating in this section. TEST the system for normal operation.

Pinpoint Test AL: The Parking Brake Warning Chime Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) uses vehicle speed data sent from the ABS module over the High Speed Controller Area Network (HS-CAN) and parking brake switch status input to the IPC to determine when to turn on the sound the parking brake warning chime.

The parking brake warning chime sounds when the ignition is in the ON state, the parking brake is

engaged, and the vehicle speed is greater than 5 km/h (3 mph). The parking brake warning chime stops sounding and resets if the parking brake is released, the ignition is not in the ON state, the vehicle speed is below 5 km/h (3 mph), or after 90 seconds from the time the chime is activated.

NOTE: Make sure the parking brake warning chime operation is verified with the vehicle moving at least 5 km/h (3 mph) with the parking brake slightly applied (just enough to turn the brake warning indicator on without damaging the rear brakes).

This pinpoint test is intended to diagnose the following:

- Brake warning indication concern
- IPC

PINPOINT TEST AL: THE PARKING BRAKE WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AL1 CHECK THE SAFETY BELT WARNING CHIME OPERATION	
• Ignition OFF. • Ignition ON. • Monitor the safety belt warning chime when the ignition switch is transitioned from OFF to RUN. • **Does the safety belt warning chime operate for approximately 6 seconds?**	**Yes** GO to AL2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AL2 CHECK THE BRAKE WARNING INDICATOR OPERATION	
• Apply the parking brake. • Ignition ON. • Observe the brake warning indicator. • **Does the brake warning indicator turn on?**	**Yes** GO to AL3 . **No** GO to Pinpoint Test L .
AL3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Chart in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AM: DTC U0100:00 and P1607:87

Normal Operation

- DTC U0100:00 (Lost Communication With ECM /PCM "A": No Sub Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the PCM over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more. For a complete list of all network messages, refer to Section 418-00 .
- DTC P1607:87 (MIL Output Circuit: Missing Message) — sets in continuous memory in the IPC when the MIL message from the PCM is missing for 5 seconds or more.

NOTE: Once the IPC sets DTC U0100:00, multiple gauges or indicators are likely to be inoperative in the IPC . Other modules that require data from the IPC all set communication DTCs and may also

exhibit system function concerns.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST AM: DTC U0100:00 AND P1607:87

Test Step	Result / Action to Take
AM1 VERIFY THE SCAN TOOL CAN COMMUNICATE WITH THE PCM • Connect the scan tool. • Check that a vehicle session can be established using the scan tool. • **Can a vehicle session be established?**	**Yes** GO to AM2. **No** REFER to Section 418-00 to diagnose no communication with the PCM.
AM2 CHECK THE IPC CONTINUOUS MEMORY DTCs • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC Self-Test. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0100:00 or DTC P1607:87 retrieved again?**	**Yes** GO to AM3. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AM3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST • Check for recorded DTCs from the PCM Key ON Engine OFF (KOEO) self-test. • **Is DTC P0562 or P0563 recorded?**	**Yes** REFER to Section 303-14. **No** GO to AM4.
AM4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded DTCs from the IPC self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** For DTC U3006:16, GO to Pinpoint Test AU. For DTC U3006:17, GO to Pinpoint Test AV. **No** GO to AM5.
AM5 CHECK FOR DTC U0100:00 SET IN OTHER MODULES • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0100:00 set in the Remote Function Actuator (RFA) module or the Restraints Control Module (RCM)?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AN: DTC U0101:00

Normal Operation

- DTC U0101:00 (Lost Communication With TCM : No Sub Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Transmission Control Module (TCM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more.

This pinpoint test is intended to diagnose the following:

- TCM
- IPC

PINPOINT TEST AN: DTC U0101:00

Test Step	Result / Action to Take
AN1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AN2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AN2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the TCM module pass the network test?**	**Yes** GO to AN3 . **No** REFER to Section 418-00 .
AN3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded IPC DTCs from the self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** For DTC U3006:16, GO to Pinpoint Test AU . For DTC U3006:17, GO to Pinpoint Test AV . **No** GO to AN4 .
AN4 RECHECK THE IPC DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0101:00 still present?**	**Yes** GO to AN5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AN5 CHECK FOR DTC U0101:00 SET IN OTHER MODULES • Clear all DTCs. • Ignition OFF.	**Yes** INSTALL a new TCM . REFER to

• Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0101:00 set in the ABS module?**	Section 307-11 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AO: DTC U0121:00

Normal Operation

- DTC U0121:00 (Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the ABS module over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- ABS module
- IPC

PINPOINT TEST AO: DTC U0121:00

Test Step	Result / Action to Take
AO1 VERIFY THE CUSTOMER CONCERN	**Yes** GO to AO2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	
AO2 CHECK THE COMMUNICATION NETWORK	**Yes** GO to AO3 . **No** REFER to Section 418-00 .
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the ABS module pass the network test?**	
AO3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	**Yes** REFER to Section 206-09 . **No** GO to AO4 .
• Check for recorded DTCs from the ABS module self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	
AO4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	**Yes** For DTC U3006:16, GO to Pinpoint Test AU . For DTC U3006:17, GO
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	

	to Pinpoint Test AV . **No** GO to AO5 .
AO5 RECHECK THE IPC DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0121:00 still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the IPC self-test. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AP: DTC U0131:00

Normal Operation

- DTC U0131:00 (Lost Communication With Power Steering Control Module: No Sub Type Information) — sets in continuous memory if data messages received from the Power Steering Control Module (PSCM) module over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- PSCM module
- IPC

PINPOINT TEST AP: DTC U0131:00

Test Step	Result / Action to Take
AP1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AP2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AP2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the PSCM pass the network test?**	**Yes** GO to AP3 . **No** REFER to Section 418-00 .
AP3 RETRIEVE THE RECORDED DTCs FROM THE PSCM SELF-TEST • Check for recorded DTCs from the PSCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 211-00 .

	No GO to AP4 .
AP4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** For DTC U3006:16, GO to Pinpoint Test AU . For DTC U3006:17, GO to Pinpoint Test AV . **No** GO to AP5 .
AP5 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0131:00 still present?**	**Yes** GO to AP6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AP6 CHECK FOR DTC U0131:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0131:00 set in the ABS module?**	**Yes** INSTALL a new PSCM (part of the steering gear). REFER to Section 211-02 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AQ: DTC U0140:00

Normal Operation

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- BCM
- IPC

PINPOINT TEST AQ: DTC U0140:00

Test Step	Result / Action to Take
AQ1 VERIFY THE CUSTOMER CONCERN	

• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AQ2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AQ2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the BCM pass the network test?**	**Yes** GO to AQ3 . **No** REFER to Section 418-00 .
AQ3 RETRIEVE THE RECORDED DTCs FROM THE BCM SELF-TEST • Check for recorded DTCs from the BCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 419-10 . **No** GO to AQ4 .
AQ4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded DTCs from the IPC self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** For DTC U3006:16, GO to Pinpoint Test AU . For DTC U3006:17, GO to Pinpoint Test AV . **No** GO to AQ5 .
AQ5 RECHECK THE IPC DTCs **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0140:00 still present?**	**Yes** GO to AQ6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AQ6 CHECK FOR DTC U0140:00 SET IN OTHER MODULES • Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140:00 set in the Audio Control Module (ACM)?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AR: DTC U0151:00

Normal Operation

- DTC U0151:00 (Lost Communication With Restraints Control Module: No Sub Type Information)

— sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- RCM
- IPC

PINPOINT TEST AR: DTC U0151:00

Test Step	Result / Action to Take
AR1 VERIFY THE CUSTOMER CONCERN • Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AR2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AR2 CHECK THE COMMUNICATION NETWORK • Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the RCM pass the network test?**	**Yes** GO to AR3 . **No** REFER to Section 418-00 .
AR3 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST • Check for recorded DTCs from the RCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 501-20B . **No** GO to AR4 .
AR4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST • Check for recorded DTCs from the IPC self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** For DTC U3006:16, GO to Pinpoint Test AU . For DTC U3006:17, GO to Pinpoint Test AV . **No** GO to AR5 .
AR5 RECHECK THE IPC DTCs • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0151:00 still present?**	**Yes** GO to AR6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AR6 CHECK FOR DTC U0151:00 SET IN	

OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0151:00 set in the Occupant Classification System Module (OCSM)?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AS: DTC U0214:00

Normal Operation

- DTC U0214:00 (Lost Communication With Remote Function Actuation: No Sub-Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Remote Function Actuator (RFA) module over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- RFA module
- IPC

PINPOINT TEST AS: DTC U0214:00

Test Step	Result / Action to Take
AS1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AS2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AS2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the RFA module pass the network test?**	**Yes** GO to AS3 . **No** REFER to Section 418-00 .
AS3 RETRIEVE THE RECORDED DTCs FROM THE RFA MODULE SELF-TEST	
• Check for recorded DTCs from the RFA module self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 419-10 **No** GO to AS4 .
AS4 RETRIEVE THE RECORDED DTCs FROM THE IPC	

SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** For DTC U3006:16, GO to Pinpoint Test AU . For DTC U3006:17, GO to Pinpoint Test AV . **No** GO to AS5 .
AS5 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0214:00 still present?**	**Yes** INSTALL a new RFA module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the IPC self-test. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AT: DTC U0257:00

Normal Operation

- DTC U0257:00 (Lost Communication With Front Controls / Display Interface Module: No Sub Type Information) — sets in continuous memory in the Instrument Panel Cluster (IPC) if data messages received from the Front Control/Display Interface Module (FCDIM) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or more. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- FCDIM
- IPC

PINPOINT TEST AT: DTC U0257:00

Test Step	Result / Action to Take
AT1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AT2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AT2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test.	**Yes** GO to AT3 . **No** REFER to Section 418-00 .

• **Does the FCDIM pass the network test?**	
AT3 RETRIEVE THE RECORDED DTCs FROM THE FCDIM SELF-TEST	
• Check for recorded DTCs from the FCDIM self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** REFER to Section 415-00 . **No** GO to AT4 .
AT4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3006:16 or DTC U3006:17 recorded?**	**Yes** For DTC U3006:16, GO to Pinpoint Test AU . For DTC U3006:17, GO to Pinpoint Test AV . **No** GO to AT5 .
AT5 RECHECK THE IPC DTCs	
• Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U0257:00 still present?**	**Yes** GO to AT6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AT6 CHECK FOR DTC U0212:87 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0257:00 set in the Audio Control Module (ACM)?**	**Yes** INSTALL a new FCDIM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AU: DTC U3006:16

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

- DTC U3006:16 (Control Module Input Power "A": Circuit Voltage Below Threshold) — sets in the Instrument Panel Cluster (IPC) in continuous memory if the IPC detects battery voltage below 8 volts on the hot at all times B+ voltage supply circuit for more than one second after the engine has been running for longer than one second.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- IPC

PINPOINT TEST AU: DTC U3006:16

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AU1 RECHECK THE IPC DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC Self-Test. • Clear the DTCs. • Wait 10 seconds. • Repeat the IPC self-test. • **Is DTC U3006:16 still present?**	**Yes** GO to AU2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AU2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Carry out the PCM Key ON Engine OFF (KOEO) self-test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC P0469, P065B, P065C, or P0A3B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AU3 .
AU3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AU4 . **No** REFER to Section 414-01 .
AU4 CHECK THE IPC VOLTAGE PID	
• Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Monitor the IPC voltage PID (MAINECUV). • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AU7 . **No** GO to AU5 .
AU5 CHECK THE IPC VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the IPC C220-32, circuit SBP03 (BU/RD), harness side and ground.	**Yes** GO to AU6 . **No** REPAIR circuit SBP03 (BU/RD) for high resistance. CLEAR the DTC. REPEAT the self-test.

 N0115640 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	
AU6 CHECK THE IPC GROUND CIRCUIT	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the IPC C220-6, circuit GD115 (BK/GY), harness side and ground.  N0115675 • **Is the resistance less than 5 ohms?**	**Yes** GO to AU7 . **No** REPAIR circuit GD115 (BK/GY) for high resistance. CLEAR the DTCs. REPEAT the self-test.
AU7 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AV: DTC U3006:17

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

- DTC U3006:17 (Control Module Input Power "A": Circuit Voltage Above Threshold) — sets in the Instrument Panel Cluster (IPC) in continuous memory if the IPC detects battery voltage above 16

volts on the hot at all times B+ voltage supply circuit for more than one second after the engine has been running for longer than one second.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- IPC

PINPOINT TEST AV: DTC U3006:17

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: DTC U3006:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AV1 CHECK FOR DTC B1317, B1676, P0563 (PCM) OR U3003:17 SET IN OTHER MODULES • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676, P065B (PCM) or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AV2 .
